Well, what happens to this modified mRNA? No RNA or protein metabolism or excretion studies will be conducted, said Pfizer too, and that is in keeping with the WHO guidelines. "We don't have to do it, so we're not going to do it." That was said to the EMA as well. Because they were following the guidelines, they said, "okay."

What do we find? We find that the mRNA doesn't get broken down very easily because of the N1-methyl-pseudouridine. We found back in early 2022: detected in the blood at 15 days; January 2023, we find it a month here, 28 days in the liver; and this seminal paper found it up to 60 days in the lymph nodes, both the vaccine and the spike mRNA. And we don't even know how much longer it would be because this is where they stopped.

And in case we didn't know that this N1-methyl-pseudouridine lasts a long time, this paper in 2015 showed that if you put just one of these in luciferase, they got protein production for up to 21 days.

The second outstanding issue is the spike protein production.

[00:15:00]

One of the things we do from a regulatory perspective, this is not really— If I want to label this as a vaccine, and I will use that term because regulatory-wise that's the way it was seen— It is really a pro-vaccine, because the active drug is the spike protein, not the mRNA. The mRNA acts as a pro-drug which gets converted to the active drug. This is not uncommon in pharmacology. We have a lot of pro-drugs we use. There are certain major advantages to using them sometimes. But what we normally would see is that if we have a pro-drug, we want to know the structure and the function of the active drug as well.

And this I found as the specific obligation number one. When I read the ePAR in January, I was quite struck with the language used by the regulator: "A severe deficiency of the characterization section is" that we don't know what that spike protein looks like and you haven't given us enough information for us to assess whether or not that pro-drug is converted to the active drug in a way that satisfies regulatory processes.

And this language was quite strong, and I was quite amazed because this shouldn't really be an issue. This really shouldn't be a problem. That was one of the things I told my family. If I don't even know what the spike protein looks like, I'm not going to take this until I find out.

Figured it was just a matter of time. June '21 came along: nothing. And as well, December '21 came along: nothing. I looked for any evidence of the spike protein for two years. And I called this "Censored" because this little pharmacy school in Ohio published this in March of 2022. And you could see here that you actually—this is Moderna, though—had protein production up to 12 days. And these researchers were quite surprised by that.

And I want you to read this section here out of their paper: "In communications with Moderna and Pfizer regarding the proteins expressed by their synthetic mRNA vaccines, each company's medical information group disclosed that they had not examined the protein dynamics for more than 48 hours" after it was transfected in cell culture; that's how we measure it. "Owing to its proprietary status, they would not disclose any information related to the nature of the protein that was expressed."

This would mean that the spike protein is proprietary, or it's information that is only kept within themselves. That does not mean the regulator does not have access to that information. Regulators deal with proprietary information all the time. When I worked for PMPRB, we knew the prices that they were probably planning to price the drug at, which is really proprietary information. So there was no excuse as far, or there was no real reason why Pfizer and Moderna couldn't give the information regarding the spike protein.

It actually did come out. I found out about it with the judicial drop, the Judicial Watch documents in February of this year; we did get what they provided to the EMA. And as you can see here, the EMA was still not happy with this information, because the sizes weren't what they expected it to be. Pfizer said, "Well, that's because there's sugars on this spike protein," which is true: the virus spike protein is covered with sugars, which affects the kinds of antibodies that are made. So the EMA said, "Well, strip off the sugars, redo it and verify it with more quantitative tests called mass spec." And eventually this was done, but

not done until February 2022, when the EMA say, “Okay, we’re satisfied.” But as far as I know these things were not verified with mass spec. So the complete knowledge of this spike protein is still outstanding.

The second related problem is: Does it get converted? And if I transfect or I put those lipid nanoparticles on cells, do they go in and do I get a spike protein? This is measured through cell flow cytometry assay, which you see here. In the top line: you see this S1 green, that spike protein? Hah! You know the cells do make spike protein. It does not quantify if the expressed spike protein will be elicited

[00:20:00]

or have the desired immune response in vivo, in active living organism, and it does not quantify how much spike protein is made. And the EMA still have problems with some of this testing.

I will give the commissioners the YouTube video that my friend— David Weissman goes to these FDA meetings. The FDA has a vaccine advisory group that advises them. And eventually in June, Dr. Portnoy asked Dr. Gruber from Pfizer how much spike protein is made and for how long. And Pfizer’s answer is, “Well, we really don’t understand that. We really don’t understand the way vaccine works, but we feel it’s an academic problem or an academic question, because we’ve got the antibodies. So it doesn’t really matter so much how much protein we make or for how long.” And this is where it stands.

At the end, the head of Pfizer R&D, Kathrin Jansen, who retired in November said, “We flew the airplane while we’re still building it.” And I think that’s really quite true. They went from step to step and really were behind the eight ball the entire time.

What you see behind this clip from Dr. Jansen is the European Medicines Agency’s procedural steps and scientific information after authorization. There are 80 pages of this stuff. If you read it, you see there’s a change to an importer or to a batch release site, a site where any manufacturing took place. We change in manufacturer starting materials, change in how you make it, lots of changes in tests and et cetera. And what Jansen said is, instead of scaling it up to a big, big thing, they scaled it up to six or seven little factories, which of course means you had even more issues with contamination and fragmented.

One thing that I didn’t actually— okay, so do I have enough time? I just want to go briefly over lipid manufacturing. Lipids are made spontaneously. They’re not like a chemically made thing. You have the lipids in ethanol, and they’re synthetic as well. The mRNA is in water and what you do is you mix it at very high speeds, like a jet mixer. And Pfizer and Moderna don’t even know how it works. This is under separate patents and the pH is **changed, and by its swirls and all this stuff, they basically self-assemble into these little nanoparticles.**

There are lots of issues with the little nanoparticles. They are sometimes not that stable. Over time they get bigger—and sometimes it takes six months—but they naturally grow bigger. And one of the reasons we have PEG on the outside is to stop them from getting bigger when they bump into something else.

We think of them as being round, with the lipid nanoparticles on the inside. This is a picture of one that— And you can see a few are empty: you don’t see any mRNA. And if you stress them—this is freeze and thaw, freeze and thaw; this is more than one freeze and thaw—they’ll start to what we call “agglomerate,” or start to clump together and fuse, and

sometimes you can release the mRNA out. We're not sure. And that's also dependent on pH. And also, the Japanese found if you shook it for five minutes, like really shake it, vortex shaking, the lipids all fall apart.

But a regulatory assessment of the LNPs was as novel excipients. What does that mean? It means the excipients are separate, non-pharmacological. They have no intrinsic activity of their own, they just enable the drug substance to be applied to the patient in the right form, and supports the way and place of action without being active themselves.

Under the regulation, the WHO 2005 regulations, you do get some toxicology profile, repeat those toxicity, some kinetics or biodistribution, and a few tests on general toxicity, teratogenicity, which I will not address.

What was not assessed by the WHO guidelines? No assessment of how long the actual individual lipids really last in the body. They did some preliminary work and supposedly we call a half-life of 25 days.

[00:25:00]

So you multiply that by five—that's what we do in order to determine how long it takes to get rid of all of those little lipids, not the nanoparticles, but the lipids. Thank goodness they're very small amounts, so the EMA said, "Well, it looks like it lasts a long time, but they're tiny. It's really small amounts, so I don't think it's going to be a problem." No verification of that though.

Drug interactions were not assessed because vaccines don't cause drug interactions. But in this case, this particular product did, and we had a few patients end up in hospital quite sick with interactions with an anti-schizophrenic drug, clozapine, because it is so inflammatory and transiently in the liver that it can interfere in some patients with some drugs.

We have an issue called CARPA. This was an outstanding issue for me. And it is complement-activation-related-pseudo-allergy. It looks like an allergic reaction but it's not, and it's due to the fact [inaudible] take on a nanoparticle. This is known. We have a drug that we give in chemotherapy, which is a nanoparticle with a chemo inside: doxorubicin used in breast cancer. And we have lots and lots of CARPA-like reactions from this, and it's well known, and we have lots of protocols on how to manage it.

CARPA, if you're not managing or looking for it, can be dangerous because there's amplification and patients can get pulmonary hypertension. They can drop their blood pressure, they can have bronchospasm, and it looks like an allergy. But it is not the typical anaphylaxis of IgE allergy—though it's treated the same. We don't look at secondary pharmacology and pharmacodynamics. Genotoxicity and carcinogenicity was not done, because these are natural MRNAs—I disagree with that characterization—and natural lipids—I also disagree with that characterization. So therefore, we don't need to worry about it. That was the rationale used for the WHO 2005 guidelines.

The environmental risk assessment: Well, you would do that for gene therapies, because you would look to see where the genetic therapy in the lipids go to, whether or not they're excreted as exosomes. In fact, we found that to occur with the Pfizer vaccine in a paper done here in 2021 by Bansal, where they found—Exosomes are little bits of the cell wall, and inside was a spike protein and partially digested lipoproteins. And these can move to

other parts of the body and actually transfect and provide the spike protein into another cell.

In addition, there's a product that's very similar that is a gene therapy product that has similar lipid nanoparticles, doesn't have mRNA. It's a non-coding, and a very, very small RNA. They found that they have some—they call them exosomes as well, that float around for a long, long time. And my colleagues and I are wondering if this is the rationale for shedding. It needs verification, it has not been studied; it is just a potential possibility as one reason why spike protein or mRNA can last in the body for some time. And it doesn't cause as much cytokine stimulation compared to intact LNPs, which can be quite immunostimulatory.

Speaking of that, here are some of the toxicity assessments done with rats. Just this month, they actually published the rat liver studies, or the rat toxicity that they did. And this is a picture right from the trials that was used for the regulatory assessment. You can see a bunch— This red in the middle, off in the lower left side, is an artery with blood in it, and little white dots that they think is a bit of lipid accumulation. It wasn't considered really super important, but it was a potential possibility that meant that we have some toxicity in the liver.

And what happened here is that the results of this study was September of 2020. And we had already started the clinical trials. Under normal circumstances, we'd either do a reassessment or amendment on the trial and measure, say, the liver function tests in a set of people, to ensure that this potential signal that was found here is not found in humans.

[00:30:00]

And actually, the EMA said, "Well, you know, it doesn't look too bad," and I would agree with that. "But we also have the patient data that's coming in and assessed in clinical trials, so we'll be able to know if this is an ongoing issue." Unfortunately, to best of my knowledge, the people who know the clinical trial data better— I don't believe that liver function tests were measured on a regular basis, and someone could correct me if I'm wrong on that.

On the biodistribution side, I think most of the people understand some of the issues regarding the biodistribution. And I will say a few things. One, if it was assessed as gene therapy, that signal that stopped at 48 hours—because we only have data to 48 hours— would not have stopped at 48 hours. It would have continued until we had those signal detection. This biodistribution study labeled the lipid nanoparticles. The issue with that is it doesn't tell you how much spike protein is made. So just because the lipid nanoparticles that we see, and were tagged, went to these organs, it doesn't necessarily mean that there's a lot of spike protein made. It is likely, but that assumption needs to be tested.

In addition, if the lipid nanoparticles have luciferase in it—which is the issue that was here—instead of the actual mRNA that is in the vials, that is in the commercial product, there's no guarantee that the biodistribution will be the same either. Because sometimes packing—you know, those mRNA, the packing within a lipid nanoparticle—can sometimes change its biodistribution.

Most importantly, there were no Specific Obligations imposed on either the toxicity issues or on the biodistribution issues, which means that there are no further studies that might be required for future mRNA vaccines. And this, in my assessment, should be changed.

Lastly, assays and tests. This was a new platform, as they say in regulatory language. We had no standards against which we could measure things. What is the right test to measure how much RNA is in those vials? Do you use this, do you use that? And even if you know which tests to use, how are they going to be done? This is what we call a pharmaceutical standard, or United States Pharmacopeia.

We use this in hospital. There are certain criteria on how we have to clean our hoods, and we can't just use any old alcohol: a specific alcohol. And we have to do it in a certain way, with a certain amount of coverage. It is very well spelled out so that you can guarantee every little pharmacy, hospital pharmacy in Ontario or whoever's following, are doing the same thing. That's a compendial standard.

There are no compendial standards for many of the tests that are used. They are currently being proposed and in talks. So hopefully that will improve things quite a bit.

The contaminants that are found in making the mRNA: We had some previous testimony about the double-stranded RNA contaminants, the entire plasmids, which is a risk—a huge risk perhaps—for genomic integration. Though I remain actually—I think that may not be, but that's just me. Double-stranded RNA. Endotoxin. Endotoxin. Endotoxin: Is what's found in the E. coli cells that you use to make the plasmid DNA. Very hard to eliminate from these products. Endotoxin is ubiquitous and it's extremely toxic. This is what causes septic shock. And this is what I saw in ICU, in the patients who got sick with gram negative bacteria: It's the endotoxin that causes much of the damage in septic shock. We need to have compendial standards. We need to make that endotoxin as low as possible. And that is an ongoing issue that needs to be resolved.

The EMA reviewer, I think was summarized here, had some very poignant observations. They said, "inherent variability in making this product." "We are going to have difficulty testing," especially on the potency side. "It's a brand-new technology," we don't know where it's going further. "Potential toxic impurities,"

[00:35:00]

and a "risk of bioavailability issue."

These guidelines are wholly inadequate. And in fact, the WHO is actually making new guidelines, which I think are still not going to be sufficient, because they're still not going to be assessed as gene therapy products.

This is what was discussed and how these products, especially the Pfizer product, was analyzed by the European Medicine Association.

And that is my testimony.

Shawn Buckley

Thank you, Maria. I'll ask the commissioners if they have any questions.

Commissioner Massie

Thank you, Dr. Gutschi, for this presentation. I have a couple of questions. The first one is, given the change in regulation, I was not aware that the classification of these mRNA-based vaccines had been amended so long ago; I thought it was more recent. So, I'm wondering—

because they hadn't mandated it more than 10 years ago, and they were probably already testing some mRNA vaccines for a number of indications like cancer and so on—why is it that the industry and the regulatory agency have not taken the steps to ensure quality attribute in production and biodistribution and so on? It seems to me that there's kind of a gap—

Dr. Luz Maria Gutschi

A big one.

Commissioner Massie

—in the quality that you would expect normally for still a new product. I mean, this is not a product that has been used that broadly.

Dr. Luz Maria Gutschi

Correct. You would expect that some of the quality issues would have been worked out ahead of time. And I don't know why they had so much— I think they weren't expecting the issues with the IVT that they found with the in vitro transcription. And all the truncated— That they weren't expecting. They were trying very hard to get the double-stranded RNA out, and the endotoxin out, and the DNA out. I think they had worked that out pretty well.

The problem I have with those contaminants is that we're not taking into consideration they're transfected, so that they're in the cell as opposed to outside the cell that you would get, say with endotoxin; you would have the endotoxin outside the cell and you wouldn't have it in. I'm not sure that was taken into consideration. But you're right. And it's not only the way I feel; it's not only that these things should have been thought upon, or it's maybe the scale-up was an engineering issue that lab and other researchers did not consider. It is sometimes how I feel as a pharmacist when orders come to us. It's like, "How am I going to operationalize that order? Because there's a bunch of steps here you guys haven't considered." And maybe there was that gap of understanding: the engineering aspect that wasn't there, number one.

And number two: It was obvious to me that it was going to be approved December 2020 no matter how bad it was. Because all of the issues that were coming up in November, I think, some of them might have been able to be solved by, say, March of 2021. Hold it off for three to four months. And that wasn't done. That's another question that I had.

But I agree. I think there were a lot of unforeseen situations that was on the biotechnical engineering field that was not considered by the researchers. That's my feeling.

Commissioner Massie

My other question has to do with the requirement by EMA on the quality—critical quality attribute of the product. If I remember well, what was qualified in the batch produced for clinical trial didn't seem to be the same level of quality in the large-scale commercial product. And I think I heard you mention that they were asked to try to get a solution for that, but it seems that this was not possible or was not done, and then it seems that the solution was, "Okay, we'll just raise the standard."

Was that what happened? And what kind of concern would that raise with the quality of the product?

Dr. Luz Maria Gutschi

Oh, it's huge.

[00:40:00]

The critical quality attributes are what has been placed— So you come up with a standard batch that you think is your quality batch. It defines how much the RNA integrity, how much purely RNA, how much of the contaminants are allowed, and how good the LNPs are. So it was quite a long list. And that was defined, as you said, for the clinical batches. And they basically dropped it all! Including the double-stranded RNA, because it was a big fight you could find in there where they said, "The standard that you put forward, Pfizer, we don't like." And yet a month later, it was accepted.

Yes, it seems to me—and this is just my impression—that the batch standards were lowered. So that basically anything that came out of the factory was acceptable. So that there would be very few batches that would be turned away. That's the way it looked like to me, that any batch was going to be accepted.

Including batches with stainless steel particles in them. I don't know if anyone remembers that story of Moderna's: In September '21, a bunch of doses were sent to Japan, and they had stainless steel particles you could see with your eye in them. And they should never have left the factory floor, or the fill and finish. Remember I said they have optical eyes, and they have people actually looking at them before they're sent out. I cannot understand, based on all my years of experience, how something with particulates that you can see with your eye—with the naked eye, you don't even need an optical or anything—left the factory floor. And yet it did.

Commissioner Massie

With respect to batch quality, we've heard in other testimony that it's possible that the activity of the different batch would actually vary, meaning the level of spike protein or the quality of spike protein that was produced from a given batch. And we've also learned that there seems to be some batch from the VAERS [Vaccine Adverse Event Reporting System] database that seems to have more adverse event associated with it.

You could look at it from two different angles. The one that has the highest amount of adverse event could have been the batches that were more active, if we speculate that the adverse event is the result of spike production. Or it could be because of all kinds of contaminants in the batch that are triggering unknown reactions in people.

What is your take on that?

Dr. Luz Maria Gutschi

I think it's all of them. But one that I am concerned about—that really, I think, needs some more work—is that CARPA syndrome I talked about. We do know that in the beginning, Pfizer's product line— Just as it was leaving, just as they were approving it, they found particulates in the Pfizer product. And if you look at the monograph—this is the stuff that the pharmacists look at—it says you should be looking at the vials. Each of them. If you see particulates, you throw it out; you don't use it.

And what was happening there: The lipid nanoparticles were agglomerating and they were getting big and they could get more toxic that way, and cause what I think is that allergic CARPA reaction.

I'm also thinking that it's not only the mRNA, it's that the lipid nanoparticles were made in such a way that they weren't stable enough. One of the reasons is that the buffer that was used by Pfizer did not keep those LNPs from agglomerating. So they changed to the Tris Buffer in October '21, which is the same one as Moderna had, and that stabilizes the nanoparticles. That might play a role.

Those lipid nanoparticles are quite fascinating, and it's taken me a long time to wrap my head around them. And they can be quite toxic under certain circumstances. So let's not rule out the lipid nanoparticles. And let's not rule out that you can have differences from vial to vial in addition to batch to batch. Okay?

One thing that I found out recently: Remember I showed you they mix them at the end? The lipid nanoparticles are diluted out and they're mixed in a big bioreactor. What they found is that you don't have the same mRNA at the top of the vat, the middle of the vat, or at the bottom of the vat.

[00:45:00]

So it's quite possible as they're filling their batches that not every vial has the same amount of mRNA. That is a possibility as well. And that is the difficulty of making a stable solution of the lipid nanoparticles.

Commissioner Massie

Yeah, on that note, I was wondering about— You mentioned that the lipid nanoparticles were assembled from lipids, right? Is there an issue, to the best of your knowledge, with the source of lipid, where they're getting it? And do we have assurance of reproducibility of the lipid quality?

Dr. Luz Maria Gutschi

In the beginning, that was an issue. And the EMA identified, "How do you make it? Were there contaminants in there?" Et cetera. That has gotten better. That is the one thing in these products that has improved: they've gotten new manufacturers; the quality has improved so that it is much more reproducible. It's easier to make lipids than it is mRNA. However, most interestingly is that you do have some metals like arsenic and lead in it just from the process, in very tiny amounts that normally would pass toxicology because it's an exposure— **Tiny amounts: we have it in our food, we have it in other drugs that normally would not cause a big problem.**

But what they found is that those metals act like a catalyst. And you ended up with reactions in between the lipids and the mRNA so that they formed what is called chemically an adduct. And when you have adducts you don't have the mRNA available; it basically is ruined. So that might be another reason why some batches or some vials did not have mRNA available to be translated, because it was adducted to the LNPs.

Yeah. All kinds of problems with manufacturing this product.

Commissioner Massie

Maybe one last question. The scale-up or the commercial production of these mRNA required an incredible logistic, in terms of having different manufacturing sites, different sources of material that would come from different places, and the assembly of the final product may be in other places. So that requires that every step at these different sites is properly, I would say, controlled for quality—examined and checked.

Do you think that the regulatory agencies had, or currently have, the resources to do the typical inspection that they would normally do for production of such large quantities of an injectable product?

Dr. Luz Maria Gutschi

No, I don't think they were done. I think the Americans tried and the Europeans tried. But it was hard to do. Some of them were done virtually. And they're just behind, right? You get qualified a year later rather than before you start making it. You basically get the paperwork. Paperwork looks good but this site inspection could sometimes take a year.

And that's not only for this product, okay? This is true for many, many drugs and many, many products we have on the market. That office is understaffed and the site visits of manufacturing plants is a huge, huge problem all across the Western world.

So, no, I don't think so. I don't think they were kept up. And who knows? Yes. Another problem.

Commissioner Massie

Thank you very much.

Dr. Luz Maria Gutschi

You're welcome.

Shawn Buckley

So are there any other commissioner questions? There are, okay, and I have a couple more too after they're done.

Commissioner Kaikkonen

Good afternoon. I'm just going to ask a more practical question. On your "Not Assessed" slide, one of the points was the drug interactions were not assessed. So if I extend this thought a little bit further to vulnerable populations living in government subsidized low-income housing, or a group home, for example, where mandates were demanded, vax for all occupants: Could this mean that there were no medical considerations, interventions, or oversight for pharmaceutical medications already prescribed?

And I'm going to take it to the bipolar population. Where they're diagnosed as bipolar, they didn't go to the pharmacy where the pharmacist may have had access to their already-prescribed medications. Rather, a nurse came into their facility and vaxxed them. I'm just wondering what your thoughts are.

[00:50:00]

Dr. Luz Maria Gutschi

I would say, at the rollout or in the beginning, this was not considered at all—that there would be any drug interactions with this vaccine. In general. And so that wasn't under consideration. I think astute pharmacists found that they were seeing deterioration in some of these patients that you're talking about and had access to their drug files. And with Clozaril in particular, because you're measuring the white counts, which are directly related to the levels of Clozaril, you could see that happening before your eyes. So that is how that was picked up. And it just required a mind to ask these questions and assess them. And so then the case reports started coming in that this is a potential problem.

But originally, no. That would not have been given a consideration. At all. And it is a concern to me because you read case reports, and you see people getting acutely psychotic or acutely having some mental health issue for a few weeks after vaccination. And the vaccine as a cause was never, ever considered. Except in retrospect.

Commissioner Kaikkonen

Thank you. That's all.

Commissioner Drysdale

Good afternoon, doctor. There was just a few things that I thought I heard you say, or picked up, and I wanted to confirm my understanding. We've heard a fair bit of testimony concerning the vaccines. And one statement I believe you said is that you did not feel it was likely that there would be genomic integration.

Dr. Luz Maria Gutschi

Yeah. That has to do with the circular DNA that Kevin McKernan has found contaminating them. I am not certain that the—I don't have the expertise to say that. I'm just saying that needs to be looked at as a potential risk, but I am concerned with the actual action of the mRNA within the cells as well. So let's not forget that. That's really what I'm trying to say.

Commissioner Drysdale

But I want to make sure I understand this, because I've asked this question from a number of different witnesses who talk about— Hopefully I get the term right, I'm not a doctor or a pharmacist. "Reverse transcription," was a word that was used before.

Dr. Luz Maria Gutschi

I'm sorry. Reverse transcription, I'm not that familiar with it, because it's very a genomic thing. So I can't make any comments regarding that particular aspect of these vaccines. If it was assessed as a gene therapy product, though, this would be assessed right off the bat, right? So that you would have the answers to that.

Commissioner Drysdale

That's an interesting thing that you talked about. You went through the definition of a gene therapy—and this clearly is a gene therapy. I need help with this, because then I heard you say, "Well, they said it was a vaccine. And then they assessed it as a vaccine, but it's really a gene therapy."

Is that, is that like— Oh gosh, I'm trying to think of historical examples where something with— Oh, I know one: Mr. Buckley mentioned a number of times that certain provinces had snitch lines but in Manitoba, they called them "ambassador lines." So you went from being a snitch to an ambassador. Are we talking about the same thing? It really is this, but we'll just call it this.

Dr. Luz Maria Gutschi

It is very, it's regulatory kind of language. In regulation, oftentimes the indication, what its use is going to be, dictates the kind of clinical trials. So Pharma gets very good at picking out what they think their drugs should be used in for the first indication, even though they really plan to use it in this disease. They will do the studies for this one, which opens up the door for the second. So it is probably an issue with how regulation works.

In this case, though, I think it was a bit egregious, because it is a gene therapy product. It probably needs its own regulatory path, in my view. Right? Because you would design the clinical trials to meet what you would need for vaccines,

[00:55:00]

but all the other kinds of tests you would do for a gene therapy product. So that would be what I think should happen. And I think that's probably the route that they'll take.

Commissioner Drysdale

I want to comment— I don't want to lose the thought about genomic integration. My understanding of what that means is, in my terms, that there's a potential—perhaps unrealized or unevaluated—that the effect of this could be to change the genetic blueprint in the receptor's body. And the genetic blueprint is the DNA, as I understand it, actually is the instruction set or the recipe. I'm trying to speak in terms that I can understand—I'm not a doctor—and that perhaps the folks listening can understand.

The DNA, as I understand it in talking with previous witnesses, is kind of a drawing or a map or a recipe as to how to make other cells. And if you integrate something foreign into that, who knows what that plan is now telling us? So we could have issues with cancer. We could have issues with—I'm being silly, but—instead of getting a liver, you get a heart. Is that what we're talking about?

Dr. Luz Maria Gutschi

Yes. Well, it's the mRNA itself— I guess there are studies that show it can potentially be reversed, that's the mRNA, it can be reverse transcribed in, so you don't need DNA in there. And it all depends where it gets reverse transcribed in, is my understanding. So if it's done in cells that are rapidly dividing or in germ cells, like in ovaries or testes, much more important than, say, it's reverse transcribed into a muscle cell, because it's not going to make anything, necessarily.

Then we have the second part, which is the contamination with intact DNA plasmids. It's much easier for them to do genomic integration. And that is, I think, the testimony that I also listened to from Laura Braden.

So there's two separate issues: The intact DNA plasmids, which are contaminants that should not be there, and that's one issue. And then the mRNA itself, can it go and reverse

transcribe? And those are issues that need to be resolved. And I really can't comment any further than that.

Commissioner Drysdale

I understand. But again, this was not something that was given to a hundred test subjects in a laboratory. This was something that people were— And I'm not sure, I'm not a lawyer either and I do not understand the difference between "coercion" and "forced." People keep saying that the vaccines were coerced into people. And when someone's threatening their job, and someone's threatening your livelihood, and someone's threatening your children, I don't know what the difference between coerced and forced is, and maybe we can get Mr. Buckley to shed some light on that.

But this was not something that was given to a hundred test subjects that agreed. This was something that was given to billions and billions of people in the world, and we don't know these fundamental questions.

And what Dr. Braden was talking about: This reverse transcription or this integration into the genome, we could have unleashed a Pandora's box on our planet. And we don't know the answer to this.

Dr. Luz Maria Gutschi

Yep. And I would say the mRNA itself, the biosynthetic mRNA, you could describe the Pandora's box even just for the modified mRNA.

Commissioner Drysdale

Two last, more easy, questions. Did I also hear you say—because I asked this question previously of other witnesses—and I thought I understood you to say that the vaccines that were used in the trials were not the same vaccines necessarily that came out in production when you went to your drugstore and got it put in your arm.

Dr. Luz Maria Gutschi

Correct. That is a big, big issue. Because of the production and the manufacturing and the quality between the two products, they are, in my view, totally different products, and should have undergone some kind of verification that the commercial batch products was going to give you the same safety and efficacy as those in the clinical trials.

Commissioner Drysdale

One last question, doctor. In December of 2020, we heard from testimony, Health Canada came out with a written statement to all Canadians that this vaccine could be trusted, that it was produced in a rigorous process,

[01:00:00]

and that it was being monitored in a strong monitoring system. In your opinion, is that statement correct?

Dr. Luz Maria Gutschi

When I heard that, I went: Did you read the ePAR? I said, “How could they say that is a strong, high-quality thing?” I guess their definition is not mine, is all I can say regarding that. That’s not what I would expect of a good manufacturing product.

I’d like to make one more note regarding this. We have regulators— Or for instance, the incorporation of the FDA in 1906. Their role was for quality control, was for labeling and adulteration. Because prior to that, kids were dying because they were given syrups that contained cocaine in it, or heroin, that was not on the label. The role of the FDA when they were first put into being was not for safety and efficacy, it was for quality control. And I feel that all our regulatory agencies have failed their basic mandate.

So yes, their definition does not meet mine.

Commissioner Drysdale

Thank you very much.

Shawn Buckley

Maria, I’ve got a couple more questions that just came to me as the first question—

Dr. Luz Maria Gutschi

Of course!

Shawn Buckley

Because Commissioner Drysdale was asking you about reverse transcriptase, and you’re talking about— Well, you’re insinuating it could be worse if this would collect in things like ovaries or testes, which I think you referred to as germ cells. But isn’t it true that the research is showing that is exactly where these mRNA particles congregate?

Dr. Luz Maria Gutschi

Yeah. So, it could be a potential—yes. The biodistribution study needs to be redone because I’m not sure how much it actually shows. It could be worse than what we think. And it could be better, I’m not sure; considering the side effects that we see I don’t think so. But it could be actually worse than what was the data that we actually have. So I just want to keep that in mind, that that is a potential possibility.

As far as all this molecular genetic stuff, I’m a pharmacist by training. This is new to me, so my expertise is really limited in this area. I don’t want to step outside my bounds.

Shawn Buckley

But you are an expert in the manufacturing process, and you’ve used some wonderfully technical terms. But a lot of the people participating are not going to understand those.

Dr. Luz Maria Gutschi

I know.

Shawn Buckley

And when you and I were discussing things, you actually said, “Are you going to ask me this question?” Which used a non-scientific term. That was: “How did the European Medicines Agency change their mind on the good manufacturing practices nightmare?” And it’s the word “nightmare” that’s jumping out, because that’s a very scientific term such as “train wreck.”

How would you describe in layperson terms the quality that was coming out at the end of the manufacturing process?

Dr. Luz Maria Gutschi

I thought it wasn’t even fit for veterinary purposes. Nothing against— They’re actually very good drugs, but I thought this was swill.

Shawn Buckley

You mean veterinary drugs are good drugs.

Dr. Luz Maria Gutschi

Yes, they are good drugs. “I wouldn’t even give my dying cat this,” is what I said when I first read it. I said, “How could anyone let this product leave their factories?” I was absolutely horrified when I first read the ePAR. And then when I read the documents that were leaked, the confidential documents: It was at least a little bit good to hear that the EMA, the bench regulators, the regulators who are actually looking at the data, were also concerned. So it wasn’t just me. They were also quite concerned with the quality.

It’s obvious that something happened between November and December 2020. That all the issues that were brought up. There was large turnover in EMA after these drugs were approved. There were some high-profile people who left. I feel that, yes, there was a lot of internal turmoil. And that this normally— Even for a pandemic! Which is usually what I am told while it was a pandemic. And I’m thinking, it’s not always better to do something than not to do something.

So, “We needed a vaccine, it’s better than nothing!” And I think that is a fallacy, and it may not have been better than nothing.

[01:05:00]

Shawn Buckley

So let me lead you a little bit. Am I correct that the European Medicines Agency identified some atrocious quality control issues?

Dr. Luz Maria Gutschi

Yes, they did.

Shawn Buckley

I mean shocking quality control issues.

Dr. Luz Maria Gutschi

Yes, they did.

Shawn Buckley

And then, within a short period of time, they basically gave Pfizer a pass on these quality control issues.

Dr. Luz Maria Gutschi

Correct.

Shawn Buckley

And following that, there was an exodus of personnel from the European Medicines Agency.

Dr. Luz Maria Gutschi

There was a few high-profile— I can't remember the person's name. There was one or two that left that were— And I remember reading about it but I don't have that collection, that actual news item. But there was somebody who did. Same thing in the FDA as well. And we know Marion Gruber left in mid-2021 because of the way the FDA was reviewing these products.

There were some people who were quite upset about this internally, that I'm certain of.

Shawn Buckley

Right and, "this" meaning basically giving pharmaceutical companies a pass on quality control that is literally dangerous.

Dr. Luz Maria Gutschi

I believe so. And I want to make one point regarding that. It's unusual for pharmaceutical companies themselves, manufacturers, to make drugs of this low quality. It's bad for their brand. It isn't necessarily about money. Because these drug companies, if you remember, they would always fight against generics: "We make the drugs better than generic manufacturing. Our quality is better." We have biosimilars, like different companies. We have generic Humira now. And there was a big fight in the—

Shawn Buckley

If you don't mind, I'm just going to focus you because we are short on time. And I was just trying to get the answer from you that this was a shockingly unsafe quality.

And then the final question. You teased us when you were giving your presentation, and you said, when you first saw these quality concern things, that you and your family would wait to see if they were resolved. Were they ever resolved for you and your family?

Dr. Luz Maria Gutschi

No, we suffered. None of us got vaccinated. My daughter— She has a PEG allergy, did not get a medical exemption. She was seven months pregnant and had to leave early and has

not gone back to her hospital job. My son lost his position as a young trumpet player in an orchestra, which is extremely difficult to get. And my husband, he got his privileges taken away as a physician working in a hospital.

And me, I was always worried I was not going to be treated well, because I have a chronic condition and concern about being admitted to hospital. So yes, it was difficult for all of us. None of us got vaccinated. And it was not a good time.

Shawn Buckley

Thank you. I don't think there are any further questions. Maria, on behalf of the National Citizens Inquiry, we sincerely thank you for testifying today.

Dr. Luz Maria Gutschi

Thank you very much for all of you and for everything that everyone is doing. Thank you.

[01:08:53]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 5: Stephanie Foster

Full Day 2 Timestamp: 05:46:44–06:15:00

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Shawn Buckley

I'm pleased to announce our first witness this afternoon is Stephanie Foster. Stephanie, can I begin by asking you to state your full name for the record and spell your first and last name, please.

Stephanie Foster

Stephanie Foster, S-T-E-P-H-A-N-I-E F-O-S-T-E-R.

Shawn Buckley

And Stephanie, do you promise to tell the truth, the whole truth, and nothing but the truth?

Stephanie Foster

I do.

Shawn Buckley

Now, just to introduce you to people, you have worked as a legal assistant in the past?

Stephanie Foster

Yes.

Shawn Buckley

And then you went on to become a teacher assistant?

Stephanie Foster

Yes.

Shawn Buckley

And you had been back and forth between Ontario because the father of your children lives in Saskatoon?

Stephanie Foster

Yes.

Shawn Buckley

Okay. Now, when you were a teacher assistant, my understanding is there was a requirement by your employer that you get vaccinated?

Stephanie Foster

Yes. I had to get vaccinated or I wasn't able to do my job.

Shawn Buckley

Can you tell us what happened with your vaccination?

Stephanie Foster

I had to get vaccinated or I would lose my job. Then also, at the time, my uncle had terminal cancer. So, my family wanted us to get my children and I vaccinated so we could come see our family. As well, as my children needed to fly back and forth from Ontario to Saskatchewan. So, they needed to be vaccinated to fly back and forth.

Shawn Buckley

Right. So, what happened to you personally after you were vaccinated?

Stephanie Foster

After I was vaccinated the first time?

Shawn Buckley

Yes, so maybe tell us about both shots.

Stephanie Foster

Pardon?

Shawn Buckley

Tell us about both shots.

Stephanie Foster

Both shots?

Shawn Buckley

Yeah.

Stephanie Foster

Okay, so my second shot, I had got it on July 11th, 2021. And after that, on August 13th, 2021, I had a seizure. I do have epilepsy; however, my last seizure was in 1999. So I do believe that the COVID shot has given me seizures again, or brought them back.

Shawn Buckley

I'll just put that in perspective: when you last had a seizure, you were 18.

Stephanie Foster

Yes.

Shawn Buckley

You're now 40. It was 22 years between the two.

Stephanie Foster

Right. And then, I also had my first booster shot at the end of January of 2022. And the end of February of 2022, I had a seizure again. Both times of those seizures, I had also lost my license.

Shawn Buckley

So the Motor Vehicle Branch would take away your license because they're worried you have epilepsy again.

Stephanie Foster

Yes.

Shawn Buckley

Now, did you have a problem after your second shot, with blacking out and falling down?

Stephanie Foster

Yes, I would get dizzy sometimes—I still do—and have blackouts and fall down. Just not really shaking like seizures, but just episodes that just don't make any sense.

Shawn Buckley

Okay. And when you say blackout, basically you lose the ability to see? Or what are you describing when you say blackout?

Stephanie Foster

Blackouts, sometimes, where I just can't see. And sometimes, I'll have a blackout where I'll just fall down.

Shawn Buckley

And had that ever happened to you before you were vaccinated?

Stephanie Foster

No.

Shawn Buckley

So that was something that was brand new.

Stephanie Foster

Yes.

Shawn Buckley

Now, your mother's deceased now, but her name was Carol Pearce?

Stephanie Foster

Yes.

Shawn Buckley

And my understanding is that your mother, Carol, was at Shopper's Drug Mart to get basically her booster shot?

Stephanie Foster

Yes.

Shawn Buckley

Can you tell us what your experience of that was?

[00:05:00]

Stephanie Foster

My mom was visiting me at my house that day and she had asked me if I would go with her to get the booster shot. I had begged her not to get it and told her I believed it was giving me seizures. She said she wanted to get it because she felt she needed to keep up with the Joneses and she just felt like it was something she had to do to keep everybody safe.

So she went—and I had given her a birthday present that day, an early birthday present—and she was supposed to come back after her shot. She left and when she was at Shopper's,

right after she got the shot, she texted me and told me she was waiting her 15 minutes. And I said, "Good job." And then, I think it was about seven minutes later— She died.

Shawn Buckley

What's the next thing that happened with you, because your mother obviously stopped texting. How did you find out that there was something wrong?

Stephanie Foster

My brother phoned me and he told me. This was about 45 minutes after my mom left my house. My brother phoned me and said, "Mom's in an ambulance and the ambulance driver said, 'get to the hospital and expect the worst.'" My brother said he's on his way to pick me up. I just started screaming, "No! No, this isn't right!" And they picked me up. All the way to the hospital, I prayed to God that she was alive. Then I got to the hospital. Right away I asked them, "I want to go see my mom," and they wouldn't let me in. They kept telling me I had to wait; I had to wait. I just didn't understand why I had to wait. They told me I had to wait for a social worker. I didn't understand because I thought, you know, a nurse would just come and bring me to her. So I just had a feeling right then that something wasn't right.

Finally, a social worker came and took us into this room and told me that a doctor was going to come and talk to us. I just had a feeling right then that it wasn't good; it wasn't good. I couldn't stop crying. And two doctors came into the room. All I heard was the one doctor said, "She's gone." I didn't hear anything else of what the doctor's saying because my mind just blacked out. I just started crying hysterically, and I just said, "I want to see my mom."

So a lady took me to see my mom. I just laid there with my mom and I kept telling her to wake up. She wouldn't wake up. Then, the doctors said I could stay with her until the coroner came. And then the coroner came and she sat beside me and I kept saying—I was screaming out loud to the doctors, to the coroner, to everybody, saying—

[00:10:00]

"The shot killed my mom! The shot killed my mom!" Like, there was no way the shot did not kill my mom.

My mom was healthy, she was super healthy, there was no health problems with my mom at all. When she left my house that day, she was perfectly fine. Then she got that shot, then she died. Seven minutes after, she died. And I see her in the hospital right after and she was gone. So I kept telling them that it was the shot; it was the shot. The coroner hadn't even looked at my mom, hadn't even touched my mom. She just sat there right beside me in the chair. I said, "No, it's the shot," and the coroner said, "No, it's natural causes."

And I knew right then: You're lying. You're lying to me. There's no way you know that.

Shawn Buckley

Sorry, I turned my mic off.

There's actually video footage of your mother coming to your house that day and then leaving that day [Exhibits SA-8 and SA-8a].

Stephanie Foster

Yes.

Shawn Buckley

Just because your neighbour has a security camera that's motion sensor.

Stephanie Foster

Yeah.

Shawn Buckley

I'm just going to find those. So, David, can you set up so that my computer is showing up on the screen? I'm just going to go back to the beginning.

So, that's your mother there in the red jacket?

Stephanie Foster

Yeah.

Shawn Buckley

And so, that's her coming to your house that day. And I'm just going to play it again because you've told us that she's healthy and it looks like she's just walking normally.

And, now, I'm going to play the video of your mother leaving. And so, this will just be minutes. This is her on her way to Shopper's Drug Mart. And I'll just play that again. I just want people to watch to see: she appears to be just a healthy, normal person. That's what you were describing is just, your mother was a normal, healthy person at the time.

Stephanie Foster

Yeah.

Shawn Buckley

Now, after this happened, some people reached out to you on Facebook. Am I right about that?

Stephanie Foster

Yes.

Shawn Buckley

And David, if you can just pull up my computer screen again. Now, you sent me basically, a Facebook string [Exhibit SA-8c]. And this is from your phone. Am I right?

Stephanie Foster

Yes.

Shawn Buckley

I'm just going to scroll down. This is actually the text conversation, the last text conversation you had with your mother.

Stephanie Foster

Yes.

Shawn Buckley

She had texted you on this thing, "Book your COVID shot and come with me. Shoppers on Herald." And you text back, "I don't want another one." And she texts, "Okay." And then you text, "You coming over?" And she says, "Waiting the 15 minutes, LOL." And you say, "Good job." And she says, "Thanks." And that's the last communication you ever had with your mother.

Stephanie Foster

Yes.

Shawn Buckley

And I'm sorry to be upsetting you with this, but we so appreciate you sharing. I'm just going to scroll down a little more because this Wendy Janzen reached out to you on Facebook. My understanding is a few people reached out to you on Facebook who either were there or had heard about what happened from others who were there?

Stephanie Foster

Yes.

Shawn Buckley

I expect there was more conversation than this, but Wendy Janzen writes to you on Facebook. "Three days ago in Saskatoon, Saskatchewan, a friend's grown daughter was standing in line with her son at the pharmacy. They saw a long line of people waiting for the needle. A woman received the needle and collapsed immediately; help arrived quickly and she could not be revived. Everyone else just stayed in the lineup for their turn."

[00:15:00]

Am I correct that you heard that from other sources, also? That, basically, people stayed in line to continue getting the shot.

Stephanie Foster

Yes.

Shawn Buckley

I'm also going to play—it's difficult to hear, but it's the 911 recording [Exhibit SA-8b].

Stephanie, you sent me one; I clipped the talking before and after, so we're just down to the 911 clip. It's difficult to hear but I just want to play it, because you sent it because they actually refer to the COVID shot as being a cause.

David, you might have to crank the volume up and I'm just going to start playing that. I apologize everyone, it is a little difficult. Oh, that didn't work, did it? Do you have that 911 one? That's not the— We'll let David play it on his system.

[Audio recording 911 call, mostly inaudible]

Shawn Buckley

I'm sorry, Stephanie, I know that's difficult to hear that. But I thank you for sharing that. That was at least the paramedics reporting that it was the COVID shot. I appreciate they're not doctors. Yeah. Thanks, David.

Now, something else happened and that followed afterwards. Because this created a bit of discussion in Saskatoon. People were concerned about what happened to your mother. And my understanding is that, so a couple of days after your mother died, somebody went to the pharmacy with just kind of the intention of seeing how they were going to respond to questions about your mother. Does that sound right?

Stephanie Foster

Right. Yep.

Shawn Buckley

You were able to get a copy of this and you've sent this to us.

Stephanie Foster

Yes.

Shawn Buckley

Okay, so, David, I'll ask you to play that. And so, just so people understand, this is not Stephanie. This is somebody else who's just decided to go back to the pharmacy and see how they would respond. Well, first of all— The first question and answer, listen carefully too, it's really interesting.

[Video] Unknown Speaker

Do you guys do COVID shots here?

Pharmacy Employee

We do. We don't do walk-ins. It's an appointment. If you want, I can give you our QR code and you can sign up for it.

Unknown Speaker

I have a question regarding the safety of it. Have you had any issues, recently, with anybody?

Pharmacy Employee

Yeah, I mean, like, there is the possibility for side effects.

Unknown Speaker

Like, what kind of side effects?

Pharmacy Employee

Um, sore arm, fever, that kind of thing.

Unknown Speaker

I heard that somebody died here two days ago right after that.

Pharmacy Employee

We aren't commenting on that.

Unknown Speaker

Why? If I want to get a shot, shouldn't I know these things first?

Pharmacy Employee

We're not commenting on that, that's what my manager told us.

Unknown Speaker

When you have to get a medicine, don't you have to let people know?

Pharmacy Employee

That's not the case with a privacy issue, I'm not allowed to do that.

Unknown Speaker

Okay, I'm going to hold off because I heard somebody died.

[Video Ends]

Shawn Buckley

Now, Stephanie, you've shared with us symptoms that you had following the shots, before your mother died. But my understanding is just the mental shock and grief of what happened has led to some further medical complications?

Stephanie Foster

Yes.

Shawn Buckley

Can you share with us those, please?

Stephanie Foster

I've gone through quite a bit of trauma.

[00:20:00]

When my mom first passed, for at least the first four months, I was basically numb. I couldn't accept the fact that my mom was gone. I couldn't sleep. I maybe could get an hour's sleep. I couldn't take care of myself. I couldn't take care of my kids. I have severe fibromyalgia, severe PTSD. My health has just deteriorated so badly. I've gained a lot of weight. I've just basically gone completely downhill.

I've had a period where I went three weeks where I couldn't even talk. I couldn't even walk. And if I did talk, I sounded like a robot. It would hurt to talk. I went to the hospital twice. They didn't know what was wrong with me. They did CAT scans. They did all kinds of tests. They just sent me home with pain meds. And I saw three different doctors in the walk-in clinic. Same thing. They looked me over. They didn't know what was wrong with me. Sent me home with pain meds.

So I was scared. My family was scared. We all thought that I was never going to get my speech back, that I would never be able to walk again. I was looking into sign language and had my kids look into sign language. And then eventually, I started slowly being able to speak again. Slowly being able to walk again. Still a little bit difficult to walk. Now, the doctors are saying that I need surgery done on my spine.

So it's just one thing after another after another. And it's just, they say— I've been to a neurologist. I've been to every kind of doctor, except a psychiatrist, because every doctor I go to says I need to see a psychiatrist. Now the problem is that I don't have a psychiatrist I can see yet.

Shawn Buckley

When we were watching that video that somebody had done, when they went back to the pharmacy and they asked if there's any side effects, and the lady said, "Yeah, basically soreness in the arm and fever," I know that would have upset you to hear.

If you could say something to the pharmacy concerning your mother, what message would you have for them?

Stephanie Foster

I want to know why they didn't help her. Why didn't anybody help her? Why did everybody just stand in line? It doesn't make any sense. I feel like she could have been helped. I feel like she could have been saved. I was told by people that everybody just stood there and by the time somebody came there, they checked her pulse and there was no pulse. I believe that if somebody got to her right away, instead of everybody just standing around, they could have done CPR and brought her back.

Shawn Buckley

And I understood it's been reported to you by several people that the line just kept going forward and people kept getting jabbed.

Stephanie Foster

Yes. I feel like they just left her there, like she was nothing; like she was just a nobody. Like, "Come on, next! Who's next? Come on, let's just get on with it."

And that breaks my heart so badly.

[00:25:00]

And then it was afterwards when the doctors and everybody is saying natural causes. No. She did not die from natural causes. And that makes me very upset because I felt like they just wanted to brush my mom under the rug and that was it.

No. My mom is a person and a wonderful person, and she should not just be brushed under the rug and forgotten about and say "natural causes" because nobody wants to say that she died from the COVID shot. And she did!

Shawn Buckley

Do you know what they listed on the death certificate as cause of death?

Stephanie Foster

They said that she had a massive heart attack. And that she died instantly. My mom never had anything wrong with her heart, ever.

Shawn Buckley

Thank you. I have no further questions but the commissioners might have some questions for you.

Commissioner Massie

Thank you very much for your very touching testimony. Did you ask for an autopsy for your mother?

Stephanie Foster

Pardon me?

Commissioner Massie

Did you ask to get an autopsy?

Stephanie Foster

Yes.

Commissioner Massie

Did you get the result?

Stephanie Foster

My brother has it.

Commissioner Massie

And what does it say?

Stephanie Foster

I believe it says, "massive heart attack." I haven't got to actually see the report.

Commissioner Massie

Is there a plan to do further investigation in the tissue of her heart to find out what triggered it?

Stephanie Foster

I'm not sure because my brother has the actual documents and I haven't been able to get access to them.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

I'm sorry for your loss. Did you get anybody at the drugstore reach out to you at all?

Stephanie Foster

Pardon?

Commissioner Kaikkonen

Did anyone at the drugstore reach out to you?

Stephanie Foster

No.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

Thank you, so we have no further questions.

Stephanie, actually, I commend your bravery to come here. I know that it was difficult. And on behalf of the National Citizens Inquiry, I sincerely thank you for sharing this with us.

Stephanie Foster

Thank you.

[00:28:16]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 6: Ryan Orydzuk

Full Day 2 Timestamp: 06:16:03–07:28:04

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Louis Browne

Next, we have Mr. Ryan Orydzuk. Mr. Orydzuk, can you please state your name and spell your last name for us, please?

Ryan Orydzuk

It's Ryan Orydzuk, R-Y-A-N O-R-Y-D-Z-U-K.

Louis Browne

Would you prefer to swear an oath or solemnly affirm today?

Ryan Orydzuk

I'll swear an oath.

Louis Browne

Do you swear that the testimony you are about to give in this National Citizens Inquiry will be the truth, the whole truth, and nothing but the truth?

Ryan Orydzuk

Absolutely.

Louis Browne

Thank you. Sir, what city or town do you reside in?

Ryan Orydzuk
Edmonton, Alberta, currently.

Louis Browne
And how long have you lived there, approximately?

Ryan Orydzuk
Well, I lived outside of Edmonton for a short period of time, but pretty much my whole life.

Louis Browne
Okay. And I understand that you worked as a federal public servant, is that correct?

Ryan Orydzuk
Correct.

Louis Browne
And how long were you so employed?

Ryan Orydzuk
Just about over 15 years, I'd say.

Louis Browne
Okay. And are you still so employed?

Ryan Orydzuk
No.

Louis Browne
Okay. Now, I understand that you're here today as an expert witness. We're going to get into your CV and whatnot shortly. And David, I can just maybe invite you to tee up— Mr. Orydzuk has a number of the documents we'll use, but we will be looking for [Exhibit] SA-9a in a moment.

But, Mr. Orydzuk, can you just tell us, in a nutshell, what is your expertise?

Ryan Orydzuk
Primarily in occupational health and safety, recognized as kind of a jack-of-all-trades in that department.

Louis Browne
Okay, and we have your CV up on the screen. So this document here, do you recognize that document?

Ryan Orydzuk

Correct.

Louis Browne

And do you want to just tell us, did you generate that?

Ryan Orydzuk

Yes.

Louis Browne

Okay, what is it? Tell us a little bit about this.

Ryan Orydzuk

This is just a document I use to kind of give a little bit of information as to my background. A little bit of what I've done, my most recent experience, some of the things that I'm proficient at, et cetera.

Louis Browne

Okay. And as far as your expertise in occupational health and safety, we're going to look at a document here shortly. But can you just tell us: How did you come to become an expert? How did you gain your expertise in occupational health and safety?

Ryan Orydzuk

It was primarily through Canada Post Corporation. I started out originally as a letter carrier with the organization and found myself what they call a Local Joint Health and Safety Committee Co-chair, after about five years of employment.

It was in that role that I showed some promise, I believe. Some executives thought I had some promise in occupational health and safety, so they told me to apply for a job as a safety officer for the Edmonton Mail Processing Plant [EMPP]. I was hired in the position, was successful in attaining it, and I worked in that position for about four years. I was peer-mentored for two years straight by a very competent safety officer. He showed me the ropes of everything I was doing and we worked as a team.

Then from there, obviously, there were lots of education events in relation to that provided by the Corporation. I did a little bit of external training. Because of my role and what I encompassed it was more of a generalist role, so I never specialized specifically in one aspect of occupational health and safety.

Louis Browne

Okay. And I believe, David, we're going to need the learning history, [Exhibit] SA-9a. I believe Mr. Orydzuk does not have that document.

If we could pull up that document, please—SA-9a? It's the learning history, second from the left there. Okay, yeah, that's the one.

Mr. Orydzuk, are you able to manipulate that document from where you are?

Ryan Orydzuk

Not that I'm aware of.

Louis Browne

Okay, if we could have that? Okay, sure, we'll come back to it.

Mr. Orydzuk then, let's go over to your letter of October 25th, 2001 [sic, 2021]. Are we able to open that? There we go.

[00:05:00]

So can you just tell us, Mr. Orydzuk: Do you recognize that document [Exhibit SA-9d]?

Ryan Orydzuk

Yeah, absolutely.

Louis Browne

And what is it?

Ryan Orydzuk

It's a document that I called my Letter of Informed Consent and this was a document that I sent to my employer. It's dated in October but it wasn't submitted to my employer until about mid-November. I originally was trying to speak to my employer verbally before I submitted anything officially. But this was the document that I gave them to advise them of the concerns I was seeing with a lot of the breaches of occupational health and safety policy.

Louis Browne

Okay. We won't go over it in detail but it is a fairly substantive document. In here, Mr. Orydzuk, though, I'll draw your attention to—for example, point number four. If we're able to go to that part of the letter, please. Therein you pose the question to Canada Post— And just to be clear, was Canada Post your employer at this time?

Ryan Orydzuk

Correct.

Louis Browne

Okay. So the question you posed at number four is, "Does Canada Post believe that their proposed vaccines are safe for their employees to take? From the start of the pandemic, Canada Post has stated that it follows the guidance from the Public Health Agencies of Canada. Vaccines are approved for use in Canada by Health Canada."

Do you recall generating that question and putting that in the letter?

Ryan Orydzuk
Absolutely.

Louis Browne

Do you want to just give us a bit of background? Because I noticed that there are several references and links underneath that though. Just tell us what was the intention here, with point number four and all of these links and references that you have.

Ryan Orydzuk

Well, in essence, what I wanted to point to the employer—and again, this is about informed consent. So a lot of folks have been mentioning that through the testimonies. And informed consent from different aspects. It could be, you know, medical informed consent, people talking about employer informed consent.

But for me, I wanted to find out exactly what my organization knew about COVID and the vaccines themselves—everything to do with what they were implementing, right? So I posed to them 90 questions or so and I provided a bunch of research. Because I had researched this for probably about six months ahead of time, because they were announcing the vaccines— At the beginning of 2021, it came out.

I wanted to just find out where they were at with their level of knowledge and what they did in terms of their due diligence as the employer to ensure that what they were providing their employees was safe to take. This one question was just an obvious one: Do you guys feel that it's safe to take? They couldn't even answer something as simple as that.

Louis Browne

Okay, thank you for that. If we can just move over to point 12 in your letter, please. And therein you state: "Does Canada Post believe that the SARS-CoV-2/COVID-19 vaccines that they are mandating their employees to take are safe, when compared against the federal occupational health and safety definition of danger?" And then you had a link therein, as well.

So now we're starting to see a blend of your occupational health and safety training being infused into the questions. I mean, it's all throughout, but this question specifically brings to bear your occupational health and training expertise.

Can you just tell us a little bit about that particular question, what you were driving at, what you were hoping to get from your then-employer?

Ryan Orydzuk

Yeah, so when it comes to occupational health and safety, it's regulated by the federal employer. A lot of things—especially work refusals and any kind of process or work that the employee does—are based on the concept of danger or hazard or risk. If something is considered a danger by the legal definition that's provided by the Canadian government or the interpretive guidelines that coincide with that definition, then the employer should be informed of that danger and the concerns that they may be facing legal liabilities with that.

So for me, in this case, I was saying to the employer, "Do you recognize what the definition of danger is as it's written in the *Canada Labour Code*? And do you think that maybe, by

chance, these vaccines meet that definition as it stands?" It was my particular opinion at that time that it absolutely met the definition of danger.

Louis Browne

And what sort of response did you get from your employer?

Ryan Orydzuk

From the start of the pandemic, Canada Post has stated it follows the guidance of the PHAC [Public Health Agency of Canada]. And I received that answer for, I think, 78 per cent of the questions that I submitted. There were 90 questions.

Louis Browne

Okay. Just a couple more with the letter and then we'll move on. But if I could get you to go over to point number 14. Fourteen: "Does Canada Post consider myocarditis or pericarditis a serious medical condition? Would refer to Health Canada experts." And then you had a couple of links there.

[00:10:00]

What were you driving at with that particular question and what was the response?

Ryan Orydzuk

Again, this is falling in line with the definition of danger to a degree, in the fact that at that particular time, there was recorded events of myocarditis, pericarditis in people that were taking the vaccine. So again, for it to be a side effect of the vaccines themselves—and as Canada Post was implementing them as personal protective equipment—for me, I wanted to say, "Are you guys aware that this is a side effect? And do you think that this is dangerous, then?" Because that is a potential side effect of the vaccines themselves. So again, leading towards that definition of danger.

Louis Browne

Right on. Okay, last one in the letter and then we'll move on. I think it's on the same page there, but number 18. And therein you posed the question, or made the point to Canada Post: "Is Canada Post aware that the injections that they are demanding their employees to take—Pfizer BioNTech, Moderna, AstraZeneca and Johnson & Johnson—are currently listed in the National Library of Medicine under clinicaltrials.gov as experimental, and that these injections are not scheduled for completion until 2023 and beyond?"

Again, just tell us a little bit about where that question was coming from, how it fit into your role and your expertise regarding occupational health and safety. What was their answer?

Ryan Orydzuk

Yeah. With this question, there was a lot of doctors at the time that I was following that were explaining that these were still under experimentation guidelines. And they were providing links in the documentation that they were putting on their websites or their web pages, whatever it was. I clicked on a few. I went to the clinical trials site. I checked out a

couple other ones in the U.S., for sure. They were showing that there was experimentations for all the vaccines still and they were all ongoing until 2023.

So to me, I was just again trying to illuminate to my employer: We don't know exactly what we're dealing with here. Maybe we don't want to push this forward yet because there could be some concerns that we're unaware of or long-term effects that we're unaware of. And I know maybe on its surface right now it could seem somewhat safe but we really don't know. So maybe we shouldn't undertake this as a workplace activity.

Louis Browne

Right on. And their response was?

Ryan Orydzuk

Again, very similar: following the Public Health Agency's guidelines.

Louis Browne

Okay, is there anything else about your letter that you'd like to reference or say at this point in time, Mr. Orydzuk? Otherwise, we'll go to the learning history.

Ryan Orydzuk

The only thing I'd like to say is, to me as a safety professional, given what I provided them straight off the get-go, this should have stopped any employer from continuing forward. Just based on the fact that I painted a very fair picture on what the legal liability was for the employer.

Not only that, I also made it very clear, abundantly clear, that the vaccines themselves met the legal definition of danger in occupational health and safety. So to me it was frustrating to have basically, a one-answer response for every question, right? So I couldn't figure that part out. But to date— I mean, this was all made part of an official work refusal at Canada Post. And I think any Canada Post employee could access this, if they just looked up the local Joint Health and Safety Committee minutes.

Louis Browne

Okay, thanks very much. So that letter of October 25th 2021 is already marked as an exhibit, SA-9d. So David, it looks like we've got the learning history up and running. Thank you for converting it.

If we could turn our attention to the learning history. This here, Mr. Orydzuk, do you recognize this document?

Ryan Orydzuk

Absolutely.

Louis Browne

What is it?

Ryan Orydzuk

It was a document provided by my learning and development team. It was originally in, I think, a different format. I just did some screen captures offline of all my event or training history at Canada Post as a federal employee.

Louis Browne

Okay, so is it fair to say that this captures a lot of your training at Canada Post, but there's still some courses that you took that are not captured here. Is that correct?

Ryan Orydzuk

Yeah, correct.

Louis Browne

Okay, so this is a 49-page document going over the various courses and in-house trainings [Exhibit SA-9a]. And again, I don't want to go through it in detail but if I could get us to page three of 49, please. Oh, 50, sorry.

So up at the top there, Mr. Orydzuk. Again, I just want you to tell us that it's the same format that we see. There's a document, there's a number, there's a title—in this case it's "A Workplace Free of Discrimination and Harassment (pre-reading)." There's a date and some other numbers and whatnot.

So just in a general sense, before we go into this one specifically, what do each of these entries tell us, as far as the course that you took, or the level of detail, or how much was involved, et cetera?

Ryan Orydzuk

Unfortunately, these ones don't tell you too much on the course detail itself. But I can say that this list includes 165 training events and I probably had over 1,000 hours of training, easily.

[00:15:00]

If not more, maybe even 2,000 in safety.

A lot of what I learned was all hands-on. That's where you really learn the job, by actually going through the process. That was why it was really good to be peer-mentored with a **Canadian Registered Safety Professional for the first two years.**

Louis Browne

Okay, great. So I do want to touch on a couple of the courses, just so we all understand the nature of your expertise. This one here: "A Workplace Free of Discrimination and Harassment." In a nutshell, what would that course have taught you? What knowledge would you get from that? How would you apply that in the workplace?

Ryan Orydzuk

It would depend on the level of the course. So different courses were given to different grades of employees, I guess you can say, because some people would have different responsibilities when it came to the actions with the courses.

For me myself, I believe this course would have been something along the lines of supervisory, so: How do you prevent this from happening? What do you do? How do you handle the employees? What do you record? Where do the documents go? Et cetera, et cetera.

Louis Browne

Okay. And if we could please go over to page 10. And if we could go one more down please, page 11, I guess.

So that one there, Mr. Orydzuk, where it says, "Introduction to Labour Relations (online)." I note that you completed this course and so again, we're not going to go through all of them but what would these types of courses have taught you?

Ryan Orydzuk

Yeah. So after my safety position at the EMPP, the organization did a big restructure and they pulled people from different parts of the organization and put them in, what was called, a human resources business partner role. And in that role my territory expanded, all my area of responsibility.

This particular course was all about— We were adopting aspects of labour relations. So I was 90 per cent safety but then I also had labour relations to deal with, and grievances. So they started to give me courses along those lines so that I could manage that as part of my portfolio. The labour relations course was: How do you respond to employee concerns? How do you prevent them from happening, so they don't go to a grievance? If a grievance does occur, what are the steps you have to take? How do you log it? Et cetera, et cetera.

Louis Browne

And so would you have also learned about the legal framework and the laws in some of these courses, or in that one in particular?

Ryan Orydzuk

Yeah, definitely. I would say more so in the safety aspect. Labour relations was dealing more with the collective agreement side of it, but Canada Post is governed under the *Canada Labour Code*, so that's like a subset. Occupational health and safety is part two of that, so that's a little bit of a different learning and a little bit of a different course material.

Louis Browne

So where would you have learned, for example, the obligations or consequences for an employer if they don't adhere to the occupational health and safety standards? Or would you have learned that sort of thing?

Ryan Orydzuk

You learn them in courses. I mean, they make it very clear. And when you hit that management step when it comes to federal entities, they provide handbooks, they provide everything in the world so that managers are very aware of their legal liabilities when it comes to occupational health and safety specifically. Because that's the stuff that a lot of employers—if they don't fulfill their due diligence, they can go to prison, they can suffer huge fines, et cetera.

Louis Browne

Okay, excellent. If we could please go to page 16. Yes, that one there. So I guess, three quarters of the way down, or the last full one, Mr. Orydzuk, it says, "Care to be Fair: Fostering Respect and Fairness at Canada Post."

Tell us a little bit about that course, what did you learn, how did you use that?

Ryan Orydzuk

Those courses were all about: how do you manage your relationships in the workplace, what the expectations are, how you address conflict discourse in the workplace. That was more of a lighter course. It wasn't heavy. I think it was, maybe 30 minutes to an hour. It was just to go through the basics of what you can do to address concerns, what you think discourse should look like between yourself and an individual in the organization, and how to resolve that. Specifically, again, if it doesn't have a resolution between yourself and the person that you have an issue with, you would raise it to your supervisors and go through that process and escalate.

Louis Browne

Okay, thank you. I think I've illustrated what I wanted to with respect to this, now 50-page document. Is there anything else you want to say about your learning history and the various courses that you took here before we move on?

Ryan Orydzuk

Nothing particular, no.

Louis Browne

Okay, that is already marked as an exhibit, as SA-9a. So at this point, Mr. Orydzuk, we will turn it over to you with your NCI testimony. Please, give us your testimony and your evidence.

Ryan Orydzuk

Thank you very much. I just want to thank the panel of course, for having me out to present this [Exhibit SA-9b].

[00:20:00]

I hope it's illuminating for everybody.

I just want to remind everybody here, too: this is a very quick and brief overview of occupational health and safety. I could honestly talk about this stuff and talk your ears off for probably about a week on it. I dig it. I don't know why. I just like safety, but there's a lot more to this.

A question to kind of start with—and this is important for the panel to consider, as well as anybody in the audience: If I was bringing this information to you as a safety professional and showing you that there were concerns, both with your liability and the risk of your own life and your employees' lives being at risk, would you consider continuing on with this? Because, ultimately, it could land you in a lot of hot water.

Ann, the former pharmacist: I listened to her discussions and I had to say I agreed with her on a lot of points she was making and I loved her touching on informed consent. She asked a question at the end of her interview, she said, "Who is accountable for all of this?" This is a question that everybody's been asking, right?

So I'm going to share with everybody who I think is accountable and how it all works and how maybe some of the occupational health and safety laws apply around this.

So who is legally responsible for the COVID-19 fiasco? Was it Big Pharma for creating the injections? A lot of people seem to think that. Was it the Public Health Agency for approving the use of the injections? Some people think that. Was it the government for pushing the mandate to begin with? Or was it even ourselves for making the decision to take the vaccine in the end?

And I don't know, maybe a bit of this is all true, but for me, it was your employer. It was everybody's employer because, up until the point employers decided to put in workplace vaccination mandates, it was an option for people to take the vaccine. It wasn't until the employer said you had to that everybody did a mad rush to go get a vaccine, because they didn't want to lose their jobs, right?

This comes back to something that my parents used to say: If all your friends jumped off a bridge, would you jump, too? And what we're, kind of dealing with in this situation, to a large degree, is the Milgram Experiment. What we have is an authority figure—and it's not just an authority figure that's providing pressure on you or coercion to do something. Like it was mentioned earlier, they're forcing you now because they're making it a condition of your employment and it's affecting your ability to pay your bills, get food on the table, et cetera.

This is what happens at the end of it all, when people push things forward a little too fast and they don't do what's expected of them when it comes to occupational health and safety. **You start to wonder.**

So employers— When they decided to put this in place, they should have asked themselves three basic questions: Am I actually required to follow this vaccination mandate because that's something that's going to come up in this? Is it even legal for me to implement this kind of vaccination mandate? And if I listened to the Prime Minister's request regarding a vaccination mandate, have I completed all my due diligence as the employer?

I can say flat out: no, no, and no.

Let's take a look at the Prime Minister's own announcement—and this was right from his own desk. If we take a look at some of the pieces in here, it should have been very evident

to folks what this was intended to be, which was a workplace policy that they were implementing to protect you.

So as you can see at the very beginning, it says here that we're doing this "to protect the health and safety of all Canadians." Then he mentions, "As the country's largest employer,"—so he mentions he's the employer—"the Government of Canada will continue to play a leadership role in protecting the safety of our workplaces." So again, this falls under occupational health and safety in the workplace.

"Employers in federally regulated air, rail, and marine transport sectors will have until October 30th, 2021 to establish vaccination policies." So he's referring to, what he calls his **"Core Public Administration,"** which he is responsible for and the boss of. However, "Crown Corporations and separate agencies are being asked to implement vaccine policies mirroring the requirements announced today by the rest of the public service."

So in this sense, again, this is proof that the employers, especially mine at Canada Post—they were never mandated to follow this process. They were asked by the government to follow this process, which means they assume all the legal liability for the process itself.

Prior to COVID-19, what was going on? Employers typically didn't try to mitigate flu viruses in the workplace, right? If anybody had the flu, take a sick day, go home. And even back then, I remember, if I was sick, my employer would be like, "Well, come into work, we need you. Come into work. I know you got the sniffles. No big deal."

[00:25:00]

But then things changed.

They did not re-engineer the work environment to try and control viral spread. They did not provide their employees any sort of personal protection equipment to stop exposure. They rarely had any seasonal signs posted in their facilities. Most employers, outside of a few exceptions like the military and maybe the medical industry, never asked their employees to take an influenza vaccine or any other medical product as a condition of their employment.

Employers would never violate the *Genetic Non-Discrimination Act* by forcing employees to undergo genetic testing as a condition of entering or continuing a contract agreement with that individual. So what a lot of employers were offering were an accommodation process where you would go get a PCR test three times a week and keep confirming to the employer that you weren't sick, you didn't have COVID. That's going to be a part we're going to touch on here and I'm going to explain to you why the employer can't do that.

Members of the public were never questioned on health and safety matters, nor were they asked to wear personal protective equipment. So our employers were literally asking people coming into the post office, "Can you wear a mask? Can you get a mask on?" And we never bothered any customers with that before and it just seemed kind of strange we were doing it now.

After that, employers—this is post-COVID-19—decided to try and mitigate SARS-CoV-2 as a workplace hazard, right? They never did the flu before but all of a sudden, they needed to mitigate SARS. They began to build barriers and install Plexiglass walls in their facilities, which were completely useless. Employers went overboard with unproven personal protective devices that were never designed to prevent the wearer from COVID.

So the paper masks that people were wearing, the cloth masks, those aren't regulated personal protective equipment devices, right? People need to wear very specific personal protective equipment that needs to be designed to mitigate the hazard in question. And paper masks that aren't fit-tested to your face, they're not going to protect you against the virus. There's no way. So providing you that is just for show. It's just, "Yeah, we look like we're trying to do something."

Employers decided to put signs everywhere, constantly reminding people to use chemical hand sanitizers, wear their masks, and remain six feet apart from one another. Then finally, employers went to the extreme and decided to create vaccination policies. I mentioned the PCR testing. And of course, people were questioned and pursued regarding medical status and mask compliance. This was at every degree in the company.

So when it comes to federal employers, this is a little bit of a flow chart here to try and explain to everybody how it all works, what due diligence is. When any employer puts a new process, piece of equipment, or they initiate a new activity in the workplace, they have to roll everything under part 2 of the *Canada Labour Code* and the Canada Occupational Health and Safety Regulations. This is to make sure that they don't harm an employee and then miss something and then go to jail for it down the road. It's really simple.

What does this break down to? Well, there's certain aspects of this: there's the Criminal Code of Canada and there's the Westray Law. The Westray Law, what a lot of people don't maybe know about it, was a law that was designed to hold employers accountable after the 1992 Westray mine disaster in Plymouth, Nova Scotia that killed 26 workers. In that same situation, we had employers that thought they knew better than the employees that were raising concerns. They thought they knew better than the safety officers that were saying that the site itself was suffering from industrial hygiene issues. And then, sure enough, an explosion occurred from all the mining dust and 26 workers were killed. So then amendments were made to the *Criminal Code of Canada* that include the employer's liability in this.

Other acts that are in consideration for the employer while they're implementing the new process are the *Hazardous Products Act*, and this has to do with stuff like your WHMIS [Workplace Hazardous Materials Information System] categories. And everybody took that training when they went to the work, right? You take WHMIS training at the beginning. And then you have of course your hazardous products themselves—and these are the ones that are recognized and registered as dangerous goods. Then of course with my corporation we had collective agreements.

And these are all what I would call fail-safes of safety, right? The employer uses these to make sure that they're doing all the necessary steps so that they don't get themselves in trouble.

And these break down into further brackets. So under the Westray law, you have to consider the duties of the employer, which are all listed in section 125 of the *Canada Labour Code* and they're very specific as to what the employer is required to do. There's informed consent, there's the right to know, the right to participate, and the right to refuse—which is a very, very, very important part of this that everybody was denied, in essence. The definition of danger, in the OH&S Interpretive Guidelines that tell you what these definitions mean.

Under the *Hazardous Products Act* and these other aspects here, you have your WHMIS, your GHS—which is your Global Harmonized System. And this is the labels that they put on dangerous products, and they're called Safety Data Sheets.

[00:30:00]

The labels are affixed to the products themselves and then the employer is required to provide these to employees so that they're aware of the potential chemical exposures in the workplace.

And then of course under the collective agreements, there's a bunch of safety stuff they need to look into, like the terms of reference. They need to consult nationally with their bargaining agencies to make sure that everything is going according to plan and the bargaining agencies need to agree with the corporation. They need to provide minutes of all these consultations. And again, there's various articles in each collective agreement that all encompass occupational health and safety.

Again, we bring this all back. This relates to due diligence and the duties of the employer when implementing a new process, piece of equipment, or activity. So you have to make sure— The employer has to do all of this stuff, look at all these codes, and this is really just scraping a little bit out. They have to look at all of this before they decide to move forward with something, right? Because again, if it's not safe and somebody gets injured down the road and they didn't do their due diligence, they can be held liable.

So after the employer has confirmed the legality of their new process— So they go through that step and they go, "Okay, we can do this. This is legal. What are the next steps we have to take?" I won't go through all of these but this is just a slide that shows some of the specifics around what that project would look like.

And just, for example, I'll go through a couple points. So the first thing: "A primary initial discussion amongst the employer's executive stakeholders to determine if the newly proposed idea has any merit as a device or piece of equipment to protect an employee in the workplace." They would assign a policyholder and somebody that would carry out the project.

The project facilitator would then create a plan for the new concept that includes timelines, employee impact, job hazard assessments, health and safety committee reviews, certifications, et cetera. They might need to bring in third parties, other assessors, et cetera. "This person would formally create the change request with the corporation and follow the design steps to maximize corporate compliance."

I won't keep going on this but this just gives you an idea of what— Once they determine it's legal then they've got to go through all these other steps, right? And I can say, I don't think a lot of this was done, right? This is what I'm leading to.

So how does occupational health and safety play into all this? Well, I think it's the piece that everybody's kind of been missing. And I think it's going to help everybody else that has concerns with the vaccines and how their employers and everybody else has been doing things.

In my opinion, this is something— Like I said earlier, if folks would have taken this process seriously with safety, it should have immediately ended any concept or any desire to implement vaccines. The bottom line is that these legally meet the definition of danger in

my opinion, and we'll get to that. But once the employer saw that letter of informed consent that I gave them, it should have stopped them right in their tracks and they should have engaged me in discussion to understand a bit more where I was coming from. None of that took place.

All right. So what they should have done is that federal employers— When the vaccine mandate was announced by the Trudeau government, when they said, "Hey, we're asking all you federal employers and Crown corporations to do this," what they should have done is the directors and all the senior officers of those corporations, they should have used the Labour Code. They should have looked at it, put it right back in the Prime Minister's face, in a sense, and said, "Hey, you know, I don't know about this. I have a lot of liability that I have to deal with, with these particular clauses. I don't know if this is a good idea. There may be some concerns that this is dangerous. We're not going to go forward with this yet because we need to do a bit more investigation." So they actually could have used this all to their advantage to kind of halt everything that was going on.

So let's talk a little bit about this one particular section here, which is the *Criminal Code of Canada* and the Westray Law. Since its induction, employers have had to follow their legal obligations listed under Part 2 of the *Canada Labour Code*. This is not a new concept in any way. In fact, because of the Westray mining disaster which we talked about, amendments were made in 2004.

So section 217, this was the amendment or the clause that was added: 217.1 of the Criminal Code creates an occupational health and safety duty requirement for all organizations who undertake or have the authority to direct how others work or perform a task, to take all reasonable steps—and that's very important to this—to prevent bodily harm to the person performing the work or task, and to any other person.

These are just some of the examples of the duties of the employers here. I didn't pull them all out, it's a very long, exhaustive list, but these are some of the key ones.

So "Every employer shall ensure the health and safety at work of every person employed by the employer... Without restricting the generality of section 124, every employer shall, in respect of every workplace controlled by the employer and,

[00:35:00]

in respect of every work activity carried out by an employee in a workplace that is not controlled by the employer..." Like a pharmacy or a place that you're going to, to get an injection, for example. So some of these clauses here: "(c) except as provided for in the regulations, investigate, record and report in accordance with the regulations, all accidents, **occurrences of harassment and violence, occupational illnesses and other hazardous occurrences known to the employer.**"

And I have that bolded at the end there because occupational illnesses and hazardous occurrences were not being measured and investigated. You see, because what ended up happening is a lot of the injuries that we were seeing from the vaccines were chalked up to natural causes. If somebody had a stroke, they said, "It's normal; everybody has strokes, you know; people have heart attacks. That's a natural thing." The problem for the employers is when they implement a device that they're using in their workplace that causes these potential outcomes, every time an employee at that point would have a stroke or a heart attack it would need to be investigated as a vaccine injury. They couldn't say it was natural causes anymore. It doesn't work like that. They're using it as a device and it's

an activity in their workplace. So they have to investigate everything after that to see if it was because of their process.

“(s) ensure that each employee is made aware of every known or foreseeable health or safety hazard...”

This one was very blatantly violated in my opinion. Especially with me, when I asked for my informed consent, I was expecting my employer to come back to me with some studies of their own to show me how they had done their due diligence. Nothing like that had taken place. So for me, it's hard to fulfill that particular clause in the Code, where you're making every single hazard aware to the employees.

And it's a foreseeable hazard, too. That's the important piece of this. When you have a safety officer present a document with 90 questions and over 50 medical studies that shows that these are a danger, you should be transmitting some of those concerns to your employees if there is a potential that they can be harmed—especially if it's coming from a safety professional.

“(t) ensure that the machinery, equipment and tools used by the employees in the course of their employment meet prescribed health, safety and ergonomic standards and are safe under all conditions of their intended use.”

Right? So the vaccines are a piece of equipment as part of an activity that the employer is using. They're using the vaccines as personal protective equipment. So if that's the case, the equipment has to be rendered 100 per cent safe. Because if you don't have personal protective equipment that's 100 per cent safe, you're increasing or you're multiplying risk for the employee. It's really straightforward. I shouldn't put on a safety vest and have a heart attack. I shouldn't put on a safety hat or safety goggles and get a stroke. It doesn't work like that. But this one particular piece of personal protective equipment, there were some issues with it and people were having adverse side effects.

“(w) ensure that every person granted access to the workplace by the employer is familiar with and uses in the prescribed circumstances and manner all prescribed safety materials, equipment, devices and clothing.”

So again, the employer is supposed to make you understand and be familiar with the devices that they're asking you to take. If an employer doesn't have any answers for you as to that device and they're telling you to continuously use it, how do you know it's safe? How do you know what you're doing? How do you know your employer has done their due diligence? So that's how that clause works.

If we continue on, this has to do with the right to know. So every employee— And this is like informed consent for safety. So whenever you have informed consent in the medical industry, what's going on is folks are going in, they're asking about the dangers with their physicians of the vaccines et cetera, et cetera. That's all standard. That's the way it's been forever, right? If you're going to take a medical product or you're going to undertake a medical procedure, it's your physician that's the one that's always kind of telling you what to do about it.

When the employers, though, decide to take a medical product and use it as a piece of personal protective equipment, it's no longer the physicians that are required to do it. It's the employer that's required to do it. The informed consent switches from the medical industry to the employer because they're the ones that are using it as their device now. So

they need to train you on it. They need to educate you on it. They need to make sure that they know what they're talking about. And they can't provide you your informed consent if they don't know any of that.

So as it says here, this is a definition right out of the Labour Code:

You have the right to be informed of known or foreseeable hazards in the workplace and to be provided with the information, instructions, training, and supervision necessary to protect your health and safety... In addition, you are given the right to have access to government or employer reports related to the health and safety of employees through your policy health and safety committee,

[00:40:00]

workplace health and safety committee or health and safety representative.

You have the right to refuse. So this is another piece that I was just blown away by. I was so upset with my employer as well as the Labour Board in a lot of ways. Because they should have handled this in a much different way.

What ended up taking place was when the employers put these vaccination plans in place—their policies, their practices—one of the things that I noticed was that there wasn't any piece in the entire process that spoke to when employees don't want to take the vaccine. It was just like you didn't have that choice. Whereas, in the past, if an employee refuses to do something that the employer is asking, it's required right away by the employer to diagnose that. Like, why are you refusing this work? And it becomes what could be a work refusal. And it's written right in the Code that they have to ask that.

But in this case, what happened with COVID: none of that happened. It was, "You're non-compliant." right away. And that was the piece that I just couldn't figure out. It's like, "Well, they're not non-compliant; they're all refusing your process. So you have to investigate every one of these concerns as a work refusal. It's not a non-compliant status. They're saying it's dangerous. They don't want to take it because they don't feel it's safe. So you have to investigate this." But that didn't take place. Everybody was just suspended or fired automatically, which is— Again, it's breaking the rules.

Louis Browne

And, Mr. Orydzuk, I'll just advise we're just under the 20-minute mark. But carry on.

Ryan Orydzuk

Okay. So you have the right to refuse work if you have reasonable cause to believe that your workplace presents a danger to you; the use or operation of a machine or apparatus presents a danger to you or to another employee; and the performance of an activity constitutes a danger to you or another employee, right?

So the activity itself is going to take a vaccine. The corporations made that very clear. Every corporation did because they wrote it into a policy or a practice and they asked you to go take two vaccines as a result. So that becomes a workplace activity, which again, the employer is responsible to monitor and make sure it's safe.

This is the definition of danger we're going to get into and this is why this is so important. The definition of danger itself is kind of highlighted in the Labour Code. But what they do is they provide a big set of rules on how to read this definition and what it means more specifically. Because everybody, when they read it on a first glance, they may have a different interpretation of how it works. The Interpretive Guidelines make sure that they quash that, in a way, so that everybody's very clear, black and white: this is what this looks like, this is what the definition means, and this is how it's applied.

A hazard—as a lot of people learn in safety class—means a source of harm or risk to an employee. A condition means circumstances and, in particular, those affecting the functioning or existence of something. So that would be like, let's say, a forklift had a battery and it was smoking. You wouldn't want to go use the forklift if the battery was smoking because the condition of the forklift appears that it's dangerous. It's not in a good condition, right?

Then activity itself means the task directly related to the employee's duties. And in this case that would be a vaccination policy.

"Reasonably expected." Okay, we're going to go through each one of these one by one. "Does not require that the threat materialize every time the hazard, condition or activity occurs." So when you take the vaccines, not everybody dies right away; not everybody suffers a side effect, right? So this meets the first point of this: it doesn't need to materialize every single time.

So let's keep going. Does it meet the rest of it? "It is not necessary to establish precisely the time when the threat will materialize nor does the threat need to materialize frequently." Okay. So again, some people have immediate adverse effects to the vaccines. They have a heart attack; they have something happen to them in the first ten days, which is the most common. But again, things could happen down the road at different times. You could develop cancer because of cell mutations, right? You could have a stroke down the road, six months later—I don't know, right? But nonetheless, it meets the next point of the definition of danger.

Let's keep going. "Only requires that a person determines in what circumstances the threat could reasonably be expected to materialize." This one's real easy: the threat's reasonably expected to materialize the second you put the injection in your arm. It's not going to hurt you if you don't put it in your arm. So really straightforward.

The last one: "There is more than one way to establish that a condition, hazard, or activity can reasonably be expected to be a threat. Evidence of actual injury in the exact same circumstances is not required." So you don't need to have the same injury occur in the same way every time, right? And if you look at all the adverse events and all these databases from around the globe, there are all kinds of different ways that you can measure this last point.

[00:45:00]

There are all sorts of them. And again, evidence of it in the same circumstances is not required.

So I mean we've met— These are all the points of the definition of danger in the Labour Code. To me, I think the vaccines completely meet this, but we can build on this even more. There's way more to come.

"Other sources of evidence include: expert opinions; opinions of ordinary witnesses having the necessary expertise"—like myself, for instance; and "inference arising logically or reasonably from known facts." So logically and reasonably, if there are databases of people having horrible effects to the vaccine, maybe you shouldn't carry it forward because it meets the definition of danger, right? Straightforward stuff.

Moving over to the next piece of this— And this is another part of this that a lot of folks may not be aware of. Section 125 speaks to the further specific duties of the employer. This has to do with hazardous products and dangerous goods. I don't want to dwell on this too much because there are some more important slides about this I'd like to talk about. But what this is basically saying is: **ensure the concentrations of substances are controlled properly, they're stored properly and handled in the appropriate manner; they're also** labeled by the appropriate SDS sheets, or the product labels; and then the SDS sheets are disseminated to the employee base, et cetera, et cetera. I won't go into this too much but—

I'll skip through this—we'll get back to the hazardous products here in a bit, I promise.

So are there any acts or regulations of concern for the employer? Yes, the *Genetic Non-Discrimination Act*, which I had mentioned earlier regarding the PCR tests. This is written right in the Act itself: "It is prohibited for any person to require an individual to undergo a genetic test as a condition of: providing goods or services to that individual; maintaining a contract or continuing a contract with that individual." And that's what every employee is in, right? So you're working with the employer, you're in that contract with them. You're under a collective agreement or maybe you are management, you have an individual contract with them.

"Offering or continuing specific terms or conditions in a contract." So in essence, here, what a genetic test means in this act, and they define it very well, is it means: "A test that analyzes DNA, RNA or chromosomes for purposes such as a prediction of disease, or vertical transmission risks, or monitoring, diagnosis, or prognosis." So when you go for a PCR test and you get that thing shoved into your brain, what ends up happening is they're looking for samples of RNA. So they're literally diagnosing the RNA as a condition of keeping your employment, which is a violation of this act. Because (b) says you can't do that as a condition of maintaining or continuing your employment contract.

The *Assisted Human Reproduction Act*: there's a lot of debate still a little bit about whether reverse transcriptase is real. I consider it very real. I've read a lot of studies on it myself but I'm not a medical doctor; that's just some of my own personal opinion based on what I read. But in essence, a clause in that particular code—and a lot of lawyers already recognize this—is that: "Human individuality and diversity, and the integrity of the human genome, must be preserved and protected." And this is in the principles of the act itself. But more specifically, in the prohibited procedures, is: **"No person shall knowingly alter the genome of a cell of a human being or invitro embryo such that the alteration is capable of being transmitted to descendants."**

And right now, we're hearing concerns of shedding and we're hearing how some of this stuff might be getting transmitted to daughter cells and passed on through genetic lines. I don't know for sure. I don't have any proof. I can't say that a hundred per cent. But this would be something for people to consider as a concern for the employer and what they were doing and how they were handling things. And this was enacted in 2004.

So we keep on going here. The collective agreements: I won't touch too much about this. I'm running out of a time here, but I'll just keep going.

So some of the potential consequences of willful and amoral conduct by the employer and how this all ties back into Westray. Again, we talked about section 217, how every employer is required to do everything they can. It's a legal duty to take reasonable steps to prevent the bodily harm to a person, or any other person, arising from their work or their task. And this is where we start to see the definitions of criminal negligence. And I don't know necessarily. Again, I'm not a lawyer, I'm not a judge. But from my perceptions, I do believe that in my particular case, people were acting negligently when they didn't want to sit down and investigate anything that I was giving to them. Because what I ended up doing was I ended up putting in a work refusal. I sat down with my employer, I submitted to them those 90 questions. And I got one response back for every single question, right?

[00:50:00]

To me, I don't think you're proving your point as the employer, in your knowledge and your due diligence, by giving me one answer. And that answer—deferring your responsibilities over to a third party that's unaccountable—that, to me, is unacceptable by the employer and that's not something that the employer can do. They can't just say, "I have all these responsibilities in the Labour Code but I'm not going to do them for this one particular task. I'm just going to say somebody else can do that."

I'll be honest, an employer could do that if they wanted to. But if you decide to do that, you're running the risk that maybe that third party—maybe they missed something or maybe they don't understand the laws and occupational health and safety regulations because they're from a different industry. Maybe they don't know what the employers are required to do or prove to the employees as an aspect of occupational health and safety.

So again, it's okay to maybe defer your responsibilities to a third party or get suggestions from a third party. But I would still be double-checking on the third party themselves, even though they were the Public Health Agency of Canada. I wouldn't want to just be saying, "No, no, they got it; they got it." And I'd be adopting all the liability as a manager or director or something like that, right? So I would still be checking into the PHAC's work.

Louis Browne

Mr. Orydzuk, we've got less than 10 minutes left.

Ryan Orydzuk

Criminal negligence: "Everyone is criminally negligent who, in doing anything or in omitting to do anything that is his duty to do, shows wanton or reckless disregard for the lives or safety of other persons."

And the definition of duty is very simple: This is a duty imposed by law. And those duties that we're referring to are all the duties listed in part 2 of the *Canada Labour Code*. They're literally called the employer's duties. Duties of the employer. So that's specifically what they're talking about with this code. So if the employer didn't do any of this and they acted negligently, they could be charged, they could be prosecuted, and they could be serving prison time. And also, they could have a massive fine levied against their corporation or organization.

This is about criminal negligence. It's just an extension of 219.

So how are these vaccines legally tied to the employer? Because I know a lot of folks would say, "Well, the employer is going to say, 'well, these are the public health authorities, or these are Pfizer's, or these are the Big Pharma's.'" No. So because the mandatory vaccination policies and practices had been announced as a safety protocol to protect employees while at work, the senior officers within said individual federal entities immediately adopted all liability under part 2 of the *Canada Labour Code*. So they can't defer that away. They're going to use it, it's theirs; it's their device.

The employer cannot hand their legal liabilities over to an unaccountable third party in the PHAC. The employer is also required to render the equipment a hundred per cent safe to use, right? So if they're going to call it PPE to protect you against SARS CoV-2 in the workplace—which is the hazard that they're claiming that they are protecting against—better be a hundred per cent safe, because that's written right in the law.

Employers can listen to suggestions that come from a third party or outside agency but they cannot defer their duties. I've mentioned this before. If the employer chooses to do this without maintaining their due diligence, then the employer could suffer the legal consequences of relying solely on one external source of information to approve their new piece of equipment or workplace process.

The definitions for employer and employee in the *Canada Labour Code*, as well as the Canada Revenue Agency, make it very clear that the employer is the one that employs one or more employees and provides you with your paycheck.

So somebody has to be liable. And if the employer is going to say, "Well, we're deferring to the Public Health Agency of Canada," I have no legal recourse against the Public Health Agency of Canada. You see? And that's how I think a lot of this was kind of being done, is everybody was kind of pushing it to somebody else saying it was their responsibility. "They're doing it, it's their mandate." Maybe folks just didn't realize that when they were adopting it as a workplace policy, it was going to be their liability.

Section 125 in the CLC states that the employer must provide every person granted access to the workplace by the employer with the prescribed safety materials, equipment, and devices. So really simple: because they're protecting against SARS-CoV-2 and the employer has written a policy to protect against that specific hazard, that instantly means that the devices that they're using to protect you against becomes their device; it's their liability.

This last point here is the most obvious one: As provincial workers compensation boards have already stated, employers that implement mandatory vaccination policies are subject to, and responsible for, managing their injury claims and responsible for covering the injury pay as a work-related illness or injury. The employer will also subsequently suffer **the raised WCB premium costs should their injury and claim rate increase due to the employer's vaccination policy.**

So every province has recognized that— **Vaccine injuries are WCB-related if the employer has put in a policy or a practice that said you had to do it as a condition of employment.**

[00:55:00]

If you got injured by that vaccine and you get that confirmed by your doctor, WCB has to cover it. There are criteria for them to follow but that's showing that the employers are liable; otherwise, they wouldn't be paying for the claim, right? So they're the ones legally liable for it, it's nobody else.

These are some of the bigger complications for the federal employers. Federal employers implemented their vaccination policy practice as a workplace safety activity. More specifically, assigning selected vaccines as a piece of personal protective equipment to protect against SARS-CoV-2.

We have to remember of course that the equipment they were assigning wasn't even protecting against the virus in question, which was the Delta variant, I believe, at the time. The mRNA was only coded for the Alpha strain. So then even providing that was already showing that it wasn't going to be effective. It wouldn't do anything, so what's the point of even giving it to people?

Because of this action, the following regulatory clause under section 12.04 of the Canadian Occupational Health and Safety Regulations—and this has to do with protection equipment and other preventative measures—must be applied directly to their policy thereafter. And this simply states: any protection equipment that is provided or used in the workplace must be designed to protect the person from the hazard in question and must not itself create a hazard.

Well, that's interesting. If anybody read the Pfizer's trial studies, which I did, five per cent of the adverse effects were COVID-19. Huh. I wonder how that clause gets met when the very device that they're saying protects you gives you the illness that they're protecting against? To me, I just couldn't wrap my head around this one particularly.

Louis Browne

Mr. Orydzuk, we've got about four minutes left. Why don't we just check in with the commission members just to see. Do the commissioners have any questions of this witness?

Ryan Orydzuk

Go ahead.

Commissioner Massie

Thank you very much for your very detailed and informative testimony. I have actually several questions.

First question is: In your experience as a health and safety officer, would you recommend to use any equipment or protocol for which the provider, the manufacturer, had complete immunity if the equipment doesn't work?

Ryan Orydzuk

The only equipment that I can think of— Sorry, can you re-ask that question? Just so that I can hear it again.

Commissioner Massie.

What I'm saying is, would you recommend to use protective equipment that you will get from a third party that is providing equipment if this third party has complete immunity if anything goes wrong with the equipment?

Ryan Orydzuk

It wouldn't be too relevant in that case because, again, the employer is required to make sure that the equipment itself is safe. I would say that I personally wouldn't be using anything if I knew that the manufacturer had immunity to it.

In this particular case obviously, I'm not 100 per cent sure but I keep hearing that the manufacturers—Pfizer, Moderna, all these—they're not given any liability. They're given guarantees that they can't be sued, right? For me, I would never, personally, do this. And when it comes to PPE, I mean comparatively speaking, when you look at let's say a biosafety security lab or the laboratory in Winnipeg there— It's a virology level-four security lab, I believe. Those folks, when it comes to a risk group level 3 human pathogen, which is what SARS-CoV-2 is considered, and that's relatable to anthrax, they wear the sealed, impermeable spacesuits with oxygen being fed in. They have the HEPA filtering particulates, masking, and everything that's included in it.

I mean, to me, if the employers are dealing with an invisible asymptomatic virus and they don't know when or where it's going to attack everybody and they're going to say it's a danger to everybody and that it's a concern that you need to take a vaccine, then why are your facilities open to begin with? Because you're just constantly exposing employees to something and providing them substandard personal protective equipment the entire time. You're placing them in danger every time they come to work. Especially if it's considered comparable to anthrax.

Commissioner Massie

My other question has to do with, when I read all of these details, a lot that I was vaguely aware of, I feel that it's been through a thought process to really cover every possible thing that you could face in a working environment.

[01:00:00]

And if these rules are properly followed, I feel that we're doing the best we can to ensure safety. Why is it then that they have not been followed? And what's happening in terms of accountability for people that overlooked the application of these rules?

Ryan Orydzuk

Currently, nothing's happening to them. I'm hoping that maybe with a little bit of information like today, sharing with folks, they might start to pursue some avenues and look at what the employers have been doing internally with COVID.

Yeah, I don't know what more to say about it other than there hasn't been any accountability. I can't believe— Because all the testimonies have been about people that are just shocked. It's like the inverse, the upside-down they're dealing with in their industries, where everything has been turned over. And you're sitting there going, "I don't get it. We've been doing it this way forever and then all of a sudden with this, it's just everything is changed and thrown out the window."

And it was done so quickly and so callously. Either it was people were afraid or they knew that maybe after they had implemented— Like especially, with my employer, I was hoping to really shock them with some of the stuff I had told them. Maybe they realized that they were guilty and that's why they just kind of kept pushing forward. And they just figured, "Well, if I'm in, I'm in, I can't stop." I don't know. Maybe they figured that they were caught.

But nobody's been held accountable in any way to date. I'm hoping that people start to dig into the safety aspects of their employers. Because I know that my employer didn't do anything with this. And further to that again, when I gave them that letter of informed consent, there should have been a discussion. Just give me an hour to talk to you about it, right? They gave me five minutes and said, "No, we're just moving you along the process, no danger." And I'm sitting there going, "Wow. I've been working for you this long as a safety professional and you're just ignoring everything I'm saying." It didn't make any sense.

Commissioner Massie

There must be other people in your role within the federal government. Are you aware of other health and safety experts that would share a somewhat different view of what you're presenting here? And would sit down with you and say, "I don't agree with you for such and such a reason and I'm willing to explain to you that you're missing important points?"

Ryan Orydzuk

Yeah. I would say that I was the only employee, I was told, that put in a work refusal at Canada Post out of 65,000 employees. But I forced it through.

When it comes to the safety colleagues and everybody else, I'll be honest: the people I was bringing this up to were all safety brothers and sisters at Canada Post, right? I was trying to get them on board with me and kind of explain, like, "Guys, we got to stop them because what they're doing is kind of crazy and dangerous and, you know, people could really be affected and people could go to jail."

A lot of folks didn't want to engage me in the conversation to begin with. But the ones that did and that were, I guess you can say, a little bit more amenable to what I was sharing, they absolutely were like, "Yeah, no, you make some good points." But when it came to the discussions and everything, everybody was dead silent. You know what I mean? Like, I was the only one bringing this stuff up. And every time I did, I'd get threats: "Oh, you're going to lose your job, I can't have you do this again, you're going to get disciplined," et cetera, et cetera. I'm just like, "Well, yeah, go ahead, you know? I don't want people to die, so go ahead and fire me," kind of thing.

But in the end, I think that a lot of safety professionals— There were some that would agree with me, others wouldn't even engage me in the conversation. I could say flat out that I think anyone that's a Canadian Registered Safety Professional in Canada—any safety officer—there's no way they could argue anything I'm bringing here. Nothing. They can't. They know it's right.

Commissioner Massie

Maybe one last question. You mentioned that, for the genetic test, the PCR tests, there is a clear regulation that it cannot be imposed.

Ryan Orydzuk

Correct.

Commissioner Massie

What about a rapid antigenic test? Is that also covered under the same rule or is it somewhat different?

Ryan Orydzuk

I would have to look more into the rapid antigenic one myself to see if it's analyzing for RNA or DNA. I don't know specifically, a hundred per cent. I do know that some of the PCR testing, I've looked into that, is sampling for RNA. I would say that is definitely a violation of the *Non-Genetic Discrimination Act*, yeah.

Commissioner Massie

Thank you.

Commissioner DiGregorio

Thank you so much for your testimony today. You've spoken about quite a few statutes and regulations—the Criminal Code, the Labour Code, OHS regulations, and the *Genetic Non-Discrimination Act*. I'm just wondering if any of those statutes or regulations, as far as you're aware, contain provisions that are specifically addressing vaccines and vaccination requirements with employees?

Ryan Orydzuk

No, there wouldn't be.

[01:05:00]

Because, again, employers never really implemented that. It would have been something, I think, that the medical industry would have dealt with at the time. But employers typically never asked employees to take this kind of product before or implement it. It was the first time they ever did it. So I would say no.

When it came to the vaccine ingredients, though—and this is an important fact—it does fall in relation to the *Hazardous Products Act*. Because SM-102, ALC-0159, ALC-0315—all the proprietary lipid layers there in all the different vaccines—those are all registered as dangerous goods. Literally. They have the signal word “danger” on the SDS sheets. They carry safety data sheets, meaning they're a dangerous chemical. The employer never gave this stuff to the employees. They never even knew about it when I brought up, you know, “Are these concerns with them?” As far as I know, they never informed any employee to date that these were the ingredients that they were being injected with, right?

So the employer would have had to disclose that as one of the pieces of this. But there were no regulations prior to that that, I think, would have really affected vaccines specifically. Because nobody did it.

Commissioner DiGregorio

Right. And so then I think I heard you say that what employers were really dealing with were trying to use rules that are not designed for vaccine mandates to figure out whether or not they could impose them. And that maybe they were relying on these— Well, I don't know if they were relying on them but there are rules that say that they have to take

reasonable steps to protect the health and safety of employees. Which is presumably what employers relied on to impose the mandate.

Ryan Orydzuk

Exactly.

Commissioner DiGregorio

But it's not really fit for service in terms of this particular category of potential harm in a workplace. Do you think, then, that we need specific regulations to address this type of scenario going forward?

Ryan Orydzuk

The truth is, all the regulations were there. The employer just blatantly—They decided to break every single bloody law there was. That's all I can say. Like, they're all there. This should have never gone forward. The second the employer looked at section 2 of the Labour Code, if they did any due diligence into the vaccines, how they worked, the technology, the ingredients— No. It would have stopped it immediately. Immediately.

Commissioner DiGregorio

And I think I also heard you in your presentation talk about an employee's right to refuse to work in a situation where they feel that they may be put in danger. Isn't the point of that kind of rule to ensure that you're not going to lose your job if you're put into a situation where you feel you're being faced with a danger?

Ryan Orydzuk

Absolutely. It's actually part of the process that there is no reprisal in any way from the corporation before, after, during—any of it. So you're paid during the whole process and the employees are entirely entitled to that.

It's my perception that they avoided that because there were so many employees that didn't want to take the vaccine. And not only that, it was just easier for them to mark them non-compliant rather than have all these employees—maybe thousands of them—bring forward medical studies and concerns in an official work-refusal capacity that would have to shut the process down. And then not only that, if people already went out and took the vaccine as part of the employer's practice then they would have been held liable. So I think that's why the employers just decided to say "you're non-compliant" this time instead of saying, "Well, this is technically a work refusal." Because under section 128 of the Code, they need to ask that question: "Are you refusing under the Canada Labour Code or the collective agreement that you're under?" And that wasn't even asked at all. It was just, you're non-compliant, suspended.

Commissioner DiGregorio

Thank you. One last question, and maybe I just missed this part of your testimony, but you mentioned that you're no longer employed at Canada Post. How did your employment end with Canada Post?

Ryan Orydzuk

They suspended the vaccine mandates there in 2022, I believe, in June. That in itself should show that this was never about safety. Because it basically shows that the vaccines didn't provide any safety if they're going to suspend the mandates after they told everybody to take it.

Sorry, I lost my train of thought. Can you ask that again?

Commissioner DiGregorio

The question was just: How did your employment end?

Ryan Orydzuk

Oh, yeah. Sorry. No, I originally was suspended. And then after the suspension ended, they invited, I think, some folks back into the workplace. For me I knew that legally, that wasn't a very good decision for me.

Not only that, given what I had gone through with the employer and what I had felt was just the most deceit and the most immoral conduct I've ever seen in my life, I would never go back and work for them. Ever, in my life.

Commissioner DiGregorio

Thank you.

Louis Browne

Thank you, Commissioners.

Mr. Orydzuk, just two final questions here. I just want to establish jurisdiction. Throughout all of this time that you were involved in doing all of this, where did this occur?

[01:10:00]

Where were you? City and province, please.

Ryan Orydzuk

I was living out of Spruce Grove at the time. And yeah, I mean, the work refusal itself took place in Edmonton, at the mail processing plant.

The first part of the work refusal was by Zoom call. And then I think I had a phone call with the NJOSH [National Joint Health & Safety] Co-chairs. But, yeah, everything took place out of Edmonton and I was residing in Spruce Grove at the time.

Louis Browne

And both of those are in the province of Alberta in the country of Canada. Is that correct?

Ryan Orydzuk

Correct.

Louis Browne

Okay, final question. Just in summary, sir, in, you know, 60 seconds-ish, what is it that you want this Inquiry and Canadians at large to take away from your evidence today?

Ryan Orydzuk

For me, I'll be honest— And there's so much more.

If folks are interested, they can always reach out to my community, because we're working with a group called Posties for Freedom. There's so much more information that people need to hear when it comes to this safety aspect. Because this is only 20 out of 80 slides I have, that you saw today. There's so much that I could talk about with you and I just hope that folks decide to look into what their employers were doing when it came to safety: Look into their national safety minutes. Ask their unions why none of this was addressed, why work-refusals were never afforded to them, why they were marked as non-compliant.

I just want people to start to understand what their legal recourse is and what they could actually do—and still do—in terms of following up with their employer. Because this isn't secret information. It's all written into our legislation. It's been around forever. You might want to question your employer as to what's going on.

Because I think it's the best way to kind of get some accountability going in Canada for what's taking place. Because this is just terrible.

Louis Browne

Mr. Orydzuk, thank you for your evidence today.

Ryan Orydzuk

Thank you.

[01:12:01]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 7: Adam Konrad

Full Day 2 Timestamp: 07:28:47–07:45:45

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Wayne Lenhardt

Okay, Mr. Konrad, could you give us your full name, please, and then spell it for us. And then I'll do an oath with you.

Adam Konrad

My name is Adam Konrad, spelled A-D-A-M K-O-N-R-A-D.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony today?

Adam Konrad

I do.

Wayne Lenhardt

First off, where do you live and what do you do for a living?

Adam Konrad

I live here in Saskatoon, Saskatchewan, and we run a fishing guiding business on Lake Diefenbaker. We have a lodge and I'm part owner with my wife and my brother. And so, basically, a fishing guide, and I'm a family man.

Wayne Lenhardt

AV people, are you able to hear him? Oh, there we go.

Adam Konrad
Sorry, I'll speak up.

Wayne Lenhardt
Okay. So you own a lodge at Lake Diefenbaker and you basically take clients fishing. Is that fair?

Adam Konrad
Yes.

Wayne Lenhardt
And you've done this for a few years, have you?

Adam Konrad
We started guiding part-time in 2008. We got pretty recognized in the fishing industry in 2007. I caught a world-record rainbow trout at Lake Diefenbaker. During that time, I was apprenticing as a mechanic and became a journeyman mechanic, 15 years. I worked through a few dealerships here in Saskatoon.

Wayne Lenhardt
Okay, so you've done it for a while.

Adam Konrad
Yeah, so, three years full-time. Ever since COVID came— In 2020, when COVID came I got laid off as a mechanic and I started guiding more. It just kind of went from there and we got really busy and I never turned back.

Wayne Lenhardt
Your season starts in mid-May, am I correct?

Adam Konrad
May 5th is opening day.

Wayne Lenhardt
Okay. So, in April 2021, you got your first shot of Pfizer, correct?

Adam Konrad
Yeah, I believe it was April 23rd. My wife and I went in and got our first shots of Pfizer.

Wayne Lenhardt
And what happened next?

Adam Konrad

We started guiding May 5th, 2021. And, I don't know, it must have been about 10 days after my shot, my heart was feeling a little weird. I had no idea why it was feeling weird. I didn't even think anything of it; we've never had any heart issues in our family.

It was May 16th. I had just finished a day of guiding on the lake and I was back at Lake Diefenbaker. I was just staying in an RV. And I just finished watching a movie at about 10 o'clock. And I got up to get a drink of water and then go to bed. When I got up, my heart started feeling weird. It was pounding really hard. And I really had no idea what was going on. But all of a sudden, I could feel a really big pounding in my chest, so I called a friend who came over. I called a lady; she said I should take Aspirin because I might be having a heart attack. So I chewed Aspirin as quick as I could. A friend came over and put an Apple Watch on me. And there was a nurse that was nearby that came over and took my rhythm.

My heart actually went out of rhythm and my heart was beating at about 240 beats a minute.

Do you want me to continue with the story?

Wayne Lenhardt

Yep, sure.

Adam Konrad

Okay. So basically, I thought I was having a heart attack. I was having a heart attack, in my opinion. Got rushed to the Outlook Hospital. Felt like a lifetime to get there. I was seeing stars and passing out. And in the Outlook Hospital, my wife got there from Saskatoon; she drove in from Saskatoon. They put the maximum dose of metoprolol in me to try to control my heart. My heart rate did not come down. It was sitting 230, 240 beats a minute and out of rhythm. Basically, my chest felt like it was exploding. I was saying my goodbyes to my family.

They had to call an ambulance to ambulance me to Saskatoon.

[00:05:00]

During my ambulance ride there, laying in the ambulance, there's one lady that was—I bet she was in her mid-30s. She asked me what shot I got. And I had no idea why she would ask me that, I still didn't know what was going on. Basically, I was having a heart attack.

And I told her I had the Pfizer shot. And she asked how long ago I had it. I said, "about two weeks ago." And she said, "Oh." I said, "So, why do you ask me that?" She said, "Well, I had it." Sometime after, her heart rate increased significantly and didn't come down for over a week, she said. And I still didn't know what was going on. I really didn't care when I was feeling like that.

They cardioverted me in Saskatoon—put me to sleep, cardioverted me—and I woke up and my heart was back in rhythm. My heart was at 240 beats a minute for eight-and-a-half hours. And I do have heart damage now due to that. I was prescribed blood thinners. The doctors basically said, "Stop drinking so much caffeine. It was probably a coincidence that just happened."

So I just continued with my life. I was on blood thinners. I had to take four or five days off of work and cancel trips to rest up. I felt like I had just ran a marathon. Two weeks later I had another attack at night. And my friend was there with me, rushed me into the hospital. And you know, it just continues after that.

Basically, once a month, it was like clockwork: I would wake up at two in the morning, sleeping, and my heart would just be pounding out of my chest. I'd stand up and then my heart would go out of rhythm and peak out at 200 plus beats a minute. This lasted seven months. I think I had eight or nine attacks. I was on the maximum dose of metoprolol and diltiazem to try to get my heart rate down. Mentally just broken, because—ever have heart issues like that and it happens at night, you know that your sleep goes to zero pretty much, after.

Moving forward to October 1st, when they put the mandates in where, in order for you to buy alcohol you had to be fully vaccinated. My father, Otto, he had been an alcoholic for 30 years and he was very set against the vaccines. He knew what happened to me. And my sister in Toronto, they had friends and were pushing him not to get the shots.

He was set on not getting any shots. He was living alone in a condo in Saskatoon. But when you take alcohol away from an alcoholic, they're going to do what needs to be done to get their alcohol, so—

On October 15th, I called my dad and I asked how he was doing and he said he's doing good. I said, "Well, how are you getting your alcohol, dad?" He said, "Well, I talked to my doctor and he said it was okay for me to get the shots." I said, "Well, okay. Well, that's your decision." Everybody makes their own decisions in life and, once your decision is made, it is what it is. I'm a person that lets people—I learn from people and my father made the decision and it was his. I said, "Okay, well, how are you feeling?" "I feel good."

Fast forward to October 26th. I knew he was getting his shot again in late October, I didn't know when. My brother had called me from Spruce Grove—I'm actually an identical twin; there's two of me. He called me and he said, "I just talked to Dad." It was 6 p.m. on October 26th. And he said, "He just didn't sound right." I said, "What do you mean he didn't sound right?" He said, "He sounds like he has dementia. He couldn't keep track of his conversation. He was asking me over and over again"— why Sean called him, when my dad called him.

I just told Sean, "He's probably drunk." He said, "Well, he didn't seem drunk. He just seemed different." I said, "Well, whatever." I was dealing with my family, my issues, business, my heart. I had just talked to my dad on the 25th, so I didn't really think anything of it.

November 1st was my last day of guiding for the year, as the weather came in. I finished a **day of guiding November 1st.**

[00:10:00]

I drove in from Lake Diefenbaker. I got home at 9:30. I was happy the season was over. I was in a good mood. I was doing great. I sit down at 10:30 and my heart flips out of rhythm again. And I just was mentally broken, you know. What do you do? You feel helpless.

Hospital again. Again, cardioverted back into rhythm. And I laid in bed at home for four or five days and recuperated again.

And on November 6th, I was wondering why my dad hadn't called me. I called his phone and it went straight to voicemail. And it never goes to voicemail because he always answers on his first and second call. He doesn't have much to do and, when I call him, he's always excited to talk. I knew that something was wrong, so I kind of blacked out. My wife took over and—excuse me—and since he was in a condo, we didn't want to go in. We called the police and they did a wellness check. And they found him laying on his floor, dead.

I'll just fast forward. They pegged his death to October 27th or 28th. He had been laying on his condo floor for over 10 days, dead and decomposing. They recommended me not to look at the body, so, I didn't. We never did. After I was just out of the hospital, too. You got to stay strong and you got to keep moving forward, right?

So we made preparations. We weren't allowed into the condo. About a week later, I feel like it was November 10th, things were very blurry at that time. Walked into the apartment and you could smell the smell: You'd never get rid of that. I reached out and his wallet was on the countertop. I pulled his wallet out. And in his wallet, I pulled out a vaccination card that said, "Congratulations, you're now fully vaccinated."

After that, I just blacked out. And broke. And that's when I—

Wayne Lenhardt

Do you have any formal cause of death on your father?

Adam Konrad

No. They said, "We can try to do an autopsy, but since he had been passed for such time, it would be difficult." And we just opted not to. So they just wrote it off as natural causes.

Wayne Lenhardt

Okay. And are you still having your monthly attacks?

Adam Konrad

No. Fast forward from the November, I was scheduled for a cardiac ablation. I had a cardiac ablation performed on February 1st of 2001. And ever since that, once my heart healed up a month or two later, I was having slight palpitations. But ever since that, my heart has stayed in rhythm now.

Wayne Lenhardt

And I'm assuming you have not had your second Pfizer shot.

Adam Konrad

No. About that, though: I did call and I sent in an adverse reaction request for me and one for my father.

I did get a call back, eventually. The lady was kind of explaining to me at the start that maybe I had a problem with an mRNA or something. I have no idea. And she said maybe that, "I recommend getting the Johnson & Johnson shot." And then I said, "Well, okay." And then, by the end of the conversation, she told me that it was a coincidence. And that if I

hadn't got the Pfizer shot, I would have been worse off. And I told her, "What's worse off than almost dying? I'd rather not take that chance."

So she says that it's a coincidence but before, she said it could be from an mNRA.

Again, I don't study anything: I'm a fisherman and a mechanic. It's just weird how they would consider that a coincidence. Two weeks after a shot, I have a heart attack. I'm a healthy person. I played soccer my whole life. I eat healthy. I do drink alcohol—I don't anymore.

[00:15:00]

I stopped, actually. After my first attack, I stopped alcohol. But nothing seemed to help. Anyway, it's just weird how they can write that off as a coincidence. And my dad's death as natural causes, even though I pushed and tried to call people, and nobody really seemed to care.

Wayne Lenhardt

Is there anything you think the government, or anyone in this scenario, should have done better in your opinion?

Adam Konrad

You know, I'm not a professional. I know that COVID is out there. I know that there are people that have died from COVID.

For me the only thing that I live my life is: If I'm doing something and it's not working, I wouldn't continue doing it. Like, if I'm a fisherman and I go to a spot and there's no water in that spot, why would I fish there? If it's not working, why do you continue doing it? Like, nobody's taken accountability for anything. And, it's just— Nobody's ever provided me answers to anything. It almost seems like they really just don't care. They make their decisions and they're sticking to it, but things aren't working out.

In my opinion, if something's not working out, why don't you pull back and do more research on things instead of injuring people over and over again? It just doesn't make sense.

Wayne Lenhardt

Are there any questions from the commissioners for the witness? Anyone?

Okay. On behalf of the National Citizens Inquiry, thank you very much for coming and giving us your testimony today.

Adam Konrad

Thank you.

Wayne Lenhardt

Thank you.

[00:16:58]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 8: Elodie Cossette

Full Day 2 Timestamp: 07:46:13–08:02:51

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Wayne Lenhardt

Could you give us your full name, Elodie, and then spell it for us? And then I'll have you do an oath.

Elodie Cossette

My name is Elodie Cossette, E-L-O-D-I-E, Cossette, C-O-S-S-E-T-T-E.

Wayne Lenhardt

Do you promise that the evidence you give today will be the truth, the whole truth, and nothing but the truth?

Elodie Cossette

Yes, I do.

Wayne Lenhardt

Where do you live, Elodie?

Elodie Cossette

I live in Estevan, Saskatchewan.

Wayne Lenhardt

And were you living there when this whole COVID mandate thing unfolded?

Elodie Cossette

Correct.

Wayne Lenhardt

Tell us what you were doing for a living at that point.

Elodie Cossette

I was a direct care support worker for a group home. There were several group homes. I worked particularly in one for the last three years. There was two ladies in that home. They had different challenges that made it so there was only two in that home.

I excelled at my job. We were given, kind of, parameters as to the rights of the clients, the rights of us, and we were told to never treat them as kids. We were given the training every year. We were told they had to consent to things.

I started to see things come down that weren't consistent with giving them the right. One of the things that I noticed was the clients did not want to take the vax. And so what they did is they asked their living family to encourage them to get the vax. When that didn't happen, I was told they made them make a doctor's appointment and then encouraged them to get the vax.

Wayne Lenhardt

How long had you been doing this kind of work?

Elodie Cossette

I did that for 10 years. It was my passion. I absolutely loved it. I love those two ladies. I found that they would do anything for me. I asked them, "Could you do this? Could you do that?"

In meetings, I found they were not treated that way always, or they didn't feel safe with the other workers so much as they did with me. I would sit at meetings and think, man, are these two people that I don't know of? Because I never had any difficulties with them.

I was passionate about my job and it was very difficult for me to lose my job.

I had seen inconsistencies for a while. I was not always an anti-vaxxer, but I had been encouraged by my company to start getting the flu vaccines. I started to get that flu vaccine. When I got the flu vaccine, later on, I got an autoimmune skin disease. When I checked with a doctor—a specialist—I said, "I think from what I find, that is a result of the flu vaccine not being tested properly." And she agreed. I said, "I don't think I should take the vax." She said, "I agree."

My boss had, in a group setting, in a team meeting, mentioned she would never get us to that place where we had to be vaxxed. I was quite happy with that. Lo and behold, I'm not too sure how it came down—whether it was the board or her—but they started to implement the need to be vaxxed or to test.

Wayne Lenhardt

Okay.

Elodie Cossette

At that point, I began to try and educate her and let her know why I didn't want it. She asked me if I could get this doctor to sign the exemption for me. I believe she liked me as a worker and knew that I did a good job. I had, up to that point, no problems with her.

[00:05:00]

I tried to go back to that specialist. She was scared for her job and said, "No way, that's up to you." You know.

At that point— I had had a mask exemption as well, and I was not allowed to do that. I worked nights for 10 years. It was totally nights. I had been wanting to get a daytime job in that home because I liked it so much, but there wasn't an opening. And by this time, the mandates came down from my boss.

As of October 30th, I had to come to work and either present a test or my vaccine. No, that's not true. The vaccine, she gave me a religious exemption; and I think it's because she knew I was a good worker—I have submitted an evaluation of me that was of excellent report—but then she said I didn't need the vaccine, but I needed to test.

At that point, I knew family members that had believed the science, that had tried to do the test because they were a teacher or something. They tested positive. They stayed home for their duration, never had any symptoms, and I didn't want to become a statistic.

Plus, I knew there were different people that, if you had the COVID shot, you could still get COVID. So therefore, if I came exposed to one of my workers who was vaxxed and allowed to be at work, I would be off two weeks. And there was just no reason why I was going to play that game.

Wayne Lenhardt

So at some point you were terminated. You tried various options.

Elodie Cossette

October 30th of '21.

Wayne Lenhardt

Okay. Yeah. So, I assume that had some effect on your financial situation.

Elodie Cossette

Yes. I've been one who pays her bills the day I get them. I hate being in debt. I hate it with a passion.

Wayne Lenhardt

Yeah. Did you try to apply for unemployment insurance? And what happened there?

Elodie Cossette

Yes, I tried. I exhausted— Pardon me.

I exhausted every road. I went up four levels and was denied. The last one was the— I can't think of the name of it. I can't think of the name of it, but it— Not a tribunal, but—

Wayne Lenhardt

Okay. So, you went to more than one level of appeal and you were denied.

Elodie Cossette

Yes, I went up four levels.

Wayne Lenhardt

Okay. But you never did get the vaccination, is that correct?

Elodie Cossette

No.

Wayne Lenhardt

Okay. Yeah.

Elodie Cossette

No. After I saw what the flu vaccine did, I wasn't going to do that.

Wayne Lenhardt

Okay, so you tried to get other employment.

Elodie Cossette

Yes, and it was stressful for me, so I decided— My passion was people, so I started my own business. It was slow going taking off, as any business at its beginnings. I did everything I knew how to get my name out there.

It was difficult, so I tried to take on other jobs that weren't my passion and consequently, was still taking money out of my retirement and had pretty much gone further than I was hoping with that.

Wayne Lenhardt

Did the COVID situation cause you any problems with your children, your family?

Elodie Cossette

I'm passionate about my kids. God is first in my life. And work and my kids and my brothers and sisters: they're at the top of the list. I had, as a parent— They're all adult kids. I've got seven wonderful grandchildren.

Wayne Lenhardt

Okay.

Elodie Cossette

They're all adults and I trained them to excel at getting education and making their own decisions and whatnot.

[00:10:00]

I believed they could make the decision on this. If my kids ever ask me advice, I look at it as a privilege to give them advice, but I feel they are adults now and I am there to support them. So consequently, with that, they make their decisions. In light of that, I care about it, I've spoken up as much as I can, but I will not sever any relationship because of my belief system.

I tried to win them. I'm proud of all of them, but they have their belief system that I don't cross unless they open the door for it.

Wayne Lenhardt

Were your siblings vaccinated, as well? Were there any problems there?

Elodie Cossette

Some of my siblings were vaccinated, some weren't. I had a sister that— She believed what the media had said to do and felt she was right to get fully vaxxed. And I had a sister-in-law that was fully vaxxed as well. And within a while, both of them, their livers shut down.

And with my sister, her stomach would get to about a nine-month pregnancy. She would have that drained: a six- to seven-hour procedure, every 10 days, for a long time. She ended up passing November 11th of '21.

And then my sister-in-law also started to have her liver shut down. And her legs would go twice the size and it was painful, with the water not draining. And she passed February 12th of this year.

Wayne Lenhardt

Okay. Did you ever catch COVID yourself?

Elodie Cossette

Pardon me?

Yes, I did. I did catch COVID. I started to notice that it was getting difficult, and I knew if I didn't act fast, it would be me going into the hospital. So I phoned a couple of reliable friends who knew what to do. One brought me ivermectin; another one got me an antibiotic and a nebulizer. And within a day or two, the tenseness was gone, but the lasting— And I stayed home for, I believe, 10 to 12 days. And then I had a lasting cough for a couple of months and another physical ailment that I had to do exercises for, for a couple of months, and then I was back to normal.

Wayne Lenhardt

Okay. Is there anything final that you would like to comment on with respect to the COVID-scenario?

Elodie Cossette

I guess the thing that hurt me most, in light of our Prime Minister, is that he made it so that people were looked at as uneducated and stupid—I don't know his words; I don't have the memory of it—for not being vaxxed. That is a stigma that I just had a problem with. And so, I gave a lot of leeway to people who were struggling with things, because—I don't know how to say it, yeah.

Wayne Lenhardt

Okay. Are there any questions from the commissioners?

Commissioner Kaikkonen

Thank you for your testimony. Do you consider the EI decision to refuse you benefits as a form of institutional segregation that made you an outsider to a system that you had no choice but to contribute to throughout your working career?

Elodie Cossette

I'm sorry, I did not follow that. Could you repeat that?

Commissioner Kaikkonen

It's my voice today, let me try that again. Do you consider the EI decision—when they refused you EI—to be a form of institutional segregation?

[00:15:00]

Elodie Cossette

Correct.

Commissioner Kaikkonen

Where you had contributed to this EI program throughout your working career and then you—but not by choice, because you have to—and felt like an outsider?

Elodie Cossette

Yeah. And what happened to me is I had bought the science at first as well. I started masking. I started doing the things at the very beginning, before all this. I started to buy it from the media.

About two days after I was fired, I went up to the parliament buildings in Saskatchewan to protest, peacefully. I won't be involved in bullying or lying, so I was part of that as well. That night, I went home to watch the news. It said that there was— There was several hundred, possibly 1,000, of us there. And they said there was a few dozen there, and they felt unsafe, and they went indoors—the Province did.

So that's when I stopped the main media. And that's when I gave grace to family members that don't get it.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Are there any other questions from the commissioners? Okay.

Okay, on behalf of the National Citizens Inquiry, thank you for your testimony today.

Elodie Cossette

And I want to thank you for allowing me to say it.

[00:16:38]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 9: Steven Flippin

Full Day 2 Timestamp: 08:15:37–08:52:21

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Dellene Church

Welcome back to the National Citizens Inquiry. Our next witness is Steven Flippin. Steven, can you please state your name and spell your first and last name for the record?

Steven Flippin

Sure. My name is Steven Flippin, S-T-E-V-E-N. Last name Flippin, F-L-I-P-P-I-N.

Dellene Church

Thank you. Steven Flippin, in your testimony here today, do you swear to tell the truth, the whole truth, and nothing but the truth so help you God?

Steven Flippin

I do.

Dellene Church

Thank you. Steven, you're a pastor who was faced with several government restrictions and mandates that affected your church body as well as your congregation. How did your church react to the initial period of lockdowns and restrictions?

Steven Flippin

Sure. So two weeks to flatten the curve is what we were told. Fellowship Baptist Church here in Saskatoon were completely willing to follow the guidance of Saskatchewan Health, giving them the benefit of the doubt that they had some science to support the idea that a short-term shutdown would be beneficial to helping maintain our healthcare system. We closed our doors in March of 2020—moved our services, our teaching, to online.

We quickly realized that two weeks was going to be a significantly longer period of time. A two-and-a-half-year nightmare, really, of this COVID disaster. And there was very little, if any, science involved in any of it. And this was our biggest problem.

We found that people were falling prey to the repercussions of isolation: anxiety, depression, loneliness, uncertainty, distress, hopelessness. We soon began questioning the wisdom behind these decisions of our government and mandates. Our services remained limited to less than 10 people in-person until June of 2020, when we finally decided that we could no longer impose such limits.

We did try to meet other requirements as we could. We've got big wooden heavy pews. We moved pews out of our facility to accommodate social distancing. We provided masks and signage and hand sanitizer and arrows on the floor to control the flow of traffic—and everything else that we now know is absolute and utter nonsense. We cancelled our children's ministry. We did everything we could to try to comply. We segregated families as best we could. We cancelled social events like potlucks and weekly in-person studies and nursery. But what we could no longer do was limit our service to 10 people. And frankly, what we found was that our people's mental and spiritual health were being far more threatened—as was everyone in society—by the COVID lockdowns than they were by COVID itself.

To our delight, in June of 2020 the restrictions eased, giving us more capacity for in-person attendance. This would be enough to accommodate, at that time, the people who wanted to attend in person. We breathed a sigh of relief at the time, but we knew: come the next flu season, those restrictions would be returning. And so our membership met and discussed the issues. We decided that, should those restrictions return, we would not be imposing capacity limits. At all.

The problem for us is that the King of the Church is not Scott Moe, and it is not Dr. Shahab, and it is not Justin Trudeau. The King of the Church is Jesus Christ and Him alone. And so, Christ orders us to regularly gather together as a local assembly. Christ orders us, over 30 times in the New Testament, to practice what we call “The One Anothers.” And you cannot practice those commands of Christ apart from gathering together.

Christ's commands were far more important to us. Christ's commands are non-negotiable. Christ's commands are not subservient to public health, nor will they ever be. And so—

Dellene Church

And also, your concerns over the well-being of your congregation's mental state.

Steven Flippin

Absolutely! Absolutely, so one of the other restrictions that was placed on churches was the prohibition of singing.

[00:05:00]

The problem is, Christ commands us to sing. I probably don't need to tell you where we landed on that command. In the fall of 2020 restrictions did tighten again, back to 30 people in person—and of course that was plus staff and volunteers.

The interesting thing for us at that time was that the local Costco here in Saskatoon was permitted to have 818 people in their store at that point. At one time. And they were able to rotate new people in and out of the store all day long, while our church was permitted to have 30 people.

We simply did not have room in our mandate from Christ to accommodate such limits. Because Christ welcomes all who come to Him, and as His ambassadors in this world, we are expected to do the same.

Our church was not in any way flaunting our choice of disobedience. We were simply going about our business quietly, peacefully, and allowing any who chose to come in person and worship with us a space to worship.

Dellene Church

Steven, can you give a little bit more information on the process that your church went through to reach that decision? Was it a board? Was it a congregation meeting?

Steven Flippin

Yeah, we have elders of our church who make all spiritual decisions for the church. We did consult with our members of the church, and we came to an agreement—yeah, fairly unanimously.

Dellene Church

Okay.

Steven Flippin

We had cancelled a ton of services for our people, but we could not compromise the Sunday morning worship. And we began to grow as a church, as a result of people finding out that we were allowing all who would choose to worship to come and join us. They were being neglected by their churches and we gave them a place to find teaching and fellowship. We would not turn them away because for us, to turn people away from worshipping our Christ is for us to flagrantly disobey our King—and we couldn't do that.

So we quietly continued peacefully gathering. And by the way our COVID numbers, as far as spread within the church, weren't any worse than the world around us. In fact I would say, because we left masking decisions up to the individual— After all, each individual in Canada has the right to personal bodily autonomy guaranteed them in the Charter. And so we left those decisions to the individuals. And because most of our people chose not to wear masks, not to place a "COVID-collector" over in their respiratory path, I would guess that actually our sickness in the church was far less than the world around us. That's science, of course.

I believe it was in early December 2021—sorry, 2020—that I received a complaint from Sask Health that someone had levied against us. We responded truthfully, letting Sask Health know that we were doing everything we could to accommodate the mandates. And we were. Everything we could.

We heard nothing further until mid-January of 2021, when we received a second complaint. The following Sunday, we had a member—a constable from the Saskatoon Police Service—

visit. He had received a complaint regarding the number of cars in the parking lot, wanted to give us a warning, but his supervisor insisted that he come in and do an investigation and report to Sask Health.

He arrived after our service had concluded. We proceeded to allow him into our facility. He looked around, made his observations. The following week we were visited covertly by a health inspector with Sask Health. He arrived as our service was already underway. As he tried to enter he didn't identify himself as a representative of Sask Health, but it was fairly easy to spot. We informed him at that time that *The Criminal Code of Canada*,

[00:10:00]

section 176, prohibits the disruption of worship services or disturbance to the solemnity of worship services in Canada.

Allow me, if you would, to read from Section 176 of the Criminal Code. It says this:

Every person is guilty of an indictable offence and liable to imprisonment for a term of not more than 2 years or is guilty of an offence punishable on summary conviction who (a) by threats or force, unlawfully obstructs or prevents or endeavors to obstruct or prevent an officiant from celebrating a religious or spiritual service or performing any other function in connection with their calling, or (b) knowing that an officiant is about to perform, or is on their way to perform or is returning from a performance of any of the duties or functions mentioned in paragraph (a) assaults or offers any violence to them, or arrests them on a civil process, or under the pretence of executing a civil process. (2) Everyone who willfully disturbs or interrupts an assemblage of persons met for religious worship or for moral, social or benevolent purpose is guilty of an offence punishable on summary conviction. (3) Everyone who, at or near a meeting referred to in subsection (2) willfully does anything that disturbs the order or solemnity of the meeting is guilty of an offence punishable on summary conviction.

I read those words because I think it's very important that those words be entered into the public record. Those words have meaning. They're not difficult to understand. You do not need a law degree in order to recognize what it is that statute prohibits. Yes, it does apply to law enforcement. In fact, that statute was put in *The Criminal Code of Canada* specifically to protect the church from the state. It is statutes like this that separate Canada—or are supposed to separate Canada—from communist and totalitarian states.

We have the freedom to worship in this country. And yes, section 176 does apply to public health. **They are not to disrupt, obstruct, prevent, interrupt, interfere, prohibit, disturb— In any way. Bringing police officers into the service to check for social distancing and masking and capacity limits and hand sanitizing? Yes, most definitely, that does qualify as a disruption to the solemnity of the worship service. It moves people's focus from our worship of God to the happenings of the world around us as imposed by the state.**

We could also think of: what other aspects of the Criminal Code of Canada were absolutely set aside for public health? I can think of none.

Dellene Church

So Steven, what was the outcome of these investigations by the police and public health?

Steven Flippin

Yeah, so SHA did— They weren't allowed in our building, which they tried a number of times. We would allow them in after our services concluded, but not during our worship service. A number of times they tried gaining access. Eventually, we were given a number of tickets. Three tickets: two given to individual elders of our church, and one to the church as an entity for obstructing a lawful investigation.

Frankly, that's laughable because a lawful investigation does not violate the law in order to investigate. That's number one. So, three obstruction charges, one ticket for \$14,000 for a mass gathering and three charges to individuals in the church for failure to wear a face covering as per the SHA requirements. [START HERE]

Dellene Church

And what were the amount of these fines?

Steven Flippin

Well, there was the \$14,000 public, the mass gathering. The obstruction charges written to the two individual elders of the church could potentially be as high as \$75,000 a piece. I believe it was. And the obstruction charge written to the church

[00:15:00]

as an entity could have been as high as \$250,000. So, yeah.

The other thing that's interesting is: We were the only corporate entity in Saskatchewan that I'm aware of that was ticketed by Sask Health and not reported to the media. And I think that's very interesting. Why would they not fully disclose the fact that Saskatchewan Health was targeting churches, was targeting worshippers for simply coming to worship and practice their faith? My guess is they didn't want the public to know. And we'll leave it at that. They were probably ashamed. They should be ashamed.

Dellene Church

So, what happened with these tickets?

Steven Flippin

Well, I would say— our government spied on churches, threatened churches, imposed huge financial penalties on churches for worshipping. We, of course, were fully aware that there were pastors in Canada— Like, this is Canada. This isn't China. Pastors in Canada went to jail for worshipping.

The Charter of Rights and Freedoms, which is supposed to be the supreme law of our land, recognizes—and that's an important word, "recognizes"—that the Government of Canada does not give us our rights. If we read the preamble to the *Charter of Rights and Freedoms*, we recognize that our rights are granted us by God Himself, by the sovereign God. That's very important for us to understand.

In order for the government to limit our rights in Canada, the *Charter of Rights and Freedoms* requires them to demonstrably demonstrate that the things that they're putting in place are needed and reasonable for limiting such freedoms. They hadn't even tried.

They just assumed that, “because we say so, that means it is what it is.” And the problem is, the courts of our land gave them carte blanche access to do that.

There was no accountability whatsoever.

Our day in court finally did arrive: September of 2022. The prosecution extended to us a deal at that time, which our lawyers urged us to accept based mainly on the obstruction charges. We were told that no court would ever read section 176 of *The Criminal Code* the way we did.

Now it's important that I read that for you. It's not difficult to understand. If a court can't read that document the way we did, then the court is not capable of reading. It's that simple. That statute is clear—exceptionally so.

The government sought to amend the charges from the church as an entity to myself as its pastor. Which they did. And again, seeking to limit the government's exposure to the public, knowing that they were targeting and financially penalizing a church. In the end, our church—or our pastor, which is the same thing—we were fined a total of \$19,600 for obstruction, a mass gathering. And those were both given to myself. And then two face mask violations, which were given to individuals of the church. So in total, \$19,600. For worshipping. In Canada.

By the way, this—today—is the first time that those fines are being exposed publicly. The Government of Saskatchewan never exposed the fact that they charged our church. It was reported in the newspaper, the “mass gathering” at one point about a month after it happened but other than that—

Dellene Church

And, Steven, another thing I wanted to bring up is, as well as you being forced to take responsibility,

[00:20:00]

personally, for these charges in the deal, you also had a very unusual quarantine experience when you and your family contracted COVID.

Steven Flippin

Yeah. In March of 2021, my wife— We had three foster children in our home at the time, along with our two sons. And one of the foster children contracted COVID from school. And we know that because of the contact tracing and all of that. And of course, it made its rounds through the whole house. We were all contacted by SHA [Saskatchewan Health Authority], ordered to quarantine and all of that, which we did. Every day throughout our quarantine, we were contacted by Sask Health. And on the last day we were called—each of us individually—by Sask Health to release us from quarantine.

It was about three or four days later that I got a call from the public health inspector who had been harassing our church. I would ask, one, how did he have my personal health record? Because legally, he had no right to my personal health record; he's a health inspector. So that's number one. He called me and informed me that he was, of his own authority, rescinding my release from quarantine because there was a new variant of concern and there was a new protocol put in place. The problem was, he didn't rescind any

other member of my family's quarantine. The kids were all back in school. My wife was back at work. Everything was fine for them. But I was to remain in quarantine for another—I think it was seven days.

Dellene Church

And what was happening during those seven days coming up?

Steven Flippin

Yeah, that was the interesting part. It happened to be the Easter weekend of 2021. And we had three worship services planned that weekend. And this health inspector was trying to shut down the worship of our church during what is one of the most important weekends of our year as we celebrate the death, burial, and resurrection of Jesus.

So why does all of this matter? The church in Western culture has always been seen as of benefit to society. And for very good reason. Where the Christian gospel flourishes, crime and poverty are reduced. The gospel message is that man is sinful, that man is answerable to a holy God who must, by nature of His character and righteousness, punish sin and sinner. And of course, our problem is that we are sinners who can expect nothing from God but wrath and punishment. But God, being rich in mercy, with great love that He had for us, gave His son. He sent His one and only son. That whoever would believe on Him and His payment on our behalf, to cover the cost of our sinfulness that we would be saved from that vengeance of God. Those saved are given a new heart, a new direction, to love God and to keep his commands.

I mention all of that because our Canadian law is actually based on the moral law of God—or at least historically it has been. Therefore, where the gospel impacts men and women, society is bettered. Allow me if you would to quote from the first president of the United States, who said this: "We are persuaded that good Christians will always be good citizens, and that where righteousness prevails among individuals, the nation will be great and happy."

Now, sadly, a pastor here in Canada—Pastor Steve Long, a Canadian Baptist minister—met three times with Prime Minister Justin Trudeau. Our Prime Minister, instead, referred to evangelical Christians in Canada as the "worst part of Canadian society." Hopefully, as I read those two quotes, you can spot the difference between a great leader and someone that history should wish passes quickly and is forgotten just as quickly.

Dellene Church

One more thing I wanted to ask you, Steven: You mentioned that your congregation grew over this time. How much did your congregation grow?

[00:25:00]

Steven Flippin

Pre-COVID, we were running about 90 people per week in in-person attendance and we lost a few during COVID. By the way, we didn't lose any that I'm aware of because of fear of COVID. We lost a few out of fear of losing their jobs if their employers were to find out they attended that church. We lost some because they didn't feel like they could bear the

financial penalties that could come upon them should they continue to attend our church. Well, today, we're running probably an average of about 220 people at Fellowship Baptist.

Dellene Church

Okay.

Steven Flippin

So, God has blessed us a great deal.

Dellene Church

I'd like to turn it to the commissioners to see if they have any questions for you.

Commissioner Kaikkonen

Thank you for your testimony.

Steven Flippin

You're very welcome.

Commissioner Kaikkonen

I just would like some clarity. You made a comment about disobedience, and I'm just wondering, is it peaceful civil disobedience, or as you allude, obedience to a different king?

Steven Flippin

Well, I would say both. So, number one, within the church, we have a responsibility to be obedient to our Lord. That's what matters in the church. But we are also citizens of Canada, and as our government infringed upon rights that are guaranteed to us in the Charter, unless they are demonstrably demonstrated to be needed to be curtailed, we have the right in Canada to submit to our conscience and uphold those rights.

Commissioner Kaikkonen

In 2015, the P.M. also said that Christians need not apply; that was, I think, before he was P.M.

Do you remember that comment, and did you see the writing on the wall for his personal bias towards Christian churches?

Steven Flippin

Yeah. I think the writing on the wall has been clear for some time, certainly.

Commissioner Kaikkonen

And in Ontario, where I am from, one of the questions we often asked is, "Why it was only the Jesus-believing churches that were being targeted and the police were surrounding? So in other words, what we found in Ontario—and it might be just because it's a greater

metropolis in the City of Toronto—is that the other churches were not being targeted: the non-Christian churches, so that would be the atheists, the mosques, et cetera. And you may not have had it because of population here, but it was something that was happening there. Do you have any reference points to their thoughts on that?

Steven Flippin

Yeah, I don't know why that is. I think that we believe fervently that obedience to our King is necessary and that, should we be placed in a situation where we are forced to choose between obedience to Christ and obedience to our government, we must choose obedience to Christ. And I think we're unique in that fashion.

Commissioner Kaikkonen

My next question is: you alluded to having moved all the furniture and tried to implement all the mandate measures within the church building. And I'm just wondering if you were to turn the tables a little bit with the government or the health authorities, would they allow you to go to their bulletin board and put a sign up that said Jesus loves you?

Steven Flippin

Yeah, my guess is not. Yeah.

Commissioner Kaikkonen

And you refer to the court; the lawyers had advised you not to pursue this in one way. I'm just wondering what that legal precedent will do going forward if you chose to go the other way or the fact that you made that decision.

Steven Flippin

Well, it's interesting because, I believe it was in 2017, the Prime Minister and the Liberal Party of Canada sought to remove Section 176 from the Criminal Code. That's interesting to me. What we found in the last few years is that the reason that statute was not removed from the Criminal Code is because there was an outcry from Canadians saying, "No, that's important that it remain in our Criminal Code." So rather than remove it from the Criminal Code, we just ignored it.

[00:30:00]

And what precedent is set when the courts ignore the fact that it's in the Criminal Code? I think that's very dangerous. What other sections of *The Criminal Code of Canada* will our courts decide they can impose if they choose to? That's dangerous.

Commissioner Kaikkonen

And that comment segues into my final question. What recommendations do you have for the courts when it comes to dealing with our Charter rights and freedoms; our ability to have the right to worship; or to have a conscience to believe, thought; all of those freedoms and rights that we have? What recommendations would you give to the courts and the institutions that are in this country, that might facilitate less—maybe facilitate more understanding of freedom of religion?

Steven Flippin

Yeah, I'm not a lawyer, but I will say: reading the Charter and watching how the Charter has been manipulated and ignored, number one, get rid of section 1. When the government is allowed to determine how we should limit freedoms willy-nilly, which is exactly what happened here—

There has been no evidence given, whatsoever, that masks work. So why are masks imposed? What's the evidence showing that Costco should have 800 people and the church should have 30 people? There's no evidence for that. It's all arbitrary. What's the evidence for two meters of social distancing? All of this. None of it was needed. None of it was helpful.

So, number one, get rid of the section 1 of the Charter. I don't know. There's a lot we could say, I think.

Commissioner Kaikkonen

Thank you very much.

Commissioner Drysdale

Good afternoon, Pastor Flippin. You said that prior to COVID, your congregation was around 90 and now it's around 210 people, something like that, attending Sunday service?

Steven Flippin

That's right.

Commissioner Drysdale

Some people would say that Canada is becoming more secular and, as such, some people in this country might not understand exactly who your congregation is made up of. Can you comment on what kind of people go to your church?

Steven Flippin

Well, we have a very broad spectrum of folks at our church. We have a lot of young families and our congregation spreads the entire age gamut. We have a number of people who have, in the last 10 years, immigrated to Canada. We've got— You name it, we've got it in our church.

Commissioner Drysdale

So, you would say that it's a broad spectrum of everyday Canadians—

Steven Flippin

Absolutely.

Commissioner Drysdale

From all walks of life, all backgrounds—

Steven Flippin

Absolutely.

Commissioner Drysdale

Ages?

Steven Flippin

Yep.

Commissioner Drysdale

So, kind of a representative slice of Canada.

Steven Flippin

Certainly.

Commissioner Drysdale

Can you describe the nature of the relationship between your congregation and its pastor?

Steven Flippin

And it's pastor?

Commissioner Drysdale

And it's pastor, yourself.

Steven Flippin

Well, I would say the relationship between the church and myself is a very close relationship. The church relies on the service that I provide in teaching and counselling and just being there for them. I'm not sure what else you—

Commissioner Drysdale

Well, what I'm trying to get at is that you serve a community support.

Steven Flippin

Absolutely.

Commissioner Drysdale

So you've created community, you're supporting community. You're trying to, if you will, provide a social fabric in which your congregation can live and prosper.

Steven Flippin

For sure.

Commissioner Drysdale

During the lockdowns and during the times of isolation, was the government doing anything to promote that same social environment, that sense of community amongst people,

[00:35:00]

to give them hope, that you were trying to do?

Steven Flippin

No. Not only were they not doing that, but they were pressing further; they were threatening. I mean, we as a church, my family, our congregation—we believed sincerely that I was going to be going to jail for keeping our church open. So not only was our government not filling that void, they were threatening to jail those who were.

Commissioner Drysdale

I'm not from Saskatchewan, but I did hear you say that, during the time that you were under lockdowns and that you were restricted, Costco was open. And were liquor stores open?

Steven Flippin

Yes.

Commissioner Drysdale

Were marijuana stores open?

Steven Flippin

Yes.

Commissioner Drysdale

But churches were under restriction, were under inspection.

Steven Flippin

Yeah.

Commissioner Drysdale

How many people in your congregation died from COVID-19 to your knowledge?

Steven Flippin

To my knowledge, we had one individual who died with COVID. And I would question whether it was COVID that killed them.

Commissioner Drysdale

Thank you, sir.

Dellene Church

On behalf of the National Citizens Inquiry, I'd like to thank you very much for your testimony today, pastor.

Steven Flippin

Thank you.

[00:36:44]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 10: Charlotte Garrett

Full Day 2 Timestamp: 08:53:04–09:17:45

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Louis Browne

Good afternoon, Miss Garrett. Can you please state your name and spell your last name for us?

Charlotte Garrett

Charlotte Garrett, C-H-A-R-L-O-T-T-E G-A-R-R-E-T-T

Louis Browne

And would you prefer to swear an oath or solemnly affirm?

Charlotte Garrett

I'll swear an oath.

Louis Browne

Do you swear that the testimony you are about to give in this National Citizen's Inquiry will be the truth, the whole truth, and nothing but the truth?

Charlotte Garrett

I do.

Louis Browne

Ms. Garrett, what city or town do you reside in?

Charlotte Garrett

Saskatoon.

Louis Browne

And how long have you lived here approximately?

Charlotte Garrett

About 18 years.

Louis Browne

And what is your profession?

Charlotte Garrett

I'm a teacher of English language.

Louis Browne

Okay, and are you currently employed?

Charlotte Garrett

I am.

Louis Browne

Have you been employed throughout the evidence that you're about to give to here today?

Charlotte Garrett

Yes, I have.

Louis Browne

In your own words, please tell us from start to finish what brings you to the National Citizens Inquiry, and then afterwards we'll go back and ask some specific questions. The floor is yours.

Charlotte Garrett

I feel that many people do not know the inside stories of schools or occupations or the punishments that many people suffered through COVID. And I would like to be able to contribute to the truth.

Louis Browne

Sure, go ahead, Ms. Garrett, and just tell us why you're here today. You can start from start to finish and then we'll come back and ask some specific questions.

Charlotte Garrett

Okay. I'm here because, as a language teacher, I teach refugees and newcomers who— My particular bunch are illiterate, and I have a responsibility to be honest and truthful with my students.

And then, as when COVID came, my family was absolutely convinced that I needed to have a vaccine. I had one. And work was also a great deal of pressure to have one.

I had AstraZeneca in April of 2021. And I was sick for three days, and then a few days later I developed tinnitus—quite rapidly, it was just like a tap turning on. It was very strong and deeply uncomfortable, very hard to focus.

Does that answer your question?

Louis Browne

Sure. Yeah, you bet.

Let's just start then in April 2021. You said that you received the AstraZeneca vaccine. And did you do that willingly? Were you happy to do it?

Charlotte Garrett

No.

Louis Browne

Had you thought about it? What was the process that you went through?

Charlotte Garrett

Thanks. No, I was not happy. I did not want to do it. I have three adult children and five grandchildren. And between my family and my work, I felt totally pressured to do it. I really didn't want to, but I did.

Louis Browne

Okay, and how did you feel after that?

Charlotte Garrett

You mean physically how did I feel?

Louis Browne

Yeah. Was there any reaction? Did you have any sort of symptoms or anything or were you just fine?

Charlotte Garrett

Well, I had the flu-like symptoms. I was achy and I had a fever for three days. I was in bed. And then about 14 days later is when the tinnitus began.

So that was—I can't say it's painful. What it does is it's a noise in my brain and it interferes with being able to think or focus.

Louis Browne

Okay, and how long how long did the tinnitus last?

Charlotte Garrett

Well, I actually still have it.

Louis Browne

Okay.

Charlotte Garrett

But it's not quite as strong as it was in the first year and a half.

Louis Browne

Okay. Now you mentioned that you had your first shot in April 2021. Did you have to take any time off of work as a result of any of this, or did you work straight through regular?

Charlotte Garrett

In May I took two weeks just to— I was teaching remotely, and I needed to be able to just rest, so I took two weeks. And then later last year, actually, I took two months away from work.

Louis Browne

Okay. Now, at any point did you consult with your family physician? What role did your family physician play in all of this, if any?

Charlotte Garrett

He was very doubtful that my reaction was the vaccine.

[00:05:00]

Although later, I found that many, many, many people had the same reaction. He still wanted me to continue getting vaccines, but he decided to get me tested to see if there was something that could prove that I had a reaction to it. Although I don't know how, because they didn't know what was in the vaccine.

And I wound up having to— I refused to get further vaccines and didn't want mRNA in my body, and I decided to ask my doctor if he would support me to have an exemption. And he did.

I guess the ability to get an exemption in Canada is very limited: you have to have a severe allergic reaction, anaphylaxis or myocarditis. I didn't have either, but he said he would give me an exemption based on that I wasn't ready to get more and that he would recommend testing. My employer actually accepted it.

Louis Browne

Okay. And as far as masking, what was the role of masking at your place of employment, if any?

Charlotte Garrett

It's an absurd policy that my employer— In fact, he wears two. Still. It was so intense at my work that people are still wearing masks. My employer will not drop the mandate for our work, for our students, even though the Saskatchewan government made it very clear that we didn't need them anymore. And he won't accept that.

Louis Browne

Can I ask you, Ms. Garret: you mentioned earlier that you had been teaching remotely. Are you teaching remotely now, are you or are you back in the classroom?

Charlotte Garrett

No, we're back in the classroom.

Louis Browne

Okay. I want to ask you about when you are teaching remotely.

Are you able to give us any rough dates or any rough timelines as to when you were teaching remotely?

Charlotte Garrett

So remotely began, as with all the schooling, in March of 2020. And then we went back to the classroom in a very limited manner almost a year ago. But I was teaching remotely for almost two years.

Louis Browne

And while you were teaching remotely, what was happening with the so-called vaccine mandate?

Charlotte Garrett

Well, it didn't matter whether I was teaching remotely or not, I still had to have the vaccines. Which meant that I had to— Even though I had an exemption, I still had to test. And even in order just to go into the building, even if it was empty, I would still have to prove a negative antigen test.

I would have to go into the building in order to prepare mailing materials, to do photocopying, to check some materials there. So even if I, if there was nobody there, it didn't matter. I still had to have the antigen test.

Louis Browne

Okay. And I understand that at your place of employment there have been regular bimonthly meetings on Zoom, is that correct?

Charlotte Garrett

Yes. And they still continue on Zoom.

Louis Browne

What was your experience? Or what can you tell us about those bimonthly meetings and your response or reaction to them?

Charlotte Garrett

It felt like I was sitting in the middle of a propaganda campaign, where the employer and the employees were all— It's all safety-jabber. It's all about keeping everybody safe. It's all about how dangerous COVID is. It was about encouraging the students, insisting that the students get vaccinated.

I actually had to record how many vaccines the student had, when they had them, which I thought was illegal. I asked my employer. He said, "No, it's fine in this circumstance." I felt like I was complicit, that I was committing a crime. I hated it.

The Zooms continued; they're still continuing. Last week was the first meeting in three years where we did not discuss COVID first, for at least half an hour.

Louis Browne

And as you described this, where you felt you were committing a crime, essentially on behalf of your employer and whatnot, how did that impact you? How did that impact your own mental health, your own physical health?

Charlotte Garrett

I was deeply demoralized, actually. I trust the Nuremberg Code.

[00:10:00]

I think that my job as an educator is not to insist any kind of medical practice, but to support the students as best I can in their learning journey.

Can you repeat the question again? Would you mind?

Louis Browne

No, of course. Just how, you're enforcing essentially the mandates, you're asking the students about their medical status, you said that you felt like you were committing a crime. I wanted to ask you a follow-up: How did all of that impact your mental health? How did that impact your health?

Charlotte Garrett

Well, at the time and it still is. I'm finding— I'm quite discouraged by it all. Because the students trust me, and they trust me to give best information.

So other teachers were teaching people how to do the antigen tests. One teacher was doing demonstrations online. They told they had programs up for vaccinations and I felt that that was not my purpose to do that. I felt that it was a violation of my students' trust.

It still bothers me. I still feel— During the online classes, I would have students coming into a Zoom class, huddled in blankets or lying down and then I'd say, "Maybe go to bed." Or a young woman came to me secretly, two weeks or three weeks ago, to tell me that she had had two miscarriages. I was just so heartbroken by that, because I know that— At the time, I wasn't her teacher, she came to my class a little bit later. But I still felt that we were doing the students a disfavoured. We weren't helping them.

I knew that, in my research, the vaccine could cause all of these consequences with fertility and with damage to the fetus, and with future problems. And the spike protein going to the womb and going into the ovaries, the testes. We don't know what the consequences are. And yet part of my job, supposedly, was to tell the students to go get vaccinated. I was appalled by that.

Louis Browne

And Ms. Garrett, since you were the one asking them about their vaccination status and whatnot, you were in a position to know when they were vaccinated. Did you observe anything among the student body as they were getting their jabs?

Charlotte Garrett

I noticed they were more tired, less focused. As I said, some were sick. As far as I know, not one of my students— Maybe, actually that's not true: two had COVID. The rest, nobody did.

Louis Browne

I want to ask you about your decision with respect to the jabs. Did you feel like people respected that? What was your response vis-a-vis other people? And we can talk about your friends and family and invitation to family events and these sorts of things.

Charlotte Garrett

Two of my children live outside Saskatoon—one in Ottawa, one in Calgary. They were very displeased that I wasn't getting more vaccinations. They didn't understand it. We actually have very damaged communication for the last number of years, because they felt that I needed to do it.

I've lost friends. Most of my social circle has changed completely. People at work, at first, did not know that I was not vaccinated. In fact, it only came up actually a week ago. Everybody I work with has five, so that's pretty appalling.

I was invited for Thanksgiving dinner, or for Christmas dinner—and then immediately, an hour later, I was uninvited because I hadn't had more vaccines. One of my neighbors is quite angry with me, but she's tolerating me.

It's been incredibly challenging, very demoralizing, very isolating. Almost a sense of like I'm a carrier of disease or something and people don't want to associate with me. Very, very painful.

Louis Browne

And those who were in your circle of trust prior-to shall we say: what was their response when you shared information with them that question, shall we say, or undermine the COVID narrative?

Charlotte Garrett

They become angry with me. They think that I'm a conspiracy theorist.

[00:15:00]

Even my own family. My son told me once I was crazy. My son-in-law refused to speak to me. It's terrible.

Louis Browne

And Ms. Garrett, you mentioned earlier— I just want to get a sense of how this factors into your analysis, but you mentioned the Nuremberg trials earlier. Can you just tell us a little bit about how did that impact you? How did that impact your decision-making throughout all of this?

Charlotte Garrett

Well, I'm older than a lot of people in the education field. When I was a very small girl, my father introduced me to the Nuremberg trials. We watched something on TV. I think we were six when we got a TV.

I remember him explaining to me what was right and what was wrong, and the sense of medical experimentation on human beings is not right.

And that has stayed with me. I really feel that people need to have autonomy and to make their own choices. And that we need to be honest with each other and not impose laws that limit our freedoms and our expressions, which is what's happened across Canada for three years, and is continuing.

Does that answer your question?

Louis Browne

It does, thank you. Now, Ms. Garrett, I'm not sure if you wanted to maybe explain to the Commission that you also had some exemptions from your family physician regarding masking and whatnot. And there was a bit of an exchange between you and your employer. Are you wanting to go into that or read anything into the record, or have we covered it?

Charlotte Garrett

Actually, I'd like to.

Louis Browne

Okay, yeah. Just go ahead and explain to the Commission what you're doing.

Charlotte Garrett

Sure. As a teacher, one of the things I did was, I questioned all along. Why are we doing this, why are we doing that? I'm not accepting it. I filed a grievance. I filed an update to a grievance. I gave a PowerPoint presentation on science and what was happening statistically in Canada.

And I did wear a mask at first. But I discovered that there was something happening with my breathing. And I went to see a specialist and found out that actually, when I had fallen as a child, I had broken my nose, and nobody knew it. And so breathing was difficult. So putting a mask on was torture.

I had several— My employer basically has accused me of being an incredibly difficult person, undermining the health and safety of our students, because I keep questioning, “When are we going to drop the mask mandates?” I mean, as far as the government is concerned, we no longer need them.

He has actually sent me some rather difficult things. He said to me, maybe I'll just read this. He said,

I am sorry to hear that you have a medical condition that causes discomfort. However, I need to point out that since the start of the pandemic, we've had a lot of communication in written form, where you've questioned the necessity of steps designed to provide reasonable protection, in line with expert and public health guidance on a repeated basis. Whether that is masking, vaccination, or other means of reducing the threat to others. This dialogue, including over issues not related to breathing at all, creates great concern that you're bringing into the workplace the whole of a body of thought based on resistance to measures designed to protect our clients.

Louis Browne

And just to be clear, Ms. Garrett, that was part of an email exchange between you and your employer where you were providing your employer with your medical exemption from your doctor.

Charlotte Garrett

Yep. I got my mask mandate, and it was not accepted. He still does not accept it. I mean emailed him again on April 18th and said, “You know, in light of the change, we are stopping now, I would expect.” And he responded not even with a hello. Just, “nope.”

Louis Browne

Okay, we are running short on time, Ms. Garrett, so I just want to check in with the commissioners. Any questions?

Commissioner Kaikkonen

Tell us how remote learning affected the students' education, mental health, or social wellness.

Charlotte Garrett

Could you say that again? I couldn't quite hear you.

Commissioner Kaikkonen

Can you tell us how remote learning, for two years affected the student's education mental health or social wellness?

Charlotte Garrett

I would say for one thing, it delayed the learning process; it slowed that down. The other thing, though, is that if I did group lessons, then nobody missed them because they were desperate for contact.

[00:20:00]

And so, the lessons became more important than just about anything. Because then they could— Even on a WhatsApp call, then I might have eight, and they're able to see each other and speak to each other, and that was a good thing.

But it was so hard for them, because: they're new in the country, they don't have that many people that they can see, and so they're isolated. So, they were also demoralized, it was hard on them, and I felt terrible for them.

Commissioner Kaikkonen

And you mentioned that the school has, for the students, a record of the students that were vaxed. Where would that information go? Just to the school? Did it go up to the health people?

Charlotte Garrett

As far as I know, it just went to the employer. Because what they were doing is they were trying to figure out how many students would be coming back into the classroom when we opened. They would have to have the minimum of two vaccines to get into the building.

So as far as I can tell, it only went to the employer and then I deleted my files. I was so embarrassed to have them, so I just got rid of them.

Commissioner Kaikkonen

What was your employer's response to the students who were still not vaxed?

Charlotte Garrett

They couldn't come to school. They would have to do some kind of online learning.

Commissioner Kaikkonen

Thank you.

Charlotte Garrett

Thank you.

Commissioner DiGregorio

Thank you so much for coming today to give us your testimony. Did you say that you taught English to newcomers to Canada?

Charlotte Garrett

Yes.

Commissioner DiGregorio

These are people who English is clearly not their first language?

Charlotte Garrett

That's right, second or third.

Commissioner DiGregorio

And when the mask mandates came in, you were teaching English with your mouth covered?

Charlotte Garrett

Yes.

Commissioner DiGregorio

Do you think it's important when learning a new language to see the speaker's mouth?

Charlotte Garrett

Let me share my experience. So if you can imagine a fairly small classroom with the white board behind me, an air cleaner directly to my left— If this is my table— An air cleaner and the smart board and a fairly small room. And in order to access the laptop, I have to stand right beside the air cleaner. And then the students all are masked.

They're illiterate in their first language. So speaking is hard. Then they put their mask on and they mumble to begin with. So then they have the mask on and they're mumbling. And I get desperate. I ask them to pull their mask down to speak. I make sure the door is shut so my employer can't see it. I pull my mask down and I show my, I explain my lips. This is how you make the "s." This is how you do the "th." It's hard. It's really hard. And my employer has no understanding of that. Does not respect it at all.

Commissioner DiGregorio

Thank you.

Louis Browne

Thank you, commissioners. Ms. Garrett, I just have two questions left. We're almost done, so second-last question. In summary, in 60 seconds or so, what would you like this Inquiry and Canadians at large to take away from your evidence today?

Charlotte Garrett

That it seems that employers— I think it's because of the federal government and the Saskatchewan government and the way that they put through their mandates: they made it possible for an organization such as mine to do whatever they wanted. If they want to continue on with isolating students, they will. If they want to continue on with mask mandates, well, they will.

It's almost arbitrary. Well, it is arbitrary, and I find that deeply insulting—and dangerous! Masks are not healthy.

I think it's really important for Canadians to know the extent to which people were affected, even the English language learners—like, how hard it is for them to be in a classroom right now.

Louis Browne

Thank you. Last question. Is there anything else you would like to share with us today?

Charlotte Garrett

I don't think so.

Louis Browne

Okay, Ms. Garrett, thank you very much for your evidence here today.

Charlotte Garrett

Thank you.

[00:24:41]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 11: Krista Hamilton

Full Day 2 Timestamp: 09:17:54–09:36:07

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Dellene Church

Krista, can you hear me?

Krista Hamilton

Yes.

Dellene Church

Our next witness is Krista Hamilton. Krista, can you please state your name and spell your first and last name for the record?

Krista Hamilton

It's Krista Hamilton: K-R-I-S-T-A H-A-M-I-L-T-O-N.

Dellene Church

Thank you. Krista Hamilton, in your testimony here today, do you swear to tell the truth, the whole truth, and nothing but the truth so help you God?

Krista Hamilton

Yes.

Dellene Church

Thank you. Krista, you were forced to take COVID vaccines in order to keep your job. Can you tell us what you did to try and avoid that?

Krista Hamilton

I went to my family doctor for an exemption and he told me I didn't meet the requirements to be exempted.

Dellene Church

And what was your health condition that you thought would qualify for an exemption?

Krista Hamilton

I have a lot of allergies, so I just was kind of hesitant to take it. So I thought that would be enough, but— And I also have asthma and that wasn't enough.

Dellene Church

Okay, what did you do then at your employment?

Krista Hamilton

I did end up taking my two vaccines. Sorry. I did take my two vaccines and I just had to show proof so then I was able to continue working.

Dellene Church

You did hold out as long as you could until you felt you were forced, or you were going to lose your job.

Krista Hamilton

Yeah, I was hoping they would roll out an exception, or that you didn't have to have one to go back. And they didn't. I went on my very last day that I could to have my second vaccine. So I waited as long as I could.

Dellene Church

Okay. And how did you react to those vaccines?

Krista Hamilton

The first vaccine, I had zero symptoms. And the second vaccine: on my second day, I started to have chest pain, and I couldn't inhale all the way. I couldn't get out of bed without help.

Dellene Church

You were immobile? You couldn't move all parts of your body, or a portion?

Krista Hamilton

I couldn't move, like, my torso. So if I was in a standing position I could walk slowly, but I couldn't move my torso. At all.

Dellene Church

Okay. And at that point did you seek medical care?

Krista Hamilton

Yes. I went directly to the ER. From there I had a bunch of tests, and they thought I could have the beginnings of pleurisy or indigestion. So they told me to go home and rest for five days because all my tests panned out okay.

Dellene Church

Okay.

Krista Hamilton

I think I had vitals, x-ray, and of your basic stuff. And the ER doctor wasn't really sure, she said.

Dellene Church

They were aware that you had recently had the COVID vaccine, your second?

Krista Hamilton

Yes.

Dellene Church

And they made no link between your symptoms and that vaccine 24 hours before?

Krista Hamilton

No.

Dellene Church

Okay. So you went home for your five days of rest. How was that?

Krista Hamilton

I mean, I was in a lot of pain. I was shallow-breathing for three days, in and out. When I inhaled, it felt like sharp stabbing pain in my chest—upper chest—so it was really hard to inhale. I was fine when I exhaled, but just, each breath hurt. And it took about four to five days to go away.

Dellene Church

And what about your ability to move, did that improve?

Krista Hamilton

It did. For three days, just from standing to sitting, or sitting to standing, or getting in and out of my vehicle was very, very difficult without feeling a lot of pain.

Dellene Church

Okay. And were you developing any other symptoms during that time?

Krista Hamilton

Well, I developed— My voice, as you can hear, I lose my voice a lot, and I have to clear my throat often. And I also have a dry cough with that.

Dellene Church

Okay. And did you have any mental symptoms?

[00:05:00]

How was your energy level?

Krista Hamilton

Well, mentally, I was okay. I just was a little scared of the unknown, like what was happening, because I've never had those symptoms before. Also, just the house-cleaning or mowing my lawn—I felt like I couldn't do a whole lot. I had to stop and take lots of breaks, whereas before, I felt I could do quite a bit, whether it was mowing the lawn or house-cleaning or whatever I was doing.

Dellene Church

Okay. And you're a mother, and you work full-time, and before this you were doing all of those things without problem.

Krista Hamilton

Yes.

Dellene Church

So after five days, things had improved some. You still had symptoms. What did you do from there?

Krista Hamilton

After five days, I started to feel better. I could move my body. But I was still having sharp, stabbing pains in my upper chest, in my left side. So from there on, I had a second— About four weeks later, I had another attack similar to this one. Went in for a second visit to the ER and they thought I had a blood clot, which, turns out, I didn't. And they sent me home and told me I had a pulled muscle, to rest for five days.

So I went home, I rested, started to feel better, but then the pain continued after that. Like, just randomly, and 4 minutes to 20 minutes at a time. But nobody could really explain it.

Dellene Church

Okay, and were you able to return to work during this period of time?

Krista Hamilton

Yeah, after about a week I returned to work. And then I did a follow-up call with my doctor. When I went in to see my doctor, he told me the x-ray for my second ER visit showed spots on my lungs on my x-ray. And he sent me to a lung specialist, which showed it led to sarcoidosis. So I was diagnosed with that.

Dellene Church

And can you tell us what sarcoidosis is?

Krista Hamilton

Actually, it's like an inflammation. I think it, well, it's spots on your lungs. I have nodules or spots on my lungs, they call it. I have several tiny spots and two larger spots.

Dellene Church

And are you being treated for that condition?

Krista Hamilton

They said eventually I could take prednisone, I believe it's called. I said no to it at first, but I think they're just going to keep an eye on me to see if I need it in the future.

Dellene Church

Okay. And still no connection made by medical that this may relate to your COVID vaccine?

Krista Hamilton

No. Nobody said anything. No.

Dellene Church

So also, then you were never provided any information on how to report what you thought had caused this or make any claim for compensation?

Krista Hamilton

No.

Dellene Church

Okay. Do you have anything else you want to add about your diagnosis and your condition, how it is now, and your treatment with the health system?

Krista Hamilton

I just found it really funny that—I did have asthma prior to my vaccines. But I just found it really odd—I was stopped in my tracks, or it wakes me up from my sleep; even a year later I still feel the effects—that no one can really say why. Maybe it points to sarcoidosis, but I don't know.

The other thing I had was eye inflammation for four months after my second vaccine, which—I don't know if it's related. Often, I have shortness of breath, even after taking my regular puffer. But I just can't explain this sharp stabbing pain and not moving my torso, which is really scary. So nobody can really explain that to me.

Dellene Church

And your pre-existing conditions with the allergies and asthma, have those worsened as well?

Krista Hamilton

I would say, I can't really tell if the— Because I take a puffer once or twice per day.

[00:10:00]

I would say shortness of breath has worsened, and just the random sharp pain that I feel, and just being tired. So those three mainly.

Dellene Church

Now, you also had a son that had an adverse reaction that required hospitalization. Do you want to talk about that?

Krista Hamilton

Yeah, so my son Liam, who was 21 at the time: he took Moderna. So his second shot of Moderna, he, I guess, was having heart pain and he went into the hospital. He ended up in Halifax—the QE2—for a week because his enzyme levels were really high.

So yeah. They did believe it was the shot and told him not to take any more. They advised him that. There's not much I know about that because he— Yeah, I don't really know much, but he was on three months of medication. It was called Colchstream, C-O-L-C-H-S-T-R-E-A-M.

Dellene Church

That was the medication?

Krista Hamilton

Yes. So they prescribed that for three months. And then he went off it. And he had a follow-up and I think that was about it. They kind of released him.

Dellene Church

And what was his diagnosis?

Krista Hamilton

Myocarditis.

Dellene Church

Okay. And they did, in his case, admit that was directly related to the COVID vaccine?

Krista Hamilton

They did. Yes.

Dellene Church

Okay. And was he provided with any information on how to report that, or make a claim for any compensation?

Krista Hamilton

That I'm not sure of.

Dellene Church

Okay. And another unfortunate instant related to COVID you had was your father passing away.

Krista Hamilton

Yes.

Dellene Church

Can you tell us how COVID impacted that?

Krista Hamilton

At the time, the nursing home here in Nova Scotia that he was at— It was December of 2020 and so each patient had two caregivers. I was one and my mom was another. My brother at the time was working in Winnipeg.

They told us my dad had less than a week left before he passes. My brother flew home from Winnipeg and he had required permission to see his father: a letter to get into the nursing home. So he got the letter. I think he arrived, went in, and then after he'd seen my dad and said goodbye, my dad was alive for another six days, and he was not allowed to go back and see him.

Dellene Church

Okay. And it wasn't like he was easily admitted to say goodbye to your dad. Is that correct?

Krista Hamilton

Yeah. They told him he had to quarantine for 14 days after seeing my father because he flew back as an essential worker.

Dellene Church

And did they also firstly try and prevent him from coming in because he was not one of the two designated caregivers?

Krista Hamilton

Yes.

Dellene Church

And he just ignored that and decided he was going?

Krista Hamilton

Yes.

Dellene Church

So what do you think could've been done better in your situation, your son's, your dad's?

Krista Hamilton

I think for myself, who— I didn't want the COVID shot— Even though I have four kids and they're all vaccinated, all the way to 18. But for me personally, I did not want the shot and I feel like I should've had the choice. And continue to work if I didn't have it, and just wear all the precautionary measures.

For my son, he just wanted the shot. So definitely his choice.

And as for my father, I just think that, if someone is dying and it's their last days— I think family—all family—should be able to go in. Especially immediate family.

Dellene Church

Right.

Krista Hamilton

I think that was very unfair.

Dellene Church

And with your son that had the reaction,

[00:15:00]

you said it was his choice. Do you know what his choice was based on?

Krista Hamilton

I don't. I mean, he did his own research. I don't know where he found his information, but I think that he chose to do it because he was around his grandparents a lot and he didn't

want to make them sick. So I think he was thinking of his grandparents more so than himself.

Dellene Church

And was he working or attending post-secondary schooling that also required that?

Krista Hamilton

No. He was working from home. He lives on his own so— At the time. But he was really afraid, because of what he heard in the news and whatnot, that he would make his grandparents sick. So he chose to get it.

Dellene Church

To protect others.

Krista Hamilton

Right. Yeah.

Dellene Church

Is there anything else you'd like to add before I turn it over for questions from the commissioners?

Krista Hamilton

No.

Dellene Church

Okay.

Commissioner Massie

Well, thank you for your testimony. Can you clarify something for me? You said your four kids are vaccinated. I'm wondering: Were they vaccinated after you've learned about your adverse effect or before?

Krista Hamilton

Oh no, I'm sorry. I should clarify. My children are— So I have three over 20 that live on their own. And then I have a daughter who was 15 at the time. She wanted to get her vaccine. Myself and her father told her to wait a few weeks to learn more about it. We provided her with information. She still chose to get her vaccine, but this was all before I had mine. And she chose to get it.

As far as my other three, they went and got it, so there's nothing that I can do. But they didn't learn about my symptoms and what happened to me until after they got theirs.

Commissioner Massie

So did they believe that you were actually injured by the vaccine, or are they not sure?

Krista Hamilton

I guess they weren't sure. Yeah. But I did feel like, within two days of me taking the second vaccine, I felt like it wasn't an allergic reaction. Like it was something more.

Commissioner Massie

Thank you.

Dellene Church

On behalf of the National Citizens Inquiry, I'd like to thank you very much for your testimony today, Krista.

Krista Hamilton

Thank you.

[00:18:13]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 12: Bridgette Hounjet

Full Day 2 Timestamp: 09:36:28–09:56:34

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Louis Browne

Good afternoon. Can you please state your name and spell your last name for us?

Bridgette Hounjet

Bridgette Hounjet: H-O-U-N-J-E-T.

Louis Browne

Ms. Hounjet, would you prefer to swear an oath or solemnly affirm?

Bridgette Hounjet

Oath, please.

Louis Browne

Do you swear that the testimony you are about to give in this National Citizens Inquiry will be the truth, the whole truth, and nothing but the truth?

Bridgette Hounjet

I do.

Louis Browne

Ms. Hounjet, what city or town do you reside in?

Bridgette Hounjet

Saskatoon.

Louis Browne

Okay. And how long have you lived there approximately?

Bridgette Hounjet

About 20 years.

Louis Browne

And I understand that you worked as a federal public servant. Is that correct? —Sorry, can you say that again?

Bridgette Hounjet

Yes.

Louis Browne

Okay. Thank you. And how long were you so employed?

Bridgette Hounjet

It's been— Going on sixteen years.

Louis Browne

Okay, and are you still so employed?

Bridgette Hounjet

Yes, I am.

Louis Browne

Okay. Ms. Hounjet, in your own words, please tell us from start to finish what brings you to the National Citizens Inquiry, and then we'll ask some further questions after that. The floor is yours.

Bridgette Hounjet

So I guess my story starts— I gave birth to my son in 2019 and so I started maternity leave August 2019. And things were great on maternity leave. Come March 2020, the world starts going in a bit of a panic. We don't finish the first swimming lesson. That's kind of when things started to happen: March 2020.

And then fast-forward to August 2020, when it's time for me to return to work. And my first day was— Already, at that time, they had started working from home, so I went into the office to pick up my laptop and kind of ease back into work, and catch up on a bunch of emails and that sort of thing. And then proceeded to work from home from there.

There was not really too many rules in place. We were supposed to stay under a certain capacity in the building. We weren't forced to work from home, we weren't forced to go in the office. Just that we couldn't be more than a certain amount in the office. I personally

chose to work out of the office full-time. I was pretty much the only one who chose that. And then others would just come in as they needed, to do certain tasks or that sort of thing. And then, I believe, that went on for the rest of 2020.

And then kind of at the beginning of 2021, the guidelines were changing, that sort of thing. Masking came into place when you were in the office. And then we were going to start setting up a schedule to do a rotation in the office. Half of us would work from home and the other half would work in the office. And we would kind of do a rotation every month just to kind of allow equal workload type of thing, as only certain duties could be done in the office. So just to kind of share those tasks, that sort of thing.

We did that for a while—well, working from home in general for a year. And then there was some chatter about—as the vaccines were being developed—that there was a possibility that they would be mandated in our workplace. And that’s when my anxiety started to go up. Because I knew, just the little bit I had read and I continued to read, that that wasn’t something I was ready to rush into. There were things unfolding, information was still coming out.

For me, there were a lot of red flags just surrounding the vaccine, so it was certainly something I did not want to rush into, but there came a point where my employer was mandating these vaccines.

I think that came into play, I think, October 19th—somewhere around there.

[00:05:00]

The rules came out that we needed to “attest” to our vaccination status by a certain day and—sorry, my memory on dates is not great, but somewhere around there—there was a date in October that we needed to attest. And from there, there was about a— If you weren’t fully vaccinated or if you did not disclose your vaccination status, you had about two weeks to either get vaccinated or submit a request for accommodation.

Now the request for accommodations were based on either a medical exemption, or a religious exemption, or a human rights violation essentially. I knew I there was medically nothing that would stop me. I knew and I had heard, you know: doctors weren’t just giving exemptions medically willy-nilly, so I knew that that was going to be impossible.

Religious? Yes, I do have a faith background, but there was nothing there that I felt I could work with.

Human rights? I had little knowledge to how that all really worked, but I tried. I tried to go with a human rights discrimination, and so I put in a request for accommodation for the human rights ground of sex: being a female and I had not ruled out having more children. And prior to having my son, I had suffered a miscarriage. So for me, there was nothing that I wanted to do to my body not knowing how it could affect my body. I didn’t want to take a chance that— If I did choose to have another child, I did not want to take the chance that something I inject in my body could have a negative effect. So that is the route I chose to do: discrimination against sex. And, honestly, reading the human rights, and kind of how it’s laid out, I was pretty certain that that’s not what they meant by “sex discrimination,” but I tried because what do I have to lose to try?

So I tried, and I sent my request for accommodation to my manager. It had to go through a process and it then had to go to nationally for the committee to review and that sort of

thing. In that time frame, while it was being reviewed, we continued to work from home, work from the office. And it was taking a little bit longer than anticipated to get a response. It was going to be in December 2021: my turn to work out of the office.

At that time—as the vaccine mandates had come into play—they requested that I test: do rapid tests three times a week, Monday, Wednesday, Friday. Didn't matter if I was at work or not: Monday, Wednesday, Friday I had to test. And I didn't have to show the result. I just had to text my manager and give the result. So I did it! Because—yeah, I did it—I wanted to keep working. I love my job and I wanted to keep working to support my family. So I did it.

And on December 23rd, I got a response that my request for accommodation was not supported. So that was a great Christmas gift that year.

On that letter telling me that it was not supported, they gave me till, I believe it was January 5th, 2022 to either change my vaccination status—and they allowed, I believe, two-ish weeks to then again either go get vaccinated so that my status has changed, in that I could go to work, continue going to work—or I would be placed on unpaid leave starting January 19th.

[00:10:00]

January 19th came and I received another letter saying, “You are being placed on unpaid leave.” January 20th: I meet my manager outside our office. I hand over all my work, computer, and that sort of thing. Really felt like a criminal handing over everything; you know, it didn't feel great. And, yeah: I was on unpaid leave for five months, until June 20th, when the federal government decided to get rid of the mandates.

It was really bizarre. I mean, our provincial government had already done away with mandates—I don't remember the exact time, but certainly months prior. So why it took that much longer for ours to be lifted, I don't know. But those five months was the worst time of my life. I was in a really dark place, and it was really hard.

June 20th came around and I messaged my manager saying, “Okay, I see in the media that the federal government is doing away with mandates. When can I come back?” And she had not seen that quite yet. There was no kind of communication that had come out for her to be able to reach out to me first. But anyway—so we made that communication and I did return to work shortly thereafter. I had taken a few weeks off just due to family commitments but I did go back to work.

I am still at work. I forgot to mention: As part of my request of accommodation, I did express to my employer that I am willing to continue testing as I had done—it had been working and there was no reason why all of a sudden it would not be acceptable—or continue to work from home. I was still so very willing to continue working. And it just wasn't good enough, and I was placed on unpaid leave for those five months.

Louis Browne

Thank you, Ms. Hounjet, for that account. I wanted to ask you a few follow-up questions. You mentioned that you put in an application for an exemption and you were denied ultimately.

Are you aware of anyone at your workplace—and I mean, personally aware of anyone at your workplace—who was granted such an exemption?

Bridgette Hounjet

I am aware of one person who was granted a religious exemption.

Louis Browne

And are you able to advise, or do you know, what religion that person belonged to?

Bridgette Hounjet

I cannot 100 per cent say which religion. No.

Louis Browne

Okay. That's fine. I'd like to ask you about— I mean, even though you're back to work now, nonetheless, you were on unpaid leave for a while. How has that affected you still today? In terms of, let's just talk— Let's start with mental stress. How's your mental health doing today, even though you're back at work but yet you had that L-walk?

Bridgette Hounjet

It's not great. I still have a lot of anger and bitterness, resentment. I see my counselor a whole lot more regularly. And I have breakdowns, I would say, quite regularly. I mean the greeter was nice enough to greet me here today and I broke down, so it just it doesn't take much. I break down at work. It's kind of embarrassing, but it is what it is. It's my reality right now. But yeah, my mental health is not great. I'm working on it.

I guess to add to that, in 2021— I play adult rec hockey and I had signed up for the 2021 season and that usually starts in September. I played two games. They made us mask while we played, skated on the ice—it was the worst thing ever—and then shortly thereafter the mandates came into play so my season was cut short.

And that, for me, is a big— That's what I do for my mental health. That's my physical activity to help with my mental health.

[00:15:00]

So that was taken away. So yeah, things were taken away: those kind of supports. But thankfully, between my family and some friends I was able to get through it. But yes, my mental health. And finances— obviously, I depleted my savings to try and support my family during this time. And I continue to have to pay back my pension, some benefits, so I'm still financially hurting from it.

Louis Browne

Thank you for that, Ms. Hounjet. And because the Commission doesn't necessarily know you from how you were before, I just want to be clear: When you say that you break down, and even the greeter was nice and you broke down: just to be clear, that's different than how you were prior to all of this? Can you just clarify that?

Bridgette Hounjet

Yes certainly. I did not break down near as much. I know, after having a child, things—your hormones—are different, so yes. But like weekly, every other day, something triggers me. I

could be driving in my vehicle and tears start flowing. It doesn't take much to— At work, certain conversations will trigger me and I sometimes have to remove myself to go have that moment. And that was not the case before that.

Louis Browne

Thank you for that clarification. Can you advise, Ms. Hounjet: Has this experience impacted your trust in government and public health authorities?

Bridgette Hounjet

Yeah, certainly. I've lost a lot of trust in some of those institutions. Just yeah, simply lost a lot of trust. I question a lot of things—which doesn't feel great to question some of those things you used to place a lot of trust in. But yeah, sadly, I do question a lot of things.

Louis Browne

And how about your impact on relationships and, you know, all manner of relationships—family, friends, workplace. Has this impacted your relationships at all?

Bridgette Hounjet

Yes, it certainly has. As I explained, I have anger and sometimes—unfortunately—that gets taken out on my family, my close friends. When you have your friends and family tell you that you're different, that you've changed, it's hard to hear.

Louis Browne

You're doing great and we're almost done. Let's just hang in there. At this point, I just want to invite the Commission members if there are any questions.

Two more questions, Ms. Hounjet. And for those who have been around a while, they know what they are. In summary, in about 60 seconds or so: What would you like this Inquiry, and Canadians at large, to take away from your evidence today?

Bridgette Hounjet

I guess, and I was one of these people, like: Read for yourself. Do the research. Be open to other views. Don't just be quick to take what is thrown at you through media, or friends or family even, for that matter. Sadly, until it affects you directly, we don't fully understand. It's hard that it has to get to that point. But just have an open mind, and let's be there for one another, so that we don't repeat this sort of thing.

I think of myself as a high-functioning person in life. If it has affected me this much as a high-functioning person, I can't imagine those who were affected medically and in other walks of life. I can't imagine what our society as a whole is going through. And let's try and move forward in a positive direction and not let this happen again.

Louis Browne

Thank you for that. Last question: Is there anything else you'd like to share with us today?

Bridgette Hounjet

I don't think so. I just want to thank everyone. This, for me, is part of my healing—to be able to tell my story. So I thank everyone for being inviting, welcoming, and open to hear my story.

Louis Browne

On behalf of the NCI, we thank you very much for your evidence today. Thank you.

Bridgette Hounjet

Thank you.

[00:20:06]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 13: Kelcy Travis

Full Day 2 Timestamp: 09:57:07–10:07:47

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Wayne Lenhardt

Kelcy, could you give us your name, please, and then spell it, and then I'll do an oath with you.

Kelcy Travis

My name is Kelcy Travis, K-E-L-C-Y T-R-A-V-I-S.

Wayne Lenhardt

And do you promise to tell the truth today, the whole truth, and nothing but the truth?

Kelcy Travis

I promise, I do.

Wayne Lenhardt

Thank you.

Due to the late hour, I think I'm going to lead you a little more than I might otherwise. You suffered certain negatives because of the COVID situation. Could you go back and tell us when it started, and perhaps tell us what financial impact it had on you, as well as on your children.

Kelcy Travis

Absolutely. I have six children. We're a blended family. We had our daughter in December 2019. I believe we had a COVID infection. I cannot prove that, but I believe we had a COVID infection in the hospital. At that time, I was then pregnant again and I had our son in 2021.

Being pregnant through this and seeing some of our systems from a different angle has rocked my world forever. I won't ever be able to look at things the same, because I saw evil and I saw corruption, and I saw a lack of transparency and accountability at all levels. The voice that I sent you, my story, I sent across the world. I sent to the United States; I sent to Dublin; I sent to municipal, provincial and federal levels; I sent to the Minister of Government Relations and I was ignored.

I was told it would be better by the end of the year.

I was unable to watch my son Archer in taekwondo. Because I was pregnant and nursing my other son, so I had to make that choice, and I wasn't allowed in recreational facilities.

Wayne Lenhardt

So you did not get the COVID shot.

Kelcy Travis

I did not. My OB-GYN, at the beginning, told me she understands why I can't trust the science because it is too new. Halfway through my pregnancy, I was told by Public Health, as I was there with another, older child for an immunization, that I should get the COVID vaccine that day, but I would have to sign a waiver. I'm experienced with non-profits and waivers, and I know when someone's trying to indemnify themselves and that sent off every warning flag in my body. My partner did get the vaccine because his grandma was dying. So he got two doses of the Moderna vaccine and I'm still scared for him because I can't lose him.

What I've seen—the good and bad in humanity—has shaken me forever and I can't unsee what I've seen.

Wayne Lenhardt

Okay, so you weren't able to attend your child's activities and you didn't want to take the vaccine because you were pregnant. And that had an impact on your ability to earn?

Kelcy Travis

Yes. During COVID, my work was basically shut down. So to try to get maternity leave, I had gotten another position in a similar field. And I was so scared, being eight months pregnant and training and going out into the community, and I kept seeing all the articles from Ottawa of these pregnant women in ICU. I knew I was making the right decision, but I was still scared for myself and my baby. And after I went through all the training and did a skin test, then they put a vaccine mandate in place at the job that I had started,

[00:05:00]

so I was never able to get my hours for maternity leave.

The last four years have been extremely difficult in all senses—not just because of COVID, but largely. And I didn't realize how much I needed people. I didn't realize how depressed I was.

Wayne Lenhardt

And you have a fairly large family. So you weren't able to attend your child's activities, to begin with—

Kelcy Travis

No, and we were one day away from eviction. My partner got laid off and my work refused to give me shifts. I was testing once a week, on Monday, at one of my positions. But what if I got it on Wednesday and carried it through the place? It didn't make sense to me.

Wayne Lenhardt

Were you able to go to medical appointments with your family?

Kelcy Travis

No, my partner missed the ultrasounds. And I thought, you know, I'm not a new mom; I'm not a first-time mom. I felt really bad for the first-time moms that didn't get to experience their pregnancy in the way that they should have.

Wayne Lenhardt

Were medical and health appointments a problem?

Kelcy Travis

Yes, they were missed. If they were non-emergent, we weren't to bring them in, and I'm still dealing with cavities and things that wouldn't be there if I would have been able to take them in. And a cavity is small, but all these things add up.

Wayne Lenhardt

Did you have any problem getting maternity leave while you were pregnant?

Kelcy Travis

I did not get it. I didn't qualify for even the reduced hours, because of the vaccine mandate coming into effect at the new job that I had found at eight months pregnant.

Wayne Lenhardt

Did you consult your doctor about getting the vaccine, and what did he say?

Kelcy Travis

I didn't. I had had family who had consulted our doctors, and I pretty much knew it would be a losing battle for me, so I just stood my ground and I just waited it out.

Wayne Lenhardt

When were you able to get pretty much back to normal?

Kelcy Travis

Now.

Wayne Lenhardt

Have your children—are they behind in school in any way?

Kelcy Travis

My son Archer was about to start kindergarten, so that's why I put him into taekwondo, so he had some form of socialization outside of his sibling interactions. And that was really good for him. And the day that I was first able to go watch him. I cried in that gym to be able to see him and have our other son, Atlas, in there with us.

This picture I just found last night and my 10-year-old drew this. One house is like a happy house and the other house, in the smoke, it says "Alone." And she is 12 now and she's suffering because she's so social. I homeschooled multiple children because I was scared of them getting sick. When I did get COVID, I thought I was going to die. I had to do my will quick. I was going to leave my babies without their mom. I was so scared, and I think they used our hearts against us.

Wayne Lenhardt

I think I'm going to ask the commissioners if they have any questions at this point, then I'll come back and wrap up. Are there any questions, Commissioners? No? If there's anything that you could change about the COVID situation you went through, what would it be?

Kelcy Travis

It would be to have some accountability and some transparency at every level. In all of our institutions, at all of our workplaces, that's what we deserve. We pay the bill. In more ways than one, we pay the bill.

Wayne Lenhardt

On behalf of the National Citizens Inquiry, thank you very much for your testimony.

Kelcy Travis

Thank you for letting me speak.

[00:10:40]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 14: Chantel Barreda

Full Day 2 Timestamp: 10:08:30–10:22:21

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Wayne Lenhardt

Chantel, if you could give me your full name and then spell it, then I'll do an oath.

Chantel Barreda

My name is Chantel Kona Barreda. So my first name is C-H-A-N-T-E-L, middle name K-O-N-A, last name Barreda, B-A-R-R-E-D-A.

Wayne Lenhardt

Okay. Do you promise that the testimony you'll give today will be the truth, the whole truth, and nothing but the truth?

Chantel Barreda

Absolutely.

Wayne Lenhardt

You were teaching at an Indian band in Lac La Ronge, I think, prior to COVID and then as it came on. Could you tell us what happened at that point?

Chantel Barreda

At the time when COVID began, I was teaching Grade 7. And we all had to go online. We finished the year kind of like that, doing homework packages and home visits. And then, at the beginning of 2021, we were back in the classroom and we had barriers, which were flimsy plastic. We had to wear masks and try to stay six feet apart. But if you know kids, that's not going to happen.

So things are going pretty good and then I got an email—well, all of us got an email. It was sent out on September 14th saying that they had a new vaccine passport mandate and that

it would be effective on September 20th. So we had six days to get all of our ducks in a row. The policy stated that if you did not get vaccinated, your employment would be terminated. And that's what happened to me.

Wayne Lenhardt

Did they give you a time period to comply?

Chantel Barreda

Oh, they did, yes. I was given until October 18th to comply with the mandate, but I was not planning on getting vaccinated because I felt that it was an experimental procedure that wasn't a real vaccine. I like to do research, so I just noticed that the definitions started to change with what a vaccine is. Anyway, so things started to change and I thought, "Well, that's weird." And then— Oh, shoot, I lost my train of thought.

Wayne Lenhardt

Correct me if I'm wrong, but I think your last day of work was September 17th.

Chantel Barreda

Right. My last day of work, physically, was September 17th. The mandate came into effect on the 20th.

So just to backtrack just a little wee bit, my daughter was also attending the school that I was teaching in, so she had just started Grade 7. And so we were suddenly out of a job and out a school as of that Monday.

Wayne Lenhardt

Okay, so you were basically not working after September 17th. Did they call that a leave without pay or was it a termination?

Chantel Barreda

Yes, I was put on leave without pay.

Wayne Lenhardt

Okay. So you were allowed about six weeks or so to comply then?

Chantel Barreda

Yeah.

Wayne Lenhardt

Okay.

Chantel Barreda

I had till October 18th. In that time, I did end up getting COVID—I ended up getting very sick. But somebody saved my life and gave me some ivermectin and I'm here today. I believe strongly that we have an immune system, and a lot of the research was saying that only those really elderly or with comorbidities were really at risk, so I just kind of wanted to trust that.

Wayne Lenhardt

It was in October—I believe, October 18th—

[00:05:00]

that you received a letter saying that they had terminated you, or you lost your job, something along that line.

Chantel Barreda

Yeah.

Wayne Lenhardt

Okay.

Chantel Barreda

I received my termination letter. In the meantime, I started the EI process. I applied for EI. They changed that too, and so I was denied my claim. And then I put in a human rights claim. And I think that was changed too, so that was denied.

Things kept changing, including “the science.” Yeah, so there I was, no job. I had natural immunity because I just had COVID and recovered, and still not able to work.

Wayne Lenhardt

Your daughter was going to that same school that you were working at, correct?

Chantel Barreda

Yes.

Wayne Lenhardt

Okay, and what happened after you were terminated? Did she continue to go to that school?

Chantel Barreda

No. No, so I had to pull her out and I enrolled her in online school. So basically, for the rest of the year, she was stuck in her room by herself.

Wayne Lenhardt

Right. And what grade was she in at the time?

Chantel Barreda

She was in Grade 7. I think our mental health at that point started to decline because I started getting the rejections from EI and the Human Rights Commission, and I started to lose hope.

Wayne Lenhardt

What effect did that have on your daughter?

Chantel Barreda

She became depressed. Well, we got her counseling. I'm not sure if that worked. I don't know.

Wayne Lenhardt

This is when it started that you couldn't go to restaurants or various stores if you were not vaccinated. Is that correct?

Chantel Barreda

That's right. We weren't allowed in restaurants. We weren't allowed in certain stores. I started to get worried. I had to—I enjoy some wine, at times, and I had to get people to go buy me wine.

Wayne Lenhardt

Where, physically, were you in the province at that time?

Chantel Barreda

Yes, I was in Saskatchewan.

Wayne Lenhardt

Did you try to get another job at that point?

Chantel Barreda

Oh, yeah. I was applying for jobs anywhere I could. One thing: when you're applying for jobs in education, if you're applying for a job at a bigger school division, you have to fill out—I think it's a 26-page online form, it's called AppliTrack. There is a section in there, and it asks if you have ever lost your employment. And I have to say "Yes" and then I have to explain why. There's a little box there where you have to explain why. And I feel like once they see that—that I'm unvaccinated—that I'm discriminated against.

Wayne Lenhardt

What qualifications do you have in teaching?

Chantel Barreda

I have a Bachelor of Education and a Master of Education, which I just received.

Wayne Lenhardt

And, I presume, a teaching certificate from Saskatchewan?

Chantel Barreda

Yeah. Yeah, I've got a valid teaching certificate. No criminal record.

Wayne Lenhardt

And with those qualifications, you're still having trouble?

Chantel Barreda

Yeah.

Wayne Lenhardt

Okay. What about health issues?

Chantel Barreda

I think the biggest thing is mentally. I feel like I was getting into quite a depression. I felt isolated, I felt alone. I lost friends. My relationships with so many people changed and disappeared, and it was a very lonely time.

Wayne Lenhardt

Okay. Did you get any kind of employment at all after you were terminated?

Chantel Barreda

Yeah, I did get a job, and I didn't have to disclose my whole medical history.

Wayne Lenhardt

Was that a permanent or part-time job?

Chantel Barreda

No, it's like a temporary contract, yes.

[00:10:00]

Wayne Lenhardt

Okay, so is it fair to say you were largely unemployed after this happened?

Chantel Barreda

Yeah, I've been unemployed. Except for last summer, which I was going to school.

Wayne Lenhardt

And is your daughter's mental outlook still rather dark, or has it improved?

Chantel Barreda

She's back in school, physically, and she's doing better. She's not stuck in her room day after day. And she's got friends, so things are improved.

Wayne Lenhardt

Okay. Are there any thoughts you would like to leave us with respect to this whole scenario, and how things could have been better?

Chantel Barreda

For sure. The first thing is: When I tried to talk to my Chief and Council about what was going on, I got blocked and ignored. And I don't think if you're in a position of leadership that that's appropriate.

I would like for people to use their critical thinking skills and to stop being afraid to stand up for what's right. I try to teach my daughters to stand up for what's right.

And one other thing is that I tried following the science, but it led me to the money. And, so I just want to leave with Mark 8:34-38, which is: "For what shall it profit a man, if he shall gain the whole world and lose his own soul."

Wayne Lenhardt

Okay, I'm going to ask the commissioners if they have any questions now, and then I'm going to come back and I'm going to go through the documents that you're going to leave with the Commission in case they're useful.

Chantel Barreda

Okay.

Wayne Lenhardt

Okay. Any questions from the commissioners? Okay, I think that's a no.

Okay, you have given me some documents, which I'm going to leave with the Commission. They include, on Lac La Ronge Indian Band letterhead, and you've labeled it "new policy," given to you on September 14th, 2021. And it's entitled Workplace COVID-19 Vaccination Passport Policy. You have some correspondence relating to your request for an exemption with HR. There's a Notice of Liability that you gave to your employer back then. There is a *Public Health Act* and affidavit—it's a Xerox of part of the *Public Health Act* and your affidavit with respect to vaccination. There is a Saskatchewan Human Rights complaint relating to violation Section 13.1, the right to education. There is your complaint form to the Canadian Human Rights Commission. There is your Termination of Employment letter

from the Lac La Ronge Indian Band. There's your Record of Employment from Service Canada, which you would need for unemployment insurance, and there's your Witness Release form. So those I will hand over to the Commission on your behalf [no exhibit numbers available].

On behalf of the National Citizens Inquiry, thank you so much for your testimony today.

Chantel Barreda

Thank you very much.

[00:13:51]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 15: Lee Harding

Full Day 2 Timestamp: 10:22:21–10:47:10

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Shawn Buckley

So we'll call our final witness of the day, Mr. Lee Harding. Lee, can you please state your full name for the record, spelling your first and last name?

Lee Harding

Lee Andrew Harding, L-E-E H-A-R-D-I-N-G.

Shawn Buckley

And, Lee, do you promise to tell the truth, the whole truth, and nothing but the truth?

Lee Harding

Yes, I do.

Shawn Buckley

Now my understanding is that you have a Bachelor of Arts in Journalism from the University of Regina.

Lee Harding

Yes.

Shawn Buckley

You have a Master's degree in Public Policy from the University of Calgary.

Lee Harding

That's true.

Shawn Buckley

You interned as a reporter for CBC and then CTV in 2004 and then worked as a casual reporter and cameraman for Global.

Lee Harding

That's right.

Shawn Buckley

You are a research fellow with the Frontier Centre for Public Policy.

Lee Harding

Yes.

Shawn Buckley

And you're a regular contributor to *The Epoch Times* in Canada and also *Western Standard* online.

Lee Harding

Yes.

Shawn Buckley

Now, my understanding is that you had an interesting experience as a reporter during the COVID-19 pandemic, where you got to know our law enforcement people a little better. Can you tell us about that?

Lee Harding

Sure. There was a freedom rally in Victoria Park in Regina and I was there covering it as a journalist. I got in there a bit late in the event and heard Laura Lynn Thompson's speech and then they were walking away, her and other speakers, to travel together—I believe it was to Saskatoon because there was going to be a similar event that immediately followed. So I did an interview and talked with them as I was walking in that direction and the police were there at the parking lot of the Hotel Saskatchewan to issue tickets. So Laura Lynn Thompson got one, Maxime Bernier received a ticket, Mark Friesen did, and R.B. Winteringham did as well.

Shawn Buckley

Right. And what was the amount of the ticket?

Lee Harding

It was \$2,800. And I think they had actually increased the amount that they were eligible to receive just shortly before the event. It was a little bit of management—I think politically probably more than health-wise. And at the time, there was no outdoor gathering of more than 10 people that was allowed. So the entire gathering was against the public health regulations.

Shawn Buckley

Right. But my understanding is that you had identified yourself as a journalist.

Lee Harding

Yes, I did. I spoke to them. And—

Shawn Buckley

Can you tell us about this? And the reason why this is important is because the police are— Their attendance, it's more than 10 people by them attending there. I would assume that journalists are allowed to go and report on things that are happening that are important to the public. So I actually think it's important for you to share this part about you being a journalist.

Lee Harding

Right. I had said to them, "I'm a journalist and I'm covering this as a journalist. I want to know, if I go back there, if I'm going to be ticketed." And I received an indirect answer. They said, "Well, you probably shouldn't go back there." So as everyone had left, I heard a rapper who was performing there. And I thought, I want to interview this guy. So I walked back into the park, talked to him after his performance. I had an idea for a photo because Victoria Park is right at the edge of the Towers downtown. I thought I'd take a picture from below. It'd be a nice backdrop for his image, an urban image in behind.

When we got to the edge of the park, that's when the same policeman who had been there with his partner at the Hotel Saskatchewan parking lot served me a ticket and he also served the rapper a ticket. I was upset because I said, "Look, I'm very clearly here for this reason and I made that plain to you." And that didn't make any difference. I'd had some people say to me later, "Well, if you were with CTV or Global, they probably wouldn't have done that." And I tended to think they were right. But maybe they thought, "Well, maybe you're activist media, maybe you're part of what's encouraging this." I really don't know, but I got a ticket for \$2,800 as well.

Shawn Buckley

So you're just raising an interesting point. Because, just at the back of my mind, I seem to recall a Rebel News reporter being arrested or ticketed maybe in connection to the trucker protest. Are you aware of anything like that or am I—

Lee Harding

That kind of rings a bell. I think that happened. I mean, we saw lots of double standards with all of this. You know, if it was the Black Lives Matter Protest, everyone's there

[00:05:00]

and they're all— They're not social distancing. But if it's anything else, no. I mean, some things got a complete free pass and others got the full brunt of the law, whether it was reasonable or unreasonable.

Shawn Buckley

And just because there would be a lot of people watching this internationally, who won't be aware of when the Black Lives Matter protests were happening in Canada. But they were basically happening around the same time as freedom protests.

Lee Harding

That's true.

Shawn Buckley

And so just for the international community, so the Black Lives Matter— You could have large protests. We had Mr. Abbott, I think it was, who was an Edmonton police officer, a commissioner at the time. And he entered an exhibit literally, of Edmonton police on their knees saluting the Black Lives Matter protesters. Nobody's getting arrested or ticketed but, if you had the next day a freedom protest, people are going to be getting ticketed or photographed and ticketed later.

Lee Harding

Oh yes, we saw the Premier of Ontario and the Prime Minister—lots of public figures that were involved in this, getting on the bandwagon.

Shawn Buckley

You seem to be suggesting, perchance, that there was a double standard, I think you even said that. Are you aware of any mainstream media people, CTV, CBC, any reporter such as that being ticketed or arrested?

Lee Harding

I'm not aware of any that were. I just think that's something they probably wouldn't want to do because they know how bad that is. But I think there was a perception that the alternate media was something else.

Shawn Buckley

Okay. We all had different things that we became concerned about. You became concerned about contact tracing. Can you share first of all, again maybe perhaps for the international audience, what we're referring to and what your actions were?

Lee Harding

Sure. In this province they had something going where if you went to the restaurant, not only was the capacity limited but you had to be socially distanced and the tables were apart and you couldn't have more than four at a table, which was sort of inane because as if we wouldn't breathe each other's air as we walk out the door. This was silly but, anyway, we're all doing this. But they also had something where they said you have to write down everyone who's come and their phone number and maybe their email so that you can contact them. So that if anyone had a COVID case, we could go back and track all these people. Which to me was very overbearing. This is more of the realm of a totalitarian state and a surveillance society. And that was one thing that I actually did talk to the Premier's office about, to express my displeasure with the way this was being done. I remember one

time though at a McDonald's, I was sitting there and the lady took her obligation, "What is your name?" I said, "I'm Dr. Shahab." "Oh," she says, "And what is your phone number?" "It's 306-555-1212." So sure, if you have all these spurious test results, where they're cranking up the PCR cycle so high you could find anything in anyone. And then what? We're going to be found, "Oh you were there when someone had it, now you're all locked down." This was a complete joke. And of course she knew that I wasn't Dr. Shahab so I'm not really deceiving anyone. Everyone just going along doing all these silly things that we were being made to do.

Shawn Buckley

And just for those that aren't in Saskatchewan, Dr. Shahab was the public health officer.

Lee Harding

He was the public health officer [Chief Medical Health Officer] in this province, yes.

Shawn Buckley

Now, I want to switch to experiences you had in trying to get stories out during the COVID pandemic. And my understanding is that you made some early attempts—early on, as the pandemic is unfolding and the vaccine is rolling out—to warn about the vaccine. And can you tell us what your experience as a journalist was? And then I'm going to ask you as you might as well answer too, if that ever happened to you before on any other topic?

Lee Harding

Sure. I had a YouTube channel and there were some reports coming out very early that there were some very adverse reactions to this vaccine. That did not surprise me because we had some people that were warning of such and those people were getting suppressed and dismissed and censored and everything else. So many people didn't get to hear about them. Well, somebody compiled a whole lot of public accounts of this—so this was social media postings, people telling their stories, it was some articles that did make either the alternate press or perhaps even the mainstream press in some places in the world—and put them all together. I did nothing but read them online for three hours. And I didn't even get through them all.

[00:10:00]

That site was taken down. I cannot recall to you right now what it was. My YouTube posting was taken down. The thing that was really astonishing to me was, some people went through some absolutely horrible experiences with their first shot and they were still thinking about taking another one or saying, "I'm going to get the next one, but I sure hope it's not as bad as this." I couldn't believe that people would keep going when it was so plainly evident in their experience how risky it was for them.

Shawn Buckley

And I'm sure they would say they weren't anti-vaxxers also.

Lee Harding

Oh, there's lots of labels going around.

Shawn Buckley

Early on, you were also trying to get some stories published about the testing on the vaccine. What happened with that?

Lee Harding

Well, I had an article early on that was talking about how the process was rushed; it wasn't as thorough as it should have been; that the mRNA technology had not really been used in a mainstream vaccine and there were a number of problems with it. I had an article that I tried to submit to Frontier Centre first. And the feedback that I got, and I don't know if this was internal feedback or if it was people within the circle of an organization that they drew upon to assess submissions that were made, because I was writing policy commentaries, but there were three sources there that were dismissed. One of them was RFK Jr., Robert F. Kennedy Jr. He was dismissed as a legitimate source because he was an anti-vaxxer. Another one was RT.com, which is Russia Today, and they said, "Look, this is a Kremlin disinformation site." Well, the doctor who had submitted this article was Malcolm Kendrick and Malcolm Kendrick had a column in *The Guardian*. And so for whatever reason he couldn't get this printed in *The Guardian*. Russia Today would print it, so they did. There was a third one, Michael Yeadon, and they said, "Well, he's an anti-vaxxer." Michael Yeadon was the V.P. of Science at Pfizer in the past. And there's no way you can have that position and be an anti-vaxxer. So you have these authorities that were being dismissed. And I'm happy to say since then, we've run articles on RFK—

Shawn Buckley

I'm just going to slow you down. So you've submitted an article. You're an investigative journalist, you would have done your research. And you're reporting on how this was rushed and about the testing standard. Is that basically what you were writing on?

Lee Harding

Yeah. Now there were aspects, I think, that maybe if I had climbed that mountain a different way, I might have been able to get through. But the problem that we kept having was that everyone who was raising an alarm about this had the Big Tech censorship, had the authorities at WHO and at the FDA and whoever else and Dr. Fauci that were all dismissing them. So now it's hard to get credible voices. You can't get credible local voices because if you spoke out about this you were risking your medical licence and you were going against your board. And a lot of people just wanted to keep their heads down because anyone who stuck them up lost this game of Whack-a-Mole. You stick your head up and this hammer comes.

Shawn Buckley

Yeah, and you're making such an important point. I don't know if you listened to the opening this morning but we were talking about labels and— How we actually had witness after witness after witness yesterday who are clearly concerned about the current COVID vaccines and yet they would volunteer in their evidence, "But I'm not an anti-vaxxer," "I'm not an anti-vaxxer," "I'm not an anti-vaxxer." This concern about that label, I just find it interesting that you mentioned that two of your sources—RFK and then Dr. Michael Yeadon— My understanding is he was V.P. of Pfizer for decades in the U.K., that he would have brought vaccines to market, but because he's now being labeled as an anti-vaxxer, all of a sudden, he's not credible.

Lee Harding

Right, yeah. And so if you ever took a surface kind of view of these things, that's what you would get. You would Google it, you'd see this person's name and you'd see a whole page of denunciation. And you would conclude that in the sum of human knowledge, this person was no good. It took somebody who had some discernment or had been exposed to some of the things before the narratives had formed in order to have enough open-mindedness to look deeper to see the other side of it.

Shawn Buckley

My understanding is you also then did a story you tried to get published in the *Western Standard*, where a lady's husband had died within three days of the second Pfizer shot.

Lee Harding

I did get that one in. I wanted to say, with the other one with Frontier that I couldn't run, also *Western Standard* turned it down and they said it "wouldn't be good for our brand." So that's their prerogative, that's fine. When I tried this later story, I did get a couple of stories in.

[00:15:00]

One of them was just as you had mentioned, with this couple in Saskatoon where the wife had deep concerns, did not take the vax. The husband took the vax and he died three days after the COVID shot. I did that story. Then someone else that I had acquaintance with—

Shawn Buckley

Can I just slow you down? Because there's something else important about that story and that's cause of death.

Lee Harding

Oh yes, well—

Shawn Buckley

And so can you share with this? Because, you know, you dug this out as a reporter and I think it's important for you to share it here.

Lee Harding

Sure. The coroner had mentioned that they had taken the vaccine. The emergency people that came to take away the body had mentioned that. But they could not get a doctor to say so. The M.D., their local doctor, said, "I'm going to talk to the smartest person I know about this and see if they think that that's possible, that there's a connection." And the so-called smartest person they know said, "I haven't even heard of any adverse reactions, so no, it couldn't be." And so they went back and she would not attest that it was that. At that point, my interview subject said, "That's when I stopped trying because I knew they were all lying."

Shawn Buckley

Right, okay. And then I had interrupted you because you were then sharing about a subsequent story.

Lee Harding

Sure. So after that, I did a story of a vaccine injury, someone who developed Bell's palsy and that one was acknowledged by the doctors. And then Carrie Sakamoto—that you'll hear from her tomorrow—I talked to her as well and she said to me, "I looked all over and you are the only one who has run a vaccine injury story in all of Canada." So I talked to her but in the meantime something else had happened, where I had tried to do a story for *Western Standard* saying that we should not be vaccinating the under 12s. And how people like Dr. Jay Bhattacharya—I hope I'm not butchering his name—had said that if you looked at the odds, it was worse to take the vaccine than not for the small risk, acknowledged already, of vaccine reactions versus your chance of getting a serious case of COVID.

I was told by the publisher, "Look, I'm not a doctor. I can't have you write a column like that. I don't know how to vet a column like that." And I said, "Well, it's the same way we draw on any other field of experience. We look at the witnesses and see what they have to say. And, is it reasonable? And let the reader decide." So then I had done a story on the— So this was another one and this was a breaking point: where there was a lady in Alberta who could not get a double lung transplant because she would not get the COVID-19 vaccine. I did a story on that and the publisher said, "Hey, I know from experience with my family that you need to have your shots because your immunity is very vulnerable in this transplant. So it's important to have them. So this is not a nothing issue. So find a doctor who will talk to you about this." Well, Dr. Hoffe had gotten back to me finally after an earlier request. I talked to him. I bounced it off of him. He said, "Well, it's absolutely absurd that they're asking her to do this. This is an experimental vaccine." And anyway, the article went up and then when the publisher saw it, he yanked the article. And—

Shawn Buckley

Oh, so the article actually went up?

Lee Harding

Yes, it did.

Shawn Buckley

So we have a retraction here.

Lee Harding

Yes, but I wasn't told that it was taken down. And then I found out and we had a conversation and I was dismissed. I patched it up maybe three or four months later. I'm very proud to be writing for *Western Standard* and for Frontier Centre. We've been able to talk about a wide variety of things, much wider than the mainstream. And I'm just telling you some of the experiences so that you can have a first hand— When the rubber hits the road, how do these things work themselves out? So eventually, actually I did an article on Carrie Sakamoto because her vaccine injury claim was accepted and she's getting some compensation and we ran that story. The reason it didn't run the first time was I was dismissed right then on the basis of the other thing, so that one never got in.

Shawn Buckley

Right, so how long was it that you were kind of dismissed?

Lee Harding

Well, I mean, it was indefinitely. But I made an overture maybe three or four months later. And so what happens now is I'll submit it. Most of the time it works. If it doesn't, I'm not going to put up too much of a fuss. And that's a working arrangement we can handle. The only time I had one lately that was not allowed was in January, when Dr. Fukushima was a Fukushima reactor of his own against the Japanese Ministry of Health.

[00:20:00]

And I ran a story on that and how other Japanese scientists were finding spike proteins in skin lesions of people who had taken the vaccine and had some very strange growths. And I talked to a guest editor and I said, "Is that story going to run?" They're like, "No, they're not going to run that one." And he says, "The same thing happens to me sometimes. There's just some places where they're hesitant."

So journalistic institutions feel they have a moral responsibility. And if their coverage is going to influence a person's choice one way or another, that's something that they think about. The other thing I know from my work with local news is that it's not just that they are a media outlet, they consider themselves a community partner, and a lot of their advertising dollars come from crowns and government organizations, come from unions, and that's in the back of their mind. I remember one time I filmed a nice little event for the kids that SaskTel was putting on and they said, "When the tape is done give it to sales, so maybe they could use it for a commercial for SaskTel." The anchor at the time said to me, "You know, we used to have a brick wall between sales and news and right now, it's paper thin."

Shawn Buckley

Have you done any investigations into the amount of money that the federal and provincial governments and the pharmaceutical companies have spent on the media in the last two or three years?

Lee Harding

Well, the \$600 million of tax relief from the federal government for media institutions is well-known. There was also something called the Local Journalism Initiative that came out around the same time— I think started in 2018. So they will pay local papers through this thing. And I remember one time doing an interview with Brian Peckford and he had been called an anti-vaxxer by one of these Local Journalism Initiative journalists. I think he was writing for the Halifax paper, and it had also run in the *Toronto Star*. And later on, the journalist found the article—it took him quite a few months—and he says, "Hey, you could have talked to me first." And I'm like, "Well, we're talking now, would you like to say anything?" And he says, "No, I'm sure I'd just be speaking the mind of my corporate and government overlords." So he had that sort of sarcastic response. Anyway, there was another exchange and I said, "You may have come by your conviction sincerely." And he responded, "It's not just my convictions, it's the convictions of the medical authorities. And ivermectin is a faux cure and all you have to do is a simple Google search to find that out. And you let— You didn't challenge what Mr. Peckford said and you allowed him to say all this stuff." Well, we were getting enough of the mainstream message dismissing these

people. Let's hear about the other side. So he doesn't view his work as being influenced unduly by this money.

But I think in the back of the minds of these publications, when they know their survival may depend on it— And probably the organization that sucks up to Trudeau the most will get the most money. I mean, why wouldn't they be falling all over themselves? That's why the *Western Standard* applied for the money to see what they'd say. They acknowledged that we were a legitimate journalistic organization. And then we said, "Thanks but no thanks. We're not going to take it. Because we're not going to be influenced by this money." The bureaucrats weren't so happy.

Shawn Buckley

Now I'm going to have to cut us short because we've got a hard stop at 6:45 for an auction. But I'll ask the commissioners if they have any questions. Okay, so we're just about at 6:45.

Lee, on behalf of the National Citizens Inquiry, I sincerely thank you for testifying. You've given us some really valuable information this afternoon.

Lee Harding

Thank you very much. I want to thank everyone—from the volunteers to the commissioners, to you, to the audience—for being here. It is very difficult to hear such awful truth go hour after hour but this needed to be done. And we're going to make an impact and the whole world's watching.

You know in the pandemic, we heard a lot of people say, "be safe." It's not time to be safe. It's time to be bold.

Shawn Buckley

I think that is an appropriate ending to our day, so we will adjourn until tomorrow morning at 9 am for the third day of hearings in Saskatoon, Saskatchewan of the National Citizens Inquiry.

[00:24:49]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE SASKATOON HEARINGS

**Saskatoon, Saskatchewan, Canada
April 20 to 22, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 3 Timestamp: 00:52:49–01:25:27

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

We welcome you back to the National Citizens Inquiry as we begin Day Three of our hearings in Saskatoon, Saskatchewan. Commissioners, for the record, my name is Buckley, initial S. I'm attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie.

I wanted to take care of a number of administrative matters. I'm told, "Oh, ask for this, ask for this, ask for this." Just because we are a small volunteer organization and we truly need your support. I'll ask that everyone who has not gone to our website and signed the petition to please sign it. We want you to sign the petition for two reasons. One, the more people that sign it, it's just a show of support and a show of demand to get to the truth. And secondly, you have to give us your email address and that allows us— Usually when we do a call out for volunteers, we do it by way of email. And then also we have a donate page on our website. Please donate. Every set of hearings, of three-day hearings, costs us roughly \$35,000. We truly are a citizen-funded initiative, where we have not had a single big supporter. We rely on sending out emails and doing call-outs to the citizens to support us.

Now somebody sent a really funny video to my wife this morning, who is a volunteer for the NCI. We're going to put that in the chat for you watching online. I encourage you to see it just so you know what it's like to be a volunteer at the NCI. But we really just kind of get you organized and cut you loose. And it can be quite an experience.

Now, there's several things that are happening. I made a call-out a little while ago for embalmers. And so we're still doing a call-out for embalmers. We had Laura Jefferey who was an embalmer that testified in Toronto and she did a call-out. I'd like everyone to know that on Monday—so this Monday at 6.30 Eastern time—we are going to have a roundtable discussion hosted by Dr. Mark Trozzi with some embalmers and a funeral director. We'd like to add some more embalmers to that and we'd like to carry forward. And the reason is, and Laura Jefferey made this point when she was on the stand, it's hard evidence. If you recall what she had testified—and we had an embalmer in Winnipeg confirm this—is they are finding these dramatic changes in the bodies of people that are vaccinated that they'd never seen before. There's three exhibits that we entered which are photos of these things.

The embalmers— Literally, to embalm a body, they basically pump out the blood and pump in embalming fluid. And they're finding that they can't because there's blockages. I call them, they're almost like earthworm-things, the embalmers are calling them "calamari." They're these very strong and sometimes very large blockages that they're only finding in vaccinated people and they'd never ever seen them before. If my memory serves me correctly, Laura Jefferey—it's at least 25 years she was an embalmer, at least—had never ever seen anything like this before. And the other embalmers are saying the same thing.

Well, that's hard evidence that you can't discount. There's been a change. And we need to wake people up about this so that we can get to the bottom of it—so that we can come up with medical solutions so that this stops happening to people.

You see, when I'm telling you that you need to speak out, that we can't be silent any longer, it's just: If we can't break through this spell that people are under—that they think reality is something different than it is—then we can't get together and solve the problems. Because we're good at problem-solving, we're good at crisis once we understand what we're in. So I'm calling out for embalmers.

We also are really weak in getting our message out to French-speaking Canadians. We have a small team. But we're pumping out all this content. And because we've been marching through English Canada, our witnesses are testifying in English. We need people who are bilingual and have the technical skills to put the French text on video clips.

[00:05:00]

Because we don't have enough resources there. We want to be putting out the evidence of these witnesses that are brave enough to come and testify, so that our brothers and sisters in Quebec can also see and learn and become part. And obviously we're going to have to do the same thing when we have our hearings in Quebec City because almost all of it's going to be in French and we'll want the same courtesy. So I'm doing a call-out for people that not only are bilingual but also would have those technical skills or be confident that they could obtain those technical skills.

Another thing is, you know: the media is conspicuously absent, the mainstream media, from these proceedings. And even the alternative media. We had Rebel News in Toronto. We didn't have them in Winnipeg. We don't have them here. We didn't have them in Truro, just to pick an example. We had the CBC show up for one day and actually, they did a fair story in Winnipeg. But they're not coming out. And I think we need to start pressuring the media. But we don't have the resources to do that. So I'm doing a call-out. Our schedule is online. Next week we're in Red Deer. I'd have to pull my calendar out but I think we start on Wednesday. What if we had thousands of people contacting all the mainstream media and Rebel News and everyone else and *Western Standard* and the like and saying, "Are you covering the Red Deer hearings? Why aren't you there?" And same with Vancouver and same with Ottawa. We basically need your help because we just don't have the resources to do it.

We are trying, but this is—we're in this together. We all know that we've got to stop pretending that reality is something that it's not. And we need to get everyone else to stop pretending. For that to happen we need to get them watching the National Citizens Inquiry. Because this is where people are learning the truth. So that's a call-out.

And then the last thing is, we want this to be a balanced inquiry. We send out summonses to public health officials and ministers of health and the like inviting them to participate in

these proceedings. But we know they're not going to come. They're going to be told not to come. And then there's a tricky little legal problem. Because if I was counsel for them, I would say, "There's no—no, no, no, you're not going. Because you're going to be sworn to tell the truth and this isn't a government inquiry. What you say can be used in other proceedings." You see, if you testify in a court or you testify in a government inquiry, what you say can't be used against you in other proceedings except for perjury. And there's good policy reasons for that.

Well, we're not going to get one of those people to come and take the stand despite our invitations. But one of the things that we can do is—there's been a lot of lawsuits. Well, the lawsuits, we're all learning, have failed. There's not a single lawsuit that I can think of, not a single legal proceeding where the court has put a brake on such government action going forward. And James Kitchen spoke about that yesterday and our first guest this morning, Leighton Gray, will likely say similar things. But the governments had to respond in these court proceedings. And they've had health officials swear affidavits. They've had health officials be cross-examined. And we actually need a team: I'd prefer a team of lawyers, but any lawyer that says they want to volunteer, I need them as counsel in Red Deer and Vancouver and Ottawa and Quebec City. But I do need a team to actually be identifying these lawsuits and obtaining copies of the cross-examinations and affidavits and things like that so that we can enter it as a record. Because we want the record of the NCI to be as accurate as possible for both sides. So understand that we're trying to do that, and I'm just doing a call-out for volunteers.

I mean, what we're doing here—and what we're hoping to continue to do—is start a conversation so that we can all discover what happened. Now, we all know the government narrative. We all know it. We can probably recite it in our sleep. And in fact, the problem is we actually know it so well,

[00:10:00]

we've been conditioned to resist any information that goes against the government narrative.

That's why I was speaking yesterday about these labels of shame. I brought up that we had witness after witness after witness at Day One say: "I'm not an anti-vaxxer." "I'm not an anti-vaxxer." "I'm not an anti-vaxxer." And that's because we've been conditioned to fear being an anti-vaxxer. It's a term that was created so that it could be a propaganda tool against us. And it works. So we have to understand that. I think most of us in this room do, but there's a large number of people that don't. And the wonderful thing is people that don't know, a lot of them are starting to watch this because you are spreading us on social media. I'll encourage you to keep doing that. I don't care if you've got 20 Twitter followers: **put out our stuff, retweet it, especially when we're going to have a hearing. But get involved in getting the message out because it is something you can do and it's something that you must do.**

But, you know, when I talk about the mainstream narrative, how is it? Anyone that is confused by anything I'm saying that happens to come across this video, ask yourself this question: How is it that every single mainstream media outlet in the Western world, not just Canada, whether it's a government-funded one like CBC or BBC, or whether it is a private news organization— And they're all supposed to be competing with each other right? Aren't we a capitalist system in theory? They're supposed to be competing with each other. How is it that they all had the same narrative? How is it that they silenced the same people? You know, if CNN was calling Dr. Peter McCullough a spreader of disinformation,

well, how come CTV didn't speak up and say, "No, actually, he's one of the most published and respected doctors in the world today. And if you check his information, what he's saying, you can verify it." How come there wasn't a single one?

And I think you need to ask yourself that question. Because, unless you have an explanation, that is proof right there that something is being imposed upon the media. We're either in a complete mass hysteria event or something else is going on. But you don't get truth when all of the media in the entire Western world—whether government-funded or private—are all reporting the same things and, more importantly, all participating in the exact same censorship.

Can anyone please tell me: when one of these doctors, I just used Peter McCullough as an example. Can anyone give me an example where one is being labeled as a misinformation-spreader, where another mainstream media outlet said, "No, no, that's not correct?" And I mean, what a coup that would be from a news story. I mean, back when we used to live in the real world, if one media outlet put out a story that was false, the others would jump all over it to try and reduce the trust so that they would have more viewers. So how is it that we have this? And how is it that even the word "misinformation" and the word "disinformation" have become so absolutely common? How is that? And we have Dr. Christian Francis [sic], our first witness on day one, explaining to us that those terms actually were invented in Stalinist Russia as police state controls.

You know, I've been preparing witnesses. For some of the experts, one of the first things I do, because I have to introduce them—I have to come up with, "oh, so you're this and that," just to introduce them to you so you know who they are—and so I just do a Google search if I'm not familiar with them. Or even if I am, just to see how somebody else has couched it to save me some work. And Wikipedia keeps coming up. In every one of these ones, Wikipedia goes out of their way to say that they're a spreader of misinformation. And that's just an example of this propaganda machine, this censorship machine. So they have been tremendously effective at casting— And I call it a spell. I think it's a spell.

You know, when we have Stephanie Foster—so I'm just switching off the media because I'm still shocked by this—where her mother is standing in the line to get vaccinated. She gets the vaccine. She's still standing. You know, so there's obviously a group of them because this is a production line.

[00:15:00]

We all know there's a lineup of people there just getting their shots. And then she falls down. And the reports are that she was dead before she even hit the ground. Well, all the people in the line see this. You can't not notice somebody falling down dead. And they stayed in the line and they continue getting vaccinated. How does that happen if we're not in a spell? If you didn't believe in things like that before, you just have to ask, "That can't be mass psychosis, can it? What is going on here?"

And how is it that in April of 2023 there is still a group of people that believes the mainstream narrative? I mean, how is it? What part of the mainstream narrative has not been proven to be false? Like, from the beginning of COVID to the end? What part? And I mean, there probably are some parts that haven't been proven to be false. But they've been— You know, "Who cares if 90 per cent of everything that has been shoved down our throats has proved to be false?" And when I say false, you know, we lie more by misleading, by stating half-truths than we do by outright lies. And that's just a human characteristic and we learn that in law.

So we have still a large group of people—and I don't know if they're the majority anymore—but we have a large group of people that still turn on the news, still get hypnotized. Understand: people way above my pay grade, and lots of them, spend their entire lives figuring out how as soon as you turn that on, right down to the sound and every colour and flash, how to hypnotize you and how to control your mind. And if you don't believe that, there's book after book after book; just do your research. But there are still people that are turning on the news and accepting that that is reality. And some still believe, they actually still believe that narrative.

But there's a group of people that are supporting the mainstream narrative that don't believe. And some of them don't believe because they're not willing to accept the cost of not believing. So let's say you're a doctor or a nurse. And you have— You participated in all of this. Surely, there's a large group of those. We're hearing person after person after person going to the hospital with what are clearly vaccine injuries.

And I'll let everyone know: before we put a person on the stand to give a story that would suggest that there's a vaccine injury, we have them interviewed by medical doctors that have gotten together and put together a set of questionnaires to rule out pre-existing conditions and other things. So that in their opinion, no, this is a legitimate story and it's a realistic conclusion. So just so that everyone knows: we don't let a single witness on the stand to speak about vaccine injury that has not been vetted by medical doctors beforehand.

I have trouble believing that the majority of doctors and medical people don't understand that there's something seriously wrong and that it's connected to the vaccine. But they'll still lose their job. A medical doctor today, if they start reporting vaccine injuries or saying it's vaccine injuries or speaking out like our first witness Dr. Christian did—they're in trouble still. And they're in trouble because we're not speaking out and demand that they do speak out and demand that they don't lose their job for speaking out. So they're still afraid because we're not doing what we need to do and give them a safe space to speak.

There's also, I think, a group of people that are supporting the mainstream narrative and may still believe it because they're protecting themselves psychologically. So we're hoping to call—if she's well enough—in Red Deer, a witness that it was severely damaged by the vaccine and the doctors agree. And she had a pre-existing condition that would put her at great risk,

[00:20:00]

and consulted her doctor and then, "No, no, no, it's all okay." And then gets severely injured and is disabled for a significant amount of time and then yet is encouraged by her doctor to get vaccinated again. And now her life is over. I mean, you'll hear, on a good day maybe she can walk around the house with a cane a little bit, where she used to be a power yoga instructor, a super-fit person that could outdo anyone in this room hands down.

We had heard people in earlier proceedings here, not in Saskatoon, who were either injured with the first shot and basically a panel of doctors have told them to go ahead with the second shot. Like, do you not think that some doctors that participate in this are having trouble accepting that they made a mistake and people got hurt?

And what about parents? If I had young kids—my kids are all adults—and I had had them vaccinated, and then I come to realize that that was a terrible mistake. How do I get to the place in my mind where I'm able to accept that? I mean, we really are going to need to be

sympathetic. But we have to end this charade. Because we'll go out of this room. Those watching online, you'll go out of your house or your office and you'll enter a world which is pretending that there is a reality that isn't true. And you have to think about that and think about: How long are you willing to pretend that things are different than they are?

Because the reality is people are dying and people are sick. And if we don't collectively come to the point where we can honestly say, "No, we've made a mistake. There are problems, but let's solve it," we're making it worse. That's the problem. When I was talking the other day about how we're personally responsible now for the hurt and death going forward— We're personally responsible. If you're not speaking out, if you're not willing to go, "I don't care. I don't care if I lose, if these people get mad at me. I've got to start speaking out and I've got to start calling out the media." We have to stop being afraid because do you understand? People are being hurt. And we can solve this. We can make it better and we need to. We need this spell to break.

Now, understand—and I mean this to encourage you—there has been a shift. Think about what we've just experienced over the last two days. And you know, you can't go through a full day of NCI hearings and not be changed. You just can't. We have been hearing from people that basically are showing us the way.

I'll go back to our first witness, Dr. Francis Christian. He spoke out early. And for him, it's just he could not tolerate us vaccinating children when they had zero risk of dying from COVID. But, you know, the vaccines had just been rushed out and the danger was just too great. He was just speaking truth and he got punished. I mean, he lost his contract. He lost his position. He was attacked in the media as a misinformation person. He's not practising as a surgeon. But he showed us the way, didn't he?

You know, we had Joseph Bourgault, who—his family collectively, they run quite a significant number of businesses with what is it, seven, eight hundred employees. They didn't require masking. They didn't impose a vaccine mandate. In fact, they were doing research and doing weekly newsletters so that their employees actually could make an informed choice. And they weren't saying don't get vaccinated either. But wasn't that showing us the way of how we could have acted and how we can act going forward?

We had a teacher on the stand yesterday talking about how they're still masked at her school. This has to stop.

[00:25:00]

We had Lee Harding yesterday, who was saying that he was having trouble publishing vaccine injury stories and the story on how the vaccine had been rushed. And there were questions about safety and efficacy and they wouldn't get published. And he actually lost his job for three months until he kind of was able to approach them and come up with a reconciliation. But he paid the price. For speaking truth.

And then we've been seeing person after person who has been hurt and has been beaten down. But they're showing us the way. Last year, these stories would have given us fear. So think about this. I'll go back to Francis Christian. He spoke out and he lost his job. And why he lost his job and why he was publicly humiliated, called a misinformation person, was to scare us, so we'd be afraid of losing our jobs or being labelled a misinformation person.

But here's the shift: He's inspiring us now. He's testifying at the National Citizens Inquiry and he's inspiring us. He didn't give me any fear and he didn't give you any sense of fear. In

fact, we found it encouraging and we found it empowering. And same with Lee and same with Joe. And the reason is because there's been a shift. Because we're getting tired of living a lie. There's been a shift. These people now inspire us. And I tell you: when these people that are injured and suffering, whether vaxxed or not, take the stand, they're inspiring us.

And do you understand we couldn't have done this? We couldn't have done the NCI before. We couldn't have been holding this inquiry before. Let's go back last year, 2022. We had just had the mandates stopped because of the truckers. That was just one year ago. They rolled—it was January 2022. And we were all in this dark gulag, lock-down, masking, absolutely everyone censored. We're all afraid. There was no way any provincial government was going to be backing down on the mandates. And then those truckers did something the rest of us weren't willing to do. Take a risk, put it on the line. Some of them are still facing charges. Some of those people involved in that. They're, in my opinion, political charges.

We watched what happened with the *Emergencies Act* being invoked and this violence on protesters. We watched a video in Toronto of a disabled and decorated war veteran being pulled from the War Memorial, thrown to the ground and kicked by the police. And a year ago that was frightening. I watched that live. I think a lot of people did. We were shocked. But those truckers: we owe them. I'm choking up because I'm so grateful for what they did. Because in my experience, watching those trucks roll and then watching Canadians all along the way with their flags and paying for their gas and all of this gave me hope. I wouldn't be here speaking to you if those truckers—

And we need to now act and give the next group hope. We need to give other Canadians hope. We need to show the way. You see, because the secret about the truckers was they're no different than us. They're ordinary Canadians of all walks of life, from everywhere, every background. They were just willing to say, "Enough. I will take a risk. I will not live the lie any longer."

But we couldn't have done this in 2022. We were just starting to get our freedoms back. Now, if we were to go back to 2021, there's no question we would have even thought of this. If we had been able to do this in Saskatoon—and I don't know, I'm not from here.

[00:30:00]

We wouldn't have been able to do it in Alberta. Maybe, I think we would have had to get a special permit. And if we did, maybe, you know: 20 people, we'd all be spaced out and we'd all be masked and it'd be some authority figure coming in to make sure that we're all being obedient little slaves and wearing our mask and being all set out. But we wouldn't have gotten the witnesses coming in 2021. They would have been too afraid.

Now, could you imagine in 2020 doing this? I mean, aside from the fact we would have had still all the same problems: Would we be allowed, would it be 20 people, would I be up here? I'd be up here wearing a mask, that would look great on TV. But probably— The fear was so deep, I mean, there probably would have been violence. People probably would have come here and protested and shut us down, like the fear was so deep.

But yet here we are, in April of 2023, and we got a full house. I don't see a mask in sight. And there's no authority figure telling us that we can't do this. We still have witnesses that are afraid of repercussions in their employment and socially, but they're speaking. Most of them are speaking.

Understand, there's been a shift. And you have to keep the momentum going, you have to become a trucker. You have to be willing to step out on the line because this only works— We can hold wonderful hearings and we can find the truth, but it only works if you start taking personal responsibility and you start doing everything that you can. And that you stop pretending that things aren't the way they are.

There's enough of us now. It's going to be costly. It's going to be very costly for us going forward but there's enough of us now that we can break the spell. We can take our country back. It's just a matter of remembering who we are again and understanding that together, we can make this better.

I'm going to stop there and call our first witness, who's patiently waiting online, Leighton Gray. Leighton, can you hear us?

[00:32:38]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 1: Leighton Grey

Full Day 3 Timestamp: 01:25:18–03:00:43

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

I'm going to stop there and call our first witness, who's patiently waiting online, Leighton Grey. Leighton, can you hear us?

Leighton Grey

Yes, sir, good morning.

Shawn Buckley

Can you turn your video on now that we're—

Leighton Grey

Certainly.

Shawn Buckley

There we go. Thank you so much for joining us. I'd like to start by asking you to state your full name, spelling your first and last name for the record?

Leighton Grey

My name is Leighton Bellamy Untereiner Grey. My first name is spelled L-E-I-G-H-T-O-N. Last name is G-R-E-Y, like the famous football cup.

Shawn Buckley

And Leighton, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Leighton Grey

I do.

Shawn Buckley

Now, just to introduce you, you are a litigation lawyer and you've been intensely involved in COVID-19 related cases since 2020.

Leighton Grey

That's true.

Shawn Buckley

And you're also a podcaster and you've featured COVID issues and other issues. And if people want to track down your podcasts, it's called "Grey Matter."

Leighton Grey

That is correct.

Shawn Buckley

Okay. You started publishing articles in the spring of 2020. Do you want to share with us your experience in what happened and what you were doing?

Leighton Grey

Certainly.

First of all, I want to say that it's an honour to be part of this proceeding, especially in Saskatchewan, which is the heritage of my family. My great-grandfather was the chief of the Carry the Kettle Band, which is at Sintaluta, Saskatchewan. I was born in Regina and so it is an honour to be part of this historic proceeding and to have my testimony part of that record, especially in Saskatchewan.

So going back to the early part of the pandemic as many people experienced it, everyone has different things to say about that. I was alarmed early on about the pandemic and particularly about how the federal government was responding to it. Because I'm an Albertan and so I haven't had the experience of a Liberal government that's ever been good for our province or the people who inhabit it. And I had been watching very closely the **Trudeau government's encroachment upon individual rights and freedoms which, if you trace it back, started from the very beginning—from the beginning of the promise of sunny ways and transparent government.**

So when the pandemic was declared, I was suspicious already about, you know, "15 days to flatten the curve." And during that time period of course— I'm the senior managing partner of a law firm and I was concerned about our employees and how we were going to keep people working. The courts were shut down. So I began to do a lot of writing and I was publishing things online. And some of the things that I said were, as you were stating earlier, counter-narrative.

Around that time, I had been appointed to a board to select judges in the province of Alberta. And because of the things that I'd been publishing online, I was attacked by the CBC. They published a hit piece on me that granted to me many of the epithets that all unvaccinated Canadians were branded with by our prime minister. Later on, I was called a racist, misogynist, something called a latent anti-Semite, I'm still not quite sure what that means.

But I was publishing things online. For example, I said that I was concerned that George Soros, for example, would use his money to influence the outcome of the 2020 presidential elections, which happened. I expressed concern about Black Lives Matter in terms of the looting and so on and that they were beholden to the left. And frankly, that turned out to be true. The thing that really got me in trouble was, I'd published in the spring of 2020 my suspicion that the Trudeau government would use the pandemic as an excuse to invoke emergency powers. And of course, that did happen. So I went through a cancel culture experience where I was asked by the Alberta government to resign from the board to select judges. And that was under pressure from the Alberta NDP leftist party that operates here in Alberta. My name was kicked around like a football and my reputation was damaged because of the things that I'd been writing, speaking out against the counter-narrative.

[00:05:00]

Of course, this was picked up by all of the mass media, including CBC, CTV, Global and others. And not only that, but I was at that time an adjudicator in Law Society disciplinary hearings here in Alberta and had been for some time. And the Law Society summarily dismissed me from that board. And they did so publicly—they published that on their website so that every lawyer and every member of the public in Alberta would see that. It was a public shaming. It was a public whipping. I lived through that. And of course, the media picked that up and that was put out there as well.

And then, I guess the most ignominious thing that I suffered was: I was a long-time director—for decades—of the Alberta Civil Trial Lawyers Association, which is a volunteer group of lawyers in Alberta who really try to help the disadvantaged, the people who are hurt in injury proceedings, in injury accidents and the like, medical negligence in Alberta. I had just received a Lifetime Humanitarian Award from them for my work with Indigenous peoples because I spent a lot of time working with people who had been involved in Indian Residential Schools claims. And I received their highest award in October of 2019, this Lifetime Humanitarian Award. And they actually asked me to resign from the board and told me that they wanted the award back. I refused that. But ultimately, I left the board and I'm no longer involved with the Alberta Civil Trial Lawyers Association.

That's the bad news. That's the terrible part of it. The good news is: going through that cancel culture experience, which I would not wish on anyone, did introduce me to another group of people, people like Ezra Levant and Sheila Gunn-Reid and John Carpay at the Justice Centre for Constitutional Freedoms. They reached out to me and they—especially John Carpay—gave me the opportunity to get involved and to use my skills that I had acquired over a lifetime of being a litigation lawyer to actually help fight some of these cases in the courts.

So that's sort of— In the Marvel world, that would be my origin story in terms of a COVID litigator.

Shawn Buckley

One of the cases that you did was the Ingram case. Do you want to share with us about that?

Leighton Grey

Right.

So the Ingram case is named after a lady named Rebecca Ingram. She was not my client. She's actually represented by an excellent lawyer, a good friend of mine named Jeffrey Rath. But Jeffrey Rath and myself were hired. I was hired through the Justice Center for Constitutional Freedoms to represent some churches who were complaining about the violation of religious freedoms that all of us experienced during COVID.

Rebecca Ingram was a lady who had been a gym owner. Of course, she lost her business because it had been shut down because of the lockdown restrictions. In December of 2020, there was an application brought in that case. In this case, it was based upon two main legal arguments. One alleged violations of the *Canadian Charter of Rights and Freedoms* but the other more interesting argument—one that I think may ultimately be successful—is that our Chief Medical Officer of Health Dr. Deena Hinshaw, who is no longer our Chief Medical Officer of Health, she's now the deputy in that capacity in British Columbia, exceeded her legal authority in making all of these lockdown orders.

But the thrust of the case was to challenge the government's lockdown restrictions. And this began in December of 2020 with an injunction application, which failed. And that began really a series of losses that we suffered throughout that process.

It began to dawn on me—and this comes back to some of the comments that you were making this morning, Shawn—that we really, as Canadians, as those who were fighting government oppression and restrictions: we really were the visiting team. We really were on foreign soil going into the courts. We were arguing against masking but we were all wearing masks and the judge was wearing a mask and the clerk was wearing a mask. We were speaking through Plexiglass or speaking over Zoom, as we are right now.

Any lawyer who has practiced in the courts knows that it's more than just a screen, it's a place.

[00:10:00]

It's called court because going back far enough, you were in the presence of a duke or a count or even a king or a queen, arguing your case. So this began to become really obvious—that something really, really important had changed.

But we went through a series of pre-hearing applications that involved striking out of our pleadings, striking out affidavit evidence. All of these applications were summarily successful coming from the government. Honestly, it felt like we were the Washington Generals that used to play against the Harlem Globetrotters, if you remember that.

Perhaps the most troubling thing was this: When we filed all of our materials in December of 2020 in support of the injunction, we actually filed substantial medical evidence, including affidavits by people like Dave Redmond, who's the emergencies expert who's going to testify in this hearing next week in Red Deer' and one of the most brilliant scientific minds in the world in terms of epidemiology, Dr. J. Bhattacharya, who I understand testified in Winnipeg. We filed all this affidavit evidence showing very clearly

that things like masks didn't work, that the risk of asymptomatic spread was minuscule, that really the weight of evidence was that this virus, the risk of it was confined to a very small, extremely vulnerable segment of the population. And more than that, by locking down everyone and wasting resources on people who are at no risk of COVID, we were really hurting the people who were most vulnerable.

And of course all of that— We filed all that evidence yet we were faced with, on the other side, the government filing nothing. In fact, they received a six-month adjournment in order to present their scientific evidence. So this is really important to understand. The entire province of Alberta was locked down, under lockdown restrictions which were very similar to the ones that were experienced by everyone across the country. And yet the Government of Alberta had not yet produced a single iota, one item, of scientific evidence to support all of those restrictions. In fact, they were granted an adjournment of six months by the courts of Alberta, just so that they could produce that evidence.

And when we finally got that evidence, with all due respect to them, it was rubbish. It was all speculation. It was all modelling. In fact, Dr. Bhattacharya recognized that the models that they were relying upon, predicting the destruction and annihilation of our healthcare system in Alberta, was based upon climate modelling. He actually recognized that they used the same models to predict climate change to predict the annihilation of our healthcare system in Alberta.

So their science and their evidence was junk. But perhaps most troubling about this is the length of time that this process took. We filed for that injunction December of 2020 and, Shawn, we still don't have a decision. On April the 22nd now, 2023, that case is still with the courts. It's sitting there, waiting for a decision. And there are hundreds of cases in the Alberta courts that are waiting the outcome of that Ingram decision, and still no decision.

There's an old adage that we lawyers know that goes something like "Justice delayed is justice denied." This is very, very concerning because, of course, those of us who have been raised up in the law, particularly during the period when I went to law school, were taught that the Charter and the Constitution—the rule of law—were sacrosanct, that these were cherished things that protected not only Canadians but protected our entire political structure in all of our institutions.

What do those Charter rights mean when you go before a court and they're not even respected in the court where you're standing? What do those rights mean when the determination of whether or not they've even been violated has to wait years to be determined? What does that mean when, as you say, the Trucker Convoy— Truckers can go to Ottawa and do more to free Canadians from the bondage of these restrictions than our constitutional law?

The lack of respect for the rule of law continues to this day. I read only this morning

[00:15:00]

that our government in Ottawa is actually trying to pass a bill that would permit it to whitewash and to essentially give itself its own report card on how it handled the COVID-19 pandemic.

So with all of that, the Ingram case is going on. We're hopeful that we're going to get a correct decision in it. I'm not very hopeful that the Court is going to find that the violation of Canadians' Charter rights outweighed the public interest in locking everyone down,

because of course there isn't a single court in Canada that has made that determination. That alone is horrifying, frankly. But essentially, that's the story of the Ingram case thus far.

The best thing we did—sorry, I just want to finish off this point—the best thing we did is we did get the chance to cross-examine the Chief Medical Officer of Health for several days. And that was quite revealing. I like to think that we were instrumental in her losing her job here in Alberta. Thank you.

Shawn Buckley

I understood that. And I wanted to pull out of you some of the things that you learned. I don't know if you saw Professor Bruce Pardy's presentation in Toronto.

Leighton Grey

I did.

Shawn Buckley

So for those watching that didn't see that, Professor Pardy was explaining how basically, the legislative branch has been delegating to the administrative branch and then the courts are showing deference, so that basically we've arrived in an administrative state. But your cross-examination of Ms. Hinshaw revealed that actually, in Alberta, it wasn't an abdication to the administrative state, it just appeared to be. There was something else going on. And can you share with us that? I think especially Albertans need to hear this.

Leighton Grey

Certainly. And when you hear from Mr. Redmond, he'll be able to explain this better than I can. But essentially, unlike in other provinces, in Alberta, there was never a state of public emergency declared. In law, that is something distinct from a public health emergency.

What happened was, in Alberta, the Jason Kenney government—when the pandemic was declared, they made some executive changes to the *Public Health Act* in this province. And they declared a *Public Health Act* emergency. And that essentially made our Chief Medical Officer of Health, Deena Hinshaw, the most powerful person in the history of our province. It essentially appointed her a health dictator.

She had control over every aspect of our lives. And the wording of the statute actually says that she could use any means necessary to fight the pandemic. And she did use any means necessary. During the course of our cross examination, though, something very surprising happened. When I asked her about her orders, she began to disclose that in fact, although these orders were in her name, they were not her orders—they instead expressed the will of the executive—and that she was going to the Premier and Cabinet to get the content to put in these health orders. This was never fully explained to Albertans.

She used to conduct daily press conferences. In fact, there are over 400 of them that I reviewed that honestly, in my respectful view, were essentially psyops in which she would repeatedly tell Albertans to get used to the new normal and to trust government and to protect your neighbours by not leaving your house and so on and so on. Essentially, what was revealed during the course of cross examination is that she was going to Cabinet and getting instructions about what to put in these health orders. Of course, under Alberta law, this is illegal, because under the *Public Health Act* the whole purpose of creating a *Public*

Health Act emergency for the entire province, which was unprecedented at that time— Normally, a *Public Health Act* emergency would be something that would be localized, but we had the entire province under a *Public Health Act* emergency. The whole purpose of doing that was to have a health expert, a doctor, basically protect Alberta from this great pandemic, this great threat.

And so it defeats the whole purpose of creating a *Public Health Act* emergency to go to lay people such as a premier and cabinet, who have no medical expertise or knowledge at all, and to get from them the contents of these “health orders,” which of course were not health orders; they were orders concerning every aspect of our lives, from when and how we could worship, whether or not we could shop, whether we could go out and exercise, whether our kids could attend school, and on and on and on.

[00:20:00]

What was revealed is that the whole structure of what Albertans were told about what they were experiencing through their government, whose job it was to protect them—that was their stated task—was essentially a fraud. It was a lie. Dr. Hinshaw was not there in order to protect the public. In fact, that narrative shifted initially from “15 days to control the spread.” Then it was of course, “We have to protect and preserve the health care system, we have to save the health care system.” And then it turned into—it was all about vaccinations. “We have to all get vaccinated to end the pandemic.”

One of the scariest things that Dr. Hinshaw said though is— In terms of the metrics of her decision, what she did is she decided that— First of all, she acknowledged that her health orders, the health orders that were passed, all violated the civil liberties and the human rights of Albertans. She acknowledged that readily. But what she did was she said that the protection of the healthcare system—a faceless, soulless institution—was more important than the violation of the individual rights. In that balancing act, and this is the way she put it: “On balance, violating the individual human rights of four million people was justified in order to protect the healthcare system.” Really, the healthcare system is not what she was talking about. In my respectful view, what she was really talking about was protection of essentially autocratic executive government power. That’s really what was being said. And to me, that was the most horrifying thing that I heard her say throughout the whole time that we cross-examined her.

Shawn Buckley

Right. And that I think is shocking and will be shocking to Albertans. Because they just assumed that she was the one exercising authority, not the Premier and Cabinet.

Leighton Grey

That was certainly the impression that was given. However, it’s very clear from the evidence that came out that that was not the truth at all. Ultimately, what it was about was trying to shift the mindset of Albertans. Those people who are Albertans understand that. As in every region of the country, we have different aspects of our culture. But Albertans tend to be very self-reliant. We tend to be somewhat libertarian overall in our thinking.

I’m not painting everyone with the same brush, but it was very clear that there was a psy-op going on. In fact, in the course of the evidence that came out during that hearing—I cross-examined Dr. Hinshaw—the Alberta government actually commissioned a psychological report about what language and what methods to use in messaging to

Albertans in order to get them to comply with lockdown restrictions and also with, of course, the vaccination programs that rolled out in the latter stages of what we now call the pandemic.

Shawn Buckley

That's alarming. I think that's the softest term I can use. How did how did discovering all of this make you feel?

Leighton Grey

I was talking about this with Jeff Rath. He and I are both 30-plus year lawyers in Alberta and he and I sort of chuckled about this. Not in a funny way, but in a sense that we were both under the same— You called it a spell. We were under a spell such that we actually thought that our legal system was something special and that judges were fair and impartial, that there was something that veiled that in integrity and justice.

My experience of doing COVID litigation sadly has exploded that. It's actually very difficult for me in dealing with courts and judges now to get myself back to some semblance of the mindset that I had before. And so that is a struggle.

One other thing I'd like to share apart from the Ingram case that really impacted me in this way, I had the pleasure to represent two courageous pastors in Alberta.

[00:25:00]

James Coates of the Grace Life Church spent 35 days in the [Edmonton] Remand Centre because he refused to sign a bail condition that essentially would violate his religious conscience. He was given a horrible dilemma between exercising his liberty, which is guaranteed under the Constitution, and violating his promise to God as a Christian pastor, because the condition would require him not to preach the truths in the Gospel to his congregation. He put his God above his liberty and he suffered 35 days.

Anybody who has ever visited a jail or a remand centre must understand that it's one of the worst places that they could possibly go. I know as a lawyer going there to visit clients that many times, I could not wait to get out of those places. And to imagine someone to choose to be there for 35 days, just imagine the courage and the integrity of this human being. Anyway, I had the pleasure of representing him because he faced a number of COVID tickets because he and his congregation refused to comply with the government diktats about capacity limits and so on, which we now know were a bunch of bollocks, so that there was really no risk to the public whatsoever. The idea of a super-spreader event now is ridiculous, we now know in hindsight, with what we know about masking and social distancing and all the other arbitrary non-pharmaceutical interventions.

I also had the opportunity to represent Pastor Timothy Stephens of Calgary.

Shawn Buckley

Before you move on to Pastor Stephens, it is my understanding in an earlier conversation with you that when you were defending Pastor Coates in court, the provincial court judge didn't even find that his Charter rights had been violated, let alone having to go to what I would call an abomination dealing with section 1 of the Charter.

Leighton Grey

That's correct. The court essentially said that Pastor Coates' Charter right—his right to liberty under section 7 of the Charter, the right to life, liberty and security of the person—was not violated simply because Pastor Coates chose to remain at the Remand Centre. That, in fact, he was granted liberty under his bail conditions, the conditional release, but that he chose not to exercise it. And the court put absolutely no weight whatsoever in this horrible dilemma that this man had been placed in through totally unnecessary, scientifically unjustified restrictions.

It's important to note that in that hearing, the Crown prosecutors were not put to the requirement of producing a single item of scientific evidence for the court. In fact, what they produced was an Alberta Health Services investigator who had a social sciences background. When I cross-examined her about her training as an investigator, the net sum effect of that was that she participated in a single one-hour Zoom call.

This person who had received absolutely no training as an investigator was given the power—was given the incredible power—to cite Pastor Coates in violation of these health dictates. He was charged with Criminal Code offences. This Alberta Health Services investigator was given the power to summon the police, to arrest Pastor Coates, to jail him. And this same investigator, with one hour of training on a Zoom call about how to conduct investigations, was given the power ultimately to recommend and to have signed into law an order that resulted in the triple barricading of the Grace Life Church for months. Which was an international embarrassment and probably was significantly responsible for Jason Kenney's ousting as our Premier.

Just imagine—and this is not unique. Many people who are watching this probably saw Artur Pawlowski, another Alberta pastor, in a video that went viral. He was kicking these people out of his church, calling them Nazis and Gestapo. The people who were given power by Verna Yiu,

[00:30:00]

who has also been since fired, who ran Alberta Health Services—these investigators were given this extraordinary power of law without any knowledge or understanding of how to wield it. Almost like if you watch Disney's *Sorcerer's Apprentice*, that's exactly what we experienced here in Alberta.

It really is stunning that these people would be given such power with very little knowledge or understanding or training of really what this power that they were handed, what it meant, and the significance of it, because it just had incredible ramifications for our province and indeed, for our entire country.

Shawn Buckley

Right. Before you go on to speaking about Pastor Timothy Stephens, I'm wondering if I can back you up and have you speak about more generally— You acted for a lot of employees who lost their jobs: CN employees, CP, Purolator, Canada Post, Westjet. The list goes on and on. You kind of became the go-to guy to help with these things. Can you tell us about what you encountered with that?

Leighton Grey

Yes. You know, this was a great honour to represent these people, but also a great frustration. Most of these people—we're talking about several thousands of them working for companies like CN, CP, Purolator, Canada Post, WestJet and many others, even the Salvation Army—these were people who are primarily unionized workers. Unionized workers, some of the viewers might realize, are bound by something called a collective bargaining agreement.

Bruce Pardy can do a better job of explaining this than I can because he's an expert in this area. But essentially, under a collective bargaining agreement, individual workers contract out their employment rights to a bargaining unit with the idea that this will sort of equalize the bargaining power between a very large-scale employer like CN, which is mostly owned by Bill Gates by the way, and these individual workers.

The problem is that unfortunately these unions are primarily run in a socialist fashion. They've become very much leftist organizations. And when it came to COVID, they clearly—by and large, with some notable exceptions—were not advocating for workers.

And so the process that we ran into repeatedly went something like this: a worker who refused to take the vaccination was told that they had to apply for an exemption. There were only two types of exemptions available. One was a religious exemption and the other was a medical one. In each case, there were very stringent tests created and almost nobody actually qualified for an exemption.

So these workers were told that they would be put on something called an “involuntary unpaid leave of absence,” which, when you're sitting at your coffee table in the morning staring in your coffee, feels a lot like, “You're fired.” Because you're not getting paid, you're indefinitely off work, and your only passport to go back to work to support your family is if you agree to have this experimental drug injected into your body.

It's significant to note, a lot of these workers that I described— These companies were impacted by federal government orders, the Ministry of Transport orders. Because of course the Trudeau government required every single federal government-regulated employer to comply and all these companies had their own vaccine mandates.

The federal government, the Trudeau government, did not have the temerity to actually impose a national vaccine mandate. That would have been clearly illegal. In fact, there's an opinion paper on this from 1996 that was given to the Canadian government at that time about this. So that gives you an idea of how long they've been thinking about this. But in any event, they did the next best thing. Most people know, the federal government is the largest employer in this country. So all these workers were impacted in this way, all of them put out of work.

Just imagine this awful choice that you're faced with. You have to decide whether or not to work and support your family or to take this drug that you know and you understand is dangerous or it violates your religious conscience or whatever. So you turn to your union for help. Your union says this, your union says, “Comply.” Your union says, “We've got this independent legal opinion.

[00:35:00]

And it says that your rights are not being violated and everything that the company and that the government are doing is fine. So just take the vax.”

So of course, these people, they're being put out the door by their employer. They have no recourse there. They can't sue them because they're a member of this collective bargaining agreement. And the union won't help them. And moreover, when they complain about the union not helping them and they would bring duty of fair representation complaints, what they heard from these administrative tribunals, these government tribunals, was the sing-song "the vaccines are safe and effective" and that there's no danger.

So these people turn to outside legal counsel, people like me. And we sort of tried to pierce through the veil—unsuccessfully. We attempted to bring human rights complaints against these employers in cases in Manitoba, B.C., and Alberta. And in each case, we were told by the courts, based upon Supreme Court of Canada legislation that the court would not take up any jurisdiction. So all these people were simply sent back to their unions.

There are now still, as we sit, many, many thousands of unionized workers throughout the country who have been put out of work and have absolutely no recourse against their employers because of the workings of these collective bargaining agreements and these unions. I can't prove it but based upon their actions, I have very, very strong suspicions that all of this was calculated beforehand: that there was some level of conspiracy between the unions and these employers and the Government of Canada. Certainly, at least, that's the way it seemed to play out in real time as the lawyer representing these aggrieved workers.

Shawn Buckley

Now Leighton, I just want to make sure that people listening to you understand. So if people were unionized, they were supposed to go to the union to have a grievance filed against their employer, but the union would not file a grievance.

Leighton Grey

Correct.

Shawn Buckley

And then, if you tried to take it to court because you've met a dead end with the union, basically you couldn't. You'd get kicked out of court and be told to, "Well, go back to the union because that's where you're supposed to find your remedy."

Leighton Grey

Correct.

Shawn Buckley

So these people basically had no opportunity at all to have an adjudication for being technically fired for not taking a vaccine.

Leighton Grey

That's correct. And I think a big part of this is that none of these companies—nor the Canadian government, nor these pharmaceutical companies—want to have a court actually adjudicate upon the safety and efficacy of vaccines. Of course, given what we know now about the Pfizer dump and the fact that in Alberta alone, death from unknown causes is the number one cause of death in our province. Death from unknown causes has increased

seven-fold since the unleashing of these vaccines upon our society. None of these people want that issue adjudicated.

And that is the next great challenge for people like me: to try and bring that issue to justice, to be adjudicated by our courts. Because it must be. We must get to the bottom of the truth about whether or not these vaccines were safe and effective, whether or not companies like Pfizer and Moderna and Johnson & Johnson knew that. And also, what this means long-term for Canadians and for society because we now have these vaccines unleashed. They're in people's bodies. The vast majority of people have taken them. What does that mean? We don't know.

I know you've had doctors who've testified in these proceedings and everyone who has spoken out has been sanctioned. The vast majority of doctors, and understandably so—they don't want to speak out. They won't say that the unknown cause is the vaccine, even though that's the quiet part being spoken out loud, as you said so eloquently this morning. That's the truth about these vaccines.

But as I said, that's the undiscovered country. That's where people like me need to go. And until we get to the bottom of that, until we get a court to adjudicate on that, we're going to be living under this spell, under this lie that none of this ever happened. If we permit our governments to do it, they're going to whitewash the fact of what they did to us.

[00:40:00]

Shawn Buckley

Yeah. It's interesting just to have a dialogue with you, because you'll be familiar with the Ontario Court of Appeal case *CG vs. JH*.

Just for the listeners, I'll tell you what I just find funny about it. And then I want to ask you about an Alberta case that was somewhat different involving inmates. For those that aren't familiar with that case, it was a family law case. The father wanted the child vaccinated and the mother didn't. At the trial level, or motion level, the judge refused to side for the father and basically wasn't willing to just accept the government narrative. So it's appealed to the Ontario Court of Appeal, which basically instructed the lower courts, the way I read the case, to take judicial notice. Which means you can accept as a fact, without there being any evidence led before you that, if Health Canada approves a vaccine, that would be prima facie evidence that it is safe and effective.

This is in relation to COVID vaccines. And Leighton, what I find so interesting is— So the Ontario Court of Appeal obviously was not aware that those vaccines were approved under a test in an interim order where the words "safety and efficacy" weren't even mentioned, let alone there being any requirement for proof. The Ontario Court of Appeal is basically, in my opinion, instructing lower courts to take judicial notice of a phantom.

But I just wanted you to kind of juxtapose that with a case that happened in Alberta where basically, when the shoe was on the other foot, the court took the opposite position. Do you want to share with us about that?

Leighton Grey

Right. This concept of judicial notice used to be something somewhat extraordinary. In my experience it was often very difficult to try to get a court to take judicial notice of anything.

Courts want to hear evidence and that's rightly so. That's the tradition of our courts and that upholds a very high evidentiary standard that is necessary.

But what we experienced in *Coates* was something much different. Whenever the government asked the court to take judicial notice of something called a pandemic, or that there was a threat to the health care system, or that people needed to wear masks, or that social distancing was necessary, the courts always readily adopted that COVID narrative. In fact, our courts in Alberta were the most locked down place in the entire province. In fact, they were one of the last places to remove restrictions.

We even had a very eminent criminal lawyer in our province, he was found in contempt of court because he refused to don a mask. He was in a courtroom with a judge who, even during a time when there was no masking law in force in Alberta, was wearing a mask. The courts here in Alberta are permitted— The judges are permitted to maintain exclusive jurisdiction over the safety of their courts. She required this lawyer to wear a mask even though there was no general masking law. He refused and ultimately, he was made to purge his contempt. He was found in contempt of court.

But the case that you're referring to, this was early on in the pandemic. And this illustrates how this judicial notice concept doesn't work the other way. There was a judge here in Alberta who heard a case from some inmates at the Edmonton Remand Centre. The essence of the case was that early on in the pandemic, when it was thought that people could get COVID from doing just about anything, these inmates brought an application that they should all be released because of the risk of exposure of a mass spreader event at the Edmonton Remand Centre.

It was kind of a clever *habeas corpus* argument, but the court there would have none of it. The court said "I can't take judicial notice of the existence of something called a pandemic. I have to have scientific evidence." That is quite correct in law but that's the only case that I know of, and I've researched this carefully— in Alberta, it's the only case I know of where a court actually said that it could not take judicial notice of something called a pandemic and the risk of a mass spreader event and the like.

So that goes to show how the way that the government is treated, or was treated, in the courts of our province when it comes to this narrative is very different from when these things are argued on behalf of individual citizens; people, even when they're trying to use the government's narrative in their favour, really can get no relief from the courts.

[00:45:00]

Shawn Buckley

Now, Leighton, can I have you talk now about Pastor Timothy Stephens and what your involvement was and what happened with his case?

Leighton Grey

Yes. Another very courageous pastor, Pastor Timothy Stephens of Fairview Baptist Church: he's a close friend of James Coates and he suffered similar treatment because at his church, again, they refused to comply with these restrictions. His church was closed, was shut down just as James Coates' was, and so he was ticketed.

At one point, this pastor was actually charged with violating something called the Whistle Stop injunction, which was really an unprecedented thing in Alberta law. There was an injunction placed on any man, woman, or child in Alberta who dared to publicly protest the government's narrative about the pandemic and lockdown restrictions. There were literally hundreds of people who were charged and some of them jailed because of it. One of them is Chris Scott of the Whistle Stop Cafe, who I understand is going to testify next week in Red Deer, but this also included Pastor Timothy Stephens.

What Pastor Stephens did: he started getting his congregation together and they would meet at undisclosed locations. This became kind of a game of cat and mouse with the Alberta Health Services employees. Ultimately, it's my understanding that they were able to detect him having an outdoor church service with his congregation and as a result of that, they arrested him.

There is a video that Rebel News produced. They were on the spot when he was arrested at his home with his six young children and his wife, Rachel. It's a beautiful sunny day and of course, Timothy Stephens, with great dignity, suffers all of this. You can see he quietly goes along but the kids are just screaming. And this is a moment that I'm sure that they will never forget. I have to say I was brought to tears watching it myself, seeing this father wrenched away from his family simply because he was conducting an outdoor church service. And of course, based upon the government's—

Shawn Buckley

Leighton, just so you know, we have the video [Exhibit SA-7]. We've had our video guy take the Rebel News reporter part out but we'll play it right now just so that those that are participating actually understand what you're saying.

[Rebel News footage is played of the arrest of Pastor Stephens before his family].

Leighton Grey

That's his wife there in the foreground.

Shawn Buckley

Sorry, carry on.

Leighton Grey

Just so people understand the level of incompetency that was involved here: when he was first arrested and jailed, he was in jail. The Alberta Health Services people had actually gone out—and the police had actually served the wrong person. They actually served the injunction order on the wrong person.

It was stipulated under the terms of the injunction that it was necessary for anyone who violated the injunction to actually be served with the document,

[00:50:00]

so that they would know, and they would have notice of the terms. Because otherwise, how can you be in violation unless you know what the terms were?

Well, they went out and they served the wrong person. The injunction had never been served on Pastor Timothy Stephens. They went out and arrested him and he was in jail. I discovered this and I revealed it to the lawyers and to the court that he had never been served, that they had actually served the wrong person. And it still took several days. I had to actually obtain a statutory declaration, a sworn statement from the person who they had mistakenly served with the injunction, before they would finally release him.

So that was the first time he was arrested. The second time he was arrested was because he had simply conducted an outdoor church service. It's worth knowing that in the Manitoba proceeding, there was an expert that was called for the government. And they were asked under oath whether there was any scientific study supporting the idea of a super-spreader event that could occur outside. The fact is, and the answer is, no: there is no accepted study anywhere of the risk of a mass super-spreader event occurring as a result of outdoor gatherings because of the way that the virus is spread and what we knew at the time.

Notwithstanding that he was jailed. And the only reason why Timothy Stephens was freed, actually, was that on July the 1st of 2021 the Government of Alberta declared a COVID amnesty. Many of us suspect that was done in order to accommodate the Calgary Stampede because they brought the restrictions back in September. But for that he would still be at the Remand Centre because he never accepted the bail condition, nor did Pastor James Coates.

He was given the same bail condition that he would not preach to his congregation and he refused to comply with that and so he was jailed. A father of six, a leader of a congregation, just an extraordinarily courageous and brilliant man: a Christian pastor jailed. So Alberta actually became known as a jurisdiction which jails Christian pastors. So much so that recently, Tucker Carlson of Fox News—his show has created a documentary in which these two pastors are featured. The documentary is about the rise of totalitarianism in Canada. What an incredible shame and disgusting embarrassment this is for the province of Alberta, indeed for all of Canada before the world, to have these Christian pastors unnecessarily jailed for long periods of time when they had done absolutely nothing.

It's significant to note that all of the charges were ultimately, through the grace of God, dropped or defeated against Timothy Stephens. We actually had to run a trial in Calgary before a provincial court judge, who quite properly found that there was no basis for these violation tickets. But we actually had to run a contested trial before a judge in Calgary in order to have these COVID tickets thrown out against Pastor Timothy Stephens.

Shawn Buckley

Thank you, Leighton. I'll open you up to the commissioners to see if they have any questions.

Leighton Grey

Thank you.

Shawn Buckley

And there are questions.

Leighton Grey

I see my good friend Mr. Drysdale.

Commissioner Drysdale

Good morning. Mr. Grey. How are you?

Leighton Grey

I am wonderful. Wonderful to see you again.

Commissioner Drysdale

I have a number of questions. And since I'm not a lawyer, I do understand that there may be questions that you will not want to—or will not be able to—answer. Because I think you're, what's the expression, you are a representative of the court or something?

Leighton Grey

Officer of the Court.

Commissioner Drysdale

Officer of the Court. But I'm going to ask them anyway. First question: Could you please enter the transcript of Deena Hinshaw's testimony into our record. It's a public document.

Leighton Grey

Certainly. Certainly. Will do so [Exhibits SA 7-b, SA-7o to SA-7q].

Commissioner Drysdale

Thank you. That way folks will be able to access that on our website and be able to read exactly what was asked and what was said.

Leighton Grey

There's also a video recording that I think we have as well, that I could submit in addition to the written transcript if you would like that [no exhibit number available].

Commissioner Drysdale

I would very much appreciate that.

[00:55:00]

Is it not a fundamental tenet of our legal system that anyone appearing before a judge or before that system is treated equally under the law?

Leighton Grey

Yes, that's one of the principles of fundamental justice that is recognized under our Charter. It's also an age-old principle that's implied under what is commonly called the rule of law.

The rule of law of course stems all the way back to 1215 and the Magna Carta. It stands for the idea that no one is above the law—but also that everyone is equally protected under that law.

Commissioner Drysdale

Does that also include the government?

Leighton Grey

Yes, particularly the government. Because it's important to remember, again going back to Magna Carta, that that was a seceding of power from the king, a divinely anointed king, to the Parliament of England. So it's very significant in terms of the rule of law that even the king is not above the law, let alone a prime minister.

Commissioner Drysdale

In listening to the conversation between you and Shawn Buckley, there's something I don't understand, then. One of the cases that you were talking about, I think it was an Ontario case, where the one side brought evidence—scientific evidence as I understand it, about various issues with regard to the vaccines and the pandemic and whatnot—but as I understand it, the judge ruled that the government's opinion was not subject to dispute. I think the term you used was judicial notice: that the judge said that the government's opinion couldn't really be discussed or argued because it was just taken for granted.

Leighton Grey

Correct. And this is what I meant when I said those of us who went into court against the government always felt like the visiting team, because we were trying to question things that were considered to be unquestionable.

There's a great recent example of this. My good friend James Kitchen, who I understand testified in this proceeding, was recently on my podcast. He represented a chiropractor named Wall who went before a disciplinary proceeding and was actually suspended by that college for a period of time because he refused to wear a mask, even though none of his patients had a problem with him not wearing a mask.

And James Kitchen had quite properly produced some of the most eminent experts that we know of, including people like Dr. Byram Bridle, on epidemiology and so on. And the chiropractic college produced a GP, a general practitioner, with no specific knowledge in epidemiology or virology or any of these things. That chiropractic college simply preferred the evidence of the GP to this mountain of expert evidence, eminent expert evidence, that was produced by James Kitchen on behalf of Dr. Wall.

I have to say, that is precisely what happened in the Ingram case. We produced eminent—I mean, if there is a better expert than Dr. J. Bhattacharya—just to take Dr. Bhattacharya for a moment, this man teaches medicine at an Ivy League college, at Stanford. He is one of the leading experts in epidemiology and he also has a PhD in economics. If you were going to design a human being who could talk about the science of COVID and also speak authoritatively about the economic and societal impacts of lockdowns, this would be the human being. He's almost like a human AI program. And yet all the Government of Alberta lawyers did throughout that proceeding was try to discredit him.

Commissioner Drysdale

I want to come back to this. Because what's in my mind right now is, I'm considering the testimony we've had in the last several days in Saskatoon. And I keep hearing "basic tenets" of something: basic tenets of law, basic tenets of medicine. And one of the things—perhaps you can't comment on this—but I heard in the last day or so, medical doctors talking about a basic tenet of informed consent.

Is informed consent, to your knowledge, something that is legally required or legally enforceable in Canada?

[01:00:00]

Leighton Grey

I think in terms of a legal concept, the answer is clearly yes. There are all kinds of examples of it in the law, everything from the type of a waiver that you would sign when you take your kids to go on a ride somewhere. There are all kinds of forms of informed consent.

The specific one that you're talking about really goes back to the Nuremberg Code of 1947, which came out of the aftermath of the experiments that were conducted on people in the Nazi death camps. That's clearly under international law and that concept has been imported, in my respectful view, into Canadian law as well.

When you think of people who are exposed to a surgery, they have elective surgery. They have to be informed fully of the risks of that operation and they can refuse that operation. Well, what we had with the COVID vaccines was something entirely different. The doctrine of informed consent was completely ignored. In fact, there's not a single person who was asked or ordered or mandated to take this vaccine, these experimental drugs, who could possibly have offered informed consent. Because we don't know even the short-term, let alone the long-term, impacts of these drugs for human biology and human society.

Commissioner Drysdale

We had testimony on this from various people—from doctors, Dr. Christian, and people themselves who were—I believe there was one lady who was pregnant and was under tremendous pressure from her doctor to take the shot when she was pregnant, when we know for a fact, based on the evidence that has been presented to us, that the vaccines were never tested on pregnant women.

So my question is: Are you aware of any legal actions being taken against doctors or pharmacies or whoever else injected people with these vaccines, considering that they were not provided with the opportunity to give informed consent?

Leighton Grey

I've researched this and there is one case I know of that is ongoing in Manitoba that's specific to the AstraZeneca vaccine.

I can tell you that my firm has in development right now a vaccine harms class action, which will be based in part upon this doctrine of informed consent but also simply based upon the fact that the Canadian government purchased and promoted and purveyed these vaccines to the Canadian populace—either knowing or having ought to have known that

they were dangerous, that there was no way actually to have individuals provide informed consent to the taking of them.

So this is an excellent question. I think early on, Mr. Buckley was talking about this spell. As we emerge out of that—let's say, this psy-op or public haze—I see that as the next frontier. I see that as the work that must be done by members of the legal profession and indeed, the principal members of medical colleges to carry on, to prosecute these cases, and to bring the responsible people to justice.

That's something that has not yet happened in our country. It's beginning to happen in the United States. There's a high-profile case that's been brought in the United States by a man named Pascal Najadi. I had him on my podcast actually. He's filed an action against Pfizer along these lines. I believe that these cases are coming, but they are sort of the new, that's the next wave. I predict that this is going to be a very, very significant area of litigation in the next decade or so.

Commissioner Drysdale

We're talking about different areas, medical and legal, and we're talking of the basic fundamental building blocks, those things that these institutions were built upon: that you're equal under the law, that you have a right to informed consent,

[01:05:00]

and that there is an obligation to inform the patient.

There's another part of this. And that is, at least in my mind— And I don't know what the legal part of this is, but in my mind the justice system is made up of a whole lot of parts. One of those parts are the police, at least in my mind. And I don't know if that's legally true. But we have heard a lot of things and we've seen a lot of things. We saw Mr. Buckley mention a video of a veteran being pulled off the War Memorial and beaten. We saw the video of, I believe it was Toronto horse-mounted police, trampling an elderly lady in Ottawa. We saw, or believe we saw, texts or WhatsApp messages from the RCMP wanting to "get some." I don't know if that was an exact quote.

In any case, my question is: Are the police above the law in Canada? Are they subject to the same laws that you and I and my neighbours and my children are subject to?

Leighton Grey

Well, I think they have to be. I think, how can they uphold the law and yet not also be bound by it?

But what you talk about raises a deeper question that I think is part of the COVID pandemic experience. And this troubles me deeply, because Canadian society—our country, I cherish. But what makes us who we are are our cherished institutions. Perhaps the longest lasting, most severe damage—apart from what it's done to individual Canadians, to their health and their well-being and their psyche and all of those things—is the damage to our public institutions. Confidence in public health; confidence in our professions, like law and medicine; confidence in our schools, in our universities; in our justice system, in our police: all of these have been compromised. There's just no other way to say it. I'm hopeful that this process that is happening right now, the National Citizens Inquiry, is going to do much to begin that healing process.

I'm a senior fellow of a think tank called the Frontier Centre for Public Policy. I was asked to write a review of Preston Manning's original paper on the COVID inquiry. I remember reading in there that one of the goals that Mr. Manning had was that this would begin a healing process whereby we could rehabilitate, which means to restore again to dignity. We could rehabilitate our confidence in our cherished institutions, including the police and all the other ones I mentioned. Because if we don't have that, we really don't have a functioning society.

Just think of the level of confidence that exists between a patient and a doctor, a student and a teacher, a lawyer and a client, on and on and on. And if we can't trust in the integrity of those institutions, how is it possible for them to work and to function? It almost invites chaos. I don't want to overstate it but I don't think it can be overstated in this context. We have a severe and a tragic corruption of confidence in our public institutions.

Dr. Bhattacharya put this very well actually, when he was testifying in the Ingram case. Talking about the failure of confidence in the public health system, he said, "What if we had something that was as contagious as Omicron but as lethal as Ebola? What would the response of the public be now, in the aftermath of COVID? How many people would die because more than half of the people in our society now don't trust the medical establishment? They don't trust the information they get from public health."

To me, that's maybe the ultimate example of the danger of the loss of confidence in our public institutions.

Commissioner Drysdale

That is certainly one component of it. The other component of it is: I've always considered, rightly or wrongly, that the "justice system" acts as a safety valve for our society. In other words, if you've been aggrieved or if the government has done something to you, you have the confidence that you can go to these institutions and get justice.

[01:10:00]

Which is different than legal, a legal decision is not necessarily justice. But if the Canadian population who are waking up, or who are beginning to realize what's happened—perhaps through this Inquiry—and they can't go, or they feel they can't go to the judicial system because of its performance over the last three years, do you think that's an incredible danger to our society or the civility of our society? Where else can they go?

Leighton Grey

I think it's extremely dangerous. And unfortunately, we have a government in Ottawa that's more interested in social justice than actual justice and law and order and maintenance of our public institutions.

As you described, I know one very dedicated and well-meaning individual, I believe in Winnipeg, who created a report about COVID and actually inspired many Canadians to actually go to police detachments and try to get certain people charged with criminal offences for COVID outrages. I think that sort of grassroots activism is what we need.

Unfortunately, it does not appear that we're going to get much relief or change by staring at the tops of the trees. I think that we've got to have a grassroots movement in our country. We're getting down to the roots, getting involved in our communities, and trying to solve

these problems of justice, of health, of education—all of these at the grassroots level, instead of looking to governments to solve these problems.

Because it seems as though what's happening right now in our country is that our governments are only interested in frightening us into believing that we are in a never-ending state of emergency—whether it's due to a virus or the climate or public debt or nuclear war or whatever. Of course, the government comes in and says you must cede more of your liberty to us so that we can solve this problem. It's sort of like what Ronald Reagan said back in the '80s, that the scariest words in the English language are "I'm from the government and I'm here to help."

I think we as Canadians are going to have to take responsibility, individually and as communities, over our communities and solve these problems at a local level. That might mean local policing as opposed to having the RCMP. Nothing against the RCMP but I think a very persuasive case could be made for saying that the RCMP at the highest levels has been politically corrupted. I think there's ample evidence for that in the public sphere.

Commissioner Drysdale

I just have a couple of short ones—otherwise I'm going to get into a lot of trouble with the other commissioners who are squirming to ask you questions, sir.

Did you take in, or were you aware of the evidence we heard from Ryan Orydzuk?

Leighton Grey

I'm very familiar with Ryan. I've had the pleasure of getting to know him as a safety expert who worked for CN [sic, Canada Post]. I interviewed him. There's an episode of my podcast where he talks for an hour about his safety expertise and how he presented ample evidence to his company for why everything they were doing in terms of the pandemic was wrong.

So yes, I'm quite familiar with Ryan and I think he's a very courageous and intelligent man. He could have prevented a lot of anguish for CN [sic] employees if the company had actually respected the advice that they hired him to provide to them.

Commissioner Drysdale

Could this possibly form a legal vector in which folks can have their employers who enforce mandates become legally liable, do you think?

Leighton Grey

Possibly. The impediment there is again, as I spoke earlier in answer to Mr. Buckley's question, that these unions are standing in the way to a large degree. I don't want to paint them all with the same brush but the vast majority of them really are aligned with the government narrative on COVID and did not want to have anything to do with taking up grievances or taking these companies or the Government of Canada to task over these safety concerns.

[01:15:00]

There certainly is a viable argument to be made. And actually, we have a case that is before the Federal Court trial division right now on behalf of hundreds of postal workers. They're

called Posties for Freedom. And Ryan's evidence is going to be a key aspect in that case if we can get to hearing. But of course, before we even get to a hearing on the merits and have his evidence heard, we're going to have to get past this procedural hurdle to have the court even take jurisdiction to hear the case.

Commissioner Drysdale

I guess that impediment doesn't exist for non-unionized workers.

Leighton Grey

That's true.

Commissioner Drysdale

I have many more questions but I'm going to pass it off to the other commissioners. Thank you.

Leighton Grey

Although I haven't been invited yet, I would be pleased to appear on your podcast, which I follow quite regularly.

Commissioner Drysdale

We would be happy to have you—following all of the hearings.

Commissioner DiGregorio

Thank you, Mr. Grey, for coming and giving us your testimony today. I'm going to limit myself to two areas in my questions.

I think you mentioned early in your testimony that you were a member of a type of judicial selection board in the province of Alberta. Yesterday we heard from a witness, James Kitchen, about his views on needing to potentially reform the judicial appointment process. I'm hoping you can shed a little bit of light on what the process is for judicial appointments, what is the role these selection boards play in it, and whether you see any room for improvements.

Leighton Grey

It is a political process in Canada. And I don't want to suggest that there are not excellent people being appointed to the bench in Alberta and in Canada. Clearly that is true. There are excellent legal minds who are being raised up to the level of the bench.

Where I got into trouble, just speaking anecdotally, is that I actually made a public pledge that I was going to select the best candidates based upon merit and that I was going to have little or no regard to what we might call immutable characteristics. In other words, if we were selecting six judges and the six best most qualified people were black, then I would pick all black. If the most qualified people were women, then I would pick all women.

It's my particular view that in appointing someone to the judiciary, especially in Canada right now, we must have the best, most principled people appointed to that bench. We

cannot be selecting people based upon metrics like diversity, inclusion, equity. Because the problem is when we do that, it risks not getting the very best people.

And the kind of power that judges enjoy in our society right now is so great—and we've seen this over COVID—that we must have people occupying those positions who have courage and at certain times, will be able to and will exercise their authority, their discretion, even when it requires an unpopular decision.

I know James has been very outspoken about this. My concern about the process is that, particularly at the federal level, there is a screening process for appointment to the Superior Court which is done through the Government of Canada. There are people who are being appointed based upon their political allegiances. In fact, Mr. Lametti, our federal justice minister, has been really very cavalier about revealing this.

That's a very deep concern. Because of course in our system historically our judges have been a bulwark against government oppression. We need to have confidence in our judiciary that they will decide cases in a fair and impartial way. And sadly, there is ample evidence in our country that during COVID, this was not working out very well.

And it goes deeper than just the judiciary. It goes all the way down into people who are on administrative tribunals; people who are deciding human rights complaints;

[01:20:00]

or on labour boards; or at universities, who are deciding, for example, student union complaints. Or, for example, I mentioned Mr. Kitchen's client, Dr. Wall, who went before the chiropractic college. There's grave concern that these institutions are becoming politicized. And of course, that is dangerous to the integrity of our law and of our entire legal system and our system of justice.

And so there is reason to be concerned about the manner in which judges are being appointed in our country. I would like to see a thorough review of the process to determine to what extent it is in fact being politicized. And again, I have to clarify this: I'm not saying that the people who are being selected to the bench are all being appointed on the basis of their politics. I know that there are excellent people and I have friends who are judges and people I admire greatly who are on the judiciary. We have very, very talented people in our courts, brilliant people in our courts. But there is a concern about the manner in which judges are being selected in this country. And I think part of the reason why I was never given the opportunity to actually sit down and select a judge is because of my views.

Shawn Buckley

Leighton, can I just jump in for a second? I'm not trying to stop the— But if you can be a little more succinct in your answers to the commissioners, just because we've got some witnesses stacked up.

Leighton Grey

Sorry.

Commissioner DiGregorio

And so on that note, I am going to actually just note that I lied: I have three questions, not two. But this next one should be very short.

My fellow commissioner asked for the transcripts of Dr. Hinshaw's cross-examination. Were there also expert reports prepared by the Province? And if so, could we have copies of those for our record as well?

Leighton Grey

Yes. So they're a matter of public record, so we can provide you with a full documentary record of that proceeding [Exhibits SA-7a to SA-7z and SA-7aa to SA-7jj].

Commissioner DiGregorio

Thank you.

And finally, I've heard you speak today about what I think is a failure of many unions to represent employees when it came to the vaccine mandates. I'm just wondering if you have thoughts on how that process can be improved upon, assuming that the way it's been going so far is not going to reach a resolution that is satisfactory to these employees. Should they be able to have recourse against their unions when this happens? Should they be able to go around their unions directly at their employers? Do you have any thoughts on that?

Leighton Grey

I think it's something that needs to be examined. In particular, there's something called the duty of fair representation that the union owes to the workers under these collective bargaining agreements. I think one thing that's of concern is: Who are populating these tribunals who actually decide whether or not the union is discharging that duty properly? That's something, I think, that needs to be reviewed.

But I think COVID, looking at the silver lining, revealed a lot of cracks in many of our institutions. I think this whole concept of unionized labour is one example of that.

Commissioner DiGregorio

Thank you.

Commissioner Kaikkonen

Good morning. I'm not a lawyer, but I do thank you for your honest testimony.

I'm greatly disturbed—maybe that's not the right word—but aggrieved by the memories of what they did to churches and how that came about in Alberta. I'm from Ontario, so I got to watch firsthand throughout the experience of this whole COVID.

But I have a question. Going back to your earlier testimony when you started speaking about the Ingram case, it's my recollection that either in late 2019 or early 2020, a Quebec lower court asked for stronger euthanasia laws, and they gave the federal government six months to put in stronger euthanasia legislation under the MAID [medical assistance in dying] program.

As we know, the federal government first asked for an extension of six months for COVID. And then they brought forward a poorly worded—and those are my words—euthanasia legislation in response to satisfy this lower court decision.

I don't want to get into regionalization and that part of it,

[01:25:00]

but the feds have had almost three years to respond in the Ingram case and no decision has been made. Do you think that the stalling by the court—and that again is my words, that's how I'm perceiving this—will result in a passage of time argument or decision or, as we heard yesterday, a moot decision?

Leighton Grey

I don't think that that will occur in the Ingram case. But we certainly have seen that happen in other cases. Of course, many people know about the high-profile decision involving Brian Peckford and Maxime Bernier with their section 6 Charter challenge. As many people know, about seven million Canadians were unable to travel on a ship, a train, or an airplane for a very long time. And those two men, through the assistance of the Justice Centre for Constitutional Freedoms, were able to, I think, bring about a change in the law.

What happened in that case is precisely what you said. By the time that they got to the Court for a determination of whether or not those travel restrictions violated section 6 Charter mobility rights, the government had already suspended them and removed them. So the court said that the issue was moot and that there was nothing to be decided.

I don't think that that will happen in the Ingram case because the Ingram case engages also— We actually asked for damages. And we also asked for a determination of whether or not the Chief Medical Officer of Health exceeded her statutory authority in making those health orders. And that's a very important determination because if that is true, if the court makes that finding—and I happen to think that that finding is inescapable—that will open the door for many, many civil lawsuits against the Government of Alberta by people who lost their businesses and so on.

I do think that we're going to get a meaningful decision in the Ingram case. I don't think that the court can escape making decisions in that particular case through mootness, although there is a concern that that could occur in cases of this kind.

Commissioner Kaikkonen

And my second question is, and you kind of alluded to this in your testimony: Do you think there will be a trickle-down effect or response in terms of the lesser magistrates, the different ones that you've alluded to, that they ought to have known?

I'm thinking specifically of the Krever Inquiry and the tainted blood scandal, when the heads that rolled were the two top officials of the Red Cross. And yet everybody who worked there, the decision-makers that were under those two, were not held accountable or responsible.

Going forward in terms of court cases, and again you've alluded to some of this, will we see some of these decision-makers who are lesser magistrates in our society, who were equally responsible for dividing the social fabric and destroying what we knew as Canadian

society—our democracy, our rights and freedoms—will they also be brought to a place where they are held accountable and responsible?

Leighton Grey

Well, that's a question that honestly, I can't answer. I don't know. Honestly, what we are seeing right now—and this gives me some degree of hope—is we're actually seeing some very rational decisions in these lower courts.

There was a recent labour arbitration case involving Via Rail in which the arbitrator actually found that Via Rail's vaccine mandate was not a reasonable basis, a legally justifiable basis, in order to terminate Via Rail employees' employment. In fact, it might be conceivable that we're going to start to get these more rational decisions at the lower levels and that they'll make their way up into the higher courts. It's my view that we are less likely to get a change, as I say, at the tops of the trees. We're more likely to get it at the lower levels, at the root, and that will make its way up.

It's of concern, and many people realize this: the Chief Justice of our Supreme Court, Mr. Justice Wagner, made some very pointed public comments in the aftermath of the Trucker's Convoy about the people who participated in that. This is most concerning.

Also, our former Chief Justice, Beverly McLaughlin,

[01:30:00]

who's sitting on a tribunal over in China: she wrote an op-ed not long after the Trucker's Convoy, again in support of the Government of Canada's narrative.

So I don't think there's a great deal of hope that we're going to get a huge change, a policy shift, at the upper levels of our judiciary—certainly not unless and until there's a change in the government narrative that we've been talking about. I'm actually more hopeful that we're going to start to make inroads at these lower levels of court and that that will make its way up to the tops of the trees, as it were.

Commissioner Kaikkonen

And my final question is about— I'm going to start off with a quote by Albert Camus: "The only way to deal with an unfree world is to become so absolutely free that your very existence is an act of rebellion."

I'm just wondering if you have any recommendations that ordinary Canadians can do— again, taking personal responsibility—that might sway the judiciary and the government to think about what they have done over the last three years.

Leighton Grey

What I encourage people to do is to get involved at the grassroots level. One of the greatest and most common shared feelings of people in our country throughout the pandemic is powerlessness. And I happen to believe that that is by design. But that's a lie. That's not true. We all have individual personal power. We all have things that we can do.

Not everyone is an eminent doctor or a litigation lawyer or a high-powered journalist or whatever, but everyone has things within their power that they can do that can make a

difference in their families. Getting involved at the local school level, getting involved in local politics, speaking out. I think we need to do more.

There's a level of complacency. There's this spell that Mr. Buckley talked about that must be broken. And the only way to do that is to do something, to take action. I think, as a country, as a nation, we've been spectators allowing things to be done to us or to be done for us. And I think the more that we get active in our own lives and within our personal reach, that's how we're going to make the greatest difference. That's how we're going to restore confidence in our communities and in our local institutions.

Where could that lead? Where could that go? The one thing that we know right now is that— I think, there's a famous quotation from C.S. Lewis to the effect of, "Be careful about putting too much faith in one person." And with all due respect to our political leaders, I don't think that we can look to them, or we can look to a ballot box, to restore our country. I think that we have to take individual responsibility for what we can control in our daily lives. And if more and more of us start to do that, I think that is the antidote to this chaos. That is what is going to restore our country to dignity.

Commissioner Kaikkonen

Thank you for taking the time to testify this morning.

Leighton Grey

Thank you, it's been my honour.

Shawn Buckley

Leighton, on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony today.

Leighton Grey

Thank you.

In closing, would you mind if I just read a brief biblical verse I'd like to share with people who watch this. It's from Ephesians, chapter 3 verses 14 to 21 and reads as follows:

For this cause I bow my knees unto the Father of our Lord Jesus Christ,
Of whom the whole family in heaven and earth is named, that He would grant
you, according to the riches of His glory, to be strengthened with might by His
Spirit in the inner man; that Christ may dwell in your hearts by faith; that ye,
being rooted and grounded in love, may be able to comprehend with all saints
what is the breadth, and length, and depth, and height; and to know the love of
Christ, which passeth all knowledge, that ye might be filled with all the fulness
of God. Now unto Him that is able to do exceedingly, abundantly, above all that
we ask or think, according to the power that worketh in us; unto Him be glory
in the church by Jesus Christ, throughout all ages, world without end.

Amen. Thank you.

[01:35:25]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 2: Jody McPhee

Full Day 3 Timestamp: 03:16:06–03:34:17

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Dellene Church

Our next witness is Jody McPhee. Good morning, Jody.

Jody McPhee

Good morning.

Dellene Church

Please state your name and spell your first and last name for the record.

Jody McPhee

Jody Lynn McPhee, J-O-D-Y M-C-P-H-E-E.

Dellene Church

Thank you. Jody McPhee, in your testimony here today, do you swear to tell the truth, the whole truth and nothing but the truth, so help you God?

Jody McPhee

I do.

Dellene Church

Thank you. Jody, unfortunately you lost your dad to the COVID vaccine. Can you tell us about that?

Jody McPhee

On May 22nd, 2021, my dad went to the local grocery store pharmacy for his second dose of the COVID vaccine. He then went around the store and purchased T-bone steaks, asparagus, and ice cream sandwiches. All of which he did not get to enjoy because unfortunately, within 45 minutes of the injection, he was dying. He managed to drive himself home for the last time. He was hospitalized that night. And sadly, six days later he succumbed to his injuries.

At that time, I was working on a project in Weyburn, Saskatchewan. My mom had called and said, "He's not talking anymore." I said, "What, he's not talking anymore?" I couldn't imagine that. She said, "You should come home."

I went to work. I tied up some loose ends. I said, "I'll be back." And I made my way to Yorkton. Upon arrival at the hospital, I didn't even know if I was going to get to see my dad. I wasn't one of the people on the visitors list. I waited in the entrance to the hospital while they called the ward to see if I was able to see my dad. I had called my mom to find out where exactly they were because I was going to see my dad regardless. My mom said, "I will come and get you," and she made her way down the hallway. I ran to embrace her. She was about to lose her husband of 47 years. Hospital workers were screaming at us, "social distancing!" I responded, "This is my mother and I will embrace my mother any time that I want." Fortunately, the doctor allowed me to go in to see my dad.

I got there. He clearly was not well. I took his hand. I said, "Dad, I made it home for you." The doctor came in and said he was dying. At the time, I didn't believe it. He had survived so much I didn't think a needle would take him out. Either way, the plan was, I was going to go home. He wasn't expected to survive the night. They had actually told me I could bring my dog into the room. So I went to my mom and dad's house to get my dog and to get my clothes and I didn't even make it halfway across town and my mom said he had died. I feel like he waited for me to get there and then he waited for me to leave.

Upon his death, my immediate response was to warn people. In hindsight, I see how naive I was because no one wanted to be warned.

My dad's death was belittled and denied by friends, family, my employer, my Prime Minister, my Premier, my MLA, and my Member of Parliament.

Dellene Church

Jody, did the medical staff acknowledge that your dad's death was a result of the COVID vaccine?

Jody McPhee

There was a conversation at the time that it was a vaccine. They questioned when he had had it, they questioned which one he had. It was then reported to the—I don't remember what it's called, where they report the adverse reactions. It's actually reported by the doctor and the pharmacist who had administered the shot.

Dellene Church

And was any information given to the family, on making a claim, about compensation?

Jody McPhee

Yes, there is actually a claim for compensation right now. They've requested further information at this point. So we're just— It's just taking time at this point.

[00:05:00]

Dellene Church

So next for you, as a result of your dad's death from the vaccine and your faith, you had made a decision not to be vaccinated.

Jody McPhee

Right.

Dellene Church

Unfortunately, your private employer put in a vaccine mandate at your work. Can you tell us how that process works?

Jody McPhee

So I had basically— I had a difficult experience happen at work on September 21st, where I was bullied and harassed by a member of management to the point where he had screamed at my coworkers that they were to get away from me because I was going to make them sick. I asked for help that day from my employer and I did not get it. I ended up in the hospital. I ended up with a diagnosis of adjustment disorder with a heightened state of anxiety and depression. I ended up off work because of that for four months.

While I was off work, the company did mandate a vaccine on their workers. I knew about it because I still had friends that worked for the company. They were informing me what was going on and I was also having discussions with different management within the company as well.

I had been approved to return to work by my doctor and I also had a religious exemption letter from my pastor. I submitted both, I believe it was the same day. I'm not sure, I might have submitted one and one day and one the next day. With my religious exemption, I asked the HR director— I actually asked, I didn't want to be religiously persecuted for my beliefs and I just wanted to be treated the same way Jesus treated the people, with love and compassion. I actually asked for that and instead I was persecuted. I carried the cross up the hill. I mean, I was fully prepared for what was to come.

So it was not only denied, it came with a letter telling me that my relationship with Christ, along with my vaccination status, would cause a considerable amount of undue hardship to the company. They would lose income. They would lose business. It would be disrespectful to the other employees. They even went as far as to tell me that their clients and their business partners had requirements in place that would not allow that exception. So it was denied.

That response was promptly followed by an email saying that my employment of seven years was terminated. The email was signed by the HR director on behalf of my manager, who I had actually— It's interesting to note, I had had an employee review just months prior, where he told me that I was consistent— In writing actually, he said I was a

consistent contributor. My work was always exceptional and he was looking forward to all of my success in the coming year with the company.

It really hurt that he could say those things and then I wasn't even able to get fired with dignity. I didn't deserve a phone call. I didn't deserve a meeting. I basically got an email from a stranger saying, "Don't come back."

Seven years, you know, I worked—and it was seven years of sacrifice. I worked in construction. We worked away from home. We were on the road. We were doing an important job. We were essential workers. We worked all the way through the pandemic. We were building facilities to help feed the world. We were heroes. We were scared but we were going to work. I you know anyone that works away from home, you literally give your life to the company. We worked a four week on, one week off.

[00:10:00]

For seven years. And I was exceptional. I went from exceptional to worthless in just a matter of months.

Dellene Church

And you suffered a further indignity after you were fired. Can you tell us about that, about trying to return to work for your retrieving your belongings?

Jody McPhee

I wasn't allowed to retrieve my belongings. Right from the get-go, when I first went on to leave, I asked to retrieve my belongings. They told me that I was basically a danger to the workers. I don't—I don't know. It was, it was pretty awful. To this day I haven't even gotten my belongings back and I was fired over a year ago. I've tried numerous times, reaching out to different people in management on job sites saying, "Please can I get my things back." They respond with—I actually got an email, like, months after I was fired, telling me that I wasn't able to talk to anyone in the company without permission for any reason, without permission from the HR director. I didn't even work for them anymore.

Dellene Church

So your next involvement was with an application for unemployment insurance?

Jody McPhee

Right. So of course I applied for unemployment insurance. I was denied. I was denied based on the fact that the person who was making the decision felt that my faith and my religion was something that was in my head, which she actually said to me. I then waited a while. I mean, as a person, you're feeling defeated and you're feeling discouraged. I waited a while and at the very, very last minute I appealed it. And I'm happy to say it was approved based on my religious exemption. So I was paid the maximum amount of benefit minus five weeks, as I wasn't available for work for five weeks out of that time.

Dellene Church

And following that, you also have been involved now in a court application for wrongful dismissal from your employer.

Jody McPhee
Right.

Dellene Church
Is that still proceeding?

Jody McPhee
Right.

Dellene Church
Can you tell us about that?

Jody McPhee
Clearly, there's strategy involved and so I don't want to say too much but we are working towards getting justice. We have a strong group of eight. We're absolutely adamant that we will not waiver and we will not back down. We were all long-term employees, long-term loyal employees.

Dellene Church
And have you had court proceedings yet?

Jody McPhee
No. I believe there was an application to strike in play and then— We have a fantastic legal team. You just heard from one of them. We have a fantastic legal team and they're working hard for us. And we have complete faith and trust that this will work out in our favor. It has to. I mean, eventually good needs to prevail; it has to.

Dellene Church
So after your unemployment insurance benefits ran out, you've suffered severe economic consequences.

Jody McPhee
I actually didn't receive— I got my insurance benefits in a lump sum over a year after I was fired. So I mean, prior to that, it was the economic consequences. I didn't have a paycheck anymore. I had to cash in my savings. I had to stay with my mom; thank God. I mean, I had a place to stay. But I wasn't able to at that point anymore—I had just sold my home and then all of a sudden, I was fired. I wasn't able to secure another mortgage or even rent an apartment right away. My mom doesn't like it when I say this, but I was essentially homeless.

I wasn't able to work for several months and I'm still only working part time for myself. I am working for myself now. I'm not able to work for anyone else because I— This clearly, I mean, I don't have the work ethic of a person who gets fired. It's something that hangs over your head and I don't think I'll ever be able to work for anyone else ever again. Because of that fear and that damage that that's done to me.

[00:15:00]

Dellene Church

But the strength you've had— The hope today is that you didn't give up. You've gone through all these processes. You also completed online schooling during this time for a new profession. And you've recently opened your own business, you're going forward. You're seeing this through.

Jody McPhee

I'm going forward and I'm seeing this through, absolutely. One hundred per cent. I feel, it's so hard to talk about, but I feel like there's so many people out there that would have liked to have seen me hanging from a tree. But they don't get to win this, I do. Because I'm sitting right here.

Dellene Church

Is there anything else you'd like to share today?

Jody McPhee

Well, first of all, I'd like to say thank you for the opportunity. Thank you to everyone that's here today, everyone who's watching, everyone who's involved in making this happen. I feel like this is just the beginning. You know, I had been waiting for a platform to speak on and I believe this is it. So I'm incredibly grateful. I'd also just like to say something to my dad. I'd like to say: Dad, thank you. Thank you for giving your life so that I can live mine strong and healthy.

Dellene Church

And do you have any suggestions for what could be done so we don't face this again?

Jody McPhee

I think what we're doing right now, I think talking is important. And I know there's going to be days that we're going to be tired and those are the days that we're going to rest, but we don't quit. We don't quit. We don't back down. We don't waiver. And we just keep going. We just keep going. And I know personally, I've got to work on getting my carefree nature back because that was taken from me. I need to work on trying to believe that most people are good. I've got to try and get that back.

Dellene Church

I'll turn it over to the commissioners to see if they have any questions for you.

Jody, thank you for your courage through all of this and your perseverance. And on behalf of the National Citizens Inquiry, I'd like to thank you for your testimony today.

Jody McPhee

Thank you for having me.

[00:18:11]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 3: Dr. Christopher Flowers

Full Day 3 Timestamp: 03:34:22–05:00:29

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness is attending virtually, Dr. Chris Flowers. Dr. Flowers, can you hear us?

Dr. Christopher Flowers

Yes indeed.

Shawn Buckley

Okay and we can hear you. I'd like us to start by asking you to state your full name for the record, spelling your first and last name.

Dr. Christopher Flowers

My name is Christopher, C-H-R-I-S-T-O-P-H-E-R, Flowers, F-L-O-W-E-R-S.

Shawn Buckley

Now, Dr. Flowers, we have entered your CV as Exhibit SA-5 in these proceedings. But just so that people participating today have some idea of who you are, I'm going to go through a couple of highlights and feel free to say more. And then I'm going to ask you to discuss the War Room/Daily Clout Pfizer thing and even explain what the Pfizer dump is.

But you have a medical degree from the University of London. You are a fellow of the Royal College of Radiology. You are a fellow of the Society of Breast Imaging. You led the breast cancer screening program in South Wales. You are the cancer lead for the South Wales Cancer Network. You are an associate professor of radiology and biomedical imaging at the University of California. You are the radiology lead of the University of California breast cancer research program. You are an associate professor of the University of South Florida and Moffitt Cancer Centre. You are a medical researcher at the Johnson Cancer Centre. And now you are medical lead of what's called the War Room/Daily Clout Pfizer Document Investigations.

And I'll ask if you can explain, for those who don't know about what the Pfizer documents are, what this organization you are the medical lead of is?

Dr. Christopher Flowers

I'm very happy to do that, but first of all, I need to swear. I do solemnly swear—

Shawn Buckley

Yeah. I'm sorry, I forgot about that. So do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Christopher Flowers

I do.

Shawn Buckley

Oh, thank you. And thank you for reminding me of that.

Dr. Christopher Flowers

So what I'd like to do is just share some slides as I talk [Exhibit SA-5]. And you've heard a lot of the things that I've been— Basically my status, giving you some validation for my medical qualifications. But also I can enhance that, perhaps just saying I've been a clinical researcher for almost 40 years now. I've been involved in many clinical trials, mainly in the field of breast cancer screening. And in this sort of situation there is a serious balance that we have to take into account with every decision we make. And that's the benefits versus the risks, the harms. It's really paramount in our thinking. I've authored many peer-reviewed papers and also chapters and whole medical textbooks. And I've received awards from prestigious medical journals for distinction in reviewing. So that gives you a little bit of my background.

But today I'm actually standing on behalf of the War Room/Daily Clout Pfizer document investigators. We have approximately 3,250 volunteers who reviewed the Pfizer documents in response to the release of the documents via FOIA [Freedom of Information Act request] to the FDA [U.S. Food and Drug Administration] from a North Texas district court. We are a mixture of medical professionals from academia, primary care, but also nurses, pharmacists, and clinical trial specialists from research backgrounds. We also have actuaries. We have all sorts of things. And one of the key components of this that we felt was very important is that we have no financial conflicts. That means no one was allowed to hold Pfizer shares or have any trades based on any of the Big Pharma companies. All of the members who helped me produce this presentation for you today are unpaid volunteers.

The background to the Pfizer documents: these are the regular documents the FDA used to record. They required Pfizer to produce, as part of their application for the emergency use authorization. They were obtained firstly by a request by attorney Aaron Siri with a FOIA with a judge in the North Texas court, who granted the request in January of last year.

[00:05:00]

Now, one of the issues that we've highlighted is that the FDA complained they would not be able to release the documents in a timely manner and it would take 75 years. So it's like they're trying to hide things—just like there have been holds on evidence for the J.F.K. assassination, for example. But thankfully, the judge ordered them to be released over the next 12 months, which they didn't do, and gave a schedule of the numbers of pages that needed to be released per month. Now, these were huge numbers of documents and number of pages.

And so only a sort of crowdfunded citizen investigation would actually work in going through all this information and pulling out the important information. One of the important questions, I think, is: When would it have been available to regulators? That means your Canadian authorities. We know for sure that the documents were shared with the European Medicines Agency as well as the agency in Australia as well as other regulators at the time, in 2020 and early 2021.

Although many thousands of these documents have been released, the way they were released and the drip, drip, drip factor of their release: they actually obfuscate the findings. Because after three months of releasing redacted documents, they started grouping files into what are called XPT files. They're a type of SAS proprietary data file. And a lot of the PDF files, the ordinary text files, if you like: they were presented as JPEG images within this file. And of course, you can't search an image when it contains words. You actually have to do optical character recognition.

And there are many outstanding documents that we need to complete the picture of both the clinical trials and the outcomes of these trials. Because the FDA actually required follow-up of a lot of these different groupings to make sure that the data was complete. So our data teams worked around the clock every month with these new files and extracted the data into searchable Excel data files. Our data team is based, in Canada, in Vancouver, all across the U.S., in London, in Paris, and in Australia.

Our team were literally able to work 24 hours of a day every time a document dump was made to produce a searchable file. They even produced an application which is available online called Abstracta, which enables you to search any of the Pfizer documents for relevant data.

As I said, many documents refer to yet another document, which in many cases have not been released. In other words, Pfizer has made it extremely difficult to get to the truth. For example, a large number of subject case report files—these are the so-called CRF files—have not yet been released. For example, female subjects account for nearly 50 percent of the clinical trials. And based on the Pfizer protocol, all females must undergo a urine analysis testing for human chorionic gonadotropin to screen for pregnancy before both dose one and dose two. So a minimum of 43,232 HCG tests would have been administered. However, so far, only nine CRF documents have been identified to date. So obviously, they're not releasing all the information.

What I would like to do is quickly go through the clinical trials and then concentrate on some of the findings that we've been able to pull out from the data.

First of all, most of the information initially came out from rat studies. These are humanized rats called Y-Star rats. And one of the very important first things was the fact that the vaccination did not remain in the deltoid muscle but spread throughout all organs of the body, including the reproductive organs. And these rats were— Basically, they were put down and analyzed

[00:10:00]

shortly after they'd been given the vaccine for testing.

The next aspect of this was the lipid nanoparticles. They were going to be containing this BNT162b2 vaccine, which is what we had as the mRNA. And they did these testing in conjunction with Acuitas Therapeutics in Vancouver. And it was noted that there was a rapid onset of symptoms from this particular delivery system. So we were told this was something that had been well-researched but, unfortunately, a lot of the rats did not do very well after injection with this lipid nanoparticle containing the vaccine.

And here is an example of the table they produced showing increasing concentrations of lipid nanoparticles over 48 hours. And it goes up from 0.01 to 12.26 in 48 hours. But we don't have any further data because that's when the rats were humanely killed. And so we presume—or at least we're told—that the dose should be falling off, but there is absolutely no evidence of it. The only data we have is that there is increasing accumulation over a short period of time. So ovaries: we're talking about reproductive organs here. And it also occurs in the male rats: it was going to the testes.

Now the Phase 1 clinical trials, these were very shortened. Normally, safety studies take at least five or 10 years. And the BioNTech studies performed in Germany and in China only really looked at 195 subjects: 45 subjects were randomized but many more were discarded. And there's no real explanation of why this was. And they tested out various doses of the proposed vaccine.

Basically, the trial was too short and had far too few subjects to come to any potential conclusion regarding safety.

Pregnant women obviously were excluded. They had not had any evidence to declare the vaccine was safe for pregnant women, fetuses, or breastfeeding of infants. And there were far too few children below the age of 16 to draw any conclusions regarding health risks to the population.

And so they started with the Phase 2 trials. They provided a number of exclusions that were required during the trial. And the interesting feature of this clinical trial was that the full trial protocol was changed many, many times during the trial. Both before the trial, during the trial, and then after the trial—which is very, very weird. I've never come across this before in any of the clinical trials I've been involved with over the past 40 years.

So there was a total of fourteen amendments, nine of which came after the start of the phase three trial and then five right at the end. These amendment dates vary from 1st of December 2020 all the way through to 2nd of March 2021.

And here is a list of the protocol amendments with the dates. So that's a Phase 3 clinical trial. You normally have a trial protocol agreed on and approved before you start the trial. And then that is supposed to help you in analyzing the results of the trial. So if you're changing the protocol, what we're talking about here is moving the goalposts at each stage. And it just brings up more questions than giving us answers.

Here is the front page of the protocol document. But one of the things that was very interesting to me—I only happened to notice it fairly recently—was, at the bottom of this very first data sheet from 15th of April 2020, the fact that the clinical protocol template for this particular vaccine was developed on the 5th of December 2019. Now, if you remember,

the WHO only declared a COVID-19 outbreak as a public health emergency of concern in January of 2020,

[00:15:00]

and then a pandemic on the 11th of March 2020. So many months later, which makes you wonder and ask questions about: How soon did they know things were happening and was this all planned?

There were a lot of danger signals in the first 90 days after the rollout of the clinical trial. I'm talking about the 90 days after the EUA [emergency use authorization] was granted and it was rolled out, firstly in the United Kingdom and Europe and the U.S.A. These are covered in what's known as a Post-Marketing Experience document. It is the infamous 5.3.6 data dump. It was broken down by what's called System Organ Class. So they decided to say neurological, cardiovascular, things like that. But as I'll demonstrate, they manipulated these slightly—to probably hide the sheer number of severe adverse events by trickling them out into different areas.

These are the system organ classes that were used in this document. And the headline findings are that: 275 patients had a stroke; 25,957 people had nervous system disorders; 17,283 had gastrointestinal disorders; and 8,848 had respiratory, thoracic, or other chest and heart disorders. Now this is a lot of people in the first three months.

What about deaths during the trial? Now, when the trial happened, by November the 14th basically, there was a data cut off point that was required in the trial. But only 50 per cent of the subjects had been exposed for long enough to give any idea of real safety data post dose one or dose two. But it was noted that by November the 14th, there had been 11 deaths. Pfizer, however, only reported 6: they had five in the placebo but they had 6 in the vax population. So there were more people died in the trial who were vaccinated than who were unvaccinated. Of these 11 deaths, the number of deaths due to heart attacks were 2 in the placebo and 3 in the vax.

I think you can see a trend here that being vaccinated in this trial was more cause of serious adverse events and death than anything else. So the difference in deaths between the two arms didn't really become obvious until March the 13th, 2021. And that was 21 versus 17. And of the 21 deaths in the vaxxed individuals, 9 died of heart attacks. But the 17 deaths in the placebo group, only 4 of those died of heart attacks. So clearly, the adverse event signals became clearer by the end of this post-marketing document 90 days—in March the 13th, 2021. And because of all of that, really at that point, the FDA should have said, "We need to put a stop on this until we've analyzed it further."

And that's really one of the main recommendations that we would suggest for any further trials of any sort of intervention: that you don't just rush through to an emergency use authorization, but you review the actual serious adverse events and any deaths from the vaccine rollout until you've had that immediate post-marketing experience follow-up.

So to try and make the findings easier to understand, our volunteers published micro-reports based on each of these individual system organ classes. These are all available for free on the dailyclout.io website under "Pfizer Reports."

The headline findings after this 90-day rollout were that there were 1,223 deaths. Most of the severe adverse events occurred within four days post-vaccination,

[00:20:00]

and within 24 to 48 hours in 70 per cent of women and 29 per cent of men. And these were all under the age of 50. The highest number of cases were in this working-age bracket of 31 to 50 years. So if you take that overall, the main findings of the post-marketing study were that the serious adverse events were mainly affecting women in the working-age group of 31 to 30 [sic, 31 to 50 in slide]. Really quite important findings.

Also, interestingly enough in the post-marketing: there were 175 cases that were under the age of 17, which include a Bell's palsy in a one-year-old. Now remember, this is supposed to be given to people 16 and over but we had a one-year-old who had a Bell's palsy. We had another young patient, only seven years old, who had a stroke. And there was also kidney failure in an infant less than 23 months of age.

Furthermore, from this point of view there was no informed consent provided, as you know. If you compare the rollout of the Pfizer vaccine and the encouragement, we were just told it was safe and effective. But if you look at any biologic advert on TV, you'll see a quick thing about the benefits of it and then you'll have two minutes probably of, "Go and see your doctor if you report this, that and the other. Tell your doctor if this, that and the other happens." There was none of that with the Pfizer vaccine. And in fact, in the insert into the vial packet that is given out, the page actually states: "This page is left intentionally blank." Because it's an EUA product, there's no requirement to provide a fully reported insert into the vaccine packet.

Let me just mention something like Bell's palsy because this is a good example of one of the severe adverse events. I report a fellow countryman of yours, Justin Bieber, who, as you know, suffered a Bell's palsy after receiving the vaccine. And this occurred in four patients who received the vaccine but none of the placebos in the trial got Bell's palsy. The other interesting thing about this was that in the trial, the placebo patients were unblinded and then vaccinated. And those that were vaccinated, they also received similar numbers of Bell's palsy after the end of the trial, which is totally crazy. Pfizer's explanation was the numbers were small, but they made no explanation as to why they considered it to be significant. Because as you know, Justin Bieber is unable to carry on with his concerts and to sing because of this palsy; it's affecting his voice.

It's really tragic when you realize that severe adverse events are not just a one-off thing but there are chronic complications as a result because it's an ongoing situation. For example, if you have a stroke as a result of the vaccine, you're permanently injured. You were a healthy person; you received an intervention that was to stop you, in theory, from dying from an infection. But instead, you ended up with a stroke, which is now lifelong that you're going to have to suffer. And I think you can see if you follow on YouTube and search for some of these, many cases of news anchors or weathermen, for example, developing a rapid onset of a Bell's palsy on air. I've seen a number of these and it's really quite fascinating.

Let me just address something that's really, really important on this point of view. Because people have said, "Well, how do you know it's due to the vaccine?" Well, if I explain what latency is, you'll perhaps understand a little bit better. Latency is the time between giving the intervention, the vaccine in this case, and the onset of a severe adverse event. And this graph is just a compilation of all the cases from the 5.3.6 document showing the vast majority of people who had serious adverse events,

[00:25:00]

occurred on day 1 and day 2 following the vaccine.

Now, it wasn't just the post-marketing event experience documentation that Pfizer reported to the FDA. But interestingly, our friends in Europe, the European Medicines Association, required a periodic safety update report. And this is covering the first six months of the vaccine rollout in Europe. Interestingly, they gave out 238 million doses in 30 European countries. And basically, their findings are very reflective of what we found in the original Pfizer documentation. It's just scaled up to a much, much larger scale. So although people say, "Well, these side effects, these serious adverse events are very rare, we don't have to worry about it," just look at these European data if you think that.

Do you really think that 1.17 million adverse events with over 5,000 deaths in the first six months of a vaccine is nothing? You know, one third of all adverse events were serious. And the commonest age range for these, again in European data, were the 31 to 50-year-old age group. Nearly half of all of the deaths, plus 86 per cent of the adverse events, were amongst healthy people. They charted that out compared with people with comorbidities. And you'd normally expect people who have some other issue—like obesity, diabetes, and other things like that—would be more likely to have serious adverse events or deaths. But no, it was actually in the healthy 31 to 50-year-old age group. We're talking about working age people, which makes you wonder, is it targeted? We need to know. We don't have any of that information.

The other aspect of both the Pfizer document and the European Union report on the Pfizer vaccination is that nearly half of the outcomes remain unresolved. We do know, however, that 23 per cent of these patients with severe adverse events did not recover. And again, the European data confirm that women suffered these serious adverse events at a rate of at least three to one compared with men.

So a question we've been asked to address was: Was there manipulation of data? We believe the data was manipulated in a number of ways. For example, in our anaphylaxis reports, we reviewed and found they'd used what's known as the Brighton Collaborative Criteria, which is a rigorous research-orientated set of definitions, to decide whether these reports should be reported or not. This allowed Pfizer to eliminate 831 of the 1,833 reports of anaphylaxis, thereby reducing the numbers that are being presented.

Furthermore, the collection of the cases for the Brighton classification were evaluated—not by a complete chart review, which is what you would normally do, or even actual patient interaction—but it was based on very limited VAERS reports or similar sources. And Steve Kirsch and others have already talked to you in their testimony about the issues with the underreporting in VAERS. It's a very variable reporting system and often you get very incomplete information.

And to trust your data to decide whether they fitted the Brighton Collaborative Criteria is actually very concerning because we need— In a healthy population, we want to know what the safety signals are. And all these serious adverse events and deaths are, by definition, harms that need to be balanced when we're talking about doing an intervention in a healthy population. So therefore, a lack of information should not be construed as data negating the diagnosis of anaphylaxis. And we would prefer to go with the 1,833 reports of anaphylaxis.

What's the importance of revealing more clinical trial data when we're assessing medical products?

[00:30:00]

And based on just reviewing the Pfizer documentation, we believe that access to more trial data, human clinical data collected at the site level, should actually be available as an open source. A population who are involved in a trial should be able to have their data analyzed by various people, and not just go to the sponsor—the sponsor being in this case Pfizer. Because then there's no way that the data can be manipulated in any way in the presentation of the findings to help them with a particular narrative.

So we believe that there wasn't enough information to provide the vaccine prototype being 95 per cent effective as reported. We believe that it was unsafe based on the raw data that we have managed to compile from all the CRF data and others from each of the sites during the clinical trial. We also believe that the raw trial data should, when you're analyzing it, include people who are qualified but have no conflicts of interest.

And I think this has been a really big problem with the committees that basically provide the recommendations to the FDA, for example, to rubber stamp a product for an EUA, for example. We believe that these people should not be incentivized, because if you're promised a good job with Pfizer or in Big Pharma after you've already authorized their product, then you're much more likely, obviously, to be compromised in your thinking and not being critical. Because the FDA— Back in the day, I remember submitting and being part of the submission process for clinical trials. And it was a struggle to get things past the FDA; they were protecting patients. But in the last few decades, they've really become compromised with the amount of funding coming in from Big Pharma.

We also believe there is a need for ongoing analysis of the data even after the product has had the emergency authorization or been administered to the public. As I mentioned earlier, it was clear from the post-marketing experience: There were both an unexpected number of serious adverse events—in fact, enough that Pfizer had to recruit another nearly 2,500 additional analysts just to cope with the sheer number of adverse events that were occurring. These adverse events were classified by Pfizer, by the sponsor. They consistently said in their reports of each of these as though there were no new safety signals, which we believe based on the findings that we've reviewed is not justified at all. It really should have been brought up to the FDA immediately. So this function should have been performed by a trusted public body with no conflicts of interest.

And I know we've heard from many people during the testimonies over the last couple of months that people are losing their faith in the medical profession—in the three letter agencies that are supposed to protect us from harms. And really, we need to come to some form of arrangement whereby we can have a trusted public body that is responsible to the population with no conflict of interest. Because if this had been actually done in the correct manner, it is likely that the trial would have been stopped immediately, just like it was done many years ago when the swine flu vaccine was being trialed. They had a number of deaths and immediately they halted the clinical trial. Well, why didn't that occur in this particular trial?

I'd briefly like to talk about the definitions of adverse events when it regards the time limit imposed. That was a question that was asked of us. Pfizer had 14,565 unique subjects who expressed 36,567 adverse events. Now, that's a lot of them. And the onset of these adverse events was anything from one day to 213 days. But as I've shown you with what's called the latency, the vast majority of these occurred within the first few days after administration of the vaccine.

[00:35:00]

That gives us little doubt that it was associated with the vaccine itself. Anything that occurs within the first few days, definitely—but certainly up to one month after the vaccine is administered. The big problem that we have with adverse events and biologics is that they're very different from standard drugs—for example, like a toxin like a chemotherapy drug. Because they've got different metabolism and clearance, as well as the possibility of immune suppression, we believe a longer period of observation is very important, particularly when looking at development of cancers and both infertility and birth defect potential.

And that is really where the very initial Phase 1 trial should have been properly done. This few-week Phase 1 trial was very, very poorly done and you can't possibly get reliable safety signals from such a short-term trial. The other aspect of this is that, unlike small molecule drugs, where you know how the drug is eliminated from the body—whether it's through the kidneys in the urine or it's through the liver and out that way—they're well-known and well-studied. The problem is that this mRNA lipid nanoparticle platform is still being elucidated. I mean, I was very concerned when I first came across this because we know that lipid nanoparticles can traverse every membrane of the body because it's got this fatty component that enables it to pass.

You have things called membranes in the body that separate important organs—for example, the brain from the circulation called the blood- brain barrier. And it does a very effective work in preventing toxins crossing from your blood into the brain. Now that's why, for example, chemotherapy doesn't work well with brain tumors—because it just can't get across very easily. But the lipid nanoparticle goes straight through the blood-brain barrier. Similarly, it goes across the placenta, which is supposed to protect the unborn child, which is why Pfizer in their clinical protocol stated very, very clearly that you had to avoid getting pregnant and having injections if you were pregnant. They actually said in the clinical trial documents that if you were going to have sexual intercourse, for example, if a male had had a vaccination, the male needed to use at least two reliable forms of contraception to avoid pregnancy if they'd been vaccinated. So they were aware there was going to be a problem. And the reports after vaccination of what has happened with patients and the colour of their breast milk, the failures of thriving, the effects on the placenta: all of these things are concerning because of the effect of this platform being able to cross multiple membranes.

The interesting thing if you look at this is that, very recently in a viral video, Dr. Fauci was on the doorstep of someone and he was trying to encourage them to get the booster vax. And he told these residents that this platform was perfectly safe. It had been researched for 20 years. And in fact, Dr. Peter McCullough, when he did his testimony in Truro, he shared that the platform was being researched back in 1986. The involvement of the U.S. military in the development of manipulation of viruses by gain of function, with the vaccine being produced as a prototype under another transaction agreement with the Department of Defense, really gives one pause that this potentially could have been a biomedical terrorist type of activity against our own population and the Western population. Should the Department of Defense really be involved in manufacturing and distributing vaccines? What's happened to the oversight of this? Did the world know that this was happening? I mean, we're only beginning to know now

[00:40:00]

the extent of involvement of the Department of Defense in the development of vaccines.

So hopefully, this will give pause to consider using this technology until we know much more about the safety profile—especially of the lipid nanoparticles, of which 50 per cent of the composition is polyethylene glycol, which you may have come across as colonoscopy prep. But it's not really supposed to be given into your blood because it takes a long, long time to try and break that down and excrete from the body.

But what about the regulators and their competence to assess a novel vaccine platform? We have to remember that government regulators are bureaucrats. They're not experts, generally, in their field of occupation. Regulators rely on outside experts like the data safety monitoring boards and the institutional review boards. However, the FDA's oversight of clinical trials is extremely lax. It's slow-moving and it's secretive. Moreover, due to the pandemic, the use of on-site, no-notice inspections was paused. So you never had the real oversight of clinical trial sites that we used to have back in the day.

We are still looking, and we haven't found, official action-indicated reports for this Pfizer study. So they're saying that, "Well, nothing serious happened." But we've seen evidence that there was fraud going on in some of the clinical sites, whereby Pfizer gave taxpayer money to these sites who basically didn't do the trial properly. For example, Brook Jackson's Ventavia case: she saw so many cases of not following protocol and so many protocol deviations that trial should have been stopped. And when she complained to the FDA, the FDA got her basically sacked from Ventavia as a clinical researcher. And that trial is still ongoing in South Texas.

So I think there are three disqualifications and closures that leave trial participants and others in danger. This includes the closure of site 1161, which was Darrell Harrington in Benchmark Research in Texas; he was found missing in action. Site 1068, the Bozeman Health Clinical Research in Montana; he had 84 out of 119 subjects with important protocol deviations and 44 exclusions and they were removed from the study in March 2021. FOIA reported violations of protocol by site 1231, which was the biggest contributor to the clinical trial in Argentina in the military hospital there in Buenos Aires. And since the clinical trial, the Argentine government have actually removed the authorization to do clinical trials with Fernando Pollock and his company, the iTrials Clinical Research in Buenos Aires, because of these protocol deviations.

I'd like to end up with some ideas on the mechanisms of harm. Because the reality that we're coming to is: yes, there are harms from the deposition and accumulation of things like lipid nanoparticles in various parts of the body, including the testicles, by the way, which also affects fertility in men. But most of the effects seem to be due to what we're beginning to call spike protein disease. The NIH [National Institutes of Health] call this long-COVID or long-haul COVID. But spike protein has now been found in every part of the human body. Autopsy studies by Dr. Burkhardt in Germany and others have actually demonstrated this when they stain for it in autopsy specimens.

So what should have given researchers pause when developing this novel vaccine platform? Well, as I mentioned, or alluded to earlier, lipid nanoparticles: they cross normal defensive membranes. So that's number one. But number two is mRNA, which can be incorporated by reverse transcription into human DNA. Now, this is supposed to be short-lived, but there is evidence from some sequencing data that it has been incorporated into DNA.

[00:45:00]

We've effectively turned our own human cells into mini spike-protein factories with no off switch. An end codon, as it's known, was incorporated into it. We're told that spike protein stops being produced at a period after the vaccine. But it's clear that in some people, the spike protein continues to be made. And there are a lot of people looking at how one can detoxify from spike protein. But at the end of the day, we need far more research into understanding spike protein, the spike protein harms, and what potential mechanisms can we use to remove this from our body.

That has left us with many questions that still need to be answered, indeed. But hopefully, this has given you some idea of the extent of problems with this Pfizer clinical trial and the vaccine itself. So I thank you for your time.

Shawn Buckley

Thank you for that presentation. Dr. Flowers, you had just mentioned that authorities are calling this, I don't know, spike protein disease as long-haul COVID and we've heard that in the media. Is long-haul COVID caused by contracting the COVID virus, or is long-haul COVID a result of vaccination, or is it the result of both exposure to the virus and or vaccination?

Dr. Christopher Flowers

Yes, again, the NIH have set up a RECOVA program, it's R-E-C-O-V-A. And they initially appointed Dr. Fauci, would you believe, as one of the executive directors of that. That made us very concerned, but all they were going to be looking at were, "Oh, this is a result of the COVID illness, and therefore you need more vaccines to try and prevent this happening." That seems to be the thrust behind it.

But we know that spike protein disease can occur after you've been vaccinated but also after you've had COVID itself, which is why some people have really quite chronic, ongoing illness as a result. So I think spike protein disease is a good overall discussion we can have. And it's a good way to go forward, looking at the spike protein: how we get rid of it and its effects. Because only by understanding this little factory that's been put in our bodies will we actually understand how to combat it and get rid of it, maybe able to turn it off even.

Shawn Buckley

Now, you had mentioned in your presentation that females are over-represented as having adverse reactions. Can you speak to what are the main adverse reactions that females are experiencing?

Dr. Christopher Flowers

Oh, my goodness, as virtually every single type of reaction you can get from strokes all the way through to heart attacks and autoimmune disease, allergic reactions. But furthermore, I think the more concerning of these is, because they're young working-age women, that it's affecting their reproductive capability, their fertility. We know, for example, that people are having problems with their menses, their periods. They're having heavy bleeding, more frequent bleeding, lots of blood clots, pain with the menses, all sorts of issues. But also, we found people are having much more trouble conceiving.

Then there's the effect on breastfeeding and the failure to thrive of infants of mothers who've been vaccinated. We know that the lipid nanoparticle crosses the placenta and gets into the breast milk. You can see changes in breast milk, changing from the normal whitish

colour to bluey green, which is more like the feces of a baby who's been changed to cow's milk; It changes from yellow to bluey-green. So it is very worrying that this sort of thing is happening.

[00:50:00]

Some of the midwives have recently come out and been whistleblowers, telling us about the placentas they're now seeing after childbirth—that instead of the normal plush, thick, very healthy-looking placenta, you're getting thin placentas with sort of fibrous areas and white areas which basically represent calcifications. So the placenta is not working properly either as a result of this.

So again, there's a lot of work to be done, but it seriously affects women in very diverse ways. But more concerning we believe, is the effect on fertility in women and failure to thrive of infants. So it almost is like a war on women, you know? Okay, it does affect men, but when you've got a ratio of between three and four times as many adverse events in women than men, it just raises more questions than answers.

Shawn Buckley

Now, when you speak about reproductive problems, is it possible that women are not experiencing adverse reactions but their reproduction is?

Dr. Christopher Flowers

That is very possible—but also don't forget there's the equal effect on men, with the lipid nanoparticles being taken up in the testicles. For example, one of the post-mortem studies, the autopsy studies from Germany: they did a cross section of the testes in someone who died suddenly. And it actually showed conglomerations of these hard fatty particles of lipid nanoparticles inside the testicles themselves, which were affecting both the Sertoli and the Leydig cells, which are the ones that basically both provide us with sperm and with the supporting secretions that enable healthy sperm to take part in fertilization.

So you've got the effects on both women and men: problems with ovulation, problems with fertilization. And then of course, because of their issues with menstrual cycles, we presume that there is also going to be problems with implantation, that there is probably something going on with the uterus itself. But as of yet, we don't have any firm evidence, so I can't give you any more information on that.

Shawn Buckley

Thank you. In the Pfizer documents, is there revelations about what the ingredients are? If I asked you, "are you confident that the ingredients have been disclosed to the public," how would you respond?

Dr. Christopher Flowers

I'd like to say they've been fully transparent. But—we know from their documents they have not been fully transparent about anything. We do know, for a start: there are a lot of issues with the manufacturing process, especially early on, when most people were being vaccinated. Which is why certain batches, for example, gave far more serious adverse events than others.

For example, the issues in making sure that there was equal amounts of mRNA in each of the lipid nanoparticles: sometimes it depended on whether you got one of the first shots from the vaccine or one of the last ones from the vial, because the concentration varied throughout the vial. Which is why, in the instructions for giving the vaccine, they told you to invert it gently five times before you drew up the vaccine. And so there was that issue.

There's a second issue and that's with contamination. Contamination of the vaccine itself: they found particles of steel, there have been some heavy metals present; and part of the QA process, if you like, is to observe the Pfizer vials. They have a light table where the vials go on and you can see; if it's cloudy, those batches are pulled. But also, not only that, there are some issues where people think there is graphene oxide present within the vaccine. Now, there has been some findings of that, but it doesn't seem to be consistent. More appropriately is the question about aluminum oxide,

[00:55:00]

as was found present in vaccines going back some time. There are worries that aluminum causes problems in children that is fairly longstanding and has caused potential harms in children over the years. And so again, the contaminants of the vials is very important.

But they also had to be transported at ultra-cold temperatures. Pfizer required the use of specialized freezers to transport the vaccine; it was only allowed to be brought up to room temperature at certain times. And they were also very, very clear that you had to avoid vibration of the vials because it would disrupt the lipid nanoparticles. And that's why they talked about, when you mix the vial, you just move it gently. So they were very concerned about all of these things that made you wonder whether the manufacturing process itself was up to normal distribution practice that is generally accepted throughout the industry. And it's fairly heavily regulated. But you look at the contracts with, for example, the European Union for the production of the vaccine, they actually had a paragraph within the contract itself that removed the requirements for good distribution practice from the production of their vaccine. Which just raises questions again: you know, they obviously knew it was going to be a problem with good distribution practice when it comes to their vaccine that they specifically excluded it in the contract.

Shawn Buckley

Now, you're an expert in analyzing clinical trial data and you've spent an enormous amount of time with the team behind you doing this. In your opinion, is the Pfizer vaccine safe for the human population?

Dr. Christopher Flowers

Certainly not. I believe that the benefits are outweighed by the harms tremendously—and definitely since Omicron. Of course, we've gone past Omicron now. We're into all sorts of new territory of, basically, what is a common cold. And there is absolutely no reason to vaccinate someone when you've got a chance of having such a severe adverse event which may affect you for the rest of your life.

Shawn Buckley

Aside from other adverse reactions, would you think that it would be safe—just based on the reproductive problems and menstrual problems experienced by females—to permit this on the market for the female population?

Dr. Christopher Flowers

The answer is no. It should not be used at all in the female population, especially in people who are under the age of the menopause. That's actually been taken up by some of the European countries. They've actually banned the use of the vaccine in basically, anyone under 75, unless there's a really good reason. There is absolutely no reason to offer this as a routine procedure. And yet in the U.S.A., it has now been added to the childhood vaccine schedule, which is extremely worrying because it's affecting our kids, who don't need this vaccine whatsoever.

Shawn Buckley

What do you think is going on? Why do you think that's happening? Because we're vaccinating kids in Canada as we speak.

Dr. Christopher Flowers

It's compliance? I have no idea. I can speculate all you want; I come up with all sorts of theories. But for me the evidence is quite clear that there is no reason to vaccinate children, who we know are extremely unlikely to suffer from deaths or serious injury from COVID. They're far more likely—especially if they're teenagers and teenage males in particular—to get myocarditis.

And myocarditis is actually a very serious condition. If you're someone who's going into college sports, for example and you've got your eyes set on either playing for the Montreal Canadiens or you're going to be going for the National Football League, you've got to be really fit. And myocarditis is something that can be subclinical. In other words, you don't have any symptoms until you suddenly start exerting yourself and you'll start being short of breath, for example.

[01:00:00]

But of course, can also cause sudden unexplained death, sudden unexpected death. We nearly saw that with Damar Hamlin: This was not an effect of being hit in the heart. He had all sorts of issues and this looks far more like myocarditis underlying this. And a healthy person— Well, he died and was resuscitated several times when he fell on the field.

So definitely not for children; absolutely not, there is no reason. I would urge the Canadian citizenry to elect people who are going to protect you from harms. And that is their main job—is to protect your population from harms of any pharmaceutical intervention from outside influences, people buying up your land, and stopping you being able to produce your own food.

Shawn Buckley

Can I just ask you and it's still on the children thing: Should parents have any concern in vaccinating their children as far as affecting their children's ability to reproduce?

Dr. Christopher Flowers

Yes. Based on the adult information we have, it's bad enough for them; but for children, it's far more important. Because when you think about it, the development of the reproductive organs in children and young adolescents: that's the time when they're forming all their important potential future offspring.

Okay, the eggs, for example, are already present in the ovaries right at the beginning. But it's the supporting cells, it's everything that aids reproduction that can be damaged by the vaccine. And there is no benefit to the vaccine, so therefore, why would you even consider vaccinating your children?

Shawn Buckley

Thank you, Dr. Flowers, I have no further questions but the commissioners have some questions for you.

Commissioner Massie

Thank you very much, Dr. Flowers, for this excellent presentation. I have a couple of questions. The first one is about the extensive review that is ongoing, as I understand it, of the data from the Pfizer file. How long do you think it's going to take before you go through the bottom of it?

Dr. Christopher Flowers

Well, unfortunately, we know that we still haven't received all the documents. We thought that by December or January, we'd have had the last data dump. But they do produce data document dumps on a regular basis—although they've started to produce some more redacted files right now. And that is a worrying trend because we used to have redacted files right at the beginning and the judge managed to ensure that they got them unredacted. So they're hiding a lot of information.

But from our analyst point of view, we're missing so much patient data that's really important: For example, as I mentioned in the presentation about the human chorionic gonadotropin assays that were supposed to be taken before dose one and dose two in the females in the study, those have never been produced. Furthermore, we don't have any of the follow-up studies that were mandated by the FDA but still not produced.

Do I have any trust that Pfizer will actually provide these for us? I have to say at this juncture, I don't feel they're going to do it. They're not going to give us all the information. We're expecting in the latter documents that all the bombshell allegations that have almost been conspiracy theories right from the get-go finally turn out to be true. Fact is worse than fiction in some ways. And we expect that to happen during these final months.

But as I say, I don't think we've seen the end of this. I think they're hoping to draw things out until the Moderna files get released in July of this year. Because then the pressure will be taken off them and maybe they'll be able to slip things out later.

Commissioner Massie

If I understand what you're saying, you're expecting that maybe when you will have additional information, should you get it anytime soon,

[01:05:00]

you'll find other interesting information that would be even more concerning than what you have found so far.

Dr. Christopher Flowers

Yes, indeed. That's exactly what we believe. All the members of the team, all the data people: you can see they've missed out in the patient files. We have so many different columns but there are important columns that are missing. They've only got minimal data. And that data was required to be collected and it is so important data that it relates to the condition of the patient at the time of the vaccine and the subsequent outcome. And so we need all that information. And so because they haven't provided that information, it just increases your concern that there is something serious going on.

Commissioner Massie

My other question has to do with this whole platform of mRNA technology that is now being promoted as a way of the future for vaccination. I understand that, in the case of the COVID vaccine, one of the issues is really the toxicity of the spike protein, but there's probably more to it than just that with the lipid nanoparticle that plays a role.

If we are continuing to push the premises that this platform is safe and effective and we're just distributing it to every other type of infection prevention, is there a risk that the kind of issues we're seeing right now with the COVID platform will just repeat itself? Unless the regulatory agency is really increasing their scrutiny on the production and all of the other aspects of the clinical trial. What do you expect will happen in the current regulatory environment?

Dr. Christopher Flowers

Yes, well, I thank you for that. That's a very important question. And in fact, that's already been going ahead because the annual flu vaccine, this time, was also an mRNA vaccine. I refused to take the flu jab this year. I said I'm not taking any mRNA vaccine ever again. I know the side effects.

I had a severe adverse event myself from a booster with something called rhabdomyolysis, where your muscle sort of almost turns to jelly and you get bleeding and blood clots in your arm. And it was really quite something. And I'm never going to take an mRNA injection again unless they can prove to me— They need to prove to me that the platform is safe and effective. The biggest problem I have is that mRNA is an under-researched platform and, in my opinion, should never be used again.

But the FDA are queuing up mRNA vaccines. Moderna have already released, for example, their plan for a whole slew of mRNA vaccines. So without changes at the FDA, but also changes locally in your own federal regulatory authorities: they need to start taking notice of this and start asking questions to protect the population. I mean, I was gobsmacked to find that the MRHA [Medicines and Healthcare products Regulatory Agency] in the U.K., for example, just kowtowed to the FDA and just took their data without analyzing it. And are just taking the recommendations as gospel, as it were.

And each country really needs to start to be more responsible for their own population. Now I know you've had issues up in Canada, as other countries have as well, with your regulatory authorities. And the over overarching arm of government has caused lots of problems. But the mRNA vaccines will continue just to be accepted as is, as a platform that's been accepted. And yet it hasn't been accepted—not by the rest of the scientific community. We have to do the research. The basic research has not been done.

Commissioner Massie

I have a question about the quality of the batches that seems to at least trigger, based on analysis, a different number of adverse events.

[01:10:00]

And one hypothesis to explain that would be that the quality of some of the batches could have been very bad and therefore didn't really express spike protein. Or was not of the right quality to do that, or could have had, as you mentioned, contaminant. So that those hypotheses could be actually competing hypothesis.

One way to address that would be to have data—very large data on the population that have been vaccinated and see whether or not they are expressing antibody against spike. Are you aware that this kind of analysis was done in order to follow up the vaccination?

Dr. Christopher Flowers

Not as yet, they have not done anything like that. And the other thing I perhaps ought to have mentioned was: some of the contamination was from DNA, from the *E. coli* that are used to manufacture mRNA.

And there have been several studies out now showing that some batches had incredible amounts of excess DNA, which were well above the normal national standards for use in vaccines. And these contaminants sometimes got sequenced actually in the spike protein itself. There was a paper very recently, last month, that showed that one of the *E. coli* super toxins was actually encoded in the spike protein DNA. It's just absolutely amazing.

You have to understand the manufacturing process, that it starts off with a big pool of colonic bacteria, basically *E. coli*, *Escherichia coli*, and they're the ones that are used to manufacture the mRNA. They're supposed to remove most of the *E. coli* DNA and separate out the mRNA, but there's always going to be some contamination. But in many instances, the papers have demonstrated that the DNA from the *E. coli* was far above the highest level permitted in the national standards. So it makes you wonder.

Commissioner Massie

You also mentioned that you had to really assemble a huge team of volunteers in order to analyze the data from Pfizer. And given the resources in the regulatory agency, maybe they're not staffed to the level to do that kind of analysis. And this would probably call for external people to do it with the right, I guess, incentive—without conflict of interest and anything like that.

Could you propose some way that it could actually be done? Because just relying on volunteer people like your team to do this kind of analysis for all of these platforms that are coming right now is going to be a significant endeavour.

Dr. Christopher Flowers

Yes, you're absolutely right, sir. And I mean, I commend what you're doing. The National Citizens Inquiry is almost, and what we're doing with the citizens' investigations, is an example perhaps of how we need to start going forward.

What we don't want to do though, is to become employees of the government, become bureaucrats. The important thing is to try and recruit people, like a voluntary thing a bit like, but people who can say that they have no conflicts of interest, that can be proven as well. And then taking part perhaps for six months at a time, three months at a time, who knows?

I mean, there may be people who are willing to do that sort of thing. And I think the War Room/Daily Clout volunteers project shows this can be done. It takes good management, it takes effort, and it takes motivation—and you need someone at the top who's charismatic, who can give that motivation to you. We're lucky in that we had Steve Bannon calling for people to respond. We had Naomi Wolf, who's a fearless female advocate, a feminist advocate who also is one of our front-facing people, and helping to organize us with her COO, Amy Kelly, to provide this sort of investigation, an investigative process.

Doing it at a federal level, as an oversight, I would love for it to come from the citizenry.

[01:15:00]

But I fear that even if this was agreed to by the federal authorities, that it would end up being yet another government bureaucracy and with the tendency to be corrupted by outside money—whether it's from the Chinese Communist Party, whether it's from Big Pharma or other interests. Things are likely to go downhill very, very quickly, so it would have to be truly, truly independent.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Good afternoon, sir. One of the things that I have been hearing over and over again is talk about informed consent, is talk about terminology. And I'm old enough to remember when it certainly became obvious that terminology mattered. There was a term that was used in the mid-1960s that was called "collateral damage," and we all know what that really meant, but they called it collateral damage. I remember a famous quote by Mr. Clinton about, "It all depends on what the definition of the word," I think it was "'it' is."

And when I listened to yourself and a number of other witnesses—and I also listened to Mr. Buckley's question about spike protein disease, and they call it long COVID. When we had a witness in the other day, they were talking about a biologic—and that this was a biologic—but they reviewed it under the requirements of a vaccine. And that a "vaccine," that definition changed, and it seems that the terms "safe" and "effective" changed.

Can you comment on that? Is that something common? Is that something that's just occurred now in this era? That words don't mean what they mean and by changing a word, you can completely change the safety protocols, et cetera?

Dr. Christopher Flowers

You're absolutely right what you just said. Absolutely right, spot on. The definition of language seems to change every day. We get redefinitions of various things. Everything seems to mean something else these days.

And I don't think you should forget that some of the three letter agencies in the U.S. actually have units that actually are there to develop narratives. And use ways of interpreting and changing language using social media, using the captured mainstream media to reinforce the message that gets the change of that word accepted.

And some of the information I have come across—in confidence, I can't say anything more—makes me very concerned that whatever we do, if we don't reform these, or get rid of some of these three letter agencies, we're always going to be up against it as citizenry. That we're never really going to have anything that's safe, never mind effective.

I mean, all this business about safe and effective: it was neither safe, as has been proven, and it was never effective either, to preventing COVID or stopping you from transmitting COVID. I remember all that thing about transmission or it prevents transmission. And then they said, "Oh, we never tested it for transmission," quite rightly.

So no, I believe that behind the scenes, government is working against us. And as a citizenry, in each of our countries, we need to take back our country. And that's the only way things are ever going to change. Because the way we're going right now, things don't look good for the future.

Commissioner Drysdale

One of the slides that I believe you showed had to do with the schedules of the original trials. And if I'm correct in what I saw, it looked like certain phases of the trials completed in late November. And then the Canadian government did a press release, I believe it was on the 10th or 12th of December,

[01:20:00]

saying that they had done a rigorous evaluation of the science and that it was safe and effective. And I'm wondering: How is it possible that the Canadian government, Public Health, could have done that kind of investigation in two weeks' or three weeks' time?

Dr. Christopher Flowers

Well, we know that that is likely a tall tale, as they say—or a fable, as the Greeks would say. I think it's evident now that the different governments relied on the FDA. They did what the FDA told them. If the FDA said it was safe and effective and then rigorously tested, then they agreed.

We've watched the presentations from these committees that basically put up the vaccine for approval for rubberstamping by the FDA. They did not do due diligence themselves. There were presentations of "fact" by Pharma or Moderna or whoever. And they're the ones who did the analysis. They provided that information to the FDA committee and the FDA committee said, "Oh, thank you very much. That's wonderful. It's definitely safe and effective. Let's go ahead and let's approve this vaccine."

So the answer is: What your government said was a lie. We know that—just looking at it ourselves as professionals, independent professionals—that it was a lie. So how many times do you have to say it's true before it becomes a lie?

Commissioner Drysdale

We had previous testimony that there seemed to be a great deal of conflict of interest within the FDA. And I think, I don't recall the name, but someone had said that one of the high-up officials in the FDA or the CDC is now a vice president or something at Pfizer. Can you comment on that kind of, I don't know what the word is, integration between—?

Dr. Christopher Flowers

The precise term for it is "regulatory capture." A lot of us, as researchers, we get funding from, for example, the NIH. So for example, I did an RO1 grant application from the NIH. Now, one of the people who approves some of these grants of course is Dr. Anthony Fauci. And if you upset Dr. Anthony Fauci or Francis Collins at the top end of the NIH, it doesn't matter what score you get on your application for research funding, you don't get the money.

So it starts at the very beginning with the researchers that a) you have to research something that the higher-ups will approve of. Otherwise, you won't get funding. If you don't get funding, your tenure at your university is in jeopardy. Your contract may not be renewed at the end of the financial year. So there's a lot of pressure on researchers.

Okay, the next thing to do is of course: if you start getting research grants from Big Pharma, basically, you don't necessarily benefit it directly, but you benefit indirectly because it helps you with your tenure. And then you become an expert for that company in the regulatory authorities—so like the VRB PAC, who responded to the FDA and analyzed the vaccine trials.

And then you've got the FDA themselves. And the funding for the FDA is through Big Pharma. I think the last count was 65 per cent of funding is from Big Pharma. I mean, how come when we're giving billions and trillions to Ukraine, and yet we're not funding directly the FDA to make sure that things are safe and they are effective before it's given to the population?

So we've got that. And then of course there's the rolling door, just like there is in Congress, for example, where someone has gone in quite poor into either the House or the Senate, and then they come out quite rich. And immediately they roll into a lobbying job for some company or other, whether it's in the military arms complex or it's with Big Pharma.

[01:25:00]

And it's like, as soon as you finish with your committee, off you go to Pfizer, you go to Merck, you go to Johnson & Johnson. And you have a very well-enhanced package of remuneration given to you for your long years of service to the FDA. "We would like to thank you by giving you this enormous salary and these fantastic benefits. Enjoy your yacht in Monaco please, sir."

Commissioner Drysdale

So what you're saying is that we've got the wolf guarding the sheep.

Dr. Christopher Flowers

That is unfortunately true.

Commissioner Drysdale

Thank you, sir.

Shawn Buckley

Dr. Flowers, I believe that is all the questions we have for you. On behalf of the National Citizens Inquiry, we sincerely thank you for your testimony today and the assistance you've given.

Dr. Christopher Flowers

You're welcome. Thanks very much for having me.

[01:26:07]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 4: Dr. Magda Havas

Full Day 3 Timestamp: 05:48:15–07:00:11

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

We welcome you back to the National Citizens Inquiry as we continue our live hearing in Saskatoon. I'm pleased to announce our next witness, who is attending virtually: Dr. Magda Havas. Magda, can you hear me?

Dr. Magda Havas

I can.

Shawn Buckley

We see you on the screen and up in the corner and we've got your slide presentation. But I wanted to first of all ask if you could state your full name for the record, spelling your first and last name.

Dr. Magda Havas

Magda Havas, M-A-G-D-A H-A-V-A-S.

Shawn Buckley

And Magda, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Magda Havas

I do.

Shawn Buckley

Now, I'm going to introduce you a little bit and then I'll kick you loose to do the presentation. I will indicate for those participating that Dr. Havas' CV is appended as

Exhibit SA-1 and will be available online. It is 54 pages long. Dr. Havas, you're a professor emerita at Trent University with expertise in environmental toxicology, is that right?

Dr. Magda Havas
That's correct.

Shawn Buckley
And you've published on COVID-related illness and death. Your primary concern is the health of humans and other species related to environmental toxins.

Dr. Magda Havas
Yes.

Shawn Buckley
And my understanding is that you were one of the first scientists to identify the dangers of acid rain around 1970. You did this by traveling around the High Arctic in Canada, measuring the sulfuric acid in the water cycle from natural sulfuric vents in the Earth. And your early work was recognized by environmental activists, who lobbied for 15 years with you as their scientific advisor, and ended in Mulroney and Bush signing into law the US-Canada Air Quality Agreement known as the *Clean Air Act*?

Dr. Magda Havas
That's correct. I was one of many scientists.

Shawn Buckley
Okay. Well, my source indicates you're one of the first, so we're going to run with that.

And after the work on acid rain, you became interested in electrical frequency effects on human health and lectured worldwide about it for two decades, along with your tenured position as professor at Trent University. And a few years ago, I'm told you had so many speaking requests for medical conferences that you took a one-year sabbatical, basically, to tour the world as a speaker on these topics.

So you're nodding, but this is being recorded.

Dr. Magda Havas
Yes, yes.

Shawn Buckley
And I do that introduction just so that people appreciate that you are one of the world leaders on basically, environmental effects on humans and on basically, electromagnetic frequencies or radiations and their effects. So I'll ask if you could proceed with what you had prepared for the Inquiry today [Exhibit SA-1b].

Dr. Magda Havas

Thank you very much.

I'd like to thank you for giving me this opportunity. And what I would like to talk about is a possible connection between COVID-19 and radio frequency radiation. And I'd like to start with four postulates. These are ideas or theories to start a discussion, all of which are based on scientific evidence.

Postulate 1 is that radio frequency radiation—and this is coming from a lot of our wireless technology—impairs the immune system, which increases the risk of infections. And this could lead to a higher case load and a higher death load.

Postulate 2 is that severe infections, which I call biological trauma, can increase sensitivity to radio frequency radiation and other toxins. And it could increase the risk of developing EMI. I call it EMI cubed.

EMI cubed stands for: electromagnetic interference, electromagnetic illness, and electromagnetic injury. If the interference is prolonged, it could relate in illness. And if the illness is severe it could result in injury. Injury can also be due to acute exposures to high levels of radiation.

The technical definition for electromagnetic interference is unwanted noise or interference in an electrical path or circuit caused by an outside source. EMI can be caused by natural and human-made sources. For example, lightning could be the source and your computer can be the victim. EMI can cause—

Shawn Buckley

Dr. Havas. Can I just stop you. Are you working through your slides? Because we're still on your first one?

Dr. Magda Havas

Oh, I am.

Shawn Buckley

Okay, so that's why I'm stopping you.

[00:05:00]

I'm not sure what's happening because I think you're screen sharing.

Dr. Magda Havas

I am.

Shawn Buckley

Because we just see the first slide that says, "COVID-19 and RFR—Is there a connection?"

Dr. Magda Havas

Okay that's really weird. Okay, well I can give my presentation but the slides add enormously to it, so I'm not quite certain how to proceed.

Shawn Buckley

Okay. So on your computer, is it going through the slide presentation?

Dr. Magda Havas

It is, yes.

Shawn Buckley

One thing that we could do is, I believe I have your slide presentation. You could just tell me when to queue.

Dr. Magda Havas

Yes, I've changed it slightly.

Shawn Buckley

Oh, I see. Now you just changed the page there.

Dr. Magda Havas

What can you see now?

Shawn Buckley

"Possible confounding factors with COVID-19."

Dr. Magda Havas

Oh, perfect. Okay. So maybe now it's working? I can continue then.

Shawn Buckley

Yep.

Dr. Magda Havas

Okay, so I mentioned that electromagnetic interference can cause electronics to operate poorly, malfunction or stop working completely. And it can also cause humans to operate poorly, malfunction, and stop working completely. That's because we're electromagnetic, as indicated by the activity of our brain and heart activity.

Postulate number 3 is that the symptoms of COVID-19 are very similar to the symptoms of electromagnetic interference; they overlap considerably. And so it's difficult from just the symptoms to determine what you have. Someone who has electromagnetic interference could actually be suffering from COVID. And someone who has COVID but perhaps has not

been tested or tested negative, could be suffering from electromagnetic interference. And this is assuming that the tests are accurate and they haven't always been.

During the lockdown, there was a deployment of 5G technology. So while the rest of us were staying in our homes, the telecommunication industry was very quickly erecting 5G antennas across the globe. And they coincided with the SARS-CoV virus. And we know that once the 5G technology is deployed, it causes an increase in radio frequency radiation that I'll present in a few minutes. And that increases your risk of developing electromagnetic interference. And since we can't tell the difference between the two, it's difficult to know what people are suffering from.

Now, when we talk about epidemiology of a disease, there are three factors that are important. One is the agent, the other is the host, and the third is the environment. The agent can cause a disease or injury. It can be chemical, physical, or biological. And toxicity and dose are two important variables. In this particular case, SARS-CoV-2 is the agent.

The host is a human who experiences the health outcome. And the risk factors here are the health of your immune system, your genetics, and behavior, among others. And here we're talking about COVID-19 and Long COVID.

The environment is an extrinsic factor that can affect the agent or the host and increase or decrease risk, severity, and duration of the health outcome. It can be physical, biological, socioeconomic, et cetera. And in this case, masking, social distancing, the closure of schools and businesses, your vitamin D3 levels and or exposure to sunlight are some of the environmental factors.

But it's my opinion that some of these environmental confounding factors have not been adequately addressed when it comes to this pandemic. And I'd like to provide two examples. We know that ultraviolet light kills the virus, which benefits the host. We also know that radio frequency microwave radiation weakens the host and benefits the virus. And it's my opinion that radio frequency radiation in the environment is a confounding factor that no one has addressed in any comprehensive way.

During the pandemic, I was busy looking at the data that was coming primarily from Johns Hopkins University but [also] a number of other organizations around the globe. And this is showing COVID-19 cases at the early stage of the pandemic. And one of the questions that I had was, why do levels of infection differ globally for this respiratory virus? And in an attempt to try to make sense of this,

[00:10:00]

I looked at various confounding factors that could be involved in this pandemic and posted that information on my website, trying to make sense of the COVID-19 pandemic with a global perspective.

And the first confounding environmental factor I looked at was population density. And here you can see population density in the figure at the bottom and the COVID-19 cases at the top. There were a number of anomalies. For example, the population in India and Africa are quite high, yet the number of COVID cases reported at the early stages was very low. And if we look at this graph that shows you population density along the x-axis and COVID-19 cases along the y-axis, you can see there's a linear relationship with Africa falling slightly below the line. But if we add North America and Europe to this, it follows a very different

trajectory. So there's something else happening in North America and Europe to make so many people develop the virus.

Now, the map of COVID-19 more closely resembles Wi-Fi hotspots. And these are global Wi-Fi hotspots as of 2020 compared to April 7th, 2020 for the virus. And you can see here there are a number of similarities with very high levels in North America and Europe and very low levels in Africa and some of the other parts of the globe.

These are some of the confounding factors that I looked at: Population, the per cent elderly, since mostly people over the age of 80 were developing and dying. Air pollution and smoking because this is a respiratory virus. Tourism and air travel since that would indicate the spread of the illness. Various economic parameters that may differ from country to country. Various types of electromagnetic pollution, which is my area of research. And freedom of the press and internet censorship to ensure that the information we were getting was valid and wasn't being censored.

And the conclusions I came up with was that there were some weak correlations. However, the scale was too large and there was a lack of data standardization. So I decided to focus on the United States data and I will be presenting some of that later in my presentation.

One of the questions circulating among electromagnetic experts in March of 2020 was: Is there a connection between the outbreak of COVID-19 and deployment of 5G networks around the world? And you may ask, why would we even ask this question? The reason is that SARS-CoV-2 outbreak and the deployment of 5G happened at the same time. So they overlapped spatially in time as well. Areas with high cases of COVID-19, for example, Wuhan, Northern Italy, and the Princess Cruise Line, all had recently deployed 5G technology. And we know that radio frequency radiation impairs the immune system, which could sensitize people to this viral infection.

And here's an article, "Reaction of the Immune system to low-level radio frequency and microwave exposures." And this is what the author concluded: that short-term exposure to weak microwave radiation may temporarily stimulate the immune functions, while prolonged exposure could inhibit the same immune functions. And this is not the only study. Dr. Henry Lai from the University of Washington reviewed the literature on neurological effects of radio frequency radiation published between 2007 and 2020. He found a total of 335 studies, three quarters of which—244—showed an effect of radio frequency radiation.

This paper just came out last year and it's regarding the evidence of a connection between coronavirus disease and exposure to radio frequency radiation from wireless technology, including 5G [Exhibit SA-1d]. And what the authors concluded was that radio frequency radiation may cause morphological changes in erythrocytes, which are red blood cells, and Rouleaux formation—which I will talk about later—that can contribute to hypercoagulation. Radio frequencies can impair microcirculation and reduce erythrocytes and hemoglobin levels, exacerbating hypoxia. It can amplify immune system dysfunction, including immune-suppression, autoimmunity, and hyperinflammation. It can increase cellular oxidative stress and the production of free radicals,

[00:15:00]

resulting in vascular injury and organ damage. It can increase the amount of intracellular calcium—this is calcium within the cell—that's essential for viral entry, replication, and release, in addition to promoting pro-inflammatory pathways.

Now we have inflammation mentioned twice here and we know that myocarditis—that's been linked to both the virus and various vaccines, is inflammation of the heart muscle. And it can worsen heart arrhythmias and cardiac disorders. And what the authors recommend is that radio frequency radiation has become a ubiquitous environmental stressor that we propose may have contributed to adverse health outcomes of patients infected with SARS-CoV-2 and increase the severity of the COVID-19 pandemic. Therefore, we recommend that all people, particularly those suffering from viral infection, reduce their exposure to radio frequency radiation.

Now, does radio frequency and SARS-CoV-2 affect the blood? The answer to that question is yes. COVID-19 started as a respiratory infection and soon became a cardiovascular problem. The first doctor who reported this was an emergency doctor in New York, and he was fired for making the statement publicly.

Radio frequency radiation affects the cardiovascular system. And here is a publication that radiation from wireless technology affects the blood, the heart, and the autonomic nervous system [Exhibit SA-1f]. This is an example of live blood cells under darkfield microscopy. The person was in a very clean environment, and this is an example of healthy-looking blood. When that person was moved to a different environment that had a Wi-Fi router, they were exposed for 10 minutes and this is what their blood looked like after 10 minutes' exposure. The cells are sticking together like a stack of coins. And this is called Rouleaux.

In this image, you can see that the blood is much more viscous. It's more like ketchup rather than red wine. It has a reduced ability to infuse the body with oxygen. This places added pressure on the heart. And in the worst case, it can produce blood clots that can lead to heart attack or strokes, which we know are on the increase with COVID patients.

Here is another study published a year later. This time, instead of being exposed to Wi-Fi, a person was exposed to a cell phone, and you can see the Rouleaux formation in the middle slide. In the third slide—the oxidative stress—this is showing that the red blood cells have actually been damaged by the radiation, and many of them will die and need to be replaced.

Now, does radiofrequency radiation affect the heart? The answer to that is also yes. We did a provocation study where we exposed people to 2.45 gigahertz from a cordless phone base station and measured the effect on the autonomic nervous system. And this is what we concluded: Radiofrequency radiation can contribute to arrhythmia, which is an irregular heartbeat, or tachycardia, which is a rapid heart rate. And the definition for tachycardia is greater than 100 beats per minute. Radiofrequency can bring on an acute stress response by affecting the sympathetic and parasympathetic nervous systems, very similar to someone who has experienced a panic attack. And finally, some people think that they're having a heart attack with added pain or pressure in the chest area.

We did an experiment with 25 volunteers initially and then we repeated it with 69 volunteers later on. And basically, a person participating in the study was lying down. They had a heart monitor attached to them that was attached to a computer. They were blinded so they didn't know when they were exposed to the radiation or not. The radiation was placed just slightly above their head and either we plugged it into a live outlet, which caused the radiation, or we plugged it into a dead outlet that omitted the radiation completely.

And basically, what the technology does is it measures the time interval between heart rate—it's called the R – R interval. And the longer this line is, the slower the heart rate; the faster it is, the shorter the heart rate. We used a power density of 30 microwatts per metre

squared. You don't have to worry about the units here, as I'll use exactly the same units whenever I'm talking about this. That's less than 1 per cent of Health Canada's Safety Code 6, which is the guideline for radio frequency radiation.

[00:20:00]

Their guideline is 4.4 million microwatts per metre squared. And what I'm going to do is show you three patient results that are very, very similar.

Here we have subject A and they're exposed to three intervals, each lasting between three and four minutes. This is their heart rate. In interval one, they were exposed to a sham, which means that there was no radiation. They were exposed to microwaves during interval two and a sham in interval three. And you can look at this and there's virtually no difference. So this person is non-reactive. They're not sensitive to this radiation.

This is a different subject, subject B, and you don't have to be a cardiologist to see that this is having an effect. This is their heart rate. And remember, they're lying down. They're not moving. And yet their heart rate after the sham exposure increased from the 60s to 120. And this is an example of sudden onset tachycardia. This person is highly reactive and this is an example of electromagnetic interference.

The third example, subject C, was exposed to sham during intervals two and four, to microwaves during intervals three and five. And you can see there's a slight increase in their heart rate and it's very irregular. This person is reactive and they're showing electromagnetic interference.

We also get information about the sympathetic and parasympathetic part of the autonomic nervous system. The sympathetic part is equivalent to the gas pedal on a car. And when it's up-regulated, we go into the fight or flight or freeze mode. The parasympathetic represents the brakes of a car. And when it's up-regulated, we have rest, digest, and heal. It was down-regulated for this individual. And when the parasympathetic is down-regulated, you're unable to rest. Hence, people have difficulty sleeping. They can't relax. They have digestive problems, and they have difficulty healing from any ailments that they may have. And this person virtually, while lying down, is having a panic attack. And this panic attack is physiological and not psychosomatic.

When doctors diagnose these patients, they think they have a mental problem, and they often recommend that the patient goes to a psychiatrist or a psychologist. And the psychiatrists are telling me that they're being sent patients who have no psychological problem at all. So this is a physiological response.

Now, at the beginning of my presentation, I mentioned that I was going to look at data from the United States [Exhibit SA-1d]. And the United States collects some of the best data in the world, much better than even in Canada. And so here we're looking at the COVID-19-attributed cases and deaths in the United States that relate to 5G. Now, 5G small cells are placed on streetlights, as you can see here, utility poles, and special poles entirely for supporting the 5G antennas. Electromagnetic scientists are very concerned about this rollout and they're requesting that a moratorium be placed on further rollout of 5G. 5G is going to end up putting many more antennas on city streets because these antennas are placed roughly 100 metres apart. They're going to be closer to buildings and to people. And this is going to increase the levels of radiation. The frequencies for 5G are over a very broad range from low all the way up to the high band. And the high band consists of something called millimetre waves. This is the first time millimetre waves have been used in

telecommunication. And there have been absolutely no health studies looking at either people or the environment, despite the fact that they're rolling it out.

And basically, what's happening is that they're conducting a global experiment very similar to vaccines. We're told that 5G is safe—just like we were told that vaccines are safe and effective. Trust us. Well, there's no evidence that we should trust the agencies allowing this to happen.

Now, here we have a map of COVID-19 cases in the United States as of September 18th. And we have deployment of 5G, also for the same date in September. And you can see here that it looks like there's a relationship with high levels of deaths, or cases, and the amount of 5G deployment. But there's a confounding variable and that is population density. If you have more people, you're going to end up having more cases. And where you have dense populations,

[00:25:00]

that's where the wireless industry is going to deploy their antennas to serve a larger population.

So we have to consider these confounders. And we did exactly that. The first time I looked at the United States data was on April 22nd. And I posted that information on my website. On May 31st, Angela Tsiang and I reassessed the data to see if it had changed. And this is what we got and this is what we also published: There were 18 states that did not yet have 5G millimetre waves deployed. And the average cases for these 18 states is 3,220 cases per million. So we're standardizing for population. Thirty-three states had 5G millimetre wave antennas. And you can see that they have more than 5,000 cases per million, which gives you an excess of 2,556 cases per million. And that's an 80 per cent increase. And these data are statistically significant.

We did the same thing for the death rate. And we found that there were 149 excess deaths per million. This was 95, 4 per cent higher. It was statistically significant. And this was roughly a doubling of the death rates for states that had 5G millimetre waves.

I mentioned earlier that the symptoms of COVID and the symptoms of electromagnetic interference are similar. So it's very difficult to distinguish between the two of them. This is a survey that was conducted in 2003. So this was pre-5G and pre-COVID. And these are people who live at various distances from cell phone base stations. And here we have the symptoms. And here we have the percentage experiencing symptoms very often. These are the symptoms in decreasing order. And you can see there's a massive overlap with symptoms that have been documented for COVID-19. And if we look at fatigue, for people that are within 10 metres—that's the red—all the way out to beyond 300 metres—which is the black—there's a huge difference, as there is for things like sleep disturbances. So these people are unable to sleep and hence they're unable to recover and they end up having a lot of additional problems, difficulty concentrating, memory loss, et cetera.

Now, what happens to radio frequency levels with the introduction of 5G? Verizon places a map on their website that indicates where they've rolled out and where different types of technology is available for the American population. And you can zoom in on this map, which is what we did for Manhattan, New York. And we were interested in two parallel streets. The dark brown, here, is indicating that 5G millimetre waves have been deployed. So along Fifth Avenue, we have 5G and along Sixth Avenue, we don't have 5G. We have a global set of volunteers: it's called the Global EMF Network. We have over 400 volunteers

from across the globe and we call them citizen scientists. So I asked one of our citizen scientists to measure these two avenues in Manhattan. And here we have the average, the median value, and the maximum value. The testing was done at five intersections and four street corners. So each of these numbers is based on 20 measurements. And you can see here that when 5G is deployed, the levels of radiation go up considerably. I've indicated the Russian guidelines and the Canadian guidelines to show you how different they are and to put this into perspective.

She also went and looked at Brooklyn, New York with very similar results, although the scale is different. So once 5G comes in, the levels of exposure go up significantly. And just as a reminder, the median value is a statistical value where half of the population or half of the samples fall below the median and half of the samples fall above the median up to the maximum. And in both cases, for Manhattan and Brooklyn, the median value exceeds the Russian guideline, whereas prior to that it didn't.

Now, this is a case report for Sweden [Exhibit SA-1h]. And this is an apartment building where they replaced 4G and 3G antennas with 5G antennas.

[00:30:00]

And what I'm going to show you is the levels of exposure before the 5G antennas were erected with the 5G antennas. Now, this couple became so ill—I'll share with you what they experienced—that they had to move. And so they actually moved to a different location and the levels of radiation were much lower. Eventually, they moved to a house in the country to get away from this radiation. This particular value was higher than what the meter could measure. And Health Canada's guideline is 4.4. So Health Canada's guideline was almost double this particular value. So Health Canada would tell you this is perfectly safe.

Now, this is information from the previous slide showing the place and date, as well as the amount of exposure. And here we have symptoms. In light blue, we have the number of symptoms experienced by the husband and wife. And in dark, we have the total symptom intensity. And these are the symptoms. You can see here with the asterisk: these overlap considerably with COVID symptoms. When 5G was deployed, the number of symptoms and symptom severity increased for the husband and they increased even more for the wife. She was simply unable to remain in this environment. And if you share this information with Health Canada, what they will say is that these exposures are below the Safety Code 6 guidelines. Therefore, they're safe. And anyone—including pregnant women, children—can be exposed to them 24/7, which is absolute nonsense.

Our exposure to radio frequencies and microwaves have been increasing dramatically since the 1990s. It's hard to believe but in 1995, less than 10 per cent of the Canadian population had cell phone subscriptions. And within a 20-year period, that increased to 82 per cent. And you can see a similar trend for many of the other countries. And whenever you have cell phones, you need to have cell phone antennas. And people who don't even have a cell phone, don't use a cell phone, are exposed to the radiation from a cell phone antenna. So in my mind, using a cell phone is like smoking, and living close to a cell phone antenna is like inhaling second-hand smoke.

This is a map I showed earlier showing Wi-Fi hotspots in 2020. Just 15 years earlier, there were very few Wi-Fi hotspots because they were used primarily by universities or research institutions—by the military in some countries. Now we have Wi-Fi everywhere in our homes. And I expect many of the people listening to this on their computers might be using Wi-Fi with their computers. We have them in schools, which is absolutely ridiculous. We

have them in parks and hospitals, on airplanes. It's very hard to get away from this. If we combine that with satellites and small cell antennas, which are both part of the 5G network, and smart meters and smart appliances and smart homes, you can see here that the levels of radiation are so much higher today than they were just 20 or 30 years ago.

Now there's something very unusual when it comes to radio frequency guidelines. They vary by about seven or eight orders of magnitude globally, which is unheard of in toxicology. Whenever we have toxic limits for things like cadmium or lead in the environment, they're very similar from country to country. And the guideline is the maximum permissible limit that people can be exposed to. And what I've done here is I've highlighted Canada and the city of Toronto, that have two very different guidelines. The lowest guideline shown here for the sleeping area in Germany is 100 times higher than the amount of radiation required by cell phones to operate.

So why these countries are allowing such high exposure limits when it's not required for the technology is really very confusing and disturbing. These guidelines are based entirely on a heating effect. If it doesn't heat your body, it's not harmful. The heating is measured over a six-to-30-minute period. So it's really giving you a short-term guideline of exposure. It was established by physicists and engineers and this was before we started using Wi-Fi and smartphones. So our environment has changed considerably, yet these guidelines remain relatively similar. And Health Canada is simply burying its head and not willing to consider the research in this area. And I'll talk a little bit more about that in a minute.

[00:35:00]

We also have short-term guidelines. These are mostly for occupational settings. And then we have long-term guidelines, which are based on the precautionary principle. And these guidelines are much more recent. They're more protective, obviously, and they were recommended by biologists and doctors who are studying the radiation effects.

Now, this study came out in 2020 showing that the lethality of COVID-19 is higher in countries that have a higher maximum permissible limit for radio frequency radiation. So we have some circumstantial evidence that there might be a relationship between the two.

What does the future hold for 5G technology? Well, this map shows you the estimated worldwide 5G adoption by mobile—by cell phones, basically. It's excluding the internet of things, so it's an underestimate. And what this map shows is that by 2021, we had 13 per cent adoption and by 2025—so within the next two years—that's going to increase to 63 per cent. And that's similar trends, once again, for other countries. Now, what the industry is most interested in is that 5G is the biggest growth-driver for smartphones and that 5G connections are to hit 1 billion this year. Plenty of room to grow. So what they're really interested are the financial aspects.

Now, what does the future hold for electromagnetic interference? Well, if we use water as an analogy for our exposure, the people who are under the water are adversely affected. And the future doesn't bode well if we end up doing nothing. The levels of radiation continue to increase and more people will be adversely affected. We really do have to reduce our exposure. Having a moratorium on 5G is one way to do it, but we need to go even beyond that. We can reduce levels so that very few people, if any, are adversely affected by this radiation. And my motto is: if it doesn't move, it doesn't need to be wireless. So the smart meter on your home can be wired, it doesn't need to be wireless. The Wi-Fi computer doesn't need to use Wi-Fi; it can be connected to an ethernet connection.

What does the future hold for vaccines? Well, according to Pfizer, the number of doses estimated to be administered in 2023 is 65 million in the United States and, by 2026, 98 million. So they are continuing to move ahead on ensuring that everyone in the population is vaccinated. The motivating force is obviously the revenue that they get from this virus.

Now, how serious a problem is this? How many people are affected? We believe that about 3 per cent have severe sensitivity and another 35 per cent have moderate sensitivity. And if we look at Toronto and Ontario and Canada, we're talking about a million people in Canada who could be adversely affected because of this radiation due to their sensitivity. And we know that those who are moderately affected, it impairs the quality of life. The next viral outbreak is going to affect these people the most— These are the most vulnerable. And it's going to reduce the tolerance of those who are moderately affected to other stressors they might have in their lives.

Now, I've done this for other provinces and territories. In Saskatchewan, 30,000 people are likely to be severely affected and almost 400,000 with mild to moderate sensitivity. With 5G, this is going to increase substantially. Now, who is helping these million people or 13 million people with mild sensitivity? It's certainly not the government, because they don't even recognize this as an illness and their guidelines certainly don't protect anyone. It's not the industry, because they're the ones contributing to the problem. It's basically volunteers. So we have volunteers, mostly in Canada, but some around the globe who are helping these individuals. And you can't help a million people with just volunteers.

We need resources for research on how to diagnose and treat those who are ill. We need to educate and train medical professionals, since this isn't taught in medical school. We need to establish green zones for safe housing because people simply cannot live in the middle of a city that has all of these antennas.

We have to make accommodations for them in hospitals and schools and in the workplace, showing these different organizations how to reduce exposure.

[00:40:00]

We need to set up monitoring programs because the government is not monitoring our exposure—unlike some of the air quality monitoring they do and fish toxins that they monitor for eating fish. And we need to set up a 24-hour hotline because a number of these people are so desperate that they're considering MAID, which is medical assistance in dying.

In 2010 and 2015, there was a House of Commons Standing Committee on Health and they made a number of recommendations. And I'd like to just read one of the recommendations from the 2010. It says, Health Canada "ensure that it has a process in place to receive and respond to reports of adverse reactions to electromagnetic radiation-emitting devices." And this is very similar to the vaccine adverse events reporting that was requested. In 2015, the committee met with different people populating it, and they came up with 12 recommendations. I'm not going to read them, but I'd like them to be in the records [Exhibit SA-1i].

This is Health Canada's and Environment Canada's response to those two HESA meetings: "Health Canada has determined that exposure to radio frequency electromagnetic energy below their guidelines is not dangerous, and no further updates are required." And Environment Canada said they are reviewing the science and this was updated in 2018. However, the committee asked for not only a review but for a report as well. And it's

my understanding that these reports do not exist. The government is not following the wishes and the recommendations of HESA. And by the way, you can still listen to the HESA meetings with the questions that were asked very similar to what you're doing with the National Citizens Inquiry.

I have a number of recommendations and they apply to different organizations. We need to establish a moratorium on 5G deployment. We have to replace wireless technology with wired technology—and that is simply bringing fibre to the premises or to the last mile, which is what appears in the literature. We have to limit wireless to mobile devices, because basically we're conducting a global experiment very similar to the experiment that's being conducted with vaccines and it's going to result in excess deaths.

In the meantime, everyone needs to reduce their exposure to radio frequency radiation, especially those with Long COVID. And once again, this can be done by replacing wireless technology with wired technology in your home. And I use the acronym FIND: reduce your frequency of use, reduce the intensity. The closer you are to these devices, the higher the levels of exposure. So don't place your cell phone next to your head, don't place your cell phone in your bra and minimize your duration of exposure.

It's important that governments listen to experts rather than Big Pharma or Big Tech. They need to implement the recommendations of the House of Commons Standing Committee on Health and Radio Frequency Radiation.

My advice for the media is that they should remain independent of government and economic backers. They should provide unbiased information and they should not ridicule or silence those who have divergent views.

And I guess one of my major concerns is with medical regulators. They have unchecked power that needs to be investigated and moderated. They are a captured agency. We have a number of examples of how they misused their power by firing doctors who were saving lives with ivermectin. I have one example from the electromagnetic field area and that is: doctors who diagnose you with electromagnetic hypersensitivity can lose their medical license because it's not recognized. This illness is not recognized by our medical regulators. We need to encourage scientists and doctors to freely discuss and debate different perspectives. Debate is a strength, not a weakness, of the scientific method. And it's difficult to know who should you trust. My advice is don't trust anyone who's doing research for political or economic gain.

And finally, I think we have to establish a special foundation to fund research, training, and support for those who are vulnerable. And we can do this by posing a \$1 surcharge for each cell phone subscription. This would provide a sustainable budget of \$34 million annually in Canada. And we might consider doing the same thing on each vaccine injection,

[00:45:00]

to help those who have been damaged by the vaccines.

"Our lives begin to end the day we become silent about things that matter." This is one of my favorite quotes and I try to live by it in my personal and academic life. I think it's very important to speak truth to power. Those who hold principled power welcome truth. Those who want unconstrained power fear truth and they try to silence us. What we have just experienced can be disempowering and it can make us fearful. It can make us collectively

[fearful] or it can make us collectively and individually much wiser and stronger. It all depends on what we do next.

May wisdom and compassion prevail. We need to stop this insanity. If not us, who? If not now, when? Thank you for giving me this time.

Shawn Buckley

Dr. Havas, you also did a survey of Canadians concerning COVID mandates. Can you quickly share that with us?

Dr. Magda Havas

Yes.

And can you see that okay?

Shawn Buckley

Yeah, you could, yes.

Dr. Magda Havas

Are you seeing this or not?

Shawn Buckley

Yeah, we see "What do Canadians think and want regarding the COVID mandates." Although you could go full screen because we still, on the left, see your list of slides.

Dr. Magda Havas

Okay, I am full screen, and it seems like it's not doing it again. Hold on.

Can you see that now?

Shawn Buckley

Yeah, we see, thank you.

Dr. Magda Havas

Oh, okay. No, I'm sorry. Let me try one more time. I'll try a new share. No, you can't see that?

Shawn Buckley

Well, we see "Time Line: Emergencies Act, Survey, Senate Vote."

Dr. Magda Havas

Okay, great. Let me just get rid of this. You can see that, that's great.

So just a very quick timeline. I was very interested in what was happening in Ottawa with the convoy. I was deeply concerned about the mandates and I was also concerned about the *Emergencies Act*. And so I decided that once the *Emergencies Act* was called on February 14th, I was curious to see how many people supported the government and how many people supported the truckers. Among my own colleagues and friends and family, there was a divide. I had people on both sides. And so I designed a survey and released it online on February 16th [Exhibits SA-1a, SA-1c].

The survey went viral. We had more than 90,000 responses to it. And we closed it on the 20th of February. I posted the information on my website on the 21st. And the Senate had a debate on the 22nd on the *Emergencies Act*, which we know was revoked. And I sent the senators a copy of the survey because I thought it was important that they know how 90,000 Canadians felt. However, a few days later, I received a note saying that the recipient had refused my email. So the government website did not accept my email to senators. And I don't know if this is legal or not, but that's what happened to me.

There were a total of 10 questions, eight of which were multiple choice, two of which were open ended, which means people could say whatever it is that they wanted. And these are some of the survey results, and I'll share them with you very quickly. Most people were Canadian citizens, 98 per cent. A few were landed immigrants. And I assume some of these weren't Canadian citizens either. So most of them were Canadian citizens.

"I support the way the premier of my province has handled the COVID situation." In this survey, people were not very happy with the way their premiers handled the situation.

[00:50:00]

When it came to where these people were located, most of them were from Ontario, Alberta, and British Columbia. And that accounted for about 70 per cent. We had a few that didn't live in Canada. And we even had some representation from northern part of Canada.

One of the questions was, "I support the Trucker Convoy." And the answer to that was "yes," with a very large percentage.

"I support Prime Minister Trudeau's *Emergencies Act*." And a very large percentage does not support this. So this survey seems to be internally consistent. You would expect if they support one, they wouldn't necessarily support the other.

Here I asked a question about the mandates and whether or not people supported the mandates. Most of the people did not support the mandates. I asked, "When would you like the mandates to end?" Most of them said immediately. And about just under 6 per cent said, "When the government says so."

"Which of the mandates do you think need to be ended?" Here we have all of them for about 82 per cent. And this is one of the questions that won't add up to 100 per cent, and that's because you could answer multiple ones. So you could answer the vaccine booster and the vaccine passport, but not some of the others. So this is the only question that doesn't add up to 100 per cent.

We also, in the two open-end questions. "So how has the mandate affected your life?" Seventy-nine thousand people answered this. And this is a word cloud. The larger the font, the larger the word, the more often it's represented. And you can see some of the words here. Family, unable, anxiety, depression, vaccine. And when I asked, "How has the trucking

convoy affected your life?" We have the word hope, we have brave, convoy, country, gave, made, truckers, that sort of thing.

And I just have two pages of each of the question, open-ended questions. And I just want to draw your attention that there were 3,391 pages of answers to the open-ended question number nine about the mandate. People who responded positively to the mandate are shown in blue and people who responded negatively are shown in red. And here we have the same thing for the trucking convoy: positive responses in blue, negative responses in red, with a few people saying, "it hasn't affected me at all."

Now, a month later—let me just see if I can do this. A month later, the CBC requested a poll. This was also an online poll with about 2,500 Canadians. And it was, as I mentioned, about two weeks later. And this was an Angus Reid Forum poll. And I looked up Angus Reid Forum. Basically what they do is they pay people to answer their surveys. Now, if they randomize the people they send the survey to, this is perfectly valid.

But if you see here, just two weeks later, people who thought that Trudeau was doing a good job or a very good job are just under 50 per cent. So there's a real match here: totally contradicts what we got in my survey. And this is CTV News in October and November, so it was several months later. They asked whether people would support a return of the mandatory mask mandate. And 69 per cent said they would and 30 per cent said they wouldn't. So once again, we're getting very different results.

While I used to trust mainstream media, it's not something I trust anymore. And so one critical question: Is my survey representative of Canadians? The answer to that is, I don't know. It was distributed online. It went viral and we had a very large sample size, which is good, which is what you want in a survey. But I don't know if there was a distribution bias. And by that I mean: Did people send it primarily to friends who thought the same way they did? And if they did, then this would invalidate the survey representing the rest of Canada. All I can say is the survey did represent the 93,135 people who responded. And I'm sharing this because I want their voices to be heard.

Thank you.

Shawn Buckley

Dr. Havas, thank you very much for sharing that. And I'll just ask the commissioners if they have any questions for you. And there are questions.

Commissioner Massie

Thank you very much for your presentation. I'm very curious about the sensitivity to the radiation

[00:55:00]

that varies quite dramatically from one individual to the other. This is measured by symptoms that we can actually monitor. Is there any other, I would say, biomarker that can be monitored that would give us some sort of a more direct measurement based on a putative mechanism of action of these radiation on people?

Dr. Magda Havas

There are a number of biomonitoring that you can— How do I stop sharing? Sorry.

So there are some biomonitoring. For example, we notice that people who are diabetic: if they're diabetic and they're sensitive to the radiation, their levels of blood sugar will increase. And it will increase within a very short period of time, within about 10 to 15, 20 minutes. And if you move them into an electromagnetically clean environment, their blood sugar drops. And we know that when diabetics are stressed physically or physiologically or psychologically, that's what happens. So they go into the fight-or-flight response and that increases blood sugar.

We've done work with people who have multiple sclerosis and we found that if we place them in a clean environment, some of their symptoms go away: the tremors, the brain fog, that sort of thing. Oxidative stress is one of the most studied markers, so anything that would tell you the levels of enzymes in your body that are increasing oxidative stress. And if you take any antioxidants, you can relieve some of your symptoms.

So there are various biomarkers in that regard that we can determine whether or not someone is actually suffering from electromagnetic exposure. And then of course, there's the blood; you can measure the blood and it goes into Rouleaux. And you can see the oxidative damage in the red blood cells at the same time.

Commissioner Massie

I have another question. Are you aware of I would say, large-scale studies—epidemiological studies—that would actually quantify that more specifically in population, or is it just that there are some correlations that we establish? But what I mean by epidemiological study: Has there been study where you would monitor specific biomarkers in population to correlate their increase with the level of exposure?

Dr. Magda Havas

Most of the epidemiological studies have focused on cancer and on reproductive problems. We know it damages sperm, for example, and there have been a number of studies looking at that. And there's an increase in things like brain tumors, breast cancer for women who store their phone in their bra. There's evidence of other types of cancers associated with the head and the face: salivary gland tumors, cancer or tumor of the ear, that sort of thing. So those studies have been done and our Canadian government, members of Health Canada, have been involved in those studies. So they're aware of the research, yet they're deciding not to incorporate any of that in their guidelines.

And indeed, the International Agency for Research on Cancer, as of 2011, classified radiofrequency and microwave radiation as a possible carcinogen. So it was a Class 2B carcinogen. So we have that for cancers. We have that for sperm damage. There are fewer studies— There are some epidemiological studies but not looking at biomarkers, just looking at symptoms in blinded individuals, so they didn't know why they were part of a study. And then we have clinical trials as well, where clinically they're exposed and blindly tested. And we have evidence of that as well.

Commissioner Massie

So in terms of the damage, is it proportional to the time of exposure?

Dr. Magda Havas

It can be. It turns out that when people first started reporting sensitivity, it was often associated with their use of a cell phone. And what they found was that they started getting heat; they could feel heat coming from the cell phone. And then their fingers would go numb. And they started getting headaches. And the headaches only lasted after they had been on the phone for a little bit of time.

[01:00:00]

And it went away as soon as they took the phone away.

And what tends to happen over time is that the latency is shorter for the symptoms. The symptoms become more severe and they end up lasting much longer. So by the time that you start testing individuals who have experienced this for a few months or possibly a few years, you expose them to the radiation and they'll have symptoms for days or weeks afterwards. And it won't go away. And that's what's beginning to happen to that very small— One to three per cent of the population are in that particular category.

Commissioner Massie

So if we would want to reduce the exposure to people with these towers, anything that you would put to physically shield the population from that would interfere presumably with the transmission of the wave and then reduce the signal. Is that the issue?

Dr. Magda Havas

The towers are a serious problem if you live close to them. And that's why the 5G small cell towers are going to be absolutely devastating for the population.

There is material that you can buy to shield your home. There's film you can put on your windows that's made by 3M, and it will reduce the levels of exposure by about 90, 95 per cent. You can also get triple-E glass windows that are very energy efficient and they seem to have the same effect; they reduce exposure. And indeed, high rise buildings near the CN Tower in Toronto won't be built unless they have that special triple-E glass because the levels of radiation in those condominiums or office buildings would be way too high. There's paint you can put on your wall that will reduce the exposure. There's fabric that you can get that uses either copper or silver fibre in them and people make a canopy over their bed to minimize their exposure so they can at least sleep at night. And sometimes they'll make curtains for their windows—and this is translucent, so it still lets the light in. There's clothing that's available. Some people will put the fabric I just mentioned in a baseball cap and they'll wear it. And they tell me that they don't get a headache then if they use their cell phone. So it shields their head from the cell phone radiation.

Commissioner Massie

You mentioned that during the lockdowns there was a big campaign to install these 5G towers. To what extent did the lockdown facilitate the establishment of these, or the building, deployment of these tower?

Dr. Magda Havas

Oh, it made a huge difference. People would wake up and sometimes they installed these towers in the middle of the night and so you'd wake up and the next morning there'd be a tower outside your home that wasn't there the day before. So they were taking advantage of the rest of us being locked down and not witnessing what was happening.

The towers that have been erected have been making people sick and they're now complaining to their municipal board of health about it because they have to approve the siting of these locations. But unfortunately, they just don't have the amount of funding required to take the industry to court if they're unwilling to remove a tower that's causing adverse health effects. And a lot more lawyers are beginning to get involved in this and I think there's going to be quite a bit of litigation as a result of the harmful effects of this radiation.

Commissioner Massie

I'm very concerned by this very wide range of the acceptable level of radiation across countries. Is there any initiative going on to standardize that at the international level?

Dr. Magda Havas

Unfortunately, there's a group called ICNIRP [International Commission on Non-Ionizing Radiation Protection]. And they're a group of industry-funded scientists, mostly physicists and engineers, who work out of Germany. And they've been advising the World Health Organization. The World Health Organization, this particular branch that deals with radio frequency and microwave radiation is a captured agency just like the FCC and, to a certain degree, Health Canada. So they're abiding by the recommendations from ICNIRP and the ICNIRP recommendations are among the worst in the world, as you can imagine.

Other countries have decided that they're not going to abide by the ICNIRP recommendations,

[01:05:00]

or what the World Health Organization recommends and they're setting their own guidelines. And some of the most protective ones are actually in parts of Europe and other parts of the world, including Russia. Russia did research on this very early on, using it both from a health perspective, using frequencies to promote health, and using them as a weapon. So they looked at it from both sides and they have moderately safe guidelines. I'd say they're not nearly as safe as some of the other countries in Europe that have now instigated the precautionary principle. And I showed you the results for Germany.

The most critical environment in everyone's home is their bedroom. If they can at least get a good night's sleep and levels of radiation are low, their body can recuperate and recover. But if the levels are high in the bedroom, then ultimately your health is going to be impaired with various chronic illnesses.

Commissioner Massie

Maybe one last question. Is there a device that would allow us to monitor the level of radiation in different rooms in our house?

Dr. Magda Havas

Yes. They're not very expensive either. There's various companies— I don't know if I can mention them on this program but there are companies in Canada that sell meters. Some of the less expensive ones are under \$200. And actually, one of the things I recommend is that people buy meters, that they put them in libraries, for example, or doctor's offices and loan them to their patients so they can go home and measure the levels of radiation. Because if you don't know what you're exposed to, you can't minimize your exposure. So measuring the levels are absolutely critical for this. And meters are readily available and aren't very expensive.

Commissioner Massie

Thank you very much.

Dr. Magda Havas

Thank you.

Shawn Buckley

And there's some more questions.

Commissioner Drysdale

You talked about, and I saw in your slide you showed, a representation of antennas on towers, on light standards, et cetera. How do we recognize these? How do we differentiate them from the cell phone towers we're used to seeing? And lastly have these got anything to do with all of our lights turning purple?

Dr. Magda Havas

Well, actually, they're putting some of the technology in lights as well. So some of the streetlights will have Wi-Fi in them as well and that's causing problems. They have a different—slightly different size and shape.

But sometimes you can't tell where the antennas are because they're hidden. They're hidden in flags, for example, so you'll have a mast with a flag on it, and inside that mast are the antennas that are for 3G, 4G, 5G. The 4G antennas tend to be rectangular, so they have a rectangular shape and they tend to go into a third of a 120-degree angle. And you have three of them if you want to cover the 360-degree circumference.

Along a highway, they'll have one facing one way and one facing the other way to cover the traffic. You can differentiate between whether it's 3G, 4G, 5G by the shape of the antenna. And you can get information on a website. I actually give a lecture on cell towers and antennas. And that's available on my YouTube channel and it gives you the basic information of what you need to know about antennas.

Commissioner Drysdale

Just, I guess, an ordinary person's question. I mean when I pick up my cell phone and I want to watch a movie on it— I don't do that but, if I want to, it works. So why are we going to 5G when what we have seems to work for what most of us need it for?

Dr. Magda Havas

I agree. The excuse the company—or the reason the company—is giving, is that they'll have much faster computing time. So for things like self-propelled cars, driverless cars, you will need a very fast reaction time and that's the direction that they're heading towards.

If these cars become available, then people won't be able to drive them who are electrically sensitive because it will just screw them up mentally and psychologically and physically. It'll just make them too ill. And as a matter of fact, a lot of the cars now are already have so much Bluetooth Wi-Fi in them that people are getting sick.

And so what the companies are saying is that we need this fast-computing power for these driverless cars,

[01:10:00]

for the internet of things. We don't even know what some of the future technology will look like. We need it for facial recognition, which is another issue that deals with our privacy, for example. We need it for things like operating at a distance. So you'll be able to set up—Someone will be able to operate and they're in one city and the patient is in another city and it's all done in a wireless fashion. I'd hate for something to go wrong during that operation if it was done in a wireless fashion.

And I think it's just a sexy thing for people to do. They love the fact that they can walk around with this little cell phone, which is basically a minicomputer, and they can do so much with it. But you can keep it off most of the time. You can turn on your airplane mode, turn your Wi-Fi and Bluetooth off, and you can still listen to music if you have it on the device. And you can still take photographs, you can still do a lot of things.

There are devices now where you can actually hook up your cell phone—you can wire your cell phone through the equivalent of an ethernet cable and still do a lot of things. You can make phone calls, everything else by doing it in a wired way rather than a wireless way.

Commissioner Drysdale

I'm not sure why we need driverless cars when we're going to be in 15-minute cities.

Thank you.

Dr. Magda Havas

I agree.

Shawn Buckley

There are no further questions, Dr. Havas. On behalf of the National Citizens Inquiry, we sincerely thank you for your testimony today and sharing with us.

Dr. Magda Havas

Thank you very much.

[01:11:56]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 5: James Blyth

Full Day 3 Timestamp: 07:02:26–07:21:02

Source URL: <https://rumble.com/v2jszo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Dellene Church

Hi James, can you hear me?

James Blyth

[inaudible]

Dellene Church

So our next witness is James Blyth. Please state your name and spell your first and last name for the record, James.

James Blyth

My name is James Blyth. It's B-L-Y-T-H.

Dellene Church

Thank you. James, in your testimony here today, do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

James Blyth

Yes, I do.

Dellene Church

Thank you. James, you are a young man with two serious pre-existing health conditions. When the vaccine mandates in Saskatchewan became very restrictive, you went to your doctor for guidance on the risk of you getting a COVID vaccine with your health conditions.

James Blyth

Yes.

Dellene Church

You were not given a medical exemption and encouraged to get the vaccine. Can you tell us how that affected you?

James Blyth

Yeah, so I had obvious questions, especially since it was such a rushed vaccine. My parents had gotten it. I think they had three doses before I even got my first one. And then my brother had got a second one. So all the pressure from family and the government, I decided, "Okay, well, maybe I should look into this."

So I went to my family doctor and I asked him—and I still remember this. He didn't have any problems with my Type 1 diabetes or my Lyme disease. And I remember this, he said that I should get the vaccine so that "I can go out to the bar with my friends." Which was a pretty big red flag because I don't go to the bar, first of all, and that's none of his business. My social life has nothing to do with my health.

So that didn't go well. But anyways, I ended up going to Saskatoon for the vaccine, which they had at the carnival grounds there. It was really weird because there was nobody there really because everyone had already had their shots earlier. So it was just like a big kind of empty— It looked like an empty slaughterhouse with, like, the gates where they would have all the people travel through.

So when I got to the nurse to give me my vaccine, I had questions and she had answered them. And I kind of knew that the nurses they don't really know— They aren't scientists, they don't really know what's going on with the vaccine. So it was kind of like they were reading from a script in a way, for all the answers.

So I got the vaccine. I waited there for 15 minutes, talked to some people. The one guy worked with the City of Saskatoon. He said that he had to get the vaccine in order to keep his job, which must have felt nice. And then I just carried on through my day.

I started noticing side effects probably a day or two after. My arm was definitely sore. My breathing went really shallow and I had a bad chest tightness. It was significant. I had never had a reaction to a vaccine like that before. So I had body aches all over and then I thought I could just kind of tough it out. So I just stayed like that for a couple days. And then one day, in the night, I woke up from my sleep. It felt like my heart had skipped a beat or something. **Like, it felt like my heart shot through to my throat in a weird way. I said, "You know what, screw it, I'm going to go to the ER in my town and just get checked up and see what they have to say."**

Well, they didn't say much or do much. They just took my vitals and that was all good. And they just told me, "You know what, it could be just a strange reaction but you seem fine." And so I got checked up and then I went home. Then I had a phone call with, not my family doctor but just another doctor at the clinic in town.

[00:05:00]

And I just told him what happened and within a couple seconds he just said, "Yeah that's not— It's not the vaccine." And I can't, you know— I can't tell him otherwise. Like I just said, this all happened after I got vaccinated. And he just—He just threw it under the bus, whatever. He didn't care, he gets his paycheck regardless.

So I was just kind of left abandoned. I just went home, I rested, I did some detoxing, thought it could help. But I still had body aches and chest tightness and shallow breathing all over. And I was starting to have some problems with my sleep.

So about five weeks or so after— This carried on for five weeks, the symptoms didn't go away. And then I started noticing some insomnia. I was starting to have really bad insomnia right around Christmas time. And so I went to the ER again. They gave me a pill for my sleep. It didn't work. And then I went back home, took the pill. Yeah, it didn't work. And this was all during Christmas too, so we had family over and everything.

So that first time I went to the ER, it didn't work. So then I went another time, probably a day or two later saying, "I can't sleep." And they gave me another pill and it didn't work. And then right after Christmas time—I hadn't slept for probably two or three days—I just told my dad, "You're going to have to drive me to the psych ward in Saskatoon: I cannot sleep."

So I went to the University Hospital in Saskatoon and they put me in the psych ward and they put me on Seroquel, or quetiapine. And they gave me a big dose; it went up to about 800 milligrams, I think was the max dose they said. And they were kind of scratching their heads, like, why do I need such a big dose of this antipsychotic? But you know what, I didn't care at the time because I hadn't slept.

So I was sleeping finally; my pattern started to get to normal. And the 800 milligrams worked but I was still having issues at that time. It wasn't perfect by any means. So about two weeks went by, I was on that high dose of quetiapine and then finally, my sleep patterns kind of regularized. Then I was released from the ward.

And I still remember this because it was pretty significant: After I got released from the ward it was around supper time—I don't know, early January—and my dad and I were wondering about where we were going to go eat. And we must have come up with some restaurant we wanted to go to. And so, as we were driving, a couple minutes later I said, "Oh, you know what? We can't even go eat because I didn't have my second dose of the vaccine." So that was fun.

And then after that I was on the quetiapine. I went to the pharmacy in town and they were all kind of scratching their heads too. They're wondering, "Is this a new medication you're on?" They're wondering why I'm on this high dose of this drug all of a sudden, right? And I just said, "yeah, I had a bad reaction." And they didn't really care because— I don't know why; they just don't care.

And eventually, so I was taking the quetiapine, this high dose of quetiapine for a while. Eventually, until I got in touch with a naturopath doctor in B.C., who was able to prescribe a big round of antibiotics because he thinks the vaccine flared my Lyme disease and that's what caused it.

And sure enough, after about two or three days of this antibiotic protocol,

[00:10:00]

I was able to wean off the quetiapine from 800 to— Well, actually, I got off of it completely. But I was still having issues with my sleep a bit. So after that, that was kind of that.

And I eventually— Like, I talked to my family doctor when I was released from the psych ward and he acknowledged that I could have had a bad reaction, which I know I did because I know my body. And he just said, “But we can’t do anything about that now. We just have to deal with what we have to deal with right now. We can’t go back, back in the past.”

So there is just no— With the doctors and the health care, they just— They wouldn’t acknowledge it and if they did, there’s just there’s no accountability. I can’t get any help. It’s like they were working against me basically, and just telling me— They just wouldn’t believe me. They didn’t have to believe me because they get their paycheck anyways.

Dellene Church

James, when you say they believe the vaccine triggered a flare in your Lyme disease, what we had talked about was they believe it actually caused an inflammation in your brain.

James Blyth

Yeah.

Dellene Church

And that’s what led to this insomnia, you’re calling it. But basically, you were unable to sleep unless you took this extremely high dose of an antipsychotic.

James Blyth

Yeah, yeah, that’s correct.

Dellene Church

And how long were you on that medication?

James Blyth

Because it took a while to get in touch with the naturopath doctor in B.C., I must have been on that quetiapine for— I would say around three or four months, it was.

Dellene Church

And do you know what a normal dose of that medication would be for insomnia? Were you ever told that?

James Blyth

No. I mean, there’s Dr. Google, but no, no, I didn’t. I just know that the nurses were worried in the ward. Because I was on 800 milligrams. They didn’t want to go any higher because I think it can cause some heart issues or something like that if you go really high. And so yeah, my nurse was just kind of astounded because they had never really seen someone on that high of a dose of that drug. But it was able to get me to sleep, at least somewhat.

Dellene Church

So during this four months, what were you able to do?

James Blyth

Lay on the couch pretty much. I don't do much because of the Lyme disease. I'm on disability as it is. So basically, the side effects from the drug itself made you really drowsy and tired. So I pretty much would just lay on the couch all day and try to find some better medical help.

Dellene Church

And you also experienced worsening symptoms with your type 1 diabetes because of this medication you were on to sleep. Is that right?

James Blyth

Yeah, that's right. So I'm good with my diabetes. I have, I think it's a 6.0 A1C. And a side effect of the drug is it raises your blood sugar. So I had to go on higher doses of insulin because of that.

Dellene Church

And have you had any adverse health symptoms because of the higher insulin you were required to take?

James Blyth

Yes, in a way. I'm really good at watching it, but it's a very— It's hard to really finesse it and get it perfect. So sometimes I would wake up in the middle of the night with low blood sugar or something because I had overcorrected the amount of insulin required. And yeah, so my insulin— Like my long-acting, which is Tresiba: it went from 18 units to 22 units, I believe. And then my fast-acting, I had to probably increase it by 10 units per day from the average of before I was on the drug.

[00:15:00]

Dellene Church

And do you know, was your reaction reported as an adverse reaction to the COVID vaccine?

James Blyth

No. I definitely don't think so. Because my doctor, when he acknowledged that, he wasn't typing anything out on the computer or anything like that.

Dellene Church

And nowhere in your healthcare, medical people you dealt with, were you ever given any information on making a claim for compensation.

James Blyth

No, no. No, I was— It was disregarded pretty quick, that's for sure. I think it's because the doctors are also— Even if they do believe you, they're also worried about the government coming after them as well, right? But it was disregarded. It was not taken very seriously.

But no one really cared either. Even the pharmacist was like, "Why are you on this drug now?" And I told them I had a bad reaction. And it's just kind of, "Oh well. That's that." Right?

Dellene Church

What do you think, or wish, could have been done differently for you in this situation?

James Blyth

Well, having an exemption would have been nice. I wasn't really sold on the vaccine as it was. I didn't want to take it because I wasn't sure how it would work with my diabetes and the Lyme disease. And I found out. So I would have liked an exemption, but it didn't happen.

Dellene Church

And in your case, an exemption wouldn't have been necessary if we didn't have the strict severe mandates in place that made you feel isolated and unable to live your life. You weren't working at the time. You weren't at school. It was your desire to live a normal life.

James Blyth

Yeah. Yeah, that's right. Yeah, it's amazing. The frustrating part is that we're funding this. We're funding to have people take our rights and control us like this. It's ridiculous, I find.

Dellene Church

Is there anything else you'd like to add before I turn it over to the commissioners for questions?

James Blyth

I guess just, my frustrations with these doctors and nurses and anyone in government really is that there's no accountability. They just get away with whatever. They get their paycheck regardless. And if there is an issue, they're protected by the government. So that's kind of my frustration, is the lack of accountability.

Dellene Church

Okay, I'll ask the commissioners if they have any questions for you.

And there are no questions, so I would just like to thank you on behalf of the National Citizens Inquiry for your testimony today and wish you health and healing in the future.

James Blyth

Yeah, well it's going in the right direction now, so that's good.

Dellene Church
That's good. Thank you.

James Blyth
Thank you.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 22, 2023

Day 3

EVIDENCE

Witness 6: Zoey Jebb

Full Day 3 Timestamp: 07:21:32–07:35:32

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Wayne Lenhardt

Okay, Zoey, if you could give us your full name, please, and then spell it for us.

Zoey Jebb

My name is Zoey Jebb, spelled Z-O-E-Y J-E-B-B.

Wayne Lenhardt

Do you swear to tell the truth, the whole truth, and nothing but the truth during your testimony today?

Zoey Jebb

Yes, I do.

Wayne Lenhardt

Just for the audience, your testimony is going to relate to how you lost a business due to COVID, so let's start right at the beginning then. This was in about 2019 and it was in Elkhorn, Manitoba. So tell us what was happening.

Zoey Jebb

The business itself was actually in Virden, Manitoba.

Wayne Lenhardt

All right. Yes, you live in Elkhorn but your new business was going to be in Virden.

Zoey Jebb

Yes. So the business was a Wellness Centre, consisted of a lot of different departments. There was a sensory deprivation float room; 24-hour access relaxation lounge with high-end massage equipment; vibro-acoustics; hydrotherapy, that sort of thing. There was treatment rooms for myself—I do a lot of body therapy—as well as other practitioners in the area to use. There was a workshop space for classes, workshops, running programs, a smoothie bar. And also, we rented out space to locals to sell handmade gifts and other wellness products.

Wayne Lenhardt

Okay, so you found a location in Virden and you had a silent partner who provided some funds. And you started gearing up for your business, which was— You were going to call it a wellness centre. Am I right?

Zoey Jebb

Yeah, it was a wellness centre.

Wayne Lenhardt

And there would be different services provided. This is what year?

Zoey Jebb

We started renovations in 2019 and we kind of opened up in phases throughout the year, soft openings for each department. And we finished renovations in November of 2019 and had every area open, just not full-hours yet.

Wayne Lenhardt

And you ended up buying equipment for this business, correct? And approximately what did that cost you?

Zoey Jebb

For the equipment for the float pool and all the massage equipment and everything, roughly about \$60,000.

Wayne Lenhardt

Okay, so you had equipment and you got it rented. So you're paying rent. You had your equipment. You ended up with a loan with BDC, Business Development Bank of Canada, am I correct?

Zoey Jebb

Yes.

Wayne Lenhardt

And that loan was for how much?

Zoey Jebb
For \$110,000.

Wayne Lenhardt
So it took you approximately how long to do your renovations?

Zoey Jebb
We started around, I think, February, March of 2019, and we completed sometime in November of 2019.

Wayne Lenhardt
Okay, so approximately nine months, then you're renovated. What happened at the end of 2019 then, and going into 2020?

Zoey Jebb
We were open and operating. I had one employee: my sister was managing for us full-time. And then we had a few other casuals and other practitioners that were renting the space. We had kind of done a soft open, so all aspects of the business were operating, just not with full-time staff or full hours yet.

Wayne Lenhardt
At some point— Was it during that fall the schools were closed?

Zoey Jebb
That was following, so in 2020, March of 2020— March 13th is when Trudeau had recommended everybody go home and so we did. And I believe it was the next week that the schools in our area closed down as well.

Wayne Lenhardt
Yeah, so the centre was closed at that point, correct?

Zoey Jebb
Yes.

Wayne Lenhardt
Did it reopen at some point?

[00:05:00]

Zoey Jebb
We were not permitted due to the regulations, Manitoba's regulations. We weren't permitted to operate until, I believe it would have been June or July. At that point the business was done.

Wayne Lenhardt

Yeah, okay. So at a certain point you're not making any money. Your place is closed. And I believe the type of work you were doing, I think, was prohibited, was it not? You couldn't service clients for a while, under the mandate, am I right?

Zoey Jebb

Right, so I do a lot of bodywork therapy and emotional release therapy, different things like that, but I'm not a registered massage therapist. So there was only certain people offering those types of services that were permitted to take clients and I was not one of them.

For the business as well, the float pool was not permitted to be open, the relaxation lounge was not permitted to be open, and we weren't permitted to do most of the workshops and classes that we had done.

Wayne Lenhardt

So at a certain point you realized this just simply wasn't going to work. You just had the debt, you had your rent, you had all of that and you couldn't operate. So what happened next?

Zoey Jebb

We tried to continue making payments. I paid a lot out of even my own pocket to try to keep things up and running. Because we kept thinking it was two more weeks, two more weeks, two more weeks—right? So eventually I spoke with my business partner and he wasn't in a position to carry on.

And we both had decided to file for personal bankruptcy because we were both personally liable for the debt. He filed for bankruptcy and I was not able to at the time, in the end. So all of the debt for everything ended up falling onto me personally.

Wayne Lenhardt

So at a certain point, the Business Development Bank sued you, didn't they? Am I right?

Zoey Jebb

They did. I believe it was June, maybe, or the springtime of 2021. I got served because they said it was taking too long to pay back—even though we were in Code Red and I wasn't permitted to work.

Wayne Lenhardt

And you had children in school all the while also, didn't you?

Zoey Jebb

My daughter's in school. My son, we've decided to continue to homeschool him.

Wayne Lenhardt

So how did you survive during this period of time?

Zoey Jebb

I did receive CERB [the Canada Emergency Response Benefit], which they cut me off of. I had to battle it out and they did finally reinstate it again.

But I mostly survived off of donations and gifts. People dropped off food and gift cards so that I could— We had food and fuel and people donated money to me.

Wayne Lenhardt

Did you eventually settle with the Business Bank of Canada?

Zoey Jebb

Yeah, I was fortunate enough again to have a friend lend me some money, so I could get a lawyer and we did a settlement. It was a good deal. They knocked down the amount that we owed, or that I owed, I mean. But the payments were really high. So I ended up having to mortgage my house to amalgamate my payments and pay them off.

Wayne Lenhardt

Were your children out of school during a period of this time, where you had to look after them?

Zoey Jebb

They were, yeah. I know for sure, for the rest of 2020 there was no school. It was just homeschooling. And I think the fall they started back up, of 2020, I believe.

Wayne Lenhardt

It's going to be rhetorical, but did you have any trouble keeping your head above water while all this is going on?

Zoey Jebb

Yeah, definitely.

Wayne Lenhardt

Is it all over now? Is the Bank of—the BBC all paid off now, or settled with?

Zoey Jebb

BBC is, because I was able to get a job that put me in a position that I was approved for a mortgage on my house that I owned. And so I used that to pay off BBC, so that part has been settled.

Wayne Lenhardt

Okay, is there still that mortgage on your house?

Zoey Jebb

I do. And the house is up for sale because I just can't really afford it.

[00:10:00]

Wayne Lenhardt

Okay, and that house is in Elkhorn, is it?

Zoey Jebb

Yeah.

Wayne Lenhardt

Okay. I'm going to stop and ask if the commissioners have any questions here at this point.

Yeah, Ken.

Commissioner Drysdale

You said that you got a loan from the Business Development Bank of Canada?

Zoey Jebb

Yes.

Commissioner Drysdale

Is that an independent institution or is that associated with the federal government?

Zoey Jebb

I believe that is a government—yeah.

Commissioner Drysdale

What was your projected operating costs of your business per month? You just started the business, so I'm guessing that you must have had a business plan and you knew what it was going to cost to operate monthly, what your costs were going to be?

Zoey Jebb

We did, yeah.

Commissioner Drysdale

I don't need to know the number reviewed it. Yeah. But I also recall that you said you got some money under the CERB.

Zoey Jebb

I did for personal. So we didn't qualify—the business didn't qualify for any of the government financing because we didn't meet the requirements, which at the beginning was: we had to have a certain amount of payroll, I believe in 2019, which we didn't have because we weren't operating fully. They did lift those restrictions later in the year but by then we were done. I personally did qualify for CERB because I was at home taking care of my children. But they did cut me off of that and I had to fight— My local MP's office actually helped me out to get that reinstated. So I did get the CERB. That's what I lived off of.

Commissioner Drysdale

I just want to follow up on that because I'm not familiar with those programs that were put in place. But are you telling me that you started a business in 2019; you carried out renovations for a period of months; you had loans from the federal government through the Business Development Bank, so you knew what the costs were, you could have proven what the costs were? And what I mean by that is, you could have proven to whoever you needed to prove it to that you had loans, that you had rented equipment, or bought or purchased equipment, and that you had rented space. But even with that documentation, with the mandates that were imposed upon you by the federal government and the federal government loaned you money through the Business Development Bank, they wouldn't help you out because you didn't have a long enough period of payroll?

So they didn't recognize that you had to invest in a business, which they recognized in the first place by lending you money. But they wouldn't cover you off to bridge you over that gap when they put in mandates, which caused you to need that, which caused you to go to bankruptcy? Is that what your testimony is?

Zoey Jebb

That is correct.

Commissioner Drysdale

Thank you.

Wayne Lenhardt

Are there any other questions from the commissioners? Is there anything else you would like to comment on or tell us then, before we conclude, about your ordeal?

Zoey Jebb

I can't even think about it right now. I'm sure there's lots. Yeah, sorry. I can't really think about that right now.

Wayne Lenhardt

Okay. All right, thank you very much on behalf of the National Citizens Inquiry for your testimony today.

Zoey Jebb

Thank you.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 22, 2023

Day 3

EVIDENCE

Witness 7: Samantha Lamb

Full Day 3 Timestamp: 07:35:39–07:50:29

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Wayne Lenhardt

Okay. The next witness is Samantha Lamb. Oh, here we are. Samantha, can you hear me?

Samantha Lamb

Yes, I can hear you.

Wayne Lenhardt

Oh, there we are. Could you give us your name and then spell it? And then I'll do an oath with you.

Samantha Lamb

Okay, my name is Samantha Lamb. It is spelled S-A-M-A-N-T-H-A L-A-M-B.

Wayne Lenhardt

Okay. And do you promise that the evidence you give today is the truth, the whole truth, and nothing but the truth, so help you?

Samantha Lamb

I do.

Wayne Lenhardt

We're going to talk today about a spinal injury that you had. Maybe you could tell us exactly what happened and when this injury occurred.

Samantha Lamb

For sure. I've been experiencing low back degeneration for about 17 years. I've been managing it with chiropractic services and acupuncture. And then in 2018, close to 2019, something happened. I woke up one morning, I was in excruciating pain. I was trying to talk to my doctors about it. They just kept trying to send me to— I've tried physio. I had tried going to the spine clinic. I had done so many different things. At that point, we started trying spinal injections and finally it took my husband coming in and saying, "Look something's really wrong." Like I was— I couldn't walk to the grocery store with him not pushing the cart, not doing anything other than just walking, without my feet going numb. And I couldn't do any of the household chores, like it was— It would lay me right out. I would come home and have to just lay with my feet up.

So in about 2019, I finally took— I went to my workplace and said, "Look, I'm on all these medications. I'm not feeling good. I don't feel like I should be here. What do I do?" My workplace was really amazing and wrote out a letter of description of my job duties, which— I'm an accounting officer for the credit union, SaskCentral, which is the central credit union for Saskatchewan. I took this letter to my doctor and she looked at the letter and said, "Yeah, based on this information, you should not be working." We then pushed her to send a referral to a surgeon. I was seen pretty quickly in 2019, in December, by the surgeon. And within five minutes of being in his office he was like, "Why didn't you come in sooner, what's going on?" And I'm like, "I was told it wasn't surgical." And he's like, "You need surgery." So I'm like, "Okay." So I signed the papers.

And then COVID hit and everything got shut down.

Wayne Lenhardt

Okay, so that was 2019.

Samantha Lamb

And 2020, yeah.

Wayne Lenhardt

2020.

Samantha Lamb

Yeah, I did finally receive my surgery. I got very upset and I actually sent a letter to my MLA. I sent a letter off to her, very upset, saying, "I'm a 40-year-old woman with four kids. I have a professional career and I'm stuck lying here on all these drugs because the healthcare system has been shut down."

I did get a call back from her office. They did contact the advocacy for me, or the medical Saskatchewan advocacy, and within a month I had my surgery. So I did receive surgery in the end of May of 2021.

Wayne Lenhardt

Okay.

Samantha Lamb

But that was two and a half years of me waiting for surgery.

Wayne Lenhardt

Did you go and have some rehab work after that?

Samantha Lamb

Yeah. Well, that was the funny thing. So the rehab afterwards— With being on disability, I was at a point where disability was running out. I only had eight months left of my disability from my workplace before they were going to start sending me to CPP [Canada Pension Plan]. And they were sending threatening letters saying, you know, “If you don’t apply for Canadian pension or CPP disability, we’re going to assume that you have applied and we’re going to start deducting the amount from payments, from your current amount that you’re receiving.”

Wayne Lenhardt

Sure.

Samantha Lamb

And so I did apply for CPP disability. And they declined me because they called me a few days before my surgery and they said, “Well, if you’re getting surgery, then we’re not going to approve you because we don’t know what the outcome will be.”

But afterwards, that left me with only eight months to heal and get up to speed.

[00:05:00]

But out of those eight months, three of them, I wasn’t permitted to do any activity. I had to wait until the bones fused because I had a decompression and spinal fusion of the L5-S1 vertebrae.

I had to wait for the bone to fuse before I was allowed to do anything. And then, because of the delay in healthcare, I didn’t receive anybody to physically assess me. So even though my referrals were sent to Wascana Rehab that said that I was having trouble standing and so on, I only received a digital back class and digital therapy. So nobody actually looked at me, nobody assessed if I could get up, nobody could, nothing.

I called my disability plan and said, “You guys want me back to work. How am I supposed to do that with no disability? No physio, no nothing.” And so they did finally approve me for physiotherapy, which they were covering the cost of for me, to attend physio. And I needed physiotherapy in the water because my decompression and spinal fusion had taken so long that I needed to be in the water in order to do any physiotherapy. And so I went to an amazing physiotherapist, but that was about five and a half months after my surgery.

And so out of those eight months, five and a half, I was waiting to get in to someone.

Wayne Lenhardt

Okay.

Samantha Lamb

And that was a huge delay out of my healing time. I finally did get in to see the physiotherapist. And because of the rules, he performed his physiotherapy in the back of a gym. So because of the rules regarding entering a physical fitness center or any of those things, you had to show a vaccination pass. And I was very uncomfortable showing my medical information to anybody other than my doctors. So they had to sneak me in the back door and I kind of felt like a bit of a criminal going to physio. So it was like they didn't really want me there, but yet they had to take me because they couldn't deny me services. That's not the way the clinic was, but it's the way I felt because I had to be snuck in the back door in order to be seen by a physiotherapist, who wanted to help me.

After a week of physiotherapy, I caught COVID. So I was quarantined for 14 days. So out of the 12 weeks that I had before needing to go back to work and out of the physiotherapy, there goes two weeks. I was quarantined for 14 days. And then I went back to physio. We did a couple weeks and then he went to Mexico where— Again, because of the rules in Canada and the testing standards and everything else, even though he was vaccinated, even though he was boosted up and everything, he had no symptoms, but because he tested positive for COVID, he couldn't come back for four weeks.

So out of the 6 weeks or 12 weeks that we should have been getting physio and he should be seeing what I'm doing, he had really only seen me for six weeks.

The disability didn't care. He wrote an assessment saying, "Look, I haven't been able to see her," which led me to pay for a physical assessment. So I paid out of my own pocket to have him do a full physio assessment on me to see where I'm at. Can I stand? Can I sit? What are my capabilities? Which we sent off to disability and it proved that I can only sit and stand for no more than 100 minutes before requiring a lay-down break.

And I looked at him and I says, "Who's going to hire me? How am I supposed to go back to work if I can't sit or stand?" My work turned around and said, "We'll accommodate her" because I could work from home. So we tried that. Within four weeks, they attempted to push me back to work within a four-week return to work up to full-time from a spine surgery.

I was just flabbergasted that they were trying so hard to get me back. And it's because they wanted me off the books.

Wayne Lenhardt

Okay, so have your injuries now abated or are they still there?

Samantha Lamb

No. They're still there. It's almost two years after my spine surgery.

Because I was pushed back to work when I first started seeing physiotherapy. I was completely off all my medication, which meant that I felt like it was slowly working. I was healing, I wasn't on any of the morphine or the nerve pain meds that I was on when I first started seeing physio.

[00:10:00]

And then the more I was pushed back to work, like, even my doctor— I had to keep going back to my doctor to get doctor's notes to say I wasn't ready to increase my hours, that my back wasn't doing well. And the more I had to attempt to do full-time hours, the more I was in pain. And so the more I started having to go back slowly on certain medications and I was trying really hard to be on the ones that didn't alter my mental capacity. Because being on all those medications: when you're reconciling a banking system when you don't have a memory recall, it's really hard. And it makes it incapable of doing my job.

As they slowly pushed me back and I got up to about 80 per cent— But that took until October to get me up to 80 per cent and I was in tears. Like, I would literally go to work work for the 100 minutes and lie down for 30 minutes, work, lie down, work, lie down. Which then pushed my eight-hour day longer. Because these 30 minutes weren't in my— I had to take them out of my personal time, which meant that I was scheduled for a longer day because I had to keep laying down for 30 minutes. And yes, I get two 15-minute breaks and a half-hour lunch, or an hour lunch, but then I'm having to work for longer days. And so by the time I was getting off my schedule, I was literally crawling back into bed. And it left me in bed. I couldn't go anywhere.

I finally phoned my doctor and said, "This is not working, I should not be at work. This is not work. This is not value of life if I'm just going to work and going to bed." She finally approved me back for disability. So now I've lost even more income because they restarted me on a new claim. They turned around and said, "Because you didn't appeal your claim, we're now going to assess you at the 80 per cent that you were capable of working and we're only going to give you 70 per cent of that income." So now I'm at less than half of my income because I wasn't capable. And I was pushed too hard and too fast because I spent all my time waiting for surgery instead of getting time to heal.

Wayne Lenhardt

I see you appear to have a pillow behind you right now. So is your back still bothering you then? And how much and how often?

Samantha Lamb

My back is still bothering me every day. I'm now back on all of my medications that I was on before surgery. I'm on a nerve pain medication, I'm on an anti-inflammatory, I'm on a slow-release morphine for the pain. I am back on physio and I have been attempting physio but they're seeing severe weakness on the left side of my body, which is where the pain was running down to begin with. And so that pain has not gone away and now I'm having **hip and pelvic floor and bowel and all these other issues. So I'm finally being sent to a neurologist. But it's been a very slow process and it's almost two years after my surgery and I'm still not okay.**

Wayne Lenhardt

Could you give us one or two things that could have been done differently along the way here that would have helped you?

Samantha Lamb

Well, I think if they wouldn't have shut down all of the surgeries, I think that would have made a huge difference. I mean, I know I wasn't in a place where I was critically hurt or my life was threatened—but because I was just suffering pain, I was placed on a backburner.

My surgery was labelled as being—what do you call it?—“elective,” saying that I wanted surgery and it wasn't a requirement. Like I wasn't dying, which— Yes, I wasn't going to die from not being able to move my back but I wasn't capable of working. I wasn't capable of functioning. I wasn't capable of taking care of my family. I wasn't being able to be a mom of four kids. It's really hard when mom breaks down.

Wayne Lenhardt

Okay, I'm going to ask the commissioners if anyone has any questions. Okay, I think that's a no. So on behalf of the National Citizens Inquiry, thank you again for your testimony.

Samantha Lamb

Thank you.

[00:14:50]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 8: Carrie Sakamoto

Full Day 3 Timestamp: 07:50:40–08:08:35

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Wayne Lenhardt

Next witness will be Carrie Sakamoto, by video. There she is.

Carrie, can you hear me? Can you hear me? Say something so I can hear you.

Carrie Sakamoto

I can hear you. I am having difficulty seeing you. They've been having all kinds of trouble with this link here. There we go. I see you.

Wayne Lenhardt

Okay. Carrie, first of all, give me your full name and then spell it for me and then I'll do an oath with you.

Carrie Sakamoto

My name is Carrie Sakamoto. It's spelled C-A-R-R-I-E S-A-K-A-M-O-T-O.

Wayne Lenhardt

And Carrie, do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony today?

Carrie Sakamoto

I do.

Wayne Lenhardt

Carrie, you live in Lethbridge, correct?

Carrie Sakamoto

Yes.

Wayne Lenhardt

Okay. And I guess we're going to talk about an injury that you suffered from the vaccine today. Let's go back to when you had the vaccine and why. What year was it? Do you recall?

Carrie Sakamoto

I got my first vaccine, which was AstraZeneca, April 21st, 2021.

Wayne Lenhardt

Okay. And that was AstraZeneca?

Carrie Sakamoto

Correct.

Wayne Lenhardt

Okay. And was that a single dose regimen, or was it two?

Carrie Sakamoto

It was one dose and then it was taken out of Alberta. So I had to choose a second vaccine, which I chose Pfizer.

Wayne Lenhardt

You had a second dose as well and that second dose was Pfizer?

Carrie Sakamoto

Correct.

Wayne Lenhardt

Okay. When approximately was that?

Carrie Sakamoto

That was June 18th, 2021.

Wayne Lenhardt

And when did you start having effects?

Carrie Sakamoto

I got sick that evening along with my husband. We both had flu-like symptoms. We were told to expect this. We were also told to expect the unexpected because we were mixing

vaccines. There had been things in the media saying it was fine, there were things saying they weren't so sure. At this point, we didn't have a choice. I already had AstraZeneca. I had to pick another one. I picked Pfizer.

Wayne Lenhardt

And who was it that told you, "Expect the unexpected?"

Carrie Sakamoto

Friends and family.

Wayne Lenhardt

Okay.

Carrie Sakamoto

Yeah, so I got my vaccine and I got sick that evening. But it was fever, nausea, achy body: just like a regular flu. I spent the next few days in bed. But my husband had the exact same symptoms, so I didn't really think too much of it until about the seventh day. And he was better and I was getting worse.

Wayne Lenhardt

Okay. So keep going.

Carrie Sakamoto

So by the seventh day, I had a really bad fever. I had a really bad headache and I had swollen tonsils on the right side. I called my doctor to make an appointment. But because I had a sore throat and this was still in the beginning of COVID, I couldn't be seen in person. So she called me, I explained what was happening. She said that most likely I had tonsil stones from fever from my vaccine. She put me on antibiotics. She said if I wasn't better in three days to call her back.

The next evening, I was being taken to hospital by my husband. My brain felt like it was on fire, is the only way I can explain it.

[00:05:00]

And because of the pain, I started vomiting and I couldn't stop. This went on for about 24 hours. But at this point, I'd been sick for eight or nine days and had hardly eaten because it really affected my throat. So I was pretty sick by this time. My husband took me into the hospital. They gave me medication for migraine and things like Gravol to stop the vomiting, which worked. So I went home. I was sent home. They said if anything changed to come back.

After that medication wore off, all the symptoms came rushing back. My husband took me back to the hospital. And on the way, as I was looking in the mirror, I saw my face start to drop. I thought I was having a stroke.

Wayne Lenhardt

Okay. Was your heart rate up?

Carrie Sakamoto

I'm not sure if my heart rate was up. All I could see was that my face was dropping—and just the one side. My mom had had a stroke when I was young, so I was familiar with what it looked like. And that's immediately what I thought was happening.

Wayne Lenhardt

So you were on the way to the hospital, though. What did they say when you got there?

Carrie Sakamoto

They admitted me and hooked me up to some IVs to try and stop the vomiting. They said they believed that it was Bell's palsy.

Wayne Lenhardt

Oh. Did they explain to you what that was and how long it would—?

Carrie Sakamoto

They said it was facial paralysis and that it should resolve itself soon. But because I was so sick, they kept me in the hospital for a few days, which turned into being 17 days. When I was in the hospital— Sorry, I just need to look at my notes here. It's a lot.

I was admitted into the hospital and I want to say about day three, or four, maybe even five, I was still very, very sick. I was in and out of sleep, sleeping a lot. When the Bell's palsy hit, my eye was paralyzed. I had a patch on my eye, my tongue was swollen and half paralyzed, and half of my esophagus, so I wasn't able to swallow. So I was given a feeding tube at this point because I was losing so much weight so fast, because I'd been sick ten, fifteen days at this point.

While I was in hospital, they had restrictions still. So I was only allowed a couple of people in—my husband and my mother and not at the same time. But one of these mornings, I want to say day five, a nurse came in and asked if somebody from Alberta Health Services could come and see me. I awoke to find a lady standing there. I was still very sick. She didn't say anything. She just stood there for a while staring at me and then left. I thought that was really strange—and I'll show you where it applies later on in my story.

Wayne Lenhardt

Okay. Did anyone tell you where or how you had gotten this palsy?

Carrie Sakamoto

Yes. So while I was in hospital, I had a lot of specialists. I had MRIs, CAT scan, ultrasounds: I mean, you name it, I had it. And the doctor who was treating me, who's a pretty well-known doctor, he came to my bedside with a laptop. And it was split-screened and there was probably eight or nine other doctors on there. And he asked if they could see me and speak

to me because they had never actually seen somebody or spoken to somebody with full-bloom Bell's palsy as severe as mine.

So after he spoke with these people, it was their opinion that Pfizer had done this to me. Pfizer was in my body and it was fighting against me for some reason.

[00:10:00]

Wayne Lenhardt

Did they give you a prognosis as to how long this was going to last, how severe it was going to be, that type of thing? What did they tell you?

Carrie Sakamoto

They said it was a new type of Bell's palsy because it was caused by this vaccine and that they didn't know what was going to happen. They figured, most likely I would go back to the way I was, that it would resolve itself, but they didn't know. My neurologist said that usually anything after a year is permanent.

And I sit here today at two years and I still have the full facial paralysis, the paralysis on my throat, the entire side of my body. I have hearing loss that requires a hearing aid now. I have vertigo on both sides. I have a lot of neurological problems. I have memory loss from trauma. I mean, the list kind of goes on and on. But the doctors are the ones who told me specifically that it was Pfizer that was doing this damage to my body.

Wayne Lenhardt

All right.

Carrie Sakamoto

After I got out of the hospital, I received a phone call from Alberta Health Services telling me that it was safe to take the booster.

I'm not sure why they called me. They've done it twice. Nobody else I've spoken to has ever received a call from Alberta Health Services saying to go get a vaccine or a booster of any kind. It makes me feel like an experiment. It's frustrating and it's scary. I literally said to the woman, "I am still injured from my first vaccine. How can you say this is safe?" She simply replied, "It just is." But that's not a good enough answer for me, so I'm still looking for answers.

I was lucky, all of my doctors have been on board from day one: my neurologists, my specialists. They all were the ones who told me that this is what was happening to me. So I applied to the vaccine injury program [Vaccine Injury Support Program]. After 20 months, I have been accepted and I was given a lump sum of money and continued medical care.

Wayne Lenhardt

So are they still reimbursing you for care at this point? I gather you had been on a farm and you have now moved to town because of all of this.

Carrie Sakamoto

I couldn't drive. I had zero independence, and my kids were— We were all stuck out on the farm when my husband would go to work. I couldn't work. I didn't have a job when this happened but my family needed me and I wasn't able to help out, so the only option was to sell our farm.

Wayne Lenhardt

Are you still being supported by the injury program, or is that all over?

Carrie Sakamoto

Yeah.

Wayne Lenhardt

Okay.

Carrie Sakamoto

It's continued care. I was only accepted on March 3rd.

Wayne Lenhardt

Of this year? Of 2023?

Carrie Sakamoto

Yeah, yes.

Wayne Lenhardt

And is that all going satisfactorily? They're paying for your care?

Carrie Sakamoto

So far, yes.

Wayne Lenhardt

Okay. Is there anything you want to tell us about this ordeal of yours that I haven't mentioned yet?

Carrie Sakamoto

I did want to say: When this first happened to me, I really wanted to share what was going on with me. And I reached out to all the news stations thinking, "They're going to want to cover this story. They're going to want to see. The doctors should know what's happening, and then if somebody else turns up in the emergency room like me, they can be helped instead of turned away three times." But I was met with resistance.

And that's actually when I met Mr. Harding. And I'm the one he did the story about that I just found out was related to him being let go from his job.

I just wanted my story to be heard, so I went to TikTok,

[00:15:00]

and there I was able to share my story. And I have a small following of about 11,000 people who really want answers as well. They're waiting to see how this is going to play out. But I want to know why I can go to the news station and speak about long COVID, if I had a story about if this was long COVID, but when you say, "vaccine injury," even though I have been approved, they don't want to speak about anything negative. So people like me are being forced to be quiet.

And I kind of— Part of the reason I wanted to do this was to give them a voice through me.

Wayne Lenhardt

At this point, I'm going to ask the commissioners if anyone has any questions for this witness? Yeah, Dr. Massie.

Commissioner Massie

Well, thank you very much for sharing your really sad story with us.

Let me make sure I understood exactly the conversation you had with Alberta Health Services. They first came to see you in the hospital to watch you? Did they engage in any conversation with you at that point?

Carrie Sakamoto

No.

Commissioner Massie

And then when you left the hospital after the doctor had acknowledged that you've been vax-injured, you received a phone call from Alberta Health Services telling you that the booster is okay for you?

Carrie Sakamoto

That it was safe, yeah.

Commissioner Massie

Do you know the name of the person that actually gave you this medical advice?

Carrie Sakamoto

I wish I had wrote that down and I am going to look through some more notes, but I didn't. And they called twice but I didn't think of doing that.

Commissioner Massie

Is there a way for you to get back to them and tell them clearly, how can it be safe when you are compensated by the government that acknowledges your vax injury?

Carrie Sakamoto

That's also part of the reason why I wanted to come here and speak, because I would like some answers to that.

Commissioner Massie

Thank you.

Wayne Lenhardt

Okay, anyone else? Okay, on behalf of the National Citizens Inquiry, I want to thank you very much for your testimony today and good luck.

Carrie Sakamoto

Thank you.

[00:17:54]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 9: Mandy Geml

Full Day 3 Timestamp: 08:09:10–08:24:01

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Wayne Lenhardt

Can you give us your full name please, then spell it, and then I'll do an oath with you.

Mandy Geml

Mandy Geml: M-A-N-D-Y G-E-M-L.

Wayne Lenhardt

And you promise to tell the truth, the whole truth, and nothing but the truth today?

Mandy Geml

I do.

Wayne Lenhardt

Thank you.

Okay. Mandy, I think just summarize to begin with. I think you had all sorts of problems because of the mandates, including with your daughters and your school and whatnot. So I think I'm going to let you just start and tell us your story, and I will interject if there's something more that I need to know.

Mandy Geml

Okay.

Wayne Lenhardt

What year did all this start? Let's start there.

Mandy Geml

Okay, I think it all really started in 2019. Me and my husband found out that we were pregnant after years of infertility and having one daughter through fertility drugs. We found out we were pregnant on our own and we were super excited, and—

Wayne Lenhardt

Can you hear her?

Mandy Geml

I can talk a little louder.

Wayne Lenhardt

I think you may have to talk a little louder.

Mandy Geml

For sure.

Wayne Lenhardt

I was told that too, so.

Mandy Geml

So we were pregnant with a daughter. We suffered a loss in the second trimester only to find out the month later we were pregnant again. And that was at the end— That was New Year's Eve, 2019. It was a really hard pregnancy and I was on bed rest for a lot. And it was just a lot of fear. And then everything happened.

And we have a 15-year-old and a toddler, three-year-old at the time. Or sorry, my 15-year-old was 13 at the time, in grade 7, and everything shut down. June of 2020, we lost a cousin—my younger cousin that I was really close with—and I couldn't attend the funeral because of everything that was going on and my pregnancy.

In August, we welcomed a son. And everything hadn't fully shut down, so my husband was allowed in the hospital with me but nobody else could come up and visit. My kids couldn't come up and it was hard. He was almost a month early; he had jaundice; he was colic; he had acid reflux. And throughout that, both my daughter's school and my toddler's preschool had shut down for the last couple months. So we were all at home. All their activities stopped. And life just halted.

And it was scary. We didn't know. We did comply with everything at first and we were scared: it was a scary pregnancy; it was a scary birth. And then things just weren't adding up. And you try to ask your doctor questions—with no answers. And you see the fear-mongering starting in the schools, my daughter's school especially, with her teachers and everything. And we—

Wayne Lenhardt

Your daughter in particular was having some trouble at school I think, wasn't she?

Mandy Geml

Yes, so that was grade 8.

Wayne Lenhardt

You were not vaccinated nor was your daughter, correct?

Mandy Geml

No, none of us were. It wasn't really even an option for us. We have allergies. I have anaphylactic allergies to different medications. And so I just wouldn't. Why would I take the chance? And my daughter as well.

She started facing extreme hardship at school. She would sit in in class and hear her teachers go on about: "The unvaccinated are murderers; nobody with a brain would ever choose not to get vaccinated."

[00:05:00]

Her entire friend group dropped her. Her friends' parents banned her from their houses once they found out that she was unvaccinated. Every time I called the school— I called the vice principal, the principal, the superintendent to discuss, calmly and politely, these things that were being said in class. With no avail. I finally got a phone call from the principal saying that, because my daughter—who joins every activity that she can and is involved in everything and honour roll— but because somebody else had tested positive, she wasn't allowed to participate for 10 days.

And I said, "Well, how does that make sense?" My daughter not once came to school sick. Not once. And she wasn't allowed to participate in her activities because somebody else, who was vaccinated, tested positive? But they could all participate: if you were vaccinated you could participate. But if you were unvaccinated, you had to stay away for 10 days.

Well, every day kids were testing positive, so she was basically kicked out of everything. And I asked the principal, "Where's your line? Where do you say, 'No, we're not going to segregate these kids. We're not going to put hate between them and division between them?'" And she refused to answer. She told me that I was lucky that kids like mine were even allowed in school and it's— It's so hard when you're—

Wayne Lenhardt

You were living in Regina at this time, correct?

Mandy Geml

We live in Regina, yeah. And it's really hard when you're trying to keep yourself together: mentally strong, dealing with postpartum, you're dealing with a baby. My infant was colic for almost a year and these issues.

And then you see your daughter, who— I mean, teenage-hood is so hard already and she's coming home in tears. Shaking because her teacher's calling her a murderer. Her teachers are singling her out. None of her friends will talk to her. None of their parents will allow her over. Her world's ending.

And then you have the leaders of your country and your province saying, "Time's up. We're not going to be lenient anymore. Things are coming down. How do we tolerate these people?" I mean, fear takes over you. And it's wild to think that you have to sit there and make plans of, "What do we do if they take it further and they decide to take your kids away because you're unvaccinated?" Or they deem you as not responsible because you're not doing this?

We went to the grocery store—me and my husband and my toddler—and I was dealing with such bad postpartum and anxiety, I couldn't wear a mask. My toddler of course wasn't wearing one. The police came and escorted us out of the grocery store: me and my toddler, while my husband paid. And even though the police officer agreed, "This is so ridiculous." You know, we had friends and family say that our children should be taken away from us, wishing illness and death on our kids and ourselves. And it was so overwhelming. And it just creates this fear inside of you as to what's next. How do you reassure your kids that everything's going to be okay? How do you— You know, my daughter faced such hate from everyone around her that she even received an anonymous letter mailed to our house saying horrible things about her. And for what?

And the teachers say, "Oh, well, we're not telling people her vaccination status," but she's being removed from everything that she's in, so how is that not? She's the only one being singled out. She can't go on bus trips. I fought to get her on a ski trip and at first, they said, "No, the bus lines won't allow anybody unvaccinated." Well, I called the bus line: that's not true. "The ski resort's not letting anybody unvaccinated." I called the ski resort in Manitoba. I talked to the manager and she said, "Well, they're just not allowed in the chalet."

My daughter went and she had to eat her lunch in a shack at the bottom of the hill with a barrel that had a fire in it,

[00:10:00]

because she wasn't allowed to go sit with the people that she had just spent hours going up with. Like, how is that fair? Why is this allowed? Kids are mean enough as it is. Why would you put that out there for them?

So with all of that happening, it took such a strain on my mental health especially. But my kid— She has so much anxiety and she had so much anxiety. She was so scared when she'd meet somebody new that they would find out that she was unvaccinated. I can't imagine that fear inside of her, having to go to school every day and sit with her classmates and her teachers and that feeling of, "These people hate me; these people wish me dead." For a child? Like, that's horrible.

And you see people online—doctors, nurses—saying they have no sympathy for the unvaccinated, they treat them differently when they come in, things like that. And as parents, you worry about your kids. What if something happens and you have to bring them in? Are you going to be separated from them? Are you going to have social services called on you? There's just so much fear.

Wayne Lenhardt

Your mother also had some problems during this time. Can you maybe quickly tell us about that?

Mandy Geml

Before everything started, she went to go seek some help at the Dube Centre. And without getting into too much detail, she suffered from depression. When the lockdown started, they put her on really high-dose medication and they locked her in her room for a month straight—maybe 15 minutes out of her room a day. There was no housekeeping, nothing. She lived in bathrooms that were filled with urine and feces. And it broke her psyche. And it's a hard— She struggles now with being in touch with reality because of the medication and that. Nobody knows how to help her. The psychologist said, "We don't know what to do."

Who's responsible for this? My kids don't have a grandma. I don't have a mom. I do, but I don't have an active mom. For what? For what? She was vaccinated.

Wayne Lenhardt

I'm going to stop at this point and ask the commissioners if anybody has anything they'd like to explore or questions here. Anyone? No.

This may seem obvious, but what two or three things could have been done better in order to save you some of this grief?

Mandy Geml

Oh, everything. Just understanding. How quickly everybody turned on each other and villainized certain people. And I tried to stay so respectful and positive through it all. And tried to keep the message that there's always two sides to a story and there is a happy medium in the middle.

And I think just hearing other people's stories could have—hearing other people's reasons why. Because people have reasons why and those should be taken into consideration.

And have our leaders accountable. How did we get to this point where they can go and spew hate in the media for a large portion of Canadians? How did we get to this point?

Wayne Lenhardt

Okay, I want to— On behalf of the National Citizens Inquiry, I want to thank you for coming today and giving your testimony. Thank you.

[00:14:51]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 10: Dr. Chong Wong

Full Day 3 Timestamp: 08:37:54–09:00:56

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

I'm very pleased to introduce our next guest, Dr. Chong Wong. Dr. Wong, we'll start by asking you to state your full name for the record, spelling your first and last name.

You were distracted. Dr. Wong?

Dr. Chong Wong

Yes. I'm Dr. Wong.

Shawn Buckley

Can you please state your full name, and state your first and last name for the record?

Dr. Chong Wong

Yes, my first name is C-H-O-N-G, Chong, and the last name is W-O-N-G, Wong.

Shawn Buckley

Do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Chong Wong

I do.

Shawn Buckley

You are a family physician and also you are an integrative medicine physician, and you've been practising medicine since 1986.

Dr. Chong Wong

That's correct.

Shawn Buckley

You were telling me earlier, when you and I were speaking, about a woman who was 44 that came to you. Can you share with us that story?

Dr. Chong Wong

Okay.

Shawn Buckley

So again, Dr. Wong, when you and I were talking earlier, you were telling me about some things that happened in your practice. You were telling me a story about a 44-year-old woman that came to your practice that had blood clots. Can you share that story with us?

Dr. Chong Wong

Yes, the lady came to me because she had heard about me and she wanted my opinion or support, I suppose. She came because she had a mass of blood clots all over her body. She was concerned because she had contacted the public health expert who was responsible for the PCR testing in Saskatchewan. Contacted her office and never got to talk to the doctor, but to the nurse.

From the nurse and what had happened, she actually had a photograph of the form that was presented to her. At the bottom of the page, my memory says, the box was checked off saying, "Continue schedule of vaccination." Basically, no change. In other words, she said, "Get the second shot." It was because of the first shot that she got the clots. So of course, she was obviously devastated by that.

Shawn Buckley

Can I back you up? She saw you before that happened, right? She saw you as a physician to get some medical advice?

Dr. Chong Wong

I'm sorry, I didn't hear you.

Shawn Buckley

This 44-year-old woman that had gotten blood clots after getting her first shot, she had come to see you to get medical advice because of her condition. Am I right about that?

Dr. Chong Wong

Yes.

Shawn Buckley

And she asked you whether or not she should be vaccinated with her second shot. She was concerned about that?

Dr. Chong Wong

I think so. She needed some support, I think. That's the idea.

Shawn Buckley

What was your recommendation to her? Did you recommend that she get her second shot?

Dr. Chong Wong

When I saw the form, I was actually quite shocked by it.

Shawn Buckley

She brought that form in with her when she saw you the first time?

Dr. Chong Wong

Pardon me?

Shawn Buckley

Did she bring that form with her when you saw her the first time?

Dr. Chong Wong

It was actually on her phone. It was a photograph of the form.

Shawn Buckley

She showed that to you the first time you met her when she came into the clinic.

Dr. Chong Wong

I'm sorry?

Shawn Buckley

David, can you turn my volume up? Dr. Wong is having trouble hearing me.

Dr. Wong, this woman comes into your clinic. And for the first time when you see her, is that when she's showing you this form on her phone?

Dr. Chong Wong

That's right.

Shawn Buckley

And she's wanting advice from you as to whether or not she should get vaccinated a second time?

Dr. Chong Wong

I believe so and possibly, just mainly, for support, I think.

[00:05:00]

Shawn Buckley

Okay. What did you tell her?

Dr. Chong Wong

"No." I said I was quite shocked by the box that was checked off to ask her to continue vaccination. She told me that she was told that, "Don't blame it on the vaccine, it's just your genetics."

Shawn Buckley

This was a nurse that had contacted her and filled this box out, right?

Dr. Chong Wong

That's right.

Shawn Buckley

Is it ethical for a nurse who hasn't seen a patient to basically make the medical call and say that you should be vaccinated after you've had an adverse reaction?

Dr. Chong Wong

No, I don't believe that's ethical, at all.

Shawn Buckley

My understanding is you referred her to a hematologist, who also was of the opinion she should not get vaccinated.

Dr. Chong Wong

She actually had seen a hematologist already.

Shawn Buckley

Okay.

Dr. Chong Wong

She told me the hematologist also told her not to get the second dose. She told me that the hematologist was very careful and giving that advice because he was concerned, apparently.

Shawn Buckley

Now, my understanding is that, in your practice as a physician during the COVID experience, people came to you asking for a medical exemption.

Dr. Chong Wong

That's correct.

Shawn Buckley

Can you tell me, with some of these people, can you share the experience you had and what ended up happening?

Dr. Chong Wong

Yes, there's a number of people. I'll give you an example. A man who basically represents the whole group. He comes to me because he's not vaccinated and he chooses not to be vaccinated. And because of that status, he's not allowed to work. The company, like its policy would be to let him go, unpaid. And my understanding too is that he will not be qualified for employment insurance as well.

So I remember seeing this man coming in. He's obviously very stressed and devastated—basically in tears, a full-grown man, probably in his 40s. When I saw him, I realized that this man is disabled. He cannot work.

Shawn Buckley

And that's because he was suffering from mental illness because of the stress?

Dr. Chong Wong

That's right. Because he wasn't able to sleep well and can't focus, the signs of depression and anxiety and not eating well. I said, "I think you're disabled." And I suggested that I would be more than happy to take him out of work on disability.

Shawn Buckley

Right. And then my understanding is that this happened a couple of times where people came in and, actually, as you assess them, you came to realize that they were disabled.

Dr. Chong Wong

That's correct.

Shawn Buckley

My understanding is, every time, the disability insurance company then hired a psychiatrist to see if they were basically under a disability. And that psychiatrist agreed with you every time.

Dr. Chong Wong

That's right.

Shawn Buckley

Okay. What you were actually experiencing, then, is by the time people came to you, asking for you to write an exemption for them, they actually had already reached that state in their lives where they were disabled.

Dr. Chong Wong

That's right.

Shawn Buckley

They weren't seeking help from people like you early enough.

Dr. Chong Wong

That's right.

Shawn Buckley

Okay. And literally, you would see grown men crying in your office.

Dr. Chong Wong

Pardon me?

Shawn Buckley

Literally, you'd see grown men crying in your office, they were so stressed.

Dr. Chong Wong

Yes, you can see the stress on their faces, how they behave. Yes, it was really quite a moving— Those experiences have been very challenging for me personally as well, seeing that.

Shawn Buckley

Can you share with us why it was stressful for you?

Dr. Chong Wong

Yeah. Just seeing the struggles they go through, that they are intimidated basically by what's happening. It's almost like their back was against the wall. There are no answers to

what they can do. Because they have families to look after. You can't collect EI. I think it was just fortunate

[00:10:00]

that I thought about it, that I can take them out on disability. I've seen not just one but a number of them that way. It's so heart-wrenching to see full grown men in tears and so much stress because, as you know, men are the providers. And so proud of their work as providers. And here are these men that are just, like, broken. They're broken when they come see me.

Shawn Buckley

My understanding is also, you saw people really broken because of the lockdowns. Can you share with us about that?

Dr. Chong Wong

Yes. There's this one lady, for example, of 44. I'd seen her before; it was still during the pandemic. And that was probably about a year, a year and a half ago. She was actually quite together and a very happy person. But by the time I saw her again— I saw her once around Christmas time too I remember, and then once maybe a couple months ago. And she was definitely a different person.

You can tell that she had a lot of anxiety. She's thinking about— She really believes she's going to die. And she just did not see any light at the end of the tunnel. When she was sitting there, talking, she was moving around, kind of a strange body behaviour. I asked her, "What's happening there." And she would say, "Well, my back's very tight." She was moving as she was talking. I think well, what is this? Anxiety, I gathered. And she has this kind of odd behaviour.

I've seen a number of cases like that: people who've really been hard done by, by the lockdown and isolation and so on. In this case, she was very fortunate. She saw a practitioner who helped her. I found out that the practitioner himself had made a house call to see her. Just in the last while, she's up and down but she's actually improved a lot. That practitioner who made a house call actually has driven her to his clinic. But now she's strong enough, she doesn't have to be driven. She walks over; it's only a few blocks away from the clinic that the practitioner is working. I saw her once as well and I was really happy that she made progress.

Shawn Buckley

Right. Now, when you were dealing with people—so she's doing well now—but when we were in the pandemic and you were seeing people basically being broken by the lockdowns, how did that affect you as a physician?

Dr. Chong Wong

Yeah, it's been tough after seeing quite a few of them. Often, you see these stories over and over again. It kind of gets to you, you know? But the silver lining, I suppose, is that it forced me to learn to take care of myself even better. I do things to help de-stress and help myself. And so I think I've learned a few things about myself, as well.

Recently, I've been invited to groups of health care practitioners, for example. Before Christmas, there was probably 40 to 50 of them. Most of them—I think, 40 were practitioners—but they were non-MD practitioners. Recently, as late as this past Monday, there was about 16 of us that got together. I was invited again. These people gave me hope. Because I'm convinced that, for them, money is not the main focus here. They want to help people. They have ways to help people who cannot afford it so they can get the services—like less pay—and maybe other services they can do and so on. So that gives me hope that the people out there want to help.

Shawn Buckley

Okay. So as a physician, you found yourself in a position where, because it was difficult, all these people coming to you,

[00:15:00]

you actually had to start taking better care of yourself because you were being affected by all of the grief and harm that you were experiencing through your patients?

Dr. Chong Wong

That's right.

Shawn Buckley

But what you're experiencing right now is that there's a group of health care practitioners. They're not medical doctors, they're from different disciplines. But they're coming together as a group to try and help people heal who have been through this experience?

Dr. Chong Wong

That's correct.

Shawn Buckley

Both to deal with their physical problems and also just to give each other hope?

Dr. Chong Wong

Yes, true.

Shawn Buckley

Okay. It's kind of an example of a group in Saskatoon that's forming to help us get out of this.

Dr. Chong Wong

Yes.

Shawn Buckley

Do they have a website or something that people in Saskatoon can go to?

Dr. Chong Wong

Yes. This group I've been invited to, the website is www.onewellnessnetwork.ca. That's the website.

Shawn Buckley

Okay. That's a group that you're joining and you're finding this very helpful.

Dr. Chong Wong

That's correct.

Shawn Buckley

I wanted to ask you some questions. You had one interaction with the College of Physicians and Surgeons. Can you tell us about that?

Dr. Chong Wong

Yes, it was about an 85-year-old man, very robust in a lot of ways. He did have prostate cancer. But he was going to the cabin. He was painting. I talked to his son just today. He was really healthy. And then one day, he— He already had contacted me many months ago for ivermectin and hydroxychloroquine. He knew he wanted that, just in case.

It turns out this man, he got sick, almost like a cold or something, I'm not sure what it was. They're not sure why. Because he told me, when I met him, he said, "Chong, I do not want to go to the hospital when I'm sick." For whatever reason, he got sick. He wasn't that sick because the son told me that the ambulance came—it took about three hours to get there, he says—and he actually walked out to the ambulance. He was short of breath somewhat, but wasn't super sick.

When he went to the hospital, the pharmacist had an interview and asked him what medication he was on. Of course, he says, among other things, he was on ivermectin, hydroxychloroquine. He said, "What doctor gave you that?" He said, "Dr. Wong." "Oh, I see." So the pharmacist made a complaint against me because of that and the College had to respond. They always have to respond to all complaints. They wrote me a letter asking me for an explanation why I'm doing that.

I wrote the letter in response. I sent them my notes because I do believe in informed consent. I told this man, I said, "Officially, these medications are not recognized as being helpful for COVID. And officially, it's not helpful and may do more harm than good for you. **If you really want it, I'll prescribe for you, but this is what is official.**" And so on. I had all that documented and all the notes were sent to the College.

I had a lawyer from CMPA [Canadian Medical Protective Association], that's my insurance. With some counsel advice, I decided to switch lawyers. I switched to a lawyer from JCCF [Justice Centre for Constitutional Freedoms] in Calgary and I'm glad I did. This lawyer from CMPA was very nice. I was very hesitant to let him go because he was such a nice lawyer. But I finally explained to him that I have a better fit for a lawyer, thank you for all your help, and so on. We had an amicable departure.

Anyhow, going back to this, I wrote the letter with some minor changes with a new lawyer. And then I got the letter from the College finally. To my surprise, the College didn't say

anything about ivermectin, hydroxychloroquine at all in the letter. That's my surprise. The only thing that they told me is to make better notes next time.

[00:20:00]

Shawn Buckley

Dr. Wong had you ever, pre-COVID, had a complaint where a pharmacist would literally complain to the College of Physicians and Surgeons because you had written a prescription? Had that ever happened in your career?

Dr. Chong Wong

I have not had any of that.

Shawn Buckley

Okay. It just strikes me as odd. It just strikes me that the physicians are the ones who are experts in treating patients and I wouldn't expect a pharmacist to have the authority to complain to the College because a physician has written a prescription.

And that had never happened to you before.

Dr. Chong Wong

I've never experienced that before.

Shawn Buckley

So that was a new one. How were other physicians? You had patients come in to you and reporting about how other physicians were treating patients who were unvaccinated. Can you share with us what you experienced from other patients about physicians treating them differently?

Dr. Chong Wong

Yes, I work in a Mediclinic, that means I see people I do not know, a walk-in clinic, right? I also see my own patients, so I get to have a very broad spectrum of people. I'm fortunate that way. And because I'm interested in the COVID pandemic and so on, the medication, the vaccine, I always ask questions of people, so I can learn more about what's happening out there in the community.

I heard it quite a few times where they would say, "My family doctor, when I told him I do not want to be vaccinated, he was just after me," he says, "very rude and told me to get it. I've lost totally trust in my doctor now." And they ask me quite often also, "Do you still accept patients?" Myself. I say, "Thanks for asking. I'm sorry, I'm full, I cannot accept you, but if you happen to come to the clinic, I'm more than happy to see you as a walk-in."

Shawn Buckley

Dr. Wong, I don't have any further questions of you, but perhaps the commissioners do.

Thank you, Dr. Wong. On behalf of the National Citizens Inquiry, I sincerely thank you for testifying today.

Dr. Chong Wong
You're welcome.

[00:23:02]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Moderator Statement: Shawn Buckley

Full Day 3 Timestamp: 08:36:36–08:37:54

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

We welcome you back to the National Citizens Inquiry as we continue on our third day in Saskatoon.

It's interesting, I was just talking to a gentleman who had come up to speak. And we were talking about— If you were watching the presentation of Dr. Havas, when she was showing the survey results, and remember, she had a couple of questions that weren't yes/no answers. You selected things, you actually wrote out your experience.

What she did was, she showed us those two blocks where the larger the word was, the more that it was mentioned. What jumped out at me—and I don't know if it jumped out at you—but when people were talking about the Trucker's Convoy, the biggest, the most mentioned word was “hope.”

And that just kind of struck me because I'd shared with you earlier that the truckers had given me hope. I think they gave a lot of us hope. And I'm thankful that we're honouring what they started by starting to tell our stories like they told their stories, and starting to live our lives in a different way like they did.

[00:01:18]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 22, 2023

Day 3

EVIDENCE

Witness 11: Louise Wilson

Full Day 3 Timestamp: 09:05:35–09:19:06

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness is Louise Wilson. Am I saying your first name right? Okay. And Louise, can you state your full name for the record, spelling your first and last name?

Louise Wilson

My name is Louise, L-O-U-I-S-E. Wilson, W-I-L-S-O-N.

Shawn Buckley

And Louise, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Louise Wilson

Yes, I do.

Shawn Buckley

Now, my understanding is that when this pandemic started, you owned and ran two Dollar Stores.

Louise Wilson

Yes.

Shawn Buckley

Can you tell us actually how business was in 2020?

Louise Wilson

We have a Dollar Store. So it has a variety of merchandise that, when the pandemic hit, they deemed essential because we have a lot of school supplies and craft supplies and household items. Some health and beauty items that, I guess, would be used for PPE. And we were fortunate to be able to stay open during the pandemic.

Shawn Buckley

Now, you have two stores, can you tell us where they're located?

Louise Wilson

Yes, in southeast Saskatchewan: Esterhazy and Moosomin.

Shawn Buckley

And I'm sorry?

Louise Wilson

Moosomin.

Shawn Buckley

Oh, Moosomin. Okay, thank you. Can you tell us how business was in 2020? You told us that you guys were deemed essential, so you could stay open. And I'm just curious what the effect of that was.

Louise Wilson

Well, we were very busy. And the reason why we were very busy was because no one wanted to go to the city. Everybody was very afraid of going to the city. They just stayed close to home. Like I said, we had requests for certain things by the thousands that we could source out because we could custom-order things. We were very busy, actually.

Shawn Buckley

Right. Just so I understand you: People are afraid to go to the city because they're going to catch COVID, so they would shop at the local Dollar Store instead of going to the city.

Now, when the first mask mandate rolled around, how did you respond both personally and with your business?

Louise Wilson

Well, personally, I knew right away the masks were useless. I'm very informed. I've done a lot of research over many years on health issues—and I knew this was ridiculous. I went along with it. I did wear the mask very reluctantly and not very well, mostly under my chin.

Shawn Buckley

You were one of those chin-wearers, okay.

Louise Wilson

I was.

Shawn Buckley

What happened when they imposed the mask mandate a second time?

Louise Wilson

I wasn't very happy about it and I refused to wear a mask. I had put out a memo to all of my staff, "You will not be harassing customers to wear a mask." I have never, ever put signs on my floor or Plexiglass in my store. And I told them if they wanted to wear a mask, they were welcome to wear one, that I wasn't going to wear one.

Shawn Buckley

And how did your employees react?

Louise Wilson

Mostly good. Some quit. Yeah.

Shawn Buckley

Do you recall why they quit, was anything said?

Louise Wilson

They were afraid. They were afraid that customers were going to be in my store. It was going to be a not-healthy environment and they were afraid that they were going to get COVID and worse. So they quit.

Shawn Buckley

I thank you for telling your staff not to harass customers. The first store I got kicked out of for not wearing a mask was a Dollar Store. Now, eventually you had a visit.

Louise Wilson

Yes.

Shawn Buckley

Can you tell us about the visit?

Louise Wilson

Well, there are a lot of people in town that could see what was going on in my store,

[00:05:00]

and made complaints. So this representative from the Saskatchewan Health Authority paid a visit and I was issued a \$2,800 fine.

Shawn Buckley

Twenty-eight hundred dollars.

Louise Wilson

Yes.

Shawn Buckley

And what was that ticket for?

Louise Wilson

Not complying to wear a mask.

Shawn Buckley

Okay, so that was on you personally?

Louise Wilson

Yes.

Shawn Buckley

Do you know how it came about that the person made a visit to your store?

Louise Wilson

Yes, it was— Someone from the town would have made a complaint to the Saskatchewan Health Authority and, right away, that triggers somebody to come out to make a visit.

Shawn Buckley

Do you know, in Manitoba we learned that there was a special name for these people. They're called ambassadors.

Louise Wilson

Yes.

Shawn Buckley

Did they have a similar name in Saskatchewan?

Louise Wilson

We call them Karens.

Shawn Buckley

You called them what?

Louise Wilson
Karens.

Shawn Buckley
Okay. So now, what happened with that ticket?

Louise Wilson
Well, I told this representative from the Saskatchewan Health Authority that I was not going to pay it and that I was going to fight it out in court.

Shawn Buckley
And why did you decide to fight it? Because you weren't wearing a mask.

Louise Wilson
I decided to fight it because I didn't think that it was lawful. And I didn't think that what they were doing was right. And I was very determined to stick up for myself.

Shawn Buckley
And what happened?

Louise Wilson
Well, we had several court appearances. I had a ticket and I recognized that the ticket had some errors on it. I was basically just trying to figure out, by any knowledge that I could amass, how I could go about dealing with this ticket that I had. And there were things wrong with the ticket, as far as: it wasn't filled out properly; things were not spelled properly; and I was going to just start there.

I thought, "Well, this should be just thrown out, it wasn't properly filled out." And I tried to say that at my first appearance.

And it turns out that the prosecutor— At that time, I should point out that we were not actually face-to-face with the prosecutor and the judge. I was in Esterhazy, the prosecutor was in Yorkton, and the judge was in Kamsack. So when I mentioned that there's problems with the ticket, he said, "Well, I don't have the ticket in front of me, we'll have to look at the ticket." And then the judge also mentioned she didn't see it in her docket neither.

Shawn Buckley
I just want to make sure people understand. So you had a court appearance on the ticket.

Louise Wilson
Yes.

Shawn Buckley
But neither the judge nor the Crown had a copy of the ticket for your court appearance.

Louise Wilson

Right.

Shawn Buckley

Okay, so what happened then?

Louise Wilson

Well, from the investigation that I had done, I realized that—their failure to present the ticket in front of them was wrong. Later on, I did ask for the transcript from them actually saying that. That they didn't have the ticket. Because I was there, but they weren't ready for me. So that was wasting my time, really, and that's not really proper.

So what they did then is they scheduled another court appearance. A month later, I came back into court, where they then set a trial date. They asked me if I was planning on using the *Charter of Rights and Freedoms*. And I said I was. And they informed me that I needed to give four weeks notice. I said I was very aware. And we set a trial date for August 9th of 2022.

So then I did send the briefs. I sent the briefs to the prosecutor,

[00:10:00]

the provincial courthouse. I did it all by myself. I was “presenting myself,” is what I should say. I didn't have a lawyer. So I wrote a brief. And then in July, I decided to put forward a motion to dismiss because I had a lot of, I felt, reason for them to drop it. So I put together a package with exhibits in it and sent it on to, again, the prosecutor and the courthouse and waited to hear back from them.

Shawn Buckley

And what happened after that?

Louise Wilson

The day before my trial date, I was preparing for court and doing trial prep. What was I going to do? And decided, “Well, I'm just going to phone and see if they've made a decision or not.” So I phoned the Crown prosecutor. And I said, “Have you come up with a decision as to what you're going to do with this motion to dismiss?” And I heard back that they made a decision to withdraw the ticket.

Shawn Buckley

And did they tell you when that decision had been made?

Louise Wilson

No, no. If I had not phoned, I'm sure I would have just appeared in court and at that point they would have informed me.

Shawn Buckley

Right. Well, at least that had a happy ending.

Louise Wilson

It did have a happy ending. It was a good day; it was a happy dance involved. I felt very happy that I endured it, like, that I followed through and to the end, and didn't give up.

Shawn Buckley

And can I ask you to share with us why that made you feel good?

Louise Wilson

Because I learned a lot. I learned a lot about how to present myself, what my rights were, and I felt that it worked out. It worked out. I was— I won, I felt like I won.

Shawn Buckley

Now, Louise, I don't have any further questions for you, but I'll ask if the commissioners have some questions for you. And there are no questions.

Louise, on behalf of the National Citizens Inquiry, we sincerely thank you for attending and sharing with us today.

Louise Wilson

Thank you for giving me the opportunity.

[00:13:31]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 22, 2023

Day 3

EVIDENCE

Commissioner Statement: Ken Drysdale

Full Day 3 Timestamp: 09:01:05–09:05:34

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Commissioner Drysdale

Excuse me, Mr. Buckley, when we were in Winnipeg a week or so ago, I had asked you a question as to what the Commission was doing in order to hear the other side of the story. In other words, had we been in contact with government officials, medical officials, et cetera, and invited them or summonsed them to these hearings?

And what you had said to me with regard to the upcoming Saskatoon meeting was that registered mail summonses had been sent April 1st to: Dr. Shahab, Chief Provincial Public Health Officer in Saskatchewan; Paul Merriman, Minister of Health; Jim Reiter, former Minister of Health; Honourable Scott Moe, Premier of Saskatchewan; Nadine Wilson, Member of the Legislative Assembly. And then there was a sixth one sent to Scott Livingstone, former Health Authority CEO, in order to get them to come and explain to the Commission exactly what had happened and to hear the government's side of the story.

So can you update the commissioners with regard to these summonses to these folks?

Shawn Buckley

Well, my understanding is the same as it was in Winnipeg, that those were sent out. And the practice is, if we send out by registered mail, if we also have an email address, we send it out by email requesting a read receipt.

I haven't followed up specifically, but our practice would invariably be, if anyone on the government's side responds, that we would slot them in at the local hearing. And we do not have any slotted in. So, I'm just surmising from that that they haven't responded to us—requesting or indicating that they would attend as a witness. Because of course we would slot them in.

The summonses will be on our website, the ones that were sent out. And anyone can verify that the wording also indicates that, if they can't attend at the one that we're requesting them to attend at, that we're marching across the land and they can attend at a later one virtually. And it also indicates that we can set up virtual hearings that aren't scheduled. We word it that way because, actually, we're very interested in hearing from any government

officials. We understand the limitations that: because we are taking evidence under oath but we're not an official government inquiry, the danger for these people is that, what they say under oath here can be used against them in other proceedings. And likely if they're seeking legal advice, that advice is for them not to attend.

With that said, Commissioner, we're making all the efforts that we can to send them an invitation. It's a non-binding summons because we can't compel them. But we are taking all efforts to ensure that government officials and former government officials have the opportunity to reply.

We also think that fairness dictates that. Because the reality is that, as these proceedings have continued, much of the evidence is indicating that there are answers that should be given by them to the citizens of Canada. That some of their activities are being questioned as being not prudent and actually, downright destructive. And so fairness would dictate that they be given the right and the opportunity to respond. But none of them have done so.

And that applies for the summons sent out to health officials and ministers of health and premiers in the Maritimes. And now, Ontario. And now, Winnipeg. And now, Saskatchewan. And I'm not in a position to speak to Alberta because the schedule is still in flux for Red Deer next week.

Commissioner Drysdale

Thank you.

[00:04:29]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 22, 2023

Day 3

EVIDENCE

Witness 12: Heather Burgess

Full Day 3 Timestamp: 09:19:07–09:40:11

Source URL: <https://rumble.com/v2isozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness is Heather Burgess. Heather, I'll start by asking you to state your full name for the record, spelling your first and last name.

Heather Burgess

Heather Barbara Burgess, H-E-A-T-H-E-R—

Shawn Buckley

And Heather— Oh, I'm sorry.

Heather Burgess

Sorry, B-U-R-G-E-S-S.

Shawn Buckley

Heather, do you promise to tell the truth, the whole truth, and nothing but the truth?

Heather Burgess

I do.

Shawn Buckley

Now, you're a retired nurse.

Heather Burgess

Yes, I am.

Shawn Buckley

You had spent your whole career caring for others.

Heather Burgess

Yes.

Shawn Buckley

And as I understand it, you had five siblings.

Heather Burgess

I have five siblings, yes, one's passed.

Shawn Buckley

Can you tell us basically, as the pandemic is starting— So we're near the end of February 2020. Can you tell us about your father and mother and what started to transpire there?

Heather Burgess

Certainly. My mom and dad resided in Saskatoon all of their lives. They were living in assisted living. My dad was almost 93; Mom was almost 88. I live in B.C., and I went back to visit Mom and Dad, and I noticed that my dad was not well. So I stayed in Saskatoon, and we found out that he had terminal cancer. And my mom had vascular and Alzheimer's dementia, a mix of both. But my dad cued her and gave her enough assistance so they could live in assisted living together. They were married for 67 years. My dad was her rock.

And when Dad was diagnosed, I knew that we would need to find a place for my mom, that she would need more care. So while I was caring for Dad while he was dying, I did find a place in Saskatoon for Mom. This was happening all through the month of February, that my dad was dying. At that time, there was no mention of COVID. We didn't know what was going to happen. And the home that we found for my mom, it was agreed that we would be able to help settle Mom in gradually after Dad passed away. We could spend lots of time with Mom. We took their bedroom suite that they slept in for many years to make it more comfortable for Mom. We had a plan.

And when Dad passed and he was passing—

Shawn Buckley

You can take your time.

Heather Burgess

The one concern that he had was, what was going to happen to Mom? I assured him that I would care for her and that everything was going to be all right. Dad passed on February 28th. All his wishes were granted. He wanted to be in his own bed, all of his children around him, my mom with him. And we buried my dad on the 15th of March.

On the 16th, the lockdowns happened in Saskatoon. My sister, who was from Winnipeg, after Dad's funeral, agreed to stay with Mom in assisted living until we moved her over to

the assisted-care home in the end of March. I went back to B.C.; I was pretty exhausted. It was an exhausting time. My sister stayed with Mom. And they were literally locked down in the building, in the assisted-living building. There were activities for the first two weeks, but after the two weeks all activities for the residents ceased, and they were basically only allowed out of their rooms to go down to the dining room for meals. Now, Mom and Dad were on the sixth floor and there's only two elevators that go up and down. They split the dining room up in the times— They put more eating hour times in and they would only have two residents to a table instead of four. Basically, that was the only time that they were out of their room.

So they were locked down until we moved mom over to her new home.

Shawn Buckley

And how long did that go on for?

[00:05:00]

Heather Burgess

That was for the whole month that mom was in assisted living with my sister. Like, they couldn't leave. They could not leave the building and nobody could come and visit.

Shawn Buckley

So for an entire month your mother and sister are locked in the same room and they're only allowed out to go for meals.

Heather Burgess

Yes. Sorry, I'll retract that. March 15th was the lockdown, so the two weeks before mom went into the personal care home, yes, they were locked down.

Shawn Buckley

Okay. What happens then? So the end of March, you've told us that you had arranged for her to go to this private care home. And the private care home had said, "Yes, you can have a family member move in with your mother to help her with this transition."

Heather Burgess

Yes. But then, of course, the middle of March, the lockdowns were just to be for two weeks. So we assumed the end of March, that would be fine, and we could move mom over. So my sister was there to make the transition with her, and basically nobody was permitted to be with my mom.

So she was confused. She'd just lost her soul mate of 67 years and there were just new faces where she was going. The surroundings were unfamiliar. And she was trying to go through a grieving process, confused, and she wasn't allowed—

Shawn Buckley

I'll just stop you. So this is two weeks after her husband of 67 years has died?

Heather Burgess

Yeah, this was four weeks actually. She was in the other home for a month after dad passed.

Shawn Buckley

Right, but obviously, she's grieving.

Heather Burgess

She's grieving because she has dementia and she can't remember that dad passed.

Shawn Buckley

Okay.

Heather Burgess

And now she's in brand-new surroundings, very confused. She thought she was kidnapped. She would have the nurses or the care aides phone us. And she would phone and she'd say that she'd been kidnapped, and did we know when Dad would come home from work to pick her up?

Shawn Buckley

Now, what was her emotional state when she would phone and say she was kidnapped?

Heather Burgess

She was crying and anxious. Yeah.

Shawn Buckley

Okay, so your mother, who has dementia, she didn't understand what was going on.

Heather Burgess

No.

Shawn Buckley

So she literally believed she was being kidnapped and she's crying on the phone.

Heather Burgess

Yes.

Shawn Buckley

And she's obviously begging for help.

Heather Burgess

Yes.

Shawn Buckley

Okay. And you guys— They wouldn't let you in even under those circumstances?

Heather Burgess

No. My one sister that lives in Saskatoon was allowed to take her for two days while the doctors medicated her to get her on to a medication that would help with her anxiety.

Shawn Buckley

Okay. What did your mother do while she was there? So she's locked down, but she started taking some action into her own hands, didn't she?

Heather Burgess

Yeah. So once we got her on the anxiety medication, she was better. But as with a lot of dementia patients that suffer from sundowners, the evening time is the worst time. So my nephew set up a little iPhone port for her that the nurses could phone us and she could see us and we could see Mom. We arranged a schedule that I would talk to her in the morning, and I would read to her. I had an old novel of hers that she loved and that gave her great comfort. I could see her and she could see me reading to her. And then in the evening, when it was most difficult for her, my sister in Winnipeg would set up her iPhone by the piano and she would play piano for mom and settle her that way.

Shawn Buckley

Did your mother ever try to leave?

Heather Burgess

Yes, she did. She was a Houdini. She tried to run away three different times. The care home manager would follow her when they saw she got out the door, just to see how far she would go and what her intentions were. And then she would bring her back. The third time, she actually even took a chair from the dining room, down eight steps to the door, because they'd raised the lock higher. And she put the chair down there so she could stand on the chair and try to undo the lock to get out.

Shawn Buckley

So your mother, who believed she was being kidnapped, tried to escape several times.

Heather Burgess

Yes, she did.

Shawn Buckley

Now when July 11th 2020 came around, the government would allow one visitor and only outside visits on the property. Am I right about that?

Heather Burgess

Yes, that's correct.

[00:10:00]

Shawn Buckley

So for the first time in five months your mother could get a hug from a family member.

Heather Burgess

Yes.

Shawn Buckley

But did that help you at all?

Heather Burgess

It could not be me. I tried to get there for a visit, but that particular home had— Their ruling was that anybody out-of-province was not allowed to come in to see Mom, even with a PCR test.

Shawn Buckley

So even if you had a test showing that you didn't have COVID, you were not allowed to see your mother.

Heather Burgess

No, I wasn't.

Shawn Buckley

What happened to your mother in April of 2020?

Heather Burgess

August?

Shawn Buckley

Oh, I'm sorry, August. Thank you.

Heather Burgess

Yes. So August of 2020, Mom fell in the home and she broke her hip. She was admitted to hospital here in Saskatoon and, after her surgery, transferred over to another hospital. I won't name names of hospitals. At that time, as much as it was a terrible thing, it was also a blessing because then she could have two visitors to see her for two hours a day within the hospital setting.

So we only have one of my siblings that live in Saskatoon. And because she had been up to see mom, I found out from her what the procedure was and that they never asked for I.D. Because I thought, "Come hell or high water, I'm getting in to see my mom." So they didn't ask for vaccine; they weren't doing the vaccinating then. They didn't ask for any I.D. So I have, luckily, two sisters with unisex names—a Terry and a Kim. So my brothers became

Terry or Kim. I became a Terry. We each took a week off that we came back to Saskatoon. And every day we went into that hospital and we saw Mom. And we didn't stay for two hours, we would stay for eight hours a day. None of the nursing staff said a word to us because they knew we were a help to them. Because Mom was a handful and she's very confused. Now she's even in a newer environment.

Shawn Buckley

Right, right. So that worked out well. But then your mother fell again and broke her pelvis.

Heather Burgess

Yes, then she fell in September and broke her pelvis. And I knew, being a nurse, that this was going to be the end, and summoned all my brothers and sisters that we should all be there. So the first day at the hospital, when I arrived and my sister was there and my brother, Mom was in a semi-private room. We were allowed to be in there; nobody said anything that the three of us were in there. Then the next day, my sister and I had requested an appointment with the palliative care doctor that we just wanted my mom to be comfortable. We knew that this was the end for her. And we arranged then the medication change. And we knew that probably by midnight that night, she would not be with us any longer.

So that evening, about five o'clock in the afternoon actually, a nurse walked into the room. I'm thinking it's probably the evening supervisor doing—it was a male nurse—his rounds. He came into the room and saw the three of us there. We're still waiting for another brother to get here. He said, "By the time I come walking down this hall into this room again, I only want to see one of you there."

So we were denied the beautiful death we had with my father to have with my mother.

Shawn Buckley

Just so that I understand. So this is a palliative care bed.

Heather Burgess

This is in the geriatric ward at this hospital. It wasn't palliative care; it was just on a geriatric ward.

Shawn Buckley

Okay. But everyone knows your mother's going to die that day.

Heather Burgess

Absolutely.

Shawn Buckley

So basically, that nurse is making a decision to deny three of you, and your mother, the opportunity for all of you to be together as she passes.

Heather Burgess

That's right.

Shawn Buckley

And so what happened?

Heather Burgess

Mom passed on at about 1:30 in the morning the next day. My one brother was with her and he phoned. And we all went up to the hospital, 1:30 in the morning. We were told how to buzz the security fellow. He come, let us right in, didn't ask us any questions. We went right up into the ward and we walked into mom's room. And we got to say goodbye then.

[00:15:00]

Shawn Buckley

So you couldn't be there while she was dying.

Heather Burgess

No.

Shawn Buckley

But no problem at all coming in after she dies.

Heather Burgess

That's correct.

Shawn Buckley

How did that make you feel?

Heather Burgess

Angry. Sad. My mom shouldn't have been denied that.

Shawn Buckley

Now, I just want to ask you personally: Going through the COVID experience with the lockdowns and masking and all of that, just how did you experience that personally?

Heather Burgess

Well, I'm unvaccinated. From the very beginning of COVID, when everything started, I was just leery. Just the red flags were popping up. What I knew about your immune system, you would never vaccinate during a pandemic. And I was met with a lot of pushback on Facebook and social media. So I kind of took a step back a little bit for a time being.

And then, when they started vaccinating children and pushing that—I never thought it would come to that. I'm a pediatric nurse. That's where I spent most of my years. And never once in all my pediatric years did I ever come across a child with a diagnosis of myocarditis. And for them to minimize it and say "a mild case of myocarditis"— There's no mild cases of myocarditis.

So then I got very vocal on Facebook. And I thought, I know a lot of people. They see it, I know they're still following my other posts. But I just thought, "If I can stop this needle going into one child's arm, it will be worth all the criticizing that you're doing of me."

I mean, I'd already been called a racist and misogynist from the leader of this country, that I was not fit to be part of society. My husband and I weren't allowed to go into restaurants, gyms. My husband was not allowed to play on his Oldtimers hockey team; he was segregated from everybody. We were members of a golf course and golf club and we weren't allowed after September 14th of 2021 to even be on the premises of that golf course.

It was a hurt locker. It was a tough time. There are friends that just didn't want to have anything to do with us. In fact, one of my friends told me that their children didn't want them "chumming with us" because we were unvaccinated. It was tough. It was tough with my own children because I have three children with spouses. There's six of them. There's only one of those six that isn't vaccinated. Three were coerced, two went willingly. But when I tried to talk to some of my kids about this— I'm a medical person and they didn't listen. And now I'm the one that has to worry the rest of my life about how this has affected their lives and how it will affect their health going forward. Because I truly believe that we're only just seeing the tip of that iceberg about what's going on underneath there and how this is going to affect so many people.

Yeah, it was hard when your kids won't listen to you. Just take a step back and just take your time with this.

Shawn Buckley

Now, do you have any suggestions on how governments could have done this differently?

Heather Burgess

How this country could have done this better? Sorry.

Shawn Buckley

Yeah. Because basically the purpose of the Inquiry is trying to figure out how we could do things better. And I'm just wondering what your thoughts on that are.

Heather Burgess

I am appalled and shocked at the medical community that have sat back and been silent. And nurses that have been silent. They're seeing what's coming into emergency now. And I understand people are afraid for their jobs, their securities, they've got mortgages to pay. But it just takes that one person to speak up and start the ball rolling. All these experts that spoke up—like Dr. Bridle, Dr. Hoffe, the study he had going—all these people have been crucified. They've lost their jobs, their credibility.

This has to change. I think it has to start changing with the College of Family Physicians and Surgeons.

[00:20:00]

It has to start changing at a government level, higher up. It was just such a great psyop. It was just a great story that they told everybody, and everybody believed it.

Shawn Buckley

Thank you. I have no further questions. I'll see if the commissioners have questions for you. And there are no questions.

So on behalf of the National Citizens Inquiry, we sincerely thank you for sharing with us today.

Heather Burgess

And I'd like to thank all of you, the panel, and all of the work that all of you have put into this because it needs to be heard.

[00:21:04]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 13: Nadine Ness

Full Day 3 Timestamp: 09:40:11–10:15:50

Source URL: <https://rumble.com/v2isozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

And our next witness is Nadine Ness. Nadine, can you please state your full name, spelling your first and last name for the record?

Nadine Ness

Sure, it's Nadine Ness, N-A-D-I-N-E, Ness is N-E-S-S.

Shawn Buckley

And Nadine, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Nadine Ness

I do.

Shawn Buckley

Now, my understanding is that you are a former RCMP officer?

Nadine Ness

Yes.

Shawn Buckley

But you had to take medical retirement.

Nadine Ness

Yes, that's correct.

Shawn Buckley

And that is because, and I hope I pronounced this correctly, you have a condition called vasovagal— Do you want to just say it for me?

Nadine Ness

I'll say it: vasovagal syncope. The medical retirement has to do with that, as well as other things. But yes, for those who don't know what vasovagal syncope is, some people have it very mildly where they see blood they faint; some people it's needles. Mine is quite severe, it's a more rare case. Sometimes it's even confined me to a wheelchair where I can't stand for more than a few minutes. One of my triggers is heat—so anytime my face gets warm, my neck gets warm—as well as fight-or-flight response because it can make you get warm, so that can also cause it.

I'm one of those rare, few people that no medical doctor out there would deny me a medical exemption. Because wearing a mask, within minutes, because of the heat, causes me to faint.

Shawn Buckley

And you did have a medical exemption from your doctor.

Nadine Ness

Yes. Yes, that's correct.

Shawn Buckley

Now, you had an issue where you were attending at a retail premise. And something happened with regards to you being confronted about not wearing a mask. Can you share that with us?

Nadine Ness

Yeah, I'll share a little bit too, a little bit before because we have to understand that this specific incident was one of very many. By the time this has happened, I've probably been yelled at, been pushed out of stores, been called names. So when I came into the store, there's always this preconceived belief that I might be yelled at or called names or even worse.

So I went into the store. I had a face shield. So even though I'm exempt from wearing a normal mask, I do wear a face shield because it doesn't trap the heat. For the most part, I can handle it. There's still instances where I have to take it off if I get too warm. But in this particular incident I was wearing a face shield. I went into this store— And I'm not going to name the store because this is not about revenge or calling people out, but I think it needs to be out there that this happened to a lot of people. But I went into this store. And I was a general contractor for my house. So anyone who's built their home, there's a lot of places you have to go to in order to get the products you wanted.

So this particular one, I was in there for about 30 minutes. Gentleman at the door greeted me, very friendly, and I was there looking at the supplies that I was looking for. When I was ready to check out, we were putting through all the supplies, and the manager came out of the office and right away— I knew right away. You can tell: if you're someone who can't

wear a mask, you can tell who's going to be nice to you and who's not. And this particular one, I knew right away. She says, "Where's your mask"? And I'm wearing a face shield, it's not like I'm wearing nothing. And I said "I can't wear a mask. I have a fainting condition. I have a medical exemption, so I can't wear a mask. I wear a face shield instead."

She's like, "Well, a face shield doesn't count; it has to be a mask." I reiterated again, "I have a medical exemption. I faint, so I can't wear a mask." And she says, "Did you sign the form?" I said, "What form?" "When you came in, you were supposed to sign a form." Apparently. The gentleman at the door never told me to sign the form, never said anything about it, probably because I was wearing a face shield. And she was very aggressive and said, "Well, you need to sign it before you leave."

At this point, any confrontation turns on the fight-or-flight. I will also add that this condition for me is made way worse when I'm pregnant and I was pregnant at the time. I was seven, almost eight weeks pregnant. I started feeling warm, so I knew it was coming. And I can usually feel it coming. It's almost like I become drunk in a way, so my cognitive thinking kind of goes away. I was just thinking, "I need to go outside to the cold so I can feel better." So I grabbed the form and I said, "I'll sign your form."

[00:05:00]

And I just did it quickly—not that I wanted to. But by the time I went to pay the debit, my condition had already gotten so worse. And I was fighting it because I didn't want to faint in front of this woman that was being really mean to me. And I ended up losing complete consciousness. And most of the time, I can avoid injury because I know it's coming. But in this particular instance, I was fighting it and so I didn't get to avoid it and I hit the floor really hard. I know I hit it hard because I had a big goose egg, I injured my neck, I injured my back, and when I came to, they were saying, "Call an ambulance."

I'm an experienced fainter, I've fainted over 50 times in my life. So I know how to recover. I just need something cold on my neck or to go outside. And she didn't want to let me leave, for obvious reason. But the worst thing is that she was making it worse because she kept defending their policy and their masks, therefore continuing the interaction—the negative interaction. So it actually made it worse. I eventually was able to convince her that, "Look, I'm okay, I'm just going to go outside, I'll wait for a while. If I don't feel safe to drive, I'll wait for my husband to come."

Now, the part that's really hard about all of this, why I wish this situation would have been avoided: Later that afternoon—and I can't confirm that this fainting episode was the cause of this but I also can't confirm it wasn't—I had a miscarriage later that afternoon. And I had another miscarriage several months later, I don't know if it's related to any potential injury **that would have happened then. This leads a little bit to the vaccine and my decision and my husband's decision. So this was not a time where the vaccine was in place yet.**

Shawn Buckley

Can I just slow you down?

Nadine Ness

Sure, sure.

Shawn Buckley

Did you end up doing anything about that? Did you file a complaint or take any actions?

Nadine Ness

Yes. So as soon as I got in the car and I recovered, I remember thinking: a lot of people who can't wear a mask, a lot of them can be due to emotional or mental health reasons, anxiety, things like that. And I didn't want this to happen to someone else. So I contacted the head office and I explained to them the situation.

Now, this form directly creates an environment where you have a confrontation with someone, no matter what, if you're demanding them to sign that. It's not just like, "Oh, I have a medical exemption." You have to sign this form. And I brought it with me to put on the record as well. So I made a complaint. And I wanted a copy of that form because I didn't know what I had signed, because at that point I was already so close to fainting.

I will give them credit: they ended up removing that policy. I have met this specific manager since and she's been very kind and friendly to me. So I will give them credit. They learned from their mistake and their bad behaviour and they've been better since. And I'm hoping from that incident that other people didn't face what I faced.

Shawn Buckley

Right. And before we jump to the vaccine issue, I wanted you to share with us about a later pregnancy and how that went and what that experience was.

Nadine Ness

I can share that part, but there's a little bit that needs to be put into why I believe I was treated the way that I was.

Shawn Buckley

Okay.

Nadine Ness

A lot of people in this province know me because I lead a big group called Unify Grassroots. Is it okay if I go into how that was founded?

Shawn Buckley

Sure.

Nadine Ness

We chose to not get vaccinated for— The biggest reason, I didn't know how it would affect pregnancy and fertility. And because we had already had two miscarriages, we didn't want to take the chance. My husband's a doctor, so we're also very much aware of what is out there, what the risk of COVID is as well. But we chose that, for both of us, it would be better just to not risk potentially having more miscarriages, to wait until we had another healthy child. So with that, we decided not to get vaccinated.

Now, the summer came.

[00:10:00]

And I'm going to give you a little bit of a story on how these mandates affected my family, more specifically one of my child.

Shawn Buckley

Bria.

Nadine Ness

Bria. My daughter, who was eleven at the time. She has OCD and anxiety and she's been diagnosed and she's being medicated. So when COVID rules came into the school basically, everything we had told her not to worry about, not to focus on, the environment at the school was now doing the exact opposite. So anyone who has a child with OCD: these mandates in schools were horrific for them.

Now, for Bria more particularly, she also has issues with textile, so masks were very difficult. So she really, really struggled in school with wearing it properly. There was a lot of back and forth and add to that anxiety. So there were several times where I actually had to go pick her up at school because she wouldn't wear her mask. Now, by the end of the school year, it had gotten so bad—her condition had gotten so much worse—that she was deemed medium to high risk for suicide. At eleven.

Shawn Buckley

So the school had done an assessment. And the masking policy for Bria had literally led her to the point where she was a medium to high risk of suicide, and she's 11 years old.

Nadine Ness

I don't know if it's just because of the mask, but I think it was all of it—the continuous sanitizing, the not being able to touch each other—all of that just exacerbated her condition that she already had.

So summer came and they announced they were removing all of that and then in the fall, that everything would be removed. And I was really happy about that. The week before school started, they announced they were bringing everything back. And my husband and I had been very silent as to what we were seeing but, at this point, we realized that it could **be my daughter's life if we don't say anything.**

The school seems to be so focused on COVID but they didn't think about all the other things that it was doing to our kids. Like, the amount of children that have been diagnosed with anxiety and so many mental health issues is just off the charts. I hear about it all the time.

So a lady asked on a town page, "When's the next school board meeting"? And I messaged her, "Are you worried about what I'm worried?" Because you didn't know which side that they were on. At this point, everyone was afraid to say anything because if you did, you'd get attacked. So it turns out we were on the same side. So I said, "Okay, let's meet at my house. We'll come up with a plan and we'll ask to present in front of the school board."

She knew a few people. So I said, "Okay, I'll start a Facebook group. I'll share my address on there so that we can meet at my house." Well, within 24 hours, we had eight hundred fifty parents that had joined that Facebook group. So you had a lot of parents not happy with this mandate—and that was within our school division alone.

So out of that we did do a presentation in front of the school board. Our presentation was received very well. We even had government officials share it on their Facebook. Basically, we brought to light the risk of COVID to children: the real risk, not the one media will tell you. And then, we also spoke about the negative effects these mandates have on our children.

There were some changes done at the school board levels. They did send like, a survey out. However, they didn't change the mask mandate. They didn't change anything to do with the policies. And it was at that point that I decided that it was safer for my daughter to be homeschooled, so I decided to homeschool my kids that year.

Shawn Buckley

My understanding is a lot of people made that choice in your district.

Nadine Ness

Yes. Within our group, we had several hundreds of parents that decided to make that choice. So much so that you heard the following. So for school funding, the funding for the year after comes from the amount of kids that were in the school. So when you heard last year that there was no funding for children in the school, it's because there were so many kids that were homeschooled the previous years. So now the funding the year after was short because children started returning to school. So it was quite significant to the point where it made the media. They just didn't say what the real reason was.

Shawn Buckley

Now, you found yourself really at the head of a group of people that are now concerned about what's going on. And that led you and the group to take other action. Do you want to share with us what you did?

Nadine Ness

Yeah. Because my husband was a physician, a lot of people turned to me and said, "Do you know of any other doctors, any other nurses?" And we became the hub for the doctors and nurses to gather in the province. Actually, we became a hub for every profession. That's what our group started.

[00:15:00]

We gave a place for people to gather within their profession to fight their unions—because the mandates were coming in, the vaccine mandates.

As someone, for the last year, who had faced so much discrimination and seen so much of the worst in humanity as someone who can't wear a mask, I knew, when the vaccine passports were going to come, what the public was going to face. Because I saw what it was the following year. I was really determined to do something about it. So our group took part in an application for a court injunction to stop the vaccine passport from coming in.

Now, they'll say that was defeated. That's what the media will tell you. But basically, the judge said, because the passports weren't in place yet or wasn't fully announced, you can't put an injunction on what you don't know fully what it is.

So we could have refiled again, once we knew fully what it is. However, the courts also put a fee to it. So basically they made us pay court costs. So it's almost like it was to deter anyone from doing that again. And I'll say it worked because our organization, we thought about it: we can refile, but then any court costs liability would fall onto us. So because of that situation, we decided not to refile.

Shawn Buckley

So basically it was a court cost of \$5,000 that acted as a deterrent?

Nadine Ness

Yeah. And it's funny too, because media tried to pick that up and make it seem like we had no chance in winning. But really, they never really said why it was struck down. So they kind of buffed that just to discourage everyone I felt. And a lot of people felt discouraged by that.

Shawn Buckley

And now after this experience, you ended up doing a video.

Nadine Ness

Yeah, so as a group, we kept thinking, "What can we do to bring on change?" And by this time, our premier had become really awful to the people who were unvaccinated—I'm sure many of you have watched the videos that we've been playing and replaying—and saying things like, "We've had enough patience," and just really awful things.

I thought: maybe we can convict them a little bit and remind them of who they used to be? And maybe try to bring a little bit of humanity back into our government officials. I decided to do a video basically, reminding them what their guiding principles are and how much they've strayed from that. And that video resonated with a lot of people in this province. It went viral. And in that video, I called on Scott Moe to give me a call. Now, our group had been working on building relationship with government officials already. So they already knew who we were.

That following Friday, the premier called me while I was in the vehicle with my daughter, and we spoke for about an hour and fifteen minutes. It could have probably ended up longer, but my daughter was losing her mind so I had to let him go. And the following Monday, the conversation, or the tone the government was taking with the unvaccinated, did a complete 180 degree. He said the unvaccinated are family, are friends, not right-wing wackos. And the reason he said "right-wing wacko" is because that's what media and Ryan Meili and a lot of news organizations were calling me. Not knowing I actually was a Liberal voter for most of my life. But I was called extremist. That's when the media attacks came.

Now, the media attacks didn't silence me. So the left-wing extremists in the province—and I will call them that because that's what they are—went on a mission to attack my husband.

Shawn Buckley

So let me just back up. So after your conversation with Premier Scott Moe, his language softens towards the unvaccinated. But my understanding is: after your conversation with him, the media went after your group.

Nadine Ness

They went after my group. They went after, I think, Scott Moe as well for having a conversation with me. They attacked our group, myself, but it didn't really stop us. We continued working. And we actually grew quite a bit from that so it was a blessing in disguise. Because now a lot of people in the province knew about us that didn't before.

[00:20:00]

So that was good.

And then I think it enraged some of the people, so then they decided to go after my husband. They wrote several defamatory posts on all social media, all the pro-COVID lockdown groups—my husband's name was listed on all of them. He was called anti-vax, discouraging people to get vaccinated, which is all false. And in fact, our group is not anti-vax. We're pro-informed consent. So if you want to get vaccinated, fine, and if you don't—And most, a lot of the people in our group are actually fully vaccinated.

So they went after him. Now, when I saw all of that, I gave a warning to the person who was posting this. And I will also say: This person was a CBC contributor, so a reporter that was doing all of this. So my faith in mainstream media is a little bit lower because of some of this behaviour.

And then the worst part is: some of the doctors that were very vocal pro-lockdown doctors also jumped into this, shared it, one of them specifically being the previous College of Physicians registrar. Not only did he share it, flame it, he also posted my husband's work location, work phone number, and encouraged people to basically harass him and come after him. From that as well, complaints, or attempts at complaints, were made with the College of Physicians. My husband was also basically— Because I said I would sue people who did defamatory posts, that I would commence legal action, the College of Physicians warned him and said, "While we can't stop your wife from saying what she's saying, we might be able to—" Basically saying because of retaliation, it could be considered retaliation from you.

Now, I'm going to give a disclaimer: My husband did not ask me to be here. He didn't ask me to retaliate for him. In fact, he probably would rather I not be here today for the simple fact that we recognize that me being here today might send the College after him.

Shawn Buckley

So can I just clarify that? There's actually concern, in April of 2023, that if you just share the experience that didn't even happen this year, that there could be repercussions from the College towards your husband?

Nadine Ness

Yes.

Shawn Buckley

Now, my understanding is that the College had an interesting policy concerning the privacy of doctors on their vaccination status. Can you tell us about that?

Nadine Ness

Yes. For those who aren't from Saskatchewan and for those who are, our College of Physicians put out a directive basically saying, if you were an unvaccinated doctor—and these are for unvaccinated doctors only and the ones who aren't in a hospital setting, so fee-for-service doctors; it was almost like it was targeted—that they had to disclose publicly to their patients that they were not vaccinated.

Shawn Buckley

I just want to stop. So vaccinated doctors didn't have to say that they were vaccinated. But if you were unvaccinated, you had to disclose that you were not vaccinated.

Nadine Ness

That is correct. And I have the policy with me as well to disclose to the commissioners.

Now my husband had a huge problem with that for several reasons. He didn't feel it would be positive to the patient-doctor relationship for them to have private medical information from him because it can be used against him to get favours. It could use be used to threaten. The same reason no doctor should normally disclose any personal information. So he decided to put— Is it okay if I read it, because it's on the record?

Shawn Buckley

Oh sure, sure.

Nadine Ness

"Dr. Ness has chosen not to publicly disclose his vaccination status. Are you comfortable seeing him, or would you rather see another doctor?"

So he decided not to post it. Now, when this left extremist attack came, one of the old registrars— And I'm going to name him for the record because I think his name needs to be, because he's still continuing to harass us to this point. Dennis Kendel posted that, "I wonder if he is vaccinated, considering he's supposed to post it." So he actually asked people to go and confirm.

[00:25:00]

And my husband received a complaint from the College of Physicians basically saying, "We've learned that you're not disclosing your vaccination status. If you do not do so, we will commence an investigation against you." So they basically weaponized his vaccination status to try to come after me, or him.

Shawn Buckley

So earlier you said— You just volunteered that your group that you belong with, Unified Grassroots, that that group is not anti-vax.

Nadine Ness

No, it's not.

Shawn Buckley

And my question is, why did you feel the need to share that with us?

Nadine Ness

Because it's something we were called on a regular basis in many mainstream media, many radio. And it's funny because we're not unvaccinated in our group; a lot of the people who are fully vaccinated went completely to our defence in all the comments and stuff, so that was really wonderful.

But it just goes to show, we're not someone that's unreasonable. And I'm not saying if you're just unvaccinated, you're unreasonable. I'm saying we're people from all forms of society: doctors, nurses, firefighters, police officers, teachers. We have 450 teachers from the province in our group. We were against this coercion that was happening. We were against this division that was happening. When you create a two-tier society, it's bound to have really negative effect into our society. But yeah, we were called all these names.

Shawn Buckley

Well, it's just so you know why I'm asking you that question is, one thing that has come up time and time again: we've had witnesses in Saskatoon who clearly are against the current vaccine, or what's going on, who just are volunteering, "And I'm not an anti-vaxxer, I'm not an anti-vaxxer, and I'm not an anti-vaxxer." And now you say, you just volunteer, "Well, our group isn't anti-vax." So that term seems to have such a negative meaning and so much power behind it that everyone is afraid of being labelled as an anti-vaxxer, that they're volunteering when we're not even asking that question.

And that's why I brought that up. I was just curious what your response would be. It seems that term has so much power in Saskatchewan.

Nadine Ness

So with that, going forward— So thankfully, in the fall of, I believe it would be 2021—I think that's when all the passports were in play—we were able to get pregnant again. So I recognize, being in a position that I am and voicing the concerns that I voice on a regular basis and exposing a lot of things, there's a lot of people in the medical community that don't necessarily like me or like my politics.

I was very hesitant following what happened next. When I learned that I was pregnant, I— Because of my fainting condition, I also have thyroid issues. But because of that, and I have previous pregnancy complications, I usually see a high-risk doctor. And I have seen this high-risk doctor for all of my pregnancies.

So when I learned that I was pregnant, with the previous two miscarriages, I waited a little bit to make sure I wasn't going to miscarry again. And then I went to my family doctor, who referred me to this high-risk doctor as per usual. Now, the high-risk doctor expressed concerns with me coming into her office because I can't wear a normal mask, I can only wear a face shield. And she actually refused to see me in the office. She said, "We could see

you in the emerg. or in the regular hospital if we really need to. But for now, we'll just monitor you through your family physician."

Shawn Buckley

Now did she explain to you why it might be all right to meet you at emerge. or at the hospital, but it wasn't all right to meet at her office?

Nadine Ness

She said that at their office, they deal with vulnerable patients and that at the regular hospital, I'm not putting those vulnerable patients at risk. Now, as someone who sees a high-risk doctor, I'm thinking, "Well, if she's not worried enough for my pregnancy to see me in person, maybe I don't really need to see her." But I eventually did go see her. But I remember there was back and forth between my family doctor and her because my family doctor was like, "She's too high-risk for me. You should be seeing her," and there was back and forth.

[00:30:00]

Eventually she did. And I think I was almost 24 weeks pregnant by the time I went to see her. The interaction with her was actually positive. I wasn't sure, just because of who I am, but it was really positive, so I will say that. There didn't seem to be animosity. She did talk about the vaccine and I'm like, "I'm pretty sure you know my stance on that." But it was okay.

However, a month before my son was born, I was having concerns that my water had broken so I went in to Labour and Delivery in Saskatoon to make sure it hadn't. And when I first got there, the nurse was super friendly, super smiley, really wonderful. And I got into the room and then eventually she had to leave to go to the nurse's desk.

When she came back, she came back with the doctor and it wasn't the same experience at all. You can sense when someone is— And especially me, I used to be a police officer, I can read people very well. She wasn't smiling anymore. She was extremely cold—wouldn't even look at me. Same with the doctor, quite cold. So I could just assume that they went to the nurse's desk and someone said, "Do you know who that is?" Again, that's an assumption, but the experience that I had from before to after: night and day.

And they did an exam to see if my waters were broken. And I've had that done before and it was the most painful exam that I've ever had—and I have a very high pain tolerance. So much so that I said something. I said, "I don't think it's supposed to hurt this much." And I was bleeding afterwards, which normally you wouldn't for something like that.

And, it turns out my water hadn't broken, so I ended up leaving. But even when I left, she didn't say bye, or when I said bye, she didn't look at me—nothing. And I got into my car and I broke down crying. I thought okay, maybe they can put their differences aside and politics aside and do what's best for the patients? But that was a situation where it was clear that that wasn't the case.

I called my husband and I said to him, "I don't know what you need to do to be okay with this, but I'm not delivering this baby in the hospital. I don't feel safe and I don't think I can feel safe delivering this baby in the hospital." Although my husband's a doctor, he's also

seen a lot of worst-case scenarios when it comes to birthing, so he was extremely against me delivering at home.

Actually, we've never fought in our whole marriage and relationship. And this was the first time where we actually fought about something. He wanted me to go deliver in the hospital and I didn't. And even to this day, I still think: when you're delivering, you're so vulnerable, right? You want to feel safe; you want to feel like they have your best interest at hand. But witnessing what happened to me as well as hearing so many stories from so many people across the province who are unvaccinated, I can't say— Going in there, not knowing who you're going to have, that I would trust even if I was to deliver again.

And I wish that would change.

Shawn Buckley

Can I just interject. So I just want to make sure that people participating with your testimony understand this. You're basically saying, when you're saying you heard things from other people, you're hearing other people tell you that they basically were not treated well in the healthcare system because of their status of being unvaccinated?

Nadine Ness

Not just from patients. I heard from nurses, who heard other healthcare professionals say horrific things firsthand. I was one of the go-to people in the province where people would say, "What can we do about this?" I've heard so many—I can't even tell you how many that I've heard—but I've heard so many. So I will say I'm very biased on this because I hear very much just one side. I will admit that completely. But it's hard not to let hearing those stories affect your perception as someone who's unvaccinated.

I think if I was vaccinated and wasn't Nadine Ness in the province of Saskatchewan, I wouldn't have been afraid. So I think that very much is a big reason as to why I felt I was safer delivering at home, 45 minutes from a hospital, than in the care of health care professionals.

Shawn Buckley

All right, thank you. I don't have any further questions for you. I'll ask if the commissioners have any questions. No.

There being no further questions, so Nadine, on behalf of the National Citizens Inquiry, I sincerely thank you for sharing with us today.

Nadine Ness

Thank you.

[00:35:39]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 3

April 22, 2023

EVIDENCE

Witness 14: Michele Tournier

Full Day 3 Timestamp: 10:15:50–10:37:59

Source URL: <https://rumble.com/v2jsozo-national-citizens-inquiry-saskatoon-day-3.html>

[00:00:00]

Shawn Buckley

And our final witness of the day is Michele Tournier. Michele, can you state your full name for the record, spelling your first and last name?

Michele Tournier

My name is Michele Tournier. M-I-C-H-E-L-E T-O-U-R-N-I-E-R.

Shawn Buckley

And, Michele, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Michele Tournier

I do.

Shawn Buckley

Now, your family is in the business of chuck racing. And we'll have a bunch of viewers that are not from the Prairies. Can you please explain to us chuck racing and your family's involvement in it?

Michele Tournier

Okay. That was probably my hardest thing, to make it a simplified explanation.

It's an equestrian sport. Where there's a chuckwagon and a driver sits in the wagon box. And there's four thoroughbred horses hooked to this wagon. And they're in an infield with three other competitors and there's a figure-eight barrel setting that they have to go around. There's also two mounted riders, one in the back, one in the front. And everybody

stands still. There's a horn that blows and everybody goes as fast as they can out of the barrels. And it goes around the racetrack. It's a timed event.

And there's prize money every day. And if you travel from show to show every weekend, mostly Saskatchewan and Alberta; and some of the shows, if you make the final or you've been a competitive wagon, there's dash money at the final day. And advertisers spend money to have the chance to advertise on the wagon tarp and that's how you make a lot of your revenue. Some of the locations have a canvas auction or a tarp auction where bidders come and buyers want to maybe showcase their company, their logo, a cause maybe that they're wanting to promote. And they do bidding and buy the chance for the rights on your wagon tarp.

So my husband does that, my son-in-law, my son: they're all drivers. And then my other son is one of the mounted riders that rides for all the various drivers. And each driver pays him a fee for each race. So we make our living at that. It was our sole income for many, many— We've done this for about 35 years. And the last maybe, 10 years, that's our sole source of income. And the other ones maybe have a little bit of other income, but that's still the bulk of how my entire family makes our living.

Shawn Buckley

So you're chuck racers. And just so that people understand. So you know and there's some— You can make a decent living doing this, as I understand.

Michele Tournier

Yes.

Shawn Buckley

But you know, the advertising on the wagons and the prize money— I mean, you can make a really reasonable living.

Michele Tournier

Yes, very much.

Shawn Buckley

What happened then? We get this pandemic and what happens to your family's income in 2020?

Michele Tournier

Well, there's a lot of talk. The Calgary Stampede is the main— It's in July. But in March, there's an auction and that's the most lucrative auction. So there was starting to be rumblings in February already about public events, whether they could have this auction. Would they go online? Then it was looking, I think Mayor Nenshi was already talking about emergency. And it wasn't looking good. So kind of starting to absorb that there's a chance that we wouldn't be racing. And we thought there was a chance possibly because it's an outdoor event, where we heard like maybe the NHL was starting to shut down a little bit. But that was just kind of a little bit of false hope.

So we were all sort of in limbo until it was finally finalized that, yeah, there would be no racing season. Usually for about two months: we leave home the end of May, go for the summer. And for about two months prior, we do training and getting things ready. So you don't know: should you train, should you get things ready? Or you just sort of going to experience summer at home for the first time in many, many years?

Shawn Buckley

So in 2020 they cancelled the whole season.

Michele Tournier

Yeah. All public events, everything was done.

Shawn Buckley

Now, I presume your horses cooperated and they stopped eating?

Michele Tournier

Yeah, they were good at that. And a thoroughbred eats—they're a high metabolism horse. I know we probably had about 55 thoroughbreds between my son and ourselves.

[00:05:00]

And you know, you have other things that you have to maintain. And being self-employed, it's not like, "Well, I'll see if we can go on EI?" and all that type of thing. So you just sort of absorbed. And we also wondered, would 2021 look any better?

Shawn Buckley

Right. But just for 2020 basically, your income then became zero.

Michele Tournier

Completely zero. Absolutely zero.

Shawn Buckley

But your costs of having to feed and care for the horses remain?

Michele Tournier

Yeah.

Shawna Buckley

What happened in 2021 then?

Michele Tournier

Well, 2021 there was still—you know, went back and forth. Some events got to go, let's say, in late 2020. Then they start to shut down again. So it looked like Calgary again was going to be cancelling. Because well, that city has a little bit different— The mayor there's a little bit involved with the Stampede as well.

But back in 2020, when they cancelled Stampede—because all public events and there was this big emergency—they welcomed the infield, where the stands were for a Black Lives Matter protest for about 3,500 people. Somehow, I guess it was safe to host that but nothing else could go on.

So 2021, they cancelled wagon racing again at Stampede but I think they had the rodeo.

And we were in the circuit mostly in Alberta. That circuit seemed to be trying to figure out how to have racing and following the rules. And the other circuits, mostly in Saskatchewan, and they looked like they were going to not try and follow the rules, were just going to try and have our sport. So we decided to switch to the more Saskatchewan circuit. It's a less lucrative circuit but at least we could go racing.

My husband wasn't keen. He was ready to say, "You know let's just call it a day, we're going to be done with this." So we sort of were leaning towards that. And then the kids and I, we thought they seemed like they're really after small business, self-employed. Western culture has been under attack way before COVID and wagon racing is a very family-based sport. So we said kind of to my husband, "We really need to go, because they win if— If we don't go, we're doing exactly what they want."

So we convinced him and we had pretty much a whole circuit at least for 2021. And there was a show that opened up in Lloydminster area that was not quite as lucrative as the Stampede, but you still had a chance to be back in the game.

Shawn Buckley

Okay, so 2021 wasn't a bust, but it wasn't as good as the regular years.

Michele Tournier

Right. Correct. Yep.

Shawn Buckley

Now, I want to switch gears because you had a sister and something happened to her during COVID. I'm wondering if you can share that with us.

Michele Tournier

Yeah. Early March of 2020, she was feeling unwell—my sister-in-law, this is, in Saskatoon—and she only has one kidney from something else. She was starting to get a little bit nervous, even before she was feeling unwell, of being around people because she was considered a vulnerable— Almost everyone was considered a vulnerable and I think maybe it was to help keep the fear. So she ended up feeling unwell, so my other sister-in-law brought her to the hospital. And they figured it was her kidney that was giving her problems.

So my sister-in-law had to drop her off at the door because nobody could go in. And so she was met with her doctor by herself. And they admitted her. And the doctor then told her that things didn't look good. She'd be having a surgery that could possibly have her, when she came out, wearing two separate bags. So that she heard by herself because nobody could be in there with her. She managed to get her lawyer admitted into the hospital to see her so she could get her affairs in order, again by herself.

So she had her surgery. And she came out of surgery to her own room; nobody was there again. She was told, yes, you will have two bags. You've had your bladder removed. You've had your bowel removed. You've had part of your intestine removed. So she called us and told us how it went. The doctor told her, "Nothing more we can do for you. And since there's no visitors allowed, you may want to go home."

Shawn Buckley

So let me just stop you. So even though she's going through what literally is an end-of-life process, she's not allowed even a single visitor in the hospital?

[00:10:00]

Michele Tournier

At that time, there were no visitors allowed at the hospital.

Shawn Buckley

And she would be very weak and drugged up and be getting all this information and there's no one there to help her?

Michele Tournier

No. She could FaceTime a little bit. But my niece actually worked at that same hospital and she asked if she—not on her floor though—if she could maybe go and see her aunt. This was right when things started. And nobody could really give her an answer. And they didn't think that would be a very good idea.

So they arranged for her to go home. And at that time the rules were: in people's households, only the members of their own household could be in your house. We didn't follow none of those rules anyway, but— So she went home to live out her last days and we would go and visit her. This was, I think she got out on May 8th. And her wish was, because she knew that there was nothing they could do for her, is that we could just all be together for Mother's Day.

We live in the country and normally Mother's Day was sort of at our place anyway. So the whole family was there. We were all at my house to grant her wish. It was a really good day. She was strong enough for that, but it was a long day. That was May 10th. And then, when she went home, she died by May 19th. So had we listened to the government that would have been— Like, there wasn't another chance for us to see her again.

Shawn Buckley

Right. I want to switch gears and have you talk about the effects on your grandchildren.

Michele Tournier

With the schools and their activities?

Shawn Buckley

Yeah. And then, you know, even just the fact of how it's more of an effect for rural children concerning isolation when the school was closed down.

Michele Tournier

Yes. The schools closed, I think it was maybe March, April—I can't remember—of 2020. So the kids were kind of sent home.

Shawn Buckley

And what happened with the sports?

Michele Tournier

Well, they stopped hockey early. All their activities got stopped. And they would go home and finish the school where you're in the country so it's not as if— You know, it's an effort to go visit other friends. And then other friends, some of their families were more scared of COVID, so they didn't all meet.

It can be quite lonely in the country, especially for children, and if they're pre-teens. And then even in the fall, my daughter decided to keep them at home and homeschool. They had a little bit of a hockey thing started—just practice. And the kids had to wear masks under their cages in order to be on the ice. And I think they had to be in little, small groups. And I mean, they should be gone out doing things and not at home as much as they were at home.

Shawn Buckley

Now, there was an incident you learned about with your daughter and your ten-year-old granddaughter driving. Can you just tell us about this? Because it kind of speaks to the fear that was created.

Michele Tournier

Yes. We all were on the same page. I was fortunate: in our family we were all on the same page to not be scared. And the kids weren't scared. But my daughter was driving with her ten-year-old in—they live out by Meadow Lake. And my ten-year-old daughter, they happened to see a police car. So I think they're at Tim Hortons drive-thru or something. My ten-year-old granddaughter ducked and my daughter says, "What are you doing?" She said, "I don't want the police to come and arrest us because we're not supposed to be together." My daughter had to explain, "That's not for us. We're fine."

So you thought you had them not scared. And they weren't scared of COVID, but now they were scared that they're breaking the law by being in the vehicle with their own mother. So it did a lot to the kids.

Shawn Buckley

Yeah, how did that make you feel to hear that story?

Michele Tournier

Well, very angry. Very angry that— But the kids shouldn't be scared like that. I mean, they shouldn't be scared. It scared them enough that they might think their mother is going to go to jail or something, or get a ticket for being in the vehicle with their own child. I mean it's, I don't know, it's just so absurd.

Shawn Buckley

Now, you had shared with us earlier about the Black Lives Matter protests, that they were allowed. Do you know whether or not—because it was illegal to have gatherings. What was the number in Saskatchewan at the time?

Michele Tournier

Well, at that time, when the Black Lives Matter happened in Calgary,

[00:15:00]

there was I think zero public events. Like, nothing. But they did allow that.

Shawn Buckley

Okay. Are you familiar whether or not there was police presence and fines with these Black Lives Matter protests?

Michele Tournier

Not that I heard. And I know there wasn't in Saskatchewan when— Like, I was at quite a few protests and fines were involved, police presence. And other protests were left alone.

Shawn Buckley

So can you can you share with us, you said that you went to other protests. What types of protests did you go to? And please describe in detail the police presence that was there.

Michele Tournier

I went to quite a few here in Saskatoon at the Vimy Memorial. And they were just about freedom: defending our rights, the rights to choose, leave the children alone, this type of thing. So the police would know we were kind of the Saturday group. And sometimes there was a large group, sometimes smaller. But the police presence was— There were marked cars in many places. A lot of times the roads were blocked off, so no traffic.

In the beginning, they didn't block the roads because they weren't sure. But then they started to block the roads and that way anybody driving by couldn't honk, couldn't see our signs. There were undercover vehicles in many places. You could see police with cameras. You could see cameras mounted taking pictures. It was quite eerie in a way actually, to see all that. And knowing we've basically always been law-abiding citizens. I would be shocked if too many at these protests actually weren't pro-police before.

And so, the one day we came, we were going to— I knew it was all blocked off. So I knew there was a Free Palestine protest by City Hall. So I says, "Let's go drive by there. I'm going to video." So I videoed and sure enough there was, I don't know, at least 200 people there.

And at the time, it was no more than 10 people outside. And then they had their sign and they were chanting, "Free, free Palestine," which I'm fine with that. But then you came our way and there was no traffic allowed, there was heavy police presence. Many people got fined for being at those protests, public gathering over 10 people. So.

Shawn Buckley

Was there a police presence at the Free Palestine?

Michele Tournier

I saw one policeman on a pedal bike when we drove by, that's all I saw.

Shawn Buckley

So completely different.

Michele Tournier

Whole different, same day.

Shawn Buckley

What were you guys protesting for, or assembling for?

Michele Tournier

Well, the mandates, the masks, the gatherings. Just— The government, we were protesting the government is what we were protesting. And protest in Regina, tickets were given there and they were the government mandates, is what basically they were doing.

And we knew the police were getting paid very well, overtime, because our nephew was a former Saskatoon policeman. And when he was still working, they'd say, "Why don't you take some shifts? You know, it's good money." And he says, "Well, I can't. Like, I agree with the people. We shouldn't be— People shouldn't be controlled like this." So we knew there was a lot of taxpayer money spent on that when, you know, actual criminals are wandering around.

Shawn Buckley

What do you think the purpose was of this heavy police presence at, basically, freedom rallies?

Michele Tournier

I think it was to intimidate, to make you feel uncomfortable. Maybe you wouldn't come next time.

And then when you knew you were starting to get some fines, that was also a deterrent, because they were all \$2,800 fines. And people don't want that. And I got stopped while I was walking and the police wanted my I.D. for just walking towards there. So there was a lot of an intimidation factor too. "You shouldn't protest the government," was basically the message.

Shawn Buckley

Now did anything happen with Crime Stoppers?

Michele Tournier

Yes. A lot of people at this one event had their pictures taken by the police and put on Crime Stoppers. It also happened in Regina where people were in the mall without a mask, I think. People were seen with their faces on Crime Stoppers. It was put out: "If you know these people, contact the police." So some had their work, the place where they work, say, "I saw your picture on Crime Stoppers." And this is, really— Like, they're on Crime Stoppers? And then SGI [Saskatchewan Government Insurance] was contacted by a lot of pictures that were taken. That's when we realized how much SGI, our government insurance, worked with the police. And that's how they identified a lot of us from being who we were,

[00:20:00]

and sort of a facial recognition thing, to know where to send the tickets to.

Shawn Buckley

And how did that make you feel, realizing that, just for protesting outside, people's pictures would be put publicly in Crime Stoppers and the government's insurance agency would be used to identify people that were protesting outside?

Michele Tournier

Well, it was very— Like, you couldn't believe you were in Canada, that there was this level of government groups, agencies going against its citizens. It just—you really were shocked that this was happening in your own country, which was supposed to be free.

Shawn Buckley

And how did all of this experience affect you?

Michele Tournier

Well, I've lost a lot of faith in, well, many institutions, whether it's government— I've always been suspicious of government but it was raised quite a bit. The policing, the judicial, the medical system with the silence. Those that enforced, I guess they enforced, but a lot of people that stood idly by and allowed this to happen to their fellow citizens. I've lost trust in our institutions and even in the people around you that seem to be okay with it happening.

Shawn Buckley

Thank you. I have no further questions. I'll see if the commissioners have any questions.

And there are no questions. Michele, on behalf of the National Citizens Inquiry, I sincerely thank you for coming and sharing your testimony with us today.

Michele Tournier

You're welcome.

[00:22:08]

[00:00:00]

Shawn Buckley

So that is going to conclude our third day of hearings at Saskatoon. We pick up in hearings next week in Red Deer. I think it'll be the Wednesday—in fact, I'm certain it is. And so I invite you to please join us.

I wanted to just leave one word with us and I believe it was on one of the slides that Dr. Havas had from Martin Luther King. I wrote down the quote as: “Our lives begin to end the day we become silent about things that matter.” And I think that's a very appropriate way to end a set of three days of hearings when we've heard ordinary Canadians sharing their stories and getting a voice again.

I'll just read that again. “Our lives begin to end the day we become silent about things that matter.”

Thank you so much for joining us at the National Citizens Inquiry.

NATIONAL CITIZENS INQUIRY

EVIDENCE RED DEER HEARINGS

**Red Deer, Alberta, Canada
April 26 to 28, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

Welcome to the National Citizens Inquiry as we begin day one of three days of hearings in Red Deer, Alberta.

Commissioners, for the record, my name is Buckley, initial S. I am attending this morning as agent for the inquiry administrator, the Honourable Ches Crosbie.

For those watching that are not familiar with the NCI, the NCI is a group of volunteers that have organized to send a set of independent commissioners literally across the country. We're going province by province before we return to the nation's capital to hear testimony to find out what exactly happened during our COVID adventure and, more importantly, to hear the voices of just ordinary Canadians: to hear what happened, to hear their experiences, hopefully, so that we can come together and heal.

Now because we're a volunteer organization, I'm always asked, "Ask for this, ask for that," at the very beginning because people are watching, and it is important. We don't have a single major donor that makes this easy for us. We truly rely on your small, little donations. And so every time we ask, please go to our website, sign our petition so that it's clear that there's a movement behind this, and donate. It costs us about \$35,000 each three sets of hearings, and I'm pleased that we are still here now in Winnipeg [sic], and I'm trusting that we will be in Vancouver next week. But we're literally funding as we go, so your donations are very much appreciated.

We also have a need for real-time translators in two weeks when we're in Quebec City. Most of the evidence is going to be in French, and we need real-time translators—a whole team. You can't have just one or two people do that, it's so exhausting. And so if there are any of you out there that have that skill, then if you want to contact our email at info@nationalcitizensinquiry.ca, put in bold letters in the subject line, urgent French translators.

Now, I'd also asked last week, we're clipping videos and we're posting like crazy on social media because the mainstream media is ignoring us, so I ask everyone every time, push us out on your networks. But we need to have content for French speaking Canadians. And so

we actually need people that are bilingual, who are not willing just to watch a clip and do a translation but also if they don't have the skills, willing to learn how to put the text on the video and actually do the whole thing. So if you're out there, please contact the NHPPA [sic] [National Health Products Protection Association, <https://nhppa.org>, info@nhppa.org Note: Mr. Buckley is president of NHPPA] and put in the subject line an explanation that that's why you're contacting us.

And then we are in need of bilingual lawyers for the Quebec City hearings. We probably need a team of about five. So if you can contact us about that, we would appreciate it. If there's any lawyer out there that has nothing to do next week, we'd also certainly welcome your help as we move to Vancouver.

I want to speak about precedents this morning. Whenever a nation faces a crisis, the nation has to choose how it's going to react to that crisis. And I want to say sometimes the nation will choose to do things it hasn't done before, although it seems to be that every crisis becomes an excuse for governments to do more and more, and we've heard the phrase from officials that there's no point letting a good crisis go to waste. So we went through a crisis, or at least we were told it was a crisis and it was hyped up as a crisis.

Let's ignore that the overall death rate really wasn't any different than a bad influenza season, but we have all gone through a crisis. And as a nation we had to choose how we were going to deal with that crisis, and we did some new things. And by doing a new thing, we set a precedent.

I mean, we locked the citizenry down. I've had clients under house arrest that were freer than we were. We basically forced medical treatments on people.

[00:05:00]

We forced people to mask. We did new things, and so we set precedents for going forward.

I mean, precedent is just an example of things you can do the next time, and it's easier the next time because we've been conditioned to accept it. We've been locked down. So if we're told another pandemic is here, we're actually going to expect to get locked down. We're going to expect to have a treatment forced on us. We're going to expect passports. We're going to expect masking.

Have you considered that for our children, this is normal? This is what they will expect to happen if a pandemic comes through. Let that sink in for a second. For our children, masking is normal, and the long-term effects of that are going to be with us for their entire lives.

Now, I want to speak about three precedents that we have set and get us thinking about them. The last one that I speak of is of tremendous importance, and it likely shows us a way forward.

The first one I want to speak about is how basically we have set a precedent where we don't have rights in a crisis, and perhaps going forward, even when we're not in a crisis, but that we're just in a hard spot. We went into this pandemic believing that we had fundamental rights. In fact, Canada was, you know, a poster child of free Western liberal democracy. We had this *Charter of Rights and Freedoms*. I don't think you could become a new citizen without learning about it, about this Constitution with this Charter and all these protections we had. And that turned out just to be a piece of paper with words on it.

We had James Kitchen testifying last week in Saskatoon, basically saying, "Well, it only lasted 40 years." It came out in 1982, the *Constitution Act* of 1982. It's a British statute. Our constitution is just British statutes, by the way. So yeah, it's probably a record for the death of a constitutional document and definitely the death of a constitutional document that purported to give fundamental rights.

Here we had the largest government-encroachment upon our rights and freedoms that any of us had ever experienced, even in wartime. And we would expect that there would be case after case after case, evaluating this encroachment and putting some breaks upon the government. But I can't think of a single case that puts a break or a check on the government going forward, and every lawyer that has taken the stand that I have examined, I've asked that question. And, you know, I welcome Leighton Gray who's here today as a volunteer lawyer to help us call witnesses, but he testified last week, and I asked him, "Can you think of a single case going forward that puts a break on government action?" And no one can think of a single case.

So we've had the largest government-encroachment in our lifetime. And going forward, the precedent we set is, this is okay. It's okay if we think we're in a crisis, and perhaps even if we're not in a crisis, for the government to take away our rights. So we've allowed a very dangerous precedent to be set. And our relationship with the government because of this has changed dramatically.

Pre-pandemic, I expect that most of us were not afraid of our government. I think most of us felt that even the government was there to protect us and that we were comfortable with the balance. We likely felt like we were equals with the government. We recognized the government had a lot of power, if we stepped out of line, if we killed somebody or stole or whatever, broke the law, we would expect the government would come down on us and exercise its power.

But we also felt that we had a lot of power, in the form of personal freedom, to basically do what we want to do, go where we want to go, without restrictions.

[00:10:00]

But we learned that that wasn't the case. So if we were in a situation at the beginning of the pandemic, where there was a balance of power between the citizen and the government, we very quickly found ourselves in the situation where the government had almost all of the power.

And that has set a precedent. We now have a precedent in Canada where if we're facing a crisis, the government has almost all of the power over us. And now what has changed is **that for many of us, we are now afraid of the government, and you know what I'm talking about.**

We're afraid that they're going to do it again. And it doesn't even matter what side you're on. If you supported the government measures you didn't like being locked down, you didn't like having to get a treatment because the government said so even if you supported it. You didn't like masking, and you didn't like having to show identity papers as if you were in a Stalinist roadblock in the Soviet Union. You didn't like it, and you're afraid that it might come back. And clearly for those that opposed what the government was doing, that didn't agree with it, they didn't like it at all either.

Now, we're being told by different world leaders that we're going to have another pandemic, that there *is* going to be a next time, and the danger for us is that it's going to be much easier for the government to impose these restrictions on us. And help me out. Once the government has taken powers, when is it that they don't go further? And the reality is—and listen carefully because you get to choose how free and how not free you are, and here's the measure—governments will, going forward, as they have in the past, keep taking more and more and more, until you reach the point where you say, "That's it. I'm standing up. Here's my line in the sand." Regardless of the consequences, you can't take any more.

That's where you'll find yourself. And so if you move that line forward, where you're still free and you start standing up while you have real freedoms, instead of when you don't, things will go a lot easier for all of us.

We're going to be calling a witness during these hearings who served a year of jail for her involvement in the Solidarity movement in Poland. And she's going to tell you that at the beginning, there was hardly anyone in the Solidarity movement. There was hardly anyone standing up. And it's obviously hard to get a movement going when there's no one standing up. And she says, "People only stood up when the bread ran out, when they were hungry." That was their line in the sand, when they were hungry. But you are going to be pushed—and I promise you—to that point where you won't take any more. And so you should decide that you're not going to take any more, sooner than later. It'll be much easier for you.

The second precedent that I want to speak about are these vaccine mandates. I mean, anyone out there who is naive enough to pretend that we had a choice in Canada—and regardless of whether you supported getting vaccinated or you didn't support—there really wasn't a choice. We didn't make it a law, but that's just a nuance that's really meaningless, isn't it, when we're being told that you can't work, you can't go on a plane, you can't go on a train, you can't go to your kid's hockey game, you can't go to a restaurant, when the social pressure is intense, where there's editorials in the *Toronto Sun* [sic], I think, that's entered as an exhibit in these proceedings: "Let the Unvaxxed Die. They Shouldn't Get Health Care." [*Toronto Star*, August 26, 2022]

And we all heard things like they should be put in camps. There was pressure, we didn't have a choice, and witness after witness will say that they felt coerced. A lot of them took the vaccine so that they could keep their job: "I have kids, I have a mortgage, I had no choice." I have personal friends that did that.

Now, here is the precedent. If you allow—and we allowed the government to basically dictate to us that we had to take a medical treatment—so we set a precedent where we don't have sovereignty over our own bodies. And actually, the term "sovereignty," a lot of people don't understand,

[00:15:00]

and it's probably more appropriate for me to use the term "ownership."

Somebody might go, "Why is he using the term ownership?" Understand that when we use the term ownership, all we're describing is that somebody who is the owner has control over what is going to happen to what is owned.

So if you own a car, as the owner, you can decide who drives the car. If it gets painted, you get to pick the color. Ownership just is our way of explaining who gets to decide what happens to something, who has control over something. And if somebody else has control

over your body, then ownership is an appropriate term. We gave up ownership over our bodies. And understand that having sovereignty, the right to decide for ourselves, having ownership over what happens to our bodies, is one of our most fundamental rights.

Whether you like it or not, you're living in a body. You can't escape the feelings. If somebody walks up to you right now and punches you in the nose, there's nothing you can do. You're going to experience pain, your eyes are going to water, maybe you're going to feel blood running down your face. If somebody jabs you with the COVID-19 vaccine and you don't have an adverse reaction, that's going to be your experience; if you do have an adverse reaction, that's going to be your experience. But it's personal. People can empathize with you, but they can't share the experience.

When you feel good, it's your feeling alone. When you feel bad, it's your feeling alone. And because you are the one that experiences your body, we have as a fundamental principle that each one of us should be the sole decision-maker over what happens to our body. We used to consider that as sacrosanct. But we gave that up by allowing the government to dictate to us, and we participated in this. We got enthusiastic about forcing other people to get vaccinated. We gave up ownership over our bodies. We gave up sovereignty. We've set that precedent.

Now understand, there are only two groups of beings that don't have ownership over their bodies. And the first group is slaves. Slaves do not have ownership over their bodies because they're owned by the slave owner. And so the slave owner gets to decide whether or not the slave must take a medical treatment. The other group that has no control over whether or not a medical treatment will be imposed on them is livestock, which again involves ownership. So in that case, we'll have, for example, a rancher of a herd of cattle, and that rancher who owns the cattle has the sole discretion over what medical treatments those cattle have.

And I can't think of a principal difference between slaves and livestock when it comes to this sovereignty issue over their bodies because both of them have no choice. A slave cannot refuse a treatment because the slave does not have ownership over the slave's body. A cow cannot refuse treatment because the cow does not have ownership over the cow's body. You cannot refuse COVID-19 vaccines during our pandemic because the reality is that you did not have ownership over your own body.

You know, I was wondering as I was putting this together, whether or not it would be more honest if we got ear tags like we put in cattle, and then I quickly remembered that that's not how we mark humans—that we mark humans by either marking them on the wrists, their foreheads, requiring vaccine passports, or—coming to a theater near you—a digital passport. We have set the most dangerous precedent, not just for ourselves but for our **children because how are they going to do this going forward because this is the country we're passing on to them?**

The third precedent that we set, which is the most important,

[00:20:00]

and likely the way out of this, is that we stepped away from the legal foundation of Canada as a liberal Western democracy— And that is that our legal system, both criminal and civil, is based on the second commandment.

And I had explained the second commandment at the Saskatoon hearings, but it's basically that you are to love your neighbour as yourself, which means you are supposed to treat your neighbour exactly how you want to be treated. Our entire legal system, criminal and civil, is based on this.

You know, no law student can get through law school [sic] without learning about the great Lord, and how he basically changed our civil tort law with the great question, "Who is our neighbour?" Who is the neighbour that we owe this second commandment responsibility to? All Western democracies—every single one, to a T, a hundred per cent—have based their legal and civil societies on the second commandment. And it's because if you base your society on the second commandment, it's the way to ensure the maximum amount of liberty for your citizens and the minimum amount of oppression, and I will explain this. And it's also the second commandment is the measure by which you can tell whether a law is a true law, or if it's a false law.

And to explain this to you, I actually have to go back and share the story of where the second commandment came from in the first place. It goes back to Jesus, and He's living in a time where the society was very rule-based, it was law-based. In fact, they referred to their religious system, which was very rule-heavy, they referred to it as "The Law." And it had become onerous, although that wasn't the intention. And I mean, we're familiar with a lot of their rules. I mean the Ten Commandments. That literally was the start of it, where Moses comes down from Mount Sinai with two clay tablets and Ten Commandments from God, with things like don't murder, don't steal, don't commit adultery, these rules.

Now, they had become very oppressive in Jesus' time, so right to the point where the people were feeling that the law was working against them and oppressing them. And that sounds familiar, doesn't it? And the problem was, is that the religious leaders—because the religion was such a major part of their society, the religious leaders owned the religion. They interpreted it, they enforced it, they basically had ownership over it, and so it became oppressive instead of free.

Now, they had a problem though. They had been running things, tickety-boo, having ownership of what was going on, and then this upstart shows up. This Jesus character starts walking, literally walking from village to village, teaching—teaching about the law in a different way that wasn't oppressive, and sharing parables. And this is getting back to these religious leaders, and they're just going crazy because the crowds were so much that actually, it became an inconvenience for Jesus. He couldn't go anywhere without the crowds following Him. And, you know, add in the reports that would have been coming back to the leaders in Jerusalem about, "Wow, and He's healing the blind, and the lame walk." The crowds were going crazy, and they clearly had to do something about this person.

He had to be dealt with because they were losing ownership over the religion. And so they thought, "Well, we need to trap Him. We need to show the crowd that He's really no different than anyone else and no smarter than us. So why don't we ask Him, 'Jesus, what is the greatest commandment?'" Because there's so many rules, He's going to pick one, and then they can start a legal argument with Him and get Him bogged down and just show the crowd He's not as clever as the crowd thinks, and in that way trap Him.

So they try this. They go to Him and they say, you know, "Teacher, what is the greatest commandment?" And Jesus saw the trap right away, and He gave an answer. And He could have stopped there because He got out of the trap with, you know, His first sentence.

He said,

[00:25:00]

“Well, the greatest Commandment is to love the Lord your God with all your heart, all your soul, and all your strength.” Well, what are the religious leaders going to do about that? Because, yes, it’s a rule-based system, but I mean, even the first commandment that Moses brought down was, you know, you serve no other Gods but Me. So they couldn’t argue with that. Jesus was out of the trap, but Jesus then gave us the second commandment to get us out of the trap.

And so He added something He didn’t need to add, and He said, “And the second commandment is to love your neighbour like yourself.” So that is treating your neighbor exactly as you would want your neighbor to treat you. And then Jesus said, “These two, that’s all the law.” You’ve got all this whole rule-based system, but that’s it. Love your neighbor like yourself. And if you start unpacking it, all these rules, and this is why this is the touchstone of how you’re going to judge whether a law is a true law, one that you should support or not: if it follows the second commandment, it’s a true law.

So you know, I had mentioned murder, theft, and adultery as just examples of the Ten Commandments. Well, we don’t murder our neighbor because we don’t want our neighbor to murder us. And so if we both treat each other as we want to be treated, then we’re free of murder. We don’t steal from our neighbor because we don’t want our neighbor stealing from us. And if all of us follow this then we’re all free from theft. We don’t sleep with the spouse of another person because we don’t want another person sleeping with our spouse. And if we both live by that then we have peaceful marriages. We’re free to have that. And so Jesus, by doing this, actually freed us from laws becoming oppressive by just pointing out, well, the whole point of us collectively having laws is so we can love each other. It’s that simple.

Now, the second commandment and the reason why every single Western liberal democracy has been founded on the second commandment, is because it brings freedom. Societies that are based on the second commandment, their legal system, and it’s taught as their culture, they don’t hurt each other because if we are all in the habit of treating each other like we want to be treated, we behave nicely. We don’t, in those societies, control or oppress their citizens because that is inconsistent with the second commandment. We don’t want to be controlled and oppressed, so we’re not going to control or oppress others.

Now, we contrast that— And that’s what we were based on, and our problem is we have left our philosophical roots. We could have, when the COVID pandemic happened, we could have chosen to love each other. And how different would it have been if all of our actions **were guided by treating people like we would want to be treated? And we can use this measure to judge our institutions and their actions during COVID.**

Our media did not follow the second commandment because if you’re a journalist, or you’re an editor controlling journalists, and you want to treat your neighbour like yourself, well obviously you want to be told the truth. You want balanced reporting. You want fear tampered down instead of ratcheted up. You want people to understand that there’s a scientific debate. You don’t want voices censored because you understand that that leads to tyranny. And do you see then, is if our media had been following the second commandment, we would have all had a different experience.

If our Public Health Officers were following the public Commandment, if the Colleges of Physicians and Surgeons— So in Alberta, my understanding is they basically directed to doctors during COVID that they were not supposed to treat early COVID. That is not following the second commandment.

The second commandment gives us basically our guide points for our posts,

[00:30:00]

for evaluating what happened with our institutions, what happened with our laws because we experienced the opposite. I mean the second commandment is about loving your neighbour, but what we experienced was hating our neighbour. And we did. There is so much hatred in this country, there's still witnesses dropping out of these proceedings at the last minute because they're afraid of testifying. They're afraid of retribution. And we still can't have honest conversations with each other, whether we're family members, whether we're friends because of the hatred because we stepped away from our philosophical foundation.

We lost our footing. And, so for going forward, we have to stand on our footing again. And I think it's the only way forward.

So that ends my opening remarks. I'd like to call our first witness to the stand.

[00:31:01]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Red Deer, AB

April 26, 2023

Day 1

EVIDENCE

Witness 1: Joelle Valliere

Full Day 1 Timestamp: 01:31:24–02:02:56

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

Now, Joelle, this is awkward because we can't really see each other. We'll be looking at each other on screens. But can you please state your full name for the record, spelling your first and last name?

Joelle Valliere

My name is Joelle Valliere, J-O-E-L-L-E V-A-L-L-I-E-R-E.

Shawn Buckley

And, Joelle, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God.

Joelle Valliere

I do.

Shawn Buckley

Now, you are a wife and a mother of three?

Joelle Valliere

Yes.

Shawn Buckley

And you're also a funeral director and an embalmer.

Joelle Valliere

Yes.

Shawn Buckley

You've been embalming since 2008 and you have 15 years' experience as a funeral director.

Joelle Valliere

Correct.

Shawn Buckley

Now, you're here to testify today about being injured by the vaccine. I wanted to start by asking you why did you take the vaccine? What was going on that led you to take it?

Joelle Valliere

I felt I needed to take it because of my work. I didn't know if COVID remained on a deceased human person. I needed to protect myself. I needed to protect my colleagues, my family, my community. We were caring for my 92-year-old father-in-law at the time. I didn't want to cause any harm to him. We like to travel. And so that's why I chose to be vaccinated.

Shawn Buckley

Now, when you went to get vaccinated what were you told? So were you told about side effects? Do you think you were properly informed about the risk?

Joelle Valliere

No, what I was informed about was just given to me on a sheet of paper. And, you know, the typical sore arm and possible site redness and inflammation.

Shawn Buckley

David, can you pull up what's on my computer screen, just so that the witness and the commissioners can see.

So you provided me, actually, with a copy of the form that you were given when you went to get vaccinated. And so at the top there's a heading, "Side Effects," which lists redness, warmth, swelling, bruising, (going below) feeling tired or unwell, headache, fever, chills, body aches, feeling sick to your stomach, swollen lymph nodes—things that really don't sound very significant. And then there's a list of "Rare" for AstraZeneca, but you didn't get the AstraZeneca, so those wouldn't apply to you. So do you remember that this is basically all you were told, were these rather minor side effects?

Joelle Valliere

Correct.

Shawn Buckley

Okay. Now, my understanding is it was April 28, 2021 where you received your first shot of the Pfizer vaccine. Can you tell us what happened?

Joelle Valliere

So my husband and I both went in on April 28th to be vaccinated. We went together, and the very next day my left leg was inflamed. I had swelling in the left leg. I went to the hospital in Drayton Valley. They examined. There was no blood clot—that was my fear.

Shawn Buckley

So I'm just going to stop you. So when you say your legs were swelling, they were swelling so much that you felt the need to go to the ER [Emergency Room].

Joelle Valliere

Correct. Just my left leg, though.

Shawn Buckley

Okay. So what happened at the ER?

Joelle Valliere

They examined. They determined that there wasn't a blood clot, and I was sent on my way.

Shawn Buckley

So in the following three to four weeks, what was your experience?

Joelle Valliere

I started to get quite tired, a lot of fatigue, loss of appetite, not sleeping well or sleeping too much. My feet began to swell a bit. And a lot of vomiting, for no reason that I was aware of.

Shawn Buckley

Now, you were still working at the time. So when you came home after a day's work, how were you doing?

Joelle Valliere

I was exhausted.

Shawn Buckley

Okay. Now something happened on your birthday. Can you tell us about that?

Joelle Valliere

Yeah. My husband and I, every year we go golfing for my birthday. We finished a round a golf, and I recognized that my feet were getting a little tight in my shoes. But at the end of the round, I looked down

[00:05:00]

and my feet were swollen right over my shoes.

Shawn Buckley

Actually, swollen right over your shoes.

Joelle Valliere

Yeah.

Shawn Buckley

So what did you do?

Joelle Valliere

I sent him home to feed the kids and I went to the hospital.

Shawn Buckley

And was there a diagnosis this time?

Joelle Valliere

Dr. Van Der Merwe did some blood work and determined that my kidney function had dropped to 34 per cent.

Shawn Buckley

And now, that actually went down as time went on, right?

Joelle Valliere

Correct.

Shawn Buckley

So what was it down to by the end of July?

Joelle Valliere

Nine per cent.

Shawn Buckley

Nine per cent. And, what's the cutoff level where, in the medical system, you're typically slotted for a kidney transplant? At what level?

Joelle Valliere

Fifteen.

Shawn Buckley

Okay.

David, if you can let me, I'm just going to take control over the screen. I'm just going to show you some photographs. And, now, I'm not going to get them all in order, but am I correct that this photo is just basically a photo of your feet when they're not swollen [Exhibit RE-3]? This is normal feet.

Joelle Valliere

So that was at the U of A [University of Alberta] after they had they had given me some diuretics and controlled my edema, at that point.

Shawn Buckley

Right. Now, just going to move to the next picture. That's an example of your feet being swollen [Exhibit RE-3a].

Joelle Valliere

Yes.

Shawn Buckley

And we've got a couple of pictures that we'll enter as part of the record. But basically, the point being is when you're saying your feet are swollen; this is actually a physical representation of the difference [Exhibits RE-3b, RE-3c].

Joelle Valliere

Yes.

Shawn Buckley

Thank you David. So what did the hospital do? You went to the hospital and they're finding that your kidney function is at 34 per cent. How did they treat that?

Joelle Valliere

So in Drayton Valley, what they were doing was trying to control my blood pressure. My blood pressure when I went on the first of June was 190 on 145. They couldn't believe that I had no chest pain, no headache, at that point. So just controlling my blood pressure was their main focus, but it was not successful.

Shawn Buckley

And literally a few days later, on June 4th, you had to go back to the ER. What was happening on June 4th? There was something with your hand.

Joelle Valliere

My left hand. I was driving the children to town. We live about 20 minutes east of town. So I was taking one to work and one to school. I noticed that my left hand began to tingle and I looked down. And from my wrist down, it was eggplant colour—a deep purple.

Shawn Buckley

Now, you ended up going to the University of Alberta. Can you tell us what happened?

Joelle Valliere

I was admitted to the Nephrology Unit after they couldn't determine exactly what was happening. But I was in emergency there, and then admitted to the Nephrology Unit.

Shawn Buckley

And what diagnosis did they give you?

Joelle Valliere

So I was admitted on the 4th of June, and on the 7th of June they did a kidney biopsy. And I was released on the 9th of June without a diagnosis at that time. On the 14th of June, the doctor of nephrology called me, and I was diagnosed with dense deposit disease.

Shawn Buckley

Now, the day you were admitted, Dr. Courtney told you about other admissions. And can you speak to us about that?

Joelle Valliere

He said that aside from myself, four other people had been admitted—so five of us—, and four of us had just been vaccinated within the month.

Shawn Buckley

And, am I correct that he basically voiced that he was suspicious about the number of people being admitted that day?

Joelle Valliere

Yes.

Shawn Buckley

And the connection to the vaccine.

Joelle Valliere

Yes.

Shawn Buckley

So now my understanding is that on June 24th you were started on immune-suppressant drugs?

Joelle Valliere

Correct.

Shawn Buckley

And were you given an explanation as to why?

Joelle Valliere

So what they told me was that the vaccine had likely put my immune system into overdrive. And in doing that, I developed an autoimmune disease. So by giving me immunosuppressant therapy was to stop my immune system—was to kill it—and hopefully stop the disease from progressing.

[00:10:00]

Shawn Buckley

And can you share with us going forward the types of things that you went through medically?

Joelle Valliere

I had eight surgeries and procedures in eight months. Aside from the medications, and in addition to the medications and the edema, I gained about 40 pounds, which I've lost now. I began hemodialysis on the 10th of August—emergency—because I couldn't walk or hardly breathe at that point. So it was an emergency to get me started before it got worse.

On the 27th of August 2021, they placed a peritoneal dialysis line. I had to let that heal for about six weeks before I could use it. And then, so I went from hemodialysis to peritoneal dialysis, which I could do at home.

On December 3rd of '21, I had my first hemodialysis line removed. December 8th of '21, my peritoneal dialysis line failed. December 9th, I had to have a second hemodialysis line placed.

Just infection after infection and it was, just— It was tough.

Shawn Buckley

And my understanding is that you were on dialysis for six months, but you were eventually able to get off dialysis.

Joelle Valliere

Correct.

Shawn Buckley

And I'm just going to show— You shared a picture. (So David if you could pull my screen up.) This is a picture you shared with us of you actually having a dialysis treatment [Exhibit RE-3d].

Joelle Valliere

Yes.

Shawn Buckley

This would also be the time you described to us you'd put on a lot of weight.

Joelle Valliere

Yes.

Shawn Buckley

So just looking at you on the witness stand and this photo, I see the difference. (Thank you, David.) So if you were to— Well, I'm asking you now: What is your current condition now? So you're off dialysis, and you've been off dialysis for a while. What are you experiencing now?

Joelle Valliere

So I actually had blood work done yesterday, and my kidney function is at 21 EGFR [Estimated Glomerular Filtration Rate]. And my creatinine levels are in the 256 range.

Shawn Buckley

And what does that mean?

Joelle Valliere

So my EGFR is the measurement of your kidney function. So in a healthy person, it should be above 60. And mine's at 21, so it's kind of like a percentage of what your kidney function is at.

Shawn Buckley

Right, and at 15 percent or below, you're eligible for kidney transplant.

Joelle Valliere

Yes.

Shawn Buckley

Are there any other things, perhaps affecting your mind or your concentration?

Joelle Valliere

So with my creatinine levels being high, it does affect your mind, your brain function. I do forget a lot of words. Foggy. I'm very tired. I work a lot because that's what I love to do, but I suffer for it. I have severe insomnia. My appetite isn't great. I have to watch my diet and my fluid intake so that I don't end up with fluid retention. I'm on nine different medications at this time, which is a great improvement compared to the about 40 pills I was taking, in the beginning, a day.

Shawn Buckley

Now, I'm going to the transplant issue. So today you're at 21 per cent, and some days you're lower than that.

Joelle Valliere

It fluctuates.

Shawn Buckley

Yeah, and my understanding is that you're actually concerned about it going below 15 per cent because you may not be eligible for a transplant?

Joelle Valliere

That's right, because I don't have my second vaccine. Although I did receive documentation that, as of April 20th, I could be eligible, but I would have to have some education on what COVID might do to me.

Shawn Buckley

So in April of 2023. So until recently, you weren't eligible to be on the kidney transplant list because you had to be double vaxxed. Am I right about that?

Joelle Valliere

That is correct.

Shawn Buckley

So here you are. You can't get another shot because your kidneys are failing because of the first shot—and the doctors agree with you on this—but they were still expecting you to then get a second shot before you would be eligible for kidney transplant.

Joelle Valliere

That's correct.

[00:15:00]

Shawn Buckley

And now you could be eligible, but you need to be educated about the dangers of COVID, presumably to convince you to get your second shot.

Joelle Valliere

That's right.

Shawn Buckley

Have you submitted a claim for your injuries?

Joelle Valliere

I have submitted a claim with vaccine injury benefits with the federal Government of Canada.

Shawn Buckley

And how long ago did you do that?

Joelle Valliere

September of 2021.

Shawn Buckley

Okay, so I imagine that's been totally processed and you're now receiving compensation?

Joelle Valliere

Absolutely not.

Shawn Buckley

Has anything happened?

Joelle Valliere

Nothing.

Shawn Buckley

And can you share with us what the complication might be?

Joelle Valliere

The complication might be that they're still trying to access documents from all the doctors that treated me since my injury.

Shawn Buckley

Okay, and is there also a concern that you might have had a pre-existing condition that would basically disqualify you?

Joelle Valliere

Correct.

Shawn Buckley

Can you share that with us?

Joelle Valliere

When I was 16, I had a strep infection. And by the time I was 19, I had decreased kidney function because of that infection.

Shawn Buckley

Were you ever treated for that?

Joelle Valliere

I was given diuretics—so a water pill—and that's all.

Shawn Buckley

Okay, and that was for a short period of time.

Joelle Valliere

Yes.

Shawn Buckley

So since you were 18 until what you've just shared with us getting vaccinated in 2021, did you have any kidney issues at all?

Joelle Valliere

From the age of 19 to 2021, I had no kidney issues.

Shawn Buckley

And you had actually had your kidneys checked out in 2012 just out of curiosity.

Joelle Valliere

Correct.

Shawn Buckley

Can you share with us the results?

Joelle Valliere

I saw Dr. Kym here in Red Deer, actually—I was living in Sylvan Lake at the time. And he felt that I was likely misdiagnosed, because there is no way, in his opinion, that somebody with MPGN, membranoproliferative glomerulonephritis, could maintain perfect kidney function with no treatment at all.

Shawn Buckley

Right, so that doctor who— And again, you just deliberately went in, you didn't need to go in, but you were curious about your kidney function. And you're basically told, "No, you never have had kidney function problems."

Joelle Valliere
That's correct.

Shawn Buckley

Now, you were off work because of this from May 2021 to January 2022, so basically for seven months. Can you share with us the economic impact of being off work?

Joelle Valliere

So for myself personally, as a partner of the funeral home, I remained on payroll because I did not qualify for disability benefits. So they did keep me on payroll. But we did have to hire help as I was the only embalmer there. So we had to hire out help.

Shawn Buckley

Right, so you're a co-owner of the business?

Joelle Valliere

Correct.

Shawn Buckley

And so basically, the economic impact is somebody had to basically replace you, and those wages had to be paid.

Joelle Valliere

That's right.

Shawn Buckley

Now, how has this affected you emotionally, having gone through this experience?

Joelle Valliere

I don't even know where to start with that. There was a time where I considered medically assisted death, which I don't know why because as a Christian it's totally against everything I believe in. But I just couldn't do it anymore.

Shawn Buckley

So you were finding this so difficult that you were actually considering having your own life taken through the government program for assisted suicide.

Joelle Valliere

Yes.

Shawn Buckley

What types of thoughts were going through your mind when you were at that place?

Joelle Valliere

I was told that the only way off dialysis was kidney transplant or death, but kidney transplant wasn't an option—just all the infections. My kids— I just— It's just too much. I really, really enjoy the work that I do. I'm so privileged to be able to walk alongside families in their darkest times, and I couldn't do that. I had to fight to go back to work.

[00:20:00]

And even now, I don't have the strength that I had physically. It was just tough.

Shawn Buckley

And my understanding is that you even had a discussion with your husband about entering the MAID [Medical Assistance in Dying] program. And for people internationally, that's the government program for assisted suicide.

Joelle Valliere

Correct.

Shawn Buckley

So it had gotten to the point where you were discussing it with your husband.

Joelle Valliere

Yes.

Shawn Buckley

Now, you just spoke about really enjoying your work and being able to assist families that are experiencing a time of crisis. You've been an embalmer for 12 years.

Joelle Valliere

Correct.

Shawn Buckley

And you started in the funeral business earlier at 2008.

Joelle Valliere

Yes.

Shawn Buckley

To qualify as an embalmer you actually have to do 50— I don't know what you call it when you embalm somebody.

Joelle Valliere

So in the province of Alberta, I took a two-year program. And in order to become a licensed funeral director and embalmer, you have to put in, much like an apprenticeship, you have to put in your 18 hours of experience. But I also had to log 50 embalmings and 50 funeral arrangements with families.

Shawn Buckley

Right, just to qualify before you started. Now, my understanding is once the vaccine rollout started, you worked till May of 2021. So you're roughly there for about the first five to six months of the vaccine rollout.

Joelle Valliere

Yes.

Shawn Buckley

And then you were off work for seven months, but you started back in January of 2022?

Joelle Valliere

Yes.

Shawn Buckley

Did you see changes when you were embalming people that you had not seen ever in your career before the vaccine rollout?

Joelle Valliere

I did. Yes.

Shawn Buckley

Can you share those with us, please?

Joelle Valliere

I found that the drainage— So the blood that would drain was very thick and sludgy. I found that it was almost like a sandy texture in some cases. And then I have— Personally, I have experienced calamari-like—

Shawn Buckley

Now, you use that term, and that's just what embalmers are now calling these new things that are being found?

Joelle Valliere

Yes. So in my experience, I had never seen that before.

Shawn Buckley

(And David, can you just pull up my computer?) So this is a photo that you provided [Exhibit number not available]. This is an example of one of those things you referred to as calamari.

Joelle Valliere

Yes.

Shawn Buckley

That you pulled out of a body when you were embalming.

Joelle Valliere

Yes.

Shawn Buckley

And my understanding is basically these things are complicating the embalming process because it's harder to pump the embalming fluids into the body. These are plugging either the venous or arterial systems.

Joelle Valliere

That's correct.

Shawn Buckley

So does it take longer to do—to embalm a person now?

Joelle Valliere

So I'm finding it's taking longer. I'm finding that I'm having to build up pressure in order to release anything that might be causing restraint in the circulatory system.

Shawn Buckley

And more specifically, you mean these things that you're referring to as calamari.

Joelle Valliere

Correct.

Shawn Buckley

Just so that we understand your evidence, so you are actually putting pressure inside the body to try and force these things to move so that they can be taken out—so that you can actually flush the body with the embalming fluid.

Joelle Valliere

Correct.

Shawn Buckley

So it's a complication that you had never seen prior to the vaccine rollout.

Joelle Valliere

I had not experienced that myself, no.

Shawn Buckley

Now, what happened when the vaccine boosters came out?

Joelle Valliere

Well, that's when I started to experience these.

Shawn Buckley

Okay.

Joelle Valliere

Although, I was away from work for quite some time, so I don't know what was happening in that time, either.

[00:25:00]

Shawn Buckley

Thank you, Joelle. I don't have any further questions for you, but the commissioners may have some questions.

Commissioner Massie

Thank you very much for your touching testimony. So there's a lot of things to unfold in what you've been through. I was wondering about how the doctors and people that were treating you were trying to understand what happened to you. I've heard discussion about previous conditions from a strep infection that are known to induce autoimmune conditions. In your case your kidney was affected, but it had been resolved after the strep has been controlled, and you had no incident whatsoever after that.

Joelle Valliere

So when I was first diagnosed at 19, which was likely a misdiagnosis according to Dr. Jim, he told me that I would require a kidney transplant within 10 years, that I would never be able to have children. And I went on to be fine for 27 years without issues to my kidneys. No edema: nothing. I've had two babies, you know, without complication.

I just don't understand why all of a sudden— So it was actually Dr. Courtney who said— Because I didn't know— Like I thought maybe, okay, so they said 10 years. Maybe I was

lucky and it took 27. But it was Dr. Courtney that said it was likely from my immune system being— I do forget a lot of words because of my creatinine levels being high— So likely because my immune system being in overdrive, it is what caused this dense deposit disease.

We were concerned that— You know, there's literature that states that MPGN and dense deposit disease are the same thing, but that is not the case at all. When I was 19, it was an inflammation of the glomeruli. So they said that the inflammation kind of, I guess, turned my glomeruli inside out. I was keeping the toxins in, releasing all the good stuff. But this is entirely different. This is an entirely different disease, and it's very rare. I'm one in 1.6 million.

Commissioner Massie

Are you aware of any situation where you might have been infected by COVID before the vaccination, with symptoms or without any symptoms?

Joelle Valliere

I don't think so. I don't know.

Commissioner Massie

So it was your first encounter, if you want with them—

Joelle Valliere

Yes.

Commissioner Massie

You mentioned there was four people that seemed to have a similar condition about the same time. Do you know what happened with these people in terms of their further treatments?

Joelle Valliere

I don't know. So Dr. Courtney, when I saw him, he did let me know that four other people had been admitted. And he was suspicious of vaccine injury. He said— But I was by far, of all the patients he'd seen, the worst.

Commissioner Massie

Did anybody suggest to you to use some sort of treatment that are being currently developed in order to get rid of spike protein, in case this could have been still present in your system?

Joelle Valliere

Not on a medical level, no.

Commissioner Massie

Okay, thank you.

Commissioner Kaikkonen

Good morning and thank you for your testimony. I'm just wondering. You mentioned you have children. How are the children affected as you continue through this journey?

Joelle Valliere

It's been very difficult on them. I think one of my most memorable conversations with my son—I had a little bit of trouble with him and he was better at this point—and he came outside and he sat beside me and he was crying. I said, "What's wrong?" He said, "I'm just so sorry, mom." And I asked him, "Why?" He said, "I feel like I took a little bit of life out of you. Now, look." And I said, "That's okay. My purpose was to make sure that you're okay, then my job is done." So—

[00:30:00]

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

Good morning, and thank you for your testimony. I think you said in your testimony that, originally, you were not eligible to get a kidney transplant because you were not double vaccinated. Is that correct?

Joelle Valliere

Correct.

Commissioner Drysdale

Were you eligible for the MAID program?

Joelle Valliere

I didn't look into it. It was just simply discussion.

Commissioner Drysdale

You also mentioned that you believe that in the compensation program that they're considering a pre-existing condition. And my question to you is, when you got the vaccine, did the doctors inform you that if you had a pre-existing condition, this could exasperate it?

Joelle Valliere

No.

Commissioner Drysdale

Thank you very much.

Joelle Valliere

You're welcome.

Shawn Buckley

There being no further questions, Joelle, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying today.

Joelle Valliere

Thank you.

[00:31:32]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 2: Catherine Christensen

Full Day 1 Timestamp: 02:03:03–03:20:48

Source URL: <https://rumble.com/v2kjiwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Leighton Grey

Good morning, my name is Leighton Grey. I'm a lawyer here in Alberta, also licensed to practice in Alberta and Saskatchewan. I appear formally as an agent, as my friend Mr. Buckley indicated. It's my pleasure to be here. I'm going to have the opportunity to question the next witness.

It's a lawyer named Catherine Christensen. Just to set up her testimony, she is going to be giving evidence in a way of an expert, a legal expert. She is going to provide expert testimony concerning the impact of COVID-19 measures on Canadian military members, which is a group of Canadians that's probably not talked about enough in this context, especially those coerced into taking the vaccine as well as those who refused the vaccine.

And she's going to give evidence about the abuse of power that she's witnessed by the Chief of Defence Staff and the chain-of-command, which she will indicate, is shocking. So firstly, Ms. Christensen, welcome to the National Citizens Inquiry. Thank you for being here today.

Catherine Christensen

Thank you.

Leighton Grey

Okay. Could you firstly state your full name for the record?

Catherine Christensen

Certainly. It's Catherine Mary Christensen. C-A-T-H-E-R-I-N-E M-A-R-Y C-H-R-I-S-T-E-N-S-E-N.

Leighton Grey

Alright, are you prepared to swear an oath to tell the truth?

Catherine Christensen

Yes.

Leighton Grey

Okay. Do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Catherine Christensen

I do.

Leighton Grey

Ms. Christensen, I understand that you are a lawyer with several years of representing military members and veterans, and that you have special knowledge, expert knowledge of the military policies, legal process, and procedures. In that capacity you've represented hundreds of military members and continue to do so, who are adversely affected by the ongoing mandate of the Canadian Armed Forces. Is that correct?

Catherine Christensen

That's correct.

Leighton Grey

You're also the founder of something called the Valour Legal Action Centre [Valour]. I know that you have a presentation that you're going to give, but just to set that up, I understand you've founded this Valour Legal Action Centre, which is a non-profit organization providing access to legal services for members and Veterans of the Canadian Armed Forces, is that right?

Catherine Christensen

That's correct.

Leighton Grey

And there's actually a board that's part of Valour, if we can call it Valour going forward, and the board accepted the challenge of representing military members facing threats and sanctions related to the COVID-19 mandate implemented by the Chief of Defence Staff in October of 2021. Is that correct?

Catherine Christensen

That's correct.

Leighton Grey

And this is kind of an interesting point and I think would be unknown to most people, and that is that members of the Canadian Armed Forces are actually prohibited from speaking negatively about the Canadian Armed Forces or about the chain-of-command and the Government of Canada.

Catherine Christensen

That is correct.

Leighton Grey

And so they're effectively censored or gagged from telling the Canadian public about what has happened and continues to happen within the ranks of the Canadian Armed Forces.

Catherine Christensen

That's correct. Fortunately, I'm not in the chain-of-command, so I can speak for them.

Leighton Grey

Right, and this is where you come in. So with that, I know that you have a presentation. Are you prepared to enter into that now?

Catherine Christensen

Yes, I am.

Leighton Grey

All right, please do so.

Catherine Christensen

First of all, I'd like to apologize to the commissioners because I know that my brief was about a thousand pages, so I apologize for the reading, but that's just the small tip of the iceberg, actually.

Leighton Grey

I read it too and there's no need for an apology.

Catherine Christensen

Thank you. Commissioners, thank you for the opportunity to appear on behalf of Canadian Armed Forces, military members and veterans that were affected by the COVID-19 policies brought in by the current Chief of Defence Staff, General Wayne Eyre.

A few housekeeping matters before I begin. My clients have signed releases allowing me to testify today. As I said, I'm not in the chain-of-command and the Code of Service Discipline does not apply to me, which is allowing me to speak on behalf of currently serving members and newly released veterans. The documents in support of my brief and my presentations today are all publicly available or were received through Access to Information and Privacy requests, and I currently represent almost 360 men and women who proudly wore the uniform of Canada. There are thousands more that my team and I have spoken to over the past two years.

I am a lawyer from St. Albert, Alberta. I was a registered nurse before I went to law school. In law school, while taking military law from two JAG [Judge Advocate General] officers,

[00:05:00]

I identified that military members needed legal services, which recognized their unique circumstances and way of life. My professors encouraged me to pursue a legal career associated with the Canadian military, as I understood it so well for a civilian. Upon being called to the bar, I hung my own shingle and began my representation of members and veterans of the Canadian Armed Forces. I wouldn't trade my practice for any other clients. I'm honoured to stand with these men and women who have served and continue to serve Canada.

By the fall of 2021, I was keenly and personally aware of the pressure to vaccinate to keep a hard-won career. I also knew from years in our courts that any attempt to question vaccination policy was going to be a big challenge despite the court being our last bastion of democracy to hold government overreach to account.

In October 2021, I was approached by hundreds of Canadian Armed Forces members about the directive from the Chief of Defence Staff mandating the injections. I was fully prepared to tell them that it was likely to be an Afghanistan of fights. And then I began to be told the stories of what was happening in the ranks, of what commanding officers were doing to their own people. These members asked me to bring my skill set and knowledge to their fight, and I couldn't let them stand alone.

If there's one thing that the best of the Canadian military is known for, is taking on a tough fight while undermanned, under-gunned, and under-equipped. Telling this dedicated group that what needed to be done in the face of adversity was all they needed. We got organized, we created teams, we equipped for the legal skirmishes, and we prepped for small advances and setbacks.

The members and veterans who voiced concerns about a mandated COVID-19 vaccination program are an outstanding group of people. They're highly decorated, they're exceptionally trained and experienced, and they have a moral code that has withstood the ultimate test of "just following orders" mentality that was supposed to die after World War II. I would put my life into the hands of any one of them. They are the finest Canada has to offer, and they've been sacrificed on a political altar.

Our military members were used to set an example for the population of Canada for a one hundred per cent vaccination rate come hell or high water. Let's be clear: the directives from the Chief of Defence Staff were not about stopping the spread or mitigating risk to the ranks or operational effectiveness. The Chief of Defence Staff stated the purpose is to show, quote-leadership-unquote, to Canadians. That's not the purpose of our armed forces, nor should it be.

The two Chiefs of Defence Staff ahead of this current serving Chief of Defence Staff did not bring in a mandate. The documentation shows they were very aware it could not be done and no doubt understood the risks of a medical treatment decimating the entire Canadian military if something went wrong. Setting up these men and women to be guinea pigs for an experimental medical treatment and then hiding the damage from it would be a war crime if it was done to prisoners of war. It certainly was a war crime in World War II, yet General Eyre did it to his own people, and he thinks he's untouchable to answer for it.

A military with leaders who see themselves above the law is a dangerous thing. History teaches us that, and it's a lesson not to be forgotten. And this experiment has gone wrong. A weakened military already suffering from not enough people in the ranks then lost

thousands more to the mandate and likely thousands more to come who were permanently damaged from the injections. The count will only rise as time moves forward.

And what happens to those who followed the orders and took the injections and are now permanently disabled? Veterans Affairs Canada is telling them, “No, not service related.” Once again, veterans will face a procedural system that fails them and are forced to go to the court for deserved compensation. Is it any wonder that the Canadian Armed Forces has a significantly accelerated recruitment problem under the current leadership?

Why have the people of Canada not heard what the Canadian Armed Forces did to some of their best people in the name of COVID-19? As has been said, it's because members of the Canadian Armed Forces are gagged from speaking out by their own Queen's Regulations and Orders. The Armed Forces haven't caught up to call them King's Regulations and Orders yet. They can't speak out, which made them the perfect population to control.

The Chief of Defence Staff has shown that

[00:10:00]

he is willing to sacrifice the entire military and their families under his command for political gain. Indeed, he received a promotion immediately after the mandate was brought in. Vice-Admiral Topshee was promoted to Commander of the Navy after he forced a third booster mandate on the Royal Canadian Navy. These were political appointments for a job well done at the expense of the members they are expected to lead and whose well-being should be paramount for them to protect.

In Canada, it should be noted that we have an additional check for our military that no one even thinks about: Soldiers, sailors, and aircrew do not serve at the pleasure of the Prime Minister, in this case Justin Trudeau. He has no power over our military. They serve at the pleasure of the King of Canada. Technically, the King can turn the military on the government or the police. Keep in mind, the King has the power to dismiss the Prime Minister or dissolve Parliament through the Governor General. His Majesty is the last line of defence. To King Charles, I would say, “Your Canadian military is in deep distress, and your troops need you to intervene before it is too late for Canada.”

The Oath of Service upholds the mission of the Canadian Armed Forces. Quote-to defend our country, its interests and values while contributing to international peace and security-unquote, as well as assist in times of true emergency such as extensive flooding or forest fires. It is a myth that putting on a uniform for military service strips a member of all rights of a citizen and removes bodily autonomy. Members who understood they were still Canadian citizens with high legal protections were vilified by an ignorant and misinformed chain-of-command who pushed an agenda that all legal avenues are closed to the member when the oath is taken. This is categorically not true.

The Chief of Defence Staff under the *National Defence Act*, section 126, can order members of the Canadian Armed Forces to receive a vaccination. Yet General Eyre chose not to use this legislated power to implement the COVID-19 mandate. Instead, he issued Directive 1 in October 2021, which was poorly written and did not follow the Canadian Armed Forces' own policies. Chaos ensued with implementation as each commanding officer put their own interpretation on what was to be done. Yes, you heard that correctly, the Chief of Defence Staff failed to produce a force-wide directive that could be acted on in one clear manner.

So then we had Directive 2, which addressed some blatant errors of Canadian Armed Forces policy in Directive 1. Still not clear enough, though, and we ended up with Directive 2 amended, which was issued.

Thrown into this mix was an *aide-mémoire* regarding remedial measures leading to what is called a 5F release, and then the Chaplain General's direction on religious accommodations trying to justify why nobody was going to get a religious accommodation, no matter how sincere their belief. Remedial measures or punishments were being handed out before accommodation requests could be applied for or granted. There was no intention to allow for religious or medical reasons to not take the injections. The right to refuse did not exist in the Canadian Armed Forces according to the chain-of-command.

By the time Directive 3 came out just over a year later in 2022, the carnage and inconsistencies were blatant. Make no mistake; Directive 3 did not remove the mandate from the Canadian Armed Forces. The mandate still exists, even as the rest of the world's militaries have been removing their mandates.

The chain-of-command can order troops into situations potentially fatal or have life-changing risks. That is without question. However, the presence of COVID-19 was not one of a deadly battle of bullets and missiles against an enemy on a battlefield. The members of the Canadian Armed Forces were at very low risk from the virus, as demonstrated, for example, by their service in high outbreak environments like nursing homes with zero Canadian Armed Forces fatalities. To date, there has been no COVID-19 death in the Canadian Armed Forces.

The true damage to the Canadian Armed Forces has come from the injections themselves, the consequences of an experimental gene therapy and the mandate. COVID-19 did not decimate the Canadian Armed Forces. The leadership did it from within.

What has been the cost of COVID-19 mandates on the Canadian Armed Forces?

[00:15:00]

I could quote you the statistics that the Government of Canada would like you to have. To say those are inaccurate is a diplomatic evasion from the reality. From a financial perspective, the cost to the Canadian taxpayer is estimated to be at least three billion dollars in lost training, experience, and expertise. Plus, there have been significant administrative costs to implement the mandate and its consequences.

The cost to members and their families add to the total. Years of service gone, benefits gone, pensions gone or reduced, injured members denied earned benefits of a medical release, denied unemployment insurance benefits, and blocked from some forms of employment due to the release category of 5F. The true cost in dollars may never be fully known.

Institutionally, the Canadian Armed Forces have lost people. Thousands of people are pouring out of the service since 2020, and they are not being replaced by new recruits. Where few recruits do join, who's left to train them? It isn't generals and admirals who train the ranks. It's the non-commissioned officers and the junior officers, and their ranks have been essentially wiped out. Some of the finest battle-experienced members were driven out of the Canadian Armed Forces when they need them the most.

The media has covered the gutted state of our military ranks where even the best sound bite from the defence officials cannot hide the sad state of our military.

How do I even begin to explain the human cost of COVID-19 mandates on the people and families of the Canadian Armed Forces? Do I talk about the young soldier made to stand in the bitter cold of a Canadian winter for three months while his fellow troops taunted him?

Do I talk about pregnant women in uniform, hounded in their homes and charged with AWOL after being hospitalized, even while the leadership had a policy to not vaccinate a pregnant member with any vaccine?

Do I talk about young, healthy people wanting nothing more than to serve their country being driven out and told they were morally weak and no better than alcoholics, drug addicts, rapists, and domestic violence abusers?

Do I talk about previously healthy men and women now facing medical emergencies and injuries that have left them disabled for life?

Do I talk about the member who was only weeks from a full pension after 35 years of service, including multiple deployments without a single blemish on her record, who lost it all while her husband was dying of cancer?

Do I talk about the shunning and ejection of some of our finest snipers and special operations soldiers that the Canadian Armed Forces was only too happy to brag about to the media a few years ago and now discard like yesterday's garbage?

Do I talk about the young women who have been sexually assaulted but stayed in uniform only to find senior leadership forcing them into yet another physical assault? To quote one of them, "Being forced to take this into my body by a superior officer was like being raped over a desk at basic training all over again."

Do I talk about the jeering taunts of non-commissioned officers bragging about coercing another member into taking the shot? "Got another one, boys."

Do I talk about chaplains who are punished for trying to speak up for the religious beliefs of their members? Do I talk about young mothers who desperately need their careers who are terrified that they have put their babies at risk just so they don't lose their place in the ranks?

Do I talk about the chaplain, now denied his role as a chaplain as punishment for standing up for his people, whose family in Poland were victims of the Nazis, and who could not stomach the coercion and forced experiments on unwilling bodies?

Do I talk about the doctors who asked how to report vaccine injuries and were ordered not to report or stay silent or to report the symptoms as something else other than a vaccine injury?

Do I talk about pilots, already isolated from their peers, who were denied attending the funeral of a close colleague after his suicide even though the funeral home had no restrictions in place?

Do I talk about members who have given 20, 25, 30, 35 years of their life to the Canadian Armed Forces and were denied a depart with dignity ceremony like their peers?

Do I talk about the commanding officer whose staff were told to leave a room if he entered it, thereby handcuffing his ability to lead?

And finally, do I talk about the vindictive postings now being handed out as punishment for those who somehow managed to avoid the purge?

[00:20:00]

The list goes on and their voices have been silenced until today. Canada needs to know that the men and women of the Canadian Armed Forces did not let Canada down. All they wanted was to serve in order to protect the freedom and rights the Canadians hold dear, and their predecessors fought for, in the past.

The blame lies in the current leadership of the Canadian Armed Forces, the Chief of Defence Staff, the Surgeon General, the Chaplain General, and the Judge Advocate General, who determined there was nothing wrong with offering the Canadian military up to a medical experiment with no value to operational readiness, and with a cost the members have only started to pay.

The members affected by the mandate tried to use the processes open to them. They have filed thousands of grievances that will all end up on the desk of the Chief of Defence Staff as the final authority. What are the chances of fairness when the one giving the order is the one who decides if it was reasonable or not?

The Ombudsman's office, which has no power to hold the chain-of-command to account, has refused to even speak to anyone concerning the mandate. There is a covenant between the chain-of-command and the members of the Canadian Armed Forces that those in command will look out for the well-being of those who serve under them. That if ordered to surrender their life, the member does so knowing that it was a just cause for the sacrifice. It is the foundation of trust necessary in any chain-of-command.

That trust is gone in the Canadian Armed Forces due to the actions of the senior leadership in reaction to COVID-19. When that trust is gone, there is no military. Canada sits defenceless. I can tell you about what has happened. I can relay their stories. But you should meet some of Canada's best, who are subject to the draconian political agenda of the Chief of Defence Staff.

I have a video that will introduce some of these who have stood up to the unlawful order and paid a heavy price. There are some images you will note are blurred to protect those still serving from a guaranteed retaliation, because there is no safe place for unvaccinated members within the ranks of the Canadian Armed Forces under the command of General **Wayne Eyre**.

[Video] General Wayne Eyre [Exhibit number unavailable]

At the heart of everything we do is our people. You are key to our operational effectiveness, and if we are to succeed as an organization, to be the Military Canada needs and deserves, every member of the Canadian Armed Forces and broader Defence Team must feel welcomed, supported, empowered and inspired to bring their very best to the table each and every day.

Catherine Christensen

You have just heard the Chief of Defence Staff, General Wayne Eyre, stating that the Canadian Armed Forces are inclusive and progressive. Yet when members stood up for their religious rights, medical rights, and human rights, they were met with fury and derision from the chain-of-command.

[Video] General Wayne Eyre

So I'm not going to talk specifics about this one case. What I will tell you, we have absolutely no time for those that do not hold the values of the Army and the Canadian Armed Forces and the values of Canada close to their heart. So the values of diversity, inclusion, respect for others, teamwork, that's who Canada is. That's who we are protecting. And those that do not embrace those values, those that do not protect those values have no place in this organization. So when we find out that there is a case, we act decisively. We don't act rashly because another one of our values is respect for the rule of law, and due process is part of that.

Catherine Christensen

In October of 2021, the Canadian Armed Forces brought in compulsory COVID-19 injections. What followed was chaos, uncountable losses, and the decimation of what little morale there had been in the ranks. Despised by their own leadership, after exemplary careers voluntarily serving Canada, they have taken a stand and paid the price. Let me introduce you to the men and women the Chief of Defence Staff says are unsuitable for further service in the Canadian Armed Forces, the ones whose moral code said "no" to an unlawful order and continue to step up a fight for a free Canada.

Canadian Armed Forces member testimony read by Catherine Christensen

My choice was taken away from me. I did not want to leave. I gave everything to the Military and made it my life and they threw me away like I was nothing when I gave everything.

[00:25:00]

I just had to get my second shot.

I feel abused and violated. I hope you can use me as an example of what they still do to people who complied. It doesn't stop the hatred.

Canadian Armed Forces member testimony read by Catherine Christensen

My ECG [Electrocardiogram] looked normal, but I insisted on a cardiac MRI [Magnetic Resonance Imaging], which was able to confirm the myocarditis.

Canadian Armed Forces member testimony read by Catherine Christensen

I was in an explosion at Comox and two days later, they were disciplining me for the COVID mandate. They didn't care that I had a fresh traumatic brain injury, and that I was still trying to comprehend what had happened.

Canadian Armed Forces member testimony read by Catherine Christensen

There are men in uniform downstairs demanding I sign papers. My family is terrified. What do I do?

Canadian Armed Forces member testimony read by Catherine Christensen

This upcoming meeting with the Lieutenant Colonel feels really threatening to me. Is there anything I need to be worried about or prepared for? I was terrified for my safety yesterday.

[00:30:00]

Canadian Armed Forces member testimony read by Catherine Christensen

What I see more, are people who walk on eggshells who seem like they regret. They followed an order in haste and now feel the consequences of a broken trust.

Catherine Christensen

I have asked military members and veterans what they would do to repair the damage in the Canadian Armed Forces. I received pages of ideas from non-commissioned members and officer ranks: really productive, positive ideas because there was no fear of consequences for speaking up. It is unfortunate that there is so little faith and trust in their own chain-of-command that the Chief of Defence Staff cannot do the same. For the purposes of this inquiry, here are their top changes.

Bring in an Office of the Inspector General. Grievances and remedial measures move to this office outside of the chain-of-command, which has shown their willingness to abuse authority during COVID-19. Set up explicit and hard timelines for each stage of the grievance process with penalties for chains of command that do not adhere to them. Currently, as a note, it can take anywhere from four to ten years for a grievance system to get a final decision before we can have it sent for judicial review.

The Inspector General would have the power to investigate and lay charges of any rank, including the Chief of Defence Staff. The Inspector General's authority over the Chief of Defence Staff would remain if there was proven wrongdoing. This precedent has already been set with the revamping of the current military justice system.

The second suggestion is to strengthen whistleblower legislation. Under the Canadian Armed Forces disclosure process, the Chief of Defence Staff has designated the Chief Review Services as the proper authority for purposes under the Queen's Regulations and Orders. But who is the proper authority if the Chief of Defence Staff is the one behind the wrongdoing?

Third: Comprehensive health care for all Canadian Armed Forces members regardless of the component or subcomponent and class of service for life, with the ability to have full access to outside specialists for the care of vaccine injury.

Number four: The members I've spoken to want an apology. They want an apology from the Government of Canada. They want an apology from the Chief of Defence Staff. They want one from the Surgeon General, Chaplain General, the Judge Advocate General, and every commanding officer, and regimental sergeant major who pushed the mandate.

Fifth: Mandatory injury or illness reporting, tracking, and investigation with explicit timelines, with serious penalties for chains of command that neglect the required steps.

Sixth: Mandatory training for all commanding officers prior to assuming command. They should be able to review and test policy knowledge from the *National Defence Act* through all of the necessary policy, various administrative and health services instructions. They

should have instruction on procedural fairness, they should have instruction on safety and risk management, and there should be a transparency of directions and commands.

[00:35:00]

Back-channel orders shall be deemed to be unlawful. For example, accommodations were supposedly offered, but in reality, they were denying them all.

Seven: Review the *National Defence Act* and remove section 126. It's too vague and not used when it should be. It is bad law. Canadian Armed Forces members and Veterans should not have to sue to have bad law removed.

Eight: Revise the Chaplain Service. Chaplain Service badly failed members of faith. Each religion should answer to its own while respecting the long-standing duty to help all members as best they can be achieved under emergency or battlefield circumstances.

Nine: Implement a robust safety officer cadre at every level within the Canadian Armed Forces.

In conclusion, to paraphrase Robert Kennedy Jr., "Why do I choose to fight for those nobody else wants to?" Because that's who needs fighting for—the members and veterans of the Canadian Armed Forces who love what they did in service to Canada—deserve no less than to be heard. Thank you. This concludes my presentation. I'm now prepared to take questions.

Leighton Grey

Thank you, Ms. Christensen. That is a shocking and compelling and simultaneously heart-wrenching and heart-warming presentation. I thank you for providing that. I understand that you're prepared to have your presentation and the other exhibits entered in this proceeding?

Catherine Christensen

Yes.

Leighton Grey

Thank you for that. I have one arising question before I hand you over to the panel, I'm sure are eager to ask you some questions. I have the pleasure of representing many Canadians who, although not in the armed forces, were subjected to vaccine mandates through the operation of federal orders. And of course, they have this in common with the members whom you represent.

It was very clear in that case that there was a directing mind in Ottawa behind, for example, the Minister of Transport order, which required everyone who is in the public service in those industries to be vaccinated. You mentioned at the outset of your presentation this historical, and legal, and, indeed, constitutional line of distinction between the Prime Minister and his cabinet and direction of the Armed Forces. However, based upon what you've learned, based upon what we've seen in your presentation, do you have reason to believe, to suspect, or indeed to conclude that there is a political direct in mind? In other words, that this vaccine mandate is actually coming from the same source as, for example,

the Ministry of Transport order or the other federal such orders directing other people in the public service, the Federal Public Service to be vaccinated?

Catherine Christensen

Yes, I do. I have no doubt in my mind that this came from the Prime Minister's office. Part of the evidence or the support to that belief is that we seem to have a real trend where General Vance was Chief of Defence Staff when vaccines first emerged. He didn't bring in a mandate, and as you recall, he was removed under the cloud of a sexual misconduct allegation.

Admiral McDonald then took his place. Within a few weeks, he was under a cloud of suspicion for sexual misconduct—because I've seen his briefing note, and it clearly states that he could not bring in a mandate.

General Fortin was in charge of vaccine rollout in Canada. I suspect that he also said you couldn't bring out a mandate, which through the sworn testimony from the Peckford hearings, the Prime Minister's office was clear that this was coming from the Prime Minister, who was angry at being heckled and demanded that a mandate be brought in. That's sworn testimony from his Office. So then we get General Fortin accused of sexual misconduct.

We then have General Eyre come in as Acting CDS [Chief of Defence Staff] at the time. He is given a briefing note from General Cadieux that you can't do this, basically, and General Cadieux is then accused of sexual misconduct.

There's a real pattern there. And then he brings in the vaccine mandate; he goes from being Acting Chief of Defence Staff to full Chief of Defence Staff and gets a promotion that I see as a reward for being obedient to higher powers.

[00:40:00]

Leighton Grey

So that answer sort of flies in the face of what the Prime Minister said publicly yesterday, that he never forced anyone to be vaccinated.

Catherine Christensen

Yeah, well, then he shouldn't have had his office provide emails in sworn affidavits to Mr. Wilson, who represented Brian Peckford and parties in that lawsuit, because that is filed evidence with the federal court that indeed, it was a direction from the Prime Minister's office, and then they were struggling to justify bringing in a mandate.

Leighton Grey

Thank you, before I hand you over to the panel, the last thing I'm going to do is I want to share a quotation that was part of your presentation to the panel from our late Majesty Queen Elizabeth II, who said that "No institution should expect to be free from the scrutiny of those who give it their loyalty and support, not to mention those who don't."

Thank you. So I'll hand you now over to the panel, I'm sure they have questions, who would like to go first? Go ahead.

Commissioner Massie

Well, thank you for your testimony. And I must say I'm not very familiar with all of the administration of the army and so on. So I got a little confused about who's in charge in the end because you mentioned that it's not the Prime Minister— What I understand from the States is the President is the Chief of the Army, so he can call—

Catherine Christensen

Mm-hmm.

Commissioner Massie

He can send the order. In our system, it's not the Prime Minister, it's the Governor or the King or the Queen. But in reality, if I understand how it would work based on incentive, the army gets the budget from the government, right?

Catherine Christensen

Yes.

Commissioner Massie

So there is a potential at least to incentivize people in the chain-of-command to follow what the government seems to want.

Catherine Christensen

Correct. By the time you're getting to the level of that senior command where you've got Chief of Defence Staff, Commander of the Army, Commander of the Navy, and Commander of the Air Force, we're talking about politicians at that level. They may wear a uniform but they're politicians, and the Department of National Defence does have influence with the politicians that these officers are. And so I suspect that there are lots of meetings that go on between either the Assistant Deputy Minister or the Minister herself between these senior levels. And whether they comply or not is kind of up to them because the Commander in Chief of the Canadian Armed Forces ultimately is the King.

Commissioner Massie

So it's independent from the government to some extent.

Catherine Christensen

Yes, and this is why public service mandates or any kind of public service policies are not applicable to the Canadian Armed Forces. Members of the Canadian Armed Forces do not actually have what we would understand to be a contract of employment with the government. They serve at the grace of His Majesty the King, which is why they are actually completely independent, and they have a completely different applicable legal system that applies to them as well as the general legal system for a Canadian citizen. So they've got two systems working from a legal perspective.

Commissioner Massie

So are you aware of other situations in history where vaccines were mandated for the military forces?

Catherine Christensen

So they did bring in, when it was still, what they were told was voluntary— The only vaccine they were giving them was Moderna.

Commissioner Massie

I'm talking about previous vaccine.

Catherine Christensen

Previous vaccine? Yes. So under section 126 of the *National Defence Act*, they can indeed order the members to have a vaccine, the caveat being that if they do not take the vaccine and they have a reason not to take it, they would be charged under section 126. They would go to court martial and then an independent decision maker, a judge, would then decide if they had a reasonable excuse not to take the vaccine. This time, they didn't use section 126. I believe they didn't do it because I don't think that someone with a sincere religious belief that wanted an accommodation, I think they would have been successful challenging that in a courtroom, and they couldn't risk having success in a courtroom turning down their mandate. So instead they circumvented that whole court martial legal system of failing to— They quoted, chains the command have said to people "You're not following a lawful order."

[00:45:00]

But a directive is not an order. And how I best explain this is an order is "take that hill"; a directive is "this is how we're going to take the hill". So in a sense, they were never ordered to have a mandate, even though that's how the chain-of-command interpreted that directive, that this is an order, and you must follow. That's to be determined in a court.

Commissioner Massie

There was no coercion per se, only incentive?

Catherine Christensen

Well, I would like to say that there was no coercion, but there was coercion, definitely.

Commissioner Massie

My other question has to do— We've heard from other experts in the commission that it's very difficult to assess the actual level of vaccine injury in the population because the system doesn't seem to be able to do a proper monitoring. There's all kinds of obstacles. I guess that in the Armed Forces they must have had a reasonably good medical system in place that would track the health of the people. So they gathered data that would allow to follow untypical issues with the health that could actually eventually be linked to a vaccine injury.

Catherine Christensen

You would like to think that. First of all, the medical system is another system that needs revision in the Canadian Armed Forces. However, I have military doctors who provide sworn evidence that they were told not to report vaccine injuries, or if they asked how, they were told, "just be quiet." They were told to diagnose them as other things, such as Guillain-Barré syndrome. When young men were collapsing in the shower after injections: "Oh, you've got Guillain-Barré syndrome, we'll release you on a medical release," if they were vaccine-injured.

It would have been an ideal group, and I think they did not track them on purpose, because they would have very quickly shown what was happening to an eighteen to forty-five group that were the most affected by vaccine injuries. That showed up really quickly.

The official statistics right now being issued for vaccine injuries in the Canadian Armed Forces, I can tell you I have more people in my files with vaccine injuries than are officially listed as vaccine-injured. The other thing I can tell you is that the best comparison I can make is to the population of the United States military. They seem to have had more recording of vaccine injuries. There was a base surgeon in Alabama who completely grounded all of her pilots because they were dropping dead in the sky from being vaccinated.

Commissioner Massie

So are we aware of any instances in the Armed Forces where people were actually killed by the virus following vaccination?

Catherine Christensen

I'm waiting for some of that information. I know of healthy young men who died in their sleep, but they are not releasing the autopsy results.

Commissioner Massie

So is there a chance with the current level of data gathering that we could actually in the future investigate what happened and find out exactly what was the extent of the issues?

Catherine Christensen

I believe so. Only in the last few weeks have I gotten someone to have doctors confirm that they were even vaccine-injured and put that in writing, who is a member of the Armed Forces. That was the first time in three years.

Commissioner Massie

Do you think that the level of vaccine injury in the Armed Forces was similar to the general population, more, less?

Catherine Christensen

I think it was more because of the age group that we're dealing with, of Canadian Armed Forces, that the vaccine injuries are high in that age group.

Commissioner Massie

Thank you.

Commissioner Drysdale

Good morning and thank you for your testimony. Over the course of the committee hearings, one of the themes that I've been hearing over and over and over again is that the fundamental tenets, the fundamental beliefs of our society have been attacked, and I'll give you some examples from previous witnesses.

In the medical profession, we seem to have abandoned the tenet of informed consent. In other words, they didn't tell their patients prior to having them take an injection what the consequences might be. Also in the medical profession, the sanctity of the doctor-patient relationship has been attacked because the Government has stepped between the two,

[00:50:00]

and the doctors are no longer able to, or directed not to, report injuries, to discuss honestly with their patients what their side effects were.

We see the same thing in our justice system where the equality, in my understanding the very basic understanding in our justice system is that there's equality under the law. So in other words, whether you're Ken Drysdale or the government, you have equal standing before the courts, and they're supposed to rule equally.

Now what I think you've described here is also a basic attack on the fundamental footings of our military, and that is that the members must trust the commanding officers because if you have mistrust between the members and the commanding officers, why would they follow an order? Can you comment on that or other observations with regard to the fundamental tenets in our society that you may have seen?

Catherine Christensen

Yeah, I absolutely agree with you that once that trust is broken, you can't have a military. Because what I'm hearing from the ranks is that, "We don't trust them anymore. They weren't looking out for us, they didn't stand up for us when they should have."

And even the ones who tried to protect members as best they could, didn't in the end. And there was an encouragement to humiliate, abuse people who didn't necessarily want to comply. And then at the same time, we get Directive 3 comes out last fall. And anyone who didn't manage to be released under the first directives was told to come back to work. And **if I told you that they entered unfriendly territory by not having the vaccine but still being allowed to come back to work, there was a lot of resentment there.**

Because there were so many members of the Canadian Armed Forces who opted to take the vaccine because they needed their job or they were close to a pension. Or they couldn't get promoted, they couldn't deploy. So now those people who complied have even less trust in the chain-of-command because why should they— "Now why should I follow an order? Because now they've allowed people to come back who you say didn't follow an order." It's a mess. When I say chaos, I mean there was chaos.

On the informed consent issue, that is a near and dear issue to my heart, having been a registered nurse for 22 years before I went to law school. I have dealt with angry surgeons

being called out to redo teaching with a patient before they would sign a consent for surgery because the patient told me they didn't quite know what was going on. And when I went to law school, I did independent legal research in informed consent. So I can tell you that there is no such thing as informed consent in this entire COVID-19 episode. There is not a single definition, legal, medical, moral, otherwise, that said anybody truly had informed consent.

And I think the more and more documentation that's being revealed by the pharmaceutical companies reinforces that they knew things that they didn't tell people. The general consensus for me is, as a lawyer I was horrified by what happened during the COVID-19 years. I was always taught that bodily autonomy was sacrosanct—as was described this morning—that people had the right to say that they wouldn't do anything medically unless they wanted to, that they had a right to be fully informed of what was happening. And there was none of that. We did lose our rights.

And my own profession of law, which is supposed to be the ones that stand up and say, "Hold on a minute. We have a constitution. You cannot do this." I know when I tried for an injunction that I was beating my head against the wall, we were basically told, "Well go use the grievance process." Sure, we'll use the grievance process. And in 10 years, when the Chief of Defence Staff who made the order decides that he made a good order, then we can go to the court.

[00:55:00]

But the other thing was that the stories that I heard from members who approached me in October 2021 had actually gone to some other lawyers, a few of them. They were told, "Don't call my office again. Don't come near my office." They wanted nothing to do with them. And as a lawyer I can tell you that there are cases that I may not want to take. And there are diplomatic ways of saying you're not going to take the case: I don't practice that kind of law. My practice is too busy. You don't have to turn people away in a way that makes them sound like they're criminals or lesser citizens. So I was highly offended for my own profession that that was the response people were getting.

They were asking fair questions. They were asking for legal advice. Whether you gave them positive or negative advice isn't the point. The point is you won't even talk to these people. You won't even let them in your office. Yeah, so I was very disappointed in my own profession for turning people away who wanted to challenge it.

Our American friends are much better at challenging their government. They've had about 200 years more practice, and they just keep challenging. Even when things go wrong in the court, they just bring another case. And they just keep going.

And I think Canadian lawyers need to wake up and start sticking up for this Constitution. I took constitutional law for a year. I never imagined I was going to have to use constitutional law in what I was doing. But thank goodness I did. And I had a great professor because all of a sudden, all those cases and the concepts of our Constitution are very, very important.

Commissioner Drysdale

If I understand you and your testimony earlier, you said that the Canadian Armed Forces brought in the mandates in October was it, of 2021?

Catherine Christensen

Yes.

Commissioner Drysdale

So that's two years ago. Do you have any idea how many members have either quit, been thrown out, retired early, or in any other way been removed from operational ranks?

Catherine Christensen

I can tell you my best guess, just from how many have talked to me or I've heard through the grapevine— There's a very good chain of communication in the Armed Forces and veterans community. I would estimate anywhere between three thousand and five thousand people were lost, and when you've got a military as small as ours, we're talking a huge hit. If you were a business and you lost ten to fifteen per cent of your people in one fell swoop, you'd be out of business and truthfully, in my opinion, the Canadian military right now is out of business. We couldn't mount a defence of our own country, let alone send people to NATO-involved [North Atlantic Treaty Organization] conflict right now.

Commissioner Drysdale

Well, I want to try to put that in perspective from my own understanding. So you believe that the numbers were somewhere between three and four thousand members, which is about 10 per cent of the operational force. Do you have any idea how many people we lost out of operational readiness when we participated in the Afghanistan war for 20 years?

Catherine Christensen

I believe it was 53 deaths in Afghanistan.

Commissioner Drysdale

So let me understand that. So after 20 years or so of military operations in Afghanistan against an identified foreign enemy, we lost 60 or so, 57 people in 20 years. And then we self-inflicted three to four thousand essentially operational casualties to our military ourselves.

Catherine Christensen

Yes. Yeah, we decimated our military with this. We are already undermanned badly. We should have close to a 100 thousand regular force and reserve force people. That's about the size of the military that Canada says that it needs. And from speaking to sources, we're down to about 40 thousand people right now.

Commissioner Drysdale

So our self-inflicted damage to our Canadian Armed Forces was more than Afghanistan.

Catherine Christensen

Way more: thousands more.

Commissioner Drysdale

I can't imagine you know this answer: How far back in our military past do we have to go before we find a comparable hit on our Canadian Armed Forces operational personnel?

Catherine Christensen

At a guess, World War II.

[01:00:00]

Commissioner Drysdale

What civilian or judicial overview is there of these command decisions?

Catherine Christensen

Well, we can go into the Federal Court and challenge— Sometimes we can do what's called a judicial review, or we can actually bring a claim. Interestingly enough, I was in Federal Court in February, not on a matter related to the vaccine mandate, but I had the Crown stand up and say to the Justice, "In Military matters, the court has no jurisdiction over the Chief of Defence Staff." The look on the Justice's face was priceless to me because our rule of law, which you heard the Chief of Defence Staff saying he follows the rule of law, means no one is outside the law. Certainly, even our King is under rule of law, and for the Crown to have this position that anything the Chief of Defence Staff is—he doesn't have to answer to our courts for—is something that I look forward to challenging.

Commissioner Drysdale

Can you make a brief comment about the availability of justice to the regular Canadian when it comes to these organizations? And I want to talk a little bit about or I'm going to preface that with, I read a report recently that the RCMP [Royal Canadian Mounted Police] were involved in an action, I think it was over 10 years ago, and that the commission investigating it finally came out with recommendations and essentially, the RCMP said "nope" to all of the recommendations.

And when I look at the civil courts in Canada, for instance, if your employer forced a mandate on an individual, the ability for that individual to access justice is almost impossible given the financial realities and the time periods. Have you got any suggestions for us on that?

Catherine Christensen

Well, the access to justice issue is huge, and especially if you're going to take on the Government of Canada, because one of their favourite strategies is to run you out of money. Over the years, because my practice has been military and veteran, I have seen things that are very concerning about the Canadian Armed Forces, but usually it was one or two people. And when it's one or two people, it can be written off as bad apples or people with issues.

But when I had hundreds of people come to me in October 2021 with this going on that was like wait a minute, they've got to pay attention now. And I happened to have listened to an American lawyer who did constitutional and government challenges all the time. And I had written to him and said, "How do you fund this? Like how do you constantly take on the

government and being able to have the staff and the people that you need to do it?" And he said, "Non-profit."

And this is why I created Valour Legal Action Centre, and we run on donations, and this is so that these people can bring these challenges forward because there's a long road to go.

Holding another commission, we've had a commission on the sexual misconduct issue. We've had a commission on the grievance system; it's four inches thick. I believe it was in my brief with four hundred and some pages Justice Fish did, said the grievance system is completely broken.

I honestly think that we need to use the American model of an Inspector General that goes outside of the chain-of-command and allows for more answers from people. And it would also allow challenges to some of these commands or some of these policies without requiring people to come up with half a million dollars to challenge the government.

Commissioner Drysdale

My last question: There's a popular saying that an army runs on its stomach. I don't believe that.

Catherine Christensen

Well, this Army doesn't because apparently, they're not feeding their troops.

Commissioner Drysdale

Well, what I believe is that, in my experience, and I've had fairly extensive experience with the Canadian Armed Forces, the Canadian Armed Forces runs on honour. It runs on a belief in the higher purpose, and it runs on the trust in the chain-of-command. We've talked— You and I have talked together about the 3,000 to 4,000 essentially casualties from the Canadian Armed Forces due to these mandates. Can you talk a little bit about the effect that these mandates have had on these basic fundamentals of honour, higher purpose,

[01:05:00]

and trust in command?

Catherine Christensen

I agree with you on the honour, and this is why I did say that I would trust my life with any one of these people. I know I'm sitting here with a big green wall behind me of people who are so happy that we're able to talk about this.

Without question, we lost the cream of the crop of the Canadian Armed Forces with this mandate. These were the people who are willing to stand up and say, "This is not a lawful order. You cannot do this and I'm not going to follow this order."

We used to have in the military what was called a strategic corporal, and Canada is well known and throughout the world for having the people on the ground who could think for themselves and think ways out of situations, and quite often with a good outcome. The Americans can tend to have a reputation for "shoot first and ask questions later." Our

military did not have that reputation. They could be in a firefight with a group one minute and the next minute act as peacekeepers and move on.

There was a reason the people of Afghanistan didn't want the Canadians to leave: because the reputation of our troops. So I would say morale was already bad. I already knew from talking to so many people because I only do military, so I get lots of information from all kinds of sources all the time. I already knew morale was bad and then this happened, and it's pretty much destroyed.

It almost is to the point where we need to start over because people don't trust orders anymore. People see the command as being against them. Like, "If I step out of line, I'm going to be gone." And the fact that they chose to use what's called a 5F, I've referred to that. That's a release category that was only made honourable not so long ago. There were lots of people serving that remember 5F as a dishonourable discharge. It has implications. You can't have a job in the public service if you've been released 5F. If you decide you want to go back in you can't get in unless the Chief of Defence Staff allows you in if you've had a 5F.

What are the chances Wayne Eyre's going to let people who were 5F back in? It's not going to happen. So the fact that they chose that one, when they could have chosen a medical release, or didn't fit the requirements of service because you weren't vaccinated, completely different categories, completely different connotations to it. And there were people who "voluntarily" released to avoid that 5F stigma that was going to be handed down to them.

Commissioner Drysdale

Thank you very much.

Catherine Christensen

You're welcome.

Commissioner Kaikkonen

Good morning.

Catherine Christensen

Good morning.

Commissioner Kaikkonen

When you refer to the fairness among federal institutions, are you aware of any examples whereby a Veterans Affairs employee coming to the end of their career lost their personal pension because of a personal and autonomous decision to be vaxxed?

Catherine Christensen

So do I know of anyone, a veteran who lost—

Commissioner Kaikkonen
A Veterans Affairs employee.

Catherine Christensen

No, I'm not aware of anyone in Veterans Affairs. In fact, it's looking like— Because Veterans Affairs is refusing to cover vaccine injury as a service-related injury, that has to then go through a system of the veteran applies, they're denied, it goes to an appeal, and if that's denied, then they can come to me. And within two years, we can bring it to the Federal Court for judicial review.

The reality is that the judicial reviews tend to go in the government's favour, but in my opinion, if they took Moderna as ordered, that's a service-related injury and there should be no question that they're covered for life, for any medical care that they need.

Commissioner Kaikkonen

And my second question, it is my understanding that both religious and medical accommodation are tenets of our democracy. So given your testimony and testimony of others prior to you, where do we stand now? Or is this just another example of the duty to accommodate being trampled by our federal government, in the Charter?

Catherine Christensen

I believe the duty to accommodate was trampled. Certainly, the case law coming out of the Supreme Court of Canada was completely ignored about accommodations.

[01:10:00]

There has been some suggestion that anyone with the rank of colonel and above was allowed an accommodation.

The public service employees had high percentages of accommodations granted. There are hardly any accommodations in the Canadian Armed Forces. In fact, it was rare, and it usually happened within those first few weeks of the mandate coming in, and then they were done.

I have lots of people who, in sworn affidavits, will say that their chaplains said, "Yes, their religion was sincere, they were sincere in their belief and should be accommodated," only to be turned down by the chain-of-command and said, "No, we're not going to accommodate you." That happened to a Catholic priest who was a chaplain. He was told his belief wasn't sincere enough to get a religious accommodation. Now if a chaplain who is a priest who is in uniform isn't an example of someone with sincere religious belief, nobody was going to get an accommodation, in that case.

Commissioner Kaikkonen

And my final question has to do with educating the public on the responsibilities and duties of the head of state. So as I understand it, the King, soon-to-be King, has the right to dissolve Parliament and to dismiss the PM [Prime Minister].

But how can this be done when the Governor General, for example, is appointed by the PM, albeit I believe through a nomination process, but ultimately the final decision rests with the PM? How do we change that?

Catherine Christensen

That's a good question. Honestly, our Governor General does need to become more politically independent because they are the last result of the legislative branch because laws don't become laws in Canada until the Governor General signs on behalf of the King.

To show how politicized that office has become: when one Governor General was dismissed rather quickly because she had abused her staff, the temporary Governor General they brought in was the Chief Justice of the Supreme Court. So for several months, Canada had the Chief Justice of the Supreme Court of Canada in charge of our judicial branch was also in charge of our legislative branch, and nobody said anything. And I'm going "What? This can't happen. How did this happen?" But it was a political appointment obviously.

So do I think our judicial branch also needs revamping? Yes. I do agree that we don't have a justice system. We have a legal system, and it does need to be held to account. I was very pleased to hear the justice of Manitoba saying that he was disappointed in his fellows of the judiciary that did not step up and say, "Hold on, we don't follow judicial notice just because the Government says it was true."

So that's a good question. How do we remove the Governor General's position from being political? Do we have a King that could do that? I don't know, because he has the power to refuse the recommendation for who's going to be Governor General and say, "No, that person cannot be Governor General, it's going to be this person." I mean, at one time, the monarch would usually have a son-in-law or a son would be appointed Governor General rather than a political suggestion.

Commissioner Kaikkonen

Thank you very much.

Catherine Christensen

You're welcome.

Commissioner DiGregorio

Good morning and thank you so much for being here today. I've heard both yourself and Mr. Grey earlier this morning, speak about this rule where service members are unable to criticize the chain-of-command or the armed services. And I'm just wondering, what's the source of that rule, what are your thoughts on that, and whether you have any recommendations on whether there need to be any particular exceptions to it or whether it is a good rule to have in place.

Catherine Christensen

Do I think it's a good rule? No, because I think it's been abused. This is where the suggestion came from to improve whistleblower legislation. I think that would help people feel protected to bring forward issues that should be brought forward. The problem is, if the issues brought forward is anyone going to do anything about it? Because that's a

chronic problem and not just in the Military. But it is part of their Code of Service discipline, *National Defence Act*, where you cannot, as a serving member, speak out against the Government,

[01:15:00]

or the Canadian Armed Forces themselves.

I have had someone who is a client of mine, posted an interview that I did without comment, good or bad, on a social media site. And they threatened to charge him with a service offence for speaking negatively about the Canadian Armed Forces, even though the opinion was mine, and he didn't say good or bad about it.

That's the vindictiveness that is in the chain-of-command right now to come after people. I'm sure they'll be watching to see if anyone posts my testimony today as part of that I would call a witch-hunt.

Commissioner DiGregorio

Is it applicable only when they are members of the service? What about after they've been discharged?

Catherine Christensen

When they're a veteran, they are allowed to speak out, and you're getting more and more veterans speaking out. Certainly, Veterans for Freedom is becoming more vocal since the Convoy and starting to voice opinions, so that's hopeful as well.

The challenge can be that if they don't know what's currently going on, if they happen to lose touch with people who are serving. But the other reality is that right now, the only chance they have of challenging anything is to hire lawyers, and lawyers are expensive. Trying to challenge something in a court is an expensive enterprise. Even if the lawyers do it pro bono there's still a lot of costs involved. If it wasn't policy that was closing their mouths, cost would be a factor as well.

Commissioner DiGregorio

Thank you.

Leighton Grey

Listen, I want to thank you for your passionate advocacy on behalf of members of our Canadian military. As a colleague I have to say I share your lament about the lack of response from members of our profession, but I know they're very grateful, all of them who've heard this, not the least of whom is a very distinguished retired colonel who's here today, and he's going to testify later in this proceeding. Thank you very much for your testimony.

Catherine Christensen

Thank you for giving me the opportunity and thank you from the members and veterans that are silently all standing behind me.

[01:17:45]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 3: Daniel Bulford

Full Day 1 Timestamp: 03:36:35–04:46:17

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry in Red Deer. I'm pleased to announce our next witness who is going to be attending with us virtually, former RCMP [Royal Canadian Mounted Police] Corporal Danny Bulford. Danny, can you hear us? So I'll ask again Danny, if you can hear us, and we can't hear you yet, so we'll work out that technical difficulty.

Daniel Bulford

I can hear you perfectly. Can you hear me?

Shawn Buckley

We can hear you now, so we'll commence. I'll ask if you can start by stating your full name for the record spelling your first and last name.

Daniel Bulford

Daniel Joseph Bulford, D-A-N-I-E-L B-U-L-F-O-R-D.

Shawn Buckley

And Danny, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Daniel Bulford

I do.

Shawn Buckley

Now, I've already indicated that you are a former RCMP corporal. My understanding is that you worked for the RCMP for 15 years and that your last eight years of that was on Emergency Services Support Team protecting the Prime Minister of Canada.

Daniel Bulford

Yes, that's correct.

Shawn Buckley

Now, you're here today to share some of your experience as an RCMP officer and to voice some opinions that you have concerning the RCMP and the police, and so I'm just going to perhaps start by asking you whether your trust in that institution changed and if you can share your experience with us.

Daniel Bulford

Yeah, definitely. Throughout the course of my career, it was a progression: you know, very proud to receive my Red Serge and my badge, get out into the field, work on detachment as a general duty officer. You quickly learn, and it's common knowledge within the force, that you'll quite often hear the expression that you're just a number. Senior management doesn't really care about you.

But the colleagues, your brothers and sisters that you're going to calls with, and you're doing the job with, that's who's supposed to have your back, and that's who you go to work for, and that's, you know, for the public and for your fellow colleagues. And it's just kind of accepted that if you get into any kind of trouble, even if you do exactly what you were trained to do, if there's an opportunity for a political win for senior managers, they're happy to sacrifice a member, even if the member did nothing wrong.

And so over time, I lost a great deal of trust in our senior managers. I was fortunate to have some good leaders throughout my career. And then, of course, with the implementation of COVID mandates, and then my departure from the RCMP for opposing those mandates, and then what I saw during the Freedom Convoy, and COVID enforcement, and then the testimony from our commissioner for the Mass Shooting Commission in Nova Scotia, and then her testimony for the Public Order Emergency Commission regarding the *Emergencies Act*— Unfortunate to say that I have very little, if any, trust in the Royal Canadian Mounted Police.

I know there are good members that are still in the organization that joined for the right reasons, that want to be there to do good work, but at the senior management level I don't have any trust that they will apply the law equally to everyone in Canada.

Shawn Buckley

Okay now, just pulling you back. So early in 2021, so the vaccine is being rolled out. It's in short supply so different groups are being prioritized. My understanding is you were actually a little surprised when your unit became eligible for the vaccine. Now can you share with us what your thoughts were about the upcoming vaccine rollout and then kind of the journey you took and how your thoughts changed.

Daniel Bulford

Yeah, so for most of 2020 I wasn't really questioning anything. If I wasn't at work, I was spending my time on our own home construction project,

[00:05:00]

and I had stopped paying close attention to mainstream media years previous. I had my trusted sources regarding COVID information, a big one being the DarkHorse Podcast hosted by Dr. Bret Weinstein and his wife, Dr. Heather Heying. They're both evolutionary biologists in the United States, so they were kind of my go-to for credible information regarding COVID-19. My wife started to express some concerns to me about the new technology, specifically the mRNA [Messenger Ribonucleic Acid], and I hadn't given it a whole lot of thought.

But then early 2021, my team was organized for a mass group of police and other first responders to go and receive kind of like a mass group inoculation session, and we were expected to just show up and get it done. And so I asked my supervisor at the time if it was mandatory. And at that time, he said, "No, but maybe in the future. And so I just made the decision at that time, to pause and wait until I could find out more about it, based on some concerns I'd heard from Bret Weinstein and from my wife.

Shawn Buckley

And then you started into an investigation just to—

Daniel Bulford

I did and I was I was definitely surprised that my team, or our unit, was selected to kind of get priority access because we were not a high-risk category. By that time, we knew very well who was vulnerable and who wasn't. And we were probably one of the lowest risk categories next to young healthy children in my team. Because we're all strong, fit, healthy men in our 30s and 40s—very low risk—, and so I was surprised. I thought, "That's odd. Why would they prioritize us when, you know, we're supposed to be the people who are willing to take risks so that other people can be safe first?"

Some of the rationale was given that if we were providing protection to the Prime Minister and other VIPs [Very Important People], we wouldn't want to be a risk to them. I also thought that was strange because it had been public knowledge already that COVID-19 had gone through his household, and also in the role that I was performing I was never in tight close to him. I was either a few vehicles behind him in his motorcade or I was up on a rooftop somewhere working with one other person.

But yeah, so essentially that was a little bit of a, not a major red flag, but a little bit of a twinge in my mind, like that doesn't make any sense to me. So then anyways after I made the decision to hold off, I started my own open-source investigation. I wanted to give it a fair, objective analysis, or as fair as I could.

I went to the official government websites first, specifically Health Canada, and then I even tried to get whatever I could from the FDA [Food and Drug Administration] and from the CDC [Centers for Disease Control and Prevention]. I found that it was very lacking in any kind of specific information that would satisfy my questions about safety and efficacy. The only thing I could really find was like a product monograph which really, I wasn't able to decipher, it's outside of my wheelhouse.

But what I did notice was just the consistent themes of repeated talking points, like general vague statements like “safe and effective,” “benefits outweigh the risks,” and cartoonish graphics, which I kind of found a little bit insulting to an adult’s intelligence, but moving on. And then there was also the inappropriate analogies: like comparing it to helmets or seat belts or, in the police case, body armour.

So then after I was relatively unsatisfied with the government sources, I went looking at the pharmaceutical manufacturers themselves. There was no publicly available trial data at that time but I was able to find fact sheets for the big four: AstraZeneca, Johnson and Johnson, Pfizer, Moderna. And even on those fact sheets for the DNA-based [Deoxyribonucleic Acid] viruses, or pardon me, vaccine,

[00:10:00]

there was an acknowledgement of thrombosis-related or blood clotting-related adverse events. And then in the Pfizer / Moderna fact sheets, there was an acknowledgement of an observed increased risk of myo- and pericarditis.

Then I went to independent media sources, such as Dr. Weinstein, and he was expressing concerns about the new technology, and he was referencing a doctor by the name of Geert Vanden Bossche, who I believe is in Belgium or the Netherlands. And he is a vaccine specialist. He was trying to ring the alarm saying that, “You do not mass vaccinate into a pandemic, and especially with a product that is a non-sterilizing vaccine,” and he further explained some concerns of his about how the function of this technology—

Shawn Buckley

We’ll just wait a second Corporal Bulford. You’ve frozen for a second so we’re just going to see if the Zoom call will catch up with us or whether or not we’ll have to log back in.

So we are currently frozen so what I suggest we do is that we have Danny Bulford re-log in and in the interim we have a clip of some of what we experienced earlier in Alberta during the COVID issues. Now, can we do both of those at the same time? So yeah, so we’ll just wait for Danny Bulford to log back in and while we’re waiting for him, we’ll watch this clip.

[00:12:12–00:21:09: Several video clips of government officials, public health officials, and newscasters speaking on pandemic measures and vaccines were played while the hearings were paused for Mr. Bulford to regain his internet connection.]

Shawn Buckley

Okay, so we have Daniel Bulford back. Danny, can you hear me again?

Daniel Bulford

Thank you. Sorry about that. Frequent power outages here.

Shawn Buckley

We were talking about your journey and I was hoping that you would get to speak about your brother because you were kind of talking about kind of how your mind changed on COVID, or the vaccine.

Daniel Bulford

Yeah, so like I had said before, what I ended up discovering was not very much detailed information at all, just a lot of generic talking points like you just saw in the video, overwhelming evidence. Well, where's the overwhelming evidence? I have yet to see any of it.

But I did find many medical science professionals all around the world, some who specifically design vaccine technology, including Dr. Byram Bridle here in Canada, raising concerns about the injection not staying at the shoulder and bio-distributing throughout the body and concerns about interference with the innate immune system.

And then you had cardiology specialists like Dr. Peter McCullough, and now Dr. Aseem Malhotra in the U.K., expressing concerns about cardiac injuries. All of these things were starting to mount as we were approaching like spring, early summer of 2021, and then my older brother who is a member of the RCMP took two doses of Pfizer and experienced three weeks of intense stabbing chest pain after his second dose, any time he tried to do anything physical at all. And when I discussed this with him, I told him, I said, "You need to go to your doctor, you need to get checked out."

And he did, and he received no diagnosis regarding his heart and he ended up getting a prescription to help him sleep through the night. And so fortunately, with connections that I've made now through speaking out and becoming a little bit more public, we've helped him align with a doctor who was willing to take that issue seriously and help him. So by summer, I had made my decision that no, I'm not taking this, and I really hoped that very few members of my family will take it either.

Shawn Buckley

I'm sorry, when the mandates were announced, what actions did you take?

Daniel Bulford

Okay, well, so I'd just like to add one more element here. So in July of 2021, the Prime Minister himself, at an infrastructure announcement in New Brunswick, made the admission on camera—you can still find it on YouTube I'm sure—that even double vaccinated people can still get infected and transmit the virus. And then he kind of paused and caught himself and said, "But it is much worse for unvaccinated people." And that was a cue to me that like, okay, there's no way that this will be mandatory.

The following weeks, early August, it was either August 6th or 8th, the CDC director, **Rochelle Walensky**, admitted to **Wolf Blitzer** on air that the COVID vaccines did not prevent infection or transmission, but they are still staying with the claim that it prevented serious illness and disease.

August 13th of 2021 it was announced publicly that the Government of Canada was seeking to make COVID-19 vaccination mandatory for federal employees, specifically including the RCMP.

Shawn Buckley

So this is after our Prime Minister admits on television

[00:25:00]

that vaccinated can still catch and transmit the virus, and this is after Rochelle Walensky, the CDC director, announces publicly that the vaccines don't prevent infection or transmission. It's after that that you were mandated as a federal employee to take the vaccine?

Daniel Bulford

It was after that that the intention to make mandates, or to implement mandates was announced, but then of course he ended up calling a snap election.

Prior to that, I was having discussions with people at work. I specifically tried to get my one supervisor to listen to a podcast interview between a podcaster from the U.K. and a high-profile doctor in the United States who was expressing concerns about the COVID-19 vaccination safety and lack of efficacy. And specifically, I was trying to get this supervisor to listen to me because I knew that they were just about to authorize for the 12 to 17-year-olds. A lot of my coworkers had children in that age demographic that played competitive sports. And his response was, "Nope, I don't want to hear it. I don't want to hear anymore. I just want to move on with life."

And so that was kind of a first taste of being ignored. And then right after the official announcement was made that they were going to implement mandates on August 13th, I emailed my commanding officer who, at the time, was a highly experienced investigator who had managed the national security side of the RCMP for a long time—very switched on, capable, competent investigator, complex issues. And I pleaded with him to look at some of the information that I had concerns, about and I sent him a couple of links. I know they're very busy, so I wanted to keep it brief and concise. I included a bunch of the doctor's names for reference, and a couple of links for something that he could reference for information, pleading with him to investigate before any further harm or any mandates were to further potentially harm Canadians and his own employees. And I was ignored: no response.

So I joined Police on Guard. And then through Police on Guard, I learned about Mounties for Freedom and that's where I focused most of my attention. And through that, we came to a consensus, in speaking with other Mounties that were in my position, no one was listening to us, and no one was taking us seriously.

Our union didn't want to take up the fight for us because they had advocated for priority access to vaccine, and some people had even been told by their union rep that, "If you weren't double vaccinated, you wouldn't even be allowed near my child." And so that was **the kind of mindset that some people in the RCMP were dealing with at the time.**

And I know other people who worked in higher profile units, like homicide investigation, that were made to feel like they were a conspiracy theorist, anti-vaxxer, like all the derogatory labels that you were seeing in the media. This was shocking to me, knowing that police know that the media lies about everything and that they twist and manipulate everything. Within my own unit, I was probably one of the least vocal people about the incompetence and ethical issues with our current federal government and so I couldn't believe—

Shawn Buckley

Can I stop you for a sec because you're talking about, you know, basically serious crimes people and many of the people watching wouldn't appreciate that these really are the cream of the cream of investigators, like these are the people with incredibly, I guess, critical minds. These people are trained to be looking at the other side and to be considering all things and basically not to get into that tunnel vision where they ignore things. And you're telling us that that basically, to a person, you were running into it; you might as well have been talking to a brick wall?

Daniel Bulford

Well, there was basically three categories: people who didn't agree that anyone should be forced to take it, but they weren't going to say or do anything; people who thought that it was absolutely necessary and that anyone who didn't take it wasn't doing their civic duty,

[00:30:00]

even though there was already plenty of evidence out there that it did not prevent infection and transmission, and so it's basically a personal choice based on a personal risk assessment; and then there was people who just didn't want to hear it at all and just wanted to— "No, I'm done. I just want to move on with life."

And yeah, the investigators and serious crime or national security sections, they are the most highly qualified investigators in the mounted police.

Shawn Buckley

And they should have been the ones investigating this matter?

Daniel Bulford

Well, they're trained to look at evidence, and from my basic open-source investigation, I couldn't hardly find any evidence supporting the mandates, and there was loads of evidence, if you just barely scratched below the surface, to raise concerns about a lack of efficacy and safety concerns.

Shawn Buckley

Right. So my understanding is the Mounties for Freedom, on October 21, 2021, sent a letter to the RCMP Commissioner Brenda Lucki.

Daniel Bulford

That's correct. Yeah, because we decided that we had to apply public pressure, both with the open letter and myself volunteering to speak out on behalf of the group, to draw attention because internally, we were having no success. No one was even willing to entertain our concerns or listen to us in any way, and we certainly were not getting any success in trying to get any kind of investigation.

Shawn Buckley

Now, we've entered that letter as an exhibit for the commissioners and the public to view; it's Exhibit RE-4. Now, following that letter, the mandates were still imposed, and can you share with us basically what that caused you to do?

Daniel Bulford

Well, after I was interviewed, I had a series of interviews, but really after the first one or two interviews, as soon as that was public, I was contacted. I had to go to the office and turn in my building pass and my keys to the building, you know, thereby my security clearance was under review and eventually revoked. I knew that that was the end of the career for me, even if I wasn't terminated at the time, that my career would be completely sidelined, at best.

Shawn Buckley

Right, and I'll just step in so that people listening to your testimony understand when you say interview, you're talking about speaking publicly against the government narrative.

Daniel Bulford

Yeah, specifically against the mandates; so I was speaking against the vaccine mandates. But another major issue, which was the biggest red flag for me during my whole, let's call it investigative process, was while investigating concerns about the vaccination. I started to learn more and more and more about doctors and scientists who were being silenced about early treatment protocols that were being used very effectively all around the world to help prevent hospitalizations and death.

And that, to me, was the biggest red flag. That, to me, was the biggest criminal activity that our public health and government and media could have been contributing to—was if there is treatments that are safe, that have been around for a long time, and doctors all around the world are trying to raise the alarm—“Hey, we found something that works and it helps keep people out of the hospital, and it helps prevent people from dying.” And our officials and our media are actively trying to suppress that, that, to me, is at the low-end criminal negligence, criminal negligence causing death, possibly even more serious, possibly culpable homicide.

Shawn Buckley

Right, okay. My understanding is you ended up resigning?

Daniel Bulford

Yes, I made the decision to officially resign in December of 2021. My reasoning for that was when I was exploring my options about what was going to happen to me—whether I was terminated or placed on leave without pay or suspended—I found a clause in our pension act or superannuation act that said that if I was terminated for misconduct I would only be entitled to my contributions,

[00:35:00]

which would have cut that number drastically. And it was ultimately up to the discretion of the Treasury Board, the final amount that I would be paid out if I was terminated for misconduct, so I know how vindictive the RCMP can be.

The previous witness talked about the vindictiveness of the chain of command in the Canadian Armed Forces and the RCMP is no different. I had had almost zero communication from anyone within the RCMP professional standards units. Actually, I had zero communication from any of them. I had very brief communication from my direct supervisor from the time that I initially spoke out in October until the time that I actually resigned in December. And I spoke with my father about it who is a 38-year RCMP veteran, and we both agreed that they're strategically trying to determine how best to hammer you without creating a public relations problem. And so I figured that my time with the RCMP was done. I should just cut my losses and try and set my family up for a new start.

Shawn Buckley

Now, you were speaking earlier and you used the words culpable homicide in connection with some of the things that you had learned. Is it fair to say that you're not aware of a single RCMP investigation into criminal activity that would be connected to COVID-19 and government directions or actions of other people?

Daniel Bulford

I'm not aware of any such criminal investigation. I have seen videos of people presenting evidence packages to different detachments, but I don't believe that anything was actually investigated seriously because I'm fairly certain I would have heard about it.

Shawn Buckley

Now, we've heard in other contexts like, for example, medical doctors that seem to have been publicly disciplined so that other medical doctors would see them as an example of what happens if you speak out. Can you tell us about detective Helen Grus, who she was, and what her investigation was about, and what happened to her?

Daniel Bulford

Detective Helen Grus is a member of the Ottawa Police Service. She is currently facing disciplinary action from her police service. I think she's charged under the *Police Services Act* for discreditable conduct and for conducting unauthorized investigations into a spike in sudden infant death syndrome in the city of Ottawa. I think it's roughly a four-times increase of the annual sudden infant death that would be typical for the city of Ottawa.

Detective Grus, from what I understand, was trying to determine whether there was a correlation with the vaccination status of the mothers and the increase in sudden infant death syndrome. And she worked in the SACA, I believe it's called, so Sexual Assault and Child Abuse Unit. She was suspended. I believe she's back to work now, but under strict restrictions about what she can and cannot do and can and cannot say.

Her next disciplinary hearing is set for this coming Friday, April 28th in Ottawa, and there still has been no decision made. Actually, if you want to read all about a very quality chronicling of that entire saga with Detective Grus, DonaldBest.ca has done an excellent job, kind of independent media reporting on it. He's a former police officer himself, former Toronto police, I believe.

Shawn Buckley

Okay, so my understanding is she's in the Sexual Abuse and Child Abuse Unit and that unit actually has a responsibility in Ottawa that any time there is an increase in infant deaths, they actually have the responsibility to look into it. So she was basically doing her job, she was just looking into whether the vaccine was the cause for the increase that they were seeing?

Daniel Bulford

Yeah, she's being punished for being a good investigator for following potential leads.

Shawn Buckley

Right. Now I had asked you if you are aware of a single RCMP investigation into any matter related to COVID.

[00:40:00]

Are you aware of an investigation by any police agency other than this one that was stopped by the Ottawa Police Department with Helen Grus?

Daniel Bulford

No, I'm not. I'm not aware of any police investigation into anything regarding COVID restrictions and mandates.

Shawn Buckley

Right. Now, as a police officer or you became a former police officer, you watched the police protest— People that basically were protesting the mandates, and you watched them not ticket BLM [Black Lives Matter] protesters. Can you share your thoughts on that and what you think is going on there?

Daniel Bulford

Well, obviously it's completely hypocritical, but also, I think it's a sign of the culture that we've created where it's safe to discipline some— Socially it's acceptable to discipline some and not others and to champion some causes and not others.

You know, for example, by comparison, I was working the day of the BLM protest in Ottawa, in downtown Ottawa, where they marched down to the U.S. Embassy. I was in the U.S. Embassy doing overwatch from an elevated position, watching over members on the ground. The crowds were there, they were loud, they were very aggressive towards the police officers on the ground. They were throwing items at them, specifically water bottles is what I really remember. There was no condemnation about that behavior and the Prime Minister even came out and knelt with them. And that was in the middle of one of our most restrictive lockdowns, if I recall correctly, in the city of Ottawa or in the province of Ontario.

And all the COVID restriction rules were cast aside for that specific protest, and even the police officers on the ground, the vast majority of them, took a knee when the protesters demanded that they take a knee. I can only remember one on the ground that I saw that didn't. And yet, if you contrast that with the actions of the police during the clearing of the

Freedom Convoy, there were protesters who did nothing more than just stand there and allow themselves to be pushed back, who ended up being assaulted by the police.

Shawn Buckley

Why do you think the police exhibited this behavior?

Daniel Bulford

In regards to the BLM protest or the Freedom Convoy clearing?

Shawn Buckley

No, no. In the Freedom Convoy. I don't know if you're aware, but we watched a video of a decorated veteran at the war memorial. The veterans had told the police there that they were not going to be violent, they were not going to resist, but they were not leaving. This veteran was actually a wounded veteran, and we watched the police throw this decorated, wounded Canadian war veteran to the ground and then start kicking him.

This video was provided to us by Tom Marazzo. I think I can speak for most Canadians that in watching what happened, we were shocked. And we didn't understand how it would be that police officers in Canada could be engaging in that type of conduct, and I'm wondering if you can comment.

Daniel Bulford

Well, I'm aware of that video as well. It's Chris Deering in the video, and he testified at the Public Order Emergency Commission. There's two things that I think may have contributed to that, based on tactics that I saw during the clearing of the Freedom Convoy.

I suspect, somewhere in the briefing process, police officers on the ground were led to believe that protesters may be armed and violent even though that was clearly not the case. But, I mean, we saw a lot of that type of rhetoric being used in the lead-up to the clearing of the Freedom Convoy including from Interim Chief Steve Bell from the Ottawa Police Service at the time.

And then, coupled with the large amount of people that were at the Freedom Convoy protest when the police were taking action

[00:45:00]

to clear the people and to clear the roads. I think there were probably some police there that were pretty scared at what might happen if the crowd had decided to turn, even though the crowd never really gave any indication that they were going to.

And so I think that kind of comes down quite often to a lack of, maybe a lack of training or a lack of experience, when they overreact based out of fear. We saw the leaked WhatsApp messages that were being circulated amongst RCMP officers who were staying at the Fairmont Hotel—talking about jack boots on the ground and wanting to practice their maneuvers with the horses after seeing the video of the person being trampled—so there's also likely some that probably enjoyed using that level of force against the Freedom Convoy protesters.

Shawn Buckley

Right. Now, you and I had dialogue before your testimony, and you sent me an interesting paragraph that I'm going to read where you're defining what the problem is, and so I'm going to read this paragraph and then ask your thoughts on basically the way out of this. But you sent me a paragraph where you wrote, "The major concern for me, after a long period of reflection, isn't so much the disgust of what the government did to drive a wedge between people and dehumanize millions of Canadians for political gain, it's the fact that so many people went along with it, either actively cheering on the authoritarianism or keeping silently safe, even when they knew it was wrong." And I'm wondering if you can explain that to us, and if you have any suggestions on how we get out of this and do this better, we'd certainly appreciate them.

Daniel Bulford

Yeah, well, I think that's the biggest issue I'm trying to reconcile personally right now. My wife and I are trying to determine where we're going to make our next permanent home. We've left the Ottawa Valley, and, I'll be frank, I'm not sure if Canada feels like home anymore. There's a lot of people that have said things to me in private or when it's safe to do so like, "Oh, thanks for doing what you're doing," and "Thanks for standing up for us," but they remain silent. That's a hard pill to swallow for us because, you know, a few took a vocal stand and sacrificed everything, like their careers and their relationships and were completely ostracized by their communities, and even people who were supportive—the silent majority is what I refer to there.

There's a lot of people who know what happened was wrong, but they just went along with it. And that's exactly what has gone wrong throughout history when authoritarian systems of government have rose to power. It's because so few people refused to say or do anything, even when they knew it was morally unjust and it was wrong.

I guess my only real practical solutions that I can think of is: tell the truth. If something is wrong and you feel that it's wrong and you know that it's wrong, say it. Yes, it takes courage. Yes, it's hard to do because you're afraid of what might happen to your reputation. But when you don't, every time you actively suppress what you believe the truth to be, a little bit of you dies, and I think you feel like a coward. And I knew that's how I would feel if I just went along with this.

Make yourself as financially independent from government as you can, so that you're not so vulnerable to future restrictions and mandates and just, along with telling the truth, it's do not comply with something that you know is unjust, undemocratic.

I mean, the vitriol in the language that we saw directed at unvaccinated Canadians because **people were still operating under the false assumption that to take the vaccine was to protect other people.**

[00:50:00]

It was false: admittedly false. That it didn't prevent infection, and it didn't prevent transmission. Yet people in our mainstream media and our government still kept pushing that agenda. And people went along with it, and no one said anything when people were forced out of their jobs, when people were arrested for not showing a vax passport at a hockey rink just because they wanted to watch their kid play hockey. No one said, or I shouldn't say no one, but very few people said or did anything. I guess all that to say people need to learn how to stand up for themselves; have some courage.

Shawn Buckley

Thank you, Danny. Those are my questions. I'm going to turn you over to the commissioners and ask them if they have any questions for you, and they do.

Commissioner Massie

Thank you very much for your very courageous stand you took in this crisis and your testimony. Do you have any training in science or medical practices before you started to investigate this thing?

Daniel Bulford

No. No, I just, and I've said that many times, I'm not a doctor, I'm not a scientist, but I know what good quality evidence looks like compared to no evidence, and so that's how I made my assessment. You know, you need a certain quantity of evidence to support a decision and a quality of evidence and so when I was making my assessment from the official sources, I found nothing but general vague statements without any significant information to back up what they were saying to support their talking points.

And yet when I found these other doctors and scientists who were being censored, they would provide detailed, high-quality information. They were highly qualified and they would always, always source and reference the documentation or the studies that were supporting what they were saying.

Commissioner Massie

So how hard was it and how long does it take to educate yourself to a level that you feel comfortable to raise questions or at least try to communicate to your colleagues or authority that there was something that was unusual, let's put it this way?

Daniel Bulford

I would estimate I probably spent at least three months looking, for myself, before I started to kind of have debate-style conversations with colleagues.

Commissioner Massie

And given your background and education, do you think that what you've done is something that is also accessible to other people in the general population? Or do you have a special way of looking at a situation that gives you this ability to self-educate yourself on an area where it's completely outside your expertise?

Daniel Bulford

No, there's nothing special about my abilities. It's just how I was trained, that when you investigate something, you are trained to look at both sides of the story. That's what I was taught right from the very most basic call I would respond to as a general duty officer: there's always two sides to a story. And so it's very accessible.

Every time I spoke publicly, I always referenced my highest quality sources of information that were free for anyone in the public, anyone who listened, to go look at for themselves. I think it just came down to a willingness to look. It's not that I had any kind of special

investigator abilities; it was just a willingness to look and to actually try and read—have the patience and the determination to look and take the time to educate myself.

Commissioner Massie

Did you experience pushback from people surrounding you that you were talking about something you had no training or expertise to really raise questions about the issue?

Daniel Bulford

Some, yes, not in a malicious way, but there'd be conversations where it'd be like, "Well, my siblings are in healthcare and they say that we need to get this vaccine," or "the unvaccinated people are the most likely to produce variants,"

[00:55:00]

which I believe a doctor like Byram Bridle could also refute.

And I mean, the problem was that the real debate amongst the qualified professionals wasn't being allowed to happen but I know I had other people say things to me like, "What, you think the FDA is lying?" And I said, "Yes." Specifically, regarding the suppression of the ability for ivermectin, for example, to be used as an early treatment drug.

Commissioner Massie

Do you think given the magnitude of this sort of information that was communicated to the population that people just couldn't believe that they could actually be deceived at such a large scale, and that's the reason why they were probably just folding back on their intention to ask questions or to question the authority because it was so big, and it was all over the world?

Daniel Bulford

Yeah, I will accept that that is likely a major factor, I'll say for the general public. I don't think that's acceptable for police officers; we are trained to look for evidence.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

Thank you for your testimony. For those of us who rely on police security clearance and background checks for working with vulnerable populations and youth, for example, how would you reconcile that one's entire historical background and their life experiences can be eradicated by an authority figure's stroke of a pen or, as you alluded to, for speaking publicly?

Daniel Bulford

Well, it's had a major impact on my professional future. I'm pretty much essentially blacklisted for ever pursuing a similar career in Canada or even in the private sector abroad. Specifically, after the CBC [Canadian Broadcasting Corporation] published an

article claiming that an OPP [Ontario Provincial Police] report had documented information from the RCMP that it was believed that I had leaked the Prime Minister's schedule months before the Freedom Convoy, which is a complete lie.

But, now that it's out in the public sphere, they take your security clearance, that's a major strike against me if I was to try and pursue private sector employment in security and intelligence. And with that article—it's very damaging—I have to completely start over essentially, in a completely new field.

Commissioner Kaikkonen

And we've all heard commentary from different people, not just your colleagues, who allude to just moving on with our lives. Do they really believe that this is a move on from your life if you allow what has happened to stand without question?

Daniel Bulford

I think, for many, the desire to just stay in the comfort zone supersedes the desire to know the actual truth.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

Good morning. Thank you for your testimony this morning. I am trying to understand a little bit about what's going on in the RCMP. In your testimony, you talked about your father's, I think you said 38 years of service. Your brother is in the service, or was, in the service, and you had 15 years in the service. You also talked about a proud day that you had when you graduated, and I think you used the term Red Serge, and I could still feel that pride in you, believe it or not. Can you tell me, you know the military, the RCMP, a lot of what they do and a lot of what their culture is based on honor, it's based on tradition. Can you tell me who, as an RCMP officer when you graduated, who did you swear allegiance to? Was it the Canadian people?

Daniel Bulford

Our oath is three parts: the Oath of Office, the Oath of Allegiance, which is to the Crown,

[01:00:00]

and the Oath of Secrecy. The Oath of Office includes the oath you're swearing to apply the law equally to every citizen without fear or favour. You don't specifically swear an oath to the Charter or to the Constitution like other police services do.

Commissioner Drysdale

The RCMP, one of their main focuses or one of their main duties is to investigate crime and report it, is it not?

Daniel Bulford

Yes.

Commissioner Drysdale

At what point are the RCMP compelled to investigate a crime? Let me help you out with that. The reason I'm asking that is because in your testimony, you talked about a number of things. You talked about whether something may be manslaughter or worse. So that made me think that if you're saying that, and we've heard a lot of testimony about it, we've heard testimony about breaches of ethics, we've heard testimony about people being coerced to do things, it's almost sounding like there was an organized crime committing in Canada. And yet you said the RCMP didn't act, or you don't believe that they've investigated, so my question is when are the RCMP compelled to act and launch an investigation?

Daniel Bulford

For something of this magnitude, and as sensitive as it is because it would involve investigating government, I don't know if I can provide a clear answer to that. But my impression is that an investigation will take place when the political will exists for one to take place.

Commissioner Drysdale

If the Canadian public can't turn to our federal police force, the RCMP, who can they turn to?

Daniel Bulford

I don't know. I've said before that if the police didn't go along with this, none of this would have happened. If the police didn't agree to enforce these restrictions, then none of these, the Freedom Convoy, none of this would have had to occur. I think I'm somewhat hopeful, you know, skeptical optimism, that maybe the Supreme Court will be the last stand.

Commissioner Drysdale

You used a terminology a couple of times that I just wanted to briefly talk to you about. You used the term open-source investigation.

Daniel Bulford

Mm-hmm.

Commissioner Drysdale

I've heard that terminology used in policing, and can you briefly tell me what open-source investigation might mean?

Daniel Bulford

It's just gathering intelligence or gathering evidence from sources that are publicly available. So quite often it's from media outlets or government websites, social media. You just basically mine information from what's available in the public sphere. So it's open source. It's not closed in. It's not protected information that's encrypted or anything like

that or that would be confined within a specific organization. It's all publicly available information if you just go looking for it.

Commissioner Drysdale

So it's information that's available in the public, if I'm hearing you correctly, for instance Facebook posts, those kinds of things. Can you comment on what kind of an effect it might have if the Canadian people believe that the RCMP is monitoring and data mining all of their social media; what kind of effect might that have on the people's perception of freedom of speech?

Daniel Bulford

Well, I think we fall into the same issue that we saw throughout the last three years. In that there are some people that will be very concerned and very outspoken about it, and there will be other people that choose to ignore it

[01:05:00]

because they don't feel it directly impacts them.

But my concern is we keep seeing these incremental steps of invasions of our privacy and our fundamental rights. If we continue to just concede and act like, "Well, it's no big deal, it's no big deal. It's just, I have nothing to hide." I've even been guilty of that myself in the past, "I have nothing to hide. I don't care if they monitor what I say." Eventually we'll get to a place where the authoritarianism will impact you.

Commissioner Drysdale

One of the reasons I asked that question is because I believe you made a comment with regard to how the upper management of the RCMP are very smart at targeting members and putting pressure on them; I'm sure I haven't got your words quite right, but that was the general gist of it. So in your opinion, is it not possible that these same people are using the intimidation of RCMP open source investigations into chilling the public discourse in our country?

Daniel Bulford

Well, yeah, I think that's definitely possible. People will self-censor themselves to avoid attracting attention.

Commissioner Drysdale

You know, that is one of the most chilling things that I've heard you say in your testimony, and I know I don't want to minimize what your family has gone through, but that our federal police force, potentially, is having a chilling effect on the exchange of freedoms and exchange of ideas in our country. And that citizens are thinking twice about what their police might be doing. Of course, they're not calling it investigations, they're calling it open-source investigations. To me that sounds very similar to a lot of other things we've heard renamed over the last two years, you know, relative versus absolute, and I have a list of them that I've asked other witnesses prior to you. In any case, that must be frightening for you and to all other Canadians. Can you comment on that just a little bit?

Daniel Bulford

Well, I know that's why we, as a family, are actively looking for a new home. I don't know— My job earlier in this was to try and raise awareness amongst police officers; that was my goal, was to raise the alarm. I worked with many people, I know many people within the RCMP and other police services. I was hopeful that if they saw me speaking out about my concerns and providing sources of information that they could go look for themselves to corroborate what I was saying for themselves, that it would rally enough police to take a stand against what was happening in Canada, and it didn't work.

Commissioner Drysdale

Is there a point where a police officer's inaction becomes a crime?

Daniel Bulford

Yeah. Yeah, there'd be a— Well, definitely, within the RCMP Code of Conduct you can be disciplined for neglect of duty.

Commissioner Drysdale

Has the RCMP neglected their duty?

Daniel Bulford

I believe they have. Yes.

Commissioner Drysdale

Thank you, sir.

Shawn Buckley

I believe that is all the questions that we have for you. Danny, on behalf of the National Citizens Inquiry we sincerely thank you for joining us today and giving us your testimony.

Daniel Bulford

Thank you very much for having me.

[01:09:42]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 4: Dr. Gregory Chan

Full Day 1 Timestamp: 05:31:52–06:39:35

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry as we continue with day one of our three days of hearings in Red Deer. I'm pleased to announce that our next witness is Dr. Greg Chan. Dr. Chan can you state your full name for the record, spelling your first and last name?

Dr. Gregory Chan

My name is Gregory Keen-Wai Chan. My first name is spelled G-R-E-G-O-R-Y and last name is Chan C-H-A-N.

Shawn Buckley

And Dr. Chan do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Gregory Chan

I do.

Shawn Buckley

Now, you are a family doctor in Ponoka and you have submitted a bunch of adverse reaction reports?

Dr. Gregory Chan

That is correct.

Shawn Buckley

And you've been practicing family medicine in Ponoka for 13 years?

Dr. Gregory Chan

Correct.

Shawn Buckley

And you also regularly work in the emergency department in Ponoka?

Dr. Gregory Chan

That's correct.

Shawn Buckley

Now, you've sent me a CV [Curriculum Vitae]. We're not going to look at it, but I'll just advise we've entered it as Exhibit RE-1F. Now, I wanted to ask— My understanding is that as a doctor, sometimes when you're prescribing a drug, you need to know that the drug is contraindicated for a pre-existing condition, is that correct?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And basically, you know, we—meaning society—we learn that a drug is contraindicated for pre-existing conditions often by learning after it's on the market and adverse reports being filed?

Dr. Gregory Chan

That's correct.

Shawn Buckley

So it's very important to learn with a new drug if any pre-existing conditions are reacting to a drug.

Dr. Gregory Chan

That's correct.

Shawn Buckley

Now, can you tell us about your experience with submitting adverse reaction reports?

Dr. Gregory Chan

Well, as the vaccine, or the injection, was being rolled out to the public— This is a new technology that hasn't been used in the general public, so I thought it would be important for physicians that are seeing patients in the emergency departments and family practice to be recording any adverse events that occur.

We only had a small amount of data from the product monograph, so I thought it would be important to ask patients whether they have had a vaccine or injection prior to their presentation to the emergency department or to my family practice. And, interestingly, it was difficult to actually get the information. You know, you go through your standard history and physical. You ask them if they've had anything new in the last three to four weeks, and the patient would say no, and you actually have to specifically ask whether they had the COVID injections or not. And then they would remember, yes, I had it within X number of days or weeks from the presentation in the emergency department or the clinic.

Shawn Buckley

So that's interesting, as you were expecting that they would volunteer that information, but it appears when you're doing the interview to see if they had actually been vaccinated, that it's not even in their point of consciousness to consider that their condition could be related to the vaccine?

Dr. Gregory Chan

That's correct. I would actually have to specifically ask about the COVID injections, and then I had to change my usual standard practice to incorporate that in my history taking.

Shawn Buckley

Right, the specific question; so you started asking people that were presenting at the emergency ward about their vaccination status and what followed after that?

Dr. Gregory Chan

Well, I actually had COVID in April 2021, so I was just coming back to work at that time. The emergency room was busy, but I started asking patients the question, whether they had an injection within four weeks of having presented with these new symptoms. And it was not clear on how to document or how to submit these adverse events in Alberta.

Shawn Buckley

And when you say it wasn't clear, what do you mean? Because, we're not doctors and my understanding is that doctors are actually under an obligation to submit adverse reaction reports in Alberta.

Dr. Gregory Chan

That's correct. With the rollout it wasn't clearly communicated how to submit adverse events. I initially thought that we were supposed to do it through the CAEFISS system [Canadian Adverse Events Following Immunization Surveillance System], through the Health Canada system. But when I was initially trying to submit the adverse events online, you'd click on the link and they would go back to another link and then it would return back to the link of the original page, and you would just go into this endless loop of trying to click

[00:05:00]

to find out how to submit the information. So eventually I just printed the forms and then filled them out by hand but that was a cumbersome job to do.

Shawn Buckley

I just want to make sure that people understand what you're saying. So you're a medical doctor, you have a degree in medicine?

Dr. Gregory Chan

Yes.

Shawn Buckley

And you likely have either a degree or some years of university prior to getting into medicine?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And so you're deliberately going to try and submit an adverse reaction report on these vaccines on the government site and basically, it's impossible. You aren't able to navigate the site so that you could fill in a form online and submit it online?

Dr. Gregory Chan

That's correct. It would take an inordinate amount of time to try and submit the information. And after clicking for 10 or 15 minutes and getting nowhere, I ended up printing a blank form and then filling it out by hand. But that's not feasible for a busy emergency department.

And you have to remember that this occurred in May, the vaccine had already rolled out since December of 2020, January 2021, so this is five months into the rollout, and at that point, the vaccine adverse event system was operating in this manner.

Shawn Buckley

Right, so and you've already indicated in your testimony this was a new technology. It hadn't been used on a wide scale in the human population before, and five months into using this technology you're reporting to us that basically, it was very difficult for doctors to report. And also, that doctors did not know how to report?

Dr. Gregory Chan

That's correct. Actually, through talking with my colleagues about looking for adverse events, one of my colleagues pointed me to the Alberta Adverse Event Following Immunization Program or AEFI for short. So that was an online form that was much easier to submit. So then my speed of entering adverse events increased after using this format.

Shawn Buckley

Okay, and my understanding is you ended up submitting 56 to the AEFI system?

Dr. Gregory Chan
That's correct.

Shawn Buckley

And can you tell us— So first of all, like these would be 56 separate individuals that you as a medical doctor formed the opinion, that they were having a reaction that was in response to a vaccination for COVID-19?

Dr. Gregory Chan

That's correct. They have specific criteria on the AEFI website, so they have to have either a new symptom; it could be a pre-existing symptom, but it has to have changed either in intensity or frequency, and it has to occur within a certain time frame, within four weeks of receiving the injection.

Shawn Buckley

And actually, David, can you just pull up my screen and put it on. So Dr. Chan, I don't know how well you can see that screen, or I think it'll be on your computer in front of you, but you sent me a copy of the AHS [Alberta Health Services] website requirements. I believe this is what you're referring to, of what can be reported. So they're saying there it basically cannot be attributed to a pre-existing condition as basically the second one following immunization?

Dr. Gregory Chan

Correct. And then if you look further down, if they "require hospitalization or urgent medical attention," then that would qualify as an AEFI.

And I'll point your attention to the second last button where it says, "Has been previously identified, but has increased frequency." So I mean, you can see that there's already a contradiction in the statements, but I mean, you would think if a person had a rash and the rash got significantly worse after receiving this product, that that should count. So that's what I was going off of.

Shawn Buckley

Right, right, and it is interesting. I mean, when we had spoken earlier, I'd asked you that, I mean, basically the way we learn whether a drug is contraindicated for pre-existing conditions is by medical people reporting an adverse reaction to a pre-existing condition, but for the Alberta reporting form, they're basically excluding pre-existing conditions as a criteria. So what happened to these 56?

Dr. Gregory Chan

According to my statistics, about half of them were

[00:10:00]

not acknowledged as far as an adverse— And I didn't receive any feedback. And half of them I received feedback on whether it was accepted or rejected as an adverse event.

Shawn Buckley

Okay, so half of 56 would be 28, So, in half of the of the 56 there was feedback, whether it was accepted or rejected or even, you know, whether the fate was unclear you had some correspondence or dealings with AHS?

Dr. Gregory Chan

That's correct.

Shawn Buckley

So what can you tell us about the half that you did have feedback on?

Dr. Gregory Chan

Of the half that I received feedback on, most were rejected.

Shawn Buckley

Okay, would I be correct in saying that six were accepted as adverse reactions of this 23?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And that eight were rejected for various reasons such as there was a pre-existing condition or otherwise didn't meet criteria?

Dr. Gregory Chan

Correct.

Shawn Buckley

For nine of the 23 you have no idea what happened except that they did contact you so you know that there was some acknowledgment?

Dr. Gregory Chan

That's correct. They would send me feedback, but it wasn't clear whether the person should receive another dose or not.

Shawn Buckley

What do you mean?

Dr. Gregory Chan

They would just say that the submission was acknowledged, but there was no clear information as to whether the person should receive another dose. Often, they'd phone and

they'd want to speak to me when I'm busy seeing patients, so my medical office staff would take the message.

Shawn Buckley

So I just want to make it clear that I'm understanding what you're saying. So this group that receives these adverse reaction reports that you sent in, would be calling you on an adverse reaction report. So you're of the opinion that the vaccine caused an adverse reaction and they're calling you to, in some cases say, "Yes, but the patient should get a second dose?"

Dr. Gregory Chan

That's correct.

Shawn Buckley

Do you have any idea how many times that happened?

Dr. Gregory Chan

Sixteen times they said that the patient should receive another dose of the COVID injection.

Shawn Buckley

And this would be in relation to the half, the 23, that they've had communications with you?

Dr. Gregory Chan

That's correct.

Shawn Buckley

So with 16 of these 23, so all of these you're of the professional medical opinion, as the patient's physician, that they've had an adverse reaction of enough of a severity that you felt the need to send in an adverse reaction report. And yet for 16 you're specifically getting called to be told that in somebody else's opinion they should be vaccinated again?

Dr. Gregory Chan

That's correct, even though it was accepted as an adverse event they were told to get another shot.

Shawn Buckley

What was your professional opinion about whether any of these 16 should get another shot?

Dr. Gregory Chan

Well, looking at the wide range of adverse events, as I said at the beginning, I was just trying to document what sort of adverse events would occur after receiving this new product, and this is post-marketing analysis in my opinion. We saw a wide range of adverse

events from rashes to diarrhea to chest pain, shortness of breath, even a stillbirth, so these events are wide and varied.

With some of the ones that they told the patient to get another shot, in my professional opinion, I felt that that was inappropriate. I'll give one example of a young man who was playing hockey, and he was playing to the point where he was doing skating tryouts. I'm not sure what the right term is for that, but he was he was competing at a professional level. He ended up having COVID, and he recovered from it to the point where he was going to compete again. He was told to get his shot, and once he had his shot, within 24 to 48 hours, was unconscious at home. He was brought to the hospital in an ambulance, and he was told that he shouldn't have another dose of the injection. Yet, curiously,

[00:15:00]

the AEFI program told him that he should have another dose.

Shawn Buckley

My understanding is that this young boy had to see a cardiologist and is no longer able to play hockey?

Dr. Gregory Chan

That's correct. He stopped his hockey career and he's moved on to something else.

Shawn Buckley

And my understanding also is that basically he could not exercise for three months after the shot because he would get dizzy?

Dr. Gregory Chan

Well, yeah, he was visibly unwell. His physical reserve was very poor. He was pale. Anytime he tried to exert himself, he was short of breath, and he had chest pain. So I mean, clinically, that sounds like there's some adverse event or condition that he was having. He was a high-performance athlete previously, so I had to walk with this patient until he recovered to the point where he could do something.

Shawn Buckley

Right, and so you've got a patient, it sounds like you would be strongly of the opinion that the last thing that this young man should do would be taking another dose?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And am I correct that whoever is phoning you has basically not seen this young boy to do a medical assessment before making the phone call that this person should be vaccinated?

Dr. Gregory Chan

With this particular case the person investigating from the AEFI team had got the details incorrect. They thought that this person was having problems with long COVID. But I specifically asked a detailed history to determine what was his exercise capacity from pre-COVID, after he had COVID and he was recovering. And then what his physical capabilities were after having the injection, and they seemed to get the details incorrect.

Shawn Buckley

Right, so did this young man get a second shot?

Dr. Gregory Chan

No.

Shawn Buckley

Now, you also told me one about a nurse that had numbness in her body. Can you share with us about her case?

Dr. Gregory Chan

Yes, this patient ended up having numbness to half of her body—from shortly after having the injection—it was very strange. Physically, there was not much to find, but she clearly stated that she had numbness to one half of her body after receiving the injection.

Shawn Buckley

And this persisted for months, am I correct about that?

Dr. Gregory Chan

That's correct. It persisted long enough that we could do investigations, and I referred her to see a neurologist and to have electromyographic studies done and eventually the symptoms faded.

Shawn Buckley

Right, but this is another one where you were phoned, and she was told to get a booster shot?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And my understanding is you also had one with an officer who, within a week, developed chest pain. Can you share that story with us?

Dr. Gregory Chan

Yes, it's very similar to the first case where this person was in a high-performance job. He had to be physically fit, took the injection, and then had chest pain shortly afterwards. And, to this day, it has not resolved. And he had the injection in late 2021, due to employment requirements.

Shawn Buckley

So we're about a year and a half on and his chest pain and shortness of breath is continuing?

Dr. Gregory Chan

Correct.

Shawn Buckley

And my understanding is that the AEFI group has taken the position that he could not be injured by the vaccine because the symptoms have gone on for a year and a half?

Dr. Gregory Chan

That's correct. They said it does not meet the criteria for myocarditis; I'm just reading the notes that my staff wrote when they took the phone call. All cardio tests were normal. They were asking that I review the criteria on the AHS website. They were basically telling me I should read their instructions again.

Shawn Buckley

Right, and these are just examples out of the 23 for which you received some feedback. Do you have any idea at all what happened to the other half, the 23 for which you did not receive feedback?

Dr. Gregory Chan

I don't have any knowledge about what happened afterwards.

Shawn Buckley

Do you have any confidence that there is fair reporting

[00:20:00]

of vaccine adverse reactions in the province of Alberta?

Dr. Gregory Chan

I have very low confidence that these are being documented appropriately. I even received a letter back from the AEFI program educating me that I had incorrectly submitted many submissions and that I needed to look at the criteria again to determine what is an appropriate AEFI.

Shawn Buckley

And just so you know, we've entered that as Exhibit RE-1E and the earlier thing that I pulled up from AEFI we entered as Exhibit RE-1A, and we've also entered your CV [Exhibit RE-1F] as an exhibit so those will be available for the Commissioners and the public to review. I'm wondering if you can tell us now, about a young man named Nathanael Spitzer?

Dr. Gregory Chan

Nathanael was a 14-year-old boy who— Maybe I'll just start with what happened in the news.

Shawn Buckley

Sure.

Dr. Gregory Chan

The medical officer of health had identified a 14-year-old boy as being the first child to pass away from COVID in Alberta.

This boy had terminal brain cancer and I was his family doctor. I was looking after him after he had his brain cancer; he had two surgeries for it and there was no more medical treatments that were available for him. I was doing home visits for this child, visiting the family, and it came to the point where the tumor had progressed to the point where he was very sick. He was vomiting and he was unable to be at home. He ended up losing consciousness and he had a seizure. The amount of pressure from this recurrent brain tumor had been to the point causing enough pressure that he lost use of half of his body, and he was blind, and he needed total care; so he had to be admitted to hospital.

Shawn Buckley

And just so that I can maybe emphasize some things for the commissioners is my understanding is he had undergone a couple of surgeries but the cancer persisted?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And that the tumor kept growing, and so that it was actually sticking out of Nathanael's head?

Dr. Gregory Chan

That's correct.

Shawn Buckley

So and we were talking just about a very difficult and sad case of severe brain cancer?

Dr. Gregory Chan
That's correct.

Shawn Buckley
And when he is admitted to the hospital, he is not being admitted to the hospital for treatment, he is being admitted to the hospital for palliative care?

Dr. Gregory Chan
That's correct.

Shawn Buckley
So and palliative care is just basically keeping people comfortable until they die.

Dr. Gregory Chan
That's correct.

Shawn Buckley
So he's entered the hospital, you're his doctor, he's there strictly for palliative care and what happens?

Dr. Gregory Chan
Well, when patients were admitted at that period during the pandemic, patients have to be tested for COVID before they enter the hospital, so he tested negative, even though he was vomiting and having some B symptoms of COVID. He required total care, so he needed someone to help him with his, you know, basic daily living activities. He was fed. He faded in the course of week to week, so it wasn't a quick thing. He was admitted August 25th and he ended up passing away on October 7th.

So each week he was weaker and required more assistance, and needed pain control. And in the last few days prior to his death he ended up having a fever, and then he had diarrhea, and he was tested and tested positive for COVID.

So when he passed away, I thought it would be important to clarify with the Medical Examiner's office to determine what the cause of death was. I'm fairly confident that it's from his terminal brain cancer that had recurred,

[00:25:00]

and that would be the cause of death, but because he tested positive for COVID, I thought it would be important to verify with an external source whether I'm correct in filling out the death certificate.

Shawn Buckley
And, just for clarification, so the Medical Examiner's office in Calgary, these are pathologists. These are pathologists that do autopsies and their expertise is determining cause of death?

Dr. Gregory Chan

That's correct. The way the Medical Examiner office works is that there's a pathologist or pathologists that work in the office and they have medical investigators that take phone calls from outside the region and they also investigate local cases.

Shawn Buckley

And so what ended up being the cause of death on the death certificate?

Dr. Gregory Chan

Well, I explained the events leading up to his death, and they, specifically, told me to not write COVID on the death certificate.

Shawn Buckley

Right, so basically the cause of death is complications from the type of brain cancer that he had?

Dr. Gregory Chan

That's correct; complications from his glioblastoma.

Shawn Buckley

Okay, that's the medical term for the brain cancer that he had?

Dr. Gregory Chan

Correct.

Shawn Buckley

And is it even remotely possible, remotely possible that he died from COVID?

Dr. Gregory Chan

In my opinion, no.

Shawn Buckley

Okay, so now when you talked about the Chief Medical Officer, just to fill in the blanks you're talking about Dr. Deena Hinshaw?

Dr. Gregory Chan

That's correct.

Shawn Buckley

And this was an announcement on October 12, 2021.

Dr. Gregory Chan
That's correct.

Shawn Buckley
And she's holding a press conference; it's on the news all across Alberta.

Dr. Gregory Chan
That's correct.

Shawn Buckley
And she's basically announcing, without using Nathanael's name, that a 14-year-old is the first child death by COVID in Alberta.

Dr. Gregory Chan
That's correct.

Shawn Buckley
And your impression of the news story was that it was deliberately calculated to generate fear?

Dr. Gregory Chan
Well, it's quite curious as to why his death was announced. I know they were announcing deaths weekly, like I was following the news and listening to the reports, but it's curious that his death would have been announced, and I did not write COVID on the death certificate. I did not even mention COVID as part of the most responsible diagnosis on the discharge summary. So I followed the advice of the Medical Examiner's office to leave COVID out of the diagnosis. So then, lo and behold, within a week, his name and his case is announced on the news.

Shawn Buckley
As Alberta's first COVID death for a young person?

Dr. Gregory Chan
That's correct.

Shawn Buckley
And the death certificate did not mention COVID?

Dr. Gregory Chan
Correct.

Shawn Buckley

The discharge summary did not mention COVID?

Dr. Gregory Chan

Correct.

Shawn Buckley

You were not interviewed?

Dr. Gregory Chan

Correct.

Shawn Buckley

And the family was not interviewed by Ms. Hinshaw?

Dr. Gregory Chan

Correct.

Shawn Buckley

And when I said you weren't interviewed you weren't interviewed from anyone, let alone Dr. Hinshaw?

Dr. Gregory Chan

Correct.

Shawn Buckley

So how would you characterize then her news conference that Nathanael is the first case of a young person dying of COVID in Alberta?

Dr. Gregory Chan

Yeah, it's very curious as to how they got the information because the family were not interviewed, I was not interviewed, and none of the documentation points to COVID. So **how did they find out that COVID was part of his medical care in his time in Ponoka?**

Shawn Buckley

Right, okay, so your thoughts are: very curious?

Dr. Gregory Chan

Yeah, I mean it was upsetting. It was distressing that this information was somehow found out by the Chief Medical Officer of Alberta, that this information was used at the time when there was a Delta surge, and they were telling people to take the injections. And this was

just before they were going to release it for under 12-year-olds, so you know this type of information being released at that particular time, is very suspicious.

Shawn Buckley

And how did the family, how did Nathanael's family react to this?

Dr. Gregory Chan

Well, Nathanael's sister had posted on social media that he did not die from COVID.

[00:30:00]

Shawn Buckley

And did the family pressure eventually lead to any retractment from Dr. Hinshaw?

Dr. Gregory Chan

I believe Dr. Hinshaw had apologized for the hurt that she had caused, for announcing his death in this way; and that occurred too within days of the family putting out the truth on social media.

Shawn Buckley

Now, Dr. Chan, it's clear from the fact that you were apparently diligent in trying to report adverse reactions to the vaccine to AEFI. You did another investigation concerning the vaccine and that involved a stillborn child. Can you tell us about that investigation?

Dr. Gregory Chan

Well, I had a patient that was previously successful with having pregnancies. They had several children, and they had become pregnant in 2021. She had received both injections when she was pregnant, had a 20-week ultrasound that was normal. The anatomy was normal. All the usual tests and prenatal visits were unremarkable, and at approximately 24 or 25 weeks it was noted that there was no heartbeat at the prenatal visit. And an ultrasound confirmed that there was a stillbirth. The timing of the stillbirth was eight weeks approximately from the second dose.

Shawn Buckley

Now, this child was delivered at the hospital, and the hospital, at your direction I expect, retained a sample of the placenta?

Dr. Gregory Chan

Yes, this patient was already at a facility to do the ultrasound. So that facility had obstetrical services, I consulted the specialist and they helped the patient with the management and aftercare after having a stillbirth. I had spoken to the patient over the telephone asking her what she wanted to do next, whether she wanted to investigate any further whether there was a relationship between the injection and the stillbirth. She declined having the baby tested, but she agreed to having the placenta tested for the spike protein.

Shawn Buckley

And what happened after that?

Dr. Gregory Chan

Well, I made a request to the local lab and pathology department to have testing done on the placenta. That is a usual practice if there's a stillbirth, or if there's some unusual event that happens with the delivery that you can ask for the placenta to be tested. And there's general testing that can be done. They take the placenta; they do histopathology on it, they look at it under the microscope. That'd be a general term to describe that. So I asked specifically to test to see if there was the presence of the spike protein in the placenta, but after much communication back and forth and some unclarity as to what I was asking for, it turns out that it's not possible to do that testing in Alberta.

Shawn Buckley

So can I ask you, when is this happening? When did you send this placenta sample to the lab to be tested for spike protein?

Dr. Gregory Chan

It was somewhere around the end of September 2021.

Shawn Buckley

So we're in the middle of a global pandemic. We have rolled out a vaccine now nine months ago in Canada, which we are told has the body manufacture spike protein, and in September of 2021 it is not possible for a doctor in the province of Alberta to have a tissue sample analyzed for the presence of spike protein? Is that what you're telling us?

Dr. Gregory Chan

That's what I understand, yes. And I have a science background. I know that you can do histochemical testing for various proteins, and in my reading of papers up to this point, I mean I know that the spike protein can be tested for. They talk about it in published papers.

[00:35:00]

So we're trying to see if there is a link between receiving the vaccine and what happened with this terrible event. The pathologists were wondering whether I was looking for the presence of COVID in the placenta when I was asking for the spike protein, and I had to clarify: "No, I'm not looking for COVID in the placenta, I'm looking for the expression of the spike protein."

And if you just look at how the vaccine is designed, it's asking your own cells to make the spike protein. They tell us it should just be located in the arm where you do the injection but other information that's come out, has shown that it can move away from the site of injection.

So eventually, with the back-and-forth it turned out that I would have to either ask the University of Alberta or the University of Calgary to partner with a researcher to do this as a research project. I have no experience in doing that.

The second option was to send this placenta to the United States, but that would have to be done out of pocket, you'd have to pay for it privately, so that was the option that we went with.

Shawn Buckley

And my understanding is the hospital ended up sending it to a lab that could not do that test in the United States?

Dr. Gregory Chan

Yes, and I should clarify that I wanted to be very clear as to what we were asking for. So I asked the patient to sign a consent form asking for testing the placenta for the presence of the spike protein, and it was sent to a university in the United States that tested for the nucleocapsid protein.

If we know the COVID virus there are various proteins on the outside surface, and obviously with the COVID injections they should express the spike protein. If you take the vaccine you'll only develop antibodies against the spike protein. The spike protein is the only thing that's being produced if you were to receive COVID injections.

However, if you see the real thing, if you saw COVID, then you'd have antibodies against the nucleocapsid protein. So the nucleocapsid protein is a natural protein that's found on COVID. I don't understand why this university would have tested for the nucleocapsid protein. It's not even part of the vaccine.

Shawn Buckley

So you tried to get this done at the hospital in September of 2021. It is now April of 2023. Have you succeeded yet in having this placenta tested for spike protein?

Dr. Gregory Chan

No, I haven't.

Shawn Buckley

You're still working on it though, am I correct?

Dr. Gregory Chan

Yes, I've been encouraged to find my own lab that can do this testing, so I'm waiting for another lab in the United States to get back to me.

Shawn Buckley

And that would be Dr. Cole's lab?

Dr. Gregory Chan

Yes, under the advice of other colleagues, they've suggested that I reach out to a pathologist that works in the United States. His name is Dr. Ryan Cole, so I'm waiting for direction from his clinic.

Shawn Buckley

So and again, I think it's very important for the people of Alberta to understand. So you're a medical doctor, you're trying to find out the cause of a stillbirth, and we're in a situation, as you've made it very clear, where the population is being vaccinated with a vaccine that makes the body manufacture a spike protein. And you, as a medical doctor, in basically a year and a half, have been unable to get a tissue sample analyzed for spike protein so that you could determine whether the vaccine was a cause or contributing cause to the stillbirth?

Dr. Gregory Chan

That's correct.

Shawn Buckley

I feel like asking if we're in a first world country or a third world country. Now, my understanding is that this mother who had— She was a mother of three, so she had a good history prior to her vaccination of delivering. My understanding is that since this stillbirth she has had two additional miscarriages?

Dr. Gregory Chan

That's correct.

Shawn Buckley

What are your thoughts about having this vaccine given to pregnant women?

[00:40:00]

Dr. Gregory Chan

I think it's a new product, and it's unclear what the effects are on pregnancy and on the baby. Prior to COVID, it's almost as if pregnant women are protected. You're not supposed to test things on pregnant women because of the effects on mom and on baby. So these products, we still have a very short history with them, and I would be very concerned about providing these to pregnant women.

Shawn Buckley

Okay, and just so that we understand, so pre-COVID-19 vaccines the practice was actually to protect pregnant women from new drugs, to protect both the mother and the baby. So they were treated with caution?

Dr. Gregory Chan

That is my understanding.

Shawn Buckley

But that policy changed dramatically. In fact, it was a 180-degree reversal for the COVID-19 vaccines where basically there was a push to get pregnant mothers vaccinated.

Dr. Gregory Chan
That's correct.

Shawn Buckley

And is it also true that in the hospital system that doctors were being basically deliberately told that pregnant women were a higher risk for hospitalization and death from COVID than the general population?

Dr. Gregory Chan
That's correct.

Shawn Buckley

And you did research and basically this is not true in any meaningful way?

Dr. Gregory Chan

Yeah, that's correct. I mean, there is no usable data from Canada as to the risk of COVID to a pregnant woman or to her baby or compared to a woman who's not pregnant, compared to pre-COVID. There is no data available.

Shawn Buckley

And is it fair to say that the U.S. data does not support what you were told?

Dr. Gregory Chan

The U.S. data, and that's the best— When the COVID injections are being rolled out— I have a prenatal practice, so I'm trying to determine how do I counsel patients on what to do with these injections. They're being told that they must get it because they're at higher risk, and I wanted to give them real numbers to determine what is the actual risk of COVID to themselves and to their babies.

So the only place to get information easily was to look at the CDC and the United States data, and looking at the data, the risk of maternal mortality, that's the pregnant mom dying from COVID, was 0.11 per cent.

Shawn Buckley

Which is a very low risk?

Dr. Gregory Chan

That's correct, and comparing to pre-COVID numbers of maternal mortality, like from 2017, that risk is about 0.017 percent.

Shawn Buckley

Right. So on an absolute risk basis, you just had no concerns as a physician about your pregnant women patients dying of COVID?

Dr. Gregory Chan

Well, the way I would counsel my patients is that I would say, "Well, these are the numbers." I had actually had some numbers then to show patients and I'd say "Well, here are the numbers and you decide for yourself. I'm not going to tell you to get it or not to get it but here are some numbers that you can work with." And the patients had to decide themselves. I mean, there are some non-material things you'd give for advice. "We don't know what the long-term effects are of receiving these injections for you or for your baby but these are the risks of dying from COVID in your particular situation, then you'll have to decide." That's the route I took in advising my patients.

Shawn Buckley

Right, so you weren't trying to encourage or discourage, you just had to do your own research to actually be able to give these patients some semblance of informed consent.

Dr. Gregory Chan

That's correct. I mean, they're walking into my office asking me for my opinion. If my opinion was just telling them to go get the shots, then that's really not an opinion. That's me telling them what to do. And, you know, patients really have to look at the information and decide for themselves. I'm not here to tell them what to do. I have to present them with information and they need to decide for themselves.

Shawn Buckley

Right. Dr. Chan, I have no further questions for you, but the commissioners likely will.

Commissioner DiGregorio

Thank you, Dr. Chan, for coming today and giving us your testimony. Hopefully you can help me understand a little bit about the fact that there are two reporting systems, CAEFISS and AEFI.

[00:45:00]

Is that two parallel adverse event reporting systems?

Dr. Gregory Chan

That is my understanding.

Commissioner DiGregorio

Okay, and so CAEFISS is a federal government reporting system and AEFI is the one for the province of Alberta, is that right?

Dr. Gregory Chan

That's correct.

Commissioner DiGregorio

Okay, and do you know if other provinces have something similar to AEFI [Adverse Events Following Immunization]? Is this parallel system running across the country, or is that unique to Alberta?

Dr. Gregory Chan

My understanding is that each province has their own reporting system and my understanding is that these adverse events are supposed to be uploaded into the CAEFISS system. That was my impression when I was submitting these documents.

Commissioner DiGregorio

Okay, so the AEFI, you believe that that information then feeds into CAEFISS?

Dr. Gregory Chan

That was my understanding.

Commissioner DiGregorio

That's your understanding. Okay, but they have separate portals or entry points at which you would make a report? Is that right?

Dr. Gregory Chan

Yes, they are separate, so CAEFISS has their own system of entering information, and the AEFI program in Alberta has their own system of entering information.

Commissioner DiGregorio

On the screenshot that we showed earlier, sorry, I'm pointing at the screen, it's not there anymore, but it was the one you showed for the purpose of showing what were the criteria for meeting the AEFI. But I noticed a little bit of text up at the top that was kind of cut off that said, yeah, there it is now. Right up at the top there that says, the Public Health Act mandates that any healthcare practitioner who becomes aware of an adverse event following immunization must report the event to the AHS provincial AEFI team. So is that a mandate that you were aware of as part of your practice?

Dr. Gregory Chan

I was not aware of that until the COVID injections came out. Adverse events from immunizations were not very frequent prior to 2020, so I became aware of this AEFI program and then, reading that, I learned of this in 2021 that it was mandatory for me to submit these. So that also encouraged me to look and submit because it's our duty to do so.

Commissioner DiGregorio

Okay, so is it fair to say then that as part of your training to become a medical doctor, you were not made aware of that mandate?

Dr. Gregory Chan

I was not made aware of that mandate.

Commissioner DiGregorio

Okay, thank you. When it came to making an adverse event report did you need to form an opinion on there being causation between the vaccine and the adverse event or was it more just if there's an adverse event following injection that you would report it? Do you have any understanding of that?

Dr. Gregory Chan

I believe my role was to link whether there's any chronology between a vaccine and an event, and if there is then I'm to detail what those symptoms were that were new and to properly document that, and then submit that. So I'm not to make causation; I think causation would be very difficult to do, but I can at least say that there's a chronology. This person that didn't have these symptoms prior to the injection, they had the injection, and then now they have these new symptoms; so if those two fit then then I'm to submit and document as much information as I can.

Commissioner DiGregorio

Okay, and so when you make the report, I think you just said you don't have to put an opinion on causation in it, and it goes up for review with, I assume, somebody at Alberta Health, and there's a review there, and they form an opinion on causation, and they either accept or reject it as an adverse event?

Dr. Gregory Chan

That's what I believe.

Commissioner DiGregorio

Okay, and do you know what the process is that they go through when evaluating your report?

Dr. Gregory Chan

No.

Commissioner DiGregorio

No, you just get the call at the end of it.

Dr. Gregory Chan

No, and based on the letter that I received back from the AEFI program there appears to be a second set of criteria that they use to determine whether something is an adverse event or not. So I'm following the criteria on the website and I'm submitting the information as I see it, and then they have a separate set of criteria to say that that is an adverse event or it isn't, and I don't know what that criteria is; they just determine and I don't know how they determine that.

Commissioner DiGregorio

Do you know if they reach out to the patient personally or is it solely based on the report?

Dr. Gregory Chan

They reach out by phone call, so usually my patients are contacted.

Commissioner DiGregorio

Okay. And are you aware of the numbers of reports that are made, maybe the overall numbers, the accepted numbers? Are those published anywhere? Is that public information?

Dr. Gregory Chan

Are you referring to COVID; the COVID injections?

[00:50:00]

Commissioner DiGregorio

For the adverse events that are reported following an injection, yes.

Dr. Gregory Chan

That was, and I believe that still is, reported on the Alberta COVID webpage, that they talk about the number of adverse events.

Commissioner DiGregorio

But that would be the number that they've approved as adverse events?

Dr. Gregory Chan

I believe that they're the numbers after this second process.

Commissioner DiGregorio

Okay. Thank you. Those are my questions.

Commissioner Massie

Thank you very much, Dr. Chan. I had a question about the time at post-injection that is considered to be reasonable for assessing adverse events. I noticed that in other jurisdictions this time could be a little bit different. Are you aware of the medical or scientific basis to establish this four-week cut-off in Alberta?

Dr. Gregory Chan

I'm not aware of any scientific basis for that. I believe that's just the number that we're told fits the criteria. I think that there could be adverse events that occur later, but the four-week criteria, I believe, is just an arbitrary number.

Commissioner Massie

Could it be because with other types of vaccine in the past, this was a general observation?
Are you aware of the reporting of adverse events for other types of vaccine?

Dr. Gregory Chan

That, I am not aware of. I think four weeks is probably a generous timeframe to say there is a chronological association between the treatment and then an adverse event, but that's all I know. I'm not sure of the history behind the timeframe.

Commissioner Massie

So given that with these new technologies, we now realize based on a number of studies that the spike protein can actually be found in tissues for—there are studies saying two months, there are other studies like almost a year. Would it be reasonable to expect that the expression or the presence of spike protein in different tissue could actually trigger adverse events way past these four weeks, in your opinion?

Dr. Gregory Chan

I believe it's possible and we won't know unless we look.

Commissioner Massie

I'm a little puzzled with this difficulty you've been through in terms of getting, I would say, a relatively simple histological assay for spike protein within the medical system in Alberta.

Is it something that you've experienced in the past for other types of assays, or although it's a new protein, histology is a pretty routine test that can normally be done in any medical system. Are you aware of that issue because of all kinds of, I don't know, administration, or other reason that happened in your experience of having difficulty to do a simple routine test like that?

Dr. Gregory Chan

I have not had difficulty previously. Previously, you would just phone and ask for a special test and then it would happen after the request was made. But you'd often have to phone and ask, but it wouldn't be difficult, it would be done.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

I'm just following up to get some clarity on a question and a response that you made. In terms of pre-existing conditions, they're excluded on the AEFI form, and then the health authorities follow up with the patients with a phone call. I'm just wondering, do you believe that they're actually reviewing the patient's personal health files as well, in terms of collecting data and information for making their determination?

Dr. Gregory Chan

I believe so. In Alberta we have Alberta Netcare. So a lot of information can be found like tests, diagnostic imaging, the dates of when the vaccines occurred, or the injections were given. That information can be found on Netcare, so I believe that they are looking through chart information: if they presented to a hospital, if they had tests done. So I believe that they were accessing other information.

Commissioner Kaikkonen

So then my follow-up would be: Do you know if there are any protections for personal health care information in Alberta?

[00:55:00]

Dr. Gregory Chan

I believe on the AEFI document they do state that they will be looking through the chart and looking through additional information and that it would be part of the process. But I'm not sure about the security of that. It does say that they do follow the Health Information Act as far as collecting that information.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

With regard to the form that you put up from Alberta Health, did I understand it correctly that if you were trying to evaluate an adverse event that you had to preclude the ones where there was a pre-existing condition as being an adverse event?

Dr. Gregory Chan

Yes, well partially. If you look at the form it says if it was a pre-existing condition it doesn't count, but then if you look on the form it says that if the condition has increased in frequency then it counts.

Commissioner Drysdale

I mean the reason I ask that is— Wasn't the vast majority of people who died from COVID, didn't they have pre-existing conditions?

Dr. Gregory Chan

That's correct.

Commissioner Drysdale

So a pre-existing condition with COVID equalled a death by COVID but a pre-existing condition with an adverse reaction from vaccine were maybe or maybe not counted because of the pre-existing condition?

Dr. Gregory Chan

That's correct. You're saying that they blame the pre-existing condition for an adverse event, but when they had a pre-existing thing like obesity or high blood pressure then they died of COVID? That's an interesting link.

Commissioner Drysdale

Well, I understood that I think it was 75 or 80 per cent of all deaths by COVID-19 had at least three or more pre-existing conditions.

Dr. Gregory Chan

That is my understanding as well.

Commissioner Drysdale

I also noticed when you were talking about the injections that often you said vaccine and then you corrected yourself and called it something else. Could you tell me why you did that?

Dr. Gregory Chan

So in my medical training I understand a vaccine to either be: a dead virus or infectious agent, or it's broken up parts of the infectious agent, or it's an attenuated version of that infectious agent. So that's a traditional vaccine. A traditional vaccine you get a standard dose of that antigen, so whatever that is, and it's deposited in your body, and then you develop a reaction to it.

This is not like that, so this is delivering messenger RNA to your body, and then the amount of spike protein that's being produced is not known. How long it's produced for is not known. So this does not fit the traditional definition of a vaccine.

A vaccine is giving you some protein or fingerprint of the infectious agent, and then you develop an immune response to it. This is a completely different delivery system, so it doesn't fit the traditional definition of vaccine.

And I know that the definition of vaccine has changed in the last three years, where the original definition was what I described, and the new definition is anything that generates an immune response. I'm paraphrasing, obviously.

Commissioner Drysdale

I also thought I noticed something else in your testimony. You talked about something that you called long COVID, and we heard from previous testimony that the real name for this was spike protein disease, I believe it was.

I'm just wondering why spike protein disease, which more effectively or more articulately says what the problem is, why the name would have been changed to long COVID disease when, to my mind, that's a little mis—and maybe perhaps I'm wrong with this—is that misleading? Do you want to talk a little bit about that?

Dr. Gregory Chan

Yeah, and I'm not well versed in long COVID and how they define it. I mean, before COVID, you would see, occasionally, patients that had some serious illness:

[01:00:00]

whether it's from a virus or other infectious agent, and they would have persistent fatigue for a long time. I mean, the most common one that I would encounter as a family doctor is Epstein-Barr virus. So a person who has infectious mononucleosis, they could have fatigue that would last for months. That's not always the case, but that has been observed. So I mean, this long COVID business, I'm not sure how they characterize that.

Commissioner Drysdale

And I'm curious about the process by which the screeners, if I can call them that, the people at AHS who would look at your reports of adverse reactions, considering your testimony that this was a new technology not used on humans before, how would they determine what an acceptable adverse reaction was or was not when they had no experience in the population with this particular injection?

Dr. Gregory Chan

That was my point with trying to submit all this data, is because we don't know what the effects are from these injections. We don't know if it's going to be mild like a rash or if a person's going to have chest pain and myocarditis or if they're going to have a stroke. We don't know. We just don't know.

The only way to know is to gather all the information and see what adverse events actually fit chronologically with taking these injections and then seeing which ones are more common. If you see that there are common side effects, then you can properly advise people going forward.

Let's say, for example, myocarditis is a common side effect, then you'd see a large number of myocarditis reports, and then you can say, well, then that's something we should be telling people now. Lo and behold, that is what happened through COVID. Before you couldn't get an exemption except for having anaphylaxis to the first shot. Now they've changed their tune saying that if you had myocarditis, well, now that qualifies as an exemption. They've recognized that that's something that's being observed.

Look at the Scandinavian countries in 2021. They observed this because they were paying attention to it. Another way to say this is that the adverse event program is a way to pay attention to what the side effects are from a new product. If we automatically throw out a whole bunch of adverse events because they didn't fit the criteria, how do we know what's actually happening, and we don't.

Commissioner Drysdale

Okay, I have two other shorter questions: With regard to the 14-year-old that was your patient and was admitted to hospital. I think I remember your testimony being that when he was admitted to the hospital, he was checked for COVID and it was negative, but some weeks later, after having been in the hospital all this time, he tested positive. Given my assumption that medical staff were wearing PPE [Personal Protective Equipment]—their

prescribed PPE—how did he contract COVID in the hospital when he was in this protected environment?

Dr. Gregory Chan

That's a very good question. I mean, he was in the palliative care room, which is in the far corner of our hospital. He never left the room. He was in the bed the whole time. We didn't have to use PPE to give him day-to-day care before he had COVID, so we were just going in and providing usual care. But most of the staff was vaccinated, and none of his family was symptomatic. I wasn't symptomatic. None of the nurses were symptomatic or sent off due to illness. So it's very curious how he had actually picked it up.

Commissioner Drysdale

Prior to 2019, was it common for doctors to make diagnoses of patients without ever having seen the patient? Was that ethical?

Dr. Gregory Chan

No.

Commissioner Drysdale

But if I understand properly, the people who were screening your reports of adverse reactions and then giving a recommendation that a patient take another injection, is that not diagnosing a patient without seeing the patient?

Dr. Gregory Chan

That's correct.

Commissioner Drysdale

Thank you

Commissioner Massie

I have a few additional short questions. The first one is in relation to the line that says that normally you are expected, as a doctor, to report an adverse event. So you seem to have been doing it quite thoroughly in your practice. What about your other colleagues? Do you know whether your colleagues were as thorough

[01:05:00]

in terms of reporting adverse events, in your hospital or in people that you know in the practice?

Dr. Gregory Chan

I believe some of my colleagues were submitting them, but we never had a discussion as far as how many they were submitting compared to what I was seeing.

Commissioner Massie

So my follow-up question on that is, what was the incentive from the system to the medical doctor to actually be proactive in reporting these adverse events?

Dr. Gregory Chan

There was no incentive to submitting these. There was no financial compensation. It takes time to submit these and to submit them properly. So it actually required an investment of time from the physician to submit these adverse events.

Commissioner Massie

Based on what we've heard from other witnesses and what you've presented here, it seems that to do a diligent reporting of adverse events seems to be an important element, especially when a new technology like the mRNA [Messenger Ribonucleic Acid] vaccines are being deployed on a large scale. What would you recommend from the health authority to do differently in order to improve the process?

Dr. Gregory Chan

My recommendation would be that an adverse event program would be set up before that product is rolled out so that those who would see people in the front, in hospital settings or in clinics, those who are providing the injections or vaccines or medical product, that they would be aware that there is a process and it is legally binding, that they must report information to the health authorities if there's an adverse event. It should be a program that's running very well, even before the product is released.

Commissioner Massie

Thank you.

Shawn Buckley

There being no further questions, Dr. Chan, on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony.

[01:07:43]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 5: Sünje Petersen

Full Day 1 Timestamp: 06:39:55–06:58:33

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Leighton Grey

Leighton Grey, appearing as agent here at the National Citizens Inquiry. I'm going to have the pleasure of asking some questions of a witness named Sünje Petersen. Ms. Petersen, can you hear me?

Sünje Petersen

Yes, I can.

Leighton Grey

Welcome to the National Citizens Inquiry. Thank you for being here today virtually to give your testimony. I understand that you're prepared to swear an oath to tell the truth.

Sünje Petersen

Yes.

Leighton Grey

Alright. And could you please, for the record, state your full name and spell it.

Sünje Petersen

My full name is Sünje Petersen, and I was born in Germany, and I'm commonly called Sunny.

Leighton Grey

Hmm. [speaks a sentence in German]

Sünje Petersen
[responds in German]

Leighton Grey
Do you promise to tell the whole truth and nothing but the truth, so help you God?

Sünje Petersen
Yes.

Leighton Grey
I understand that you are joining us from Whitehorse, Yukon. Is that correct?

Sünje Petersen
Yes, that's correct.

Leighton Grey
In reviewing the notes of what you proposed to give as your testimony, you want to talk about how business closures and lockdown restrictions, or non-pharmaceutical interventions by another name, affected you and your family's business. Is that correct?

Sünje Petersen
Yes.

Leighton Grey
Okay. Do you want to talk about that? I understand that you have a tourism business that was impacted by COVID restrictions in the Northwest Territories [NWT].

Sünje Petersen
Yes. So we live in Whitehorse, but our outfitting area or tourism operation is in the Northwest Territories. And mainly, our clientele comes from overseas, or at least from the United States, so 95 per cent of our clients are from outside the country. So with all the border closures, our business was zero. So not only could we not have our American clients, but because the NWT also closed its border to the rest of Canada, we weren't allowed to take Canadian clients, either.

Leighton Grey
Ms. Petersen, would you mind turning your camera on for us?

Sünje Petersen
Oh, let me see. I'm not really good at this stuff. Video, it is on, but it shows not "Start video."
I don't think it will work.

Leighton Grey

All right.

Sünje Petersen

Yeah, I'm really sorry. It says everything is on, but it does have a slash through it, and it said, yeah, and I'm not good at this, and the husband isn't here.

Leighton Grey

Can you click the button with the slash?

Sünje Petersen

Yeah, but then it says, "Start video," but nothing happens. I have it. It's an external one. I have it in, Logitech webcam, then I open that. "Cannot start video; failed to start video camera. Please select another camera setting."

Leighton Grey

All right, we can hear you really clearly, so we'll just carry on. Okay?

Sünje Petersen

Yeah, I'm sorry, though.

Leighton Grey

No, there's no need for an apology. I understand that you lost about one and a half years of income in your business. Is that right?

Sünje Petersen

Yes, that's right, because the borders did not reopen until— So we lost the entire business year in 2020, and then we lost almost half our season in 2021 because the borders opened late. Our business usually starts in the middle of July. So we were set to start July 15th, but the border didn't open until August 9th, I believe, for Americans, and September 7th for the rest of the world.

Leighton Grey

And I understand even after you were able to reopen that, in fact, you had to apply for a special permit to fly into your remote fly-in camp and that this is very problematic for you. Is that right?

Sünje Petersen

Well, yeah, it's a very remote camp, and this is where all the silliness really comes in. So everybody wants it to re-open. But first of all, in 2020 nobody was allowed to go to the NWT. Our family had to apply for a special permit in order to go to our area. We fly in, I should really say that. So almost everybody who comes to our area comes in directly from Whitehorse, Yukon, so they don't even travel through the NWT. And so in 2020, we need a special permit for our family to go there and just check up on things.

And then in '21, everybody actually had to apply for a separate permit and had to state that they are self-isolating in camp.

[00:05:00]

And also, everybody was supposed to phone in every few days and state their COVID symptoms. I believe that was in 2020, maybe not so much in '21. But yeah, so it was a special permit for tourism operators to bring in their clients. And like I say, we're totally remote. Those people never touch ground in populated NWT.

Leighton Grey

I also understand you brought your concerns to the attention of a health officer by way of a series of emails, but that the health officer was worried about some sort of possible cluster or superspreader event?

Sünje Petersen

Yes. So I was writing back and forth with Dr. Kami Kandola, the Chief Public Health Officer of the NWT. I tried to state to her the following points: We are in a remote location. Our people don't go and meet anybody in NWT. They will not stay in base camp. It's one-on-one guiding, so one client with one guide. They are staying 14 days. And in case of emergency, we are set up for a direct flight back to Edmonton, or the Yukon if we had to. But everything— There was no touch with anybody. We couldn't infect anybody.

But Dr. Kandola got back to me. Her main concern supposedly was that there could be a cluster outbreak in a remote location. Now, I don't know how you get a cluster when you have two people. And her other thing is best-laid plans might not work out, and our healthcare system will be overwhelmed when your one client will use it, which we weren't intending to. And so I kept going back and forth with her on all these things. I said, "Why is there no testing? If you come in Frankfurt, Germany, there's a COVID test, and they are allowed in." Also, the Yukon, for example, allowed clients to come in if they went to a remote location. And Dr. Kandola didn't. We had only five Canadian clients booked for the 2020 season, and we really, really wanted to take those clients. It would have made a huge difference to us.

And so I asked her, "So what are your epidemiological reasons for not letting these people in? Five people, what is that? And they are coming one by one compared to a supermarket or a Walmart full of people in downtown Vancouver." I wanted to know a number. I said, "What would be the infection rate? What is your real problem? Why are you blocking me?" And I did not get an answer to that. I never got a proper answer to my questions. And furthermore, there were 84 NWT doctors who actually wrote a letter to Dr. Kandola and said, "What you're doing, your lockdowns, it's killing people. It's causing huge disruptions in the communities. We can't do that." And she blocked that, too. So on the one hand, she was telling me, "Oh, I talked to other people, and this is our reasoning, and I talked to other doctors, and this is what we've come up with." But on the other hand, her own doctors in her own territory didn't agree with her. And she shut them down. So this is what happened.

Leighton Grey

Many small businesspeople in urban settings were frustrated by the circumstance whereby places like gyms and restaurants and retail outlets were shut down during COVID, while big box stores—I won't name them, we all know who they are—were left open. And many of

them actually had restaurant counters and things like that operating inside. You had a similar situation or a similar frustration in your case because at the same time that all these things were unfolding for you and these lockdowns were affecting your business, there were in fact, mining operations taking place in the southern part of where you live and camps that are much larger than yours. And yet those were all allowed to continue to operate. Is that right?

Sünje Petersen

Yes, that's correct because I wrote that to Doctor Kandola. I said, "There are workers who are going into mining camps. On top of that, there's also truckers coming and going; there were nurses coming and going." Like, there was all kinds of workers. But she said those were essential, and I was not.

Leighton Grey

So you spent a lifetime really over 20 years building up this business, right?

Sünje Petersen

Yes.

Leighton Grey

And it was only by being very resourceful and resilient that you were able to save your business from bankruptcy.

Sünje Petersen

Yes, if we wouldn't have been in business for almost 20 years,

[00:10:00]

and if we wouldn't have had savings, we would have gone bankrupt. Because we lost one and a half years of income. Just think about anybody out there, anybody listening here or even— that's what I said to Dr. Kandola, too, "How about we slash your income for one and a half years? When are you going to do that?" So this is our life. This is not just the job I go to, it's our lifestyle, it's our business.

And it goes further than that. It's our family that's impacted. But it's also our guides. It's the aviation companies that fly people in and out; it's hotels, restaurants. We make roughly 1.5 million dollars revenue every year and on top of that, that's all money that comes from overseas. So it's a good income for Canada. So we have 1.5 million revenue. We ourselves of that make maybe four to five hundred thousand for our family. Our kids work with us. So the rest of the million goes to other people within here, within Canada. All that is blocked; all that is shut down.

Leighton Grey

Well, all of that sounds incredibly stressful. I'm curious, though, how was your mental health impacted by this? Obviously, your civil liberties were suspended. But leaving aside the economic part of it that you've talked about, what about the personal side? Were you able to see family overseas? Or I understand that you had a family member actually who

passed away during this period; you were not able to attend for that family circumstance. Can you talk about how all this affected you and your family personally?

Sünje Petersen

Yeah, so when it first started, we were in complete uproar. I mean, they closed everything down in March. At first we were hoping they would open up, for our season to be normal. By the time May rolled around, we were like, "Oh my God, what are we going to do?" We have emails every day coming in: people like, "Are we going to be able to come hunting? When will the border open?" So our work impact was a lot larger than it usually would have been. There was the stress to deal with and then just thinking what— All our life basically fell apart. Okay. Like, this is what we do. That's what we live for. And none of that was happening.

Our oldest daughter was trained to be a downhill ski racer. She had to come home in tears because they shut the ski hills and sent her home. She wasn't allowed to run races. On top of it, the following year, she wasn't allowed to train because she couldn't go up Mount Norquay unless she was injected with a COVID-19— I don't want to call it vaccine because it doesn't immunize.

My stepfather got sick the day after his second shot. EMS [Emergency Medical Services] had to come and pick him up. He was in the hospital for two or three months. He wasn't able to make red blood cells anymore and he died, and I couldn't go home. My father died while the travel ban was still in place. So I couldn't go and be with my family then. My mother is in hospital now. Her liver is giving out on her, organ failure. Now I can go and visit. But I just want to put it in this order because that's three parents out of four, seeing as I have step-parents. All of them are injected with a COVID-19 vaccine. I mean, the thing that we didn't know when we would be able to operate anymore. The fact that we couldn't go on a vacation, that we couldn't go overseas, be with family when they needed us.

The fact that our children were really impacted because they are 21, 18, and 16 now, so they were a little bit younger. Our oldest, her dreams fell apart. She couldn't go to a university or any such a thing. She works for a company now where the COVID-19 injection is not required. It's a trucking company. Then our next daughter, we usually homeschool. But the next daughter, she went to school in Whitehorse for half a year. It was a special program. It's theatre, music, and dance. Her heart was hanging in there. She really wanted to do that. There were all kinds of problems there. They were not attending to that school properly. They didn't let the kids do their arts, music, dance, and drama. She went back. The next year, she had to wear a mask while everybody else didn't have to wear one anymore in the Yukon.

In reality, it affects you on absolutely every single level. There wasn't one thing that was proper. I couldn't go to a restaurant because in the Yukon, they blocked everybody. My kids couldn't go sports. All the kids in the Yukon couldn't go unless they were injected for COVID-19. They weren't allowed to go and participate

[00:15:00]

in sports and restaurants and social life. We weren't allowed to have company over because we weren't injected. What is this? I can't even invite my friends over? This is not right. It really hit me on every level, professional, personal, friendship.

And then, on top of it, because I stood up within my community—I was in the Tagish Advisory Council—I stood up and I talked against this injection. Well, I don't want to go into it, but anyways, I'm not a doctor. You just heard everything from the other doctor. I tried to stand up within my community and warn people and say, "Look at it. This is a new technology. Maybe you want to check this out. This is wrong and this is wrong and this feels like Nazi Germany to me."

I'm sorry, I know it's an overused term, but this is what happened in East Germany. This is what happened in Germany in the 1930s. I could see the parallels. I was treated as a Jew here. I had to show my health passport, which I didn't have, so I couldn't do anything, right? There are people who don't talk to me anymore, friends, neighbours. That's fine, but it's not nice. Somebody even sent social services on me claiming I hit my child five years ago at the community hall. This is how evil people are when you don't do what they think.

Leighton Grey

But the comparison you draw to Nazi Germany is striking. It's a little-known fact that actually the Nazis did require people to carry health passes during that time period in history, you probably know that.

Obviously, this has caused irreparable damage to your family. I hope that you've been able to restore your business to some level of profitability.

My last question for you is, if you could say something to the Government of Northwest Territories or the Government of Canada or to this panel, the people listening, about what you think could be done better, or could have been done better in terms of the response to the COVID-19 pandemic, what would you say about that?

Sünje Petersen

It's actually really simple. Don't lock up the world. Go and quarantine those people who are actually sick so that the rest can't get sick from them. But don't make the entire world into a hospital. This is not how it works.

Leighton Grey

Well, you've obviously read the Great Barrington Declaration, so bravo for that.

Sünje Petersen

I signed it.

Leighton Grey

With that I'm going to turn you over to the panel for questions. Who would like to go first? No questions.

Is there anything else you'd like to tell us, Ms. Petersen?

Sünje Petersen

No, maybe just that this is just me talking here. But there are eight other outfitters in the NWT and there's a lot more in the Yukon: there's tons of tourism business. This was a big

deal for a lot of people, and it has cost Canada and Canadians a lot of income. But an income is really what keeps you alive and keeps you moving. It's tanked the economy so bad. I don't think anybody actually knows how much.

Leighton Grey

Thank you, Ms. Petersen, for your testimony here today.

Sünje Petersen

No, thank you guys for doing this. I'm sorry you couldn't see me.

Leighton Grey

We're sorry, too.

Sünje Petersen

Thank you.

[00:18:38]

Final Review and Approval: Anna Cairns, August 30, 2023.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 6: Tracy Walker

Full Day 1 Timestamp: 06:58:33–07:13:25

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness is Tracy Walker. Tracy, can you state your full name for the record, spelling your first name and last name?

Tracy Walker

Yes. Tracy Walker, T-R-A-C-Y. Walker, W-A-L-K-E-R.

Shawn Buckley

Tracy, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Tracy Walker

Yes, I do.

Shawn Buckley

Now, you are a hair stylist. You've been doing this for 36 years.

Tracy Walker

Yes.

Shawn Buckley

You're also a mother of two grown kids, and you have two grandchildren.

Tracy Walker

Yes.

Shawn Buckley

Now, you're here today to tell us about some economic things that happened to you with regards to the COVID lockdowns. My understanding is that you had a studio in your house in 2020 when the COVID pandemic hit.

Tracy Walker

Yes.

Shawn Buckley

Can you tell us what happened once the government locked us down in 2020?

Tracy Walker

Well, it's very obvious. If you're in a self-employed position where you're mandated that you cannot work—that and my husband, as well—it put a very huge impact in my life. I am a diabetic, so let's keep to work.

I work out of my home. I had a private entrance: a door locked from my household, its own bathroom. So, there was absolutely no one that would be in my household. So it was a private everything. I only was taking, at that point in time, one to two clients a day, depending if there was a family. So if there was a larger family, I would allow all of them to come. But generally, I would keep it pretty casual. But then when the lockdowns came in and I was not allowed to work, I really was at a loss. Both my husband and I were at a loss of what to do and how we were to maintain just the basics of our lifestyle, not necessarily our "lifestyle." Because we really didn't have much.

Shawn Buckley

Can I ask, was your husband able to continue working when the lockdown was imposed?

Tracy Walker

He was also shut down for a time being because well it was an office environment. And until they established that they brought all the equipment— He was able to work out of my home. Except for, I'll get to my next point, where we did not have a home for a time being. And I'm not too sure where you want me to go with that.

Shawn Buckley

Well, actually, tell that story because you obviously did have a home. You had a hairdressing suite in your basement.

Tracy Walker

A beautiful home. No, it was on the main floor.

Shawn Buckley

That was isolated from the rest of the house. What happened to that?

Tracy Walker

Well, I actually— At the exact same moment that we were in this, “What do we do?” Sheila Gunn Reid from Rebel News had put out iwillopen.com. or stayopen.com. and said reach out to us if you are not going to stop working, and you’re going to try and work through this. So I reached out to her. Unbeknownst to me, I was the first one that did. So the next morning, I actually got a call. Instead of watching Sheila on my phone, she was in my house. And so we had an interview about that very thing, where— I had bylaw officers come to my house because of that, sadly. But not sadly because I got literally phone calls from across the world: France, Italy, all through Canada, all through Canada, for the support in this.

Now, I had reached out— This is when the government had offered the mortgage deferral program. And so, I reached out to my broker and said that, “Really, we’re at a loss of what we can do, and our options are nil and none. So, I’m going to have to apply for the mortgage deferral program.” And she said to me that, “I’m sorry, the government did not state anything about brokers. It only applies to banks and credit unions. So you are responsible for your payment at the first of the month.”

[00:05:00]

And I’m like, but I have no income. My husband has no income. There is no subsidy coming from anywhere. She told me that I would have to do whatever I could to get this payment. Otherwise, your house is going to be going into foreclosure.

We were not in any default. I think, maybe two years, we were late one payment, if I want to bring everything onto the table. But only by a couple of days. Like it was not even a long period. It was just a couple of days. So there was no real just cause for them to deny us grace of any sort. I explained this to her. She said that, “Simply, it’s not my problem.” She goes, “You see, I work for the company, the broker company, not for you. I am here to collect the money for them. It is your problem.” And I said, “Well, the last I checked, it was the world’s problem.” And she said, “No, it is your problem only.” And within a month and a half, we were served with foreclosure papers. In a month and a half. There was no recourse. There was nothing.

So in this time that they put our house up for sale, we had to find ourselves a new home. And I was there for 15 years. So it’s not like two or three years in this house. It was a long period of time: grandchildren growing up, as everybody knows that’s had a home for any length of time. So expecting it to be my retirement home, in my home that I was going to live for the rest of my life in.

Then, we could not find accommodations because I have two big dogs. We could not find accommodations, so we were actually homeless for almost two months. We lived in our trailer. And my husband got this special smart hub that we could use for that area that he could continue to work from his computer, and well, remotely. So, we were off grid for that length of time. And again, begging the broker company, if we could, please— We will pay to stay until we can find a home. They said, “No. You have to be out by a certain date.”

There is a lot more that goes with that. As I was working, I have my very best friend in the entire world. My mom and her mom were best friends, and they were pregnant with both my girlfriend and me. So we’re only a few months apart. But she’s a nurse. And she came in for her haircut. It was the day that I had the interview with Sheila. So it was exciting. I’ve never experienced anything like this. And I was explaining to her what I was about. And she basically told me that I was an anti-vaxxer, anti-masker, A-hole. And that I was the reason why this society is where they are. I have yet to ever speak to her again. So to lose a lifelong

friendship that's probably— Even though losing my house was very heartbreaking, but that was probably the most scarring in the entire world. And still to this day. And knowing what she must know now, she's a pediatrics' nurse. So I'm only going to assume that she must have heard something. But that I just wanted to add in there. I don't know if there's any more questions.

Shawn Buckley

There's a couple of things I wanted to ask you questions about. So you're living in the trailer. You're off grid. Obviously, you can't work anymore because your hair studio was in the house. And you told us you were a diabetic.

Tracy Walker

Yes.

Shawn Buckley

Am I right that you actually were in such financial straits that at times you guys couldn't eat and you had no insulin?

Tracy Walker

Yes, that is a fact. Yeah. So insulin is not covered, even when you have Blue Cross. And of course, when you're having no money and no means to work, our food was very minimal. But that's how you stay slim. No, just kidding. It's the worst way to get skinny.

[00:10:00]

It's the worst way. But yes, it affected both my husband and I. My husband lost 35 pounds over that time, and I lost about 15 to 20 pounds. But it could have been because I had to stretch my insulin, so that instead of the full amount, I would take portion amounts, which is so wrong to do. But it was the only thing that I could do to make it stretch till I could make enough money or my husband could make enough money to pay for some more insulin. So yeah, I was in dire straits for a while, and it did affect my health greatly.

Shawn Buckley

This would have been in Alberta, Canada likely in 2021?

Tracy Walker

That's correct.

Shawn Buckley

So you told us that after your interview— So you're still at your home, you haven't been foreclosed on yet, that you had visits from the bylaw officer. Can you share that with us?

Tracy Walker

So okay. Yes. So the foreclosure. On their end, it took a while for them to get the For Sale sign on my front lawn. But the bylaw officer that first came by— Of course, I was like, okay,

here we go. I'm going to jail. My client literally ran into the bathroom. And so he handed me a warning, not a ticket. It was a warning. But when I explained to him, and I said, "Sir, you have to understand that I have no other means to survive. I'm a diabetic, and I need— It's not that I'm doing this out of rebellion. I'm doing this out of pure survival. And I have no choice but to break the law." Or this mandate because it wasn't a law. And I clarified that with him that it was a mandate, not a law.

And I said, "Look at my studio. There is no way that I am more contagious or more at risking people than Walmart or Superstore." And he agreed. He nodded his head. He didn't say yes, but he nodded his head. And then, he had come back, probably three times since then. He was told that— He said, "Okay, so I have to hang this notice— 'Do not enter, forbidden territory,'" if you may, for lack of better words. And he said that, "I was supposed to nail this to your front door or to the door to your studio." Well, I have a glass door. So he looks at the glass door, and he looks back. And he says, "Apparently, that's not going to work." So he just said, "Here you go, I'm handing it to you. And just so you know, I'm going to be off for the Christmas months. And there will be another gentleman that's going to be stepping in. He's going to be driving in a black SUV. He'll be driving up and down your back alley and in your front yard watching for people to come and go."

Now, this is at Christmas time. As a hairdresser, that's the busiest money-making time. And all he told me, God bless his soul, he said, "Just keep your blinds closed and try and keep it as minimal congestion and all." And I don't have a lot of clients that come all at once, so it wasn't a big deal. So, I just carried on. And then I did get a call after Christmas from the same bylaw officer and said, "Thank you so much for abiding by the rules," which I didn't. And he said, "It was reported that they saw no reason for suspicion that you were doing anything wrong," and that he wanted to thank me for that. So I don't know if one talked to the other, and one said, just whatever. I don't know, but I had grace. And I'm very grateful for that.

Shawn Buckley

You were shown kindness.

Tracy Walker

I was shown kindness, I was.

Shawn Buckley

Thank you. Now I have no further questions. I'll ask the commissioners if they have any questions for you.

There being no further questions, Tracy, on behalf of the National Citizens Inquiry, I sincerely thank you for your testimony today.

Tracy Walker

Thank you for the opportunity.

[00:14:52]

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 7: Judy Soroka

Full Day 1 Timestamp: 07:13:25–07:22:04

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness today is Judy Soroka. Judy, can you state your full name for the record, spelling your first and last name.

Judy Soroka

My full name is Judy Soroka, S-O-R-O-K-A.

Shawn Buckley

Judy, do you promise to tell the truth, the whole truth, and nothing but the truth?

Judy Soroka

I do.

Shawn Buckley

Now, you are a retired nurse.

Judy Soroka

Yes.

Shawn Buckley

And in connection to your nursing practice, you sustained a back injury back in 1992, which is now chronic?

Judy Soroka

Correct.

Shawn Buckley

But that injury resolved and you were able to keep working as a nurse.

Judy Soroka

Correct.

Shawn Buckley

Now, over the years and into your retirement in 2017, you basically were able to keep things going and in check by doing things like having chiropractic, massage, physio, and other things. Can you tell us about that? Tell us what you were doing, and then tell us what changed once the lockdowns came.

Judy Soroka

After the injury resolved, I really didn't need any regular health practitioner services. I was able to exercise, maintain a healthy lifestyle with running and hiking and doing gardening. I love gardening, and the like. And then as, of course, aging happens, I was having some discomfort and went to my doctor, and she suggested I see a sports medicine therapist.

This was in 2009. And he recommended a prolotherapy, which is a different kind of therapy. It's not cortisone injections, but they use a 10-inch needle on a 10-millimetre syringe and inject a sugar solution in the back just to stimulate the healing of the back. And that worked very, very well. I was able to go back to do whatever I was doing. And then when the lockdowns came, I was able to go to the gym. I was lifting weights. I was probably the healthiest person, for a nurse. For a nurse, we always sustain injuries. I was doing pretty good. And then when the lockdowns happened, I could not go to the gym. I could not swim. And I began to have more pain. So I went back to my doctor and again referred me to the same sports medicine specialist. Fortunately, he was still around. He hadn't retired. And again, I had the same prolotherapy treatment in the other side.

And just so you know, those treatments are not covered by Alberta Health Care. They're about \$250 a shot and looked about— Usually about 10 injections into the site. That did not really resolve the problem. The first one was successful. This one was not quite successful. I finished the treatments in 2021. In conjunction with this therapy, I also was to go to a physiotherapy. There are special exercises to do to help with the healing and the strengthening and endurance. And I was not able to do that because of the lockdowns. Moreover, I chose not to get the gene therapy based on my research. And of course, there's repercussions from that. So when the lockdowns were lifted and we needed the vaccine passport, I was disallowed from participating in society as other people did. I was not given the privilege.

Shawn Buckley

And just so we're clear. So you weren't able to go swimming again. Which was necessary for you to keep your back problem in check?

Judy Soroka

Yes, and to go to the gym to do the exercises that I had to do. I was not able to do that. So consequently I still had more pain. I went back to my doctor, and I said, "I think I've got a new normal going on here." She says, though, "There's no new normal for you." And I've

been with her for over 30 years. And we did the x-rays, and the x-rays have shown that I have deteriorated in my spine. I've got a bit of a curvature and my spine is now twisted where it's impinging on my spinal cord. Surgery is not an option; risks outweigh the benefits. If I'm unable to maintain some sort of mobility I could end up in a wheelchair.

Shawn Buckley

Am I correct that if it twists any more, there's a danger of paralysis?

Judy Soroka

Yes, that's correct.

Shawn Buckley

You were telling us that you were very active prior to the lockdown. My understanding is,

[00:05:00]

and you mentioned garden, but basically you would also hike. You were a White Hat Volunteer at the Calgary Airport, so you'd be walking a couple of k [Kilometres] a volunteer shift. Basically, you were extremely active prior to the lockdowns.

Judy Soroka

That's correct.

Shawn Buckley

How are you now?

Judy Soroka

I've had to give up a lot of things, which is very, very hard for me. People accuse me of "the moss doesn't grow under my feet." My husband can attest to that. But I've had to give up gardening. I cannot go back to the airport at Calgary. I cannot walk long distances. I cannot sit for lengths of time. My height is actually shrunk two inches, and I am short and that doesn't help matters.

I've got beautiful grandchildren. I cannot play with them like I'd like to. It's not a day that goes by that I don't have pain. I have declined to go on strong painkillers, like narcotics or using cannabis or anything like that, because I could not function that way. So I live with pain pretty much every day. I bought a new mattress, three thousand dollars for a new mattress, to see if that would help. I've done everything I can. And in discussion with my doctor, she didn't really intimate that it was because of the lockdowns, but she has recognized there was a change in my physical status before and now.

Shawn Buckley

Now, how has this affected you socially, the lockdowns, and then also not being to attend in different places because you're not vaccinated?

Judy Soroka

There has been a huge division. I've lost, as a previous lady mentioned, I've lost long-term friends. They're afraid to be around me. My mother passed away in September of 2021. She was admitted to the Peter Lougheed Hospital, diagnosed with one condition, but she died with COVID. And there's an accusation that I gave her COVID because I was not jabbed, if I may say so. And that was really hard. The remarks were very, very cruel. And my mother had not been vaccinated, injected, until she was into the hospital, and she died within a few weeks. Socially, yes, I've lost long-term friends. I will be celebrating my 45 nursing-year reunion in June. And I cannot go to that because there have been comments made from my classmates—who I thought better of, as critical thinking nurses open to debate and dialogue—that the unvaccinated essentially should not be part of society, and it would be okay if they just died.

Shawn Buckley

And how do comments like that make you feel?

Judy Soroka

It's very hurtful, very cruel, and I do acknowledge that and I do mention that. But it just doesn't seem to sink in that those remarks are very cruel and very hurtful and that it's not true.

Shawn Buckley

Judy, I don't have any further questions. I'll ask if the commissioners have any questions for you. And there are no questions. Judy, on behalf of the National Citizens Inquiry, I sincerely thank you for your testimony today.

Judy Soroka

Thank you for your time.

[00:08:39]

Final Review and Approval: Anna Cairns, August 30, 2023.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 8: Dean Beaudry

Full Day 1 Timestamp: 07:34:37–08:47:35

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

[No audio until 00:01:14]

Dean Beaudry

My name is Dean Beaudry, D-E-A-N B-E-A-U-D-R-Y.

Leighton Grey

Mr. Beaudry, do you promise to tell the truth, the whole truth, and nothing but the truth in this proceeding?

Dean Beaudry

I do.

Leighton Grey

All right. Sir, I've mentioned earlier your education and your background. I'd like to go into this a little bit more before we dive into your presentation. I understand that you spent about 30 years working for Syncrude in Fort McMurray, working on multibillion dollar projects in terms of managing risk assessment and mitigation methods. Is that right?

Dean Beaudry

That's correct.

Leighton Grey

You retired about seven years ago, and you now live in Cochrane?

Dean Beaudry

Right.

Leighton Grey

Okay. So I understand that you've developed a presentation called Quality Decisions in High-Stakes Situations. Before you delve into that, I wonder if you could just give us an idea of what caused you to create this presentation. What was your motivation? Inspiration? Your muse?

Dean Beaudry

Well, I was asked to present, so I had to find something to present. I volunteered to be part of this initiative, and someone picked up that I had background in risk management. So when I was asked to talk about it, I had to do a lot of homework. If I'm honest about this, I've been working pretty hard on this for about a month. I made many more slides than I'm actually going to present today, and I had to pare it down. So I'm going to not only talk about risk management but a little bit of management in general. And I'll also say that within my career—at least a dozen times—I've been the lead investigator in major incidents and had to produce reports for that. What I'm presenting is kind of like that work, that I'm quite familiar with.

Leighton Grey

I wonder if you wouldn't mind then going into your presentation [Exhibit RE-5-Beaudry-Presentation re NCI Red Deer-Final], and then I'll have a question or two afterwards once you've completed that.

Dean Beaudry

Sure. Okay, this is kind of like a movie where the movie gives you the end. You get to hear the end part of the movie first. I framed it this way because I think what I have to present will be more understandable in the context of this.

This diagram is a root cause analysis. When you have an event like we've had where Canadians have suffered, basically, you ask the question, "Why?" There's lots of detail in here you can look at as I'm talking; I'm not going to go into it in great detail. But what you'll see in the next two pages is I get these down to what we call in investigations "the root cause."

So just as an example. We'll start with, Canadians suffered severe social, emotional, educational, mental and physical health, and economic consequences as a result of federal and medical governance and COVID actions. So you ask, Why? Why did that occur? So on the left-hand side: The priority was higher for

[00:05:00]

COVID over equally important health and national issues. Well, why was the priority higher? And there's two roots below that. They are, procedures that balanced priorities were dismissed as well as international experts and Canadian stakeholders calling for balancing of priorities, were dismissed.

We'll go over to the right-hand side and look at another "why" Canadians suffered. Well, there was high levels of social isolation, division, and fear. Why did that occur? Well, the unvaccinated, unmasked, and dissenting opinions were vilified; COVID mitigations caused isolation; and fear was used to drive compliance. So I'm just going to leave it there. But I'm going to talk to the roots that are highlighted.

So one root was, scientific process was not followed. So when you follow a scientific process, ideally, you get to what's true and right. And then, on the right-hand side, there's a root there, "The vision and values that once defined us as Canadians has waned." We're not quite the same nation we used to be. If you have good vision and values, you have the conviction to do what's right. So in essence, you could stop there. If we know what's true and right and we do what's true and right, we don't have this fairly terrible outcome.

But there's other reasons. And another root that I end up on this page with is a "Broken consequence model," which we'll elaborate on further. And just to carry on and finish the root cause, one of the roots was "Unchecked and inadequate governance action." Well, why did that occur? Well, there was public trust. And why did public trust occur? Well, I think there was some naivete. And also you get down to "The government has a lot of influence on media."

I think, probably the biggest root for unchecked governance action was "Undue authority." And why did that happen? Well, there was a suspension of Charter rights and that provided the authority for general lowering of ethical and privacy standards, coercive vaccination requirements, vaccine passports, travel restrictions, lockdowns, all the bad things that happened. But also it eliminated the requirement for critical thinking and difficult decisions.

So I was a manager for 20 years. I had management peers, and the easy answer was always, "Give me more money. I got a problem. I need more money." Well, when you give a manager some more money, they just spend it rather than critically think. And so sometimes we have to have a pause to cause ourselves to think harder.

Leighton Grey

Sorry, did you say manager or cabinet minister? I didn't catch that.

Dean Beaudry

I was a manager. So when we do a decision, it's not that complicated. There's priority, information, alternatives. You do a deliberation, and you come up with a decision. In my experience, high-stake decisions always have tension. This isn't a new thing. Any business that has risk in it is doing this all the time. So we in Canada, we end up with a big risk. Those decisions have tension. And that tension can be good or bad. So to push it on the good side, there's some guideposts that we use. And the first one is around emotion.

Emotion has really no place in a high-stakes decision. We need to detach from emotion. I'll give you a personal example. So about 30 years ago my wife and I took a rock-climbing course, and I found myself 20 feet above the ground many times. But this one time, I had worked out really hard before I climbed up 20 feet. I got 20 feet up, and my muscles started failing. And my hands start shaking, and my legs are shaking. And then fear begins to grip me. I was paralyzed with fear. I had full fall protection. I could only fall six inches. But I was paralyzed with fear. So reality and my emotions were not connected at all.

[00:10:00]

And so, we have to disconnect from our emotions. You also have to disconnect from other people's emotions.

So there is a number of decisions that I've made in my career where I've actually had people right in my face telling me I was trying to kill them. And that's a pretty tough spot to be. We need to honour those emotions. And in circumstances that occurred like that, I would sit down with the individual and give them the background to the decision, all the data that was used in the input of the decision to help them get more comfortable for what we're going to do. In fact, on one occasion, I had an individual in my office making a declaration like that. I said, "What time are you doing the job?" "Why?" "Because I'm going to come out and stand beside you." And he said, "Okay. That's good enough." I didn't even have to give him an explanation. I'm willing to do what I'm asking you to do.

The second emotional thing is cognitive dissonance. So we all develop our own opinions, and sometimes we get new data that conflicts with what we think. When we are dismissive of that data, that's called cognitive dissonance: where what we feel and the information actually are in conflict. So that's why emotion is a really bad thing to use in a difficult decision.

The next guidepost is around authority. So authority needs to come from knowledge and sound judgment. People have positional authority. That's a bad place for decisions to come from. A person in a positional authority should be ensuring that knowledge and sound judgment is used versus just making the decision. I see that failure occurring too often. Another important guidepost is your character. So there's ethics and accountability. On the ethics side, if there's a conflict of interest you need to declare it and take yourself out of the decision. Or, at least, declare it so that people know what your bias is. And then accountability, which is people's ability to count on you. If you're not willing to put yourself in the position of someone who might suffer a negative consequence as a result of your decision, you are not accountable. If you're not willing to take negative consequences yourself when you make bad decisions, you are not accountable.

And then competence. It's funny that competence is the lowest one on the list; it's important, but it's not the most important. So you have to have the competence to ensure that you've got the right priority and the right information and the right alternatives. And typically, that doesn't exist in one or two people. Typically, you don't do well unless you have people with different biases involved.

So the strategy for minimizing failure points is to bring everybody on the same side, which can be really hard when you've got strong biases. In order to make that work, you need some ground rules—guiding principles or values—and you need a process. I'm a trained facilitator in situation appraisal, problem-solving and decision-making, risk assessment, and management. There's tools—they call them instruments—that help guide groups with dissenting opinions to a good answer. So if you've got ground rules and a process and a group facilitator, you've got a better chance of achieving a good result.

Consensus is what you're trying to achieve. And that's not necessarily agreement, but the participants can live with and support the priority and the information, the alternatives, and the decisions. Once they support it, they're bound to support it publicly. So you can't be involved in this and agree in the group and then go outside and say, "I don't agree with what everybody said or did." You might not like it. But you understand, and you find it acceptable, and that's really what consensus is.

Applied science is a process. So we didn't do applied science: The only reason not to do this is when control is prioritized over doing what's right. And that's a values failure.

So here's—from where I used to work—most of our guiding principles. I'll just read a couple of them to you. I think you might agree that it's easy to get agreement on these types of principles.

[00:15:00]

"We have the courage and conviction to do what is right: we achieve our results with courage, wisdom, and integrity, being ethical in all of our endeavours, principled in our decisions, and accountable for our actions.

"We interact with care, honesty, and respect: we uphold the dignity and worth of our colleagues and everyone we interact with in our communities."

So really, these principles—I'm not going to read them all—but they answer things like priority. They answer things like stakeholder engagement, character. And then they answer where we get our authority to make a decision.

So now we're into the meat of things. This colourful table is called a risk matrix. When we do risk assessment—when we evaluate risk, when we evaluate mitigations—we use a risk matrix. Lots of people believe that risk is consequence: I'm going to suffer death. That's only half of the equation. We also need to put probability into that. So there's some tables on the right that show probabilities, and really, probability is just a number. We've got some word descriptions like "it's a 'likely' probability; it's an 'unlikely' probability, 'rare.'" But those all translate to numbers, and the numbers are on the page there. And then consequence—we've talked about death as a consequence—that's also on the table, on the right.

So just to put this in context, I've got an example. In 2020, there were 15,000 accidents that were fatal in Canada. So the probability is grade four math; I'm an expert in grade four math: 15,000 over the population of Canada gives you a number, and that's a Probability 2. See over here. So a Probability 2. And it's a fatal accident, so it's a C4 [Consequence 4]. When we put it on the matrix, it looks like that [generalized Medium Risk 8].

When we've got a new risk coming up, we should be comparing it to a risk we're familiar with. Because new risks are— They get into your emotions if it's something really unfamiliar. So accidental death in Canada: it's a generalized Medium Risk. It's an everyday risk we're at peace with and we all tolerate. We apply diligence to it, but we're not stressed out. I drove from Cochrane today: I wasn't stressed out driving here; I could have been in an accident. So it turns out that the generalized COVID risk is exactly the same as accident risk. And I'll show you that a little bit later.

What is risk mitigation? Risk mitigation is putting a barrier in front of the hazard. So ones we're familiar with are seat belts and airbags, and they address consequences. They aren't helpful if you're not in an accident. But if you're in an accident, they reduce the probability that you will be harmed more than you would if you didn't have those mitigations in place.

Probability mitigations are those actions that you take to reduce the probability of something happening. So attentive driving is a good example: if you're paying attention to your text, your cell phone, your probability of being in an accident gets higher.

Mitigation effectiveness assessment: In risk management, when you add a mitigation, you have to evaluate it. Does it cause a change to the risk position on the risk matrix? So if we go back [Risk Matrix Table]— If I'm going to mitigate, say, something up here, it should

cause a change in position. It should be down and to the left. So that's what it means, that we need to change the position in the risk matrix.

Does it introduce new risks? Because, sometimes, mitigations do. And airbags are a good example of that. So airbags introduce a new risk to small children. That's why they had to add a mitigation on the mitigation. That's why when I've got my grand puppy in the seat beside me, the airbag is not deployed because the dog weighs less than what's safe for that airbag to deploy. And then, is there cost benefit?

[00:20:00]

And, again, if there's new risks, are they mitigated?

So let's get into a little bit more detail. This table [COVID Risk Factors], the first column is age group. All the data that I will use relative to COVID comes from Government websites. So the first column is the age group. The third column is the number of deaths that occurred in Alberta in those age groups. The fourth column is the number of people in that age group. What we see is that the average age of COVID death is 79, and 99 per cent of deaths were over 40-years-old. And nine one-hundredths of one per cent [0.09 per cent] were in the under-20 age group.

So I heard a little discussion earlier about pre-existing conditions. I pulled this off of the Alberta website. You can't find it anymore. I just happened to get it before it was taken down. And we can summarize some things from this. The average number of pre-existing conditions of a COVID victim was 2.6 or more. You'll see this red part of the chart here; it says three or more. So that's why when I average it, I say 2.6 or more. Ninety-six per cent of COVID deaths had at least one pre-existing condition, and four per cent of COVID deaths had no pre-existing condition at all.

I also took another snapshot down. It is now disappeared, but it came from the Alberta Health website. In the four months leading up to early June 2022, there were 868 COVID deaths: 79 per cent of those were vaccinated; 21 were not vaccinated. At this time, Alberta's vaccine-unvaxxed ratio was 77-23. So vaccination didn't stop anything: infection, transmission, or death. I'm not saying vaccines didn't have some impact for some people. I'm just saying this is a factually correct statement.

So now let's put these age groups on that colourful risk matrix. If you look at this table over here [Probability vs Reference Risk], each of the age groups is labelled with a letter designation. If you look on the matrix, I've had to add boxes for D and E, so the people under 40 aren't even on the risk matrix. I want to make sure I'm clear: I've added those boxes; they aren't on the risk matrix. So if you're in a business and you are good at **managing risk, you do not put a mitigation in for something that's not on the risk matrix. It's illogical.**

Now, there were 32-and-a-half million vaccinated Canadians: that's from the Canada Health website; that's people that had two jabs. There were 10,685 serious adverse events. We just do our grade four math, and we get a number [10,685/32.5 million = 0.00033]. So we're not talking about death here; we're talking about a serious— So we're in this column [C3, Significant] and this probability [P2, Unlikely].

Okay, so what are these serious adverse events? This is again from the Canadian website: 427 deaths reported; 1,500 cardiac; 1,500 clotting; 87 spontaneous abortion; 468 paralysis and stroke. And we've got a safe vaccine. So if we look at just the deaths and we do 427

over 32-and-a-half million, we end up with 1 in 75,000, which is also off the risk matrix. So from the perspective of death as a result of the vaccine, it is an acceptable risk.

So this analysis is more like an autopsy; it's based on what's already happened. Health Canada statement says, "The benefits of all COVID-19 vaccines continue to outweigh the risks of the disease."

Well, what about the risk of vaccine injury? So for the under-20 age group, 670,000 people would have to be vaccinated to save one life, and that would probably result in a vaccine injury to 221 people,

[00:25:00]

including nine deaths. So the harm far outweighs the benefit. So I don't know what risk matrix they're using, but the one I have 20 years of experience, or close to 30 years' experience in, wouldn't support some of the statements that they've made.

So when we talk about moving on the risk matrix, you'll see the people in age group A would move with the mitigation down and to the left, which is what we want. The people in group B would move to the left, which is what we want. The people in groups C, D, and E would all be moving into a worse position on the risk matrix.

This isn't new information. This was in the Great Barrington Declaration, which states, "We know that vulnerability to death from COVID-19 is more than a thousand-fold higher in the old and infirm than the young. Indeed, for children, COVID-19 is less dangerous than many other harms, including influenza." So I looked at the influenza results for Alberta this year. There's been three influenza deaths in the 0-19 age category; that's higher than the annual rate of COVID.

So let's talk a little bit more vaccine risk benefit. I'll explain this table a little bit. The age group is in the first column. The number of people that have to be vaccinated depends on the efficacy of the vaccine. If you want to save one life in the under-five age group and the vaccine efficacy is 50 per cent, you have to vaccinate 1.5 million of these children. If the efficacy is 25 per cent, you have to vaccinate 3 million. But when you do that, if you apply the injury and death rate, you can see that anything that's in the red, you just don't want to do it. So Health Canada implies that vaccines are safe at one death per 75,000 vaccinated—two-jab people. Using the same criteria, you are safe from COVID in the red shaded area without vaccination. So we have this data available to us, and it would have been available within the first six months. They would have been able to see the stats rolling in. Perhaps we could have had a health care practitioner that could use tables like these to provide vaccination guidance to individuals or groups based on age, pre-existing conditions, risk tolerance, and vaccine efficacy.

It's interesting that 10 countries didn't have a pandemic. So Nigeria, Republic of Congo, Tanzania, Niger, and there's six other countries like that that have deaths in the 15 people per million population as a result of COVID. Of the 10 countries that had a population of 438 million and compared to G7 countries, they did between 1 and 200 times better. So I heard someone say earlier: "We're not a third world country." I kind of wish we were a third world country. For Canada, the results would have meant about 98 per cent reduction or 50,000 fewer deaths. So my question is, Wouldn't science or just due diligence want to know why 10 countries did not have a pandemic? And didn't we have the money to assess this? We built up half a trillion dollars in debt. Couldn't we have sent someone to

investigate this and understand it? Ironically, all 10 of those no-pandemic nations have endemic malaria, so they use anti-parasitics.

Lockdown effectiveness. So Sweden, they delegated down in their bureaucracy to the state epidemiologist who said, "The cost of locking down would be horrifyingly high." He's a prophet. So the Swedish population had a few restrictions, but most COVID measures were entirely voluntary. And this chart compares the U.K., or Britain, to Sweden. Britain had fairly severe lockdowns. Sweden had none. If you look at the two traces,

[00:30:00]

they're pretty close to on top of each other. And if you look at the data, when we had the data, you look at these first two bumps. This line [green line] represents the end of 2020: at this point, you could write a master's thesis on this data and make decisions from it. So Sweden, without locking down, achieved better COVID results than other G7 nations, such as USA, Italy, U.K., France, who had some of the most stringent lockdowns. And the question, doesn't science have curiosity? Don't we want to understand how an alternative approach was working? Didn't we have the money to research this?

And then, one more little point: South Dakota was the only state in the USA that had zero lockdowns. Twenty-one lockdown states had higher COVID deaths. South Dakota was right in the middle of the states in terms of their COVID deaths. So just another mitigation effectiveness point.

Another point here is if we'd applied lockdowns when death rates were going up and taken them off when death rates came down—reapplied, took them off—we would have convinced ourselves that we were doing something of value. Very good correlation here. No causation whatsoever.

So Alberta ICU [Intensive Care Unit]: two weeks to flatten the curve. So the blue line here is ICU capacity; the pink shaded area down below here is how full is the ICU. So in 1100 days, the ICU was overfull for 17. And it got to about 10 per cent overfull. Again, you can see the blue arrows up and down related to lockdowns increasing or decreasing. And there's one more flag on here: This flag is, by the time we reached mid-July 2021, all the over-age-40 people or 99 per cent of the vulnerable people had been provided vaccine opportunities. I don't know the rate at which they were vaccinated, but they were all provided the opportunity. And the peak in ICUs came after that. We, again, added half a trillion dollars in debt, and we didn't build any more ICU capacity.

So masks, I just took one piece of information from the organization called Cochrane, and it's got nothing to do with where I live. Its reviews have been considered the gold standard. **And this is their statement: "There is just no evidence that masks make any difference. Full stop."**

Now, let's talk about priorities. The legal priority of the Government is to uphold the Constitution, and within the Canadian Constitution is the *Charter of Rights*. The *Charter of Rights* protect freedom of association, expression, religion, et cetera. "In order to suspend these rights, section 1 requires that there must be evidence that either the state is in peril or the existence of the state is in peril." So that's words from Brian Peckford. And I was told also, to state that "Canadians are in peril." Okay. The onus of proof on section 1 is on the person seeking to justify that limit, which in this case was the Government.

So here's the top 10 leading causes of death in 2020. When we do our probability math, we see there's actually two buckets on this page. Below the red line is Probability 1. Above the red line is Probability 2. And I also want to talk right now about what an emergency is. An emergency is an urgent, sudden, serious event or an unforeseen change in circumstances that necessitates immediate action to remedy harm or avert imminent danger to life, health, or property.

So if we go back to our accident example—on an individual basis when there's an accident—someone might be bleeding, they need emergency assistance: we need an EMT [Emergency Medical Technician] there, lights and sirens, et cetera.

[00:35:00]

But when we're talking about national, we're not talking about that. We're talking about the national risk and the national harm.

So the national harm— And this is really cold and unemotional. People die from COVID; people die from accidents. That's really crappy. But we need to approach decisions like this without emotion. The national harm is death of four one-hundredths of one per cent [0.0004%] of the Canadian population each year. That's what accidents are. It's the same for COVID. And it continued to be the same for three years, and now it's declining. This year it looks like it'll be about 11,000. So it's going to fall below the red line this year.

Which is more peril? Accidents or COVID? Accidents pick on everyone: COVID picks on the aged and infirm. Accidents are normalized: COVID is fear-producing. Accidents and COVID produce about the same number of deaths. Accidents produce 225,000 injuries a year: long-COVID, I don't know. I couldn't find data on that. For accidents, the mitigations are harmless to individuals and harmless to society, and are subject to proper legislative process. The mitigations for COVID cause loss and suffering to individuals, cause loss and suffering to the nation, were subject to coercion through unjustified emergency powers and medical ethical violations. Accidents are easily characterized: COVID competes with 2.6-plus other potential causes and pre-existing conditions.

So they're the same. There is equal justification to suspend human rights to mitigate accidental deaths as COVID deaths. And I would say a mitigation that would be effective on accidents is to close highways to all but essential traffic. That sounds a bit absurd, doesn't it? So when you're looking at this, if you go back to the previous table [2020 Top 10 leading causes of death] and on the left-hand column, those were all labelled A, B, C, D, E, and you didn't know where COVID was, you wouldn't think it was an emergency because you got so much evidence that it's not.

For a nation, the logical priority is to protect what underpins our needs. Same with a business. I worked where we had a goose that laid golden eggs, and business is the goose that lays the golden eggs: it pays for all basic needs of all individuals and is a source of all Government revenue and social security. And the hierarchy in business is production. Production underpins all business: the production of lumber, the production of wheat, the production of cattle, the production of minerals, the production of automobiles. That's what our economy is built on. And thriving business leads to affordable food, energy, and housing, and supports the tax base.

So we've got legal priorities and we've got logical priorities. Let's put those mitigations on the matrix [Mitigation Results]. I'm not going to go through what vaccinations and the

mitigations did not do; I've already done that. But on the financial side, it didn't take much homework to see some really disturbing things.

So per taxpayer, we're going to be paying about \$3,300 in debt servicing compared to 2019. So a two-income family, that's \$6,500. If someone has a \$300,000 mortgage and they didn't have a fixed rate, they're going to be paying about \$8,300 more. Rents are \$2,000 a year or more. Food for a family of four—that's from Dalhousie University—is up \$4,000 since 2019. Heat and fuel is up \$2,000. And I want to be really conservative in this number, and so I picked a conservative number: there's 15.3 million households, works out to about \$170 billion a year extra that Canadian families are going to have to pay.

[00:40:00]

And that's not including paying down the debt, which really is just deferred tax. So our mitigations moved our national risk—which was a medium risk—to extreme.

Accountability—This chart shows a business here in the light blue, and at the top of the chart is the C-suite: the CEO [Chief Executive Officer], the CFO [Chief Financial Officer], Chief Medical Officer. In a private and publicly owned business, that suite of people have legal and personal accountability. If they make very bad decisions, they can go to jail. If they make poor business decisions, they can lose compensation. It's what real accountability is about. Without consequences, there is no accountability. Immediate and certain consequences are strong; those can be as simple as a pat on the back or a boot print. Future and uncertain consequences are weak. I've probably done 2–300 performance appraisals in my career. And about 80 per cent of people really don't connect with those very much. They don't relate to them. It's only once a year, and they don't know what the outcome is going to be. So can you imagine if there's an election every four years? That's a really, really weak consequence.

So we have a broken consequence model [from slide].

Pfizer and Moderna had unprecedented revenue increases: Pfizer's up 70 billion a year for at least two years now; Moderna is up 19 billion a year for at least two years. Moderna's income was zero four years ago, and now they're making 19 billion a year. The federal government contractually transferred liability for vaccine injuries from Pfizer and Moderna products to the Canadian taxpayers, and those contracts are unavailable for taxpayer review.

The federal government bureaucrats received \$191 million in bonuses and raises throughout the pandemic. The MPs [Members of Parliament] received their automatic raises. The Canadian public received \$170 billion worth of cost-of-living increases, and **total deferred taxes went up by \$566 billion. And that's more than \$50,000 per Canadian.** So if you're a family of four, that's more than \$200,000 in deferred tax that you will eventually have to pay.

The vaccine injured received pain, suffering, stigma, long waits, and claim scrutiny. Vaccine approvers and safety claims have not been publicly scrutinized.

Mainstream media news generally aligned with government narratives. CBC [Canadian Broadcasting Corporation] receives \$1.2 billion in tax funding and received \$85 million in raises and \$99 million in leader bonuses over three years. Other mainstream media received \$600 million in taxpayer-funded corporate welfare, while mainstream media shareholders received dividends.

Individual lawsuits aimed at holding the government to account have to secure independent legal financing. The government chooses the arbiters of these suits and uses taxpayer funding to defend its actions.

Medical governance has disciplined doctors for non-compliance to approved therapies. Have they disciplined doctors who advised further vaccination to the vaccine injured? (I don't know.)

There are laws to ensure accountability of officers of private and publicly traded businesses. There are laws that indemnify elected officials.

Leadership—What we had was a reaction, and I would say an emotional reaction. What we want is vision. We want our basic needs met, and we don't want them met by the government. We want them met by a good economy. And vision looks like freedom and opportunity. What we had was bullying, gaslighting, and emotion. What we want is knowledge and capability, and that looks like seeking and acting on wise counsel. This nation is filled with wise people. What we had was lack of transparency and "cover your butt." What we want is commitment and accountability:

[00:45:00]

consequences commensurate with the result. What we had was division. What we want is unity and compassion, focusing on what brings us together. I took a cultural diversity course—I don't know—15 years ago. It was a three-day course, and I took away one thing: we're all 90 per cent the same. Why do we focus on a 10 per cent difference?

So I'll end with my prayers. God keep our land, glorious and free. You can look the other one up [II Chronicles 7:14]. Thanks.

Leighton Grey

Thank you, Mr. Beaudry. I wonder if you could turn to, I believe it's the fourth slide in your presentation. It's the one that has a strategy for minimizing failure points at the top. It talks about applied science as a process. That's the one. I wonder if you could put in that little part at the bottom right-hand corner? Yes. [Graphic reads: "The only reason to not do this is when control is prioritized over doing what is right—a values failure."]

I want to take what you said, and I want to put it in the form of what lawyers call "a hypothetical." And when people hear the hypothetical, it's going to sound hauntingly familiar.

So it turns out that what happened in this province, in Alberta, was that our government had no interest in a consensus process like you've described here. What we did instead is, under section 29 sub 4 of the *Public Health Act*, a Public Health Act dictator was set up. One person: Deena Hinshaw, Chief Medical Officer of Health. It seems to me that's the beginnings of where we went wrong. But you say there, in the bottom right-hand corner of that graphic, "The only reason to not do this is when control is prioritized over doing what is right."

I want to present you with a little hypothetical, and then I want to get your opinion about this.

Most people who have done any management training or taken an ethics course are familiar with something called the “dilemma of the trolley track.” It goes something like this. Trolley dilemma is an ethical thought experiment where there is a runaway trolley, a train, moving down railway tracks. In its path, there are five people tied up and unable to move, and the trolley is heading straight for them. People are told that they are standing some distance off in the train yard next to a lever. If they pull this lever, the trolley will switch to a different set of tracks but will kill only one person who is standing on the side track. People have the option to either do nothing, allow the trolley to kill the five people on the main track or pull the lever, diverting the trolley onto the side track, where it kills only one person. It seems that this has been presented many times all over the world. Results show that—over-ridingly—historically, people in Europe, Australia and the Americas (that’s us) were more willing than those in Eastern countries to switch the track or to sacrifice the man to save more lives. But in Eastern countries, such as China, Japan, and Korea, there were far lower rates of people likely to support this morally questionable view.

Let’s bring this closer to home. I actually put this trolley dilemma in some form to our Chief Medical Officer of Health when I had the opportunity to question her. I said to her, “Look, you knew that when you were imposing lockdown restrictions, you were suspending, violating the human rights, the civil liberties, you were destroying or upending their businesses, the economy, schools, all these things. You knew that. And you did it anyway.” Her answer was that, on balance, the lockdown restrictions and other public health measures were justified in the public good. So in her hierarchy of needs, in Alberta, we needed to preserve the healthcare system.

So my question to you is this: Seeing how our Chief Medical Officer of Health sorted out her own form of trolley dilemma,

[00:50:00]

would you agree with me that that proves your conclusion? That the only reason to do what she did was in the hierarchy of needs to prioritize control over doing what was right? Would you agree with that?

Dean Beaudry

I think we put her in an awkward position when we didn’t put her with a team.

Leighton Grey

Right.

Dean Beaudry

So there’s a lot of things to protect, and this isn’t an unusual situation. You encounter this in high-stakes business all the time. There’s always things that need to be balanced. There’s a lot of things that I feel went wrong.

When you put in mitigations and you don’t assess their impact or where they land on the risk matrix, that’s a big problem. When you have dissenting opinions and they’re qualified people and you don’t bring them in, that’s wrong. There were so many things that went wrong: the level of competency is either really, really unbelievably low, or what’s going on is intentionally trying to mess up our economy. It’s hard to believe that the incompetency

could be that low. This isn't that hard, and there's lots of expertise: we have lots of expertise in Canada; we are a brilliant nation. I can explain how to do it right based on 30 years of experience. I can't explain how anyone can possibly do it this wrong. I have no explanation.

Leighton Grey

Thank you, sir.

Dean Beaudry

I would say, though, that when we get to be a nation that doesn't protect our children, it sickens me. It's just unbelievable.

Leighton Grey

Well, I'm sure on that point we can all agree.

Thank you for your presentation. I'd like to open up to the panel now. Who would like to go first?

Commissioner Massie

Well, thank you very much, Mr. Beaudry, for your excellent presentation. I'm kind of familiar with these kinds of matrix risks. We used to do that all the time for our research projects.

One of the challenges as you do that is the assessment of the risk level because some of that are not that precise in terms— I mean, there's a value judgment in all of these risk assessments. I understand that in order to come up with the best possible level of assessment, you need to probably get the opinion from different people. And what I've seen as we were doing that, typically, is that the opinion varies with the individual. But also a very important factor in this variation of opinion is the further away people are from the operation—people that are really high up and not doing the stuff very often—would have either completely low, low, low level of assessment or extremely high because they are not connected.

So what would you suggest in order to practise that in a more meaningful way? Because you know, health is a big thing; it's not that easy to define. But what would you suggest, within government health institutions, to really come up with the best practice to do that?

Dean Beaudry

Well, it's called stakeholder engagement.

I was in a business. I worked in 13 different roles; I worked in many different departments. And every department thought the other department was stupid. And that's almost like human nature. That's why you bring people together because once you bring them together, you realize they're not stupid. You realize that their opinion has a basis. And if you're unwilling to do that, you're not going to get the right answer.

[00:55:00]

I had 20 years of people that really understood the vision and values and really understood delegation. And then the head of my organization was lopped off, and a whole new C-suite came in. And they were micromanagers; they thought they knew everything. And the performance of the company went down rapidly when that happened. So you need to engage the people that are closest to the front line. The frontline people— Like if in health care, all the doctors and nurses and everyone on the frontline had everything they needed, there would be no need for management. Period. If they're well-trained, they know how to do their jobs, there's no need for management. So management's job is to support them. And the way you support them is you get them involved in decisions that impact them.

So I don't know if that answers your question. But, yeah, it's stakeholder involvement. You need stakeholders involved. To be accountable, you have to be— you have to look the person in the eye that's having the negative consequence. When you're not doing that, you're just not an accountable person. And you shouldn't be in leadership.

Commissioner Massie

My other question in that space is with respect to perception of risk. Because sometimes people will have a perception, for example, that flying a plane could be more dangerous than driving their car. Because when they fly a plane, there's a lot of things that are out of their control. And when they drive their car, they feel that they have it under their control. So that's one aspect that can actually distort a little bit the perception of risk, and it could actually have a major impact when people will come up with risk assessment.

And I'm wondering, in the beginning of the pandemic, there's been a lot of decision in government in the western country based on modelling, which actually were predicting a very, very terrible outcome if government was not doing something to mitigate the risk. Do you think that this has distorted the perception of the risk and created all kinds of other consequences in the decision-making process?

Dean Beaudry

There is no doubt that that distorted how people felt about it. But when you do modelling— Like, if you do any modelling, you do testing with reality. Within three months of people starting to die of the pandemic, you could have looked at what the trends were and compared it to the models, and you would have found that they were vastly different. I would say, probably somewhere between three and six months in, you could have predicted exactly what—well not exactly—but quite close to what actually rolled out. It was predictable. So the modelling is— Well, it turns out it wasn't very useful, and it created fear. So emotion, we talked about it quite a bit, emotion needs to be out of these decisions. And understandably, it's hard to do that. But it needs to happen. We need to detach from our emotions. Lots of people have given testimony, and a lot of hurtful things have occurred as a result of emotion and not fact. And we've trended towards not listening to people who have experience in dealing with facts and information and data; we've trended towards opinion-based things.

At one point in my career, I was doing projects and just saw lots and lots of poor decisions coming out. I set up this criteria saying you need to write down the information that you're using to make the decision. You have to label it. You have to label it fact, opinion, or assumption. And that was transformative. Because once people realized that they were making decisions on basically hearsay or models or things that couldn't be proven as factual,

[01:00:00]

my project teams actually got to work. They started understanding the whole— When you're making a decision, it has to be based on facts or well-corroborated opinions, and minimize the assumptions. I can't see any evidence of that having occurred.

Commissioner Massie

You also mentioned that the data was probably baked in three months, at the beginning of the pandemic; we should have already adjusted.

Dean Beaudry

Right.

Commissioner Massie

And we've heard from other people, other experts, that it was true also for other data that were coming in for efficiency of masks or vaccine, and so on and so forth. And it seems a current pattern in government that there is a big lag between acknowledging what are the real data and the decision.

So I'm wondering, why is there this kind of inability to recognize or to update the data? Because you mentioned something about cognitive dissonance, I'm just wondering whether this inability to acknowledge that what we have thought needs to be adjusted—and it lags long, and there's a very long process before it is acknowledged—could that be due to what I would call emotional dissonance? In the sense that the status that you get from associating with your opinion is threatened the moment reality show you that it doesn't jive anymore. And you will probably cling to it to avoid the consequences of having your status challenged because you were not right for a certain period of time, and you really lag to acknowledge it. So what do you think about this idea?

Dean Beaudry

That's part of the values crisis. It's really hard to admit when you're wrong. But it's also very freeing. And you know what we have to do is we have to just practise it. Because you practise it a couple of times, and you realize your reputation actually gets better when you're honest. So yeah, it's part of the values crisis, and I can't answer for people who have different values.

But I will say this. When you get people in a room and you say, "Do you believe in these values? Do you believe we have the courage and conviction to do what is right?" no one is going to argue with those values. If they do, they'll be shunned, I'm sure. When we're together, we have better values. No one's going to say I like lying as a value. Or I like not being transparent as a value. And so, as Canadians, as leaders, we need to ask ourselves what our values are. Do we believe in telling the truth? Do we believe in being accountable? Do we believe in talking to the people that are most impacted by our actions? This is what the pandemic is: it's a pandemic of loss of values.

Commissioner Massie

Maybe I'll ask two quick questions, I guess. In your model, you took the numbers straight from the government website in terms of assessing the number of COVID dead or adverse effects of the vaccines?

Dean Beaudry

Yes.

Commissioner Massie

So if we take these adverse effects from the vaccine, we've heard other experts mentioning that there's most likely an underreporting factor. You have not used that underreporting factor in assessing whether the vax, as a mitigation measure, would actually move even further towards higher risk than lower risk.

Dean Beaudry

Well, definitely. You know— Who knows? If someone dies, they can't report their side effect. Who knows how much is there? That's why I use the actual numbers on the website.

Commissioner Massie

And even with these numbers, you think that the mitigation measure was not doing what it was prepared to do?

[01:05:00]

Dean Beaudry

I'm saying the mitigation appears to have been helpful for one or maybe two age groups. That's what it appears.

Now, if there were much more adverse events, then maybe it was only helpful for one or possibly none. I don't know without validated facts. I did hear testimony today where only half of the adverse effects were even acknowledged, and half of those were cancelled, if you will. So yeah, the number is probably much higher, and the risk is probably much higher. But I don't have my finger on that pulse. That data appears to be carefully guarded.

Commissioner Massie

On the case of the COVID deaths, you took the number from the government. So you're assuming when you range it in the same level as car accidents that all of the COVID deaths that we get from the official number are really attributed to COVID as a primary cause or main cause of death?

Dean Beaudry

Yeah, I didn't challenge— I just used the data; I didn't challenge. So if a third of them— If there's four comorbidities and the person has COVID, wouldn't that mean that only 20 per cent of them died of COVID? Maybe the other four comorbidities or pre-existing conditions were the cause. Unless we do an autopsy, we don't really know. And it appears like there

was a lot of encouragement to label things COVID when it wasn't. A 14-year-old died of brain cancer, and they say it was COVID. I don't think so.

Commissioner Massie

But your analysis is based on the official number? No challenge to that number?

Dean Beaudry

The analysis is based on the official number. Yeah. You guys can look it up yourself at Canada Health and Alberta Health. Except for the things that I've told you have been taken down. But I said I would tell the truth, and the truth is I got that information from Alberta Health.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

I would like to thank you for bringing forth II Chronicles 7:14. I think there's a spiritual component to the last three years that we have not discussed. So thank you.

My question has to do with very early in your presentation, you spoke about Canadians suffering severe social, emotional, educational, mental, and physical, and economic consequences of lockdowns and mandates. And I'm just wondering, just after that, you ask "Why?" But the question of asking why seems to be from a minority position, maybe. Or, also, the question of asking why is now.

Do you have any understanding as to why people did not ask why very early on when they were actually suffering these consequences?

Dean Beaudry

Well, I think the convoy was asking why. I think lots of people were asking why. And people with dissenting opinions were cancelled. If you look on YouTube policy, for example, it basically tells you, "Don't disagree."

And then you end up with— I had a family member when we were discussing this. This was someone who probably should not have been vaccinated and was getting vaccinated to protect my mother-in-law; and didn't I care about my mother-in-law? When you use **emotional blackmail, you get results. That occurred in my own family, and I'm sure it occurred in lots of families. And then when you take things away from people. Like, I got vaccinated: I'm retired. I want to travel.**

[01:10:00]

I want to see my newborn granddaughter. I can't do that if I don't get vaccinated. So tell me the question again. I think I got off-track.

Commissioner Kaikkonen

Maybe I'll move on a bit. Just from even today, the community standards of YouTube means that the National Citizens Inquiry can be put on suspension for seven days. So how do we get to the point where we ask, "Why?" or ask even more in-depth questions when, 2023, we still have to experience these kinds of things? When can ordinary Canadian citizens choose to ask questions?

Dean Beaudry

Well, this inquiry is the best thing since the convoy. When the convoy happened, I started to feel Canadian again. And this inquiry— I'm thankful to be here. It feels like I have an outlet for pent-up frustration. I feel like I'm among peers and friends and family, other Canadians that I love. I think this is the best thing we can do.

When you've got a person like Brian Peckford who's just such an amazing and honourable guy and mainstream media won't run his story— I don't know how you fix that. I just don't know. I've got family in mainstream media. One night, late at night, there was a conversation ended abruptly in order to maintain the relationship. And I understand. I understand people are in positions that basically require compromise in order for them to express themselves. Or maybe they can't even make that compromise without suffering some other consequence. The consequence model on all this is very, very broken. So I don't know the answer.

Commissioner Kaikkonen

Thank you very much.

Dean Beaudry

You're welcome.

Leighton Grey

It appears there are no further questions. Thank you so much, Mr. Beaudry, for your compelling evidence here today.

Dean Beaudry

Thank you.

[01:12:58]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 9: Colin Murphy

Full Day 1 Timestamp: 08:47:38–09:13:24

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Leighton Grey

Welcome, Mr. Murphy. Our next witness is Colin Murphy. He is a proud Albertan. Calgarian. Welcome to the National Citizens Inquiry, Mr. Murphy.

Colin Murphy

Thanks for having me.

Leighton Grey

Firstly, I wonder if you wouldn't mind just stating your name and spelling it for the record.

Colin Murphy

My name is Colin Murphy, C-O-L-I-N M-U-R-P-H-Y.

Leighton Grey

Sir, are you prepared to tell the whole truth, nothing but the truth, so help you God.

Colin Murphy

I am.

Leighton Grey

Sir, I understand that, as I mentioned, you are from Calgary. You're a businessman.

Colin Murphy

Yup. In business for over 22 years.

Leighton Grey

You have kind of an interesting business in that you produce and run large-scale sporting events and music festivals, right?

Colin Murphy

That's correct. We're a service provider for those events.

Leighton Grey

And you are involved in this with your wife.

Colin Murphy

Yeah. She helps on the side. It's been a family business. My dad started it a long time ago, and so it took a long time to slowly build up the inventory, build up the reputation, and the client base that we have.

Leighton Grey

So I understand that when the pandemic was declared, this was hugely disruptive to your business.

Colin Murphy

It's interesting. In the event space, when you get to be well known, you almost have your year laid out, especially when you've been doing it for 20 years. So around December/January, when it was coming to light that COVID was coming around, you immediately start to go, "Where's it going to impact me in three months? Five months? Down the road," right?

But you already have your summer laid out in December. So it's more: When's it going to hit? And what's it going to do? And how as a business can I get through whatever they're going to do? But it's unprecedented. You don't know what they are or aren't going to do to you. But you see it coming for sure.

Leighton Grey

Is it fair to say your business is somewhat seasonal, or do you have these events going on year-round?

Colin Murphy

I would say 80 per cent of my revenue comes in the summer. Those are almost all annual clients that always occur. You might get a deviation of five, ten per cent, more or less, but you always have the same clients. You're doing the same events. It's a great time. You know what you're doing. You have the staff. Everything is allocated perfectly.

Then in the winter we were lucky enough. It gets thinner. It's quite competitive, but we had one or two really solid clients. It was a sporting event, and you traveled all around Canada, and it was a great, great contract. We really loved working with them and just seeing all around Canada.

Leighton Grey

I understand that just in the first year, bearing in mind that the pandemic was declared in March of 2020, just in that first year though, your business lost over a quarter of a million dollars. Is that correct?

Colin Murphy

Well, so COVID happens, and everyone starts getting really, really nervous about it. And no one knows what's going to happen. So they basically cut everything in March. We were not allowed to do any more events. So we go home, hang with our family, and ride this thing out to see what's going to happen.

I believe it was around April where I think Quebec was first. They basically cancelled the summer. They said, "No more events in the summer." And quite quickly, Jason Kenney completely followed suit and said, "We're not doing anything this summer."

So I've got three permanent staff, including myself, and four or five contractors. And basically, our revenue went from \$300,000 to zero. We had to lay everyone off, had to cancel everything, and basically shutter the business. Everyone had to go off of employment because we didn't have the means.

The problem was that one of the things that was established was that the government was going to cover 75 per cent of the wages. But if you have no revenue, you can't cover anything. So basically, what ended up happening was we shut down to ride the wave out. And again, I'm going to be sympathetic. No one at that time knew what was or wasn't happening. You could get some data, but to be sensitive, you basically grinned and bore it and said, "Let's wait and see what's going to happen." This is the first summer. So the whole thing was completely shut down.

Leighton Grey

Notwithstanding that really catastrophic situation in 2020, I understand that you were able to retain and maintain some of your customer base.

[00:05:00]

Those of us who lived in Alberta during that time remember the phrase "graduated reopening," which started to happen—did you just cringe?—started to happen in 2021, right? And I understand that there was sort of a "bubble" approach that permitted you to put on some limited events in 2021. Is that right?

Colin Murphy

So most events have to work eight months to six months out of their event date to get organized and actually get all the ducks in a row.

The problem was that they shut down the summer, but when September came along there was no guidance. There was no leadership. There was no— Everyone was chasing everyone else saying, “What do we do? What do we do?” I honestly don’t think— No one wants to take accountability, so they defer everything to the next person. Even my clients— I don’t blame anyone. But everyone’s looking for answers and deferring to the next person, deferring to the next person, so that when they’re wrong, they can actually say, “Oh, that wasn’t me who made a decision. I relied on them.”

But, basically, most of my clients could not get any planning or anything done going into the next winter. But I was very lucky because one of my clients was able to establish a bubble and through those means we were able to hire some people back on and get through that with the revenue.

However, we came back up to the summer, and there were no guarantees the summer was going to be open. Because the summer was closed before, everyone was still nervous. So everyone had to basically hold back on all their plans. So once the bubble was gone, then you still did not know what was going to happen in the summer until Jason Kenny, again spontaneously, said two weeks before the Stampede, “Hey, we’re open! Let’s go!”

Leighton Grey

Right. COVID-free forever. Who could forget?

Colin Murphy

Let’s rock it!

Leighton Grey

I understand, also, that through your business you run events, you produce events, outside of Alberta and that this posed a problem for you in terms of the differences in restrictions as between Alberta, Saskatchewan, Manitoba, and other provinces. Do you want to talk about that a little bit?

Colin Murphy

What’s interesting is people don’t really know how things flow.

So we’re going to get into vaccination time. The whole goal was that once everyone got vaccinated, everyone could return to normal; we could start doing events again.

Unfortunately, I’m not vaccinated for my business, and I’m looking at this— One of my main clients who did the bubble and they presented me with a scenario in August saying, “Great news, we’re open for business.” But it was going to be 90 days on the road.

Now I’m sending three to four crew on the road all around Canada. At that time, the quarantine rules were different in every province. And they were spending about 12 to 14 days in each location. So what was happening is that I’m looking at my chart here saying, “I’m going to send four people to St. John’s.” They get to St. John’s, and all of a sudden on day eight or day nine, it doesn’t matter what they’re doing, they get COVID. Well now, they have a 14-day period where they have to quarantine in St. John’s. But their plane leaves in five days, and the event’s all done. And they have to go to another event. So as a logistics manager, I’m a small company. I don’t make millions and millions of dollars. So I’m going, “Whoa, whoa, whoa, I can’t take this liability.”

My client, they like my services. But I can't provide them the services because of the unknown because of all these weird regulations and where things were. And so because of that, one of my best clients— These are people who we've worked with for a long time. The volunteers at these events, we would see the same ones. It was such a community. And my workers, who I absolutely adored, they did such a good job. And for no reason of my own, all of it got wiped out. Just all gone.

You can't do anything about it. You can just go, "Oh, that was nice. That's a good memory, and let's move on from here."

Because there was no consistency across the board, it was impossible to schedule anything. So unfortunately, I had to get rid of that contract, which was my winter contract. And so then things got even thinner. And that was when things started kicking in and everything else was changed.

Leighton Grey

I understand that you tried to bring your frustrations with the lockdown restrictions to your elected representatives but without much success.

Colin Murphy

I'm very fortunate because I have Jason Copping in my riding,

[00:10:00]

and we all know what a wonderful person he is. So when COVID was hitting in April, the very beginning, I had a long conversation with him on the phone. I basically was saying what I believed to be where this may be heading. Not that I was right or wrong but just "Hey, watch out for this."

Multiple times throughout this whole ordeal he does answer the phone. I've had several conversations with him. I've gone to his town halls. I've tried to present things to him to try to mitigate and, early on, try to open up earlier and/or provide alternatives to the way the course was being set for us. Every single time he would— He would basically just ignore you. He would just stare blankly at you and go, "Okay, Okay, Okay," and then nothing would get done.

If he wanted something from you, he would answer your calls. But if you sent a video to him or some statistics or anything to him, there was just no response. I'm not saying he should listen to me. I'm not a medical person or anything. But I was pleading to look at **those people who he should be listening to. People who are way more knowledgeable on the subject than me, and there's tons of resources, especially now. But they're still not doing it, and I have no idea why.**

Leighton Grey

I understand, sir, that despite all of this, you're still involved in your business, but not to the same level. Why is that?

Colin Murphy

Well, you can't. I don't trust the government anymore. I don't trust anything they're going to do. All the events are there to bid on. For me to actually go and say, "Okay I want to get this contract back, or I want to get this contract back." Then now, I have to hire people. Now I have to train them, and I trained guys for five or six years. Now I have to go through that labour of training people and trusting them on the road with my equipment and my reputation.

Once you've done all that, then you bid on the event. Now you're deep into money and deep into investing in personnel, and all of a sudden, the government will come along and change it. So I don't trust any of that, and because that trust is broken, I really can't do anything more.

We're doing well. I'm happy. I've got fantastic clients, and I'm back to when we were small. You grind it out. You do what you can. My dad's 78, and he's still joining me on the road. So you do what you can.

Leighton Grey

So you've got this great family Alberta business that employs yourself and your wife and your dad and all these other skilled people, has great potential. You had a dream that it would grow much bigger. You obviously have incredible expertise that's applicable.

But what's holding you back really is something emotional and psychological and, to some degree, rational. And that is your distrust in your government because you're afraid that if you do invest all that time and energy—and every business owner knows what this is like. I feel you, okay. To have a sense that a government, which is supposed to be there to support you, to help you grow your business, or at least not interfere with your ability to do that; you're worried that that's the very entity, the very force, that's going to come along and pull the rug out from under you.

Colin Murphy

Well, when you have a business, the right way to do the business is you believe in something. You put your house on the line. You buy equipment. You get a loan. Basically, you put everything on the line. So when the government shut down the summer, the first year, you lose all that money.

It didn't pay for your trucks, didn't pay for your trailers, didn't pay for your loans, didn't cover anything. Everyone is like, "Oh, the government's going to support you. Didn't the government give you something?" They didn't do anything. The federal government gave you a loan and, basically, said, "Hey, here's a little bit of money. Take all you want. Pay us back," and that's coming into fruition. It kicks in in December or something like that. Then the provincial government gave a little bit of money here and there. But again, we're talking about a lot of money, risking it all on the line, and I already went through all that.

That's the problem. I don't know how people nowadays— Look at all your small businesses. They all believe in something, and they pour it all into it. You own a restaurant. You own a gym. You own a hair salon. You're a trucker. You put all your money to buy a truck you want to drive across Canada and deliver product. And out of nowhere, the government can just change it. It's crazy, and there's no recourse. There's no recourse for their actions. They just go, "Oh yeah, well, we made a decision." Hey, pay for my grocery bill every year, thank you very much.

Leighton Grey

And the problem is compounded by inflation

[00:15:00]

related to the pandemic, higher interest rates, debt, costs of things like gas and fuel, all these things. I expect you have to run equipment and machines, large-scale machines.

Colin Murphy

Yeah. The biggest problem is the supply chain right now. The supply chain is completely disrupted. You guys won't see it, but parts are very hard to get. If you want to get a power distro—it's this thing that converts power so you can run all these things—they say six weeks. But it's probably nine weeks to probably twelve weeks. Before, that was unheard of. The parts don't exist.

And that's now. I don't know where the crunch is going to go. I'm not going to get on the line and foresee that. But there's been a massive change in how things are working right now. And the labour force in our industry is quite thin. In other words, people who you used to be able to— You used to be able to get crew. They're called crew, and they come in, and they help out. There used to be a good supply of crew. And I don't know where they are anymore. They're really not around.

Leighton Grey

So not to put too fine a point on it, comparing where you are now to where you were pre-pandemic, you have the wherewithal to run your business, but the landscape has changed completely.

Colin Murphy

Oh, yeah. And you don't know where it's going to go. You have no clue where it's going to go.

Leighton Grey

Predictability, of course. Thank you, sir. Is there anything that I didn't ask you about that you want to say to the Inquiry?

Colin Murphy

The frustrating part that I have with this whole thing is a lot of people were vilified, but it seems that people don't talk anymore to each other. You can talk to friends and family members, and everyone has a little thing that's wrong. Everyone has a story. But they don't share the stories in one unit, one big group. And because they don't share in one big group, they can't connect the dots. Not saying there are any dots. Not trying to get in trouble here. But it would be nice if somewhere down the road, there is an event or there is a continuous event.

I know it happens in Europe a lot. They go to the news agencies, and they post things on the walls there, or they have marches. In Canada, we've backed away from doing some of that. But we really need a national acknowledgement of the effects of what happened here.

I know that on April 28th is the WCB, Workers' Compensation Board— They have this actual day where they commemorate people who lost their lives on the job. I really think there has to be a really big push. And we have to hammer it through media, who don't listen to us. And we have to all get together. People have to see the effects of all of this. Because by having little chats here and there, they're not talking, by not talking— For my kids right now, I'm worried about the future. It's not just the consistency of labour; it's the consistency of life, the way of life. Because that's all changed. People get used to change, and I don't want some of the change. I don't think it's good change.

Leighton Grey

You don't want Deena Hinshaw's "new normal?"

Colin Murphy

I don't want passports. I don't want any of that stuff. It's just crazy.

Leighton Grey

Sir, thank you for that suggestion and for your testimony. I'm going to turn it over to the panel now and see if they have any questions.

Commissioner Kaikkonen

Thank you for your testimony. I'm sure there's a lot of Canadian businesspeople who could relate. My question is what changes need to happen for you to trust government again?

Colin Murphy

Well, I honestly don't know. Decentralized decision-making is key, I would say, with government. I would trust certain avenues.

Politicians have avenues of employment. How do I say this? Different jobs benefit from different political landscapes. So my political landscape benefits from certain ideologies. So it's biased for me to say what I think is going to help me because I really want more liberty and freedom to do what I want to do, less restrictions, and less saying, "You have to do everything this way and this way."

So I don't really know, but I say decentralized would really, really help. In other words, rules at least where, if there was a decision made in the federal level, it doesn't necessarily impact the provincial level because it might not agree with our certain values and beliefs **here. I think there has to be a distinction because it exists in other things across all the other provinces.**

So maybe decentralization and talking—getting more input. I will say one thing.

[00:20:00]

My industry didn't speak up for itself. I think a lot of small businesses don't have a voice because they're all spread out, and they're everywhere. There's no real big centralized— The unions right now that are protesting, well, they're huge. But small business is the same size, if not bigger, but they don't come together and join that. So maybe some way of

collectively bringing people together and having one voice. I'm sure that would help. But it's a lot of work and I don't know how much time we have to do that.

Commissioner Kaikkonen

Thank you very much.

Commissioner Drysdale

Good afternoon. We've heard from several witnesses previously about the impacts on their industry. I don't know a lot about your industry, but some of the things that we've been hearing is that the mandates seem to favour large companies and destroy small companies. In other words, they have more resources, they have more money at their disposal, and some of these companies, for instance, our mainstream media companies, got hundreds of millions of dollars to support them.

So what happened in your industry? Did it consolidate? Were the small people pushed out?

Colin Murphy

Specifically in Alberta, three companies became one. In the last three years most of them consolidated into quite large companies. If you look at the large conventions, the large sporting things, those things, they'll all get— There's no question that now that they're so large, they have the workforce.

Some of my old clients— I gave up a client last year I've had for 19 years. I didn't give them up because I didn't want to do their event, and I didn't have any malice to them. I physically could not get the workers and provide the level of service that I was comfortable with to do the job. And so I said, "I'm sorry I can't do your event anymore, and here's some companies that are larger." They were able to get through it because they have deep pockets and/or they have other revenue sources that helped get them through.

I'm not complaining about it. Everyone has their merits and such. It's just unfortunate that as you're getting bigger and bigger and you have this five-, ten-year plan, it doesn't take much—and everyone tells this to you—it doesn't take much, for one little thing to happen, and it just changes everything. Gone.

Commissioner Drysdale

Well, it seems to be a common theme of a lot of the business owners. We've been talking about the consolidation or in some instances, monopolization of their businesses.

Can you comment a little bit on the ability of very large companies to address the needs of very small clients? I mean, Canada is a country of small companies, of small events. Are these large monopolies or consolidated companies able to properly service and are they interested in servicing those smaller events that you used to do?

Colin Murphy

I think most of them will. Most large companies will only go for the large ones. If they go for a small one, they'll bid really high, and they'll basically say, "Hey, if I get it, then I get it and we'll go in there." They'll blow it out of the park; they'll do a great job, for sure. But what they're doing is they're taking that small sporting event only as a finite budget. And so

where they might have allocated a certain percentage, if that goes up 40 per cent that impacts the bottom line.

And most sporting events on the small scale, it's for the community. It's not some guy who's a promoter, who's just pocketing the money. It's actually a group of people who got together and said, "If we throw this event on and we make money then that can help with the arena or it can help over here, over there." So they're very important.

But I would say the problem with the landscape is that 30, 40 years ago, businesses supported events. Whereas nowadays, the government got rid of a lot of that, the write-offs. So now a lot of events are very dependent on government funding for the event. So the events themselves have to make sure that they toe the line.

Commissioner Drysdale

Well, that's a really interesting point. I want to make sure I understand that. So some time ago, it was common for businesses or communities to support these events, but now the government supports them and, therefore, has control over them. Is that what you're saying?

Colin Murphy

Well, I couldn't infer that. But I'm just saying they definitely got rid of the way that sponsorship was done. Sponsorship in the past was done with a different model, I believe. But now it's totally different.

I think the problem is that you have large companies— It's just a business cycle, and unfortunately, the business cycle

[00:25:00]

was interrupted by something larger, and I'm just a slight victim of it. I'm doing fine without it.

But there needs to be better preparations on how to mitigate the business cycle from being interrupted from external sources.

Because other areas did fine. I mean, Florida—that's the problem—is that Florida never closed. Florida stayed open. Sweden. So there were examples around the world where things were doing okay.

Commissioner Drysdale

Thank you.

Leighton Grey

Mr. Murphy, thank you for your testimony here today and for being part of the National Citizens Inquiry.

Colin Murphy

Thank you.

[00:25:45]

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 10: Kyrianna Reimer

Full Day 1 Timestamp: 09:13:48–09:36:43

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness today is Kyrianna Reimer. Kyrianna, can you please state for us your full name, spelling your first and last name for the record?

Kyrianna Reimer

My name is Kyrianna Joy Reimer, K-Y-R-I-A-N-N-A, Reimer, R-E-I-M-E-R.

Shawn Buckley

And Kyrianna, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Kyrianna Reimer

I do.

Shawn Buckley

Right now you work in financing. But when COVID hit you were a nursing student trying to work your way through to get a nursing degree. And my understanding is you'd like to go back. Can you share with us basically how the COVID experience for you unfolded as you were trying to get through the school of nursing?

Kyrianna Reimer

So in September 2021 I returned for fall semester, third year. We were told at that time that the vaccine was highly recommended. We didn't have a due date that we had to be vaccinated by, but this quickly changed. And throughout that semester, as AHS [Alberta Health Services] changed their policy, so the school changed theirs as well. As that came up, the date I remember the most was October 14th, we were supposed to have our first jab by.

Shawn Buckley

And my understanding is at that time you were actually seriously entertaining getting the shot, but your opinion changed. Can you speak to us about?

Kyrianna Reimer

Yeah, I'd considered getting it because I really believed that nursing was where I was supposed to be. That was something I'd spent a lot of time thinking and praying about, and it had led me to the conclusion that this was where I needed to be.

So I was going to get the vaccine so I could continue my studies. But as I reflected on years I'd spent in nursing, certain principles came up. One was the ethical morality surrounding the current code of ethics, which says that a patient may not be coerced into taking a medical directive. When a nurse is receiving a vaccine or a jab, whatever you want to call it, at that time, they're considered a patient. To be coerced into receiving it, it goes against the current code of ethics, undermining the ethical standards in addition to the scientific standards, as outlined in what we had studied during our microbiology course.

Generally, a vaccine takes five years minimum to be released to the public. This one shouldn't have been released so fast, obviously.

Shawn Buckley

Right. So the speed kind of spooked you. I'm trying to understand what you're saying about the code of ethics. So the nursing code of ethics requires that a patient have full consent for it to actually be ethical to then administer a treatment, such as a vaccine. But you found yourself in a situation where something was being imposed on you. And that, actually, violated the code of ethics that nurses are supposed to comply with. Did I kind of get that right?

Kyrianna Reimer

That is correct because it wasn't an optional thing. There was coercion to receive it or drop out of the program, which costs both financially and as far as time goes, whoever decides to stand up for their rights in that.

Shawn Buckley

Right. My understanding is you actually had a project where you had to write a letter on a topic, and you chose this ethics issue as your topic.

Kyrianna Reimer

Yeah. Um—

Shawn Buckley

And you smile. So it is a bit of a cute story. Can you tell us about that?

Kyrianna Reimer

The project was to write to a member of the government regarding an issue that was affecting the healthcare system. So I decided to write on this one.

Shawn Buckley

Okay. So it was a broad, broad assignment. Students were allowed to pick their own topic, so it wasn't meant to be topic-specific. You were able to pick your topic, but it was to write to a politician on a healthcare issue, and so likely it was to look at how you would address it.

[00:05:00]

Was it an exercise in teaching nurses to be advocates on health issues? I'm just curious what the purpose was.

Kyrianna Reimer

Yeah, that was the idea. It was to be an advocate for patients and be actively involved with the government to support moral health practices and good health practices at the governmental level.

Shawn Buckley

Okay, so you picked an obvious topic on advocating for patients because here you were actually experiencing that very issue yourself. So I imagine that the professor that graded your paper was very fascinated and pleased with the current topic.

Kyrianna Reimer

No. No, that was not what happened. I received a poor mark on that paper with a statement that said, "Please don't write about personal subjects."

When I asked my teacher later on and reviewed with her about it, she compared holding my opinion on the COVID vaccine with oral hygiene, stating that she said of herself, "If I decided I shouldn't brush my teeth, I couldn't go and tell my patients you can't brush your teeth. Because we have literature that supports that this is good for the health. And the governing bodies above us also dictate that this is good for our health. So that the governing bodies have dictated that this is a healthy procedure, we can't speak against them."

My prof was a nurse.

Shawn Buckley

So in effect, you are being told that to advocate for a patient, you basically have to advocate for whatever the government line is, which seems to me, and you can comment, to totally undermine the purpose of writing to a politician. You're basically saying, I support the government's position. So okay.

Now there was something else that caught your attention and led you not to be vaccinated. I understand you were concerned about basically the treatment that was being meted out to other treatments.

Kyrianna Reimer

Yeah, I took issue with the testing of the vaccine just because during our earlier courses we had been told that it takes five-plus years for a vaccine, or even regular medicine, to be released to the public in most cases. It seemed odd that we were accepting this one so blindly so early on in the testing process.

This went against the scientific standards that I thought nursing stood for. So both the ethical and scientific standards were lost, making nursing seem like a pretty pointless profession.

Shawn Buckley

Right. Now, you were making efforts to bring your position forward to the College of Nursing to see if they would grant you an exemption or change the mandate. How did that go?

Kyrianna Reimer

At first, there were a number of exchanges of emails. I asked them about their date because they were enforcing an earlier date than AHS originally. I pointed out that this was illegal because they were, in fact, enforcing their own rules, which went against my rights.

To this, as AHS changed their policy, they continued to move backwards and give me more and more time, so I was able to finish that semester. However, later on in January, I wrote to them because AHS had once again changed their standards. I had been held back for a class for that semester because I wasn't seen fit to enter the clinical placement.

When I realized this, I contacted them, and they told me that there wasn't anything that they could do about it because they would put the AHS mandates across the board for all of their clinical placements. At this time, I was in community placement, which we had several that were not AHS facilities.

[00:10:00]

But the College was enforcing the AHS requirements across the board. I served two of my teachers with notices of liability and received an answer in return.

Shawn Buckley

Okay, and so can you explain for us what a notice of liability is?

Kyrianna Reimer

The notice of liability was basically a statement saying that you're enforcing these medical directives that go against my rights as a Canadian citizen both on Charter rights and freedoms as well as ethical standards for healthcare practitioners and professionals. And so, I had two of those sent out to two of the nursing profs there.

Shawn Buckley

Okay, so basically you were trying to give them notice that the actions they were taking were violating what you thought were fundamental rights for Canadians at the time. My

understanding is that basically they took the opinion that what you were doing was misconduct.

Kyrianna Reimer

That's correct. I was given a letter of misconduct threatening that they would suspend me as a student at Red Deer College because of my actions.

Shawn Buckley

And Kyrianna, I'll just let you know that I did receive the copy of that, and we will make it an exhibit [Exhibits RE-8 and RE-8a] so that both the commissioners and the public can see how they responded. And we will also make that notice of liability an exhibit [exhibit number unavailable] so that that can be part of the record going forward.

Kyrianna Reimer

Thank you.

Shawn Buckley

So you basically— December 2021, found yourself removed from the nursing program.

Kyrianna Reimer

I was permitted to continue with an asynchronous online course, but my clinical placements were cancelled. This happened very suddenly, and I did everything I could to try and get back in, including contacting members of our local government and reaching out to some of the facilities in person.

Shawn Buckley

Right, and that didn't work very well, did it at first?

Kyrianna Reimer

Neither one worked.

Shawn Buckley

Okay. So how long was it before you were able to participate again?

Kyrianna Reimer

Well, the asynchronous course I was able to complete for the winter term, but I wasn't permitted to return to studies until the fall just because of the way the nursing courses are laid out. You have to follow a pretty strict schedule. It's not like a pretty regular one where you get to choose your classes each semester. So I was held back for a whole year.

Shawn Buckley

Right. Now I want to go to a couple of specific things that you experienced. My understanding is that during one of your practicums you had to take a COVID test for a person who had been admitted at night. Can you just share with us what was happening?

Kyrianna Reimer

Yeah, so we had a patient who was admitted the night before, and I was on the morning shift. When I came in, they told me that one of the things I needed to do was take a COVID test for this person, which I did. Once I completed the COVID tests, we were told that this person had to be moved from the room where they currently were.

So we moved them and their stuff into a separate room where they were isolated and removed all of the items that were disposable within the room and did a full sanitization of the room. There was another patient in the bed who had slept there all night. They were neither tested nor moved, and that didn't seem to be a problem.

Shawn Buckley

Okay, so that just seemed to be an example of a silly reaction. Obviously, this patient tested positive, but they don't test the other person in the room.

Kyrianna Reimer

The other patient, we hadn't even gotten the test back.

Shawn Buckley

Right. Now, there was some messaging about the hospital you were at being full capacity. Can you speak to us about this?

Kyrianna Reimer

Yeah, we were told that it was full capacity. In the wards where I was, a third to a half of the rooms had one bed removed. Usually it's a double capacity room, so you'd have two beds within each room. And we had stacks of beds in the back where there had been one removed from the rooms

[00:15:00]

so that they could isolate by themselves.

Usually, this is unusual. If you have two people with the same suspected condition, they can share a room. So two people with COVID could share a room, but in this case, apparently, they needed to be alone.

Shawn Buckley

Right. So in effect, they reduced the capacity of the hospital so that they could make the claim that the hospital was full.

Kyrianna Reimer
It would seem that way.

Shawn Buckley
Okay, now in witnessing some of these things, how did it make you feel?

Kyrianna Reimer
It didn't make me particularly trust my profs and the nurses on the wards or the government. It also made me wary of what I could say around the other students, mostly because they all supported the lockdowns, the mandates, the testing.

Shawn Buckley
Were you aware of any other student in your program that shared your views?

Kyrianna Reimer
We didn't talk about it very much. To my knowledge, there wasn't. I remember several conversations that the students had had when I was around where they bashed some of the other methods of treatments, including ivermectin and people that would use it.

Shawn Buckley
And when you say "bash," you mean speaking in a very negative fashion.

Kyrianna Reimer
Speaking very negatively.

Shawn Buckley
Right. So probably ridiculing.

Kyrianna Reimer
Yes.

Shawn Buckley
So how has this affected you mentally? I understand it's set you back in the nursing program now, I think two years.

Kyrianna Reimer
Yeah, I had the option to return in Fall 2022. But when I went in to take a preliminary test that I required for going into clinical placement, I had horrible anxiety and no desire to return and be among my peers or the other nurses that I had worked with before because of the negative experiences there. So yeah, it has set me back a couple of years.

Shawn Buckley

Okay, and just when you were talking about that, it sounded like you were having some difficulty. Is it fair to say that you're still having some distress over what happened?

Kyrianna Reimer

I would say that there is some. I still don't trust nurses, generally—the ones that I worked with anyways. I don't trust most of the students. My experience since then, having attended a hospital since that time, has not been a positive experience.

Shawn Buckley

Can you tell us about that?

Kyrianna Reimer

I had a foot infection last fall, and I went to the ER for three nights. I had to take IV [Intravenous] antibiotics. The first nurse who was there, she didn't complete her proper testing. So generally when you enter the room before you get hooked up to the IV, they'll ask you your name; they'll check your wristband. They have to do full checks. Between when she brought the IV meds in, I was taken for x-rays. The IV meds hung in the room until I returned.

You're never allowed to leave medication unattended. When she came back to hook me up to the machine, she didn't do her checks, and I pointed out that it had been unattended. Her response was, "Are we really going to do this now?" She said, "Do you want me to give you these or not?" I let her administer them, and she informed me, too, that we do things differently here in the ER than you learned in your nursing classes.

Shawn Buckley

Okay. I want to move on to a different topic. I want to talk about the Trudeau hotel experience or the escape Trudeau hotel experience. Can you basically tell us what you experienced in May of 2021 or when you came back from Costa Rica?

Kyrianna Reimer

Yeah, I had travelled to Costa Rica to volunteer, get some nursing practice down there with an independent group because we had been held back during 2020 in some of our practicums. So I went to volunteer there.

When I came back, I was rerouted into Toronto instead of flying into Calgary. When I landed, they told me I had to retest

[00:20:00]

because I was forced to test before I got on the plane. But I had to retest now and also quarantine in one of the hotels. I refused and the lady who was there told me that she highly recommended it. And when I said I wasn't willing to, she said it would be expensive tickets.

As I had a plane in 20 minutes, I asked her to please write the tickets. And then I took those. They put a mark on my passport. It was a sticker to show that I wasn't allowed to leave. And then I went to my gate with the tickets.

Shawn Buckley

And what did the tickets total?

Kyrianna Reimer

\$7,000.

Shawn Buckley

And you have a trial coming up, actually this month for those tickets. They haven't been resolved yet.

Kyrianna Reimer

Yes, it'll be in two days from now.

Shawn Buckley

Now, when you returned then to Alberta, my understanding is that you were supposed to quarantine for 14 days. Did you have any visits?

Kyrianna Reimer

Yeah. After the period of quarantine, I had an RCMP [Royal Canadian Mounted Police] officer show up at my door to ensure I was still quarantined, even though the time had run out.

Shawn Buckley

Right, okay. And then my understanding is, though notwithstanding that the visit was a little late, you were getting notice after notice after notice through ArriveCan concerning your quarantine.

Kyrianna Reimer

Yeah, during the quarantine, I had been receiving those notices through the ArriveCan app that I had to keep checking in and providing my information as was recommended and legally responsible.

Shawn Buckley

And how did that experience make you feel?

Kyrianna Reimer

Watched, controlled, and minimized as if I couldn't be responsible for my own health. Yeah, it was overreach by the government and completely inappropriate.

Shawn Buckley

Thank you. Those are the questions I have for you. The commissioners might have some questions.

There are no questions from the commissioners. So Kyrianna, on behalf of the National Citizens Inquiry I sincerely thank you for coming and testifying today.

Kyrianna Reimer

Thank you.

[00:22:55]

Final Review and Approval: Anna Cairns, August 30, 2023.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 11: Leah Cottam

Full Day 1 Timestamp: 09:36:47–09:55:21

Source URL: <https://rumble.com/v2kjwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

And our next witness is Leah Cottam. Leah, can I get you to state your full name for the record, spelling your first and last name?

Leah Cottam

Okay my name is Leah Cottam. L-E-A-H C-O-T-T-A-M.

Shawn Buckley

And Leah, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Leah Cottam

I do.

Shawn Buckley

Now, I think it's fair to describe you as a farmer/rancher. Would that be a fair description?

Leah Cottam

Yeah, I live out in the country. I have 22 cows. They're in the process of calving and 25 grass heifers that go out in the summer.

Shawn Buckley

And you help some of your neighbors with calving and you've been having a pretty busy week as I understand it.

Leah Cottam

Yes, actually it's my cousin and she has 276 cow calves.

Shawn Buckley

Okay. And then you also have a job where you work as an administrator, and you've been at that task for about five years.

Leah Cottam

Correct.

Shawn Buckley

Now, you are vaccinated and my question to you is: What led you to the decision to get vaccinated with the COVID vaccine?

Leah Cottam

Okay. I've been looking after my aunt that is 84 years old. So with the pressure of everything, I watched the media. I watched COVID come across the country, jump across the pond. Everybody recommended that as soon as, in my age group—I'm 50 something plus—that I have the ability to go and get my vaccine. I got mine May 6th. So as soon as I was available that I could do it, I went and did it. I work for a company that over the year, it became mandatory to work for one of our contractors that you had to be vaccinated otherwise you could walk out the door.

Shawn Buckley

Now, my understanding is that when you got your first shot you had no adverse reaction to it.

Leah Cottam

Correct. And then I got a second shot.

Shawn Buckley

Okay. Tell us what happened.

Leah Cottam

Well, nothing really. My next one, July 6th. So nothing in 2021. Nothing happened to me that time either. My arm was a little sore but just like everybody else, I was fine.

Shawn Buckley

You were fine for about six months, and then what happened?

Leah Cottam

Then in November we had gone, we have some area just outside of Rocky Mountain House, and we were moving cows. So the cow and the calf go out to the pasture in the summer, and

then in the winter or in the fall, November, they get split between cows and calves. And then the calves go to market and the cows come home. So while we were working the whole day, which is basically normal, moving gates and everything like that, opening and closing. The next day my feet got sore. And then I could hardly walk and then— Can I just keep going?

Shawn Buckley

Yeah.

Leah Cottam

So this lasted for about a week. Then I went to a walk-in clinic in Red Deer, and the guy sent me for x-rays, the doctor, and told me that I had— I went back to visit him after the x-rays came back, and he said I had plantar fasciitis. And that there was basically nothing that you could do, footwear, and stuff to put support on your feet. And then, I don't know, it was in the balls of my feet, so it was at the front of my toes. When I did research, I just, plantar fasciitis really is on the heel of your— I'm not a doctor. I didn't know. I don't know. But it was very weird. So that was November. Can I just keep going?

Shawn Buckley

Yeah, no, no, I'll stop you if I want you to stop. I think you're getting to the lifting arms part.

Leah Cottam

Yeah, I am actually. So that's November and then my birthday is in December. I'm a Sagittarius.

[00:05:00]

I have to get a driver's license. So I need a physical every five years. I went to my family doctor, and I complained about my feet, still. And then, in the meantime, what had happened was I couldn't lift my arms, like this. Couldn't lift them up. I couldn't type. I couldn't type on my computer. I found it very troubling. Anyway, they did blood tests, came back, and said, "No there's nothing wrong with you." So this is in Calgary. I have a family doctor in Calgary.

Then I came back to Red Deer. And then come January, I start to swell up in my hands, and it moves from my left hand to my right hand to my feet. Inflammation all over my body. So I go to a walk-in clinic. They do more blood tests. I've got pages of blood tests. And they tell me that there's absolutely nothing wrong with me, nothing wrong with me. Then I go back to Calgary. I talked to my family doctor. Again, she says, "According to the bloodwork there's nothing wrong with you."

So I come back to Red Deer and finally my hands are so swollen I look like the Michelin Man. And I can't put my shoes— My feet in— I can't put my socks on. I can't put my shoes on.

Shawn Buckley

So your feet are so swollen you can't put your socks on.

Leah Cottam

Yeah, they didn't fit.

Shawn Buckley

Okay. Go on.

Leah Cottam

Yeah. So anyway, I went to a lady, another walk-in clinic in Red Deer. She was an English walk-in nurse. She took my blood work and said she was going back to England, so come back next week or something like that. But then what happened is—now I'm in April of 2022. So now I'm laying in bed on Friday night, and I can't move because my chest hurts so much. So I didn't know what to do. And then I just got up, and I went into the emergency in Red Deer. And he, all of a sudden, looked at the blood work that came from the English lady, the walk-in doctor, and my inflammation was off the charts. So he immediately put me on pills—two pills for pain, one for stomach—and then gave me a recommendation to go see a rheumatologist the following Wednesday.

Shawn Buckley

Now, you went there because of chest pain. Was there any diagnosis concerning the chest pain?

Leah Cottam

No, he offered to give me a— Oh he did a chest x-ray. Yes, he did. And then offered for me to go to a CT [computed tomography] scan or something like that. In the follow-up, I have also had another— well I've had a CT scan and two other chest x-rays. So the result of the chest x-ray is that my lungs are filling up with fluid and—not filling up, but there's fluid in the bottom of my lungs—and it's because of the inflammation in my system. I have a specialist in Calgary that has been monitoring me since the start of all of this.

Shawn Buckley

Now prior to the vaccinations, is it fair to describe you as a healthy individual?

Leah Cottam

Yes. I thought I was.

Shawn Buckley

So can you give us kind of a contrast because I think some of the people don't understand just how disabled you were. Like my understanding is some days you couldn't turn the keys in your car, or you couldn't pull your pants up, or put a bra on, or hold a glass of milk. Can you share some of these things?

Leah Cottam

Exactly like that. It wasn't just that. It was from my socks to my knees, to my arms that I couldn't move or lift above my shoulders. My hands were so swollen. I lost all the strength in my body completely.

[00:10:00]

And not only that. I've been trying to lose— I'm 50 plus years old. I've been trying to lose weight my whole life. It's just not in my genetics. I was 175 pounds. I now weigh 145 pounds. And I don't know why or what it was. It just dropped. And then, if I looked at it afterwards, it was every muscle that I had, I didn't have anymore. So like turning— like opening the door or even closing the door in my car, I struggled with it. Putting my seatbelt on. I couldn't get my seatbelt on. But then I couldn't get it— I couldn't undo it to get it out. I struggled turning. And it's just turning the key. I didn't have the strength to turn the key. And then my feet were sore. So then it was very hard for me to walk. And I think I kind of got a little depressed, and I ended up just sleeping because I was in pain all the time. And I think I missed the whole summer of 2022.

Shawn Buckley

Right, and how did you do mentally, going through this?

Leah Cottam

I got through. I was a single parent, so I always had to get up and get it done because there was nobody else to get it done. So I think I was depressed at: Why me? I'm sure everybody goes through that same kind of question. Why me? What's happening? What's wrong? What can I do? Why is this like this? Yeah, I resorted to sleep. I went to bed.

Shawn Buckley

Now, my understanding is that you're doing better than you were. But you still are fairly weak. So things like opening gates are difficult, and even still doing stairs and things like that are different than before. But you are better than you were in the summer of 2022.

Leah Cottam

Yes, I'm getting better. To carry a bucket of barley is— Last year I couldn't do it. This year I can do it. So my strength is coming back. But my hands are still swollen. Yeah, I'm getting better. I've quit losing weight. That was a little scary thing. I've plateaued at 145. That was very scary. So they put me on another— I went from taking zero drugs to taking 12 pills a day. And now I'm giving myself injections once a week, two different drugs.

Shawn Buckley

So how many drugs are you on today?

Leah Cottam

I take two different injections. They put me on a biological drug and methotrexate. And I've kind of weaned myself away from the painkillers. So now I'm taking vitamins and one other prescribed pill.

Shawn Buckley

Thank you. I have no further questions for you. Perhaps the commissioners have some questions. And they do.

Commissioner Massie

Thank you very much for your testimony. I'm curious about the blood testing that you've been through over a long period of time that couldn't detect anything. And then you had another test done by another doctor, and now you could detect it. So is it that it became apparent all of a sudden? Or was it because it was not really well detected previously? What's the situation there? Because you had clearly inflammation, right?

Leah Cottam

I did, but they never tested for it. And no matter when I went back, it would come, and it would go. So it wasn't something that was a constant thing. Like it would show, my hands would swell up for like a day and a half and then it would go down and then it would come up over here and then it would go to my feet. Like it would roam my whole entire body. And then the reason why the last lady did it is because I was inflamed. So I don't know why the medical system, or any other doctor didn't do the proper test that they were supposed to do, or whether it was— I don't know.

[00:15:00]

Commissioner Massie

So it seems that you are suffering from some sort of chronic inflammation that is treated by a number of drugs. You mentioned a biological drug that you inject. I'm curious to know what kind of a biologics are you taking? Do you know?

Leah Cottam

It's called Amjevita.

Commissioner Massie

Okay, it's an anti-TNF [anti Tumour Necrosis Factor], is it?

Leah Cottam

Yeah, I'm not sure. It's supposed to help the body—

Commissioner Massie

Dampen the inflammation response.

Leah Cottam

Yes.

Commissioner Massie

With that you've been making progress and recovering?

Leah Cottam

Yes, that just started in February. It took a long time for me to get the proper medication to where I am in January of this year, because I can still have flare-ups. So I would go see the

rheumatologist, and I would get steroid injections. It basically kept me going every three months. And then I just— She wanted to see me back. And then I'd go back, and I'd get another shot, so I could move, and I could function.

Commissioner Massie

Was there any diagnostic to explain your loss of muscle strength? Is it related to the inflammation process or is it something different?

Leah Cottam

I think it's part of what they said rheumatism, rheumatoid arthritis. So and if they can catch it. I didn't really, I didn't really ask a lot of those kind of questions. I just know that if I take the drugs, I feel better. If I get a steroid shot, I feel better. I find that if I look on the internet, I can look at so many different— I can look at the pills that I'm taking and each one of them has a side effect that I don't want to know anything about. And then I get another one that has a side effect that I don't really want to know anything about. So even with the two or three pills that I'm taking, I'm still developing, I would call them liver spots. And then they go away. They show up, and then they disappear. But then I talk to the doctor about it and that's not a side effect.

Commissioner Massie

So I'm curious about the time lapse between your last injection and the appearance of the side effect, which is fairly long. It would certainly not register within the, what is it, four weeks in Alberta. So was there an acknowledgment that this is a potential cause of your inflammation? Or was no link established between the vaccine and your chronic inflammation.

Leah Cottam

No. I did bring it up to a couple of doctors. But as soon as I brought it up, the subject was changed.

Commissioner Massie

Thank you.

Leah Cottam

You're welcome.

Shawn Buckley

There being no further questions, Leah, on behalf of the National Citizens Inquiry we sincerely thank you for attending and testifying today.

Leah Cottam

Thanks for having me.

[00:18:34]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 12: Jacques Robert

Full Day 1 Timestamp: 09:55:42–10:22:04

Source URL: <https://rumble.com/v2kjiwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Leighton Grey

Next witness is Mr. Jacques Robert. Welcome, Mr. Robert, am I saying that correctly?

Jacques Robert

Yes, you are.

Leighton Grey

Okay. Welcome to the National Citizens Inquiry. Thank you for being here today.

Jacques Robert

Glad to be here.

Leighton Grey

Would you please start by stating your name and just spelling it for the record?

Jacques Robert

My name is Jacques Robert, spelled J-A-C-Q-U-E-S R-O-B-E-R-T.

Leighton Grey

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Jacques Robert

I do.

Leighton Grey

Thank you. So Jacques, yours is a very troubling personal story of tragic loss. It's an important one to be told, but I understand that you lost your wife. Would you like to talk about that?

Jacques Robert

That's incorrect.

Leighton Grey

Oh sorry, I beg your pardon, different Jacques. You lost your job, beg your pardon.

Jacques Robert

That's it. Yes.

Leighton Grey

You were dismissed from your job after 15 years?

Jacques Robert

That is correct.

Leighton Grey

And that was because you chose not to comply with company policy for attestation for vaccination.

Jacques Robert

That is correct.

Leighton Grey

What type of work were you doing?

Jacques Robert

I was a manager of a technical services for a real estate services company. So property management was my field of engagement.

Leighton Grey

And you were engaged in that for over 15 years I understand.

Jacques Robert

Yes.

Leighton Grey

This dismissal, was it in the form of an actual firing where your employment was terminated, or were you put on what was called an involuntary unpaid leave of absence?

Jacques Robert

So the way it worked out, I'll sort of precursor this with the eventual date They put specific mandates to comply with their company policy and it was to take the shot. And there were a few stages to get to the end, and when it got to that end, they put me on an eight-week unpaid leave of absence. And I think their strategy was to think because it was an eight-week unpaid leave that they were real and certain about what their position was, and I knew what the outcome was going to be. So January 14th, 2022 was the last day of my employment following that eight weeks of unpaid leave. When it came to, I believe it was March 15th, maybe the 17th—isn't that funny that 2022 is a common day?—March 15th 2022 or 2020. I remember that day as well when everything shut down. They let me go. I still would not comply with their company policy, and really their company policy was to make you be vaccinated or have the shot. I was not willing to disclose my personal health information, although they knew what the case was, and that's when it all ended.

Leighton Grey

When did you first find out that this mandate was coming into effect?

Jacques Robert

I don't know specific dates, but it was in 2021, and it would have been around July, I believe is when the first wave of these mandates were going to occur. And it followed with a time in October.

And then, we knew they were always updating their policy and we knew that it was going to happen come January. So it was staged, and that's what caused, in my opinion, a whole lot of stress and angst even working, knowing that my demise or the certainty of my demise was coming. And I couldn't do anything about it. And how do you perform your job well under the knowing that it was going to end. That was a big challenge. And to work with your co-workers along the way, you know, was a challenge.

[00:05:00]

Leighton Grey

Were you provided with any information from the HR [Human Resources] department or somebody else at the company about why they were imposing the mandate?

Jacques Robert

They were following health guidelines.

Leighton Grey

So it was coming from the Government of Alberta, they were just trying to basically move in lockstep with the Alberta Government's position.

Jacques Robert

So I worked in a regional office, and we had regional offices in all the major centres across Canada. So they were really following Canada health guidelines. But, of course, it trickled down to whatever Alberta Health Services was imposing as well.

Leighton Grey

Is it fair to say that you had office type work, that's what you did?

Jacques Robert

Yes.

Leighton Grey

It seems to me that that would have lent itself readily to some type of accommodation where you could work from home. Was that ever offered to you or anything like that?

Jacques Robert

It was, yeah. There was a certain time when they shut everything down and they were willing to work with us, and to maintain the services that we needed for the buildings. My position allowed me to work from home. There were others that weren't. The operation staff had to be in the office to keep the building running, even though there was almost zero occupancy. So I was able to work from home, five days a week. What they slowly, like they did with the mandates, brought in the opportunity to have the flexibility to work from home and then two days in the office. And we had to kind of schedule with our crew workers when we could be in the office.

Leighton Grey

Were you told why that situation couldn't continue? Or was it a situation where they just insisted that everybody had to be uniformly and universally vaccinated?

Jacques Robert

I would say that they knew that everybody was going to have to be vaccinated. They just sort of eased everybody back into the opportunity to have faith in the company that we would all get back to work and everything would go back to normal. And I still think to this day that they still have the flexibility of working from home and mandatory days in the office too. So hopefully that answers your question.

Leighton Grey

That accommodation, that is working from home, that was not offered to you after you refused to provide your private medical information?

Jacques Robert

No, it was not.

Leighton Grey

What about something like testing? Was that accommodation offered to you?

Jacques Robert

Yeah. There was a point in time, and again, I don't remember the specific dates, but we were forced to be tested, if we were to come back into the office. They told us that we were supposed to be tested. We were supposed to take the test, and they worked on the honour system that if you tested positive, you had to stay home. If you didn't, then you were able to come into the office for your selected work days.

Leighton Grey

But they did not offer you the option of testing as an alternative to vaccination. Do you understand what I mean?

Jacques Robert

Yes, I do. No, that was not part of the plan.

Leighton Grey

Were there any exemptions offered, like religious or—

Jacques Robert

None.

Leighton Grey

medical?

Jacques Robert

No exemptions.

Leighton Grey

Why did you refuse to provide your personal medical information to the company?

Jacques Robert

Primarily, it's because I felt it was a real hit on our own rights and freedoms and to have our bodily autonomy, and it's none of their business, really. That's why I didn't want to disclose it. I mean, the fact of what I was learning and getting myself exposed to, as it related to the shots and how that was rolled out, I was suspicious of it from the very beginning. And when both sides of the stories were coming out, I could say that I was open to both, but I was really pushing away what I felt to be propaganda and the false narrative against what I was able to find in real, credible, documented, and proper, believable sources of information to say that

[00:10:00]

this vaccine or shot was ineffective. And I didn't want that in my body. I simply didn't want it, and that basically led me to fight against [sic] my charters of rights and freedoms and not have to disclose that information to anybody.

Leighton Grey

The loss of your employment must have been a significant financial stress to yourself and your family. Do you want to talk about that a little bit?

Jacques Robert

Sure, I mean I think they got— Just to support what I'm about to say, I'm the only one in the Calgary office who was let go because of my non-disclosure, my lack of attestation. There were others who were with me but they were coerced into complying. So because I was the only one, I can only speculate.

They did a pretty good job of looking after me. They gave me a pretty fair severance, but that doesn't last forever. So it was hard for me to go forward with the uncertainty of work, I guess. And yes, today I'm still bridging my finances, bridging my lifestyle and bridging my family support, with my life savings. So you know severance runs out and I still don't have any work and the uncertainty of the work I'm capable of doing is— How can I put it? I don't know if I can get a job there again because I feel they're still imposing those restrictions on the staff.

Leighton Grey

Have you tried to obtain other work in the same field?

Jacques Robert

Not in the same field, no. I choose not to because I think I know the answer. I feel like I know the answer. I probably won't be able to get in there. Because I'm not complying with their policy.

Leighton Grey

Are you concerned that this will sort of blackball you within your field, or that this will follow you around and prevent you from obtaining replacement employment?

Jacques Robert

Possibly because I have been vocal about my circumstances and my beliefs. So being open on social media and trying to share information, I feel as though I'm exposed, so the likelihood of that is possible.

Leighton Grey

Did you apply for employment insurance following your dismissal?

Jacques Robert

I did.

Leighton Grey

And what was the result of that, were you denied?

Jacques Robert

No, I was not denied. I think they gave me a shortened term of compensation. I'm still fighting for my eight-week unpaid leave time. They have a case against it. But yeah, I'm no longer collecting unemployment. I'm done.

Leighton Grey

Do you recall what your employer indicated on your record of employment as the reason for your dismissal?

Jacques Robert

Termination without cause.

Leighton Grey

I understand that this whole situation has also been a great deal of stress on your family. It has caused some family division and mental stress that you are unable to attend your grandchildren's recreational activities and other family events. Do you want to talk about that?

Jacques Robert

Yeah, for sure. Because we were never compliant with the mandates and the shots, I think it was the last year, or maybe over 2021 into 2022, we were unable to go watch our grandkids play in their indoor sports. So that in itself, I think, created some challenges within the construction of our family.

Families love each other, so we do have that love for each other, but there is still that piece that is hanging over the difference between our beliefs and what our kids' beliefs are. And so it did create a little bit of divisiveness within the family. You know, some challenging conversations were had, crucial conversations, but it never amounted to much because it was always, I don't want to talk about it. But I understand it, you know, I'm not against what they decided because they're adults,

[00:15:00]

they can choose whatever they want. That's what this is all about: freedom of choice.

Leighton Grey

Did you consider filing a human rights complaint against the employer over the discrimination that you suffered?

Jacques Robert

I did at first. I did speak with someone to try to obtain some legal guidance on that. I was advised that it would have been a really tough battle, at that time, because there was no precedence to this kind of event; they didn't know where this was going to lead. But it's in

the back of my mind of still being able to do that. Because I have that history and I have everything documented as well, in regards to all the history and everything that unfolded through my loss of employment. So it's in the back of my mind. I just don't know where I'm going to go with that.

Leighton Grey

Do you anticipate that you'll be able to return to work at some point?

Jacques Robert

Yeah, I am able to work. I'm trying to do something as a self-employed individual and trying to build something that way. So it's working from home and taking control of my own destiny. But again, I can't tap into my life savings and my retirement savings now, which I'm doing. There's an end to that. I feel I will have to go back to work sometime very soon, if my online business or my vision of working from home and being self-sustaining is not as successful. I don't want to put that in my vision, but that's what I'm working towards.

Leighton Grey

Sir those are my questions, is there anything else that you want to share with the inquiry that I may not have asked you about?

Jacques Robert

Yeah, I'd like to be able to share some of the experiences that we had within the work environment. The coercive nature, I feel that the corporation had on us as staff was, as far as I'm concerned, unacceptable. Not only did it apply to those who were working for the company, but we have a lot of service providers that were working for the company.

You can name them: cleaning, mechanical, electrical, maintenance, architectural firms, you just name it, there was a whole list of service providers to which, they too were forced to be vaccinated if they were to enter the front doors and do work within the company. So you can imagine how that effect of following these restrictive measures mushroomed out to the community. So it wasn't just us, it was the entire family who lived and breathed within those buildings that were also affected. So I really felt that was important to share because I'm just one, but what they did, was to many.

And also sometimes the environment within the building itself, when we were able to go back to the office and work. I remember the ridiculousness. I have to state this because it seemed so ludicrous. They put markings on the floors where you can walk, and you have to go this way. And there was a one-way direction in our office: all the perimeter offices and then, there's an aisle. And you had to go this way to go to the washroom and God forbid if you stepped out of line there, you had to wear masks in your office. And I worked in a perimeter office with a closed door, and they still expected you to wear masks while you were in the office. Needless to say, I did not comply. And when they finally relaxed that, you were also mandated to wear a mask if you opened the door from your office to go to the washroom. And even though it was a skeleton crew, there were times where I'd be at the office and there was two other people. And we're taking a whole floor plate of a 12,000 square foot building. And he's over there or she's over there and I'm over here, and they're telling me that I have to wear a mask to go to the washroom. So there was some ridiculousness attached to that.

And also. when you walked into the elevator, they told you, this is on a sign, "Please don't face anybody, you're only allowed two in the elevator.

[00:20:00]

And when you stand in the elevator, please stand facing the mirrored wall at the back." So it was like you had to stand looking away from the door and the other person had to stand at the kitty corner of the elevator car or a cab to make sure that you didn't share anything.

So those were kind of the stressors and the challenges of the environment and having to work in that, people complying with that and trying to have good conversations or open conversations with individuals about what ridiculousness that was going on in the office. So I felt it was important to be able to share some of that just to kind of add to the impact of the restrictive measures that it had on everybody. Those who complied and those who didn't and the divisiveness that it created, not only in the work environment but at home and everywhere else.

Leighton Grey

Just by way of follow-up, I've represented a lot of people who've suffered similar treatment by employers, in my practice. And in talking with them, I was always struck by the fact that although they were interested in the more practical things, like loss of money and things of that nature, there were two things that really came through with all of the people that I talked to who were put into this situation, as you were.

The first one is a deep sense of betrayal, and the second one is a sense of dehumanization. That they were no longer a human being of value. Because when you think of the employment relationship, most of the time it starts out somebody applies for a job, there's a competition and they're picked. They're picked for the team, which is always a good feeling, if anybody's had that feeling. And then you begin that journey with the company, you devote your life, you spend your time, you devote your expertise, and all your skill and worry. You help, whoever you're working for, make money or succeed in whatever endeavor that they're doing. And then one day, suddenly, none of that matters. You rise through the ranks, maybe you're a senior manager, well-paid, you've got a sense of belonging and then suddenly, all of a sudden, that just stops and the employer says, you know, take the shot or else or you're gone. Does that resonate with you?

Jacques Robert

It most certainly does, I felt human resources really was there to protect the company and not the individual. Because they're the ones that I felt had no compassion for what I was going through and what others were going through as well. And yeah, it really gave you the sense of, call it that corporate wheel, where everyone is dispensable. I did not feel indispensable. I felt, as things led to the end, that I was not being valued. And it even came across from some of my colleagues and some of the other employees who I interacted with. So yeah, dehumanizing? I could categorize it as that because it really felt as though my value that I had to give to the company, wasn't there, and it was ripped away, ripped away for sure. So thank you for asking that question.

Leighton Grey

Even if they offered you the same job again, you probably couldn't go back, could you? You couldn't go back as the person you were before they did this to you because that trust, that relationship, that sense of belonging, give and take, that's destroyed. It's severed, isn't it?

Jacques Robert

You're not the only one who's asked me that question, and yeah, I don't think I can go back to work there. I feel as though that relationship and that commitment to value that I could present and bring to the company, it wouldn't be there, that loss of commitment—it's gone. Gone.

Leighton Grey

When you multiply that, hundreds of thousands of times, you can get a sense of the incredible impact that has upon the Canadian economy, the Canadian workers.

Jacques Robert

Absolutely.

Leighton Grey

The Canadian workers are the bulwark of our economy, right?

[00:25:00]

Jacques Robert

Absolutely.

Leighton Grey

They're the people doing things, building things, making things, doing the risky, hard jobs.

Thank you, sir. Thank you for your testimony today.

Jacques Robert

Thank you.

Leighton Grey

I have nothing further, perhaps members of the panel do.

Commissioner Kaikkonen

I just have a quick question in terms of following up what the lawyer has just said here. Did either your employer or HR come to you and discuss the possible changes to your employment agreement at any point in this journey?

Jacques Robert

They didn't come to me personally. It was always communicated via the internet, their internal communications, as to what was unfolding and how the policies were going to be enforced.

Commissioner Kaikkonen

Thank you.

Jacques Robert

And if I could add to that, when I did try to go to them, all they would respond to is, that's company policy. That was it.

Leighton Grey

All right, sir, it appears that's all the questions from the panel, so thank you again for being part of the Inquiry.

Jacques Robert

Appreciate the time for everybody who's all here. Thank you.

[00:26:22]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 1

April 26, 2023

EVIDENCE

Witness 13: Sherry Strong

Full Day 1 Timestamp: 10:22:05–10:47:15

Source URL: <https://rumble.com/v2kjiwek-national-citizens-inquiry-red-deer-day-1.html>

[00:00:00]

Shawn Buckley

So our final witness today is Sherry Strong.

Sherry, if you want to come up and take the stand.

Sherry, can you state your full name for the record spelling your first and last name?

Sherry Strong

Sherry Strong, S-H-E-R-R-Y S-T-R-O-N-G.

Shawn Buckley

And Sherry, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Sherry Strong

I do.

Shawn Buckley

Now, my understanding is that you are currently the Alberta Director for Children's Health Defence.

Sherry Strong

Canada.

Shawn Buckley

Canada, yeah. Oh, sorry. Can you just very briefly tell us what that is?

Sherry Strong

It was an organization, the Canadian arm of the American organization that was formerly headed by Robert Kennedy Jr., now Mary Holland, and basically it is designed to address anything that is set up to harm our children, and to protect our children from all the different elements, environmentally, mentally, emotionally, spiritually, and physically, that are set up to harm our children.

Shawn Buckley

Now, before COVID came along, you were a professional author and public speaker.

Sherry Strong

I was.

Shawn Buckley

Oh, no, we'll actually describe that because some of us don't actually appreciate that that can be a career, that your primary source of income can be public speaking.

Sherry Strong

Yes, a lot of my family don't understand that either.

Shawn Buckley

Yes. Do you want to share with us you know what you spoke about and how that came about.

Sherry Strong

Yeah, I lived in Australia for 22 years. I was, what you would call at that time, a celebrity chef nutritionist, and I got involved in nutrition. I became the Victorian Chair of Nutrition Australia, the curator and co-founder of the World Wellness Project, a lot of other things. But one of the things that I did was, I sat on boards that consulted the Australian government on public health policy.

So when all the COVID nonsense began, I recognized right away that it was not what they were saying it was.

Shawn Buckley

Right. Now, where were you when COVID began we back? Were you back in Canada?

Sherry Strong

Yeah, I'd been back in Canada for 11 years and I had a well-established name and reputation in Australia, 22 years. So it was kind of crazy professionally to come back to Canada with none of that—no one knowing me here, apart from my family. So it took me 11 years, and I rebuilt, and I got back on the speaking circuit. So I was represented by bureaus, and I was being hired by clients around North America to speak at conferences on health and well-being, and beating sugar addiction, and a lot of things related to food and nutrition. I branded myself as a food philosopher, which again also confounded my family.

Shawn Buckley

Right. Now obviously being paid as a public speaker as a career depends on there being conferences and events. So tell us what happened to your business when COVID hit and our friendly government decided to lock us down.

Sherry Strong

Yeah, and I can honestly say I was blindsided. I never imagined that happening. And literally my income and career ended overnight, as I knew it. And then because I recognized what was going on, I couldn't help but speak out about it. And I was very aware that in the process of speaking out about what was actually going on and the truth of what was actually going on, that that was a killer for any future speaking work because it's very reputation-based and most of these places are very sensitive and politically correct.

Shawn Buckley

So I just want to make sure that we understand. So the type of clients that were hiring you to give lectures tend to be, I assume, bigger corporations and the like. And they buy into a specific message. And so when you started speaking out, you understood that this was basically going to end your business.

Sherry Strong

Absolutely. I was very aware of it. And even on social media, because I also promote a lot of my work by social media, not only was I very aware that my speaking out would—I have online courses that I sell and things like that—that it would impact that. And if I wrote honestly in my newsletters, it would impact sales from there, but also to the point where I had friendships, decades long, who were very afraid to actually like any of my posts or comment on anything or me to comment on their things because they know that association with me could kill their brand or the brand they represented.

Shawn Buckley

Okay. So pre-COVID, probably people would be liking your stuff all over,

[00:05:00]

and just enjoying being a part of your social media presence. But post-COVID, basically because you were telling truth, you became somebody that was dangerous to associate with online.

Sherry Strong

Yes. Social pariah and all-around dangerous woman.

Shawn Buckley

And how did that make you feel?

Sherry Strong

Well, you know, people talk about being courageous. I never felt— It's one of those things when you're a person— And in my career as a nutritionist and, you know, celebrity chef, I lost a lot of work because I was a truth-teller and I wouldn't promote brands that sold horrible things even though they— To give you an example, I was offered \$120,000 to shoot a commercial that was two days' work for a brand of milk that was targeted at children called Calcium, and I turned it down right away. So I didn't have a problem with that piece of the courage piece. I was afraid for humanity. I was really sad and went through a real dark night of the soul around, that humans couldn't see through this and what they were willing to do to one another to save their physical assets or their social reputation as opposed to be more concerned about their fellow man or their soul. That was hard.

Shawn Buckley

Yeah, that's kind of following up. I don't know if you were here when Danny Bulford was testifying earlier, but that's been a theme today.

And what are your thoughts on why humans can't see through this, or couldn't see through it? I guess they still can't—a large number.

Sherry Strong

Well, it's a very complex web that I believe is very well designed to get us addicted, not just to food that dumbs us down and makes us sick and makes great business for other businesses, but our social networks. So I have a friend who literally: by liking my stuff, and if she could actually see through the narrative, her marriage would end, her friends would disappear, her career, which is very high profile, would end. So I am incredibly concerned and worried that we have been manipulated from birth to like things, to become addicted to things, to have social constructs, to even social events, sporting events; I mean, how many people took something they didn't want to take to go travelling or to attend sporting events? The very fabric of our society: it was like they looked at all the things that we loved and depended on, and I think, were addicted to. And they really pressured us to do things that went against our body, our conscience, and our soul.

Shawn Buckley

I want to switch gears, because you weren't living in the beautiful province of Alberta before, and you moved here for your parents, and there's been a couple of experiences with them. Can you share that with us?

Sherry Strong

Yeah, so my mom about eight years ago took an antibiotic and almost died. She went to heart, kidney, and liver failure. It has a black box warning, and she survived; but she was disabled. My father had been looking after her for six years on his own, but approaching eighty he could no longer do that on his own. So in November 2020, my sister said, "Would you come to Alberta and take care of mom and dad?" I found a house and moved them in with me and was taking care of them, and about ten months later my mom got pneumonia and we took her to hospital even though we were really afraid of— Because of my work with Children's Health Defence I have interviewed over a hundred experts, witnesses, victims of the mandates, but I've heard many hundreds of more stories of people who

aren't willing to speak out or don't feel safe speaking out, those kinds of things. So I was afraid to take my mom to the hospital. On the first night we admitted—

Shawn Buckley

Can I just stop you?

Sherry Strong

Yes, of course.

Shawn Buckley

That's because your mother was not vaccinated. Am I right?

Sherry Strong

Well yes. Yes, not vaccinated and we as a family refused to test as well. And so we were afraid for her care. The night she was admitted, on New Year's Eve 2021, we had a great doctor. And when people say there's no good people left in the system, I will deny that because we have met beautiful, good-hearted people, trapped in a very broken system,

[00:10:00]

who are trying to do their best; and for whatever reasons, I'm actually glad they're still good-hearted people there. So this doctor assured us that my mom would be fine, they wouldn't try and vaccinate her or test her or that kind of thing. And I went home at about midnight. I came in the next morning and my mother was absolutely terrified. She had been abused by a doctor. A doctor stood at the door and yelled at her for 15 minutes and abused her, yelling at her, and my mom said, "I can hear you, why are you yelling at me?" She said several times and the doctor continued to yell so everyone in the emergency ward could hear, and she said, "Why are you refusing testing? Why are you refusing treatment?" And my mom said, "I'm not refusing treatment, I'm choosing treatment."

We were very selective about things. We definitely didn't want a fluoroquinolone antibiotic. That had disabled her, so it would disable her further, things like that. We didn't want to test. My mom was actually willing to take a swab test as long as it wasn't one of the official COVID swabs. But they refused to do that. And this woman was so abusive to my mother that my mother, who's not religious, was reciting the Lord's Prayer as she left and as I came in because she felt she wasn't going to make it out of the hospital alive. And I've since told that story many times, and I've had many people tell me, "You're so lucky you took your mom out of the hospital that day because had you not she would have been dead." Because they've had family members under the exact same circumstances who had died, and there's a very important kind of afterward to this story that I think is absolutely significant.

It took me nine months to make a complaint. I went to patient services. I made a complaint with patient services. I went through the College of Physicians, made a complaint. And my intuition said to phone the chief administrator of the hospital. And so that morning I did, this is September 2nd, and I got through to this administrator, and I had a long conversation about the treatment because I said, "My mother's file will come across your desk but it won't have her picture and according to your policies it won't even have her name and I want you to know her story and what happened to her and how your doctors are treating people here who are choosing treatment, not refusing treatment." And she said

to me—she was actually really kind; she listened to me, she was reasonable—and she said, “You know, I’m on the opposite fence of you. I’m fully boosted.” And I said, “Well I suspect you are, but,” I said, “as the chief administrator of a hospital you should know that the number one cause of deaths in Alberta, September 2nd at that time, over 3,600, was unknown causes, and as someone who’s administering this and enforcing this to every staff member you should actually know this.”

Now, I don’t know if she was— She felt earnest but it was like she didn’t know. And the significance of this story is that a month later when I was talking to Patient Services, I was saying how lovely this woman is and how compassionate she was and the woman from patient services said, “Oh Sherry, I’m so sorry to tell you, she died unexpectedly and suddenly at work on September 8th.” So she went in the prior week. She actually knew about it. Whether it registered in the incredible timing of it, that I chose that week to make the complaint and I chose to actually speak to her, the irony or the extraordinary nature of it was not lost on me.

Shawn Buckley

I think we’ll just slow down a bit because for people that will be participating in watching your testimony that aren’t from the province of Alberta, they may not understand exactly what you’re saying. So what you’re saying is that in the province of Alberta, the leading cause of death last year, and you can tell me if it was the year before because I think it was too, is actually unexplained cause. So that’s where they’re not attributing it to any cause, and yet there’s no investigation. So here we are where the main cause of death is unexplained and there’s no official explanation, and that’s what you were referring to. Am I correct?

Sherry Strong

Correct. And the Chief Administrator of a hospital said she didn’t know that.

Shawn Buckley

Which is quite amazing, isn’t it?

Sherry Strong

Yeah, it is.

Shawn Buckley

Okay, and then something also happened with your father. Can you share that with us?

Sherry Strong

Yeah, so recently my father was admitted to hospital. We since found out that he has a tumour

[00:15:00]

which is blocking/obstructing his ability to eliminate. And we were again, based on my mother’s experience, a little, well, we were a lot paranoid going into the hospital. But it was the right decision to take him in. So I stayed with him. I camped out on the floor kind of

thing, wanting to protect him. And I truly do believe that that also saved his life: not staying over, but being his patient advocate and digitally advocating for him.

When he left the emergency and went up to the second floor, as the nurse was putting him into the room, she said, "Do you know how much you're costing this hospital?" My father hadn't been to a hospital in 55 years and the cost that she was referring to was because he wouldn't test or be vaccinated, and so they had to put on the gear. They had to put on the gowns and the mask and the gloves. Their policy, which I explained, which, "We don't mind if you don't wear all those things. It's your policy not ours, so the cost is basically on you guys, and I'm quite certain my father saved you hundreds of thousands of dollars by not going to the hospital in 55 years."

The other thing that happened a few days later, and of course, I advocated for him. At one time when they brought a social worker in that said, "How are you doing?" like trying to treat me like I was a mental patient. So I said, "I'm fine how are you?" There was five people in the room and my dad was just overwhelmed. My dad, he's 80, he's emaciated, he's essentially only had liquids for weeks and he's seriously ill.

And they brought five people in to mediate the medical directive that I had legally filled out correctly, to basically say that it wasn't valid because I needed two doctors and a social worker to assess that my father wasn't of the mind to make me his personal medical advocate. Which is all incorrect, but when the five of them walked into the room, my dad was so overwhelmed he started crying.

We had another doctor who— She came in. They have doctors that are there for a week. So seven days and then a new doctor, and then a new doctor, so there's no continuity except what they read on their system, their multi-billion dollar system that was actually designed as an inventory system not a medical system. So they don't get all the information. And this one doctor came in, and fortunately, I had said, "Well if you're not going to respect the directive, at least get my father to call me and put me on speakerphone if you're going to speak to him when I'm not there because you're going to have two conversations if you don't do this: one with him at the time, and then one with me afterwards."

And this one doctor couldn't get a hold of me. My mum was on the phone and she had told my doctors, sorry, she told my dad and my mother that surgery wasn't even likely a possibility because the cancer was riddled throughout his entire system.

There was not one test that they did that could have given her that information. And when I spoke to her the next day she tried to say my dad didn't understand what she was saying. I said, "My mum is very lucid and she was shaken to the core by what you said as well." And I said, "What test were you referring to, to actually give my father that information?" And she tried to deny it and I said, "Because there's no test. They've identified there's a tumor. But we've not had a biopsy, we've not agreed to a biopsy. So there's no way you can even say that there's cancer in his body, let alone throughout his body." And when she came into his room to discuss this with me, I said, "Yesterday my father was hopeful about surgery. This morning he asked me about medically assisted death. You took away his hope."

And there are many instances. These are the ones that stand out of bias in care. I know from my own personal experience, from the stories that I've heard, that bias in care literally can kill people. So we have a very broken system. There are still good people in that system, but it's very scary to actually navigate that, and as you probably gather, I'm not a wallflower. I will stand up for my dad, and I will fight for my dad. And that poor nurse who

also suggested he get a COVID test and vaccine; a young new nurse bore my wrath, so that was another instance.

He went in and did all his things with my dad and then said,
[00:20:00]

“Well, why don’t you get tested? Why don’t you get a COVID vaccine. It’s going to protect you. You’ll be able to live longer,” that kind of thing. My father was furious. So I know that bias of care actually does cost lives. And the elderly are treated differently. There’s more of a disposable attitude towards the elderly in hospitals; I’ve witnessed it. And I have many other witnesses who will corroborate that.

Shawn Buckley

Right. Now, to end on a good foot, my understanding is, actually in your life some really positive things have happened since our COVID pandemic.

Sherry Strong

Yes, I was worried that you may not want to hear this because we want to basically say that the COVID response was wrong, and it was. It was absolutely wrong. But what I do know that in every tragedy there’s the opportunity for humanity to rise up. What I have witnessed in my own life is: not a big fan of six months of winter a year—I definitely got weak and soft in Vancouver and Melbourne. But I’ve always said that cold cultures breed warm people. And coming to Alberta, specifically, what I have found is I lost a lot of friends that I shared interests with. I still have friends, even though I see things differently to them because we share values and we truly love each other, but what I’ve gained is a community of people.

Honestly, it feels like *It’s a Wonderful Life*. That kind of community of people who are actually there for each other, salt of the earth people, who have common values, who will help one another out, who don’t always agree on everything. don’t see the things the exact same way, but they understand what’s really important for us. As hard as it’s been, I have a bank of memories with my parents, of caring for them, in a way that COVID wouldn’t have brought the people in this room, the people that I’m meeting, I never would have met any of you had it not been for this, what we would all say is a terrible event.

Another like big surprise is: I did go on dating sites when I came here; it was really scary, and I had one person who actually wished me dead when he found out that I wouldn’t get vaccinated or test and also said, “It’s so good that you weren’t able to reproduce” because I was not able to have children. It was a big thing in my life.

I met someone else on that site who said, “This might change things for you, but next week I’m taking custody of my one-month-old niece.” And I said, “Can I help?” We never ended up dating, but she now calls me mama, and I get to see her and care for her and love her and have that experience of having a child that never would have happened if not for all of this. So yeah, the number one thing is for all the inhumanity that we’ve seen I think one of the best gifts of being within what we call the freedom movement—people who are truly interested in other humans—is there’s a richness in life that I only thought was in Capra movies.

I probably think the last thing, too, is all of this is really deep in my faith, not just in aspects of humanity, but in our Creator, in God. I had kind of a superficial relationship and belief

beforehand. I would say I'm spiritual but not religious. Although I'm not religious, I have a greater faith in something, a Creator, and something way bigger than us, and a grander plan. That's the thing that through all the darkness and the dark nights of the soul that that keeps me realizing there's a phrase that I've used a mantra that I've used that's kept me going: Love wins, Good wins, God wins.

Shawn Buckley

So that's a beautiful ending. So I'll ask if the commissioners have any questions And they don't.

Sherry, on behalf of the National Citizens Inquiry I sincerely thank you for your testimony. And I have to say I'm particularly touched with the end of your testimony. It's beautiful.

Sherry Strong

Thank you.

[00:25:10]

[00:00:00]

Shawn Buckley

So that is going to conclude our proceedings today. Please join us tomorrow at 9 a.m. Red Deer time, so that's Mountain Time as we continue with day two.

I think that Sherry has left us on a positive note. All of us, regardless of where you were in the COVID conversation, had some very dark nights of the soul, to use her terminology.

But I think we've also all experienced some real positives, and the friendships that we have developed through this experience are different. They are more rich, and I can say, you know, as being a volunteer with the NCI, I've just developed some profound friendships. And I'm very proud of the commissioners that we have and just the volunteers—that people would commit themselves, basically to give Canadians a permission to speak again. And people are saying that they have hope. And so I think we do have to understand that Good wins and God wins and Truth prevails. We've just, we just needed be patient.

But now it's our time and there are more of us than you think there are, and our numbers are growing. So on that note, we will conclude the first hearings of Red Deer National Citizens Inquiry hearings.

NATIONAL CITIZENS INQUIRY

EVIDENCE RED DEER HEARINGS

**Red Deer, Alberta, Canada
April 26 to 28, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

We welcome you to the National Citizens Inquiry as we begin day two of our hearings in Red Deer, Alberta. Commissioners: for the record, my name is Buckley, Initial S. I'm attending as agent this morning for the Inquiry Administrator, the Honourable Ches Crosbie.

I'd like to start, for those that are not aware of the National Citizens Inquiry, that we are a citizen-run and -funded— Excuse me. It's interesting how I always have a frog in my throat when I start these openings. But we're citizen-run and -funded, and we depend on you to make donations to keep this going. This costs us about \$35,000 for each set of three hearings. We anticipate the Quebec City one is going to be much more expensive because we need real-time translators. And if we don't get volunteers— So I'm asking, if you're out there and you are a real-time translator that can attend in Quebec City in two weeks, to contact the National Citizens Inquiry. Our email addresses are on our site, and put in bold in the subject line, French translator.

We also need teachers. We want to have some discussions with teachers about what's been going on with kids, and we might want you to participate in an online event about that.

I can tell you that I'm frustrated, and I think a lot of people are frustrated that the **mainstream media isn't covering this. Any time in our known history, have citizens of any country banded together, appointed independent commissioners, and marched them across the country, let alone one as large as Canada, to inquire into a significant government action on an event that has changed all of our lives? That, in itself, should be a front news, a news story. It should be the leading story on TV, and yet it's really not a story at all.**

We try to get the message out on social media—YouTube keeps taking us down—and TikTok and the like. We're still getting censored, even on Twitter, apparently: there's something happening where when people are searching for us they can't find us—even though in theory, Twitter isn't banned.

What's frustrating is that we're all living in a country where we're still pretending that a reality that is false is true. We can't have a discussion with half of the country about what really happened. It's like the emperor is still out there, and the little boy hasn't pointed up to say, "Well, the emperor has no clothes." Because the emperor has no clothes and we want, we need to be the little boy. The NCI needs to be the little boy because the reality is, if you watch an entire day of the National Citizens Inquiry you will be changed, and we need to get people watching the National Citizens Inquiry.

I've asked everyone to use your social media to get us out there, but I'm asking you now to become creative because what you can do is figure out how to— Maybe you should run an extension cord out, put your TV out by the sidewalk on your lawn, and live stream us. When we're not running, we've got videos of the past ones so that anyone walking down your street has to know what's happening. We have to think outside of the box. You know if you've got one of those big screen TVs on a van, park it in a busy street and run our hearings and run the recorded ones. Somehow we have to get people watching.

We're just a small little group of volunteers that are scrambling just to be ready for the next hearing. We truly need you to do it. That's what a citizen initiative is; it's you getting involved in doing things. So that's my call-out today.

I want to move to my opening remarks and share with you a story that—well, it's not a story—it's something that happened to me and it changed my life. I'm not sure how many years ago, I'm going to guess 15, 16 because I recall that my kids were with us going up to Valemount, BC, in August. It's probably noon.

[00:05:00]

It's a sunny day, and this is a perfect day for a nice travel. We have got the family in the vehicle and going down the road. And for the first time in my life I ran into a daytime police roadblock—blocking both lanes of traffic—not checking just commercial vehicles, checking every single vehicle on the road. You had to stop; traffic was backed up; this is a major highway, the Yellowhead Highway, and they were making inquiries of every single vehicle.

I was fit to be tied because up until that moment, up until that moment, I was free to drive on a highway in Canada without encountering a police roadblock. I had been free till then, but that freedom had just been taken away from me. And they're still doing that in the interior of BC, and the worst offender is the Valemount RCMP detachment. But you see, I lost that freedom, and my kids lost that freedom that day, and that freedom can't be taken back unless we get enraged and force the police to back down. But we never get enraged, and we never force them to back down.

As I reflected on that or actually steamed and boiled about that, I remember thinking I'm glad my dad's not here. He's never been in trouble with the police, but he would have just gone ballistic. My dad was born in 1939, a few months before Germany invaded Poland and the official start of— The Second World War started on September 1. So he was raised in his generation. And each generation has a different idea of what's tolerable and what isn't, and in his generation, roadblock equals police state, full stop. Free societies do not have roadblocks for their citizens; free societies do not have identification papers, full stop. That's why I was glad he wasn't there because to him he might as well have been in Stalinist Russia.

But a precedent has been set, and you see, for my children, that's now normal. When we approach the holiday season, we have holiday check stops now. We all expect it because of

the danger of drunk drivers, and we can't challenge safety. So I was about to say, and I'm not minimizing the danger of drunk drivers because I've been conditioned, you can't argue about safety, and I'll talk about that a little later. But we've been conditioned to accept as normal that in the holiday season the police can set up roadblocks and check every single vehicle, which means those of us that aren't drinking are going to be stopped. Now, understand in my generation, by the time I was driving we had them, so to me that's normal, but the generation before me, they were free from that. They were free from that. In fact, the courts had to decide on issues like roadblocks for safety. "We're not a police state," the Crown argued to the court. "It's not like we're Nazi Germany and stopping people just for their identity papers. We're doing this to protect people. Do you know how dangerous drunk driving is? Do you know how many people die from drunk driving?" The court said, "Yeah, we'll accept this for safety."

It's always about safety. You're not supposed to use the words "always" and "never," but I literally can say that almost always the courts side on safety, and that's because in our society you can't argue against safety or you're a villain. But the irony is that there's nothing more dangerous, there is nothing more dangerous than granting the police and granting the state more power: nothing. Any historian can tell you the largest cause of death is Government, full stop. I see people in the audience, they know exactly what I'm talking about. The largest cause of death is Government. I mean just in our last century, well let's go back a little longer, but I mean we've got Nazi Germany, we have Stalinist Russia,

[00:10:00]

China. I mean examples that just pop to the tongue.

And here we are in Canada and— You know, it probably started as early as I can remember, I was fascinated with the Holocaust because I was so horrified. I couldn't get my head around how that could happen, and more so because Germany was a Western nation. They were educated; they were just like us. In university I took classes on it; I was just fascinated. And I wasn't mature enough to understand that a question I was asking myself just showed that I didn't understand, and the question I'd ask myself was, "How could the Germans do this?"

See, that shows that I totally don't understand because I was thinking that they were different than, let's say, Canadians. See, by even asking the question, "How could the Germans do that?" I'm implying that Canadians couldn't do that. I didn't understand that actually, we're all the same. There's no difference between Germans and Canadians. There's no difference at all. So I didn't understand that it could happen here and that it will happen here.

You know, I've spoken a couple of times during this COVID thing that I was hearing about putting unvaccinated people in camps—some people are nodding their heads. There was that dialogue we heard about putting unvaccinated people in camps—not by the government, they weren't saying that—but other people were saying that, and it was trending on social media and the like.

But you want to know what was scary, even though the government wasn't saying that? Did you see our prime minister or any member of our government stand up and denounce that talk? Because in a society that has responsible leadership, you do not allow the citizens to publicly have a discourse about putting a subgroup of citizens into detention camps without standing up and saying, "That is not appropriate; and that's not going to happen."

So why did not a single politician at any level that I am aware of—other than maybe Randy Hillier—stand up and challenge that dialogue?

You know I mentioned Randy Hillier. I watched a video and I'm sure it's online. He was a member of the provincial legislative assembly in Ontario during the COVID adventure that we just went through. I watched a video where he, as an opposition MLA [sic] [MPP: Member of Provincial Parliament] is asking the government, "Well, there are detention camps being built in Ontario" because there were detention camps being built across Canada by the federal government during COVID. Were you aware of that? So back to when I was naïve, I thought it couldn't happen here, but he was asking the government, "Okay, well we're building detention camps across Canada, we're building them in Ontario. Who are they for? Who are the camps for?" That's a good question. The camps are still there. Who are they for?

We're not different. We're not different at all. We are setting precedents here. You see, the police state can happen here. For my generation, holiday roadblocks are normal; for the next generation, daytime ones will be normal. Do you understand that for our young kids right now, for our children, right now masks are normal? For us, it's just this horrible affront, whether you supported the idea of wearing them or not. It's like, "Oh, my gosh, we're wearing masks." For our young children that's normal. For our young children watch their parents; being afraid of government is normal because we're now afraid of our government; the power balance has moved so far. But what's worse—and listen to this—because our children watched us, for our children being afraid of each other is now normal.

[00:15:00]

And I don't know how we come back from that.

Passports have become normal for our children. I've mentioned this on other openings, but it's so important to understand that passports are a police state ritual. So here we had this situation in Canada where for the vaccinated to access restaurants, and hockey games, and the like, they had to show their identity papers. That's a police state ritual. Let's just go back to the classic police state you know: So you're in Stalinist Russia or Nazi Germany or the interior British Columbia and you're at a police roadblock. No, it's not funny because we have roadblocks in the interior of British Columbia. Somebody here just laughed. It's not funny at all.

So you're at a traditional police state roadblock and you have to show your papers. So you're in a city, and a main intersection is blocked. The police state doesn't care where you're going. They know where you live; they know where you're going to sleep at night. That's secondary. So before— When you don't have a police state— And for us, let's just **talk about the vaccinated who participated in this ritual. Before this ritual they were free to go wherever they wanted—they didn't have to show identity papers. They were free. And even the idea of thinking you had to do something before you could go to a hockey game, or do something to access a restaurant, that would have been just crazy talk because you were free.**

But what the ritual does is, at a subconscious level, it teaches you you're not free. Because for you to go to that Oilers game you have to basically give your passport and the symbolism is you're not free to go there. You're no longer free: you have to go through this. You have to participate in this action dictated from your master, the government, before you can participate. And subconsciously every time you do this, you are reinforcing that the government is your master. And for you to access this privilege—because you can't go

there just on your own without this ritual, it's not a right—so to access this privilege you have to humiliate yourself and reinforce in your mind who is the master and who is the servant and it's a ritual. Our children watched this. Your children watched you in Canada give your identity papers—we call them vaccine passports—they watched you give identity papers for you to access services. And how do you redeem yourself from that? How do we come back from having our children watch us, in Canada, show identity papers to do things that we were free to do before?

This talk just came to me at about 7:30 this morning. I had no idea what I was going to open with and then I just started writing cursory notes. I hardly have anything on a piece of paper—just these thoughts. And the thought of Gandhi came to me.

I must have been a kid watching that Gandhi movie and after there were all these riots and Hindus are killing Muslims and Muslims are killing Hindus, and there's this scene where this one man comes to Gandhi. He's just torn. He is in absolute distress, and he tells Gandhi—I forget if he was a Muslim or a Hindu, but let's just say he was a Hindu—and he says, "I murdered a Muslim child. How do I get redemption?" Gandhi, in his peaceful way, answered, "You find a Hindu child whose parents have been murdered and you raise him to be a Hindu."

How do you come back from having your children watch you give identity papers to access services? And I ask you this: It's the most important question that anyone's going to ask you for the rest of your life. Will your children see you resist identity papers going forward? Will they? Will you redeem yourself?

[00:20:00]

Because digital passports are coming to Canada and even the word "passport"— Passport is something we don't use internally in a country. You use a passport to go to another country. And we've been conditioned to think, "Oh, we need this to get permission. "

How could we call this a vaccine passport? Do you think that was an accident? It wasn't an accident. People—that, you know, a pay grade well above mine, and a large number of them—would have come up with that term as the best term to condition us to accept identification papers. So even the word "passport" should be alarming you and the government is using that term for the digital ID [Identification]. We also hear "digital passports." It should be alarming us. The government is talking about this.

The stores are already putting turnstiles in. One of the stores that I go to, if I have time—and right now I don't— But if I have time when I go grocery shopping, I go to Superstore first, and then I go to my small little organic place. Not long ago, Superstore put in turnstiles. They're the type that just push open as you go through, they're not locked or anything. But it's new and it's deliberate, and other stores are putting them in. And this is to condition us for our digital passports. They don't hinder our access, but you're going to have to ask the question, "Why?" Why is the Superstore putting in these little turnstiles that I have to go through when I enter the store? They weren't there before. The store has been there as long as I've lived in St Albert. So it's been there for at least seven years. Why are they there?

I mean they don't require a digital passport. They don't even lock. They're clearly not there to scan my ID, but they're conditioning me to know that they're there, so that when the locking ones are put in, where I do have to give my digital ID for it to unlock, it would be

less of a change for me. That's why they're there now: to condition me so that I can accept them.

When the digital IDs come out, they will be sold for our safety—it's always about our safety. They'll be tied to our health records, and somehow, this will all be for our safety. Probably, you know, to fight organized crime. Who knows what the reasons will be, but I just promise you they will be for our safety because we give up freedom for safety and you can't argue about safety.

I remember years ago, the first Harper Government introduced Bill C-51 against the *Food and Drugs Act*, and the natural health community went ballistic because it was basically a transition away from using the courts to discipline people. What has been happening in our legislation, both federally and provincially, is that it used to be if you violated some act or regulation, you'd get charged and go to court. But the problem is that sometimes courts are reasonable.

I take that back: You know a judge on a regulatory matter, he or she is just going to do their job and the system works. But that's very inconvenient for the state. Why not just allow big administrative penalties that can destroy people and have an internal appeal process despite the conflict of interest? They were moving that way.

I got involved in the Bill C-51 fight, but they introduced a similar bill: Bill C-52, the *Consumer Product Safety Act*. You probably all heard about that in the news. It was, "we're going to make baby cribs safer" and all of this. And I didn't fight that one the first time around. I fought Bill C-51 and there was a tremendous movement and then an election is called and they don't reintroduce Bill C-51 but they reintroduce the *Consumer Product Safety Act*, and I wasn't going to fight that one because I was into protecting natural health products.

And I remember getting a call from the CEO of a very large baby toy and crib and carriage manufacturer. And the CEO was saying "Are you going to do anything?" And it's no, even though, word for word, all those provisions were the same as the as the other one that I had fought. I said, "No I'm not, but why aren't you?" And he said,

[00:25:00]

He said, "You can't. It would be a public disaster nightmare for any in the industry." Because everyone knew this was just going police state, full on—it had nothing to do with safety. In fact, ironically, the more tougher the legislation on safety, the less safe we become in things like baby toys and the like. But he says, "No one in the industry can stand up against this because the media will slaughter us." So you understand, you can't fight safety or you are a villain. So they were asking me to pick up the fight. And it just shook me to the core. So here, a whole industry that is going to be pummeled and be moved out of the rule of law can't stand up and protest because they know that they'll be slaughtered in the media as villains for going against safety.

So understand safety is a trap. Safety is a weapon. Safety is the most dangerous word in the English dictionary when uttered by a government. Safety literally equals death, and we are experiencing that.

We just went through a situation where a large number of Canadians became vaccinated for safety. And we are seeing witness after witness here—the historians will probably write and call this a pandemic of the vaccinated. The numbers haven't peaked. We're going to be

calling Ed Dowd as a witness in Vancouver who is an expert on crunching actuarial data. One thing that is the most alarming is the number of working age population—our most healthy people—who are becoming disabled. I live in the province of Alberta and last year the largest cause of death was “unknown.” That wasn’t even a category that they could use a couple of years ago. Well, it’s not unknown, it’s caused by the vaccine, but we can’t admit it yet; and because we can’t admit it, we can’t solve the problem and stop the damage.

But this was done for our safety, and it’s just an example of how dangerous that is. It’s an example. And the world sees Canada as a police state. Do you understand that? The world sees Canada as a police state and that’s because we are a police state. And with things like the digital passport coming, 15-minute cities coming, restrictions on our agriculture and the whole thing: it’s just coming down. The cell door is closing. The cell door is closing. And you may—and I use the word may—you may be able to still get out of the cell. There might still be enough room between the edge of the cell door and the wall that you may be able to get out. But I can’t tell you that you will because we are so far down that road that it’s just almost impossible for us to tell.

So you have to start sharing the testimony of the National Citizens Inquiry with everyone that you can. You literally have to put the TV out on the street. We have to stop this. We have to get people understanding what the truth is. People will watch this forum because it is controlled; it is under oath; it is managed by independent commissioners, and so it’s safe.

And so I’m calling on all of you to put your foot between the cell door and the wall because we don’t have much time.

[00:28:57]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 1: David Redman (Parts I and II)

Full Day 2 Timestamp: 01:22:04–03:08:01/10:38:30–11:05:40

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

PART I

[00:00:00]

Shawn Buckley

And I'd like now to call our first witness of the day. I'm very pleased to announce Mr. David Redman.

And I should inform you that David was a lieutenant colonel before he retired from the armed forces. And David, can I ask you to state your full name for the record, spelling your first and last name?

David Redman

My name is David Norman Redman, D-A-V-I-D R-E-D-M-A-N, Redman.

Shawn Buckley

And, David, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

David Redman

I solemnly affirm.

Shawn Buckley

You solemnly affirm. Now, you were an officer for the Canadian Army for 27 years?

David Redman

Yes sir, I was.

Shawn Buckley

And you used the operational planning process handling major emergencies throughout your career?

David Redman

Yes sir, I did.

Shawn Buckley

You were then in Emergency Management Alberta [Alberta Emergency Management Agency / AEMA / EMA], retiring as the head of that agency responsible for Alberta provincial response to major emergencies and disasters?

David Redman

Yes sir, I was.

Shawn Buckley

You led the team that wrote the revised pandemic response plan for Alberta that was ignored during this pandemic?

David Redman

Yes sir, I did.

Shawn Buckley

And you have acted as a senior advisor for eight years in Canada and the USA in emergency management?

David Redman

Yes sir, I have.

Shawn Buckley

Now, you have come here today to present both on the pandemic plan and what happened, and I'm going to invite you to just launch right in.

David Redman

Thank you very much. Commissioners, members of the Inquiry, thank you for having me today. What I'm going to do in the next hour is walk you through a three-part presentation, but if I can just go back to my history very, very briefly.

Twenty-seven years in the army I spent learning how to handle major problems. As an officer in the army first I was taught, it was called task procedure, then it was battle procedure, then it became the estimate of the situation, and then it became the operational planning process. So as problems and challenges got bigger so did the process, but the process was identical—all the pieces of it as you worked your way up. The aim of the process was to bring all of the experts together, needed for the task you were given.

People have this vision of the army that there's a colonel at the top and everybody just does what they're told. Nothing can be further from the truth. The colonel has a whole team of experts who are always part of the planning process and yes, the colonel wears it if it goes wrong, but all those people help build that plan through this dedicated process.

When I left the army, I became part of Emergency Management Alberta and in each of the provinces and territories of Canada, there is an EMO [Emergency Medical Office] and they follow an almost identical process. Now it's been civilianized, so you take the word "enemy" out and you put "hazard" in, but it's the same process. And as we worked in EMA, one of the things I got to know was how the municipal government works. And every province and territory in Canada, the municipal government is different because they're a product of the Province. They belong to the Province and they're defined differently, so it's important to recognize differences between provinces.

Every Province has an EMO and they're staffed and trained and fully equipped. The [federal] government has an EMO, it's called Public Safety Canada, again staffed and trained. And one of the things that that agency does is identifies that which is most critical in their jurisdiction. So, for instance, within a province there's an actual secret classified list of all the things that are most critical—and that's going to be important later in my presentation—and it's maintained on an annual basis. But what that EMO also does is it manages fires, floods, tornadoes, terrorism, and should have managed the pandemic.

Can you make my slides visible to everyone [Exhibit RE-2d-Redman-2023-04-27 Presentation – Canada's Deadly Response to COVID-19]?

Shawn Buckley

They're up now, David.

David Redman

OK. This cartoon was given to me by a 15-year-old girl in the middle of the second wave. And I think it perfectly describes what was happening in our country, province by province. And what you see very proudly standing in the middle of the picture is the Medical Officer of Health for that province, stating very clearly, they're defending the medical system. The Premier hiding behind them and using them as overhead cover, making sure that they didn't get any of the splatter while we defended the medical system.

And the great glowing

[00:05:00]

rays coming out from our health care system. But surrounding it, at the top, you see the body bags of all the seniors that we allowed to die because we didn't do targeted protection for them.

And as you work your way around, on the left-hand side, you see the absolute destruction of our children's education and socialization. You see all the body bags for all of the people who died of cancer, diabetes, and all the other serious health care concerns that we simply ignored because only COVID counted. You see the destruction of our societal health and integrity. Our societal health— We've seen a massive increase in spousal abuse, child abuse, but we've also seen that you can't even travel internally in your own province, let

alone between provinces, so our societal order has been destroyed, all in the name of protecting the health care system.

And on the far side, right-hand side, you see the destruction of our economy. And everyone said, "Well, it's not a problem, we're saving lives." But the people that work in every one of those businesses, its citizens of this country and their lives were destroyed. And if we don't think that taking the national debt, sorry, the debt of our country from \$750 billion to \$1.3 trillion in one year will not affect our children as they pay taxes to pay that debt off for the rest of their lives, then you don't understand how an economy in our country works. All in one cartoon.

So my presentation is going to be in three parts. First, I'm going to explain to you what emergency management is because most people don't even know it exists. It's been existing since the 1950s. It used to be called civil defence, and it's gone through many iterations, but it's now called emergency management. And I'm going to give you a very quick overview of what it is; so you know how badly we misused the systems or abused or ignored our systems. Then I'm going to walk you through the example of this pandemic using the emergency management response and comparing it to what we actually saw. And then I'm going to sum up with perspective and concluding remarks.

So let's start with emergency management doctrine. Every day, every one of us manages risks or hazards in our life. Walking out the front door of your house is a decision, climbing in your car is the decision. So there's five different dimensions when you're talking about emergency management. If you miss any one of them, you do so at your peril. If you do all of them, and you do them all well, you can link them all together with a process that I'll describe.

So let's start at the top with the hazards. In Canada, we follow an all-hazards approach. What does that mean? That means every EMO, whether it's at the municipal order of government, the provincial order of government, or the federal order of government, assesses for their jurisdiction which of those hazards are most prevalent within their community. And they're looking to see what would be the impact of natural hazards and human-induced hazards. And there's a difference at the bottom. You can see "Safety" and "Security," and I don't consider them evil words. I consider them good words if they're done by the citizens.

So down one side, you see I've put an arrow head towards biological human. But it's just one of the hazards that are considered routinely and are monitored daily, weekly, monthly, and annually with reports going to the elected officials, the mayors or the reeves. So they understand in their community which of those are required to be looked at. The important thing to note is one hazard can of course impact all the other hazards. So you need to be **looking at them collectively, not singularly.**

Within emergency management, there are three types of agencies: subject matter agencies, coordinating agencies, and supporting agencies. The subject matter agencies are normally defined by law. So when you look at something like rail transportation, in the *Rail Transportation Act*, there is a certain organization assigned to be the regulator to ensure that those hazards are constantly reviewed, updated, and in the legislation there are specific tasks for the subject matter agencies.

At the bottom are supporting logistics agencies. And in almost every emergency or disaster, all the other organizations become supporting agencies when that one other hazard pops

to the top for that period of time. And they all help that one subject matter agency get through the emergency.

But common in the middle is called the coordinating agency, and those are the EMOs. And they exist at the municipal order of government, the provincial order of government, and the federal order of Government. And there can only be one per organization of government.

[00:10:00]

So there's one in Calgary. There is only one agency for the Province of Alberta: the **Emergency Management Agency**. There is only one for the Government of Canada: **Public Safety Canada**. There's not multiple. So you don't have to train huge quantities of staff and emergency management in every single hazard. You only need one coordinating agency that works across all of those hazards.

So let me give you a graphic that describes that. These are the tubes that make up our economy. And it's known as the tube chart. I've given it so many times on both sides of the border, everybody calls it Dave's tube chart. Clearly, there's many more tubes that make up our economy. That's all that fits nicely on this graphic, and it also tends to relate very clearly to a pandemic for the reasons that you'll see abundantly later. Every one of those tubes is filled up with Canadian citizens. Some of those tubes are predominantly private sector. Some of them are predominantly public sector.

Private sector, a good example, energy. Whether you're talking about the power grid, whether you're talking about the production of natural gas, or your gas stations on the corner, upstream, downstream, middle stream. But they're made up of citizens. The regulators tend to be government agencies, but the private sector makes up most of them. And one of the things that we learned following September 11th 85 per cent of all critical infrastructure in our country is owned and operated by the private sector. So if you don't link private sector and government together, you can't respond in times of emergency or disaster. The health care sector is predominantly public sector in most of our systems here in Canada, but there are private sector partners in it, and again, a regulatory system.

And it all works fine in every one of those tubes until they're impacted by a major emergency or a disaster. Then we expect citizens to be able to care for themselves for 72-hours. And if you go onto the website for the EMO, for every province and territory in Canada, you'll find your 72-hour kit and what you as a citizen are supposed to do to be able to take care of yourself. Now, as Canadians, we just used to call that personal responsibility, but things have evolved such that we have to actually teach people that they need 72 hours of water and that they need enough fuel to be able to run whatever they need to run and to **care for themselves in terms of their medications**.

So the citizens are supposed to look after themselves, and then we have first responders, and we have brilliant first responders in our country—fire, police and EMS [Emergency Medical Services]—that rush to those who have been directly impacted by the specific hazard we're talking about. And right above them is the municipal order of government that they work for. And that municipal order of government has an emergency operations centre and trained staff when it gets past the capabilities of their first responders to respond. They have written plans, general, for a response to emergencies, but they also have hazard-specific, in most cases, annexes. And every municipality, for instance, in Alberta, had an annex for the pandemic that was never opened.

When it gets past one community, then the provincial order of government steps in, opens their operations centre and brings all those other supporting agencies to support those municipalities that are at risk and coordinates across every one of those tubes to bring the assets of every one of those tubes to that emergency. Our order of government is then on top to drive support. We call it mutual aid between provinces and territories for those that are smaller and have less resources. We have the ability to bring all of them together and to work between provinces and help each other.

So what you see on the left-hand side is government leadership, and I want to really emphasize this right now. For the provincial order of government, the Premier is the responsible person, period. All the other people that come to support the Premier are supporting agencies or members of the task force, but the elected officials in a democracy are always in charge, not a bureaucrat like a medical officer of health. Never, ever. And who supports that government leadership? The EMO. They're trained, they're ready, they're disciplined, and we'll talk about their training in a second, but they're ready to go. And they are always standing by with the hazard assessment, watching it evolve and ready to pull the plans off the shelf and use them.

But on the other side, you see the private sector, and the EMO works constantly across all of the critical infrastructure and every industry group within the province. They know them by first name. I certainly did. I knew who was in charge of the Cattlemen's Association, who was in charge of the Alberta Electric System Operator. I knew who was responsible for the production of honey. Really.

There are four functions that make up emergency management:

[00:15:00]

Mitigation, preparedness, response, and recovery. Mitigation is either removing the target from the hazard or the hazard from the target. That's the simplest way to define it. You'll see lots of pretty words there. But in your mind, just think about the risk is coming for you. How do we stop it getting to you, or how do I get you out of the way? Right? One of the two.

Preparedness involves walking through with all of the experts required to prepare plans to be ready to respond to any one of those hazards that's a major emergency or disaster potential in your jurisdiction: municipal, provincial, or federal. And having those plans trained and exercised constantly. You don't just write the plan and put it on a shelf. You bring together everyone who's actually going to respond in that emergency, and you run them through exercises. You watch them perform the tasks, and you train people up if they were delinquent or unable to complete their tasks.

The response then takes those plans off the shelf, spells them off, and makes them specific for the actual emergency that you're looking at. And there's a full-trained staff that knows how to run response. And there's operation centres with desks for every one of the subject matter agencies, the lead subject, the subject expert agency. We always used to call it the big kids' table, and that's where the hazard-specific person, the subject matter expert would sit, and everyone else was in rows, all looking towards the charts so we could run, support the subject matter agency with whatever they needed while taking care of the entire rest of the economy in the jurisdiction.

But the minute you start a response, the minute you take another team aside and you make them responsible for writing the recovery plan. Have you seen a single recovery plan in our country announced by any provincial government for this pandemic? The minute you start

response, you set aside a separate team to write recovery and have that plan ready to go the minute you know the pandemic went to endemic.

There are 10 activities that make up all of life. It doesn't matter if you're a soldier, sailor, airman, or whether you're a civilian in any industry, those are the 10 activities that you use to run your home. Governance at the top: operations, plans, logistics. But when you're working in a provincial agency, those are specific activities that require specific training. So you have people in the operations group that are trained to run operations. In the plans group, you have people that—the process I'm about to tell you—can teach that process and run that process for anyone in government. The ones shown in blue are formal courses that we train all first responders in every province and territory in Canada in, and it's called the Incident Command System. You see in the bottom in the blue. So those are specific training.

Every one of our first responders follows it, and it's not about doing their trade, i.e. being a paramedic or being a police officer; it's how they come together when a site gets too big and they have to work together. This is an actual activity and courses they must qualify in to move up in rank to run the Incident Command System for an event on the ground. But you need all of the boxes by the time you get to the provincial order of government. Most municipalities have separate, large municipalities have specific groups for every one of those boxes.

So how do you link all five together? With the last. So what you see here is a table, and there's hazards all the way down. You need an actual thoughtful process that leads you through every one of the boxes on that chart. And using the provincial order of government because health is a provincial responsibility, and that's where we're going in this discussion into a pandemic. You need to apply all ten activities to your mitigation plans, to your preparedness plans, to your response plans, and then to your recovery plans. You need to do each one of those boxes for all ten activities that make up all of life, and you need to resource them with the seven resources that make up every activity. There's nothing missing. If you miss any portion of this, either the seven resources, the ten activities, a specific hazard, any kind of grouping or organization, you have missed something at your peril. But there's experts that do this, and it's not hard for them. It might seem confusing for you the first time you step into it, but people live their whole lives doing this for you.

And those are the things for the commissioners that many people see and think need to be changed or corrected, and I put it to you, they are. There's some specific things we need to fix after this pandemic in terms of legislation, regulation standards, standard operating procedures, and how we move forward.

So that's the five dimensions.

[00:20:00]

How do you link them all together? What does the process look like? This is the emergency management process. It's identical to the army process, but it's also identical to the risk management process. Those of you that were here yesterday and watched the presentation on risk management, that's how civilians would use these words. But in government, this is how we talk about it in terms of municipal and provincial order of government.

Hazards are out there every day, and all of a sudden, one of them pops up. So situational awareness for our elected officials happens all the time. There's constant briefings on a monthly basis going to the Premier. It's wildfire season here in Alberta. It's just starting. So there's a briefing note on the Premier's desk saying it's wildfire season, here's the status of

your Sustainable Resource Development firefighting teams. We can draw on our surrounding neighbours, the adjacent provinces, the wildfire operations agreement, mutual aid agreement is in place for all of Canada, blah, blah, blah, blah—just getting the Premier ready.

So it pops. Something happens. And what you see in the orange boxes is elected official engagement. That's where they're briefed, that's where they make the decisions. Okay? And they're part of the supervising and monitoring. So all those orange boxes— The black bullets are all what's being done by staff to support the elected officials. This is a democracy. Elected officials are always in charge. Never the subject matter agency, always the elected officials, whether a mayor or a reeve or whether they're a premier. And every one of those black bullets, and we're going to walk through them in an example, but every one of those black bullets is a staffing function and there's oodles of paper that get produced in order to do each one of those. So just defining the aim in an emergency, there is gobs of paper developing different types of aims for the Premier to select, which is the aim for that jurisdiction.

So when in a court case, for instance, where I was testifying against the Medical Officer of Health of Alberta, I brought stacks of evidence showing what had obviously been overlooked. They were unable to bring any piece of paper and simply said they had done the process. You have to be able to prove you've done the process. There's stacks of paper for every one of those black bullets that they were unable and are still unable to produce.

But what's happening while you're doing and managing that emergency? The hazard is evolving. As well, remember that all hazards list? Other hazards are popping up. So in the middle of pandemic, wildfires just didn't say, "Okay, we'll give you a break for two years, but we won't have any fires, okay? We won't have any train derailments. We won't have any toxic spills. There won't be any other problems. We can only deal with one hazard at a time." That's just ridiculous. But that EMO has all the pre-prepared plans for all the other hazards, and in the same emergency operations centre, you can switch between who's the subject matter agency, because today the fire just got too hot, and we can just set the pandemic aside for 24 hours while we evacuate Wood Buffalo, okay?

So let me move to the second part of the presentation. Now you understand what emergency management is, and that every province and territory has it, and in almost every province and territory, the municipal order of government has been ordered to have it by that province and territory, keeping the elected officials in charge.

Let's start with the aim. If you get the aim wrong in a military mission, you kill thousands and thousands of soldiers. If you get the aim wrong in a provincial response, you can kill your entire jurisdiction. Okay?

So the first thing you have to do is get the aim right. In our predefined pandemic plans—and there are predefined and provincial pandemic plans in all 13 provinces and territories in Canada. Every single one of them had a written pandemic plan: every one of them. If you don't believe me you can go to pandemicalternative.org, a group in Ontario built a huge research storage website for me back in December 2020, and we went to every government website, and we got them and stored them in case they decided to wipe them away and hide them. So on pandemicalternative.org, which is a Canadian-focused pandemic website, it's only talking, and it's called "alternative," because we were trying to get the message across that there was an alternative way of doing what we were doing in December 2020. And they found me because of the 12 letters I had sent to every Premier in this country, starting in April of 2020, saying:

[00:25:00]

“Stop, drop, please phone me. I don’t want a job. I just need two hours of your time. I want to give you this presentation.” Okay?

That’s the real aim. To minimize the impact of the virus on all of society. You heard within days it switched to be to minimize the impact on the healthcare system or the medical system. Absolutely wrong aim. The result is what you’ve lived through for three years. You get the aim wrong: everything that follows is wrong.

Let’s talk about the overarching principles of emergency management. Number one, pandemics happen continuously. This wasn’t our first. In my lifetime, there have been five pandemics. I was born in 1954, and so Asian flu back in the 1956-57 era. We have huge documentation from five previous pandemics, and we’ve made massive lessons learned, both in emergency management and in public health, all thrown away. But more importantly, there is going to be another pandemic. I hope to see two more. Why? Am I a sucker for punishment? No, it just means I’m still alive for crying out loud. I want to live through two more pandemics, but I never want to live through another pandemic that is managed the way this one was.

Emergency management—these are principles—is the foundation on how we respond to every type of hazard, every emergency over and over and over. And these staff are trained, they’re competent, they’re capable, but they have some fundamental principles. And the very first one: you control fear. You never, ever, ever use fear.

I wrote my fifth letter to the premiers in August of 2000 [sic], warning them that they were using fear and that it would have unintended consequences that would last for 60 years until the children who have been affected by our response to this pandemic die. It was a very specific letter. I tried different approaches, and every letter I wrote, none of them worked. So I’m a failure. Confidence in government: You never use fear, you use the opposite. And everyone says the opposite of fear is bravery. It’s not, it’s confidence.

Confidence that you can get through something. Confidence that you can get through something together is the opposite of fear: fear of each other, fear that you can’t work together, fear that everyone is a hazard to you. I’ve been in some really awful places in the world in my 27 years in the Army—always with a rifle to defend myself. I was one of the lucky ones. But I watched populations that were raped, burned, and destroyed because their governments used fear. Use confidence in emergency management. You never, ever use fear. Your job is to suppress fear, and you suppress fear not by lying to the population. You don’t try and diminish what’s coming at you. You tell them how you’re going to handle it, and that you’ve got a plan, and that we can get through this together, and here’s how we’re going to do it. Okay?

Surge capacity is a real thing. It’s not done by taking stuff from someone else. New surge capacity is developed in every emergency. When we have a flood, and we need to dike a river all the way from the BC border to Saskatchewan to give them the water for free, we don’t re-roll things. We build new capacity. We get our citizens to come out and help build dikes, and it’s a new capacity. It’s not a re-rolled capacity.

Mutual assistance used to be a cornerstone of emergency management. Moving a patient from Calgary to Edmonton is called mutual assistance. It suddenly became evil. It was as if you had completely failed because your hospital couldn’t take every patient. We’re in the

middle of a pandemic. Of course, there will be ups and downs in every community. Communities help each other. They don't block the movement between each other. Constant feedback and evaluation of evidence. These are basic principles that were completely ignored in this pandemic.

My bottom line in terms of principles is pandemics are always public emergencies because they affect all the public. They are never public health emergencies. It's absolutely ridiculous to call a pandemic a public health emergency, and public health should never have been in charge of all of society. They are responsible for the healthcare system. Point final.

Let's move on to governance. The Premier in a province and pandemics:

[00:30:00]

healthcare is a provincial responsibility, so the premiers are in charge. Period. There is no discussion. The Prime Minister is in support of the premiers. He is not the person in charge of the pandemic. Never should be: never could be. He does not run the healthcare systems.

The Prime Minister should only have sent support that premiers ask for. He shouldn't have forced them into responses by making edicts and handing out \$500 billion to get his design for a pandemic implemented.

There should have been a task force in every province that was on all of society to respond to the pandemic, and what should that have looked like? It should have included people from every one of those supporting agencies, governmental and private sector. It should have included a huge team of the biggest brains in the province, and their knowledge in terms of all of the impacts on every one of those blue tubes should have been brought together. What did we do instead?

We put the Medical Officer of Health in charge, who gathered a group of doctors—nobody from the power grid, nobody from water supply, nobody from municipal order of government, nobody from all the other supporting agencies—and they made, designed a response to protect themselves. Public health is supposed to protect the citizens. Citizens aren't supposed to protect public health. The coordinating agency then would have supported that task force. The coordinating agency would have then run the full provincial response. They never did.

Hazard assessment. Let's go back to what we actually knew in February of 2020. How did I get this top-secret information? I used this [cellular phone]. Every one of you could have done this. The key is: the information was readily available. These charts coming out of **China, you simply picked up your phone, you typed coronavirus, remember it wasn't called COVID back then, coronavirus, death by age, and then you typed in Italy, Spain, China, whatever, and you would get these.**

This is in February 2020. We knew what was coming. Look at the people who are dying. Over the age of 70, what are they dying with? Severe multiple comorbidities. This was February 2020, readily available, updated routinely. I did a snapshot then, and this is in the document I originally sent to the premiers to try and say, "Hey, what are you doing? You need to be doing target focused protection," and we'll get to that, but we knew then, was that just a random sample?

Every single week, starting the first week of March, the World Health Organization produced these tables. Every single week, you can still get them, they're still available, and they're available worldwide. Who's dying? Really old people. In fact, the average age of death in Canada is 82 years old with three or more multiple comorbidities, severe multiple comorbidities. Nothing has changed.

This was known the first week of March, the second week of March, the third week of March, and what did our medical officers of health do? They tried to convince us that everybody was at equal risk. Absolutely untrue. One of the comorbidities that's missing from this chart, and which is an extremely important comorbidity, but we don't talk about it in North America because it's considered fat-shaming, is obesity. Eighty-three per cent of the people who have died in Canada and the United States, in fact, it's 87 per cent in the United States, died obese. That means their BMI [Body Mass Index] was over 30. So what did we do?

We closed all the gyms. We told them they couldn't go outside and use the walking trails, and we gave them absolutely no feedback on how to make themselves healthier in terms of diet and exercise. We did exactly the opposite. We knew what the comorbidities were and that we needed to really look at those comorbidities and build surge capacity for them while we were building surge capacity for COVID because they were going to be impacted.

We did exactly the opposite. People saw the terrible pictures coming out of Italy. The people dying in the streets. Who were they? There's from May 2020, okay? But we knew this in February. We knew this in March. It's really old people with severe multiple comorbidities. Did that actually change? Here's the same chart from May 2022. No, it never changed,

[00:35:00]

and yet the narrative coming out of our MOH [Minister of Health] never changed either.

This is a slide you've seen in other presentations. It's now been taken down, and every one of my slides, every piece of information and data, you'll see I put the website right on it, so you can go get it yourself. But this is no longer available. It shows that people without comorbidities simply aren't at the same level of risk. In fact, it's minuscule risk.

This is the latest—and I've stopped updating this chart. This is at the end of three years, so this is March of this year, and what you see is Canada's data, as a country. But what's really interesting on this, if you look over here on the right-hand side, you will see that it says that, as at the end of March, there was 52,000 Canadians died of COVID, and that's the number that Theresa Tam still uses to scare the hell out of you every day that this is a horrible disease. But quietly behind the scenes, every province and territory in Canada has been amending their data. If you see the number on the other side, circled in red, this is from exactly the same day off of exactly the same website from the Government of Canada, you'll see that it's 36,000 died, not 52,000. Why is that? Because they're very carefully, now, removing all the people that died with COVID not from COVID. Okay, so they're cleaning up their act before we come looking for them.

So let's move on to mission analysis. Now, this is the meat of the process. Whether you're attacking an enemy or the enemy is COVID, mission analysis is where you break apart all your tasks given and your tasks implied. Just the "what." Never the "how." And you do this with the smartest people in your province. Okay, this is where the task force, and I did this for counter-terrorism with what I call "26 of the smartest people in Alberta" on September

the 12th, 2001. The following day I was made the director of counter-terrorism for Alberta, which I ran, implementing the plan that we wrote in the first two months over the next two years. But I led them through mission analysis.

What does it look like?

You sit there and you are first given, with your task given. These are the four tasks given that were written right into the Alberta, and every province and territory in Canada had a plan just like this, with the task given in preparation for the next pandemic.

Control the spread, try and reduce morbidity, but “appropriate” prevention measures is the keyword there and I highlighted it with “appropriate” underlying quotation marks. We’ll talk about that.

Mitigation of societal disruption through the continuity of critical services, not the closure, the continuity. People are going to get sick with this new virus. How do you make sure you can continue every activity in every business while people get sick?

The critical infrastructure, you have to make sure you have backups and backups, so you need surge capacity in every piece of your critical infrastructure, the people piece, because some are going to get sick. You’re not going to close them down. You’re not going to send healthy people home. You might in fact order sick people to come to work while you sort of isolate them because you don’t have enough people. Exactly the opposite.

Minimizing the adverse economic impact. I almost laugh every time I read that one. And making sure there’s effective and efficient use of resources. We failed at four out of four. Those were the tasks given in the pre-written pandemic plan in Alberta and are similar in every other province.

So you now have to rip those four tasks out into the detail required. So what’s that goal number one turn into? And this, you see the et cetera, this is one person’s brain. Imagine if you had 26 of the smartest people in that province’s brains to pull from. This is just my brain.

Number one, how are we going to care for those most at risk? We knew exactly who they were. How are we going to develop over here on the other side, a risk analysis for the population so that our family practitioners can— Our family practitioners know— We know that most of our seniors that died were in long-term care homes. So right away we should have been developing plans in bullet one for long-term care homes with the people that run the long-term care homes. Right?

Public, public for profit, private for profit, private for non-profit. Three [sic] [Colonel Redman cites four groups] groups: bring them all together, bring the unions in, bring all the best experts in, and build a plan to get us through the first wave. Then we’ll figure out the second wave, right? But over here, what about all the seniors that were living in multi-generational homes that were living at large on their own, in their own houses still? Family practitioners knew exactly who they were and where they were.

[00:40:00]

They were their doctors. We should have been developing for our family practitioners, good advice, common sense things, and trying to figure out ways to help them.

But down here, on the very bottom on the left-hand side, the development of treatment. You're going to hear from a whole bunch of doctors and talk about a whole bunch of possible treatments, but one of the things that no province or territory in our country did was peer-reviewed analysis of potential treatments worldwide.

We should have had an intelligence agency watching for every country in the world and how they were managing COVID, and whatever treatment options they were finding, like ivermectin, the terrible "I" word, but all the other ones. And we should have done peer-reviewed studies to see which ones worked. And even if they only did 3 per cent, just like in AIDS, when you add five 3 per cent options together, you get a really effective treatment option. And other countries in the world figured this out, but we never did. We did exactly the opposite. Our medical officers of health never did this task, implied matrix, and never developed teams to go and study how.

I'll go through the next ones quickly, but no one ever contacted the electric system operator in Alberta or any other province in our country to make sure they'd have enough people to get through the pandemic. Good thing they did. If our power grid had collapsed, it would have been awful. But even more importantly, water supply is a municipal responsibility, and our municipal order of government was excluded from the entire planning and execution process. Most water treatment facilities and most municipalities have two or three experts that run them. Emergency Management Alberta knew them by name. They were never included in the process.

How do you make sure you do not close business? Continuity is the word, not closure. And I mean for every business, but there will be some like tourism what other people, other countries do would have affected our tourism industry, and we should have only supported those industries that had to close because they simply couldn't exist with the clients that were going to show up at their door. Okay? But we should have ensured continuity of every other business, and we needed to make a list of them in the tasks given and implied.

And how do we manage critical resources? Well, we watched ourselves fail completely on that repeatedly. But the second portion is, after you've done your tasks given, you have to do the tasks implied that aren't in those first four.

And this is a standard template of tasks implied for every emergency, every single emergency. Okay? And Emergency Management has this list and always does it and sits down with the task force that's assigned and walks them through it and says, okay, these are the what's, can you think of any more? And then we build groups to go away and bring back options to do this.

The most important are protection of rights and freedoms and suppression of fear. Both **completely never even considered.**

I was the director of counter-terrorism for two years in the Province of Alberta and worked on both sides of the border, personally briefed Senate and Congress in the U.S. on what we were doing in Alberta to sustain our oil and gas. I personally briefed the American ambassador. It was always made very, very clear to me that security trumps trade. But on top of that, all that time in two years, what's the most important thing in counter-terrorism? You never deny a Charter right or freedom because if you do, the terrorists have won. That's what they were trying to do. They were trying to destroy our rights and freedoms and destroy our faith in democracy because they don't like it. We handed the response to this pandemic to our medical officers of health and what did they do? They

immediately destroyed our rights and freedoms worse than any terrorist attack ever could have done.

The next thing you do is develop options. You take all of those teams that you break out of that huge list of to-dos, you put them into groups, you bring the smartest minds for each one of those red-bulleted tasks, and you send them away for a week, and they have to come back with a costed plan. But that plan is including multiple options. There's always more than one way to skin a cat. For every option, you have to do a full cost-benefit analysis so the Premier can say, "Okay, this is what we're going to do for long-term care homes. And this is how we're going to manage critical infrastructure."

But they pick the option that they think will best protect all of society. Remember the mission statement? So your elected officials are given the options and in the box below in decision, it is the elected officials that decide which option for each of the groupings of tasks.

[00:45:00]

But the cost-benefit analysis is how they make their decision.

So we had pre-written plans before this pandemic that told us all of this information and put it together and had done part of the cost-benefit analysis for us, built on the really, really, really hard lessons learned from those previous five pandemics. Those plans, in fact, highlighted the use of a word that you now call lockdowns, but which I have always called non-pharmaceutical interventions. Okay? They had been studied inside and out for 20 years.

The document you see on the left was last updated and issued worldwide in September 2019. The 15 NPIs [Non-Pharmaceutical Measures] that you see listed on the right-hand side of the chart are showing green for ones we should have used in this pandemic, orange, which are partially applicable—and I'll talk to one in specific—and red never should have been used for this pandemic. That document on the left is 60 pages long and it discussed each one of those 15 separately, in detail. You can get the document for yourself and it says things like, for workplace closures: closures should be a last step only considered in extraordinarily severe pandemics. We did it as a first step with absolutely no cost-benefit analysis.

Let's talk about face masks because everybody likes to talk about face masks. In the first two years, I never mentioned face masks because then everybody just thought I was a conspiracy theorist. Face masks have no effect for a virus of this type. They have an effect for other viruses, but not for this virus, and we knew that from this document. This is a **highly transmissible virus that they aren't applicable for. Face masks, in orange,—because in a hospital setting, worn by healthcare practitioners—of the right type of mask, for a limited duration, put on by assistance, taken off by assistance, and disposed of immediately—made sense. The document clearly said "should never have been used in the general public" because they cause massive societal impacts and damage and have no noticeable gain in stopping transmission. Okay, sorry, got to go back just for a second.**

What was the worst thing we did? We destroyed our children. That's why I circled that one. The socialization and the development in elementary school, junior high, and senior high, and what we've done to our children will damage them for the rest of your life. There are many studies that show that one-year loss of education causes a five to 15-year decrease in economic ability, earning ability for that individual, and a three to five-year decrease in

lifespan. So until our children die, unless we do something to correct what we have done, this impact will exist on them. And we didn't do it for one year. We did it for two, and in some cases, three years, in our own country.

But we knew that from the study of the NPIs that all of those NPIs would have a very insignificant effect on transmission of a virus of the type of COVID. So we knew that in September 2019, we should never have used them.

But after the first wave, study after study after study compared non-lockdown to lockdown countries and showed exactly the same thing. And you've heard from Dr. J. Bhattacharya previously. This is him, but this was after the first wave, but folks, there was, this is another 35, wave after wave after wave, proving that lockdown to non-lockdown countries, and I'm sure you've all been told there was no non-lockdown countries in the world, but that's simply a lie.

Many countries in the world didn't use any of the non-pharmaceutical interventions and came out exactly the same in terms of transmission. But what we know now and what we knew in September 2019, in a 60-page document, was that non-pharmaceutical interventions cause massive collateral damage. And I'm not going to go into it. You're hearing testimony from all the others. Well, all I'm going to do is say to you that I put them into these five bins, and you can collect all of the damage.

The mental health damage that we'd done and we knew would happen. And so to me, that's individual. That's each person. The fear you have of your neighbours, the fear you have of each other, the fear you have that we're going to do this again to you. Societal fabric: the tearing apart of our society and our democracy;

[00:50:00]

the people who had other severe health conditions that we ignored and who missed diagnosis and treatment; our children's development, important—their academic development, but far more important—their social development; and our economic well-being as individuals, businesses, and as a nation.

And I come back to the fact that we doubled our national debt. Don't think that won't have a forever impact for at least the next 60 years. And this isn't one or two or a few witnesses. There are hundreds and hundreds and hundreds of studies all been collated for us that our mainstream media continues to ignore.

I end this portion with: there should have been a written plan issued through the mainstream media to every citizen in every province saying how the Premier was going to lead the response to the pandemic and inviting feedback from the citizens. "This is what we're going to do for the first phase. We know there's going to be a second phase and probably a third phase. But in the first phase, this is what we're planning to do. This is how we're going to try and walk our way through the first wave till we know more, and we invite your feedback."

It should have been in every inbox in every citizen in each province and territory. You've never seen a written plan by any province or territory. Therefore, you've never known what the government was going to do. You just knew that it was not going to be in your best interest.

So let's go to the third part and I'm going to go through this quickly. First of all, I want to give you perspective because you've heard this from many people, but I like to collate things for people so they understand modelling. Everybody talked about modelling for the first two years and how we were all going to die.

The Imperial College of London model had been completely debunked. It had been shown to be wrong in every major emergency in the past ten years. The model outputs always predicted horrible, horrible situations. That model should never have been used. We knew it was completely flawed, and yet it was used by every province and territory in Canada, by the medical sub-officers of health, to tell you we're all going to die.

Number one, you never use fear in a pandemic, you do exactly the opposite. I'm an engineer, okay? We use modelling all the time. A model, not that one, should have been used to predict the surge capacity that was going to be required. You didn't care. It should have been invisible. Getting more hospital beds, getting more this, but the Premier could have said, "You know, we're developing real new surge capacity," and that's confidence. But you never use a model and release it to the public to terrify them. The evidence constantly proved the model wrong. Mainstream media, the medical officers of health, and the elected officials ignored the evidence every single wave and reused that model. How dare they?

The infection fatality rate was known for people under 65. The infection fatality rate of COVID was known to be less than seasonal influenza. For people over 65, it went up but never became much worse than seasonal influenza, and yet we did nothing to protect them. We never did target, focused, treatment options for our seniors.

The daily death count was used as nothing more than a terror weapon and was never put in perspective to other causes of death. Non-lockdown results from countries like Sweden, places like Florida were intentionally ignored and never talked about by your medical officers of health or your premiers.

And saving our medical system was the contra mantra, and I can do this for every province; but Doug Ford is such a perfect example. He was standing in front of the camera crying, telling people in Ontario they weren't locking down long enough, hard enough, and deep enough and that they had 1,750 people in acute care beds. He never once mentioned that there's 22,357 acute care beds in Ontario. When you ignore perspective, you can create terror. But if you were told that there's 2,000 beds used out of 22,000 beds and you're still saving the medical system, it would have caused you to question the response. Perspective was intentionally denied.

This is a cartoon that circulated all through Europe. It didn't circulate in North America. I have friends that helped me for the last three years all over the world. This was sent to me. **And you see Boris Johnson, back in the first wave, trying to decide to lock down or not lock down,**

[00:55:00]

but really, he only has two options—lockdown or option B is lockdown. And the elephant in the room is Sweden. The elephant's got the little Swedish flag there because they never locked down, right? That's the elephant in the room.

So what did happen in Sweden? They decided in 2022 the pandemic was over in Sweden, so they don't report anymore. Look at the number of young people that died, look at the number of old people that died. They never wore masks. They never did school closures

other than the senior high schools for two weeks in the first wave. They never did any ordered workplace closures. They never did social distancing. He recommended Dr. Tegnell who ran the response.

And the response he ran was exactly what the Alberta and every provincial plan said we were going to do. He followed his plan. We threw ours away. They don't have an increase in mental health issues (like we do), increased suicides, increased overdoses, increased spousal abuse, increased child abuse. They don't have that because they didn't do that. And they came out of this economically better than all of their neighbours in Europe.

Let's do a fast comparison to Alberta. If you normalize the population between Alberta and Sweden, Sweden had less COVID deaths. If you actually believe the case count numbers that we have in Alberta and for Canada, I can do the same thing for Canada. Alberta came out worse than Sweden in straight COVID deaths. Forget about collateral damage. Yes, they have a much older population than us and they did not do targeted protection. Dr. Tegnell has personally and publicly apologized for the lack of targeted protection in the first two waves which caused many of their seniors to die needlessly. But how did they do overall? This is cumulative excess deaths. Look at Sweden and look at Canada. I let you make your own decisions. This is from 2022.

You saw India, you saw bodies floating down the Ganges and the terror that our mainstream media and our medical officers of health using India as a terrible example. India had three times less COVID deaths per capita than we did. Three times less with 36 times the population in one third of the geography. You don't hear them talking about that. Perspective has never been allowed. Why did they do so much better? They only had 2.8 per cent vaccination rate when Delta hit India. They did treatment. They did massive treatment, population-wide, and we denied the ability to do that in Canada. Our MOH [Ministry of Health] and our College of Physicians and Surgeons fired doctors if they did it.

Fast comparison to other things. Traffic accidents, top left—heart disease, the other side. Even if you are between the age of zero and 60, you were three times more likely to be a traffic vehicle fatality than you were to die of COVID. But we didn't see our government—Shawn's opening this morning—our government didn't ban cars. You were three times more likely to die in your car. They should have taken our driver's licences away.

And let's do one last comparison to pneumonia. Pneumonia worldwide. 2.5 million people die every year of pneumonia. COVID was less than pneumonia. And yet the World Health Organization, as we speak, is getting sovereign countries to sign a new WHO [World Health Organization] agreement that they will give up their sovereignty and allow WHO to run the next pandemic based on this extremely successful model of the use of NPIs worldwide: sooner, longer, and deeper. Canada is about to sign that agreement. We didn't close the world for pneumonia. Why not?

My final slide, conclusions. We discarded emergency management, and it has cost us dearly. The aim right from the very start was obviously flawed, and yet no one challenged it. Except for—I say no one—a few of us challenged it. Most of you sitting in this room didn't believe it. But our citizens did, as a group. The hazard assessment, we should have protected our seniors immediately, and I'm prepared to talk about what I mean by that in questions if you're interested.

But remember, I'm the guy who said you never deny a Charter right or freedom unless the individuals agree. The Oakes test is the minimum standard. It has been thrown out. Every single Charter right before it's denied must pass the Oakes test.

[01:00:00]

There has never been a single Oakes test for a single Charter right or freedom that was denied. Not one.

Lessons learned, we threw away every lesson we'd learned, and there's no point in running the lessons learned after this pandemic. Because the only lessons we'll learn if we let our governments do it now is exactly the wrong lessons. The use of NPIs were known not to stop transmission but to have massive, massive collateral damage. To use them over and over, in my opinion, is criminal negligence causing death, and we need to hold accountable those who did it. Our Prime Minister, our premiers, and MOH are those responsible people, and they need to be held accountable. If we do not immediately and vigorously remove the belief in lockdowns, we will redo this, and not just for a pandemic. We will redo it over and over and over, and our citizens will be compliant.

The presentation I've just given you is based primarily on a paper I wrote July 1st, 2021 [Exhibit RE-2e], and sent to all the premiers in the mainstream media, Canada's Deadly Response. It's 130 pages. You can get it at that link that you see. It's been used in court cases against MOH and premiers across our country, and the others are supporting documents. I stand ready to answer your questions.

Commissioners, I would point out that I've never talked about vaccines once, because in emergency management, you never count on a vaccine. A vaccine takes five to ten years to develop if you're using proven technology. They take ten years plus if you're using new technology, and a pandemic is long over before you ever get a vaccine. You may wish to have a vaccine if the virus is not a constantly shifting and changing virus. The chief medical of the vaccine program in Great Britain said in August—before our Prime Minister called certain people in our public, racist, misogynist people with unacceptable views—the medical officer of health in Great Britain said, "The coronavirus is now the sixth form of the common cold. We need to learn to live with it, there never will be a vaccine. We've never had a vaccine for the cold."

But I've never talked about vaccines because emergency managers know they come too late. You have to deal with the development of herd immunity long before you ever will get a safe and effective vaccine. Ladies and gentlemen, your questions please.

Shawn Buckley

Well, I get to go at you first, David. One thing that struck me is you showed data there that just the regular pneumonia that we live with for our entire life is responsible for more **deaths during this pandemic than COVID. Is that correct?**

David Redman

Pneumonia worldwide has always been a larger threat than COVID. In Canada, we had a more successful rate because of our— For one strain of pneumonia, there is a very good vaccine. And so we've had an ability to reduce pneumonia deaths in Canada. But worldwide, COVID was less of a risk than pneumonia.

Shawn Buckley

Now, in every year we have, I think you called it, the seasonal influenza. We have, I call it low vitamin D season, but other people call it flu season. But basically, we have a season where we have influenza and we have a number of deaths in Canada. Did I hear your evidence right that for our regular seasonal influenza for persons under the age of 65 that COVID was more of a risk to those under 65, all right, less of a risk, than seasonal influenza. That was too long. So I'm just going to rephrase that question so—

David Redman

I can answer the question. In previous presentations which many of you have seen—that I have given for the past two years before I stopped doing public presentations in February 2022—I always had a graph which showed the seasonal influenza curve from the past five years and I overlaid it with the COVID curves. And so in terms of transmission of the virus (and it's in my position paper), there's no distance between the lines. COVID went up and down no matter in Canada, no matter how hard we locked down, no matter how soon we locked down, the virus transmitted itself exactly the same. And people always ask me the question: Well, why was Taiwan and why was Australia and New Zealand able to do better in terms of sealing off the disease?

Number one, Canada is not an island.

[01:05:00]

We had 20,000 truck drivers crossing the Canada-U.S. border every day throughout the entire pandemic. Why? Because we have a just-in-time food supply system, and we would have starved to death if we hadn't done that. So the spread of the disease just happened naturally and it suddenly became a crime to get sick. You were held in disdain by your friends and neighbours if you caught COVID because you obviously did something wrong, but they never cared if you caught the flu the year before.

Shawn Buckley

And for those under 65 the flu was more dangerous.

David Redman

And for those under 65, the flu had a higher infection fatality rate than COVID through the entire pandemic to this day and now significantly less.

Shawn Buckley

Now you had mentioned at the beginning of the pandemic, you know you have said you lived through four of them and I think you mentioned the Asian flu in the 50s, but didn't we have one called the Hong Kong flu in the 60s? Like we've had bad influenza seasons before, and I mean bad, they far exceeded the seasonal influenza.

David Redman

Absolutely correct and if you go to the position paper, there's a grading system for pandemics. It's been known worldwide. CDC put together a graphing and charting system that's been used for every pandemic dating all the way back to the Spanish flu. And so what you have to consider is both the transmissibility and the deadliness of the disease and it's

on two axes. If you place this pandemic, it is, at worst, a moderate pandemic. Most people would consider that it actually slides down into a low-level pandemic based on the CDC modelling. So this entire pandemic we've been told that it's an extraordinary event, the worst pandemic since the Spanish flu. The facts don't bear that out and the model system used by CDC—and they're part of the perpetrators of the fact that they say it's a terrible—they didn't even use their own models.

Shawn Buckley

So I wonder if the media hadn't been hyping this, would this even have been a situation where emergency plans would have even been engaged?

David Redman

We have been destroyed by our independent media, and censorship has been obvious and apparent. I'm sure everyone in this room knows it, but for most Canadians they think the mainstream media has been doing a great job simply giving them the information that the MOH and the premiers have been giving them every day. What the mainstream media forgot is that their job is to hold government accountable, and in so doing they could have used one of these (holding up cellular phone) just like I did and known that the people who are most at risk were our seniors.

Let me give you the example, just one example: Theresa Tam said in the summer of 2022 that it's a national embarrassment, us [Canada] placing last in the OECD [Organisation for Economic Co-operation and Development] in protection of our seniors through this pandemic—73 per cent of all deaths in this pandemic in Canada happened in long-term care homes; 73 per cent died in long-term care homes, not in the general public. They were our seniors with severe comorbidities. Theresa Tam personally admitted that it was a national embarrassment to place last in the OECD of countries with similar public health care systems. The mainstream covered it for one day, and you will be very hard-pressed to find that statement. I have it; it's right here, and it's in my paper.

Shawn Buckley

David, actually wasn't going at the censorship thing. I was just actually wondering, would this in the normal course of events been a situation where emergency plans would even be invoked?

David Redman

I would have put it to you that in February— Okay, let me answer your question specifically and then give you an aside. In February 2020, if I was the head of AEMA, I would have taken the pandemic influenza plan as written; I would have asked for a briefing session with the Premier; I would have asked the Premier to form a task force; and I would have prepared as if it was going to be a horrendous pandemic. Because you always go big and then ramp down. By the middle of March, I would have recommended to the Premier that for the first wave we consider options for protections of our long-term care homes and nothing else.

Shawn Buckley

And would it be fair to say that—so Alberta had a plan—basically every province in Canada and pretty well the entire world, and the World Health Organization would have had plans similar to the Alberta plan?

David Redman
Absolutely correct.

Shawn Buckley
Because basically everyone could look at the past data and draw the same conclusions.

[01:10:00]

David Redman
Everybody was using the same lessons learned and had rewritten and rewritten their plans. If I can take you back in time, I retired from Emergency Management Alberta in December 2005.

This document, the WHO document, first came out with the comprehensive study of all 15 NPIs in the summer of 2005. So the Deputy Minister of Health at the time asked me to co-chair with her the mission analysis session where we would completely redesign the Alberta plan because NPIs had not been studied in depth before, and clearly the Alberta plan was inappropriately based on using a number of NPIs. So that's why in 2005, we rewrote the Alberta plan. It was published in 2006 after my retirement, and it was upgraded because all-hazards specific plans are rewritten every 10 years by every province and territory in Canada. The one in Alberta was republished in 2014 after another comprehensive review, basically looking like the one from 2005.

So yes, every province and territory in Canada had plans. They had pandemic plans that look very similar to the Alberta one. All 13 of 13 are available on pandemicalternative.org because we collected them; and the Government of Canada plan looked very similar to being a supporting plan for the 13 provincial plans, a supporting plan not the leading plan.

Shawn Buckley
And not a single government in Canada follows their pre-existing plan.

David Redman
In my opinion, they burnt them all.

Shawn Buckley
Thank you. Those are my questions. I am confident that the commissioners will have questions.

Commissioner Massie
Thank you very much, Mr. Redman, for this very thorough presentation. I have a couple of questions. I don't want to take all the time. I want to leave my colleagues also to ask some questions.

So my first question has to do with the planning of an emergency plan. I mean, I was working in the government, and we're always looking at these preparedness plans from a

microbiology, immunology, virology standpoint, which is one aspect, of course, and you have to work it out properly.

But to my surprise, I saw looking at the internet, as you pointed out, on cell phone or computer, there was a kind of a plan at a very high level called Event 201. That if I summarize what I've read from there is that in order to get the best possible response to this kind of global emergency, you need a global plan that will actually be prepared at high level by real experts and then will be deployed, really top-down, using all kinds of interesting communication tools.

For example, we've learned from some document in U.K. that they have this nudging unit that would actually lead people to really adopt the behavior that would be aligned with this global plan. So how would you qualify that kind of plan or planning for emergency of pandemic with respect to the most current, I would say, state-of-the-art knowledge that have been practiced for all of pandemics of the past decade?

David Redman

I would suggest you that Event 201, led by Bill Gates, was a well-intended but totally misguided group of individuals who had an industrial background, with a few doctors who had a particular bent, and the bent was, they loved NPIs. And they produced results that made absolutely no sense, in my opinion, and yet it was almost a complete carbon copy of what we did in Canada.

But I would point out to you that many countries in the world didn't believe in Event 201, didn't follow Event 201. Sweden being the classic example, and people like Ron DeSantis, Governor of Florida, who just went, "No, this is wrong." And the reason is they recognized the collateral damage, and Event 201 is based on basically locking down the entire world until another vaccine can be prepared.

And Commissioners, I would hasten to point for the Canadian public that within the next week, if it hasn't already happened,

[01:15:00]

Canada will be a signatory to the WHO agreement that models Event 201 response for all time in the future. And that the countries that sign the agreement agree they will give up their sovereignty and follow the direction from the World Health Organization, which is based on the rapid and continuous use of NPIs.

Commissioner Massie

My other question has to do with the definition of a pandemic. Professor Didier Raoult in Marseille has always presented the notion that these infectious diseases spreading in population cannot be global because it depends on the population, it depends on the environment, the weather will play a role, the interaction between people, and therefore it has to be analyzed at a reasonably local level.

We've learned during the pandemic, for example, that there's been a gazillion of variants that we've learned about in this particularly evolving virus because we started to sequence it like we've never done before. Had we done something similar for other influenza or other types of infection, we would probably have seen similar profiles, but in this particular instance we learned a lot about the emergence of these variants that eventually became

variants of concern because they came in some area and then they were going to spread all over the world and so on.

But the reality is that the variants come and go and they sometimes remain very local, sometimes they can spread a little bit more. So this whole notion that you could come up with a plan that will be kind of a one-size-fits-all is a little bit difficult to reconcile with the notion that there's going to be a large, many factors, local factors that will influence.

And you've named, for example, the comorbidity in people that are more vulnerable, that's one element. But it could be also other elements that play in the environment that will play with the spreading and so on. So this whole notion of having a global plan for pandemic management with not much recognition for local management— Because circumstances will be very different depending on countries and so on. So how can we actually find a better way to communicate that this old grandiose plan is half-baked in the sense that, yes, you could have high-level recommendation, but what about the local implementation of the measure?

David Redman

I totally agree with both the professor and yourself. Emergencies are always bottom-up, but there's a reason for that. And in a pandemic, as you say, there are so many conditions. So let's just address a few.

Remember the all-hazards. Each jurisdiction, every municipality, every province has to make their own assessment of what it is for them. Whether environment plays such a huge role in every possible hazard, just like it does for a disease. When I do my comparisons, I never compare Florida to us. The climate in Florida is not the Canadian climate. And how a disease evolves and spreads in Florida is totally different than Canada.

But Sweden is a very good collateral model because their urban versus rural densities are like Canada. Their climate is very similar to parts of Canada, at least significant parts of Canada. So if you're going to compare apples and oranges, if you're going to build like-minded responses, you have to look for all of the impacting factors, and the best way to do it is not try and compare yourself to anybody other than to look and see what works somewhere might work here and test it.

So when you build a plan for Alberta, it's going to be different than the plan for Nunavut. Totally different because of population density, because of numbers of people, because of geography, because of climate, all with the same virus. And yes, the virus mutates— And I almost screamed at the television. I did scream. My poor wife is right there. She knows. I would get so mad when I would hear people say ridiculous things about— How could our **Medical Officer of Health— Remember the 10 activities make up all of life, one of them is intelligence?**

How could we not have built a medical intelligence section that was trying to find all the variants that were happening in Canada, that were not happening worldwide,

[01:20:00]

and to see if there was a possibility for the transportation, and what would that mean?

It seemed like every wave and every variant became a surprise, but the response was always lock down. So we didn't even learn that there was going to be new variants until they almost arrived in our country. So yes, everything is local.

The way the disease evolves is local. So the idea that a World Health Organization would make a one-size-fits-all massive lockdown approach— Look at Africa, folks, sub-Saharan Africa, with absolutely no lockdowns. And it wasn't because the virus is more or worse or everything else. Its climate, its geography, it's a whole bunch of things in a very hot, dry climate versus a hot, wet climate. Look at COVID worldwide, you'll see the variations.

So it makes absolutely no sense to make a single worldwide plan to be driven out of a bureaucrat, non-elected World Health Organization to give up national sovereignty. It makes no sense.

Commissioner Massie

My last question would have to do with— You've made specific recommendations in terms of how can we do it better? As I was listening to you, it occurs to me that there's the knowledge, the expertise from the people that will support the ultimate decision by the Premier in every province. Do you know whether there is a mandatory training for this Premier, in risk management?

David Redman

There is no mandatory training for any elected official and it's something that we've long discussed because one of my ministers when I was running EMA had been a florist for 20 years. His arrival to suddenly be my boss meant he needed to learn that he was responsible for the response to major emergencies and disasters in the province. He was a very willing student. The one before him was not.

The Premier, I was blessed with having the same premier for all five years in EMA, Ralph Klein, and that man was one of the most empathetic people I had ever met. Every election— What happens in every province and territory before a premier becomes a premier, there's a briefing book and every significant function within the province prepares a one-page briefing note and premiers can invite the preparers of that note to come and give a talk and to learn more, but it's a voluntary system on their part.

But every premier in this country knows they have an EMO, it's in their briefing book, it's there the day they become premier. Should there be a mandatory training session? I would put it to you that every elected official, every elected official, local, municipal, provincial, should have a minimum of a one-week indoctrination training period where they **understand, get to understand what their role is as an elected official. It sounds great, you know, "I'm going to represent the people of Kohlberg," but what does that mean? How do you do that? How does the parliament work? How does the system work?**

There should be a training for that. But the minute you become a minister—go up the next step in your elected lifestyle—you should have a specific one-week session for the ministry you're now accountable for. Because unlike the United States where Congress and Senators are there simply to represent their people and do not actually run departments, ministers in our government in Canada, in the provincial order of Government and the federal order of Government, run departments.

They become the CEO [Chief Executive Officer] of a huge bureaucracy that works for them and for the people of that province. And to understand what those people do, every time they change ministries, there should be a compulsory one-week period, and it shouldn't be voluntary. It should be a requirement, in my opinion, and for the Premier, one week even more for the most critical functions that a premier is responsible for. And there isn't one bigger than responding to major emergencies and disasters for the people of their province.

Commissioner Massie
Thank you very much.

Commissioner DiGregorio

Thank you so much for coming this morning and giving us your testimony. I will also try to limit my questions, although I have many. I noticed in your presentation you spoke about the non-pharmaceutical interventions being something that are not resorted to as a first resort, but that actually seemed to be what our government did in this case in terms of implementing lockdowns in fairly short order when COVID showed up. I'm just wondering what could possibly be the goal or the justification for implementing lockdowns so early.

[01:25:00]

Is it the hope that the virus will go away? Is it that we're waiting for another intervention like a vaccine? I'm just struggling to understand how that could have been justified.

David Redman

So let's start with "the mission was wrong." If your mission is to protect the healthcare system, NPIs [Non-pharmaceutical Interventions] make a lot of sense because you actually believe that you can get all of the population to protect you, but they can't. They don't. It was well known. They wouldn't. But if you put the wrong person in charge, you end up with the wrong result, if you declare the wrong mission first. So I use three words, and I've done this with lots of people in lots of venues. And I try to be as kind as I can because the three words I use, I'll give them first and then we'll go through them. I use incompetence, hubris, and self-gain.

So at the start of the pandemic— Even in my paper, I give the benefit of the doubt for the first wave. I only call it gross negligence, which you can be held culpable for. But after that, I call it criminal negligence. And the incompetence started right at the very beginning. First on the behalf of every premier in Canada for not being in charge and not doing leadership **and not doing their own personal exploration of evidence. Then they chose to put the wrong person in charge. The person in charge was them. But they chose the medical officers of health, and the medical officers of health are not trained to run major emergencies or disasters. They simply are not.**

So the incompetence portion led us to putting people in charge who watched what happened in China and went, "Hey, maybe that'll work." Absolutely fear-based totalitarian response in our democracy? I don't think so. But that's what they did, so incompetence.

You put the wrong people in charge. The Medical Officer of Health was incompetent in not saying, "I can't do this alone. I need a governance task force to reflect all of society." They made the flip in the mission statement to being to protect the medical system, and the

Premier allowed them. But they should have immediately said, "This isn't how our plans are written. This isn't what I believe should happen. I believe this should be an all-of-society response." So why did they go to using NPIs?

You have to ask them, and I've asked them in court case— Leighton Gray and I were part of a case against Deena Henshaw. They have no proof to show they did a cost-benefit analysis to justify the use. I have no idea why.

Hubris, second word. Once you make a decision, you never admit a mistake. And so wave after wave after wave, they did the same thing, even though the evidence told them, "Stop, you're doing the wrong thing." Hubris makes it really hard to say you're wrong. It's not impossible. Ron DeSantis did it in Florida. After the first wave in May, he went, "I think we're doing something wrong." And he invited Dr. Jay Bhattacharya. After two days, he walked to a microphone, and his first words were, "I got it wrong."

Admit your mistake, the public's willing to accept that. Now tell them what you're going to do, but tell them why it was wrong. Hubris, the second roadblock.

And then why did they want to use them and keep doing them? Self-gain. And self-gain is in so many ways, it doesn't just mean you're going to get monetary input. In fact, I'm not saying that at all. What I'm saying is, "I'm on the TV every night. My job is secure if I keep doing lockdowns. Everybody seems to like this. The public's demanding more."

Instead of telling the public why you're not going to do it, it's just so much easier, and you win the next election. Look at Doug Ford. He won a landslide. Legault won a landslide. Self-gain comes in many forms.

So why did they use it fast and never bend? Incompetence, hubris, self-gain. It's my only possible conclusion.

Commissioner DiGregorio

Thank you, thank you. You actually answered my second question at the same time as the first, which was why you were emphasizing that elected leaders needed to make the decisions as opposed to bureaucrats, so those tied together very nicely.

My third question relates to— I didn't see in your framework where the media fit, and I'm wondering if you can comment on how that should go, and even whether or not it goes too far to maybe list them as a one of the potential hazards that need to be dealt with.

David Redman

Okay, so let me answer the second part first,

[01:30:00]

just in case it doesn't come up. Remember I said there has to be a recovery plan and it should have been started to be written the day after response began. I've written a paper on what recovery should look like. It is exactly the same operational process, and it needs to include everything that we need to do.

We have been completely failed by our legislative system. We've been completely failed by the institution of our medical system. We have been completely failed by our independent journalists and we have been completely failed by our court system.

So when you build your recovery plan, the first thing has to be an admission that what we did was wrong, or we cannot correct any of those faults. And then there needs to be a written recovery plan issued to every citizen of the jurisdiction, every province and territory in Canada, saying how we're going to fix the terrible collateral damage we've done, and how we will run a proper "lessons learned" to make sure we never do this again this way. So to me, the whole thing backs up to the failure of our institutions.

So let's talk specifically about the media, which was your question. From the beginning of this pandemic, the mainstream media—so let me be specific, CBC [Canadian Broadcasting Corporation], CTV [CTV Television Network], and Global in my opinion—became the Ministry of Propaganda for the Government of Canada and for the premiers of Canada. They stopped becoming, in any way, investigative journalists. They could have seen the same numbers I presented on slide after slide; and I don't just mean at the start of the pandemic, I mean every wave, what was happening worldwide and the things that were going on in Sweden versus the things that were going on in Canada: they chose intentionally never to do that.

I will tell you that I was approached in February 2021 after becoming known because of Danielle Smith's talk show and *C2C Journal* in December of 2020. I was approached by a mainstream investigative reporter. He came to my house and he came to Dr. Ari Joffe's house and he did two two-hour interviews with each of us. There was massive footage, massive material. He then ghosted us for four months, and I kept sending documents to him that I thought might help in his documentary.

Finally, I received in my mailbox a handwritten letter, no email, no telephone call, nothing—a handwritten letter—because he'd come to my house, he knew my address, dropped in my mailbox said, "Please never mention my name, please never admit that I did this interview with you." Terror in his handwriting and in his words that people were shutting him up. He had tried to market the documentary and had been threatened in many ways.

I will give you one more example of what I know to be censorship. You all know "W5." Molly Thomas called me personally in April of 2021, and Dr. Ari Joffe, and did online interviews with us both. Have you ever seen that session? Molly Thomas has ghosted me to this day, and Dr. Ari Joffe. Censorship in the media is real. It happened. You've heard some really good testimony.

I've watched previous testimony from other far more experienced people in the media than me. The media should have been an ally with emergency managers distributing a written plan from every premier to the people of its jurisdiction. The media became partners with the government, but on the wrong side of the propaganda curve, and to this day, mainstream media. If you want to see any of the things I've done, you can get it through alternative media. It's out there, but 60 per cent of our population still believe lockdowns work, and vaccines were the only way out of this pandemic, and that's because of the mainstream media.

Commissioner DiGregorio

Thank you.

Commissioner Kaikkonen

Thank you for your testimony. I'd like to speak to the mobility challenges across this country, and I'm going to speak from my own personal experiences. I believe it was at Christmas, so December, beginning of January 2021, and I could be held accountable on those dates being wrong, but I believe that was the year.

I have family across this country,

[01:35:00]

so I drove east first. I went to New Brunswick, where I had to apply for— Within 24 hours of arriving in New Brunswick, I had to apply for papers that I could give to the RCMP roadblock when I got to New Brunswick border that would allow me to drive through the province, only stopping for gas. When I got to Nova Scotia—similar situation—I had to apply in advance for paperwork that would allow me to travel within the province, giving the destination of where I would be, and my COVID recovery plan if I had COVID, or my plan for arriving in that province. When I got to Prince Edward Island, like I say, I have family all over. When I got to Prince Edward Island [PEI], it was a great big barricade at the border had been erected, and we all had to be subjected to COVID testing. It was quite significant. There was a number of cars lined up, and only PEI residents were allowed to bypass that process.

Going the other way, in northern Ontario, coming out to Alberta to see family here, this is in the same four-week period, I had signs in northern Ontario that said that there would be COVID testing at the Ontario-Manitoba border. That never happened. And I travelled freely to Alberta without any restrictions or mobility challenges. I'm just wondering, in that same four-week period, how COVID could differ depending on which part of the country you were in.

David Redman

Clearly it couldn't. Remember the cartoon drawn by that 15-year-old girl that she sent to me and gave to me—that in fact ended up being a protest button in the Yukon. Societal health damage is a real thing. COVID had nothing to do with that. The actual virus had nothing to do with how our government responded because if it did we would have done targeted protection for our seniors and everybody else would have moved normally.

So the damage that the fear and the intentional growth of fear caused to our population almost made the public want those type of movement restrictions. They felt that somehow **someone from Manitoba was unclean if they tried to come to Saskatchewan.**

Why? Because being sick and getting sick became a crime. Just being sick. It didn't matter if it was the flu, it might look like COVID. Being sick became a crime, and the damage to our society by the constant never-ending use of fear, which is exactly the opposite of what emergency managers say you should do, caused massive societal disruption. And those barricades and those roadblocks were an expression of fear.

Worse than that, people took action into their own hands. Wonderful Canadian citizens, who I never would— When I was in the former Republic of Yugoslavia during the middle of the '95 Civil War, I watched atrocities on a daily basis. I believed that would never happen

in my country. If you drove a car with Alberta plates into British Columbia, you knew your tires were likely going to be slashed and the windows broken by rocks.

That's private citizens expressing the fear that their elected officials, that their MOH, and that their media had driven into their head. Worse, our courts backed the use of fear. So even if you said, "I don't want to do that," you saw the court cases constantly supporting the government's use of fear.

So no, the virus of course never should have ever been used for a reason to stop movement restrictions within our country. It was on the list of red things, the one that said internal movement restrictions that was shown in red. That applies directly to your question. Internal movement of the 15 NPIs, one of them is internal movement restrictions, "No, makes no sense."

The virus— It's almost like we thought the virus had a brain, and that the virus knew where the Manitoba-Saskatchewan border was, and personally wouldn't cross it unless you carried it because the virus knew the border was there so it wouldn't do it on its own. Absolutely ridiculous.

Commissioner Kaikkonen

Thank you. My second question may be a little outside of your scope, but I'm going to ask it anyway. When it comes to posturing, and the provinces are responsible for two high-end budgets, and that's the health and the education. Education closed down. They basically locked our students out of schools

[01:40:00]

and took a back seat to health. So I'm just wondering, in terms of posturing the two, is it possible that education will be pushed aside and health will take the forefront in terms of budgeting and that education just will be totally lost, not just on our students, but as a bureaucracy or as a ministry in the provinces?

David Redman

If that happens, we have destroyed our country permanently. I put the circle around education and the social and academic development of our children as the number one thing on that slide of things to continue.

The cost for medical care is a real concern. The OECD—the Organization of Economic Cooperation and Development, 36 countries—for countries similar to Canada with a public health care system, we pay the second most of all of the OECD for our health care. We have the second worst outcomes. That's in terms of wait times, that's in terms of numbers of acute care beds, ICU [Intensive Care Unit] beds, but the actual delivery of medicine in terms of wait times for hip replacement, for heart disease, for all of it. We rate second worst in the OECD of 36 countries and we pay the second most. Clearly, that's not sustainable.

We need to figure out a way to make our public health care system better. And I don't just mean better, I mean we need to make it magnificent, but we need to do it through using bright minds. And people always say we need to think outside the box. I hate that term. I've made officers never use that term in my presence in the Army. It was one of Colonel Redman's no-nos. Because no one can think outside their box. Everybody has a box and that's your box. It's based on your entire life experience, the knowledge you've learned, and

the skill that you have in applying it. Nobody thinks outside their box. So how do you fix problems? You use that process.

Why? Because you bring all the brightest boxes in the world, that all think differently, together and you run them through a process and you suck everything out of their brains and put it down. And then you develop options on how to use all that knowledge. You weigh them on a cost-benefit analysis. You make a plan and you execute the plan. You don't just write the plan; you execute the plan. So in my mind, the entire point of what we've done is that we just discarded all the boxes and only took one.

And so I don't believe that we've ever intentionally tried to fix our healthcare system in a meaningful way, bottom-up and top-down at the same time. Okay? It's always the top-down. I understand top-down. I was an officer. But bottom-up and top-down together and fix our healthcare system.

At the same time, that recovery plan I talked to you about, the very top bullet after removal of fear is, fix our children.

What we've done to our children for three years will last them their whole lives. My son-in-law teaches in elementary school. My youngest daughter teaches in a junior high. And all my grandchildren are either in college, working, or are in senior high. So I have personally been able to watch the impact of this three years on children in elementary schools, children in junior high, and children in senior high. It's atrocious. Children in junior high, when the hormones hit, go off like time bombs. They'll be sitting in a classroom, and they'll just start screaming. No reason.

If we don't understand what we've done to our children, then as a nation we don't deserve to be a nation. We should just let someone take us over, call it a day, and send our children to camps where they can be re-educated.

We need to fix the social damage we have done to babies through to 18-year-olds, so that they can take over a country and understand what a democracy is and be ready to run it after we're gone. That doesn't happen by simply saying the pandemic is over. Isn't that wonderful? Pandemic's over.

No! You have to have a recovery plan to fix the collateral damage we've done in every box. But the most important box is children because they are damaged goods, not just academically, but especially in social development.

[01:45:00]

So education has to take a front seat compared to health care, in my opinion. And more than that, we need to take it past just out of the schools.

The mental health issues we've created have to be dealt with by a proactive, not reactive, mental health care system.

Shawn Buckley

David and Commissioners, I'm just wondering: we've got an issue with the counsel that has to leave at two, that has four witnesses to run. Are you available David to take further questions from the commissioners after we—

David Redman

I'll be here until noon tomorrow.

Shawn Buckley

Okay. So Commissioners with your leave, just because we've got some other constraints today, I would suggest that we take a 10-minute break, and then march through four witnesses to lunch. And just take a late lunch and then have Mr. Redman come back after that for questions. So we will adjourn for 10 minutes.

[01:45:57]

PART II

[00:00:00]

Shawn Buckley

And Commissioners, the only person we have left is, you still had questions for retired Lieutenant Colonel David Redman. So we'll ask David if he could come back to the stand. Oh, and it's been a long day, so I appreciate that you'll have to go back in your notes.

So while the commissioners are looking at their notes, and in all fairness, they didn't know I was going to bring David back at this particular juncture. I'm going to invite everyone to come back, who are watching online and present here, tomorrow. I often said that you can't watch a day of the National Citizens Inquiry and not be changed. And I just think of, you know, Drue Taylor, who was a power yoga instructor, and just the suffering. That, you remember, she moved her camera briefly and we saw her walker that she can use in her home. But to go to a store, she has to be in a wheelchair. And if she makes the decision to walk around her house, that she's going to pay a physical price and have to lay down. And then when we see Regina here speaking about the experiences she had in Poland and how she's seen basically the same thing here, it's just very difficult.

So I'll just ask the commissioners—

David Redman

Shawn, can I just make a comment about Regina?

Shawn Buckley

Absolutely.

David Redman

A strange coincidence, in my career, in 1981, I was posted in Germany as part of 4 Mechanized Canadian Brigade Group, part of NATO [North Atlantic Treaty Organization]. And when solidarity broke— People don't understand that the Cold War was a real thing, especially for the people in Europe, and people where those two great nations decided to duke it out in the rest of the world.

But in Germany, you remember Germany was divided, and the inter-German-Czech border, the inter-German-German border, there was a— All the tactical plans said that if the Russians moved 10 divisions, and a division is 11,000 soldiers, so if they moved 10 divisions into the border areas, which included East Germany, Czechoslovakia, around Poland, that was the trigger. That's all they needed in order to take all of Europe. They would be able to roll straight through at the Fulda Gap and other areas, and they would march right to the sea.

So when Regina was taking her heroic actions, and solidarity stood up in the middle of December, on the other side of that border, every NATO soldier stood too, three times in the month of December, and the final stand too, we rolled with all our weapons, all our equipment, all our ammunition, and we stood on the East German and the Czechoslovakian border, and we were there for the month of December.

And it was because we thought the Soviets might come for us, but the real intent we knew at the time was to crush Solidarity. They chose not to, but the impact of that on all those nations and the heroic actions that they took meant that, by 1989, only eight years later, the wall came down. I was lucky enough to be on my second tour in Germany when the wall came down. The very night it came down, we were on a Canadian tour with the German Panzer Division at the Fulda Gap, and we saw it happen on the TV. And we rolled to that border and watched the people from East Germany roll in their Trabants across the border, completely shocked, and within hours, terrified, drove back.

But the actions of a person like Regina can never be underestimated. The wall came down because of what happened in Poland in the month of December 1981. The lessons she gave in her testimony today can never be overlooked. We are at a point of peril, and she's trying to warn you.

Shawn Buckley

David, thank you so much for sharing that and I believe the commissioners are now ready for their questions.

[00:05:00]

Commissioner Drysdale

Lieutenant Colonel Redman, I appreciate you brought that up because I was thinking about when, in your presentation, you talked about emergency planning, and how many years you've been involved in it.

You know, 40 years ago, I was involved in it too, and we were planning for a nuclear war. And just to show how far back that goes and how real that was, and I mentioned that for a couple of reasons: one, in regards to what your statement is just now, but secondly, since you were over there and because you're a lieutenant colonel, you've seen people in all kinds of situations, high-pressure situations, real situations. Is that correct?

David Redman

Absolutely sir, in particular in operations in Egypt after the '73 war and in Bosnia during the '95 war.

Commissioner Drysdale

Well, my question comes to the— And this is a similar question I've asked of the police, the judiciary, all levels of government, and industry that we've seen. You know, the emergency planning groups in Canada are long established, going back decades, very highly trained, very respected, very dedicated people. They're not in it to make a lot of money. They're in it to serve the country: highly trained, highly organized, tested and proven.

How did this happen? How did they get pushed aside, and maybe I'm wrong about this, but I didn't hear a peep from them. How did they get pushed aside by the politicians who then pushed aside their own responsibilities and gave them to bureaucrats? How did that happen?

David Redman

I have to tell you that you need to ask every premier in Canada that exact question. And I know you've called them and they've refused to come. I can tell you what happened in Alberta because it's my stomping ground, and because I still know people all through the Government of Alberta. So let's—

When a premier decided that instead of assigning a full task force to protect all of society and turned to the MOH, that was the first piece of incompetence. Once done, the MOH grabbed control, and I mean grabbed, and there was a power struggle. In my very first letter, I wrote only to the Premier of Alberta. All subsequent letters went to every premier in Canada, and I subsequently forwarded the first letter to the other premiers. I know they received them. I got automatic replies for them all, and there was a Freedom of Information request on the premier of Prince Edward Island, and before they could release everything I had sent to him, they had to ask me. And so I got a complete return of everything that I had sent to all the premiers. So I know they got it. It was all in the Premier's office.

So what happened was the MOH, at least in Alberta, and I'm sure exactly the same thing happened, was delighted that they could enact all of the things in the *Public Health Act*.

There had been a great discussion and I don't want to be too long, but there was a great discussion back after September 11th, 2001, that there should never be conflicting powers in any legislation. The *Public Health Act* and the *Emergency Management Act* were the only two acts in a very detailed two-year review of legislation, which I was part of working with the Minister of Justice because I was the director of counterterrorism, to go and get rid of all conflicting powers. And the only place where conflicting powers continued to exist after September 11th was in those two acts, the *Emergency Management Act* and the *Public Health Act*. And the powers, the extraordinary powers in the *Public Health Act* exactly mirror the extraordinary powers in the *Emergency Management Act*. The difference is a bureaucrat holds the powers in the *Public Health Act* and the governor general in council, which is the elected government, holds them in the *Emergency Management Act*.

So when the Premier handed the responsibility to coordinate the response to the Medical Officer of Health, they abrogated their responsibility to actually declare a state of emergency instead of a state of public health emergency, two completely different declarations.

If it was a state of emergency, it had to be reported to Parliament and had to be updated every 30 days and justified. That is not a requirement under the *Public Health Act*. So

clearly, the lesson that we had learned in 2003 when we did that review, that those conflicting powers needed to be removed, never happened.

And it was because the Public Health Agency at the time

[00:10:00]

guaranteed they would only be used for localized events, i.e., one municipality or smaller, and for a very short duration of time: clearly that became a lie.

So once you've handed that over, the Emergency Management Agency in Alberta was **sidelined completely**. And I can tell you, it's in my court testimony, just how badly it was sidelined, because the head of the Emergency Management Agency of Alberta was allowed, during the first wave, to apply for a lateral transfer to parks, to become an ADM [Assistant Deputy Minister] in parks.

So clearly, the Government of Alberta did not value their Emergency Management Agency and let the leader of it— In the middle of the worst disaster in the history of the province of Alberta (in their terms, I don't believe that, but in their terms), they let the head of their Emergency Management Agency wander away on a lateral transfer. They didn't even bother trying to rehire to the position until December 2020, and the position was ultimately filled in 2021. And, of course, the new individual didn't have the same background, hadn't worked all across with the private sector in the province.

So once you've made that decision, once you've decided, then that agency was removed. I was contacted by people both in the provincial agencies all across Canada, and in the municipal agencies, particularly in Alberta, and many of them simply walked away. They retired, if they could, they found other employment, because they were told, and I have emails from their supervisors, that if they spoke out one more time in terms of the fact that the provincial plan and the municipal plans were being ignored, they would have been fired. So the emergency management people weren't just sidelined, they were treated like everyone else.

The rules that were applied to them, long before the vaccine passports were applied to them, to keep their mouths shut or leave. So you have to realize that starting— Once I started to get those letters out, and people started to read them, I presented to political groups all across the country, both federal and provincial in many, many provinces and the Government. I presented to groups of media that were interested in listening and then became ghosted. I talked to doctors' groups all across Canada who knew what that was being done was wrong, and totally agreed with the presentation, and they were silenced or censored. To me, I can't get into the courts because I'm still involved in court cases, but I **believe that our four major institutions have been compromised. And emergency management—really well-trained—were being used for fires and floods, but completely ignored for the pandemic. And, in fact, suppressed.**

Commissioner Drysdale

You know, we talked to a witness earlier about the military, and they talked about how many people the military lost—3,000, 4,000, something like that. They testified that loss was probably the largest loss that our military has seen since World War II. What kind of loss has our emergency planning groups experienced, and are they ready now for something new, or have they been devastated like the military has, both from a morale standpoint and a personnel standpoint?

David Redman

I can't tell you in terms of numbers. I simply don't know. There's 13 of them. They're spread all across Canada and they're varying sizes, so I simply don't know. I certainly know that their morale has been devastated from the ones that I still talk to and those that left aren't ever going to come back. They believe that the profession is in severe jeopardy.

But this isn't new. I presented, two sides— I presented to the Senate Standing Committee in 2008 after I had retired from EMA. I was asked by the heads of emergency management all across Canada. The organization is called SOREM, the Senior Officials Responsible for Emergency Management, and it's the heads of each of the agencies from each of the provinces and territories. And emergency management needed to be taken seriously after September 11th, and I was asked to be their spokesperson because I couldn't be fired; I'd already retired. And so I presented a response to the Standing Committee on emergency preparedness in Canada, the Senate Standing Committee, and their report was scathing that we weren't taking the management of emergencies in our country seriously, and they listed a series of things and I came back and agreed but gave solutions. That committee was never listened to and ultimately was stood down.

[00:15:00]

And then most recently, last October, I was asked to testify in front of the Standing Committee on National Defence because the Prime Minister of Canada had asked that committee, the committee Standing Committee on National Defence, to review whether or not portions or all of the Canadian Armed Forces should be rerolled for emergency management for disasters and emergencies in Canada. My testimony was extremely pointed. I said that the Armed Forces of Canada was to defend the national sovereignty of our country, period.

And then I put my emergency management hat on and said, "You already have an emergency management agency in every province and territory in Canada, why would you reroll the military to do it unless you have another agenda? You know you have EMOs in every province and territory and Public Safety Canada exists; why would you reroll the Military?"

So it was an hour of testimony, and we went back and forth. I have no idea what that will do, but our Armed Forces are in such a terrible state in terms of numbers, equipment, supplies, and I made that very clear in my testimony. And that the mere concept of taking a portion of that completely depleted organization— I would put it to the Canadian Army is under 17,000, the New York City Police Department has 35,000 police officers in uniform. So your army is less than half the size of the New York City Police Department.

So how and what's the status of emergency management in Canada? I think we need to take a real focus, and check its status and rebuild it, and give it back the role it should have had in this pandemic. Because we can never do this again, and those professionals are the one that will help us ensure it never is done this way again.

Commissioner Drysdale

Thank you, sir.

Commissioner Massie

I have two quick questions. First one is, I've seen the plan that you've elaborated and the rules that should be followed and everything, and I guess that, as you pointed out, people would look at that and agree in principle we should be doing it. But the reason why that we failed to do it; and it doesn't seem to be, at least in the short term, consequences for that. What would be the plan mid-term in order to make sure that these rules, that seems to be very reasonable, are actually being deployed when we need them?

David Redman

So for the past three years, I've been telling the public, I need one premier, and I'll explain that why. It takes one leader to break through the iceberg, and I don't want to believe in heroes. I don't believe that one person can solve it all because it takes a whole group, as I showed you, in order to manage any emergency.

But to walk this back, because health is a provincial jurisdiction, you need a premier who has the courage to say, "What we did was wrong," and then actually use that process to write that recovery plan, and to bring all the experts together, not to rewrite the pandemic plan, that's part of it, but to rewrite the plan on how we're going to overcome the massive damage we've done.

And in so doing, make the public aware, step by step, we should never have closed schools, and why. We should never have closed business, and why. We should never have closed movement and dedicated size of meetings. You could only have the people of one household.

Every one of those is in those NPIs, and the "why" is very clear. But it's going to take one Premier, very brave, to say "I'm going to do a complete investigation of what we did in this province," and that then will shine the light for the citizens of that province to maybe open up their eyes to every other province and territory in Canada.

I had given up on the premiers after the first year and thought maybe I could solve the problem in the courts, and that's why I wrote that position paper, which has now been used in many court cases, and the courts have abandoned us.

So I go back to what Jeff Rath said earlier today. We now have to change the legislation so they can't do it again, but we still need that one province to say "we did it wrong," because the public today still believes lockdowns work and vaccines were the only way out. And both those are lies.

[00:20:00]

Commissioner Massie

My last question is about all of the expertise that people have in this space, would it be for risk management or science or whatnot that you need in order to bring to bear, to come up with a plan in this given situation. One of the issues that I've seen is that a lot of people that are knowledgeable could actually very often find themselves with an institution which would put them in some sort of conflict of interest in order to speak up, fearing for their position, their grants or other type of pressure.

But there is a number of "senior" people that you would hope have some wisdom that could be available to set up some sort of a panel or commission of wise people that have no link,

no conflict of interest, and the only interest they would have is to bring to the table what's the best possible solution based on their recognized expertise that they've gathered over their long career.

So would there be a way to establish a panel like that as an advisory body that would not be as susceptible to all kinds of influence?

David Redman

Absolutely. In the other, one hour presentation I have that's on recovery, in my final conclusions I say that it is useless to hold a government-led inquiry until all the current leadership is gone. So we're talking five years because they'll never hold themselves accountable.

An independent agency, my only concern would be: Who do they report to and what is their power? Because if you can't enforce the findings of a commission, there is no need for a commission. It's an exercise in futility unless, like your commission, it's for public awareness.

And so public awareness is an admirable attribute. But to actually then take a group to rewrite the plans, first of all they need to be provincially based because a pandemic is a provincial government, and which province is going to host it and lead it? And that's why I have come all the way back in my circle after three years to saying, "Without a premier that panel will have no power."

If a premier appoints a panel like that that covers all areas of society, is prepared to admit what was done was wrong, they can then actually enact legislation like we've heard. And in my opinion, that's one of the key components is getting the legislation right. But legislation is only as good as the people that implement it.

And so you have to make sure that you separate the powers so that only the elected officials can hold the power because we can hold them responsible every election. Where bureaucrats can— And remember, I was a civil servant for my whole life, first in your army and secondly in a government institution. I understand the good that civil servants do, the ones who believe they are servants of the people, and there's many, many, many of them— but what we've seen is what happens when civil servants take their personal interests instead of those of the public. So yes, we can establish that type of a commission, but it has to have teeth, and it has to be able to actually implement the changes to show the people, number one why, and number two that there's a better outcome.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

We have heard testimony over the journey across this country about the military going door to door, and seeing who was inside if they were vaccinated, and also going into nursing homes. Do you have any thoughts on that?

David Redman

Number one, I don't believe the military did that. The police might have, but the military, to the best of my knowledge, was never used in that role.

The military's role is either aid to the civil power or aid to the civil authority in most, in two ways. For them to have done that, there would have had to been a request from the province, from their Attorney General to the Chief of the Defence Staff [CDS], to have aid to the civil power, authorities granted for the military to take a role like that. I am unaware of any request from any provincial Attorney General to the Chief of the Defence Staff, and I am unaware of the Chief of Defence Staff authorizing any aid to the civil power.

What was requested that we're well aware of is what happened in Quebec, an aid to the civil authority, which was made by Premier Legault, in order to get the medical staff to go into the long-term care facilities. A completely different task, aid to the civil authority for that type of use,

[00:25:00]

and we see that used for fires, floods, tornadoes, bagging sandbags on the Red River, that's a normal sort of role.

But an aid to the civil power is very specific, has to be made by an Attorney General directly to the Chief of the Defence Staff. It's very public approval. It does not go through the Prime Minister. It goes directly from the Province to the CDS [Chief of Defence Staff], and only the CDS can approve it. And the CDS can only approve it if he has the resources to meet that commitment while still meeting NORAD [North American Aerospace Defense Command] and NATO commitments. So I'm unaware that that ever happened.

I certainly know that on the internet there were many, many claims of the military building things and doing things. And I still have pretty good connections in the military—testified to the Standing Committee on Defence, as I've said—I am unaware of any request for an aid to the civil authority during the entire pandemic.

Commissioner Kaikkonen

Perhaps it was just more media propaganda. Thank you.

David Redman

I absolutely would believe that's possible. When I was the head of Emergency Management in Alberta, an aid for assistance during times of floods and fires and the rest of that went through EMA. But for civil authority, it went the other way through the Attorney General. And they're very rare: normally for prison riots.

Shawn Buckley

Lieutenant Colonel Redman, thank you for staying so that we could, at this late hour, ask you further questions. And on behalf of the National Citizens Inquiry, I sincerely, sincerely, thank you for coming and sharing. You've opened some eyes today and shared some very important information and thank you.

David Redman
Thank you.

[00:27:10]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Red Deer, AB

April 27, 2023

Day 2

EVIDENCE

Witness 2: Dr. Justin Chin (Parts I and II)

Full Day 2 Timestamp: 03:21:09–04:40:51/05:22:06–05:41:13

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

PART I

[00:00:00]

Allison Pejovic

I'd like to welcome everyone back to the National Citizens Inquiry. My name is Allison Pejovic, last name P-E-J-O-V-I-C. I am a lawyer called to the bar of Alberta, and I'll be asking questions of our witnesses today.

My first witness today is Dr. Justin Chin. Could you state and spell your name for the record, sir?

Dr. Justin Chin

That's Justin Chin, J-U-S-T-I-N C-H-I-N.

Allison Pejovic

And do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Justin Chin

I do.

Allison Pejovic

Thank you. Now, Dr. Chin, I believe you have something that you wanted to say before you begin in terms of disclosure?

Dr. Justin Chin

Yeah, I would just like to disclose that what I'm saying is my personal opinion. It doesn't necessarily reflect any opinions of the institutions that I represent or I am affiliated with. As you go through my speech, you'll see why I've been asked to make that clear.

Allison Pejovic

Thank you. And very briefly, Doctor, could you please provide us today with a brief overview of your qualifications?

Dr. Justin Chin

Sure. I'm a specialist emergency physician. I have a bachelor's degree in science, followed by a medical degree, and then a five-year specialty with the Royal College of Physicians and Surgeons of Canada in emergency medicine. And then I've been practicing full-time as an emergency physician, since 2013, so for almost a decade now.

In addition to that, I have disaster medicine training. I have my master's degree in that field, as well as field experience. I was a response coordinator for an NGO [Non-Government Organization], a disaster relief organization that deployed to multiple places. I helped coordinate a response to Nepal after the earthquakes. I was also the chair of that organization for a term and deployed myself to Haiti three times after the disaster there, as well as to Pakistan after floods. And in addition to that to the Philippines after Typhoon Haiyan.

I work as a full-time physician, as I mentioned, including an additional role as a trauma team lead for major traumas in our accredited trauma program. And even during the pandemic, there were shifts where I helped out and took evening coverage in the hospital, in the COVID ICU [Intensive Care Unit]. So I have experience in varied fields. That would sort of summarize my training and experience, though I know I'm listed as an expert witness. I myself don't like that term for various reasons, so I like to tell people to take that with a grain of salt, but we move on.

Allison Pejovic

Thank you and just for the commissioner's benefit, his CV [Curriculum Vitae] was provided to you as Exhibit RE-10.

Now to begin, Dr. Chin, I'd like to talk about your early role in the COVID pandemic. Can you provide us with an overview of early disaster response preparations that you were involved with during the COVID pandemic?

Dr. Justin Chin

I think it's very interesting that I'm following Lieutenant Colonel Redmond who spoke at length about this. And I'm someone who likes to keep informed on many different aspects of the world, from health to fitness to economics to finance to medicine, obviously. So I was aware of what was going on from various channels and all the reporting that was going on about this new emerging pathogen sort of in late 2019 and coming into early 2020. Thinking about it, and following along closely, I was wondering about preparations and starting to make them myself and in that way sort of felt myself a little bit ahead of the curve.

And so I began, obviously, making various preparations for myself, my family, as well as speaking to people in the hospital saying, you know, there seems to be something going on around the world, and if this escalates, then we should be prepared, and I have some training in this, and so I'd be a resource to help out.

And I must say that a part of that, when I think about it looking back, I almost feel a bit ashamed because I too was captured by some of that fear and some of the propaganda that was being disseminated out. It was even to the point where, you know, very early on, I think it was early February of 2020, I went to the Home Depot with a mask on and got some funny looks because this is well before anybody was even wearing masks.

But I was preparing quite ahead of time. It is even to the point where before we even had these lockdown restrictions, I had this zone director of emergency medicine at my dinner table, a friend of mine, because we'd prepared in the past,

[00:05:00]

our hospital, for different things. And we've had in services on how to put on the protective equipment for Ebola and where to separate patients and so on. But what seemed to be coming down the pipeline here was much worse than that, and it was portrayed as being something that would be, you know, massive numbers of patients. So how are we going to cope, and how are we going to manage that? And, so we were drawing up plans to help assist with things.

So I mention these things just to show that, like, I'm not someone who was reckless about health or didn't take risk seriously from the beginning. I was actually someone who— When we didn't know, we were trying to augment everything to the biggest capacity. And now, looking back, it seems a little bit foolish that, you know, I advocated for some measures in the name of safety because we obviously didn't consider the long-term harms if these measures were implemented, especially for a prolonged period of time. So I had this interesting role where I was preparing for the pandemic.

And just to give you a quick story here, I was the physician who was involved in caring for one of the first patients who came to the emergency department, before we had community spread. So we were being told by authorities that we were only having patients who were known connected to travelers, or travelers. And the patient that was triaged that came into the hospital, came in with the cardiac potential condition. So he got put in a room, and I examined this patient and was in there. And it was only later that it seemed more apparent that he was having breathing difficulties. And I was exposed to this patient. I wasn't wearing any protective equipment at the time. And you know, the next day, because we have access to all the records and different alerts from our emergency medicine systems, I got the notification that his test had come back positive for COVID.

And at the time, this was quite frightening. You know, being captured by that fear, there were reports and stories out of different parts of the world where young physicians were dying and were put on ventilators. And this was seemingly a big deal because we were talking about it all around the world and there seemed to be some rise in the curve in different places like Iran and in Italy and in Washington state.

And so, you know, it seems kind of a crazy memory to have now, but I remember that evening in the middle of the night saying well, if this is community spread—because this person that I spoke to, he reported to me that he had not travelled anywhere and was not in contact with anybody that was travelling—that this was a big deal. We should probably

have to get everybody that he's been in contact with, notified—everybody certainly in the hospital that I was working with, that are taking care of this patient—because now he was in the hospital and brought to the ICU, so all of them need to know sort of right away. And I got on the phone, and I actually woke up many people in the middle of the night that night: the medical officer of health, ICU doctors, the infectious disease doctor. I let them know that, “Listen, I was exposed to this patient and his test had just come back positive, just came along the way, and we should be starting to get things going.”

And in the middle of it, I hung up the phone and I looked at my wife and I said, “Well, I’ve been exposed. Now it’s been over a day since I saw this patient, and from what we’re hearing, this could be devastating. It could be that the virus is already replicating in my oropharynx, or in me and my respiratory tract. And so, you know, I need to isolate myself instantly. So I will lock myself up in the third floor—the bedroom floor of our house— and there’s a bathroom up there. But I won’t kind of get close to you right now to give you a hug goodbye, and I won’t say bye to the kids—I had a newborn as well as a three-year-old. I won’t say bye to them either because as devastating as it might be, maybe in two weeks from now I’m going to be admitted to ICU, and I might pass away. But I chose this and the last thing I would want is me saying goodbye to them for even a minute here, then two weeks later you’re dealing with, you know, our children being sick.”

So I say this just to point out that, you know, I too was captured by this fear and I took things seriously. There were risks that were perceived. And I think it’s some context of background that whenever the information comes in, you should evaluate it, and then see if it matches. And then over time my position changed. And so yeah, that’s my background from that.

Allison Pejovic

Thank you. I wanted to ask you about

[00:10:00]

was there a difference between what you were hearing in the media in respect of the types of people who were being hospitalized and dying of COVID and the types of people that you were seeing firsthand. And what I mean by that are, Were the people that were being hospitalized and dying of COVID otherwise healthy people in your professional opinion? Could you describe for us that, some of their characteristics?

Dr. Justin Chin

Yeah, I sort of alluded to that my position changed over time because, you know, what I was seeing in the emergency department myself—and obviously I’m a single physician, not representative of everybody—, but it wasn’t as severe as what was being reported in the media. And so that to me was kind of a first thing that maybe started me to become skeptical of, you know, how much fear was being driven.

Even some specific cases. Like I was the physician who cared for a patient who was young who ended up getting quite sick and passing away. And it was reported that this was a mostly healthy individual who had died from COVID, and now even young people are dying that are healthy. But in reality, that wasn’t the case. The media didn’t get that right. They were inaccurate in that this patient had a very low injection fraction, which means he had pre-existing severe cardiac disease, and he also wasn’t on his medications for type 1 diabetes, which are necessary.

So his presentation was not consistent, quite, with COVID itself. It might have contributed to his presentation, and maybe even exacerbated, made it worse. But this patient himself—it was reported one way, but clearly, I won't give specific details of the patient more than that, but it wasn't accurate. And so the media reporting in my mind wasn't quite what we were seeing in the front lines. And even the numbers: We were seeing COVID patients, but it wasn't to the extent that it was being portrayed in the media.

You know, it was a time when my overall thinking on this changed. I was seeing other patients, too. So I recall vividly then seeing patients who appeared to be suffering from more mental illness, overdoses, things that I was wondering whether or not these could be attributed to the lockdown restrictions or non-pharmaceutical interventions, as Colonel Redmond puts it.

And I recall this one patient, he was in his late 30s, you know, very fit looking gentleman, and he came into the hospital with thoughts of wanting to end his life. And looking at this gentleman, I spoke to him, and I was wondering: What led to this? And he outlined to me that he used to work in the trades for about two years before the pandemic and had decided at one point that he no longer wanted to have that sort of a life. He was pretty much healthy, but thought he wanted to settle down, build a family, meet someone. So he moved to Edmonton. And he had made some money before that, so he had some savings, but he decided to stop his job, get his personal trainer certificate, and go from there. So that's what he did. He had moved to the city and started to work as a personal trainer. But very shortly, it was only a few weeks after he had just started working in that field that the lockdown restrictions had come down, and he was no longer allowed to work.

And so this patient, he outlined to me how he wasn't somebody who really— He did drink alcohol, but not a lot. And he told me that when he had nothing to do and nowhere to go, he couldn't make a living. He had no meaning in his life anymore. He was basically in tears and telling me that all he wanted to do was make a life for himself, and he was being restricted from doing that. He told me that he had tried to beat alcohol addiction and alcohol use disorder a couple of times through detoxification programs and rehabilitation and that it failed. And now he said to me, "You know, what is there left to live for? I can't work. I can't do anything." And he asked, you know, he was hopeless. He told me he wanted to end his life.

These were the type of patients I was seeing, and he asked me some directed questions. He said to me, "How does it make sense that people can go and there can be hundreds of people in Costco, but I can't go to a gym to teach people how to exercise?" And then he said, "How does it make sense that people can walk into the front of a restaurant wearing a mask, sit down and talk for two hours and eat dinner together? And you know, I can't socialize in other settings?" I didn't really have a good answer for him because, you know, things weren't matching what I was seeing.

At the same time, I was having these discussions with other physicians in the back office. And I had an environmental service worker come in

[00:15:00]

and interrupt us and apologize and said to the doctors—and we were discussing the absurdity of some of the mask restrictions—and she said, "Oh, I, you know, I didn't know that the doctors felt this way. I thought you were all on the same page that we had to do everything, and mask all the time, and fully abide by all these restrictions." And I said, "Well, yeah, but everything should be questioned and debated, and we should look for

evidence towards it.” And she said, “Well, I just wanted to bring that up because my daughter,”—and I still get sad when I hear this—she said that her daughter used to come home from school every day crying and upset and didn’t want to go anymore. And we questioned her, “What was that all about?” And she said, “Well, she can’t play with her friends at recess. She can’t socialize. She’s told that during lunch hours, she has to sit straight forward at her desk and eat, but not—Pull the mask down, take a bite, and pull the mask back up. One day she turned over to talk to a friend while it was happening and she got yelled at by her teacher.”

And I was just thinking how devastating that was, that she mentioned that her child was an only child. And I have children of my own, and I was doing the best to ensure that they could still socialize. Thankfully they have siblings at home that they can interact with, but this child was an only child, and I couldn’t imagine that she couldn’t do her extracurricular activities. She couldn’t do so many different things. So I was seeing things and effects of the restrictions that were causing harm. And then I was seeing the fear that was being pushed on the other way, and I started to ask quite a few questions about what was going on, and really started to look more closely into whether or not we were causing more harm than good.

Allison Pejovic

So earlier you talked about a shift in your own thinking about COVID and the dangers of COVID, and you started to see— You just talked about potential harms. Is there anything further that you wanted to discuss in terms of what you saw could be potential harms of carrying down this path, towards citizens and society?

Dr. Justin Chin

Yeah, I mean, I think there’s numerous examples that I can provide. I think going into the details of each single one isn’t sort of necessary. But when people say that there is, you know, developmental deficits and damage to society from many different aspects from— I mean, people will say that, well it’s just the economy or just a business, but I mean that’s more than that. Businesses are people’s livelihoods; it’s how they provide for their families.

So I took this as something that— I took an oath in medicine to do no harm. And if we were doing things that were causing harm, I really thought that we needed to ask questions about things. I thought, as a scientist and as somebody— I don’t like the term when people say, “Well, trust the science” because clearly people quite understand that science isn’t something to be just trusted blindly as authority. It’s a process. It’s a method by which we evaluate the world. It’s a method by which people look at data and come up with the best actions to go forward. It’s a process. And so you know, in that way my opinion is that robust debate about the things that we were doing and evaluating: Both the benefits and the harms are necessary.

So I mean, that sort of leads into something that I really wanted to point out today is that, you know, I took to different venues to try to— I guess I was now differing from what was common narrative, but I was saying, “Well, we should question, we should ask these different things.” I spoke to colleagues over the course of the last couple of years. I’ve written letters to elected officials. And just like everybody else, I could see the messages being shared by other physicians, other people on what we should do for restrictions. And I was putting on posts on my social media mostly just questioning what was going on and asking some legitimate, I thought scientific, questions and generating hypotheses of whether or not these could cause harms.

I have a list of things here that I've printed off that I can share that are interesting because the next thing that happened was, because of those posts came a coordinated attack, what seemed to be a coordinated attack, against me from another activist physician in Alberta. It was one where it rapidly escalated, where that came on, and then there was a subsequent unfavourable piece in the CBC [Canadian Broadcasting Corporation] about me.

A CBC reporter emailed me one day, while I was on shift, and asked me

[00:20:00]

if I wanted to respond to a piece he was doing on misinformation. And I actually emailed it back within a couple of minutes and said, "Absolutely." I was kind of questioning whether or not he was thinking I was spreading some misinformation, and I don't believe I ever was. But he then asked. I said, "Well, absolutely, I'm happy to respond. If there's something specific you'd like me to comment on, please send me, you know, what comments I can make," and then he responded, "No, we won't be doing that. We just want to get a comment on why you've been spreading misinformation."

So he clearly wasn't looking out for the truth or for unbiased reporting. He basically said, "Well, you're guilty of this crime, and we don't really want you to speak to any of the things we're accusing you of. We just want you to comment on why you're guilty." So it was quite amusing to me, and that escalated very shortly. I received an email a couple of days later from the chair of my department, the Dean at the University of Alberta, that I was being terminated.

So right away, it took me aback to think, wow, I'm a part of a sort of respected academic institution that's supposed to search for truth, ask questions, generate hypotheses, yet what I was doing in good faith with that violated their code of conduct.

And it's interesting because they write these codes of conduct, and they're not legal frameworks, they're just what they say, and they're very vague: how to be respectful or professional or maintain certain levels of conduct. But then after that, I guess they get to be the judge, jury, and executioner as well because when they first presented to me, I just got this email saying I was terminated. I didn't have a chance to defend myself. I wasn't even told which pieces of post they were concerned about. You know, there was no trial, there was no hearing, it was just, you're terminated.

And so it hit quite hard, because it was something that I didn't think would happen, clearly. And it speaks to the censorship of physicians because, I mean, I'll put it a couple of ways: One is that as soon as I get that, it makes me a bit more hesitant to continue to speak out because I lost one portion of my ability to work. Now, I hadn't lost yet the ability to work in Alberta Health Services as a practicing physician. So when I hadn't lost that ability to work yet I could still pay my mortgage and feed my children and earn an income. But if another institution, if the College or somebody else came after me for their same vague code of conduct violations, then 20 years of education and training would be gone, like I would no longer be allowed to work.

So that puts a bit of a hesitation on me to continue to spread truth, and my concerns with what we were doing. But it also makes other people hesitant too because my colleagues who know that happened to me might also say, "Well, if this could happen to Dr. Chin, then I won't speak either because I don't want to risk that same type of loss." Now thankfully, I didn't have a massive academic appointment, as some people do with research portfolios and everything else, but if it happened to them, it could be a huge loss.

And it was quite interesting that I was—for the social media posts that were very benign, or asking questions, really—that I was attacked for this in that way. When I asked my chair directly, I said “What was the specific post that you were concerned about, or what was it?” and he said “Well I—” He couldn’t tell me, first of all, and he said he had no choice. He said he had no choice but to sign off on this. So his superior told him that he had no choice but to terminate me.

So if you think about how that works in a hierarchical system, it just means that if he’s responsible for all of the academic emergency physicians, and he’s been told by one person. Well, that same person can tell the chair of medicine or the chair of surgery or the chair of any other department, and they can silence people, you know, in a systematic format and stop people from speaking because then they’ll be self-censored.

So it was quite devastating to me and disappointing that the academic institution would take this route. And it was quite comical too because at the same time because of this, I was getting threats on social media. Some were calling for, you know, violent assaults of me and attacks, and some of these threats were from other health care providers.

[00:25:00]

And one of them called for me to be, if I would be seen on the street to be, let’s just say, injured or murdered.

And the person who commented on that same post said, who’s in support of that said that, I think if the words were actually, “I support this,” was another emergency physician, not in my hospital but in the same zone. So he would have been under the same academic umbrella as the chair. And to my knowledge, and I could be wrong on this, I don’t think that he suffered any consequences or had his academic appointment abruptly terminated for code of conduct violations. So the double standard is interesting, that somebody can wish harm on another person on social media and that’s all fair and games, but if I ask questions, then somehow I should be injured or hurt.

So you know these attacks, they certainly prevent other physicians from speaking out. And I know of other people who’ve asked, “Well, are you sure you want to attend this testimony and testify, and what risks will you have upon you?” and I said, “Well, I know people who’ve declined and not been interviewed, given their testimony. And it’s fully understandable because threats of harm can come to them, or even just the risk of loss of their employment or academic appointments.” That risk was definitely present.

Allison Pejovic

Thanks, Dr. Chin. Would we be able to get more of a specific idea of what was it that you said that you considered truth and it was deemed misinformation that was so bad that it got you fired and threats were made against your life? What did those posts say?

Dr. Justin Chin

I have a few of them here, so I can read them. One of them was, “Strong social connections improve health.” I said that, “I’m against the restrictions. There are scientific reasons why they are likely to make health outcomes worse.” I said, “Taking a calculated risk in the present includes the comparison with the future potential risk.” I mean, these are apparently very egregious. The next one was, “COVID is real,” so I wanted to make that clear. And then I said, “But there are serious questions with regards to the restriction

policies which need to be explored. Restrictions should be evaluated as an intervention considering potential harms and potential benefits.”

I mean, I have lots here, but some of them link to articles that people had said, so I would basically say something. There was one that I just said, “Time will tell,” and it would link to an article that was written that said, “Decision to lock down caused 228 times loss of years of life, as reported.”

Now, again, it’s just questioning. I wasn’t saying that necessarily I agree with everything in every article, but I had questions. And I thought that as a scientist or a health advocate or somebody who’s taken an oath to helping people, that these questions should be addressed, and we should have the freedom to speak about them.

Allison Pejovic

And was your academic appointment reinstated?

Dr. Justin Chin

Yeah, so there was an appeals process, and that’s how I eventually was able to obtain which posts they were concerned about. It’s kind of funny because when you look at the digital tracking of those, they all came from maybe two or three—it doesn’t seem like very many, however—people who would have complained. Because it said screenshot 834, screenshot 835, screenshot 836. So essentially, the same person went and screenshotted everything and sent them off. But it doesn’t matter. A mob, I guess in this sense, came after me and complained and then, yeah, I was promptly terminated.

Allison Pejovic

And now that we know more about COVID than we did before, and since your reinstatement, have you received an apology from those health care workers who you say threatened you physically?

Dr. Justin Chin

Uh, no. I have not. I know we know a lot more. It’s most of the things that I stated at the time are now quite well known, or at least we’re asking more questions about it, and it’s acceptable to, I guess, ask these questions. And no, nobody has apologized to me. I mean, I still have good relationships with the people I work with, and I’ve had discussions with them, and some of them have apologized about the way things went. But I haven’t received apologies from the people who put out threats of harm online.

[00:30:00]

No.

Allison Pejovic

Okay. So I’d like to move into a different area. Now we’ve had other experts at this inquiry testify about adverse events resulting from the COVID-19 vaccines. Have you personally encountered or treated anyone who you believe was suffering an adverse event from a COVID-19 vaccine?

Dr. Justin Chin

Yes, I have. I think as a part of this testimony, I want to help provide, you know, fill in some of the pieces of different areas. I think many people have talked to different level data of what vaccine adverse events numbers might look like and how they might be quite a bit higher than what's being reported, or how the reporting systems are flawed in different ways. And I would fully agree with that.

And I think it's important from the front lines for me to relay exactly some specific examples again of how these adverse event reporting, or even acknowledgment, might be biased or even unrecognized. And the reason I say that is because I believe many physicians—and not intentionally, maybe just because of subconscious bias—are not aware of it. And maybe, and even patients may not even be aware that they're suffering from a vaccine adverse event because of how difficult it is to recognize them in some ways.

So the first is that, you know, I think there are very plausible mechanisms that we need to consider for why a vaccine adverse event may take longer than a few minutes or a few days to manifest in a patient, right? So if there's an ongoing antigen production or spike protein production that causes immune complexes, or if there's some way that different systems in the body have been altered, then that may not manifest in the first day or two days as like anaphylaxis would necessarily, or instantly, or it might manifest over time. So a patient might start to develop something a few weeks, two weeks after, for example, getting an injection, and then they're feeling something but don't realize it—don't tie it back—especially if they're being told over and over again that this is safe.

So you have to imagine what it's like to be a physician in the position where you're in an emergency room, and if you think about 2021, the early months, we had patients coming in just like they always did. So we have now patients that are coming into the hospital with maybe a new headache, and it's very severe. And maybe somebody comes in with palpitations, and you check and their blood pressure is a bit higher. And so you know, during those months that I'm referring to, you can have about 50 per cent, almost half, or maybe even more that would have had the injection in the recent preceding week, two weeks, four weeks, five weeks, because there was a massive uptake at that point in time.

So what do you do as an emergency physician when somebody comes in, you've worked them up, they don't have something that's very dangerous: You're going to send them home. Do you then go and report every headache that comes in? Every vague, arm weakness or neurologic complaint? Well, it's hard. It's hard to know. So that's why surveillance data afterwards doesn't capture nearly everything that we need to. But even if you think about severe diseases, so let's talk about something that's more pathological, more of a serious condition. And I'll give you a specific example.

So I had a patient who came in, in his fifties, who had some high blood pressure before. He was a smoker and had diabetes. So he wasn't in great health; he had some comorbidities, and he had gotten the injection a few days before. And so he comes in with chest pain and ends up having a heart attack and gets admitted. Well, I certainly would report that. But, you know, when I see my colleagues or I see other people look at that case, some of them don't even look back to see if he had a vaccine recently. And even if they did, they say, "Well, you know, this patient has a long-standing smoking history. You know, they probably would have gotten an MI [Myocardial Infarction] or a heart attack anyway. So how do we know if it's, you know, the vaccine caused it?" But the important point is that the surveillance isn't supposed to check for causation. It's supposed to look for correlation in a temporal relationship. So those ones don't get reported, or may not get reported.

And I had patients who I saw with sudden cardiac death soon after the vaccination.

[00:35:00]

You know, the bias that I'm trying to point out here, I'll give you another story of a patient that I saw. And it was quite interesting because this patient came in with—was in their sixties, a female who had symptoms of a stroke—so the patient couldn't move one side of their body and their face was drooping. When you come to the emergency department where I work, you have a team that comes. So the paramedic reports to the nursing staff and the physician staff and there's an emergency team as well as a stroke team. So we're a very coordinated system that works together to rapidly assess this patient for what's going on. And this patient did have comorbidities. This patient had diabetes and had abnormal lipids. And so came in, and the paramedic is reporting to the nurses that the symptoms started at two hours ago, and the family noticed they couldn't move the one side and rushed in and reports all of the comorbidities to us. And funny enough, the paramedic says to the nurse as she's reporting, "Oh, but great news. The patient just got their third booster four days ago." And the nurse goes, "Oh, how awesome."

Like it was, when you don't even think that somebody with pre-existing vascular disease, and now gets an injection, that may exacerbate that in some way—and there are definitely mechanisms by which this could happen—that you're actually just cheering on that this injection is almost going to save us from the pandemic. You're not thinking that this patient might have contributed. In fact, that's the first thing I was thinking was, "Just had this a few days before?" This should be something that makes you stop and question and ask.

But those type of cases don't get reported because—I had certainly reported that one, but I don't believe that all physicians would do that. Because in that case, actually, what I did was I stood by and I listened to the stroke resident speak to the stroke staff who was admitting the patient and I listened in, I listened in as they were reporting the case, and the plan was to admit the patient for ongoing treatment in the hospital. And then as I listened in I was very careful to make sure it was told. And the stroke resident didn't report to the attending physician that they had a recent injection.

So I interrupted and I said, "You know, I see you guys are finished here, but uh, did you notice that the patient had this injection very recently?" "Oh, oh, no. Yeah, we didn't notice that," was the response I got. And I said, "Well, yeah, so you know, don't you think we should be reporting this as a possible, uh, you know adverse event, you know it's a quite serious condition. It's a debilitating stroke very soon after." And the stroke neurologist said to me "Well, no," and he made excuses. He said, "This patient does have abnormal lipids and high blood pressure and their age in their 60s, so this patient could have had a stroke anyway." But you know, that's not the point. The point is that at that level, you're not supposed to make subjective decisions on this.

I had a young patient in their 30s who had known high blood pressure and came in because he also was paralyzed. But not from the same clot in his brain; this patient had a bleed in his brain, and his blood pressure was very high. And on a CT [Computed Tomography] scan, the characteristic area where a high blood pressure bleed would occur, that's what we diagnosed. And when I got all the consultant reports back, none of the consultant reports mentioned that this patient had a recent vaccination.

Now, I'm not saying that that was the only factor in his permanent paralysis from a brain bleed. But because, again, I can only even look to correlation as well. The point is that if this patient maybe didn't have as high blood pressure, or his pressure brought up by a recent

injection, which could have happened. And maybe for the vast majority of healthy people who take an injection, their blood pressure goes up transiently for a week or two, and so they get some palpitations, and it goes away, and there's no problems. But for this patient with pre-existing high blood pressure, that was enough to push him up higher. But the consultant reports didn't mention that at all. They just said that this is a high blood pressure bleed and that's where the blame should lay, and that it doesn't get recorded.

So you know, taking adverse event reporting, as much as there's some great testimony beforehand about how the difficulties are, with even once you report it, to get it counted, we have to remember that this is not the way to look for events. There's people ask well, how do we tell? Well, you know, retrospective data or looking back and surveillance, it'll always be flawed. Because the question will always be there:

[00:40:00]

Was there some other contributing factor that caused this? Maybe the lockdowns caused the person to be more stressed and his high blood pressure went up.

So you know, there's too many things. The only way you could really do that—well, there's a few ways—but more accurate ways of determining the cause would be tissue level, things like from a pathologist point of view which people have testified to how difficult that is. But then in science we use randomized control trials.

So when randomized control trials, you look beforehand and you say, okay, if we group certain patients and we control for other medications, we're blinded. What happens if we give 50 people an intervention, 50 people we don't? How many people on one get any sort of side effect, or not. And we look at the data.

Now, unfortunately, we're in a situation where even some of those trials are, you know, there's some flaws, but they're biased by who's running them, if it's run by the pharmaceutical company. But even with that, we don't have trials that are continuing to go into long term. The groups that were intervention versus placebo, the intervention group was unblinded, and we've lost that control group. So it is very difficult.

Allison Pejovic

Thank you and next question. How did your first-hand experience with possible vaccine adverse events that you saw in some patients shape your own opinion on the COVID vaccine?

Dr. Justin Chin

Well, certainly I had evidence first-hand of how I did not believe that safe and effective narrative because I could see with my own eyes deficiencies in safety, right? And as far as efficacy is concerned there is bias reporting when you use different tricks like reporting relative risk reduction and not absolute risk reduction. Other people have testified to that as well. So when I was seeing this, you know, I had my concerns.

Now, I'm not one that is in a position to recommend or dissuade anybody individually from vaccination because I'm not a primary care physician, I'm an emergency physician. But for myself, I had to make a decision. And so I had to come up with looking at all of the different potential benefits and the possible risks. And from a benefit point of view, I had to look at multiple factors.

So what was my risk of the disease? It was very, very low from the data at my age, but probably magnitudes lower than that because I had a complete absence of comorbidities. I was fit and healthy. You know, there's evidence that people didn't go to the ICU at the same proportions, depending on their vitamin D levels. And I had an optimal vitamin D level. So again, magnitudes lower risk of the disease. So the benefit is going to be much lower for me too.

And in addition to that, I checked my antibodies. So I had, at some point, had a small illness that must have been COVID. It wasn't that severe. And I knew that I was protected. So I guess I had natural immunity, lots of factors, and proof of concept, because now I know my body system could beat it. And then there were other treatments that were available, so I was willing to take them if I needed to. So the benefit was marginal. Any claims that this was going to prevent transmission or cause me to harm other people by not getting it, those were unfounded and weren't borne out in the data.

So then I had to take into account the risks. So I took into account the risks for myself, known ones. Younger males tend to have increased adverse events in myocarditis. I was fit and healthy and still performed active sports and competitive sports. And there's even long-term unknown risks. So I made the choice, my personal choice, to exercise my medical autonomy, and after becoming informed, I chose not to get vaccinated.

This led to quite a bit of absurdity in my perspective, because there was a time when I wasn't allowed to work. I was restricted from working in the hospital because of that choice at a time when supposedly we needed all hands on deck in an ongoing fashion. And up until that point, I was caring for a variety of patients, including COVID patients that I had intubated, including elderly, and all sorts of the variety that we see in the emergency department.

And, you know, when that happened, it was something that, it became absurd because, yeah, I was allowed to— Sorry, I'll correct myself here.

[00:45:00]

I wasn't allowed for a certain period of time, but then I was allowed back. So just to be clear, thankfully, our provincial authorities, I guess, received enough pressure from various places to let people who were exercising their medical autonomy back to work. Other places still don't, which is shocking to me.

But we were allowed back. And so here I was going in to work daily, helping people with their illnesses, caring for people. And at the same time, I was being restricted, and I wasn't allowed to go to restaurants or some hotels. And when I tried to travel the country, I wasn't allowed to get on a plane to visit people. I wasn't allowed to do certain sports, and it wasn't just me. There were millions of other Canadians who were being restricted on certain aspects of their lives.

This included my children, who suffered from this too. Because you know people say, well, they missed one sports competition, or one dance competition, or this. These things, I coached and volunteered for youth sports and childhood sports, and missing one is maybe not a big deal, but missing a number of events over two, three years, these are developmental and very integral parts of children's lives to train for something like a dance competition or a national championships. This was stolen from them, and some of them weren't allowed to because of their informed personal choices.

And it was worse than that because the language that was used against us, it was hateful. We were marginalized, right? We were being portrayed as this small fringe group. Fringe. What does fringe mean—on the margins? We were being marginalized. The language that was being used towards myself and millions of other Canadians was that we were an enemy, right? They used language like, we were putting others at risk, we were dangerous, it was said that we were part of an angry mob, that we're lashing out.

These are words designed to divide, to make somebody seem like an enemy, right? That we were putting other children at risk, which we clearly weren't because of the characteristics of the inoculation, you know, didn't stop transmission. But we were labelled in this way. I was labelled as a racist or a misogynist. And these terms, I mean, it was appalling to me because I was going in to work every day helping people, and I wasn't allowed to do certain things. If I had a family member in the part of the country who got sick, I wasn't allowed to go visit them and help them.

I've lived in Canada for my whole life. I'm of a visible minority and a son of immigrant children—a son of, sorry, immigrant parents—a child of an immigrant. And, when this happened, I reflected upon what it meant to be Canadian, how I had never really faced that. I had never faced discrimination or anything here. I actually think that, and I'll defend that this country is probably one of the least racist countries. I mean, certainly there are flaws, and I don't want to take away from anybody else's personal experience that they have. But when I reflected upon, you know, decades of living in Canada, I thought maybe there's one or two times I've been in a new city and I go somewhere and somebody looks at you funny and you wonder, well, are they looking at you because you're different? Well, it's probably because they haven't seen you before. But I've never really had any overt discrimination against me my whole life.

Yet all of a sudden—and it wasn't just a person looking sideways at you or being rude to you—it was our elected officials who were supposed to represent us, putting in place policies and mandates that were preventing me from living, from freely engaging in activities. I mean, they say, well, it's a personal choice and there are consequences, but you know it wasn't right because of the characteristics of what they were proposing—you know, we violate our medical autonomy.

[00:50:00]

I mean, the policies are in place that you need to show a certain card or something to get into a restaurant, or you stop showing up to work the day the mandates come in. It becomes quite obvious to the people around you that the reason you're not there is because you've chosen something. So you become an identifiable group. So an identifiable group was now being discriminated against. And we were— Hateful rhetoric was thrown at us.

So you know, to think that I could— I've represented my country on a small-scale stage and sports competitions internationally with the Canada flag proudly on my back. And I've had disaster relief missions where I had the Canada flag on my backpack as I went to Haiti and as a part of a charitable organization and volunteered to help other countries, representing our country. And I was proud of that. And then I had people who were elected to represent me imply that I was taking up space, and that questioned whether I and millions of other Canadians should be tolerated.

Allison Pejovic

And Dr. Chin, thank you for that explanation of what happened to you in a very factual way. Are you able to just go in a little bit more detail about how did that treatment affect you, if at all, mentally?

Dr. Justin Chin

I mean I have a strong support system, I have good family. It wasn't pleasant to face attacks in various ways as I had mentioned today, but you— It wasn't pleasant. I like to think of myself as a very resilient person, I like to stand up for my principles. And I knew that every night that what I was doing was because I was standing for my principles. And so as much as the attacks came, I think I was able to withstand them quite well. But again, I'm not going to speak for everybody on this. I'm sure some people had worse attacks, or also because of it, the impact that hit them could have been much, much worse as well.

Allison Pejovic

And do you believe that a false consensus amongst the medical community was obtained in respect of this response to COVID?

Dr. Justin Chin

Yeah, I think that, you know, I alluded to before that how when you censor or attack groups, or you vilify them, that a false sense of consensus might be obtained because you're not going to hear from the physicians that want to speak out, right? And so when you think about how that happens, those attacks, they serve a very deep psychological purpose, right? Like in our whole evolutionary history of humans, we have a lot of things that are very nice for us: running water and everything that's built up the infrastructure that we have. But for large parts of our evolution, being a part of a tribe and the safety of that tribe was very important. And if you were ostracized and kicked out of the tribe, I mean, that could mean starvation and the cold and dying. So in some ways it's a threat that can impact you very— Let's say it's very impactful.

And you know, those type of things certainly tell people, "Let's not speak out." So you know, it's interesting because people ask me this question every once in a while and they say, "Well, if all this data is true, that, you know, there are more adverse events, why aren't we hearing physicians speak out about it more, or why didn't we hear physicians speak out about it or other people say things?" And I say, "Well, obviously—," and I pointed to the ways where a physician might be biased and not even think to report something or not even understand that it might come up. But physicians, we're trained in medicine and evidence-based medicine in various ways. And so we like to think that we live in an ideal world where the evidence is great. The studies show this and we can follow our practice. But in reality, it's an applied science, and there's always new data coming in.

And so what the vast majority of physicians will do—and this heuristic is one that's understandable, right?

[00:55:00]

So if you have a certain disease that you want a treatment for, and you have accumulated mountains of studies over many, many years that show that this treatment is the one you should use—treatment A is the one you should use—so what happens then is that so many studies accumulate that people start to write consensus statements, and different bodies

the urologic society might say that we should use this medication for it. So they put up their consensus statement.

And then so what do many of the physicians do? Well, they don't necessarily have the time to go through and look at all of the papers that made up that consensus statement. And they don't sit us down in a room and say, well, here's 50 papers on COVID and the harms of lockdowns or this, or the harms of this medication and the benefits of it. Spend five hours, come out, and see what you think. Well, no, physicians don't have time for that. We're working hard every day to see a variety of things. You have obstetricians going to deliver babies, you have pediatricians treating kids, you have surgeons operating. And so the heuristic is that you can follow that consensus statement. And it may be imperfect, but it works. What else do you have?

So and yes, some people do dig into the data more deeply and look at these things. But it's a good heuristic to follow because if you've worked all day long as a physician in your family medicine practice or your obstetrics practice or whatever, you want to come home and maybe see your family and enjoy the rest of the day. You don't want to go digging into tons of papers of the latest emerging evidence on COVID. So you just follow what is coming down from you from medical officers of health or from the Public Health Agency of Canada. It's not, you know, as ideal as we would think about how evidence-based medicine comes out.

Now you have to think of in COVID, the problem with COVID is that all of this evidence didn't have years to accumulate. It was a small amount. So following the consensus statement in this case, especially if there's political aspects that bias people from publishing or reporting or disseminating information, that is when the heuristic fails. And so you know, for many of the physicians out there, I don't necessarily blame them. I think that they were a little bit too naive and should be a little bit more skeptical to trust, sort of, just top-down authority in certain ways. And so that's how, I think, another way false consensus can be achieved because people are following these failed, these flawed heuristics.

And you know, then there's the other group of people that were skeptical, physicians who testified, physicians who were much more brave than I was, who spoke out in various different ways. And you know, I applaud those physicians because I hold them to the highest esteem. They risked a lot to speak out and try to inform the public about what they were concerned about. I mean, that's two of the groups: the people who were just kind of not skeptical enough, the people who were skeptical, and they spoke out even despite the attacks because being a martyr certainly or choosing that path is not easy.

You know, then there's a third group of people out there that I would really hope could have some self-reflection and maybe listen to all the testimony that they've heard, and **some of the things that they may not be aware of about how the world isn't as ideal as they think that they can maybe just trust authority or trust experts. Because there was a third group that went out of their way to attack the people who were asking questions. They slandered us; they mischaracterized us. Even if they had the best of intentions, they were censoring us and doing things. And they were part of the process that when they took those actions, they caused people not to be informed fully about what was going on.**

And when they took those actions, they contributed to the harms of prolonged non-pharmaceutical interventions or lockdowns. They contributed to the harms of people who are now suffering from vaccine adverse events, particularly for those who were coerced into taking a test they didn't want, or not informed fully—especially if for that individual patient the risk-benefit ratio was not in their favor and now they're suffering from the

consequences of it. For the people who were attacking us, I think they should take some self-reflection about how they contributed to harming others.

[01:00:00]

And it disappoints me that it even still exists out there that I can see people being falsely mislabeled or mischaracterized when they're actually out there trying to help people and protect people.

Allison Pejovic

Thank you, Dr. Chin. Those are my questions today. I'm wondering if the commissioners have any questions.

Commissioner Massie

Good afternoon, Dr. Chin. I first want to acknowledge your courage in coming forward with this. We all know that we've had witnesses still talk about consequences to this day that are being hurled at them. So I just wanted to mention that first.

My first question is, and you mentioned that late in 2019, early 2020, you became aware of this COVID-19, or a potential pandemic. And my question to you is, at what time did you become aware, or what time were you trained in the pre-existing pandemic plan that was in place for the health sector in Alberta or in Canada?

Dr. Justin Chin

Yeah, so even though I had a disaster medicine masters and had worked in other areas with the charitable organization, I was not formally a part of our own disaster preparedness framework in Alberta. I knew we had one and I had seen it briefly, but I wasn't completely versed in that. So I knew it existed and I guess that's where, you know, I apologize too that by being captured by the fear and pushing some of the early interventions that the Lieutenant Colonel Redmond spoke about here. Because yes, a complete task force that encompassed all aspects of the pandemic should have been made up. Now obviously when you're in your silo from the medical aspect you're going to push for everything, and so well, we want more of this and more beds, and we need to augment it in these sort of ways. So but then you hope that there's a framework in place that restrains that and takes into account everything else.

Commissioner Massie

Well, I wasn't particularly speaking about the overall disaster plan. What I was speaking about is the influenza pandemic plan that existed in Canada overall, and it was authored by Theresa Tam. And I believe there was one in Alberta, as there were in many other provinces, which were specifically focused on what the health care sector should do in the case of a new influenza pandemic. So again, my question was, were you given training in that? Did your employer make that available to you?

Dr. Justin Chin

No, in general we have so many different aspects of our jobs that we're responsible for, but I wasn't and most physicians aren't.

Commissioner Massie

Okay, my second follow-up on that then is we were told that we were in an unprecedented pandemic and it was gripping the world and there were tremendous deaths going on. And you were trained as not just an emergency doctor, but I think you have training and experience in disasters. How often did your hospital scrum, or make meetings, or get the staff together to talk about what was going on, what they were experiencing, what they expected from the staff directly about the pandemic?

Dr. Justin Chin

There were meetings, and there were people that got together in various groups that reported to the zone structure, and it just seemed very disorganized. It wasn't one that met sort of a good and proper framework. And so early on I was asked to help in certain groups. "So can you make a recommendation on what we should do, how do we double the number of beds, or how do we put patients in this?" You know, as time went on and I started to ask questions about, "Do we still— Does it really make sense to have these plexiglass barriers, and is it really helping, or is it reducing the ventilation?" When you spoke on something that appeared to be looking at a more complex or more nuanced look at the intervention, but the other side might say, "Well, it's for— It's just for safety." I mean, somebody who spoke with that wasn't listening to—

Commissioner Massie

You know, that's an interesting answer because we had a witness testify in Saskatoon,

[01:05:00]

and he owned a manufacturing facility; they manufactured tillage equipment. And every week, according to his testimony, he would bring out a newsletter, and he would have meetings with staff to describe to them what was going on, what were the reasons for it, what they were planning to do in the future. And he was manufacturing farm equipment. And if I understand properly, that same kind of thing, at least in your experience, wasn't going on in our hospital.

Dr. Justin Chin

Well, I want to state that it was going on, but not in a very clear and organized way. So we were getting briefings and memos from all different sorts of places, so to make sense of it all was challenging and almost nearly impossible. But to say it didn't happen is not quite characterizing. We were getting: "We're going to do with this today." and "These groups have decided," "Well, we're going to put a new triage process," "This is the route people are going to go."

But, most of it was all driven by, "Well, what is the maximal thing we can do more to this," and not, "Okay, well, if this is the intervention we're going to be proposing, do we really have good evidence for the benefits, and do we really have evidence for the harms?"

And sometimes there was. Sometimes there was a few studies or something cited. Well, the evidence for doing this is a theoretical paper on transmission, or some study that showed that COVID spread this way in a bus somewhere—a very small study. And so it was either limited evidence or poor evidence, and any evidence to the contrary would say, "Well, that might make things— We might as well be safe than sorry." It's that, sort of, pushing the safety-ism window farther.

Commissioner Massie

One of the things that I've been told over and over again by witnesses, particularly professional. No, not particularly, [inaudible] constantly professional witnesses. We had a retired judge on, and we had doctors and retired doctors, and we've had retired police officers. And I always ask the question, "How did this happen, and what kind of pressures were they under?" And each one of them has always said to me, "Well, you know, we judges and we doctors are part of the community, part of the society, so we feel those societal pressures."

So my question to you is this: You are a medical doctor—and I think I heard you say at one point that you had 20 years of training that were potentially going to be thrown away if you lost your position. So you're a trained doctor means you're a trained scientist to some degree. And yet, at the beginning of the pandemic, listening to the reports, with your training as a medical doctor—I don't know if you categorize it this way—but I think I heard you say that you were somewhat terrorized by this. And so my question is, with your significant training and experience, how do you think the general public were affected by the same things that you were hearing, despite the fact that you had this potential buffer of many, many years of training as a doctor?

Dr. Justin Chin

Yeah, so yeah, physicians or experts or whatever field, we're human. And I too can be captured by fear of death or disability, or death or disability of my loved ones. So obviously, it could happen to not just anyone, it could happen to everyone. And that's exactly why it's important to let people know exactly what I might have been seeing that might differ from the narrative. Because you frame that correctly in that, of course, they're going to have a much worse time, when behind the doors of the emergency department their impression might be that we're intubating every second patient that's coming in, and sending them to ICU, and body bags are rolling out. And if they had that impression, then the fear is going to be much worse in them. It can even happen to me, it can happen to everybody, and it's important to be able to speak freely about what you're seeing so that if accurate and valid information can come out, then it can alleviate those fears.

Commissioner Massie

You know, you talked a little bit about when you were in the emergency room, and you overheard some discussions, and you questioned about the possibility— Or sorry, you volunteered information to some other doctors that this patient had just recently received the injection. And they had dismissed the possibility that

[01:10:00]

the injection may have contributed to or caused the issue on the basis that the patient was elderly or had these comorbidities.

And my question is: It doesn't sound like—could you comment on this for me—but to me it doesn't sound like they had the same reflectiveness when they were counting COVID deaths. In other words, I've heard statistics from witnesses that whatever the number is, 80 or 85 or whatever per cent of the people that deaths that were attributed to COVID had three or more comorbidities, and we had testimony I think yesterday, 90-some per cent had at least one comorbidity. So it almost sounds to me like there's a difference in the way they evaluated the two instances.

Dr. Justin Chin

The discrepancy that you're mentioning here, it's quite interesting because on the one hand you're under counting because of the biases of the vaccine adverse events, right?

And the reasons for undercounting I'll just say, you know, if you're in such fear, or you really want to get out of this pandemic, and you believe, or you've been sold the idea that it's safe and effective, then, you know, you're going to push this, and you're going to continue to believe that. And so it's a self-fulfilling prophecy, right? Like, so you don't see it because you're not looking. And then you don't think that anybody has strokes with it, so you just continue to ignore it over and over again.

But the other side is, what you're saying is that people will be overcounted the other way.

Because there's a subjective decision that's required to determine if you're going to recognize it, I guess, or report it if it's correlated. But there's not a subjective decision necessarily for a PCR [Polymerase Chain Reaction] test—and there are many reasons to talk about how it's flawed. But so yes, that patient who comes in with comorbidities and has an event. They have a heart attack and they say, "Well, you know, COVID is a pathogen that actually affects the vascular system too," and we swab them and the test was positive, so they get counted for sure.

So it'll be automatically counted that COVID is in there. Because you have a binary there; you have a one or a zero: COVID test positive or COVID test negative. If it's a positive, it's like, "Oh." And if they end up progressing to death within that time, they go, "Somebody who tested positive for COVID on day one, on day seven they died," because it pushed their comorbidities or their pre-existing health to this new place of damage, and they passed away.

So a specific example is, I had a patient who came in and they had a known blood disorder, and they were in their 60s or 50s—I can't remember, I think it was 50s—and this patient, because of their blood disorder, their platelets had gone down, and they had a devastating catastrophic internal brain bleed, okay? And their platelets had gone down only a few days after they had gotten the injection, right? So it's another one where I questioned, and I looked at the reports, and the thinking here from the doctors is, "Well, a patient with this type of blood disorder, it's very common for them to suddenly drop their platelets. And so it was their underlying disorder that caused the platelets to go down, and then just suffer and die."

Now again, I don't know that the injection— Maybe that would have happened. Maybe the patient would have had their platelets drop and this devastating outcome would have happened. So I'm not saying that the injection definitely caused it. I'm saying it's temporally correlated to it. But I can tell you this: is that what would have happened if that same patient had come in a few months prior and they had had a bit of a sore throat, or maybe even no symptoms, but they were swabbed and the test was positive, and their platelets had dropped. And if he noticed their platelets had dropped and their brain was bleeding, we would have said that this patient is suffering from one of the other vascular complications or other problems with this very variable pathogen, COVID. It caused them to drop their platelets, and then they ended up having a devastating outcome. So we'll count that in the count box of COVID. But they're not going to be counted on the other side because it takes this objective decision to report them.

So you have this imbalance. And you know what, for many people they may not even notice it. The patient might not even know because if they're admitted to the hospital or the patient's family asks multiple times, "Well, what happened?" "Oh, you know, this is what

happens during your known blood disorder, is your platelets go down; this is an unfortunate and sad known complication.” And the family might not even know, the patient might not know, the doctors don’t even know, and there’s biases that humans, we’re not perfect.

Commissioner Massie

Of course, I mean, if I understand part of what you were talking about, then, in your answer and previously, the reporting system is not intended to report absolute numbers. It’s intended to report trends.

[01:15:00]

In other words, if you see something, you report it, and it goes into the system. And then later on when you evaluate the system, you might see a number of reports of such-and-such, but if it’s not an unusual raise in the numbers, then it’s not an indicator of a problem. But if you don’t report it, you can never get those indicators, those warning messages.

Dr. Justin Chin

Yeah, and I thought about this for a long time, and I mentioned it when I was saying earlier, is that even then, it will always be undercounted, subject to bias, and flawed by the retrospective nature of the study. So that’s why you need prospective, properly done science, randomized controlled trials that can evaluate this in a proper fashion. We just don’t have those.

Commissioner Massie

My last question, before the other commissioners pull me off the stage, is if you’re dealing with a highly infectious patient—I don’t know, HIV [Human Immunodeficiency Virus], something like that—and you give that person a needle, you inject them with something, what do you do with the syringe afterwards? Do you put it on the countertop? Do you hand it over to somebody?

Dr. Justin Chin

Yeah, so the proper procedure would be to place any sort of sharps in a specific sharp container so that nobody else can be injured by that, and any biohazard material needs to be placed in an appropriate biohazard container.

Commissioner Massie

So would that count for, let’s say you’ve got an infectious patient and you use gauze and you wipe the infection, and is that a biohazardous material as well that would be disposed of in some way?

Dr. Justin Chin

Yeah, the proper procedure would be that if you had a bodily fluid or any sort of vector of transmission, or potential vector of transmission, that that should be placed in the appropriate biohazard container.

Commissioner Massie

Then, given that—and I've been thinking about this for a while, and my apologies for putting you on the spot on this—but we were told that COVID-19 was deadly. We were told it was incredibly contagious, and we were told to wear cloth or paper masks. But I'm not aware of any instructions about those masks becoming biohazardous material and being disposed of in a way that wouldn't reinfect the person's hands, or the person touching the garbage can or whatever else. Is that an inconsistency, do you think?

Dr. Justin Chin

Well, it's hard to explain inconsistencies at that level because, overall, there were many levels of inconsistency with regards to the characteristics of a novel, what appears to be aerosol-spread virus that doesn't tend to infect from a contact drop—like from a direct contact of it—but needs to be exposed to certain mucous membranes of your respiratory oropharynx, you know, the certain ocular exposure.

So it's hard for me to give a quick, simple answer to that, other than to say that there are glaring inconsistencies in our attempted management of these through non-pharmaceutical interventions that, I believe, in some ways people who pushed for them had the best—Let's say, many people probably had the best intentions and may have been captured by fear or so on as well but don't realize the true nature of their intervention, or they may not have had any effect on preventing transmission or decreasing anybody from getting infected. And in addition to that, I would say that they almost certainly didn't calculate the second and third order harms of what those interventions might be.

Commissioner Massie

I appreciate your diplomacy and—

Dr. Justin Chin

And it's interesting, but I do think that many people did have good intentions. I don't necessarily want to attribute malice when you just don't know. But I think that the road to hell can be paved with good intentions in some ways.

Commissioner Massie

I appreciate that and—

Shawn Buckley

Can I break in and it's just I'm going to ask the doctor are you available later for questions? It's just the kitchen closes in half an hour. So if we're going to eat at all, then we have to take a break.

Dr. Justin Chin

I can take quick questions right after lunch. I have to work at an emergency shift this evening, but yeah, I'm available for that, yeah.

Shawn Buckley

Okay, so we will if it's okay with commissioners, because it's just there's a whole group that needs to eat and that will be impossible because the kitchen staff's already agreed to stay a little later for us. So we're going to adjourn for half an hour.

[01:19:42]

PART II

[00:00:00]

Allison Pejovic

Welcome back to the National Citizens Inquiry. We're still speaking with Dr. Justin Chin and he's going to take some follow-up questions from the commissioners.

Commissioner DiGregorio

Dr. Chin, thank you for staying to answer our questions. I just had one question. You spoke a little bit in your presentation today about concerns with using the adverse events reporting system to detect issues that may happen during the vaccine rollout. And we heard a similar concern from a doctor actually in some testimony in Truro, Nova Scotia. And whereas you've talked about really randomized control trials being the best way to get the data that's necessary, he spoke about the possibility of population-level studies following up and looking at population rates of things such as strokes, cardiac events. And is this the best thing that we can do in the absence of randomized control trials, which I've understood from other testimony that we don't have the ability to do anymore?

Dr. Justin Chin

Yeah, I think that as far as the process is going to be concerned regarding a scientific evaluation of what's going on, we should take into account all different types of evidence. From evidence that is, you know, specific patient level—an adverse event—and we can dig in deeply into that. We can take, I guess, pathology level data too where tissue samples can be evaluated under a microscope. We should take in levels of data that are retrospective that look back. We should take in levels of data that look at, you know, other metrics that might pop up and suggest things. And people are doing that in insurance data and in population level data.

Now, with each level of scientific evaluation, it'll have different potential limitations to it. So with a trial that looks at the population level, I alluded to you before, is you don't know if there was some other factor that changed in the population or over that time period that wasn't just, you know, an injection, right? It could be an effective and new environmental thing that we don't really know about, or it could be some other thing that confounded. That's why you need the prospective trials.

But, to answer your question, in a specific way, yes, we should be looking at everything. We should take into account the data at multiple different ways, understand their limitations, but still try to figure out the best way to move forward, and actionable items that we can do and make the best recommendations that we can as human beings trying to navigate this

world because it's challenging. The best process that I know of is the scientific process and method.

So clearly, I'm not anti-science. I advocate for doing these, but I think we need to be rigorous about the methodology of what we do. We also need to be skeptical of different things and ensure that we know that different things can confound studies and bias them in different directions. And those can be incentives from different ways, from how they get published or who has the funding to do a large study or what incentives that the intervention might bring profit to companies. And so we need to be aware of all of the different things that can influence what we're looking into.

Commissioner DiGregorio

Thank you.

Commissioner Kaikkonen

My question has to do with disclaimer that you offered at the beginning of your testimony and the code of conduct. Codes of conduct traditionally are just words on a page, and I don't think there's a whole lot of legal basis for having codes of conduct, but it seems that more workplaces do have them: organizations, health sector, education sector. So I'm just wondering, it's often used, the codes of conduct seem to be increasingly used—maybe that's a better way to put it—for discipline, suspension, you know, acts of contrary opinions, as in your case. And I'm just actually wondering, when did— So I understand why you use the disclaimer, I understand that totally. I'm just wondering, when did the academic and health care sectors move to this place where legitimate questioning, investigative thought processes, critical thinking, where do we move from this place, and when did it become a societal and workplace norm to the point where we are no longer able to ask the questions that just contribute to conversations across this country?

Dr. Justin Chin

I can comment on it.

[00:05:00]

I can't speak to, you know, a specific timeline when certain codes of conduct might have been introduced in different levels of institutions or academia. But you're certainly correct in that I see that it is used as a tool for enforcement or compliance. I mean, I think that it's challenging because, as an institution, you need to safeguard those institutions against certain things, right? Or you believe you need to. Like, you believe you, as an institution, as a university, that if somebody does something that's, you know, going to bring the institution into, or shed a bad light on it, or do something that's egregious and is going to reflect badly on them, that perhaps they need to find a way to have something in place where they can distance themselves from that. And they create these policies or codes such that, "Well, we have these in place so that, you know, if such an event occurs, then that person can face consequences."

Now, the thing about it is that in a proper, just society, you could probably not require that at every single given level. You could probably say that, well, we have an overarching legal system that is predicated on principles. And I'm not a lawyer here, but that they would tell you that it requires that evidence be presented. That a person has their right to defend themselves, that they're innocent until proven guilty, that there's due process involved,

right? And so that's the system under which people should be evaluated for their conduct. And we live in a society, so we need some sort of guiding principles by which we behave and we treat each other and we don't harm each other. So I can see the— I can give some, you know, understanding to why institutions might develop these.

But the problem is when they become vague and when they reach a point where they're used as a tool and the effects are unintended, I would assume, that stifles debate or diminishes progress, or in the worst cases, prevents accurate information from coming out. And that accurate information, had it come out, might have prevented people from being harmed for various reasons that I spoke to.

So how do we stop that? I think we have to, I think— I think it's a job for the lawyers. But the lawyers in Canada have to start going towards these institutions and saying, "Yes, you've disciplined or done something to this person in the name of your code and conduct. But your code of conduct does not really have any legal basis, or it is not following the due process. And therefore, we have to strike down this action that you took because—" Well, I mean, in the proper process too, like through a hearing or with the judge saying that, "Yeah, you can write whatever you want on a code of conduct that your employees have to do x, y, and z, but great that you put it down, but that's not valid legally. You can't force them to do this. You can't prevent them from speaking. You can't just subjectively decide that what they're saying is harmful, or unbecoming, or it's unprofessional because those terms are just too vague and you need more strict guidelines or how you're going to enforce this."

Because enforcement of these types of codes of conduct come with real action. So you enforce something because of a subjective interpretation, and the real action is somebody loses their job or they lose their ability to earn a living or provide for their family or the years of their training are now being, negated.

So it's a form of— I guess, it's a way of writing cancel culture on a piece of paper, and the words should be meaningless because they should be evaluated within the system of the proper, legal framework of the jurisdiction that you're in.

Commissioner Kaikkonen

Thank you very much for your testimony.

Commissioner Drysdale

Thank you very much, Dr. Chin, for your very courageous testimony. I have a couple of questions. I'd like to come back to the question about the side effects. Because you mentioned frequently during your testimony that when faced with some side effect, one way to examine whether it could actually be related to the vaccine was to examine other pre-existing conditions. And if so then you say, "Well, maybe it's not linked to the vaccine because there are some other conditions that could explain that." But what I'm thinking is that is it fair to say that in the population—people—don't display the same level, say, of propensity to have autoimmune disease?

[00:10:00]

Is it something that is widely distributed equally, or is it some people that are much more prone to that than others?

Dr. Justin Chin

Yeah, so I mean the answer is that it is very complex. And, you know, we try to generalize from studies or from report data, and so on, what certain effects might mean. But that's very different from at the individual level. At the individual level, one person might have a severe autoimmune reaction, but 999 of people don't, so it's a one in a thousand. It doesn't mean that there's only a small autoimmune reaction in a thousand people. It means that the one person is suffering severely, or one person already has some pre-existing condition and some new antigen in the body now causes an immune response. Or causes some other effect that tips them to the point where they experience something more severely. Whereas even that little extra injury or insult to a different person, they might have felt nothing.

So it is completely variable. And that's why, as I was stating before in the previous a couple of questions ago, is that population level data can give you one piece of the puzzle. Individual level that I can give you another piece of the puzzle. Pathologic data give you— All these pieces of puzzles need to be looked at and evaluated, and we can learn a lot from different levels of evidence.

Commissioner Drysdale

But given that it was very challenging, as we've heard from many people that had vaccine injury, to get medical exemption for a number of reasons, it was very often dismissed. Isn't that reasonable to expect that these people that had a condition that might then make them more susceptible to adverse event. If you refuse a medical exemption and after that they'll get vaxxed, and they will probably get the side effect that otherwise they would not have gotten because they knew that they were more prone to get it in the first place.

Dr. Justin Chin

Yeah, there are so many unknowns, and how do you guard against that? And how do you figure out the best plan of action for any new therapeutic? And there are some suggestions that I can make is that obviously you don't rush things. You evaluate things with proper randomized controlled trials. But some trials might not include every patient. They might have excluded people at the beginning because they had comorbidities. And so then there's no side effects. And then you rolled it out, this intervention, to people who did have comorbidities or were in different age demographics.

So you do as much evaluation of the data as you can and you try to generalize it; you might not be able to. You also try to do as many different studies and different populations and with different doses and you evaluate them in the proper methodologic fashion. At the end of the day, all of this will always lead to some unknown because that's life. We live in this world and there are tons of unknowns. So what do you need to do. You need to step back and say, "Okay, well what are the guiding principles."

The guiding principles are that as a physician, when you have an intervention, you don't as an authority tell them what to do. What you do is you say, "To the best of what we have available, there's this intervention or drug. And it looks like the benefit could be this, and the risk without getting it could be some certain thing that we think, based on these studies, and the side effects could be these. And some of the side effects we don't know, and we're going to give you the best data. And this study actually didn't really include you because you are older, and they didn't put people at your age in that study." Or, "You have these medical conditions, and they didn't put those people in the studies. But this is the best we have. I'm sorry, this is— Medicine can only— Humans can't be perfect." But that's as far as we go.

And then we say, "Now that we've given you all the proper information, I can maybe suggest what I think what I would do if I was you. But at the end of the day, I've tried my best to inform you fully."

And that's the principle of informed consent, right? We've given you all the information, and now you have the choice without coercion to make a decision. Do you grant the consent for this? Or do you withdraw your consent? And if you do that, then you leave it up to the individual to make the decision with imperfect data and some unknowns. But you leave, at the level of the individual, you have them decide what to do.

And that to me was a principle of medicine that I was taught, and that I truly believe in, and I follow. And even if a patient with malignant cancer tells me

[00:15:00]

that they don't want chemotherapy, and I think, well, at your age you might actually benefit from it, that's still not my position to impose my values or my choices onto that patient. It's for that patient to decide after I can inform them fully of what the risks, benefits, treatment of everything might be. And their values can help direct them, and their decision must be made without coercion or influence that is unbecoming.

Commissioner Drysdale

Maybe one last question about the bias you mentioned that you have seen from people that are very busy and may or may not have the time to do the in-depth research on every topic.

Is it fair to say that in the medical profession, and even for the public in general, vaccines are seen as a process, or a technology, that has really helped to improve the general health of people in many conditions, with several examples showing that these vaccines have contributed to improve the health? This is taught in medical school. Is it fair to say that?

Dr. Justin Chin

Yeah, I think that we have a history of other— I mean, you can't always compare things that have studies for many, many years to new things now. You know, the evidence that you have to go back and look towards, you need to always know that there could be flaws in everything. But to answer your question, like, I've been vaccinated for many things now, and I based that decision off the evidence I knew at the time. And when you come to something new, you have to say, "Well, it's not the exact same thing. Or is it similar enough?" But you can make your decision. And I think people just need to be educated about that. And you have to ultimately leave it to them to decide.

Commissioner Drysdale

Is it fair to say that based on that, I would say the benefit of the doubt would be given to the practice of vaccine. And even with the new technology, anybody who'd want to exercise some sort of questioning or critical thinking would have a very big case to put in order to raise the awareness and say, "Are you sure that in this particular case, this approach is the appropriate approach?"

Dr. Justin Chin

Yeah, how to comment on that is I think that there is a status quo, and if you have to challenge that in any way, in any field, it becomes difficult, and it becomes challenging. But the best way to do that is to have people express their opinions, present their data or their claims. So science is about falsifiable claims, right? So somebody makes a claim that's falsifiable. And it holds true until such time as somebody else can come along and falsify that in a way and say, "No, I've got evidence, and it's this." And if they're wrong and it's not actually falsifying it, then you discard it and you keep going on. But if something else comes along, it's different. Like, if you lived thousands of years ago and you thought that you had a different model of the way the solar system worked, but then somebody comes in and provides some other evidence, you change your mind, right? You can't just say, "Well, the status quo is everybody believes in this, so we're just going to exclude people from continuing." It's not the way to advance progress in my opinion.

Commissioner Drysdale

Thank you very much.

Allison Pejovic

I believe we're finished. Thank you very much, Dr. Chin, for attending today and telling us your professional opinions and views. And thank you very much.

[00:19:07]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 3: Scott Crawford

Full Day 2 Timestamp: 05:41:13–06:19:15

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Allison Pejovic

So our next witness this afternoon is Mr. Scott Crawford.

Good afternoon. Can you please state your name for the record and spell it?

Scott Crawford

Certainly. It's Scott Marshall Crawford S-C-O-T-T C-R-A-W-F-O-R-D.

Allison Pejovic

Thank you. Today, do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Scott Crawford

I do.

Allison Pejovic

And I understand, Mr. Crawford, that you would like to say something in advance of your testimony today?

Scott Crawford

Yes, please. I'd like to preface my testimony with the understanding that the testimony I'm about to give is my personal account, my personal experience and observations, and I'm not representing any other individuals or agencies.

Allison Pejovic

Thank you. I understand that you are a paramedic with 30 years of experience. Can you briefly just go through where you work and a little bit about your background?

Scott Crawford

Certainly. I started in EMS [Emergency Medical Services] in 1990, started working on the ambulance with a small service just south of Calgary, a couple of small services, and went to school. I worked part-time and casual and became an advanced care paramedic in 1994. And so, at the advanced care level, I've been a paramedic now for 29 years. Started with the City of Calgary in 1998, and then in 2009 Alberta Health Services took over a number of the EMS services in Alberta and including Calgary.

Allison Pejovic

Thank you, and for the commissioners' benefit, we have provided Mr. Crawford's CV [Curriculum Vitae], which is entered as Exhibit RE-9D. So I'd like to take you back to the year 2020, and let's talk about what you saw in terms of people who were sick with COVID symptoms. Did you notice an increase in emergency calls in 2020 than what you had experienced years prior?

Scott Crawford

At the very beginning of COVID, we actually noticed the call volume seemed to dip. With a lot of the information that was coming out through the media and through health authorities, our call volume curiously diminished. It seemed that folks were perhaps a little hesitant to call.

Allison Pejovic

And in terms of the people who were needing emergency care, what were you seeing and what symptoms did they have?

Scott Crawford

Generally, most folks appeared to have flu-like symptoms: nausea, headaches, general malaise. Most of the folks that we typically encountered were healthy, and aside from feeling unwell, most actually didn't require transport. We would arrive at the scene, work through a pre-screening matrix, and most folks, we were actually able to assure them, give them some tips on what they could do to best manage their system at home, and so from that regard, it wasn't unlike any other flu-like symptoms or flu-like season that we might encounter.

Allison Pejovic

And did you encounter people who were very ill?

Scott Crawford

Yes, there was a small subset, typically folks that already had pre-existing medical conditions that— COVID virus seemed to exacerbate those.

Allison Pejovic

And were you, yourself, afraid of COVID when it first arrived in Canada?

Scott Crawford

Yes, we were watching, obviously, the information coming out from the origins of the COVID virus. Watching seemingly healthy people suddenly become very ill and realizing that we were going to be on the front lines dealing with that. So I became quite concerned and also concerned for my family and wanted to make sure that my family was provided for, so I actually made the decision to retire long enough just to commute my pension so that if anything happened to myself, that my family would be provided for. I was sidelined for about two weeks; long enough to satisfy my employer and LAPP [Local Authorities Pension Plan], and I went right back to work on a casual, albeit full-time, basis.

Allison Pejovic

Okay, so let's move forward to early 2021 which was when the vaccines were first being rolled out in Canada. At that time did you see a difference in the kinds of injuries or symptoms that you had with patients, as opposed to what you had seen during the early COVID days, people that you were transporting?

[00:05:00]

Scott Crawford

Yes, on a growing subset. Now, one thing, I guess, I need to make clear is that when I commuted my pension and retired and went back casually, I moved from the urban environment from the city of Calgary out to some of the local surrounding communities that were south of Calgary, so the population was somewhat different.

But one of the things that I noticed with a handful of patients was them experiencing very unexpected injuries and I'll give one example. I picked up an elderly lady and transporting her to hospital, and this is based on what she was telling me, that literally a few days after getting the vaccine, she got this terrible severe pain in her elbow, and she was convinced that it was the vaccine that had caused this and was just so full of regret. I remember her saying to me that "You know, I didn't feel right about this vaccine. I talked to my doctor about it, he said it was going to be fine. I took the vaccine and literally a few days later, I have this, this horrible pain and I've been to see my doctor. My doctor doesn't know what it is. They haven't been able to give me anything to help with this pain." The transport time was very short, literally a minute or two to the hospital, and certainly that was one concern that we had.

Allison Pejovic

And so, just in general, you said that you noticed an uptick in calls. Can you just compare the difference? You had said that early on you were seeing people with flu-like symptoms with COVID. Were you still seeing those kinds of symptoms in the same numbers in early 2021, or were the presenting symptoms different, and if so, how?

Scott Crawford

Yeah, a couple interesting, initially, with the first COVID variant, the symptoms seemed to be much more severe. But that said, typically, when folks first got sick— Usually, the crux

was, in my experience, between day 8–11 of the onset of symptoms and usually if something untoward was going to happen it would happen in that 8–11 day span. Once people got past that day 11, day 12, day 13, typically their symptoms would resolve.

And with the subsequent variants, in and throughout 2011, we noticed that more people seemed to be experiencing symptoms. It was as if the transmissibility, the infectiousness, increased but the symptoms were much more mild. The other thing, there were a number of instances that caught my attention when folks would suddenly have a very rapid and unexpected sequela.

I had occasion to transport one gentleman from a rural area that was previously healthy, had no medical issues, lived on an acreage, on a farm, and had a catastrophic stroke literally the day after he got the vaccine. I believe it was a second vaccine. STARS [Shock Trauma Air Rescue Service] was not available, so we transported this gentleman to Foothills Hospital. It was about an hour transport time, and when we brought that gentleman in, and we called ahead, they were expecting us, we went right back to the trauma room.

And while I was delivering the report to the physician, I mentioned at the very end, I said “Just so that you’re aware, this patient was vaccinated yesterday.” I was quite taken aback that the physician snapped at me and said, “Just a minute here, do you think this has anything to do with the vaccine?” and he asked me, “What vaccine did the patient get?” I mentioned it was the Moderna and he said “You know, it’s a perfectly fine vaccine. You know what, you can go now.”

And I think anyone within earshot, certainly, if anyone else had had concerns perhaps with another patient, I can understand where they would probably be a little bit reluctant to share that information. So that was another experience that I wanted to share with the commission.

Allison Pejovic

Were there any other instances where you responded to an emergency call, and you learned that the individual had a COVID vaccine within a day or two?

Scott Crawford

I can’t specifically think of any offhand right now. As I say, I moved from the urban to a suburban rural environment, so the dynamic was a little bit different. I can certainly speak to some anecdotal reports, but yeah. That’s—

[00:10:00]

Allison Pejovic

Okay, and so, let’s talk about AHS [Alberta Health Services] having a mandatory vaccine policy. Did AHS have a mandatory vaccination policy for you and your employment?

Scott Crawford

Yes, they did.

Allison Pejovic

And how did that policy affect you at your job?

Scott Crawford

Well, obviously, seeing some of these vaccine injuries, I was quite concerned that I myself might experience an untoward sequela, as a result. So I also—a long-time church attender—my family, we prayed and looked to God for direction. And I distinctly felt led not to get this vaccine, and so yeah, I made the decision not to get vaccinated.

Allison Pejovic

And as a result of that decision, was there ever a time when you were treated poorly by anyone that you worked with or in the community?

Scott Crawford

Yes. There was, a number of weeks before the vaccine, the initial vaccine mandate was rolled out, there was one particular individual, with a handful of others, that started an online campaign of bullying, harassment, and shaming. If any of us took a view that wasn't in line with the prevailing narrative, we were shamed and bullied online.

Allison Pejovic

And did you know that person, personally?

Scott Crawford

I did. The individual worked as a fellow practitioner. Not someone that I knew really well, but just enough to nod at one another when we were passing in the hallways.

Allison Pejovic

And can you loosely describe the online bullying?

Scott Crawford

Yeah, some of it was on Facebook and a couple of different platforms, Twitter. Some of the statements that were made: "If you aren't willing to get vaccinated, you don't deserve the privilege of caring for others. We don't want you. We don't need you." "If you're a health care worker that's joined an anti-vax group, this will stick with you with the rest of your career. It's worse than crossing a picket line. You're affecting the safety of patients and hurting the credibility of health care workers that actually care and follow the science. We're embarrassed to be associated with you." And see another one here: "It's very simple, if you work in health care, it's your duty to protect the vulnerable, If you're going to embarrass this profession by going to a rally or joining an anti-vax group, I'm going to publicly and personally shame you for the rest of your career."

At one point, I did appear at the *Western Standard* to express some concerns. Again, my screenshot was sent out online—my picture—and I was referenced specifically, and the individual said that he was disgusted by me, and that I embarrassed my profession, and this individual hated me for it.

Allison Pejovic

And what effect did this behavior that you experienced online have on you personally and upon your mental health?

Scott Crawford

Well, certainly, you feel very isolated and targeted. My kids, I've got two children, and typically when they were out and about and they'd see other paramedics in uniform, they would walk over and say "Hey, do you know my dad?" And it was always great to hear the words of positive exchange that would go on following that.

However, after this and the workplace turning quite toxic and hostile, I was concerned for my family and I had to caution my children that, "Listen, if you see somebody else in uniform, don't let them know that I'm your dad." I didn't want them to get caught with any hateful vitriol. And certainly, God forbid, if they ever needed to call the ambulance, I didn't want their care biased.

Allison Pejovic

And as a result of this bullying that you experienced within your own professional community, did you take any action?

Scott Crawford

Yes, on September 14th, just hours before AHS announced their vaccine mandate, I sent a 36- or 37-page notice of objection to my immediate supervisor, his supervisor, and all the way up the totem pole, to include AHS CEO [Chief Executive Officer], Dr. Verna Yiu. I also included the premier,

[00:15:00]

health minister, a number of other individuals that I thought should be aware of this. And in that, I described my concerns with the vaccine mandate. I asked them for the information that they were relying upon to make this decision.

I also provided some information that I had looked at, and seemed to counter the prevailing narrative and asked for some clarification on that. I also described the bullying and harassment that was going on, that moving forward with these mandates was causing a tremendously polarizing event within the rank and file.

I also touched on natural immunity. I was quite interested to know— It seemed the prevailing narrative was that natural immunity actually seemed to offer much more, better protection against the vaccine.

Allison Pejovic

And are you a member of a union?

Scott Crawford

I am, yes. I'm with the Health Sciences Association of Alberta [HSAA].

Allison Pejovic

And did your union respond or provide support in respect of your notice of objection and bullying complaint?

Scott Crawford

Unfortunately, they did not. I did not get any response back from the union. Not only did I copy the union president and one or two other like labour relation officers, much of that online vitriol that I expressed before, our union president and a number of our union executive endorsed some of this online vitriol with either thumbs up or heart signs.

I mentioned that in my notice of objection and obviously had concerns of— You know our union is supposed to be protecting us and here, it appears that they're endorsing some of this vitriol. And further to that, Alberta Health Services ignored the concerns that I had, that this bullying and harassment was going on. I find that particularly troublesome, especially as I raised concerns about my safety and my family's safety. Extremely disappointed that HSAA and AHS didn't take that more seriously.

Allison Pejovic

So what happened after you submitted that notice of objection, was there an investigation? What was the end result of it?

Scott Crawford

Eventually—I never did hear back from AHS. Eventually, I did get through putting in repeated complaints, and whatnot, in to my LRO [Labour Relations Officer] that was handling my case. On November 22nd, HSAA finally did acknowledge and accept my complaint. HSAA hired two investigators. Actually, one investigator to investigate the president and the other investigator, to interview or look at the actions of some of the union executive.

And not entirely surprising, the verdict came back that they both recommended that my complaint be dismissed. Some of the rationale for that included that these individuals were making the endorsements with some of this hateful vitriol, that they were doing it to just support or encourage folks to get the vaccine and not necessarily, the hateful aspects of it; and also that they were making these endorsements personally and not as with the union position.

Allison Pejovic

I wish to advise the commissioners that Mr. Crawford's notice of objection and its dismissal are entered as exhibit numbers 9, 9A, 9C and 9E [RE-9-Crawford-Decision Final – Ltr fr VP-IC; RE-9a-Crawford-HSAA Investigation Report Jan 12 2022-Jamie Dunn Final-IC; RE-9b-Crawford-Final Decision Ltr-Complain-4 Mbrs-Ltr fr VP-Jan 2022-IC-IC; RE-9c-Crawford-R Farmer Report to HSAA – Final Report – January 19 2022-IC; RE-9d-Crawford-CV-IC RE-9e-Crawford-AHS HSAA Ltr of Objection (Mandatory Vaccine) and Harassments Bullying Complaint[100]-IC].

And Mr. Crawford, at any time, did you ask AHS whether you could be tested for natural immunity?

Scott Crawford

What I did in the course of being in the hospitals and while this was going on, I had occasion to speak to a physician. With the vaccine mandate approaching, I was quite curious to know if I had natural immunity. And so, I asked this physician, I said "Hey, what would be involved with me, just getting a requisition so I could be tested?" And he advised me that they were not permitted to put that requisition in to be tested for COVID antibodies. And he also stated, furthermore, lab services are not permitted to test for that.

Allison Pejovic

Did he give you a reason why?

Scott Crawford

No, he didn't. I thought it was rather curious, but I learned more information down the road that I think will tie into this.

[00:20:00]

Allison Pejovic

At any time did you ask for a religious exemption to the vaccine requirement?

Scott Crawford

Yes, I did. We were advised, when this vaccine mandate was rolling out, that AHS would entertain medical and religious exemptions. I applied for a religious exemption, and subsequently, that was denied.

Allison Pejovic

And did they tell you the exact basis of that rejection?

Scott Crawford

They did. When they reviewed my application, they advised that they felt that these were personal reasons, and that precluded me. It's the one thing that I would state to that, you know, attending church for 40 years, family attend, or my wife and youngest daughter, attend Glenmore Christian Academy. We are very religiously ardent, and I was directed—divine direction—to not get vaccinated [sic]. And as God as my personal Savior, I align, naturally, I would align my personal beliefs in that that manner as well. So it just seemed to be a very convenient catch-22 that, because my personal beliefs align with the divine direction that I was getting, that my religious exemption would be precluded.

Allison Pejovic

And I understand, Mr. Crawford, that during COVID, a family member of yours had a serious medical emergency.

Scott Crawford

Yes, mid-October, I was working on the ambulance and transporting somebody to Children's Hospital, and I got a cell phone call from Life Alert. I learned that my mom was

having a medical emergency of her own, and it turns out that she had had an aortic aneurysm and required immediate surgery. So Mom went in and had the surgery, and although she survived the cardiac surgery, she'd had a catastrophic stroke while she was on the operating table.

A day later, once they were weaning her off the sedatives, we discovered that Mom had had this stroke. The doctors, their care, was exemplary. Very thankful to have the team working with Mom. And after a week's time, it became apparent that Mom was not going to recover. She was in a comatose, in a vegetative state, so we made the very difficult decision, my brother and I and extended family, as well as the health care team, to remove mom off life support. And in preparing for that, one of the things that the cardiac care unit asked is, they asked me if I'd had any close contacts.

Now, I work as a paramedic, so the reality is, is I do. In the regular commission of my duties, I have a number of close contacts on a very regular basis. It also just so happened that my youngest daughter had just tested positive for COVID, mildly symptomatic, and had isolated in her room. When I let, just in the interest of openness and transparency, when I let them know that, the response was very immediate and they said, "Well you can't be up here for 14 days now."

And suffice to say, this was the anvil that broke the camel's back. You know, we've had a very difficult two years here. You know, some of the hateful situations, the very difficult work environment that we're working, and you know I myself— It looks like I'm not going to be able to spend my mom's last day, you know, be with Mom as she transitions and joins my father who predeceased her five years ago.

In the exchange, they asked me if I was vaccinated, and I said "No, I'm not." And when I reviewed, I had gone and got a negative COVID test, I was asymptomatic, I got a negative COVID test. And I was looking at their compassionate exemption testation and there was no mention of any requirement to be vaxxed. And here's the real kicker: AHS, didn't matter if I had a close contact or not, as long as I was asymptomatic, I was still expected to report to work. Conceivably, I could have transferred another patient in and out of that unit, I could have transferred my mom in and out of that unit, but because I wasn't vaxxed, I was not going to be permitted to be with my mom when she transitioned.

Allison Pejovic

So just to confirm, you were not allowed to be with your mother the day that she passed away?

[00:25:00]

Scott Crawford

Well, I was, and I ended up sending a letter. They were not going to permit me to join my mom when she passed away, so I ended up writing a letter to the patient concerns folks and then I also cc'd [carbon copied] AHS CEO, Dr. Verna Yiu, the Chief Medical Officer, Dr. Deena Hinshaw, and the Health Minister and expressed my concern and angst and, I'm going to be quite honest, contempt for this decision. To AHS's credit, and I thank you very much for this, they came back and, "Oh, there's been a misunderstanding," and they allowed me to be with my mom. So I am thankful for that, but I don't think, had I not pushed back— Yeah, I wouldn't have been with her when she passed away.

Allison Pejovic

Okay, I'd like to move into one last area here. I'm going to call it, "EMS in Crisis." During the time of the COVID vaccine mandates, how well was the EMS system functioning?

Scott Crawford

EMS was already in a state of crisis. Days leading up to the vaccine mandate eventually being rolled out, I think it was December 12th, was the last day for us that were unvaxxed.

Then December 10th or 11th, Calgary, the HSAA were posting some of the stats and red alerts that EMS was in, and on the one, literally days before the vaccine was to take place, Calgary and Edmonton were both posting that Edmonton and Calgary were in a red alert. There were no ambulances available.

Sometime during the pandemic, it was made known that Alberta Health Services had 47 per cent of their staff on medical leave so we just didn't have the manpower. And then, in so far as myself, I was supposed to work a shift in Priddis on December 13th and 14th, but I was placed on unpaid leave, suspended, and the ambulance had to be shut down both on the 13th and the 14th.

Allison Pejovic

Sorry to interrupt, is this 2021?

Scott Crawford

This is 2021. Yup, December 13th and 14th, 2021. And there were a number of other dates that I was supposed to— I would have, otherwise, been working in the ambulance in High River, and the ambulance had to be shut down on a number of dates there, as well. One of them, they did manage to find another primary care paramedic that was able to operate at a basic life support level. But there can be no doubt that the introduction of this vaccine mandate diminished the amount of emergency care available to Albertans. And I find that very curious.

Allison Pejovic

And at that time, were the paramedics able to respond to all emergency calls or what would you say was the ability of EMS to respond; was it 50 per cent of the time, most of the time?

Scott Crawford

That is a very good question. I wouldn't be able— They would, technically, be able to respond to all of the calls; it would just be a delay until the next available ambulance. But just to give you an idea after the vaccine mandate, I think was December 27th, the union, HSAA, put on another graphic or a notice on Facebook that on December 27th, Calgary was in a deep red alert and for 20 of the surrounding communities, had no ambulances available. They call it, like, revolving red alert. So a very large swath where there were no ambulances available to respond.

Allison Pejovic

So just to be clear, were you suspended from your job because of your refusal to receive the COVID vaccines?

Scott Crawford

Yes.

Allison Pejovic

And for how long?

Scott Crawford

For three and a half months. My last shift was on December 12th, and I think I was back on beginning, first week of April, I believe. So three and a half months, roughly.

Allison Pejovic

And can you comment on how you feel your suspension affected emergency service delivery to Albertans?

Scott Crawford

Well, just with me not being available, they had to shut my truck down in a number of instances. So Priddis had to be shut down on two occasions, and my truck in High River had to be shut down on at least half a dozen times, because I was not there.

Allison Pejovic

And while you were suspended, did you apply for EI [Employment Insurance] benefits?

Scott Crawford

I did. I applied for EI. However, my suspension was coded as misconduct, and not going to lie, that was a— You know after two years in the trenches,

[00:30:00]

that was quite a hit. And consequently, I was not entitled to any EI despite having paid into that for well over 30 years. I did get it, and subsequent appeals were also unsuccessful.

Allison Pejovic

Thank you, and my last question to you today will be just to explain for the Inquiry the overall impact of everything that you've been through. Whether it's what happened with **your mom, the online bullying, and everything you've seen in terms of what you think might be going on with some of the vaccine's potential injury to people. How has that affected you and impacted your life and you mentally?**

Scott Crawford

Oh yeah, certainly. I mean, obviously, as you can appreciate, those were incredibly difficult times to have the dissension among the ranks, the bullying and harassment and seeing our union endorsing that behavior. You know, the expectation is that the union is going to be there to protect our rights and to support those. And with AHS ignoring— I sent a number of complaints into AHS and never received a response back.

I think it's inconceivable that in the midst of a pandemic that you would treat your staff like that, and that you would place your staff on unpaid leave when it reduces the capability of the healthcare system responding to that. I guess I'm also concerned, too, that in the face of information that was contrary to the prevailing narrative, that those concerns were not addressed or even acknowledged, for that matter. So that's also of concern.

And the way that it affected my family was with the situation with my mother, with my children. It was very unfair and yeah, I'm very disappointed. It's left me with a large measure of contempt with the way that things were handled.

Allison Pejovic

Thank you, Mr. Crawford. I'm going to turn it over to the commissioners for any questions.

Commissioner Massie

Thank you very much for your testimony. We've heard from a previous expert that during the pandemic, it seems that the aims shift from protecting people and society to protecting the medical system. Do you think that the vax mandate for people, in working as a paramedic, did actually contribute to protect the medical system?

Scott Crawford

I would say that there's an argument that pushing forward with this mandate actually diminished the capability of Alberta Health Services to provide care. That's my personal opinion.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

Prior to COVID, did you have anybody, on your performance reviews, say that you negatively affected the safety of patients?

Scott Crawford

No, never.

Commissioner Kaikkonen

And when it comes to your— You were given guidance to ask for a religious exemption, but you were denied. After they reviewed the application, they thought it was for personal reasons, and yet in your testimony you refer to your personal Saviour. It's obvious to everybody listening that you had deeply held convictions and beliefs, and that you were acting according to your conscience. So I'm just wondering, at any point did the employer or the union provide any assistance of how the religious exemption could be worded differently so that your religious exemption could be accepted?

Scott Crawford

No.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

Good afternoon. Were you provided with any specialized training, when the COVID pandemic was announced, with regard to how to deal with the COVID patients, that kind of thing?

Scott Crawford

Yes, we did receive some training with regard to wearing PPE [Personal Protective Equipment] masks, how best to manage these patients with a pre-screening tool that if patients met certain criteria, we could leave them at home and give them some tips on how to manage their situation.

Commissioner Drysdale

Was there regular planning meetings or strategy meetings as the pandemic progressed, updating you on procedures and methods?

[00:35:00]

Scott Crawford

There was. With the emails that we were getting. Most of the other extraneous emails stopped, and most of the information that we were getting had to do with COVID. So we were getting information from the higher-ups via email, and then occasionally, there'd be the odd discussion if you bumped into your supervisor as well.

Commissioner Drysdale

We've heard testimony in other places in Canada, from paramedics like yourself who were suspended or released or terminated, whatever the terminology is these days. Are you aware of the number of people in the paramedic service where you worked that were affected by this?

Scott Crawford

I know there was a number of us. I couldn't accurately state in terms of EMS. Yeah, I can't give an accurate number with that. I do know that when AHS was in the newspaper, that **when staff were coming back, there was only 750 folks that were coming back but I believe there was much more that went off on leave with the vaccine mandate.**

Commissioner Drysdale

Did you say that there were 750 coming back?

Scott Crawford

That was one of the newspaper's articles that I was reading. Yeah, there was 750 staff, I believe, returning, that were expected back here in early April of 2022.

Commissioner Drysdale

Have you got any idea how many people are in the service to begin with?

Scott Crawford

Well, I believe there's over—and I guess I just need to be careful here because I'm not entirely familiar with the stats—I know that there's some staff that were casual staff. There could be different subsets that were included and not included here. But AHS as a whole has over 100,000 staff.

Commissioner Drysdale

How many, sir?

Scott Crawford

Over 100,000.

Commissioner Drysdale

Okay. Thank you.

Commissioner DiGregorio

Just the last couple of questions for me. Do paramedics receive training in recognizing adverse effects from vaccines?

Scott Crawford

No, we did not.

Commissioner DiGregorio

And would paramedics participate in the reporting of adverse events?

Scott Crawford

We typically didn't. We weren't aware of the tools or the reporting platforms. And I suspect if other paramedics had similar encounters at the hospital as I did, that they may be reluctant to report those. And if they did, I'd be skeptical if they did get reported.

Commissioner DiGregorio

Thank you.

Allison Pejovic

Looks like that's it. Thanks very much for your participation today, Mr. Crawford.

Scott Crawford

Great. Thank you.

[00:38:17]

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 4: Michelle Ellert

Full Day 2 Timestamp: 06:19:33–06:41:35

Source URL: <https://rumble.com/v2kqsgc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is attending online, Michelle Ellert.

Michelle, can you hear me?

Michelle Ellert

Yes, I can hear you.

Shawn Buckley

Okay and we can hear you, so let me start by asking you to state your full name for the record, spelling your first and last name.

Michelle Ellert

Yes, my name is Michelle Ellert, and it's spelled M-I-C-H-E-L-L-E. My last name is spelled E-L-L-E-R-T.

Shawn Buckley

And Michelle, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Michelle Ellert

Yes, I do.

Shawn Buckley

Now, I'm going to introduce you without saying what you do or mentioning who your employer is because my understanding is you don't want there to be any repercussions for your testimony today.

Michelle Ellert

Yes, that's correct.

Shawn Buckley

Okay, but your employer mandated vaccination.

Michelle Ellert

Yes, they did.

Shawn Buckley

Can you tell us about that? My understanding is that that came about in 2021. So can you share with us basically what happened?

Michelle Ellert

Yes, there was numerous communications that I received through email from my employer, and I was notified that I would need to be fully vaccinated to work in my workplace as of November 1st, 2021. So the mandate stated that if we were not fully vaccinated, it would be an unpaid leave or potentially termination of my employment. So the deadline for the first dose was September 21st, 2021.

Shawn Buckley

Now, were you apprehensive or hesitant about getting vaccinated?

Michelle Ellert

Yes. Absolutely.

Shawn Buckley

And can you share with us why?

Michelle Ellert

There's a few reasons why I did not want to take the vaccine. First of all, my mother, she's an elderly lady and lives in a care home. So they were mandated as well to take the vaccination or receive the vaccination. Pardon my words: they're maybe not mandated, but it was very encouraged. Since she did get her first vaccine and I noticed after that there was a lot of falls, and she was continually taking trips to the hospital for these falls. And then her blood pressure was quite out of whack after these shots.

So we're very similar: she's allergic to amoxicillin, so am I. She's allergic to sulfa drugs, so am I. So I was very concerned that if she was having any reactions to it, I might be in line for that as well. Secondly—

Shawn Buckley

Can I just, can I just stop? So had your mom ever been falling before the vaccine?

Michelle Ellert

No.

Shawn Buckley

What was she like before the vaccine? She was able to walk around and—?

Michelle Ellert

Yes, she was able to walk around and talk normally. And as times kind of progressed, she can't talk anymore, and she's no longer able to walk anymore. She's in a wheelchair at this point.

Shawn Buckley

Okay, sorry to hear that. I'm sorry, I interrupted you. You were giving another reason why you were hesitant.

Michelle Ellert

Yes, number two reason for not wanting it was just the timeline of things. I remember being in the hospital with my dad, who had passed away in December 2020, and I was watching the news and they came out with this brand-new novel Corona virus. The world's never seen this virus before. It was brand new. So then to think in a year and a half, and I'm not a logistics expert or anything like that, but how a new virus could be researched and developed a vaccine, and then tested and then produced and then distributed out to the world in a year and a half? It just seemed like a really short timeline, and I didn't feel comfortable with, Was there enough time for testing? Do they know what happens to people in five years from now after taking this vaccine?

Shawn Buckley

Right okay. So kind of your own research you were apprehensive, and yet you did eventually decide to take it. So what was it that overcame your hesitancy?

Michelle Ellert

Ultimately, I could live without going to a restaurant or a concert or any extracurricular activities, but when it came to threatening my employment of not being able to bring home a pay cheque to provide for my daughter and for my family. To be able to pay the mortgage and pay for food. I really didn't want it.

[00:05:00]

So I was looking at other jobs online, but the majority of those jobs were requiring the vaccination as well, so I kind of felt if I didn't do it, I didn't know what was going to happen. My employment was going to be threatened, and we have a house to pay for. How are we going to do that?

Shawn Buckley

So it was it was really economic necessity that led you to do it.

Michelle Ellert

Absolutely. Yes.

Shawn Buckley

Now, my understanding is that then you and your husband and your daughter, on September 24th, 2021, then all went together to get the first shot.

Michelle Ellert

Yes. That's correct.

Shawn Buckley

Okay, and can you tell us how you reacted to the shot?

Michelle Ellert

Well, they told me that I'd probably feel like flu-like symptoms and maybe not very well for a couple of days after the shot, which I did experience some of those symptoms. But I thought well, this is probably just what happens. I noticed that a few days after the shot when I used the bathroom, it was hard to urinate and I'm— I've never have this problem before. And I was like, what? What is happening here? So it wasn't burning. There wasn't any blood or anything like that. It was just kind of an odd feeling. Like, I couldn't use the bathroom like I usually did.

So days went by, October 5th came and it was the same kind of experience in the morning using the bathroom. But by the time 4:30 in the afternoon hit, I went to use the bathroom is like, wow, it feels normal again. Like things are moving here a little more freely. But by the time I hit the end of that, it was burning like fire. It was burning and then there was blood on the paper. So I thought, wow, this has to be like a bladder infection. This is the only kind of thing I could kind of relate this to.

So at that point, I needed to go get a rapid test done in order to continue on carrying on with my work, because I wasn't fully vaccinated at that point. And I went to the drug store where I was getting the rapid test. And here where I live, there's like 40,000 people who don't have a family doctor. So it's very hard to get in to see your family doctor. And being a urine infection, you're supposed to deal with those quite quickly. So I asked this pharmacist if she would be able to prescribe me some ciprofloxacin, because this is a drug that's normally prescribed for bladder infections for me due to being allergic to amoxicillin and sulfa drugs. So I went home. I took one of the ciprofloxacin and then by 6:30, I use the bathroom and now there was blood clots and my urine was bright red, blood red. It was something I'd never seen before.

So at that point, I went to the emergency department. They took some blood and they took urine samples and I was basically told at the end of that visit that, "Well, it was just a bladder infection. Just go home and keep taking the cipro." I've had a few bladder infections in my life, so I know that the drug does work, and by two days later, I'm like, "Why? I don't feel well. I just— things don't feel right. I don't feel good."

So I phoned my family doctor. Pardon me, not my family doctor, my kid's doctor. My family doctor was retiring at the time and they would not book an appointment to go in and have an appointment with her. So I begged and I pleaded with my kid's doctor, "Please, can somebody see me? There's blood in my urine and I'm not feeling well after taking this medication."

So at that point, I went to see the family doctor and he told me, "Well, I don't believe that the ciprofloxacin is working for you, so let's try a different drug. But if miraculously, you start to feel better by the end of the day, then just carry on with cipro."

So I went home from the appointment and I noticed like, I didn't really feel any worse. I didn't really feel any better, and I was quite confident that the drug I was taking would work for this bladder infection, I thought. So I didn't switch to the nitrofurantoin, and I kept taking the ciprofloxacin, and then it came to the end of my prescription. There was no more pills left and I still wasn't feeling well.

So I went to the emergency department again, and at that point, the doctor there in the emergency wouldn't allow me to explain what had happened to me in the last five days. I wasn't allowed to talk about anything prior to why I was in the hospital at that moment. And I said, "Well, it's my heart. My heart is like pounding out of my chest. It's running away from me." And so they did some heart tests, and he came back and he said: "Well, you have anxiety. You're fine. Just go home."

Shawn Buckley

Now my understanding, your blood pressure was really, really high.

Michelle Ellert

Yes, yes, it was. It was like 190 over 130 that day I believe. I have some notes here written about that. So yeah, it was quite high.

Shawn Buckley

So when they're telling you it's anxiety, this is anxiety with blood pressure through the roof.

[00:10:00]

Michelle Ellert

Yes, and he also informed me at that time that the urine sample I provided a few days before didn't grow a culture of a bladder infection. And he said, "Well, you don't have a bladder infection." And at that moment in time, being kind of overwhelmed with what was happening with my heart and the awkward feeling of being in the hospital, I didn't think about, "Well, if I don't have a bladder infection, then why am I peeing blood? Like what's happening here?"

So after that, I contacted my kid's doctor again, and I told her—told the nurse—about this experience at the hospital and how I was told that there wasn't a culture of a bladder infection. And so why would I be peeing blood? So she had told me that she was going to get a ultrasound or speak to Dr. Cunningham. And anyhow, they have arranged a ultrasound for me to go to. I went to that, and all the results of course came back normal.

With the blood test that I was given on the first trip to the emergency room, there was abnormal things in my blood work, and none of that was ever really discussed with me as to what that meant. But as the months kind of went by, I was put on a medical leave as of December 1st, 2021, and I haven't been able to return back to work.

I've had a barrage of symptoms that are somewhat softening at that point, but are really quite debilitating. I've got the chronic fatigue. Last year at this time, I was in bed 90 per cent of the day. I couldn't get out of bed. I was just chronically fatigued. There was muscle weakness and lots of pain in my hips and my knees. My vision is blurry. There's kind of a haze over the top. Like I said, some of these have kind of softened, but there's been just these symptoms have carried on from this point in October till today.

Shawn Buckley

Can I just back you up? When the ultrasound was done, am I correct that the doctor suggested that perhaps you were having an immune response to the vaccine?

Michelle Ellert

Yes, after that point of getting the normal results on the ultrasound, he did tell me he believed it was an immune response to the vaccine. And there's numerous paperwork that he filled out for the time off of work that stated that it was because of a vaccine injury and an immune response to the vaccine.

Shawn Buckley

Right. Okay. Now you've shared with us some of the symptoms that you've experienced since then. Can you tell us a little more about that brain fog? Because you were telling me about, you know, a manual that you had basically written and the fact that you couldn't go back and make amendments, that your mind was so affected at the time.

Michelle Ellert

Yes. So this would have been the last week that I worked. Because I wasn't fully vaccinated, I was sent home to work from home because I wasn't allowed to be at my place of employment. So we were about five days into the work week, and I just had a headache going on for five days constantly on this right-hand side of my head, and it wouldn't go away. I had written a manual. It was 425 pages, and it was a procedure manual for the unit that I work in. At that point, I had notes and things that I needed to add and things I needed to adjust, but by that end, last week, I was scrolling up the document and down the document. I couldn't figure out where to add things, how to word things. It would just take me forever to really complete any of my work at that point. Reading has been quite difficult for me since then. There was a point where I was having to read things out loud to understand things because as I read, it just doesn't seem to go in like it once did. You know, you just read it and you understand, but that's not how it seems to work for me now.

Shawn Buckley

So now it's been 13 months, or 13 months after you ended up seeing a specialist.

Michelle Ellert

Yes.

Shawn Buckley

And the specialist, what did the specialist tell you? At that point, you had basically been suffering for 13 months.

Michelle Ellert

Thirteen months. Yes, that's correct. And I went to see— I was told it was an internal medicine specialist, but at this point, I'm not sure if it was a cardiologist. Sorry. The brain fog and confusion over the last few months. So it was one or the other. I told him my story of what symptoms I had, and how things kind of went. And so we did some more urine tests and some more blood tests and all of that came back normal. And I'm still having these symptoms and he says, "Well, first of all, we can't call this a vaccine injury."

[00:15:00]

He says, "We don't have any proof." So for the first 13 months of going through all of these unexpected symptoms and being all of a sudden disabled, and being told it was an immune response to the vaccine, I was told that "No, we can't call it a vaccine injury anymore. We don't have any proof." So at that point, he referred me to a sleep study and the sleep study came back, was normal. And then he's now referred me on to a neurologist. That was January, and I still have not to this day received the phone call or a booking for the specialist with the neurologist.

Shawn Buckley

Right, my understanding is you also suffer from POTS [Postural Orthostatic Tachycardia Syndrome]. And can you explain what that is?

Michelle Ellert

So I have been seeing a doctor through the Canadian COVID Telehealth system. And also because of my long-term disability that I'm currently on, of course, they want me to return to work, so I've been seeing a physiotherapist to kind of assess when I'm able to return to work. So through these kind of assessments, they've talked about dysautonomia and POTS, Postural Orthostatic Tachycardia [Syndrome]. So it seems like when I stand or I do physical activity of any sort my blood pressure will skyrocket. I start to get weak in the knees, I start to feel nauseous, and basically at that point, I've got to sit down. The last time I went I was in with the physiotherapist for an assessment and they had me lifting a box with a 10-pound weight from my waist to over my shoulders. I did this a matter of four times, and my blood pressure had skyrocketed to 182 over 132. That's where the assessment kind of ended.

Shawn Buckley

Right, so they basically stopped that assessment because your blood pressure was at a dangerous level?

Michelle Ellert

Yes.

Shawn Buckley

Now can you tell us what happened to your daughter after she was vaccinated?

Michelle Ellert

Yes. I wish I could give you a lot more detail than I can, but given the circumstances, I was dealing with a lot of new features happening in my body, that I wasn't quite sure why things were happening to me. But my daughter, after her shot, came and it started with the burning in her mouth. Looking back through my notes today, I did note that she had like boils and kind of boils and white dots on her tongue, and this was kind of the first symptom, I guess, that she brought to my attention.

So we went to the doctor and he said, "Well, usually we only see this in patients who are lacking vitamins and minerals." My family eats fairly well, and so I don't know, we're eating the same diet. There shouldn't be kind of that issue of lacking vitamins and minerals, but he gave her a mouthwash after, to kind of deal with that burning. The burning stopped after that, but given a week or two later, we were back there again for the same reason: she had burning in her tongue.

Then she had an episode of burning in her scalp, which required a steroid shampoo. She's also been diagnosed with tachycardia as well, and I apologize, there was some words before the word tachycardia, and I just don't know if they said postural orthostatic tachycardia, or if it was a different type.

She's also been diagnosed with chronic fatigue syndrome. She's 14 years old. She should be full of life and energy, but she comes home from school and she's absolutely pale and white, and you can see she's completely exhausted. And this goes on week after week here. She missed a lot of school last year. This year she does seem to be somewhat improving, but it seems like it's hard for her to make it through a full week of school without having a nap between four and seven, for about three to four days a week.

Shawn Buckley

Okay, so your daughter when she comes home from school about three to four days a week, she'll actually nap when she gets home, from about four to seven. Now how does this compare with how she was before she got vaccinated?

Michelle Ellert

At that time, I had a happy 13-year-old kid. She was full of energy. She was healthy. She was happy. Like she would go to school. Things were normal, just like myself, things were normal. We would go to work and go to school, and it wasn't exhausting. We were still able to do things after a day of school or a day of work. So she's completely changed in that regard. She's just not, there's no life, there's no energy left in her, I feel anymore.

Shawn Buckley

And how do you feel that the medical system has treated you since you were vaccinated?

[00:20:00]

Michelle Ellert

I'm very thankful for my daughter's doctor who has put me on a medical leave because there is absolutely no way I would be able to work five days a week, eight hours a day. The fatigue and the headaches and things that I experienced in a day, there is no way. So I'm very appreciative of that.

But the only problem is there has not been, at this point—how many months were passed—no diagnosis. I was told in the beginning it was an immune response to the vaccine, and then I see a specialist, and then I'm told we don't have any proof. But I'm still sitting here this many months later, and I don't have diagnosis of what's wrong with me or how to treat what's happening to me.

Shawn Buckley

So I just want to be clear because you were vaccinated back in September of 2021, and we're now near the end of April 2023. You've been off work on disability leave since December 1st, 2021, and still no one has provided you with a diagnosis.

Michelle Ellert

Not from AHS, nope. There's been no diagnosis from them. I'm still sitting here waiting. I'm very thankful for Canadian COVID Telehealth at this point. I feel like if it wasn't for the doctor that I'm able to see that I would still be in bed 90 per cent of the day.

Shawn Buckley

Right. Now those are my questions. I'm going to ask if the commissioners have any questions of you. And there's no questions.

So Michelle, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying today.

Michelle Ellert

Thank you so much for having me. It's appreciated.

[00:22:02]

Final Review and Approval: Anna Cairns, August 30, 2023.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 5: Dianne Molstad

Full Day 2 Timestamp: 06:41:36–06:54:44

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness today is Dianne Molstad.

Dianne, can you please state your full name for the record, spelling your first and last name?

Dianne Molstad

Dianne Molstad, D-I-A-N-N-E M-O-L-S-T-A-D.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dianne Molstad

I do.

Shawn Buckley

Now, you worked for the Edmonton School District for roughly 30 years, and you're a retired counsellor and teacher. You've got several university degrees and graduate work that you've done. Is that correct?

Dianne Molstad

Yes.

Shawn Buckley

And you have had a long-term issue with high blood pressure.

Dianne Molstad

Yes, indeed. I came back to Canada from a cruise with my Toronto girlfriend in February of 2020, and I was still trying to maintain the hypertension. So the blood pressure would shoot up to 180, I was taking it at home. I knew that it was about time because of my obesity, that I needed to get on a medication.

So I went for my yearly checkup, and that was in February. I was still working out at the Y [YWCA/YMCA], although I had to quit that because they refused to allow their volunteers to work if they didn't have the COVID shot. And I refused to get that shot, and I still don't have it. So I went for my yearly checkup in May of '21, and I told Christine that I was ready to go on the medication because I didn't want to die of a stroke. I was really enjoying my grandchildren, who are wonderful, and I spend a lot of time with them. Although my son and his wife had the shots, they would never allow their children to have the shots, but they wanted to travel back and forth to Hawaii and whatnot. So I spent a lot of time with my grandchildren, three and four at the time, and then a new baby. And so I've continued to do that.

Shawn Buckley

Can I just slow you down here? My understanding is you call your doctor Christine. You had been seeing her as your doctor for 30 years.

Dianne Molstad

Yes, indeed. I'd gone to the Baker Clinic all my life and my obstetrician, my gynecologist, had my children through that clinic. My children went to pediatricians there and I maintained that clinic, although the doctors did change. I had Christine for a doctor for almost 30 years, give and take some periods of time when I was out of Canada and out of the city.

Shawn Buckley

Okay, so now you have this appointment. Does Christine write you the prescription you are after?

Dianne Molstad

No, when I went back after the medical and got the results, that was at the point where we were going to discuss the medication, but she told me at that appointment on June 2, that I would not be able to come back to her clinic again if I did not take the shot. So I was just in shock because I didn't know what to do or to say. I said, "What? How can you do that?" "Oh, I can do that." And I said, "Well, what about all of your other patients?"

Because I knew she had a lot of senior patients like me. I was, well, I'm almost 78 in May, but I was at that time a bit younger. I have to admit now, I guess I'm a senior. But, at any rate, I was in shock. A lot of her patients are a lot older than that, too, and I've seen them in the waiting room.

So at any rate, I couldn't do anything. I just left, and I went home very angry, and very upset. And my son said, "Mom, just get a new doctor. Forget it. Move forward. Get a new doctor." And so I started the process that day. I started to go on the—

Shawn Buckley

Can I just make sure everyone understands? Was it strictly because you would not take the vaccine that your doctor of 30 years basically fired you as a patient?

Dianne Molstad

Yeah.

Shawn Buckley

And she made it clear that any patient that she had that was not vaccinated was going to be fired.

Dianne Molstad

Could not go in her clinic.

Shawn Buckley

Regardless of how much the patient may have depended on her for assistance.

Dianne Molstad

Correct.

Shawn Buckley

Okay, and I'm sorry to interrupt, but I just think it's so important for people to understand what you're saying.

[00:05:00]

Dianne Molstad

And it was really shocking because people were being bullied. In retrospect, I didn't put in a complaint to the medical association because by that time I realized they wouldn't have done anything anyway because they were all in lockstep. It would have been futile.

So I didn't bother with that. I proceeded to try and make appointments, and although I was disappointed somewhat—she was a bit of a bully—but she had diagnosed things for me, like, you know, she wasn't involved in my cancer diagnosis, but she was involved in another diagnosis. She was excellent at some areas of medicine, and so I really liked her.

So at any rate, I started to phone around and I found out then, in Alberta at the time, you had to be approved by the doctor. So you were not allowed to just go and make an appointment. You had to go through what was called a meet-and-greet. And if you didn't meet the qualifications of that particular physician, then they wouldn't take you on.

Shawn Buckley

My understanding also was that you were actually on the phone for four days trying to even find doctors that would have an appointment with you.

Dianne Molstad

Absolutely. I used the internet, and you have to look up physicians that are taking new clients, new patients. And then you phone, and you find out, and you wait. So yeah, it was like two days, and then over the weekend, and then two more days. I set up a number of appointments, but I needed to see somebody fairly soon.

And the reason that you can't see someone soon is because it's a meet-and-greet. And so they extend the time to a week, two weeks, three weeks, a month, three months. So I was in a bit of a pickle because by this time my blood pressure is, of course, escalating. I finally found a clinic in North Edmonton that took mainly Aboriginal people, and they agreed to take me, at which I was thrilled.

I went to see a Dr. Prince, who was wonderful. He talked me through the process and helped me onto a medication. But he was only there temporarily, and he was going into administration. So I was kind of left again in the search in trying to acquire a regular physician that I could go to for the monitoring of the medication. He gave me some hints on how to monitor it. And talked to me about people that were in isolated areas that had to do this on their own, and don't be upset about it, and there are a lot of people that live in northern regions. I understood that because I—

Shawn Buckley

And you live in Edmonton.

Dianne Molstad

I live in Edmonton.

Shawn Buckley

So it's kind of a remote region of one million people. So don't worry, you might have to manage yourself. You can't get a doctor because you're not vaccinated.

Dianne Molstad

Exactly, yeah. So that was part of it. But I had worked up on the reserves in Fort McMurray during the stats census. So I sort of understood in part what he was saying. And there are some people in northern regions of the country that don't have access to doctors, regular physicians.

So at any rate, the process continued. And I went for the meet-and-greets. And I went for several. And then finally, I had one with a doctor in South Edmonton, a Dr. L—as I've been told that I might be sued. But at this point in my life, I say, bring it on. My son said, "Don't worry, Mother, you don't have any money anyway. They won't sue you."

Shawn Buckley

Right, so you'd like to mention the doctor's name, but we've kind of counselled you "let's not name." And we don't need to. But please share the story about what happened because that's the important part, is the encounter.

Dianne Molstad

It was awful because I pride myself in being a fairly smart, independent, strong, individual woman, and I was totally insulted. She told me that I wasn't very intelligent and then asked me for the regime of vitamins and things that I was taking. So I gave her a list, off the top of my head, of all of the vitamins I was on and the amounts. She said, "Oh, well, you're absolutely taking a toxic level of vitamin D," because I was taking 4,000 units, "and why are you taking zinc? You don't need to be taking that."

I was taking 25 milligrams only of zinc at the time. And then other medication, I take a Valtrex as a prophylaxis,

[00:10:00]

because like 95 per cent of the population I have herpes. No, okay, I'm not going to go into that.

Shawn Buckley

I don't think we need that list.

Dianne Molstad

I'm sorry, yeah, I do go on.

At any rate, she basically insulted me and demanded that I— bullied me again about the vaccine. And I said, "No, I'm sorry, I am not going to take that shot." And I didn't go into the reasons. I just stood firm and said, "I'm not going to take the shot." Then, she actually accepted me as a patient, and that kind of flabbergasted me because I thought for sure she would refuse. But after bullying me and insulting me and insulting my intelligence, she said that she would take me on as a patient.

So I thanked her very much, and of course, left thinking there's no way I would ever go back to her.

So I continued in my process and eventually found a wonderful doctor at another clinic in Edmonton, the Allen Clinic. She was a young woman who gave me the lecture that they had been instructed to give all of their patients: that I should have the vaccine and blah blah blah. And I said, "You know, Dr. Porth, I'm not going to have it, and I appreciate what you're saying." She said, "Well, I have to let you know, I can't give you any exemption." And I said, "No, I don't want anything. I just want a doctor." I was pleased that she accepted me. But she did actually move after a year. She had to go to Manitoba.

But I do have a wonderful doctor now who told me, "You can vent anytime." He said, "Don't get me going because if I start to vent—" He said he's horrified at what they did to doctors in Alberta, and how they were forced to not treat their patients who were ill. And so he's a great guy; he's originally from Trinidad, wonderful man. And just totally, totally upset about the fact that, you know, they couldn't treat—

Shawn Buckley

I'm going to stop you. I actually don't have any further questions for you. I'll ask the commissioners if they have any questions for you.

Dianne Molstad
No. No. Okay, great.

Shawn Buckley
And there being no further questions—

Dianne Molstad
Thank you. Oh, and I just want to say, thank you so much for allowing me to testify. I just am floored. There were so many people that had applied, and thank you so much for allowing me because mine is so minute compared to some of the testimonies I've seen online and I've listened to, that I just feel I'm in an elite club. Thank you very, very much.

Shawn Buckley
I had to wait for the clapping to die down, Dianne. On behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing your story with us.

[00:13:08]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 6: Dr. Curtis Wall

Full Day 2 Timestamp: 06:54:44–07:19:45

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness, he is attending online. It's Dr. Curtis Wall. Curtis, can you hear me?

Dr. Curtis Wall

Yes, I can.

Shawn Buckley

Can you turn your camera on? There we go. So Curtis, can you state your full name for the record, spelling your first and last name?

Dr. Curtis Wall

Curtis Wall, C-U-R-T-I-S W-A-L-L.

Shawn Buckley

Curtis, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Curtis Wall

Yes, I do.

Shawn Buckley

Now, I guess I should call you Dr. Wall. You have been a chiropractor for 26 years.

Dr. Curtis Wall

That's correct.

Shawn Buckley

And in that 26 years—but for an incident you’re going to speak about involving COVID—you have not had a single issue with the college that licenses you as a chiropractic doctor.

Dr. Curtis Wall

That’s correct.

Shawn Buckley

So can you share with us what happened?

Dr. Curtis Wall

Yeah, so I’ve got several bullet points to share, just to keep me on track.

Shawn Buckley

Sure, do you want to share screen then and show us those?

Dr. Curtis Wall

No, they’re just kind of random.

Shawn Buckley

Okay. I’m sorry. I thought you meant slides. So carry on.

Dr. Curtis Wall

If you have any questions, please interject.

So the beginning of 2020, of course, a pandemic was called. I’ll say right up front that I was suspicious about what was being declared: call it a gut feeling, call it intuition or discernment, but I just felt like something wasn’t right. And then, if we head to April of 2020, our profession said that we had to keep our offices closed. They were closed except for emergency care. And so, that lasted for approximately one month. And then in May of 2020, we were allowed to reopen, but the profession had created a pandemic practice directive. And among many requirements in that directive, one of them was mandatory masking, which I did.

I did initially mask, but immediately after wearing a mask, I noticed that I didn’t feel great: I felt anxious. I felt claustrophobic. I felt shortness of breath. I couldn’t concentrate properly. And I couldn’t provide the right kind of patient care. So I did that for several weeks and decided after that, I just couldn’t wear a mask. So I took the mask off. And from approximately June of 2020 and going forward, I never wore a mask. And then if we had to fast forward to early December of 2020, I received a call from Alberta Health Services [AHS]. Health Inspector Heidi Ho said that they had received an anonymous patient complaint that I wasn’t wearing a mask or my staff wasn’t wearing a mask—and at the time, my staff was my son—and that I had no plexiglass barrier in the office.

Shawn Buckley

So can I just stop you because you hadn't been wearing a mask for some time. How were your patients reacting to that?

Dr. Curtis Wall

Really good. I had maybe one or two patients that would ask me why. And I would give my reasons, and they were quite fine with it. If anybody was not good with it, I would not have known. They may have left my practice, but 99 per cent of people were just fine.

Shawn Buckley

Okay, so as far as you knew everything was going fine.

Dr. Curtis Wall

Yes.

Shawn Buckley

And then you get this call from an AHS inspector.

Dr. Curtis Wall

Yeah, that's right. And so, I did confirm. I said, "Yes, I'm not wearing a mask. And I do not have a plexiglass barrier in the office." And she said, "Well, we're going to have to pass this information off to your college." And so the very next day, I received a phone call from the Registrar of the College [of Chiropractors of Alberta], Dr. Todd Halowski. And he asked me to fill him in on what transpired with the call with the Alberta Health Services inspector. So I told him some of the details. I told him that I was mask exempt and he stated that he wanted to know what was the reason behind my mask exemption. If I was coming within six feet of patients,

[00:05:00]

the pandemic practice directive stated that I had to be masked. I told him that I wasn't comfortable sharing personal health information with him just based on privacy laws. And so at that point, he said, well, he was going to have to pass this information on to the complaints director of the College, who was David Lawrence.

And so the very next day I received a call from David Lawrence. He asked me if I had not been wearing a mask and if I had no intention of doing so going forward. I said, "That's correct." And very nonchalantly, he said, "Well, I'm going to be initiating a process to have your licence suspended. And that will carry out very quickly." At that point I was quite shocked. I said, "Well, what about accommodation for me? I have an inability to wear a mask." And he stated that his primary responsibility was to protect the public, and that my not wearing a mask was putting my patients in danger, and that I was putting them at an unnecessary risk. To which I said, "How am I putting them at risk when I'm asymptomatic, and that if somebody gets COVID, they have a 99.9 per cent chance of surviving?" And so he said that he wasn't willing to— In fact, he disagreed with that information. He said he wasn't willing to debate me or discuss the issue further. So I told him I didn't want to lose my licence over this. And he said, "Well, I can't make you wear a mask. But if you're not going to wear a mask, you're going to have to sit out the rest of the pandemic and not

practise.” And so he said he was going to be passing this information on to a council-appointed member, who was going to look over his decision to suspend my practice, and that council-appointed member would either confirm or deny that.

Shawn Buckley

And so, you’ve got legal counsel involved. You hired James Kitchen who’s been a witness here.

Dr. Curtis Wall

So that’s my very next point. Because at that point, I realized I was definitely in over my head. I needed legal counsel, and so I actually contacted the JCCF [Justice Centre for Constitutional Freedoms]. They put me in touch with James Kitchen. I’ll be quite honest, James has been a lifesaver, and he has done such excellent work. And so I’m much indebted to his services. It’s very stressful, that time. Like I said, and like you mentioned, in 26 years of practice I have not ever had a complaint issued to the College from a patient. And I’ve never been in trouble with my regulatory board. So these were definitely stressful times.

So after that, James demonstrated to the College that traditionally, licensed suspensions are reserved for practitioners who commit sexual abuse, commit fraud, or come to work intoxicated; that, really, I had not demonstrated any threat to my patients by a perceived threat or perceived danger of COVID. But, on the same note, James recommended that I would try to get a medical mask exemption through my GP.

So I contacted my GP and the nurse on the phone said that I had become inactive and my doctor was not seeing new patients. And he was also not issuing mask exemptions. So at that point I was looking for a GP. I did eventually find one, somebody who was willing to see me in his office, who provided a consultation, and he also provided me a mask exemption, based on my mental concerns and limitations.

From there, the very second week of December of 2020, Alberta Health Services came to my office door, two health inspectors, Heidi Ho and another inspector, and they placed a closure notice on my door effectively barring me from practising. And so for one month James and I had to come up with a strategy to satisfy Alberta Health Services’ relaunch template.

[00:10:00]

Excuse me, I’m just going to have a drink of water here.

So for that next month, I was not working, and I had to create this relaunch template, which involved installing a Plexiglass barrier and also submitting various other pieces of information, including the fact that I had now a medical mask exemption letter. The College determined that they would not suspend my licence, but that they were going to place conditions on my practice. Two of those conditions were obtaining patient signatures. One form indicated that patients recognized I had a medical mask exemption, and they agreed to be treated by me without my wearing a mask. And then the second letter they had to sign indicating that they answered “no” to all the pre-screening COVID questions.

Shawn Buckley

These would be the typical questions that, if you went to the hospital, you'd get screened: I've been travelling. Do you have a fever? All of the set COVID screening questions.

Dr. Curtis Wall

That's correct.

Shawn Buckley

Now, when did they impose those two conditions on you?

Dr. Curtis Wall

That was in January of 2021.

Shawn Buckley

Now, we are in April of 2023, and there hasn't been a masking requirement, I think since the truckers' convoy in January of 2022. Are those conditions still in effect on your practice?

Dr. Curtis Wall

Yes they are. They said that the conditions would remain in effect. The initial declaration they made was that the conditions would stay in effect until there was a declared end of the pandemic. And to my knowledge, I don't think there has been a declared end.

Shawn Buckley

Okay, so I expect that you are the only chiropractor in the Province of Alberta that is screening all of their patients for COVID-19 in April of 2023. And you just smile because this is quite silly, isn't it?

Dr. Curtis Wall

Yup, you're right.

Shawn Buckley

So now my understanding is that, eventually, your hearing for misconduct did proceed, and it went on for a full eight days. And I want you to tell us about your four experts and about the one expert that was called for the College.

Dr. Curtis Wall

Yes. Can I interject just before that so I don't forget?

Shawn Buckley

You sure can. You sure can.

Dr. Curtis Wall

In the late spring—because I’m coming to that right away—but late spring of 2021, Liberty Coalition Canada heard about my case and decided to support me by covering my legal fees and media coverage. And that’s another organization I just want to recognize and say that I’m indebted to. So a big thanks to them.

So yes, the hearing was originally supposed to be four days, virtual, of course. And those four days of hearing started in September of 2021. Quite quickly, we realized that four days was not going to be enough time to cover all the expert witnesses. And so in the end, it ended up being eight days of hearing and they concluded in June of 2022. And so I had testifying for me, Dr. Byron Bridle, of course he’s a world-renowned immunologist and vaccinologist. I had Dr. Thomas Warren, a medical microbiologist. I had Dr. Bao Dang, who is a respirologist. And then I had Chris Schaeffer, who is an occupational health and safety specialist in mask fitting.

Shawn Buckley

And what expert did they have for the College?

Dr. Curtis Wall

Their expert witness was an Alberta Health Services doctor, Jia Hu, who was involved in the scale-up of testing vaccinations, communications, and policy development with all things related to COVID.

Shawn Buckley

And my understanding is that in February of this year, a verdict was released. Can you tell us what the verdict was?

[00:15:00]

Dr. Curtis Wall

Yes, the hearings tribunal is composed of two chiropractors and two public members. And, in January, the end of January this year, they released their 90-page verdict [Exhibit RE-7], declaring that I was guilty of professional misconduct. And so, currently, I’m waiting for the penalty phase. I’m waiting for them to determine what they’re going to do based on all the findings.

Shawn Buckley

As far as professional misconduct, did they actually make up a new word to describe you?

Dr. Curtis Wall

Well, one of the words they used was that I was “ungovernable.” They indicated that I had a constant theme of challenging authority and what they deemed to be proper government mandates and policies. That my challenging of authority and these mandates, on a repeated basis, indicated that I had an intention to defy the pandemic directive in the first place, and that made me ungovernable.

Shawn Buckley

Okay, so I actually think it's important for us to break down what you're saying. So you had called for esteemed experts into the issue of masking, actually dealing with the facts. And you were found to be ungovernable not because they had experts to dispute your experts but because you were not following, basically, the government guidelines. So it's ungovernable now for a health care practitioner or a chiropractor in the province of Alberta to challenge a public health guideline?

Dr. Curtis Wall

Well, that's what it would seem to indicate.

Shawn Buckley

But this is important because you basically are waiting to see what your sentence is going to be. You're telling us that, basically, what they're saying is you are ungovernable because you are not accepting the government narrative as far as what's going on with masking.

Dr. Curtis Wall

Yes.

Shawn Buckley

So it's arguably professional misconduct now to disagree with government narratives if you're a chiropractor in the province of Alberta.

Dr. Curtis Wall

Yes.

Shawn Buckley

Okay, and I'm sorry. So you're still now waiting for sanctions. My understanding is that you could be liable for the costs incurred by the College for these proceedings. Can you tell us roughly how much the College has spent in finding you ungovernable?

Dr. Curtis Wall

My understanding from my legal counsel is that the College has spent well over half a million dollars just on my case alone in the last two and a half years.

Shawn Buckley

How did this affect you going through this experience?

Dr. Curtis Wall

Well, again, quite stressful. I'm a person who keeps his head down: does his job. I do not like to make waves. So for me to be thrown into this type of situation is very uncharacteristic of me. People who know me, know me as a quiet person who works behind the scenes. And so it has definitely challenged me. It's challenged me to step up to say something when I see something is wrong. And it's been stressful for my whole family.

It's probably more stressful for somebody to watch a loved one that's going through a challenge than it is, maybe, for that person who's experiencing it. So yeah, definitely, it's been a challenging time.

Shawn Buckley

Have you felt supported by other chiropractic doctors in Alberta?

Dr. Curtis Wall

Very good question. For quite a long time, I never heard a word from a single chiropractor. And that's not to the detriment of any chiropractor because I believe my case was extremely downplayed. And unless, as a chiropractor, you were staying quite in touch with some of the disciplinary situations going on, you might completely not even know about my case.

[00:20:00]

In fact, I would not doubt that there are still chiropractors in the province who have no idea about my situation. So initially, I did not hear a whole lot from chiropractors. But one by one, they were starting to pop out, and I did start to connect with other people who I trusted. And now I have quite a few who are very supportive. I couldn't do it without their support, and so I'm very grateful.

Shawn Buckley

Now, going forward, is there anything that you think should have been done differently?

Dr. Curtis Wall

Yeah, so the question was posed to me that, what could Canada do differently based on my situation? Is that what you would—

Shawn Buckley

Really, it's an open question. As an inquiry the commissioners are tasked— one of their tasks is to try and come up with things, how we could have handled this whole situation differently. And yours is a very personal story. But I'm wondering if from that—because you would have been really thinking about this—what would you say we could have changed to have better outcomes going forward?

Dr. Curtis Wall

Yes, policies, I think. I've been looking at the whole topic of policies of late. I'm not an academic in the sense of a bureaucrat understanding all these things. But I think that we have policymakers and developers at the top of the food chain—if I would have to put it that way—that push these policies down to policy enforcers, which I would say would represent our governments, our military, our police, our regulatory bodies even. And so these policy enforcers, even my own regulatory body, seemed to really— It's like they had no choice.

I wish they could have stepped back, looked at more evidence instead of so quickly having rushed into making some of the decisions they did, especially when it comes to the topic of

informed consent. I would suggest that wearing a mask is a medical procedure because it carries a risk of producing physical or mental harm. And so any healthcare professional very well understands the process of informed consent. If you're going to do a treatment on a person, you have to fully explain what that treatment is, what are the risks and benefits of that treatment, and what, maybe, alternative treatments you could do instead of that treatment. And so in my mind, regulatory bodies did not exercise informed consent as significantly as they should have or as properly as they should have when it comes to whether masking or the shots.

And so I wish that going forward, some of our regulatory agencies would have seriously considered these policies. You had Lieutenant Colonel David Redmond on this morning. He's been one of the people I've looked up to and studied his writings. And I wish our governments and our regulatory boards would have looked at some of those studies and findings because they were already put in place. They were already recognized.

Shawn Buckley

I don't want you to go too much into what other people have said. But you did raise a very interesting point in saying that there's an informed consent part to the masks. I have to confess I hadn't thought of that before. But a mask would be considered a medical device under medical device regulations and that the rationale for us getting vaccinated was actually to protect others, which was the same rationale that we were given to use masks. So I think you've raised a very important point.

And I don't have any further questions. So I'll ask the commissioners if they have any questions for you. And there being no further questions, Dr. Wall, on behalf of the National Citizens Inquiry, I sincerely thank you for attending and giving your evidence today.

Dr. Curtis Wall

Thank you very much.

[00:25:01]

Final Review and Approval: Anna Cairns, August 30, 2023.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 7: Angela Tabak

Full Day 2 Timestamp: 07:19:45–07:34:25

Source URL: <https://rumble.com/v2kqsgc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

So our next witness is Angela Tabak. Angela, can you please state your full name for the record, spelling your first and last name.

Angela Tabak

Certainly. Angela Tabak, A-N-G-E-L-A T-A-B-A-K.

Shawn Buckley

I'm sorry for mispronouncing your last name. You know that I know your family, and so I think of you as having a different last name. You are a small business owner. But before we go any further, I'm going to ask if you promise to tell the truth, the whole truth, and nothing but the truth today.

Angela Tabak

I do.

Shawn Buckley

You're here today to basically share something that happened concerning your son, Kyle Quinton.

Angela Tabak

Yes

Shawn Buckley

Can you please share that story with us?

Angela Tabak

I can. The beginning of the COVID time or whatever we want to call it, March of 2020, my three children were all young adult age. My oldest had just given birth to my first grandchild, living in Virginia, in February of 2020. My son Kyle was 21 at the time. He was living on his own, working full-time. And my youngest was slated to graduate from high school in June of 2020. So we all know what happened with those kids at that time.

My son was of great concern because when he was in high school, he was involved in, I guess you could call it a freak accident, and sustained a massive head injury that really changed him and put him in a very precarious situation when it came to his mental health. We were dealing with anxiety, thoughts of depression, and those types of things. But in early 2020, he was doing pretty good. Like I said, he was living on his own and working full-time.

However, when COVID hit, he very much latched on to the fear and the messaging: the constant messaging that we were bombarded with, the daily case numbers that we were being shared with by our medical professionals, the media and the messaging that came with that. It was about mid or late April of 2020 when he first called me. He was extremely anxious. He was sick, he said. Pretty sure that he had COVID, and he had no food in the house, and he was asking me to go to the grocery store and get some groceries for him. So, of course, I did that. That happened a number of times over the next 18 months, where he would call me and ask me to bring him a meal or bring him some food.

Shawn Buckley

Can I just slow you down and make sure that this is sinking in?

Angela Tabak

Sure.

Shawn Buckley

So prior to COVID, he's living on his own, he's working full-time, and basically, he's managing well. But after COVID, you're having to bring him groceries because he's afraid to go out?

Angela Tabak

Pretty much, yes. Even though he worked in what was considered an essential service industry, he reduced his hours, reduced his hours, reduced his hours, and eventually completely quit his job.

Shawn Buckley

He was actually an agricultural lab field sampler, so he wouldn't be around people. He would be going out and taking samples in the field.

Angela Tabak

Right, he would be in a truck by himself taking samples and then bringing them to the lab.

Shawn Buckley

Okay, but he was so buying into the fear narrative that even that, he was afraid of.

Angela Tabak

Yeah, absolutely. So sometimes I'd bring him food. Sometimes he'd let me into the apartment. Sometimes he wouldn't; he would just ask me to leave it on the step. Sometimes he'd let me in, but he was extremely cautious and nervous and would look around to make sure that there was no neighbours watching for fear that he would be reported for having his mother over. So yeah, he just really, really bought into the narrative.

However, there was a little bit of a bright light for him in that he realized that the colleges were all online. He'd always had a dream of owning his own business.

[00:05:00]

So he decided that he was going to attend Lethbridge College online for the year starting in September of 2020, starting a two-year program. So he did that, and he did pretty well, except he failed one course, which wasn't a surprise to me. When he told me about it, I knew because of the cognitive issues that he had after his head injury and the struggles that he had to graduate from high school that that particular course would have been a challenge to him.

So this was April of 2021. And I remember us talking and discussing what had happened with the course, discussing his head injury, discussing the anxiety, and all those things that he was experiencing. And he decided that he was going to get help, that he was finally going to go get help and get on top of this. He was nervous about attending school in September without getting some answers and getting some help. So he went to our family doctor, who referred him to a counsellor, who then referred him to a psychiatrist.

Shawn Buckley

Can I just slow you down? When you say he was nervous about going back to school, that was because it would be in person and he's afraid because of COVID.

Angela Tabak

That was part of it. I mean, that was all up in the air right then. We didn't know whether it was going to be in person or whether it was going to be online again. He was hoping for online but also just nervous because he wanted to succeed. And he felt that there was something in the way of him being able to succeed, that he had failed this one course. He felt badly about that. So it was both those things.

Shawn Buckley

Okay.

Angela Tabak

So, yes, he was referred to a psychiatrist. Now this particular psychiatrist insisted that he would not have in-office visits with his patients. They were all to be telehealth because of the COVID mandates and requirements and whatever we were dealing with. And so my son was sent a questionnaire. It was 120 pages long. He and I spent a number of hours on the

phone going through this questionnaire. There were a lot of things that he needed help finding out about because it was all my family history of mental, physical, emotional health, and his father's, and his own, and whatever traumas he may have dealt with. And I remember going through this questionnaire with him—and I've gone to doctors and counsellors all my life—and being struck by the fact that a lot of the things on this questionnaire were things that you would normally cover in an in-person appointment with your doctor or your counsellor. I just assumed that it was because of COVID that this doctor was having the patients do this at home, and then later, he was going to do something with it.

There was about a five- or six-week period between the first telehealth appointment with this doctor and then his follow-up appointment, which going back through my text messages, it looks like it was probably July 27th was his follow-up appointment.

So the night before, my son called me and had a few more questions that we just had to finish up. And I could hear him stacking the papers. We're on the phone, him on the speakerphone, stacking the papers. He was so proud of himself that he was finally getting help, and that he had gone through this very difficult process of filling out this questionnaire and opening up every can of worms basically that this kid ever had. And dealing with the monsters, basically, including all this anxiety and stuff that he'd been experiencing the last year up to that point.

The next morning according to my son, he took the questionnaire to the doctor's office and dropped it off as he was instructed to do. That afternoon he had his telehealth appointment with the psychiatrist, and, according to him, when the psychiatrist came on, he said, "How are you doing? What can I do for you?" Kyle explained, "Well, I dropped off my questionnaire at the office." And the doctor said, "Oh, I'm sorry. I'm not working in the office today. I'm working from home. I don't have your questionnaire. So, we can't really go over it. So you will have to call the office and rebook your appointment."

Shawn Buckley

Can I just interject? Because it just seems to me that a psychiatrist is dealing with people that are mentally fragile and would likely be dealing with people that would need to be seen in person. This telehealth thing for a psychiatrist, I find interesting. Did you think that was strange?

Angela Tabak

I had major concerns about that,

[00:10:00]

major concerns. Because I knew how fragile he was and what had happened to him, how it had gotten even worse since COVID.

So when my son told me this three days later after the appointment, I said, "Well, when is your next appointment?" He said, "Well, the first one they could get me in was September 25th." And I was concerned about that because I knew the whole reason he's gone through this was because he wanted to be prepared to go to school whether it was in person or whether it was online. He was nervous about this. I even said to him, "Hey look it, if you want me to go all Mama Bear, I'll call up the office and we'll get this figured out." He said,

"No. No, no mom, don't worry. It's going to be okay. It's going to be alright." At that time, I recognized that there was some resignation in his voice that I was not too happy about.

So it was Labour Day, September 5th. It was a Sunday night. He called me, and he call me quite late, which was nothing out of the ordinary. We chatted for about 10 or 15 minutes. We talked about the fact that he was starting school on Wednesday. It was going to be in person. He was nervous about that, but he also said, "But I'm looking forward to getting back to school." Then, I was like, "Okay, great bud, like you've got it, you can do this. You're going to be all right."

The next morning his father called me about 6:30 in the morning to tell me that he was gone. He had called 911 and told them what he was about to do. He had given them his address. He lived in a building that had multiple units. He was concerned that they would damage the front door; so, he had gone down and unlocked it and propped it open for EMS [Emergency Medical Services] to be able to come in. He told them that he didn't want anybody to find him a few days later. He had written his two sisters and his dad and myself each a personal letter. Each letter began in the same way with an apology but also stating that the pains, the anxiety, and depression can no longer get to me. He had laid out his wallet and his ID so that the police officers would be able to find it easily. He had written a letter of apology to the police officers and to the EMS apologizing for what they were going to have to come in and see.

Because he had made that call, we were able to get him on life support quick enough that we were able to save a number of his organs and donate them. That was the kind of boy that he was, always tender-hearted and always looking out for everybody else. I feel that the standard of care for the mentally ill was extremely, extremely compromised through these COVID mandates and that singular focus on a respiratory illness took the lives of many, many other people.

Shawn Buckley

I don't think that there's a dry eye in the house. I don't have any further questions for you. Perhaps the commissioners will.

There will be no questions. Angela, on behalf of the National Citizens' Inquiry, I sincerely thank you for sharing that with us.

Angela Tabak

Thank you for the opportunity.

[00:14:40]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 8: Drue Taylor

Full Day 2 Timestamp: 07:49:15–08:27:57

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. As we continue on the second day in Red Deer, our next guest is attending virtually. Drue Taylor. Drue, can you hear me?

Drue Taylor

Yes, I can.

Shawn Buckley

Now, Drue, you are 33 years of age.

Drue Taylor

I am.

Shawn Buckley

I'm going to begin by asking if you can state your full name, spelling your first and last name for the record.

Drue Taylor

Sure. I'm Drue Taylor. D-R-U-E T-A-Y-L-O-R.

Shawn Buckley

And Drue, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Drue Taylor

I do.

Shawn Buckley

Now, I had pointed out that you're aged 33, just because I want people watching your testimony today to appreciate that you're a young person. Now, how would you describe yourself before you became vaccinated?

Drue Taylor

I was extremely active, very lively, and just tons of fun.

Shawn Buckley

Okay, and my understanding is, you were a yoga instructor, is one of the things that you did?

Drue Taylor

I was. And a professional massage therapist for humans and horses.

Shawn Buckley

Right, and going back to the yoga thing, though, you actually did a class that was termed as power yoga.

Drue Taylor

I did. And I also did weighted yoga where you do power— Different type of things with weights.

Shawn Buckley

Right, so when you tell us that you were very fit and you're very active, you were actually, basically, as a professional yoga trainer leading classes that fit people would find to be challenging.

Drue Taylor

They did.

Shawn Buckley

Okay. So can I ask you what led you to become vaccinated? What was going through your mind? What were the issues?

Drue Taylor

Well, as someone who loves science, and the medical community has saved me a couple of times with medications. At the same time, I've never had any reason to not trust a vaccine. I've never had a reaction from one. I've had all vaccinations that have been asked of me or

required for travels, and I've never had a reaction. So going into hearing about the COVID vaccines, honestly, I was actually kind of excited for protection of COVID.

Shawn Buckley

Okay. The mainstream messaging was telling us that it would be a protection and you were excited about that protection. Did you seek any advice before getting vaccinated?

Drue Taylor

Absolutely. I did. I have had a blood clot in my lung before. I have a condition called Leiden Factor V [V Leiden]. So it makes my blood 15 per cent thicker than the average person. So before vaccination, I did see my primary health care doctor, and he highly recommended the vaccination because COVID also causes blood clots. He just said not to take AstraZeneca because, at that time, there was already some things with blood clots related to that. He suggested I take Moderna.

Shawn Buckley

Okay, so this doctor that you consulted, was this your family doctor?

Drue Taylor

Yes, absolutely.

Shawn Buckley

So you specifically asked about it because of this pre-existing condition, and your doctor encouraged you. And just so that the people watching your testimony— You said your blood is 15 per cent thicker. The risk of that is you are more likely to form blood clots than other people.

Drue Taylor

Yes, that's correct.

Shawn Buckley

Okay. So the doctor is saying actually COVID causes blood clots, so that you need to be protected from COVID.

Drue Taylor

Yes, I was in the high-risk category.

Shawn Buckley

Okay. Now my understanding is that you got your first shot on April 24, 2021, and that was a Moderna shot.

Drue Taylor

That's correct.

Shawn Buckley

Can you share with us what happened?

Drue Taylor

The day we got the shot, honestly, I was relaxed. I was happy after the shot. We went home and within four to six hours, I did not feel okay. It felt like my heart was going to literally beat out of my chest. If you are a female, you've ever had pregnancy and a baby kicking in your uterus. It's exactly what it felt like, but in my chest. Just really hard kicks. And then whenever I stood up, I would just feel this immense pressure. I would get super dizzy, extremely nauseated. I could hear my heartbeat in my head. I didn't feel normal. I felt like I was going to just black out, whenever I stood up.

[00:05:00]

So I did end up going to the emergency room that night.

Shawn Buckley

And what happened at the emergency room?

Drue Taylor

They did testing, like EKGs [Electrocardiogram] and that came back normal. But when I was doing that, I was lying down. The nurse caught sinus tachycardia. So when I would stand up, my heart rate would go to 130 beats per minute. But all of their testing and blood work that they had done that night, they said came back normal. So I was sent home. The emergency doctor requested an emergency Holter to assess my heart further.

Shawn Buckley

And when you're telling us that when you stood up, your heart rate would be 130 beats a minute. That still is a resting heartbeat, right? You weren't doing any exercise or walking around. All you did was stand up.

Drue Taylor

That's correct.

Shawn Buckley

Okay. So you're sent home with the Holter. What do you do the next day? You contact your doctor.

Drue Taylor

So the emergency Holter didn't actually come right away. She requested it. It came a while later. But going home the next morning and into the next day, I actually received a phone call. No, before that I contacted my family care doctor, and I let him know what happened to me. He immediately said don't take the second vaccine. This is a reaction, and we need to figure this out. I want you to stay home and rest, and this is weird. We don't know what's going on, so rest and keep me updated.

Shawn Buckley

Now did your family doctor say anything about whether or not you should be taking the second shot?

Drue Taylor

Immediately. That was his first thing. He said, "Don't do it." He said, "This is a reaction. Don't take the second vaccine." That was his immediate response.

Shawn Buckley

Okay, and then my understanding is three days later you get a call from AHS [Alberta Health Services].

Drue Taylor

Yeah, so AHS—unknown to my doctor—they had their own doctor now on my case because the hospital had to put in that I had an adverse reaction because I was in the hospital in the ER within hours of taking a vaccination. But I got a phone call from a nurse named Karen, and she let me know that all my tests were coming back fine, and that it was not an adverse reaction. And I let her know that there was further testing going on.

Shawn Buckley

Now, so this is a nurse that's telling you that it wasn't an adverse reaction. My understanding is that she had reported that a Dr. Song had reviewed your case, and that she was just passing on that information?

Drue Taylor

That's true.

Shawn Buckley

Did you ever speak with Dr. Song? Or be examined by Dr. Song?

Drue Taylor

No, and she refused to let me speak to him about my case. And I asked her specifically to talk with the doctor because I wanted to understand his reasoning. And she said, "No."

Shawn Buckley

In your life, whenever you had—I assume you've been to the ER before—had you ever gotten a call from AHS following an emergency room visit before?

Drue Taylor

Never. I've never had doctors I didn't know contact me or be put on any kind of health case I've had, ever in my life.

Shawn Buckley

Okay, and did this Karen tell you anything else? Did she tell you about your symptoms and perhaps what you should do?

Drue Taylor

At this point no. Like I said, I let her know that further testing was going on. I wasn't willing— Like I didn't want to talk about the vaccines at that point, because I was pretty stubborn in that I definitely had some kind of reaction, because it was right after. So I was frustrated in talking with her.

Shawn Buckley

Now, you had a few conversations with her.

Drue Taylor

Three. She called me three times.

Shawn Buckley

Okay, can you tell us about the other calls that she made?

Drue Taylor

Sure. So after the Holter monitor came back normal, the cardiologist at the Sturgeon Hospital also asked for an echo of my heart—an ultrasound of my heart—and that came back normal as well. And then at that point, he referred me to another cardiologist, Dr. Gee, at the Royal Alex [Royal Alexandra Hospital]. And I had seen him, and he was suggesting that I might have POTS [Postural Orthostatic Tachycardia Syndrome]. And this is the first time I had heard about POTS, but I was going to have to wait for a testing. So to test for POTS, which is Postural Orthostatic Tachycardia Syndrome, you have to do a tilt table test. And it was COVID. That it was happening, there was a lot of different closures, and different things were being, you know—

Shawn Buckley

Drue, I'm just going to slow you down. And maybe just back up and ask

[00:10:00]

you about the second and third call a little later.

But she's communicated to you that it's not a vaccine reaction?

Drue Taylor

Yes.

Shawn Buckley

But your doctor thought you did have a reaction.

Drue Taylor

Yes.

Shawn Buckley

To the vaccine. And my understanding is you also spoke to the pharmacist.

Drue Taylor

Yes, I did. The pharmacist I called back, as well with my doctor, the day after I ended up in the hospital. And she said that she would file the paper works necessary.

Shawn Buckley

Right, so the pharmacist thought it was a reaction also.

Drue Taylor

Immediately, yeah.

Shawn Buckley

Okay. So after this first call from Karen at AHS, what symptoms were going on and continuing?

Drue Taylor

There were 15, 20 plus symptoms.

Presyncope: So, I felt like I was going to pass out any time I stood up. I would have to hold myself against the wall for a few minutes when I first stood up—and this is something I still do.

Blood pooling: So my blood would pool, and it was into my fingers, my tip of my nose and my feet really bad.

I would have numbness in my hands and my feet. Random extreme body pains.

My entire diet changed. Whenever I ate, I would feel like my heart was rushing. And I felt like I was going to pass out just from eating.

Someone coming to talk to me, whether they were really excited, or if one of my kids was having an issue or something like that, where it was a more stressful situation, I would immediately feel sick.

I was also getting sick daily, multiple times, daily. Basically, anytime I tried to ingest anything, I would either get sick or have horrible constipation. Basically, anything my body used to do, was not doing.

Shawn Buckley

Was there any shaking in your body?

Drue Taylor

I had extreme trembles, and I still do. But my hands will shake and my whole body just feels shaky. Yeah, I tremble, and I would tremble.

Shawn Buckley

Did this affect the way you had to shower?

Drue Taylor

Oh. Showering immediately made me feel like I was going to faint. There's no way I could be in a warm or hot shower without having a severe issue. And it just made me feel like I was, you know, in the middle of a storm on a ship and I couldn't see. It was horrible.

Shawn Buckley

Right, and what about your sleep?

Drue Taylor

I could only sleep about 20, 30 minutes at a time before my body would then wake me up with my heart racing. I felt like I was falling out of an airplane. And I would wake up feeling like, "I have to go now. Something is going on and the war was at my door." Only 20, 30 minutes of sleep is what I could manage before a massive cold sweat and waking up to feeling terrified.

Shawn Buckley

Right, and were you able to continue with your employment at this time?

Drue Taylor

No. At this time, I owned my own massage therapy company and was still teaching yoga. I could not see any clients.

Shawn Buckley

Now, how long did these symptoms that you've described go on?

Drue Taylor

They lasted pretty severely for five to seven weeks after the first vaccination. And they slowly started becoming manageable. But then all of a sudden summer hit—and the heat outside—I started having new symptoms like heat strokes, which I've never experienced. I used to teach hot yoga. So the symptoms lasted. I wasn't ever able to get back to my full normal work ethic or normal self.

Shawn Buckley

Okay, now you did start trying to work again. Can you tell us about how that went?

Drue Taylor

Sure. About after five to seven weeks, I slowly started taking on, one to three clients in a week. But after I tried to work— The way I've always done massage therapy is a very physical way. And I was drenched in sweat after a 60-minute massage, which is not typical for me. I had scrubs and two layers underneath, and everything was soaked, and I was just dripping. I felt like I had ran three marathons and like I, again, went to war yesterday. So after one massage, I was just drained for the whole day, and no one could even approach me. My head was just pounding, and symptoms were severe.

Shawn Buckley

Now prior to your vaccination, how many clients would you typically handle a day in your massage practice?

[00:15:00]

Drue Taylor

Anywhere from five to eight clients in a day. And if I was working with my horses, anywhere from one to four in a day.

Shawn Buckley

Okay, and again, you're also a massage therapist for horses.

Drue Taylor

Yes.

Shawn Buckley

Now, let's talk about your second call from AHS. Can you tell us about that?

Drue Taylor

Sure. So that was after I had seen the second cardiologist who had suggested POTS, but I was waiting on the tilt test. So this was between my tilt table test to determine POTS and the first vaccine—so it was around August—she called me. Then at this point, I was starting to, like I said, feel the symptoms of the heat and things were— I still wasn't right. But she called me, and she told me that based, again, on all of the information that she had—from the echo, from the original Holter—that I had nothing wrong with me, and that I should get the second vaccine. And at this point, she absolutely said that there was actually— Not only that I should get the second vaccine, but I needed to because I have had a blood clot in my lung before. So she told me I needed to get the second vaccine, even though my cardiologist at the Royal Alec was waiting for further testing. And he, at this point, did not recommend the second vaccine.

Shawn Buckley

And again, had any AHS doctor even spoke to you, let alone examine you?

Drue Taylor

No.

Shawn Buckley

And had AHS ever, prior to this vaccination, phoned you for anything?

Drue Taylor

No.

Shawn Buckley

And did you ask them to phone you? Did you engage in some process and ask them to contact you about this?

Drue Taylor

No. To be totally honest, I was probably pretty rude to her on the phone, because I was very frustrated that: a) she was calling me to tell me this without me talking to the doctor; and b) she was telling me to get the vaccine when at this point, I had several doctors telling me to wait.

Shawn Buckley

Right, and you would have communicated that to her, that your doctor was saying don't.

Drue Taylor

Oh, I did.

Shawn Buckley

Right. Now your symptoms continued. Can you tell us kind of how things progressed?

Drue Taylor

Sure. So like I said, in the summer, I was experiencing extreme heat issues. We normally go to BC, and I was—the entire time we were there—I just was sick. My head was screaming. I felt like I couldn't talk to people. Going out in the sun was just awful. I just basically cried and stayed downstairs trying to stay cool.

Towards the fall, I did end up getting the tilt test. I believe that ended up happening in November. So it was really late fall, beginning of—

Shawn Buckley

Now, this this is for POTS, right?

Drue Taylor

Yeah, so a tilt table test.

Shawn Buckley

Can you explain what the word, the acronym POTS stands for and what it is? Just so that people listening to your testimony understand what you're being tested for.

Drue Taylor

Sure. POTS is postural orthostatic tachycardia syndrome. So basically, when a person stands up and their heart rate reaches above 130 or higher, and it maintains that as they stand, that's POTS. It's postural tachycardia, so when you stand your heart rate goes crazy.

Shawn Buckley

Okay, so Dr. Gee had suggested that you take this test. And you do. And tell us what happened.

Drue Taylor

So I did take the tilt table test with Dr. Gee in November—by the time it was able to happen. And they told me it was inconclusive. When it was said and done—I didn't pass out—but again, at this point, I had never passed out. I had only felt pre-syncope, or like I was going to pass out. So when the test was concluded, Dr. Gee came in and he talked with me for a few minutes saying that I should get the second vaccine, and he was not going to be giving me an exemption. He believed it was a coincidence that I had symptoms so quickly after. He left the room then. Oh, sorry. He also told me that he would be referring me to a neurologist for my anxiety and he dismissed all other symptoms.

After he left the room, there was also a resident cardiologist who had been present for the tilt table test, and the nurse who had been there the whole time tracking my blood pressure. This resident cardiologist and nurse proceeded to then talk to me for 15 minutes, about why it was important for me to get the second vaccine. They talked about their personal experiences with it, and why they believed that I absolutely should. And the nurse's advice to me was just to simply have some pickles in reference to my symptoms.

[00:20:00]

Shawn Buckley

So you have basically largely been disabled. You have been seeing doctor after doctor. You're not actually passing out with this table test, but I imagine your heart rate is being measured and it's going through the roof, which is not normal. And the cardiologist tells you to get the second shot, and you probably weren't even asking about whether you should or shouldn't. Am I right?

Drue Taylor

That's correct. At that point, I just wanted to know what the heck was wrong with me.

Shawn Buckley

And then the resident doctor and the nurse—and I assume you didn't ask them about whether you should get vaccinated or not—lecture you for 15 minutes.

Drue Taylor
They did.

Shawn Buckley
How did you interpret that? I mean, what did you think was going on, with all this energy by two doctors and a nurse, for you to take your second shot?

Drue Taylor
To be totally honest, I was so lost. I felt like I was in the middle of just everyone. I felt like the doctors had no idea what was wrong with me because there was no information on this vaccine, and then they couldn't pinpoint or tell me. But they also didn't want to take any kind of— I don't know if I want to say blame as the correct word, but the doctors didn't say, "I don't know." They could have said, "I don't know what's going on with you. You need further investigation." But they didn't. They said, "You don't, and you need this vaccine."

And that, to me, didn't sit well. Because the science that I know and that I love, you continue testing. And then when you find something that, you know, makes the previous science null and void, you go with the new science. So it makes sense to me that people take this vaccine, that there's going to be reactions. But what didn't make sense is that they weren't acknowledging me at all about that reaction. Why not study me instead? They just pushed this other vaccine on me, and I didn't know what to do. I had no idea if I should take the second vaccine. Which I, at that point, I did feel like I should because I was scared to get a blood clot again. Because I've already had that and that was horrifying. So I was scared and confused and lost.

Shawn Buckley
And I'm just curious because this is December of 2021. Am I right?

Drue Taylor
Yes.

Shawn Buckley
And so COVID hit us in the beginning of 2020. So literally about two years in. Did anyone ever test you for antibodies to see if you had acquired COVID and then had obtained natural immunity?

Drue Taylor
No. I had voluntarily gone to get tested for COVID just because I was, you know, trying to take on clients in my home, and I wanted to be as careful as I could. So when they allowed it to be voluntary, I did go and get tested, and it was negative every time. And they never tested me further for any kind of antibodies.

Shawn Buckley
Right. Okay. So you go in to get your second dose on January 8th, 2022, when you get a shot of the Pfizer vaccine. Can you tell us what happened?

Drue Taylor

Right away it was okay. Honestly, I came home and hugged my husband, and I was like, oh my God, maybe I didn't react to it. But then, about 24 hours later, all of my symptoms came back—tenfold—and I actually did begin passing out. I couldn't stand without, just feeling like a bomb hit me. I couldn't reach, sitting up straight would just make my heart rate skyrocket. Everything was worse and there was a lot more symptoms and they were more severe.

Shawn Buckley

Can you tell us about those?

Drue Taylor

Well, passing out for one thing. Standing up, sitting down, if I got stressed, I would pass out. I couldn't watch screens at all, like reading things, texting, talking, watching a show, nothing. I could basically just sit there and exist and even then, the room would spin.

Throwing up was constant. Like I couldn't keep anything down.

Going to the bathroom, I actually passed out trying to go to the bathroom. And it happened to me consistently. Anytime I tried to go to the bathroom, I was pretty much just passing out.

Showers became impossible. Raising my hands to wash my hair or anything like that, that didn't work.

I couldn't communicate also. I was stumbling my words and I still do when my symptoms are high. I'm medicated right now, and I have lots of water in me—which I didn't know I needed as much as I do now. But I couldn't speak,

[00:25:00]

I couldn't walk, I couldn't do anything.

Shawn Buckley

Now it is 15 months after your second shot. Tell us about if you're able to walk now, 15 months after your second shot.

Drue Taylor

Kind of. I use my walker and I have a cane that I often use. And some days I can make it around my house just walking, but I'm holding on to my counter, my table, and I'm using my arm on the wall. Still, I need this, just because when I stand up, I just start to feel dizzy and nauseous.

Shawn Buckley

And my understanding is, if you do choose to walk around your house, that you pay a physical price for that.

Drue Taylor

Oh my gosh, yes. Every day, just any activity that I do, I need to rest after. I'm not like I was. Every little thing I do requires rest and thought. Like, you know, getting up to go to the restroom for a normal person isn't a thought. But for me, I have to get up, and then feel that rush a little bit. And then it just, I'm exhausted after something very simple. And it takes me some time to rest. Like even after this interview, I have to go lay down for probably two hours just to feel okay.

Shawn Buckley

Right, so for you sitting there doing this interview is going to exhaust you to the point where you're going to have to go lay down for a couple of hours.

Drue Taylor

Absolutely.

Shawn Buckley

Can you go to the store with your walker?

Drue Taylor

No, I need a wheelchair if I'm going to a store somewhere where I'm not sure if I'm going to be able to sit down right away, and I don't know how long I'll have to walk for. I absolutely can't go more than a block without an issue, so I take the wheelchair if I'm going to any kind of store. And I rarely go to a store because that usually takes me three, four days to just kind of recover from.

Shawn Buckley

Right, and are you able to reach above your head?

Drue Taylor

If I'm medicated and I have water in my system, I can do it. But still not without struggle. I still struggle to do that. I feel, again, this rush and I can hear my heart rate just in the back of my neck, and I get a massive headache.

Shawn Buckley

And how is showering today, 15 months after your second shot?

Drue Taylor

I still have to sit down. I generally take cold showers. Heat still is a massive trigger for a flare for me.

Shawn Buckley

Right, and I'm just thinking that, when you had seen Dr. Gee and done the table test, because you weren't passing out, he said that you didn't have POTS. Now there's no doubt in anyone's mind that you have POTS. Am I correct?

Drue Taylor

That's correct. I was diagnosed in April or May of last year. Dr. Raj diagnosed me with POTS and likelihood of hyper and genetic POTS, which is a sub-type.

Shawn Buckley

Okay, and there's also no doubt that it's the vaccine that caused it.

Drue Taylor

Yeah, it definitely triggered it.

Shawn Buckley

The doctors agree with that now.

Drue Taylor

Yes, they do.

Shawn Buckley

And has this affected your eating? So just again going to your experience now 15 months after your second shot.

Drue Taylor

Yeah, I can't handle gluten, dairy, soy. Anything with histamines I stay away from. My diet is basically the same things every day and for me to get in— I'm not getting in enough calories still. I can't eat enough in a day. I feel too sick. In fact, I feel better when I don't eat much because digestion is something your autonomic nervous system handles, and mine is not functioning.

Shawn Buckley

Now, you'd mentioned, Dr. Raj. So he's a new doctor that's helping you. Is he giving you any hope going forward? How is he describing what your likely future is?

Drue Taylor

Dr. Raj has said to me that there is no cure for what I have, and his job is to make me comfortable. He said that more than 70 per cent of his patients do not end up back at work.

[00:30:00]

So he's just trying to make me not as miserable in my day.

Shawn Buckley

So you're 33 years old and your doctor is basically saying his job at this point is to make you comfortable.

Drue Taylor

Yup.

Shawn Buckley

How does this experience make you feel?

Drue Taylor

There is nothing that could have prepared me for this. And I feel like my life is literally turned upside down. And every day I have to choose to look at my silver linings, like my cup of tea that tastes good. I have to really— You know that's my good thing. Where my friends are like, "I went to Mexico." And I'm like, holy crap, for me to fly—

I don't even know what to dream for right now for me, or to hope for because we're a year plus after and I still need my walker. And pressure changes suck with the weather. I can tell it makes me flare.

This whole process has been— It's devastating. It's extremely depressing. I really struggle right now to push through every single day. And to just listen to the comments from people who don't understand what I'm going through, like, "Why aren't you better yet?" It's like, because I have chronic illnesses now, and I have to explain this so many times—as does my husband—that nothing in our lives is normal right now.

Shawn Buckley

Can you tell us how this has affected your children?

Drue Taylor

They're such good kids. They were really used to me being the mom that would run next to them when they rode their bikes. We would go out multiple times a week to parks. I was so active with them. I would do yoga with them and guide them through it.

Now they know to leave me alone if my door is shut because I can't handle talking to them at that moment, or I'll puke, or I'll pass out. They know that if I'm dizzy, and my head is down on the table, that they can't approach me. They have to go to Dad. They know not to ask for things from me, and they just go to Mike—my husband—now a lot of the time for things. It's changed my parenting style completely.

Shawn Buckley

Finally, my understanding is that you filed for the vaccine injury program. And this June, it'll be a year. Has anything happened with that?

Drue Taylor

Oh, I just a couple days ago got an update. And they had said, "We're in the medical board phase," so phase two of three. So only half of the doctors have— They only have files and medical records from half of the doctors that I released them to get files from. And I have been in the medical board section, or phase two of this program for months now. And I figured, you know, I'd be moving along quicker than this.

Shawn Buckley

Thank you. Drue, I don't have any further questions for you, but the commissioners may have some questions. And they do.

Commissioner Drysdale

First, I thank you for your testimony. Can you tell me whether or not you requested or gave permission for an AHS doctor, who you did not know, to examine your personal medical files?

Drue Taylor

I never did. I never gave permission.

Commissioner Drysdale

Thank you.

Commissioner Massie

Thank you very much for your testimony. So sad to see the situation you're in. I'm wondering, given the really sad experience you had after the first vaccine, was there anyone around you that would give you what we might consider a second opinion to really make you consider that this was not a wise move?

Drue Taylor

No. Every single doctor that I talked with beyond— No, every doctor after that tilt test told me that I needed the vaccine, not just to take it.

[00:35:00]

My personal health care doctor, he was reluctant to tell me to take the vaccine. But he too simply said, "You know, your cardiologists and your specialists are telling you to take the vaccine. Let me know when you do." There was not one doctor that looked at me or my file or talked to me and told me, "You know what, you had a reaction, and I think we need to do further investigating before you continue on to the second one." Every single doctor that I spoke with told me I needed the second vaccine because of my blood clot past.

Commissioner Massie

Did you have the chance to provide some feedback to these doctors that advise you, or lecture you to get the second shot as to whether, given your current situation, they would revise their medical advice?

Drue Taylor

Honestly, I hope one day I get the opportunity to see, at least Dr. Gee, the cardiologist who handled the tilt test, or at least to let him know how I'm doing because I hold him accountable to a certain extent, absolutely. He could have told me I needed further investigation and to see an autonomic specialist. And instead, he told me to get the second vaccine—that I needed it—and to see a neurologist. And he dismissed me.

I think that all of the medical professionals on my case telling me to get the second vaccine—especially Dr. Gee and the cardiologist present and the nurse, and the AHS nurse and Dr. Song—they all need to see me now. They need to look at my records now, and see how much suffering I have gone through in the last amount of time. I feel I'm owed more than an apology from them. There needs to be a change, this was not okay.

Commissioner Massie

Can they look at you straight in your eyes?

Drue Taylor

I would like them to. I would certainly look them in the eye and tell them that this was not okay. And do you think that your advice to me was okay? I would like to ask them that. Because I would not have gotten the second vaccine knowing what I know now. Absolutely not.

Commissioner Massie

Thank you.

Commissioner DiGregorio

Thank you so much for sharing with us today. You mentioned that you're taking part in the vaccine injury compensation program and that you're still in the middle of the process. How long have you been in the process?

Drue Taylor

June will have been a year.

Commissioner DiGregorio

Okay, and do you have any expectation of how long it will take for you to get some resolution in your case?

Drue Taylor

They originally told me the process would take anywhere from 12 to 16 or 18 months. Honestly, I forget if it was 16 or 18, but they did tell me it would take some time.

Commissioner DiGregorio

Okay, and what is your understanding of what type of compensation you will be available to get?

Drue Taylor

My understanding is that it's on a case-by-case basis, and when it gets to that point, we'll cross that bridge.

Commissioner DiGregorio

Thank you.

Shawn Buckley

Drue, the commissioners don't have any further questions. On behalf of the National Citizens Inquiry, I sincerely thank you for being willing to come and share with us today.

Drue Taylor

You're welcome. Thank you.

[00:38:42]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 9: Jeffrey Rath

Full Day 2 Timestamp: 08:27:57–09:20:23

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is going to be Jeffrey Rath. Jeffrey, can you come up to the stand, please?

Jeffrey, can you state your full name for the record, spelling your first and last name?

Jeffrey Rath

My name is Jeffrey Ralph Wallace Rath, J-E-F-F-R-E-Y. Rath, R-A-T-H.

Shawn Buckley

Jeffrey, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Jeffrey Rath

I do.

Shawn Buckley

Now you've been a constitutional lawyer for 32 years. Can you briefly introduce yourself and the experience that you've had as a constitutional lawyer?

Jeffrey Rath

Certainly. My educational background, I hold honours degrees from the University of Alberta in political science. I have an honours degree in law from the London School of Economics and Political Science, which is a college of the University of London in England. I have been practising almost exclusively in the area of constitutional and administrative law for 32 years, winning a number of cases, including cases at the Supreme Court of Canada on behalf of Indigenous people of Canada.

And since the outset of the assault on our personal liberties and the liberties of my fellow Canadians, I've been engaged in COVID litigation since the fall of 2020, in cases involving the Alberta government and citizens whose rights, lives, and businesses were destroyed by the medical dictatorship presided over by Deena Hinshaw in this province.

Shawn Buckley

Now, we've had several lawyers come and speak on different issues concerning how the Courts have dealt with COVID. But you're here to share with us something different concerning administrative law reviews. I'm wondering if you can introduce that topic to us and then share your thoughts.

Jeffrey Rath

Certainly. As a result of my experience in the courts through COVID, and I would say my experience in the courts doing administrative law prior to COVID and then after COVID, it really became clear to me that the real problem that we face in terms of having the courts protect the rights of citizens in the context of administrative law and judicial review is one single word. It's a word that has a very subjective interpretation as it's applied by the courts and by the judges. And that word—its variations of the word—the word “reasonable” and the word “reasonableness” in an administrative law context.

And, of course, going back through the history of administrative law, the standard of reasonableness in administrative law has always been a tricky one. The English test was out of a case that then came to be known as the *Wednesbury Rule on Reasonableness*, which was: the decision of a bureaucrat or a bureaucratic or administrative decision-maker was only unreasonable if it could not have been made by any other reasonable decision-makers. So you can see how circular that is. And how easy it is for any decision-maker, having a particular will to not decide in favour of an applicant, could easily just use that definition to step out from underneath ruling in favour of the citizen or ruling in favour of actual judicial review.

Now in the Canadian context, I would submit, and my concern is two cases have created substantially even more mischief than the old *Wednesbury Rule* that was brought up through what's called the *Dunsmuir* case in Canada. But the two cases that I'm concerned with—and I think need to be legislated out of existence because there's no remedy in the Courts, and they're common law cases, so they can be legislated out of existence—is the *Doré* case or *Doré* versus the *Barreau du Québec* case, which was used by the British Columbia Court of Appeal in *Beaudoin et al* versus the Attorney General of British Columbia to deny rights in that case. And then the other case from the Supreme Court of Canada, which I say needs to be legislated out of existence, is the *Vavilov* case [*Canada (Minister of Citizenship and Immigration) v. Vavilov*] at the Supreme Court of Canada, which basically takes the *Wednesbury Rule* and then injects it with steroids and creates a situation where no citizen challenging an administrative decision has a hope of ever winning in the face of a decision that's made by an alleged expert in the context of their expertise.

Of course, that's what we've run into in the context of COVID. We have people that the courts defer to.

[00:05:00]

Deena Hinshaw—let's start with her—perfect example. She's afforded the deference of an expert, notwithstanding the fact that a number of statements that she's made publicly and

otherwise were negligent and delusional. I'll provide an example of what I would consider to be a negligent and delusional statement made by Deena Hinshaw.

That was the day that she stood up and encouraged everybody in this province to not worry about if they've been injected with AstraZeneca— To sign up for Dr. Hinshaw's magic vaccine buffet, and then go on and get injected with Moderna and get injected with Pfizer. It's all okay: that's what she did. She signed up for her own special vaccine buffet and encouraged other people in this province to sign up for this program of hers that had never been studied. We've looked for the studies. There aren't any.

There's no drug company in the world that expends millions of dollars to determine how their product, that they've already spent millions of dollars quasi-licensing—because we know these products aren't really licensed—to see how their products interact with other companies' quasi-licensed products from a safety perspective. So there's Deena Hinshaw, I think, delusionally and negligently, encouraging men and women in this province to sign up for her vaccine buffet.

We know from the news reports—that poor woman in Lethbridge and other reports—that the people that have signed up for her vaccine buffet have been horribly injured and have actually had recognized vaccine injuries through the vaccine injury program as a result of Dr. Hinshaw's negligence standing up publicly and encouraging people to sign up for her untested, scientifically unproven vaccine buffet. Which I would submit is completely unsafe, unregulated, and was completely inappropriate for her to recommend.

Notwithstanding this, however, according to the Vavilov decision at the Supreme Court of Canada, she is an expert. And the courts need to defer to her expertise in terms of all of her decisions because no judge should ever question a decision of an expert in their field of expertise. What I would suggest is that concept— And again, these are just common law concepts: This is judge-made law. This is not constitutional law; this is not law that's made by legislature. It's judge-made law. Within Canadian jurisprudence, the framework of our democracy and our legal system, it forms part of the common law; it's part of our constitutional order. But it's easily written and overwritten by a simple statute, which is what I'm focused on now.

We're never going to get our lives back; we're never going to recover what's happened to us. But we can all make sure this never happens again by insisting that the people that we elect and the legislators that we elect take concrete steps to amend our statutory framework to make sure that this never happens to us again.

One of the things that I would be recommending is statutory amendments to the *Alberta Interpretation Act* to start off with, to make it clear that the standard of reasonableness is to **no longer apply in cases where the rights of a citizen are at issue. And the test, in all of those instances, should be correctness, with the onus of proof on a balance of probabilities lying with the bureaucratic decision-maker seeking to infringe the rights of the citizen through their decisions. If those people were held accountable, I don't think we would have suffered the things that we've suffered over the course of COVID. Because the bureaucrats, like all of the people on the Scientific Advisory Group as an example, all of whom I believe should be sued into oblivion for the things that they did: making decisions to limit vaccine exemptions to the narrowest of circumstances.**

Testimony in the Ingram case proved that they had no psychiatrists or psychologists or anybody with psychiatric training on that panel. Obviously, we had psychiatric experts that we were consulting with throughout. We heard that heartbreaking testimony earlier today

with regard to the consequences of what these decisions were in the realm of the suicides that have occurred in this province because the Scientific Advisory Group was not considering the impacts of these mandates: be it a mask mandate where people are suffocated; or vaccine mandates where rape victims and other people, who have suffered horrible abuse, literally felt like

[00:10:00]

they were being held down and re-violated against their will, again. To the degree that drove suicides, none of that was considered by the Scientific Advisory Group, the College of Physicians & Surgeons [of Alberta], Deena Hinshaw.

Psychiatric exemptions were not available to people that didn't want to get vaccinated or were unable to get vaccinated for those reasons. We had the suicide rate going through the ceiling. To this day, we can't get anybody in Alberta Health, including the Chief Medical Examiner from the Province, to answer correspondence forwarded to his office by Leighton Gray and I, demanding from him the degree to which suicides were driven by these mandates and driven by these policies.

We asked that question of Dr. Hinshaw under oath. She would not answer the question. She said, "Oh, the person you have to ask is the Chief Medical Examiner." Of course, we asked the Chief Medical Examiner, and we don't even have the courtesy of a response to our correspondence. We all know that the impacts of all of these things have been real. The health and mental health of our children has been impaired as a result of these delusional decisions that the courts pay deference to. In that regard, I'd like to mark these documents as exhibits. I'm going to provide electronic links to them.

Shawn Buckley

Yeah, so Jeffrey, we've spoken about that. You're going to provide me electronic copies, and then we will enter them as exhibits. I don't have the exhibit numbers. I have to get that from the person that files them. Then they will be available online so that anyone watching your testimony will be able to access exactly what you're referring to today [exhibit number unavailable].

Jeffrey Rath

I'm just going to hold these documents up. Because these documents, I'm tendering as evidence of the delusional nature of the decision-making at the Public Health Agency of Canada by Theresa Tam, who was the one that was telling everybody, "Oh, it's safe and effective; everything's safe and effective," and to whom Deena Hinshaw swore under oath, **she was deferring. She didn't need to personally inquire into the safety and effectiveness of the vaccines because the great expert, Dr. Theresa Tam, has said they're safe and effective.**

Well, this same Dr. Theresa Tam, on October 25th of 2022, drafted a paper. I'm going to hold it up, and it's called *Mobilizing Public Health Action on Climate Change in Canada*. I think she's unhappy that her COVID powers have been stripped. So she's now declared that climate change is the largest single public health emergency facing Canadians and that we all need to know that climate change is caused by racism, colonialism, ableism, and heteronormativity: are the four causes of climate change.

And, of course, because it's the largest public health threat to Canadians—keep in mind what they did to us during COVID—they could theoretically lock us up in our homes again

so that we're not as heteronormative, able-bodied people wanting to go to work, who may or may not be racist or colonialist, or whatever other "ist" or "ism" they want to accuse us of, lock us in our homes, and then when we go to court to judicially review these decisions, either under the Charter or just straight administrative law principles, we run smack into Vavilov or Doré, which say that:

Oh well, this is a reasonable decision that is made within a range of reasonable decisions that can be made by a reasonable bureaucratic decision-maker. And we really can't get behind her decision because she's an expert, and we have to take judicial notice of her expertise.

Regardless of the fact that we're scratching our heads over the fact that heteronormativity may or may not have anything to do with climate change, or ableism may or may not have anything to do with climate change, she's an expert: we can't question these decisions to lock you back up in your homes. This is the law of Canada as it stands from the Supreme Court of Canada. Have a nice day.

So again, what I'm strongly advocating is that legislatures have to act. And I'm specifically requesting Daniel Smith consider immediately bringing bills to the legislature. I don't care that an election is a month away. The legislature is still in session, I think. I want to see amendments to the *Alberta Interpretation Act* to ensure that, in the future, all judicial reviews are on the basis of correctness, with the onus being on the bureaucrat to prove, on a balance of probabilities, that their decision is correct and demonstrably necessary to override the individual rights of the citizen.

I want to see amendments to the *Alberta Bill of Rights* to ensure

[00:15:00]

that property rights in this province are not governed by the Supreme Court of Canada's decision in *Authorson* [*Authorson v. Canada (Attorney General)*], which says that legislatures can override property rights decisions simply by running a bill that eliminates property rights through the legislative process.

I want the *Interpretation Act* to state specifically that businesses cannot be shut down by legislative fiat and that property cannot be taken away from Albertans, be it their firearms, their cars, their tractors, their combines, their fertilizer, whatever it is that the Trudeau dictatorship wants to take away from us next.

Shawn Buckley

Jeffrey, can I step in and just slow you down a little bit? The first thing is you've got some very specific ideas to bring about change to help ensure that our rights are protected and that the decisions of administrative people can be reviewed.

I'm wondering if—being that you're going to be sending us these two documents anyway—you could write those out for us because I think the commissioners in drafting the report and considering how things could be done differently could really benefit.

Jeffrey Rath

I'd be happy to do that. I'd actually meant to prepare a paper in advance of the hearing, but I was called into a two-day hearing on the Court of King's Bench on short notice. So I will prepare a paper with the appropriate citations and exhibits.

Shawn Buckley

Okay. Just to slow us down again because I want to make sure that people hearing your evidence understand. So we've already heard about how basically we've moved into an administrative state, and we have these public health officials making these decisions. And what you're saying is, "Well, if one of these decisions affects us as a citizen, maybe even if our life depends on it and we appeal, as citizens, we're going to expect the court to ask, 'Is this decision right or is it not right? Is it correct, or should it be overturned?'" But the court doesn't even have the right to see if it's correct because these appeal decisions say, "No, no, Judge, looking at this appeal, the issue is, could somebody have reasonably made this decision?" Which is such a big, grey, messy pool that we really don't have an effective review.

Jeffrey Rath

Well, I'd like to comment on that because I think we're all painfully aware of the horrible decision involving that poor woman in this province that needed a lung transplant. At the end of the day, the court simply deferred to the doctors on the transplant committee and found that the requirement that she be vaccinated in advance of the transplant was a reasonable one; you either go along with your reasonable doctors or prepare to die, right? Effectively, this woman was sentenced to death by administrative law from my perspective.

Keep in mind, in the context of that case, had the review been on the balance of correctness, that lawyer would have been able to call esteemed experts like Dr. Dennis Modry, who is the former head of the entire transplant program at the University of Alberta—who's actually a personal friend of mine; and who I spoke to about this case in particular. It was certainly Dr. Modry's opinion that the transplant was not contraindicated by not getting the COVID vaccine.

Dr. Modry was concerned that there were numerous studies floating around that indicated that the mRNA [Messenger Ribonucleic Acid] vaccine may, in fact, be a contraindication for transplants because of risks associated with organ rejection, and so on, with the vaccine. So had that decision been reviewed on a standard of correctness rather than reasonableness, that poor woman may, in fact, have been able to look forward to living and, instead, she ends up being sentenced to death by judicial review and administrative law, which I think is horrible.

Shawn Buckley

So that's the case that makes your point. So here it's a life and death decision for that lady. She appeals it. But she doesn't even have the right, even though it's life and death, for the court to say, "Yes, this is a correct decision, or this isn't a correct decision."

Jeffrey Rath

That's it exactly. And I think that that law— and again that's why I say quite strongly that the Vavilov decision and the Doré decision need to be legislated out of existence by the Alberta legislature. Certainly, the legislature has the authority to do that, and it needs to do

it sooner rather than later. But of course, the problem is— And if I could just speak to this quickly. I'm not sure where I'm at on my time.

Shawn Buckley

I was hoping you'd go 30 minutes, which gives us about seven. But I know the commissioners are going to have a bunch of questions for you.

Jeffrey Rath

Okay, well I just want to wrap up on this one point, and then I'll defer to the commissioners for questions.

[00:20:00]

Following along with that thought, in terms of needing to legislate an end to that type of deference to decision-makers, there needs to be real accountability for these people.

One of the things that's happened, at least from my perspective because I also represent a number of doctors who've been under attack by the College of Physicians and Surgeons, I was representing doctors that were on the verge of being fired by AHS [Alberta Health Services] because for health reasons or other personal reasons, they couldn't be vaccinated. The legislature needs to take an active role in making sure that this doesn't happen again. Because these are people's lives that are being destroyed by these decisions. People's lives are being put at risk by these decisions, and people are actually losing their lives because of these decisions. As far as I'm concerned, I don't think there's any better definition of the word "unreasonable" than for that circumstance to continue to prevail as a matter of jurisprudence in this province.

Shawn Buckley

Thank you, and on that note, I will ask the commissioners if they have any questions for you.

Commissioner DiGregorio

Thank you so much for sharing your testimony with us today. Can you help me understand a little bit about what your specific recommendation is in terms of legislating? I understand that under the common law, as it exists now, there are two standards of review that can be used to review a tribunal's decision or an administrative board's decision. So one is the one you're speaking about, the reasonableness, and the other is the correctness.

Jeffrey Rath

Correct.

Commissioner DiGregorio

And so when one of these decisions gets reviewed by a court, the court first determines, "Am I reviewing it on a standard of reasonableness, which is just, could this board have reasonably reached this decision? Or am I determining whether this decision was correct?"

Jeffrey Rath

No, the standard of review with regard to expert boards and tribunals, and now under Vavilov, is always reasonableness and not correctness and with the court giving a huge amount of deference—and I think it's undue deference—to so-called expert boards and tribunals.

You know, a discussion I was having with a colleague of mine is that judges make difficult decisions and complex commercial litigation all the time on the basis of expert testimony. So why is it in the context of administrative law when a citizen's rights are at issue— And we're talking serious rights: Your right to life. Your right to continue to operate your business, to earn a living. When you think of all the lives that were destroyed through COVID. I know business owners that committed suicide because they were bankrupted through COVID by having their restaurants shut down. So those types of decisions are being made on an ongoing basis, and the courts defer to the decision-maker. They defer to Deena Hinshaw. Notwithstanding the fact that we have actual evidence from her own mouth that she's not only unreasonable but she's negligent in the practice of medicine—but the courts still defer to her as an expert.

So that's what I want to legislate an end to, whether we do it through the *Interpretation Act* or we draft a new *Alberta Administrative Law and Procedures Act*, or whatever it is. On the property issue, we can make a simple amendment to the *Alberta Bill of Rights*, under section 1, to make it clear that property rights are not the rights spoken of under Authorson but our substantive rights, not procedural rights, to own property in this province. Those are the types of changes that I think need to be changed immediately to ensure that the type of abuse that we've all suffered never happens again. If that answers your question.

Commissioner DiGregorio

Well, it brings another question. So you're suggesting that we use these two concepts of standard of review that already exist. But simply legislate that— Because Vavilov has said, "It's reasonableness when you're dealing with an administrative board," we legislate that you have to use the alternative standard of correctness.

Jeffrey Rath

That's it, exactly. I'm saying that we outlaw the standard of reasonableness because, as far as I'm concerned, bureaucrats should not be given the benefit of the doubt over the rights of a citizen. So that's where I see the tension because keep in mind: The bureaucrats control Alberta Justice. They control the constitutional law branch of the Department of Justice in Ottawa. They literally control hundreds of millions of dollars worth of legal resources in this country, where they can litigate these cases against us on an ongoing and continual basis to maintain these abusive standards against us. The citizen really doesn't have a chance anymore. So what I'm saying is that the concept of reasonableness in judicial review needs to be outlawed and replaced with the standard of correctness to level the playing field between the bureaucrats and the citizen.

[00:25:00]

Because these people need to be reminded that they are public "servants." They are not our masters.

Commissioner DiGregorio

I know you have some thoughts, how you've expressed that this could maybe be done through the *Interpretation Act*, maybe the *Alberta [Law of] Property Act* or the Bill of Rights. But what about all of the statutes that contain specific privative clauses that ask the courts to pay deference? Do all of those need to be revisited?

Jeffrey Rath

As I said, I think that they should be outlawed across the board. One of the statutes that, I think, requires an immediate amendment is the *Public Health Act*, specifically section 66.1, that exempts people like Deena Hinshaw—who are making clearly negligent public statements with regard to public health—from being sued. Section 66.1 of the *Public Health Act* says that if they're acting in good faith, they're virtually immune from lawsuit. That's why the CM decision of Justice Dunlop's gave me such hope because Justice Dunlop flat-out said that Deena Hinshaw's decisions with regard to her so-called orders were not lawful decisions under section 29 of the *Public Health Act* because she didn't make the decisions as required under the *Public Health Act*. She, in effect, acted like a cocktail waitress: Took a list of drinks into the Sky Palace cabinet and said, "What beverage would you like today, boys?" They'd pick one from the list and then tell her what to do. And then, of course, what we saw, Cabinet would say, "Well don't blame us. Dr. Hinshaw made the decisions." And she'd throw them under the bus and say, "No, no, no, they made the decisions. I just gave them a list, and they picked what they were going to do to the citizens. I just told them what their options were."

But keep in mind, one of the options was no restrictions or limited restrictions. But they wouldn't pick that one. They picked the one in the middle because they didn't want to irritate the hard-core, let's-lock-everybody-down and mask-everybody-14-times people on one end of the spectrum. And they didn't want to make it appear that they were giving in to the people that thought all of this was hogwash at the other end of the spectrum. So they literally picked the "rights abuses" in the middle of the spectrum to equally offend both sides, which they seem to have well-achieved in doing.

I'm hopeful that Justice Dunlop's decision will prevail and that all of Deena Hinshaw's orders will be found to have been illegal because they were not issued under section 29 of the *Public Health Act*. As my friend Colonel Redmond has testified: They could have been issued under the *Emergencies Act*. But the Kenny Cabinet didn't have the courage to do that themselves. They wanted a scapegoat under Deena Hinshaw, which is what made her orders illegal. But as far as I'm concerned, I want section 66.1 of the *Public Health Act* gone so that Deena Hinshaw can be sued by all of the people that followed her advice and signed up for her vaccine buffet and took one of each. And have been horribly vaccine injured as a result.

Commissioner DiGregorio

We've heard from a number of other lawyer witnesses who testified about the concept of judicial notice, which is the idea that a judge can accept a fact without actually seeing evidence of it and that the courts may have been taking judicial notice of facts to support decisions in favour of the government. Do you have any thoughts on the concept of judicial notice?

Jeffrey Rath

Outlaw that, too, quite frankly. I mean, it's sort of a subset of the issues that we've been discussing. The problem that we have now is that this concept of judges being able to take judicial notice of decisions of the delusional—like Theresa Tam saying that capitalism causes climate change and heteronormativity causes climate change, et cetera—that needs to be stopped. Full-stop. But only the legislatures can do it now because that concept has been elevated to such a high appellate level in Canada that lower courts, within the Canadian system of *stare decisis*, would find themselves bound by it.

So we're not fixing the problem in court. The problem needs to be fixed in the legislatures. All of us here, collectively in this room, need to be encouraging all of our friends and neighbours not to vote for anybody or support any legislator that would not support this type of legislation.

Commissioner DiGregorio

Thank you.

Commissioner Massie

I have a question. You're proposing to pass a law at the level of the Province to outlaw these measures. What's going to happen at the higher court and the federal level? Can that be superseded?

Jeffrey Rath

Well, I guess we'll find out in six to eight years when it gets to the Supreme Court. But, at least, we'd enjoy our freedom

[00:30:00]

in the meantime, would be my answer. But that having been said, in all seriousness, I'll try not to be so tongue-in-cheek with my response. The Superior Courts, including the Supreme Court of Canada, routinely uphold provincial limitations legislation. And trust me, as somebody who's litigated against the Department of Justice for 32 years, they love raising provincial limitations legislation as bars to constitutional claims. So what's good for the goose is good for the gander. If the federal government can rely on limitations legislation to defeat the constitutional claims of citizens, I see no reason that valid provincial legislation that gives effect to section 92 of the *Canadian Constitution Act, 1867*, specifically the property and civil rights provision of that constitutional document, as superseding the federal criminal law.

A good example is gun legislation, where the Province could literally pass a law that said that any federal criminal legislation that sought to seize property in the province of Alberta offends property and civil rights in the province to the extent that the firearms restriction wasn't issued as a bail condition, or alternatively, following the conviction of somebody for an act of violence involving a firearm. I think it was Carol Conrad in our Court of Appeals who said it was massive overreach for the federal government under the criminal law to attempt to seize chattel property in a province. So these limitations are available. I would think that we'd have a reasonable shot at upholding that legislation on a going-forward basis.

As I said, in the interim, at the very least, the legislature passing legislation like that would put the judiciary on notice that the citizens of Canada and the citizens of Alberta are tired of judge-made law and people being sentenced to death by administrative law in this country. It's got to stop. I think the only way to stop it is through legislation.

Commissioner Massie

Can I ask a question that may be a little bit outside of your field of expertise because I know that this is common law.

Jeffrey Rath

I'm a lawyer. We'd never admit to that. I'm kidding. Sorry.

Commissioner Massie

In Quebec, it's not exactly common law, it's a—

Jeffrey Rath

No, no, je comprend.

Commissioner Massie

What I've seen in Quebec is that it seems that we've been through the same sort of issues in court. So do you think, what you're proposing to change at the provincial level across Canada, could that also be enacted in Quebec?

Jeffrey Rath

Oh, absolutely. I have to say the Government of Quebec has been very, very good at ousting federal jurisdiction through le code civil in Quebec. The civil code in Quebec, as you're well aware, is really just a form of legislation. It's a codification of the law in Quebec, and the Quebec legislature is very used to passing laws that limit or restrict the applications of federal law in Canada. What I'm suggesting is that the Government of Alberta needs to wake up and start aggressively adopting the same approach. Of course, they'll be labelled as extremists in the press, but so be it.

Commissioner Massie

Thank you.

Commissioner Drysdale

I just want to back up on this a little bit because, constantly, one of the themes I keep hearing from all kinds of people, doctors, lawyers, is that the fundamental tenets of our society have been challenged or destroyed or dismissed. And what you were talking about: you were talking about this reasonableness and judicial notice and these kinds of things. How is that consistent with the basic fundamental tenet of law that the two parties arrive in court on the same footing, that they are considered equal under the law, and the evidence will be weighed and a decision made on the basis of that evidence?

Jeffrey Rath

Well, from my perspective, it's not. When you look at the history of administrative law and administrative law cases, the scope of the bureaucracy to affect our lives was always a lot more limited. But because of this massive growth of the administrative state, bureaucrats now feel that they have the right to interpose themselves into virtually every single aspect of our lives. We saw that through COVID.

What I said very early on in COVID that, from a legal perspective,

[00:35:00]

it's like after the crash of 2008, 2009: all the financial institutions were forced to go through what were called stress tests. From my perspective, our democracy and our fundamental system of justice in Canada underwent a massive stress test through people ordering things by fiat, through the medical dictatorships that were running across this country, et cetera. And we failed. We completely failed the stress test.

And I think that we need to take the lessons from that stress test in the same way that the banks and the financial institutions did. Governments need to do the same thing that they did post the crash of 2008 and 2009. They need to step in and legislate safeguards for the citizenry of this country as against the bureaucracy in the administrative state that now operates as a virtual dictatorship in this country. Don't think for a second that when Theresa Tam and her minions at the Public Health Agency of Canada are now saying that climate change is the largest public health threat to Canada that they're not going to start flexing their muscles and issuing dictates.

They want to end capitalism in Canada. And that's without considering for a minute Economics 101. If you're a government employee whose entire salary is paid by the taxpayers, how is it that you're going to be able to continue to be employed and have your salary paid when capitalism is magically abolished in Canada through the waving of a magic fairy wand? I mean, it's completely ludicrous. And these delusional people are the ones that the courts defer to under the doctrine of reasonableness. And it has to stop.

Commissioner Drysdale

Well, I listened to you and I listened to your passion. But it almost sounds like the old story about the little Dutch boy with his finger in the dam. I refer you to a bunch of different things. Lieutenant Colonel Redmond, this morning, talked about the deferral—and these are my words—the deferral from the legislature to the administrative state. In other words, **the mayors and the premiers, et cetera, were supposed to make these decisions, but they deferred to the public health officers. When I look at something like Bill C-11, and I see the legislature deferring their decisions to the CRTC [Canadian Radio-Television and Telecommunications Commission], and when I see the health legislation being considered, which is deferring Canadian decisions on health to the WHO— that's a trend. What you're talking about here is the same trend. So it seems like there's a lot of holes in the dam.**

Jeffrey Rath

No, I understand that. I think as long as we have the government we have in Ottawa, there's no fixing Ottawa. But I really believe in Alberta, we're at a tipping point. I personally and passionately believe that we have an opportunity here to fix things, at least in our little

corner of the world, by insisting that the Alberta legislature address these problems through legislation and fix these problems. I think the political will is there. We just have to insist that our leaders take a step back from the bureaucrats and the administrative state, and act on their own and advise the bureaucrats and the administrative state that the elected representatives are in charge, not the bureaucrats.

A recent example, and I'll just say this quickly. I have a friend that was speaking to a city councillor here in Red Deer. He said, "How the hell is Red Deer on the list of World Economic Forum 15-minute cities?" The councillor said, "I didn't know that. We didn't make that decision." The decision was made by bureaucrats within the City government. "Oh, well, there's federal money available to put up cameras to monitor people, and there's money available to restrict traffic flows and make people's lives more miserable. So we just thought we'd take the money. What's the problem?" But these decisions to restrict our rights and to drastically impact our rights are being made at the wrong level by people that shouldn't have that decision-making authority and, certainly, not without the supervision of the people that we elect to make sure that those types of decisions are not made without consulting the people.

Commissioner Drysdale

You're right. I believe you're right. What you're talking about is influencing the legislature, which means you need to influence the people who elect these people. But then, on top of it all, the fourth branch of government, which is the media, is completely on the other side. You still have to this day, in April of 2023— We've heard a lot of different testimony where these mandates and restrictions and all kinds of other things are still in place. You still have mask mandates.

[00:40:00]

That is a consequence of the disconnect between the people and their media, which is now standing in the way between the people and the legislature. Which is kind of similar to what's happened in the courts. The courts are supposed to stand between the legislature and the population.

Jeffrey Rath

But again, that's why initiatives such as this one, I believe, are so important. I mean, the citizens have a voice and are being able to communicate through this wonderful forum that's been provided here to tell our legislators what we think. That's all we can do.

My background is actually in Treaty and Aboriginal rights or Indigenous law. And I've spent 30 years moving the needle by litigating cases in virtually every single jurisdiction in the country. But we can't give up. I mean, you just have to keep hammering on them and hammering on them and hammering on them. You have to be relentless because if you are not, the views of the bureaucrats will prevail. Let's face it, these same people that are talking about colonialism and white supremacy and racism, these are the same people that I've been litigating against for the last 32 years because they're colonialist, white supremacists, racists who despise the rights of Indigenous people. You'd think every time I get a new Indian added to the Indian list that I've committed some crime.

So don't think for a second when Theresa Tam and her people are decrying colonialism, racism and white supremacy, that that's an end to climate change, that they're not part of the problem. And they're not the problem. Because how many First Nations territories do

we have in Canada that still don't have clean drinking water yet damn near a trillion dollars was wasted over COVID. It's a national embarrassment.

Commissioner Drysdale

Yeah, I just want to point out that you sound to be in a similar situation that Mr. Buckley was talking about first thing this morning when he did his introduction. He was appealing to the people, not to the courts, not to the media, but he's appealing to the people of Canada to take responsibility. It sounds to me that that's really what you're asking for, and if you don't get that, your chance of success is much, much reduced.

Jeffrey Rath

I agree with that. But I mean, that's why I'm here, and that's why I do the things that I do from a public education perspective. All of us need to take a role, every single person here. If you're angry about what I've said, go home and write a letter to your MLA [Member of Legislative Assembly], send an email to your MLA, send an email to Danielle Smith. She'll listen. Don't bother sending one to Rachel Notley. She ain't going to pay attention. Keep in mind that Rachel was fine with the unions not grieving the claims of their members who were fired or laid off without pay for not being vaccinated.

So focus on the people that will listen and make them listen. They're your elected representatives. Everybody here has a duty. Every time you get mad, send an email. They do pay attention. There's a lot of people in this legislature that, even though they haven't been as brave as we'd like them to be, they care and they'll listen.

Commissioner Drysdale

Thank you, sir.

Shawn Buckley

Jeffrey, I'm just wanting to clarify for the audience because sometimes experts just assume that people know what is being said. I just wanted to clarify a couple of things. You were talking about Alberta passing amendments in the *Interpretation Act*, basically protecting civil rights. I think it's important for people to understand that under section 92 of the *British North America Act, 1867*, which is the first part of our Constitution, provinces have jurisdiction over property and civil rights. And that's why they would have the authority, and that's also why Quebec could do the same thing because all provinces have that right.

Jeffrey Rath

Absolutely. But again, the problem that we've had in Alberta is that the bureaucracy has convinced governments that the power of the administrative state should govern rather than our elected representatives. We need to force our legislators through the democratic process to re-tip the scales to at least an even playing field.

Shawn Buckley

And then the other thing that I was hoping people understood. You were talking about: we have to bring changes to the *Interpretation Act* to bring this test of correctness. So I'll just bring people back. So let's say the example you gave where the lady could not get a lung transplant because she's not vaccinated. This is a life-and-death decision for her. And

your one point you've explained: It shouldn't be reasonableness. It's just, "Is this a correct decision or not?" But you also want to change where the test is a balance of probabilities—where the bureaucrat has to justify. I want people to understand that this lady, when she did her appeal, she had the onus to show that the decision was unreasonable, let alone not correct. What you're suggesting is,

[00:45:00]

no, when rights are at play—especially where somebody's life is at stake—no, the experts should have the onus, the burden of proof. I just wanted to make sure that people listening to your testimony understood you because that's a very important thing that you're suggesting. And I just wanted people to understand.

Jeffrey Rath

Yeah, that's exactly what my testimony is, and that's exactly what my recommendation is going forward. Thank you.

Shawn Buckley

Thank you. So Jeffrey, on behalf of the National Citizens Inquiry—

Jeffrey Rath

Oh, I think there's one more question.

Shawn Buckley

Oh I'm sorry. I didn't see that. I thought they were done.

Commissioner Kaikkonen

Good afternoon. I'm not a lawyer and I'm from Ontario. So I can tell you that most of us in Ontario that have lost our voice in many occasions are very thankful for you people in Alberta who do stand up. So that should be a help.

But as a non-lawyer, I'm just going to kind of go through a number of thoughts that I have because I can't really formulate a question right now. I need some thought and processing time, but I'm going to run through a number of thoughts that I have.

So in the raw milk decision that came down in the Supreme Court, I believe a year ago now, it was a week-long decision and the farmer had taken it all the way to the Supreme Court. He was regularly raided at his farm for providing raw milk to people who had health injuries or health sickness and were able to survive better or manage their health issues better through raw milk. Now, I watched the interveners in that Supreme Court case. And the interveners were the same ones that were the civil servants who raided the farm regularly, who made the decisions, who rejected the appeals, and were basically the ones who shut it down. And so the Supreme Court ended up saying, "The raw milk farmers, you've lost your case." That's my first point there because the judge, jury, and executioner at that time was the civil servants. It was the administrative state. That farmer took everything he had in terms of finances and resources and arguments to the Supreme Court level because he believed in fighting for the citizens.

My second point is how do we reconcile that CRA [Canada Revenue Agency] employees currently write the speeches for MPs [Members of Parliament], our federal MPs? How do we change that so that the bureaucrats or the civil servants are not running the show? My third point is the MPPs [Members of Provincial Parliament] in Ontario. When a private member's bill comes in, and it's 28 pages long, you know they're not going to read it. And it's going to go through the legislature for a second and third reading simply because they're not going to read it, and they're not going to have the arguments to argue against it. Even though people are writing to these MPPs and saying, "Oh wait a second. There's some serious issues with this potential legislation." And yet, they don't do it.

I also look at things like Elections Ontario, who is a silo unto itself, who is responsible and accountable to no one. You cannot get access to information; you cannot get anything from them whatsoever. They are a silo unto themselves. Whatever the CEO [Chief Electoral Officer] of Elections Ontario says, that's it, doesn't matter. He has undue influence, significant undue influence, over the Premier's office.

So although it's not a question, there are a number of thoughts I have: just how do we as ordinary people turn this around to a place where the citizens matter in this country, not only in the political level but the judicial level and from the head of state level? And how do we restore the fundamental rights and freedoms that we have in our democracy because I feel that we've been left as the people who pay the wages and no matter how many voices we have, we're not significant to any of those players? I thank you in advance for whatever you can answer.

Jeffrey Rath

Well, thank you for that. That's a lot to chew on. But again, I think, it just comes down to what I've been talking about today: all of us, as citizens, need to take responsibility for what's happening in our respective provinces and take responsibility for our respective governments and our respective legislatures. I think it's an old truism of democracy that we always get the government that we deserve. I think people need to start looking inward and then focusing their anger and energy outward to make sure that politicians understand how it is that we feel about rights restrictions and how it is that we feel about the growth of the administrative state.

I was horrified to hear today that AHS is back up to over 105,000 employees after having been trimmed back to 60 or 70,000. These bureaucracies just continue to grow and grow and grow. Maybe that's what Theresa Tam's so-called experts at PHAC [Public Health Agency of Canada] are talking about when they say, "let's bring an end to capitalism."

[00:50:00]

They want everybody employed by the government as a government bureaucrat, and we can all join the administrative state. But God knows how we are going to pay for it if we don't actually produce anything or grow anything or have real jobs as working men and women in this country.

My hope is that all of us watching this process and taking part in this process will understand that, again, it's a bit of a cliché: But it starts with us. The responsibility lies with us to make sure that, on a regular basis, our legislators know what we're thinking and how we feel and how inappropriate so much of what's being done in their name, as our representatives, is in the context of just poor bureaucratic decision-making and needs to be questioned at every turn.

I think we need statutes that also hold bureaucrats accountable, to make it easier for individual citizens to sue individual bureaucrats, so that they're personally liable for the decisions that they make and they don't get to hide behind the government. Those are all things that should be considered, especially in light of what we've suffered in the last several years.

I personally believe that Deena Hinshaw should be held personally liable for recommending people sign up for her vaccine buffet. Anybody that's injured under that regime should be suing Deena Hinshaw personally. That advice can't be anything other than negligent: there isn't a single scientific study in the world that supports that prescription.

Those are the types of things that I worry about and that I think about. I don't know if that answers any of your questions. But even your raw milk decision, I think, would be cured by the changes to administrative law that I'm proposing.

Commissioner Kaikkonen

Just as a follow-up, the raw milk farmer is still being raided even after that decision, and he doesn't sell raw milk anymore. But thank you for your commentary.

Jeffrey Rath

Thank you all for listening. It's been a real honour and a pleasure to be here.

Shawn Buckley

So before everyone claps, let me thank him. So Jeffrey, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing your thoughts. You've given us a different angle to think about on how we solve this, and we really appreciate you coming and sharing with us.

Jeffrey Rath

It's been a real privilege. Thank you.

[00:52:26]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 10: Regina Goman

Full Day 2 Timestamp: 09:20:40–09:59:36

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is Regina Goman. And Regina your first name could be [discussion on pronunciation of name].

So can you state your full name for the record, spelling your first and last name please?

Regina Goman

It is Regina Goman, R-E-G-I-N-A G-O-M-A-N.

Shawn Buckley

And Regina, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Regina Goman

I do.

Shawn Buckley

Now you have a very interesting history and I think people are going to be fascinated to hear your story. I'm just going to tell a little bit about it and then I'm going to have you share it, but all I'm going to say is that you basically were involved in the Solidarity movement in Poland at the beginning, and there were great personal consequences for your activity. And my understanding is you came to Canada as a political refugee in 1986.

Regina Goman

That's correct.

Shawn Buckley

And so can you share with us basically your involvement in the Solidarity movement and then kind of what happened to you personally because of your involvement?

Regina Goman

First, I'd like to apologize up front if I stumble words or become emotional. I've been still experiencing severe anxiety due to delayed post-traumatic stress disorder [PTSD], which was directly caused by my employer's actions in regards to COVID policies.

As a young woman back in the late 70s and early 80s, I was involved in freedom movement against the communists. In 1980, in August, our movement became legal and official under the Solidarity Union. I was involved in my company that I worked for. I was the president of the union, and I was also a secretary in our local union division.

Shawn Buckley

And I'll just say that you're referring to the Solidarity Union; so you were the president of the Solidarity Union in your company, and the solidarity group in your municipality.

Regina Goman

Yes, because at that time, during the communism, we did not really have unions. That was the whole movement, the whole freedom movement was called a union. That's how we became a union solidarity.

Shawn Buckley

Okay, so carry on. So you were talking about August 1980. Tell us what happened in December of 1981.

Regina Goman

On December 13, our government called the Martial Law, which deprived all of us of any rights. And just like it happened here, like I can see the analogies here in Canada when we got this *Emergencies Act*. That suddenly, there was a beautiful protest in Ottawa, and it became illegal, and people were being persecuted. The same thing happened back in Poland when our leaders, on December 13, were pulled out of their— At night they were pulled out of their homes by our military and the police, and they were put in isolation.

From that point on, we started helping out the families of those who were being isolated. And at that time, of course, there was no freedom of speech anymore, and our society relied on the mainstream media, just like here again, where is all lies. And people don't see the alternative news. So I got involved in editing, printing, and distribution of the literature, which included all the information: what was actually happening in the country, how people were being persecuted.

[00:05:00]

And that led to me being arrested, and that happened on Good Friday in 1982.

And I was tried by the Navy Court that was during the martial law, and I was sentenced to three and a half years in jail just for doing— Every time when I go to rallies, and when I see

the people who are distributing *Druthers* or other information, that reminds me right away, that was my crime that I was actually sentenced for.

And I spent time with criminals, and they made sure that we supposed to get re-socialized. So the only source of anything to do was just, like, you had to ask to get a book to read when you were sitting in your cell and doing nothing. You were only allowed to go for half an hour walk, but that was only if you behaved. And because at that time during the communism, there was no political prisoners. The only political prisoner in that jail that I stayed in was the lady who was in charge of the camp for the children during the Second World War.

So all of us, we were treated worse than criminals. And we had to listen, all the hours we were awake, to the communist propaganda for the government, hoping that we'll get re-socialized.

And that's again— I can see what happens here when the mainstream media are keep on telling us what we're supposed to be thinking. And just like this COVID—when after the first few months, I thought yes; like, I was actually scared when I was watching those movies out of China, those videos when people were dropping dead. But it didn't take long just because we, during the communism, we learned how to critically think. We right away, we found something is wrong here in this picture. So, of course, I started seeking some alternative information, and sharing with others when I found out what is really happening.

Shawn Buckley

And I'm just going to refocus you because I want people to understand that you were sentenced to three and a half years in prison for distributing information that was not aligned with the government information. Is that correct?

Regina Goman

That's correct.

Shawn Buckley

So it wasn't that it was against the law to distribute information, but not information that went against the government narrative.

Regina Goman

Exactly, because there was the government narrative that the people who stood up were the outcasts, who were just causing the beautiful communist country to prosper.

Shawn Buckley

Okay, and so basically it was a crime to do what we're doing here: is sharing information that goes against the government narrative.

Regina Goman

Yes, exactly. And that's why I'm pleading to you all. Please take advantage of the time that we have left because the time is coming, with that Bill C-11 is just the beginning. But what you're seeing now when they call— For example, the other day I was listening about, I

think, Thailand where they're talking about the misinformation—how to stop it. And here in Canada, what to do to stop the misinformation, which means the truth.

We are to— We should be speaking when we still got that time. We shouldn't be actually looking for what others think because these are the precious moments. This will pass, and with all this propaganda happening right now, which scares me so much because, of course, first it's COVID. The Big Pharma, and even Trudeau, they're investing big money, so there will be lots more of this, this vaccines, this mandatory vaccines.

But then again, just like the previous witness said, the biggest is actually this climate change. That's what I'm worried about. What happened when I came a few years back—it was just when Greta Thunberg came to Edmonton—I took time to go downtown in Edmonton and just watch it. And it scared me totally because, just like you said Shawn, about the Nazi times— Those times— Like, of course, I lived through the communists. But we were witnessing people who survived the Holocaust, and those people were telling us what was happening.

[00:10:00]

Actually, my diploma, I based on writing the interviews with people who survived. And I've seen those Hitler Jugend organizations, how the young generations was being brainwashed, and indoctrinated. And this is what's happening now in Canada. We are worried, of course, very much about this sexuality being taught in schools, and those poor children being indoctrinated.

But what I saw in Edmonton when Greta Thunberg came, it scared me so much. And I need to talk about it to warn you about. Because that day I went downtown and I saw those buses, and those were coaches coming from all over Alberta bringing those young kids. And they walk through Jasper Avenue towards the legislature in Edmonton. And when I saw this anger and hate in those little kids; how they were being programmed and indoctrinated: yelling, screaming— Right away, I thought this is just like Hitler Jugend operated. This is what our little kids are being programmed to, and they hated.

Since I was there, I, of course, counter-protested and stood by the one father. He took time off work, and he came with his two little children to counter-protest. There's this whole show of Greta and those kids. And we've been watching those big coaches, it was cold, I think it was spring, if I recall, and those are all diesel fuelled. They lined up those big coaches along 109 Street in Edmonton next to the legislature and burning that fossil fuels. Those kids were yelling they hate it, they say leave the planet for us. This is being— And sometimes when I'm watching, flipping through the channels, and seeing that advertisement—

Shawn Buckley

Regina, I don't want to stop you, and yet on the one hand, I want to focus you. I'm going to give you a lot of time to talk because you have some experience that we need to hear from.

I'm just wanting to refocus you more on the COVID issue and your experience, and then I will let you talk further. Because you have an experience that no one else in this room has, and for the people that will be watching your testimony online, both live and afterwards, you have some wisdom to give us. But I just want to kind of focus on the COVID stuff first.

So your sentence for three and a half years, my understanding is this is after a year, you were granted an amnesty and were released.

Regina Goman

Yes, that was about thirteen months.

Shawn Buckley

Okay, but after you were released, the Interior Ministry was going after people like you, so you came to Canada as a political refugee.

Regina Goman

Yes, because we still continue to believe in the cause, so I still was fighting. And at that time, we could see the corruption again, like even in all these organizations, just like it's happening here. The organizations that were supposed to be protecting us, of course, like they failed, and even churches failed. At that time, we had one priest who actually was murdered by our intelligence services, who actually had to admit to that.

The situation was getting worse, and some of my friends who decided to move on because we felt betrayed, and they started seeking asylum in other countries. At the point when even my family was indirectly, of course, persecuted, I listened to the advice of one of my colleagues who actually came first to Canada. He encouraged me to go to Canadian Embassy to get them promissory of the visa so I could be protected by the Canadian government before I leave.

Shawn Buckley

Can I just back you up though because somebody just has indicated to me that C-11 passed today. But I just want to ask because it's with some irony, I think, your answer. But why did you choose to come to Canada

[00:15:00]

because you could have gone as a political refugee, you could have gone to pretty well any country because of treaty obligations. Why did you choose to come to Canada?

Regina Goman

Yes, and I actually would be much better to stay in any of Western European countries because I was close to home. And here in Canada, I have no ties, no relatives. But a friend of mine who actually immigrated to Ontario, he encouraged me to come to Canada because he says, "Here we're going to have freedom of rights and our religion."

And again, ironically, this is the same friend who now, he practically sold everything he had in Canada and moved out to the Third World country in pursuing the freedom. Because we know there is no more freedom in Canada. And we all know it.

Shawn Buckley

So can you share with us, because you lost your job over this, the vaccine mandate. Can you just share with us what happened about that? And I will ask actually to do that briefly because I want us to get back to kind of you explaining some lessons to us.

Regina Goman

Yes, so from the very beginning, I knew that we're being lied to, and all this COVID is about stripping us of our rights and freedoms and replacing that with privileges.

And also, I've been Christian, and I've never in my life, adult life, I cannot say when I was just born in a hospital, but in my conscious life, I've never have taken a vaccine. And I believe that God never failed me because I've been working up north, walking through the office in minus 40, 50 degrees, and I've never, in all of my years with my employer, I've never taken a sick day. That's how my God protects me, and which is why I would never allow for any injection to be put into my body, and especially something that could corrupt my DNA, which I believe is God's signature on my body.

And that was my argument back to my company when I was saying there's all this billions of people in this world, and there's no two people with the same DNA. What does it say? When God creates you, he breathes his life into you, and gives you that gift, which I'm going to cherish, regardless of what's going to happen to me. I will never allow any treatment, regardless, if it's something that has been established, just like, for example, tetanus.

I've been a passionate gardener. I would never do that.

Shawn Buckley

I'm just going to focus again. Sorry. Now, you applied for a religious exemption, and I think you didn't want me to name your company, but the company you worked for is quite a large company. And my understanding is that a large group of people applied for a religious exemption, but not a single one was granted in the company. Is that right?

Regina Goman

That, I cannot say. From the group of people that I'm in touch with, which is about 70 of us, we all received the rejection, and that was exactly the same rejection letter. And it was sent on exactly the same date on November 23rd, regardless of when we submitted our requests. I submitted my request on September 30th, and I had to wait almost two months for the response, which, of course, caused me a lot of trauma. Because I loved my job. I loved what I was doing, and I was appreciated by my supervisors. And I was hoping to work there until I retire.

Shawn Buckley

So can I just point something out? So you apply for a religious exemption on September 30th, 2021. You have a performance review the following month in October 2021, where basically you were highly praised by the management for the excellent work,

[00:20:00]

and you were recognized for your achievements in your performance review. Am I right?

Regina Goman

That is correct.

Shawn Buckley

And then the following month, you basically learned that your application for religious exemption had been denied. And so basically you were forced out on— You were going to lose your job but something else happened. You went and you ended up on medical leave. Can you tell us about that?

Regina Goman

Yes. I felt that my rights were being abused by my employer. It started all back in 2020 December, when I knew things are not going to get any better. I wanted to go for visit with my family in Poland, and that was during my vacation.

At the time there was no government restriction to travel overseas; however, there came a memo from my senior management that any travel has to be approved by our vice president. I went and checked with my supervision to make sure that this is only for work related travel. However, my supervisor checked with the management and was told that no, it includes all travel, including personal. At that point because I truly always cherished my freedom, at that time, I felt like my rights are being infringed on since I did not see any reasonable explanation for trying to take away my right to freely travel. And that was during my vacation, and at that time we have already as non-essential employees, we've been working remotely from home, and so even if I did come back with COVID, I wouldn't pose any danger to my co-workers because you cannot get infected through your computer.

So I knew that my employer was actually going over the rights and taking away my freedoms. And that situation, because I kept on following up, the time was running out, and I wanted to go for my vacation. Of course, flights were being booked. And it came to a point where I kept on pushing my management to intervene with the senior management to obtain this approval. And that caused quite the tension that I should—I done something wrong because I wanted to use my right to freely travel.

Shawn Buckley

Yeah. Now a couple of things were going on, as I understand. So your employer, and I know we've skipped over some stuff like I mean, they were pressuring you guys to get vaccinated, and they were treating you unfairly with this travel. And my understanding is, in February, you ended up seeing a psychologist who diagnosed you with delayed post-traumatic stress disorder.

Regina Goman

Yes, because the main reason I took it really hard was when after waiting almost two months to receive the response to my request, and I was very sure because I did comply with all the requirements. So I was sure that I would get the religious exemption because at that time, I was already a member of the church where Pastor supported my views on keeping my body clean as the temple of the Holy Spirit, and I would not tamper. And I thought I will receive that approval. However, that letter, it was implied; there was not really a specific reason given at that time. It's only when we filed a statement of claim with the Court when, [inaudible], my employer actually responded and said that they believe that the letter from the spiritual leader has been taken off internet.

That hit me so hard because in this beautiful country, I've never been accused of any lies. I've never compromised my— I've never done anything to, to be told that I lied.

[00:25:00]

And so I responded to Human Resources, and I said that I can provide any supporting documentation including a statement from my pastor, again, that that letter was genuine, and I had fulfilled all the required conditions to receive this religious exemption.

Shawn Buckley

And they wouldn't let you basically provide that.

Regina Goman

No, they refused. They say that decision is final, it's not up to appeal.

Shawn Buckley

But that actually reminded you of your trial in Poland, didn't it, where you really weren't able to defend yourself.

Regina Goman

Yes.

Shawn Buckley

And your psychologist basically has found that your post-traumatic stress disorder is a combination of what you experienced with your persecution in Poland, and now you're experiencing the exact same thing in Canada, and that's creating this reaction.

Now, you came to Canada believing that this country would give you freedom, and you came after you had actually been imprisoned in Poland for standing up against communism.

My understanding is that in February of 2022, you were invited by the Polish government to a ceremony where you were to receive the Cross of Freedom and Solidarity for the contribution you had made to, really, what was a revolution in Poland. But ironically, in February of 2022, because of the Government of Canada travel mandates: here after coming to Canada to be free, you could not go back to Poland to receive the Cross of Freedom and Solidarity because you were of a class of citizens that was not allowed to fly in Canada. Is that right?

Regina Goman

Yes, that's correct. I was just told— Well the lady volunteer, when she did the interview with me, she asked a question, "Where is my cross?" And I followed up with the Polish Consulate in Vancouver and was told it is being kept safe in the Consulate.

Shawn Buckley

Well, I can also tell those watching, if you go to the Canada Gazette, which is basically the federal government's newspaper where they publish regulations and things like that, and you do a search under Regina's name, you will find that it's recorded in the Canada Gazette that the Polish government awarded her this Cross of Freedom and Solidarity. So now, I told you that I was going to give you the opportunity to basically share your thoughts on what we should do.

And so you've lived through a police state, and you come from experience that none of us in this room have, and so I'm asking you now: What is your advice for us? What should we do?

Regina Goman

Actually, just like the Bible states, you have to be either hot or cold. You cannot be lukewarm. This is the time now. This is the time to speak up. And I know because I come across my friends and when I ask them, "Please come to the rally, please support this when you still can. Because the day will come that anything, that it will be called misinformation, that's what we're going to go to jail to. And this is the time now. The time is precious. And we cannot come up with excuses." Because sometimes my friends say, "Well, I'm going to be with you in my spirit." I say, "No, your flesh is needed." And just like we were told by the previous witnesses, we have to get involved. We have to get involved in every level of politics.

I promised myself when I came to Canada— The Polish organization approached me and they asked me, "Do you still going to join us in the fight?" And I said, "If I was to fight, I would have stayed back in Poland." And I stayed out of the politics for over 30 years, building my life and providing for the family.

But now is the time. We cannot just pull back and say, "Well, I don't want to be involved in politics." Because the politics are going to shape what is going to happen to you tomorrow. And tomorrow it will be too late. Because our children, grandchildren, they're being indoctrinated.

[00:30:00]

Just like when I saw that group following Greta Thunberg, those kids, they were full of rage. And I was shocked. I was scared. These beautiful Canadian kids who never experienced any hardships in their life—where that rage comes from is indoctrination. That's what's happening in the schools. That's where they are being told that we are destroying their future.

Now is the time. It's the time to speak and teach them. And regardless, I became an outcast even within my own family. Because I was told that I shouldn't be speaking politics, I shouldn't be speaking religion, or COVID. I still do speak. Because just like when I accepted Jesus, and I knew I have to share that good news with people, I lost my friends. But this is something the same, we need to speak, regardless how they take it.

And if they don't want to accept, at least we'll know, we'll have a clean conscience. We've done what we possibly could have done. And we lived, we stood up till the very end. And we did not allow the evil to destroy us, to destroy our children. And this is the time. That time, just like we've heard that Bill C-11 that got passed, this is going to affect all of us.

And that kind of gathering, it will become illegal, and it can happen overnight. And we were told about that, and we saw it here in Canada, when this *Emergencies Act* was called. And that's exactly what happened back in Poland in 1981. It happened overnight.

So this is what I'm pleading with you. Don't push, don't feel like, well, I shouldn't do, I shouldn't, I should be gentle. Maybe they will listen to me, no. We need to speak truth, and we speak, have to speak very with power, and not pull back. And regardless of the cost. That's what I'm telling my friends. "Today you're telling me you're not going to come to the rally because you have extra, some work at home to do." Pretty soon, you will not have your work, saying, "Oh, well, I have to take my kid to the hockey game." Pretty soon, you will not be allowed to have a hockey game. And we have experienced that already, right? And the sad part is, the history repeats itself. Every single time, when you look at the pattern, when you look at the Hitler era, when you look at what Goebbels did, when you look what the communists did, and when you're seeing what the mainstream media are doing now.

The people who are apathetic, who are just sitting and saying, "Well, I'm not going to vote, I'm not, I'm not, I don't want to be involved." We know, we have to, we have to speak up, and we have to go to every single level. We have to go to the school boards. We have to. We have to go to all the political rallies, we have to. Because otherwise, one day, we're going to stand, and those kids are going to tell— "Where were you when those decisions were being made? Now it's too late." And your own children will hate you because they will be fed. That's what kids in schools during the communists, were fed with. That's why my neighbours, in my neighbourhood, they were laughing at me. They were saying, "What is she doing?" Because there was a handful of us. And suddenly, now, what the history says, "Well, yes, you've been a hero. You have been awarded the cross for what you stood up then." And the same thing is happening now.

We need to stand up. And regardless, again, regardless of the cost because pretty soon nothing will matter. They're going to implement this digital ID, and they're going to take all our rights. And then you will be at their mercy, begging them for the privilege to travel, for the privilege to go to a game, or to a restaurant. And I was being yelled at in stores because I refused to wear a mask. And even I went to the doctor to get that mask exemption, just so I have it. I've never shown to nobody. But I was still denied. My employer would not actually recognize my mask exemption when they called us for a couple of weeks because that was one of their trying to pressure us to take the vaccine.

You know, when we were getting those letters, and they were telling us, "You're not going to earn your yearly bonus." Many people went and got vaccinated. I got this outstanding review. And what happened? I never got my bonus. Do I care about it? No, because I know we have much higher principles than just money. And at some point, that money will mean nothing again anyways.

[00:35:00]

So this is the time.

Shawn Buckley

Regina, I'm going to let the commissioners, I'm going to ask them if they have any questions for you. And there are questions.

Commissioner Kaikkonen

Thank you for your testimony. When you speak of the indoctrination of our children and that we're told we're destroying our children's future, and that is what they're hearing in school, I can attest to that as a school trustee in my area that that's what they're doing.

But I know also there's a body of research that you may be able to speak to and you may not. It's called the coloured shirt movement, when some of us might remember the Brown Shirt movement in Nazi Germany. There's a Pink Shirt movement, how it's tied specifically to tyranny. You can go find that research. It's online. It's pretty available. And it talks about all of the different shirt movements that our youth do, and how it links with tyranny and the research is very solid. I'm just wondering if you could speak to that.

Did you see any youth that had colored shirt movements that were working through the school system that would lead to some of us to be informed about where tyranny would be the next step for those youth, those young people?

Regina Goman

For what I've been seeing was how those children were being indoctrinated and they've been rewarded. And to belong to a specific colour, you had to earn to that level.

When I was doing my research and writing based on those experiences from people who actually experienced that, and the ones who stood up to this propaganda, they were being beaten by those groups of youngsters because there was so much hate being planted in their minds, that they could not act in a human way. It was all about this propaganda machine.

And that's what I'm seeing here where the children are being— Because we taught them that about the authority, "Your teacher is an authority. And whatever the teacher is teaching you, you bring home." And actually, I've heard from my niece's little son came home from school and telling his dad that fossil fuels, that's evil, that we need to stop it. And the little children, like 10 years old, those are the kind of topics they're being taught in schools.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

Regina, there being no further questions on behalf of the National Citizens Inquiry, we sincerely thank you for setting an example for us and coming and sharing your experiences with us at the National Citizens Inquiry.

Regina Goman

Actually, I thank you for the opportunity and for this great initiative when we can still record all the damage that had been done to this society. Because when I came here almost 40 years ago, that was a beautiful country and built on Christian values. And what happened to this country when we are looking for possibly just leaving it and going somewhere else in search of freedom. Thank you.

[00:38:56]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 11: Babita Rana

Full Day 2 Timestamp: 09:59:36–10:14:09

Source URL: <https://rumble.com/v2kqsgc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is Babita Rana. Babita, can you please state your full name for the record spelling your first and last name?

Babita Rana

Babita Rana, B-A-B-I-T-A R-A-N-A.

Shawn Buckley

Babita, do you promise to tell the truth, the whole truth, and nothing but the truth?

Babita Rana

Yes.

Shawn Buckley

Now, you are a computer programmer at the University of Alberta.

Babita Rana

Yes.

Shawn Buckley

And you have worked there for over 20 years.

Babita Rana

Yes, I've been there for about 28 years as a student and staff.

Shawn Buckley

Right, right. Now, can you tell us what happened, what your experience was as an employee at the university when COVID came along?

Babita Rana

Okay, so March 2020, everything shifted to remote work. So ever since March 2020, I've been working from home. My whole team shifted to remote work and that transition went pretty smoothly, just given the nature of our jobs. It was all on computers online, so we found our groove pretty quickly. And yeah, we worked from home until September 2021.

Shawn Buckley

I'll just stop you. Because you're a computer programmer, you and your whole team can— You don't have to be on site; you can work from home.

Babita Rana

Exactly. I was able to perform 100 per cent of my duties remotely in that year. In those 18 months between March 2020 and September '21, I did not have to go into the office at any point to do my job.

Shawn Buckley

Okay. I just think it's important for people to understand that as your story goes forward. So I'm sorry, continue.

Babita Rana

Okay, so September 2021, that is when the university introduced the COVID-19 directive. Compliance was mandatory, and they had given us the options— Or they had told us that they would make accommodations for medical exemptions and religious exemptions. So I applied for a religious exemption early October 2021. That exemption was denied. I received an email late on a Friday night around 10 p.m. telling me that the exemption was denied, and I was given five days to appeal. So essentially, two business days to appeal. I managed to get in the appeal, and the appeal was also denied. And shortly thereafter, I was informed that I would be placed on leave without pay.

Shawn Buckley

Can I just back up and flesh out with you a few questions about the religious exemption? **Because my understanding is that a number of employees, over 100 applied for religious exemptions and that you're aware of this because of discussions with the union. Am I correct?**

Babita Rana

That's right. I'm told that the university received over 100 religious exemption requests from staff. That doesn't include students and that doesn't include the medical exemptions.

Shawn Buckley

Okay, we're just speaking about staff. But as far as religious exemptions, you were advised by the union that over 100 applied. And my understanding is that 100 per cent of those applications were denied.

Babita Rana

Yes, that's what I was told by the union.

Shawn Buckley

And that they were all denied on the same day.

Babita Rana

They were all denied in the same fashion. We were all given similar canned email responses that went out at the same day. I know this because I was in communication with other staff who were affected by this. We were sharing stories, and they had said that they had received the same email at the same time.

Shawn Buckley

Okay, now the University of Alberta actually has its own human rights office.

Babita Rana

Right.

Shawn Buckley

And so you made an application to the University of Alberta Human Rights Office. Can you tell us what happened?

Babita Rana

So yes, after my appeal was also denied, I submitted a formal application. The university has this office called, Office of Safe Disclosure and Human Rights. And through our union collective agreement, there's a process whereby you can submit a formal discrimination complaint. So I ended up submitting that complaint

[00:05:00]

after I received my notice that I was going to be placed on leave. There was also this work-from-home program that the university had introduced in mid-November of 2021. So that was basically just formalizing what we had already been doing, working from home. It was just paperwork. But that work-from-home program wasn't available to me because I wasn't vaccinated. The rest of my—

Shawn Buckley

I just want to get it clear. So first of all, you had a job that 100 per cent you could do from home, and you were doing from home.

Babita Rana

Yes.

Shawn Buckley

You weren't asked to come back to the campus.

Babita Rana

Yes.

Shawn Buckley

But notwithstanding that you were working from home, there was a program that you could apply for to be classed as working at home. But to qualify for that you had to be vaccinated.

Babita Rana

Right, so my entire team was approved to continue working from home, but I was excluded from that.

Shawn Buckley

So the university thought that because you were unvaccinated, you weren't safe to work at home, apparently.

Babita Rana

Yes.

Shawn Buckley

Okay. Did they explain that to you? Because I'm having a few cognitive difficulties.

Babita Rana

They would phrase it as I was non-compliant with the COVID mandate; therefore, I couldn't apply for the work-from-home program. And I would argue that I would try to be compliant with their COVID directive via this exemption route, but they kept denying that.

Shawn Buckley

So you filed under this safe disclosure and human rights process. My understanding is there was four of you that did this. There were four complaints that were submitted.

Babita Rana

Yes, four.

Shawn Buckley

And my understanding is that actually the University of Alberta then stepped in and just stopped those complaints, terminated them.

Babita Rana

Right. So I was checking in with my union. This would have been probably early February 2022. I was checking in on the status of my complaint, and my understanding was that they were trying to settle on an arbitrator. And then shortly thereafter, I received notice that the University had reviewed the complaint and decided that an investigation was not needed. So they closed it. Closed all four.

Shawn Buckley

So your union had to file a grievance about that process now.

Babita Rana

Right.

Shawn Buckley

And you've been waiting 14 months on that grievance and nothing has happened.

Babita Rana

That's right.

Shawn Buckley

And you also then filed an Alberta Human Rights complaint, and you've been waiting 14 months, and nothing's happened.

Babita Rana

That's right, yes. My human rights complaint was accepted by the intake officer pretty quickly. But it's been pending approval from the director.

Shawn Buckley

I'm wondering if you can share with us, how have you been affected by this experience that you've had?

Babita Rana

Well, I was under a lot of stress in late 2021 when I was trying to get the University to see my perspective. I'd emailed the president several times; I'd emailed the board of governors several times. I got no response from them. I emailed the minister of advanced education and that office eventually got back to me and said that it was out of their hands and that I should get vaccinated.

But yeah, I was under a lot of stress at that time. I was worried about how we were going to manage our family finances when we were missing an entire income. And that's when a lot

of my physical health issues started as well. I think that's all because of the stress. And I still deal with those physical health issues today. It's been a long recovery.

Shawn Buckley

Right, so now that we're in April of 2023, you're still affected with depression.

Babita Rana

Yeah, so January 2022, that's when I was on leave. And looking back at that time now, I realized I was depressed. I was depressed, I was frustrated, and I was confused. I couldn't understand. That first week, I literally just sat on the couch with my kid, and I watched cartoons. I thought about nothing. I did nothing.

[00:10:00]

And I couldn't understand why I was sitting here when I could have been sitting ten feet over there at my desk working. But somehow that was unsafe for me to be ten feet over there. I was confused. I was angry.

Shawn Buckley

I know you don't want to go into details, so we won't. But I did want to just confirm with you that when you're talking about physical health issues that you also experienced because of the stress, it literally affected your day-to-day life for some period of time.

Babita Rana

Yeah. Everything from my ability to sleep, to being able to do basic hygiene, to getting dressed, to cooking, to cleaning, to being able to play with my kid. Every single thing that I did in my day was affected. There was a lot of pain, and it was extremely debilitating. And I still am trying to recover from that. I'm told that it's possible that it may not be a 100 per cent recovery.

Shawn Buckley

Right. I wanted to bring that up, even though you didn't want to go into the details, just so that people understand that this is something that's been lasting and significant. We're just not going into the details.

Now, I don't have any further questions for you. I'll ask if the commissioners have any questions.

Commissioner Drysdale

One of the things I've been hearing from multiple witnesses is that they applied for religious exemptions. I've heard this from police; I've heard it from doctors. I've heard it from folks like yourself. Did the university explain to you how they judged whether or not you believed in whatever it was you believe in, in your religion? How were they the arbiters of that?

Babita Rana

In my requests, I had made it very clear to them that I felt very strongly about my position. I had made it very clear to them that there were elements, from like a Hindu and a Christian background, that supported my arguments. Because I have both in my background. So I thought that I had met the legal definition of a valid religious belief, a sincere belief that connects to a larger belief system.

And they said, "No." They said, "No, your beliefs are not sincere. Your beliefs do not connect to a larger system; therefore, you're denied." And I found that to be extremely offensive. I laid out my personal history, my religious background. I laid it all out for them in an attempt to convince them of how important this was to me. And then for them to come back and say, "No, your beliefs are not good enough." That was extremely offensive and degrading to go through that.

Commissioner Drysdale

How did you feel and how do you feel about your employer looking into and questioning probably one of the most personal aspects of your life?

Babita Rana

Yeah, it's wrong. I tried to express to them that this is something that I'm very passionate about. Who are they to judge my beliefs? I couldn't understand it. It made me very frustrated, very angry.

Commissioner Drysdale

Thank you.

Shawn Buckley

So there being no further questions, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying today.

Babita Rana

Thank you.

[00:14:33]

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 12: Madison Lowe

Full Day 2 Timestamp: 10:14:12–10:24:27

Source URL: <https://rumble.com/v2kqsgcc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is Madison Lowe. Madison, can you please state your full name for the record, spelling your first and last name?

Madison Lowe

Madison Ragna Lowe, M-A-D-I-S-O-N L-O-W-E.

Shawn Buckley

Madison, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Madison Lowe

Yes, I do.

Shawn Buckley

Now, you are a software developer, you've got a software engineering degree, and you've been working as a software developer for nine years.

Madison Lowe

That's correct.

Shawn Buckley

Now, you made a decision to get vaccinated with the COVID-19 vaccine. Can you share with us what led you to that decision?

Madison Lowe

Well, I felt pressured to get the vaccine to see people, to go to restaurants, to travel. And I went to a government website, a canada.ca website, that was displaying the number of adverse events and the number of shots distributed in Canada. And I used that website to determine if I was comfortable with the risk of the vaccine.

Shawn Buckley

Okay, so you're basically going to a Government of Canada site to get truthful information about adverse reactions so you can figure out, basically— Do a risk benefit analysis for yourself.

Madison Lowe

That's right.

Shawn Buckley

Did you also look at how they were collecting the data? Can you speak about that?

Madison Lowe

Yeah, the same canada.ca website, I was curious how adverse events were collected, how post-marketing surveillance was performed. And I found guidance on submitting an adverse event form on the website. The guidance included what constituted a serious adverse event. It had timelines for if a symptom shows up within a certain amount of time from getting a vaccine, then you should report an adverse event. It had this information for non-mRNA vaccines, but I made the assumption that the process would apply to mRNA vaccines as well.

Shawn Buckley

Is it fair to say that you felt assured that the data was being collected in a rigorous way and an unbiased way?

Madison Lowe

Yes, I made the assumption that it was collected in a rigorous and unbiased way, and also that new, bad side effects were being actively looked for.

Shawn Buckley

Right, and I use terms that actually you had brought up during an interview, just in case anyone thinks I'm leading this witness. You were actually basically doing due diligence to try and make an informed decision.

Madison Lowe

Yes, I was.

Shawn Buckley

And then you decided the risk was low, so you took the vaccine.

Madison Lowe

Yeah.

Shawn Buckley

So can you tell us what happened?

Madison Lowe

So I got two shots of Moderna, and three days after my second shot, I started getting new symptoms that I'd never had before. I had a high resting heart rate. I'm a runner, so my resting heart rate is usually around 60 beats per minute, and it was spiking over a hundred beats per minute and getting up to 130. Sometimes these episodes would come along with feelings of anxiety, but the worst part was that they would trigger pre-existing gastrointestinal issues, and that was really the debilitating part.

Shawn Buckley

Now, but when you say pre-existing gastrointestinal issue— Before the second shot, you managed that; you managed the symptoms of that pre-existing issue; you were able to, you know, live reasonably normal.

Madison Lowe

That's correct. I was able to participate in all aspects of life, fine.

Shawn Buckley

Okay, so you're speaking about something completely different than before.

Madison Lowe

Yeah.

Shawn Buckley

And how long did these symptoms persist?

Madison Lowe

Well, many months. Six months full on and then started getting better, and I am much better now, but still not 100 per cent.

Shawn Buckley

Okay, now you actually went to your doctor to see if you could get your adverse reaction reported. Can you tell us about that?

Madison Lowe

That's right. So I went on this canada.ca site that was showing how to submit an adverse event report. And I brought that site to the doctor I was seeing at the time and told her,

"Look, I meet the criteria for an adverse event. So we should report it so that it's tracked."
And she agreed, and she submitted the adverse event report, which is great.

[00:05:00]

Shawn Buckley

Okay, so your doctor was on side. Your doctor submitted the form. And what happened after that?

Madison Lowe

A little while later, AHS [Alberta Health Services] phoned me to tell me they weren't going to submit my report to the surveillance database because it was not a known side effect.

Shawn Buckley

I'm just going to stop you there. I think you need to repeat that and speak slowly.

Madison Lowe

AHS phoned me to tell me they were not going to submit my adverse event report to the surveillance database. This is the database that I believe was driving that webpage that I was using to make the decision because it was not a known side effect. So at that point in time, I knew that that webpage wasn't showing all the data that I cared about.

Shawn Buckley

Right, so basically the message is that they were not looking for new side effects.

Madison Lowe

That is what I concluded from that.

Shawn Buckley

How did you feel about that?

Madison Lowe

I was shocked. I had no idea that the post-marketing surveillance system was so broken, I guess.

Shawn Buckley

Right, so how would you recommend that we do things differently going forward?

Madison Lowe

To make an informed decision about a pharmaceutical, I would like data to be collected in a thorough, accurate, and unbiased way. I would like statistical analysis to be performed on all the data by experts. I would like the methods, results, and conflicts of interest to be publicly available. And I would like the risks and unknowns to be made public.

Since my report was tossed away, I don't trust that anyone is investigating whether or not my symptoms were caused by the vaccine. And to me, that's an unknown. And when I make a decision, the unknowns, matter as much to me, as the known risks.

Shawn Buckley

Thank you. And I actually thank you for those four points which I saw the commissioners writing down, because I know you actually you put in a lot of thought in making those recommendations. I'll ask the commissioners now if they have any questions of you.

Commissioner Drysdale

When you were given your two Moderna shots did whoever provided those injections, did they talk to you about what the unknowns were, what the side effects might be, what the risks were, what the benefits were, so you could make an informed decision?

Madison Lowe

No, certainly not. The only messaging I remember receiving about the shots was that they were safe. And that's basically it.

Commissioner Drysdale

And you reviewed the government website as well, you were saying in your testimony, prior to getting the shots?

Madison Lowe

Yes, I looked at the webpage that was showing the number of adverse events.

Commissioner Drysdale

And they didn't provide any information about adverse effects or the risks of having taken the vaccine, as well?

Madison Lowe

There was a lot of— There were some adverse events listed. The rate was quite low, so I thought it was acceptable for myself.

Commissioner Drysdale

Did the website tell you that death was a possible side effect?

Madison Lowe

I specifically remember looking that up. And that was really interesting for me because I was looking at— I looked for the criteria for how they figured out if death was associated, or death was caused by the vaccine. And what they reported was, they had a number of deaths that were reported as being caused by the vaccine, and then they decided that they weren't, and then several that were inconclusive. But none that they had determined were actually caused by the vaccine.

Commissioner Drysdale

Did you have any understanding before you went in for your shots what your risk of actually contracting and dying of COVID-19 was, given your age group?

Madison Lowe

No, I don't think I did.

Commissioner Drysdale

Thank you.

Shawn Buckley

There being no further questions, Madison, on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony today.

Madison Lowe

Thank you for the opportunity.

[00:10:15]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Witness 13: Garry Bredeson

Full Day 2 Timestamp: 10:24:26–10:38:30

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

Is Garry Bredesen still here? Yes, Garry's coming to the stand.

Garry, can you please state your full name for the record, spelling your first and last name?

Garry Bredeson

Garry Bredesen, G-A-R-R-Y B-R-E-D-E-S-O-N.

Shawn Buckley

And, Garry, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Garry Bredeson

I do.

Shawn Buckley

Now, you are a small business owner in the area of freight logistics, and you've been doing that for 25 years.

Garry Bredeson

Yes.

Shawn Buckley

And I forget now, when I wrote down your kids' ages, whether it was at COVID time or now. But I wrote down your kids are 25, 23, and 21. So is that now or when COVID hit?

Garry Bredeson

That's approximately what it is now, yes.

Shawn Buckley

Okay. Now, when COVID hit, your oldest was at UBCO, which is the University of British Columbia University campus in the Okanagan.

Garry Bredeson

Correct.

Shawn Buckley

And your middle child was at the University of Alberta?

Garry Bredeson

Yes.

Shawn Buckley

And your youngest child was at the University of Victoria.

Garry Bredeson

Correct.

Shawn Buckley

So now you're here to testify in— One of the themes is about the impact of the lockdowns and the COVID measures on education, and I'm wondering if you can share with us what you saw and what your thoughts were.

Garry Bredeson

Well, all three boys were in university as of 2019, and we did hear of some rumblings coming out of China around Christmas time in 2019. And at that point, the boys were all home for Christmas, and then on their departure back to university, we told them to be careful not to expose themselves needlessly, and just to be careful.

And promptly, the oldest boy got sick with flu-like symptoms, very severe. He missed about 10 days of school. And then the youngest, he likewise got ill. Probably not as severe, but he did experience discomfort. And from that point on—later on in the school year—around March, we had heard that, I believe it was that year, that the universities were going to shut down and go online for the remainder of the year.

My wife and I were taken unawares of that edict coming down, so we had to scramble to get our youngest back from UVic [University of Victoria] and get him back into Alberta so that he could continue and finish off his year. So basically, we had to scramble, get the truck out, and load up all his stuff out of Res, and get him back to Alberta. So obviously, that was quite the undertaking on last-minute notice.

Shawn Buckley

Can you speak to us about the social impacts on your kids with the lockdowns and online and all of that?

Garry Bredeson

For sure. Obviously, all young people are very social, and them having to come home and learn from our basement online was, it was a definite negative. And it seemed like the universities, they made some effort to make it seamless, but obviously it's never the same when you have two young men in the same room trying to learn with labs and whatnot, online. It's practically impossible for them to absorb and to excel.

From what they accomplished, it's very impressive how they managed to make that happen despite what the government had put in front of them. And basically, it was done to them. It was not something that happened. It was done to them.

Shawn Buckley

Right, and I remember when we were talking, you were kind of just expounding on your first year of university.

[00:05:00]

So your youngest child at UVic, I mean that's when you make your connections, and that's when you meet people, and it's very social. And that, basically, it just didn't go that way for him.

Garry Bredeson

Correct, you know, he— For first year, you know, they want to be making those contacts where you might be in class with these people for the next four or five years. And he never had that opportunity. And next thing you know, everybody's hiding from each other. It was a matter of you're— If you get too close to somebody, you know you're impacting their health, and all of a sudden, you're being labelled a killer.

Shawn Buckley

So it's not just that the universities were shut down, that they weren't having the activities, but it's actually the university students, a lot of them were afraid of each other.

Garry Bredeson

Correct. They didn't know any better than the rest of us; what they were being fed was a continual diet of fear and admonishment for being social, or even just trying to be a regular student. The University of Alberta still has that up on their website. Stay away from each other. Get vaccinated. It's all— It just never stops. How they could ever get beyond that if they ever followed the edicts that the universities were putting out?

Shawn Buckley

Right. And how do you think the quality of education was when they had to switch to online? Clearly you'd already mentioned labs, and I can't see those being very effective. What are your thoughts on the quality of education?

Garry Bredeson

Well, in talking with our boys, obviously it was a clear travesty against their education. They clearly got a much lower level of instruction, and— But on the plus side, we got to pay more.

Shawn Buckley

There's always a silver lining.

Garry Bredeson

Yes.

Shawn Buckley

Now my understanding is that in 2021, in the Fall term—your youngest son was still at UVic—that UVic actually surprisingly did not have a vaccine mandate. So you—as long as you were getting weekly PCR [Polymerase Chain Reaction] testing—you didn't have to be vaccinated to attend. But something happened at Christmas. Tell us about getting them home at Christmas, because that was an interesting year for you.

Garry Bredeson

Yeah, well, during November of that year, we found out that all the roads got washed out of lower mainland BC. And our plane ticket that we had pre-purchased for our youngest coming out of UVic was not going to be honoured because our government deemed that we were unfit to fly with people that were vaccinated. So we were lowered to a lower status and were relegated to crawl on the ground with the bugs. So we had to find him travel, some sort of travel means to get back into Alberta.

We found a group of parents that were in the same position that we were, and we were looking at all options like chartering an airplane, or chartering a bus, or whatever. But what we found out was that even if we could get an airplane chartered for our kids, there was no airport that would accommodate them, because they were unclean.

Shawn Buckley

Right, so even if a chartered plane was there on the tarmac, the airport policy was you couldn't even go on a chartered plane just filled strictly with unvaccinated people. So that was a dead end.

Garry Bredeson

That was a dead end, and even going into a small airplane or airport such as— It was nearby Cochrane, which is just a small airport. But because it's federally funded or—

Shawn Buckley

I think it's constitutional jurisdiction.

Garry Bredeson

Yeah. We weren't able to even accommodate that. So we ended up renting him a car.

[00:10:00]

Thankfully, they allowed us to rent a car because he's only 21 years old. And so he had to navigate the highways, which were torn apart, and take goat trails back home into Alberta. And it was just a nightmare.

Shawn Buckley

Now, I just want to switch gears and ask you how you were personally affected by the mandates and the government measures.

Garry Bredeson

Well when the mandates came down, business stopped because all of our trucks were not allowed to go across a border. So we lost contracts that were pre-negotiated during the previous year. And by the time they opened the borders up again for truck traffic, we basically were squeezed out. And at that point, we had to find a different revenue stream.

And then for ourselves, socially, we couldn't go to restaurants. Friends and family that we normally had no issues with, all of a sudden we were being deemed social outcasts because we took a different mindset than what they did. And if you bring up any sort of evidence or websites, and evidence from revered vaccinologists and virus scientists, they were deemed as people we couldn't refer to because they had an alternative agenda. So therefore, we were effectively shut out.

Shawn Buckley

We're supposed to ask witnesses how they would do things differently. And I know when we were talking, I made a specific note to ask you about personal responsibility, so can you share your thoughts on that?

Garry Bredeson

Well, personal responsibility, we all have to make sure that we are looking into the reasoning behind these laws, or mandates that our government, our representatives are bringing forward to us, ensuring that we are seeing exactly what they are saying is true. We can't just go out and say, "Okay, it's our government. We elected them, so therefore they're telling us the truth." There's just no way that we can just rely on that. We need to go out there, find the truth, make sure that we spread the truth, and we are always asking questions of our elected officials.

It's always handy that they are not allowing us to talk to them directly anymore, because of the COVID issues of— Whenever there is an election, we cannot ask direct questions because we might be spreading death and destruction as far as the government is concerned.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions for you. There being no questions, Garry, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying.

Garry Bredeson
Thank you.

[00:14:04]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 2

April 27, 2023

EVIDENCE

Closing Statement: Shawn Buckley

Full Day 2 Timestamp: 11:05:40–11:06:26

Source URL: <https://rumble.com/v2kqsc-national-citizens-inquiry-red-deer-day-2.html>

[00:00:00]

Shawn Buckley

And that will conclude the second day of hearings in Red Deer.

We invite you to share with us tomorrow as we start at 9 a.m. Mountain Time for the third days of hearings. Again, and I can't stop saying that you cannot attend a day of the National Citizens Inquiry and be the same person at the end of the day.

There's just something— I almost want to say therapeutic, but I don't have a word. There's just something about seeing these people tell their stories that is life changing and I invite you to participate.

[00:00:46]

NATIONAL CITIZENS INQUIRY

EVIDENCE RED DEER HEARINGS

NCI | CeNC

**Red Deer, Alberta, Canada
April 26 to 28, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Opening Statement, Shawn Buckley

Full Day 3 Timestamp: 00:46:31–01:20:51

Source URL, <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Shawn Buckley

We welcome you back to the National Citizens Inquiry as we begin day three of three days of hearing in Red Deer, Alberta.

I'd like to always share just briefly what the NCI is. We're a group of volunteers that just came together with the vision of appointing independent counsellors and marching them across this country so that people could tell their stories: so that we could get down to the truth, and so that we could come together again.

And we're doing that, but the NCI has become something much bigger. Because along the way, just you watching people tell their stories and us encouraging you to take personal responsibility to actually start acting has made the NCI something completely different, where it's even hard to define. Because it's you and it's the actions that you take. And there's just wonderful things happening that we have nothing to do with, which is part of the NCI.

So every day it's evolving, but we're so thankful for all the little teams. There are whole teams of people volunteering on different projects. I don't even know who they are, and I don't need to know who they are. And you know, even an event like this here; we are in Red Deer, well, it was a local team that put this together. We don't have an administration where we can send people out and put an event like this on. We actually rely on just people that have said, "Hey, I will help. This is important. I'll put this together." And I mean, I can tell you it's just an incredible amount of work. And we owe gratitude and thanks to the local team that did this.

And I just cited as an example of how people can make a difference: You see a need do something. Think of just something you can do. There's a person that's going to be attending an event in Europe and wants to present about us, and asked, "Well you know I need a little, almost a commercial." And a Mr. Dahl just stepped up and did it, put it together for us. I don't even know who this gentleman is. But another volunteer, Peyman, had gotten this fellow involved, and it just happens, and it's very exciting.

Our social media team—because I always do an ask out—so first go to our website, sign the petition so that we kind of have a numbers count, to say, you know, people are behind this. And then also please donate.

As I say, this takes about \$35,000 every city that we stop in for three days. And you know, we just kind of keep up. But isn't it beautiful that we do? Because you know, we have discussions. Do we have enough to keep going? And then you guys come through and you donate and we have enough to keep going. And so here we are in Red Deer. You know when we had past discussions, "Are we going to get this far?" And next week we're in Vancouver. And the week after that we're in Quebec City. And then the week after that we are in our nation's capital, Ottawa. And it's all because you are participating, and so I thank you for that.

Our social media leader has asked—because our big problem is we don't have the media. "Where's the mainstream media here?" This should be front-page news because a group of citizens has gotten together. You have gotten together. You're here. People are online watching. We're creating this record that actually the entire world is watching what we're doing as an example. And I'd like to encourage those in every single country to band together and do the same thing. To create a record of your voices, of our voices, because we're all in this together. To create a forum where people are free to speak, to share their stories, so that we can hear them and come together. So we urge you to do that, but the media is not here.

And so we're relying on social media. The one forum that is the least censored is Twitter. Every time— And this is from my social media guy; I'm not on social media, so I hope I even say this correctly: Every time you tweet anything that is related to what the NCI is doing—COVID, censorship, mandates, freedom, Bill C-11, whatever it is—if it's anything that touches this movement,

[00:05:00]

just go hashtag NCI because that affects the Twitter algorithm, that you're including us as relevant to what you're speaking about. So that's a specific ask that we had.

Now this morning before we begin, I want to get to Bill C-11, which passed the Senate yesterday, and then lightning fast, the Governor General in Council signed it. Lightning fast because for federal laws they have to pass the House of Commons, they have to pass the Senate. They can begin in either one of those houses, but they have to pass in both. And then they're not law because the Queen is our executive—read the Constitution. And so the Queen or her representative, who happens to be the Governor General in Council, actually has to sign it before its law.

And sometimes a law will pass Parliament and it'll sit for quite some time before—I said Queen and it's King. I'm sorry I'm having to adjust. And so please forgive me, it's just been all of my life it's been Queen. So but it's King. But you knew what I meant anyway.

But you know, sometimes it'll be quite some time until it gets to the Governor General for a signature. And I don't know why that is, but I certainly noticed with interest that Bill C-11 has to be so important that it was signed the very day that it passed. I think we all should be thankful at how Johnny-on-the-spot our government is in protecting us. I tried to say that with a straight face but I don't think I succeeded.

I want to talk about a principle about reaping what we sow. And language comes out of out of the New Testament in the Bible, and it's just a basic principle that, "Don't be fooled. You will reap what you sow." And it's an agricultural analogy, which basically is saying, "Listen, if you go and plant something in the field, you're going to get what you planted." And the analogy is the same for your life, right? So if you go into a field and you seed that field with Canadian thistle, what are you going to get at harvest time? You're going to get Canadian thistle. And if you plant that seed with oats, what are you going to get? You're going to get oats, so you are going to reap what you sow. That's what this means, but it's meant to be applied to our lives. So make no mistake, what you invest your life in is what is going to come back to you.

I spoke on Day 1 about the second commandment being the foundation of our legal system, both our criminal legal system and our civil legal system. And the second commandment is just basically, love your neighbour like yourself, which just means treat your neighbour exactly how you would like to be treated. Now if you sow love—if you follow the second commandment—so if you were to sow love, basically plant love all around you, that's what you're going to get.

And if you plant hatred—so if you live your life hating and you sow hatred—that's what you're going to get back. If you sow truth, you get truth. If you sow lies, you get lies. Now this applies to you personally, but this also applies to us as a nation. If we sow love, we're going to experience love as a nation, and just the commonsense application of that is, the logic is inescapable.

If we love each other we're going to experience love. If we hate each other we're going to experience hate. We are going to experience it if we hate. If we tell the truth and insist that others tell the truth, including government and media, we will experience truth. And if we are dishonest, and we sit back and allow our government and our media and others to be dishonest,

[00:10:00]

then we are going to experience dishonesty. And if we censor, if we silence opinions that we disagree with, if we allow others to censor with all this online shaming, if we allow our government and media to censor, then we are going to experience censorship. And you can't escape the logic.

So this adage, this truth that you reap what you sow is the best—I can't say—the second best-argument that I can think of for why we have to follow the second commandment and get back to that fundamental bedrock principle that our society was based on. That we are to treat each other like we want to be treated ourselves, that we are to love each other because if we don't then we're going to be treated in a way we don't want to be treated. It's as simple as that. You have to do it for you. That's the second reason you should do it. There's a more important reason that I'm not going to speak about, but if you think about it it'll come to you.

Now I want to talk about Bill C-11, this bill that passed yesterday. Actually, I think I had Lieutenant Colonel David Redmond back on the stand, and then somebody holds up writing, "Bill C-11 passed," and so indeed it did, and I had announced it while I was up here. For those of you who aren't familiar with Bill C-11, and certainly people that are watching from other countries, and we are being watched by people in other countries: We have in Canada what's called the *Broadcasting Act*, which creates this Broadcasting Commission which has powers to basically control content. This has been around for a long time, and

we've been told for a long time that one of the prime drivers—and the purpose has changed over the years as our social values have changed, but—[is] to promote Canadian content.

Here we are, this little nation of 36 million people beside the United States which generates Hollywood, and all of that generates all this culture that's exported worldwide. And there was a concern—well, let's promote Canadian culture—but that's evolved to other things. I spoke yesterday about how dangerous it is to give the police and government powers.

What Bill C-11 does, is it brings into the control of the Commission online content. So here we've had the internet in theory, free of censorship. We all know that's not the case, and it's come out in the United States and the Twitter files—thank you Elon Musk for sharing the Twitter files with the world.

We've learned that actually in the United States, government agencies, including the White House, had been sending instruction to social media platforms to censor voices that they disagreed with. So we, literally, have evidence of government censorship in the United States.

Now, I don't think that there is a Canadian alive today—that has two neurons that are still connected so they can fire between each other—that can honestly say they believe that there has not been extreme censorship in Canada. I'm not aware of evidence of the Canadian government sending instructions, or our spy agency, or other agencies collaborating with social media platforms. But it's certainly interesting that the same types of voices that were Canadian that were being censored in the United States were being censored in Canada and the NCI experiences it.

I think we're off TikTok again; it just keeps happening, I'm not sure, but we've been pulled off; we are routinely being pulled off YouTube. It's kind of funny that in the freedom movement, I don't think you're legitimate or you've arrived unless you're censored. And we laugh because it's funny, but isn't that something, that in Canada in 2023 we come from this British legal tradition that prized freedom of expression. I mean, it's in section two of our *Charter of Rights and Freedoms* which is part of our Constitution that has become non-relevant anymore, but it was also in our common law.

[00:15:00]

The courts used to protect freedom of expression, because we had learned historically that if people cannot share their voices, then tyranny follows.

Because we believe what we believe, because we have accepted information that we've heard. And if we can't hear new information and different information, we can't change our mind. And understand that changing your mind is actually something that physically happens. So the term "changing your mind" is a very important and accurate term. We've all been in this situation, like maybe we're mad at somebody because they did something and we're mad we've invested a lot of energy in it, and then we learn that actually they didn't do it. And all of a sudden we're not mad, and we actually change our mind, we will change how we feel. And your neurons, your brain actually gets rewired, it actually gets changed.

I think that one of our fundamental freedoms, what it means for us to be humans, for us to become better and improve, and to learn more, and to become wise, is we get to change our minds. Surely, we don't believe the same things we believed when we're children, and are

we going to believe different things in 10 years or 20 years? That's what wisdom is: the changing of your mind as you experience more.

But censorship halts that. If the government has a near-total control on information and just gives one side, one narrative, and other viewpoints or opinions are censored: first of all, you're going to believe the information. You won't have a choice at first because we just tend to accept information, and then we have to be critical about it later. But how can we be critical about it later if we don't have information that's critical, so that we find ourselves in a situation where we can change our mind. And changing our mind to something that happens consciously.

This is a war for our minds, and if we don't have access to a wide range of information then basically, we become slaves to the government that controls the information. And that's why police states control information, and that's why police states censor, and that's why it used to be—past tense—that countries that we would call liberal Western democracies would privilege free speech. And that's why we based our laws on the second commandment which privileges free speech. Because if we are to treat others as we want to be treated, we don't want others saying, "no you can't speak; you can't share your opinion." Could you imagine living in a world where you can't share your opinion? Oh, wait a minute; we're in there.

The government now has the ability to control the internet and the internet is the only place that we can get our voice out, and it's the only place that you can get your voice out. Unless we start, you out there start, becoming creative and holding events and doing other things like you're starting to do, and it does this kind of in an Orwellian way.

This morning I pulled up Bill C-11 to kind of look at some of the sections, and remember it's always about your safety; there's always a good reason to take away our freedom, and in here it's our freedom to hear dissenting opinions. On its face it looks like it doesn't do that. It says things like section 4.1: it starts by saying it doesn't apply to just people posting online—doesn't apply. But then we read on, and you combine section 4.1 and 4.2, and except that they can "prescribe." So they can pass a regulation saying, "Yes, but it applies even though generally it doesn't apply to just people posting stuff online. We can pass regulations saying, 'Well, you know, but this, this, this, this, it does apply too.'"

Now they say that they're only supposed to pass these regulations in a manner consistent with freedom of expression.

[00:20:00]

This becomes Orwellian because wait a second: We're going to give bureaucrats the ability to censor our voices in a manner consistent with freedom of expression. Do you do you see how absolutely Orwellian that is?

I want you to understand the term "Orwellian" and if there's anyone out there and actually there's a lot who have not read George Orwell's book *1984*, which I think was written in 1949. You have to read it, and then first of all ask yourself, How did this guy write this book in 1949 trying to describe what things would be like in 1984? Because you are going to be spooked at how accurate it is. And one of the things, and it's written in a novel format; so it's an entertaining read in any event. It's a must-read.

But one of the things he talks about is this control of language. It's called "newspeak,"

where basically they're changing the definition of words because actually words are just concepts of meaning. If, let's say, a culture doesn't have a concept— Like there's cultures that don't have the concept of snow, because if you're a Polynesian tribe on an isolated island in the South Pacific you don't have a word for snow. But if you are Inuit, you have a whole number of words for snow. Some cultures didn't have the concept "zero."

Language matters; if we can get rid of words, we actually get rid of concepts, and then our minds and our belief systems get narrowed. And in this book, it speaks of newspeak; on how they're changing, the "Ministry of Truth" is changing language in an effort to control the population.

I read that book when I was a young university student doing my first degree, and it never dawned on me that I would ever see language being changed around us, but we're seeing it. We're seeing new definitions. We're seeing educational institutions banning certain words because they're racist or colonial, or like—this counterculture is a deliberate move. It's funny how, you know, in the name of inclusion, in the name of diversity, we have never hurt inclusion or diversity more; you see, it's newspeak. It doesn't mean what it pretends to mean.

And if you were to read Aldous Huxley's *Brave New World*, which was also written long ago about how society would be—you know, the parts and memes about open sexuality—and start comparing it to what's happening in our culture. And you see these two gentlemen, Orwell and Huxley, knew that there would be attack on the very foundations of our culture, which includes our sexual mores and values, and the family. Again, you have to ask yourself: how could they be so tremendously accurate?

But going back to Bill C-11, so bureaucrats now, the Commission—so we're back to bureaucrats—are going to have the right to pass regulations or to prescribe what areas they can regulate of our online speech. And so there'll be broad areas and then— These will be regulations passed in the regular format, so they'll be gazetted in the Canada Gazette twice and then they'll become law. And then some bureaucrat's going to make a decision that will be censoring because it's the whole purpose. You're prescribing areas of speech that they have the right to control.

And then we're right to where John Rath was talking about. So we have a bureaucrat that will censor speech. It's a bureaucratic decision made by a commission with expertise in these areas and if you were to appeal it, it will be on the basis of reasonableness, and you will have the onus of trying to prove it. And almost none of us have the resources legally to go against the government; because our system is deliberately designed to be expensive, so that the citizen can't have rule of law and can't be treated equally, it's all by design.

So it's not a mistake.

[00:25:00]

And then the court will give deference to the commission that has expertise and that is how our voices are silenced, and so this is why Bill C-11 is dangerous because it basically is allowing bureaucrats to now tell us what speech is permissible and what speech isn't.

I think we have to think about what Regina told us yesterday. The lady that was part of the Solidarity movement in Poland, who was sentenced by a naval court to three and a half years of imprisonment for handing out pamphlets that contained information that went against the government narrative. So basically, she was in prison for doing what we're

doing here. We're allowing people to take the stand and give information that is inconsistent with the government narrative, and that is where censorship leads: is with witnesses that we're calling, with the people putting this on putting their lives on the line, being in prison. That's where we're going as a nation.

And she said yesterday, and she was quite adamant, she said, "You must act," and that "the time is now." So turn off the TV, get off the couch, and get going. And we cannot wait. We cannot wait because the government will not stop.

And the question is: Have you had enough? Have you had enough? Are you finally going to decide to stand up? And her point is, "while you still can." Because that cage door is almost shut and then you can stand up all you want and you can rage in your cage. But there's nothing you can do; the time is short. And the government is coming for you because they never stop until you stand up and they can't push you any further.

I have at the bottom of emails that I sent out in my law firm a quote by Frederick Douglass. Now he's been dead for well over a hundred years, but Frederick Douglass was a slave. He spent most of his life as a slave, and then he finally got his freedom, and he became an author. He wrote what I'm going to read to you, but it is a fundamental truth, and this is a man that understood. He studied governments. He was motivated because he spent most of his life as a slave. And he said, "Find out what any people will quietly submit to."

So I'm just going to stop there. You find out what any people will quietly submit to. So how much is a people going to take before they finally stand up? That's what he's saying. So find out what any people will quietly submit to, and you have found the exact measure of injustice and wrong which will be imposed upon them.

Governments will push until you stand, so you actually have to. If you're going to decide what is acceptable for me, how much freedom do I want for my kids, you can't sit on your ass and watch the government take them away, which is what's happening and has been happening writ-large for the last three years. It's been going on longer than that, but I mean, it's all visible to us now.

It's an eternal truth. You have to stand up, and if you wait until you just can't take it anymore— One thing I didn't pull out of Regina on the stand is, she said, "You know at the beginning of the Solidarity movement there's just a few of us and we're in danger, and we're trying to get this out, and we're all afraid and there's just a few of us, and the masses weren't there to support us." And I said, "Well, what changed? When did the masses support you?" And she said, "When the bread ran out. When people got hungry." That was their line in the sand: when people got hungry. So if their economy hadn't deteriorated to the point where the bread ran out, she would be rotting in jail right now. We would have never heard of the Solidarity movement and the wall wouldn't have fallen. Because they weren't willing to get off their ass and stand for freedom,

[00:30:00]

and demand freedom, and demand an end of censorship, and demand a return to the second commandment, until they were hungry.

And you're not going to stand; most people have just been silent, even though they disagree because they don't want to lose anything. Well, you're going to lose it all, and then you're not going to be able to do anything. They want to put us in 15-minute cities, do you know what that is? You can walk a mile in 15 minutes. That's the average brisk walk, 15 minutes.

So they want to section our cities into 15-minute walks, so just think of circles that are, you know, where you could walk across the circle in 15 minutes. They want to then barricade the roads, so that we can't drive: all for climate change. And I live in St Albert, we've been selected as a 15-minute city; I believe Red Deer— I mean you can go into the World Economic Forum site and get a list of the 15-minute cities.

You know, what's my property value going to be worth once people figure that they can't drive their vehicle to my house? Is it going to be worth a dollar? Who's going to buy it that isn't in a 15-minute city? And why would you set up 15-minute cities and not allow us to go from point to point? Does the word "digital passport" mean something different to you now? This is coming, and it's an eternal truth that until we stand up, we are done.

I'm going to end by just sharing lessons my father taught me when I was a child. My father is an honest man to a fault, and he doesn't like bullies, and he has some wisdom. I had one older sibling that—for whatever reason, two years older—wasn't in the cool kid crowd. And you know how school kids are right? So you're not in the cool kid crowd. Then I show up at school and I'm not in the cool kid crowd, and there was a lot of bullying. And although it might sound offensive, what I'm going to share to you was actually the only way to solve the problem. My father's belief was: the only way to stop bullying is you got to fight back, and back then that meant physically fight.

I remember one day when my brother comes running into the back door and slams the door, and there's literally about 8 to 10 kids out there that had chased him home to beat him up, as a crowd. And my brother, he's home, he's thinking, "Phew, I'm safe," but my dad actually realized he wasn't safe because he had just run away from the bullies. So my dad drags my brother out there, and he goes like, "There's a whole crowd of you. Surely that's not fair, like you know 8 or 10 to 1. You pick one. Pick your biggest guy and that guy can fight Richard." And that's what happened. And then they didn't bully him again.

And there were times where I had to fight bigger people because they wanted to—you can only run so long. And dad said, "It doesn't matter that you're going to get beaten up. You plant a couple of good shots in the nose, and it's going to hurt them. They will never bully you again because they don't want it to get to a fight." And he was right.

You have to stand up, even if it hurts. And I'm sorry, that's just the way the world is. You have to stand up to bullies. And if you don't, they're just going to keep beating you up. So I just can't get over what Regina said to us yesterday. She pleaded with us, she came to Canada to be free. She pleaded with us to stand up. And the point she was making is, the time is short and your life depends on it. So I'm going to end there.

[00:34:20]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 1: Christopher Scott

Full Day 3 Timestamp: 01:20:51–02:12:52

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Shawn Buckley

We'll call our first witness. Chris, can you come and take the stand for us this morning? Just so those online know where I'm standing, I can hardly see the witness, you see a little tuft of hair there.

Chris, can you please state your full name for the record, spelling your first and last name.

Christopher Scott

Yeah, Christopher James Scott, C-H-R-I-S-T-O-P-H-E-R J-A-M-E-S S-C-O-T-T.

Shawn Buckley

And Chris, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Christopher Scott

I do.

Shawn Buckley

Now, as I understand it, you are the owner of the Whistle Stop Cafe.

Christopher Scott

That's correct.

Shawn Buckley

And what town is that in, and what's the population of this town?

Christopher Scott

The Whistle Stop Cafe is in Mirror, Alberta with a population of, last Census: 502. But I think we're about 520 now.

Shawn Buckley

Okay, hey, so it's growing.

Christopher Scott

Growing, like a weed.

Shawn Buckley

When COVID hit and the lockdowns started, my understanding is you had only owned this café for six months.

Christopher Scott

That's correct. I spent the previous close to 20 years in the energy industry as an oil field worker. And I decided that due to constant government interference in my industry, I was better off doing something like owning a restaurant where the government wouldn't abuse me as they had in the energy industry.

Shawn Buckley

And just so you guys know, there's some foreshadowing going on here. So tell us, did that work? Were you able to avoid bureaucratic interference in your business life?

Christopher Scott

No, as a matter of fact it put me on a collision course to meet the biggest bully I've ever faced.

Shawn Buckley

Okay, now my understanding is when they first locked us down and told businesses to close, like restaurants, that you actually did comply, and you did close the Whistle Stop Cafe.

Christopher Scott

I did. We complied with all the rules. I mean for the most part we went along to get along with the attitude that, you know, it's not going to be forever. We'll just get through it, and we'll just comply even though we knew it was wrong.

Shawn Buckley

Now, while locked down, while we had these restrictions, my understanding is that you started hearing stories in the community that mental health issues were on the rise. And you just made a personal decision that you should try and find something to do to help. And can you share with us what you did to try and kind of help the community that was suffering mentally because of the lockdowns and other conditions on us?

Christopher Scott

Of course. One of the blessings, and the curse, of being the hub of a community is that you hear a lot of stories and people share things with you. And one of the things that we heard very consistently was people were going stir-crazy, families were stuck without anything to do, like kids weren't doing sports, tensions were high, instances of domestic abuse were on the rise, mental health issues were on the rise, suicides were on the rise.

All of the things that don't generally take the spotlight because number one, it's uncomfortable to talk about or look at, and number two, it's just not prioritized in our society to deal with those things. But we're hearing them, and so I was thinking: well, how do we do something while following the rules—because nobody wants to get in trouble with the government, right—that will help people get out and do something with their family, have some sense of normalcy, and not get in trouble?

I don't know where the idea came from, but I ended up buying an inflatable drive-in movie screen and a projector—not much different than the one that's right there—and an FM transmitter. I set the inflatable movie screen on the roof of the Whistle Stop Cafe and then I invited everybody to come out, while following the rules. Like park six feet apart, and follow physical distancing, and wear the silly breathing barriers, and the whole nine yards. And we had hand sanitizer. We had enough hand sanitizer we could have run a Co-gen [Co-generation] plant on it.

And we offered free movies so that families could come out and do something. And the first night that we offered the movie, there was about five or six cars. I decided to do this five nights a week. We did a Monday, Wednesday, Friday, and Saturday. The second night there was 30 cars, and then the next week there was 100 cars.

[00:05:00]

And it became this tiny little bit of relief in this beautiful province of Alberta, where people could come and be kind of normal, and do something so that they could break the monotony of the mandates and restrictions. And it was all fine and dandy until we got on the radar of the bureaucracy. They actually shut us down because they didn't have a specific set of rules for that type of business.

Shawn Buckley

My understanding is eventually, after a large amount of bureaucratic effort, they came up with some rules and you were permitted to continue.

Christopher Scott

That's correct. We could offer drive-in movie services while following the rules, and people did. They were really good about that. I mean we had line-ups outside to come in and get popcorn. People were actually standing eight feet apart on their own without being asked, so it's not that people didn't want to follow the rules, they just wanted something to do. They did allow us, but one of the conditions was nobody was allowed to use the restrooms.

Shawn Buckley

Right, okay. Now, so you're complying, and how is that affecting your business economically?

Christopher Scott

Well, in a short period of time, just like most other businesses, it took me from a positive cash position to a negative and declining cash position.

Shawn Buckley

Okay, now you ended up opening on January 24th, 2021. And can you just share for us kind of what things were happening before then, that led you to open?

Christopher Scott

Sure. So as many people will likely remember— The election prior to this, we elected a government that we had a huge amount of faith in. And the premier, you know, we thought he was going to come and save us. It didn't turn out that way. In December, I watched him actually apologize to businesses for choosing which businesses were essential and which were not, basically choosing who lives and who dies in business. And they said they'd never do it again.

And I watched our premier say this, and I thought, yes, this is the guy that we elected. This is the guy that's going to get Alberta through this. And a few short days later, he returned to TV and said he was now locking us down again and closing businesses again. "But don't worry because this time it's only going to be 30 days (of a two weeks), and then we'll just get back to normal because we need to protect the healthcare system."

Now that phrase "protect the healthcare system," that struck me as odd right from the beginning, because as I looked around at all the healthy people around me, protecting the healthcare system seemed like a strange thing to ask for. If we wanted to protect people, we should be talking about protecting people's health. We should have been encouraging people to focus on their health, and make sure that they could handle sickness by focusing on their health.

But it was never about that. It was always about protecting the system. And I had a big problem with that. So the 30 days came and went. Deena Hinshaw, the Chief Medical Officer of Health, came on TV and she said, "Well, you know, we need another week. It's not quite working yet. We need you guys to stay closed for another week." And I was livid. I was livid, and I said to myself, when Jason Kenny shut us down again in December, that after this 30 days, I was going to protest this by opening.

Thirty days came and went. Another week came and went, and Deena Hinshaw returned to the airwaves. And she said, "Well, we can't let you open yet. And we really have no end in sight." And it was at that moment that I realized that number one, this was not about protecting people's health. This was not about keeping people safe. It was about control.

And if it had been about keeping people safe, the level of incompetence from our government to go on the air and say that they had no idea or no plan, that was not okay with me. At this point we had heard some devastating stories of what happened to people and their families; businesses were being lost; the damage was unbelievable. And so I decided that I was going to exercise my constitutionally protected Charter right to protest. And I opened my restaurant in protest of government policies that were not aligned with what our rights as Canadians are.

Shawn Buckley

And that happened on January 24th, 2021.

Christopher Scott

That's correct.

Shawn Buckley

So what happened after you opened in protest?

Christopher Scott

Well, I have got to say, being the only restaurant in Alberta open, you're very busy.

[00:10:00]

We had a lot of customers. We ran out of food consistently, but something else happened. I opened in protest partly because of what was going on around me and what was happening to other people. But to be perfectly honest, the motivations were more selfish because I was put in a position where it was either fight or flight. I was either going to lose my business or I was going to stand up and do something about it. And so I did that mostly for myself.

I protested mostly for myself. But as people started pouring into the café and they saw somebody standing up—they saw somebody protesting these mandates—they started sharing stories with me that completely changed the way I look at the world, the way I look at the government, and the way I looked at myself. I was forced into a position where I had to accept the fact that if we don't stand up and do something and be an example for other people that also need to stand up, nothing will be fixed. It'll never end. And so you know the authority, of course, tried to— They dropped the hammer of God on me.

Every agency in the province was on me: daily or every other: daily visit from the RCMP [Royal Canadian Mounted Police], and from environment to public health inspectors. Constant threats, constant intimidation: "Oh you're going to lose everything. We're going to take your business. We're going to take your food-handling permit. You're going to lose your liquor licence. You're probably going to lose your house."

As a matter of fact, the second time the Chief of Police, Sergeant Bruce Holliday— The second time he spoke to me, he came with the health inspector. And as the health inspector left Bruce and I, to go find some things to cite me on, which they didn't, Bruce leaned in close and he said to me, "You know, I admire you standing up for yourself, and I admire what you're trying to do, but you've already made your point. You should just close and follow the rules because you cannot win against the government."

Shawn Buckley

So I just want to make sure that I'm clear. This is the Chief of Police?

Christopher Scott

Yeah, Chief of Police.

Shawn Buckley

So it would be an RCMP officer?

Christopher Scott

Right.

Shawn Buckley

So the officer actually supports, ethically, what you're doing, but is communicating to you that as a citizen of Alberta, you don't have a chance of standing up against the government to basically have a right to protest.

Christopher Scott

That's right. And you know, the ironic thing is, he was right. A citizen cannot win against the government. I was put in a position where to fight the government, and to stand up for my rights—and after realizing what was happening, the rights of people around me—where the outlook is grim. I mean, you retain a lawyer in this province for something like this, and they want \$25,000 from you upfront, before they even do anything. It costs \$10,000 to prepare a piece of paper.

And somebody like me, there is not a snowball's chance in hell that I could stand up and do that on my own. But something amazing happened. A lady by the name of Sheila showed up at the Whistle Stop Cafe, and she's a reporter for *Rebel News*. And they had a program at the time called Fight the Fines, and they were crowdfunding so that people like me could actually stand up against the government.

So with their help, I went from a 100 per cent assured loss to, "We actually have a chance to do something now." Thousands of people, probably millions of people from all over Canada chipped in. And they stood up with people like me who were trying to stand up against the government. And all of a sudden that truth that Sergeant Bruce Holliday had said to me, that "you can't win against the government," that truth changed to "you can't win against the government, but 'we' can win against the government" if we stand together and start speaking some truth.

And we unify around the truth and move towards doing what's right; we can actually win against the government. Because that's the one thing that stands the test of time, is truth, and the truth is that what was done to us was wrong. The bureaucracy that did what they did to us did it in error, for whatever reason. It doesn't matter why they did it, but it was an incorrect path. And we're seeing that now.

I mean, we've heard testimony from everybody, from Lieutenant Colonel David Redman, who wrote the plan on how to deal with this, and watched it thrown out the window

[00:15:00]

in lieu of following Deena Hinshaw and Cabinet's advice. We heard from him. We've heard from people that have been devastated by this, to the point where they've lost family members to suicide because they couldn't see any hope in continuing on in this country.

In this free country with free healthcare, where if you have a mental health issue you should be able to phone a doctor and get some help before you fix it yourself by ending

your own life. But we lost those things because the bureaucrats failed to uphold our civil liberties, our rights and freedoms that are guaranteed to us under the Constitution. And now, as I hear people testifying at the NCI: these are stories that I've been hearing for two years. As people flooded into the café, it wasn't just a café and a gas station in a dusty little town, anymore. It became this place where people went to because it was a symbol of freedom and hope because somebody was doing something.

Shawn Buckley

Now, Chris, it's my understanding that not only people from Alberta came to the Whistle Stop Cafe because it was this signal of hope, it was this little beacon of light in the darkness, but actually people came from other provinces to the Whistle. Can you share with us that? Because that, I think it's important to understand, that just you taking a step created hope.

Christopher Scott

Yeah, we've had people from all over the country show up there. There were people driving 8-12 hours to come and have a burger at the Whistle Stop Cafe, because they believed in what we're doing. It wasn't what I was doing. This was a conscious decision that I made after speaking with my family, and my friends, and my staff.

It was never just me. If it was just me, I would have fallen flat on my face a week after it happened. This was a "we" thing. It was dozens of people, hundreds of people even, volunteering to help through the physical parts of it. And thousands and thousands of people helping with the financial part, it was never a "me." It's never going to be a "me." It's a "we" thing. And that's why I think it's so important that people pay attention to what's going on here.

Shawn Buckley

If I can focus, because I just think you're saying something here that is tremendously important. And before we move on— Because even just going back to you buying that inflatable drive-in screen and holding those drive-ins, you explained how maybe there were five cars the first time, and then more and more, and all of a sudden, it's an event. Because it gave people something to do. And it would have helped with mental health.

That was an example, Chris, of you doing something, just deciding to do something. Do you see? And I'm just making a point of this because you set an example of how you can make a difference. It's not just you, but other people could make a difference. If you just go, "Wait a second, we have a problem here, what can I do?" and you came up with this creative idea. And you pointed out *Rebel News* that had made this decision: we've got to have crowd-funding, so that people have an opportunity to stand together against the government.

Because, as you pointed out, it can't be done alone, and I think we're all very proud of *Rebel News* for doing that. But they made that decision to do that, and then you and your team made a decision: "No, we're going to protest because we have to," and you're giving us examples that I'm just emphasizing because small groups of people making decisions make a difference.

And I think there will be a lot of people participating in your testimony today that heard about the Whistle Stop Cafe, and it gave them a little glimmer of hope that somebody was standing up while the rest of us were all cowering in fear. And so I just wanted to

emphasize that you making the decision, because it's the point you're making now, isn't it, is just people making a decision can make a difference?

Christopher Scott

Yeah, and as much as it pains me to do so, I can steal a quote from Hillary Clinton, and say "We're stronger together," and I'm not talking about what she was talking about, when it comes to stuff like this. We are absolutely stronger together.

Shawn Buckley

Now, you said that the police officer told you one person can't stand against the government, and you've told us it's true, but we together can stand against the government. Can you share with us the efforts that the government went through and are still going through, because you're still facing proceedings?

[00:20:00]

So share with us basically all the steps that the Alberta government has taken to close a café in Mirror, Alberta, a town with a little over 500 people.

Christopher Scott

Well, as you mentioned, some of this stuff is currently before the court. So unfortunately, I have to decline to get into specifics. And that is out of respect for the proceedings that are still going on. But I will say in a more general statement that the government and bureaucracy: there is no limit to how far they will go to try and crush those who oppose them. I can say that I'm disappointed and, actually, I'm disgusted by some of the things that I've seen, some of the tools that have been used against me to try and get me to stop protesting.

Shawn Buckley

Now, do you mind if I go through some of them, just to kind of highlight for people? I know you don't want to go into details, but a lot of this is public. In addition to AHS [Alberta Health Services] visits and multiple tickets, how many tickets have you been— Or they weren't tickets, you were actually summonsed to court to face charges. How many times did that happen?

Christopher Scott

I lost count when I ran out of fingers and toes, but I think it was 23.

Shawn Buckley

Okay, so 23 separate summonses to attend at court. My understanding is that basically they got the liquor licensing authorities involved and pulled your liquor licence.

Christopher Scott

They did, yeah.

Shawn Buckley

They got Occupational Health and Safety involved to come and visit you.

Christopher Scott

Yes.

Shawn Buckley

They seized liquor.

Christopher Scott

Yeah.

Shawn Buckley

They went to the person that you had a contract [with] to allow you to even purchase the restaurant. So they went to a private person to try and get them to pull the café back from you.

Christopher Scott

They did.

Shawn Buckley

So they were trying to involve private sector people. They actually seized and chained the doors of the Whistle Stop Cafe to physically take it away from you.

Christopher Scott

Yes, they did.

Shawn Buckley

So that's just some of the things. That's not all, but just some of the things. They got an injunction against you. I think you can share with us the terms of the injunction and Jane and John Doe.

Christopher Scott

Oh, of course. So what's commonly known as the "Rook Order," was an injunction sought by Alberta Health Services against me, Glen Carritt, the previous owner of the Whistle Stop, and the Whistle Stop Corporation, in addition to John and Jane Doe in Alberta. And the Rook Order basically said that it was declared illegal to attend, organize, incite, or promote any illegal gatherings.

Shawn Buckley

Right. So because John and Jane Doe were included, that applied to every single resident of Alberta.

Christopher Scott

It did, yes. And that part of it was challenged in the courts. And it was challenged successfully, and that was removed. But the named individuals are still on there. Now, as a Canadian and as an Albertan I still believe in the Constitution. I believe in the Charter of Rights. I don't think it's perfect, but I think it was well intended, and as written, I think it should protect us.

And I stood on that, and I will always stand on the fact that my right to protest is literally my only recourse against government policy that I disagree with—aside from getting into politics and doing it myself. But that's my only recourse and that should never be taken away from me. So I engaged in a protest. As a matter of fact, I advertised it as the biggest protest Alberta has ever seen. It didn't turn out that way because the weather didn't cooperate, but there was a couple thousand people there. And I was arrested and incarcerated for exercising my Charter right to protest bad government policy.

Shawn Buckley

And my understanding is you spent three days in jail.

Christopher Scott

I spent three days in jail. I was subject to sanctions of \$30,000 in fines, 18-months-probation, a compelled speech portion where the courts ordered me to tell people what the government wanted them to hear before I spoke, and I wasn't allowed to leave the province of Alberta.

Shawn Buckley

So I want to make sure that people actually understand this compelled speech part of your sentence. When you were sentenced, in addition to \$30,000 and time served—and I understand you were also put on a year and a half of probation—but you were ordered to write text that the Court gave you publicly.

[00:25:00]

So you were to make a public statement and basically read what the Court told you to read. So not only did you not have freedom of speech but you were compelled to give a speech that the Court dictated to you.

Christopher Scott

That's correct.

Shawn Buckley

Now, going forward, and I understand, and you've made clear, that there's things you can't talk about because there's still legal proceedings, you're still facing other sanctions that aren't finished. But going forward, what could you leave us with as kind of lessons learned and what we need to do, to do this better going forward?

Christopher Scott

Well, I see there's 10 minutes and 30 seconds left, I don't think that's enough, but I'll do my best.

Shawn Buckley

Well, no, and I think you've learned watching yesterday, that our time limits are not hard and fast, and I know the commissioners are going to have questions for you also. But you do have some lessons to share with us, and you do have some thoughts.

Christopher Scott

Yes, I do.

Shawn Buckley

I'm inviting you to share them.

Christopher Scott

I'll try and be quick. So during this little adventure that I found myself on, it's become necessary for me to read a lot. You know, we tell each other in the schoolyard when we're kids—when somebody asks, "Oh, can I use that?" or whatever. And we say, "Well it's a free country, isn't it?" We're conditioned to believe that we have these rights and freedoms. We're conditioned to believe that our forefathers fought and died for our freedom so that we wouldn't have to. And during the course of this adventure, I've realized that that's a lie.

Our forefathers didn't fight and die for freedom so that we wouldn't have to. They fought and died for our freedoms so that we would have the opportunity to keep them, and that comes with a hefty responsibility. And I learned this as I went through some legislation that was being used to try and stop me from earning a living, from exercising my civil liberties, including the right to protest; I learned that there is legislation out there right now, and Jeffrey Rath talked about it yesterday. I think Lieutenant Colonel David Redman, he alluded to it a little bit in his testimony.

There is legislation out there right now that allows the bureaucrats to strip our rights and freedoms away without justifying that they need to do it. And that's exactly what happened to me. Bureaucrats decided that it was unsafe for me to pour coffee and serve hamburgers, in a café with a capacity of 40 people that was generally maybe 10 to 15 people in there. They told me that it was unsafe for me to earn a living, and they did that without ever proving or justifying in a court of law, or with any scientific evidence presented in our province where this legislation exists.

And they used that legislation to strip away my rights. Now you might think, "Okay, well, we need that, so that if there's something that's going to harm the people of Alberta, we can step in and deal with it quickly, and I would agree with that. But if you look into legislation like the *Public Health Act* of Alberta, that is a very, very dangerous piece of legislation. And I'll explain why, better after this. But that legislation says that, and I'm going to paraphrase here; this is the best I can remember, "In fulfilling her duties to protect the health of the people of Alberta, the CMOH [Chief Medical Officer of Health] may at any time, as long as it's in good faith, take any steps necessary to do so, including seizing property, personal or private."

That means if the CMOH, or anyone acting under her orders to promote the health and safety of the people in Alberta, if they think that your house needs to be seized and used as a vaccination clinic, they can do that under the law. And you have no recourse except for to pay a lawyer \$50 or a \$100,000 and go to court. And two, or three, or ten years down the road prove that they shouldn't have done it. That's what that legislation allows. The wording is very specific in public or private; your private property is not off-limits.

As a matter of fact, we saw that during the pandemic. We saw people reporting their neighbours for having their grandkids over for Christmas dinner, on private property. We saw police showing up at people's houses and issuing them tickets for having their friends over. I don't mean to sound crass, but this can go anywhere from having a church service in your house, the police will be involved in that because it applies to private or public, to having a swinger's party in your bedroom.

The government can literally shut you down for anything that you do in your kitchen, in your bedroom, in your church, in your restaurant, in your café. Even more dangerous than this, now we have a federal government— We have Theresa Tam, the top doctor for Canada,

[00:30:00]

alluding to the fact that climate change is one of the most serious risks to health.

Now, if climate change is a serious risk to health, and our health authority can take any steps necessary, any steps they think is reasonable, as Jeff Rath pointed out yesterday, in order to combat these things for our health, what does that tell you about what the federal government can do, going forward?

The federal government has said that, in their opinion, capitalism and liberties need to be dismantled for our health. And there's legislation that allows our provincial governments to do almost anything they want to us in the name of public health. Where does that put us as Canadians? There's another piece of legislation that can be used in the same manner, and Jeff talked about it yesterday. And that's the Civil Emergency Measures Act [*Emergency Management Act*], I think it's called.

Our government and our bureaucrats have unlimited power against us, and even worse than that, the judiciary that's supposed to protect us against these things has failed because that judiciary defers to those who are doing these things to us, as the experts, to justify their actions. The onus is on me to prove that my actions were justified in pouring a cup of coffee in my restaurant, and if I can't prove that, if I can't prove my innocence, I'll be fined into oblivion or maybe jailed.

Right now, we have four men who are jailed; they've been jailed for over 450 days. They haven't had a trial, they haven't had their day in court, they're innocent, and yet they sit in jail because they spoke against the government. They stood up for their rights. They're in jail because bureaucrats have decided that their civil liberties need to be removed to protect the bureaucracy. And this is the free country we live in, this is the free country of Canada, where Polish immigrants testify under oath and say that they're thinking of leaving this free country that they fled their home to—because they want freedom.

Well, I need to ask you folks, "Where are you going to flee to?" because I've thought about it. Where are we going to go as Canadians in the freest country on earth? Where are we going to go when our freedoms, and our liberties, and our rights get stripped away from us to the

point where we need to flee to live our lives as we choose? There is nowhere else to go, not one place on this planet. There might be places warmer where we can escape this for some time, but unfortunately these things catch up.

And Shawn, he asked how George Orwell knew in 1949 how these things would happen. How it could be so prophetic? These books that he wrote: *Animal Farm* where the animals looked in the window and they couldn't tell the difference anymore between the pigs and the humans. The bureaucracy, those who were standing up for them, became the bureaucracy they're fighting against. How did George Orwell know that?

George Orwell was a democratic socialist. He knew where that led. He also liked history. And the one thing I've learned—aside from we don't live in freedom, we're only free when the government says we are—the one thing I've learned is that history will repeat itself over, and over, and over again. And we are no more enlightened today than we were 5,000 years ago. We still are subject to the same things: greed, lust, gluttony, all those things. The same things have been used to control us for thousands of years.

And you know what the number one thing is? Fear. Number two is hunger. Civilizations all over the world have fallen to tyranny because of fear and hunger, and that's where we're at right now. I'm hungry for freedom. I'm hungry to live my life as I was intended, to exercise my God-given rights that no government gives me. And the only thing I fear is the apathy that I see in Canadians and the media—the apathy and the fear that prevents them from taking a stand and doing something to prevent the things that have happened in history from happening again.

And that brings up another point. We have to stop looking around and looking for someone to save us. Nobody is coming to save you. I'm not going to save you; Danielle Smith isn't going to save you. No politician's going to save you, the only person that's going to save you is you. So before you start condemning a politician,

[00:35:00]

or asking someone to do something for you, you need to look in the mirror and ask yourself what you're willing to do to protect your rights and freedoms. What you're willing to do to ensure that the lives that were lost to gain you the freedom that you have today, remains for your kids.

What are you willing to do? Are you willing to put \$10 in a jar? That's great! Are you willing to put your business on the line? Amazing! Are you willing to support those who are taking a stand so that they can continue to do it? Do it; do something; do anything! Because, as you heard yesterday from somebody who has lived it, there will come a day when you either look back and you say, "I wish I did something," or you look back and you celebrate the decision you made to do the work to ensure that the rights and freedoms that we're born with remain with us and remain with our kids.

It's not about a restaurant. It's not about coffee. It's not even about a passport to go in a restaurant and have lunch. It's about standing up for what humanity is supposed to be.

So we've got some pretty difficult choices, and I really hope that this Inquiry, I really hope that people pay attention to it, and they start to think about these things, because you know with what we hear of coming from the federal government right now, and knowing what legislation is there that can be used to accomplish what they want to do, I really think we're in the endgame.

Shawn Buckley

I think those are very apposite words that you're sharing with us. I'm going to ask the commissioners if they have any questions of you.

Commissioner Drysdale

Good morning.

Christopher Scott

Good morning.

Commissioner Drysdale

Can you tell me how you were treated by the mainstream media or the government media in Canada? Did you get a fair and balanced analysis of what you were doing?

Christopher Scott

Early on, I would say that it was more balanced and fair than I anticipated. But after a little while, I mean, they're like a pack of wild dogs, and they feed off each other. So I am a rebel and a scofflaw. This is sarcasm, by the way. I've been called a rebel and a scofflaw and an anti-vaxxer and an anti-masker. And the media has framed me as someone that just doesn't care about the rules. They've made the public believe that I wouldn't force people to provide papers to eat a hamburger, so obviously, I must allow rats in the kitchen.

Well, sorry, folks, but the only rats in Alberta are the ones that called the cops on their neighbours over Christmas. You know, there are some good folks in the media. There's a CTV news reporter that I actually would call a friend. And he's on side about a lot of this stuff. But unfortunately, speaking up and doing the right thing in those institutions is a death sentence for your career. So we can't count on them.

Commissioner Drysdale

How were you treated by the alternative media in Canada?

Christopher Scott

Better. Much better. Sheila Gunn Reid spent a week at the Whistle Stop Cafe sitting on the floor, doing the rest of her work in the corner while the police badgered people. And now looking back, I don't know if it was because of the fight, or the burgers. Because the burgers would be worth sitting on the floor for five days, but you know, I'm not even going to call them the alternative media, I'm just going to call them the new media. They have been very good at actually telling the truth of what people like me are doing, where no other media would.

Commissioner Drysdale

Mr. Buckley made an announcement this morning in his opening remarks about the passage of Bill C-11, which is the amendments to the *Broadcasting Act*. Do you have any comments about how those changes may affect your ability to access the new media, in your words?

Christopher Scott

Well, this is one of the things where time will tell. They say that they're not going to use this piece of legislation to silence media, but I don't believe it for one second. I mean, all you've got to do is turn on the radio and you hear the woke mob saying whatever they want, but you don't hear any conservative voices.

[00:40:00]

And it's not supposed to be that way. The legislation was supposed to protect Canadian content.

And I was taught that as a kid. I remember going through that part of class and learning about how Canada protects Canadian music and the CRTC [Canadian Radio-television and Telecommunications Commission] is so great, and all that kind of thing, right? I think it might prove to make it more difficult to access that online. But one thing people have to remember is online isn't the only thing we have. The one thing that we lost over the last three years is the ability to gather in peaceful assembly. We still have that ability.

And Bill C-11 may just mean that we have to do more things like hold more events, and have more backyard barbecues, and get rid of that silly idea that it's impolite to talk about politics or religion. You know, the two things that affect everything. Politics affects everything in our life from before we're born, to after we die. Every single step of the way is politics. Religion affects everything else in our eternal lives. The two most important things in our lives. And yet it's considered impolite to talk about it.

So if we break down that stigma and start peacefully assembling, and having conversations again, we have the ability to share ideas similar to what they did in Poland with the Solidarity movement. I mean, it was all in people's houses and backyards. As a matter of fact, my great, great grandfather was one of the men who burned his guns, and he wouldn't fight for the Czar. And he was sentenced to hard labour in Siberia, and he wasn't released until, I think, the Czar had a son: he was so happy he released all the prisoners, whatever.

Anyway, he came to Canada and his stand against tyranny didn't stop here. He was issuing birth certificates and legal documents to people that the government said were second-class citizens and couldn't have them back then, you know? And it wasn't the media that changed things. It was people's willingness to peacefully assemble and do what they had to do, and share ideas that moved them and got them the rights that they were looking for at the time. And that may well be where we have to go in the future. And the bright side of that is there are places like, oh, I don't know, a little out of the way café where we love to have conversations with people and share those ideas.

Commissioner Drysdale

You mentioned in your testimony that you were arrested and that you were detained for, I think it was three and a half days.

Christopher Scott

Right.

Commissioner Drysdale

Did they handcuff you when they arrested you?

Christopher Scott

Of course.

Commissioner Drysdale

Can you describe what your experience was when you were detained, were you in the Remand Centre? Were you in a lockup? Were you in general population?

Christopher Scott

No, they left me in the drunk tank for three days.

Commissioner Drysdale

Can you describe that room for me please?

Christopher Scott

Oh, it was horrible! Well, there is a silver lining, and I'll talk about that in a minute. The drunk tank is a concrete room with a concrete bed, a stainless-steel toilet, which is also the sink, which is also where you get your drinking water from. The lights are on 24 hours a day. It's not a pleasant place to be. But they gave me a book, and I hadn't read a book in about two years, so that was nice. And the concrete bed straightened out my back, and I felt better when I got out. So there was a silver lining there. And I suppose if we're going to go through those things, we have to be able to find the silver linings in every tribulation. I was surprised to be stuck in the drunk tank for that long, because generally they bring you there, and then they move you to remand, and you have a bed, and whatever. But yeah, it wasn't pleasant.

Commissioner Drysdale

Were you violent?

Christopher Scott

How so?

Commissioner Drysdale

I'm just asking, if you were in handcuffs, did they put you in handcuffs because you were at risk of being violent?

Christopher Scott

No, they put me in handcuffs because they were scared of what I would do with my hands. But I think maybe next time they should probably muzzle me because my words are a lot more dangerous than what my hands will do.

Commissioner Drysdale

My last question has to do with your community of 500 or 520 people. What was their general impression? Were they supportive? Were they unsupportive? Was there a mixture? What was the general consensus there in the community about what you were doing because you were bringing attention to this small rural community?

Christopher Scott

Well, it was mixed. In the beginning, you know, it was exciting for most people, I think. There were of course those who had completely succumbed to fear, and they saw me as a vector of disease that had to be avoided at all costs because of what they were being told. In the end, after the dust settled, I think the community is probably split 50:50. Half seem to be supportive and agree with the position I took, and half don't.

Probably the line there

[00:45:00]

is the same as it would be provincially or nationally. We're divided, right? We heard things like "this is a problem of the unvaccinated." Lieutenant Colonel David Redman, he mentioned yesterday that the leadership, in this province and in this country, they did things that they should never do. They used fear as a tactic, and that fear has caused the division that we're seeing in towns like mine, and in the province of Alberta, and across the nation.

Commissioner Drysdale

You know, sorry, that was going to be my last question, but you mentioned terms and attitudes toward you, which were quite hateful. What was the source of that? Why did people think that? Why were they, in your opinion? What was feeding that in people?

Christopher Scott

In my very humble opinion, because I'm not a psychiatrist, there's a lot of reasons why people would not like me. Number one: I'm not likable. Number two: during this whole thing, a lot of people stood up, and they supported me. As a matter of fact, they supported me to the point where they helped me purchase the restaurant to remove the mechanism Alberta Health Services was trying to use to force me to stop protesting. They helped me buy it, so that that person was out of the equation. Some people didn't like that. They see me getting something that they don't believe I deserve, and they hate me for it.

Other people legitimately believe the narrative, in that I should have just followed the rules and done everything and protected everybody, and forced people to take a jab they didn't want to eat a hamburger in my restaurant—which I wouldn't do, by the way. My restaurant was open by then, and we were serving food again. I got my licences back, and the government decided they were going to bring in that vax passport. I shut down my dining room, because I was under bail conditions that said I had to follow the public health orders, and I wouldn't do it. I would never ask somebody for their papers so that I could pour them a coffee.

So I had to shut down my restaurant for that. And, you know, there are people, they don't understand that. Some people saw that as an inconvenience. "Oh, Chris, why wouldn't you just allow me to show you my vax passport so I can have a coffee here?" And the answer is

because it's not right. "Why would you not follow this part of the rules? You can be open, just only serve this select group of elite people that did what the government want." Because it's not right.

I'm not going to put my ability or potential to earn money over my principles, like that. And people didn't understand that. And so you know, they hate me for it. As a matter of fact, my friend Kerry, over there, and I, of all the things that could have happened to a guy that owns the Whistle Stop Cafe, we got hit by a train. Can you believe that? We got hit by a train, and on social media, the outpouring of concern was amazing. People were legitimately concerned for us and asking all the time how we're doing.

But there were some people that said things like, "I was so happy when I heard that. It's such a shame that you two free-dumbers didn't die." And that hit me like a freight train. The idea that in this country, where we're supposed to be free to disagree on certain issues, and our leadership is supposed to foster good relations between us, right? They're not supposed to divide us with fear. That we've come to a point where one side actually wants the other side to die because they don't have the same opinions. And it's no different in my town.

Commissioner Drysdale

Thank you.

Commissioner Kaikkonen

You alluded to the cost of court and what it costs for an ordinary citizen to fight against these kinds of government abuses. And I believe that there's a lot of people in this country who believe the same thing, that they'd like to fight on principle through the court system, but it's just unattainable, or they will lose all their assets.

What would you suggest in terms of recommendations? And yes, I'm aware that you're still in court, but what recommendations could you make, just from your own perspective that might make court more accessible to ordinary Canadians when they feel that they've been abused by government authorities?

Christopher Scott

Short of finding an organization that will help you crowd-fund, I really don't have any ideas. I mean, even a lawyer will tell their clients not to fight on principle because it's costly, it rarely wins, and in the end, you lose everything, and you gain nothing.

[00:50:00]

So standing on principle oftentimes means that you end up with nothing. One of the things that I don't talk about too much, but I'll mention it now, is part of the decision-making process for me to engage in protest, to use my Charter right to protest.

One of the decision-making process parts was that I had to ask myself, what am I willing to lose? Because it's very likely that I'll lose everything fighting the government. I've watched it happen around me numerous times. We've all seen it. And if you don't make peace with the reality that you will very likely lose the things that you find that you hold dear, like your property, for instance, you can't take on that kind of fight. So I had to very quickly have an internal conversation with myself and accept the fact that I would very likely lose the

things that I'd worked my life for. So short of doing that, and being okay with the negative outcome in that regard, and finding an organization that will help you with legal costs, there's really nothing else you can do that I'm aware of.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

Chris, there being no further questions, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing with us today.

[00:52:01]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 2: Dr. Misha Susoeff

Full Day 3 Timestamp: 02:12:52–02:52:37

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness is Dr. Misha Susoeff. Misha, can you state your full name for the record, spelling your first and last name?

Dr. Misha Susoeff

Yes, sir. It's Misha Mooq Susoeff, M-I-S-H-A S-U-S-O-E-F-F.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Misha Susoeff

Yes, sir, I do.

Shawn Buckley

Now, by profession, you are a dentist, and you've been practicing dentistry for the last 17 years.

Dr. Misha Susoeff

Yes. I'm a dentist, I'm an entrepreneur, I'm a father, and I'm a husband.

Shawn Buckley

Now, Misha, when we were having an interview earlier in the week, you brought up a kind of a different issue with informed consent, and I'm kind of excited about you to explain that. So can you explain the position you find yourself in, being legislated by the *Health Professions Act*, and then your thoughts on informed consent?

Dr. Misha Susoeff

Over the course of the last few weeks of following the National Citizens Inquiry, I think we've had a lot of good expert testimony regarding informed consent. But I'm finding myself— As a practitioner who lives in that world, I feel that I'm inhabiting a post-consent world. And I don't understand, as a practitioner, how I move forward from that. So as we've heard previously at the National Citizens Inquiry, consent is foundational. It's sacrosanct to the provision of any type of medical services. And in Alberta, we are the different health care professions legislated under the *Health Professions Act*. We are self-regulated, and we design our own regulations.

Now, every health profession in Alberta will have within their professional standards, guidelines surrounding consent. And consent is a multi-factorial, multi-layered concept, and if you remove one component of consent the entire pillar collapses. And what I've watched happen in my province, in my country, and frankly around the world, is that the concept of voluntary consent has been ignored. And voluntary consent is the concept that there can be no outside persuasion in the medical decision-making of any patient. So that means from their health care professional, their doctor, their chiropractor, their dentist, nor from a policeman, nor from a politician, nor from a hostess at a restaurant, and if at any point that the voluntary nature of that person's medical decision is violated, there is no consent. The consent is repudiated.

Shawn Buckley

Now, one thing that jumped out at me when we were having a conversation is: You said that you can't provide medical services to anyone if you think there's a third party in the decision. And it's the way you phrased it as "a third party in the decision" that I found so interesting. And I think that's what you're talking about: as a medical practitioner, if you think they're doing this because a spouse is forcing them so that they can travel, or an employer is forcing them just to keep in a job, that literally there's a third person in the room when you're trying to assess consent.

Dr. Misha Susoeff

Exactly. And at that moment when there's a third party involved making a decision for the patient, as a health care practitioner, you no longer have consent; it's been vitiated.

Shawn Buckley

I really appreciated that you brought a new term to the table. Because that is a different way of us thinking about it: that there's literally a third party in the room, and that that's something that healthcare practitioners need to be mindful of. Now, as this pandemic hit us, you were involved in doing some social posts. And I'm wondering if we can switch gears and have your thoughts— share with us kind of what happened with some social posts that you were involved with.

Dr. Misha Susoeff

Yes, sir.

[00:05:00]

I was watching in horror as the public discussion around mandatory vaccination was being tested in the media. And because of my background, a little bit, I was particularly sensitive

to this. So because of my familial history—my grandmother was raised in a residential school, and through other unrelated circumstances, I was raised on a First Nations reserve in interior British Columbia—and because of my familial history, and having had a front-row seat to the cruelty that Canadians were historically able to subject each other to, I saw what was coming as a really big error.

Now, this was at the time, if you'll recall, when we as a country were mourning the discovery of bodies at the residential school outside of Kamloops, and across the country the flags were at half-mast. So when I looked out the window of my office, I could see that we were currently mourning our last atrocity, and we were hurtling straight towards the next one. Now, to answer your question about social media, I made some public posts about this, and I tried to educate the people who followed me about— Canada holds a dubious distinction of being—before COVID—one of a few countries in the world who had an internal passport system. And by that I would mean like North Korea, for example, or East Germany, or Venezuela, where you have to show your papers to move.

Shawn Buckley

In fact, before you go on and explain who this applied to. My understanding is that before South Africa came out with their apartheid program, they came to Canada to see how we did it concerning this population, and I'll let you carry on.

Dr. Misha Susoeff

Yes, sir. Maybe a little-known fact: Canada, around 1880, instituted an internal passport system called the Indian Pass, which kept Native North Americans incarcerated upon their reserves. If they wanted to leave the reserve and trade, for example, they would have to beg a pass, a passport, to leave the reserve and move freely amongst the population. So I tried to bring this to the attention of people around me and I said, "Look this isn't the first time we've done this. And we're still mourning it now a hundred years later, and we're about to make the same mistake."

Now, it was around this time that we were starting to see some of the early physicians who had stood up publicly, some of them whom have testified at the Inquiry—Dr. Francis Christian comes to mind—who had asked a couple of simple questions and had been censored. Not just censored, but they had potentially lost their livelihoods because of it. And a lot of my social media following is employed within the medical community. And one thing that told me about the type of censorship that we were experiencing, what we're about to experience, is my social media post got zero traction: not one single "like," not anything. However, I got a lot of private messages. People who said, "Yes I totally agree with you," but were afraid to say it publicly. So already at that point the self-censorship within the medical community at large had begun.

Shawn Buckley

So and I just want to make sure people understand. So you're basically posting to draw the analogy of what we had done before with internal passports and the like.

Dr. Misha Susoeff

Yes, sir, internal passport version two.

Shawn Buckley

And people are afraid to like your post because they're afraid of being attacked. They'll tell you privately that they agree with you, but publicly they won't identify at all with what you're sharing.

Dr. Misha Susoeff

Exactly. And it was at that moment I realized that we were in big trouble.

[00:10:00]

Shawn Buckley

It's interesting. One of the things that came up in the Saskatoon hearings is we would have witness after witness speak against the current vaccine, but then volunteer that they're not anti-vax, and so it just seems that we're self-conditioned not to go against certain memes, and we have a fear to stand up. So I'll let you continue. I want you to talk about the economic harm that you experienced with the pandemic.

Dr. Misha Susoeff

As an entrepreneur, my wife and I run multiple businesses, and I feel almost guilty bringing this up. But the economic consequences for all of us were real. I'm blessed that we managed to skate through the pandemic response largely unscathed with our health, which is different than what a lot of the witnesses at NCI have attested to.

We did have a business that we had to close; it was no longer viable. The business was a seasonal business. It made most of its money over the Christmas season, and it was closed for two consecutive Christmases in a row, so that business was no longer viable. It had to be closed: the employees laid off.

Also, as an entrepreneur, we had deep roots within our community. And as Mr. Scott mentioned earlier, you didn't have to look too far across our borders to see jurisdictions that put value upon the individual sovereignties, or maintained the value of individual sovereignties, and their judicial systems were working for them. So we started to sell our assets in Canada, and we were looking across the border to find a different place to live.

Shawn Buckley

So you're actually so concerned with what was going on that you were selling assets with the view of potentially having to leave Canada.

Dr. Misha Susoeff

Yes, sir, sadly.

Shawn Buckley

Now, can you tell us about changes that you have seen in your dental practice after the vaccines were introduced?

Dr. Misha Susoeff

There have been many changes. I mean, frankly, dentistry was thought to be a very high-risk profession early in the pandemic. We were all very scared to go to work. We thought every patient interaction was going to lead us to hospitalization. So that was a challenging thing. As time went on, our sensitivity decreased, but we found that our patients were damaged. And I'm in an interesting position where I get to have 20 or 30 short social interactions a day. I get to know people. And I saw how badly damaged people were on both sides of the continuum. You know, regardless of how you felt about the pandemic response, there were people on both sides that were really being affected by it.

And I can think of, for example, some people—very lovely, intelligent, smart, high functioning people—who were so afraid to sit down in my chair. They'd come in covered with garbage bags and kitchen wash gloves, rubber gloves, sanitizing them with alcohol swabs, wearing an N95 mask over their nose and trying to hold their breath during a dental appointment. So the fear was palpable from those people. And it was sad to watch.

Shawn Buckley

Now, in the dental practice, there's some procedures that kind of go on for a while. So for example, if somebody was to get an implant, you've got to pull the tooth, wait for the bone to grow back, and then put in the implant and wait for it to set. And then put on the tooth that is going to sit on the implant.

So prior to vaccination, had you ever had a patient die mid-treatment? So you've got one of these types of treatments that is going to be stretched out over several months or a year.

Dr. Misha Susoeff

Prior to the pandemic, I don't recall that ever happening.

Shawn Buckley

Okay, now did that change after the vaccine rollout?

Dr. Misha Susoeff

Yes, sir, I would have patients disappear mid-treatment, not to return.

[00:15:00]

Shawn Buckley

Okay, and how often has that happened to you now?

Dr. Misha Susoeff

Sir, when we spoke on the phone the other night, I estimated three. Now, I'm hesitant to say this because I went into my database yesterday. My database isn't designed—you can't make any inferences from this statement—but in the past three years it's been 17.

Shawn Buckley

Seventeen.

Dr. Misha Susoeff

Yes, sir.

Shawn Buckley

So now you've been practising as a dentist for 17 years. Prior to the vaccine rollout there had never been a single patient that had died mid-treatment. And you've had 17 patients since the vaccine rollout.

Dr. Misha Susoeff

Yeah, exactly. To my recollection prior to the pandemic.

Shawn Buckley

Now, have you had patients who've— Basically, have you seen changes in their health conditions in a way that would be different than pre-vaccine?

Dr. Misha Susoeff

Yeah, and I'm going to corroborate the testimony of— We had a wonderful embalmer on. I think she was in Winnipeg. She described herself as the God's gift to embalming, so I thought she was really cute. And she testified how the people that she was seeing were not keeping up with their basic hygienic care of their bodies.

Shawn Buckley

And I think that was Laura Jeffries and she testified in Toronto. Just so if anyone wants to track down her evidence. It was Toronto. But I'm sorry to interrupt. You were sharing.

Dr. Misha Susoeff

Yeah, so it's difficult for me to attribute that to anything in particular other than the fact that the basics of these people's care for themselves was diminished. And then, also, a lot of people were absent for a long period of time; they just didn't come in and see us.

Shawn Buckley

Now, you are a medical practitioner, and as a dentist you have to know what's going on medically with your patients because some of the treatments of yours might be contraindicated. Were patients coming up with different diagnoses, and were any of them attributing causes?

Dr. Misha Susoeff

Yes, sir, and I'm going to contradict the testimony of Dr. Gregory Chan—I believe he was here on the first day of the Red Deer hearing—where he said that patients were hesitant to make a correlation between a vaccine injury and a new medical condition. So when I see a patient, every time I see a patient, we update their medical history. And I have been and still am, seeing patients with new medical issues. And it's surprising to me how readily, or how often, they will attribute it to their vaccination. And this is spontaneous. So they'll tell me, "Oh, yeah, well, I got a pacemaker after my second vaccination, and it was probably the

vaccine. But can you imagine how crazy those people are who don't get it?" So that was an interesting thing.

Shawn Buckley

Can you just say that again because that sounds almost unbelievable what you just explained? So you're saying that you actually had a person come in. They needed a pacemaker. They blamed it on the vaccine. So they recognized at least in their minds that it's a vaccine injury.

Dr. Misha Susoeff

They at least accepted the possibility.

Shawn Buckley

Right, and they're volunteering this, right?

Dr. Misha Susoeff

Yes, sir.

Shawn Buckley

And yet they they've made a comment how stupid people are who aren't vaccinated.

Dr. Misha Susoeff

It's unbelievable.

Shawn Buckley

But you are reporting to us that people are commonly telling you that their new medical conditions are associated with the vaccine. I am curious if people are more willing to do that now than perhaps a year ago. If you've seen kind of a change in attitude, or if that's been consistent throughout.

Dr. Misha Susoeff

In my recollection, I would say in my practice that was consistent throughout, and it just happened yesterday.

Shawn Buckley

Right.

So you've had basically—

[00:20:00]

You've observed staff members and family of staff members basically be negatively affected from the vaccine. What can you tell us about that, and we don't need to describe anything in any way that would identify people, but—

Dr. Misha Susoeff

Of course. Again, I'm hesitant to attribute any injuries to the vaccination. However, this is what people are telling me. I do have a very highly valued staff member, and her and her husband at the time, I believe, had a five-year-old daughter. And they were facing the same kind of pressures that we all faced, and they made a difficult decision as a family. So he was mandated through his work to become vaccinated, and she wanted to be able to continue to take her daughter to her dance lessons and it was very, very important. And they made a difficult decision as a family that they were going to go ahead with it, but they were going to mitigate their risk because they felt it was risky, and they didn't want to go ahead with it. So one of the couple took the Pfizer vaccine, one of the couple took the Moderna vaccine, just so there would be a parent left for the daughter, just in case something happened.

Shawn Buckley

And did anything happen?

Dr. Misha Susoeff

Yes, unfortunately, and again there's a temporal correlation—but I can't attribute this to vaccination—but the father almost immediately developed a fairly aggressive cancer and spent the rest of the year receiving treatment for that. And thank God, everything so far has turned out fine.

Shawn Buckley

And my understanding is that you've had a couple of other staff members develop medical conditions. Again, you can't attribute it, but one with diabetes and another with tinnitus.

Dr. Misha Susoeff

Yes, sir. And they both have their suspicions, or they will vocalize their suspicions that because of the temporal correlation that those injuries are due, or those new medical conditions, are due to vaccination.

Shawn Buckley

Before I open you up to questions by the commissioners, I wanted to ask you how you have been affected by this. How has this experience affected you personally?

Dr. Misha Susoeff

I'm really sad. I'm really angry; I don't recognize my profession, the medical profession. I think we've been let down. The concept of informed consent is beaten into our heads throughout our training. And I've spent maybe six years as a clinical professor, assistant clinical professor, at the University of Alberta, and I've trained students. And it's not optional. It's not an optional concept.

And I think we've really been abandoned by the medical profession. And as I saw the mandates— And don't get me wrong, I think that potentially, vaccination could have been a part of the mosaic of our response to COVID, not the only response, or else. But when I saw the concept of mandatory vaccination working its way through the media, I sat back smugly in my chair and I crossed my arms behind my head and I said that doctors will never let it happen. And they disappeared.

The first couple stuck their necks out and then their heads got chopped off. And I insist to this day that the streets of Ottawa should not have been packed with trucks, it should have been the Mercedes and the Escalades, and it should have been the doctors honking and waving flags. They should have been there to protect us. But I think what happened is those payments on those Mercedes and the Escalades were more important than standing up for the basic pillar of medical professionalism.

Shawn Buckley

I think you're sharing a really important point. And remember our last speaker, Scott. I mean, his point is: together we can do a lot. Remember, he said that one person can't stand up. And I wonder also—exactly as you said—a couple of doctors stood up, and to use your words, they had their heads chopped off. So basically, they got attacked in the media and their licences to practice taken away. But if all the doctors had stood up, what was the government going to do?

[00:25:00]

Fire all the doctors? Label all the doctors as misinformation spreaders? The thing that I think we forgot as a society is if we stand together, and we don't participate in the social shaming, if we stand together, we could do something, and you thought the doctors were going to stand up.

Dr. Misha Susoeff

I was convinced it couldn't happen, and I was floored, and I'm still floored that we've gone this far.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions.

Commissioner Kaikkonen

Good morning. Thank you for your testimony. You testified that dentists update their patients' medical records on every dental visit. So personal health records are current within your office. But would you also recommend that all healthcare stakeholders, for example, the ER physicians like Dr. Chin, do the same? Or do you see some issues emerging from extensive documentation by the bureaucrats within Alberta Health Services, for example, as we've also heard some negatives from testimony?

Dr. Misha Susoeff

So ma'am, let me see if I understand your question. Are you suggesting that the collection of personal medical information could be problematic?

Commissioner Kaikkonen

Just when it gets to the Alberta Health Services' online version. When they get to decide after the fact whether an adverse event reaction is valid, they look at somebody's personal records. So not from the perspective of you as a dentist, or from any doctor who's trying to stay current in a patient's medical history, but when it gets online and it's in the system.

And the bureaucrats, as you said before, get to make decisions as to whether that adverse event is valid or not based on what they see in the computer.

Dr. Misha Susoeff

In my opinion, the information should be collected solely for the provision of medical services for that individual, based on the relationship between the doctor and the patient. And I don't believe that information should be accessible by a bureaucracy—maybe if it were anonymized—but we are very heavily regulated as far as how we manage patient information.

It's even within our ethical guidelines for advertising. So say, for example, if my dental clinic makes an advertisement and somebody responds to it on a social media, I can't acknowledge that response because that would indicate that, yes, in fact, they are a patient of record in my office, which is unethical. I can't do that because that's disclosing some of their own personal information. So the maintenance of those records is very important and keeping them private.

Commissioner Kaikkonen

And my second question is about informed consent. I, personally, believe that everyone should complete the Tri-Council Research Ethics Certificate program online, if only to be informed. But do you believe, as a dentist, or just in your personal experiences with ordinary Canadians, that most hardworking Canadians either truly understand the tenets of informed consent, or how do we get them to learn?

Dr. Misha Susoeff

I don't know if it's up to the layperson to understand consent. It's up to the medical practitioners: our responsibility. We are proposing in many instances irreversible changes to a person's body. And you need their express permission. First of all, their understanding about what they're giving you permission to do, and like I mentioned earlier, that's a multi-factorial, multi-layered process. It's just not a one-time event.

Commissioner Kaikkonen

Thank you very much.

Dr. Misha Susoeff

Thank you.

Commissioner Drysdale

Good morning, Doctor. Thank you for your testimony. During your testimony, you talked about you had made certain social posts concerning vax passports and the passes that were issued to Aboriginal people in the earlier part of the century. My question is: Have you had any blowback? Have you had any issues with the professional association that governs your profession?

[00:30:00]

Dr. Misha Susoeff

No, sir. So far, I've managed to fly below the radar and God willing, I will continue to do so. Although this is my coming out, so to speak, publicly, and so it did take a lot of courage to sit in this chair today.

Commissioner Drysdale

You know, I'm a little confused with some things. I hear the term "guidelines." I hear the term "mandates." I hear the term "regulation." The term "law." Is informed consent, is a definition of that and the requirement for that, within the Act that governs dentistry?

Dr. Misha Susoeff

Yes sir. Within every health profession, within every self-regulated health profession, as legislated by *The Health Professions Act* in Alberta.

Commissioner Drysdale

But we hear a great deal of testimony from both patients and all kinds of doctors that that requirement has not been lived up to. And I'm wondering why I haven't seen any action by the professional organizations?

Dr. Misha Susoeff

Sir, the professional organizations are required by legislation, if they receive a patient complaint, to initiate an investigation into that event. And if there were to be justice done, I believe, in this country, everyone who sat down in that chair in front of their pharmacist, or their doctor, or their nurse, and said, "I'm here because of my work," or "I'm here because I want to travel," or "I'm here for any other reason," that consent was not obtained. And that individual who made that injection violated their professional standards. There should be a complaint made to the regulatory body of that profession. There should be millions of complaints made right now.

Commissioner Drysdale

We've heard from previous testimony, I think it was a pharmacist and I can't recall where, but they had sought out the insert, that's the informational booklet that would come along with a medication, for instance the vaccine. And that it was blank. Given that the inserts were blank, might that be a defence to a practitioner who didn't really give any information about side effects to a patient? Or is there a higher requirement for them to seek out that information independently?

Dr. Misha Susoeff

That's a complicated question. The products were approved for use on an emergency use authorization and I believe because of that fact the requirements for the package inserts were lessened. Now, that's something that, obviously, when a patient is making an informed decision that's probably something that they should know.

Commissioner Drysdale

Thank you.

Commissioner Massie

Thank you very much, Doctor, for your testimony. I was wondering: Given the high risk of contamination in your profession, when you are seeing patients, you must have put in place some measures to minimize the risk of contamination. Did you track over the past three years the number of incidences where you could have had contamination during the practice in your business?

Dr. Misha Susoeff

Well, every day. So we treat people with universal precautions. So, for example, we don't turn away a patient who has HIV [Human Immunodeficiency Virus] or hepatitis. We treat everyone the same way. When the pandemic began, I mentioned that dentistry was thought to be the highest risk profession because we're bathed in oral aerosols all day long. Our regulatory bodies did put in place enhanced personal protection. So we donned disposable gowns, face visors, N95 masks. At the beginning of the pandemic, obviously, the PPE [Personal Protective Equipment] was hard to come by. So we were reusing masks. I had a couple of N95s that I just luckily happened to have in my garage, and we reused those masks for weeks at a time.

[00:35:00]

I read just recently in a publication from my regulatory body that as far as we know, however, there have been no documented cases of COVID transmission between patient and dental staff in Alberta. So the protection that we used was effective. And I was watching carefully as the pandemic progressed, within my office, and as far as I know there was not a single case of transmission not only between staff and patient, but between staff and staff.

So all of my staff got sick eventually, but we could always trace the infection from a daycare, for example. So I had lost my staff one at a time. I thought that if I had someone get sick, bring it into the office, that we'd all be out. It didn't happen that way. It happened gradually over the course of a year.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Something in your answer to Dr. Massie caused me to want to ask you this question, and that is: I believe you said that in your practice, regularly you treat all patients, whether they have HIV infection, whether they had any other kind of infectious condition, you treated them, and you took precautions for that.

Dr. Misha Susoeff

Yes, sir.

Commissioner Drysdale

But we heard a great deal of evidence that in the medical profession, as a matter of fact, I think we had evidence here in Red Deer, that someone was denied a lung transplant, a life and death operation, because they didn't have a vaccine. How do we square that you can provide dental care to patients that may be vaccinated or unvaccinated, or might have HIV

infection and you still provide that service, but on the other side of that medical profession, we have testimony that says that they were being denied service?

Dr. Misha Susoeff

I'm aware of that case and I'm not sure how somebody in a healing profession can rationalize that decision other than it being political.

Commissioner Drysdale

Thank you.

Shawn Buckley

Misha, before I thank you, I just think that it's appropriate to expand on something you had said.

So when you were explaining to us in your testimony that First Nations people needed, literally, a passport, they needed permission to leave the reserve, you spoke about when that started. But I think it's important for people to understand how recent it is that it ended. I recall I was at a gathering on the Poundmaker Reserve some years ago and listening to elders speak about how you had to get, yes, your written papers from the Indian agent, even if you wanted to go to the adjacent reserve to visit a relative. So you literally were prisoners in your reserve, and you had to get written permission to be able to leave. And that did not end until Prime Minister Diefenbaker brought in the [*Canadian*] *Bill of Rights*, and I forget now when that was, I think it was 1956 or something like that, which is very recent [The *Canadian Bill of Rights* received Royal Assent on August 10, 1960].

So you can still find First Nations elders who can explain to you that they were prisoners for most of their lives on the reserve and had to get written permission to leave, much like when they bring in the 15-minute cities, we will need to get permission to leave. So this is a recent part of Canada. When you're saying to yourself, well, it can't happen here, what do you mean? We've had it already. It's actually been a short period of time where it hasn't happened here.

So on behalf of the National Citizens Inquiry, we so thank you for coming and sharing your testimony and giving us actually a couple of new things to think about that haven't been presented.

Dr. Misha Susoeff

Thank you.

[00:39:45]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 3: James Coates

Full Day 3 Timestamp: 03:03:58–03:56:25

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Wayne Lenhardt

Good morning, Pastor Coates. Can you hear me?

I see your lips moving, but I can't hear any sound.

James Coates

Okay.

Wayne Lenhardt

There.

James Coates

I'm not sure how to mitigate that.

Wayne Lenhardt

I think we have you. We've got sound now. Okay, could you give us your full name, and then spell it for us, and then I'll do an oath with you.

James Coates

Yes, my name is James Coates, J-A-M-E-S C-O-A-T-E-S.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

James Coates

Of course.

Wayne Lenhardt

Okay, just for our audience who may not be aware, I do recall that at one point you were interviewed by Tucker Carlson on his show, and you've had a certain amount of publicity, so I think I'll just turn you loose. Let's start in March of 2020 and start telling your story, and I will intervene if I think of something relevant.

James Coates

Yeah, sure, and just a word of correction: it was actually my wife that was on Tucker Carlson. So I was in prison at the time, and she was on Tucker's show and interviewed by him. And we think that may have been instrumental in my release, but I can put that aside for a moment.

So when the pandemic began, like everyone, we didn't know the full extent of the severity of the virus. And we were in the same place everybody else was as far as the information that was being given and trying to, you know, anticipate the severity of this thing. So when churches were ordered to close, shut down, limit gatherings, we opted to comply. We did that reluctantly, but we complied with nearly all of the guidelines that were in place for services. So we went to live stream. We were limiting to the capacity number that was given. We were, for the most part, reasonably socially distanced and all of that.

So we were largely in compliance, and during that time, during that first public health emergency, we were gathering data. All of us in the leadership were assessing the severity of the virus, evaluating the government's handling of the pandemic and the lockdowns, and the effects of them. So when the premier at the time, Premier Kenney, announced the end of the public health emergency in June of 2020, we were at that point in time prepared to open our doors and let our people decide whether or not they were going to return to normal, in-service gatherings. So we did that, and our people to some degree came back—not everyone—and our doors were open at that point in time. There were still guidelines in place; because the emergency had lapsed there was really no teeth in the legislation to penalize us for that.

And for the most part we were smooth sailing, as far as our services were concerned. We had a couple of cases of individuals coming to our gatherings—who were mildly symptomatic and then subsequently tested positive for COVID-19—and then did our own, internal contact tracing to see to what extent there was spread. And we had no evidence of any spread in our gathering, in either case. And we opted for two Sundays. During that time that we had opened up, we decided to go just to live stream for two Sundays, just to make sure that we weren't in some sort of ongoing spread of the virus. And again, this was still pretty early, so we're back in the summer of 2020.

But after those two Sundays, we had determined there was no ongoing spread of the virus, and so we reopened again. And that would have been in July, as I recall—July 2020—and we were open all the way until we ultimately were locked out of our facility in April of 2021.

Now, when things really kind of got dicey was in the second declared health emergency that was announced in November. At that particular point, our gatherings were getting some scrutiny from the community around us. Complaints were being made to AHS

[Alberta Health Services]; AHS was then contacting us. And we knew, come Sunday, December 13th, 2020, that AHS would be coming to our facility, and we were anticipating that. It turned out that they came that day with the RCMP [Royal Canadian Mounted Police]. We were trying to be, just, very transparent with our people, to give them as much information as possible

[00:05:00]

to be able to navigate the very awkward circumstances that we were finding ourselves in. And so we sent an email ahead of December 13th and let our people know what they could expect. I found out later that that email was leaked to AHS, and so that's why AHS brought the RCMP to ensure they'd get entry into our facility.

So on December 13th, 2020, we had AHS and the RCMP in our services, standing on our balcony as we began our services. And we actually honour the RCMP; we actually believe that law enforcement is really important and realize that law enforcement officers are, you know, scrutinized pretty negatively—and especially with what was going on at that time in the U.S., south of the border of us. So we stood and gave a standing ovation to the RCMP, and honoured them and did that for multiple Sundays, in fact. And ultimately, we began our services, and they would kind of get the evidence that they needed and they would leave.

And so AHS, at that point in time, was driving the investigation. They came back on December 20th. I preached a sermon on that Sunday called, "The Time Has Come." In that sermon, I laid out a theological defense for why the church ought to be open. I also did get into some of the medical and legal aspects of the whole issue at play. And it was that sermon that really dialed things up because that sermon went viral. It made the six o'clock news on Monday, where they took an excerpt from that sermon, played it on live TV. And really, from my perspective, picked a phenomenal excerpt because the excerpt climaxes in the statement that Jesus Christ is Lord. And he is Lord! And so we were thrilled that they had selected that excerpt to use on the six o'clock news.

And so yeah, I mean, I spent that week wondering if I was going to get a knock on my door and whether I'd be with my family for Christmas. So things were dialing up. So I was already, at that point in time, concerned that there might be repercussions to me legally and that I could be potentially arrested for the fact that we were just opening our doors.

I mean, all we were doing as a leadership was opening our doors and letting our people decide whether or not they wanted to be there. They wanted to be there, and as shepherds of the flock, as shepherds of Christ, we're not going to tell people they can't come to the gathering. We knew, at that point in time, that the virus wasn't nearly as serious as they were making it out to be, that the measures that were in place were definitely government overreach. We knew at that particular point, in our obedience to Christ, that we had to stand and keep our doors open. That to capitulate at that point in time would have been born out of fear, would have been born out of any one of a number of motivations that would, ultimately, just be summed up as disobedience to Christ. We had to be obedient to Him, to honour Him, to glorify Him, so we took that stand.

And in the days and weeks subsequent to December 20th, I would say that the government utilized every possible tool they could to force us into submission. They used the court of public opinion through the media because we were severely treated in the media. They used the court system. The Court ordered us to comply with this health order that we had been given on December 17th.

And so at that particular point we had to decide what are we going to do? Are we going to appeal this? If we appeal it, then it's going to be, like, an eight-week wait for the appeal. And in theory, if you're going to appeal something, then you really ought to be complying with the legislation in place leading up to that appeal. We just did not feel we could do that. And so we opted to continue to meet—and could have been held in contempt of court, which can come with up to two years in imprisonment.

I mean, I can remember the Saturday where it was the Sunday before that Sunday that we would be in contempt of court, and I asked my lawyer at the time, James Kitchen, I said: "What's the likelihood of me doing jail time for this?" And he said, "Pretty likely." And I said, "How much?" He said, "Well, probably a couple of months." And that was a heavy Saturday. I mean, that was a really heavy Saturday. The pressure that was on me at that particular point was immense and difficult, in this moment, to describe.

[00:10:00]

But we're here wanting to obey Christ and willing to lose it all for Him. So by God's grace, I was able to settle that turmoil that I was in that day, complete my sermon. And we met that following Sunday and could have been held in contempt of court—which AHS never took us back to court to do—which, at that point in time, seemed to indicate that they weren't ready to jail a pastor.

And so they basically ordered us to close our building unless we were going to comply with the *Public Health Act*. We just thought, well, that's kind of a lateral move. I mean, we've been having that discussion all the way along. So we were expecting them, in the week following that one Sunday where we would have been in contempt of court for them to take us back to court, but they were just ordering us to shut our doors, which is kind of what they were doing anyway. So we just continued to meet.

Things changed on February 7th because, at that point, the RCMP came into our building without AHS, on a Sunday. So that was a significant change for me; I knew things were different at that particular point, and that meant that the RCMP was now driving the investigation. So we had the RCMP in our gathering, on our balcony, on February 7th. And following that service, I was informed by one of the members of our leadership that they were going to arrest me, and so sort of up to me to determine when that would be. Would I turn myself in, or how would that look? And I just said, "Well, let's just do it now. I mean, let's not wait." So the RCMP came back to our facility—within about 15 minutes actually—and we went into the office. I was read my rights; I was arrested. I was released in the same moment, but officially arrested and served with what's called an "undertaking." The undertaking was ordering me to comply with the *Public Health Act*. I indicated to the officers, at the time, that I could not agree to the terms of the undertaking, so they wrote "refused to sign" where my signature would have gone and then indicated they'd be back next week, which meant they knew I'd be back next week.

Which was an amazing week because that following week I was doing—

Wayne Lenhardt
Excuse me?

James Coates
Yeah.

Wayne Lenhardt

Do you recall exactly what the undertaking was?

James Coates

Well, it was an undertaking ordering me to comply with *the Public Health Act*.

Wayne Lenhardt

Oh, okay. Okay.

James Coates

That was the whole thing the whole way along, they were trying to utilize every tool they possibly could to get us to comply with *the Public Health Act* and we're saying we can't do that. And we can't do that because it's in violation of the Lordship of Christ. Christ is head of His church. He dictates to the church the terms of worship. You know, initially when the pandemic broke, given our ignorance around the virus and even the new circumstances that we were dealing with at that time and our call to be submissive to the governing authorities—Romans XIII—we complied initially. But by that point in time, compliance with the government would have been disobedience to Christ, and so we knew that we couldn't comply with the *Public Health Act*.

Wayne Lenhardt

Okay. Carry on.

James Coates

In that following week, I did a funeral. So I'm doing a funeral in the following week. So I've got the RCMP in my services, I'm doing funerals, and I'm just thinking to myself, does the government really want to jail a pastor who's just doing exactly what the Bible commands him to do?

So anyway, that following week we met, I preached a sermon called "Directing Government to Its Duty." That sermon went viral, as well. That sermon, I think, has over a hundred thousand views, if I'm not mistaken. And so that sermon went viral and it was on the heels of that sermon that I was going to be arrested again. I would need to turn myself in on the Tuesday because the Monday was Family Day. So I had two more sleeps in my bed and would turn myself in on Tuesday.

I turned myself in, and was brought before the justice of the peace. I had two hearings. The first was adjourned, and the second was going to result in my release. Ultimately, the Justice didn't think that it was necessary to imprison me, and he didn't think that imprisoning me would actually prevent our church from continuing to gather—and he was right, obviously—, and so I'd be released. So at that point in time, the question was for me at that point, I'm just in waiting: What kind of condition am I going to get?

[00:15:00]

Like, am I going to be released and given a condition or am I going to have to agree to my condition to be released? And I knew I wouldn't be able to agree with the condition to be

released. So both myself and the RCMP officer were just kind of waiting to see how the condition would be written.

And the release of my bail condition required that I agree to the terms and I just couldn't do that. I couldn't agree to the terms because that would— Basically, the bail condition was, any time that I set foot on Grace Life Church property, I would need to be in compliance with the *Public Health Act*; which would mean that I can't just open our doors and host church services because we wouldn't be socially distanced. I'm not going to mandate the people mask and so forth. We'd be over the capacity limits and everything. So I just said, "Well, I can't agree to that condition." And at that point in time, I therefore couldn't be released. And so I was going to be held overnight until the morning, when I'd be taken to a courthouse.

In the middle of the night as I recall, it was about 3 a.m., I was woken up to be printed and my mug shot to be taken; which I thought was very strange in light of the fact that all I had to do was sign my condition, I'd be home. So I thought that was unusual.

To get to the courthouse the following morning, I was shackled and cuffed. Again, seems a bit strange in light of the fact that I'm not a flight risk. I mean, all I have to do is sign my condition and I can go home, so I don't need to be shackled. But I was brought to the courthouse the following day on, I guess it would have been, the 17th, Wednesday, of 2021, and it was determined at that point in time that I'd be taken to Remand Centre. And we would obviously appeal the bail condition that I was given, but there would be a period of time between that day and when that bail hearing would take place.

So later that day, I was taken to the Edmonton Remand Center. I spent 35 days in Edmonton Remand and was released on, I believe, Monday, March 22nd, 2021. I was released because the Crown adjusted the terms of my release and gave me terms that I could agree to. And so there was a deal that was struck between my legal team and the Crown to give me terms that I could agree to. I agreed to those terms, was released, and then we had our first service now that I'm out.

What's very interesting is that, during the entire time that I was imprisoned, AHS did not attempt to get into the facility, nor did the RCMP, but on the first Sunday that I'm back, they wanted to come in again. And we had two gentlemen from our church—wonderful men—who used Section 176 of the Criminal Code to keep them from interrupting our worship service and they were successful. And so we had that gathering. And in the following week, would have been, now— I think it was April 7th when this happened, Wednesday, April 7th, 2021. In the following week after that service—my first service back—I believe it's the RCMP, they broke into our building, changed our locks, locked us out, put up three layers of fencing around our facility so we couldn't access the property at all. There was 24/7 security surveillance of the property. There was security staff that wouldn't let us on our facility, and we were locked out.

So at that point in time, we went underground, and were going from location to location in undisclosed service locations. And we were just continuing to do exactly what we're called to do in obedience to Christ, is worship Him, and we did that. And you know, on the one hand, that was a really sweet time of worship because we were truly just worshipping, in the hundreds, the Lord, under the blue sky and out enjoying the elements. What was not so wonderful about that is that the government, law enforcement was, you know, dogging our steps. So had we not moved at one point, very likely that our entire leadership would have been arrested, had we gone forward with that gathering. Because we know that they were where we were the week before and there was apparently a canine unit.

And so anyway, we were pretty sure that that would have resulted in an arrest. In fact, I think that would have been the same weekend that Tim Stephens got his first arrest. And that was all revolving around the court order that AHS got in conjunction with the Whistle Stop—

[00:20:00]

Is it Chris Scott, who was just on a moment ago? Anyway, so that's when AHS was using that dirty court order and using it very liberally. When it was for a particular purpose, they were using it for everyone. And of course, thankfully, the court system did rectify that. A higher court ruled that that was an unlawful use of that court order, which is wonderful.

And so we just basically were the underground church until we received our building back on July 1st—when everything opened up on Canada Day—and had our first service in our building on July 4th. And then just continued to meet.

And everything was, again, going along rather smoothly, until the third declared public health emergency took place. And you know, we just didn't know exactly how the government was going to handle it at that point in time. That was in September of 2021. And the question on our minds was, did the government want to have round two of that same battle or not? And it turns out that they didn't; they completely left us alone. There was no media coverage. AHS wasn't there, RCMP. We were left entirely alone at that point in time. There may have been an RCMP vehicle in the vicinity a couple of times during that period of time, but, for the most part, we were just entirely left alone and able to meet in peace as we had always intended.

Wayne Lenhardt

So at this point, you pretty much got back to normal, but it took until about September of 2021, am I right?

James Coates

Well, I mean— It's a good question because we were still meeting during a public health emergency. So is that normal? Like, we were meeting, but our government, on paper, wasn't permitting it. And I'm trying to recall now when that emergency ended. I can't even recall right now when the third one ended. I can't. So that would have been normal.

Wayne Lenhardt

I don't exactly recall, either.

James Coates

So normal would have been we're meeting, and we can't be penalized, arrested, fined for meeting. That's normal, and that didn't happen until later; probably into 2022 sometime.

Wayne Lenhardt

Okay, so is there anything else still pending that you want to tell us about?

James Coates

You know, the only thing that is still kind of pending would be the legal stuff. And everything is hinging on the Ingram case at this point in time, which is another case that's currently in the court system—and has been for over a year now—that we're waiting for a decision to be made on that. Once that decision falls, then a number of other dominoes will fall in lower courts, and we'll deal with my stuff personally. Which, at this point, the worst-case scenario is I'd be on the hook for a \$1,200 fine; which is really nothing at this point in time. The piece that remains for me personally is more symbolic, in the sense that I'm contesting the Charter right violation.

As far as our church is concerned, we could be on the hook for tens of thousands of dollars. But, again, you know, we'll just consider that money well spent because it was spent to worship our Lord and Saviour, Jesus Christ.

Wayne Lenhardt

At this point, do the commissioners have any questions?

Commissioner Kaikkonen

I'm going to feel like the mayor in Texas at the beginning of COVID, who demanded that they get all the sermons from the ministers in that town. I'm just asking if, the two sermons that went viral, if we can have it introduced as evidence?

Sorry, Wayne, can we have the two sermons that went viral introduced as evidence?

Wayne Lenhardt

I suppose we could, if we have a copy of it.

Commissioner Kaikkonen

Are you okay if we have a copy of those two sermons that went viral?

James Coates

Yeah, actually, there's two ways you can go about that. So the sermons are on our YouTube page. You can do that. I also have a book that I've co-authored, called *God vs. Government*. Both those sermons are in that book. They've been modified slightly for the nature of it being a book and not a sermon. But the record of those two sermons, in effect, is in that book,

[00:25:00]

God vs. Government, that I've co-authored with Nathan Busenitz. Otherwise, there might be a way to get a transcript of the sermon itself.

Commissioner Kaikkonen

Thank you. And I'm sure that when you were in the wilderness, you felt like the church in the wilderness in Moses' time. So when the government was dogging your steps, how did you feel as a person—as an individual and a pastor—but, also how did the congregation feel?

James Coates

You know, it's difficult for me to be able to speak to how the congregation felt because I think that there would have been a variety of different responses to what was taking place. In some cases, there might have been excitement. In some cases, there might have been more concern, more turmoil. I think at that particular point, the congregation wasn't experiencing the heat of the government oppression.

If there was any sort of heat they were experiencing at that point in time, it would have been more from co-workers, employers, family members. Because our church had been made so public, in terms of what we were doing, that it did impact the work environment for certain folks and, certainly, the family relationships that would have existed in extended family. So I don't know that the congregation would have been feeling much, in way of — There would have been certain congregants who might have been involved in actually making their location available, and so they would have felt a little bit of cost in all of that, for sure.

But I think, you know, in my case, I can remember one Sunday in particular that we were heading out to a location, and we were trying to be discreet and fly under the cover, which is hard to do when you're, you know, three, four, five-hundred people, and it just seemed like we were blowing it at every point. And so you know, when all was said and done—

I'll tell you this story. So we were driving into a particular location and we can see that there are residents in the area who are there and watching us drive in, on their phone, not looking happy at all. And I'm just going, "Oh, we're finished. We're toast. I mean, this is it." So I'm going in thinking we're done and this is during the time that AHS had that court order they were using. It's the same Sunday, as I recall, that Tim Stephens had his first arrest, and it's the same Sunday that we would have been arrested had we met at the other location.

So anyway, we had one of our members go and speak to this this family and just say, "Hey, listen, we're a church and just let us know if you're going to call the cops and, you know, we'll leave." And they were thrilled! When they found out we were a church, they were thrilled. And then when they found out we were Grace Life Church, they were even more thrilled. And then they said they were going to phone all the neighbours and make sure all the neighbours knew everything was okay. Which was great in one sense, but probably gave that location away in another.

But, yeah, there were moments. It was hard. The whole time was hard. I mean, the level of intensity! There's no question, the government oppression, the intensity that we were experiencing on a, basically, daily basis was out of this world. I mean, our nerves were shot by the end of all of that. It was exhausting, but it was necessary because we believe there's a cost in following Christ and our desire is to bring honour and glory to His name.

Commissioner Kaikkonen

And in terms of AHS, they would have had all the legal resources at their fingertips, and financial resources, as well, to get proper legal opinions that they couldn't apply that court case to every single entity, being the churches and the restaurants. What do you think they were thinking? Was it just laziness, perhaps, on the part of AHS, seeking out legal opinions that would have dug deeper, rather than having to go to a higher court ruling?

James Coates

Yeah, I mean, I think at this point in time, if I were to comment on what I believe motivated that, it's not going to be flattering for AHS. I don't think it'd be profitable for me to presume on what was in their hearts. I think, yeah, it'd probably be better to ask someone like Leighton Grey that question because he was involved, as I recall, in dealing with that whole court order being modified—yeah, the JCCF [Justice Centre for Constitutional Freedoms]. So I'm reluctant to comment on that because I think it could get me into trouble.

Commissioner Kaikkonen

It might get me into trouble, too.

[00:30:00]

I actually have two more questions; theological. A lot of the churches in Ontario where I was, were arguing Romans XIII: I and II, as their basis for staying closed. And I asked this question of a minister in Truro, so I'm going to kind of put you on the spot a little bit here, as well. I'm just wondering, how did you respond, from a theological perspective, to that argument that Romans XIII: I and II applied, and that was justification for all churches being closed, while you were still open?

James Coates

Yeah, so I mean at the outset, it's typical. I don't know that there's any theological tradition that wouldn't acknowledge that there are limits on government authority. You see that in the context of the Apostles, in Acts 5, they declare, in no uncertain terms, "We must obey God, not man." So everyone agrees that there's a limitation on government authority. There's a point where they are beyond their authority, and so that would be a good place to kind of, like, frame everything.

But if you go to Romans XIII, this gets settled because all authority is from God. So He's the source of it. He delegates that authority to spheres of authority, the government being one. And anytime God delegates anything, it's always with a particular purpose and that purpose is outlined in the verses that follow. That the government is in place to bring law and order; they're in place to praise good behaviour. The Bible defines what is good. They're there to penalize evil conduct. The Bible defines what is evil.

And so the government doesn't have unilateral, total authority to do whatever it wants in the matters and affairs of a country. They have a very particular responsibility given to them. And when they're beyond that authority, we're not under obligation to obey.

Obviously, if you choose not to obey, there are consequences that can come from that, as is evident in our case. But there are clear limits that are placed on the governing authorities. And it's not their authority to tell the church when it can worship, how it can worship, how far apart people have to be, whether a mask is to be worn while one worships, whether you can sing or not. That is outside of their jurisdiction. That is entirely within the context of the Headship of Christ over his church, and it's our responsibility, as elders, to protect and guard that Headship. And so when the government is trying to infringe on the authority of Christ by telling the church when and how it can worship, we're going, "No, you can't do that." And it's our responsibility to say no.

So everyone agrees that there are limits on government authority. So appealing to Romans XIII to justify compliance in the context of COVID is just begging the question. It doesn't

answer anything. Romans XIII needs to be accurately handled and applied to particular circumstances.

Commissioner Kaikkonen

And churches are known for their good works in the community, is that right?

James Coates

Well, they certainly ought to be. I mean, I certainly can't speak for every church. But from my vantage point, as Grace Life continued to meet, the accusation would have been that we were not loving our neighbour when, in reality, we were. There's a beautiful—

Whenever you are obeying Christ—and we were obeying Him at the context of His Headship over the church. Whenever you are obeying Him on any level, you're obeying Him on every level. So once we settled that, no, this is clear overreach. The government doesn't have this authority. Romans XIII has limitations. Christ is head of His church. This is how our worship services are to be governed. Once we checked those boxes and worked all that out, then you can go to loving your neighbour.

We did the best thing possible to love our neighbour, whether they realize that or not. So whether an Albertan loves us or hates us, whether they support what we did or don't, it doesn't matter. We did the best possible thing for our province. And ultimately, it's the Lord's judgment, to either vindicate or otherwise, that claim. We actually loved Albertans, whether they liked us or not, through and through. And I think that is a testimony of good works in the community, for sure.

Commissioner Kaikkonen

And then my final question is a little bit heart-wrenching for me to ask, but I'm going to ask it anyway. When you think of the visual of the RCMP standing while the congregation may have been sitting—before the standing ovations, where they thanked and recognized and acknowledged the RCMP in the church service—I'm just wondering how the children felt.

[00:35:00]

Here's these authority figures standing. They have guns. They are authority figures within the community. And then we take that respect that the church gave to those RCMP officers and then we take it, fast forward to the point where you were being arrested and other pastors were being arrested and the children had to watch.

I'm just wondering, has there been any conversations, either within your family or within the congregation members, where their families would be standing by and watching this where authority figures are put into their rightful place? And what, actually, they were thinking as children when these authority figures, that you readily and willingly gave respect to, suddenly changed their perspective, and said that what you were doing was not something that they acknowledged or approved of?

James Coates

Well, let me say this, that the officers that we were engaged with were guys that respected us, they treated us well. You know, we can disagree. I can disagree. I might have approached it differently if I were in their shoes.

In my estimation, the responsibility of a law enforcement officer, when an unjust order comes in, is to tell their superior, "No, we're not going to do that." Now, the superior can do a few different things at that point in time: they can fire you; they could just say, "Okay, well, you won't, another guy will." And that guy might not be as kind and nice, you know, so obviously these officers had to kind of weigh the pros and cons of being the ones that were going to be the front men on this case. But I would just say they were respectful, they were kind and gracious. And so apart from: I wish more law enforcement officers would have just said "no" to the superior above them and in unison—that would have been phenomenal. The next best thing is that they would treat us with respect, and they honoured us because we honoured them, and so I would just say that.

I think as far as the kids are concerned: yeah, it was confusing for the kids. I mean, kids grow up wanting to be police officers, right? They love law enforcement. To be a policeman is cool. So when the police are coming into your gathering and are arresting your pastor, yeah, it's confusing for the kids. But the wonderful thing is this, though: Christ is a saviour of sinners. And we are all sinners; we have all sinned and have fallen short of the glory of God.

And so as parents who love Christ and who have been saved through His death and resurrection, we are shepherding the hearts of our children and we're wanting our children to receive the saving benefits of Christ and His work on the cross. And part of that is we're shepherding their hearts and helping them understand that they need to extend forgiveness and grace to law enforcement and to honour and respect them, even if they're not being honourable.

So there's no question that there would have been discussions that would have come up at that time, but we have all the tools in the scriptures to shepherd their hearts and to help them to think through that. And to ensure that their heart toward law enforcement is what it ought to be, which is one of honour and respect. And so though it was confusing for sure, you know, we've got what we need to navigate that.

Commissioner Kaikkonen

Thank you very much for your testimony.

James Coates

You're welcome.

Commissioner Drysdale

Good morning, Pastor Coates.

James Coates

Good morning.

Commissioner Drysdale

Can you tell me how many people were in your congregation prior to 2019, and how many are in your congregation today?

James Coates

Yeah, so on a strict average as we tracked our attendance, we would have been 350 on average, annually, in the years leading up to our whole saga with AHS. And at this point in time, now, it's hard to know what the annual average is, but we're often over 900. So it nearly tripled in size.

Commissioner Drysdale

What is the physical capacity of your facility?

James Coates

Yeah, so it's a little over 600, as far as the fire code occupancy, so we have two services now to accommodate that. And so yeah, we've got two services that we're currently running.

[00:40:00]

Commissioner Drysdale

So you have 900 congregants, plus or minus. Can you describe to me who makes up that congregation? What kind of people are in your congregation?

James Coates

Yeah, I don't know how to answer that. I mean—

Commissioner Drysdale

Well, are they all tall people? Are they all short people? Are they all plumbers? Are they carpenters? Are there doctors? Are there lawyers?

James Coates

Yeah, it's a wonderful cross section of Albertans. Yeah, doctors, professors. We've had law enforcement officers. We got mothers, widows. We've got a wonderful diversity of ethnicity. Yeah, it's exactly what you would expect the gospel to accomplish, where some from every tribe, tongue, and nation come together and worship the Lord, Jesus Christ.

Commissioner Drysdale

The reason I asked you that question is because I want to get a feel for whether this is an unusual group of people, or they're representative of the people of Alberta. You know, that it could be my neighbour, or they could be the person working with me at work. So having said all of that, can you can you describe for me how important it is for a believer to come to church and congregate? Is it a guideline? Is it a tenet? Why is that important?

James Coates

Well, and there's different ways to answer that question because, on the one hand, it's a command. I mean, we're commanded not to forsake the gathering of the Saints: Hebrews X. So on the one hand, we could go in the direction of the command. And there's all kinds of

commands in scripture that necessitate gathering corporately as the body of Christ, from all of the commands to one another: to love one another, to serve one another, and so forth. So we could just load up a grocery list of commands that necessitate gathering, but then we can go a different route and say, if something's commanded, there's a reason why it's commanded. And the reason why it's commanded that we gather is because the corporate gathering of the church is critical to the spiritual growth and development of the believer. And so it's in the corporate gathering that all of the means that the Holy Spirit uses to strengthen the believer, to grow the believer, to make the believer more like Christ, all of the different means that he uses, are most operative in that gathering: the preaching of the word, corporate prayer, corporate singing, the fellowship that takes place before and after the corporate gathering. All of that is absolutely critical to the spiritual growth and development of the Christian.

So when the government is saying that you can't meet, not only are they telling you can't do what God commands, but they're also keeping you from all that is critically necessary for your spiritual health. And I would make the case that your spiritual health is fundamentally more important than your physical health. Because look, if you don't know Christ— Let's just cut to the chase. If you don't know Christ savingly, then when you die, you enter everlasting hell. So that's problematic. That means that you could be the healthiest person today, get hit by a car, and enter eternal judgment. All of us need to be delivered from the consequences of sin.

I think, yesterday, the Ten Commandments were read. And the law is wonderful; it is good and holy and perfect. And yet, in reality, it makes us aware of our sinfulness. I mean, when you look at the commandments, you know you come short of them. Who hasn't lied? All of us have sinned and fallen short of the glory of God. And so the law condemns; it makes us aware of our sinfulness. And that's why we need a saviour, and Christ is the saviour. God, the Father, sent His son into the world to live the life that we couldn't: the perfect holy life, die the death we deserve. Where He suffered under God's wrath, upon the cross, for the sin of all who would ever believe in His name. He died, went into the grave, and rose again, proving He had conquered both sin and death. We need to believe that message in order to be saved. And if you've believed that message, then regardless of what happens to you in this life, your eternity is secure.

So we can go from the command—you are commanded to meet—but there's a reason why you're commanded to meet

[00:45:00]

and it ties into your spiritual health. And your spiritual health is far more important than your physical health. Far more important because it has consequences for eternity.

And I would just say that if there are any who are listening to this now, who have not received Christ by faith, that they would turn from their sin and believe on Him now. What an opportunity, in this moment, to hear the saving message of the gospel and to be reconciled—

Commissioner Drysdale

I appreciate that, sir, but we have limited time, and I needed to interrupt you a little bit.

The reason I asked you that question is—I'm going to try to condense, in my clumsy way, what you were saying—essentially, this is a fundamental tenet or a fundamental belief of being a Christian.

What I'm going to ask you now is that, I don't know how much of the testimony you've been watching, but over and over and over again with the testimony that I've been watching, I've heard as a matter of fact, a previous witness, Dr. Susoeff—I'm not good with names—anyway, a previous witness who's a doctor said that one of the basic, fundamental tenets of medicine is informed consent. I heard lawyers and judges testify what the basic, fundamental tenets of justice was, and that is that two parties can appear before the court and be treated equally, and that's been violated. And I can go on and on about all of these groups who have basic, fundamental tenets, and they violated those.

And you didn't, and you went to jail. As a matter of fact, you were handcuffed and shackled, which I might want to talk to you a little bit about. But can you comment on the fact that so many of these other groups that I've talked about actually violated their fundamental requirements, and some of them are written in law—like in civil law—which is a little different than you, and yet you were in jail, and they're not. Could you comment to me about that a little bit?

James Coates

Yeah. Let me just try and get into my headspace on that. Because I had a thought, even as I was thinking about the content of the testimony of the previous dentist. There's a couple of things that I could say about that. One is that when it comes to— Yeah, you know what? I'm thinking through this. So I want to say that the government was telling me that I can't do exactly what I'm supposed to do. And so if you're telling me that I can't do the thing that I'm on God's green earth to do, and that I'm commanded to do, then we have a problem. And I'm going to have to take a stand at that particular point.

Whereas I want to say that, in the context of the medical profession, there is room for more pragmatism. There's room for more, you know, trying to stickhandle through that whole situation and try and sort of protect yourself, while still, maybe, doing what you're supposed to be doing. And maybe there isn't. I don't know.

I mean, the stand that we took is directly connected to why we exist. Maybe the doctor's in the same boat, and that's the point that the previous witness was trying to make: that they were violating their responsibility at the most fundamental level. At which point, if that's the case, if they were in the same boat that I was in but just failed to take the stand, then they may lack—

You have to realize that I'm laying my life down for Christ and He's worthy to lose it all for. If you don't have Christ then you might not navigate the situation the same way that I did. Now, I realize that that brings the whole other issue into play, as far as other pastors keeping their churches closed. But, yeah, I don't know what to say except that we wanted to obey Christ, and it was all for Him, and it would have been disobedience to capitulate, and so we just couldn't.

Commissioner Drysdale

One last thing, I just want to get a better picture in my mind. When you were arraigned—I guess that's what they call it—you were brought in with handcuffs? When you came into court, I believe you said you were shackled and handcuffed.

[00:50:00]

James Coates

Well, yeah, I mean, definitely when I was transferred from the RCMP headquarters to the courthouse Wednesday morning, after having turned myself in and having been with the justice of the peace. Yes, I was cuffed and shackled. We have video footage of it. It's made it into a documentary.

Commissioner Drysdale

Can you describe what shackles are? I think most people know what handcuffs are, but I'm not sure everyone knows what shackles are.

James Coates

Yeah, shackles, it's like cuffing your ankles. So you know, you've got to take baby steps, because you can't take a full stride, because your ankles are cuffed. It's what you put on criminals who are a flight risk. And so yeah, to shackle me and even cuff me— Yeah, it was significant. I remember sharing with my wife they did that to me, over the phone, and it got to me. It affected me significantly, that they shackled me, for sure.

Commissioner Drysdale

Were you humiliated by that?

James Coates

Oh, that's a good question. Is it humiliation? There were tears, for sure. I wept. Could I call it humiliation? Maybe. I'm not sure.

Commissioner Drysdale

Thank you, sir. That's all my questions.

Wayne Lenhardt

Are there any more questions from the commissioners?

Pastor Coates, if you wouldn't mind providing us a copy of that sermon that was requested by one of the commissioners, I think it was called "The Time Has Come," and maybe email it in. We'll enter it in on the record for your testimony and we'll make sure that it's accurate that way.

So on behalf of the National Citizens Inquiry, thank you very, very much for your testimony today.

James Coates

Thank you for having me. Appreciate it.

[00:52:27]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 4: Dr. Eric Payne

Full Day 3 Timestamp: 04:38:08–06:23:33

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Wayne Lenhardt

Good afternoon, Dr. Payne. If you could give us your full name and then spell it for us, and then I'll do an oath with you.

Dr. Eric Payne

Sure. My name is Eric, E-R-I-C, Thomas, Payne, P-A-Y-N-E.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony?

Dr. Eric Payne

I sure do. So help me God.

Wayne Lenhardt

You have quite a number of credentials, so perhaps rather than me do this, could you just give us a quick snapshot of your expertise.

Dr. Eric Payne

Yeah, sure.

The first slide, actually, I put them all there on the bottom right so that they're there.

I grew up in Ottawa. I did a Bachelor of Science in Physical Education at Queen's, and then I did a Masters of Science at McMaster University with a view to start medical school here in Calgary.

I was in medical school from 2003– 2006. I stayed at the Children's Hospital here in Calgary to do pediatric neurology residency for five years. Then I went to SickKids Hospital [Hospital for Sick Children] in Toronto for three years to do a Neurocritical Care Fellowship and an Epilepsy Fellowship.

I did a Masters of Public Health during the summertime at Harvard during those years, and then I got recruited to Mayo Clinic for six. I was there from 2014–20, at which point I got recruited back to Calgary by the original crew. During that time, my wife and I had grown our family to three kids at that point. Two of them were born at Mayo Clinic and are American citizens.

But I got recruited back mainly because of my neuroinflammation and neurocritical care. I was given 50 per cent protected time for research. I was given three years' start-up funding, until it was removed. It really was the culmination of everything I'd worked for to get that job. I was very excited to be back here with my family. We moved back here February 2020, so it was a month before we all shut down.

Wayne Lenhardt

At a certain point COVID happened and some mandates occurred as well. So at a certain point that started to affect your job and your status as an MD. Can you tell us about that?

Dr. Eric Payne

Absolutely, there was an effect right away. I had one meeting face-to-face with the division where I saw my colleagues and then everything else was Zoom.

The Children's Hospital during that first year was empty. It really was not busy. What happened was that staff, like nursing, got moved around. We had clinic nurses in our epilepsy clinic, for instance, who had previously worked in the ICU [Intensive Care Unit], even if it had been 10 years ago, and they got pulled back into the ICU. Some of the nurses who were in the pediatric ICU, they got moved to the adult ICU.

Fortunately, COVID, and we knew this within the first month, it really doesn't affect children very much. I've got the numbers to show you what we actually ramped up here over the last three years, but we've been very lucky. It's not like kids don't get sick, but it's vulnerable kids that get sick.

That was the first year, and moving into the fall of 2021, as soon as, frankly, our politicians started telling us that they weren't going to mandate this, it was pretty much a guarantee that they were going to mandate this.

At the time that the College of Physicians & Surgeons of Alberta [CPSA] met to discuss whether or not they were going to tie our licences to the vaccine, they had a town hall meeting that I listened in. It was because of that meeting, and because they were actively discussing whether or not to prevent me from practising medicine without taking this experimental genetic vaccine, I wrote a letter to the College explaining, I guess, my reservations. Really, it was a call—

I think I can move some of these here, but this was the letter, and this letter is still the source of two open misinformation complaints against me, but I behoove anybody to find one major point in that paper that's inaccurate. Every single point was backed up by fact,

and the warnings that scientists that are much smarter than me were giving have all come true.

[00:05:00]

It wasn't like you had to look up to space to figure this out. We had track records with animal models with respect to these respiratory vaccines and all, so on. Alberta Health Services [AHS] had decided at the end of August to make that part of my— In order to keep privileges and be able to continue at the hospital I had to take the shot.

We started with the letter, and frankly, that just exploded. It went everywhere at the same time. It was a very overwhelming few weeks, but that being said, the thesis was what's there in red. The medical evidence clearly demonstrated that these things were not 100 per cent or 90 per cent. They weren't showing 80, 90, 100 per cent effectiveness in the community, so we knew that that was decreasing over time.

I could cite studies, which I'll show in a second here, where Israel and the U.K., for instance, were two to three months ahead of us on the rollout. It was pretty easy to look to them to see what was going on. They were taking the same shots. They were dealing with the same virus, and it continuously seemed to predict itself.

In the fall, when our government was making this mandatory and coercing us into making a decision about whether or not you wanted to keep working or whatever, they didn't have the data to back that up, especially someone like myself—who is early 40s and otherwise healthy—my risk from COVID is basically zero.

At that point, we knew that these things didn't stop transmission. So if they don't stop transmission—they don't even really reduce transmission in a robust fashion—we've got real concerns that we could be inducing vaccine enhancement with time, with further variants. It seemed prudent to be using these therapies in a more focused way against the most vulnerable: sort out what happens.

We knew for sure by the fall these things didn't stop transmission, so it seemed ludicrous. The Canadian government just announced that they were aware that the viral load between a patient with and without the vaccine was the same. That means if you've got the same viral load, you have the same capacity to transmit that to somebody else. I was able to cite three papers at the time showing that the viral load was the same. It wasn't like it was a surprise that that was the case.

In fact, I even cited a report by the CDC [Centers for Disease Control and Prevention] director herself who acknowledged that they knew that there was no difference in viral load between vaccinated and unvaccinated. This was at the time that they were deciding to force these things onto us. We talked about the fact that— Where was the biodistribution data? Where does this thing go in the body? How does it get broken down? How long does it last? The basics. It wasn't in existence until Dr. Byron Bridle and a group, through an access to information, got the Japanese RAP [Risk Assessment Profile] data for the Pfizer study.

We had a couple other small clinical trials showing that the spike protein circulated and lasted. Given that it seemed that this thing was capable of causing clotting and inflammation wherever it landed, they were relying a lot on the fact that this thing was supposed to stay in the arm and not travel.

I've listened to ophthalmologists. How can you possibly have eye issues post-vaccine? This thing stays in the arm. Well, it doesn't. It travels everywhere. It travels to the eye as well.

The idea that they didn't know that when they chose to hide that to us, it seemed too far-fetched to me. It was clearly being hidden from us.

We were also using a vaccine that at that time, and I use that loosely because they changed the definition of a vaccine right at the time in order for this to qualify. Smart people like this group here that report in the *New England Journal of Medicine*: you're using a leaky vaccine that doesn't cause sterilizing immunity in the middle of a pandemic. You were putting enormous evolutionary pressure on the virus to evolve. These people were warning exactly what I just said: Consider targeting vaccine strategies focused.

I won't play this video just in the sake of time, but this video clip, and it will be available afterwards [Exhibit number unavailable], about two or three minutes, every single clip in this was available at the time that these things were being mandated onto us.

When Israel public health official here is saying that 60 per cent of the ICU admissions were in the double-vaxxed in the fall, that was a sign of where things were going to come,

[00:10:00]

and so U.K. was acknowledging that, and everybody was sort of acknowledging that. This study up here on the right, that's one of the ones that had the same viral load between the vaccinated and unvaccinated.

I emailed that letter, that I just went through a little bit, directly to the Council at the College, about 15 Council members. Almost all of them are doctors, so it was written at a level to push some discussion with respect to the science, and it was really a cause for some prudence. Can we slow down here, especially with kids, because we knew so much about their risk at that time.

The College has yet to respond, so almost two years out I have not even received an email from them to acknowledge that they received that, with the exception that they've sent me two complaints for misinformation. The first one related directly to this letter still, and so Dr. Mark Joffe, this was before he was the chief medical officer in Alberta, he was the only person that responded. I sent my letter to the CEO of AHS, Dr. Verna Yiu, and she forwarded to Dr. Joffe, and he was the only one kind enough to respond.

I thought his response spoke volumes. He thanked me for my thoughts. He didn't say, "You're an anti-vaxxer, misogynistic, misinformation spreader." He said: "I appreciate your concerns. We're going to do this anyways. Do you want to take the AstraZeneca instead?" Obviously, that thing got pulled, so it was a great recommendation, but nonetheless, we got a response, and that was good.

At the same time, an enormous amount of pressure went on at the Children's Hospital. A friend of mine and someone I trained with, Dr. Mike Vila, he also wrote a letter. He's a pediatric hospitalist, and he's got four sons, and he wrote a letter at the same time.

Within a week later, there were 3,500 healthcare professionals in Alberta, including 80 physicians, who wrote a letter. A lot of the same science obviously overlapped, all saying the same thing. Those physicians who signed that letter got a phone call from the College asking if they still wanted to keep their name on that letter.

Then very shortly thereafter— My letter went out on the 15th. On September 24th, in the *Calgary Herald*, this gentleman, Tim Caulfield, who I mentioned during my testimony in Toronto, but I'm going to expand on because he's been busy the last month, suggested that questioning the safety and efficacy was like questioning the pull of gravity. That hasn't aged well for sure, and that's also not what I was saying. I was saying it was very clear time dependency.

He is an important person because I didn't realize who he was when I first read this article. But if you look at any mainstream media there are a few people whose name always comes up to beat doctors down or scientists down when they say something they're not supposed to.

So Mr. Caulfield is a member of the very ethically sound Pierre Elliot Trudeau Foundation. He is a Canada Research Chair in health and policy. And he, just at Christmas time, was awarded the Order of Canada for his work fighting health misinformation, specifically with respect to COVID.

Frankly, there are not too many people that spouted more misinformation than Mr. Caulfield. He was recruited to start giving talks throughout the province. And this photo here on the right with Dr. Verna Yiu happened, I think, in the spring in 2022.

Shortly after he came and gave a talk to the Children's Hospital, I received my second complaint for misinformation from a colleague who had attended that talk. So he's a very convincing individual, there's no doubt.

But what I mentioned last time is that he refuses to debate or discuss. So yeah, he's worried that he's going to denigrate their movement by even entertaining this. But the reality is, if you guys had facts and you showed them to me two years ago, you would have had an ally. But when you don't have facts, you've got to shut down the debate, you got to beat people down, and that's what's happening.

That same week, September 28th, essentially: the person I refer to as King COVID at the Children's Hospital, Dr. Jim Kellner, he spent 10 years as the department head just before I arrived. He's also a pediatric infectious disease doc, someone that I would have loved to have had a conversation with respect to my letter. And I certainly, as I said multiple times, if there was anything that was inconsistent in that letter, I was willing to retract it and change it or whatever.

But instead of that conversation, there was a town hall meeting with the Department of Pediatrics, so all my colleagues—it's virtual—and he started the town hall with this. So it was a defamatory

[00:15:00]

sort of process that took place.

Immediately following this meeting, my pager was ringing off because everybody was like, "Are you okay?" It was no doubt who he was talking about. There were only two paediatricians at the Children's Hospital who had spoken out, myself and Dr. Vila. I'm fine with this. I have no animosity towards him about this myself. I'm angry about how this has affected the kids, and the unwillingness to discuss these things.

But what happened at the hospital within the next week of that was remarkable. It's my opinion that he gave permission to people at the hospital to be angry at the unvaccinated. He stoked division and hatred within the hospital. And I can tell you that with certainty because I had multiple people come into my office in tears, people who didn't want to take the shot, people who had been there for decades.

One of the ladies who came to my office, had been there for a long time in admin, she had just finished hearing a very senior surgeon at the Children's Hospital state that if he had an unvaccinated person in his OR, he wouldn't save them. This is the kind of stuff that was being said and permitted at that time. So it was definitely a whirlwind and it was difficult.

I've got that whole one-hour town hall on video. It's a pretty fascinating listen, but I'm not going to make you listen to that.

On October 1st, so three days after the town hall meeting, I received a letter at 3.05 p.m. on a Friday. This is the extent of it, this letter here on the left, telling me that as a result of concerns brought forth by several different learners at stages of training and after discussions between so and so, we have decided that we're going to reassign your learners until further notice. So attempts to figure out what was said, what caused that, to discuss that—nothing happened. They wouldn't meet with me.

I followed up with them recently in March and just asked to sit with the postgraduate medical education leader to say, "Can we sit down? Your decision to prevent trainees is affecting my ability to be an academic neurologist at this position. Can we sit and talk about this? Let's hear what you have to say." I got the email back from AHS lawyers (on the right) basically stating that a meeting is not required; that the impact on learners when I convey my COVID immunization during clinic interaction in the workplace, the learners experience discomfort [sic] in the inconsistency with this. And that I've got a duty to provide evidence-based medical information to patients.

You know, I agree. There is not a single statement that I've made that's not backed up by science. And I find that really remarkable, that an institution that—I spent the last eight years of medical school and training here—their decision is effectively ending my academic career here and they don't even have the decency to sit down and look you in the eye. And the best they can come up with is this nonsense.

This is informed consent, right? If multiple jurisdictions, including the World Health Organization recently, have all stated that the risk-benefit analysis is not there with respect to kids, and I go and I tell a family that; if that causes the learner discomfort, who's in the wrong?

The reason that learner probably feels discomfort is because they've been subject to the propaganda for two years and they believe it. But ultimately, I've got a responsibility to give the pros and cons to my patients, and I'm not going to stop doing that. They ultimately don't even have the ability, I think, to sit in the room for 5–10 minutes and discuss this because if they could, they would have.

We launched a lawsuit, four of us, against Alberta Health Services, stating that this was unconstitutional, and it was a pretty fascinating time for sure. There were four of us. There was an anesthesiologist, Dr. Joanna Moser; yesterday you had Gregory Chan testify, he was one of the individuals as well. And Dr. Loewen was the fourth.

There was a week after we'd all submitted our affidavits and people were testifying, and we got to read the affidavits and try to respond to them. Every single one of our immediate supervisors came up and said that we were immediately expendable. In my case, even though they had just recruited me and had thrown what they had thrown at me to recruit me here, still misrepresented those circumstances.

But what was really remarkable was, on the day that

[00:20:00]

Dr. Joanna Moser— She's an anesthesiologist, she also has a PhD in mRNA [Messenger Ribonucleic Acid] technology, she's an extremely smart woman—she had two medical exemptions, one signed by a specialist, one by a family doctor, due to her previous allergic reaction, even. And she had a religious exemption letter signed. AHS refused to accept those.

At the time that her immediate supervisor was testifying that they didn't need Dr. Moser's anesthesiology street cred, they had several openings for full-time anesthesiologists in Red Deer. Literally later the night after their testimony—this was sent out at 10 o'clock— this urgent email was sent out diverting ambulances from Red Deer, specifically because they didn't have anesthesia coverage. So within 24 hours of testifying that we don't need anesthesia, they had to close down the trauma center because they didn't have anesthesia. And that stayed shut for a couple of days.

So this idea that they were enforcing these mandates to protect patients didn't seem to line up with what I was experiencing in real time. Just to fast forward here a little bit, Alberta Health Services ended up taking immediate action against anybody who refused to take the shot. And this got pushed back a couple times, but December 13th at midnight, I received an email, so did the other individuals who had at that point been non-compliant, stating that we were locked out.

If you look down here, this is from a complaint that was started because of concerns I was writing unwarranted COVID-19 vaccine exemption letters. They sent in two investigators at eight o'clock in the morning, eight hours after they locked me out. And they did this in front of all my colleagues, started pulling my charts.

It caused a lot of stress for some people at the hospital, for sure. And I obviously had a very guilty look on my face. Here I am locked out and now I've got two College investigators going through all my records. I didn't even know that that had happened until February when I got this complaint, and they stated that it was closed because they hadn't found any evidence to suggest I wasn't compliant. Even though I had written a few exemption letters, **they deemed them well-written and justified.**

On January 6th, Alberta Health Services sent me a letter stating that they were not going to renew my salaried contract. So this was two years into our three-year startup agreement. We had a three-year startup letter of intent offer signed. They had provided several hundred thousand dollars of startup funding to create a neuroinflammation clinic.

They just basically ended it there. Specifically, you can see in quotations, due to "non-compliance with the University of Calgary's vaccine directives," because they would "preclude me from meeting the future education and research deliverables necessary to remain" part of the salary contract.

I still was able to do a lot of teaching because I have a reputation internationally for some of these things. So I was still being requested to teach, but nonetheless, that mandate lasted until February 28th. So I was officially—six weeks, that was it—I was non-compliant with their COVID immunization policy.

By July 18th, AHS had dropped their mandate as well. February 9th, the College removed one of my unprofessional complaints because I agreed to go back with testing for a few months. As I said, I've still got two open complaints for misinformation, one from a colleague I've had for a long time.

Unfortunately, what I've experienced is there are a few colleagues that'll come talk to me. They generally will pull me aside and whisper, "I agree with you, but you can't say that out loud." But most have just not talked. Most will just turn the other way, for instance. And the complaint itself: I've never had any of that stuff brought to my attention. It was brought behind my back.

The College, they have recently mentioned to me—because these complaints are still open after a year and a half— They're supposed to resolve these things after a few months, six months, and then they've got to give you an update. They informed me recently that they've hired a third party. And the third party that they've used with other people recently has been a company out of Manitoba that is made up of about a dozen ex-RCMP [Royal Canadian Mounted Police] officers: no scientists. So a bunch of RCMP officers are going to decide whether or not my science letter was inaccurate.

[00:25:00]

And so over the last couple of months they put out an offer for my job again, just before Christmas. I decided to apply for it. Because—why not?—I moved my family here. I wanted to be back. It's not like I'm leaving the Children's by choice right now.

I was told about a month ago that they weren't proceeding with my application. They weren't going to interview me. They've gone with four other applicants. Three of them are still fellows. They're still trainees. One of them is about two months out of fellowship. The other ones are still fellows. And then the fourth individual is a very good general child neurologist. But ultimately, that child neurologist was the person who wrote me the letter that I showed you, removing my trainees.

This is an interesting tidbit. Jeff Rath, who testified yesterday, represented the four of us. He had sent the four of us something, I can't remember what it was, something he had written as a complaint to the College or whatever. And then he got a response from an AHS lawyer telling him to cease and desist sending him stuff.

So he was like, "How did I add you to the email?" It turns out that AHS lawyers have been intercepting and monitoring our emails. So I decided, knowing that they were actually going to listen, I wrote them a letter about myocarditis and kids, stating that you're causing more harm than good. But we obviously were not dumb enough to be writing back and forth anything important. But it was remarkable that this lawyer unwittingly acknowledged that they've been monitoring our correspondence.

In the interest of time—and I spend a lot of time going through science—but I do want to highlight a few things with respect to the Alberta data.

The overall case hospitalization rate is under 4 per cent. Less than 1 per cent of patients who caught COVID died or were in the ICU, and this is an overinflated number because we don't have the real denominator. Ninety-six per cent of all COVID-related deaths have occurred in Albertans over the age of 50. So going back to my own case with respect to the mandate, I was not in the high-risk group.

Paediatric: there have been five kids who have died with and from COVID since the start. The first child reported, passed away in the fall of 2021 and Dr. Hinshaw had an announcement about that child's death. It was a couple of weeks before they were starting to push the vaccines in the 5–11-year-olds, and they stated this child had died from COVID—until a family member reported that this child actually had stage four brain cancer and had tested positive, had not died from COVID. She had to apologize for that. How the Chief Medical Officer of Health did not know the full medical record for the first child in Alberta who died, a year and a half in, when she made that announcement, is a bit of a mind-boggle to me.

If there's one graph that should have had us pulling these things, it's this one—and this is not available anymore. But this is the number of cases and it's relative to vaccine status. So per 100,000 vaccines, or not, you can see that as Omicron came around—this is January, February, Christmas in 2021, 2022, when the truckers were in Ottawa—you were twice as likely to get Omicron if you were double-vaxxed.

This continued. In fact, you were most likely to get COVID in Alberta if you had three doses. Alberta decided to take this data down March 13th and we haven't seen this again. Last testimony, I showed you similar data from Ontario, British Columbia, United Kingdom, United States. This negative vaccine effectiveness over time is pretty well-established. It's not a conspiracy.

We don't have the data here in Alberta publicly available to us anymore, but other places have still been publishing what's happened with Omicron.

This is across all age groups over time. This is vaccine effectiveness starting at around 60–80 per cent, and this is zero. So for all age groups, by the time you get to about six, seven months, you've got negative vaccine effectiveness.

This is a prospective study that was done at Cleveland Clinic, and they did their healthcare workers, 50,000 healthcare workers, to see who was going to get Omicron. Impressive dose response curve. This is greater than three doses was the most likely to get Omicron, then three doses, then two doses, then one dose, and then zero doses.

You are absolutely more likely to get infected with COVID if you've had vaccines against COVID.

[00:30:00]

While I still face two misinformation complaints, we've had some doozies: "You won't get COVID if you take the jab." That was said by basically everybody until it wasn't true anymore.

This is a video and again in the interest of time, I won't show it, but basically, he's asking Pfizer's representative under oath: "Did Pfizer know that the vaccine stopped transmission?" Then she's like, "No, of course we didn't know that. We had to move at the speed of science."

It seems that they knew things that they weren't letting us know. I will ask you in a second here to play this video by Paul Offit. Paul Offit has been one of the most vocal individuals. I think he's a paediatric infectious disease doc from Children's Hospital of Philadelphia. He's been very pro-vaccine and yet did a complete 180 with respect to the Omicron. Listen to the end because he points out the fact that the FDA [Food and Drug Administration] is kind of a placeholder. They're not even asked to vote on this stuff anymore. So please play that video.

[VIDEO 1] Paul Offit

Do the benefits of this vaccine outweigh the risks. I don't see the benefits. We really need much better data before we move forward on this and I can only hope that it is coming. I feel very strongly about my no vote there. In fact, the only reason I voted no was because "hell no" was not a choice. And it just surprised me that we were willing to go forward with this with such scant evidence. I think the phrase I used was "uncomfortably scant."

So you just sort of felt like the fix was in a little bit here, maybe that's not the right phrase, but it was obviously something that they wanted. And I felt like we were being led here and with a critical lack of information.

[VIDEO 2] Paul Offit

Right now, they're saying that we should trust mouse data and I don't think that should ever be true. I don't think you should ever risk tens of millions of people to get a vaccine based on mouse data.

[VIDEO] Unnamed Speaker

And there's no public data on that yet. What's more, for these fall booster shots, the FDA is not consulting with Dr. Offit and the rest of the Independent Vaccine Advisory Committee.

Dr. Eric Payne

They're not that interested.

[VIDEO 2] Paul Offit

—because when you do that— So we'll get all the data from the two companies, which is then available to the public. By not doing that, by simply saying "we don't need that advice" what we're also saying is we're not going to be transparent about what we have to the American public and I just think that's not fair.

If you clearly have evidence of benefit, great. But if you clearly don't have evidence of this benefit, then say no.

Dr. Eric Payne

And then, shortly after this, Bill Gates. This is the individual who obviously told us that these things worked—and he made a lot of money on that. This is just a 20-second video:

[VIDEO] Bill Gates

—they're not good at infection blocking.

Dr. Eric Payne

So with respect to Paul Offit's comments, he's right. Some of the data that we have that was the most helpful was the actual data that Pfizer submitted to the FDA when these things were being released. And now that they don't have to submit those things, we never got that data for the boosters, for the Omicron.

And the other main point to make about the Omicron bivalent booster is that both of the spike proteins that they generate are extinct. They don't exist anymore.

Over the last six months, we've seen the French health authorities, we've had England, winding things down, Denmark has changed, Florida has changed things. Denmark even went so far as to say that vaccinating children with these experimental shots was wrong and we shouldn't have done it and we won't do it again. Recently, Quebec is no longer recommending this for those who aren't vulnerable, so its young kids are excluded. The World Health Organization, just a couple weeks, is no longer recommending these things.

And then Switzerland came out recently also. And the other thing about Switzerland is that it seems like they're going to put the onus on the family doctor themselves or whoever is going to give the injection. So if you want to get an injection now, you have to get a prescription from a family doctor. And if something happens, that family doctor is liable, which I think is a brilliant idea for Alberta.

You know, I just showed you getting the disease, but in the Alberta data itself, death and severe disease is overrepresented the more shots you get as well. I have this thing highlighted in red just to show you one of the ways that they've been playing with the numbers on us. If you look at the number of hospitalised cases and the number of deaths here, this was since January 2021. We didn't even get to 50 per cent

[00:35:00]

vaccine uptake until the summer of 2021.

So everybody in the first six months who got, or died, or hospitalized from COVID would have been in the unvaccinated. So they were inflating these numbers.

And it took a while for these things to roll out and for us to catch up to what we were seeing in the U.K. and in Israel. You know, here's July 4th, 2022, 81 per cent hospitalizations had one shot, 78 per cent had two, 51 per cent had had three. That was the last time they showed us the hospitalization data. They've taken that away. For almost a year, we haven't seen it. And 54 per cent of deaths had had three doses, 19 [per cent] had had two. This vaccine outcome tab is gone.

But the important thing on this one, this is the COVID genetic vaccine uptake among Albertans. We only got to 39–40 per cent uptake on the third shot. And this plateaued right after Omicron at Christmas time. So when you have 55 per cent of patients dying with three shots, but only 39 per cent of patients who have taken three shots, you've got an over-representation there.

This is the two-shot data. You can see the older populations have been better at taking these jabs. But you can see, most age groups took two, right? The 5–11-year-olds, we haven't got up over 40 per cent with two. And then on the third dose, none of the younger kids have taken three doses. The teenagers who had very high uptake, 90 per cent, less than 20 per cent of teenagers have taken three shots.

And the timing is important because I think what happened was people had taken two, three shots and they got Omicron anyways. So why are you going to keep taking shots if you got the disease you were trying to prevent against? And I think that's what woke a lot of people up. I know I have friends that woke up and that was what prevented them from giving it to their kids.

These are the rainbow graphs that were sort of made famous. These have also been taken off the website. But what these things show, interestingly, is how many days after your shot, were you diagnosed with COVID? So you get the shot: how many days? And we know that you're considered unvaccinated if you have not had two shots and waited two weeks. What these graphs are actually showing is in the first two weeks, there's actually an increase. There's a slight increase in cases. It goes up before it goes down for whatever reason. And once that got made aware, Alberta took that data down.

A couple of questions, a few sentences on ICU capacity. And the reason this is important is because, "two weeks to flatten the curve" was all about protecting our resources, right? Everything we did was to not overwhelm the health system. So what was our capacity?

Here's an opinion piece that was written in the *Washington Post*. And this was October 2021. And they compared Alberta to Alabama because we both have similar populations, like 4.9 versus 4.4 million. But Alabama has 1,500 intensive care unit beds, and we had 370.

Because of that, Kenny's Government talked about ramping this up to something more reasonable, which never happened. And Dr. Yiu even went so far to say that we're only getting space in our ICU when somebody dies. So she's trying to make us feel good about not taking shots, but she's saying we're only opening up space when somebody else passes away.

And then very, very quickly we find out that the AHS CEO is actually spreading misinformation about ICU bed capacity. The AHS retroactively had to edit the ICU bed data. Here is Dr. Deena Hinshaw admitting they manipulated ICU numbers. And here's former Premier Kenny admitting that they were overstating Omicron hospitalizations by 60 per cent. So at the time that they're telling us hospitals filling up, hospitals filling up, they were playing with numbers and overstating cases.

These are the numbers that they had made available on their public website. So that's the best I have, ICU bed capacity. Here in the bottom is the COVID occupied beds. And keep in mind, half of those are with COVID and not from COVID. This in the orange is unoccupied. So if you look at the absolute, here's your 400 beds. They almost never got to the 400 beds.

If they had actually increased space to even 600 or 700 beds, the way that they had discussed— Based on this graph, while we were up against the wall for sure, there's a lot of questions about just how much we were at capacity, I think.

The fear factor: we've all felt that. It was incredible what we were dealing with. I'm going to point out just that you were not allowed to go to hockey and criminal acts, but you know, this type of stuff here. I did my own research Halloween joke. This came from a council member at the College.

[00:40:00]

This is a doctor who wrote this and wrote it about five or six days after receiving my letter. This is another doctor stating that those of us who chose not to take the experimental jab were bad humans.

Recently, I think that the hate is sowed from the top down. There's no doubt about that. And as I say, the same as I said in my own hospital, it gives permission to people to act bad when the leader is acting bad.

What Canadians don't realize is that we were subject to a psyops[Psychological Operations(s)] operation. This is acknowledged in the CBC. The Canadian military ran a PSYOPS operation against us, and when they told us they were going to shut it down, they continue to do it. And that was to stoke fear and get us to be compliant.

Once our new premier came in, you start getting all these articles where they're gaslighting Premier Smith. Here's that gentleman, Tim Caulfield, again. "I find it horrifying sometimes when I see some of her comments, her being the premier." Then you've got this little hyperbole by the person writing it or not. I have to believe that most people realize that's nonsense, but nonetheless, that's what we see in our mainstream all the time.

Mr. Caulfield recently just published this lockdown revision[ism]. The reason that I have this here, is because it is the thesis of that paper that the reason that people are not trusting public health measures right now, the reason parents are not vaccinating their kids with their regular vaccine schedule anymore, is because of people who have spread misinformation.

So not acknowledging that if you coerce people into taking something that ultimately doesn't work, that might affect people's continued uptake on this. I think it's complete nonsense that a small group of people that have been pointing to data all the way through are responsible for the fact that our public health officials no longer have the trust they once had.

The masking misinformation has been personal. We masked our children like everybody else did at the beginning. It killed me because we knew it didn't work. But nonetheless, we're finally making some headway on this. This is again, when the premier came out and said we were not going to mask our kids anymore, there was this gaslighting of her in the mainstream media. Right away they started hitting her again,

Dr. Francescutti [Dr. Louis Hugo Francescutti], he used to be the head of the CPSA council. He was the chief CPSA doc in Alberta. And he states that she's not pointing out the science, "show us something that's not on Uncle Joe's website, show me the data, something."

Another article, this person from Zero Covid Canada, "this is strong misinformation" and so on and so forth. Another colleague at the Children's Hospital, Dr. Cora Constanetinescu. "masks do work. It's backed by science and common sense." Dr. Constanetinescu has got some interesting conflicts of interest with respect to Big Pharma as well. And I'd like to point out specifically her involvement with the COVID-19 Zero group.

Lots of people have written about masks, but Dr. Alexander was kind enough to join me for a paper we submitted to Brownstone. Jeffrey Tucker presented it recently. Brownstone is one of the only places that would publish this stuff. I would write my letter and he wouldn't even get a response. So to the doctors that say that the premier doesn't have any evidence, this letter has got 60 references showing you that there's not a single policy-grade study

that masks work for influenza or for COVID. All the policy-grade studies, randomized control trials, meta-analysis, all show that it does not work.

I emailed this to the new CMOH [Chief Medical Officer of Health] in November. I responded again in December because we had a new multi-center randomized trial done out here in Alberta.

Dr. Fauci was under oath and he couldn't name a single study in support of masking.

And then in the last month— What's interesting about this is the last author, Dr. John Connelly. He works for Alberta Health Services. He's a doctor here. So two of the best papers out there showing us that masks don't work are authored by somebody who works for AHS and yet we're still forced to mask ourselves at AHS.

Then about a week ago, we've got a really nice study, this is not the only one, showing you, not surprisingly, that there are side effects to these things.

The CDC, for the first time in 20 years, changed how many words kids are supposed to know by a certain age. They reduced the number of words by six months. That's enormous! I saw this with my own son. He's four and there were some articulation issues. He was offered some speech therapy and then they called us back to say, "We're so overwhelmed with the need for speech therapy,

[00:45:00]

he's actually on the milder spectrum, we're not going to give it to him anymore."

I've talked to lots of speech therapists. This is a real issue. Kids learn by looking at faces and mimicking this, and we've prevented that. This is the reason for highlighting the 0-19 stuff—because this is the one-page propaganda piece that was plastered everywhere. It was in the emergency department, it was everywhere. And then it was first introduced to us physicians at the hospital in the summer of 2021.

Are there long-term effects caused by COVID-19 vaccines in children? "There have been no reported long-term effects after COVID-19 vaccination." I confirmed with the author of this, and I've got this on email, that they had two-month data in adults. That's it.

They go on to talk about long COVID. We know long COVID is extremely rare in kids and it's generally the kids that are in the ICU and very, very sick that get it. More fear mongering.

They sum it up with, "Okay, we've got a survey that shows that long COVID goes away if you take the shot." That was what they were presenting to patients. At the same time saying that these shots were 100 per cent safe and effective. That was what they were being told even when they didn't have the data to back that up.

We get into these crazy modelling madness, that somehow the people who are unvaccinated are getting more accidents. Trust me, it was nonsense.

This Fisman [Dr. David Fisman] guy is going to come up again in a second, but while we present data showing you the real-world data that you're more likely to get COVID, be hospitalized with or from COVID, and die with or from COVID, the more shots you have, they respond with modelling data.

And this one was incredible. This was written by Fisman, Fisman, I guess, maybe is how he pronounced his name. He was part of the Ontario COVID-19 Science Advisory Group and he quit because of political interference. Here's all of his Big Pharma—which is an incredible list of conflicts of interest there. If you just Google this, these are all articles on the same paper.

This thing went international. I was hearing this from people. I heard it from somebody in Italy. When you look at the model because he provided it—which was really nice of him to do—if you look at this one number, just one number, baseline immunity of the unvaccinated: How much of the population is vaccinated right now? He made an assumption. He didn't take a reference and he stated it was 20 per cent.

We knew, if you look at the serial COVID prevalence in the CDC at that same time, that 90 per cent of people had seen COVID. Almost 100 per cent of us have seen it now. If you put in 80 instead of 20, that whole model flips itself: now it's the vaccinated driving the pandemic.

Lots of people noticed this. Denis Rancourt, who testified here said it nicely: "main conclusion does not follow their model." Other people were more accurate: "using flawed inputs to vilify a minority." That paper is still up on the *Canadian Medical Association Journal*.

Theresa Tam: I still don't know how you can possibly think that we saved 800,000 lives. We've lost 20,000 patients in Canada in three years with or from COVID—40,000 deaths with or from, half of those, 20,000 only. The idea that these things helped saved lives, it's fanciful thinking.

The funding part, I'm going to say, we know that there's infiltration. How is it the FDA approved these things? Lots of evidence, peer-reviewed articles, showing that this is a real problem. Pfizer funds the Canadian Medical Association. Here's an article with a link to *Globe and Mail*. When you go to *The Globe and Mail* to link it's no longer available, but if you go to the "way back machine" you can read that the Canadian Medical Association received \$800,000 from Pfizer. This is back before the COVID pandemic: *True North*, their top 10 stories in 2021: number three was a professor in Toronto who didn't disclose his AstraZeneca funding.

Their number four story was Dr. Jim Kellner, the Children's Hospital physician I mentioned. It turns out that he had received almost \$2 million from Pfizer over the few years leading up to COVID. It's important for you guys to know that universities take 30 per cent indirect. On just that \$2 million, the University of Calgary, the university that won't let me interact with trainees, took \$600,000. And that's not the only grant that he took during that time. It's not like he pockets these things, this goes to his funding. But I would say, as someone—**These are people that dedicate their lives to taking care of kids. I genuinely believe there's no maliciousness, malintent, but**

[00:50:00]

\$2 million is an enormous unconscious financial bias.

And when you're not willing to discuss things, that's when things get into trouble. And when Kenny came out and said the summer was going be ours again, we've got enough people that have had COVID, we've got natural acquired immunity, Dr. Kellner and others were there to say, "Wait a second! Natural acquired immunity for COVID? I don't think so."

If you can play Fauci's video here, a short one. This is what we all expect, what we all understand from natural acquired immunity after you get a shot.

[VIDEO] Anthony Fauci Interview

[Video is largely inaudible. Dr. Fauci is asked whether someone who has the flu for 14 days should get a flu shot. He answers that the infection "is the most potent vaccination."]

Dr. Eric Payne

Somehow that was lost in history for a couple of years.

I won't go through these. Probably the last videos I'm going to show; but the mainstream media in February, this year—the papers are incontrovertible now. "Natural acquired immunity is much better than vaccine acquired immunity with respect to COVID." That's not surprising.

This summarizes a lot of the safety data that I went through last time. I'm not going to go through it again. But there is an absolute mountain of safety signal evidence that should have behooved us to look into it, especially with respect to kids.

If you take all vaccines over 40 years and you look at how many adverse events were reported into these systems, like the vaccine adverse reporting system VAERS or VigAccess access or whatever, the adverse events that were seen in the first six months after the COVID vaccine rolled out were more than all vaccines put together for 40 years.

They had removed the RotaShield vaccine after 15 cases of bowel obstruction. We've got 40,000 deaths in this system right now, which is an under-representation probably of a factor of 10.

This vaccine-induced immunity—Fauci explaining that they knew about it—it was a concern. We've got evidence that it's happening right now. Peter Hotez here on the right, he's at Texas Children's. He's a very pro-vaccine kind of guy. But he specifically states, a couple of months before the vaccines, that he had done research on coronaviruses specifically, and what they find that when you give the shots to animals—and even in kids because he mentions that there are two children that died in one of these programs—when they get exposed to the virus naturally, subsequently, there's a ramped up immune system and it can have a bad outcome.

So they were aware of this stuff. And the evidence that I showed you with respect to how many people have had the shots versus how many people have died in the population, it shows you that there's something else going on.

This just came out. I don't know how you can keep your job, frankly. I don't know how you sleep at night. The German Health Minister in March, 2023—you can watch this whole interview. In 2021, he claimed that COVID-19 vaccines had no side effects. But he states now that that was an exaggeration in "an ill-considered tweet. It did not represent my true position. Severe COVID-19 injuries? I've always been aware of their numbers. They have remained relatively stable at one in 10,000."

So we've got a child whose risk of dying from COVID is one in three million, but they've got a one in 10,000 risk of a serious adverse event. That equation doesn't make any sense.

And in fact, it's not one in 10,000. If you actually look at the best data, which is the clinical trial data as reported here by Dr. Doshi: Serious adverse events, these are life-threatening, death, hospitalization, significant disability or incapacity, congenital anomalies, birth defects. They were found to occur in about one in 800 in the clinical trials that were done.

We've talked about the bio-distribution. We know it goes everywhere. The Canadian government right now even acknowledges that "spike protein are degraded and excreted within days to weeks following immunization." They tell you it's there.

They still claim that this thing doesn't get into your DNA, your nuclear DNA. There is a study, I mentioned it last time, that at least opens up that possibility in some instances.

This is the most recent bio-distribution data

[00:55:00]

that we finally had made available to us, Pfizer Australia. These are all the tissues where we see spike protein: reproductive organs, brain, everywhere, eyes. It gets everywhere—bone marrow.

We've got autopsy studies of people who have died post-vaccine because of myocarditis. We find spike protein on their pathology. We find circulating spike protein in patients with vaccine-induced myocarditis.

We've got kids. There are these two adolescents who lived apparently in the same neighborhood and died, within a few days of getting the shots, from a heart attack. And the histopathology shows that it was the vaccine that caused it.

We also know that it's not just the spike protein, but the lipid nanoparticle itself causes inflammation. It's a problem and it may explain things like the rainbow graph. Why are you more vulnerable to getting sick for two weeks? There may be something to do with your innate immune system.

Tons of neurological side effects. I say this as a neurologist: I'm begging my neurology colleagues to wake up on this. I have colleagues who don't even put Bell's Palsy on the differential on these things. It can happen post-COVID, it can happen post-vaccine.

We know that there's batch-dependent events, 71 per cent of suspected adverse events in 4 per cent of the batches. This is a production problem. We ramped up production really fast.

And so this will be the last video here. But the long-term side effects.

If you can play the one on the left first.

[VIDEO] Bill Gates Interview

[Video is largely inaudible. Mr. Gates alludes to the fact that long-term side effects data should not be a factor because it takes too long to obtain.]

Dr. Eric Payne

And then the one on the right please.

[VIDEO] Interviewer

... Many scientists are beginning to believe that a vaccine against AIDS may be impossible to make and too dangerous to test.

[VIDEO] Anthony Fauci

If you take it and then a year goes by and everybody's fine, then you say, okay, that's good. Now let's give it to about 500 people. Then a year goes by and everything's fine. You say, well then now let's give it to thousands of people. Then you find out that it takes 12 years for all hell to break loose and what have you done?

Dr. Eric Payne

I think those are wise words and, unfortunately, he didn't follow them.

These are the last few points and then I'll take questions.

I did not get into the paediatric data. I just didn't have time for all the details. But I was very involved in the Stop the Shots campaign with the Canadian COVID Care Alliance. There was a letter that a number of us on the Science Committee signed and we sent to physicians in Ontario warning them about the vaccine and kids. Those are available in the CCCA [Canadian COVID Care Alliance] website if you want to get 100 references on why these things are bad in kids.

This is the only piece of data you needed to know not to give these to kids. This was one of the pieces of data that we would not have got—Dr. Offit was saying that FDA is not going to get access. This is a Pfizer briefing document when they were trying to get approval for the 5–11-year-olds.

Because serious illness is so rare with COVID, even in the adult population: the 40,000 patient trials—nobody ended up in hospital. So they had to model out death. So based on Pfizer's modelling, 1 million fully vaccinated children—2 million COVID shots—was going to save maybe one life. And by their numbers, 34 excess cases of ICU myocarditis. And we know about 20–50 percent are going to die within five years.

So you were going to probably lose, based on this number, five kids because of excess myocarditis in the ICU, and you're going to save one life.

We know, because in Ontario the incidence of myocarditis is actually one in 5,000 overall, one in 3,000 for Moderna, one in 18,000 for Pfizer. They took away AstraZeneca because of a risk of clotting—one in 55,000—and yet the Pfizer vaccine is still being still being given to kids.

The risk–benefit was never there for children and at the time that this was approved in October we already knew it didn't stop transmission.

They keep talking to us about RSV [Respiratory Syncytial Virus]. There was an RSV and influenza surge. Here is again some of the data that was submitted to the FDA. I'm going to highlight the block in the clinical trials for kids. In both Pfizer and Moderna when they assessed it, children had an increased risk of getting RSV and getting influenza in the first 28 days after getting a COVID shot.

So we are actually slightly increasing a child's risk

[01:00:00]

of getting RSV and influenza by giving them a COVID shot.

Lo and behold, we've got nine clinical trials right now on www.clinicaltrials.gov where they're trying to use mRNA technology to produce a vaccine targeting RSV, including in kids.

Similarly in order to fix the hearts that they've damaged, Moderna is going to now start injecting an mRNA shot directly into the heart to repair the damage.

This was alluded to this morning, and this case really is upsetting. I really don't understand how you can be a physician, and with the data that I've gone through here, deny somebody a possible life-saving treatment—a person who is in that situation through no fault of her own. It wasn't bad lifestyle. It just happened.

We have the data that I showed you. We also have case studies showing that post-transplant you can end up rejecting these things.

Not only do we have differentiation between provinces on transplant teams; currently in Alberta there's a difference between the transplant teams in the same hospital. The transplant team who is refusing to provide the transplant despite the fact she's vaccinated for everything else, has another transplant team for another solid organ in the hospital that no longer is requesting the COVID shot.

So it's completely egregious that this woman is dying in Alberta right now. To the physicians who are involved with that: I don't know how you sleep at night. I would implore you, it's not too late to do the right thing.

We've got a pandemic of unknown deaths. You've probably heard about this, but just look at these numbers. Number one cause of death in Alberta in 2021 was unknown and ill-defined, 3,300 cases. For COVID, there were almost 2,000 cases with or from COVID, so about half of those.

So you know you're looking at three or four times more cases died for unknown reasons than from COVID in Alberta, and nobody's paying attention. We're not doing extra autopsies. We're not trying to figure this out at all. We're literally watching more people die for unknown reasons, and we're doing nothing about it. It makes absolutely no sense.

When you listen to these things, you know it's obviously multi-factorial. You've got lockdowns, you've got mental illness that crept up, you've got surveillance cancers that got missed, but the idea that the vaccine, when our Canadian government has already paid out for death, is not contributing to some of these deaths is completely nonsense. Dr. Rancourt's presentation just blows that out the window.

This is the last slide.

For those of you that don't understand or are not aware that the World Health Organization is attempting a power grab, this is the second time they've done this this year. Our Canadian government previously signed over our sovereignty to them. So did the U.S.

It gives the World Health Organization emergency powers to usurp what we would do in the case. What's worse is that they get to define emergency. These are the guys that changed the definition of vaccines, so we can't allow that to happen.

Leslyn Lewis is in my estimation one of the only politicians with a backbone and some real credibility and ethics. I encourage you to go and sign this petition. We cannot sign over our sovereignty to the World Health Organization.

And with that I'll take any questions.

Wayne Lenhardt

I have one minor matter left, but maybe at this point: Are there any questions from the commissioners on this testimony?

Commissioner Massie

Thank you very much Dr. Payne for your very thorough presentation. I mean, it's a lot of data to wrap around our heads.

One of the questions that I have is about the timing that the data becomes available and the lag we often see either from the medical community, sometimes even from scientists, and certainly from people in the health regulatory agencies. I was not aware that this lag was that important in the past because I didn't really pay attention to it.

Do you think, based on the study analysis you've done, that this lag between acknowledging the cutting-edge science information and I would say, proposing treatment or a solution or policy that are aligning with the cutting-edge science, has that increased during the COVID crisis, or was it there all along?

[01:05:00]

Dr. Eric Payne

Yeah, it's a very good question. I think it depends on the data.

If you're looking at the provincial data that I went through for Alberta, that stuff was remarkable. That was updated every week. Alberta's website for the data and what they were collecting was—I don't know if there was anybody who surpassed it. The data was there quickly with respect to that.

The decision-making on that data was another thing. There were also specific things they did to make it look worse for the unvaccinated, like changing the denominator over the course of a year. So the timing wasn't necessarily the problem sometimes. It was that they were obfuscating how they presented the data so that we didn't see it.

This was even more egregious with the academic published literature. Dozens and dozens of examples, including the Cochrane review on masking that was just done. If you talk to that author, it took them almost a year to get that published. They had to fight. Cochrane tried to fight back and not let that get published.

In the first six months when everybody was thinking "what could we do for treatment" what was one of the first things that happened? We had a *Lancet* paper and *New England*

Journal of Medicine paper saying that hydroxychloroquine killed patients. Those were totally fabricated. They got retracted, but the damage had been done.

It's not just the timing and how quickly this data gets to us. There's been blockades at getting this thing out, especially if it's hurtful data.

With respect, for instance, to natural acquired immunity, why all of a sudden, after thousands and thousands of years, is this not going to apply to COVID? At that time, if they acknowledged that natural acquired immunity was a thing with respect to COVID, that meant half the patients who were eligible for a shot wouldn't have got it.

So that was my impression as to why they were obfuscating that point. It is a problem. My biggest problem is the censorship as opposed to the timing of getting these data, I think.

Commissioner Massie

You mentioned in one of your slides that there seems to be an increase in other types of infection for people that got the COVID mRNA injection. It might sound a little counterintuitive that the vaccination against COVID would impact the susceptibility to other viral infections. In your research, have you found ways, or a potential mechanism, that could explain that?

Dr. Eric Payne

Yeah, absolutely. I mentioned some of them last talk. We've got multiple papers showing that the innate immune system in particular is affected. Innate: our automatic immune system, not the one that generates, remembers antibodies, and so on, and so forth, but specific cytokines like toll-like receptor have been impacted.

So we've got these proteins that circulate throughout our bodies looking for infections, looking for proteins that shouldn't be there. They're also keeping cancers at bay.

These jabs affect natural acquired immunity. So I think that does explain to some extent why we're seeing some people just get sick for all sorts of reasons. I think it also explains some of the very aggressive cancers that we're seeing because that surveillance system that's supposed to be in place to protect that from happening has been hijacked by these shots.

Commissioner Massie

Among the severe adverse effects that we've seen from people that testify at this Commission, we've often heard about a condition of autoimmunity with joint pain and all kinds of other issues like that. Do you have any hypothesis to explain how this type of vaccination could actually trigger that kind of inflammation?

Dr. Eric Payne

We know, and the Canadian government acknowledges now, that the spike protein, which is what is generated by these mRNA and DNA vaccines, can travel everywhere. And it is a protein that our bodies recognize as foreign. And sometimes our immune systems misdirect. So you get what's called antigenic mimicry.

We may have a protein in our body that looks very similar to the spike, for instance, so they may attack it. They also told us that the spike was going to be presented on a membrane surface. So you can imagine as your immune system is coming in, if you're presenting this on your heart muscle, and your immune system is coming in to recognize it and try to form antibodies, that there may be some casualties in the surrounding tissue.

That's part of it in terms of the inflammation,

[01:10:00]

is a misdirected immune system response. But as I also mentioned, the fat ball, the lipid nanoparticle, that in itself is inflammatory as well. So it's not just spike.

There's a video of Bancel [Stéphane Bancel], who is the Moderna CEO, and he was asked about this, in 2016-17 when they were working on this. Their main concern when they were working on this was the lipid nanoparticle. They were worried about repeated doses and what that effect would have. But as I pointed out, after six months in the trials—data that they went to court to try to prevent the release of—they then gave the vaccine to the placebo arm. So we do not have a comparison group at one year, two years. We don't have, even six-month data in the booster shot. We have zero idea of what the ramifications long term are from repeated lipid nanoparticle injections.

Commissioner Massie

We've heard from several testimonies that the people that had reported adverse effects were often turned down because it seems that people that have more frequent adverse events for whatever reason—medical conditions—also have, or you can identify, pre-existing conditions. You could then point out that it's not the vaccine, it's the pre-existing condition.

Do you think there is a link between people that are prone to autoimmune disease or other types of conditions that would make them more susceptible to vaccine adverse events?

Dr. Eric Payne

I think if your overall physical health is poor, you're going to be at the highest risk of having an injury to the vaccine as well, so that's not a stretch to me.

Commissioner Massie

So I guess that initially when people were deploying the vaccine, you would have expected that it would have made sense to target the vaccination to the more vulnerable people because they are more likely to have severe disease or to die from it.

But if at the same time these people are more susceptible to developing a severe adverse event, are you not doing something counter-productive?

Dr. Eric Payne

I've been scratching my head with that.

Everybody points to DeSantis in Florida for what he's done with respect to the shots, but they're still giving it to 50-year-olds and those who are vulnerable. Given the mechanism of

action of these vaccines, given the mountain of evidence with respect to short-term and long-term and medium-term events, these things should be pulled across all groups.

What benefit? We know that the more shots you take the more likely you are to get to that the virus and die from the virus. So why would we be giving this to the more vulnerable people? So I get that dichotomy. I agree with you 100 per cent.

One of the groups that they say is high-risk are those who do have chronic autoimmune diseases. I've got this email: I couldn't believe this: the Alberta Health Services, when they were giving guidance on the vaccine initially. Because the issue is, if you're on chronic immunosuppression, how is your body going to mount an immune response to the vaccine? Is it even going to help you? Because of that they recommended that doctors take their patients off the chronic immunosuppression, give them the shot for a couple of months, then restart it.

How many people on chronic immunosuppression can come off for a few months? In reality what happened is the doctors didn't take them off the medicine, but they gave them their shot anyway.

We don't have data. Those types of patients, just like pregnant women, were excluded from the original trials. We don't have data on those high-risk groups.

The other part, as you alluded to: patients coming to doctors and not being believed. The vaccine adverse event reporting system, with all of its limitations, 80 per cent of the injuries reported are in the first 48 hours after a shot. There's a temporal relationship to it. You can't explain it away.

The problem is because these shots can linger in your system for weeks and months. We've got evidence six-plus months that the spike protein is still circulating. Most doctors are not allowing their brains to think beyond the first week or two.

Even in the clinical trials

[01:15:00]

that Moderna and Pfizer conducted, they only looked at 28 days. So they stopped looking beyond. But we've got a product that we know is still being pumped out and circulating for months and months and months. So doctors need to open their minds up to what they typically would consider a temporal relationship to these things.

But it is really tough because, as you say, people have got multiple medical things. How do you sort that out? While we're talking about these vaccines other people are saying "Well it's all long COVID." It gets grey. But there is no doubt that there are—I mean I've heard these patients—really bad injuries.

Even in the paediatric trial, the 12–15-year-olds: There was a girl, Maddie De Garay, who ended up with the transverse myelitis—inflammation of her spinal cord—and she's in a wheelchair now. I gave a talk a couple months ago, there was a woman brought up on stage. She developed transverse myelitis within a week of the shot as well.

These are serious things, and for the most part what I'm observing is that my colleagues are not putting those two and two together.

Commissioner Massie

So on a more personal level, knowing everything that you don't know and learn through your research, and trying to communicate, and also being part of a community of other scientists and doctors that have come up with similar observations, how does it feel to work in a work environment where you're pretty alone, very often, in your everyday operation?

Dr. Eric Payne

It's a mix. There's pros and cons to it. I love my job. I really do. I like being at work. I like the acuity of the stuff that I do. And the Children's Hospital—the reason I came back is because the place is filled with really awesome people. These are people who dedicate their lives to looking after kids. So I would say there is still a cohort of people at that hospital that enjoy seeing me and will interact with me.

There are others that will come down the hallway and turn around. You know, overall, I wouldn't change the thing. I feel very fortunate that I was able to see what was going on, that I was able to articulate a defence in order to see what their response was, which was nonsense. And so I've known since very shortly after my letter came out that they didn't have data to combat that.

When you're standing with truth you just deal with the consequences. Otherwise, how do you sleep at night if you believe what I believe, and you're a dad, and you're a paediatric neurologist, and you don't say anything? You don't have a choice.

So that being said, I do feel awakened, like a lot of us here, to a lot of things beyond just COVID. And I'm very, very blessed and fortunate for that.

Commissioner Massie

Thank you very much.

Commissioner DiGregorio

Thank you so much, Dr. Payne, for coming today and giving us your testimony.

I'm hoping you can help explore a little bit about the Alberta Health Data Reporting. I presume that these numbers that began to be published about COVID data on the Alberta website is new, since COVID was new, but was that based on a history of reporting respiratory virus information? Do you know anything about what Alberta has done?

Dr. Eric Payne

Yes, the system that was created, new specific to COVID, I've never followed a similar database in Alberta.

The infectious disease docs and paediatricians and family docs are the ones that report those surveillance-worthy illnesses to health officials. And I imagine there's some place online where these things are up. When they say higher increase of syphilis and chlamydia versus previous years, those are reportable viruses.

But I'm not aware of a database for RSV or such things. Clearly the influenza numbers get looked at, but not in a robust database the way that they created for COVID.

Commissioner DiGregorio

So then, in your opinion, what would have been the purpose of publishing the data in the way that it was published? Was it to help medical practitioners to get a better understanding? Was it to help the public?

What are your views on that?

Dr. Eric Payne

Well, I think they were generating the data in order to act on the data themselves, with the idea being that they were trying to minimize the impact on our resources. They were trying to anticipate

[01:20:00]

when the hospitals were going to fill up, when they weren't, trying to enact lockdowns and so on, according to those things.

Why the decision-making process to allow all of those data to be public so that people can look at it? I don't know what sort of decisions were made there. What I can tell you is not nearly enough Albertans looked at that database.

In clinic, you show it to people sometimes and their jaw drops—60 per cent of the people who died last month had three shots. They'd never heard that before, but it's right on the public database.

What's more concerning is that when it started to show that there was a clear signal that we should be concerned about, instead of joining other jurisdictions which have limited this availability, they pull the data off the website so we couldn't see it anymore. The last time we last saw the death data was July of last year. I guarantee you it's even worse now.

Commissioner DiGregorio

So when data began being removed, or disappearing, from the system, was there any explanation or acknowledgment that it was being removed or did it just disappear?

Dr. Eric Payne

We got that announcement. For instance, the vaccine outcomes was a specific tab. They just took the tab off so you can't click on the vaccine outcome tab. In terms of why—because they were not the only group doing this—BC, Ontario, everybody stopped showing the data at the same time.

I still cannot wrap my head around the fact that, given the signal that that data was showing, how is it that in Alberta we're still recommending these shots to children? When Quebec, the World Health Organization, Florida, all these other jurisdictions, some a year ago: Denmark, "We made a mistake giving this to kids. We will never do that again."

Where is that language here in Alberta, with the data that we have? I haven't heard it.

Commissioner DiGregorio

Thank you.

The other question I had come from something else you said, which as a lawyer, to me was very concerning. You mentioned that at some point there was an acknowledgment by the AHS that they were monitoring and intercepting emails between yourself and your lawyer.

I'm just wondering if you can give me a little bit more context around that.

Dr. Eric Payne

Yeah. The context that I have was essentially what I mentioned: Our lawyer sent the four of us something that was not that important, but he just said—but [inaudible] the AHS—he then was contacting us asking, did you get this? And none of us got the email. Then within hours he got an email from the AHS lawyer telling him to stop sending her stuff. And he's like, "Oh man, how did I not include Eric and Joanna and Greg, but the AHS lawyer?"

And so that's how we found out, because he did not include her. She was getting those things.

Commissioner DiGregorio

And he was emailing you at your Alberta Health Services account?

Dr. Eric Payne

Yeah. It was one of those things that was not an attorney/client—I would never have trusted AHS. I mean, when you log into the system, they're recording every stroke key on your computer. So I'm not going to discuss strategy through my AHS.

But it never even occurred to me. As I say, Jeff's reaction was, "I must have included the AHS lawyer by mistake." That is pretty shocking, right?

Commissioner DiGregorio

Thank you.

Commissioner Drysdale

Good afternoon, Dr Payne. I have a couple of questions related to some of your testimony.

We've heard testimony in a number of places across Canada that citizens have been approaching police, RCMP, et cetera, in order to investigate some of the issues, and the RCMP have refused to investigate. But I thought I heard you say that the College of Physicians & Surgeons had hired a group of RCMP to investigate their claim against you.

Is that correct? Did I hear that correctly?

Dr. Eric Payne

Yeah. I don't know for sure if this is the same company that's doing my case, but I know for a fact that that company's been involved with similar physicians who have gotten in trouble with respect to COVID.

Commissioner Drysdale

So the RCMP, or retired, or ex-RCMP I hope, are investigating medical issues or concerns when they're being paid privately, but they won't for the citizens. Is that what you're saying?

Dr. Eric Payne

Yeah. One of the physicians I've come to know

[01:25:00]

was actually on the College's complaints, and in his experience he never saw them solicit a third opinion until this. This is new for them to be doing that stuff.

What we've also experienced is that I can have a two-sentence complaint saying "misinformation" without any specifics, and a year and a half later that's still open. But if I put in a complaint, or my lawyer puts in a complaint, with respect to Deena Hinshaw's comments on that child—and I know this because he did—and it got removed. The CPSA just kicks it back after a month saying "She didn't do anything wrong; we're not going to investigate her."

There's a doctor in Ontario. He was distributing, I think it was hundreds, but at least dozens of vaccines, to children before the vaccine was approved in Canada, and he got a slap on the wrist. And that's already settled.

There's definitely a two-tiered system. If the complaint jives with the propaganda and with the narrative then you're not going to get beaten down, but if you're speaking up then they're going to drag it out.

The reality is that because my training really lends itself to an ICU setting, I'd love to have a hybrid system where I'm doing some ICU stuff and also clinic. Saskatchewan has lost all their child neurologists and epilepsy doctors. I'd be happy to do some locums out there, do some remote stuff, but because there are open complaints against me, I'm locked down. So for a year and a half, the college is keeping this hammer over me, which is completely unfair. We'll see how this all resolves.

Commissioner Drysdale

One of the things we keep hearing about is basic tenets, whether it's in medicine or anything else. And I understand that one of the basic tenets in medicine is informed consent.

My question is, and this might sound silly, but if you need a shot of something, Doctor, who gives that to you? Do you give it to yourself or do you get another doctor to do it??

Dr. Eric Payne

If I was getting a shot, I would go to see another doctor.

Commissioner Drysdale

Does that other doctor owe you: to give you informed consent? In other words, do they talk to you and make sure you understand what the issues are around it?

Dr. Eric Payne

Well absolutely.

Every single clinic visit is a conversation in informed consent. A decision to start seizure meds is an informed consent decision.

If I'm having a conversation with my family doctor, he probably won't have to go through the same level of informed consent with me because I'm aware of the issues.

But there isn't a single person, I feel, that has received informed consent with respect to these COVID jabs. Not a single person.

Commissioner Drysdale

Well, does informed consent mean that I just tell you what I know about it and you just have to accept it, or does the doctor tell you what the pluses and minuses are and you get to say yes or no?

Dr. Eric Payne

It's supposed to be the latter because you can have the same clinical situation but a different family dynamic, and it's not going to be the same choice for the different families.

Commissioner Drysdale

How can a medical treatment, a vaccine, then be mandated? Doesn't that remove the informed consent? We heard testimony earlier today from a dentist who said that as a physician, when you are aware a third party might be influencing the decision, that you can't ethically do it. How is that possible?

Dr. Eric Payne

No, that's right. Absolutely, this is basic stuff.

One of the arguments in our case against AHS was that this is assault: "We're saying no to being injected and you're forcing that injection."

So there was also Charter violations from the perspective that "here you are forcing me to give up my vaccine status, which you're then going to use against me to fire me." It was a really interesting position to be in.

If you pull up the Nuremberg criteria, no, you're not allowed to coerce. I know the lawyers on the other side and some of the other people don't like when we say, "I was forced into taking the shot," but you were definitely extremely coerced, and coercion is not allowed either.

So that is how it's supposed to be. I explain the risk benefits as best as I know them, I answer any questions, and then we try to come to the right decision. There's not always a right decision. There's a lot of grey. So that's why you have to have that process.

With respect to the COVID jab there were a lot of instances—

[01:30:00]

our prime minister this week, he is now acknowledging that some people got seriously injured from the disease. He's also acknowledging that, he stated that, the shot's not going to be for everybody. People are going to have different medical reasons to take it or not to take it. If I had COVID twice, why would I take this? So he acknowledged it there this week. But that was completely removed across the board globally, generally speaking, to get compliance in the interest of avoiding vaccine hesitancy and not overwhelming our infrastructure.

Commissioner Drysdale

From your presentation, it looked like you'd done a fair bit of research on the process under which the vaccines were developed or approved. And we heard from other witnesses earlier concerning quality control issues in the manufacturing of these injections. And we also heard in problems related to the actual implementation of the shots; in other words, they were supposed to aspirate and they weren't aspirating. We also heard a few days ago how with the Pfizer shot, they were supposed to gently turn the bottle five times up and down before they gave it to them in order to mix the contents of it.

So my question on that is, have you considered the impacts of these other issues, these quality control issues in manufacture and the way the shots were actually implemented, in your analysis of what's going on with this?

Dr. Eric Payne

I have the benefit of listening to some extremely smart people on the science and medical advisory committee at the Canadian COVID Care Alliance. There are some people whose job is in patent assessment of exactly these types of things. So I have had the benefit of documents explaining all the issues on this stuff.

I mentioned at the end, in Denmark paper, 70 per cent of the adverse events were in 4 per cent of the vials. That suggests that there is inconsistency between vials, unless it's all at the same centre. We know that's going to be the case.

We know that mRNA in general, if you're talking about general mRNA, it's very hard to work with because it doesn't stick around very long. This is different a little bit because they change it. They added a pseudo-uridine and it's made it very persistent, so you can't just use your brain on previous mRNA stuff.

There's no doubt that if the vial thawed and you didn't get something that was still frozen, you probably got a dud, fortunately.

We know, and I mentioned this in my testimony to you last time, I think almost on a similar question afterwards, but we've got a recipe in the mRNA and the DNA to produce a spike protein. Part of the regulation process was that it's got to produce a proper-length spike protein, at least 50 per cent of the time, which is remarkable how low that is. Nonetheless,

they couldn't do it. When they produced the studies to show that protein through these things called "western blots," there's extremely convincing evidence that those things were fabricated. They were never even able to generate a consistent vaccine that was producing the spike at the proper length 50 per cent of the time.

They say they didn't skip any processes, but we obviously know that that can't be true. One of the main things was the distribution, ramping all that up. The people who I've listened to talk about this, they tend to favour just normal human problems, on the distribution side effect, than a malicious thing, where pharmaceutical companies are making bad vials and good vials. I think I would agree with that.

Commissioner Drysdale

My last question, and it may seem like an odd question, but I always need to put things in perspective for myself in order to understand them: I think in previous testimony we heard that in order to get the emergency use authorization—it's an American term rather than a Canadian term—that the Pfizer test process was two months long, and then they unblinded half of it, I don't know how long it went after that. You said six months I believe.

Dr. Eric Payne

And the EUA [Emergency Use Authorization] is there because of exactly what Gates said. You don't have two-year data until you have two years. And so you cannot get approval until that long-term data exists.

They've made an exception. They don't have that long-term data. We weren't supposed to get phase three long-term data for these trials until fall of 2022, and 2023.

[01:35:00]

Not even the initial stuff. We're not going to get that because, as I said, they unblinded: they gave everybody the jab.

So it's truly remarkable. We're flying blind here with the exception of these passive surveillance systems. And you guys have heard the problems with those things.

Commissioner Drysdale

Well, just to put that in perspective if you had a two or six-month test period and I was testing—I don't know? Cigarettes—would I detect that they caused cancer in two months?

What about thalidomide? If I had a pregnant woman who was two months pregnant and I gave her thalidomide, would I know after two months whether or not it was going to have a problem?

Dr. Eric Payne

Yeah, you'll learn that in nine months with thalidomide.

Commissioner Drysdale

And so we didn't wait nine months.

Dr. Eric Payne

No, not even close.

This is why when you're looking at a risk benefit that doesn't even favour children to begin with, and then you add this massive unknown, which is the long-term stuff, in the context of a mechanism, the injury and bio-distribution data suggests that this can cause trouble. I've had a hard time understanding why the Canadian officials and the U.S. officials have been approving these things.

The Canadians have basically been rubber stamping what the U.S. officials did. Paul Offit is now trying to get on the right side of history here. He did a lot of bad things in the first two years from my estimation, but that being said, he acknowledges that the booster data is so egregious that he can't go along with it.

I painted a picture where Big Pharma is this big bad wolf type of thing but there's this whole other level to this. I know you've had testimony to that effect, but for those people who are trying to get what that higher level is, I recommend sub-stacks by Sasha Latypova and *Bailiwick [News]*. Robert F. Kennedy has talked about this as well.

This is a military operation. They're talking about countermeasures. I mentioned a case last testimony: Brook Jackson, who's a whistleblower for Pfizer in the U.S., she took them to court and I mentioned that case. Just two weeks ago that case got dismissed. The reason it got dismissed was because the government stepped in and said that these were countermeasures not vaccines, and that Pfizer— It was not up to them; it was up to us.

So all of a sudden now you're starting to get a better picture of why these things were rolled out that way. I think Pfizer definitely has got a lot of culpability here but there is an enormous— When you look at the Twitter files release, for instance—we know that the U.S. government was specifically censoring scientists like Bhattacharya, whom you had here. "We don't like what he says, silence him." That was the level of integration that they had to keep that bubble closed.

And the sequelae to that, interestingly enough, with the FDA approvals, is that it's a dog and pony show. What the FDA approved didn't matter. It was going to get approved anyway.

I guess the data got so bad that eventually these guys were having trouble with it and stood up against the Omicron. But they had like 10 mice. They had literally injected 10 mice, and they were using the spike protein from the original Wuhan strain, which was two and a half years old, and they were using the Omicron 4 or 5 strain, at a time when we had already moved on. Yet that is still the shot that we're recommending to children.

Commissioner Drysdale

Thank you.

Wayne Lenhardt

Hello, the time is moving on, so I think we should wrap up shortly, but I have one quick question.

We have some evidence that early treatment protocol worked. We had Donald Trump, we had Rudy Giuliani, so on and so forth.

Were there any studies done on whether safe and effective early treatment protocols worked during this period of time? Because if they did then the entire vaccine scenario becomes irrelevant. We should have been using the other.

Dr. Eric Payne

You're absolutely right.

If you have a repurposed drug, like a combination of ivermectin, hydroxychloroquine, and vitamin D, that works and keeps 80 to 90 per cent of people out of hospital, if it's used early, you don't have a reason for emergency use authorization.

There's clear evidence that they worked to demean those drugs. In France, for instance, hydroxychloroquine was available on the shelves. They started taking that down in the fall just before the pandemic started. All of a sudden something over-the-counter is not available.

Why is that relevant? Well, we had SARS-COV-1. I was at McMaster University in early 2000s when that came through. We know that hydroxychloroquine and chloroquine worked against SARS-COV-1. It was already on people's radar. So that treatment stuff has been one of the more egregious parts of the story.

With respect to your question on trials, there are prospective observational trials.

[01:40:00]

The best early treatment stuff was by McCullough and Alexander and Zelenko, their multifaceted treatment approach using all these repurposed drugs. They didn't claim that they knew the exact right order at the beginning, but they were at least willing to try. They've modified that given how these things have worked.

The FLCCC [Front Line COVID-19 Critical Care Alliance], Paul Marik, and Peter Kory, have done the same thing. They got outstanding protocols.

Our government here in Alberta started a trial to look at ivermectin, then they stopped the trial, and they never continued to do it.

So three years out we don't have any of these trials in Canada.

There was a slide that I did take down with respect to Fisman and the Ontario Science Table. They specifically, on that Table, have been recommending against vitamin D.

Vitamin D is a hormone that is extremely important not just with bone mineral density but to our immune systems. In Canada, in the winter, when you don't get sun, we're all vitamin D deficient. So our Ontario science committee, instead of saying, "Check vitamin D and if you're deficient, replace it" said, "Just don't give it."

In fact, we've got huge amounts of data that vitamin D can be beneficial. In that original multifaceted treatment trial that McCullough published, the table that always caught my eye listed about 15 different countries that had tried to give their people something. It was a combination pack: usually an antibiotic like azithromycin, hydroxychloroquine, vitamin D, zinc. These were third world countries that were doing it. Not just third world countries, some others.

But our government, at a time where other governments that don't have the means that our government has, were trying to treat this when we didn't know what was coming. And what did we get? I get a letter from my Canadian Medical Association telling me that I shouldn't be prescribing hydroxychloroquine—before I'd even thought of prescribing hydroxychloroquine. They were shutting down that access.

It's really, really sad that we haven't established any trials for the things that you're talking about three years in. Because the overall feeling from the people that know that data is that if you give the right stuff, you can prevent 80 to 90 per cent of the admissions.

Wayne Lenhardt

My last question, Doctor, is I have a document here that looks like it's a press release from Alberta Health Services. It's dated July 2nd of 2020, and it's entitled "Global Recognition Grows for AHS," and I would like to show you this and just see if you're familiar with it or if you can tell us anything about it.

Dr. Eric Payne

I know what you're talking about. Is there "World Economic Forum" on the title anywhere?

Wayne Lenhardt

Yes. And this entity was formed in the fall of 2019. It would have been just before—

Dr. Eric Payne

Yeah, that's right. And they announced it in the summer of 2020. They were very, very proud of that. So three months in, Alberta Health Services signed on to the World Economic Forum.

Wayne Lenhardt

Have you seen that before and can you tell us anything about?

Dr. Eric Payne

Yes. I remember seeing this.

I sent it to everybody who would listen to me. I remember thinking this was troubling news because when you're the rookie on the block, you want to prove yourself. So here we are three months, and AHS is now part of the World Economic Forum. Having said that, the Mayo Clinic that I used to work at is also part of this group. You obviously know about a lot of these people.

The idea that there's a global entity that can better control our health care in Alberta doesn't make any sense. We know that there were differences even within Alberta. Calgary and Edmonton during COVID were not the same as the rural province. So you're going to lose that if you defer to a global entity—especially one who wants to define "emergency" whatever way they want.

But I haven't seen anything more than this. I haven't seen further follow-up of that. But I find that concerning given the statements made by Klaus Schwab with respect to the World Economic Forum, and stating publicly that he knows—and this was years ago—that 50 per cent of the Liberal cabinet was for the World Economic Forum and for Agenda 2030. So our leaders don't seem to be playing for our team sometimes.

Wayne Lenhardt

On behalf of the National Citizens Inquiry, I want to thank you very much for your testimony today.

[01:45:25]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 5: John Carpay

Full Day 3 Timestamp: 06:23:39–07:28:12

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness today is John Carpay.

John, can you state your full name for the record, spelling your first and last name?

John Carpay

John Victor Carpay. John, J-0-H-N, Victor, V-I-C-T-O-R, Carpay, C-A-R-P-A-Y.

Shawn Buckley

John, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

John Carpay

I do.

Shawn Buckley

Now, John, you have a bachelor's degree in political science from the University of Laval.

John Carpay

That's correct.

Shawn Buckley

You have a law degree from the University of Calgary.

John Carpay

Correct.

Shawn Buckley

And you have, you are, and have been for some time the President of the Justice Centre for Constitutional Justice or Freedoms [JCCF]. Can you share with us about the JCCF, what you guys are about, and give us a brief outline of the involvement that you guys have taken with the COVID pandemic? Because you guys have been quite busy.

John Carpay

So the Justice Centre is a registered charity. We are a non-profit. We are 12 years old. We were founded in 2010. Our mission is to defend constitutional freedoms through litigation and education.

We were, to my knowledge, the first non-profit in Canada to call for an end to lockdowns. This was in May of 2020, so we were two months into violation of Charter rights and freedoms, and we have a paper on our website called, "No Longer Demonstrably Justified." And our argument in May of 2020, and since that time, is that the lockdowns are doing more harm than good. Therefore, under the *Canadian Charter of Rights and Freedoms*, those are not justified violations of our Charter rights and freedoms.

So since March of 2020, we've had court cases across Canada. We have challenged lockdown measures in British Columbia, Alberta, Saskatchewan, Manitoba, Quebec. We represent Sheila Annette Lewis, who is the lady that needs a double organ transplant, who currently, in Alberta, will die without that medical treatment. Prior witness Dr. Eric Payne alluded to that. That's one of our clients. We've defended the free speech rights of doctors and nurses to speak freely and honestly their own views and opinions about medical and scientific issues. We've represented students threatened with expulsion from university for refusing to take the COVID vaccine, government workers threatened with loss of employment.

We also are paying for the legal defence, the criminal defence, for people like Tamara Lich and Chris Barber, who've been criminally charged for doing nothing other than peacefully exercising their Charter freedoms of expression and association and so on. And so we have lawyers in BC, Alberta, Saskatchewan, Ontario, Quebec, fighting court cases all across Canada.

Shawn Buckley

And am I correct that basically you guys depend on donations from the public to fund these lawsuits?

John Carpay

We neither ask for nor receive any government funding for our work, and indeed we rely entirely on voluntary donations to carry out our work.

Shawn Buckley

Okay, thank you for sharing that. So now you are invited here today to share with the National Citizens Inquiry your thoughts actually on specific actions or changes that could

be made, so that going forward we don't experience things the way we have experienced them. And I'd like to invite you to start your presentation at this time [Exhibit RE-12].

John Carpay

Yes, I've got a got my own computer here, but I don't know if the Commission staff is able to put the—

Shawn Buckley

Yeah, we're up and if you open that laptop likely it would show up on that laptop also, it won't, okay, so—

John Carpay

No, I've got the same presentation on my own laptop. So protecting Canadians' human rights and constitutional freedoms in the context of a public health emergency. So we acknowledge that it is a valid choice on the part of governments and legislatures

[00:05:00]

to have public health legislation on the books. We're not calling for a repeal of that. It's also perfectly valid for legislation to provide parameters and guidance on what to do in a public health emergency. We're assuming that that legislation is valid and it should remain on the books, but I have 18 recommendations, which I'll go through briefly.

Maybe the next one or two slides down. Next one down. One further.

Yes, chief medical officers, health authorities, and so on, must at all times disclose to the public the specific assumptions, data, statistical models, sources for their modelling, etc. Case in point: here in Alberta, Premier Jason Kenney and Chief Medical Officer Deena Hinshaw, on April the 8th, 2020 presented a model to the Alberta public suggesting that even with lockdown measures in place, 32,000 Albertans could die of COVID. That number, 32,000, is higher than the 27,000 total annual deaths in Alberta from all causes. All-cause mortality in Alberta: 27,000 per year. And here we have the chief medical officer and the premier saying 32,000 people could die of COVID. Of course, this proved to be completely false, and so wildly exaggerated as to become false. Governments were asked, I asked the government, what is your basis for this model? How did you come up with this number of 32,000? Is it based on Neil Ferguson modelling? Did you pull it out of thin air? What's the source? How did you come up with this number? No answer: completely stonewalled.

So this first recommendation, I could give many, many other examples: The specific documents need to be made available to the public at all times on everything pertaining to the public health emergency. Go to the next slide if you like.

This recommendation is that the chief medical officer must submit to a weekly questioning by elected members of the legislature. I use the word legislature to mean both federal Parliament and the provincial Legislative Assembly. So I'm using one word. These 18 recommendations are intended to apply to both levels of government, federal, provincial, and territorial, which is analogous to provincial.

One aspect of our Constitution, one of the constitutional principles, is democratic accountability. It is the idea that we, the people, elect our representatives and our elected

representatives pass the laws under which we live. And there is maybe not direct accountability through citizens' initiative, but at least there's some accountability because you can hold to account the federal MPs [Members of Parliament], provincial MLAs [Members of the Legislative Assembly], for the laws that they are passing. This went out the window in March of 2020, where the chief medical officer in Alberta, BC, Saskatchewan, and so on, federally— All of a sudden, these chief medical officers became like medieval monarchs. In fact, Deena Hinshaw's orders, "I, Deena Hinshaw, Chief Medical Officer of Health, decree as follows." I mean, it was literally like a medieval monarch. And there was zero accountability. There was buck passing. You phone your MLA to say that you disagree with lockdowns, and they say, "Oh, well, you know, we're just listening to the Chief Medical Officer." But she, in turn, often said, "Well, it's really up to the Premier. I'm just your lowly humble, you know, making recommendations." There's just this ongoing buck-passing for three years.

Anyway, legislation needs to be amended to make it such that the chief medical officer appears weekly for questioning before all party committees, federally, provincially, as the case may be, to answer questions. Next slide, please.

Using existing emergency response plans—I'm not going to dwell on this. I believe that this was addressed extensively by Lieutenant Colonel Redmond or another witness. This needs to be legislated. Obviously, if these plans are disregarded— Well, okay, so for next time around, we need legislation that says that existing emergency use plans have to be used, barring unanticipated information that transparently justifies a deviation.

[00:10:00]

Next slide, please.

Next recommendation for legislative change is that if the chief medical officer declares a public health emergency, that needs to go to the legislature for an open debate followed by a vote. And in that debate, the chief medical officer puts forward all of the documents on which she or he relies; so it's transparent. The public can see it; the MLAs can see it. And members of the legislature can also table alternative and additional sources of information. So all of the information on the table, vigorous debate, and then a free vote. Next slide, please.

We have automatic recommendation for automatic expiration, 30 days after that vote has taken place. Now, it can be renewed. Some public health emergencies could legitimately be longer than 30 days. It's not up to the legislature to determine that. That should be determined by reality and science. It can be renewed, but there has to be another debate and another vote and the presentation of documents and data. So we have an open, public, transparent process. And so we have the debate.

Why? Because debate is a tool for arriving at the truth. When everybody thinks alike, nobody thinks very much. Many of these recommendations directly or indirectly get back to free expression, which is a pillar of our free and democratic society. The only way to move forward in science, the only way to pursue truth is when there are no sacred cows. And you can freely challenge other people's views, and then you have pushback, refutation, debate. Next slide, please.

Number six: recommendation that the documents on which the chief medical officer relies as a basis for a declaration of public health emergency be made available to the public. I

actually, I'm noticing now that might be redundant with the previous recommendation, but in any event, we can move to the next one. There's a blank.

Adopting a broad approach to public health societal well-being. It is imperative that governments provide a cost-benefit analysis. This is also required by the *Canadian Charter of Rights and Freedoms*. In section one of the Charter, it says "the *Canadian Charter of Rights and Freedoms* guarantees the rights and freedoms set out in its subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society."

The onus is on the government to justify any violation, whether it's a violation of our freedom of speech, association, conscience, religion, peaceful assembly. The Charter right to bodily autonomy, which is protected by the Charter section 7, right to life, liberty, security of the person, includes expressly—courts have been very definitive on this—we have a right to bodily autonomy. Individuals have a right to decide what medical treatments to receive or not receive. It's in the Charter, section 7. We have mobility rights: Charter section 6, to enter and leave Canada freely. To move freely within Canada.

Any of these Charter rights and freedoms, if violated by government, the onus is on the government to justify with evidence the violation of these Charter rights and freedoms. Now, there's a complex test called the Oakes test, and it's quite nuanced. We don't have time to get into it. It's not in this presentation, but I'm focusing on one element of the Oakes test, which is that when governments violate any of our Charter rights and freedoms, the onus is on government to show that the benefits of that violation outweigh the harms.

So it's a requirement, which our Alberta government, and to my knowledge, every provincial government, and most certainly the federal government, have failed miserably to adhere to what our Constitution requires. This is a requirement. This is not optional. This is a requirement of the Constitution of Canada, that when a government violates any right or freedom, the onus is on the government to demonstrably justify that violation. So with what we've seen, the failure of the last three years to have an honest cost-benefit analysis, to have instead a fanatical, dogmatic approach whereby governments have clearly already arrived at the conclusion that lockdowns are wonderful and are saving many lives:

[00:15:00]

instead of that, there needs to be an honest, ongoing assessment. Next slide, please.

Part of that is that health is defined as a state of complete physical, mental, and social well-being, not merely the absence of disease or infirmity. That happens to come from the World Health Organization, but in spite of that, it's a very good definition. There's more to health than simply avoiding one illness or one disease. And so in formulating government responses to a public health emergency, our government officials, both elected and non-elected, should take into account all dimensions of human health: physical, mental, psychological, so on and so forth. Next slide, please.

And so we recommend that legislation be amended so as to include a requirement on the government to provide a comprehensive report once per month, which evaluates, measures, monitors, explains the impact of public health measures on individuals' mental health, and that would include things like alcoholism, drug overdose, spousal abuse, child abuse, suicide, physical health, cancer, obesity, all-cause mortality, access on data to diagnostic procedures and surgeries, and individuals' financial well-being, also relevant. There are many medical and scientific studies showing there's a correlation between

higher standard of living and better health. So if you hurt people economically, you're also hurting their health. Next slide, please.

Government's monthly report: seniors' long-term care must be included in that monthly report. What we did to our seniors in long-term care homes in the last three years was horrific. It was abuse. It was torture to isolate people, lock them up, to make it illegal and impossible for them to get the love and care and attention and affection of their own family members. It was also the media fear-mongering that kept young, healthy workers away from the long-term care facilities where they worked, because they were scared of COVID unnecessarily. And so in Montreal in particular—and I apologize, that's not first-hand testimony, but that's from media—horrific situations with seniors not getting care in long-term care facilities. Why? Because the staff were frightened away by media propagandists and afraid of COVID. Next slide, please.

Eleventh recommendation is that we need to pay special attention to how lockdowns, vaccine passports, harm the vulnerable. That would be groups like recent immigrants, those experiencing physical and mental disability, those experiencing addictions, Indigenous persons, and so on and so forth. Next slide, please.

Number 12: I alluded to this. The right to bodily autonomy needs to be expressly enshrined in legislation. Human rights legislation can be amended to add as a prohibited ground of discrimination. So for example, we already have on the books: you cannot discriminate against somebody on the basis of sex, religion, skin colour, national or ethnic origin, family status, et cetera, et cetera, et cetera. So it would be very simple, very easy. You add to that list no discrimination based on medical treatments received or not received. And there you go. You've got the protection there.

Legislation should also spell out that it becomes illegal—in the context of employment and in the context of providing public services—to ask people about their vaccination status. Private conversation, that's completely different. If you want to ask a family member, your next-door neighbour, go ahead and ask away. But when you're applying for a job or if you're in a restaurant, public services to where human rights legislation applies.

And then last point there: an appropriate exception can be created for medical doctors, other health care providers. Obviously, there can be an appropriate time in a place where doctors and other health care providers should be able to ask patients about their medical history and treatments. So human rights legislation would not apply to that. Next slide, please.

There should be a statutory right of a civil remedy, making it possible to, if somebody pressures you, coerces you into receiving a medical treatment, then you can sue that person and that remedies are available. And that can be created by statute. Next slide, please.

[00:20:00]

This one is imperative, one of the most—perhaps the most important—recommendation.

Legislation needs to be amended so as to force the colleges of physicians and surgeons to respect the pursuit of truth, to respect the free expression rights of their members. And they should apply as well to the colleges of nurses, colleges of midwives, chiropractors, psychologists, psychiatrists, podiatrists, paediatricians, et cetera, et cetera, et cetera, et

cetera. Nobody should lose their free speech rights just because they enter into a profession. These are government bodies.

And prior to 2020, the college did not tell doctors how to treat their patients. There were ethical standards, yes. A medical doctor cannot have sex with his patients, for example. Or if a medical doctor was rude or verbally abusive, that would be an ethical violation. So by all means, these colleges appropriately are empowered to uphold and enforce a code of ethics. Prior to 2020, the college did not jump into the doctor-patient relationship and start to tell doctors, "Well, you shall prescribe anti-cholesterol medication to patients with high cholesterol levels. Or you shall not prescribe anti-cholesterol medication." It was left to the judgment of every doctor. There's all kinds of medical debates that have taken place recently and over the centuries. In recent times, the college does not interfere.

Science progresses and moves forward. Once upon a time, there's a very high—and the doctors in the room will know this to be true—a very high rate of women who died after childbirth. Why? Because medical doctors were not washing their hands prior to delivering babies. And so there was a doctor who happened to be a woman. I don't know if it matters or not. And she said, "Hey, we need to start washing our hands before delivering babies." And initially, she was mocked and ridiculed, and she was dismissed as a conspiracy theorist, and a kook and anti-science, et cetera, et cetera. But scientific progress and through debate, science advanced, and everybody came to realize that this doctor was correct. And doctors should wash their hands before delivering babies, and that vastly reduced the mortality rate amongst women, postnatal. Next slide, please.

Contracts need to be transparent. When they involve millions of dollars, millions of tax dollars, even if they involve only thousands of tax dollars, the public has a right to see these contracts while they're being negotiated and after they've been signed. Next slide, please.

Legislation should be amended to say that pharmaceutical companies are liable for use of their products. There shouldn't be any exemption through legislation or through contracts. Next slide, please.

Democratic accountability / Access to justice: A public health emergency should not become an excuse or pretext for our democracy to diminish as it has in the last three years, where we have reverted to a medieval monarch who decrees from week to week what laws we shall live under. Chief medical officers need to be accountable to the legislature, and again, federally, provincially. And it's very important that the legislatures, federal and provincial, not be disrupted just because there's public health emergency. And there's no excuse now with the technology that we have today that maybe didn't exist 20 or 40 years ago. Same thing applies to the courts. Most of the work done by judges is from behind a laptop. It involves paper. Yes, there are trials, and there are times when a judge has to be in the courtroom and listening to the witnesses. But most of the work of the courts is not done in that context. Most of it is done when judges are reading the case law and reviewing the written documents, reviewing the evidence. So the public health emergency should not become an excuse for courts to deny access to justice, which sadly has happened since March of 2020.

Eighteenth and final recommendation for legislative change is that once a public health emergency has ceased to exist for 90 days, the responsible government shall commence a public inquiry.

[00:25:00]

Public inquiry shall have 90 days to gather evidence and shall release a report 90 days thereafter. So 270 days after the conclusion of public health emergency, there will be a report that will assess and evaluate the government's response.

I applaud the National Citizens Commission for doing what the governments themselves ought to have done. And it is a shame and a disgrace that generally, and I think we have an exception in Alberta, but other governments, they're not even looking at what's gone on in the last three years. So this too, legislation needs to be changed to require governments to hold that inquiry.

So my thanks again to the Commission for inviting me to be here. It is a great honour and subject to any questions, I would conclude my submissions here. Thank you.

Shawn Buckley

So John. I was just hoping to clarify a couple of things and it's just when we have an expert up here, sometimes, they just assume that some people know things. And so your point number 12, when you're saying well, we should include in human rights legislation the right to basically decide not to accept a treatment. I'm hoping that the commissioners and people participating watching your testimony will understand the *Charter of Rights and Freedoms* only applies to governments, but provincial human rights legislation applies to non-government bodies and that's why it would be added.

John Carpay

Exactly. Exactly.

Shawn Buckley

Because some people might not understand that nuance. And then I don't let any lawyer escape the stand, especially I wouldn't let the president of the JCCF, without asking this question. And it's just, we've experienced the largest intrusion of government over our rights in our lifetime, even for older people that have been through the war. We have now suffered a larger intrusion into our rights.

Can you think of a single case going forward that would act as a break on any level of government doing the exact same thing again?

John Carpay

I'm not sure if I'm following your question. Can I think of a single case, meaning like a court action or could you elaborate a little bit?

Shawn Buckley

Yeah. A court action. So where a court has said, "Hey wait a second school, you can't impose masking, or you can't impose a vaccine passport, or you can't lock people in their homes, or you can't tell people they can't travel on a plane or a train."

John Carpay

I'm very sympathetic to the arguments put forward by Ghent University Professor Mattias Desmet, who talks about mass formation, mass psychosis, and how fear can take over. And I

think what we've seen in Canada in the last three years is a lot of fear—a lot of it, self-perpetuating. Some of it, you know, falls from the get-go.

I mean, Neil Ferguson stating in March 2020 that COVID would be as bad as the Spanish flu of 1918: that proved to be demonstrably false as early as April or May. I mean, early on we knew that that was simply not the case. But the fear lingered on.

In answer to your question, I apologize for perhaps being a bit indirect. The way to avoid a future repeat of this, I mean, having better legislation on the books is definitely part and parcel of it. But it's for everybody to work hard on speaking truth to our neighbours, our friends, our families, our co-workers, and getting Canadians to a point where we recognize that these lockdowns were horrific human rights violations. And they were not justified. They were not based on science. They were not excusable. And unless and until we get the majority of Canadians to really recognize that human rights were violated in 2020, '21, '22, to the present. There are health care workers in BC that cannot, they're not allowed to, come back to work, because of a decision they made a year and a half ago to not take the shot. That's still a reality in British Columbia with doctors and nurses and health care workers.

So the solution is to get Canadians to recognize the violations that took place, in the same way that today we recognize that it was a horrific human rights violation to force the Japanese Canadians who were living in the Vancouver area—

[00:30:00]

And there was fear. People feared the invasion from Imperial Japan. The Japanese troops would land on the shore and they feared that the Japanese Canadians would rise up and assist the foreign invaders. Even though the police had already told the government that, "No, we think that the Japanese Canadians are safe. They're not a threat to our national security. Many of them are third, fourth generation. They don't even speak Japanese. They're 100 per cent loyal to Canada." Well, never mind the facts. These people were dispossessed of their homes, their fishing boats confiscated, and forced to move into labor camps in the interior. Now, because we recognize today that that was wrong, there's a chance we won't repeat it, right? But imagine if we didn't recognize that that was wrong. It would increase the chance of that being repeated. So public education is very important to avoid this. That would be the best inoculation.

Shawn Buckley

Right, okay. I'm just going to circle back because have you— Are you aware of a single case like that, if this happens again, your JCCF lawyers could rely on and say, "No government, you're not allowed to do this?"

John Carpay

We've had, you know, we've had mixed success. I have not been too pleased with some of the court rulings where it appears that the judge is simply relying on a media narrative and not really taking a hard look at the evidence before the court. And you can see that in the judgment. There's all these conclusions that have been dumped too, that are not rooted in evidence that was submitted before the court. Disappointment in that is not going to deter us from doing the best we can to be active participants in the system that we currently have. I think it's all you can do.

Shawn Buckley

Okay, the only other thing I wanted to ask you before I let the commissioners ask you questions or invite them to, is your recommendations are fairly heavy on, you know, this being a public health emergency and public health officer. And Lieutenant Colonel David Redmond makes a point; he says, "Well, actually public health should never be in charge of an emergency." That there specifically was another organization for that, and that if there was what we would call an emergency involving public health, public health would be advising that other agency, but the other agency takes into consideration a wider variable of things.

Would it be fair to say that the suggestions you put forward would equally apply if another agency was put in charge of an emergency, regardless of whether it's public health emergency or some other type of emergency?

John Carpay

Well, absolutely. I think what's behind this is that we need to take a holistic approach to whatever crisis there is, whether it's public health emergency or some other kind of emergency. You know, if we've got a big problem with forest fires, I mean by all means we want the expertise of firemen, but do we want one fireman to take over as a medieval monarch and decree all the laws of the land that we're all going to live under, just because he's a fireman? That wouldn't make any sense.

And just because it is a public health emergency, and I recognize that medical doctors do have—medical doctors generally have much more expertise than non-doctors about medical matters. That doesn't qualify a medical doctor to have this kind of autocratic power, where there's this singular fixation, as if the only important thing in life is to stop one virus. Which is impossible by the way. You can't stop the virus. But anyway, so yes, these recommendations would create a situation where, by all means, the chief medical officer plays an important role and can make recommendations. But you still have a holistic approach where the elected members of the legislature, which include doctors and lawyers and firemen and nurses and housewives and so on and so forth, that they have input on this.

Shawn Buckley

Thank you. I have no further questions. I'll ask the commissioners if they have any questions.

Commissioner DiGregorio

Thank you so much for coming down today and giving us this very thoughtful and well laid out set of recommendations. I understand that you're proposing these as legislative changes that could be imposed. And so then presumably each province would be looking at making such changes,

[00:35:00]

if they were to take these recommendations, and potentially even the federal government in the areas for which they're responsible. Are these really representing guardrails to give guidance to governments on how to proceed in emergencies going forward?

John Carpay

Yeah, I like your characterization. I had not thought of the term, but I think it would be fair to say, yeah, these are guardrails. They're not going to guarantee perfection or perfect outcomes. But these legislative changes, I hope, if implemented, would prevent the massive and horrific human rights violations that we've seen since March of 2020.

Commissioner DiGregorio

And is it your view that we need these guardrails, given the way that the courts have been responding to Charter challenges and cases in the COVID-19 realm?

John Carpay

Yeah, the problem's been courts, politicians, government-funded media, medical establishment: these different actors together. And these legislative proposals, I think, would have an impact on all of those. One of them specifically is about the colleges of physicians and surgeons: that they are to foster, facilitate, respect the scientific process, which includes debate, and not say, this is the truth and you shall abide by it. Because that's anti-science.

Commissioner DiGregorio

And so isn't the Charter supposed to already contain protections that these guardrails shouldn't be needed? Are guardrails like these needed in analyzing and applying the Charter going forward?

John Carpay

I think these guardrails, if they were on the books federally and in every province, would vastly reduce the chance that that Charter rights and freedoms would be violated, so there'd be less of a need to go to the courts. Judges are human and so you know, what we've seen in the last three years is that those who are susceptible to fear and that fall into this absence of thinking and very emotional, fear-driven response, it doesn't discriminate on the basis of education or intelligence. There are highly intelligent people and very educated people who accept as well as who reject the government narrative. So some of these judges are human and they've fallen into that fear and that's very unfortunate.

Commissioner DiGregorio

I asked that because we've had a number of legal experts testify before the Inquiry so far, some of who have suggested that we need to delete section 1 of the Charter, or that other amendments need to be made to the Charter. And I guess what I'm trying to explore here is whether these types of measures would eliminate the need that people see for the Charter to have to be gone back into?

John Carpay

Obviously, in respect to this presentation today, I have not turned my mind much yet to changing the *Canadian Charter of Rights and Freedoms* itself by, for example, removing section 1 or changing section 1. Legislative changes are a lot. The journey of a thousand miles must begin with a single step. These will not be easy to get these legislative changes through. But I think trying to change the Constitution is nearly impossible. It's much, much

harder than legislative change. I think we should consider both. I think we can do these legislative changes. Get those done quicker, faster, easier than constitutional change. But I think constitutional change, certainly section 1 needs to be looked at, in light of what we've seen in the last three years.

Commissioner DiGregorio

Thank you. And if I could just clarify a few of the ones that you went over with us. So specifically, number 12, which was about respecting the right to bodily autonomy and I thought I saw in there restrictions on collecting of private health information.

And I'm just wondering whether that needs to be restricted to health information or if the recommendation would be for other personal information as well? And I apologize I didn't read the whole thing because we were going quickly.

John Carpay

No, no problem. They are connected. The Justice Center is active in raising awareness about the dangers of centralized digital ID and of course there's some connection with the health legislation.

[00:40:00]

Governments cannot violate— It's very hard for governments to violate your freedoms of travel, mobility, religion, conscience, expression, association if they don't first have data about you, right? So if we can succeed in protecting privacy, where we say, look, it's not government's business, where I go and who I hang out with and my personal banking and finances and purchases, and my travel and my political opinions, et cetera, et cetera, it's none of the government's business. The government has no right to collect this data on me, okay? If we achieve that, then the chance of the government being able to violate our rights and freedoms is a lot smaller and certainly with medical information.

It was disgraceful here in Alberta early on where the health minister, Tyler Shandro, unilaterally amended legislation to allow police to give, sorry, to allow the Alberta Health Services to give personal, private, confidential medical information to police. It's absolutely outrageous. Now, the pretext was, well, some people are spitting on police officers so we need the DNA sample to make sure that the person that spat on the police officer, et cetera. Okay, fine. You could have a very narrowly crafted, narrowly tailored provision to authorize some partial release of one individual's medical information in that situation, where they spat on a police officer, right. But this was just a global, "Yup, Alberta Health Services can turn information over to police."

Commissioner DiGregorio

Thank you. And another one of your slides or recommendations, which I think was number 13, you proposed that there be statutory civil remedy, I think, for harms from the vaccines. At least I think that's what you were getting at there. And then you also went on in number 16 to talk about not giving liability protections to pharmaceutical companies.

And we've also had other people testify as to the need for accountability, which I think taking away the liability protection for pharmaceutical companies does. But do we need to consider what liability protections are appropriate or not appropriate for other, such as the public health officers, the chief medical officers, and do we need to consider that as well?

John Carpay

Excellent question. The recommendation here on point number 13 was focused on a right to sue somebody if you got pressured, coerced, manipulated into getting medical treatment like a vaccine, and you were pressured into that you could then sue the person that pressured you into it. These submissions today don't comment specifically on being able to sue for vaccine injury, but obviously I think that that should be possible. And I think that's a good thing and that's all part of justice.

If somebody harms you then you get to sue them. That's part of our justice system—has worked for a long time. In terms of bringing to justice, I'm frequently asked at public meetings: Will our politicians and chief medical officers who imposed these human rights violations on us, will they ever be brought to justice? And my answer is yes, someday, but only if we get to a point where the majority of Canadians recognize that we did suffer massive human rights violations. And as long as the public is not at that point, then those who perpetrated the human rights violations will not be brought to justice. So again, it goes back to changing public opinion is the big task that that lies ahead.

Commissioner DiGregorio

Thank you, and my last question just revolves around— I'm struck by your recommendations, how they seem to repeatedly refer to transparency and freedom of speech. And this is a theme we have seen with many of the witnesses over the inquiry. Can you just speak to how important that is and will be going forward?

John Carpay

Everybody wants good laws, right? Ask any audience in any room, who wants bad laws? Well, everybody wants good law. How do we get to good laws? Well through debate and discussion, and if debate is stifled and a presupposition is put forward—you know, "Well, we already know what the right tax policy is or the right Aboriginal policy or the right environmental policy or the right criminal justice policy;

[00:45:00]

we already know that, and so there's no debate."—You're not going to arrive at good laws.

The whole idea of democracy in the legislature is there should be a cut and thrust. And the government, you know, you have first reading, and then it goes to committee, and the committee looks at it and says, "You know, look maybe the bill generally is a good idea, but you know we should really change section 7 and section 14. And we need to think about this, think about that." And so even in the legislature you have this idea of debate and you improve legislation, so when it comes back again it's better than what it was the first time. So we need the free research, free inquiry, free debate, free speech in order to arrive at truth in all realms. And that can be, that would include science and politics and religion and art. Everywhere, every sphere, every dimension, we need that open debate without censorship as the best means to arriving at truth.

Commissioner DiGregorio

Thank you.

Commissioner Drysdale

Thank you for your testimony. Many of the recommendations you're making seem to be focused at trying to make the public health emergency legislation a little more accountable. But I'd like you to talk a little bit about the problem with that. We already have also legislation, which is very similar for emergencies all over, overall. And no emergency is one discipline. In other words, when there's a hurricane or a tornado or an earthquake or something else, there's multiple disciplines that have to come into it: medical, transportation, engineering, trades, et cetera. And those people who are in the emergencies area, and I've been involved in that, are trained in planning, logistics, figuring out the goal. Lieutenant Colonel Redmond the other day talked about, you know, if you don't establish your target properly, you're obviously not going to hit the proper target.

Shouldn't the solution or a part of this solution just be to roll that whole medical thing back into the *Emergencies Act*, so that they have the proper planning placed on top of them? Because we hear testimony after testimony about how these public health officers, who may or may not have any training in emergency awareness and understanding the complexity of one of these emergency systems, they're running this thing. As opposed to just getting rid of it and rolling it into the *Emergencies Act* legislation. Can you comment on that?

John Carpay

I have not looked at the provincial legislation. If you're talking about the *Emergencies Act* federally, and of course this is quite relevant: the Justice Center has commenced a court action seeking a ruling that the prime minister acted illegally because the Commission report, the Rouleau report, didn't bring a desirable or satisfactory outcome. In fact, the evidence that was placed before the Public Order Emergencies Commission very strongly suggests that the requirements for declaring a national emergency were not met. So that that would be my only response.

Commissioner Drysdale

And also within your recommendations, you talk about an investigation 30 days after or 90 days after or whatever the recommendation was. You know, without a functional media, without a media that's looking after the people and pointing out conflict, obvious conflicts of interest, which you kind of sort of referred to just now, how can you rely on again saying that there has to be an investigation where there's no media scrutiny on it and there's no legal reins on it? You can put any person with conflict of interest ahead of that and come out with whatever you want?

John Carpay

Well, I think, the government-funded media—two things: One is they failed us; they failed Canadians. They failed democracy. They failed society by parroting government narrative in a way that I've never seen media do that to the same extent before 2020, where anything that a government official said was taken to be gospel truth and was just propagated and repeated.

[00:50:00]

So they really lost their way.

Now, what's interesting though is when we had the Public Order Emergencies Commission, and I suppose some of the reporting may have been biased, but the media did report on that. And it was possible to learn about the evidence that was being presented before that Commission. The media landscape is changing and the government-funded media are becoming less influential every day. The fact that they need to go to the government, cap in hand and beg for money, tells us that they do not have a viable business; and so they're slowly dying, I think, a well-deserved death. And what's happening is you've got independent media such as the *Western Standard*, *The Epoch Times*, the Rebel [Rebel News], *True North*, the *Counter Signal*, and the independent media are growing. *Blacklocks Reporter* is another one: doesn't receive government-funding. Whereas the government-funded media, fewer and fewer people are listening to them. So this is taking much longer than what I would want, but slowly, but surely government-funded media are dying and independent media are growing. And so it's not impossible to get the truth out.

Commissioner Drysdale

I appreciate that point, but we heard over and over again in this testimony how the government picked winners and losers. You know, the corner store on the street went out of business and the big box store had all kinds of profitability. So in that consideration, and given that Bill C-11 just passed, can you comment on how Bill C-11 may affect that possibility to continue hearing those alternative sources outside the government narrative?

John Carpay

The worst threat to our freedoms is self-censorship and it's a worse threat than C-11. C-11 is a problem because it gives new and additional powers to the CRTC [Canadian Radio-television and Telecommunications Commission], where government looks to be gaining control over our podcasts and YouTube videos, websites so on and so forth, and so the best thing to do with our freedom of expression is to exercise it. Our Charter freedoms are like a muscle, right? I'm not a medical doctor, but I've been told that if you spend your days on a couch watching TV and if you never exercise, that that's bad for your health. Whereas, if you exercise your muscles, it's good for your health, and it's the same with our Charter freedoms.

So the best defence against C-11, unless and until it's altered or repealed or struck down by a court, is to continue to exercise our Charter rights and freedoms in a robust fashion. Not only is that the best defence, I think it's the only defence that we have right now and in the next few days, weeks, months. It's the only thing we can do: to keep on speaking the truth to the best of our ability.

Commissioner Drysdale

Thank you, sir.

Commissioner Kaikkonen

Thank you for your testimony. I appreciate the fact that you're a lawyer and I'm not. So I qualify myself when I say that. But one of the things that my understanding is, since '82 when the Charter was enacted, we had three years in every province and federal government to align the laws with the *Charter of Rights and Freedoms*. Since '85 we've watched a proliferation of laws go into place and that was by the legislature, you're right on that. But the judiciary had a responsibility to pull it back and they have not.

So I just wonder how we're supposed to rein in a legislature, when that's where most of the recommendations that you've made go to, when the judiciary itself is providing, as you say, mixed decisions that really don't protect the rights of ordinary Canadians? And for ordinary Canadians, if I turn that the other way: How do they have access to a judiciary when they have their rights and freedoms violated, without prohibitive costs and having to deal with that as well, in terms of just moving the law to a place where it recognizes—and the judges as well—that Canadians are the ones who have a right to be free? They're born free, and their God-given right is to be respected by their institutions.

John Carpay

Thank you. Pre-2020 there are mixed results insofar as lots and lots of court rulings, where the courts sided with the government and upheld the law,

[00:55:00]

but also lots and lots of rulings where the courts sided with the Charter claimant and struck down a law in whole or in part. I don't know off the top of my head what the specific breakdown would be.

There's certainly been a shift in the last two years with rulings pertaining to COVID and lockdowns. I'm seeing a lot more deference to government than what I was seeing prior to 2020. The cost of litigation—it's a huge problem. I mean this is why you've got groups like the Justice Center, where we get the donations from Canadians, and then we provide legal representation free of charge because the people that we represent, they would need a hundred thousand or two hundred thousand dollars in the bank to pay for legal bills if they had to represent themselves. So that's a big problem—how expensive litigation is. And there's no easy answer to that. I welcome a follow-up question. I have a feeling I haven't really addressed kind of the heart of what you're getting at.

Commissioner Kaikkonen

So one of the people who testified this morning, one of the witnesses advocated that millions of complaints should be made against the professionals in their discipline that refused to— That did not provide informed consent. So that would be one way that the people could actually address in some form some of the abuses that they have suffered over the last three years.

But how do we—if we take that thought further, because that's an action that everybody can take personal responsibility for and actually follow through with—how do we make a judiciary accountable to the people? Where do we start, as ordinary Canadians, to change that mindset that whatever the government says the judge will agree with, as opposed to the fact that ordinary Canadians are willing to take their finances and their assets and put them on the line to fight abuses that were clearly wrong and clearly violate the Charter?

John Carpay

You can have an accountable judiciary where perhaps you have the election of judges, would be an example, or you can have an independent judiciary. You can't have both. The way our system is right now, in theory, and I think largely in practice, is you have the accountability on the democratic side; so the lawmakers can be removed from office if you don't like your MLA or the party or the government. You can be involved in the democratic process. You can remove people from office and replace them. You know, there are pros

and cons to elected judges. There are some U.S. states that have that, and there are people who say that that works really well, and other people argue it does not work very well. Our system in Canada: the idea is the judges are independent, so that there cannot be any kind of threat or, you know, something hanging over the judge's head that if you don't rule the way that I want you to, there's going to be accountability there. So we have an independent judiciary. I don't know how you can have a judiciary that's both independent and accountable. I just don't know how one could achieve that.

Commissioner Kaikkonen

And then I'm just going to pull out an example, and I wish I had all the details. So I may be a little bit lost on some of the details. Certainly, in the time frame I'm not aware of it or I can't really pin it down.

But in Ontario, the legislature decided, I'm going to say six or seven months ago, that they should have an appointed chief medical officer that was above the legislature. That would have a five-year contract, a five-year renewable contract, and a year I believe it was on top of that, if the legislature so chose. So is that not contrary to everything that we're talking about here? That we've addressed that there is the problem has been this kind of dictator at the top of the legislature above the legislature, and how do we counter that as people? That, our legislature who you're giving all these recommendations to, would actually think it's okay to have a chief medical officer that is over and above the elected official? And again, I'm going to take it back to, Where do the people of Canada get that accountability and transparency if the legislature itself, the MPPs [Members of Provincial Parliament] in Ontario, think that that's a good idea?

[01:00:00]

And they think that that's okay to push first, second, and third reading quickly through.

John Carpay

Well, that proposal, as you've described it, sounds like a permanent medical dictatorship; even worse than the quasi-permanent medical dictatorship that we've already suffered through.

Most politicians, in my view, are followers, not leaders. And that's for better or for worse. I don't mean it as an insult or a compliment, but just as a description.

If in Alberta, if three-quarters of Albertans in 2020 had been vociferously opposed to lockdown measures, I don't think the government would have imposed those lockdown measures. But I think there was strong public support; to the precise extent, it's hard to know. But there was considerable public support. And so there were people phoning and emailing their MLA's saying, "Lock us down harder, and we want more of our rights and freedoms taken away. We want more restrictions." And that's what a lot of MLAs were hearing, and they're sensitive to that. So I think when you get what sounds like a very bad proposal to have an appointed chief medical officer serving a five-year term with all kinds of powers, well, people in Ontario need to contact their MPP and say, "That sounds really awful. I want you to vote against it. And if you don't vote against it, I'm going to vote against you in the next election." And just be involved in the democratic process. I think that's really important.

Commissioner Kaikkonen

And on your last, I believe it was the 18th, you suggested that there should be a public inquiry 90 days in, and that that report from the public inquiry should be made available to the public 270 days later. We've had those. And it didn't go in the favour of the people. So I just wonder whether it needs to be a broader or more specific, maybe, recommendation. Like here, we're going across the country. We are listening to the views and opinions and the experiences of ordinary people. People who are Canadians who have experienced atrocious abuses in all sorts of factors. And we will have a report. But how do you, again, bring government to the point where they recognize that this is a huge proportion of the population in Canada and beyond, that has experienced things that they actually perpetrated? So how do we bring it back?

John Carpay

I think the work that the National Citizens Inquiry is doing is contributing to that. You are doing what the federal government and every province should be doing right now. So these 18 proposals are more of a skeleton. So for each one of these proposals, there would be a lot of extra work and that's okay. Every legislature has a team of drafting lawyers whose full-time job it is to draft legislation, right?

So these are kind of broader statements of principle. But say, on point number 18, mandatory public inquiry after conclusion of public health emergency, there's an example of where the elected politicians with their staff lawyers that work for the legislature could sit down and could very specifically craft, you know: How do the commissioners get appointed? How do we make sure that we get unbiased commissioners? What kind of evidence is received? And all the details will be spelled out. So this is kind of the skeleton, the starting point.

Commissioner Kaikkonen

Thank you very much for your testimony.

John Carpay

Thank you.

Shawn Buckley

John, there being no further questions, on behalf of the National Citizens Inquiry, I sincerely thank you for coming and giving your testimony today. And I'll advise you that the PowerPoint that you provided will be made in exhibits so both the public and commissioners can review it, to understand your testimony better.

John Carpay

Thank you. It's a real honour for me to have been here with you today. Thank you.

[01:04:33]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE RED DEER HEARINGS

NCI | CeNC

**Red Deer, Alberta, Canada
April 26 to 28, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

We welcome you back to the National Citizens Inquiry as we begin day three of three days of hearing in Red Deer, Alberta.

I'd like to always share just briefly what the NCI is. We're a group of volunteers that just came together with the vision of appointing independent counsellors and marching them across this country so that people could tell their stories: so that we could get down to the truth, and so that we could come together again.

And we're doing that, but the NCI has become something much bigger. Because along the way, just you watching people tell their stories and us encouraging you to take personal responsibility to actually start acting has made the NCI something completely different, where it's even hard to define. Because it's you and it's the actions that you take. And there's just wonderful things happening that we have nothing to do with, which is part of the NCI.

So every day it's evolving, but we're so thankful for all the little teams. There are whole teams of people volunteering on different projects. I don't even know who they are, and I don't need to know who they are. And you know, even an event like this here; we are in Red Deer, well, it was a local team that put this together. We don't have an administration where we can send people out and put an event like this on. We actually rely on just people that have said, "Hey, I will help. This is important. I'll put this together." And I mean, I can tell you it's just an incredible amount of work. And we owe gratitude and thanks to the local team that did this.

And I just cited as an example of how people can make a difference: You see a need do something. Think of just something you can do. There's a person that's going to be attending an event in Europe and wants to present about us, and asked, "Well you know I need a little, almost a commercial." And a Mr. Dahl just stepped up and did it, put it together for us. I don't even know who this gentleman is. But another volunteer, Peyman, had gotten this fellow involved, and it just happens, and it's very exciting.

Our social media team—because I always do an ask out—so first go to our website, sign the petition so that we kind of have a numbers count, to say, you know, people are behind this. And then also please donate.

As I say, this takes about \$35,000 every city that we stop in for three days. And you know, we just kind of keep up. But isn't it beautiful that we do? Because you know, we have discussions. Do we have enough to keep going? And then you guys come through and you donate and we have enough to keep going. And so here we are in Red Deer. You know when we had past discussions, "Are we going to get this far?" And next week we're in Vancouver. And the week after that we're in Quebec City. And then the week after that we are in our nation's capital, Ottawa. And it's all because you are participating, and so I thank you for that.

Our social media leader has asked—because our big problem is we don't have the media. "Where's the mainstream media here?" This should be front-page news because a group of citizens has gotten together. You have gotten together. You're here. People are online watching. We're creating this record that actually the entire world is watching what we're doing as an example. And I'd like to encourage those in every single country to band together and do the same thing. To create a record of your voices, of our voices, because we're all in this together. To create a forum where people are free to speak, to share their stories, so that we can hear them and come together. So we urge you to do that, but the media is not here.

And so we're relying on social media. The one forum that is the least censored is Twitter. Every time— And this is from my social media guy; I'm not on social media, so I hope I even say this correctly: Every time you tweet anything that is related to what the NCI is doing—COVID, censorship, mandates, freedom, Bill C-11, whatever it is—if it's anything that touches this movement,

[00:05:00]

just go hashtag NCI because that affects the Twitter algorithm, that you're including us as relevant to what you're speaking about. So that's a specific ask that we had.

Now this morning before we begin, I want to get to Bill C-11, which passed the Senate yesterday, and then lightning fast, the Governor General in Council signed it. Lightning fast because for federal laws they have to pass the House of Commons, they have to pass the Senate. They can begin in either one of those houses, but they have to pass in both. And then they're not law because the Queen is our executive—read the Constitution. And so the Queen or her representative, who happens to be the Governor General in Council, actually has to sign it before its law.

And sometimes a law will pass Parliament and it'll sit for quite some time before—I said Queen and it's King. I'm sorry I'm having to adjust. And so please forgive me, it's just been all of my life it's been Queen. So but it's King. But you knew what I meant anyway.

But you know, sometimes it'll be quite some time until it gets to the Governor General for a signature. And I don't know why that is, but I certainly noticed with interest that Bill C-11 has to be so important that it was signed the very day that it passed. I think we all should be thankful at how Johnny-on-the-spot our government is in protecting us. I tried to say that with a straight face but I don't think I succeeded.

I want to talk about a principle about reaping what we sow. And language comes out of out of the New Testament in the Bible, and it's just a basic principle that, "Don't be fooled. You will reap what you sow." And it's an agricultural analogy, which basically is saying, "Listen, if you go and plant something in the field, you're going to get what you planted." And the analogy is the same for your life, right? So if you go into a field and you seed that field with Canadian thistle, what are you going to get at harvest time? You're going to get Canadian thistle. And if you plant that seed with oats, what are you going to get? You're going to get oats, so you are going to reap what you sow. That's what this means, but it's meant to be applied to our lives. So make no mistake, what you invest your life in is what is going to come back to you.

I spoke on Day 1 about the second commandment being the foundation of our legal system, both our criminal legal system and our civil legal system. And the second commandment is just basically, love your neighbour like yourself, which just means treat your neighbour exactly how you would like to be treated. Now if you sow love—if you follow the second commandment—so if you were to sow love, basically plant love all around you, that's what you're going to get.

And if you plant hatred—so if you live your life hating and you sow hatred—that's what you're going to get back. If you sow truth, you get truth. If you sow lies, you get lies. Now this applies to you personally, but this also applies to us as a nation. If we sow love, we're going to experience love as a nation, and just the commonsense application of that is, the logic is inescapable.

If we love each other we're going to experience love. If we hate each other we're going to experience hate. We are going to experience it if we hate. If we tell the truth and insist that others tell the truth, including government and media, we will experience truth. And if we are dishonest, and we sit back and allow our government and our media and others to be dishonest,

[00:10:00]

then we are going to experience dishonesty. And if we censor, if we silence opinions that we disagree with, if we allow others to censor with all this online shaming, if we allow our government and media to censor, then we are going to experience censorship. And you can't escape the logic.

So this adage, this truth that you reap what you sow is the best—I can't say—the second best-argument that I can think of for why we have to follow the second commandment and get back to that fundamental bedrock principle that our society was based on. That we are to treat each other like we want to be treated ourselves, that we are to love each other because if we don't then we're going to be treated in a way we don't want to be treated. It's as simple as that. You have to do it for you. That's the second reason you should do it. There's a more important reason that I'm not going to speak about, but if you think about it it'll come to you.

Now I want to talk about Bill C-11, this bill that passed yesterday. Actually, I think I had Lieutenant Colonel David Redmond back on the stand, and then somebody holds up writing, "Bill C-11 passed," and so indeed it did, and I had announced it while I was up here. For those of you who aren't familiar with Bill C-11, and certainly people that are watching from other countries, and we are being watched by people in other countries: We have in Canada what's called the *Broadcasting Act*, which creates this Broadcasting Commission which has powers to basically control content. This has been around for a long time, and

we've been told for a long time that one of the prime drivers—and the purpose has changed over the years as our social values have changed, but—[is] to promote Canadian content.

Here we are, this little nation of 36 million people beside the United States which generates Hollywood, and all of that generates all this culture that's exported worldwide. And there was a concern—well, let's promote Canadian culture—but that's evolved to other things. I spoke yesterday about how dangerous it is to give the police and government powers.

What Bill C-11 does, is it brings into the control of the Commission online content. So here we've had the internet in theory, free of censorship. We all know that's not the case, and it's come out in the United States and the Twitter files—thank you Elon Musk for sharing the Twitter files with the world.

We've learned that actually in the United States, government agencies, including the White House, had been sending instruction to social media platforms to censor voices that they disagreed with. So we, literally, have evidence of government censorship in the United States.

Now, I don't think that there is a Canadian alive today—that has two neurons that are still connected so they can fire between each other—that can honestly say they believe that there has not been extreme censorship in Canada. I'm not aware of evidence of the Canadian government sending instructions, or our spy agency, or other agencies collaborating with social media platforms. But it's certainly interesting that the same types of voices that were Canadian that were being censored in the United States were being censored in Canada and the NCI experiences it.

I think we're off TikTok again; it just keeps happening, I'm not sure, but we've been pulled off; we are routinely being pulled off YouTube. It's kind of funny that in the freedom movement, I don't think you're legitimate or you've arrived unless you're censored. And we laugh because it's funny, but isn't that something, that in Canada in 2023 we come from this British legal tradition that prized freedom of expression. I mean, it's in section two of our *Charter of Rights and Freedoms* which is part of our Constitution that has become non-relevant anymore, but it was also in our common law.

[00:15:00]

The courts used to protect freedom of expression, because we had learned historically that if people cannot share their voices, then tyranny follows.

Because we believe what we believe, because we have accepted information that we've heard. And if we can't hear new information and different information, we can't change our mind. And understand that changing your mind is actually something that physically happens. So the term "changing your mind" is a very important and accurate term. We've all been in this situation, like maybe we're mad at somebody because they did something and we're mad we've invested a lot of energy in it, and then we learn that actually they didn't do it. And all of a sudden we're not mad, and we actually change our mind, we will change how we feel. And your neurons, your brain actually gets rewired, it actually gets changed.

I think that one of our fundamental freedoms, what it means for us to be humans, for us to become better and improve, and to learn more, and to become wise, is we get to change our minds. Surely, we don't believe the same things we believed when we're children, and are

we going to believe different things in 10 years or 20 years? That's what wisdom is: the changing of your mind as you experience more.

But censorship halts that. If the government has a near-total control on information and just gives one side, one narrative, and other viewpoints or opinions are censored: first of all, you're going to believe the information. You won't have a choice at first because we just tend to accept information, and then we have to be critical about it later. But how can we be critical about it later if we don't have information that's critical, so that we find ourselves in a situation where we can change our mind. And changing our mind to something that happens consciously.

This is a war for our minds, and if we don't have access to a wide range of information then basically, we become slaves to the government that controls the information. And that's why police states control information, and that's why police states censor, and that's why it used to be—past tense—that countries that we would call liberal Western democracies would privilege free speech. And that's why we based our laws on the second commandment which privileges free speech. Because if we are to treat others as we want to be treated, we don't want others saying, "no you can't speak; you can't share your opinion." Could you imagine living in a world where you can't share your opinion? Oh, wait a minute; we're in there.

The government now has the ability to control the internet and the internet is the only place that we can get our voice out, and it's the only place that you can get your voice out. Unless we start, you out there start, becoming creative and holding events and doing other things like you're starting to do, and it does this kind of in an Orwellian way.

This morning I pulled up Bill C-11 to kind of look at some of the sections, and remember it's always about your safety; there's always a good reason to take away our freedom, and in here it's our freedom to hear dissenting opinions. On its face it looks like it doesn't do that. It says things like section 4.1: it starts by saying it doesn't apply to just people posting online—doesn't apply. But then we read on, and you combine section 4.1 and 4.2, and except that they can "prescribe." So they can pass a regulation saying, "Yes, but it applies even though generally it doesn't apply to just people posting stuff online. We can pass regulations saying, 'Well, you know, but this, this, this, this, it does apply too.'"

Now they say that they're only supposed to pass these regulations in a manner consistent with freedom of expression.

[00:20:00]

This becomes Orwellian because wait a second: We're going to give bureaucrats the ability to censor our voices in a manner consistent with freedom of expression. Do you do you see how absolutely Orwellian that is?

I want you to understand the term "Orwellian" and if there's anyone out there and actually there's a lot who have not read George Orwell's book *1984*, which I think was written in 1949. You have to read it, and then first of all ask yourself, How did this guy write this book in 1949 trying to describe what things would be like in 1984? Because you are going to be spooked at how accurate it is. And one of the things, and it's written in a novel format; so it's an entertaining read in any event. It's a must-read.

But one of the things he talks about is this control of language. It's called "newspeak,"

where basically they're changing the definition of words because actually words are just concepts of meaning. If, let's say, a culture doesn't have a concept— Like there's cultures that don't have the concept of snow, because if you're a Polynesian tribe on an isolated island in the South Pacific you don't have a word for snow. But if you are Inuit, you have a whole number of words for snow. Some cultures didn't have the concept "zero."

Language matters; if we can get rid of words, we actually get rid of concepts, and then our minds and our belief systems get narrowed. And in this book, it speaks of newspeak; on how they're changing, the "Ministry of Truth" is changing language in an effort to control the population.

I read that book when I was a young university student doing my first degree, and it never dawned on me that I would ever see language being changed around us, but we're seeing it. We're seeing new definitions. We're seeing educational institutions banning certain words because they're racist or colonial, or like—this counterculture is a deliberate move. It's funny how, you know, in the name of inclusion, in the name of diversity, we have never hurt inclusion or diversity more; you see, it's newspeak. It doesn't mean what it pretends to mean.

And if you were to read Aldous Huxley's *Brave New World*, which was also written long ago about how society would be—you know, the parts and memes about open sexuality—and start comparing it to what's happening in our culture. And you see these two gentlemen, Orwell and Huxley, knew that there would be attack on the very foundations of our culture, which includes our sexual mores and values, and the family. Again, you have to ask yourself: how could they be so tremendously accurate?

But going back to Bill C-11, so bureaucrats now, the Commission—so we're back to bureaucrats—are going to have the right to pass regulations or to prescribe what areas they can regulate of our online speech. And so there'll be broad areas and then— These will be regulations passed in the regular format, so they'll be gazetted in the Canada Gazette twice and then they'll become law. And then some bureaucrat's going to make a decision that will be censoring because it's the whole purpose. You're prescribing areas of speech that they have the right to control.

And then we're right to where John Rath was talking about. So we have a bureaucrat that will censor speech. It's a bureaucratic decision made by a commission with expertise in these areas and if you were to appeal it, it will be on the basis of reasonableness, and you will have the onus of trying to prove it. And almost none of us have the resources legally to go against the government; because our system is deliberately designed to be expensive, so that the citizen can't have rule of law and can't be treated equally, it's all by design.

So it's not a mistake.

[00:25:00]

And then the court will give deference to the commission that has expertise and that is how our voices are silenced, and so this is why Bill C-11 is dangerous because it basically is allowing bureaucrats to now tell us what speech is permissible and what speech isn't.

I think we have to think about what Regina told us yesterday. The lady that was part of the Solidarity movement in Poland, who was sentenced by a naval court to three and a half years of imprisonment for handing out pamphlets that contained information that went against the government narrative. So basically, she was in prison for doing what we're

doing here. We're allowing people to take the stand and give information that is inconsistent with the government narrative, and that is where censorship leads: is with witnesses that we're calling, with the people putting this on putting their lives on the line, being in prison. That's where we're going as a nation.

And she said yesterday, and she was quite adamant, she said, "You must act," and that "the time is now." So turn off the TV, get off the couch, and get going. And we cannot wait. We cannot wait because the government will not stop.

And the question is: Have you had enough? Have you had enough? Are you finally going to decide to stand up? And her point is, "while you still can." Because that cage door is almost shut and then you can stand up all you want and you can rage in your cage. But there's nothing you can do; the time is short. And the government is coming for you because they never stop until you stand up and they can't push you any further.

I have at the bottom of emails that I sent out in my law firm a quote by Frederick Douglass. Now he's been dead for well over a hundred years, but Frederick Douglass was a slave. He spent most of his life as a slave, and then he finally got his freedom, and he became an author. He wrote what I'm going to read to you, but it is a fundamental truth, and this is a man that understood. He studied governments. He was motivated because he spent most of his life as a slave. And he said, "Find out what any people will quietly submit to."

So I'm just going to stop there. You find out what any people will quietly submit to. So how much is a people going to take before they finally stand up? That's what he's saying. So find out what any people will quietly submit to, and you have found the exact measure of injustice and wrong which will be imposed upon them.

Governments will push until you stand, so you actually have to. If you're going to decide what is acceptable for me, how much freedom do I want for my kids, you can't sit on your ass and watch the government take them away, which is what's happening and has been happening writ-large for the last three years. It's been going on longer than that, but I mean, it's all visible to us now.

It's an eternal truth. You have to stand up, and if you wait until you just can't take it anymore— One thing I didn't pull out of Regina on the stand is, she said, "You know at the beginning of the Solidarity movement there's just a few of us and we're in danger, and we're trying to get this out, and we're all afraid and there's just a few of us, and the masses weren't there to support us." And I said, "Well, what changed? When did the masses support you?" And she said, "When the bread ran out. When people got hungry." That was their line in the sand: when people got hungry. So if their economy hadn't deteriorated to the point where the bread ran out, she would be rotting in jail right now. We would have never heard of the Solidarity movement and the wall wouldn't have fallen. Because they weren't willing to get off their ass and stand for freedom,

[00:30:00]

and demand freedom, and demand an end of censorship, and demand a return to the second commandment, until they were hungry.

And you're not going to stand; most people have just been silent, even though they disagree because they don't want to lose anything. Well, you're going to lose it all, and then you're not going to be able to do anything. They want to put us in 15-minute cities, do you know what that is? You can walk a mile in 15 minutes. That's the average brisk walk, 15 minutes.

So they want to section our cities into 15-minute walks, so just think of circles that are, you know, where you could walk across the circle in 15 minutes. They want to then barricade the roads, so that we can't drive: all for climate change. And I live in St Albert, we've been selected as a 15-minute city; I believe Red Deer— I mean you can go into the World Economic Forum site and get a list of the 15-minute cities.

You know, what's my property value going to be worth once people figure that they can't drive their vehicle to my house? Is it going to be worth a dollar? Who's going to buy it that isn't in a 15-minute city? And why would you set up 15-minute cities and not allow us to go from point to point? Does the word "digital passport" mean something different to you now? This is coming, and it's an eternal truth that until we stand up, we are done.

I'm going to end by just sharing lessons my father taught me when I was a child. My father is an honest man to a fault, and he doesn't like bullies, and he has some wisdom. I had one older sibling that—for whatever reason, two years older—wasn't in the cool kid crowd. And you know how school kids are right? So you're not in the cool kid crowd. Then I show up at school and I'm not in the cool kid crowd, and there was a lot of bullying. And although it might sound offensive, what I'm going to share to you was actually the only way to solve the problem. My father's belief was: the only way to stop bullying is you got to fight back, and back then that meant physically fight.

I remember one day when my brother comes running into the back door and slams the door, and there's literally about 8 to 10 kids out there that had chased him home to beat him up, as a crowd. And my brother, he's home, he's thinking, "Phew, I'm safe," but my dad actually realized he wasn't safe because he had just run away from the bullies. So my dad drags my brother out there, and he goes like, "There's a whole crowd of you. Surely that's not fair, like you know 8 or 10 to 1. You pick one. Pick your biggest guy and that guy can fight Richard." And that's what happened. And then they didn't bully him again.

And there were times where I had to fight bigger people because they wanted to—you can only run so long. And dad said, "It doesn't matter that you're going to get beaten up. You plant a couple of good shots in the nose, and it's going to hurt them. They will never bully you again because they don't want it to get to a fight." And he was right.

You have to stand up, even if it hurts. And I'm sorry, that's just the way the world is. You have to stand up to bullies. And if you don't, they're just going to keep beating you up. So I just can't get over what Regina said to us yesterday. She pleaded with us, she came to Canada to be free. She pleaded with us to stand up. And the point she was making is, the time is short and your life depends on it. So I'm going to end there.

[00:34:20]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Shawn Buckley

We'll call our first witness. Chris, can you come and take the stand for us this morning? Just so those online know where I'm standing, I can hardly see the witness, you see a little tuft of hair there.

Chris, can you please state your full name for the record, spelling your first and last name.

Christopher Scott

Yeah, Christopher James Scott, C-H-R-I-S-T-O-P-H-E-R J-A-M-E-S S-C-O-T-T.

Shawn Buckley

And Chris, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Christopher Scott

I do.

Shawn Buckley

Now, as I understand it, you are the owner of the Whistle Stop Cafe.

Christopher Scott

That's correct.

Shawn Buckley

And what town is that in, and what's the population of this town?

Christopher Scott

The Whistle Stop Cafe is in Mirror, Alberta with a population of, last Census: 502. But I think we're about 520 now.

Shawn Buckley

Okay, hey, so it's growing.

Christopher Scott

Growing, like a weed.

Shawn Buckley

When COVID hit and the lockdowns started, my understanding is you had only owned this café for six months.

Christopher Scott

That's correct. I spent the previous close to 20 years in the energy industry as an oil field worker. And I decided that due to constant government interference in my industry, I was better off doing something like owning a restaurant where the government wouldn't abuse me as they had in the energy industry.

Shawn Buckley

And just so you guys know, there's some foreshadowing going on here. So tell us, did that work? Were you able to avoid bureaucratic interference in your business life?

Christopher Scott

No, as a matter of fact it put me on a collision course to meet the biggest bully I've ever faced.

Shawn Buckley

Okay, now my understanding is when they first locked us down and told businesses to close, like restaurants, that you actually did comply, and you did close the Whistle Stop Cafe.

Christopher Scott

I did. We complied with all the rules. I mean for the most part we went along to get along with the attitude that, you know, it's not going to be forever. We'll just get through it, and we'll just comply even though we knew it was wrong.

Shawn Buckley

Now, while locked down, while we had these restrictions, my understanding is that you started hearing stories in the community that mental health issues were on the rise. And you just made a personal decision that you should try and find something to do to help. And can you share with us what you did to try and kind of help the community that was suffering mentally because of the lockdowns and other conditions on us?

Christopher Scott

Of course. One of the blessings, and the curse, of being the hub of a community is that you hear a lot of stories and people share things with you. And one of the things that we heard very consistently was people were going stir-crazy, families were stuck without anything to do, like kids weren't doing sports, tensions were high, instances of domestic abuse were on the rise, mental health issues were on the rise, suicides were on the rise.

All of the things that don't generally take the spotlight because number one, it's uncomfortable to talk about or look at, and number two, it's just not prioritized in our society to deal with those things. But we're hearing them, and so I was thinking: well, how do we do something while following the rules—because nobody wants to get in trouble with the government, right—that will help people get out and do something with their family, have some sense of normalcy, and not get in trouble?

I don't know where the idea came from, but I ended up buying an inflatable drive-in movie screen and a projector—not much different than the one that's right there—and an FM transmitter. I set the inflatable movie screen on the roof of the Whistle Stop Cafe and then I invited everybody to come out, while following the rules. Like park six feet apart, and follow physical distancing, and wear the silly breathing barriers, and the whole nine yards. And we had hand sanitizer. We had enough hand sanitizer we could have run a Co-gen [Co-generation] plant on it.

And we offered free movies so that families could come out and do something. And the first night that we offered the movie, there was about five or six cars. I decided to do this five nights a week. We did a Monday, Wednesday, Friday, and Saturday. The second night there was 30 cars, and then the next week there was 100 cars.

[00:05:00]

And it became this tiny little bit of relief in this beautiful province of Alberta, where people could come and be kind of normal, and do something so that they could break the monotony of the mandates and restrictions. And it was all fine and dandy until we got on the radar of the bureaucracy. They actually shut us down because they didn't have a specific set of rules for that type of business.

Shawn Buckley

My understanding is eventually, after a large amount of bureaucratic effort, they came up with some rules and you were permitted to continue.

Christopher Scott

That's correct. We could offer drive-in movie services while following the rules, and people did. They were really good about that. I mean we had line-ups outside to come in and get popcorn. People were actually standing eight feet apart on their own without being asked, so it's not that people didn't want to follow the rules, they just wanted something to do. They did allow us, but one of the conditions was nobody was allowed to use the restrooms.

Shawn Buckley

Right, okay. Now, so you're complying, and how is that affecting your business economically?

Christopher Scott

Well, in a short period of time, just like most other businesses, it took me from a positive cash position to a negative and declining cash position.

Shawn Buckley

Okay, now you ended up opening on January 24th, 2021. And can you just share for us kind of what things were happening before then, that led you to open?

Christopher Scott

Sure. So as many people will likely remember— The election prior to this, we elected a government that we had a huge amount of faith in. And the premier, you know, we thought he was going to come and save us. It didn't turn out that way. In December, I watched him actually apologize to businesses for choosing which businesses were essential and which were not, basically choosing who lives and who dies in business. And they said they'd never do it again.

And I watched our premier say this, and I thought, yes, this is the guy that we elected. This is the guy that's going to get Alberta through this. And a few short days later, he returned to TV and said he was now locking us down again and closing businesses again. "But don't worry because this time it's only going to be 30 days (of a two weeks), and then we'll just get back to normal because we need to protect the healthcare system."

Now that phrase "protect the healthcare system," that struck me as odd right from the beginning, because as I looked around at all the healthy people around me, protecting the healthcare system seemed like a strange thing to ask for. If we wanted to protect people, we should be talking about protecting people's health. We should have been encouraging people to focus on their health, and make sure that they could handle sickness by focusing on their health.

But it was never about that. It was always about protecting the system. And I had a big problem with that. So the 30 days came and went. Deena Hinshaw, the Chief Medical Officer of Health, came on TV and she said, "Well, you know, we need another week. It's not quite working yet. We need you guys to stay closed for another week." And I was livid. I was livid, and I said to myself, when Jason Kenny shut us down again in December, that after this 30 days, I was going to protest this by opening.

Thirty days came and went. Another week came and went, and Deena Hinshaw returned to the airwaves. And she said, "Well, we can't let you open yet. And we really have no end in sight." And it was at that moment that I realized that number one, this was not about protecting people's health. This was not about keeping people safe. It was about control.

And if it had been about keeping people safe, the level of incompetence from our government to go on the air and say that they had no idea or no plan, that was not okay with me. At this point we had heard some devastating stories of what happened to people and their families; businesses were being lost; the damage was unbelievable. And so I decided that I was going to exercise my constitutionally protected Charter right to protest. And I opened my restaurant in protest of government policies that were not aligned with what our rights as Canadians are.

Shawn Buckley

And that happened on January 24th, 2021.

Christopher Scott

That's correct.

Shawn Buckley

So what happened after you opened in protest?

Christopher Scott

Well, I have got to say, being the only restaurant in Alberta open, you're very busy.

[00:10:00]

We had a lot of customers. We ran out of food consistently, but something else happened. I opened in protest partly because of what was going on around me and what was happening to other people. But to be perfectly honest, the motivations were more selfish because I was put in a position where it was either fight or flight. I was either going to lose my business or I was going to stand up and do something about it. And so I did that mostly for myself.

I protested mostly for myself. But as people started pouring into the café and they saw somebody standing up—they saw somebody protesting these mandates—they started sharing stories with me that completely changed the way I look at the world, the way I look at the government, and the way I looked at myself. I was forced into a position where I had to accept the fact that if we don't stand up and do something and be an example for other people that also need to stand up, nothing will be fixed. It'll never end. And so you know the authority, of course, tried to— They dropped the hammer of God on me.

Every agency in the province was on me: daily or every other: daily visit from the RCMP [Royal Canadian Mounted Police], and from environment to public health inspectors. Constant threats, constant intimidation: "Oh you're going to lose everything. We're going to take your business. We're going to take your food-handling permit. You're going to lose your liquor licence. You're probably going to lose your house."

As a matter of fact, the second time the Chief of Police, Sergeant Bruce Holliday— The second time he spoke to me, he came with the health inspector. And as the health inspector left Bruce and I, to go find some things to cite me on, which they didn't, Bruce leaned in close and he said to me, "You know, I admire you standing up for yourself, and I admire what you're trying to do, but you've already made your point. You should just close and follow the rules because you cannot win against the government."

Shawn Buckley

So I just want to make sure that I'm clear. This is the Chief of Police?

Christopher Scott

Yeah, Chief of Police.

Shawn Buckley

So it would be an RCMP officer?

Christopher Scott

Right.

Shawn Buckley

So the officer actually supports, ethically, what you're doing, but is communicating to you that as a citizen of Alberta, you don't have a chance of standing up against the government to basically have a right to protest.

Christopher Scott

That's right. And you know, the ironic thing is, he was right. A citizen cannot win against the government. I was put in a position where to fight the government, and to stand up for my rights—and after realizing what was happening, the rights of people around me—where the outlook is grim. I mean, you retain a lawyer in this province for something like this, and they want \$25,000 from you upfront, before they even do anything. It costs \$10,000 to prepare a piece of paper.

And somebody like me, there is not a snowball's chance in hell that I could stand up and do that on my own. But something amazing happened. A lady by the name of Sheila showed up at the Whistle Stop Cafe, and she's a reporter for *Rebel News*. And they had a program at the time called Fight the Fines, and they were crowdfunding so that people like me could actually stand up against the government.

So with their help, I went from a 100 per cent assured loss to, "We actually have a chance to do something now." Thousands of people, probably millions of people from all over Canada chipped in. And they stood up with people like me who were trying to stand up against the government. And all of a sudden that truth that Sergeant Bruce Holliday had said to me, that "you can't win against the government," that truth changed to "you can't win against the government, but 'we' can win against the government" if we stand together and start speaking some truth.

And we unify around the truth and move towards doing what's right; we can actually win against the government. Because that's the one thing that stands the test of time, is truth, and the truth is that what was done to us was wrong. The bureaucracy that did what they did to us did it in error, for whatever reason. It doesn't matter why they did it, but it was an incorrect path. And we're seeing that now.

I mean, we've heard testimony from everybody, from Lieutenant Colonel David Redman, who wrote the plan on how to deal with this, and watched it thrown out the window

[00:15:00]

in lieu of following Deena Hinshaw and Cabinet's advice. We heard from him. We've heard from people that have been devastated by this, to the point where they've lost family members to suicide because they couldn't see any hope in continuing on in this country.

In this free country with free healthcare, where if you have a mental health issue you should be able to phone a doctor and get some help before you fix it yourself by ending

your own life. But we lost those things because the bureaucrats failed to uphold our civil liberties, our rights and freedoms that are guaranteed to us under the Constitution. And now, as I hear people testifying at the NCI: these are stories that I've been hearing for two years. As people flooded into the café, it wasn't just a café and a gas station in a dusty little town, anymore. It became this place where people went to because it was a symbol of freedom and hope because somebody was doing something.

Shawn Buckley

Now, Chris, it's my understanding that not only people from Alberta came to the Whistle Stop Cafe because it was this signal of hope, it was this little beacon of light in the darkness, but actually people came from other provinces to the Whistle. Can you share with us that? Because that, I think it's important to understand, that just you taking a step created hope.

Christopher Scott

Yeah, we've had people from all over the country show up there. There were people driving 8-12 hours to come and have a burger at the Whistle Stop Cafe, because they believed in what we're doing. It wasn't what I was doing. This was a conscious decision that I made after speaking with my family, and my friends, and my staff.

It was never just me. If it was just me, I would have fallen flat on my face a week after it happened. This was a "we" thing. It was dozens of people, hundreds of people even, volunteering to help through the physical parts of it. And thousands and thousands of people helping with the financial part, it was never a "me." It's never going to be a "me." It's a "we" thing. And that's why I think it's so important that people pay attention to what's going on here.

Shawn Buckley

If I can focus, because I just think you're saying something here that is tremendously important. And before we move on— Because even just going back to you buying that inflatable drive-in screen and holding those drive-ins, you explained how maybe there were five cars the first time, and then more and more, and all of a sudden, it's an event. Because it gave people something to do. And it would have helped with mental health.

That was an example, Chris, of you doing something, just deciding to do something. Do you see? And I'm just making a point of this because you set an example of how you can make a difference. It's not just you, but other people could make a difference. If you just go, "Wait a second, we have a problem here, what can I do?" and you came up with this creative idea. And you pointed out *Rebel News* that had made this decision: we've got to have crowd-funding, so that people have an opportunity to stand together against the government.

Because, as you pointed out, it can't be done alone, and I think we're all very proud of *Rebel News* for doing that. But they made that decision to do that, and then you and your team made a decision: "No, we're going to protest because we have to," and you're giving us examples that I'm just emphasizing because small groups of people making decisions make a difference.

And I think there will be a lot of people participating in your testimony today that heard about the Whistle Stop Cafe, and it gave them a little glimmer of hope that somebody was standing up while the rest of us were all cowering in fear. And so I just wanted to

emphasize that you making the decision, because it's the point you're making now, isn't it, is just people making a decision can make a difference?

Christopher Scott

Yeah, and as much as it pains me to do so, I can steal a quote from Hillary Clinton, and say "We're stronger together," and I'm not talking about what she was talking about, when it comes to stuff like this. We are absolutely stronger together.

Shawn Buckley

Now, you said that the police officer told you one person can't stand against the government, and you've told us it's true, but we together can stand against the government. Can you share with us the efforts that the government went through and are still going through, because you're still facing proceedings?

[00:20:00]

So share with us basically all the steps that the Alberta government has taken to close a café in Mirror, Alberta, a town with a little over 500 people.

Christopher Scott

Well, as you mentioned, some of this stuff is currently before the court. So unfortunately, I have to decline to get into specifics. And that is out of respect for the proceedings that are still going on. But I will say in a more general statement that the government and bureaucracy: there is no limit to how far they will go to try and crush those who oppose them. I can say that I'm disappointed and, actually, I'm disgusted by some of the things that I've seen, some of the tools that have been used against me to try and get me to stop protesting.

Shawn Buckley

Now, do you mind if I go through some of them, just to kind of highlight for people? I know you don't want to go into details, but a lot of this is public. In addition to AHS [Alberta Health Services] visits and multiple tickets, how many tickets have you been— Or they weren't tickets, you were actually summonsed to court to face charges. How many times did that happen?

Christopher Scott

I lost count when I ran out of fingers and toes, but I think it was 23.

Shawn Buckley

Okay, so 23 separate summonses to attend at court. My understanding is that basically they got the liquor licensing authorities involved and pulled your liquor licence.

Christopher Scott

They did, yeah.

Shawn Buckley

They got Occupational Health and Safety involved to come and visit you.

Christopher Scott

Yes.

Shawn Buckley

They seized liquor.

Christopher Scott

Yeah.

Shawn Buckley

They went to the person that you had a contract [with] to allow you to even purchase the restaurant. So they went to a private person to try and get them to pull the café back from you.

Christopher Scott

They did.

Shawn Buckley

So they were trying to involve private sector people. They actually seized and chained the doors of the Whistle Stop Cafe to physically take it away from you.

Christopher Scott

Yes, they did.

Shawn Buckley

So that's just some of the things. That's not all, but just some of the things. They got an injunction against you. I think you can share with us the terms of the injunction and Jane and John Doe.

Christopher Scott

Oh, of course. So what's commonly known as the "Rook Order," was an injunction sought by Alberta Health Services against me, Glen Carritt, the previous owner of the Whistle Stop, and the Whistle Stop Corporation, in addition to John and Jane Doe in Alberta. And the Rook Order basically said that it was declared illegal to attend, organize, incite, or promote any illegal gatherings.

Shawn Buckley

Right. So because John and Jane Doe were included, that applied to every single resident of Alberta.

Christopher Scott

It did, yes. And that part of it was challenged in the courts. And it was challenged successfully, and that was removed. But the named individuals are still on there. Now, as a Canadian and as an Albertan I still believe in the Constitution. I believe in the Charter of Rights. I don't think it's perfect, but I think it was well intended, and as written, I think it should protect us.

And I stood on that, and I will always stand on the fact that my right to protest is literally my only recourse against government policy that I disagree with—aside from getting into politics and doing it myself. But that's my only recourse and that should never be taken away from me. So I engaged in a protest. As a matter of fact, I advertised it as the biggest protest Alberta has ever seen. It didn't turn out that way because the weather didn't cooperate, but there was a couple thousand people there. And I was arrested and incarcerated for exercising my Charter right to protest bad government policy.

Shawn Buckley

And my understanding is you spent three days in jail.

Christopher Scott

I spent three days in jail. I was subject to sanctions of \$30,000 in fines, 18-months-probation, a compelled speech portion where the courts ordered me to tell people what the government wanted them to hear before I spoke, and I wasn't allowed to leave the province of Alberta.

Shawn Buckley

So I want to make sure that people actually understand this compelled speech part of your sentence. When you were sentenced, in addition to \$30,000 and time served—and I understand you were also put on a year and a half of probation—but you were ordered to write text that the Court gave you publicly.

[00:25:00]

So you were to make a public statement and basically read what the Court told you to read. So not only did you not have freedom of speech but you were compelled to give a speech that the Court dictated to you.

Christopher Scott

That's correct.

Shawn Buckley

Now, going forward, and I understand, and you've made clear, that there's things you can't talk about because there's still legal proceedings, you're still facing other sanctions that aren't finished. But going forward, what could you leave us with as kind of lessons learned and what we need to do, to do this better going forward?

Christopher Scott

Well, I see there's 10 minutes and 30 seconds left, I don't think that's enough, but I'll do my best.

Shawn Buckley

Well, no, and I think you've learned watching yesterday, that our time limits are not hard and fast, and I know the commissioners are going to have questions for you also. But you do have some lessons to share with us, and you do have some thoughts.

Christopher Scott

Yes, I do.

Shawn Buckley

I'm inviting you to share them.

Christopher Scott

I'll try and be quick. So during this little adventure that I found myself on, it's become necessary for me to read a lot. You know, we tell each other in the schoolyard when we're kids—when somebody asks, "Oh, can I use that?" or whatever. And we say, "Well it's a free country, isn't it?" We're conditioned to believe that we have these rights and freedoms. We're conditioned to believe that our forefathers fought and died for our freedom so that we wouldn't have to. And during the course of this adventure, I've realized that that's a lie.

Our forefathers didn't fight and die for freedom so that we wouldn't have to. They fought and died for our freedoms so that we would have the opportunity to keep them, and that comes with a hefty responsibility. And I learned this as I went through some legislation that was being used to try and stop me from earning a living, from exercising my civil liberties, including the right to protest; I learned that there is legislation out there right now, and Jeffrey Rath talked about it yesterday. I think Lieutenant Colonel David Redman, he alluded to it a little bit in his testimony.

There is legislation out there right now that allows the bureaucrats to strip our rights and freedoms away without justifying that they need to do it. And that's exactly what happened to me. Bureaucrats decided that it was unsafe for me to pour coffee and serve hamburgers, in a café with a capacity of 40 people that was generally maybe 10 to 15 people in there. They told me that it was unsafe for me to earn a living, and they did that without ever proving or justifying in a court of law, or with any scientific evidence presented in our province where this legislation exists.

And they used that legislation to strip away my rights. Now you might think, "Okay, well, we need that, so that if there's something that's going to harm the people of Alberta, we can step in and deal with it quickly, and I would agree with that. But if you look into legislation like the *Public Health Act* of Alberta, that is a very, very dangerous piece of legislation. And I'll explain why, better after this. But that legislation says that, and I'm going to paraphrase here; this is the best I can remember, "In fulfilling her duties to protect the health of the people of Alberta, the CMOH [Chief Medical Officer of Health] may at any time, as long as it's in good faith, take any steps necessary to do so, including seizing property, personal or private."

That means if the CMOH, or anyone acting under her orders to promote the health and safety of the people in Alberta, if they think that your house needs to be seized and used as a vaccination clinic, they can do that under the law. And you have no recourse except for to pay a lawyer \$50 or a \$100,000 and go to court. And two, or three, or ten years down the road prove that they shouldn't have done it. That's what that legislation allows. The wording is very specific in public or private; your private property is not off-limits.

As a matter of fact, we saw that during the pandemic. We saw people reporting their neighbours for having their grandkids over for Christmas dinner, on private property. We saw police showing up at people's houses and issuing them tickets for having their friends over. I don't mean to sound crass, but this can go anywhere from having a church service in your house, the police will be involved in that because it applies to private or public, to having a swinger's party in your bedroom.

The government can literally shut you down for anything that you do in your kitchen, in your bedroom, in your church, in your restaurant, in your café. Even more dangerous than this, now we have a federal government— We have Theresa Tam, the top doctor for Canada,

[00:30:00]

alluding to the fact that climate change is one of the most serious risks to health.

Now, if climate change is a serious risk to health, and our health authority can take any steps necessary, any steps they think is reasonable, as Jeff Rath pointed out yesterday, in order to combat these things for our health, what does that tell you about what the federal government can do, going forward?

The federal government has said that, in their opinion, capitalism and liberties need to be dismantled for our health. And there's legislation that allows our provincial governments to do almost anything they want to us in the name of public health. Where does that put us as Canadians? There's another piece of legislation that can be used in the same manner, and Jeff talked about it yesterday. And that's the Civil Emergency Measures Act [*Emergency Management Act*], I think it's called.

Our government and our bureaucrats have unlimited power against us, and even worse than that, the judiciary that's supposed to protect us against these things has failed because that judiciary defers to those who are doing these things to us, as the experts, to justify their actions. The onus is on me to prove that my actions were justified in pouring a cup of coffee in my restaurant, and if I can't prove that, if I can't prove my innocence, I'll be fined into oblivion or maybe jailed.

Right now, we have four men who are jailed; they've been jailed for over 450 days. They haven't had a trial, they haven't had their day in court, they're innocent, and yet they sit in jail because they spoke against the government. They stood up for their rights. They're in jail because bureaucrats have decided that their civil liberties need to be removed to protect the bureaucracy. And this is the free country we live in, this is the free country of Canada, where Polish immigrants testify under oath and say that they're thinking of leaving this free country that they fled their home to—because they want freedom.

Well, I need to ask you folks, "Where are you going to flee to?" because I've thought about it. Where are we going to go as Canadians in the freest country on earth? Where are we going to go when our freedoms, and our liberties, and our rights get stripped away from us to the

point where we need to flee to live our lives as we choose? There is nowhere else to go, not one place on this planet. There might be places warmer where we can escape this for some time, but unfortunately these things catch up.

And Shawn, he asked how George Orwell knew in 1949 how these things would happen. How it could be so prophetic? These books that he wrote: *Animal Farm* where the animals looked in the window and they couldn't tell the difference anymore between the pigs and the humans. The bureaucracy, those who were standing up for them, became the bureaucracy they're fighting against. How did George Orwell know that?

George Orwell was a democratic socialist. He knew where that led. He also liked history. And the one thing I've learned—aside from we don't live in freedom, we're only free when the government says we are—the one thing I've learned is that history will repeat itself over, and over, and over again. And we are no more enlightened today than we were 5,000 years ago. We still are subject to the same things: greed, lust, gluttony, all those things. The same things have been used to control us for thousands of years.

And you know what the number one thing is? Fear. Number two is hunger. Civilizations all over the world have fallen to tyranny because of fear and hunger, and that's where we're at right now. I'm hungry for freedom. I'm hungry to live my life as I was intended, to exercise my God-given rights that no government gives me. And the only thing I fear is the apathy that I see in Canadians and the media—the apathy and the fear that prevents them from taking a stand and doing something to prevent the things that have happened in history from happening again.

And that brings up another point. We have to stop looking around and looking for someone to save us. Nobody is coming to save you. I'm not going to save you; Danielle Smith isn't going to save you. No politician's going to save you, the only person that's going to save you is you. So before you start condemning a politician,

[00:35:00]

or asking someone to do something for you, you need to look in the mirror and ask yourself what you're willing to do to protect your rights and freedoms. What you're willing to do to ensure that the lives that were lost to gain you the freedom that you have today, remains for your kids.

What are you willing to do? Are you willing to put \$10 in a jar? That's great! Are you willing to put your business on the line? Amazing! Are you willing to support those who are taking a stand so that they can continue to do it? Do it; do something; do anything! Because, as you heard yesterday from somebody who has lived it, there will come a day when you either look back and you say, "I wish I did something," or you look back and you celebrate the decision you made to do the work to ensure that the rights and freedoms that we're born with remain with us and remain with our kids.

It's not about a restaurant. It's not about coffee. It's not even about a passport to go in a restaurant and have lunch. It's about standing up for what humanity is supposed to be.

So we've got some pretty difficult choices, and I really hope that this Inquiry, I really hope that people pay attention to it, and they start to think about these things, because you know with what we hear of coming from the federal government right now, and knowing what legislation is there that can be used to accomplish what they want to do, I really think we're in the endgame.

Shawn Buckley

I think those are very apposite words that you're sharing with us. I'm going to ask the commissioners if they have any questions of you.

Commissioner Drysdale

Good morning.

Christopher Scott

Good morning.

Commissioner Drysdale

Can you tell me how you were treated by the mainstream media or the government media in Canada? Did you get a fair and balanced analysis of what you were doing?

Christopher Scott

Early on, I would say that it was more balanced and fair than I anticipated. But after a little while, I mean, they're like a pack of wild dogs, and they feed off each other. So I am a rebel and a scofflaw. This is sarcasm, by the way. I've been called a rebel and a scofflaw and an anti-vaxxer and an anti-masker. And the media has framed me as someone that just doesn't care about the rules. They've made the public believe that I wouldn't force people to provide papers to eat a hamburger, so obviously, I must allow rats in the kitchen.

Well, sorry, folks, but the only rats in Alberta are the ones that called the cops on their neighbours over Christmas. You know, there are some good folks in the media. There's a CTV news reporter that I actually would call a friend. And he's on side about a lot of this stuff. But unfortunately, speaking up and doing the right thing in those institutions is a death sentence for your career. So we can't count on them.

Commissioner Drysdale

How were you treated by the alternative media in Canada?

Christopher Scott

Better. Much better. Sheila Gunn Reid spent a week at the Whistle Stop Cafe sitting on the floor, doing the rest of her work in the corner while the police badgered people. And now looking back, I don't know if it was because of the fight, or the burgers. Because the burgers would be worth sitting on the floor for five days, but you know, I'm not even going to call them the alternative media, I'm just going to call them the new media. They have been very good at actually telling the truth of what people like me are doing, where no other media would.

Commissioner Drysdale

Mr. Buckley made an announcement this morning in his opening remarks about the passage of Bill C-11, which is the amendments to the *Broadcasting Act*. Do you have any comments about how those changes may affect your ability to access the new media, in your words?

Christopher Scott

Well, this is one of the things where time will tell. They say that they're not going to use this piece of legislation to silence media, but I don't believe it for one second. I mean, all you've got to do is turn on the radio and you hear the woke mob saying whatever they want, but you don't hear any conservative voices.

[00:40:00]

And it's not supposed to be that way. The legislation was supposed to protect Canadian content.

And I was taught that as a kid. I remember going through that part of class and learning about how Canada protects Canadian music and the CRTC [Canadian Radio-television and Telecommunications Commission] is so great, and all that kind of thing, right? I think it might prove to make it more difficult to access that online. But one thing people have to remember is online isn't the only thing we have. The one thing that we lost over the last three years is the ability to gather in peaceful assembly. We still have that ability.

And Bill C-11 may just mean that we have to do more things like hold more events, and have more backyard barbecues, and get rid of that silly idea that it's impolite to talk about politics or religion. You know, the two things that affect everything. Politics affects everything in our life from before we're born, to after we die. Every single step of the way is politics. Religion affects everything else in our eternal lives. The two most important things in our lives. And yet it's considered impolite to talk about it.

So if we break down that stigma and start peacefully assembling, and having conversations again, we have the ability to share ideas similar to what they did in Poland with the Solidarity movement. I mean, it was all in people's houses and backyards. As a matter of fact, my great, great grandfather was one of the men who burned his guns, and he wouldn't fight for the Czar. And he was sentenced to hard labour in Siberia, and he wasn't released until, I think, the Czar had a son: he was so happy he released all the prisoners, whatever.

Anyway, he came to Canada and his stand against tyranny didn't stop here. He was issuing birth certificates and legal documents to people that the government said were second-class citizens and couldn't have them back then, you know? And it wasn't the media that changed things. It was people's willingness to peacefully assemble and do what they had to do, and share ideas that moved them and got them the rights that they were looking for at the time. And that may well be where we have to go in the future. And the bright side of that is there are places like, oh, I don't know, a little out of the way café where we love to have conversations with people and share those ideas.

Commissioner Drysdale

You mentioned in your testimony that you were arrested and that you were detained for, I think it was three and a half days.

Christopher Scott

Right.

Commissioner Drysdale

Did they handcuff you when they arrested you?

Christopher Scott

Of course.

Commissioner Drysdale

Can you describe what your experience was when you were detained, were you in the Remand Centre? Were you in a lockup? Were you in general population?

Christopher Scott

No, they left me in the drunk tank for three days.

Commissioner Drysdale

Can you describe that room for me please?

Christopher Scott

Oh, it was horrible! Well, there is a silver lining, and I'll talk about that in a minute. The drunk tank is a concrete room with a concrete bed, a stainless-steel toilet, which is also the sink, which is also where you get your drinking water from. The lights are on 24 hours a day. It's not a pleasant place to be. But they gave me a book, and I hadn't read a book in about two years, so that was nice. And the concrete bed straightened out my back, and I felt better when I got out. So there was a silver lining there. And I suppose if we're going to go through those things, we have to be able to find the silver linings in every tribulation. I was surprised to be stuck in the drunk tank for that long, because generally they bring you there, and then they move you to remand, and you have a bed, and whatever. But yeah, it wasn't pleasant.

Commissioner Drysdale

Were you violent?

Christopher Scott

How so?

Commissioner Drysdale

I'm just asking, if you were in handcuffs, did they put you in handcuffs because you were at risk of being violent?

Christopher Scott

No, they put me in handcuffs because they were scared of what I would do with my hands. But I think maybe next time they should probably muzzle me because my words are a lot more dangerous than what my hands will do.

Commissioner Drysdale

My last question has to do with your community of 500 or 520 people. What was their general impression? Were they supportive? Were they unsupportive? Was there a mixture? What was the general consensus there in the community about what you were doing because you were bringing attention to this small rural community?

Christopher Scott

Well, it was mixed. In the beginning, you know, it was exciting for most people, I think. There were of course those who had completely succumbed to fear, and they saw me as a vector of disease that had to be avoided at all costs because of what they were being told. In the end, after the dust settled, I think the community is probably split 50:50. Half seem to be supportive and agree with the position I took, and half don't.

Probably the line there

[00:45:00]

is the same as it would be provincially or nationally. We're divided, right? We heard things like "this is a problem of the unvaccinated." Lieutenant Colonel David Redman, he mentioned yesterday that the leadership, in this province and in this country, they did things that they should never do. They used fear as a tactic, and that fear has caused the division that we're seeing in towns like mine, and in the province of Alberta, and across the nation.

Commissioner Drysdale

You know, sorry, that was going to be my last question, but you mentioned terms and attitudes toward you, which were quite hateful. What was the source of that? Why did people think that? Why were they, in your opinion? What was feeding that in people?

Christopher Scott

In my very humble opinion, because I'm not a psychiatrist, there's a lot of reasons why people would not like me. Number one: I'm not likable. Number two: during this whole thing, a lot of people stood up, and they supported me. As a matter of fact, they supported me to the point where they helped me purchase the restaurant to remove the mechanism Alberta Health Services was trying to use to force me to stop protesting. They helped me buy it, so that that person was out of the equation. Some people didn't like that. They see me getting something that they don't believe I deserve, and they hate me for it.

Other people legitimately believe the narrative, in that I should have just followed the rules and done everything and protected everybody, and forced people to take a jab they didn't want to eat a hamburger in my restaurant—which I wouldn't do, by the way. My restaurant was open by then, and we were serving food again. I got my licences back, and the government decided they were going to bring in that vax passport. I shut down my dining room, because I was under bail conditions that said I had to follow the public health orders, and I wouldn't do it. I would never ask somebody for their papers so that I could pour them a coffee.

So I had to shut down my restaurant for that. And, you know, there are people, they don't understand that. Some people saw that as an inconvenience. "Oh, Chris, why wouldn't you just allow me to show you my vax passport so I can have a coffee here?" And the answer is

because it's not right. "Why would you not follow this part of the rules? You can be open, just only serve this select group of elite people that did what the government want." Because it's not right.

I'm not going to put my ability or potential to earn money over my principles, like that. And people didn't understand that. And so you know, they hate me for it. As a matter of fact, my friend Kerry, over there, and I, of all the things that could have happened to a guy that owns the Whistle Stop Cafe, we got hit by a train. Can you believe that? We got hit by a train, and on social media, the outpouring of concern was amazing. People were legitimately concerned for us and asking all the time how we're doing.

But there were some people that said things like, "I was so happy when I heard that. It's such a shame that you two free-dumbers didn't die." And that hit me like a freight train. The idea that in this country, where we're supposed to be free to disagree on certain issues, and our leadership is supposed to foster good relations between us, right? They're not supposed to divide us with fear. That we've come to a point where one side actually wants the other side to die because they don't have the same opinions. And it's no different in my town.

Commissioner Drysdale

Thank you.

Commissioner Kaikkonen

You alluded to the cost of court and what it costs for an ordinary citizen to fight against these kinds of government abuses. And I believe that there's a lot of people in this country who believe the same thing, that they'd like to fight on principle through the court system, but it's just unattainable, or they will lose all their assets.

What would you suggest in terms of recommendations? And yes, I'm aware that you're still in court, but what recommendations could you make, just from your own perspective that might make court more accessible to ordinary Canadians when they feel that they've been abused by government authorities?

Christopher Scott

Short of finding an organization that will help you crowd-fund, I really don't have any ideas. I mean, even a lawyer will tell their clients not to fight on principle because it's costly, it rarely wins, and in the end, you lose everything, and you gain nothing.

[00:50:00]

So standing on principle oftentimes means that you end up with nothing. One of the things that I don't talk about too much, but I'll mention it now, is part of the decision-making process for me to engage in protest, to use my Charter right to protest.

One of the decision-making process parts was that I had to ask myself, what am I willing to lose? Because it's very likely that I'll lose everything fighting the government. I've watched it happen around me numerous times. We've all seen it. And if you don't make peace with the reality that you will very likely lose the things that you find that you hold dear, like your property, for instance, you can't take on that kind of fight. So I had to very quickly have an internal conversation with myself and accept the fact that I would very likely lose the

things that I'd worked my life for. So short of doing that, and being okay with the negative outcome in that regard, and finding an organization that will help you with legal costs, there's really nothing else you can do that I'm aware of.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

Chris, there being no further questions, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing with us today.

[00:52:01]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 2: Dr. Misha Susoeff

Full Day 3 Timestamp: 02:12:52–02:52:37

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness is Dr. Misha Susoeff. Misha, can you state your full name for the record, spelling your first and last name?

Dr. Misha Susoeff

Yes, sir. It's Misha Mooq Susoeff, M-I-S-H-A S-U-S-O-E-F-F.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Misha Susoeff

Yes, sir, I do.

Shawn Buckley

Now, by profession, you are a dentist, and you've been practicing dentistry for the last 17 years.

Dr. Misha Susoeff

Yes. I'm a dentist, I'm an entrepreneur, I'm a father, and I'm a husband.

Shawn Buckley

Now, Misha, when we were having an interview earlier in the week, you brought up a kind of a different issue with informed consent, and I'm kind of excited about you to explain that. So can you explain the position you find yourself in, being legislated by the *Health Professions Act*, and then your thoughts on informed consent?

Dr. Misha Susoeff

Over the course of the last few weeks of following the National Citizens Inquiry, I think we've had a lot of good expert testimony regarding informed consent. But I'm finding myself— As a practitioner who lives in that world, I feel that I'm inhabiting a post-consent world. And I don't understand, as a practitioner, how I move forward from that. So as we've heard previously at the National Citizens Inquiry, consent is foundational. It's sacrosanct to the provision of any type of medical services. And in Alberta, we are the different health care professions legislated under the *Health Professions Act*. We are self-regulated, and we design our own regulations.

Now, every health profession in Alberta will have within their professional standards, guidelines surrounding consent. And consent is a multi-factorial, multi-layered concept, and if you remove one component of consent the entire pillar collapses. And what I've watched happen in my province, in my country, and frankly around the world, is that the concept of voluntary consent has been ignored. And voluntary consent is the concept that there can be no outside persuasion in the medical decision-making of any patient. So that means from their health care professional, their doctor, their chiropractor, their dentist, nor from a policeman, nor from a politician, nor from a hostess at a restaurant, and if at any point that the voluntary nature of that person's medical decision is violated, there is no consent. The consent is repudiated.

Shawn Buckley

Now, one thing that jumped out at me when we were having a conversation is: You said that you can't provide medical services to anyone if you think there's a third party in the decision. And it's the way you phrased it as "a third party in the decision" that I found so interesting. And I think that's what you're talking about: as a medical practitioner, if you think they're doing this because a spouse is forcing them so that they can travel, or an employer is forcing them just to keep in a job, that literally there's a third person in the room when you're trying to assess consent.

Dr. Misha Susoeff

Exactly. And at that moment when there's a third party involved making a decision for the patient, as a health care practitioner, you no longer have consent; it's been vitiated.

Shawn Buckley

I really appreciated that you brought a new term to the table. Because that is a different way of us thinking about it: that there's literally a third party in the room, and that that's something that healthcare practitioners need to be mindful of. Now, as this pandemic hit us, you were involved in doing some social posts. And I'm wondering if we can switch gears and have your thoughts— share with us kind of what happened with some social posts that you were involved with.

Dr. Misha Susoeff

Yes, sir.

[00:05:00]

I was watching in horror as the public discussion around mandatory vaccination was being tested in the media. And because of my background, a little bit, I was particularly sensitive

to this. So because of my familial history—my grandmother was raised in a residential school, and through other unrelated circumstances, I was raised on a First Nations reserve in interior British Columbia—and because of my familial history, and having had a front-row seat to the cruelty that Canadians were historically able to subject each other to, I saw what was coming as a really big error.

Now, this was at the time, if you'll recall, when we as a country were mourning the discovery of bodies at the residential school outside of Kamloops, and across the country the flags were at half-mast. So when I looked out the window of my office, I could see that we were currently mourning our last atrocity, and we were hurtling straight towards the next one. Now, to answer your question about social media, I made some public posts about this, and I tried to educate the people who followed me about— Canada holds a dubious distinction of being—before COVID—one of a few countries in the world who had an internal passport system. And by that I would mean like North Korea, for example, or East Germany, or Venezuela, where you have to show your papers to move.

Shawn Buckley

In fact, before you go on and explain who this applied to. My understanding is that before South Africa came out with their apartheid program, they came to Canada to see how we did it concerning this population, and I'll let you carry on.

Dr. Misha Susoeff

Yes, sir. Maybe a little-known fact: Canada, around 1880, instituted an internal passport system called the Indian Pass, which kept Native North Americans incarcerated upon their reserves. If they wanted to leave the reserve and trade, for example, they would have to beg a pass, a passport, to leave the reserve and move freely amongst the population. So I tried to bring this to the attention of people around me and I said, "Look this isn't the first time we've done this. And we're still mourning it now a hundred years later, and we're about to make the same mistake."

Now, it was around this time that we were starting to see some of the early physicians who had stood up publicly, some of them whom have testified at the Inquiry—Dr. Francis Christian comes to mind—who had asked a couple of simple questions and had been censored. Not just censored, but they had potentially lost their livelihoods because of it. And a lot of my social media following is employed within the medical community. And one thing that told me about the type of censorship that we were experiencing, what we're about to experience, is my social media post got zero traction: not one single "like," not anything. However, I got a lot of private messages. People who said, "Yes I totally agree with you," but were afraid to say it publicly. So already at that point the self-censorship within the medical community at large had begun.

Shawn Buckley

So and I just want to make sure people understand. So you're basically posting to draw the analogy of what we had done before with internal passports and the like.

Dr. Misha Susoeff

Yes, sir, internal passport version two.

Shawn Buckley

And people are afraid to like your post because they're afraid of being attacked. They'll tell you privately that they agree with you, but publicly they won't identify at all with what you're sharing.

Dr. Misha Susoeff

Exactly. And it was at that moment I realized that we were in big trouble.

[00:10:00]

Shawn Buckley

It's interesting. One of the things that came up in the Saskatoon hearings is we would have witness after witness speak against the current vaccine, but then volunteer that they're not anti-vax, and so it just seems that we're self-conditioned not to go against certain memes, and we have a fear to stand up. So I'll let you continue. I want you to talk about the economic harm that you experienced with the pandemic.

Dr. Misha Susoeff

As an entrepreneur, my wife and I run multiple businesses, and I feel almost guilty bringing this up. But the economic consequences for all of us were real. I'm blessed that we managed to skate through the pandemic response largely unscathed with our health, which is different than what a lot of the witnesses at NCI have attested to.

We did have a business that we had to close; it was no longer viable. The business was a seasonal business. It made most of its money over the Christmas season, and it was closed for two consecutive Christmases in a row, so that business was no longer viable. It had to be closed: the employees laid off.

Also, as an entrepreneur, we had deep roots within our community. And as Mr. Scott mentioned earlier, you didn't have to look too far across our borders to see jurisdictions that put value upon the individual sovereignties, or maintained the value of individual sovereignties, and their judicial systems were working for them. So we started to sell our assets in Canada, and we were looking across the border to find a different place to live.

Shawn Buckley

So you're actually so concerned with what was going on that you were selling assets with the view of potentially having to leave Canada.

Dr. Misha Susoeff

Yes, sir, sadly.

Shawn Buckley

Now, can you tell us about changes that you have seen in your dental practice after the vaccines were introduced?

Dr. Misha Susoeff

There have been many changes. I mean, frankly, dentistry was thought to be a very high-risk profession early in the pandemic. We were all very scared to go to work. We thought every patient interaction was going to lead us to hospitalization. So that was a challenging thing. As time went on, our sensitivity decreased, but we found that our patients were damaged. And I'm in an interesting position where I get to have 20 or 30 short social interactions a day. I get to know people. And I saw how badly damaged people were on both sides of the continuum. You know, regardless of how you felt about the pandemic response, there were people on both sides that were really being affected by it.

And I can think of, for example, some people—very lovely, intelligent, smart, high functioning people—who were so afraid to sit down in my chair. They'd come in covered with garbage bags and kitchen wash gloves, rubber gloves, sanitizing them with alcohol swabs, wearing an N95 mask over their nose and trying to hold their breath during a dental appointment. So the fear was palpable from those people. And it was sad to watch.

Shawn Buckley

Now, in the dental practice, there's some procedures that kind of go on for a while. So for example, if somebody was to get an implant, you've got to pull the tooth, wait for the bone to grow back, and then put in the implant and wait for it to set. And then put on the tooth that is going to sit on the implant.

So prior to vaccination, had you ever had a patient die mid-treatment? So you've got one of these types of treatments that is going to be stretched out over several months or a year.

Dr. Misha Susoeff

Prior to the pandemic, I don't recall that ever happening.

Shawn Buckley

Okay, now did that change after the vaccine rollout?

Dr. Misha Susoeff

Yes, sir, I would have patients disappear mid-treatment, not to return.

[00:15:00]

Shawn Buckley

Okay, and how often has that happened to you now?

Dr. Misha Susoeff

Sir, when we spoke on the phone the other night, I estimated three. Now, I'm hesitant to say this because I went into my database yesterday. My database isn't designed—you can't make any inferences from this statement—but in the past three years it's been 17.

Shawn Buckley

Seventeen.

Dr. Misha Susoeff

Yes, sir.

Shawn Buckley

So now you've been practising as a dentist for 17 years. Prior to the vaccine rollout there had never been a single patient that had died mid-treatment. And you've had 17 patients since the vaccine rollout.

Dr. Misha Susoeff

Yeah, exactly. To my recollection prior to the pandemic.

Shawn Buckley

Now, have you had patients who've— Basically, have you seen changes in their health conditions in a way that would be different than pre-vaccine?

Dr. Misha Susoeff

Yeah, and I'm going to corroborate the testimony of— We had a wonderful embalmer on. I think she was in Winnipeg. She described herself as the God's gift to embalming, so I thought she was really cute. And she testified how the people that she was seeing were not keeping up with their basic hygienic care of their bodies.

Shawn Buckley

And I think that was Laura Jeffries and she testified in Toronto. Just so if anyone wants to track down her evidence. It was Toronto. But I'm sorry to interrupt. You were sharing.

Dr. Misha Susoeff

Yeah, so it's difficult for me to attribute that to anything in particular other than the fact that the basics of these people's care for themselves was diminished. And then, also, a lot of people were absent for a long period of time; they just didn't come in and see us.

Shawn Buckley

Now, you are a medical practitioner, and as a dentist you have to know what's going on medically with your patients because some of the treatments of yours might be contraindicated. Were patients coming up with different diagnoses, and were any of them attributing causes?

Dr. Misha Susoeff

Yes, sir, and I'm going to contradict the testimony of Dr. Gregory Chan—I believe he was here on the first day of the Red Deer hearing—where he said that patients were hesitant to make a correlation between a vaccine injury and a new medical condition. So when I see a patient, every time I see a patient, we update their medical history. And I have been and still am, seeing patients with new medical issues. And it's surprising to me how readily, or how often, they will attribute it to their vaccination. And this is spontaneous. So they'll tell me, "Oh, yeah, well, I got a pacemaker after my second vaccination, and it was probably the

vaccine. But can you imagine how crazy those people are who don't get it?" So that was an interesting thing.

Shawn Buckley

Can you just say that again because that sounds almost unbelievable what you just explained? So you're saying that you actually had a person come in. They needed a pacemaker. They blamed it on the vaccine. So they recognized at least in their minds that it's a vaccine injury.

Dr. Misha Susoeff

They at least accepted the possibility.

Shawn Buckley

Right, and they're volunteering this, right?

Dr. Misha Susoeff

Yes, sir.

Shawn Buckley

And yet they they've made a comment how stupid people are who aren't vaccinated.

Dr. Misha Susoeff

It's unbelievable.

Shawn Buckley

But you are reporting to us that people are commonly telling you that their new medical conditions are associated with the vaccine. I am curious if people are more willing to do that now than perhaps a year ago. If you've seen kind of a change in attitude, or if that's been consistent throughout.

Dr. Misha Susoeff

In my recollection, I would say in my practice that was consistent throughout, and it just happened yesterday.

Shawn Buckley

Right.

So you've had basically—

[00:20:00]

You've observed staff members and family of staff members basically be negatively affected from the vaccine. What can you tell us about that, and we don't need to describe anything in any way that would identify people, but—

Dr. Misha Susoeff

Of course. Again, I'm hesitant to attribute any injuries to the vaccination. However, this is what people are telling me. I do have a very highly valued staff member, and her and her husband at the time, I believe, had a five-year-old daughter. And they were facing the same kind of pressures that we all faced, and they made a difficult decision as a family. So he was mandated through his work to become vaccinated, and she wanted to be able to continue to take her daughter to her dance lessons and it was very, very important. And they made a difficult decision as a family that they were going to go ahead with it, but they were going to mitigate their risk because they felt it was risky, and they didn't want to go ahead with it. So one of the couple took the Pfizer vaccine, one of the couple took the Moderna vaccine, just so there would be a parent left for the daughter, just in case something happened.

Shawn Buckley

And did anything happen?

Dr. Misha Susoeff

Yes, unfortunately, and again there's a temporal correlation—but I can't attribute this to vaccination—but the father almost immediately developed a fairly aggressive cancer and spent the rest of the year receiving treatment for that. And thank God, everything so far has turned out fine.

Shawn Buckley

And my understanding is that you've had a couple of other staff members develop medical conditions. Again, you can't attribute it, but one with diabetes and another with tinnitus.

Dr. Misha Susoeff

Yes, sir. And they both have their suspicions, or they will vocalize their suspicions that because of the temporal correlation that those injuries are due, or those new medical conditions, are due to vaccination.

Shawn Buckley

Before I open you up to questions by the commissioners, I wanted to ask you how you have been affected by this. How has this experience affected you personally?

Dr. Misha Susoeff

I'm really sad. I'm really angry; I don't recognize my profession, the medical profession. I think we've been let down. The concept of informed consent is beaten into our heads throughout our training. And I've spent maybe six years as a clinical professor, assistant clinical professor, at the University of Alberta, and I've trained students. And it's not optional. It's not an optional concept.

And I think we've really been abandoned by the medical profession. And as I saw the mandates— And don't get me wrong, I think that potentially, vaccination could have been a part of the mosaic of our response to COVID, not the only response, or else. But when I saw the concept of mandatory vaccination working its way through the media, I sat back smugly in my chair and I crossed my arms behind my head and I said that doctors will never let it happen. And they disappeared.

The first couple stuck their necks out and then their heads got chopped off. And I insist to this day that the streets of Ottawa should not have been packed with trucks, it should have been the Mercedes and the Escalades, and it should have been the doctors honking and waving flags. They should have been there to protect us. But I think what happened is those payments on those Mercedes and the Escalades were more important than standing up for the basic pillar of medical professionalism.

Shawn Buckley

I think you're sharing a really important point. And remember our last speaker, Scott. I mean, his point is: together we can do a lot. Remember, he said that one person can't stand up. And I wonder also—exactly as you said—a couple of doctors stood up, and to use your words, they had their heads chopped off. So basically, they got attacked in the media and their licences to practice taken away. But if all the doctors had stood up, what was the government going to do?

[00:25:00]

Fire all the doctors? Label all the doctors as misinformation spreaders? The thing that I think we forgot as a society is if we stand together, and we don't participate in the social shaming, if we stand together, we could do something, and you thought the doctors were going to stand up.

Dr. Misha Susoeff

I was convinced it couldn't happen, and I was floored, and I'm still floored that we've gone this far.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions.

Commissioner Kaikkonen

Good morning. Thank you for your testimony. You testified that dentists update their patients' medical records on every dental visit. So personal health records are current within your office. But would you also recommend that all healthcare stakeholders, for example, the ER physicians like Dr. Chin, do the same? Or do you see some issues emerging from extensive documentation by the bureaucrats within Alberta Health Services, for example, as we've also heard some negatives from testimony?

Dr. Misha Susoeff

So ma'am, let me see if I understand your question. Are you suggesting that the collection of personal medical information could be problematic?

Commissioner Kaikkonen

Just when it gets to the Alberta Health Services' online version. When they get to decide after the fact whether an adverse event reaction is valid, they look at somebody's personal records. So not from the perspective of you as a dentist, or from any doctor who's trying to stay current in a patient's medical history, but when it gets online and it's in the system.

And the bureaucrats, as you said before, get to make decisions as to whether that adverse event is valid or not based on what they see in the computer.

Dr. Misha Susoeff

In my opinion, the information should be collected solely for the provision of medical services for that individual, based on the relationship between the doctor and the patient. And I don't believe that information should be accessible by a bureaucracy—maybe if it were anonymized—but we are very heavily regulated as far as how we manage patient information.

It's even within our ethical guidelines for advertising. So say, for example, if my dental clinic makes an advertisement and somebody responds to it on a social media, I can't acknowledge that response because that would indicate that, yes, in fact, they are a patient of record in my office, which is unethical. I can't do that because that's disclosing some of their own personal information. So the maintenance of those records is very important and keeping them private.

Commissioner Kaikkonen

And my second question is about informed consent. I, personally, believe that everyone should complete the Tri-Council Research Ethics Certificate program online, if only to be informed. But do you believe, as a dentist, or just in your personal experiences with ordinary Canadians, that most hardworking Canadians either truly understand the tenets of informed consent, or how do we get them to learn?

Dr. Misha Susoeff

I don't know if it's up to the layperson to understand consent. It's up to the medical practitioners: our responsibility. We are proposing in many instances irreversible changes to a person's body. And you need their express permission. First of all, their understanding about what they're giving you permission to do, and like I mentioned earlier, that's a multi-factorial, multi-layered process. It's just not a one-time event.

Commissioner Kaikkonen

Thank you very much.

Dr. Misha Susoeff

Thank you.

Commissioner Drysdale

Good morning, Doctor. Thank you for your testimony. During your testimony, you talked about you had made certain social posts concerning vax passports and the passes that were issued to Aboriginal people in the earlier part of the century. My question is: Have you had any blowback? Have you had any issues with the professional association that governs your profession?

[00:30:00]

Dr. Misha Susoeff

No, sir. So far, I've managed to fly below the radar and God willing, I will continue to do so. Although this is my coming out, so to speak, publicly, and so it did take a lot of courage to sit in this chair today.

Commissioner Drysdale

You know, I'm a little confused with some things. I hear the term "guidelines." I hear the term "mandates." I hear the term "regulation." The term "law." Is informed consent, is a definition of that and the requirement for that, within the Act that governs dentistry?

Dr. Misha Susoeff

Yes sir. Within every health profession, within every self-regulated health profession, as legislated by *The Health Professions Act* in Alberta.

Commissioner Drysdale

But we hear a great deal of testimony from both patients and all kinds of doctors that that requirement has not been lived up to. And I'm wondering why I haven't seen any action by the professional organizations?

Dr. Misha Susoeff

Sir, the professional organizations are required by legislation, if they receive a patient complaint, to initiate an investigation into that event. And if there were to be justice done, I believe, in this country, everyone who sat down in that chair in front of their pharmacist, or their doctor, or their nurse, and said, "I'm here because of my work," or "I'm here because I want to travel," or "I'm here for any other reason," that consent was not obtained. And that individual who made that injection violated their professional standards. There should be a complaint made to the regulatory body of that profession. There should be millions of complaints made right now.

Commissioner Drysdale

We've heard from previous testimony, I think it was a pharmacist and I can't recall where, but they had sought out the insert, that's the informational booklet that would come along with a medication, for instance the vaccine. And that it was blank. Given that the inserts were blank, might that be a defence to a practitioner who didn't really give any information about side effects to a patient? Or is there a higher requirement for them to seek out that information independently?

Dr. Misha Susoeff

That's a complicated question. The products were approved for use on an emergency use authorization and I believe because of that fact the requirements for the package inserts were lessened. Now, that's something that, obviously, when a patient is making an informed decision that's probably something that they should know.

Commissioner Drysdale

Thank you.

Commissioner Massie

Thank you very much, Doctor, for your testimony. I was wondering: Given the high risk of contamination in your profession, when you are seeing patients, you must have put in place some measures to minimize the risk of contamination. Did you track over the past three years the number of incidences where you could have had contamination during the practice in your business?

Dr. Misha Susoeff

Well, every day. So we treat people with universal precautions. So, for example, we don't turn away a patient who has HIV [Human Immunodeficiency Virus] or hepatitis. We treat everyone the same way. When the pandemic began, I mentioned that dentistry was thought to be the highest risk profession because we're bathed in oral aerosols all day long. Our regulatory bodies did put in place enhanced personal protection. So we donned disposable gowns, face visors, N95 masks. At the beginning of the pandemic, obviously, the PPE [Personal Protective Equipment] was hard to come by. So we were reusing masks. I had a couple of N95s that I just luckily happened to have in my garage, and we reused those masks for weeks at a time.

[00:35:00]

I read just recently in a publication from my regulatory body that as far as we know, however, there have been no documented cases of COVID transmission between patient and dental staff in Alberta. So the protection that we used was effective. And I was watching carefully as the pandemic progressed, within my office, and as far as I know there was not a single case of transmission not only between staff and patient, but between staff and staff.

So all of my staff got sick eventually, but we could always trace the infection from a daycare, for example. So I had lost my staff one at a time. I thought that if I had someone get sick, bring it into the office, that we'd all be out. It didn't happen that way. It happened gradually over the course of a year.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Something in your answer to Dr. Massie caused me to want to ask you this question, and that is: I believe you said that in your practice, regularly you treat all patients, whether they have HIV infection, whether they had any other kind of infectious condition, you treated them, and you took precautions for that.

Dr. Misha Susoeff

Yes, sir.

Commissioner Drysdale

But we heard a great deal of evidence that in the medical profession, as a matter of fact, I think we had evidence here in Red Deer, that someone was denied a lung transplant, a life and death operation, because they didn't have a vaccine. How do we square that you can provide dental care to patients that may be vaccinated or unvaccinated, or might have HIV

infection and you still provide that service, but on the other side of that medical profession, we have testimony that says that they were being denied service?

Dr. Misha Susoeff

I'm aware of that case and I'm not sure how somebody in a healing profession can rationalize that decision other than it being political.

Commissioner Drysdale

Thank you.

Shawn Buckley

Misha, before I thank you, I just think that it's appropriate to expand on something you had said.

So when you were explaining to us in your testimony that First Nations people needed, literally, a passport, they needed permission to leave the reserve, you spoke about when that started. But I think it's important for people to understand how recent it is that it ended. I recall I was at a gathering on the Poundmaker Reserve some years ago and listening to elders speak about how you had to get, yes, your written papers from the Indian agent, even if you wanted to go to the adjacent reserve to visit a relative. So you literally were prisoners in your reserve, and you had to get written permission to be able to leave. And that did not end until Prime Minister Diefenbaker brought in the [*Canadian*] *Bill of Rights*, and I forget now when that was, I think it was 1956 or something like that, which is very recent [The *Canadian Bill of Rights* received Royal Assent on August 10, 1960].

So you can still find First Nations elders who can explain to you that they were prisoners for most of their lives on the reserve and had to get written permission to leave, much like when they bring in the 15-minute cities, we will need to get permission to leave. So this is a recent part of Canada. When you're saying to yourself, well, it can't happen here, what do you mean? We've had it already. It's actually been a short period of time where it hasn't happened here.

So on behalf of the National Citizens Inquiry, we so thank you for coming and sharing your testimony and giving us actually a couple of new things to think about that haven't been presented.

Dr. Misha Susoeff

Thank you.

[00:39:45]

Final Review and Approval: Anna Cairns, August 30, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Red Deer, AB

Day 3

April 28, 2023

EVIDENCE

Witness 3: James Coates

Full Day 3 Timestamp: 03:03:58–03:56:25

Source URL: <https://rumble.com/v2kxc9w-national-citizens-inquiry-red-deer-day-3.html>

[00:00:00]

Wayne Lenhardt

Good morning, Pastor Coates. Can you hear me?

I see your lips moving, but I can't hear any sound.

James Coates

Okay.

Wayne Lenhardt

There.

James Coates

I'm not sure how to mitigate that.

Wayne Lenhardt

I think we have you. We've got sound now. Okay, could you give us your full name, and then spell it for us, and then I'll do an oath with you.

James Coates

Yes, my name is James Coates, J-A-M-E-S C-O-A-T-E-S.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

James Coates

Of course.

Wayne Lenhardt

Okay, just for our audience who may not be aware, I do recall that at one point you were interviewed by Tucker Carlson on his show, and you've had a certain amount of publicity, so I think I'll just turn you loose. Let's start in March of 2020 and start telling your story, and I will intervene if I think of something relevant.

James Coates

Yeah, sure, and just a word of correction: it was actually my wife that was on Tucker Carlson. So I was in prison at the time, and she was on Tucker's show and interviewed by him. And we think that may have been instrumental in my release, but I can put that aside for a moment.

So when the pandemic began, like everyone, we didn't know the full extent of the severity of the virus. And we were in the same place everybody else was as far as the information that was being given and trying to, you know, anticipate the severity of this thing. So when churches were ordered to close, shut down, limit gatherings, we opted to comply. We did that reluctantly, but we complied with nearly all of the guidelines that were in place for services. So we went to live stream. We were limiting to the capacity number that was given. We were, for the most part, reasonably socially distanced and all of that.

So we were largely in compliance, and during that time, during that first public health emergency, we were gathering data. All of us in the leadership were assessing the severity of the virus, evaluating the government's handling of the pandemic and the lockdowns, and the effects of them. So when the premier at the time, Premier Kenney, announced the end of the public health emergency in June of 2020, we were at that point in time prepared to open our doors and let our people decide whether or not they were going to return to normal, in-service gatherings. So we did that, and our people to some degree came back—not everyone—and our doors were open at that point in time. There were still guidelines in place; because the emergency had lapsed there was really no teeth in the legislation to penalize us for that.

And for the most part we were smooth sailing, as far as our services were concerned. We had a couple of cases of individuals coming to our gatherings—who were mildly symptomatic and then subsequently tested positive for COVID-19—and then did our own, internal contact tracing to see to what extent there was spread. And we had no evidence of any spread in our gathering, in either case. And we opted for two Sundays. During that time that we had opened up, we decided to go just to live stream for two Sundays, just to make sure that we weren't in some sort of ongoing spread of the virus. And again, this was still pretty early, so we're back in the summer of 2020.

But after those two Sundays, we had determined there was no ongoing spread of the virus, and so we reopened again. And that would have been in July, as I recall—July 2020—and we were open all the way until we ultimately were locked out of our facility in April of 2021.

Now, when things really kind of got dicey was in the second declared health emergency that was announced in November. At that particular point, our gatherings were getting some scrutiny from the community around us. Complaints were being made to AHS

[Alberta Health Services]; AHS was then contacting us. And we knew, come Sunday, December 13th, 2020, that AHS would be coming to our facility, and we were anticipating that. It turned out that they came that day with the RCMP [Royal Canadian Mounted Police]. We were trying to be, just, very transparent with our people, to give them as much information as possible

[00:05:00]

to be able to navigate the very awkward circumstances that we were finding ourselves in. And so we sent an email ahead of December 13th and let our people know what they could expect. I found out later that that email was leaked to AHS, and so that's why AHS brought the RCMP to ensure they'd get entry into our facility.

So on December 13th, 2020, we had AHS and the RCMP in our services, standing on our balcony as we began our services. And we actually honour the RCMP; we actually believe that law enforcement is really important and realize that law enforcement officers are, you know, scrutinized pretty negatively—and especially with what was going on at that time in the U.S., south of the border of us. So we stood and gave a standing ovation to the RCMP, and honoured them and did that for multiple Sundays, in fact. And ultimately, we began our services, and they would kind of get the evidence that they needed and they would leave.

And so AHS, at that point in time, was driving the investigation. They came back on December 20th. I preached a sermon on that Sunday called, "The Time Has Come." In that sermon, I laid out a theological defense for why the church ought to be open. I also did get into some of the medical and legal aspects of the whole issue at play. And it was that sermon that really dialed things up because that sermon went viral. It made the six o'clock news on Monday, where they took an excerpt from that sermon, played it on live TV. And really, from my perspective, picked a phenomenal excerpt because the excerpt climaxes in the statement that Jesus Christ is Lord. And he is Lord! And so we were thrilled that they had selected that excerpt to use on the six o'clock news.
