Title: Inquiry into the Appropriateness and Efficacy of the COVID-19 Response in Canada
Publisher: National Citizens Inquiry

First Publishing: PDF, English, Canada, November 28, 2023
<https://nationalcitizensinquiry.ca/>

ISBN 978-1-7382185-6-1

National Citizens Inquiry, 2023. Inquiry Into the Appropriateness and Efficacy of the COVID-19 Response in Canada.

This title has three volumes:

Volume 1: Executive Summary

Volume 2: Analysis

Volume 3: Transcripts (Volume 3 is further broken out into sections by City.)

Commissioners: Kenneth R. Drysdale
 Heather DiGregorio
 Dr. Bernard Massie
 Janice Kaikkonen

Thank you to the thousands of volunteers across Canada who worked tirelessly to make the hearings possible.

11. Transcripts

11.1. Introduction

The inclusion of full transcripts of each of the witnesses as part of the official record is an essential component of the Commission's work. These transcripts serve to preserve the firsthand accounts, opinions, experiences, and perspectives of those directly impacted by or involved in the issues under investigation.

Process of Transcription: The transcription process involved the detailed recording of all verbal testimony given by the witnesses during the hearings. A team of volunteer transcribers, utilized both manual (human) or automated (AI-based) methods, as well as multi-levels of manual reviews to ensure accuracy and efficiency. Every word is documented in the transcript, preserving the tone and context of the testimony.

Quality Assurance: Transcripts are carefully reviewed for accuracy. This may involve listening to the recorded testimony multiple times and correcting any errors. In some cases, unclear or disputed sections may be annotated within the transcript.

Importance of Transcripts: The transcripts serve multiple purposes. They provide a permanent, verifiable record of the hearings. This is important for ensuring the transparency and accountability of the Commission's work. It also allows those who were not present at the hearings to access the information presented.

Furthermore, transcripts can serve as a valuable resource for future research, policy development, and historical record. They ensure that the experiences and voices of the witnesses are preserved for posterity, contributing to our collective understanding of the issues investigated by the commission.

In this way, the transcription process provides a meticulous, enduring account of the testimonies provided by the witnesses. It plays a vital role in preserving the evidence, upholding the integrity of the Commission's proceedings, and informing future generations.

11.2. Opening Statements

We are proud to present full transcripts of the opening statements made at each of the eight hearings held across Canada as part of this Commission's proceedings. While these statements are not direct testimonies from witnesses, they hold significant value and form an integral part of our understanding of the proceedings.

The opening statements set the tone for each hearing, encapsulating the mood, context, and undercurrents of the deliberations that followed. Delivered by key figures in the Commission, these remarks provide insights into the purpose, motivations, and aspirations of the Inquiry. They elucidate the themes that emerged in each hearing, illuminating the unique character and concerns of the various communities involved.

These transcripts offer an opportunity for readers to delve into the emotions, reflections, and aspirations that framed each of the eight hearings. They capture the intensity, hope, and commitment that defined the opening moments of each session. Each opening statement is a call to attention and a pledge of dedication to the truth-seeking mandate of the Commission.

The Commissioners have underscored the importance of these opening statements as part of the official record. Their inclusion reflects our commitment to preserving a complete and nuanced account of the proceedings. It is our hope that these transcripts will serve not only as a historical record but also as a source of insight and understanding for future generations as they reflect on this pivotal period in our national journey.

With the availability of these opening statement transcripts, we invite you to immerse yourself in the spirit and resolve that catalyzed each hearing, deepening your understanding of the proceedings and the invaluable contributions made by all involved.

11.3. Witness Testimony

We are honoured to present to you the complete transcripts of the testimonies provided by both lay and expert witnesses during the hearings of this Commission. These accounts form the heart of our proceedings, encapsulating a wealth of experience, knowledge, and insight that has been crucial to our understanding of the issues at hand.

Lay witnesses—those individuals who have lived through the events under investigation—provide personal, firsthand accounts that breathe life into our understanding of these experiences. Their testimonies paint a vivid picture of the human impact of these events, revealing the deeply personal and often poignant realities that lay behind the facts and figures. These accounts provide an invaluable perspective that helps us appreciate the complexity and the human dimension of the issues we are exploring.

Expert witnesses, on the other hand, provide a different yet equally valuable perspective. Drawn from various fields such as healthcare, education, law, and social sciences, these individuals offer insights grounded in extensive study, research, and professional experience. Their testimonies help us to understand the broader context, uncover underlying mechanisms, and explore potential solutions.

Both types of testimonies—lay and expert—are integral to our investigation. Together, they offer a nuanced and multifaceted understanding of the subjects at hand. The dialogue between personal experience and professional expertise deepens our appreciation of the complexity of the issues under review, informing our deliberations and guiding our recommendations.

The transcripts of these testimonies, painstakingly prepared by our dedicated volunteer transcription team, offer an accurate, detailed, and enduring record of these proceedings. They ensure that the voices heard during the hearings continue to resonate, informing and inspiring future discussions and decisions.

As you explore these transcripts, we invite you to reflect on the diverse perspectives, experiences, and insights they represent. These are the voices that have shaped our work, and we hope they will also shape your understanding of the important issues that have been brought before this Commission.

11.4. About the Transcripts

Our transcription volunteer team was a dedicated group of individuals who committed their time and expertise to support the essential work of this Commission. Their collective mission was to ensure the accurate and comprehensive documentation of each witness's testimony, preserving their stories and contributing to a deeper understanding of the issues at hand.

This team was comprised of a diverse and skilled group, including both professional transcriptionists and individuals with strong listening and typing skills from various backgrounds. They were united by their shared dedication to accuracy, attention to detail, and respect for the content they handled.

Our volunteers understood the importance of their role in this process. They were committed to translating the spoken word into text with the utmost care, maintaining the tone and intent of the original statement, and ensuring that every voice was accurately represented.

Their work played a critical role in ensuring transparency, promoting accessibility, and preserving the historical record of these proceedings. Through their efforts, we maintained a thorough and lasting account of the testimonies presented to the Commission, contributing to our collective understanding and memory of these impactful events.

In recognition of their dedication and important contributions, we extend our deepest gratitude to our volunteer transcription team. Their unwavering commitment to this task reflected the spirit of service, civic engagement, and commitment to truth that was central to the work of our Commission.

Part 1 of 9: **Truro, Nova Scotia**

NATIONAL CITIZENS INQUIRY

EVIDENCE TRURO HEARINGS

**Truro, Nova Scotia, Canada
March 16 to 18, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 1

EVIDENCE

Opening Statements: Ches Crosbie and Commissioners

Full Day 1 Timestamp: 00:42:37–00:51:53

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

Thank you, everybody, for your patience during this little bit of delay. We had some technical things to work out. As you can see, we've got a fairly big array of equipment here and talented people working it. Apparently, the Wi-Fi was not quite as muscular as we might have hoped. That was one problem. But I think we've got the bugs worked out of it. And the reason we have all this, of course, is we want to reach a bigger audience than the people in this room.

I've been walking around and chatting with some of you, and I get a real sense of excitement and anticipation from the folks I talked to, that they want a process that is going to bring the truth out. And that's what the NCI—the National Citizens Inquiry—and the commissioners are here to deliver to the people of Canada. And that's the truth.

So this is the first of nine hearings that are going to be held across the country: the first one being here in Truro, National Citizens Inquiry. And they're each three-day hearings, and I want to welcome the commissioners. I want to welcome the witnesses, on-site guests, all those following the proceedings from home. My name is Ches Crosbie. I'm a long-time lawyer in Newfoundland and Labrador, and I focused on medical malpractice and class actions. I have a King's Council designation, and I was Leader of the Opposition in the House of Assembly in Newfoundland and Labrador. That's when I chose non-practicing status, so I'm not a practicing lawyer. This means I can't give legal advice or act as a barrister and solicitor in the courts. My position under the rules of this Commission is **Administrator**.

The Commission is consensual, it makes its own rules, and has no legal powers based in statute. It's based on the desire of Canadians for the truth. Now I'd ask commissioners, in light of this truth-seeking mission, to just say a few words about who they are and why it is they've chosen to devote such substantial volunteer time to the mission of this Commission of truth-seeking. Perhaps we could start on this side, Ken.

Commissioner Drysdale

Hi, I'm Ken Drysdale. I'm a professional engineer with 41 years of experience. I spent a lot of that time preparing forensic engineering reports for various technical issues, and so

that's kind of the background that I bring to this. On a more human side, I have six children, four grandchildren, two godchildren, and that's the reason I'm here.

Commissioner Kaikkonen

Good morning. My name is Janice Kaikkonen. I am here for all sorts of reasons like you. I really believe that the truth must prevail in all our discussions. I'm hoping for open discussion and debate to come back into this country and that our freedom of expression, or constitutional rights and freedoms, are honored once again as the bedrock of our foundation. I have seven children and seventeen grandchildren. I often have to think about how many there are. I work with vulnerable populations, the people who are most at risk, in my day-to-day. I'm an academic and I'm also a researcher. And most recently I was elected as a school board trustee in Ontario.

I live on a farm. I raise turkeys as well. So, I kind of have all the bases covered. And I'm here to hear you. I'm so thankful that there's so many of you who are willing to step up and to speak. I think it's very important. And we will do you justice and we're going to listen. Thank you.

Commissioner DiGregorio

Hi, my name is Heather DiGregorio. I am a lawyer from Calgary, Alberta. I've been practicing at a regional firm in Alberta for close to 20 years. My area of law has been tax, so a little bit different from what we're talking about here. I've appeared at all levels of court for tax:

[00:05:00]

the Tax Court of Canada, the Federal Court of Appeal, most recently at the Supreme Court of Canada.

But why I'm really here is, my wish is that we have an honest and open inquiry here with a group of people who are all committed to be open-minded and to hear from Canadians and really get to the bottom of what it is that we did as a country in our pandemic response, and what effect did it have on us. And we want to determine, was there anything we did that worked? What can we do different next time? And we're here to listen, we're here to learn, and we're going to come up with recommendations on how to deal with the next one that comes along. And that's why I'm here.

Commissioner Massie

[In French] Hello everyone. Hello everyone, I'm Bernard Massie. I'm a consultant in biotechnology. I retired as a scientist at the National Research Council, where I worked for 35 years in biotechnology with expertise in therapeutic antibody development and adenoviral-based vaccines. [In English] I'm going to translate that immediately. My name is Bernard Massie. I'm a retired independent consultant in biotechnology. I've been working at the NRC for 35 years, in the area—to simplify—of therapeutic antibody development and adenoviral-based vaccines.

So I'm bringing to the table, I would say, scientific expertise in therapeutic antibody development. And, as with the other members of the Commission, on a human level I was really—I would say—amiss with all the stories I was hearing from the scientific community and medical community, which to me didn't jive with my understanding of the science. And

I wanted to go to the bottom of it. So that's why I thought I could join the Inquiry and listen to people that can actually bring their perspective on what happened during this crisis of the pandemic.

I have five children, two grandchildren, and I'm really concerned world we're trying to build for them. And I'd like to see something different for the future. And I'm hoping that, with this inquiry, we're going to let truth emerge and we're going to try to find ways to do better next time.

Ches Crosbie

Thank you kindly, Commissioners. There's a fifth Commissioner, Christian Grebe, who has a very distinguished track record. She has a PhD in history. She knows a lot about war crimes and crimes against human rights. She's a practicing lawyer in Alberta, and she'll be able to say a bit more about herself when she appears at the next hearing.

Our rules provide for commissioners, in case of necessity, to not attend. But they have to either be present virtually, so that they can be taking in the evidence as it comes out, or they can review it later. It gives us that bit of extra flexibility.

Now, given the time thing that's gone on here, as much as I might like my own opening remarks, I'm going to suspend them for right now. I think we'll go straight into the evidence. I might get a chance to make these remarks anticipating the evidence that the commissioners should expect to hear sometime later in the proceedings.

Right now, I guess we should really go to our first witness. Are we okay with that? Are we ready to go?

Okay, let's go!

[00:09:27]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 1

March 16, 2023

EVIDENCE

Witness 1: Dr. Chris Milburn

Full Day 1 Timestamp: 00:52:05–01:36:03

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Chad Horton

Good morning, everyone. This certainly isn't about me, but just by way of very brief introduction: My name is Chad Horton, and I'm a partner at MacGillivray Injury and Insurance Law. And I'm here today and for the next couple of days to help facilitate this process and help these witnesses tell their stories.

Dr. Milburn?

Dr. Chris Milburn

Sitting in front of a lawyer is a place a doctor never wants to be.

Chad Horton

Here we go. Before we get into the details of your examination, can you kindly provide the Commission with an overview of your education, training, and experience?

Dr. Chris Milburn

Sure. So my name is Dr. Chris Milburn. I'm a native Nova Scotian. I graduated in 1999. I've been a full-time emerge. doc, been involved with family medicine. But also—importantly for the purposes of this—I've been quite involved with public health in several roles, both on several local committees, local initiatives over many years. I was a member and then head of the Canadian Medical Association Committee on Healthcare and Promotion, which is one of their core committees that deal with public health issues. I was a long-time member and then the chairman for the Doctors Nova Scotia Public Health Issues Committee. So I have a foot in public health and a foot in frontline medicine.

Chad Horton

Now, you may have somewhat answered this question already. But what are your primary areas of interest and involvement in medicine?

Dr. Chris Milburn

Emergency medicine and public health are probably at the very opposite poles. Public health deals with populations and big picture recommendations—what's best for this population. Emergency medicine is the most focused part of medicine; it's one patient, one problem, at one instant at a time. So I have a real interest in both of those, which are in a way polar opposites, but they really should connect.

Chad Horton

Okay, and what was your specific role in early 2020 at the beginning of the pandemic?

Dr. Chris Milburn

So when the pandemic began, from the public health point of view, I was still Chair of the Public Health Issues Committee for Doctors Nova Scotia. But I was also the Chief of Emergency Medicine for eastern Nova Scotia, the Eastern Zone of Nova Scotia Health Authority. So, I had a kind of a high-level oversight role on 13 different emergency rooms and urgent care centers from Antigonish right up to the tip of northern Cape Breton.

Chad Horton

Can you explain your professional responsibilities as the Emergency Room Chief of the Eastern Zone?

Dr. Chris Milburn

Yeah, so I was responsible for making sure that we had a coherent approach to providing emergency care for that zone. You can imagine that was kind of a broad role. And so when COVID hit, my role was to take all these new policies and procedures and to make sure that our staff at all the different sites was aware of what the approach was going to be—what was the safest and best approach to see a patient who might be infected with COVID. So I was really kind of taking the policies and procedures that were being developed at a high level and trying to get our staff on the front lines up to speed.

Chad Horton

Okay. So setting aside your duties as Chief of Emergency, but within your role as an emergency room physician—and I appreciate this number likely varies, but on average—how many patients could you expect to treat in the run of a regular week?

Dr. Chris Milburn

Yeah, so to some degree my schedule is flexible but in a full week where I might do, say, five shifts I could see up to 150 patients a week. So I was more or less functioning as a full-time emerge. doc and doing the chief job sort of in my spare time, we'll say.

Chad Horton

That sounds busy.

Dr. Chris Milburn

Yeah, never bored.

Chad Horton

So, can you confirm for the record, Dr. Milburn, that you've actually provided me with a copy of your CV?

Dr. Chris Milburn

Yes, I have given you my CV [Exhibit TR-20].

Chad Horton

Okay, we'll make that available to the Commission.

So based on your education, training, experience, and any clinical literature that you had read or were familiar with,

[00:05:00]

what was your understanding of the danger posed to public health by COVID-19?

Dr. Chris Milburn

I'll try to give you a brief answer. So, when COVID first reared its spiky head in China, there was a lot of fear. I was one of the ones who was afraid because we have a very unstable and fractured emergency system already with a lot of worker shortages. So we were struggling to provide care. And when we kind of looked at, you know, first China and then Italy and then New York City, we were quite afraid of what might come. At first, we thought—we were given the idea that—there's an extremely high mortality rate and that, quote unquote, "everyone was at risk." That was actually a quote from our premier at one point. But very quickly, in the first month or two, the data started to come out. The average age of death was 80 or more than 80 in Italy. It became clear pretty quickly that it was very, what we call "risk-age stratified." And it turns out that for a young, healthy person, the risk is maybe somewhere around one 5,000th to one 10,000th of the risk for an elderly, unwell person. So, by the summer—certainly by June or July of 2020—that age stratification of risk was becoming apparent.

Chad Horton

Okay. Now, would you have been in a position in your role as an emergency doctor and Chief to personally observe the impact of both the COVID-19 illness and also the impact of COVID policy measures on Nova Scotians in your area of responsibility, being the Eastern Zone?

Dr. Chris Milburn

Yeah, for sure. So, we had sick COVID patients, mostly, almost entirely elderly or what we call comorbid, and that was an issue. But I believe, in my experience, it pales in comparison to the issues that I saw both as Chief, you know, second hand, but also just personally working as a frontline doc: the impact that things like hospital shutdowns had. For instance, I can rhyme off several patients who died of cancers that I believe they didn't need to die of because their care was delayed. I had patients who were scheduled for joint replacements who were living in chronic pain and suddenly saw the wait list stretch out over the horizon for them. I saw—I look after a nursing home for the last few years—and I saw those patients locked down. I saw patients in nursing homes give up, stop eating and

die because they were essentially prisoners and couldn't see family. You know, I watched family outside windows crying, looking at patients inside. So I saw these terrible impacts of COVID policy, and they were much more prevalent. They were a much bigger issue than the impacts of actual COVID.

Chad Horton

Can you just repeat your conclusion again, what you just said at the end?

Dr. Chris Milburn

Yeah, I think there's a lot of talk on the impacts of COVID. When we hear this in the mainstream news, or we hear politicians or bureaucrats talking about it, they talk about how COVID impacted us in the last few years. But although I did see some very, very elderly, very unwell people die after they got COVID, I didn't really see it shortening lifespans. But I saw major impacts on the population from COVID policy. So, I'd like to distinguish those. There's impacts of COVID policy, which I think were huge. There's impacts of COVID, which I think were relatively small if you parse them out.

Chad Horton

So you're talking about impacts of COVID policy, or you spoke about that partially. I want to explore that a little bit. Now, you described numerous observations you made over a period of time. During the relevant time that you were just discussing, did you look for answers regarding either the reasoning or the data supporting the policy decisions behind the scenarios that you've just described to us?

Dr. Chris Milburn

I did. So, as Chief of Emerge., nurses I work with and a handful of physicians

[00:10:00]

were concerned with policies. For instance, universal masking policy: Was that really necessary, was it justified? It was extremely uncomfortable for nurses, and these policies were made by somebody who sat behind their own desk in Halifax and never had to wear a mask. So, it was easy for them to make policy. When I asked for the justification, what I ended up getting back was either nothing in most cases, or when I did get back answers, the answer was, "Well, our committee met, and we decided." I was never provided with justification: "Here are the papers. Here are the minutes from the meetings." The committee that decided these things was in camera. We were not privy to what was happening. They'd never ask for our feedback on policies. They'd never ask for what we saw as the impact of those policies, how do you see this playing out, is this good or bad?

So, we did— And I say "we" because, as a group of doctors, behind the scenes, we sent several emails to Dr. Strang to ask for things like, for instance: What's the justification behind recommending vaccinating children? The recommendations in Nova Scotia seemed to actually go against the recommendations of NACI [National Advisory Committee on Immunization]. And we sent formal letters. I sent informal emails, and the best I ever got back was, "because our committee decided."

Chad Horton

So just one little point for the people watching at home or for members of the audience: When you say most of the meetings were in camera, what does that mean?

Dr. Chris Milburn

It means they were private; they involved politicians, the Health Minister, the Premier; they involved some hand-picked bureaucrats; but physicians like me were not asked to be part of it. We were not privy to the notes, we were not privy to the data that was used. Those were private, confidential meetings.

Chad Horton

And did you specifically ask for the notes or the minutes coming out of those meetings?

Dr. Chris Milburn

I specifically asked how those decisions were made. Could they please give me the justification? And again, I either got nothing or, "our committee decided, and that's why."

Chad Horton

Do you have any more specific recollection of what sort of responses you got to those inquiries?

Dr. Chris Milburn

No, not much recollection because the usual reply was none. Emails would go off and they would disappear into a black hole and I would never hear back; they were mostly ignored. And that includes recently too. I've still been asking, and they're still ignored and sucked into the black hole.

Chad Horton

The black hole. So, no response whatsoever?

Dr. Chris Milburn

No response was the most common response.

Chad Horton

And what was your perception about what was going on there?

Dr. Chris Milburn

Well, I think my perception is very much like most people who attempted to get answers. And the perception is that these decisions are— There's a saying, "when you mix politics with science you end up with politics." And these committees did have people like Dr. Strang and some upper-level doctor bureaucrats on them. But the decisions, I do not believe, were scientifically-based. I think they were politically-based and that's why we couldn't get an answer back. Because it was a political decision made for a certain appearance rather than, you know, following the science, so to speak.

Chad Horton

So myself as a Nova Scotian, who occasionally listens to the radio, I do have some first-hand awareness of the fact that you had been in the media and had some involvement. But can you briefly describe your media involvement over the years?

Dr. Chris Milburn

Yeah, I've always been an outspoken guy. I'm willing to say my views in public and to try to back them up. And so, for many years. I've done interviews on CBC Radio, including— I was asked to be part of this thing called the "Issue Panel" [Exhibit TR-20a], which is a regular feature of CBC *Information Morning* in Cape Breton, where they get three people on, they throw out an issue that's topical in the news. The three people debate it and argue it. It's kind of off-the-cuff. I had been on this for a number of years. I can't tell you exactly how many times, but every few months I get asked to be on. And the typical way that would happen was they'd ask me, could I be on next Thursday? And then a few days before—or just the day before—I get an email saying, "here's going to be the topics." Because of my schedule, I would typically look at that— This particular time that we're about to discuss, I looked at the email at midnight and I was to be on at 7:30. And I noticed that the topic was COVID policy.

And I kind of thought, "Well, this is bound to be controversial." But I felt—

[00:15:00]

By that time, I had tried to get answers from within the system. And I just felt that the public needed to know that there were physicians, nurses, other people out there who had an inside view on the system but didn't agree with the policies. Because there was, I believe, a real attempt to make it look like all the doctors were onside. And I decided to go ahead and speak my views. I made it clear that I was not speaking for NSH [Nova Scotia Health]. I was speaking as my own self, but I felt people needed to know there was another side to this and some doctors felt differently.

Chad Horton

I understand from your evidence that you were on the "Issue Panel" by invitation a number of times over a period of time. When is the last time you appeared on the issue panel?

Dr. Chris Milburn

So, yeah, this would be in June of 2021. The move to vaccinate every human being in Canada was well in full swing. And I was asked to be on. Like I say: I looked at the email the night before. The issues that came up that day were: Number one, the schools had just been put back in. They had been out for quite some time; they had just been put back in. I was asked what I thought of them going back in. And what I said was, I don't think they should ever have been out. I think there was clear evidence that was bad for kids to be out of school. Kids were not at risk from COVID, nor were they vectors. So I don't think they ever should have been out. So I kind of contradicted public health statements in that way.

Number two, I was asked what I thought of potential vaccine passports, because they were just kind of on the horizon at that point. I said, number one, I think they're unconstitutional. And I also made the point that these vaccines were brand new. And by definition, we did not know long-term side effects. That's not an opinion, that was just truth.

And the third thing I said that turned out to be controversial was that I thought the public health role should be advisory, not a rulemaking body, because they were unaccountable. And that when we gave them this much power, that some people enjoyed that amount of power. And history shows us that people who are given power only give it up reluctantly. I made those points. And that was the last time I was ever asked to be on the “Issue Panel.”

Chad Horton

And more specifically, when was that? What was the date?

Dr. Chris Milburn

Yeah, so I can kind of tell you how things played out. So, that was on a Thursday morning. I got numerous—

Chad Horton

What month was that?

Dr. Chris Milburn

I'm sorry, early June 2021.

I can't tell you exactly, but it was a Thursday morning. I got tons, actually tons, of supportive emails through the next couple of days. And then on Saturday, I got an email from friends saying, “Did you hear that Strang got ambushed at a press conference?” And I looked it up and saw the clip. And Tim Bousquet of the *Halifax Examiner* had ambushed Dr. Strang with questions. He said, “Did you hear that Milburn told people not to get vaccinated and basically said you were power hungry?” So it was a mischaracterization of what I said.

I've had, what would you say, very reasonable communication with Dr. Strang in the past. So I sent him an email basically saying, “Look, I saw that you were ambushed.” I didn't say it that way, “I'd love to talk to you, here's my cell number.” So I reached out. Later that day, saw his reply, which was: “Milburn should stick to emergency medicine, and I'll take care of public health.” And basically, accused me of not being qualified to speak because I wasn't an expert like him. So I didn't get a reply back from the email. So as I described it, I felt the icy winds blowing.

On the Tuesday morning, I got a call while I was at work from Dr. Don Bryan, head of the Eastern Zone: we had a long conversation. He explained to me that I had created vaccine hesitancy, that—as Head of Emerge.—it wasn't appropriate for me to ever criticize public health. That, you know, I had sort of undermined the NSHA [Nova Scotia Health Authority]. And I was told that I was no longer Head of Emerge. as of that point. I asked Dr. Bryan—the one thing I asked him, he and I have been colleagues for years—“I'm fine with all that. If that's your decision, I obviously can't argue it. But please put this all in a memo. What you've told me, please be public with it. I am going to be asked why I was fired. I would like you guys to state why I was fired, because you're the ones firing me.”

More than a week went by.

[00:20:00]

I think he probably went to the lawyers of the NSHA. And the statement that came out said, “Dr. Milburn is no longer head of Emerge., thanks very much for your service.” So, they never publicly said all of the things that Dr. Bryan told me in a 25-to-30-minute conversation, creating vaccine hesitancy, et cetera, et cetera. All the reasons I was fired, they would not put in writing.

Chad Horton

Do you have any awareness of any record of that conversation?

Dr. Chris Milburn

No. Like I say, I actually worked in the same office as Dr. Bryan. And part of my work— We had a great relationship for many years, so I trusted him. You know, looking back at it, I guess you should always record these things. Trust no one. But I kind of, really innocently thought that he would actually be honest and open and actually say what he’s told me publicly. And I was very wrong.

Chad Horton

I just want to unpack a little bit of what you said there. And what I’m hearing is that one of their concerns was that you were promoting vaccine hesitancy. Was anything communicated to you with respect to what specific statement you made that could be construed as promoting vaccine hesitancy?

Dr. Chris Milburn

Yes. One of the things people should note and might be surprised: I’m vaccinated myself. I got two: I got the first two vaccines because we were told at that time. As a frontline staff, I work with the most critically ill and comorbid and elderly people there are in our community there; I’m face-to-face with them on a regular basis. I was told that by being vaccinated, I would prevent or at least greatly lower my odds of passing it on. So I was vaccinated myself. So I’m a vaccinated anti-vaxxer. But in terms of promoting vaccine hesitancy, my great sin was in saying that this was a new vaccine and the side effects—especially the long-term side effects—were not well spelled out. So by definition, we couldn’t develop a risk-benefit ratio.

Because whenever I speak to a patient about getting any treatment, be it a vaccine or something else, I always talk about, “Here’s the benefits to you, here’s the risks to you.” The patient always makes the final decision. But I could say, based on this, I would recommend it or I wouldn’t. I didn’t have that information at that point. I couldn’t advise somebody this vaccine is more benefit than risk to you. I only got it myself. I didn’t know the risk-benefit ratio, but I was willing to take the chance because I thought it would prevent me from passing on to my patients. I did it as a safety thing for my patients.

I wouldn’t have recommended it to anyone else at that point with the dearth of evidence. But that was what I did. From Dr. Bryan’s point of view, I created vaccine hesitancy by daring to say that the vaccine might have side effects that we don’t know about.

Chad Horton

Now, I understand from the commencement of your testimony that you’ve been a practicing physician for more than 20 years. I understand from your testimony that you

have significant emergency room experience, and you also advise that you had involvement in public health—or at least a strong interest in public health.

Dr. Chris Milburn

Great interest for over 20 years, and involvement.

Chad Horton

Within the scope of your education, training, and experience, do you have any knowledge—or is there any perspective that you're aware of within the medical realm—that that statement that we do not have long-term safety data was incorrect?

Dr. Chris Milburn

It turns out it was very correct. The first data on myocarditis was coming out at that time, but it wasn't public. It turns out we've had—I believe it's over 80 cases in Nova Scotia alone. That's the government data, not mine. And if you look at the Nova Scotia government website, they've admitted to a host of other side effects, which were not apparent at that time and certainly not told to the patients at that time when they were choosing to be vaccinated or not. They were not told about these potential side effects. So I stand by my statement. It's just become more and more true over time.

Chad Horton

So was it your understanding at that time, to put it directly, that you were stating an objective fact?

Dr. Chris Milburn

Yeah, what I said—"we don't know long-term side effects"—was just a fact because that's just true with a new vaccine. It's not an opinion, it's not, "That's Milburn's take on it." That is just a fact, like the sky is blue.

Chad Horton

At any point during your career as an emergency physician or chief in Nova Scotia, did you ever sign any agreement or contract—or were you ever told—that there were restrictions

[00:25:00]

on the opinions you could express, either as a private citizen or within your capacity as a doctor?

Dr. Chris Milburn

No, absolutely not. I always labored under the impression that I had the same rights to free speech as anyone else in Canada. I was always extremely careful because I not only was on the "Issue Panel" but I got interviewed about other things on the radio or in the newspaper. I always made it—I always took great pains to say, "This is my personal opinion. I'm not speaking for the Health Authority." I made that very clear. So I never signed anything to say that I would agree to agree with all of my colleagues or agree to agree with Dr. Strang or not criticize my profession.

Matter of fact, I think it's essential that we physicians do. I was very critical of my profession during our complicity in the opioid crisis and thank God we were allowed to speak out and we've somewhat turned that around. It's just essential for docs to be able to speak out and we have— No, absolutely I never signed anything and was never told that I wasn't allowed to speak out.

Chad Horton

Okay. And from your earlier testimony, I understand that you had issued correspondence. Or I think, as you described it, you were seeking answers to the reasoning behind various policy decisions, correct?

Dr. Chris Milburn

Correct.

Chad Horton

Okay, and when you did that, did you express any of your personal concerns, whether in your capacity as a private citizen or as a medical professional? Did you express any concerns about the policies that were being implemented in Nova Scotia?

Dr. Chris Milburn

Yeah, absolutely. I had concerns like, say, that the masking policy really decreases job satisfaction. It makes retention difficult. The school closure policies were very destructive for children. I expressed these both to some degree publicly. But behind the scenes, I expressed these over and over—numerous concerns I had

Chad Horton

Okay, and was it your understanding that your termination was specifically related to the comments you made on the CBC program?

Dr. Chris Milburn

It absolutely was. Dr. Bryan made that very clear to me on the call. Matter of fact, I had had a very good performance review just several weeks before with Dr. Bryan and then I appeared on the radio. And I was told that because of what I said on the radio, I was being terminated.

Chad Horton

Okay, so prior to your termination: After you had expressed concerns internally and asked questions about policies, did anyone professionally ever approach you and suggest that those views were unacceptable, that you had unacceptable views?

Dr. Chris Milburn

Sorry, after I spoke out or before?

Chad Horton

Prior to your termination.

Dr. Chris Milburn

No, I was never, definitely. I understood that some doctors disagree with me, and some agree with me, but I was never told that I wasn't allowed to have those views or not allowed to express them, no.

Chad Horton

So was your first awareness that your expressions were problematic at that termination meeting?

Dr. Chris Milburn

Yes. But I will say that I'm far from innocent to these things. I knew the lay of the land. I had watched other doctors be dragged through the mud and walked over the hot coals because of speaking out with their views. So when I said those views, I knew they were potentially controversial and would potentially make some people angry at me.

Did I expect to be fired as Chief of ER? I did not. I didn't think it would go that far, even though I knew that it would ruffle some feathers.

Chad Horton

Now, you indicated previously—and we didn't explore this, but you indicated—that after your appearance on that particular CBC program in June of 2021, you had said that you had received supportive emails. Can you explain what you mean by that? Can you elaborate please?

Dr. Chris Milburn

Yeah. I was on the radio at 7:30 am and I started to get texts. And then by the time I first checked my email a couple hours later I had a couple of dozen emails in my inbox. Within a week I had, I would say, at least a couple of hundred emails of people supporting me. After I got fired and that came out, I know for a fact that the NSHA and Dr. Bryan specifically received a lot of angry emails sort of supporting me and supporting my right for free speech. So I know there was a lot of support on my side.

[00:30:00]

There were detractors too. A Twitter mob came after me and organized to launch a formal complaint about me. That was all very public on Twitter. So there were both sides but there was a lot of support.

Chad Horton

A formal complaint on the basis of what?

Dr. Chris Milburn

That's all— You can read about that on Twitter. For various reasons, I'm not allowed to talk about that, but you can see that playing out on Twitter.

Chad Horton

So after you were terminated as Chief of Emergency, do you know if and when that position has been filled?

Dr. Chris Milburn

Yeah, my understanding— It was a very busy job. Theoretically, I was paid as a 0.2 position, but it wasn't much more than that. So there's two people filling that role now, one for one part of the zone, one for the other.

Chad Horton

So am I understanding correctly that your responsibilities were delegated to two of your colleagues?

Dr. Chris Milburn

Correct.

Chad Horton

Not a new hire?

Dr. Chris Milburn

Not a new hire.

Chad Horton

And I believe you testified earlier this morning that in your capacity as an emergency room physician, you would treat—or you could expect to treat—approximately 150 patients per week?

Dr. Chris Milburn

That would be a big week. That would be sort of the maximum I'd see in a week. But yeah, the average week would be definitely over a hundred.

Chad Horton

Okay, average over a hundred. And where are you practising now, and in what capacity?

Dr. Chris Milburn

I am an old-fashioned rural family doctor now. I work in the small village of Canso in a tiny hospital there. And I do everything from palliative care, house calls, to I mind the ER and whatever comes in. I do family practice, and I take a mole off if you need it. So I'm an old-fashioned country doctor.

Chad Horton

I expect that the community appreciates you. So after leaving your previous role as an emergency room physician, wherein you would see between 100 and 150 patients per week, do you know if and when the vacancy that would have created has since been filled?

Dr. Chris Milburn

Well, Nova Scotia Health is constantly recruiting. Since I left that position, I have had colleagues retire; there's been new hires there. So the answer is they don't specifically advertise my one position and try to fill that one position. It doesn't work that way. We have sort of a stable of doctors. And when I stopped working in at the regional site as an Emerge. doc, it just meant that 12, 14 shifts per month were unfilled and the other docs had to step up and take more shifts on. So it made things busier for everyone else. That does affect the overall picture, because these are doctors who might have picked up shifts that would have been empty in a rural Emerge., but now they are doing more shifts in Sydney. So it does have an impact on the overall lay of the land in terms of staffing.

Chad Horton

Dr. Milburn, broadly speaking, what motivated you to come in and speak with us today as part of this process?

Dr. Chris Milburn

Yeah. There's a whole other side to COVID out there that has not been well-represented in the mainstream media, in discussions, in statements from our chief medical officers of health or our premiers. There's many, many Canadians who feel that these policies were overreach, probably unconstitutional in many ways, and that they were destructive and harmful. That side of the debate has not been well represented, and I just want to be a part of getting that message out there: that there is another side. I don't think I'm always right, maybe I'm wrong on some things, but we have to have the debate. You know, science is about debate and arguing. Einstein said science can only flourish in an atmosphere of free speech. So that's why I'm here.

[00:35:00]

Chad Horton

Final question. Based on what you just said, as you've gone through this process, are you aware of any like-minded physicians practicing in Nova Scotia who share the concerns that you expressed today?

Dr. Chris Milburn

There are many. There's a saying: punish one, silence a thousand. And there are a lot of doctors behind the scenes, a lot of doctors and nurses who would love to speak out. I know there's some doctors who wanted to testify here but are still uncomfortable to do so. Doctors and nurses were kind of held hostage because, if we lose our position, it impacts— We can't care for our patients. And when it comes right down to it, doctors and nurses want to care for their patients. So the threat of job loss or losing our licenses or whatnot is used basically. Our love of our patients and our desire to care is actually used against us here. And it works well.

I can tell you there are many, many doctors who'd like to speak out; many, many nurses who'd like to speak out; many other health care workers. And they still don't feel comfortable, even though we're in 2023.

Chad Horton

Dr. Milburn, thank you for coming in and answering these questions today.

Dr. Chris Milburn

Thanks for having me.

Chad Horton

Don't leave.

Ches Crosbie

I apologize Dr. Milburn; I should have sworn you in before, but we can fix that.

Dr. Chris Milburn

Okay. I can assure you my wife swears at me enough!

Ches Crosbie

Dr. Milburn, do you affirm that what you have told the Commission of Inquiry is the truth, the whole truth, and nothing but the truth?

Dr. Chris Milburn

Absolutely.

Chad Horton

Thank you. And one final point. For the Commission's consideration, as Dr. Milburn indicated, he's provided me with a copy of a CV. We will forward that to you for your consideration. And also, two news articles: a CTV article, "Cape Breton doctor removed as head of emergency medicine for Eastern zone" [Exhibit TR-20a] and another article by *SaltWire*: "Dr. Chris Milburn wants health authority to tell public reason for firing" [Exhibit TR-20c]. We will put those in for the Commission's consideration. But they are a matter of public record.

Thank you, Dr. Milburn.

Commissioner Massie

Dr. Milburn, I want to ask you two clarifying questions. The first one is about the first impression or reading that you had about the potential risk associated with the vaccine. And yet you decided to take the vaccine, considering that this could be the right thing to do, given that you were facing vulnerable people and you didn't want to put them in danger.

So my question is: you've been working in public health, so you probably have a notion about epidemiology and all of these things that would actually support that kind of decision based on anything you had available. So, my question is: What was your assessment at the time in terms of the potential for these vaccines to actually benefit in stopping or reducing transmission?

Dr. Chris Milburn

I'm not a vaccinologist, but I know enough about vaccines to know there's certain things like smallpox and measles, which don't mutate, so the vaccines against them work very well. We don't have smallpox now because we have a smallpox vaccine and we eliminated smallpox. There's other things like the flu. We've had flu shots for 25 years and we still have the flu. I knew that COVID fell more into the realm of the flu.

But I think at the time when the vaccines first came out, we were still learning a lot about COVID. So I wasn't sure: Is this going to be more like measles or more like the flu?

[00:40:00]

The initial data—which I now look at in a very different way, let's say I don't trust it much—seemed to say that it did decrease your odds of contracting COVID and therefore passing COVID on by a lot. So again, I had assessed my own risk by January or February of 2021 when I got vaccinated. I had assessed my own risk as being low, so I didn't get vaccinated for me. I didn't think I needed it. I thought I would do fine with COVID, being skinny and relatively healthy. But I got it because I thought it would reduce the odds of passing it on. Obviously, the data was in its infancy at that point, so I knew that that wasn't a sure thing. But I went into it knowing that. And I was fine with taking that risk on myself, but I was not fine with pushing that risk on anyone else.

Commissioner Massie

Okay. The other question is more of— I'm asking about your opinion. You mentioned that even today, in 2023, a lot of people in the medical field practicing in hospital and nurses and so on are still reluctant to raise any issue they might have about past or even current policies. Based on your experience in this area, what would be your best guess of why is it that people are still locked, and what would it take to unlock and speak?

Dr. Chris Milburn

I'm going to go by memory, but I believe it was in 2021: every physician in Nova Scotia got an email from the College saying, "Your duty is to support all public health policies. So far, we have not had any problem with anti-maskers or anti-vaxxers." They actually used those words in the email to us, "and we appreciate your compliance." And they talked about the need for unanimity. The College is the body that gives us our license or can take it away.

So it's not just physicians feeling like they might get in trouble. It's the College saying: "You will agree with public health, you will be unanimous, you will not speak out against masks, you will not speak out against vaccines." So there's a very good and logical reason. It's not just a feeling, but it's actually a dictum from colleges. And that's happened across Canada, it's not just in Nova Scotia. So there's still a lot of fear out there. And, as I say, we're three years into this. And there's many doctors who may share my opinions—either completely or at least some of them—and would not be willing to go on the record with it. I would say the great majority are not willing to be on the record.

Commissioner Massie

So if I understand, what you're saying is that, until such a time where the College of Physicians would actually remove that kind of directive, people will maintain their silence.

Dr. Chris Milburn

Correct. And I'm actually in the process of kind of speaking with the College behind the scenes to say I think they should walk back some of that now. For instance, the Cochrane collaboration has said that masks do not work: mask policies do not work. Are we now allowed to criticize them given that the Cochrane collaboration has said they don't work? Are we allowed to state that? And so, I'm pushing back but I do think we need to keep working on this because physicians are still in fear of speaking their opinion.

Commissioner Massie

Thank you.

[00:43:58]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Nicolle Snow

Good morning, everyone. Can you hear me okay? My name is Nicolle Snow, and I'm an injury and insurance lawyer with McIlvery Law. And I am honored and very happy to be a part of this process. Thank you for being here. We're just waiting for the witness, who's virtual.

Nicolle Snow

Good morning, Dr. McCollough.

Dr. Peter McCullough

Good morning. Can you hear me?

Nicolle Snow

Not well, so we're going to work with that. We'll keep going here, Dr. McCullough, so they can sort out the sound. I can hear you; it's just not projecting that well.

My name is Nicole.

Dr. Peter McCullough

I have until the top of the hour.

Nicolle Snow

Okay, yes, no problem at all, and I do apologize for being late. We're running a little bit late. We had some technical issues. So we're going to move through, and I'll have you out here by the top of the hour. Thank you for being here. We're going to put you under oath.

Ches Crosbie

Thank you, Dr. McCullough. Do you affirm to tell the truth, the whole truth, and nothing but the truth?

Dr. Peter McCullough

Yes, I do. Thank you.

Nicolle Snow

Dr. McCullough, we know you're a cardiologist, an internist, an epidemiologist. Could you start by giving a summary of your qualifications and experiences?

Dr. Peter McCullough

I'll do so quickly, I'm in practice in Dallas, Texas, in internal medicine and cardiology. I hold degrees from Baylor University, University of Texas Southwestern Medical School, University of Michigan School of Public Health, and Southern Methodist University Graduate School. I've been in practice now for greater than four decades and I have published extensively on the interface between heart and kidney disease. In the last three years, I have directed my clinical and research focus on COVID-19. I have over 60 peer-reviewed papers on SARS-CoV-2 infection, COVID-19 illness, and I've commented extensively in the US Senate, multiple state senates, as well as in the media.

Nicolle Snow

Thank you. And Dr. McCullough, you also have a clinical practice whereby you've had opportunity to treat COVID-19 or vaccines.

Dr. Peter McCullough

Yes.

Nicolle Snow

Okay, I want to turn to SARS-CoV-2, Dr. McCullough. The Government of Canada determined in the early stages of the COVID crisis—so in and around early March 2020—that the virus was highly transmissible and a virulent pathogen with an approximate 1 per cent fatality rate, for which there was no natural immunity and no effective antivirals. Can you comment on those conclusions?

Dr. Peter McCullough

I disagree that SARS-CoV-2 infection was one that was early on well-characterized. It was highly transmissible from symptomatic person to susceptible person. It had an overall case fatality rate far less than 1 per cent available to risk stratification. So, the elderly, those with multiple risk factors, at risk for death. And we knew early on that the virus was amenable to antivirals and, more importantly, use of drugs to reduce inflammation and thrombosis.

Within a few months of the onset of the pandemic, myself and researchers had already synthesized and then quickly published the first peer-reviewed paper describing the treatment of SARS-CoV-2 infection at home to reduce the risk of hospitalization and death.

And that was ultimately well-supported over the next few months with multiple comparative studies.

Nicolle Snow

Thank you. What do we know about the virulence of the virus now, Dr. McCullough?

Dr. Peter McCullough

It's greatly reduced with the continued progression of mutations to the Omicron and the sub-variants.

Nicolle Snow

Dr. McCullough, Canadians were advised that until a vaccine was created, the only available interventions were non-pharmaceutical measures to reduce transmission in the population—such as frequency of contact reduction, such as isolation, as well as probability of transmission-reducing measures such as social distancing, hand-washing, mask-wearing and so forth.

Can you comment on the assertion,

[00:05:00]

that these were the only available measures prior to the vaccine rollout?

Dr. Peter McCullough

Yeah, I disagree with that. Before the vaccine rollout, we had dozens of very viewed manuscripts: comparative studies that sequence multidrug therapy for the acutely ill worked to reduce the risk of hospitalization and death. And just shortly after 2021, we had a breakthrough paper showing that virucidal nasal sprays and gargles markedly reduced PCR positivity and reduce the risk for hospitalization. And there were no published studies at any time showing that public masking, social distancing, hand sanitizers or locking down those people without the illness had any impact on the pandemic.

Nicolle Snow

And Dr. McCullough, is there any real scientific logic to social distancing and masking and lockdowns in the context of this virus?

Dr. Peter McCullough

Not among well people, so there were no data suggesting that somebody perfectly well could transmit the disease and make somebody symptomatic who was adjacent to them. So the only thing that clinically was practical is somebody acutely ill with a characteristic signs and symptoms to keep distance from others. So the only people who needed to go into quarantine were those acutely ill with SARS-CoV-2, not the universe of people without the illness.

Nicolle Snow

Dr. McCullough, I know that you and a group of doctors had did some early research on the COVID in the early stages, treatment of COVID in the early stages. You touched on that a bit earlier. Can you speak about your findings in a bit more detail and how those findings were received once published?

Dr. Peter McCullough

The very first paper published on sequence multidrug therapy for COVID-19 in the *American Journal of Medicine*, August 7, 2020—myself as the first author—was widely applauded. It's still the most frequently read paper from the *American Journal of Medicine* over the last three years. It's listed as a top paper of interest. It received multiple letters to the editor as interest with replies, and it became the base standard of the Association of American Physician and Surgeons Home Treatment Guide in October of 2020.

So it was a breakthrough piece of information, a breakthrough paper. And it was followed up in December of 2020 in an updated protocol, which included now more drugs available to use, in *Reviews in Cardiovascular Medicine* in December of 2020.

Nicolle Snow

Thank you. I want to turn your attention now to the COVID injection. It is sometimes, well it's most often called a vaccine; it's sometimes called gene therapy. Are you able to speak to just what the injection is and how it operates?

Dr. Peter McCullough

In the United States, 92 per cent of those who've received a COVID vaccine—I'll just use the word "vaccine"—have received messenger RNA vaccines. And the messenger RNA vaccines, in my interpretation, are synthetic genetic materials: a genetic code with a three prime and five prime synthetic nucleoside analog caps, which make the messenger RNA essentially indestructible. They are loaded on lipid nanoparticles to provide distribution throughout the body, including the brain, the heart, the adrenal glands, reproductive organs—all the critical organs in the body. Messenger RNA has been demonstrated to be circulatory in the bloodstream for at least 28 days. We know that it codes for the spike protein of SARS-CoV-2. The spike protein was engineered by the University of North Carolina Chapel Hill and published by Manchurian colleagues in 2015. This work was done in the Wuhan Institute of Virology, Biosecurity Annex Level 4.

This messenger RNA that people have received codes for is the lethal part of the virus. And then once the messenger RNA is in the body, there is an uncontrolled production of the **spike protein in terms of quantity and duration. The spike protein is proven in over 1,000 peer-reviewed papers to cause damage to the brain, the heart, the blood vessels; to cause blood clotting; and to cause immunologic problems in the bone marrow.**

Nicolle Snow

Thank you, Dr. McCullough. It sounds like, then, that the COVID injection doesn't operate like a true vaccine. Is that correct?

Dr. Peter McCullough

The messenger RNA vaccines harnessed the body's own genetic material to produce the spike protein.

[00:10:00]

And the spike protein causes damage to the body, as I've described. Now, the aspiration I anticipate was that the spike protein would induce immunity. But we understood very quickly that there was no effective immunity from the vaccines. And so within 90 days of the release of the Pfizer vaccine in the Pfizer post-marketing data—which they kept as regulatory documents and were released under court order to the public—Pfizer had recorded dozens of fatalities due to COVID in people who were fully vaccinated with the product. And sadly, Pfizer recorded 1,223 deaths directly attributable to the vaccine.

Nicolle Snow

Dr. McCullough, are you able to speak on the research and development process for this product? In other words, did it follow established regulatory standards for vaccines?

Dr. Peter McCullough

In a paper by Lalani and colleagues in the *British Medical Journal* in the last month, the description of messenger RNA development is laid out in a timeline since 1985. So the United States has had a long-standing interest in the development of messenger RNA. And then in 2012, DARPA, the research division of the U.S. military, created a program called the ADEPT-P3 program. It's on their website even today stating that the military had a desire to use messenger RNA to end pandemics within 60 days. So the United States made an unprecedented government investment in messenger RNA. However, human studies were never performed until we had a condensed, rushed production of the vaccines for COVID-19 in Operation Warp Speed.

So, it had a very long development cycle. There were many issues to tackle, and then it was in a condensed set of prospective randomized trials to gain emergency use-authorized approval.

Nicolle Snow

Did safety and efficacy have to be proven in the production of the product?

Dr. Peter McCullough

Safety and efficacy always have to be proven. With genetic products, the safety by regulatory standards takes a five-year timeline. So the safety study should have been started way in advance, since the United States been working on this since 1985 and they simply weren't done. Efficacy had to be proved for the outcome of hospitalization and death. And hospitalization and death were never a primary or secondary endpoint of any trial. And so there can be no claims that the vaccines reduced hospitalization and deaths, since they weren't assessed in these trials. Where recorded, there was no reduction in hospitalization and death. In fact, deaths were more frequent in those who took a vaccine. And in the United States, the consent form doesn't make the claim that the vaccines reduced hospitalization and death.

Nicolle Snow

I want to turn your attention to the vaccine event recording systems, Dr. McCullough. I know in the U.S. where you are, there's the VAERS [Vaccine Adverse Event Reporting System]. In Canada, we have CAEFISS, that's the Canadian Adverse Events Following Immunization Surveillance System. There's the yellow card system in the U.K. and the European Safety Monitoring System. These systems have been in place for decades, as I understand it, at least in Canada. CAEFISS has been in place since 1987.

Can you speak about what, if any, unusual findings are showing up in these vaccine reporting systems following the rollout of the COVID injection?

Dr. Peter McCullough

In June 11, 2022, the World Council for Health summarized those safety data systems: 39 total, but four major ones, including VAERS, YellowCard, the EUGIS system, and the WHO Vigi-safe system. All of them have been recording record numbers of injuries, disabilities, and deaths.

For example, in the U.S. VAERS system, all vaccines combined and accumulating all injections before COVID, a child would receive greater than 70 injections over the course of childhood. Per American child—and we knew 98 percent of Americans were taking vaccines at this level—there was a total on average of 158 deaths per year in this entire data system, which is the best. With COVID-19 vaccines as we sit here today, as of March 3rd, 2023, for U.S. domestic cases only, VAERS has recorded 17,071 deaths that have occurred within a few days of taking the COVID-19 vaccines, and 16,454 permanently disabled Americans.

The VAERS reports are largely done by doctors, nurses,

[00:15:00]

and those caring for patients where they believe the vaccine is the cause of the injury or death.

Nicolle Snow

Dr. McCullough, is there an accepted percentage of adverse events that are considered medically tolerable, if you will, beyond which the product would be removed from the market for safety concerns?

Dr. Peter McCullough

I've chaired over two dozen data safety monitoring boards as the head of the board or a member, including those for the NIH [National Institutes of Health], BARDA [Biomedical Advanced Research and Development Authority], the Military Research Division of the NIH, as well as pharmaceutical companies—in vitro diagnostic companies. It's my testimony that five, 10, 15, no more than 50 deaths—even for the largest program—would ever be tolerable. That programs would be shut down. And then a deep dive on safety to figure out why people are dying after taking an injection.

It's my testimony that, knowing what we know— The rollout of Pfizer in the United States was started December 10th, 2020. Pfizer should have been pulled off the market before the end of January of 2021, with fewer than 27 million Americans being injected. Moderna

probably should never have rolled out. And if it rolled out, it would have been pulled off the market shortly afterwards. Janssen, again, should have never had market entry because Pfizer and the entire product line would be off the market because there would be an understanding that the spike protein being produced is lethal to the human body.

Nicolle Snow

Dr. McCullough, you spoke a little bit on adverse events already, but would you speak in a little more detail on the cardiovascular events that are medically known to be connected to these COVID vaccines?

Dr. Peter McCullough

There are over 200 peer-reviewed papers published on cardiovascular syndromes directly attributed to COVID-19 vaccination and agreed to by regulatory authorities. One of them is myocarditis or heart inflammation. Two studies have indicated that 2.5 per cent of people who take a vaccine suffer heart damage. About half of them, it's symptomatic. Half of them, it's not: the peak age is 18 to 24 years, 90 percent are men, 10 per cent women. It's a skewed distribution with a tail up into the 60s and 70s.

There have been fatal cases, autopsy-proven, by Verma, Choi, Patone, and Gill. It is conclusive that in a fraction of those who have received the COVID-19 vaccine, heart inflammation or myocarditis is fatal; and the mechanism of death is sudden cardiac death, a sudden arrhythmic death, a young person collapsing and not being resuscitated by CPR.

This is now well described here in the peer-reviewed literature. An important paper by Yonker and colleagues in circulation from Harvard has shown, in young boys and girls hospitalized at Massachusetts General Hospital with myocarditis, about 90 per cent acutely are hospitalized to recognize the symptoms. Those who are having myocarditis have unopposed spike proteins circulating in the body damaging the heart. Those not affected with myocarditis actually have appropriate antibodies neutralizing the spike proteins. What I conclude is that, unfortunately, a small number of people do produce spike protein that is not effectively neutralized by the antibodies and so they have unevaded heart damage.

Myocarditis is lethal and, of course, a single death in a young person is unacceptable, because young people are not at risk for hospitalization and death with the virus. The COVID-19 vaccines should have always been contraindicated for young people not at risk for the illness. In addition to that, the vaccines cause a progression of atherosclerotic cardiovascular disease. They precipitate coronary atherosclerotic plaque rupture in traditional plaque, cardio infarction. The vaccines are proven to cause blood clots, both in arteries and in veins. The U.S. FDA [Food and Drug Administration] has published on this. In a paper, Wu and colleagues have demonstrated thousands of Americans developing blood clots after COVID-19 vaccines, where the FDA agrees that vaccines cause the blood clots, describing them going from the ankle to the hip. So, very large blood clots in the venous system: in the Wu paper, 11 per cent are fatal.

[00:20:00]

Additionally, the COVID-19 vaccines have been associated with a whole variety of other cardiovascular manifestations, including vasculitis, a problem of inflammation in the blood vessels in the kidneys. In a paper in the *Journal of the American Society of Nephrology*, Wu

and colleagues describe the progression of the vasculitic and nephritic kidney disease in those, worsening their chances of survival free of dialysis.

In summary, the COVID-19 vaccines, by the mechanism of myocarditis progression of cardiovascular disease and blood clots, are believed to be the cause of unknown death in any individual where the vaccine is known to be taken by that person.

Nicolle Snow

Thank you. Dr. McCullough, the Canadian government has maintained that the COVID vaccines are both safe and effective, and continues to encourage Canadians to take them, including children: to vaccinate and to booster.

Given what you have had to say about COVID-19, its virulence, the vaccine, and the statistics on adverse events, what is your opinion on whether the vaccine is both safe and effective?

Dr. Peter McCullough

The decision on safe and effective is made by senior care doctors with medical authority. I would have—and I do have—medical authority over government officials in Canada. It's my testimony today that the vaccines are neither safe nor effective. And that opinion has superiority and supersedes any government statement.

Nicolle Snow

Thank you, Dr. McCullough.

My last question is really just about corrective measures. A lot of people the world over have taken the injections. What, if anything, can they do to mitigate the damage they have incurred in their bodies?

Dr. Peter McCullough

Two points. One is the toxicity and the risk of death appear to be cumulative. So the first point is to take no more injections because the next one could be fatal or disabling. Second point is to be vigilant. Blood clots, heart damage, neurologic damage, intracranial hemorrhage stroke: all these need to be clinically recognized and treated the best they can conventionally.

None of the governments have started large research programs into vaccine injuries, disabilities, and death, and that research is greatly needed. Very similar to the tobacco settlement and the final recognition that tobacco causes disease in the U.S. tobacco settlement: much of the money received by the tobacco industry had to be turned around into research for doctors to learn how to treat patients. We'll need a similar type of program with COVID-19 vaccine injuries.

A paper by Zogby and colleagues, a representative survey in the United States, showed that 15 per cent of those who've taken a vaccine have some new medical illness—some new disease that we're dealing with. I've covered just the tip of the iceberg in terms of the cardiovascular complications, but they also span the fields of neuropsychiatric problems, autoimmune problems, and so there's a great medical need to care for those individuals. And I would just say there's also an acute medical need, even though very few people now are taking COVID-19 vaccines. This CDC V-safe data, which was released under court order,

reveals 7 per cent to 8 per cent of people who take a vaccine have to acutely go to the hospital and be hospitalized in the emergency room or urgent care center. So there's a great need to still manage the acute problems that develop within a few hours of taking it in a shot.

Nicolle Snow

Thank you, Dr. McCullough. I thank you sincerely for giving evidence here at this Inquiry today.

Don't go away just yet. I'm leaving a few minutes here in case any of the commissioners would have questions for you. Thank you very much.

Commissioner Massie

I have some expertise in biotechnology and vaccine, so I've been following everything you've published and said on many conferences. One other thing that really puzzles me is: What's happening with all the evidence that has been pouring in for more than two years?

[00:25:00]

What's happening that the medical establishment and all the health institutions are still promoting that kind of intervention?

Dr. Peter McCullough

In the United States, the medical establishment, I think, has been greatly influenced by the COVID Community Corps program. The COVID Community Corps program announced early in 2021 that over \$13 billion was sent out by the White House and the Department of Health and Human Services to a variety of health institutions, thousands of media outlets, Hollywood pro sports teams—all to promote the vaccines. We know separately that Pfizer and Moderna contracted a public relations firm called Weber Shandwick. And Weber Shandwick initiated a corporate program called Plan VX. Plan VX promoted vaccine mandates within large companies.

Then lastly, Weber Shandwick had an installed marketing unit within the CDC vaccine office. This has all been uncovered by Senator Rand Paul in October of 2022 and is publicly disclosed.

Commissioner Massie

Thank you.

Nicolle Snow

Okay, those are all the questions. Thank you so much, Dr. McCullough, for appearing here today.

[00:26:46]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 16, 2023

Day 1

EVIDENCE

Witness 3: Dr. Patrick Phillips

Full Day 1 Timestamp: 02:31:26–03:26:07

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Nicolle Snow

Okay, everybody, thanks for taking your seats. We have our next witness up, who is Dr. Patrick Phillips out of Ontario. I'll let you bring him up on the screen there.

Hi, Dr. Phillips, how are you?

Dr. Patrick Phillips

Good, how are you?

Nicolle Snow

I'm well, thank you. Before we get started here, we're going to affirm you. I'm going to let that happen now.

Ches Crosbie

Dr. Phillips, you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Dr. Patrick Phillips

I do.

Ches Crosbie

Thank you.

Nicolle Snow

Good morning, Dr. Phillips, you're joining us from Ontario?

Dr. Patrick Phillips

I am joining you from Ontario.

Nicolle Snow

Thank you for being here to give testimony in this proceeding. Dr. Phillips, can you start by going over your medical credentials?

Dr. Patrick Phillips

Yes, I graduated from Dalhousie Medical School in New Brunswick in 2016. After that, I did go to the University of Toronto, where I completed my two-year family medicine residency. And after that, I entered into practice.

Nicolle Snow

All right, and can you give a little summary of where you were practising?

Dr. Patrick Phillips

Sure, yeah. Like many new graduates, I primarily worked locums, which is basically filling in temporarily at various locations. As well, I had a weekly addictions medicine practice where I saw patients once a week in downtown Toronto, giving methadone and suboxone. But as time went on over the last few years, I did kind of narrow down the places where I was working, doing emerge. and medicine, to Nipigon and Englehart. And then eventually I moved full-time to Englehart at the beginning of 2021.

Nicolle Snow

Okay. And your locums were in the area of family medicine and emergency medicine?

Dr. Patrick Phillips

Yes.

Nicolle Snow

Okay. And your practice in Nipigon was in the area of Emergency Department work or family?

Dr. Patrick Phillips

Both. So comprehensive family medicine, which is in-patients, office-based family medicine and emergency.

Nicolle Snow

Thank you. And Dr. Phillips can you confirm that you sent me a copy of your CV?

Dr. Patrick Phillips

I did.

Nicolle Snow

All right, and the CV for the record is exhibit number TR-0001.

Are you currently practising, Dr. Phillips?

Dr. Patrick Phillips

No, I'm not. My medical licence has been suspended by the CPSO [College of Physicians and Surgeons of Ontario] since May 3rd, 2022.

Nicolle Snow

Okay, and why was your medical licence suspended?

Dr. Patrick Phillips

So, it was suspended primarily for holding a medical opinion that is contrary to the public health directives and some of the consequences of that. We'll get into some of those details later, but that's essentially it.

Nicolle Snow

Okay, thank you. We'll talk about that in a little bit. When was the suspension effective?

Dr. Patrick Phillips

May 3rd, 2022.

Nicolle Snow

Dr. Phillips, did you take the Hippocratic Oath and what is that?

Dr. Patrick Phillips

I did take the Hippocratic Oath as part of our ceremony at Dalhousie Medicine. It's an oath, basically, that the medical profession has taken, or some other oaths that are also taken across the world, in order to uphold medical ethics. And to put the patient and our oath to the patient first, above any other authority, so that the patient's interests are always the number one priority of doctors in that doctor-patient relationship.

Nicolle Snow

And I'm sure you took that oath seriously.

Do you know what the Declaration of Geneva is, Dr. Phillips?

Dr. Patrick Phillips

During the course of World War II—both in Germany and Japan, and many other places—there were atrocities committed by these regimes that were primarily carried out by doctors, physicians. Physicians who were actually captured by a public health ethos of believing they're doing what's best for the race: for the Aryan race as an example in Germany, or just following government directives or following orders. And so, after the

doctor trials in Nuremberg in 1947, Canada, among many other nations, signed on to the World Medical Association. And the World Medical Association came up with this oath,

[00:05:00]

as a way to prevent those atrocities from happening again. So that doctors will not just follow orders blindly but will put the rights of their patient first.

And if I can quote, I won't do the whole thing but a few of these are very relevant. Most have the medical schools in the U.S. make the oath of the Declaration of Geneva and most of them in Europe. I'll just pull a couple out of it here: "I solemnly pledge to dedicate my life to the service of humanity. I will respect the autonomy and dignity of my patients. I will maintain the utmost respect for human life." And most pertinent I think here is: "I will not use my medical knowledge to violate human rights and civil liberties, even under threat."

So that was—Canada was a signatory to this.

Nicolle Snow

Thank you. And it sounds like those passages in particular resonated with you, Dr. Phillips, did they?

Dr. Patrick Phillips

Absolutely.

Nicolle Snow

Dr. Phillips, on April 30, 2021, the College of Physicians and Surgeons of Ontario issued a statement forbidding physicians from questioning or debating the official COVID-19 response measures in Ontario.

What do you know about this, and can you give a little more detail on that?

Dr. Patrick Phillips

Yeah. Although the College was quietly coming after doctors for having an opinion that goes contrary to the government narrative before this, amazingly, the College came out and very explicitly forbade doctors from carrying out our oath and scientific method for patients.

So, what they state in their message, that they just sent out as a tweet; it wasn't a policy, it wasn't a regulation. But they put this out saying that, "Physicians hold a unique position of trust within the public and have a professional responsibility to not communicate anti-vaccine, anti-masking, anti-distancing, and anti-lockdown statements, and/or promoting unsupported, unproven treatments for COVID-19." They go on to say, "physicians who put the public at risk may face an investigation by the CPSO and disciplinary action when warranted."

This was shocking to me and many others. As a result, I gathered together with a group of physicians, and we together created Canadian Physicians for Science and Truth. And made the declaration asking and demanding for the CPSO to rescind their statement. And in that declaration, which has thousands of signatories of the public, and there's over 700 signatories in the physician category. Well, not all those have been vetted, but there's

definitely hundreds in there. Basically, saying that this statement—to follow this, would be a violation of three things. So, one is the scientific method, which requires the advancement of medicine, requires that we have to challenge the status quo. We have to be able to speak freely again, to debate things. And that requires us to be able to be wrong, right? Because otherwise you can never challenge things.

The other one is our obligation to give evidence-based medicine to our patients. And that means discussing the evidence. If the evidence says people are dying from this vaccine, that people are suffering severe adverse events, or that it's not effective, those could be considered as anti-vaccine views. But they're true. And so, we have an obligation as physicians, no matter what the College says, to give the truth to our patients as we see it.

The third one is our duty of informed consent. In order for us to administer a vaccine to somebody, they have the right to be informed of all of these things. About the fact that we don't have any long-term data. About the fact that patients have died from these vaccines and many others, including for lockdowns, for masking, and others. Without that, if doctors are muzzled, patients don't get informed consent. And that is their right. So we basically demanded from the CPSO to rescind this statement, which they did not do.

Nicolle Snow

Okay. And you mentioned this group of physicians that got together and created this declaration: do you happen to know the website?

Dr. Patrick Phillips

Yes, CanadianPhysicians.org, where you can see our declaration in its entirety, and the signatories to it.

Nicolle Snow

Thank you.

[00:10:00]

Dr. Phillips, where were you practicing in and around the time of the pandemic when the pandemic was declared?

Dr. Patrick Phillips

In the beginning of 2020, I was working between two sites. I was living in downtown Toronto, but working primarily in northern Ontario, flying in and flying out to Nipigon and Englehart.

Nicolle Snow

Okay. And your practice was in a hospital setting?

Dr. Patrick Phillips

Hospital and an office space as well.

Nicolle Snow

What measures were taken in your region with respect to the COVID crisis? In the hospitals you're working in and, et cetera.

Dr. Patrick Phillips

There were a number, and they were changing all the time. But some of the most striking ones were the switch from in-person medical care to phone-based care in the medical community. That was throughout all of Ontario. Patients could not see their doctor unless in very rare circumstances. So almost all medicine was done just by phone, where doctors were asking patients to do their own physical examination, which they're not trained to do. And basically, doing guesswork, which was quite concerning.

Nicolle Snow

Did that pose any other concerns for you?

Dr. Patrick Phillips

Definitely. In the beginning, I was watching a lot of what the media was showing on Italy and New York. And so, I was concerned that there was an extremely deadly virus coming around at that time. I don't believe that now. But at that time, I thought maybe this is worth it. Maybe there's something we need to do, because if everybody comes into the office and catches COVID—the deadly form of COVID that I thought was coming—then I thought it could be worth it.

But yeah, that was kind of my main concern until later on, when I started to see the real consequences of this shift. And that's when I began to speak out.

Nicolle Snow

Okay, and what kind of consequences were you seeing in your practice?

Dr. Patrick Phillips

I was seeing a few things. One is devastation to both the physical health and the mental health of patients. To give you one example, there was one patient who I saw in emerge. Over the last year, she was treated for back pain over the phone—severe back pain to the point that she was on opioids. And she only came to see me in emerge. by the time her pain was so bad she had to call an ambulance. And when I saw her and physically examined her, what she called back pain was actually a giant tumor. It was actually a liver riddled with cancer.

That was not the only example of this, of late-presenting cancer of patients who were treated over the phone. If they were able to see their doctor in person, that could have been caught much earlier and possibly treated. But by the time I saw her, it was metastatic. I saw a number of patients like that.

The other thing I saw that really concerned me was the mental health of patients. And while I did see an uptick in overdoses in suicidality and depression in emerge. in adults, what was most striking was the children. I'd never seen so many suicidal children—as young as eight, right? And it's very rare for that to happen. But I noticed a common thread, and that was children— During the height of lockdown, when schools were closed, parents

were told by public health to keep their kids at home. No play dates, no play, no sports, nothing. And so, these children were essentially locked up at home with no friends, no socialization. And that, I believe, was the leading cause of the suicidality in children. Which concerned me.

And nobody was saying anything. In fact, what I found most concerning is, at that exact same time, the Ontario Medical Association, the Ontario Hospital Association, and Public Health were putting out advertisements saying: "Ontario's doctors are calling for stricter lockdowns to stop the spread of COVID." And I'm like, "No, I'm not. I'm definitely not!" And they didn't even send out a survey to ask what my opinion was.

That was what really led to me believing I needed to speak out here: because there's no other side of the story that's getting heard.

Nicolle Snow

Okay. Dr. Phillips, you worked in a hospital setting and there was a lot of early concern that hospitals were going to be overrun by patients with COVID-19. What did you observe with that respect?

[00:15:00]

Dr. Patrick Phillips

I did not see that at all, quite the contrary. I saw, especially in the beginning, a steep decline in the number of patients who came in—especially in the early 2020. I thought it was kind of nice at the time, not knowing these harmful consequences, because I was paid the same amount to do very little.

But our emergency rooms were empty and there was very little COVID in our communities. Nevertheless, because of the media, the people in our communities were still afraid and still reluctant to come in to seek care in the Emergency Department, which is devastating for some people.

Nicolle Snow

Have you had occasion to treat any patients that you believe were suffering from COVID-19?

Dr. Patrick Phillips

Very few but yes, I did. We had a few in our community. The COVID wave came later, mostly after I was no longer working in the hospital. But while we did have a few; I did treat one while I was working in the hospital in Kirkland Lake.

Nicolle Snow

And can you offer any details about that?

Dr. Patrick Phillips

In my opinion, it was a very disturbing story. It was a middle-aged, like 50s, 60s, woman who came in, diagnosed with COVID. And she was short of breath, and she needed oxygen.

At that time, there was so much evidence. There was study upon study: I think there were 30 to 40, when you bring those together, showing that ivermectin would reduce mortality by 50 to 70 per cent. We have very few drugs that can do that.

When she came in and she was under my care—at that point, I was working as a hospitalist on the floor in Kirkland Lake, which is the sister hospital to mine in Englehart. I felt a duty to give her informed consent and to prescribe to her ivermectin for the treatment of her COVID, because she had a number of risk factors for severe disease or death.

When I wrote that, the pharmacist reported me to the chief of staff. The chief of staff then ordered me to cancel that order for ivermectin, including the zinc and vitamin D and other harmless vitamins that I also prescribed to her, which we know can be helpful. And he ordered me to call the local ICU in Sudbury—well, the distant ICU in Sudbury—and get their permission to prescribe outside the guidelines, which requires remdesivir, which is very harmful, and others, such as steroids. And they basically only allowed me to prescribe the steroids, so I gave her steroids. But I was shocked that this chief of staff ordered me to cancel lifesaving treatment to this patient that peer-reviewed research shows reduces mortality.

Nicolle Snow

Approximately when was that?

Dr. Patrick Phillips

This was in March 2021.

Nicolle Snow

Okay. And I think you said that was March 2021 that that occurred?

Dr. Patrick Phillips

Yes.

Nicolle Snow

Okay.

Have you had occasion to prescribe ivermectin again or was that the end of your prescriptions for ivermectin?

Dr. Patrick Phillips

I would have, but again, in my community, there was very little COVID and the ones that were there were very mild. They didn't need to be hospitalized for the most part.

I did prescribe ivermectin again to a patient who had what I believe could have been a vaccine injury. She received a dose of the vaccine and after that, had nausea lasting for weeks—nausea, fatigue, muscle aches. So, I did prescribe according to the FLCCC [Front Line COVID-19 Critical Care Alliance] protocol, which was ivermectin, fluvoxamine and atorvastatin, which was successful. It did resolve her symptoms, but the pharmacist reported me to the College. And as result of that, the College did put a restriction on my

licence forbidding me from prescribing ivermectin, fluvoxamine or atorvastatin for COVID—among other things, such as vaccine exemptions and mask exemptions.

Nicolle Snow

Okay, and we'll get into some of those details on the charges in a moment. I want to move into the post-vaccine period.

You've spoken about that a little bit.

[00:20:00]

You had a patient that had a vaccine injury. The rollout of the vaccines was in and around early 2021. What, if any, protocols were put in place at the hospital you were working in with respect to monitoring vaccine effects?

Dr. Patrick Phillips

So, I mean, our hospitals spoke nothing at all about monitoring vaccine effects, but we do have a legal obligation to report adverse events. Some of the more serious ones we're obligated to and other ones we're kind of permitted to.

Nicolle Snow

Is it a form that you complete, Dr. Phillips?

Dr. Patrick Phillips

Yeah, there's a form. The CAEFISS [Canadian Adverse Event Following Immunization Surveillance] System basically is very local in the sense that there's a form through Ontario Public Health that we fill out and send to our local public health officer. Who then is supposed to investigate and pass the investigation onto Public Health Ontario, and then they're supposed to amalgamate the data and pass it on.

Nicolle Snow

Okay, and you mentioned CAEFISS. That's the Canadian Adverse Event Following Immunization Surveillance System. It's a bit of a mouthful.

The adverse event forms that that you were just speaking about: those were the forms that the doctors would fill out in the hospital if they thought something was a vaccine adverse event? And can you confirm that you gave me one of those blank forms?

Dr. Patrick Phillips

Yes.

Nicolle Snow

Yes. Okay, and that is marked as Exhibit TR-0001a. So TR-0001a is the exhibit, it's the Adverse Event Following Immunization Reporting Form.

Dr. Phillips, as I understand the evidence that you just gave, you would not be forwarding that form to the CAEFFIS system. You would be forwarding it to a public health officer who would then determine whether it would be filed with CAEFFIS.

Dr. Patrick Phillips

Correct.

Nicolle Snow

Okay. Is vaccine aftermarket monitoring an expectation for physicians?

Dr. Patrick Phillips

It's supposed to be, yes.

Nicolle Snow

And for what reason?

Dr. Patrick Phillips

Yeah, we're actually obligated by law. For certain severe ones, we're obligated to report these adverse events when we see them. And then outside of that there's kind of more of a permissive requirement. I think it's an ethical requirement to pass on all adverse events that happen after these, especially in the context of an emergency use authorization. So, something that's not fully tested but yet was rolled out early. Even more, we have in my opinion an ethical obligation to report all possible adverse events, so that the CAEFFIS system will be able to detect possible harm and be able to withdraw the product if it's warranted.

Nicolle Snow

Okay. And the purpose is to monitor the safety and the effectiveness of the product. Is that correct?

Dr. Patrick Phillips

Exactly.

Nicolle Snow

What kind of events were physicians required to take note of, according to the form—the adverse event form?

Dr. Patrick Phillips

It's pretty broad on the form. I can't recall all of them off the top of my head. I don't have it in front of me.

Nicolle Snow

Yeah, it's okay. If you don't have it in front of you, it's marked as an exhibit in any event. Did you have any occasion to complete any of those adverse event forms?

Dr. Patrick Phillips

Yes.

Nicolle Snow

All right, can you elaborate on that?

Dr. Patrick Phillips

Yeah, I did. I did complete 10 adverse event reports that I sent in. I'll give you kind of the basic details of these reports really quickly here. All but one of them, as far as I know, were not submitted. So nine of them were rejected, as far as I know. The first one is a person with nausea for two weeks and vomiting, including hematemesis or bloody vomiting. This started four days after the second dose of Moderna.

The second one was a new onset severe vertigo and ringing ears, by diagnosis vestibular neuritis, that came up four weeks after his Moderna shot. The third one was sudden onset, in a young woman: sudden onset arm weakness for four hours. Weakness in the arm and complete decrease of sensation in an entire half of her body,

[00:25:00]

with persistent loss of sensation in fingers, lasting hours to days. In my opinion, it was stroke until determined otherwise, so I started the stroke protocol.

Nicolle Snow

How many days post-vaccination was she?

Dr. Patrick Phillips

Oh, sorry—this was nine days after her Moderna shot.

The fourth one was an elderly woman with severe delirium, a high fever, and left arm numbness four hours after her Moderna shot, lasting greater than 48 hours. That's the point I saw her.

The fifth one was a woman with dementia but was functional at home, able to talk and walk. But after her dose—I'm not sure which vaccine it was—she lost the ability; she slowly declined over the course of about two to three weeks and lost the ability to communicate and to walk as well.

The sixth one was an older woman who developed palpitations, so a heart issue, possible arrhythmia with severe hypertension, and that started one week after her Moderna shot.

The seventh one was a younger woman with persistent numbness to the right side of her forehead; she lost sensation there entirely. No other symptoms really, but that started two hours after her Pfizer shot and then persisted.

The eighth one was intermittent left arm weakness. His arm would become weak, he was dropping things and no longer able to work. That would happen three to five times a day. That started two days after his Pfizer shot. And two weeks later—so it was two days after and then persisted—then developed persistent daily headache, nausea, and vomiting. It could have been something going on in his brain or others. I don't have the final diagnosis because, as an Emergency [Department], we don't follow our patients, we pass them on to others; they're investigated.

The ninth one was a middle-aged woman, who tragically—16 days after her Pfizer shot, with no other health history—had a devastating bleed into her brain after her blood pressure surged into the two hundreds. She lost the ability to talk and walk, she was found on the floor. She then was devastated.

The tenth one is, the only one that I know was actually accepted as an adverse event, and that was a severe rash on a woman's arm that came on eight days after the vaccine. That was kind of a ring-like rash that spread up above her shoulder and down the arm.

Nicolle Snow

And so, as you as you've indicated, that tenth one where there was the rash on the arm, that was at the site of the vaccination, was it?

Dr. Patrick Phillips

Yep.

Nicolle Snow

That's the only one that you know definitively was accepted.

What happened with the rest of them? Did anyone contact you?

Dr. Patrick Phillips

I was contacted by the public health officer; he sent me a letter after the first five. He told me that none of these five meet their criteria for an adverse event, so they've all been rejected and, "Take note of that because I'm doing my reports." I send a note back to him by fax asking for the details of why each one of these were rejected. "Do you need more information?" I want to make sure that not just rejected for a clerical reason and I did not get a reply.

I was very concerned about this. I was concerned that the public was not getting informed the consent about these possible severe adverse events. Many of those may have been strokes. And so, in order for us to have a safe vaccine safety system, they need to be able to get these reports to be able to know if a product needs to be pulled off. So I did go public. I did an interview with Rebel News where I spoke about these adverse events. And the letter that I got sent saying they're all getting rejected, and as a result that public health officer complained to the CPSO. And they're investigating me, and I'm charged for professional misconduct for those nine of the adverse events that were not accepted. They're saying that I'm being incompetent for filing these adverse event reports and they're saying I failed to meet the standard of practice in the profession.

Nicolle Snow

Okay, stunning. All right, Dr. Phillips, let's talk a little bit about your personal life outside of your clinical practice. You've indicated that you were quite vocal about the concerns that you had that were going on inside your practice and in the hospital system. Can you speak a little bit about that?

[00:30:00]

Dr. Patrick Phillips

Like my Twitter feed, you mean?

Nicolle Snow

You indicated that you were quite vocal outside of the hospital system. And you also indicated that public health officer came after you when you were vocal, so maybe you could talk about that.

Dr. Patrick Phillips

Yeah, so around that time—like I said, at the end of 2020—when I was seeing those harms from the lockdowns, and the medical association was saying, “doctors are calling for harsher lockdown,” that was the moment that I made the decision that I need to speak out.

I got onto my Twitter account, and that's where I've done a lot of my speaking out about public health measures: about the science that public health isn't talking about, like vitamin D, exercise, things like that—other public health measures that are effective, and the ineffectiveness and harms of lockdowns, of masking, and of these vaccines.

I spoke out on Twitter, and I've done a number of alternative media interviews, and I even did a press conference with [inaudible] on Parliament Hill in June. And for all of these, the College opened up a section 75 investigation here in Ontario. And they have charged me with professional misconduct and incompetence for my communications, saying, again, that statement from before: that we're forbidden from saying anything that goes contrary to other public measures, and therefore they've charged me with professional misconduct for all of it.

Nicolle Snow

Okay, and is that what led to the eventual licence suspension?

Dr. Patrick Phillips

Yes, all of these things combined. Yeah, they opened up a number of investigations that kind of all piled on top of each other. Essentially, the charges are on my public speaking contrary to public health measures. They're charging me with professional misconduct for providing prescriptions for ivermectin, for vitamin D, for zinc, and vitamin C. They have charged me with professional misconduct for providing vaccine exemptions to patients, for either medical conditions or for being coerced, as somebody promoting their autonomy. They've charged me with professional misconduct. I think that's the majority of it.

There's a lot of side charges as well. Yeah, as well as reporting all these adverse events. I have those nine charges of professional misconduct for each of my adverse event reports.

Nicolle Snow

All right. I think you indicated some of this was also related to you writing exemptions and so forth. And was that in the context of a family practice?

Dr. Patrick Phillips

Yeah, so some of them I did privately. And some of them I did in the Emergency Department. I had people coming to me. After they saw me speaking publicly, they would come into the Emergency Department and ask for letters of support or for notes and I gave that to them—either if they had a medical condition or sometimes for patients who were being forced against their will and they were under duress and couldn't give their consent. And so, I gave letters of support in those cases.

Nicolle Snow

Okay. It sounds as though, Dr. Phillips, that when you spoke out about your views with respect to your concerns with the protocols and so forth, were you somewhat under the microscope after that point?

Dr. Patrick Phillips

Oh, absolutely. Any interview that I gave on media, every Tweet that I've ever made, anything that I've ever said, they have recorded and gotten transcripts of to prosecute me. One funny story about this: I spoke in Toronto at the World Freedom Rally, I think it was in January. And there was a whole crowd of people at the rally: none of them wearing masks at all, right? Because it's a freedom rally. There's two people that are coming in with masks with a microphone and a recorder, and they kind of came right up to me. There's only two people in the whole place wearing masks. I later found out in my disclosure that that was the College actually coming to record my speech. And I have the transcript of it from those two people at the rally.

Yeah, I was definitely under the microscope!

Nicolle Snow

Okay.

[00:35:00]

Is it fair to say that your actions throughout the pandemic and your willingness to speak out is directly connected to your desire to protect your pledge to your patients?

Dr. Patrick Phillips

Absolutely. What I'm most concerned about— And as a physician, the way I've always practised medicine, is that we're there as an advisor. We're there to share our medical knowledge to help patients make choices with their own health care. And I was so concerned about this change in ethics in the medical community, where coercion is normalized, and where doctors participate in coercion in forcing patients into things. I found it abhorrent. And that was what mostly led me to want to speak out: to protect the rights of patients for their wants, their desires, their freedoms to be at the center of the medical system and the doctor patient relationship. Yes.

Nicolle Snow

Thank you so much for offering your testimony here today, Dr. Phillips. There may be questions from the commissioners, so I'm going to ask you to hold on there. Hold on one moment, there may be questions.

Commissioner DiGregorio

Thank you, Dr. Phillips. I just have a few questions following up on some of the things that you've spoken about today. Early in your testimony, you talked about there being a college statement that was issued forbidding doctors from communicating anti-vaxx, anti-mask, anti-lockdown type positions. Is that something that we have in our evidence as an exhibit? And if not, is that something that we would be able to take a look at?

Dr. Patrick Phillips

Oh, yeah, definitely. It's still on their Twitter feed. It's on their website. They have not taken it down. Yeah, I can send it on to you.

Commissioner DiGregorio

Thank you.

Another thing you mentioned was some of the early measures that were taken early in the pandemic and the switch from in-person visits with doctors to phone-based appointments. I'm just wondering if that was a recommendation, or what was the impetus for that to happen on such a large scale.

Dr. Patrick Phillips

It was essentially a requirement put out there. Virtually everybody was doing this and suggestions by the College we now know are our requirements. They treat a suggestion as a suggestion, "you will be prosecuted." So yeah, that's basically what happened. They did have exceptions. If a child was to get a vaccine or if somebody—we were supposed to basically talk to them first on the phone. Then if required, you bring them in for a physical examination. So, there were still physical examinations happening, but it was drastically reduced. And most doctors were depending on patients to kind of report their physical exam.

Commissioner DiGregorio

Thank you. And the last question I had was around the public health officer investigation that you talked about. I think you mentioned that it was after you had submitted your first five reports that you received a call.

Were you not contacted earlier than that as part of the investigation?

Dr. Patrick Phillips

No, I thought I would be. I thought they'd call me because I dictate a lot of my reports. Again, working in emerge., it's not the same as a family practice where you have an ongoing relationship with a patient. When I work that day, I submit my reports and paperwork that same time. A lot of my reports are dictated; they're kind of not fully done yet. So I expected he would contact me back, asking for more information, or asking for—I dictated reports

for my emerge. visit. And they didn't contact me at all, even after I requested him to contact me. Because I was concerned about these rejections.

Commissioner DiGregorio

Thank you.

Commissioner Massie

Thank you very much.

Based on your assessment of the, I would say, state of the art in terms of evaluating whether an adverse event report is serious or not: What was the protocol that was explained to doctors to guide them to fill out those reports? Did you have access to a specific protocol?

Dr. Patrick Phillips

I didn't know about the protocol until after. But in his letter, he sent me the guidance document,

[00:40:00]

for what criteria they use to determine whether something qualifies for an adverse event or not. It is an extensive document. But the number of adverse events they're looking for is very limited, to kind of one and a half pages. For COVID specifically, it was about 10 adverse events they would look at, and if it didn't fit in that category it didn't count.

The one example I liked for how arbitrary a lot of these criteria were, I'll give you one example: If you administer a vaccine and a patient has syncope, they faint, it doesn't count at all, unless they also have an injury. So, if they faint, hit their head, and have a bleeding to their brain, that does count. But again, even in that circumstance, it only counts if it happens within 30 minutes. If that person faints at 31 minutes and then they fall and have a bleeding to their brain, that report will be rejected.

For each category they have arbitrary time requirements and if it doesn't fall within those strict criteria, they're rejected. And these were developed before the COVID vaccines, before Pfizer data that came out in a post-marketing analysis that they were forced to release under a FOIA [*Freedom of Information Act*] request in the United States showing pages and pages of adverse events of concern. So they had 10—just 10 on this form when there were hundreds to thousands that Pfizer notified and found were adverse events that **we should be monitoring for.**

My patients didn't fit in those categories of those 10, therefore they were rejected. But we now know that even Pfizer themselves acknowledged a wide array of adverse events that my patients certainly would have been fitting into.

Commissioner Massie

Based on your best assessment again, what would you say about the so-called under-reporting factor that, in the States, has been calibrated or has been assessed in the range of 40 to sometimes up to 100. Some people say it's 10-fold. What would be your evaluation on that in your practice in Canada?

Dr. Patrick Phillips

Yeah. I mean, if you look at what happened with me, it shows you what happens when you report adverse events. So, there's a number of things that happen. One, they often get rejected. So you get pushback from public health themselves. The other one is I got reported to the College and I'm being prosecuted for reporting these adverse events. Even if my adverse events were wrong, even if they weren't adverse events, how does it make any sense that it's professional misconduct to report them? People know that. My case is very public. I just use that as an example that doctors know there's consequences.

There are consequences on a number of levels: from public health; from the colleges, their licences at risk for reporting; and within their hospitals as well. So, doctors—besides their maybe internal biases—even if they didn't have those biases, their license is at risk from reporting any adverse events.

Yeah, it's definitely underreported, to answer the question.

Commissioner Drysdale

I have a couple of questions about the CAEFISS system. And some people don't even understand what that system is. Is it fair to say that it's very similar to the VAERS [Vaccine Adverse Event Reporting] System in the United States?

Dr. Patrick Phillips

No. It's the same idea in that it's vaccine adverse event reporting. The VAERS has problems with its transparency, but it is extremely transparent compared to our Canadian system. So you can go on the VAERS, and you can look at those reports. They're just de-identified and you can look at them. Anybody can report to the VAERS system, not just your doctor. You can report it yourself. They verify them to make sure that the lot numbers line up and the patient to make sure that they're genuine. But in Canada, it's completely opaque. Nobody knows who's reporting what. And there's multiple levels of censorship. So the doctor can choose not to report, even if the patient asked him to. Then, even if the doctor does report, it goes to the local public health officer, who is the person tasked with promoting the vaccine and forcing people to get the vaccine, that's their role. So they have a major conflict of interest in investigating adverse events. They have the ability to reject it.

[00:45:00]

And then they send it to Public Health Ontario, which has the ability to amass the information and filter even more out. And then they report it to Health Canada.

There are so many layers for things to get censored, covered up. And I can tell you, I got an email as part of disclosure for my charges at the College that the public health officer sent on June 11th to the College, saying that my batch of adverse event, none of them were— My batch of adverse event reports were not submitted to Public Health Ontario. So yeah, none of them as far as I know, made it into the system to be able to be reported in the safety system.

Commissioner Drysdale

Did you know prior to submitting those adverse events reports that they were subject to censor?

Dr. Patrick Phillips

No, I did not know that. I didn't know much about the system. I learned it along the way.

Commissioner Drysdale

Have you had any of your colleagues indicate to you that they were hesitant in reporting to that system, based on your experience?

Dr. Patrick Phillips

Based on my experience, yeah. When people heard what happened to me, then yes, I've heard from some that said they wouldn't report. I'll mention one more thing that really, I found disturbing to me, that influenced myself and some other doctors. And that was: In that letter, and what I found out about that process is, when the public health officer investigates, and they decide something is not an adverse event, they called up each and every one of those patients that I saw, told them it was not an adverse event, and told them that they're required to get their next dose. So that's documented in paper with every single one of them.

That I found very disturbing. What I started to realize is that I'm actually putting my patients in harm's way by reporting, because they're going to be at risk of being gas lit in the sense that they're going to be told that this is not an adverse event, because it doesn't meet the strict criteria, and therefore they should get another dose of something that could have caused them severe harm.

It's malpractice in my mind. If somebody had a reaction to Tylenol, we would put that in their chart and say, "don't take Tylenol." Even if we're wrong about it, you want to be cautious and say, "okay, look, stay away from Tylenol, this caused your arm to go numb, don't take another one." But instead, when I report them, they're getting told to take another and they're told it's not related. And I realized at some point that it's actually harmful to patients to report.

Commissioner Drysdale

Prior to the public health officer essentially making a medical determination with one of your patients, are you aware of— Two parts to the question: First, did the public health officer in any instance actually bring the patient in for examination before making a recommendation to that patient?

Dr. Patrick Phillips

No, they called them up, but there were no physical exams in the documentation that I saw.

Commissioner Drysdale

And do you know anything at all—and this is perhaps a bit of a stretch of a question—but do you know anything at all about the public health officer's clinical experience in treating patients?

Dr. Patrick Phillips

In my area he actually does. He's a part-time family and emergency doctor and then part-time does the public health office. I think in the majority of places that are more populated, it's a full-time job. But in my case, he does have clinical experience.

Commissioner Drysdale

Okay, my last question on this is: Is there any practical suggestions that you might make for the future in order to improve this system, the CAEFFIS system?

Dr. Patrick Phillips

Yeah. There's a number of them. I think we need to follow the VAERS system, where any reports that go into that system need to be available to the public, with removal of identifying information.

There should be a verification process, but it should be more around the details, right? Name, age, date of birth, lot numbers. To make sure it's a genuine report. But then don't censor it or keep it hidden.

There needs to be a division of powers when it comes to investigating adverse events from vaccines and promoting vaccines.

[00:50:00]

That's a major conflict of interest for the public health officer to be tasked with those same things. If you're pushing these vaccines on everybody, you're not going to want to see adverse events. You're not going to want to believe that you're pushing something that might be harmful to people, so you're going to be more likely to discount those adverse events. So yeah, I think it needs to be transparent, so they're submitted right away. The public need to be able to submit them as well. If your doctor doesn't want to report it, the patient should be able to report as well.

And we need cut-off criteria. How many deaths are we going to tolerate before we pull something off the market? They pulled off treadmills after four people just got injured, no deaths at all. It's pulled off the market immediately. Breast milk, I think one baby died from baby formula. They pulled it off the market immediately.

At this point, there's tens of thousands of deaths, credible reports of deaths reported to the VAERS system. It's still on the market—not only on the market but being forced on people. It's an atrocity, honestly. But we need that criteria. We need to be, after how many deaths? **I would say five. Five credible reports of death, pull something off. We should not be giving this to the public. Maybe even five is too many.**

But right now, what's the point in reporting? The criteria are already met. These things are deadly. They're dangerous. They kill people, including my own cousin. Autopsy confirmed. And they're dangerous. The reporting system is useless unless you're going to act on it. We need to have laws in place that, after certain criteria, a product needs to be pulled off the market to protect public safety.

Commissioner Drysdale

Thank you.

Commissioner Kaikkonen

A quick question: is it normal historically for pharmacists to report physicians when they prescribe medications for their patients?

Dr. Patrick Phillips

That's not normal. I've never experienced that before. Pharmacists do have a role to verify things and double check things, right? Because sometimes doctors do make mistakes, and that's legitimate. But in all of those circumstances, they call back the doctor and they ask you to clarify, "Is this what you meant to prescribe? Is this the right dose?" And they'll often catch things. But I've never seen where they go directly— They don't even call you and they directly report a prescription to the College of Physicians. That's new, I think.

It's a snitch culture that's kind of developed over the course of COVID. And it happened not just with the pharmacists for prescriptions for ivermectin, it also happened with vaccine exemptions. So if you filled out an exemption, a good chunk of the exemptions that I filled out were sent to the College from employers as well. So yeah, I think it's a cultural thing that's happened. It was seen in totalitarian regimes like Russia and Germany, and it's part of the totalitarian experience.

Commissioner Kaikkonen

My last question is, if you had to do this all over again, would you do anything different?

Dr. Patrick Phillips

Yeah, I would. There were a few things that I would have done differently. Essentially, no. Like on all these things, reporting adverse events or other things: maybe looking back now, seeing those patients that got called and told to get another shot, maybe I wouldn't have reported them as much. Or I would have stopped earlier. I would have still told the patients, like, "Look, don't get this."

But essentially, no. I think I made the decision according to my conscience at the right time. And I learned so much along the way. Of course, there's always things you would have done differently if you went forward. But as far as providing treatment with ivermectin, providing exemptions to people who are being coerced against their will into gene therapy, for reporting adverse events, and for speaking out to give people the other side of the story: the facts, the scientific facts, the harms, the lockdowns, and other things. I would totally do that again, even knowing I would lose my license.

Commissioner Kaikkonen

Thank you, Dr. Phillips.

[00:54:44]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Ches Crosbie

There's Cathy. How are you today, Cathy?

Cathy Careen

I'm very well, thank you. How are you?

Ches Crosbie

I'm well, thank you as well. It's a great room of people here who seem to be very interested and enthusiastic to hear all the evidence, including yours.

I'm going to ask you first, though: do you affirm to tell the truth, the whole truth, and nothing but the truth?

Cathy Careen

I do.

Ches Crosbie

Thank you.

Criss Hochhold

Hi, Cathy. We meet again.

Cathy Careen

Absolutely. Before we start, though, I do really want to thank everybody involved with this and just giving everybody an opportunity to speak their experience and share what they've experienced for the past few years. It's an honour to be able to speak here today, so thank you for that.

Criss Hochhold

You're welcome, Cathy. So, tell us a little bit about yourself, Cathy. What do you do?

Cathy Careen

I'm an educator. And I say educator because I am a teacher by trade. But when I was working in the school system, but not as a classroom teacher, I was what was called a TLA, a teaching learning assistant. So, when all this happened, I was full-time permanent.

I'm a mom. I have three kids, ages 7 to 21. I'm a big animal lover, and, you know, I'm just an average person.

Criss Hochhold

Absolutely. What do you teach, Cathy? Do you still work as a TLA now?

Cathy Careen

So, we were able to go back to work last June 1st, and then I did. And then I went back in the school year, starting in September. So I worked with Newfoundland and Labrador English School District. And then I just got this other job opportunity, which I just thought I would explore. It was more money, and not that that's really the issue, but given the fact that I was unemployed for a number of months, our family was financially stretched. So I really had to explore this opportunity and see. My heart is still in education, and I do hope to go back at some point.

Criss Hochhold

Absolutely. How long were you working as a TLA?

Cathy Careen

I've been in the school system with the NLESD since 2007, sometimes replacement. I've moved in and out of doing different things. I've consistently worked with young people; I've worked with Choices for Youth in the past. So as a TLA in this permanent position, that was— I guess this is my fifth year. 2019 is when I started.

Criss Hochhold

Okay, excellent. What grades are you mainly involved with?

Cathy Careen

My school is K to [Grade] 4.

Criss Hochhold

K to 4. And the ages that you typically teach will be—?

Cathy Careen

The way that the TLAs are support, so we basically helped the teachers. So, I was most often with the K to 2. They were 5 to 7 years old.

Criss Hochhold

Okay so just starting out in life really.

Cathy, in your submission to the NCI, you had stated that you were diagnosed with Guillain-Barré Syndrome.

Cathy Careen

Yes.

Criss Hochhold

Can you tell me more about that, please?

Cathy Careen

So, I am a Newfoundlander, but I was living in Ontario. Just after I moved back home to Newfoundland, I became ill with— I had pneumonia and I was experiencing really weird symptoms. I was getting hives and weakness in my extremities. And just without sharing all the details, I ended up— Nobody really knew what was wrong with me. I went to emerge. My doctor was following me, the symptoms kept getting worse. Remembrance Day weekend, after seeing another specialist on Friday, who kind of wrote it off as a flu, on the Sunday of Remembrance Day weekend—I think it was actually Remembrance Day—I woke up and I couldn't move. It's hard to explain. Anyone who's had an epidural or given childbirth and how heavy your limbs feel, that was the feeling that I had, and it was a struggle for me to walk and it was progressively getting worse.

By the time I went to emerge., I could only get my hands up like this to my head, but I couldn't comb my hair; I couldn't brush my teeth, and I was like, "Okay, this is not a flu." So I went and I saw a neurologist, who just so happened to be at emergency that day for something else.

[00:05:00]

He came and saw me and decided that I had to stay for observation. After some tests, it was determined that I had Guillain-Barré Syndrome. The first thing they did for me was put me on IVIG [intravenous immune globulin]. And it got worse: I couldn't move my arms at all. It's really weird with Guillain-Barré: like, it's not like if you had a car accident, you're paralyzed from the waist down and everything is known. I couldn't move. With help, I could get to a seated position, but I couldn't go to the washroom myself. I couldn't feed myself. My mom gave up her job and came to my bedside and she helped me actually. Yes, I was in hospital, but she did all my primary care for me. I was a young mother at the time. My children—I only had two then—were five and eighteen months old.

After two weeks of being in the hospital— Sorry I focus on this part, but it is important to understand where I was coming from. After two weeks of being in the hospital, it was— Like I said, they treated me with IVIG first, and it got worse. And then it was determined that I should have what was called plasma paresis, where I had a line inserted in my jugular. My blood was put through a centrifuge and all the bad plasma was taken out. And that went on for two weeks with the hopes of getting rid of all the plasma.

What happens with Guillain-Barré, your immune system— A doctor would better be able to explain it, but essentially what happens is your immune system is attacking your body. My

immune system was attacking the myelin sheets around my nerves, that was preventing my brain from communicating and doing certain things. I know of people who've been paralyzed to the point that they were on respirators.

Thank God that did not happen to me. But I was essentially paralyzed. I couldn't do anything for myself. I couldn't lift my arms. I couldn't feed myself. I couldn't comb my hair. I couldn't dress myself. I couldn't go to the bathroom without help.

And so then, once I was considered medically stable, I was moved into the Miller Center, which is a physical rehabilitation center in St. John's. A lot of times you'll see stroke patients there. And so, I stayed there then for four weeks as an inpatient. It might have been six, but for sure it was four. As an inpatient, where I had intensive physiotherapy and occupational therapy to try to get myself back to where I was—even though sometimes people are not lucky enough to get back to where they were and have long term residual effects.

But I was a mom. And not being able to hug my children, it was really hard. That was a thing that got me through—was thinking about getting back to my kids. After a lot of hard work—I used to be able to go home on visits. Sometimes on the weekends, sometimes in the evenings just for a few hours. But on the weekends, there were certain stipulations that my family had to have. There had to be a bed on the main floor. I was allowed to go home on weekend visits to visit my kids.

I remember one night sitting in a wheelchair and not being able to move. And my little 18-month-old, this toddler, fell flat on her face. And your instinct is to hug her, and you just can't move. And I had to sit there and just watch her cry while I summoned my mother-in-law to come pick her up and console her.

It was very surreal, a very traumatic experience for me. As you can see, I can move, I'm back to normal. My neurologist said it was pretty much miraculous that I gained the recovery level that I have. I should be very grateful for that. Now, I do have residual effects. I don't know how to describe them, they're like pins and needles in my extremities sometimes. But they're more intense than that. It's more like razors. And they just kind of come and go. And I do have a lot of tight muscles that I regularly have to get massage therapy and stuff for, like in my legs and hips.

After discussions with my neurologist—I have a letter that I submitted to you, where he said to my family doctor that it was advised for me not to get. He specified vaccinations in the letter as pneumococcal and influenza, which really, at that time, the only respiratory-type vaccinations that were available. But in our conversations, he would discourage me against vaccination period. Unless there was, you know, a way to benefit sort of deal.

So I've kind of lived my life that way for 15 years. Not as an anti-vaxxer.

[00:10:00]

I have three children; my children are all vaccinated. My pets are all vaccinated. I was not an anti-vaxxer.

But just to give you a level of an idea of the kind of support I had for this: because, since I recovered from Guillain-Barré syndrome, we had the H1N1 epidemic, that outbreak. And, you know, my family doctor was a doctor who I had with Guillain-Barré syndrome. I was her first Guillain-Barré patient. And she always, always supported me with this. So the

conversation around H1N1— I was a substitute teacher at the time. Classes were filled with sick children going home during the day and that sort of thing.

She wanted me to get my children vaccinated and my husband vaccinated for what she considered herd immunity to protect me, because I wasn't going to get vaccinated against H1N1. And that was what we determined together as a team: well, no, you can't be getting vaccination. So, I'm not an anti-vaxxer but I typically never got my children vaccinated for influenza. I really do believe, when it comes to influenza, healthy children should just deal with that growing up. I think that's part of building your immune system. And after some serious thought, I was like, "Okay, maybe I should have gotten it, a lot of young people are dying." So, they did get vaccinated.

But I, on the other hand, continue to teach out in the school system. So, one night I get a phone call from my family doctor who was very concerned about me out there teaching. She just said, "I've been thinking about you. Would you mind if I put a prescription of Tamiflu at your pharmacy for you? So that if you get any signs whatsoever of this H1N1 influenza, that you go get it." Now, I never needed it.

Another example is I used to volunteer with Therapy Dog. I volunteered at the Janeway here, which is a children's hospital. And I volunteered in seniors' homes. Now, you have to always get your tests, do the tuberculosis test. You submit your vaccination record and that sort of thing and your MMR. My MMR comes back as inconclusive because I was born before 1982, when we only got one shot. Now, I could get another one, but they advised against it.

Even when it came to the tuberculosis test, where they insert a little bit of the virus under your skin: again, they found the alternate blood test for me so I could go volunteer in these places. Now, I don't remember exactly, but I believe I did have to sign a waiver for volunteering at these, but I was allowed to go. I was allowed to go.

So, when it came to this vaccine, I was very vigilant. I started listening to people, reading things as quickly as I could just to see what this was about. I was scared too of COVID.

Criss Hochhold

Cathy, let me just quickly interrupt you then. You've got a wonderful flow going. I really appreciate the wealth of information you're providing us. I'd just like to ask a couple of clarifying questions.

What year was the original diagnosis of your Guillain-Barré syndrome?

Cathy Careen

November 2006.

Criss Hochhold

So that was in 2006. And you said there was a neurologist there at the time that happened to be there. And I do have a letter, and I will forward that to the commissioners as well for consideration: the medical exemption and recommendation. But the neurologist suggested to you in writing not to get any vaccines because of the potential hazards associated with it, is that correct?

Cathy Careen

Yes.

Criss Hochhold

Yes. Okay. Now, you may not remember the exact conversation that you had with your general practitioner—your family doctor—in regards to the vaccine. Specifically, let's say to the COVID-19 vaccine. Can you surmise potentially the conversation that you had with your physician?

Cathy Careen

I grappled with getting this when I knew it was going to possibly be mandated. I wasn't sure what to do. Let me be clear: I really did value my family doctor. I felt I had a really good relationship with her, so I called her just to talk this out with her. In all fairness, she didn't push it on me. But she didn't have—or didn't express—the same kind of concern that she did, for example, when H1N1 happened. It was basically, "Well, this is what we're recommending, and we recommend everyone to get it."

She didn't want to see me lose my job. So, she did agree to write a letter for me—again which I submitted to you as well. Because what happened, so you know—I listened to different sources of information. I've often followed the GBSCIDP.org website.

[00:15:00]

They had a whole section for people like myself, who were feeling like survivors. Apparently in December of 2020, Dr. Fauci recommended against the vaccine for people who were— Sorry, survivors of Guillain-Barré syndrome. And this organization actually wrote an open letter to Dr. Fauci asking that he reconsider that. There was a doctor on that website as well. Dr. Peter Donofrio, I believe his name was, was this chairman of the Global Medical Advisory Board. And I watched a video from him where he talked about how miraculous these vaccines were: 95 percent effective, no adverse effects.

So, as time went on, there was a news story that came out, Global News out west, I think it was dated June 17th. It was of a gentleman who had gotten Guillain-Barré syndrome from the vaccine and was seeking compensation. And in that news article, there were, I think, 14 people identified in Canada who were getting Guillain-Barré syndrome as a result of the vaccination.

I followed what was happening in the States. I followed people like Dr. Peter McCullough, who spoke earlier, and Dr. Robert Malone and their concerns. And the more I had those concerns—and, like I said, I had concerns anyway just with vaccination. I've lived my life 15 years without that. When there was outbreaks of anything at school, hand washing essentially is what I did.

So when our premier met with Francois Legault, who— Quebec had already had the mandates. I felt, okay, that's exactly where we're going, and we did. I reached out to my union on September 29th to express my concerns. At no point was I what you'd call angry. I wanted to change the conversation, because I felt like this was just too black and white of an issue.

Not that my concern is any more than anyone else's concern. But I know there had to be people like me, who had similar concerns, whether it was just because it was a new vaccine,

or they had something like blood clot issues, or— and you couldn't even have the conversation.

So my doctor did write a letter for me. But in that same letter she basically confirmed my diagnosis, said that I was advised of the COVID vaccine benefits. And I declined because of the small chance of relapse. And my neurologist told me that relapse— So the average population has a one in 100,000 chance of getting Guillain-Barré syndrome. Mine was now increased significantly because of having it again. It is still rare, don't get me wrong. It's still rare, but it's there. And my neurologist also emphasized the importance of being healthy. I take my health very seriously now. I mean, I suppose I always did on some level, but probably even more so now.

So it's not something I took lightly. And the way I see a vaccine: Why would I stimulate my immune system, which has already shown that it can turn on me on purpose? If I get a cold or pneumonia or something, I mean, I do my best to avoid that. I do my best to avoid getting sick. I take my vitamins, I exercise, I go outside. I wash my hands—

Criss Hochhold

Cathy, I think it sounds like you're taking all the necessary caution that are best for you to make sure that you're as protected as you can be without taking a vaccine. And I hate to interject, but we are running a little bit short on time. I really appreciate your story. I know you have much to tell us, but unfortunately, we have such limited time.

I just have one final question before passing on to the commissioners if they have any. Just briefly: How has this experience affected your financial situation with your family? Because I believe there was an impact there, too.

Cathy Careen

Well, I was put on paid leave. I went through the whole process of my union. I was advised to seek an exemption. That's not what I originally wanted. I wanted to just grieve the process in the beginning because I felt everyone should have a choice. I applied for EI [Employment Insurance]. I was denied. I appealed it. It was denied. On my ROE [Record of Employment], it says that in the little note box I was unvaccinated as for the mandatory policy. I had no source of income. My elderly parents were on standby, ready to sell their house so I wouldn't lose mine.

It put a lot of stress in our house, obviously—me not working. My kids got to see me being stressed.

[00:20:00]

I cried pretty much every day, because it's just a disbelief. I sit home and I was like, "I can't go to work, I'm not allowed to go to work." Even now, I still have trouble processing that.

Criss Hochhold

It is difficult to believe that, even with a medical exemption, your record of employment—which will be in exhibit for you—actually mentions in the comment section, "not vaccinated as per mandatory policy."

Cathy Careen

Thank you. I was going say, I did try all the regular ways to have the conversation. I reached out to my union before the mandates. I reached out to local radio talk show hosts. I reached out to politicians. I wrote an eight-page letter to our premier and I got no response.

Criss Hochhold

Thank you very much, Cathy. I really appreciate your time. Just if there are any questions from the commissioners, please.

No? Okay, there are no questions.

Cathy, once again, thank you very much. I really appreciate your time and I wish I would have more time to listen to more of what you have to say.

Thank you very much.

[00:21:30]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 16, 2023

Day 1

EVIDENCE

Witness 5: Shelly Hipson

Full Day 1 Timestamp: 04:42:47–05:37:30

Source URL: <https://rumble.com/v2djisi-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

The Commission is back in sitting, and I'd ask us to come to order, please. Thank you. Next witness is Shelly Hipson. Shelly, I'd ask you to affirm that you intend to tell the truth, the whole truth, and nothing but the truth.

Shelly Hipson

I do.

Ches Crosbie

Thank you.

Gayle Karding

Good afternoon, Ms. Hipson. If you could just tell us what brings you here today. What role have you played in this situation?

Shelly Hipson

Over the last two years, I've been interested in finding out the truth from government. In order to do that, there's a process called Freedom of Information. Online you can pay \$5 and request any record, and so I became kind of obsessed. I got lots and lots of records, 80 to 100 records, trying to piece this all together.

Gayle Karding

So, just walk us through, very briefly, how you do that and what exactly you can ask for.

Shelly Hipson

You can't ask a question, or you can't ask for analyzed data. You have to ask for a specific record. So, you may ask for a record about vaccines and adverse reactions to the vaccines, hospitalizations. There's the Department of Health and Wellness, and then there's the Nova Scotia Health Authority. The Department underneath that has a Public Health Branch:

that's where Dr. Robert Strang would be working. And then separate from that is the Nova Scotia Health Authority, which is a registered charity. And you're also able to do Freedom of Information requests to both of those entities.

Gayle Karding

You brought hard copies of a selection of your, we'll call them FOIPOP [requests under *The Freedom of Information & Protection of Privacy Act*], just for ease of reference. I take it these aren't all of them.

Shelly Hipson

Oh, heck no. I've got about four large, huge binders, so I was very kind to you guys. You've got the mini version of some of the highlights, and I hope that it presents enough of the picture of what I've accumulated.

Gayle Karding

Just to be very clear, every single document that we're going to be looking at today, the source is government?

Shelly Hipson

Yes, it's a government document. It's something that's come directly from those departments or the Nova Scotia Health Authority.

Gayle Karding

And specifically, I think, with the exception of maybe one or two pieces of paper, these are all specifically from the Nova Scotia government?

Shelly Hipson

Yes.

Gayle Karding

All right, for ease of reference for you explaining this to us, as well as for the Commissioners, we've divided these FOIPOPs into basically three temporal periods. So, why don't you start with describing what is the first temporal period that we're dealing with, and then you can start walking us through the information that you have received.

Shelly Hipson

What I wanted to start with is a foundation, and that foundation piece is in your binder. It's Nova Scotia Health Authority zero eight two. What that provides us goes back to 2015. So, 2015, 2016, 2017, 2018, 2019, 2020, and 2021. What we're looking at are the ICUs, the total ICUs throughout Nova Scotia. It's a big one like this, if you want to follow.

So the Nova Scotia Health Authority ICUs, and then Aberdeen Hospital, Cape Breton Health Care, Colchester, Cumberland, Dartmouth, QE2, South Shore, St. Margaret's Valley Regional and Yarmouth Regional at the top. This provides us with a scope, a context.

We can see from looking at this, in 2020, if we go down to ICUs and hospitalizations, the total for 2020 was 7,306.

Gayle Karding

Seven thousand, three hundred and six, what?

Shelly Hipson

ICU hospitalizations.

Gayle Karding

Okay.

Shelly Hipson

If we go up to 2015 and look at the total ICUs in that first column, we can see that, in 2020, it was the lowest number of ICUs since 2015, at the 7,306. Other years were 7,906, 8,300.

[00:05:00]

You would have thought maybe a pandemic would have been in 2016, as that was the highest.

2017: 8,014.

2018: 8,005.

2019: 7,708.

And we go down to 7,306 in 2020. And when we add those ICUs together for 2020, the 7,306 – I've just added to July, for example, because I have other documents that go along with that timeline – there were 12,220 ICU's.

Gayle Karding

Tell us where you found the 12,000 number?

Shelly Hipson

It's the 7,306 total for 2020 and then I've added January, February, March, April, May, June, July of 2021. I didn't include August and September because other documents go along just to the end of July. That totals 12,220. So, if we can remember that number, around 12,000 people went into ICU for about a year and a half of the pandemic.

Gayle Karding

So just to be clear, this very large document, essentially what it is: the NSHA-082 was multiple pages, and all you've done is tape them together so that it's visible all at once.

Shelly Hipson

Yes, we can also see in March 2021 that the number of ICU beds went from 121 to 117. So even in a pandemic, they were reducing the number of ICU beds. This happened throughout several hospitals. For example, Cumberland went down two, Cape Breton went down one,

Aberdeen Hospital went down four. So, it's just an interesting observation to me during a pandemic, that there would be a decrease in hospitalizations overall.

Gayle Karding

As well as a decrease in the number of ICU beds available.

Shelly Hipson

Yes. So when somebody says there's four people in hospital it can give us a reference, but there's a lot of beds there. So it's a helpful tool.

Gayle Karding

Okay, and you've put some yellow highlights, at least on my copy. Have you done that on the commissioners' copies?

Shelly Hipson

I sure hope so. That was my intention last night. I'm trying to get them done.

Gayle Karding

So those are not original to the documents, obviously.

Shelly Hipson

No, they're not. Just to help people see what I'm trying to do here: If we turn the page in your document, everybody was hearing and being bombarded with the ICUs and the hospitalizations. I was curious what was really going on, so I did a Freedom of Information request: How many ICU hospitalizations were there each month for COVID-19 in 2020 and for each month up to, including July? So, when I did that, this is what I got back, was this one.

Gayle Karding

It's entitled COVID-19 ICU hospitalizations.

Shelly Hipson

And if we want to take a brief look at that, we can glance down again by hospital. And these are just your 10 ICU hospitals. So out of the 10, five of them had no ICU hospitalizations for a year and a half into the pandemic. Aberdeen, Cumberland, South Shore, Regional, St. Martha's, and Yarmouth had no ICU hospitalizations. If we look at the rest of them, they are less than five.

Gayle Karding

With the exception of the QE2. On a couple of occasions.

Shelly Hipson

Yes.

Gayle Karding

Okay, and when you say ICU hospitalizations, this is specifically referring to in the COVID-19 units?

Shelly Hipson

Yes, this is COVID-19 ICU hospitalizations. So when we look at the 12,220 ICUs that happened during that same period on the first sheet that I gave you—there's another little sheet, because I told them that I couldn't add these at the bottom—so there's another one. We can see that Aberdeen had zero, Cape Breton Health Complex had ten, Colchester Regional had nine, Cumberland zero,

[00:10:00]

Dartmouth five, QE2 74, South Shore zero, St. Martha zero, Valley Regional 12, and Yarmouth zero. When I work those out, basing it on the number of ICUs in this first one, they are all less than 1 per cent. So COVID ICU hospitalizations were less than 1 per cent.

Gayle Karding

Okay, what's the next document that you have here?

Shelly Hipson

So that dealt with ICUs. The next one: "Well," I thought, "they're not in ICU, maybe they're all in general admissions." So I did a combination, and that's Freedom of Information NSHA 2021-173. And that's quite a long one. You're probably going to have to stretch it out here.

Gayle Karding

In the next one that I have— Oh, you've got a long one, okay.

Shelly Hipson

Yeah. It should be in the orange in the back. And just to give the audience sort of a visual as well, I've highlighted the yellow, which would be zero hospitalizations and ICUs throughout Nova Scotia.

Gayle Karding

You mean specifically—and I'm looking at this document reading it—you mean specifically COVID hospitalizations?

Shelly Hipson

COVID, ICUs and general hospitalizations. The vast majority, I was quite surprised: There's no one there. It's pretty empty of COVID.

Gayle Karding

It would appear that there's a number of spaces here that are blocked out with a section 20, sub 3, sub A cited.

Shelly Hipson

Yes—anything less than five, they blank them out. They gave me the reason that if it's one person, I may be able to figure who that person is. So it's to protect their privacy. It's interesting they black them out for their privacy.

But anyway. So, that's what that is. They're still all less than five.

Gayle Karding

Okay. Have you provided the document where they provided that explanation in the binder?

Shelly Hipson

Yes, it's one of the Freedom of Information responses.

Gayle Karding

Okay.

Shelly Hipson

I did ask them for an update on this one, and if we turn the page—it's not always easy to get. The update: they wanted to charge me \$2,190. So, freedom of information sometimes is not free. They may put stumbling blocks, I feel, in your way to be able to access that information. I just stuck that in.

Gayle Karding

Let's just back up. I want you to explain, or just clarify, that first NSHA 2021-173. What was the period over which you were seeking and obtained this information? Over what period?

Shelly Hipson

That went for the year 2020 and up until October 2021.

Gayle Karding

So, January 2020 to October 2021.

Shelly Hipson

To October 2021, yes.

Gayle Karding

And when you asked for the update, what was the period that you sought in NSHA 2022-047 that was going to cost you \$2,000?

Shelly Hipson

I asked for November, December, January, and February, so four months.

Gayle Karding

And that was going to cost \$2,000?

Shelly Hipson

Yes.

Gayle Karding

Had they asked for any additional funds in the original NSHA-2021-173 to give you the same information, for the period of a year and ten months?

Shelly Hipson

No.

Gayle Karding

So that will cost you \$5.

Shelly Hipson

Yes.

Gayle Karding

What ended up happening to your updated request?

Shelly Hipson

I redid it and I broke it apart. I do have it a little bit further on and it gives us an opportunity to compare what was happening in 2020-2021. Then it shows something kind of significant at the beginning of 2022. I have that more towards the end.

Gayle Karding

Okay. So just to put some of this

[00:15:00]

into our situational context, this long document is related to NSHA 2021-173 and includes all of the COVID hospitalizations and ICU hospitalizations of January 2020 to October 2021. The vaccine began to be rolled out at the end of 2020, December 2020. Does that sound about right?

Shelly Hipson

Mm-hmm.

Gayle Karding

Okay. So far, it would appear, looking at this these numbers, that they seem to remain consistent up until October 2021. Is that fair?

Shelly Hipson

Yes.

Gayle Karding

All right. So, the next FOIPOP that you want to address is what?

Shelly Hipson

It's a comparison of deaths from diseases of the respiratory system from 2019 and comparing it to 2020. We were told there's so many COVID cases. What was really going on with all of the respiratory illnesses? And that is this sheet here.

Gayle Karding

This is 2022-00455-SNSIS, standing for Service Nova Scotia and Internal Services. March 30, 2022?

Shelly Hipson

Correct. We have 2019, and we can see, we'll just scan right down. We've got influenza 42, pneumonia 148, other chronic pulmonary diseases 496, et cetera. It totals 895 total deaths from diseases of the respiratory system. So, 895 in 2019.

In 2020, if we scan down all of those as well—and that includes 66 of COVID-19—there's 827. So, 895 in 2019, 827 in 2020. It actually decreased by 68 during that period.

Gayle Karding

Now, this particular graph, is this one that you produced?

Shelly Hipson

It's one that I produced. The actual documents I've put in your binder. The hard copy data. I've just put them into a graph so that we can compare what happened between the two years.

Gayle Karding

Okay, so you've done, not really an analysis, but you just reorganized the data, pulled the ones that were specifically respiratory, and put it into this graph. But you've provided the actual FOIPOP where you sought records providing total number of deaths per month in Nova Scotia for 2019, 2020, 2021 and so far in 2022, as of March 30th. Records showing a breakdown with totals of causes of death for 2019, 2020, and 2021. What you were provided had a lot of other causes of death as well.

Shelly Hipson

That's right.

Gayle Karding

Okay. And you've highlighted for the commissioners which ones you've used to put into your graph. If they wish to double check your work, or confirm those numbers, they can do that.

Shelly Hipson

That's right.

Gayle Karding

Okay. And so, this is a comparison of 2019, which is pre-pandemic and the first year of the pandemic which was 2020.

Shelly Hipson

That's right. I asked for 2021, but it was incomplete, so I wasn't able to use that data.

Gayle Karding

All right, would you like to move on to the next?

Shelly Hipson

So, we are at 2021-015-75HEA. The important thing here, I feel, if we just turn to the second page; it's page one, just after the FOIPOP. I highlighted in your binders a deceased case. And I'm just going to read that out to you, because it is quite concerning to me that this would be the definition.

Gayle Karding

Let me just back up for everybody's benefit. We're talking about a FOIPOP request made on December 15th, 2021. Is that when the response comes?

Shelly Hipson

That's the response. I made it on August 19th, 2021.

[00:20:00]

Gayle Karding

Okay, and this is what you had sought from the government. You had sought the definition of a COVID-19 case, and a couple of definitions, including how they define a deceased case, and so on.

Shelly Hipson

Exactly, yes. So, a deceased case, that's on page one: "A probable, or confirmed COVID-19 case whose death resulted from a clinically compatible illness. Unless there is a clear alternative cause of death identified such as, example, trauma, poisoning, drug overdose."

I'm going to read it again. "A deceased case: a probable or confirmed COVID-19 case whose death resulted from a clinically compatible illness. Unless there is a clear alternative cause

of death”—trauma, poisoning, or drug overdose. “A medical officer of health, relevant public health authority, a coroner, may use their discretion when determining if a death was due to COVID-19. Their judgment will supersede the above-mentioned criteria. A death due to COVID-19 may be attributed when COVID-19 is the cause of death or is a contributing factor.”

So, a COVID-19 death may be attributed, or is the cause of death: the public health authority or coroner may use their discretion and it can be from a clinically compatible illness.

Gayle Karding

Okay.

Shelly Hipson

Page 4, Table 2, COVID-19 cases. It’s just interesting to note that out of a total of 5,884 confirmed cases, one quarter of them were asymptomatic. In Table 3, number of deaths of asymptomatic people are zero. I started to question the whole testing of asymptomatic people. So it’s interesting how many had no symptoms.

If you don’t have any questions there, I’m going to go right to the next—

Gayle Karding

Okay, I don’t believe that I do. This particular FOIPOP covers March—or the graphs cover—it would appear, March 2020 to August 2021.

Shelly Hipson

Right.

Gayle Karding

Okay. And these graphs, just to clarify, because some of these graphs you’ve made— These graphs are ones that were included in the response as they appear from the government.

Shelly Hipson

Yes.

Gayle Karding

Okay.

Shelly Hipson

So the next Freedom of Information is Nova Scotia Health Authority 2021-185. And what I asked for was, “any record, proof, document, report that an asymptomatic positive COVID-19 case is contagious and spread to others in Nova Scotia.” The response is: “We have conducted a thorough search of our records, but we were not able to find any records responsive to your request. We are now closing the file.”

Gayle Karding

Okay, and that was on December 7th, 2021.

Shelly Hipson

Mm-hmm.

Gayle Karding

So that one seems to speak for itself.

Shelly Hipson

Yeah.

Gayle Karding

Okay, the next document is a graph. And I take it that this is one that you produced right?

Shelly Hipson

Yes, it is.

Gayle Karding

And just to highlight for the commissioners, the sources of your information of the numbers that you've put in here are entered in the middle there where it says FOIPOP, and it provides a number. Is that right?

Shelly Hipson

Yes.

Gayle Karding

Okay. And then the percentages are something that you did.

Shelly Hipson

That's my calculations.

Gayle Karding

Based on the numbers that are in the documents cited here.

Shelly Hipson

That's right.

Gayle Karding

Okay, so can you just very quickly walk us through what this is?

Shelly Hipson

Okay, so I just wanted to put it in context. The population of Nova Scotia is just over a million people. In 2020, there were 238,474 tests done. And in 2021, 1,347,912. That's totaling just over 1,500,000 tests that were completed. Comparing that to our population,

[00:25:00]

that's a substantial number of tests. Of course, there could be people that are retesting, but that's a lot of tests. The negative tests were 1,564,648. So out of all of those total tests for two years, 20,446 were positive.

The number of people that died was 114. We know of those 114 in that first year, at least that 53 of them died at Northwood, a long-term care facility. Those are my percentages, so I'm just going to skip over those. The number of people that die in Nova Scotia: it's approximately 10,000 people a year. So, 20,000 people died in those two years, and 114 of them were from COVID.

Gayle Karding

Attributed to COVID.

Shelly Hipson

Attributed to COVID, yes. It's a very low percentage, which leads me into the next Freedom of Information response, which would be about the comorbidities. A hundred and fourteen people died. At least 53 of them were in long-term care. So, I wanted to know what else was going on? Why did they die? In order for me to stay healthy and my grandmother to stay healthy.

So the next one was Freedom of Information 2021-01142. I asked for the comorbidity data that the people had who died with or from COVID-19, including ages, sex, any information, or studies that has been gathered on those who have died with COVID-19 in Nova Scotia.

And the next one is this. And we can see in Table 1, that 86.7 per cent of them were 65 years and older. Only 13.3 per cent of them were under the age of 65. Down in Table 3, we can see that cancers were 6.7 per cent, cardiac disorders were 60 per cent, chronic renal disease was 11.1 per cent, diabetes was 21.1 per cent, immunocompromised conditions were 5.6 per cent, neurological conditions were 54.4 per cent, and pulmonary disorders were 18.9 per cent. And most of them were in long-term care. So just to add context to that.

Gayle Karding

Okay, I think now we're moving into the next temporal phase, where we're talking about after the rollout of the vaccine. We do need to pick up our pace a little bit to make sure that we get everything in. So, let's introduce your documents and the commissioners would be able to mostly consider the documents themselves. What's the first one you're speaking to—2021-01590-HEA?

Shelly Hipson

That's one of the first ones that I did that I learned about the adverse events following immunization. I'm going to leave that for them to read, due to time.

I'm going to skip to 2022-01349. And in that Freedom of Information request, made on August 29, 2022, I asked for correspondence, reports, documents given to, sent to, reported to, received by Dr. Robert Strang from doctors, pharmacies, medical officers, hospital administration, long-term care, nursing homes administration, on the topic of COVID-19 vaccine adverse events, side effects, and deaths that have occurred since it was rolled out in our province. This would include correspondence and reports on adverse events and deaths that are temporarily associated with the vaccine that have not been clearly attributed to other causes, that Dr. Robert Strang has in his possession.

Page one, Dr. Robert Strang is sending out references for communication. We saw how, across Canada, the chief medical officers seemed to parrot a lot of lines. I can understand that now because it was included in this particular Freedom of Information response. We see Dr. Bonnie Henry, Dr. Dina Hinshaw, Dr. Teresa Tam all being included in this.

Gayle Karding

Okay and this one refers to media lines.

[00:30:00]

Shelly Hipson

Yes.

Gayle Karding

So, they're indicating how people should discuss this in the media.

Shelly Hipson

With the public. Yes.

Gayle Karding

Is there anything to highlight there in particular, or just that they all have the same media lines distributed to them?

Shelly Hipson

On page 5, January 21st, 2021. That's only about a month after the rollout. Question 3, "Can vaccinated people spread the virus to others?" "There is limited evidence on whether someone who received the vaccine is still able to spread the virus." So here we were told that it was safe and effective, but that clearly states that there is limited evidence on whether someone who received the vaccine is still able to spread the virus.

"Everyone must continue following public health measures regardless of vaccination with COVID-19 vaccines to protect themselves, their loved ones, as well as people and communities at risk of more severe disease and outcomes of COVID-19."

Page 13 are emails to and from Robert Strang and their medical officers. The first one is: "Hi Rob. In case you receive any queries, I'm looking into an adverse event following immunization following the death of a resident vaccinated in long-term care. A female received a Moderna COVID-19 vaccine and died."

So that's one, and I'm just going to flip through them. Another one: "Hi everyone. Please be aware of an adverse event following immunization reported today and confirmed"—and I'm not even going to try to pronounce that word—

Gayle Karding
Encephalopathy.

Shelly Hipson
Thank you. "Develop neurological symptoms." Another one, a serious adverse event, vaccine-induced immune thrombotic thrombocytopenia.

Gayle Karding
Is that on page 16?

Shelly Hipson
That's on page 16, yes. So, with that one they choose to notify the Premier's office. There are people that have adverse reactions, including swollen, tingly lips, closure of the throat, and they are still recommended to proceed with their second dose of the vaccine.

Gayle Karding
Can you cite page 19?

Shelly Hipson
Sorry page 19. On page 24, it's just interesting: "Some adverse events are identified during the clinical trial process. However, new issues can arise once a health product is on the market because it is being used by a much larger number of people." Very much larger.

Page 27, again. Just itchiness and swollen throat after a Pfizer shot. Shelley McNeil is going to assess this situation. And this is after the second dose actually. And they— Of course, I mean, they were allergic to the first one. No big surprise. Immediately experienced headache, itchiness, flush. So the second one, the same type of reaction.

Page 29. "Some unusual adverse events following immunization came in today. Stroke, thrombotic events, thrombocytopenia alone, thrombosis, thrombocytopenia."

They knew—this was in the first few months—that people were having these adverse reactions to the vaccine.

Gayle Karding
I guess I should have been asking you for dates. That most recent one that you just cited where there's stroke, thrombotic events, pulmonary embolism: that was April 15th, 2021, for example.

Shelly Hipson
Yes.

Gayle Karding

And the earliest one that you cited was January 24th, 2021?

Shelly Hipson

Um-hmm.

Gayle Karding

So those are all between those dates.

Shelly Hipson

Yeah.

Gayle Karding

Okay, so let's move on to the next set.

Shelly Hipson

Zero-two-one-two-four. I asked the same thing—

Gayle Karding

This is for a different time period, I take it.

Shelly Hipson

A different time period. I had to break that one down because I couldn't get it all at once. They were going to charge me some money, so I broke it up. Page one at the bottom: we can see allergic reactions, anaphylaxis to one, two, three, four, five, six, seven—continuing on page two—eight people.

[00:35:00]

Neurological reaction. Female receives a Pfizer, excuse me, vaccine and has a seizure.

If we scan down, some of those are pericarditis, hyperthyroidism, rashes, pulmonary embolisms.

A male receives a Moderna shot, rash toes then serious and hospitalized. A male gets Pfizer and has a cardiac arrhythmia, thrombotic stroke, pericarditis, ischemic stroke, ischemic stroke, hemorrhagic stroke.

Gayle Karding

I'm just going to stop you. So what's interesting about this set is that at this point in June of 2021, they're now breaking down their emails to Dr. Strang into five-day increments.

Shelly Hipson

Yes.

Gayle Karding

This particular email is addressing June 7th to 11th, of 2021. They've got eight allergic reactions. They've got one neurological reaction, eight that they consider non-serious—but it includes a pulmonary embolism as well as a vitreous detachment and pericarditis. And then they've got six serious hospitalized, which you've just read to us there. A couple of ischemic strokes, hemorrhagic strokes, pericarditis, thrombotic stroke, and so on, and a death, which appears was due to pulmonary embolism. That's all in a five-day period?

Shelly Hipson

Yes.

Gayle Karding

And Dr. Strang's response was: "Will be interesting. So do we have serology for specific cases?"

Gayle Karding

He responded to that, indicating that he had seen it.

Shelly Hipson

Yes.

Gayle Karding

Okay. So then moving on very quickly through the next—

Shelly Hipson

It's the same sort of thing: anaphylaxis, allergies, pericarditis.

Gayle Karding

This is June 14th to 18th?

Shelly Hipson

Yes, June 14th to the 18th. Seizures, ischemic stroke. Again, pericarditis. Another pulmonary embolism. Even things like colitis and allergies. Another pulmonary embolism. So that's that date. And it just keeps going. He was receiving these emails knowing that people were being seriously injured and dying and having strokes. Yet it was being told to us that it was safe and effective. Page five, he has the word "concerning."

Gayle Karding

So just to back up. The response to the June 14th to 18th email: that email was sent on June 18th at 6:14 p.m. And at the top of the page at 8:17 p.m. What was Dr. Strang's response on the top of page 3?

Shelly Hipson

"So we would have to acknowledge a single case, but with few details due to privacy."

Gayle Karding

Okay. And then on that particular date, they were reporting six allergic reactions. Five they considered non-serious, but including pericarditis, tachycardia; five serious, hospitalized, including a bilateral pulmonary embolism, seizure and stroke in the same person. And on that particular date, no deaths were reported.

Shelly Hipson

Right.

Gayle Karding

And then on the next page, page five, that report covered— Well, it's in a slightly different format. But on July 12th, Noella sends an email to Dr. Whynot. "We have several myocarditis, pericarditis reports that we received today. This is the first one." And following the email thread up, what was Dr. Strang's response on page five?

Shelly Hipson

Just, "Concerning."

Gayle Karding

This is all in June and July of 2021. And the mandate and the vax pass were brought in in the fall of 2021.

Shelly Hipson

That's right.

Gayle Karding

There's several more pages of this. But, as interesting as it all is, I think we should fast-forward. And we will make electronic copies of these available to the commissioners. I'll speak to whoever might be able to put them on the web as well. What's the next one? You've got two or three minutes.

Shelly Hipson

Okay. I just want to highlight in 2022-1408, that they are not counting any of the deaths after 30 days. We can see sort of a criteria

[00:40:00]

that they have to follow. The criteria are very tight: localized events, seven days; allergic events, 48 hours; neurological events, 56 days. What I've noticed in the reply to my Freedom of Information request is that there are no adverse events being recorded after one month. So I don't know what people are seeing in their community, but I certainly have concerns of what's happening in mine. And it may take a little bit longer for blood clots to manifest into death. And they are not recording anything after one month.

Gayle Karding

Okay. I don't know how you feel about making the last one that we discuss, the comparison of the more recent hospitalizations for COVID? I think that's the one in your red folder at the back, but I'm not—

Shelly Hipson

I think it is, yeah. 161.

Gayle Karding

Yes. NSHA 2022-161.

Shelly Hipson

So, if we pull out that— We've gone from basically zeros. Did I did write on my copy, did I write it on your copy?

Gayle Karding

Probably. I've got lots of notes.

Gayle Karding

Five thousand, nine hundred, seventy-two.

Shelly Hipson

Five thousand, nine hundred and seventy-two general admissions for COVID.

Gayle Karding

Over what period?

Shelly Hipson

From—it's just January to October 2022. So, we've gone from nothing, zeros, to a substantial increase to general hospitalizations that are happening.

Gayle Karding

Specifically for COVID.

Shelly Hipson

Specifically for COVID.

Gayle Karding

As attributed by the government.

Shelly Hipson

Yes.

Gayle Karding

Are there any other ones, any last thing you want to include in there before we close?

Shelly Hipson

The exemptions, I just wanted to touch on that. The Public Service Commission did the exemptions for their government employees: 76 people applied for an exemption; 67 of those were declined. And I was quite surprised that the criteria for the exemption came from the Nova Scotia Public Service Commission and the Nova Scotia Department of Justice. They were the ones that created the exemptions for people, which was very hard to get an exemption.

The other thing that I just want to mention briefly is in the Adverse Events Following Immunization for the year 2022. On page 4, at the bottom, “a category of adverse events following immunization labeled other serious or unexpected events are not shown but are relatively frequent. These primarily include reoccurring conditions, gout, and cancer.”

They have actually acknowledged reoccurring cancer in a government document—in January 2022.

Which just leads me to Statistics Canada saying that the third week of January 2022 was the deadliest week in Canada since the pandemic began, with 27 per cent more deaths than would be expected. Recently we’ve had an article in the CBC: “Nova Scotia tight-lipped about the spike in deaths. Unexpected high numbers of people are dying in an untimely fashion.”

Gayle Karding

Thank you very much.

Shelly Hipson

Thank you.

Commissioner DiGregorio

Don’t go away yet, I have a question.

Gayle Karding

Oh, sorry, questions. Ms. Hipson, the commissioners may have questions.

Shelly Hipson

Yes, sorry.

Commissioner DiGregorio

Is this on? Can you hear me? Oh, there we go. Thank you for that. I have a couple of questions around the Freedom of Information process. Did you experience any issues in having your requests granted?

Shelly Hipson

It's been unreal. I had to be so determined and patient. There were so many stumbling blocks. I would apply and they'd extend it for another 30 days. And then they'd say, "Oh, you know, 30 days, the extension, that's 60 days.

[00:45:00]

Then it's going to cost you—this is one FOIPOP—it's going to cost you \$540." It was an important one, so a few of us chipped in on it. And even when I paid the \$540, they did not grant me the information. So it's been unreal, yes.

Commissioner DiGregorio

And how do you think they could improve that process?

Shelly Hipson

That's a great question. Freedom of Information is not free. Ontario, I believe under their act, it's more so than here in Nova Scotia. They have the liberty to put it as a stumbling block in your way. So, I would like to see it. If it's true, Ontario can't do that. So, I would like to see it. It's our information. They are our public employees. None of this I should have had to go through Freedom of Information requests. It should have been given to us. And then we wouldn't have been scared.

Commissioner Massie

I have a couple of questions. I'll start with a medical one, maybe it's out of your expertise. I noticed that many of the cases reported were sort of anaphylactic shock. Are you aware whether they make any distinction between anaphylactic to some drug or septic shock? Because septic shock can actually be induced by LPS, that have been shown recently to be a fairly present contaminant in the mRNA preparation.

Shelly Hipson

Yeah. Sadly, that is beyond my scope.

Commissioner Massie

They haven't made the distinction?

Shelly Hipson

No, I've never seen it in my information.

Commissioner Massie

My other question is— This is a very thorough work you've done. Your dedication is impressive. If you would now synthesize the message that you can gather from all of the data from the government site and contrast that with the message on the government site, what would be your appreciation?

Shelly Hipson

I think what I'm hearing you say is: Compare what I know and what they've told us from this?

I think it's sad that they didn't provide the context and they created so much fear. With the fear, people went out and got vaccinated for something that, based on my numbers, has a 99.5 per cent recovery. That troubles me: that we have those types of people that would do that to us in our government. It troubles me to see that nobody was in ICU and yet in the media line, it felt like we were just being totally overwhelmed, that the hospitals were overwhelmed, the schools were, you know.

In my mind, I cannot fathom why anybody would want to do that to people. It troubles me that that's who we have in leadership positions.

Commissioner Massie

Maybe one last question. The pandemic is a global event, so you would expect that you would have similar numbers across provinces in Canada or the States or other countries. When I look at the numbers you have compiled for Nova Scotia, by and large, that seems to be fairly low compared to what we've seen from other places. Do you think that there's something special about the people in Nova Scotia or the way the pandemic has been running in the province?

Shelly Hipson

With media lines that they used across the country, I bet if you went to every province and did exactly what I did, you'd be quite surprised. I feel that it would expose the truth. I do feel that we've been bamboozled into thinking that something was really deadly. And I don't think that happened.

I think it was like when you look at even the deceased case, and it can be probable and from a clinically compatible illness—

[00:50:00]

I mean, to a coronavirus? And they're including that in a count. It's pretty easy to get those numbers up, right? People in long-term care, sadly, when they die, they do fill up with mucus. To swab that? Okay, you've got the symptoms of COVID.

And here in Nova Scotia, 83 is the median age of somebody dying of COVID-19 in the province. The life expectancy in Nova Scotia is 80.

Thank you for your questions.

Commissioner Massie

Thank you.

Commissioner Drysdale

You talked a fair bit about ICU beds in the province. I have a couple of questions. One is: Did you also ask about the ICU bed staffing? Because it's one thing to say you have a bed and it's another thing to have a staffed bed.

Shelly Hipson

That's a great question. And I did. I asked for the number of beds that were staffed over the last two or three—2019, 2020, and I believe it's for 2021. And there are around 3,100 staffed beds. And I didn't see a decrease. Now, that might be happening in 2022.

I did do another Freedom of Information asking how many people were no longer working or who were out on COVID. And that seems to be growing. So yes, that's a great question.

Commissioner Drysdale

My next question again has to do with ICU beds. I thought I heard that you were looking at stats prior to 2019, and so my question is: Did you look at ICU bed numbers in the province, say from four or five years ago, and then try to see what the trend was? Whether the ICU beds in the province prior to the pandemic were increasing or decreasing or staying the same?

Shelly Hipson

That's what this beauty chart is here, the first one. As far as the beds are concerned, they're staying about the same. As far as the ICUs, hospitalizations particularly with COVID: I think they could be seeing a bit of a problem. There is another fold in there with the ICU beds and it looks to me like they've tripled for COVID ICUs.

Commissioner Drysdale

One last question because I know we are short on time. This is more or less based on the testimony we had earlier from Dr. Phillips. You talked about a number of adverse reactions, and you did a FOIA request on that. Do you have any information as to how many of those adverse reactions were actually reported into the CAEFISS system?

Shelly Hipson

No, not into that system. I don't. I see where I've done Freedom of Information requests and I'm seeing a change in those numbers. They're decreasing, they're not increasing. So, I do question how much cleaning of the data they may be doing. I don't think they're all getting in there. And when I start to see the emails and the number of strokes and things that are happening and then I see the serious adverse events, the number should be much higher. There's something going on there in my opinion.

Commissioner Drysdale

Thank you.

Commissioner Kaikkonen

Thank you for your presentation. I just have one quick question. Given that the chief medical officers across the country had the same messaging for communications to the populace, I'm just wondering why there were different mandates and measures put in place from Nova Scotia to other provinces within Canada? Did any of the Freedom of Information requests actually give any evidence as to why that would be happening?

Thank you.

Shelly Hipson

No, the media lines that I received were primarily dealing with reactions to the vaccine. So, they were specific to that.

Commissioner Kaikkonen

Thank you.

Shelly Hipson

You're welcome.

Gayle Karding

Okay, thank you, Ms. Hipson.

[00:54:56]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Truro, NS

March 16, 2023

Day 1

EVIDENCE

Witness 6: Dr. Stephen Bate

Full Day 1 Timestamp: 05:39:00–06:01:27

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

Dr. Bate, thank you for appearing here. I'm going to ask you to affirm that you intend to tell the truth, the whole truth, and nothing but the truth.

Dr. Stephen Bate

I do.

Gayle Karding

Thank you. Good afternoon, Dr. Bate.

Dr. Stephen Bate

Good afternoon.

Gayle Karding

I'm one of the Atlantic Council on the NCI team. Can you just very briefly walk us through your credentials?

Dr. Stephen Bate

Okay, I'm a retired dentist graduated with a Bachelor of Science in Chemistry from the University of Western Ontario in 1986 and in dentistry, Doctor of Dental Surgery, in 1991. I practiced privately in Concord, Ontario from 1991 to 2013. I've since retired due to injuries in my shoulders and have moved to Newfoundland in 2017.

Gayle Karding

And I understand that your university education was heavily weighted in the math direction, is that right?

Dr. Stephen Bate

Yes, in fact I didn't pursue a degree in mathematics—but I took all of my elective courses, while pursuing a BSc in chemistry, in math and physics.

Gayle Karding

And you have a special interest in statistics and data analysis.

Dr. Stephen Bate

I do, yes. I've got a keen interest in it.

Gayle Karding

Do you apply that interest in a number of areas?

Dr. Stephen Bate

Yes, for many years, I was doing stock analyses personally and I have always been interested in sports analysis. But the last few years since the breakthrough cases, when they occurred, it piqued my curiosity. Because being in the medical field, I always believed that vaccines would stop transmission to a great degree—if not some degree. But when I started hearing about breakthrough cases, I did send an email to our health officer Dr. John Hage outlining my concerns. I knew people were saying, "Why am I getting this disease? I got vaccinated."

I received a response basically saying that the government was tracking breakthrough cases. They weren't going to be producing any evidence or any numbers for the population, but national surveillance was being done. Which kind of shocked me.

Gayle Karding

You had an opportunity to apply your math skills and data analysis skills to two discrete areas that we want to talk about today. The first being the Pfizer document, the document released by Pfizer— or I suppose, more accurately released by the Department of the FDA [Food and Drug Administration]— after that order by the judge in January 2022. Is that right?

Dr. Stephen Bate

Correct.

Gayle Karding

What is that document? I think we have a copy to put up.

Dr. Stephen Bate

Yeah, it's the adverse events that Dr. McCullough referenced earlier. I pulled this up last year and looked at it. And was rather shocked, to say the least, that a lot of it was redacted at the time. It got re-released a month later.

When I went to look at it again, I couldn't find it, because it was originally released to March 1st, then they moved it to April 1st. So it got harder to find. But when I did this, what I discovered was that there were about 42,000 participants in their clinical trials. They were monitored from December 14th to the end of February of—I guess—2019 to 2020. And 42,086 had side effects, numbering nearly 160,000 side effects. The average person had almost four.

They reported that out of the 42,000 individuals that Dr. McCullough referenced, 1,223 resulted in fatal results; 9,400 of the outcomes were unknown. Which is astonishing.

Gayle Karding

Well, what does that mean, "unknown?" Or what would you think that means?

Dr. Stephen Bate

Well, they didn't report. And then my personal understanding is people that die don't report. I can't say they all died but, how they got lost in the system, I don't know.

Further to that point, if I can just move to the next slide: this is in the same report. They spoke of the pregnancies that were involved, the mothers they followed. There were 270 pregnancies. In the end, they only were able to— Two hundred and thirty-eight they did not follow, they got lost. Thirty-two they followed. Only one had a normal outcome of a live birth.

I'll move on. Further in this report, they categorized by physiological—what was the cause, basically. They broke them down into cardiovascular, neurological, all the different possible categories of this. And just to show you one here for cardiovascular: they state in the relevant event outcomes. Fatal was 136. And the conclusion, which is too small for me to read here, but I believe it says, "The cumulative data indicates no safety concerns.

[00:05:00]

And surveillance will continue."

Gayle Karding

That's at the bottom of that slide there. Let's just review here. "Conclusion: this cumulative case review does not raise new safety concerns, surveillance will continue."

Dr. Stephen Bate

Correct. And just to illustrate that that was not an isolated incident, the very next one is people that got COVID either through transmission or possibly from the vaccines, the same thing happened here: 136 fatal conclusions. "This cumulative case review does not raise new safety issues. Surveillance will continue."

So that's Pfizer's own data that they tried to hide for 75 years. I think I know why.

Gayle Karding

When you say tried to hide for 75 years, can you just tell us what you mean by that?

Dr. Stephen Bate

Well, they were asked to report and give their data, and they refused to. There was a doctor in the States who—I can't think of his name offhand—but he had to spend a lot of time and money to go to the Supreme Court in various jurisdictions to get a judge to finally say, "Yes, you need to release that data."

Gayle Karding

Okay. What's the next page that we're looking at here?

Dr. Stephen Bate

We're looking now at Canada.

Gayle Karding

So sorry—we're moving on from the Pfizer trial.

Dr. Stephen Bate

I'm just looking at safety issues here in Canada. So that's just from the manufacturer. In Canada, it was reported January 8th of 2021, so it was the second week of reporting. This is what they reported: that there had been 10 serious adverse events reported and 338,423 doses administered, for an overall incidence of 0.003 per cent who were serious.

And now I move to the next one. As time went on, they made provisions to update the data. As more events occurred, they could re-establish what the numbers were from previous reports. Down the road, this would be December 9th, 2022: that very week they'd reported previously suddenly had 31 serious outcomes and 256,000 doses were no longer in arms. They only had 82,500 doses administered.

Gayle Karding

So sorry, what is the contrast you are pointing out here?

Dr. Stephen Bate

Well, basically, they— After a year and 44 weeks, they decided to then update the data. They'd been doing it progressively throughout the time. But at that point in time, the number of serious adverse events tripled, and the number of doses that they claimed were given went down by a factor of four. So tripled the serious adverse events, one-quarter the number of doses given; 12-fold increase in the serious adverse events were actually observed early on in the vaccination program.

Gayle Karding

And where did you obtain this data?

Dr. Stephen Bate

This is all from healthinfobasecanada.ca. You look for vaccination safety data, it's all there.

Gayle Karding
Is this still there?

Dr. Stephen Bate

I'm not sure. I actually got this from a third party who sent this to me. I had some of this data and she sent this to me in an email just a few days ago, so I'm not 100 per cent sure.

Gayle Karding
Whether it is still accessible.

Dr. Stephen Bate

I'm not sure. I think it is, but again, it gets changed all the time.

So really noteworthy, if I can just move on to the next here, is: this is a slide showing— The numbers in pink and the yellow outline are what the data was for these first six reports of 2021. And the ones that are just in the purple are what they had reported. So you can see that there's— The 338,000 original doses and 10 adverse events became 31 and 82,000. As time goes on, the doses became more true or accurate. But you can see even in May of 2021, where they had originally reported 1,262 serious adverse events, it was actually 2,234 now being attributed to that time frame.

Gayle Karding
What, if anything, do you make of that?

Dr. Stephen Bate

If I could just continue, there's an explanation forthwith. So basically, back early on—this is April 15th, 2022—as the numbers started climbing, they had 128 Guillain-Barré syndrome attributed side effects, and myocarditis/pericarditis were 2,044. And this again is from a third party. I didn't write the red things in here, so you can try to ignore those.

Then in May of 2022 they reclassified these based on the Brighton Collaboration Index. And they grade these things in different levels—1 to 4. Suddenly they have two classifications for each of these. And then they decided later on in May to go back to 1, and they dismissed 120 Guillain-Barré syndromes. And a thousand myocarditis/pericarditis were then no longer attributed to this. So I believe, as they went back and increased the numbers

[00:10:00]

from the previous ones that were not reported, they then removed these, so that the total numbers continually went up just a little bit week to week.

A bit of sleight of hand, I'd say.

I'm going to move on to effectiveness now. I just want to go through a series of these just to show these are screenshots that I took from the same healthinfobase.canada.ca. You may be familiar with these. They used to categorize these as such: unvaccinated cases not yet protected, partially vaccinated, fully vaccinated, and fully vaccinated with additional dose.

I've got this from May 8th, 2022. I then got June 5th, 2022. July 3rd, July 31st, August 28th, and September 25th. Now, in each of these publications—

Gayle Karding

Sorry, are we going to go back and look at those and you're going to walk us through those charts?

Dr. Stephen Bate

I've got all the data on this hand thing I did, right? So those numbers are all here, but I'm going to summarize them shortly. For instance, May 9th to June 5th, unvaccinated cases were four times more likely to be hospitalized, five times more likely to die from their illness—which I would only assume would be per case, based on a percentage of cases—compared to fully vaccinated cases. During the same four-week period, unvaccinated cases were four times more likely to be hospitalized, six times more likely to die from their illness compared to cases fully vaccinated with one or more additional doses.

I'm just going to go quickly through these. They're the same; there's five of these. And again, these are only here because I screenshotted them. That data is no longer there. There's a few of them that are there but if you go back, they only go back to April of 2022. And half of the dates, if not more, have no data whatsoever. In fact, if you go back to the very first one, I think it's April 10th or something, if you click on that one, it has the September 25th—in the future—data on it! It's absolutely nonsensical.

But I'd really like to highlight one here. It's August 1st to August 28th. These are some pretty big numbers. They claim that unvaccinated cases were five times more likely to be hospitalized and seven times more likely to die from their illness compared to cases with a completed primary vaccine series. During the same four-week period, unvaccinated cases were seven times more likely to be hospitalized, and eight times more likely to die from their illness compared to cases with a completed primary vaccine series and one or more additional doses.

So I did this. This is my work. I'm old school. My dad taught me early in my life that if I wanted to remember things, you write it down. You don't just look at a screen or type it in. It doesn't stay. I've been doing for a couple years now. I've got five books of this graph paper that I've been doing analysis of various things COVID-related on. This is a summary of those numbers for everything that I showed you there. Hospitalization rates are given and death rates for the periods. I really want to isolate on this August data. And the last three reports are very, I'd say, very damning to the vaccinated. I'm going to look at death rates individually here. For July 3rd to 31st, the death rate in the unvaccinated was 1.09 per cent. In the fully vaccinated plus one dose, it was 0.94. With two doses, it was 1.95. For those with any vaccinations whatsoever, fully vaccinated—they stopped doing the partial ones—1.23 per cent.

So now, in August, these numbers become a little more scary. The unvaccinated is: 1.36 per cent of cases resulted in death. The fully vaccinated with boosters: 1.90. They claimed that you're eight times more likely to die if you're unvaccinated from your case than if you'd had a booster dose or more. And in fact, those people were dying at about a 40 per cent higher rate. Not lower by eight factors, higher by 40 per cent. And the same holds true in the September data as well.

I just want to point out quickly—I do believe I have it here. This is the World Odometer, yesterday's data. I believe the number of deaths attributed in Canada so far is 51,000 some-odd, out of slightly over 4 million cases reported, for an overall mortality rate of 1.12 per cent. So 1.12 per cent. If we look at the fully vaccinated with one or more doses and two or more doses, those numbers for the last two months are basically double what they've been for the entire duration of the pandemic, with a less mortality variant in play, apparently. These are rates, not numbers.

So how is it that twice as many people that are diagnosed are dying than throughout the entire pandemic? That is what I can't quite comprehend.

Gayle Karding

Okay, does that conclude your prepared statements?

Dr. Stephen Bate

Not quite, no.

[00:15:00]

I just want to point this out as well. So these are basically the same things I looked at: What they claimed the percentage, or the factor of hospitalization and deaths were compared to what the actual numbers that they published in the same report actually were. And you can see from the bottom three here: basically, hospitalization rates were lower in the unvaccinated. The death rates in particular were much lower in the unvaccinated population than those receiving fully vaccinated, plus one or plus two booster doses.

Further to this, I want to talk a little bit about the vaccination coverage that's been reported. And this is the most up to date. This is from Canada.ca. And I just want to look at the one here saying, "total population that has received at least one dose," is stated at 80.7 per cent. And then if we go to the same place you go to access this, you click on a different button. You can get the health info-based number and this one says at least one dose, 83.4 per cent.

And that is a 3 per cent of the population difference. It's the same people doing the data, I believe. Somehow, they report two different numbers. It boggles my mind a little bit, to quote John Campbell on that. But I do find that astonishing, that the same people report different numbers from the same webpage.

And I just want to quickly point out from the previous speaker—and I thank her for her diligent work. I think it's noteworthy, when we look at respiratory illnesses that result in all these problems and lockdowns and mandates and so forth, if we look historically— And this is hard to find, I looked it up just a couple months ago, and I thought last night, because I'm a fast talker I might be able to slip this in too, but I looked at data for the influenza virus. And in the USA in 2019-2020, there were 36 million cases confirmed. And in the 2020-2021 flu season, there's no data. They said it was too little to find. And I did find one reference and the number was 1,675. This represents a 99.995 per cent reduction in influenza cases confirmed in the United States. Infer what you will. In Canada those numbers went from 55,379 to 69 the following year.

Say what you like, it seems something may have got renamed. But at the end of the day, there were more COVID cases reported than flu cases previously. So how did that happen?

I'd like to point out one thing— With my bit of a mathematical mind, I looked into the cycle thresholds that were being run on PCR tests in Newfoundland and Labrador, where I'm from. They're running at 45. Now, I know Dr. Carey Mullis, who developed the PCR test, stated that anything above about 26 cycle thresholds was meaningless because there's too many false positives.

To put into perspective: I did a little math. And if you have a loonie in your hand, your loonie is worth one dollar. And if you ran that at 45 cycle thresholds—which is to multiply it by two 45 times; it's an effort of magnification—it comes out to over 31 trillion dollars. To put that into a more visual perspective, that one loonie weighs seven grams.

If you took seven grams and multiplied that by 245 times, you'd have the mass of enough Titanics to lay end-to-end for 1,200 kilometers.

So if you want to bump up some numbers, run 45 cycle thresholds. No problem. Done.

There's one more comment I'd like to make. In Newfoundland and Labrador, they've been doing pie charts. They've stopped. Everyone I've talked to pointed out their discrepancies. They have ceased to report vaccination status data. But in Newfoundland and Labrador, all told, I think we've had 300 or 400 deaths. I haven't looked at it recently. They haven't reported it recently, so I don't know. But I know that between May 11th and June 8th of 2022, there were 11 deaths reported. And they used to do daily updates and say how many cases were from which area, which age groups, and so forth. They noted in that release on June 8th of 2022 that, of the 11 deaths, very sadly and tragically, one had occurred—our first death in the under 20 age group. And at the same time, another one was reported in the 30 to 39 age group.

[00:20:00]

And to this date, they are still the only two under the age of 40. All 11 deaths that week were fully vaccinated. So not a single unvaccinated person under the age of 40 has died in Newfoundland and Labrador attributed to COVID during the entire pandemic.

Gayle Karding

Thank you very much for your presentation, Dr. Bate. I'll defer to the commissioners for questions.

Commissioner Massie

Thank you for your presentation. I've seen some analysis of the government website in terms of the number they were coming up with respect to the likelihood of getting hospitalized or dying.

I'd like you to comment on what kind of data representation you could actually come up with in order to generate these kinds of conclusions, given that the numbers you've calculated are completely different.

Dr. Stephen Bate

Well, it's speculation. I don't want to say they're lying necessarily, but it seems to be a form of coercion that, "If you don't get the vaccine, you're probably going to die." We've seen it through the media throughout—especially in the States. You know, "If you don't get it, it's

going to be a painful, terrible winter,” and all this sort of thing. I also know personally that in Newfoundland and Labrador, they’ve reported for almost a year now that 100 per cent of the over-70 population is fully vaccinated. Personally, I know about 20 people in two small towns, totaling about 14,000 people: Clover Town and Gander. I have a list of 21 people over the age of 70 that are unvaccinated. And for this to be true, for the 100 per cent to be not 99.9, there could only be 31 in the whole province.

Commissioner Massie

Do you want to ask a question? All right. Thank you. Thank you very much.

[00:22:27]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie

Welcome. Do you swear to tell the truth, the whole truth, and nothing but the truth?

Vonnie Allen

I sure do.

Ches Crosbie

Thank you.

Vonnie Allen

My name is Vonnie Allen. I was born and raised in Amherst, Nova Scotia. I left Amherst and moved to Moncton, New Brunswick, only long enough to get my RN diploma and begin my nursing career. In April of 1987, I moved back to Amherst with my then-husband and began working at Highland View Regional Hospital. In February of 1988, upon returning from my two-and-a-half-month maternity leave, I was given casual employment on the maternity unit. Little did I know that maternity is where I was meant to be and that I would develop a passion for it that would last almost 34 years—until I was unceremoniously put on unpaid leave on December 1, 2021 for standing up for my rights and declining to take an **experimental medication**.

I am the proud mother of four adult children and the blessed nanny of three little boys. Only one of my children has been awake and supportive of me throughout this three-year ordeal. Unfortunately, the oldest three have believed the mainstream media and the government and have been made unreasonably fearful like so many others. Two of them have forbidden me to speak of anything related to COVID and the mandates. I have been muzzled and disallowed to talk of the impacts that the COVID mandates have had on my life: The loss of my career, the loss of my income, the loss of respect from much of my community, the refusal of EI to give back any of what I paid in for over 35 years, the seven months I lived with no income except what I could borrow from friends and family and an RRSP I was forced to cash in, the inability to step foot in my local bowling alley for five

months, a place I called my second home for over 40 years, and the denial of entrance to my own local hospital when my youngest daughter had a grand mal seizure last year and had to be rushed in by ambulance.

She didn't know her own name. She couldn't speak. She was totally incapable of advocating for herself. She was terrified. And I, her mother, a formerly respected veteran nurse of that very hospital, a hero just two years earlier, was not allowed past the front door because I was not vaccinated with an unproven experimental drug.

I was married to my children's father for 29 years, spent 36 and a half years with him total. He was emotionally abusive, an angry man, and he worked when he felt like it. So for all but two years of our marriage, I was the major breadwinner. For two years, he worked up north in Baker Lake, Nunavut, and made great money. But then he quit and felt that because he had missed so much while he'd spent many months away, he was entitled to a year off. So the bills piled up. I tell you this because for my entire marriage, I lived paycheck to paycheck, robbing Peter to pay Paul. Which credit card should I put money toward this pay?

When I left him in 2016, I took on all of our accumulated debt, \$55,000, in return for him not demanding spousal support. I got a consumer proposal, and I paid off our debt as well as my vehicle. Times were still tough for me for a few years. But then they were both paid off, and for the first time in my life, I had money. I could buy groceries without worrying. I could give money to my kids when they needed it. I could give them each \$200 or \$300 at Christmas time to help them out. I could go on vacation or rent a cottage in the summer, and I could actually save money. Life was good.

Fast forward to 2021. I started to hear grumblings that I might lose my job if I didn't comply with the vaccine mandate. My unit was so short-staffed that overtime was readily available. I started picking up overtime shifts in an effort to build a nest egg just in case I should lose my job.

[00:05:00]

But I didn't really believe that was going to happen. Surely to goodness, during the worst nursing shortage in history, someone would come to their senses, and the most senior, most knowledgeable, most experienced nurse in the obstetrical department would not be put off work.

But that is exactly what happened. I went to work on December the 1st and was told by Director of Health Services, Lisa Lynch, that I had to leave. And being denied EI, my little nest egg didn't last long. My employer told EI that I left voluntarily with no just cause. It didn't seem too voluntary to me. In March of 2022, I was forced to put in for retirement, and I'd had no intention of retiring in the immediate future. I loved my job. I didn't receive a check until June. Fortunately for me, they backdated my retirement to December the 1st. Unfortunately, my ex-husband got 45 per cent of my pension. So once again, after paying back all the people I owed, I was soon back to living paycheck to paycheck—and through no fault of my own. I had done nothing wrong.

In 35 years, I had never been disciplined or reprimanded. I had only stood up for my rights, and not in a hateful, malicious way. I had simply declined to put into my body what I felt was not a safe or necessary chemical. And anyone who really knows me knows that I have avoided chemicals as much as possible for many years. So this wasn't a new radical stance for me. It was totally in keeping with my natural lifestyle.

I was devastated to lose my job. I loved nursing. My dad used to tell me that when I was a little girl, I always wanted to be a nurse and a mother. So I was a happy woman. Caring for obstetrical patients in labour and delivery, teaching breastfeeding to countless women, caring for them postpartum was my passion—and I was damn good at it. Just ask the women of Cumberland County and surrounding areas who have delivered a child in Amherst since February of 1988, and they will confirm that. To this day, I meet women of all ages in all settings who tell me that I was there when they had their child and that they have never forgotten me.

Obstetrical nurses have a huge impact on women's lives, as well as their families' lives, and I was very fortunate because our unit looked after off-service patients and pediatric patients as well. Heart attack patients from ICU, awaiting cardiac catheterizations, surgical patients, medical patients, gynecological patients, palliative patients—we got them all. And I was always thankful for that because it kept me learning and enabled me to keep my hand in all aspects of nursing to some degree. And it allowed me the privilege of caring for men and women of all ages. So nursing was my passion, and though I had done nothing wrong, I was no longer allowed to do it.

And that brings me to my co-workers. How I loved my co-workers. And I can safely say that the majority of them loved me, and they depended on me. They looked to me to answer their questions and show them how to do things. They came to me to start IVs because I was the expert. They came to me for my advice because I was the only one on my unit with 35 years of knowledge and experience. I hadn't seen it all, but I had seen and been involved in most of it.

Labour and delivery nursing involves looking after two patients, and one of them can't be seen. It's an art, a talent, a gut feeling, a skill, and it's not a skill that one develops overnight. It requires knowledge, but it also requires experience. You can read about all the obstetrical emergencies in a book and take a course and ace the exam. But nothing can replace living through those emergencies firsthand and learning how to deal with them to come out on the other side with a live mother and a live baby who are both fully functional. And sometimes, regardless of what you do, you lose a baby. I have experienced that firsthand with my first pregnancy culminating in a stillbirth. So I was always drawn to those mothers who suffered a similar loss. I felt I had something to share with them, and Lord knows that no one else was jumping up and down to look after them.

[00:10:00]

In my almost 34 years in obstetrics, I had dealt with most obstetrical emergencies, both as a patient and as a nurse. So I was not just a valued and loved co-worker. I was their **mentor—their only mentor.**

The next person in line to me had about five years' experience. One co-worker had worked in obstetrics with me many years before but had actually left nursing altogether for several years. So upon returning, she had forgotten a lot of what she had known and had also lost her confidence. And confidence is important. Knowing what you know. Not being cocky, but confident. It is knowledge and confidence that allows you to stand up: To stand up for your patients and be their advocate. To stand up to the doctors when you don't agree with their approach or treatment. To stand up for yourself and your co-workers when management is putting you and them into unsafe working situations. And I did that for my patients and my co-workers. I stood up for them. And I stood up for myself, which is why I don't have a career anymore.

Thank you.

Gayle Karding

Thank you, Ms. Allen. I'm going to follow up with some questions. I think you've touched on everything that I could think of for your personal situation, and you've described in a very heartfelt way the impact on you personally. I do want to spend some time with you since you spent so long in the Cumberland region practicing nursing. I wanted to talk to you generally about the health care system there in and around the time of the pandemic.

Vonnie Allen

Yeah.

Gayle Karding

You used the phrase in your evidence, "fully staffed," and how infrequently the unit was fully staffed, and so there was lots of overtime available. What would a fully staffed unit look like?

Vonnie Allen

So full staffing on my unit was considered to be two RNs and one LPN around the clock. In the year before I left, full staffing was in place probably about 60 per cent of the time. Often, we were staffed with one RN and one LPN. If we were lucky, we had one RN and two LPNs.

Our LPNs were good. They were smart and capable, but their scope of practice had limitations. LPNs are not permitted to be the labour and delivery nurse. They could be the second nurse in the delivery room and look after the baby when it was born, and they could initiate a resuscitation if it was necessary. But if there was only one RN on, it meant that if there was a patient in labour, she had to be one-on-one with that patient. It meant she had no one to relieve her for breaks and no one to look after a second labour patient if one came in. That was a scary scenario, one that you were always hoping would never occur.

And having only one RN put a lot of pressure on our LPNs. They were expected to look after the entire unit outside of the delivery room, plus come in to help the RN during the delivery. So if we couldn't staff with two RNs, we always tried to have two LPNs with our one RN. More bodies was preferred. LPNs were more likely to pick up extra shifts if I was the RN on that shift. Because they had confidence in my knowledge and ability to keep my cool and handle whatever situation came up.

Gayle Karding

And when you were fully staffed, or at least had a full RN contingent, which would have been two of you on at once, you've said that you were often acting as a mentor to the other RN who was on.

Vonnie Allen

Oh, absolutely, yes, yeah.

Gayle Karding

And so, when you weren't there, presumably one of those less experienced were the only ones on. If there was only one.

Vonnie Allen

Yes. And they were put into terrifying situations. And the thought of being two or three, or four, years' experience, five years even, and not having anybody else for back up? It's terrifying.

Gayle Karding

My understanding from speaking with you earlier was that in the context of this short staffing from March to September, your obstetrics unit was actually closed.

[00:15:00]

Sorry, from March to September 2020, your obstetrics unit was closed.

Vonnie Allen

Yes.

Gayle Karding

What was the reason to the best of your knowledge for that closure?

Vonnie Allen

We were closed from March 27th to September of 2020. We were told it was because we were already so short-staffed that if any of us got COVID, the unit would end up shutting down anyway. So we were rerouted to other areas in the hospital, most often medical, but sometimes surgical or ICU or emerg., and during those five months bed occupancy was down drastically. There were no COVID cases in the hospital. There were very few patients in the hospital. Medical had 38 to 39 beds and they might have 20 beds occupied. The ER generally had very few patients during a shift. Often the nurses were sitting around behind the desk chatting because they had no patients. And the majority of patients on medical were patients with dementia, awaiting placement.

And I have to speak on their behalf. Here we were in our black and white uniforms with masks on. They were already confused. They could never get familiar with anyone because we all look generally the same. The mask muffled our voices and hid our facial expressions and kept them from reading our lips when most of them had some degree of deafness. I would often stand across the room from them, pull my mask down so that they could see that I was a human being, and talk to them in a raised voice so they could read my lips. It was a horrible way to treat people. They weren't permitted any visitors and they knew none of us.

I saw some amazing nurses go out of their way to try to enable these patients to FaceTime with their families or talk with them on the phone, but most of the patients struggled to understand what was going on.

Many of them died before they were ever placed in long-term care because the rules for getting into long-term care were ridiculous during COVID. If they became palliative, then they were permitted a family member—or sometimes two—but never at the same time. Imagine. It could be two people who lived together at home, but they weren't allowed to visit their dying mother at the same time. Often by the time they were palliative, they no longer recognized their own family members because they hadn't seen them for so long. The masks and the rules were a travesty to health care and particularly to this segment of our society. And during all that time we did plenty of testing, but we never had one case of COVID.

Gayle Karding

In the context of the government messaging about how unsafe an unvaccinated nurse would be to their patients, did you ever alert any of your patients to your status?

Vonnie Allen

Every one of them.

Gayle Karding

How did you do that? Tell us about that.

Vonnie Allen

I would just bring it up in conversation. I was led to believe by the occasional person—not many. My nursing co-workers were very supportive of me, unlike a lot of people that I hear of. But on occasion, I would hear grumblings that patients didn't want to be looked after by nurses who weren't vaccinated. So I made a point of telling them all that I had not been vaccinated against COVID.

I never once had a single patient respond in a negative way. I never had one of them ever ask to have another nurse. Now, at times that would have been difficult because I would have been the only RN. But there was never a patient that ever made me feel uncomfortable or like they felt like they were being looked after somebody who had the plague.

Gayle Karding

Those are all my questions. I'll defer to the panel for any questions.

Commissioner Drysdale

I have a couple of short questions. Were you the only one in your health community that was affected like this, that were let go?

Vonnie Allen

In my hospital, I was the only RN. There were two LPNs on the medical floor who didn't take the vaccine and so lost their jobs.

[00:20:00]

I have no way of knowing how many other people in my hospital in other departments or how many other people in, say, nursing homes in the community didn't take the shot.

Commissioner Drysdale

It also said that the unit was closed down between March and December.

Vonnie Allen

March and September.

Commissioner Drysdale

September 2020. And the reason given was that if they lost one nurse, they couldn't operate.

Vonnie Allen

Yeah.

Commissioner Drysdale

So my question is, when they lost you, how did they operate?

Vonnie Allen

Well, I can tell you they're not a happy bunch. They were terrified when they started thinking that they might lose me. We would have staff meetings and one of the girls would say, "Why aren't we going to talk about the elephant in the room here? Like, what are we going to do if Vonnie has to leave? What are we going to do about this?" And our unit manager would respond by saying, "Well, you know, that's not really something that I have any information about. I can't really talk about that." And nobody was giving us any answers, and we just kept hoping beyond hope that it wouldn't happen. We had just started a new rotation recently and we were having a difficult time filling the spaces in that rotation. As I said, overtime was readily available. So they were wondering, "What are we going to do when we lose you too?" And not just another staff member, but the one with the most knowledge of anybody there.

One of my co-workers messaged me last week, and I actually sent the message to Gail. She said, "Vonnie I'm still grieving the loss of you from our unit." She said, "It's never been the same since you left. I feel like it was the beginning of the end for us." She said it's not a good place to work anymore. It's not safe and she said, "It's just not right, you know. We're missing you badly."

Commissioner Drysdale

Did you receive any comments, support, or anything from the rest of the staff—the doctors? You talked about the LPNs. You talked about the nurses. I didn't hear you say the doctor word.

Vonnie Allen

Well, it's interesting. One of our obstetricians, I had a great deal of respect for her. She had a few more years' experience in obstetrics than I did, and she and I often disagreed on a lot of points. But we respected each other enough to agree to disagree. But when it started getting down to the end and I knew I was going to lose my job, she would approach me and say, "Vonnie, what are you going to do? Like, why don't you take the vaccine?" And I'd say, "No, I'm not taking the vaccine. I'm not sure what I'm going to do, but I'm not taking the vaccine." And "Well, aren't you worried?" "Well, yeah, I'm worried, you know?" And then she sent me a message one day on Messenger that said, "I've been hearing that you might not be able to get your pension. They might just pay it out in one lump sum. I'm really worried about you." And she said, "Aren't you worried?" And I responded and said, "Yeah, I am worried, but doesn't that seem a little bit Nazi to you?" Take this experimental drug that has no proven effectiveness and no safety record, or you're going to lose your job and you might lose your pension too. And she responded back by saying, "No, that doesn't sound Nazi to me. No one's leading you to the death camp. No one's taking you to the gas chambers." And then she went on this big tangent about how important it was to take it. Nobody said it was 100 per cent effective, but you need to take it to protect all those vulnerable people in society. That's the last time I ever messaged with her.

Commissioner Drysdale

Thank you.

Vonnie Allen

And as far as the other doctors on the unit, they didn't really have much to say. One of them is my family doctor, and I've always admired him.

[00:25:00]

But none of them stood up for me, basically. We had one doctor in the entire hospital who spoke out very, very candidly about the vaccines, about the lockdowns, the mandates, the masks. I don't know how he's still practicing. His Facebook page is covered on a daily basis with this stuff, and I'm thinking, how is he getting away with it? You know, he's still a doctor. He's the only one—the only one who spoke out against it.

There's one other thing I'd like to point out. When I left, I took with me a lot of knowledge and experience. And one of the areas that I can assure you is really suffering right now is breastfeeding. I never took the lactation consultant course. I started it when my children were very little, but I soon realized that my kids would only be little for so long and it took up far too much time. One of my co-workers, a friend and a co-worker for 28 years, she took the course. She went off sick in 2016 with cancer and never came back to work and ultimately died in 2020. But even during her years at work, she was team lead, so she spent much of her time at meetings and rarely had direct patient contact. So I became known as the breastfeeding guru.

I had breastfed my own four children and taken numerous courses over the years, and I had helped literally hundreds, if not thousands, of women breastfeed. As with maternity in general, I had a passion for it. The girls often called me "the boob whisperer." They said, "if Vonnie can't latch that baby, no one can." I spent a lot of time teaching women to breastfeed and latching their babies. And some babies won't latch. So I came up with plans to get their babies fed until we could latch them. I taught hand expression and pumping to moms as well as my co-workers. I hand expressed more women's breasts for colostrum than you

could ever imagine, because it's something that women don't come naturally. They don't know how to do that naturally. I latched babies to moms who couldn't keep their eyes open and held the babies there while their mothers slept. I spent countless hours with both inpatients and outpatients trying to resolve breastfeeding issues: latching problems, lack of supply problems, sore nipples, blocked ducts, oversupply problems, you name it. I was the solution-finder.

I had two colleagues— two of my LPN co-workers, who also had a passion for breastfeeding. And I was always so pleased if one of them was coming on after I'd spent my shift with a difficult breaster. I knew that they would work just as hard as I had to try to help that woman have success. But they would usually come to me to confirm that what they were doing was right. We would discuss different tactics and ideas and brainstorm with each other. But I was the one with all of the years of knowledge and by far the most hands-on experience. So when I left, that was gone.

The fact that they could just do this to us. And this is supposed to be about our health, all of these mandates. But none of it has been good for anybody's health.

If you have no more questions, I have one final thing to say. Once upon a time, I was a respected member of my community. I was a respected aunt, mother, sister-in-law, and friend. Because of the stance I took, because I declined to take an experimental drug with no science to back it, I lost my job and my credibility. I've lost the respect of my oldest children, a niece, many of my friends. My sister-in-law has blocked me. I have been discriminated against and denied entrance to restaurants, theaters, my bowling alley, my friend's party. I was unable to go away on vacation with my four oldest girlfriends of over 40 years. I spent 35 years in a profession

[00:30:00]

where I helped and cared for other people, but now I am not allowed to speak because my opinion no longer matters.

I have been censored.

Gayle Karding

Thank you, Ms. Allen.

[00:30:35]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 1

March 16, 2023

EVIDENCE

Witness 8: Leigh-Anne Coolen

Full Day 1 Timestamp: 06:56:15–07:11:22

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

The next witness is Leigh-Anne Coolen. Leigh-Anne, do you affirm solemnly to tell the truth, the whole truth, and nothing but the truth?

Leigh-Anne Coolen

Yes, I do.

Gayle Karding

Good afternoon, Ms. Coolen.

Leigh-Anne Coolen

Hi.

Gayle Karding

Can you tell us where you're from?

Leigh-Anne Coolen

I'm originally from Newfoundland. I live now in Head of Jeddore.

Gayle Karding

Head of Jeddore, Nova Scotia?

Leigh-Anne Coolen

Yes.

Gayle Karding

I understand that you did take one dose of the vaccine?

Leigh-Anne Coolen

Yes.

Gayle Karding

And when did you do that?

Leigh-Anne Coolen

On May 27th, 2021.

Gayle Karding

Did you do that of your own accord?

Leigh-Anne Coolen

No.

Gayle Karding

And can you elaborate on that?

Leigh-Anne Coolen

My employer started, I guess, maybe March or April, with a real push for everyone to get vaccinated. I held off until I couldn't any longer, and I had to go get my first shot. They expected two, but they got one.

Gayle Karding

Okay. What were your reasons for hesitating?

Leigh-Anne Coolen

Because it was too soon. Everything was just, "Oh, here's a vaccine. It'll help." I didn't trust that it would help. I'm not an anti-vaxxer by any means. I'm fully vaccinated. My son is fully vaccinated. My husband is vaccinated. I'm not against vaccines. I was just against this because I didn't trust it.

Gayle Karding

When you say that family members in your household are fully vaccinated, you mean the kind of traditional vaccines, that sort of thing?

Leigh-Anne Coolen

Yes. Exactly, yes.

Gayle Karding

Okay. You started to feel some pressure in March and April from your employer.

Leigh-Anne Coolen

Yes.

Gayle Karding

Did your employer have a mandate in place?

Leigh-Anne Coolen

They did mandate it. I'm not sure if they had a written mandate. I'm sure it's probably in the company policy in some way shape or form. I do have emails from the president, kind of telling everybody to go get vaccinated; remember, get your vaccination; send in your verification kind of thing when you're done, so we can have that on file.

Gayle Karding

Were you ever told what would happen if you did not get vaccinated?

Leigh-Anne Coolen

We were told that we wouldn't be able to work there anymore.

Gayle Karding

Okay. So in May of 2021 you did receive your first injection. Do you know which one you got?

Leigh-Anne Coolen

It was Pfizer.

Gayle Karding

Pfizer, okay. And do you know where you got that and who administered it?

Leigh-Anne Coolen

I don't know who administered it, but I do I know where I got it. It was at the pharmacy in the Superstore on Cole Harbor Road.

Gayle Karding

In the pharmacy. And do you have the lot number for that?

Leigh-Anne Coolen

I do, but I don't have it with me. I know I filled it out on something, but I—

Gayle Karding

Alright, so you got one injection of Pfizer in May of 2021. And tell us what happened after that.

Leigh-Anne Coolen

Everything seemed normal until Sunday, June 20th, when I don't remember much. I remember waking up in the morning and hearing my husband talking to, I assume, somebody on the phone. Because it was only him and I in the room.

It was the paramedics. I had had a stroke. The ambulance came and, the next thing I knew, I had paramedics at the foot of my bed. They took me to the hospital, and I was there for five days.

Gayle Karding

Has your husband described that experience to you?

Leigh-Anne Coolen

He has. Not in great detail, because he's still traumatized from the event. I make noises in my sleep. He wakes up immediately thinking, "what's going on here?" So yeah, he still lives with it.

Gayle Karding

And what did he tell you about the experience?

Leigh-Anne Coolen

I don't even know how to put it into words. He said my face was kind of twisted, obviously. Because I had a droop on one side of my face. I was trying to say words. He couldn't understand anything. I wasn't there, so I don't know, but he doesn't really elaborate on it because he doesn't talk about things like that.

Gayle Karding

Okay. The five days that you were in the hospital, can you describe how you were feeling, some of the symptoms you were having?

Leigh-Anne Coolen

I don't remember any symptoms at all, really. It kind of just happened, and it went away. I'm left with memory loss, or I don't know what to call it. I can't get my thoughts organized as quickly as I used to be able to. But I went through several tests in the hospital, several CAT scans, everything. I had blood work done, I think, twice a day.

[00:05:00]

I had an IV with a heparin drip because of the blood clots. The blood clots were in my arteries, not in my veins. I do have Factor V Leiden, but it is actually in my report from the hospital that they don't believe that was the cause of the stroke. Eith all the other tests that

I had done, nobody gave me a reason as to why this happened. So I'm still left wondering why.

Gayle Karding

Okay. When you were in the hospital, was there any discussion about whether you'd had your vaccine and when?

Leigh-Anne Coolen

No. Before I got out of the ambulance, they gave me a COVID test, because I wasn't allowed in the hospital without one. I did mention to them at that point that I had just had my vaccine about three weeks ago. And nobody said anything. A couple of days later, I believe, when I was in the room and there were medical teams visiting, I had mentioned that I had had my vaccine about three weeks ago. And nobody paid any attention to those words coming out of my mouth. They kind of just turned around and walked away, and nobody said anything about it.

Gayle Karding

So during the entire time that you were in the hospital, no doctor or medical professional asked you any questions about the proximity of your stroke to your vaccine injection?

Leigh-Anne Coolen

None.

Gayle Karding

How old are you?

Leigh-Anne Coolen

Now I'm 42.

Gayle Karding

And at the time?

Leigh-Anne Coolen

Forty-one.

Gayle Karding

Forty-one years old. Is there any history of stroke in your family?

Leigh-Anne Coolen

There is. My grandmother, I believe she was in her 50s when she had a stroke. I think she also has—or had—factor 5 Leiden. She had blood clotting: I believe she had a blood clot in her leg. She did have a pulmonary embolism, a stroke. She had an aneurysm that was

clipped. It didn't leak or anything, so they settled that. But she had the typical Factor V Leiden things happening.

Gayle Karding

Okay. Do you know whether her stroke was consistent with that condition?

Leigh-Anne Coolen

I can't say one way or the other.

Gayle Karding

All right, and we have your discharge summary that we can put up on the screen. It's one of the exhibits and—

No? Okay, I was given an exhibit number. If I could just have one moment, I'm going find that, indicating that you have this condition, this Factor V Leiden. And indicating specifically that it was not responsible for your stroke and that's because your stroke was an arterial clot?

Leigh-Anne Coolen

Yes.

Gayle Karding

And Factor V Leiden is specifically responsible for intravenous clotting?

Leigh-Anne Coolen

Yes.

Gayle Karding

Okay. It's at TR-003. I'm going pass up this copy to the panel because we were supposed to have that uploaded so that they can see that.

And I'm specifically referring, Commissioners, to the second paragraph, starting with the word "hematology." Second paragraph on the first page. Hematology was consulted and the patient was started on a Heparin drip. It was felt that her Factor 5 Leiden mutation was not **the cause of these arterial clots, as this is associated with Inktree's venous clotting.**

So the one pre-existing condition that you're aware you had, they have ruled out as the cause.

Leigh-Anne Coolen

Yes.

Gayle Karding

And you're not aware of any other pre-existing conditions which would potentially cause you to have a stroke at 41-year-old?

Leigh-Anne Coolen

No, I'm not aware of anything.

Gayle Karding

In the context of that year, or the previous years, were you generally healthy?

Leigh-Anne Coolen

Yes.

Gayle Karding

Okay. What, if any, long-term impact have you felt this has had on you?

Leigh-Anne Coolen

It's like I don't know myself anymore. I know my thoughts and stuff. I can process thoughts, thoughts come quickly, I just can't organize them to get them out. Things that I enjoyed doing, I don't enjoy anymore.

[00:10:00]

I just— I don't know. I'm just— I'm just here. Like it's just all the drama with everything around the whole vaccinations and you can't talk about it and everything else. So just sweep it all under the rug. And it gets to you. Really.

Gayle Karding

Are you on any medication that you weren't on previously?

Leigh-Anne Coolen

I am. They prescribed atorvastatin for high cholesterol.

Gayle Karding

Okay.

Leigh-Anne Coolen

And vitamins: vitamin D, vitamin B12

Gayle Karding

Is that in relation to—?

Leigh-Anne Coolen

That's what they prescribed for me when I left the hospital.

Gayle Karding

Okay. Do you have regular updates with your family doctor?

Leigh-Anne Coolen

I don't. I haven't had a family doctor for quite some time. I do have a nurse practitioner now. I do have to go and get some blood work done for an update.

Gayle Karding

How often do you have to do that?

Leigh-Anne Coolen

Nobody told me anything, so I guess it's my own discretion.

Gayle Karding

Did you ever have any conversations with her after your stroke?

Leigh-Anne Coolen

After my stroke, I did talk with the nurse practitioner at that point. He was very supportive. He seemed like he kind of felt that maybe the vaccine did have something to do with it. That made me feel fantastic, because I'd never had anyone actually on my side before.

Now, I don't have him any longer. He's been replaced with another nurse practitioner. I did speak with her about it, but she's not as vocal as he is about it. So I assume that she doesn't want to talk about it.

Gayle Karding

Are you aware of whether or not your first nurse practitioner—the male—reported the symptoms of your stroke to the vaccine injury database?

Leigh-Anne Coolen

I'm not aware that he did.

Gayle Karding

Did the mandates have any other impact on you? Actually, before I move on to that, I understand you did not have the second dose.

Leigh-Anne Coolen

Correct.

Gayle Karding

What, if any, impact did that have on your employment?

Leigh-Anne Coolen

I had to leave my job because they kept at me about another vaccine or an exemption letter. In a follow-up appointment I had with hematology, I asked the doctor on the phone, "Is there any way I can get an exemption letter? Because work is asking me to get the second vaccine." She told me, if I was worried about having another stroke, to get my second vaccination before my fragment injections ran out, which was the prescription that they sent me home with from the hospital.

That's when I gave up and I said, "I'm not going to get an exemption letter. I'm not having another vaccine, so I'll just have to move on." And that's what I did. I quit that job in December 2021.

Gayle Karding

Did the rules and mandates, the vaxx pass, all that sort of stuff: Did that have any other impact on your life?

Leigh-Anne Coolen

Well, my husband got the second shot because we were still at that job and they pressured him to get it. He felt like he had to get it to support the family.

My son completely refused it. And I don't blame him. He did feel pressure from his friends. He did get bullied. He did get kicked off the soccer team because he wasn't vaccinated, and he wasn't allowed to play. I told him, "If you want to participate, I'll take you to get vaccinated." "No, I don't want it. I don't want it." And I didn't push any further.

It was a simple question, "if you want it." But because of what happened to me, he refused it and I'm very thankful for that.

Gayle Karding

How old is he?

Leigh-Anne Coolen

He's 18.

Gayle Karding

Okay, those are my questions.

Commissioner Drysdale

You said that you had gotten one dose of one of the vaccines.

Leigh-Anne Coolen

Yes.

Commissioner Drysdale

When you went to get your vaccine, what did the person who gave it to you, the pharmacist, whoever it was that gave it to you: How did they explain to you the risks and the benefits of the vaccine so that you could make an informed decision?

Leigh-Anne Coolen

Nobody explained anything.

Commissioner Drysdale

Thank you.

Gayle Karding

Thank you very much, Miss Coolen.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 1

March 16, 2023

EVIDENCE

Witness 9: Chet Chisholm

Full Day 1 Timestamp: 07:11:50–7:33:40

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Alison Steeves

Good afternoon. My name is Alison Steeves. Like Ches, I'm a non-practising lawyer, a member of the Nova Scotia Bar.

Ches Crosbie

Thank you. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Chet Chisholm

Yeah.

Ches Crosbie

Thank you.

Alison Steeves

Can you please state your name for the record?

Chet Chisholm

Yeah, my name is Chet Chisholm

Alison Steeves

And where are you from?

Chet Chisholm

I'm from Antigonish, Nova Scotia.

Alison Steeves

And what is your occupation?

Chet Chisholm

I am a paramedic. I've been a paramedic for 12 years.

Alison Steeves

For 12 years?

Chet Chisholm

Twelve, yes.

Alison Steeves

And how do you like being a paramedic?

Chet Chisholm

Oh, it's the best job in the world, man. It's probably one of the most rewarding professions that you can ever work. You show up on people's worst day and your goal is to improve it. No one's ever mad that the paramedics show up. Well, some are, but not many!

And with everything that's happened, if I had a lot of friends and colleagues, who say, "Hey, if you could go back and do it all again, would you?" And my answer has always been, "Yeah, I'd go back, and I'd have done it sooner."

Alison Steeves

So back in March 2020, when we started hearing about COVID, were you working as a paramedic at that point?

Chet Chisholm

No, I was currently off work. I was off with workers' compensation in March of 2019. I was diagnosed with post-traumatic stress disorder and was placed on medical leave awaiting treatment.

Alison Steeves

Were you planning to return to work, eventually?

Chet Chisholm

Yeah, that was the hope. My mental health team was pretty keen on getting me back to work. I was gung-ho to get into treatment, get back on the trucks. And kind of what was looming on the horizon, and the state of EMS in Nova Scotia, I felt it was imperative to do so.

Alison Steeves

Did you receive the treatment that you were waiting for?

Chet Chisholm

No, I was I on deck to get what's called EMDR, which is eye movement desensitization and reprogramming. It is often used very well with PTSD, and they see a lot of success with first responders and veterans. And my first appointment was kind of like the meet-and-greet appointment, to kind of set up a rapport. That was the first day of lockdown. So we showed up, we talked about what we were going to do, and that was it. Everything got canned thereafter, and then I was put into limbo and wasn't seen again for close to another year. Because we weren't allowed to have any in-person appointments whatsoever.

Alison Steeves

So you did get the treatment after a year?

Chet Chisholm

No. I went from a psychologist to working with a counselor, and we were kind of doing the prep stages, building the rapport, getting a background on what was going on. And things would kind of— We'd get a little bit of momentum and then they'd say, "Well, you can't meet in person again, and EMDR is an in-person thing."

So we'd have to just kind of do talk therapy on the phone and discuss things and talk about stressors. But we never really got to, we never got into a groove of things.

It was on and off, on and off, on and off, up until probably late spring, early summer of 2021. Things just kind of got canned again, and I got put back into the wait list and waiting in limbo. And where we continue to sit.

Alison Steeves

And what impact would you say that the delay in this treatment had on you?

Chet Chisholm

I've certainly had relapse since I saw my PTSD symptoms, which I've had previously somewhat under control. And not being able to— You kind of had to do maintenance while you're working through this. And we couldn't do any of that. And being in person, and actually being able to connect with somebody and talk about these things, and work through it, and then actually build to a therapy, is incredibly beneficial. There's such a disconnect when it's on the other end of a phone or on a screen. And not only that, but my counselor was getting extremely frustrated. She's like, "you are pretty well primed and ready to go, we can get you back on the trucks and get you going. But this keeps getting in the way." It's like we always had to keep starting from scratch again.

Alison Steeves

So are you still on leave from the same job?

Chet Chisholm

Yes, I'm still on leave. And due to the time frame that I've been off with our contractual agreement with the union, because the clock has ticked down,

[00:05:00]

I've been terminated for my position at EHS [Emergency Health Services].

Alison Steeves

So you're only allowed to be off for so long with an injury before you become terminated.

Chet Chisholm

Yeah. At two years. They'll hold your full-time position for two years. So that timeframe ran out. And, as we'll get into it in a little bit here, that's when we needed to push for this, so I don't lose anything else. At a three-year mark, you're canned, and that's it. You lose all your seniority and everything.

Alison Steeves

Do you have reason to believe that, had you received the treatment in the time frame that was originally scheduled, you would have returned to work in time to avoid losing your job?

Chet Chisholm

Pretty well everyone in my mental health team was pretty keen. Like, pretty sure Chet's going to go right back on the trucks. He wants to be there. And there's been such a high success rate with this with other first responders. It was looking good. Not so much.

Alison Steeves

During the time you're awaiting treatment, did you take the vaccine against COVID-19?

Chet Chisholm

Yeah, there was a push for it from our employer. And initially, I declined because I was eligible in December of 2020 and January of 2021. Because I was off work, I'm a young guy, pretty healthy. I said, "No, thanks. I'll wait. If we're going to give it to anybody, give it to people who are vulnerable and whatnot, I don't need it right now."

But when it became available for people in my age group, for people in their 30s, I got my first shot on May 21st. And the reason is we work with the most vulnerable people at the most vulnerable point in their life. And we are in constantly different clinical situations throughout a shift. You can start your shift in a backseat of a car in a ditch. And then you can be in an old-folks home and treating a COVID patient. And then you could be going into the ICU. It's a mixed bag every time you go to work. So the likelihood that I'm going to get a lot of exposure to COVID is quite high. And it's going to be in the back of an ambulance. And it's going to be probably right in my face. So the hope was that this could help mitigate cross-exposure amongst vulnerable people.

Alison Steeves

You didn't feel coerced to taking it?

Chet Chisholm

Yes and no. I was a little annoyed with kind of, the push. It's like, "Hey you got to do this, you got to do this right now." But I wasn't ever angry at the point of getting it. Because if it did what they said it did on the tin, then that could be beneficial—both for myself but, more importantly, for the vulnerable people whom we deal with every day.

Alison Steeves

Who administered it to you, do you recall?

Chet Chisholm

It was given to me by an RN and that was done at one of the local pharmacies in Antigonish.

Alison Steeves

Before taking it, did they advise you of the risks?

Chet Chisholm

The only risk that we really discussed was the risk of anaphylaxis. Because I have food allergies. So we talked about that, because it's like, "Hey, just hang around for like an extra like 20 minutes or so just so we can keep an eye on you." And I've done vaccination clinics for flu shots and stuff. I know you know the whole rigamarole of, "Hey we're going to give you this, we're going to keep an eye on you and make sure nothing happens. And if something happens, we'll report it and take care of you."

Alison Steeves

And how did you feel after taking it?

Chet Chisholm

Initially, I felt fine. But by that evening, I was pretty slack; really, really tired. And that was kind of par for the course for any other vaccines I've gotten for work or school in the past. But what kind of really drew attention to some things is I've been dealing with PTSD and crippling insomnia for years at that point—for two years at that point, where I would need to take medication to sleep. I went from not sleeping at all, to sleeping most of the day, to sleeping probably like 20 hours or more. And then just being incredibly sluggish and getting a little shorter breath here and there, and that kind of escalated over the next few weeks.

Alison Steeves

So those symptoms persisted and increased?

Chet Chisholm

Yeah, it started with incredible fatigue, which led to shortness of breath. And then eventually, I would get a tinge of chest pain when I was laying on my back. And it ultimately built up to— My dad had taken a tree down in the yard, and I went out to help him just load a couple chunks of log in the front of his tractor.

[00:10:00]

I got extremely short breath. I had stabbing chest pain here, just left my sternum, which radiated into my back. I told my dad. I was like, "Hey, we have to go to the hospital right now; something's up. I can't say what, but there's something very wrong at the moment." And I became incredibly diaphoretic, really sweaty, and pale as a ghost.

Alison Steeves

Had you had similar symptoms in the past?

Chet Chisholm

No.

Alison Steeves

You said you went to the ER. You consulted a healthcare provider about these symptoms?

Chet Chisholm

Yeah, I went in, talked to the triage nurse and said, "Hey, this is what's going on." And was admitted, had EKGs and stuff done, and explained, talked to the nurse. These are all people I work with, and I'm like, "Dude, what do you think's going on?" And it's like, "Well, I think it's one of these things." And they're like, "Yeah, something's definitely up because you never look like this."

We did a bunch of EKGs, blood work, did my vitals, my vitals were all abnormal.

Alison Steeves

And did they find anything?

Chet Chisholm

Not at the time. I was really hypertensive. My blood pressure was up quite a bit. I was tachycardic. But the doctor didn't seem to see anything in my blood work or my EKGs. He just said, "maybe it's just esophageal spasms," and sent me on my way.

Alison Steeves

And did the symptoms persist after that?

Chet Chisholm

Yeah, they never quite resolved. They would calm down, but they did persist. And any time, on any exertion or lying on my back, things would exacerbate. I'd get more short of breath. I

could, again, develop more chest pain. The fatigue persisted. Well, it still persists, but I would be pretty well bedridden some days. No energy to get up and do anything, which was entirely new. It was like a complete shift. Because I used to be up doing stuff pretty regularly. I used to be in really good shape and whatnot. So it was a drastic change.

Alison Steeves

And how many health care providers did you consult about these symptoms?

Chet Chisholm

Well, I was admitted into the emergency room three times over the course of the summer.

Nothing was ultimately found, aside from having abnormal vitals and just symptoms that I presented with. The second physician that I saw in the ER kind of just shrugged and said, "Man, I don't know what's going on. You're obviously in distress, something's up, but we can't pinpoint anything." And the third doc I saw, which would have been probably late July, said, "I think this warrants further investigation. We should order some more cardiac tests, like echocardiogram, and you should follow up with your family doc, get a cardiac MRI, and get a stress test and see if we can pin down what's going on. I don't know for sure, but just on the way you're presenting and what you're telling us and your vitals—there's something here, there's something wrong, so we need to look into it."

He actually gave me a shot of Toradol, which is a strong anti-inflammatory, which took the edge off for maybe a couple hours. But again, the symptoms persisted. I had discussions with my family physician, who was often very dismissive and abrasive about my concerns. And I've had a yearly follow-up that I had with WCB [Workers Compensation Board]. Because we have a follow-up every year where a physician comes in and talks to you, and it's like, "Hey, how's your PTSD going? What are the symptoms you're having?" And we talked about that, and then we talked about this. And he's like, "yeah, based on your history and kind of the cycle of symptoms, there's something going on here, and we should look into it."

Alison Steeves

Did you ask any of these physicians if there could be a link with the COVID-19 vaccine?

Chet Chisholm

I don't think I ever asked if there was a link, but when they asked, "When did this start?" I told them I didn't feel good after getting the vaccine and it hasn't let up since. But I don't think we ever specifically honed in. I suspected it, but do I know for sure? Absolutely not.

Alison Steeves

So they couldn't find anything objectively wrong to explain your symptoms and they knew that they had started within close proximity to you taking the COVID-19 vaccine. Do you know if any of them filed an adverse event following immunization form?

Chet Chisholm

No, there was no discussion of that.

Alison Steeves

They didn't ask you any more questions about that or indicate that they were concerned?

[00:15:00]

Chet Chisholm

No, none whatsoever.

Alison Steeves

How did they respond when you mentioned that it was in relation to the vaccine?

Chet Chisholm

It wasn't really discussed; it was just kind of glazed over. Some of the nurses expressed more concern when they asked me. I had paramedic colleagues who expressed their concern just with the timing and some of the things that they had seen on calls that they have been discussing with me as well.

Alison Steeves

And have you shared your concerns about a link between your symptoms and the vaccine with others?

Chet Chisholm

Yeah, I've spoken to numerous family and friends and colleagues. And you get a mixed bag of the way people react. I've had people call me an anti-vaxxer, a far-right conspiracy theorist, and every other nasty thing under the sun. But then I've had others who've come to me and said, "This is what happened to me, this is what my family members experienced."

I've had medical colleagues come to me and say, "Hey man, we were talking about what might have happened to you in the hallway. The other crew that was there was talking about how they had three kids who had myocarditis and POTS and stuff coming in through 911." We don't see kids in EMS very often, and that was concerning.

But yeah, it's been a mix. I've had friends who have since abruptly stopped talking to me whatsoever. I've talked about this publicly and my concerns, and I've talked about some of the problems that we're having in EMS right now. I've had people from across the country thank me for speaking about these things. Recently, I had somebody reach out and say, **"You and I have never met, but I know who you are because you helped someone in my family on a 911 call, and they still talk about you years later. Thank you for doing this. Thank you for talking. Thank you for your service, and I'm sorry for what you're going through."**

Alison Steeves

You had concerns that these might be related to the vaccine. Your first dose—did you end up taking the second dose?

Chet Chisholm

No, I did not.

Alison Steeves

And in October 2021, when Nova Scotia implemented the vaccine passport policy and several mandates, how did this impact your life?

Chet Chisholm

Well, because I'm not vaccinated enough, I was banned from restaurants. I wasn't allowed to access some different services, couldn't go to the gym—not that I was feeling well enough to do so anyway. When I went in to pick up the results from my echocardiogram and copies of my bloodwork and EKGs from the hospital, I stopped at the door and they said, "You can't come in." It's like, "I'm picking up bloodwork, man, I just got to go around the corner." And it's like, "No, you need to be double-vaccinated to come in here." And it was a back and forth throughout a good 20 minutes explaining, "I'm here because we're investigating, trying to determine if something has happened with results as a result of this. I need to get that paperwork so we can figure out what happened, if anything." Eventually they're like, "Just let him go in, he's just got to go around the corner. It's 30 feet."

And one of the worst things is that one of my best friends was diagnosed with cancer during the pandemic. And because I haven't taken the shot twice, I wasn't allowed to go see him when he was dying in the hospital. I never got to say goodbye to one of my best friends. Because "you're not vaccinated enough, you're not allowed in here."

And, as many people know, the vaccine mandate for healthcare providers is still in effect. So even if I do get a clean bill of health and my PTSD is, you know, wiped clean, we're going to go. I'm still banned from going back to work: I'm not allowed to go.

Alison Steeves

Chet, do you have any final words about the impacts of the COVID-19 measures on your life?

Chet Chisholm

Yeah, it's had a significant impact, not only on my mental health, but on my physical health. Associated with PTSD as well. And you can see just with the way EMS is right now in Nova Scotia: Morale is plummeting every day since the start of 2020. We have lost 331 paramedics from the workforce, that's one quarter of the paramedics who work for EHS. **We've since hired some new people, but these are people who are fresh out of school; they don't have experience. Even on my rotation, there's four of us on my rotation that have either been put off on injury or PTSD. And there's 60 years between the four of us. And that's gone, you can't get that back.**

[00:20:00]

It's infuriating. It's also detrimental to the well-being of everybody in this province that there's people like me—and I'm not the only one who's in this situation—who want to go back to work. And who would like to help and who would like to fix the problem, as the EMS system is crumbling. But we're told no. I've even spoken to Michelle Thompson and the answer is, "That's the policy. We're sticking with the policy." And if you haven't seen

what the medical exemptions are to get to opt out for healthcare provider: you need to have either blood clots, myocarditis or pericarditis, a stroke, or have an allergic reaction. All of which have to result from the first shot. You have no medical exemption, it's "take it or else you're let go." Or if you have an adverse event, you're probably not going to be working again anyway.

Alison Steeves

Thank you. That's all my questions.

Chet Chisholm

No problem.

Alison Steeves

Do the commissioners have any questions? No.

Chet Chisholm

Cool.

[00:21:50]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 1

March 16, 2023

EVIDENCE

Witness 10: Artur Anselm

Full Day 1 Timestamp: 07:33:55–07:46:50

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

Thank you for attending as a witness, Mr. Anselm. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Artur Anselm

Yes, I do.

Ches Crosbie

Thank you.

Nicolle Snow

Good afternoon, Mr. Anselm. Where are you from?

Artur Anselm

I just live in Grand Lake, Nova Scotia. Just about 40 minutes from here.

Nicolle Snow

And who do you live there with?

Artur Anselm

Just in the backyard, in a small cabin. I live with my parents right now, but I'm building a house for my family, so.

Nicolle Snow

Nice. For your family, you said?

Artur Anselm

Yep, my wife and small daughter. She's 14 months old.

Nicolle Snow

And are you employed?

Artur Anselm

Yeah, I work for Canadian National Railways.

Nicolle Snow

What do you do there?

Artur Anselm

I'm a track maintainer. I make sure the tracks are safe for the trains to run and we repair any defects and change rails. Stuff like that.

Nicolle Snow

And how long have you been employed with CN Rail?

Artur Anselm

Six years, it will be six years this year.

Nicolle Snow

And what policies or mandates did CN Rail adopt during the COVID crisis days?

Artur Anselm

November 2021, they implemented the vaccine mandate. And if you weren't vaccinated, you were off paid, off work. Forever, basically.

Nicolle Snow

What was the deadline that employees were given to vaccinate by?

Artur Anselm

The deadline was November 15th, 2021.

Nicolle Snow

And did you receive notification of that directly from your employer?

Artur Anselm

Yeah, I received it from my supervisors and my managers. And work emails as well.

Nicolle Snow

Okay, and you brought in with you today an email dated September 8, 2021, from CN Communications, stating that there was a vaccine mandate that would be effective as of November 1st, 2021.

Artur Anselm

Yes, that's correct.

Nicolle Snow

Okay, and that will be marked as an exhibit [exhibit number unavailable]. What happened after that?

Artur Anselm

Well, basically I was very much against taking any shots. Because I saw what was happening to my co-workers after the vaccines and they were getting sick. They weren't feeling well.

And I really held my stand up until— I was becoming a new father and I had to put food on the table for my family. So I decided to bite the bullet. And on November 13th I took the first shot.

Nicolle Snow

And to clarify, did the timeline for vaccinating remain November 1st? Was it extended?

Artur Anselm

It was extended. It was November 1st and then I just kept not getting it and then they extended it to November 15th. And then on the 13th, I took the shot.

Nicolle Snow

Okay. Just to confirm, Mr. Anselm, you brought in with you today an email dated October 14, 2021, from CN Rail indicating that the mandatory vaccine deadline was extended to November 15th. And what you're saying is, on the 13th, you went ahead and got your vaccination.

Artur Anselm

Yeah.

Nicolle Snow

Did you do so feeling coerced or pressured?

Artur Anselm

Definitely. I was getting phone calls daily from supervisors and everybody and telling me, "After the 15th, you can't come to work, and you'll be off pay."

Nicolle Snow

All right, and so were they indicating that they were going to terminate you? Or put you on leave without pay.

Artur Anselm

They weren't clear with it. They said either you're terminated or you're going to be off pay, basically laid off. So I wasn't sure what was going to happen.

Nicolle Snow

What happened on November 13th when you had your vaccination? Where did you go?

Artur Anselm

To be honest, I don't remember the location—but it was just a walk-in clinic and a nurse vaccinated me.

Nicolle Snow

All right, and do you know that it was a nurse? Did she tell you it was a nurse?

Artur Anselm

She did not, but that's my assumption.

Nicolle Snow

Okay. Do you know that the batch number of your vaccine?

Artur Anselm

No, I could look it up, but I don't know it right now.

Nicolle Snow

Were you made aware of any of the potential risks associated with vaccine?

Artur Anselm

Yeah, I was aware from my own research from before.

Nicolle Snow

Sorry, I'll cut you off. I mean, did the person who administered the vaccine have any discussion with you about the risks associated with the vaccine?

Artur Anselm

Yeah, she actually told me that, for guys my age, there is a potential risk of having heart problems. And she said, "Oh yeah, if you have any heart issues just go to the doctor's office."

They'll give you some drugs and make you feel better." And I was like, "Okay that sounds pretty good." I didn't want to take it, but I still did.

Nicolle Snow

It didn't sound overly serious, in your view.

[00:05:00]

Artur Anselm

No. Like, why are you guys making me take this if there's risks? And I'm perfectly healthy, right?

Nicolle Snow

What if any symptoms developed following the first vaccination?

Artur Anselm

Well, first of all: a week after my vaccine, I got seriously ill, just with very bad flu. And I was basically out for a week. And then two weeks following my vaccination, I started to develop heart pain. And the heart palpitations, shortness of breath, weakness. And just I didn't feel good at all. I felt like I knew something was wrong, especially with my chest. I kept getting stinging chest pain.

Nicolle Snow

And had you had any of these kinds of symptoms before in your life?

Artur Anselm

Never. No.

Nicolle Snow

And how old are you, Mr. Ansel?

Artur Anselm

Now I'm 26.

Nicolle Snow

And how old were you when you got the vaccine?

Artur Anselm

I would have been 25 years old.

Nicolle Snow

What did you do when you started experiencing these heart pain symptoms?

Artur Anselm

Well, I went to the emergency room at the Cobequid Health Center. Just did a walk-in emergency and they checked my vitals. They took my blood. They made sure I wasn't having a heart attack and basically sent me on my way.

Nicolle Snow

Did you have any discussion with them about whether this could be vaccine-related?

Artur Anselm

Yeah, I did. I told them this all started after the vaccine. I never had any issues with my heart or anything like that. And they just said, "Oh yeah, like whatever, you're good. You don't have a heart attack, so."

Nicolle Snow

Okay. And was there any discussion about completing a vaccine adverse event form?

Artur Anselm

No, I never heard anything about that.

Nicolle Snow

So as far as you know, that was never completed by the doctors?

Artur Anselm

No.

Nicolle Snow

And what happened after that?

Artur Anselm

After that, I went home, and I kept going to work. I kept fighting the pains. And then I decided to go to my family doctor as well. I told him what was going on after the vaccine, that I was having chest pains and shortness of breath. And same thing with him. He said, "No, it's probably not from the vaccine. Just don't smoke anything. Don't drink anything. And you'll be fine." And I tried that. Symptoms never went away.

Nicolle Snow

Okay, and did your doctor or your family doctor have a discussion with you about whether or not to fill out an adverse event form?

Artur Anselm

No, we never had any discussions about that.

Nicolle Snow

And your doctor didn't feel that there was any connection between the vaccination and the symptoms you were having?

Artur Anselm

No, he did not.

Nicolle Snow

What happened after that?

Artur Anselm

After that, I went in again to my family doctor. I told him, "Listen I'm going to lose my job if I don't get the second shot." I didn't really want to get it at all, obviously. And I asked him, "Can you fill out a medical exemption for me?" And he said, "No, I can't do it without any proof." I just said, "All right, I guess I'll be laid off." Then I went in again—I think it was my third time—and he finally referred me to a cardiologist to get an MRI.

Nicolle Snow

Okay, and so then did you go to the cardiologist?

Artur Anselm

Yeah, I saw the cardiologist. They scanned my heart and did all the tests. And it turned out that the outer lining of my heart was inflamed. And I had pericarditis, myocarditis. And the cardiologist said, "This is from the vaccine."

Nicolle Snow

Okay, and so who is the cardiologist that you saw?

Artur Anselm

His name is— One second, sorry. Dr. Douglas Bate, or, sorry, Hussain Beydoun. That was his name.

Nicolle Snow

B-E-Y-D-O-U-N. And you brought with you today a letter from Dr. Beydoun dated February 11, 2022. Do you have that in front of you?

Artur Anselm

Yep. I've got it right here.

Nicolle Snow

And would you look at page 2?

Artur Anselm

Yep.

Nicolle Snow

And just read the first line at the top of that page.

Artur Anselm

"Very likely, Mr. Anselm has pericarditis, myocarditis post-mRNA vaccine, echocardiogram done today was normal in the view the symptoms improved significantly. I would not start anti-inflammatory therapy. Any change, please let me know and I will be happy to reassess him. I would not recommend him for a second dose, and I am copying this to my colleague."

Nicolle Snow

All right. Mr. Anselm, you received that exemption,

[00:10:00]

to not have to take the second dose, correct?

Artur Anselm

That's correct.

Nicolle Snow

All right. And let's go back to your employment. Had you been working through this at this point?

Artur Anselm

No, it turned out I had just had a kid, so I was able to get the parental benefits, even though I was laid off. So that kept me going, luckily.

Nicolle Snow

Okay, so you were on parental leave during this period. And what happened with respect to the exemption that you had? Were you able to use that to return to work?

Artur Anselm

No, I was still kind of pissed off. I didn't really want to talk to anybody. And then my manager called me in July. He said the mandates were dropped and you can return to work. I said, "All right, I'll take my whole leave until September and then I'll come back to work." September 2022 is when I returned to work.

Nicolle Snow

So there was no period where you had to return to work prior to the mandates being dropped.

Artur Anselm

Yeah, that's correct.

Nicolle Snow

You remained off in your parental leave.

Artur Anselm

That's correct.

Nicolle Snow

Did you have any conversation with them during that period when you were on parental leave as to whether or not they would take you back with the exemption?

Artur Anselm

No, I did not. I just didn't even want to bother for now.

Nicolle Snow

Okay. How has your heart condition impacted your life?

Artur Anselm

It has impacted me in every aspect of my life. Physically, I can't really do the things I used to anymore. Like with less vigor. Mentally, I was just full of regret, and it made me kind of a less of a father—not less of a father, but mentally I was down. It impacted my fatherhood. Mentally, physically, everything.

Nicolle Snow

All right. Thank you. Those are all my questions. And we'll just pause for a moment to see whether the commissioners have any questions.

Commissioner Drysdale

You said that you had worked with CN Rail, I think you said six years?

Artur Anselm

Yep, six years.

Commissioner Drysdale

When you signed your contract with CN Rail, your employment contract, was there a clause in there requiring that you had to take whatever vaccines that they might require in the future?

Artur Anselm

No, there was none of that. In my eyes, it's illegal what they did.

Nicolle Snow

Thank you, Mr. Anselm.

Artur Anselm

Thank you.

[00:12:55]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 1

March 16, 2023

EVIDENCE

Witness 11: Cassandra Murray

Full Day 1 Timestamp: 07:48:00–08:22:55

Source URL: <https://rumble.com/v2ddo8a-nci-truro-day-1.html>

[00:00:00]

Ches Crosbie

Kassandra, do you affirm that in the evidence you will give this Commission, you will tell the truth, the whole truth, and nothing but the truth?

Kassandra Murray

As a child of God, yes, I do.

Criss Hochhold

Thank you. Kassandra, would you please give us your full name?

Kassandra Murray

Kassandra Maureen Murray.

Criss Hochhold

Where do you live, Kassandra?

Kassandra Murray

in Halifax, Nova Scotia.

Criss Hochhold

And what do you do for a living?

Kassandra Murray

I am a teacher.

Criss Hochhold

Fabulous. Where do you teach?

Kassandra Murray

Currently, I just teach privately. I used to teach, though, in a private school.

Criss Hochhold

Okay. Which private school, or school, were you teaching at?

Kassandra Murray

You want me to name the school?

Criss Hochhold

No, that's fine. Let's just say a private school.

Kassandra Murray

Yeah, it was a private school within the Halifax.

Criss Hochhold

And how long were you teaching at that private school?

Kassandra Murray

I was there for— I think, three years.

Criss Hochhold

Three years at that school. And how long were you a teacher overall?

Kassandra Murray

Over 20 years.

Criss Hochhold

Twenty years. That's some significant experience there.

Kassandra Murray

Correct.

Criss Hochhold

And what grades, or grade, did you teach?

Kassandra Murray

At the time, at that school, I was teaching a Grade 1-2 split.

Criss Hochhold

So that would make the kids about—?

Kassandra Murray

Anywhere from six to eight years old.

Criss Hochhold

Six to eight years old. When the mask requirements came in— You have a mask exemption from a physician, is that correct?

Kassandra Murray

That's correct.

Criss Hochhold

How was your experience getting that exemption?

Kassandra Murray

From my physician?

Criss Hochhold

Yes.

Kassandra Murray

My physician was really good about it, actually. I went in there and I explained to him why I didn't want to wear a mask, what I felt, how it would impact my health. And he had no problem giving me the exemption.

Criss Hochhold

Fantastic. Did the school respect that exemption?

Kassandra Murray

For a short while. But there was a lot of toxic and harmful situations I was put in—like, a hostile environment that I was put in, because I had that medical exemption.

Criss Hochhold

Okay. Can you give me an example of such a hostile act that they took towards you?

Kassandra Murray

Sure. When I first came in with the exemption, they were not really happy about it. They put it on file, though, so that it was well-documented that I had it. And they said that, because I wasn't wearing a mask, I had to—they didn't say I was segregated, but I'm saying it—I was segregated to use a different bathroom. I wasn't allowed to use the same bathroom as the rest of the faculty. I had to use a bathroom that was in the basement that wasn't very clean. The school had a mold mildew issue, which I was working on with my lungs too. So that didn't help it at all.

I had to use the bathroom in the basement. And every time I had to go to the bathroom, I had to leave the children, run down the stairs, go to the bathroom, come back up, and come back into the class. I also wasn't allowed to use the faculty room where they took their breaks. I had to go into this small closet that was right beside my room, that we used to use as a cubby room. And it was about—I don't know—maybe about five feet wide by about 20 feet deep. There was no ventilation in this room, just the door going out to the hall. So often when I would go into that room during break time, during my breaks, I would have to leave the door open to the hallway just so I could get some fresh air in there.

That room was also used that, if children were sick, then the child would have to go and be put in there. And if that was the case, I couldn't be in there and I needed to leave the building. So rain or shine, that's where I was.

Then the other piece was: I couldn't use the bathroom. I couldn't use the faculty room.

Criss Hochhold

Can you tell me about potential meetings, faculty meetings?

Kassandra Murray

Even though I wasn't allowed to use the faculty room, I had to stay six feet away from everybody. At a faculty meeting, I was allowed at the faculty meeting,

[00:05:00]

where everybody was in the same room. They were six feet apart, and I wasn't wearing a mask. And some of the other faculty members would also take off their masks. I was allowed in that, but I wasn't allowed in the other situations.

Criss Hochhold

Please correct me if I'm mistaken. But you were able to attend faculty meetings with other faculty who were comfortable taking their masks off. Were you able to share a lunch space with that same faculty?

Kassandra Murray

No, I wasn't allowed to go in that room where they were doing that.

Kassandra Murray

And even at one time, if I may, I was sitting in that cubby space—that small closet—and I was doing some work and having something to eat. One of the faculty members, I was down

like, near the end, not near the hallway door. And a faculty member came by the door. She looked in and she said, "I'm going to close this door because you're breathing in there."

And she closed the door, and I didn't know what to say. I said, "Fine." And I just—yeah.

Criss Hochhold

She closed the door because you were breathing in there.

Kassandra Murray

Closed the door because I was breathing in there, yes!

Criss Hochhold

That's very interesting, because I don't normally go into rooms and not breathe.

Kassandra Murray

Yeah!

Criss Hochhold

I think we all have similar experiences; we all tend to breathe no matter where we go! Unless it's the other place, and we won't go there—

Kassandra, how did that make you feel?

Kassandra Murray

It was really traumatizing for me. It made me feel uneasy. I started seeing psychotherapists to kind of help me through the trauma of what it was doing to me. It made me feel really isolated and cut off from faculty members that I had called friends before. That now, I wasn't a friend, you know, because I wasn't complying.

Yeah, it was really harmful; it was really damaging to me. And then also, because it was such a toxic and harassing environment, I felt like I was policed all the time. They were walking by the room— Because I had to stay six feet away from the children within my classroom. And with grade one and two, which is like herding cats sometimes, it's very difficult to stay six feet away from them without a mask. I would see teachers kind of peeking in the room, making sure there was no children around me and things like that. And they would often have parents come into my room to kind of "help," because the parent would mask. And I wouldn't.

Criss Hochhold

To your knowledge, were any of the other teachers "policed" like that?

Kassandra Murray

Not to my knowledge.

Criss Hochhold

Kassandra, because you were in such a position of care with really the most vulnerable and our most precious treasures, children: Did you have any special rituals that you would go through in the mornings to assess them somehow, just about their overall health or mental wellbeing?

Kassandra Murray

Yeah, so prior to the COVID protocols, I always met my children at the door every morning and shook their hand. We look at each other in the eye. We shake each other's hand, and we say good morning to one another. And it's a good way to connect with the child. It's a good way to get an assessment of: What does their hand feel like? What is their handshake like? Is it firm? Is it weak? Is it wet? Is it sweaty? Is it dry? Are they making eye contact with me? And it gives me a good indication of how I can best serve that child that day. And then at the end of the day, we would also do the same thing. But that stopped with the COVID protocols. I had to get creative and inventive.

Criss Hochhold

What do you mean when you say you get creative and inventive?

Kassandra Murray

I still wanted to— Because I know how harmful it is for a child to be disconnected. When they're in a traumatic experience or in an environment like that—where they're feeling fearful, because it was really inciting a lot of fear in the children—to have that connection is really important. Because they tend to disconnect and you can see that. I could see it in the class and how that was playing out with the children. I thought, "I need to somehow keep this connection with the children." So I had each child get a tree branch of some sort, six feet long. Then we decorated the ends: one end was a red or pink. The other end was blue.

[00:10:00]

So that we always knew what end I would shake—the color—and what end they would shake—the color. So it wasn't getting mixed up, and we would still shake hands with the stick.

Criss Hochhold

Well, at least you were able to creatively form some sort of connection with the kids, even though the schools and the mandates brought in some rather ridiculous rules and procedures.

Kassandra, you've been a teacher for a long time. How would you compare the learning environment that was brought in by the school system at those times versus the years prior?

Kassandra Murray

Well, our faculty meetings became more and more geared towards how to police protocols for COVID and what Public Health was mandating. And so, then our teaching became more fear-based and informed that way with the children. You know, "Make sure you sanitize your hands every day before we go outside the room."

And if I may elaborate on that: one of the rules was that even if the children were going out into the hall to the bathroom to wash their hands with soap and water, they had to sanitize before they went out. Just in case they touched the walls. And there was one line going this way and, six feet apart, one line going this way, like a coming-and-going line. So they were watching to make sure I was making sure the children would self-sanitize. What happened was, one of the children came in and she had caustic burns on her hands from the sanitizer. And I thought, “Oh my god, this is awful, why are you doing this?” And her parent actually wrote in and said, “I do not want my child putting sanitizer on her hands. She’s fine to just wash them.” I was very grateful that that parent chimed in for that.

Criss Hochhold

Absolutely. You’ve seen some devastating things physically on the children because of the caustic burns from the overuse of sanitizer. What about their mental state?

When I think back when I was a kid—not that that’s a good thing—but you know, trying to have a happy childhood. And a teacher was that connection, particularly in those very early grades. Because really, at the end of the day, you do become a replacement parent for some little kids that are five, six, seven years old. You take on a bit of a motherly role.

Criss Hochhold

After the precautions were brought in, how was the learning environment? How were the kids? Like were kids being kids? Or what would you compare it to?

Kassandra Murray

Prior to the protocols, the children would go to each other’s desks. They would eat together; they would play games together; we would put all our desks together for birthday celebrations; we did all these things. After, we weren’t allowed to do that. And even outside, they were supposed to be six feet apart, and they weren’t allowed to sing. And they weren’t allowed to sing inside, and if they were singing outside, they had to sing six feet apart.

So the children become fearful of one another. Their self-regulation is being either stopped or it’s going to be delayed, because they’re unsure of what they need to do and where they need to go. Their cognition—

Because there were children that were masking in the class. It wasn’t mandated at that time for the children to be masked, but some families wanted their children masked, and some families even had children double-masked. And you could see the blood drain from their face. They didn’t have the rosy cheeks and things like that; you could really see the difference. Their cognition, their rate of taking something in and digesting the education that they were being given— It’s like eating a bad meal, right? It wasn’t working, and you could see that they couldn’t keep up or they were really tired, or they got tummy aches. You’d see a lot of that happening. And I had this special little tent in the room that I had to sanitize every time somebody came in or out of it. But at least it was a space where the child could curl up with their own little blankie and pillow.

[00:15:00]

And just kind of regroup a little bit, reconnect in that space, a shelter.

Sorry if I’m going off on a tangent a bit.

Criss Hochhold

That's okay, you're talking about the kids and that's great.

Kassandra Murray

You can see that this development of self-trust, development and trust in others starts to get delayed, or impaired in some way. Because they're cut off, have sensory deprivation. Their sense of touch is cut off, even their sense of hearing could be cut off if they're not hearing their friends properly. Or somebody that is muffled, you know: other teachers that did come in and had a mask on, you can't properly hear tone in the voice. So you can't really comprehend what's being said to you. And there's a lot of sensory deprivation that was happening there. The sense of smell, taste—all of those things were slowly declining in the children that were wearing masks.

I found, where typically I had a certain curriculum, that I was bringing at a good rhythm and everybody was able to digest, now I really had to pull back on that. I really had to have intuitive pedagogy, right? Where you kind of have to intuit what the children's needs are and just meet them where they're at.

Criss Hochhold

Absolutely. As with any school system, whether public or private, there would be learning outcomes that should be met or need to be met, so we know that the kids are progressing at a set pace, if you will.

Do you find that you were able to meet those learning objectives that had been set for those kids?

Kassandra Murray

I would say those learning objectives were definitely delayed. Like I just said, where I had a certain rhythm, you knew by this time: you wouldn't be meeting these outcomes. Typically, that's how it worked, but they were really pulled back—not just because of the impairment of the children being able to digest the information, but also from the onset of the unnecessary protocols that we were always told to police with the children, to make sure they understood the rules and what needed to happen. And then trying to explain that to the children in a way that's loving and kind and warm so that it doesn't further incite any fear.

Criss Hochhold

Absolutely. That makes perfect sense, Kassandra. I'm just going to take you back for a moment because your colleagues certainly seemed to have an extreme fear of someone that wasn't wearing a mask. How did the kids feel when you showed up in the classroom with no mask? Did you have to give an explanation as to why you, this teacher, is not wearing a mask and some of the rest of the teachers are?

Kassandra Murray

With children at this age, typically they're part of the whole. They haven't really quite come into their own self-individuality. That usually happens around the nine-year change. At this age, their consciousness is more, "I'm part of the whole. You're part of me, I'm part of you." There were some children that were like, "Miss Kassandra, why don't you have to wear a

mask?" I said, "Well, I choose not to wear a mask." I'm not going to get into it with the child. And that was the end of that. I just gave them a very simple answer, and that was the end of that. So that was how that was met.

But ultimately, they didn't really pay attention. Like you said earlier, they look to you like children still. They call you "mom" half the time in class instead of Miss Cassandra. "Oh yeah—sorry, Miss Cassandra." Right? Because they're looking for that adult that is giving them, nurturing them, and providing them with an environment of love and warmth. And they just want to hug, come into the folds of that. And so, yeah, so there were children that would just unconsciously want to naturally come up and give me a hug. And I would kind of hide them off to the side, right? "Okay, shh, we're not hugging!" So anyway. Yeah.

Criss Hochhold

Wow. It's kind of frightening what happened and what managed to be brought in and imposed on our children. I don't really have any other questions, but is there anything that you feel that you'd like to ask before I defer to the commissioners?

Please go ahead.

[00:20:00]

Kassandra Murray

Yeah. So, one of the other things that had happened, just to give you another picture, is the executive director, who's supposed to be impartial and fair to everyone: one day I was walking close to the office, and she was coming out of the office, which meant that we were kind of going by close to one another and she had her mask on. She literally turned her back to me because I was walking beside her.

And then after, there was a time where we all went online. I won't even get into how detrimental that is for children, but then we went online learning. And when we were coming back from the online learning, it was mandated that all the children and everyone within the school had to wear a mask. Even the little pre-primary ones all had to wear a mask. So they called me, and they said, "We can't have you come back to school. We can no longer honor your medical exemption and we won't, and we can't have you back to school. What we're going to do is we're going to put you on paid leave, but we're going to have a substitute teacher lead your class and you have to provide them with lesson plans." I did that for a few weeks and then everybody went off online again.

So then, near the end of the school year—I think it was the end of May, beginning of June, I'm not quite sure, but this is 2021—they were going to go back into the classroom for one or two weeks. They said, "Well, we can't have you back in the classroom; we can't honour your medical exemption and we won't. Unless you want to wear this helmet—" It's called a microclimate helmet; they were willing to pay over \$400 for this microclimate helmet that looks like one of those old sea diver helmets. I thought, "No, I'm not; those children have enough. I am not stepping in front of those children with that." Never mind my own trauma of having to deal with that, and I have a medical exemption.

So that was where I said "no." And they just kept making this environment for me at the school very toxic, very hostile. Watching me all the time. All these little things adding up and I decided that this was not in my contract; this was not the terms of my employment.

My terms of employment were significantly changed. And so, due to the employer's conduct, I felt forced to leave my job. And I made my decision to resign.

Criss Hochhold

Fantastic. So just quickly to reiterate: you had a valid medical exemption from a physician in Nova Scotia. And the school chose to disregard it entirely and essentially told you, "Your exemption means nothing to us. If you want to come and put on a spacesuit and teach—" Because that would be a wholesome environment to them.

Kassandra Murray

That's correct.

Criss Hochhold

Thank you very much, Kassandra.

Kassandra Murray

You're very welcome.

Criss Hochhold

Have a great day.

Commissioner Drysdale

I have a couple of short questions. I believe you mentioned that there were still faculty meetings going on.

Kassandra Murray

Correct.

Commissioner Drysdale

And you'd attend those faculty meetings. Some people didn't have masks on and yet seem to be okay. My question has to do with the intent, or the content of those faculty meetings. How much time, if any, in those faculty meetings was spent discussing the protocols for masking, et cetera, versus what protocols should be in place to compensate for the things you were seeing going wrong with children? With their learning being reduced or being impeded and some of the social issues.

My question is: How much time were they spending trying—those coming up with protocols—

[00:25:00]

to mitigate the effects of the masks on the children's learning environment?

Kassandra Murray

I would bring something up to try to mitigate, and I was immediately shut down. There was very little to none on mitigation. I would say that probably one third of the meeting was spent on protocols, what we need to do, how we could be better. I even have an email that was sent out by the executive, by the education director. It was sent out to all the faculty. And she specifically named me in this email, and she says, "For you, Kassandra, I would ask that you double up on your physical distancing and also support the parents who come in to support the class during transitions as well as in class time."

So I was really put in the spotlight because of what was a private thing for me with my medical exemption. And that was put out through the whole school.

Commissioner Drysdale

I just want to make sure I understand that they said you had to double up on your distancing.

Kassandra Murray

That's what they wanted me to do.

Commissioner Drysdale

Your distancing was six feet and they wanted—

Kassandra Murray

They wanted me to do 12 feet.

Commissioner Drysdale

How many kids were in the classroom?

Kassandra Murray

How many did I have that year? I remember, I would say approximately 18.

Commissioner Drysdale

Would it be possible in a classroom to be 12 feet away from 18 children?

Kassandra Murray

No.

Commissioner Drysdale

I have one other question, and maybe it's just I didn't understand something about this. I thought you said that you weren't allowed to go into the lunchroom and have lunch with the staff?

Kassandra Murray

Correct.

Commissioner Drysdale

Did they eat their lunch with the mask on?

Kassandra Murray

I wouldn't know because I wasn't allowed in the faculty room!

Commissioner Drysdale

Thank you, that's all I've got.

Kassandra Murray

You're welcome.

Commissioner Massie

I have two questions. One short question. You probably have heard— I've never seen it myself, because I've been out of the university and school, and so on, for a long time. I've heard that there are a lot of issues in the American campus, but maybe also in some places in Canada, about the so-called safe space and microaggression. That is, people that are sensitive to opinions or behavior. And I'm trying to understand what that could represent in an environment but with teenagers or young adults. Maybe this is something that can be, I don't know, managed somehow.

But in a school with children like that and among adults, which are the faculty: Would you compare what you've lived through to something like microaggression?

Kassandra Murray

I don't know. I'm not sure how to answer that question. I know I felt segregated, and I felt discriminated against. I just felt very isolated. I don't know about the microaggression piece.

Commissioner Massie

So how did you feel emotionally?

Kassandra Murray

Oh, emotionally. Emotionally, I was really traumatized. I was really sad, and I was thinking, "What am I going to do for work now, how am I going to make a living? I can't go back into that environment; they won't even let me back into that environment." You know, they made it very difficult for me.

I went into this very anxious, stressful state of fight or flight and thinking, "Okay, I need to go boots in. And just get moving and figure out what I'm going to do." And that's where I was really grateful that I had this doctor that was helping me, a psychotherapist. Because she was really helpful to help me get through that stage.

Commissioner Massie

My other question— Maybe you're not aware of it, but in Quebec they conducted a very extensive study to look at the impact of these measures in school on the learning process and behavior of the children, and so on.

Are you aware of similar studies in Nova Scotia?

Kassandra Murray

I'm not aware of similar studies in Nova Scotia directly.

But from some of my training in working with transdisciplinary healing education, working with educating traumatized children, right?

[00:30:00]

And seeing how trauma and these things not only have mental health implications and psychotherapy indications for the children at the time— If it's not worked out immediately, it can turn into other illnesses and disease, right? But it also can have a delay in the development of their organs, in the development of how they move and their growth.

So there is a lot that can happen physiologically and psychologically with the children.

Commissioner Massie.

Thank you.

Criss Hochhold

Thank you very much Kassandra, I really appreciate your time.

Oh—I'm sorry, my apologies. Let me take that back for a moment. I'm sorry. I still appreciate your time, but we have one more question.

Commissioner Kaikkonen

Hi Kassandra, I just want to take it just a little bit bigger, broader. Who determined the protocols? Was it external and was it the provincial health, or was it just internal within the private school system?

Kassandra Murray

We were told that they were getting their mandates from Public Health. That's what we were told at faculty meetings. The school had put together a small group of individuals— teachers and parents that put together what they felt were the measures and protocols that our school would be doing. So they were getting this from Public Health; they were getting whatever mandates or protocols. And then they would take that, and then they would implement it in a way, for our school, following those guidelines. That was my understanding. That's what we were told.

Commissioner Kaikkonen

Were you ever given a copy of those mandates from provincial health, or you just read about in the media, that kind of thing?

Kassandra Murray

I don't recall being given anything. I just remember us being told this was what was happening. Yeah, it was kind of like an agenda note, right? This is part of our agenda. But it didn't go into—

Commissioner Kaikkonen

Did you see any discrepancies with what was happening within your private school as compared to other schooling alternatives in Nova Scotia? I'm not from here, so that's why I asked.

Kassandra Murray

I wasn't sure what was happening in the public school system because I'm not part of that. I just knew what was happening in our private school, I didn't know too much about what was happening in the other school systems. I was just really involved with what we were doing.

Commissioner Kaikkonen

And then one final question: In terms of incident reporting, was there any reporting process within the school system for the hand sanitizer issue?

Kassandra Murray

No, there was no incident reporting for that. It was the parents coming back to say, "my daughter has caustic burns from this overuse of sanitizer, and I don't want her using it anymore."

Commissioner Kaikkonen

There would be no path to document what was happening with that child and taking that information—sorry, I just lost my voice, I think—to the public health authorities?

Kassandra Murray

Not that I'm aware of.

Commissioner Kaikkonen

Okay, thank you.

Criss Hochhold

Is there one more question forthcoming? No.

We do have an audience question for you, Kassandra, as well. The question is: Thinking of air quality and our scent-free schools, did the hand sanitizer have any negative impact?

Kassandra Murray

As far as scent sensitivity?

Criss Hochhold

Yeah. Usually I find that, and I'm going to presume that with whoever is asking the question— Are you talking about scented hand sanitizers? Because they were both available, I believe, at the schools.

Kassandra Murray

Have a smell to them, yeah. In my class personally, I didn't notice any scent sensitivities to the sanitizer, only the physical sensitivities of rash, the burns, things like that.

Criss Hochhold

Wonderful. I believe we've got all the answers to all the questions. Thank you once again very much, Kassandra.

Kassandra Murray

Thank you.

Ches Crosbie

Thank you all. The hearings will rise for the day and reconvene tomorrow at 9 a.m. Thank you.

[00:34:55]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

EVIDENCE TRURO HEARINGS

**Truro, Nova Scotia, Canada
March 16 to 18, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Ches Crosbie

An existential threat to our democratic way of life occurred towards the democracies in the 1930s. It was called the Great Depression. But when Franklin Delano Roosevelt made his inaugural address as President of the United States in 1932, he didn't tell people to be afraid and stay home. He told Congress and the free world that we had nothing to fear but fear itself. We heard a bit yesterday from Shelly Hipson about how data and statistics were manipulated to make people feel afraid in this province, Nova Scotia. No great nation prospers and grows on a platform of fear. But as a virus spread out from Wuhan China, governments chose to opt for fear and to ignore their own previously approved and adopted pandemic plans, which instructed them to protect the vulnerable, allow others to carry on their lives normally, and maintain public confidence. They panicked into a war against a virus—a war which all reason and experience told them was futile and doomed to failure. And the first casualty of war is the truth.

Many citizens might say the COVID crisis is over. I just want to forget about it, move on. The problem with forgetting about it and moving on is that governments may never relinquish power and control once they have it.

Coercive measures such as injection mandates to travel by air are only suspended, to be brought back whenever government deems necessary. And in many settings, including courts and hospitals, mask mandates are still in effect, despite the evidence of myriads of studies, the latest one being the famous Cochrane review—the definitive study on masking, which reviewed 78 randomized control trials and concluded that masking was completely ineffective. Masking of any type. That came out just two or three weeks ago. And they continue to double down on their advocacy of injections whose efficacy data, you will hear, has turned negative and whose safety is in heavy scientific dispute.

No government in Canada has had the courage to hold independent hearings into their response to the COVID crisis and learn lessons for the future. What went right and what went wrong? Were we told the truth? Did politicians, officials, and media promote and enforce a single government approved narrative, a dominant narrative, about SARS-CoV-2 and suppress alternative competing narratives based in science? If mistakes were made,

what reforms should be implemented to reduce the chance of those or similar mistakes occurring in the future?

Commissioners, at the outset, we should recognize and acknowledge the pain of those many people who lost family and friends to COVID, but we should also recognize and acknowledge the pain of so many people who have lost family and friends to the measures taken to combat COVID. You will hear evidence that these measures include the unscientific suppression of cheap and effective early treatment; deaths from loneliness, despair, and addiction caused by brutal lockdown and isolation methods borrowed from prison discipline; and the unprecedented levels of injury and death caused by experimental injectable products which did not fit the traditional definition of vaccine, and which governments still promotes.

We should also acknowledge the injuries of those who struggle with prolonged symptoms of infection injury from the

[00:05:00]

injectable products and psychological injury from the campaign of fear and isolation. In the face of the COVID crisis upheaval since early 2020, it's only reasonable that this inquiry ask the question governments don't want to ask. Why did so many Canadians die or fall ill both from SARS-CoV-2 and from the efforts to mitigate its damage? Were our national public health responses based on the best possible evidence? And was that evolving evidence constantly re-evaluated to optimize the outcomes for the population as a whole? Were any COVID countermeasures actually counterproductive? And did they result in more harm than good? In other words, did governments use cost-benefit analysis to evaluate their actions; or were their actions, as many citizens suspect, the product of unspoken agendas for profit, power, and control?

Answers to such questions are critical to the future of Canadian democracy, to the individual rights and freedoms which sustain Canadian democracy, and to our future economic well-being. In the absence of government interest in commissioning independent public hearings, a network of volunteers from across this great country has come together out of a desire for a better Canada. The National Citizens Inquiry is entirely citizen-funded and citizen-run, and is therefore entirely independent of any government influence. You Commissioners have sworn to go where the evidence takes you and to make your findings and recommendations based on the evidence you will hear during this inquiry. And the evidence will be disturbing.

The witnesses who have come forward to this inquiry told us almost without exception that they have done so because they want to give voice to a perspective which has been ignored and suppressed in the government-sponsored narrative, enforced by mainstream media. The Commission has invited a large number of politicians, public health officials, and other leaders of the official response to the COVID crisis to appear before you and give evidence at a hearing venue convenient to them, either in person or by video link. If they fail to appear and explain to Canadians their side of the narrative, its basis in science, and why their actions were justified and continue to be justified, it will be because they do not wish to account for their actions to the citizens of Canada. It will not be because they were censored, silenced, or deplatformed by this inquiry.

If leaders of the COVID crisis response do choose to explain themselves to Canadians, they could be asked for their response to the following issue. The AstraZeneca COVID-19 vaccine program was suspended in Canada due to its risk of causing severe adverse events. The

main one was blood clotting in one in 55,000 inoculated adults—one in 55,000. Why has the same safety standard not been applied to suspend the mRNA program? Dr. Joseph Fraiman, from whom we will hear this afternoon, calculated with colleagues a one in 550 rate of serious adverse events, as revealed by reinterpretation of the clinical trial data, which is the supposed gold standard for knowledge about a new drug. The study by Dr. Fraiman was published in the prestigious journal *Vaccine* and cited by the Surgeon General of Florida in his recent letter to the FDA.

In suspending the AstraZeneca program, our regulator established a safety standard for itself for triggering suspension of a COVID injection program.

[00:10:00]

This standard was one serious adverse event in 55,000 inoculations. Peer-reviewed estimates of the serious adverse event rate for the mRNA vaccines are orders of magnitude higher than one in 55,000. Why have we failed to apply the safety standard we applied to AstraZeneca products to the mRNA injection program? The issue of the safety and efficacy of the injectable products is a leading battleground of government propaganda and a focus of mainstream media suppression of the tsunami of scientific information which contradicts government claims.

Government no longer claims that the mRNA injectable products stop infection transmission. You will hear evidence, and in fact have already heard evidence from Dr. McCullough, that these injections work by the injection of instructions to ourselves to produce a foreign protein on their surface. This foreign protein, the spike protein, is produced in unknown amounts for an unknown time and is interpreted by the body as a toxin. You will hear that the shots have tremendous quality variation in the manufacturing process. They are in fact experimental, no matter how they might be classified legally, with no medium or long-term information about their risks. You'll hear evidence from a Canadian expert, Dr. Denis Rancourt, that these experimental injections have killed more than 10 million people worldwide—more than 10 million people worldwide. You will hear that scientific peer-reviewed literature has delivered the following verdict. An abundance of studies has shown the mRNA vaccines are neither safe nor effective, but outright dangerous—outright dangerous.

Commissioners, the life, safety, and health of our friends and family, the viability of our democracy, and our future national prosperity rest on your deliberations. The Charter of Rights and Freedoms states that Canada is founded on principles that recognize the supremacy of God and the rule of law.

God speed you in your task and may God and the rule of law prevail. Thank you.

So that's a big task.

[00:13:06]

EVIDENCE

Witness 1: Darrell Shelley

Full Day 2 Timestamp: 00:32:11–00:55:57

Source URL: <https://rumble.com/v2djjsi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Now I think we have our first witness for the day.

Criss Hochhold

Good morning, everyone, Commissioners.

Ches Crosbie

Sir, do you affirm to tell the truth, the whole truth, and nothing but the truth?

Darrell Shelley

I do. Can you hear me?

Criss Hochhold

Yes, we can hear you. Thank you. Can you please state your full name for us?

Darrell Shelley

Yes. Hi Criss, thanks for having me here today. My name is Darrell Shelley. I'm from Stephenville, Newfoundland. I relocated to Toronto in 2004, where I lived for 16 years, returning to Stephenville in December 2020, during the COVID pandemic.

Criss Hochhold

Before you moved to Newfoundland you said you resided elsewhere, can you tell me more about that? What precipitated your move to Newfoundland?

Darrell Shelley

I lived in Ontario for 16 years. I left Newfoundland as a young man, as many do, to seek employment opportunities. I ended up starting a business called Mighty Mouse Staffing, which was founded in early 2017. I was a freelance audiovisual technician in Ontario, a self-employed businessman the entire time I was up there. And after, when the COVID pandemic struck, it really took a dent in our business. We specialize in technical labour and the installation of events for producers, venues, shopping malls, public spaces, and we also provide skilled trades and construction when required. So when the live event industry shut down, it completely destroyed our business.

Criss Hochhold

Terry [sic], did you take any preventative steps to try and mitigate the potential impact of lockdowns or restrictions for your business?

Darrell Shelley

Yes, yes we did. So we ended up ordering KN95 masks, which are PPE from Asia, which is on par with the N95 masks you would get here, for what we call respirators. And we wanted those because they were supposed to keep our workers safe and we had to continue to work throughout the pandemic. So we ordered thousands of them. We got an importation license and we were ready to continue throughout the pandemic. We saw that it was coming before they had started to announce the emergencies of March 2020. So we were ordering these things about six to eight weeks before that time. When we started out in 2020, we just had peaked at what was going to be our best year ever based on contracts we were landing. We had about 20 freelancers that were working close to full time and 80 freelancers on call. We were on a gross track for over 1.5 million in 2020 from a business that started with only \$1,500 of one client back in 2017.

Criss Hochhold

So you built your business from 2017 to 2020, basically from \$1,500 income to a projected revenue of \$1.5 million, is that right?

Darrell Shelley

That's correct, yeah, and everything that we did was related to the event business at that time in the live event industry. So when the lockdowns happened in March, we had to tell everybody, "We're finished for now, we'll be back maybe in a few months." We weren't sure, so we held on to those KN95 masks. We just put it as a tool in our arsenal, Criss, like the same as you would with, you know, your boots, your steel-toed boots, your hard hats, or whatnot. And we figured we will get back to work at some point in time. But when June hit, we realized we weren't going back to work. That we were going to be permanently locked out of work here. And Doug Ford, because we were Ontario, he kept calling for PPE, PPE; and they kept telling people, the public, not to buy masks, that they only needed them for the government.

Well, when the government says something like that, it makes me want to make sure that I've got enough for myself first. But knowing we weren't going to need them, I had enough for my family. I had more than enough for my family and I teamed up with another friend of mine who owns a company called portable UBC and we decided to take all of our PPE and donate it to long-term care.

[00:05:00]

Because Doug Ford was calling for help with long-term care. We saw these videos on the news of people in long-term care were suffering. And if you remember the military had been called in, so we decided, "Okay, we're going to do our part, we're going to donate these things." Now they were calling for procurement, and we could have made money. I said, "No it's not the right thing to do. We're in a pandemic. We're all in this together, right?" That was the idea, was to help each other. So if I could help brothers and sisters and long-term care facilities get through their day, I had medical grade respirators that could help them, I was going to donate them.

And then we had a big snag when we actually decided to do that, which was the very first sign for me that there was a lot more to this pandemic that had to do with financial gain than it did to do about keeping people safe.

Criss Hochhold

Terry [sic], how many masks were you donating or looking to donate?

Darrell Shelley

So we had about 5,000 of them between us, and I had reached out to OPSEU [Ontario Public Service Employees Union], which is the union that handles long-term care facilities in Ontario. And I reached out to the president, Warren Smokey Thomas, and Eduardo Eddie Almeida, the first vice president and treasurer. They wouldn't get back to me for the first few times. I tried calling. I tried repeated e-mails. Finally, I got a little bit aggressive with one of my e-mails, and I did get a response. Their answer was to give it to the government, at which point I said, "I'm not interested in that. I'm interested in giving them to you." I said, "we will bring them ourselves. We have an importation license. These are legitimate. Taxes have been paid on them. Can we just bring them to you and help your people out?" And they just completely shadow-banned it. They blocked us. They didn't want to talk to us. They ignored us. It was over. I didn't understand why. So I went and did some investigating. I found it on their website. They were selling branded cloth masks with their logo on it, non-medical grade, to their own union employees. And that's the only PPE they were letting them have, which weren't going to keep them safe from the so-called virus. And here we were with medical grade respirators, an importation license, and excess of 5,000 masks that we didn't need.

And now, on a side note, OPSU is seeking nearly \$6 million that they allege that Warren Smokey Thomas and Eddie Almeida had stolen from union executives over the years. So I don't know if they were making money off these masks, but it sure as hell put a red flag up for me, and we decided eventually to donate them to a homeless shelter called Homes First in Toronto. So we gave it to them, but it was pretty amazing that they were calling for help in long-term care. And here we were, coming to save the day, and we weren't able to do it because they wouldn't let us do it.

Criss Hochhold

And you were shut down from providing masks to the elderly population, particularly long-term care facilities, which were certainly a high-risk category. So thank you for that.

Terry [sic], what happened to your business? Because you said you built it up from the dream, so to speak, from very small income to a projected income of 1.5 million. And the

second question— Actually, let me preface that, I'm sorry. Your business had contractors, you had employees, 20 contractors, and you also said you had up to 80 subcontractors. When the lockdowns and restrictions came, what happened to your company? What happened to those employees, to those contractors and subcontractors?

Darrell Shelley

So the audiovisual community and event-staffing community in the city they had these online sort of events where they were trying to rally people to— You know, let's be all in this together and let's stay home and let's stay safe and all that. But after a while, after a few months, we started to see that this really wasn't the case. Walmart was open, the liquor store was open. People down in the United States, you know, a lot of places were still open. A lot of technicians that were highly skilled moved to the United States temporarily. Some of them left the business completely. A lot of them switched trades or left the town because, I mean, living in southern Ontario near the GTA is ridiculously expensive. You need to keep making money every day or you're going to go under, and by the time we got said and done with it, I think we managed to pick up some work in 2020. Our one and a half million projection ended up turning into about nine grand in sales from March to the year-end, and we almost lost our company.

We managed to survive because we started an online pet supply business and dog breeding business when we came back to Newfoundland called Shelley's Pet Palace, and we were able to do that mostly online. And now in 2023, we are just starting to get Mighty Mouse Staffing back to pre-pandemic levels, and we're hoping for a good year. But we've had to rebuild our entire crew and network because a lot of people have exited the business.

[00:10:00]

Which was sad because we lost a lot of really good people from that industry.

Criss Hochhold

No question of significant impact on the staffing because people would have found different trades, different avenues of revenue which may not return to the business. Certainly, a significant impact, and to go from a projection of 1.5 million to an actual recognized revenue of \$9,000 is simply incredible. Were you able to regain some of the clients that you lost because of the significant reduction in your ability to provide the services?

Darrell Shelley

So thankfully, yes, we managed to keep a couple of our clients. One of them does a lot of work in shopping malls, which managed to remain open. So that little bit of work floated us during the tough years, the two tough years that just—that we just went through. But it was nowhere near what we were at before. I mean, it was literally, I had to put myself on the jobs. I had to travel back, which was quite a struggle: traveling throughout the pandemic with the various restrictions changing on a weekly basis, not knowing if we were even going to be able to travel. So I wanted to go into telling my little story about how I had to actually come home and try to take care of my mother, because getting back to the island of Newfoundland during that time was a nightmare.

Criss Hochhold

Absolutely, and Terry [sic], you've segued from the business aspect which affected you and your family, but I want to touch upon your personal story as well. You mentioned your mother, so certainly a significant life event that impacted you. Can you tell me more about that?

Darrell Shelley

Yeah, Criss, so, I mean, what proceeded—the story I'm going to tell right now probably brought me to where I am right now, my political and professional ambitions. Because I couldn't believe that this could happen on Canadian soil. I couldn't believe that this could happen in our country. So my mom was having a rough time with her health at the beginning of the year. We didn't make it home for Christmas in that previous year, so we planned to come back sometime year 2020 anyway. In May, Mom got sick.

Criss Hochhold

May of 2020?

Darrell Shelley

2020. Like really sick, more than before, and she had to stay in the hospital for a couple of weeks alone. It was really hard on her. She was unable to leave and she was only allowed one visitor, which was her designated visitor, which was her sister. During this time, my nephew was born. There were strict hospital restrictions due to the pandemic for visitation—for births as well. So my mother was unable to witness the birth of her second grandson, due to the pandemic restrictions. And the baby was not able to come see her due to the restrictions in the hospitals. I think that's when she got diagnosed with cancer, and I think it was a really lonely, difficult time for my mother. I regret that I wasn't able to be there for her at that time.

Criss Hochhold

Absolutely, I'm very sorry to hear that. How did you feel when you first learned that you weren't able to visit your mother, you know, going through such an end-of-life stage at this point in time? How would that make you feel, Terry [sic]?

Darrell Shelley

Yeah, we knew that we might be able to come home if we applied for an exemption. But in May 5th, 2020, Bill 38, an Act to amend the *Public Health Protection and Promotion Act*, backed by the Newfoundland government, was enacted. And this included banning non-residents from entering the province. However, residents were still able to leave and return. So if you're from Newfoundland, you can leave and go to Canada. But if you're in Canada, you can't come to Newfoundland. First time I've ever heard of anything like that ever happening. You're not allowed to go to this province, sort of, right? It allowed the police to conduct warrantless searches and contain persons who are suspected of being in contravention to the *Public Health Protection and Promotion Act*. To enter any premises without a warrant, to take samples, conduct tests, make copies, extracts, photographs, videos, inspect as the inspector considers necessary. And to make available any means to generate and manipulate books and records that are in the machine-readable format, such as an electronic form, or any means necessary, for the inspector to assess any books and

records and no timeline given. So they can just come into your house, take your laptop, leave, and come back three months later and say, "We found something in your laptop."

Criss Hochhold

So there were some very, very trying times for us. Sorry to interrupt you, Terry [sic], but I want to focus back on your mother a little bit actually. Because you weren't able to visit with her due to these travel restrictions that were brought in, but were you able to connect with your mother in another way potentially?

Darrell Shelley

Yeah, Criss. Yeah, to just correct you, it's Darrell.

Criss Hochhold

Oh, I'm sorry.

Darrell Shelley

Yep, no problem. So yeah, like I was just about to get into—

[00:15:00]

In May 2020 the Civil Liberties Association wrote to the attorney general, Minister Andrew Parsons, concerning the restrictions put in place by the government. I sent that to my mother and I said, "You know, I don't know if we're going to be able to get home. I don't know what's going on." So June 4th, my wife and I applied for a travel exemption into the province. And to our surprise, we did get it the next day. Taking care of someone in palliative care assistance was an option. We chose that option and we did a lot of teleconferencing, video calls with Mom. But we were really worried about traveling through the other Atlantic provinces because we heard about the difficulties that other people were having.

We didn't know if we were going to be able to get through New Brunswick and Nova Scotia. We didn't know if we were going to be able to even get on the boat and then they may change that last minute. So Mom was doing better through the summer and had lots of family and friends to help her as she was going through chemo. So we didn't think it was necessary to really take the risk of trying to travel and maybe getting stopped along the way or something. So we didn't go at the time. And then in the fall, Mom took a turn for the worse. We decided to travel home right away to take care of her full-time at that time.

Then on November 7, 2020, I had to apply for another exemption because the old one was only valid for 30 days. Now, this 30-day rule was never stated, was never made public. There was no way to know it. I had to inquire because I was going to pack up. I left my condo behind, everything behind to come home. My business was shot, so there was no work happening anyway. And this time, I applied for my entire family. We were planning to travel back on November 23. Then on November 13, I was talking to my mother with her on Messenger that day. Everything seemed fairly normal and fine. She was on the phone with her sister, I believe, that night. And sometime after midnight, she died in the kitchen. The restrictions that were put in play by the Government of Newfoundland and Labrador and the other corresponding Atlantic provinces robbed me of being able to see my mother in her dying days.

Criss Hochhold

I'm very sorry to hear that, Darrell. Absolutely. As we're coming in towards the end, I want to ask: were you able to find some closure after all this with your mother's passing?

Darrell Shelley

Yes and no. We weren't sure if the exemption would be valid, but we came home anyway. At this time, after Mom passed away, there was no way for me to be able to get back to see the body to say goodbye, do a proper send-off. She had to be cremated pretty quickly. What we decided to do was to have a wake. And I knew that there was a fourteen-day isolation and I wasn't supposed to go. Some family members said to me, "Do it anyway," others said, "No you can't." So I didn't tell anybody I was coming back and no one in town, no friends, no relatives, nobody knew of her wake. She was robbed of that. I didn't know anything about it. I came home, got off an airplane full of people. Got into a truck completely isolated. Went to my house, completely isolated. Got in the truck went to the wake, had to put a fake name down to walk in. Went in and saw her in the empty room.

And to this day, there's people in this town didn't even know there was a wake. The only other person who went was my brother and his family. Nobody else was there. I didn't even see them, because they went at a different time. People were calling me saying, "You are going to get arrested if you break the quarantine." And I said, "My mother is dead." I said, "I'm coming back to say goodbye to her body and we paid thousands of dollars for it. I'm going to do it." So I set her up, it was it was mixed emotions. I was completely alone with no one there to confide in. You know, my father was very helpful by giving me his truck and everything. But the people in Newfoundland and Labrador were scared. They were totally petrified.

The amount of discrimination I felt in the next few months, traveling home, getting on that boat, and coming from Ontario, from my fellow Newfoundlanders was despicable. It was ridiculous. You are talking about a person that hadn't left his condo for almost—more than half a year. I was never sick. We weren't working. I was isolated most of the time. All I did was went outside to walk my dog. The amount of discrimination was ridiculous. The government had everybody pitted that the outsiders were going to bring some killer plague to the island of Newfoundland. And everybody believed that this is going to happen. I heard things like, "You're going to be the first case in Stephenville," and, "You would affect the entire town." When I came back—I came back on December the first, was when we finally landed, when we got over with our stuff. We quarantined for fourteen days. The last day of quarantine was my fortieth birthday. No one came to visit me on my birthday. People called and things like that but nobody came. It was my last day. Like I said we saw very little family over Christmas. It took twenty-nine days before I was able to sit down with my brother to discuss my mother's affairs.

The government destroyed everything and had everybody living in fear. It was so sad. As people found out we were from Ontario, they would run away from us. When we couldn't get help offloading, I couldn't get help to offload my things. Even if I actually did it in another room by myself.

[00:20:00]

I was offering somebody two hundred dollars an hour to help me offload my stuff, after driving all the way from Ontario, getting harassed by a border guard in New Brunswick, who said I couldn't stop. Having to take the license plates off my truck and off my trailer. It took three days to offload that stuff by myself. I had to return to my mother's house to go

over her belongings. Same towels that she used were still hanging in the bathroom and nobody to help us. The intimidation factor was unreal, and I couldn't believe that the people of Newfoundland were so scared and convinced that we were going to bring this plague and kill everybody. It took a long time for us to be able to reconcile that as friends with our neighbors, with our families, and people [inaudible] to get back to normal.

Criss Hochhold

Absolutely right and then we are still reconciling with that, so thank you, Terry [sic]. We are coming short on time. I have no further questions for you. Appreciate your time and I'm going to defer to the commissioners, if there are any questions that they'd like to ask of Darrell. No?

Yes, there is one question.

Commissioner Kaikkonen

I'm just wondering, when it comes to the different travel regulations or guidelines in the different provinces. When you mentioned that you were harassed in New Brunswick, by the border patrol, could you just kind of elaborate a little bit further on that?

Darrell Shelley

Sure, yeah. It was after driving through Ontario and Quebec with no issues really. We got to the New Brunswick border at Edmundston and they had a full lockdown situation. It was almost like driving into a— I've traveled in Europe. I've gone from country to country like France to Switzerland, and other places. And when you do, there are places where they search you, and they lock you down. And you know that's understood. It felt like that, it felt like I was going into another country. Like I was being questioned about who am I, where am I going, why am I going there and I had my papers. I said, "I'm going on back to Newfoundland," and she said, "Well, you can't stop along the way." I said, "Well, if you know anybody who's got a 5.7 litre V8 with a trailer that can drive all this distance without stopping on one tank of gas, I'll take two trucks, thanks."

I had my family, my puppies, a long drive, we were already tired, we weren't allowed to stop. She said, "Well, if you do stop—" I mean she pulled over other officers and they started interviewing us. And they were, like, flashing in the back of our car and looking around and trying to find out what we were doing. And they said, "If you do stop, you've got to wear a mask, you've got to put the gloves on; you can't go inside any building to use the washrooms or anything like that; you can't eat. Go straight to Newfoundland and get straight on the boat." If anybody knows, that's a very long drive, it's hard to do it in one day. It's impossible to do with families, and puppies, and a trailer like I said. So I had to stop. I had to take the license plates off. I had to hide, I had to pay cash most of the time because I was afraid that they were going to track my Visa or my debit card. I mean this is early 2020, before they had any of the vaccine passports or anything like that, and we were terrified.

We didn't know what to do. Coming into Nova Scotia, they had flashing signs about getting ready, getting ready, and when we got there, there was nothing. We just drove right through Nova Scotia and went straight to Newfoundland. It was so bizarre. Each province had their own set of rules and again, New Brunswick was pretty intimidating. She said, "If you stop for any reason at all, we're going to send you back to where you came from." So I would go back to Ontario where I had no home, where I had no condo, where I had no

company anymore. And I wouldn't be able to go and take care of my mother's affairs. I'd basically be homeless if they decided to turn me around, if I didn't cooperate with them.

Commissioner Kaikkonen

Thank you.

Darrell Shelley

Thank you. Thank you for what you're doing. Thank you for taking the time to listen to me today.

Criss Hochhold

Thank you, Darrell. I appreciate your time.

Day 2

EVIDENCE

Witness 2: Terry Lachappelle

Full Day 2 Timestamp: 00:57:02–01:17:47

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Good morning, Mr. Lachappelle. Do you, in the testimony you will now give, affirm that you will tell the truth, the whole truth, and nothing but the truth?

Terry Lachappelle

I do.

Criss Hochhold

Good morning, Terry. I know we've already sort of mentioned it, but can you please give us your full name?

Terry Lachappelle

Yes, my name is Terry Lachappelle.

Criss Hochhold

Where do you live, Terry?

Terry Lachappelle

Right now, we live in rural New Brunswick.

Criss Hochhold

And what did you do for a living?

Terry Lachappelle

I'm a retired military veteran of 21-plus years.

Criss Hochhold

Where were you posted, Terry?

Terry Lachappelle

Six different provinces.

Criss Hochhold

Let's go with the most recent, or your last posting.

Terry Lachappelle

Right, CFB Trenton.

Criss Hochhold

Okay, so before moving to rural New Brunswick, your residence was Trenton, in Ontario?

Terry Lachappelle

Correct.

Criss Hochhold

What did you do for the military? What was your occupation or your capacity?

Terry Lachappelle

My occupation was MSE Op, Mobile Support Equipment Operator. Basically, a truck driver. I retired in mid-2018, and I started working on the base as a civilian in— Sorry, this is a little hard to say, but in 2020, as a public service.

Criss Hochhold

Breathe, nice and relaxed. It always helps to breathe deeply. Take a couple deep breaths, and we'll go from there, okay?

Terry Lachappelle

I'm good.

Criss Hochhold

Excellent. Terry, you retired from the military in 2018 and then took a public service position with the military. Correct, as a public service?

Terry Lachappelle

Yes, as a civilian.

Criss Hochhold

As a civilian. Okay. And then you left that job in 2020, you said?

Terry Lachappelle

In late 2020, yes.

Criss Hochhold

What precipitated that?

Terry Lachappelle

Well just about, you know, early 2019, early 2020, the COVID pandemic was happening. And I listened to a lot of different news outlets—not just mainstream media but also alternative news outlets. And I was hearing rumors and reading rumors about possible injection mandates for all public service employees. My wife also worked on the base as a public service employee. And I was watching that really carefully because I was worried obviously, right, what was going to happen. So between the two of us and my military pension, we were doing fine. I mean, you know, \$170,000 a year, roughly. We had a couple nice vehicles, nice home, completely renovated, you know, camper, pool, hot tub for my back. Everything was going good. Until I believe in September or October, it was announced from the federal government—you can look it up; it's still on their website—that yeah, indeed, you know, no jab, no job. So you either take the injection, or you'll be placed on indeterminate leave without pay for public service employees.

Criss Hochhold

And this would affect both you and your spouse?

Terry Lachappelle

Oh, huge. You know, when you have a comfortable life and we're just starting to get used to that, and then all of a sudden, poof, it's gone. So I saw the writing on the wall. I saw the deadline. It was there in writing. So come back a bit, I knew what was going to happen. I knew what we had to do because there's no way I could afford all of that, you know.

Criss Hochhold

So you've made a decision. It sounds as though—and please let me know if I'm incorrect—But you said you then received documentation from the military that says if you're not **vaccinated by a certain date, that your employment would effectively be terminated.**

Terry Lachappelle

Right.

Criss Hochhold

But you've made a decision not to get vaccinated, is that right?

Terry Lachappelle

Correct, because a lot of red flags. I mean mRNA is nothing new. I'm sure everybody in this room has looked it up, did a little research, whatever. It's decades-old technology.

[00:05:00]

And the first red flag to me was, why wasn't it ever brought to market before. And then the push, the push, I mean, coercion? Really? Coercion to take something that I don't want to take; to take a medical procedure I don't want to undergo? You know, like, you never buy the first model Tesla. You're going to wait till they work out some bugs first, right? And my backup plan was always, well if I'm wrong, I can always take it. You know?

Criss Hochhold

When you said coercion, can you tell me a little bit more about exactly what you mean by that?

Terry Lachappelle

Well, when the government announced that you either take it or you get placed on leave without pay for basically forever, I talked with my wife and I said, "You know, we got to sell everything. We have no choice because I can't afford this." A military pension isn't very big, right? So we had to sell the house. We went down to one vehicle, sold the motorcycle, sold everything. I mean, a lot of stuff I couldn't even take with me, the movers wouldn't take. Luckily for us, we did make a little bit of money on the sale of the house, so that kind of tied us over for a little while. We hired some movers. We moved back to southern Ontario, back to Niagara. Ended up in a small—maybe 550 square foot—apartment on the third floor. Big difference. It's not something I really want to wish on anybody. I mean, it might have been easy, just take it, carry on with my life but no, no.

Criss Hochhold

You felt that, based on the research you've conducted and the information available at the time, that it wasn't safe for you to take to continue employment? Rather than potentially the prospect of losing your home, your vehicles, everything that you've built up? Because you had quite a long, lengthy career with the military.

Terry Lachappelle

Right, well, based on what I was reading—I watched a little bit of mainstream media, but I tried to stay away from it—a lot of other alternative sources. I never take anything I see online at face value. You have to kind of read between the lines, use a grocery store method, take what you need, and leave the rest behind.

The stuff I was reading was just like, wow. No, I don't even want to take a chance on this right now, so I'm going to wait. I'm going to see what happens. Unfortunately, I didn't have time to wait, because the date was on the wall, November 1st, and then on November 15th, you're being placed on leave without pay. So we did what we had to do. And it was really like a punch in the face. You know, here's an organization I worked for half my adult life. Okay, when I was in the military, I was medically released. I kind of understand that, I mean, you get to a certain point in life where you can't do what you used to do. So yeah, I couldn't do the soldier thing anymore. That's fine. You know, I understand that. And there were some benefits there for me on retirement. But this, there's just basically nothing.

They're taking away two full-time incomes and replacing it with nothing. I mean, we all know what happened with CERB [Canada Emergency Response Benefit]. I didn't even want to go near that, because I knew they'd come back to get it. It's 'the government after all, right?

Criss Hochhold

So it sounds like your overall experience with the military up to this point has been rather favorable. You enjoyed your career with the military?

Terry Lachappelle

For the most part, ups and downs. Well, like any job, right?

Criss Hochhold

Absolutely, absolutely. But overall, it was pretty good until these mandates came into effect and then you had to make a life-altering decision. Why did you choose to move from Ontario to rural New Brunswick?

Terry Lachappelle

Well, before we moved to Niagara, we looked for an apartment in and around the Belleville, Trenton, even as far as Kingston. No way I could afford an apartment on a military pension. I mean they're eighteen hundred, two thousand dollars a month. That's basically my military pension, right? So there'd be no money for food, there'd be no money for bills, there wouldn't be anything. So we did manage to find a small apartment in Niagara that was just over a thousand dollars a month. So we rented that while we tried to figure out what we were going to do. And I contacted a veteran friend of mine in rural New Brunswick, and he said, "Hey, why don't you come and look around here? I'm sure you can find something. The prices are still reasonable." So I did. I jumped in the car. I came to New Brunswick. I looked around. I found a spot. My mortgage broker made it happen.

[00:10:00]

It was a miracle, really. So just based on my pension, we qualified for the property because I said, "There's no way this is going to be taken away from me again." You know? So any other little job that my wife could get, or I could get, or something like that, it's just a bonus, right? And that's how we ended up in New Brunswick, sixteen hundred kilometers away from my father and my brother.

Criss Hochhold

Did you have any family in New Brunswick at all?

Terry Lachappelle

I have some cousins around Sussex and St. John's, and my one veteran friend there, not too far from us. And there's other veterans in Fredericton, and I think there's a few in Moncton. That's going way back to my Army Corps days, but yeah. Everybody's so far apart out here, though. It's like, "I'm going to go visit, my friend, Rob. Oh wow, he's 45 minutes away!"

Criss Hochhold

Well, yes, sir, in the Maritimes, we tend to have some distances. Terry, I know you've talked to us, and you gave us a glimpse into your financial situation when you went from a combined income of about \$170,000 a year, benefits from the federal government working for the military, to roughly \$35,000 a year. And you reluctantly had to move from Ontario, where your immediate family is, to a place where you really have no immediate family, which is a significant distance away.

Terry Lachappelle
Right.

Criss Hochhold

How are you dealing with that—if I may ask—emotionally? How is your mental health because of all this as well?

Terry Lachappelle

Well, how do you deal with it? Day by day. I mean, what do you want me to say, right? You do what you got to do to get it done. My rock is over there, my wife, right?

Criss Hochhold

Absolutely. And I can appreciate that very much so. Since moving to New Brunswick, have you had contact or have you seen your immediate family, like your dad? When was the last time?

Terry Lachappelle

No, not since. It takes money to drive, you know, from New Brunswick to Ontario, and I have to do it in short hops. I almost threw my back out just driving here today. But I wanted to be here.

Criss Hochhold

I appreciate you being here.

Terry Lachappelle

Because this is so important.

Criss Hochhold

It is, absolutely.

Before moving to New Brunswick— I'm sorry to have to go there again—but not having contact with your dad, or at least a physical presence with him prior to moving to New Brunswick, how often would you spend time with your father?

Terry Lachappelle

Almost every day. That was really the whole pull to move there. It was one of the only places, we could afford to rent; it was also to spend time, you know, with family. Trenton is about a three-hour drive, so it's a six-hour round trip. Being right there, I mean, I could just go knock on his door and say, "Hey come on over," you know, "for breakfast."

Criss Hochhold

Alright, so you went from a lot of contact to actually zero contact.

Terry Lachappelle

Zero. None.

Criss Hochhold

None at all.

Terry Lachappelle

Well, other than maybe, you know, a Facebook conversation—

Criss Hochhold

Right.

Terry Lachappelle

A video conversation or a phone conversation, yeah.

Criss Hochhold

But certainly, no quality time, so to speak, in person. Like you would have before, like we'd like to do with family.

Terry Lachappelle

Correct.

Criss Hochhold

Do you have any other family in Ontario that you had to move away from as well, aside from your father?

Terry Lachappelle

My brother, my daughter, a lot of friends, acquaintances.

Criss Hochhold

When was the last time you saw your daughter?

Terry Lachappelle

Last time we saw her was when we left. That would have been mid-August, roughly mid-August of last year.

Criss Hochhold

Of 2022?

Terry Lachappelle

Yeah.

Criss Hochhold

So about seven, eight months—seven months, roughly.

Terry Lachappelle

And if it wasn't for my brother helping us move, I don't know how I would have done it. Couldn't afford movers, right? So U-Haul wanted \$6,000 for a truck. I'm like, "no, I can't do that."

Criss Hochhold

After everything you went through, what I do want to know—and I think potentially the commissioners as well—is, if you had to do it over, would you reconsider? Would you take the shot?

Terry Lachappelle

Wouldn't hesitate. I'd do the same thing all over again.

Criss Hochhold

Do the same thing.

Terry Lachappelle

Because I had no choice.

[00:15:00]

Criss Hochhold

Because earlier you mentioned coercion a bit, where your quote-unquote "choice" was take the vaccine or lose your job,

Terry Lachappelle

Right.

Criss Hochhold

That you didn't see that as a valid choice.

Terry Lachappelle

No, that's not a choice. That's no choice at all. That's, you know, that's like me telling you, "Hey, drink this or you lose your job." "Well, what's in it?" "I don't know. Just drink it!" "Well, what's it going to do to me?" "I don't know. Just drink it! It's safe and effective, I promise." You'd be like, "Yeah, I don't think so." I mean, what do you want me to tell you? It's almost beyond coercion. It's blackmail is what it is. Let's call it what it is. Because that would be blackmail.

And the harder you tell me to do something that I don't want to do, the more I'm going to push back. I'm that kind of guy. I'm a Taurus. It ain't gonna happen. I will push you. And to this day, people call me an anti-vaxxer. I've lost friends. I've lost people that just don't even want to talk to me anymore, right? I post a lot of things online, controversial things maybe. I've spent a lot of time in Facebook jail. I visited my daughter there a lot, too. Because, you know, that's where they put you when you post things they don't agree with.

Criss Hochhold

Okay, Terry, you've raised a very good point. And actually, I'd like to ask: you said you're not an anti-vaxxer. Now, when you joined the military— Do you have to take vaccinations typically, when you enter the military for deployments, things of that— So have you taken any vaccines while in the military service?

Terry Lachappelle

We'll go back to my childhood. I've had all my childhood vaccines. I did the needles parade right here in Cornwallis, Nova Scotia in 1985. They called it a parade, but it wasn't really a parade: jab, jab, jab, jab, back and forth. Before I was deployed, I couldn't even tell you what they were. They just said, "You need to take this." Okay. I took it. Because I knew they're just traditional vaccines; mRNA is a messenger ribonucleic acid, I believe it's called, and somebody can correct me if I'm wrong. It's not a traditional vaccine. And when I was posted to Ottawa in 2012, they noticed that all my vaccinations were expired. So they said, so you need to take them all over again. "Oh, and look, you've never had the Hep A, B, C, D, E, F, G." So I took all those too, without hesitation. I will put my vaccine booklet up against anybody's in this room, any day, hands down. Hands down, I'm going to win.

Criss Hochhold

So no hesitation whatsoever for all the prescribed vaccinations within the military up until the COVID-19 came in. And based on what you've said to us is that there simply—I'm going to paraphrase it—but simply there wasn't enough documentation and proof of safety for you to take a risk on an experimental vaccine. But you had no issues whatsoever taking any of the vaccinations that were required because you know they've been proven, and they've been effective, and they've been around. Is that correct?

Terry Lachappelle

Correct. Yep. Too many red flags.

Criss Hochhold

Thank you, Terry. I appreciate your time. I'm going to refer to the commissioners for any questions.

Commissioner Kaikkonen

I'm just wondering if there was an appeal process before the imposed deadline, if there were any other options that you could have taken?

Terry Lachappelle

Not that I'm aware of. I didn't allow them to put me on leave without pay. I just resigned.

This was in mid-September. So about a month and a half before the end of October deadline.

Commissioner Kaikkonen

Thank you.

Terry Lachappelle

And just to add to that if I may. We do know people in the public service that have been placed on leave without pay. So it wasn't just something they might have done. It was done. And I personally know a lot of veterans that were released—dishonorably discharged—because they refused the COVID vaccines.

Commissioner Massie

Thank you for your testimony. I was going to ask exactly the question: In your assessment, what would be the proportion of people that refused to take the jab? According to the people you know around you in the military, for example.

Terry Lachappelle

Well, there was a number floating around of approximately 900, 800–900 military personnel that were dishonorably discharged.

[00:20:00]

And coincidentally, some of them I know personally, and they were actually called back. And they said "No," you know, "you kicked me to the curb. I'm not coming back." And as far as the civilians, I only know of a couple, myself personally. I don't know the numbers on the civilian population, I wasn't there very long. I was there for less than a year when all this happened, so.

Criss Hochhold

Thank you very much for your time, Terry. I'm very grateful for you being here today.

Terry Lachappelle

You're welcome. Thank you. Have a good day.

[00:20:45]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 3: Peter Van Caulart

Full Day 2 Timestamp: 01:20:05 –01:46:22

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Welcome, Peter.

Peter Van Caulart

Thank you. Good morning.

Ches Crosbie

Good morning. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Peter Van Caulart

I absolutely do.

Ches Crosbie

Thank you.

Criss Hochhold

Good morning.

Peter Van Caulart

Hi Criss.

Criss Hochhold

Can you please just repeat your full name for us.

Peter Van Caulart

My name is Peter Van Caulart. I'm a resident of Kelvin Grove, Prince Edward Island. I have been there since 2019, in November, and moved from Niagara, Ontario, to Prince Edward Island. My family and I moved because we have a business and discovered a business opportunity that was going to work for us, provided we weren't interfered with. And as everybody knows, March 11th, the interference came and it's changed our lives drastically.

Criss Hochhold

March 11th of—?

Peter Van Caulart

2020.

Criss Hochhold

Peter, you said you moved from Ontario to Prince Edward Island for business development opportunities?

Peter Van Caulart

Yeah. That's correct.

Criss Hochhold

Can you tell me more about your business, please?

Peter Van Caulart

My wife and I run a business that is a private post-secondary institution for training the people who are the professional operators running water treatment plants and wastewater treatment facilities in this country. Our work is comprised of preparing those people for their provincial examinations for recertification and initial licensing. It's the only profession that I know of that requires individuals in the profession to recertify on a cyclical period of typically three years.

Criss Hochhold

And what exactly—to make sure everyone understands what that means—do you teach them? What is the subject matter?

Peter Van Caulart

Yes. We provide the training in the physical, chemical, and biological sciences: hydraulics, the engineering, the chemistry, the biochemistry of treatment of drinking water, public drinking water, the conveyance of that drinking water in the distribution systems, the collection in the wastewater collection systems, and the ultimate treatment in the wastewater treatment facilities for final-end disposal.

Criss Hochhold

And when you say, "final-end disposal," what does that mean?

Peter Van Caulart

Wastewater has to go back to where it came from.

Criss Hochhold

And how long have you been doing this?

Peter Van Caulart

Since 1987.

Criss Hochhold

And when you instruct, how does that typically take place?

Peter Van Caulart

The instruction largely is in-class, in-person instruction with small numbers of students. It's somewhat boutique training, mostly hands-on because there are many skills that have to be transmitted through verbal communication and reinforcement. I've brought some photos that I'd like to introduce to the Commission, and I'll hold them up and then pass them on. The first photo is a photo of me with a class of students in a laboratory doing this kind of work. The second photo is a photo of the students performing an analysis after the instruction. This is very typical, so initially we'd have a small classroom briefing, then go into the laboratory and perform the work. And, I've done this for over 33,000 students in the period of time that I've been instructing in this field.

Criss Hochhold

Incredible. Where do your students come from: All over the world? Canada? The United States?

Peter Van Caulart

We've had students from the United Nations Human Resources branch, from Cyprus. I've conducted classes in Australia. I've conducted training throughout Ontario, the military bases across the country, Newfoundland, Labrador, Ontario, here in Nova Scotia, Alberta, Manitoba, and British Columbia.

Criss Hochhold

You have clearly a breadth of experience. For the commissioners, those pictures that Peter held up are exhibits number TR-0009 as well as TR-0009a.

[00:05:00]

Peter, then you made a choice to move from Ontario to Prince Edward Island for those business development opportunities. Were you impacted, or was your business impacted by the lockdowns, restrictions, or government mandates?

Peter Van Caulart

The simple answer is yes, but I will elaborate. We discovered a business niche that almost compelled us to consider moving to Prince Edward Island from Ontario for several reasons. I'm getting close to the end of my career and my ability to want to keep teaching. We

discovered that we really enjoyed Prince Edward Island from frequent visits in the past. My wife and I discussed this. If we were going to settle down, this was a great place to do it. And all of the pieces worked with my insight in believing that the Maritime provinces were underserved in the level of instruction that I was able to bring, that I had been doing in Ontario for a number of years.

I ascertained that I could travel back and forth to Ontario, still maintain the business that we had there, and develop new business here in the Maritimes, particularly with the indigenous communities of the North Shore of New Brunswick. And we have made inroads and it's been great. Our reception initially when we were advertising and putting out the information that we were here was, "Oh, thank God somebody like you is here in the Maritimes"—both from the Maritime operators that I came in contact with and the people who run municipalities, who own and operate these kinds of facilities.

Criss Hochhold

Peter, what were some of your biggest challenges that you faced during those times to keep your business going? Because you said that it happens in person because you need to have access to a laboratory, so there's a lot of hands-on. So when restrictions and mandates came in, how did that impact you? And so what were those challenges that you faced?

Peter Van Caulart

You have to understand civil servants—and I don't wish to disparage all of them—, but I will explain, having been one once for the Province of Ontario. There is a mentality that you must follow the group-think, and whatever is currently in favour is the thing that's going to be done. So there are lots of people who like to build empires and lots of people who like to run their own little show.

That said, many of the municipalities simply followed what was a directive from their provincial governments, which was a directive from the national government. And those facilities were deemed closed, so there was no access to drinking water facilities, there was no access to wastewater treatment facilities, the laboratories associated with them, or the people who staffed them.

Criss Hochhold

So the treatment facilities and the freshwater facilities, drinking water facilities were closed, meaning you could not provide any instruction whatsoever. How did that impact—

Peter Van Caulart

The impact was huge. Revenues essentially went from one level to zero.

Criss Hochhold

Because, as you've mentioned, this has to be done in person, so an online type of teaching is not something that's feasible.

Peter Van Caulart

Yeah, the Zoom type of instruction that many people experienced during this time simply didn't work. I teach adults. Adults, predictably, are kind of like herding cats when you get

them into a classroom. In particular, individuals who do not sit in an office on a daily basis that are active throughout a facility, maintaining, monitoring, and operating the facilities. So many of my students, the feedback that came back was, “We really don’t want to play Hollywood Squares, and we prefer that— We’ll wait until you can come in for live interaction and training,” which is exactly what we did. In buying the time, I have to stress that I had to dissolve assets. So corporate assets, personal assets, monies we had saved for retirement, that sort of thing, was all used to try and keep our lives afloat.

Criss Hochhold

So in order to make ends meet, so to speak, you had no choice but to essentially shut down your business because of these mandates and restrictions.

[00:10:00]

Peter Van Caulart

The business essentially shut down, and I refused to take the vaccine until the last possible moment. And unfortunately, I had to take the vaccine because I was faced with an economic crisis that I didn’t want to go through.

Criss Hochhold

And the necessity for taking the vaccination, what was that for?

Peter Van Caulart

The federal government declared that nobody could travel on an aircraft without vaccines or without the injections, and I had an economic benefit that was available to me in Ontario. My own province, however, constrained me from traveling by car because I could not return back to the island unless I had been vaccinated. For all the mandates that happened everywhere else, the mandates on Prince Edward Island were even more draconian. Because basically a bunker mentality was set up on the island to prevent any sort of person from coming onto the island. And if anybody was following numbers and stats, there was a period of time when everybody was glib about the fact that we were an island. We were isolated, therefore we were very lucky and the angel of death had passed over us, and we were not going to be impacted nearly as bad as what we saw in the news in other places.

Criss Hochhold

How did it make you feel? Because it sounds as though, based in what you said, you had to wait until the very last minute and then you got the vaccinations simply for—simply is not is not the right word to use—but for an economic benefit. How did that make you feel?

Peter Van Caulart

It’s the decision I most regret in my life. My wife and I both went to go and get the first shot. And I had to do it for us and for our family. She did not have to do it. And she turned to me and said, “I just, I just can’t do it.” And I said, “That’s fine, don’t do it. I completely understand it.” She supported that I had to do it, but she did not agree that I should have it, and I certainly did not want to take it. I regret it, and I have done everything in my power to research the detoxification protocols that are available. And for anyone listening,

nattokinase is one of those things that's on the list. And I believe Dr. McCullough probably spoke about it yesterday. Chaga, vitamin D3, vitamin C, liposomal.

Criss Hochhold

Terry, sorry to interject, but we do have to move on, and I appreciate the seriousness and the consequence. But I'm also aware that you have—aside from a significant economic impact on you and your family—I also understand you have some personal impact with relation to a family member.

Peter Van Caulart

Correct. So in staving off the inevitable injection, for me it was not until September of 2021, I believe. I was not able to travel to my mother who was in care in Ontario. And my second biggest decision is, regrettably: I had to sign the form that required her to get her vaccine in care. I was faced with the conundrum as her medical power of attorney, that if I did not sign it, they would eject my mother from care. This is a woman in a wheelchair who could not move, and they were going to eject her from care. They were going to turn her out, and I would have to find alternative accommodation for me being in PEI, she being in Ontario. And my third photo I'm going to hold up is the photo of my dear mother, Adele [Exhibit TR-009b]. And this is a, a great photo.

But that's the last time I saw her [Exhibit TR-009c].

[00:15:00]

That was through a window at a healthcare facility in November of '20, when I was able to fly before vaccines were made available. Under the constraints that were imposed at the time, she was on a second-floor window in her room. We had an hour and a half conversation because I was fully aware that that was perhaps the last time I was going to see her for a long time. And after she had her second injection, she developed vaginal bleeding. And this is a woman in her 80s who'd never had any problem with her reproductive system whatsoever. She bore four children naturally. And to develop vaginal bleeding was curious at the most. And her wishes were carried out very quickly after her death. And I wish to hell I had insisted on an autopsy and a particular investigation as to the cause of what really killed her.

Criss Hochhold

Thank you, Terry [sic]. You said that your, once again the word, "choice" that you faced was because of your medical authority of attorney, that you had to sign for your mother to get vaccinated in the care facility. If not, she faced ejection.

Peter Van Caulart

Correct. The care facility was a not-for-profit care facility in Ontario, and the care she had received up till that time was exemplary. It was much better than many of the places my wife and I had sussed out. The year previous, we had seen horrible places. And so we were very confident that she was in the best care possible at the time. But they of course went full mandate, full blinkers on. There were no deviations from their rules. And their imposed rules: they claim they came from the government. I know that everybody claims they come from the government, but they pile on their own little twist to them. And by the time every

one of us had to deal with people who said, “You have to wear a mask here or have to show your pass there,” we all had some pretty stiff encounters with zealots.

Criss Hochhold

Thank you. I’ll have more questions. We are running short on time, so I think you’ve already presented a great testimony. So I will defer to the commissioners for any questions for follow-up.

Commissioner DiGregorio

Thank you for your testimony.

Peter Van Caulart

Of course, thank you for your service.

Commissioner DiGregorio

I just have a few clarifying questions about your business. You mentioned that you had adult students. I’m just wondering if you can tell me who a typical student would have been in your business.

Peter Van Caulart

Oh, certainly. All my students are adults. None of my students are directly out of college or university. They’re all people who are actively employed. As a result of their employment in this industry, the water and wastewater industry, they have to seek provincial licensing in order to continue to work in the business. That licensing is only valid unless they recertify. The recertification usually takes place every three years. They have to show a certain number of continuing education units and contact hours in order to get that recertification. In Ontario, it’s quite high. It’s a little less here in Atlantic Canada, but nonetheless, if they do not have it, they cease to be able to be employed.

Commissioner DiGregorio

Thank you. And one other question. I think I heard you say that one of the reasons your business became depressed in PEI was because of the closure of facilities, but that if you could travel to Ontario, you could still work. And was that something different in Ontario from PEI at that time?

Peter Van Caulart

No, the net kept getting tighter and tighter. Every time I made an overture to arrange something—and I had made several things work at the last minute—it was somebody within the municipality who suddenly came down with a:

[00:20:00]

“No, no, we can’t have anybody from outside our group to infiltrate and potentially infect us. And, therefore, we’re closed.”

Commissioner DiGregorio

Okay, thank you.

Peter Van Caulart

You're welcome.

Commissioner Massie

You alluded to the protocol that had been developed and still developing for detoxification from the vax injuries. Did you personally suffer any vax injuries?

Peter Van Caulart

No vax injuries, but I am grateful that I have used the knowledge and skill I have to find the things that I needed necessary to diminish whatever potential I believe is out there for a vax injury. I do question a change in my overall energy level, but I cannot conclusively say. Because part of the problem of all of what has gone on in the last three years is that everything is broken. Access to the medical system is broken. Access to get tests and confirmatory things done are broken.

I happen to be a pilot, and I've been a pilot since I was 17, and I can tell you that a two-year medical examination that was a normal course of events is no longer a normal course of events. It's a telephone conversation with a medical practitioner to get reassessed. And being a pilot, I have two major concerns. That is those pilots in this country and other places who got the vaccine: If they have a potential for some sort of vaccine injury, I have a real concern about being in the air with those pilots. And the second thing is that the pilots that didn't get the vaccine, who were furloughed for whatever reason because their airlines had mandates, or their mandates were imposed on them by the federal government, those people are the ones that you definitely want to seek out and fly with and support whatever airlines they might be with. And lastly, I think there's going to be a large amount of Canadians who when it comes time to receive or transfuse blood in medically necessary conditions: a condition about whether or not you're receiving vaccine available blood or non-vaccine available blood will be an issue as well.

Commissioner Massie

Thank you.

Commissioner Drysdale

Sorry, I have just a couple of quick questions about your mother.

Peter Van Caulart

Thank you.

Commissioner Drysdale

How long after she got the second injection did her medical condition start, and how long after did she pass away?

Peter Van Caulart

She passed away four months after the second shot. Her medical conditions occurred within three weeks of the first shot.

Commissioner Drysdale

Secondly, did you have any discussions with the medical personnel that you thought it might be a reaction to the vaccine?

Peter Van Caulart

I did. And you can probably understand what that reaction would have been. "Oh no, you can't possibly know anything because you're not a doctor."

Commissioner Drysdale

So then is it safe to say that it was not registered in the CAEFISS [Canadian Adverse Events Following Immunization Surveillance] system as an adverse reaction?

Peter Van Caulart

I believe it wasn't.

Commissioner Drysdale

Thank you.

Peter Van Caulart

You're welcome.

Commissioner Kaikkonen

Thank you for your testimony. I just would like to ask: you refer to the PEI protocols and mandates as draconian. Could you kind of expand on that, please?

Peter Van Caulart

I don't think I have enough time. The initial response on the island was to literally barricade the bridge, and they put up a barricade. Everybody was required to go through some sort of search procedure questioning that was, I'm going to say, literally unCanadian. **Things that you'd never expect to hear or experience in Canada. These are the same kinds of questions that I answered routinely going across the border 30 years that I lived in Niagara because I was only 15 minutes from the Canadian/US border. I'm quite used to answering the nature of those kinds of questions for border security. But I never expected to experience that in PEI or New Brunswick when I once came over to New Brunswick. Because I got myself declared essential because of the nature of the work I did—and in traveling to Sydney, Nova Scotia, I can tell you that I was stopped at the border between Sydney and New Brunswick—**

[00:25:00]

by a group of angry people who had been locked down, and by individuals wielding bats threatening to smash cars as a result of their reaction of being locked down at this point for over a year. The only reason I got through that roadblock was because I was declared an essential, and I explained it to the individual wielding the bat, and he acquiesced and allowed me to pass through. I was able to deliver the training in Sydney, Nova Scotia to the people who were waiting for me there. Sadly, I was only into that training two days before Nova Scotia locked down Nova Scotia, and I was required to return back to Prince Edward Island. So that training was postponed for another period of time, and I was able to go back and complete it. But almost three or four months later.

Criss Hochhold

Thank you very much, Peter. I really appreciate your time this morning.

Peter Van Caulart

Thank you. And my fellow Canadians, thank you. We're awake.

[00:26:17]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 4: Amie Johnson

Full Day 2 Timestamp: 01:46:50-02:10:45

Source URL: <https://rumble.com/v2djjsi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Amie Johnson, do you affirm that you will tell the truth, the whole truth and nothing but the truth?

Amie Johnson

Yes, I do.

Alison Steeves

Good morning, Amie.

Amie Johnson

Good morning.

Alison Steeves

Can you state your full name, where you are from, and your occupation?

Amie Johnson

Sure. So my name is Amie Johnson. I'm from Chester, Nova Scotia. I am a dental hygienist, currently unemployed.

Alison Steeves

And since when have you been unemployed?

Amie Johnson

February of 2022, so just over a year.

Alison Steeves

So in February 2022, at that point, how long had you worked as a dental hygienist?

Amie Johnson

I was three months shy of 22 years.

Alison Steeves

Twenty-two years. And how do you like being a dental hygienist?

Amie Johnson

I love being a dental hygienist actually. I love interacting with people, helping them, you know, making sure that people are taking good care of their oral health, and which in turn is their overall health. It was a great profession.

Alison Steeves

Back in early 2020, were you employed as a dental hygienist at that time?

Amie Johnson

Yes, I was.

Alison Steeves

And who was your employer?

Amie Johnson

Chester Family Dental, Dr. Natasha Zink.

Alison Steeves

How long had you been at that place?

Amie Johnson

Just shy of 22 years.

Alison Steeves

So right out of school.

Amie Johnson

I went there straight out of university. Yeah, same office, same employee, same employer.

Alison Steeves

And how would you describe your experience working there up to that point?

Amie Johnson

It was great. There was ten of us, all women. We were a cohesive group. We worked together five days a week, you know, ate lunch together, went out to lunch, went out for birthdays, you know, parties, all that stuff.

Alison Steeves

I imagine being there 22 years, you would know the patients really well.

Amie Johnson

Extremely well. And you know, that's the other thing too, the patients became my friends as well, you know. Like, a lot of patients I would see every four to six months, regularly. I would see, you know, between 12 to 15 patients a day for five days a week.

Alison Steeves

How big is Chester, Nova Scotia?

Amie Johnson

Chester in the winter is about 3,000, 3,500 people. In the summer, we can go up to like 12,000 people.

Alison Steeves

Okay, so people know each other pretty well.

Amie Johnson

Yeah, we're a pretty small-knit community. We're about halfway between Halifax and Lunenburg.

Alison Steeves

So in 2020, as you begin to hear about COVID-19, were you concerned?

Amie Johnson

Initially, yes, I was. So dentistry doesn't fall under health care. So we fall more under the Nova Scotia Dental Board, and of course, for me, the Dental Hygienists Association. So in **March of 2020 we were actually shut down prior to the province actually shutting down schools, and you know, the nursing homes and things like that because they were taking it very seriously. It was very unknown. They were worried about transmission. Obviously, we deal with germs, people's mouths, so you know it was pretty important to kind of figure out what was going on. And yeah, so we shut down early March and didn't reopen until June of 2020. So we were shut down for a few months there.**

Alison Steeves

So that was a dental board decision?

Amie Johnson

Yes, it was.

Alison Steeves

So you would have been at home during that time?

Amie Johnson

Yes, I was.

Alison Steeves

And so when the vaccines became available, did you choose to take any of the vaccines?

Amie Johnson

No, I did not.

Alison Steeves

And why not?

Amie Johnson

Well, when they first started talking about the vaccines, on a positive note you're thinking, okay, this is a good thing. But then you start doing your own research, and you realize, you know, COVID has a 99 per cent plus survival rate. And so something that was so rushed, the vaccine was so rushed, and experimental, I was just like, you know what? I think the previous gentleman that was up earlier said, "Let's just wait, I'm going to hold back." And that was kind of my initial reaction, was like, you know what, I'll just wait, let other people take it and kind of iron out the kinks and see what's going on. And then I quickly realized this wasn't for me.

Alison Steeves

And what sources did you consult in making that decision?

Amie Johnson

Well, I'm a numbers person. I like statistics. So you know, initially I would, you know, check like the dash, the Nova Scotia dashboard, and Stats Canada, and even the World Health Organization, but the numbers just never seem to add up. Like these people were vaccinated, but the numbers keep getting bigger. And then the biggest red flag for me was when they put the vaccine passports in. And so the exposure sites here in Nova Scotia— We have the exposure site website, you know, don't go there, don't go there. And all the exposure sites are places where people that were unvaccinated couldn't go. So how are we the problem? How are the unvaccinated the problem when the exposure sites are all vaccinated people? So I quickly realized that the vaccine doesn't stop transmission. And from my dental standpoint, the only reason why I would take the vaccine is to protect my patients.

[00:05:00]

That I wouldn't want to transmit COVID to a patient. But if the vaccine doesn't stop transmission, what is the point of taking the vaccine, if its effectiveness for severity of disease is still questionable and doesn't stop transmission?

Alison Steeves

So during that time, how did you feel about the way the media was portraying COVID-19 and the vaccines?

Amie Johnson

Well, it's actually very disheartening. It makes you question everything that the media said over the last years: very biased, very fear mongering. Again, I worked from June of 2020 until February of 2022 through this whole pandemic. I've seen 10, 15 patients a day, and a majority of them are scared to death. And that's really sad, that they're scared of something that does have a 99 per cent survival rate. And we don't know much about the vaccine, and they're putting so much faith in the vaccine.

Alison Steeves

So when you made that decision not to take the vaccine, did you share that with your co-workers?

Amie Johnson

Absolutely. You know, at lunchtime or just in random conversations. And my co-workers weren't so receptive of that.

Alison Steeves

Can you describe a bit more in detail just how this decision happened?

Amie Johnson

Sure. At the start, when the vaccine started coming out, I would say, "No, I think you guys should hold off, wait." Because, again, dentistry doesn't fall under health care. But because we're such high exposure, we were given the opportunity to get the vaccines quite early on with the nurses and the doctors. So nine out of 10 of us were right there, the first ones in line getting the vaccine. And people were trying— My co-workers were like, "You should do it, you should do it." But then that quickly turned to, instead of just saying, "You should do it, you should do it," to anger, animosity, alienation. I would go to work just to work, and **there was no more going out to lunch with my co-workers or talking to them on the weekend or, yeah.**

Alison Steeves

Why do you think that they reacted that way? What do you think? Why were they telling you to get the vaccine, and why were they upset?

Amie Johnson

Well, they felt that I was not only putting my patients in danger but also them and being irresponsible. Just because I'm unvaccinated doesn't mean that I don't take my job

seriously, or I don't care about my patients. But that's how they were perceiving it as, that I was being selfish and only thinking about myself.

Alison Steeves

And you said you're no longer employed. So were there mandates?

Amie Johnson

So because I fall under the Dental Board and the Nova Scotia Dental Hygiene Association—Both the Board and the Association did not mandate vaccines. Both, of course, were recommending vaccines, but we were not legislated to get to get a vaccine because it didn't stop transmission. So their official statement was the vaccine doesn't stop transmission, so there's no benefit for the patient. I'm sure all of you have gone to the dentist, so you know that we use universal precautions pre-COVID, and then those universal precautions were only amped up even further. We had to wear gowns. We had to double mask, face shields, goggles, you know, gloves. There were new protocols on scrubs. We would have to change them even if we left the office even for a minute. It was very extreme. But no vaccine mandate.

So then at Christmas, December of 2021, my employer came to me, and she officially said, "You need to get vaccinated." And I said, "No." And I said, "Let's have this discussion about the vaccine," And she said, "I'm not discussing it. You don't follow the science." And I said, "Okay." So then, when we came back after Christmas, because we closed for three weeks over Christmas, one of my co-workers got sick and tested positive for COVID. And she was triple vaxxed and was extremely sick for three weeks—very, very ill. But one of the protocols that we did have was that, to come back to work, all of the employees had to have negative PCR tests: to come back to work before the office reopened after my co-worker had COVID.

So reluctantly, I went to go get my PCR test and it came back positive. I was totally asymptomatic. I never got sick. And so when I called my employer Dr. Natasha Zink to tell her, she was not happy obviously. But because I was unvaccinated, I had to wait the full 14 days of quarantine, even though I was asymptomatic. And at that time the protocol was only down to a week, but because I was unvaccinated, I had to have the full two weeks off. And so I was set to go back to work on a Monday. And a couple days later, before I was getting ready to go back to work, she called me

[00:10:00]

and she fired me. And she said that I was putting my patients at risk, and that because I wouldn't get vaccinated, I was no longer to work there.

Alison Steeves

So you were immediately terminated.

Amie Johnson

I never went back to work after testing positive for COVID.

Alison Steeves

And did she fire you with cause, or did she pay you—?

Amie Johnson

Well, she said that first, I was putting my patients in danger. And secondly, she said there would be a shortage of work because patients wouldn't see me because I was unvaccinated. And the hypocrisy of the whole thing is that my co-worker who had COVID was extremely ill for three weeks, was triple vaccinated, still has a job; but I'm unvaccinated and tested positive for COVID but was completely asymptomatic and I don't have a job. After 22 years, yeah.

Alison Steeves

So your income ceased immediately.

Amie Johnson

Yes, she did pay me some sick leave for those first few days when we were waiting for the test results for the PCR test, and I did get my three weeks of vacation pay.

Alison Steeves

How did it feel to be let go from that position?

Amie Johnson

I mean, it was devastating. Like I said, you don't work somewhere for 22 years and not love it, right? And it wasn't a job; it was a career. It was my identity. So it was really, really hard. Really, really hard. Not to mention financially hard. I made almost \$80,000 a year, and that's a lot of money to lose in a household. It put a lot of pressure on my husband to make sure that he could pull up his socks and help more as well.

Alison Steeves

So since then, have you sought employment elsewhere?

Amie Johnson

Yes, I have. So like I said earlier, I do live in a small community. There is two other dental offices within about 15 minutes of us. So one of the offices, one of the hygienists was retiring, and I had—you know, from a friend—had heard that. So I reached out to—it's called Chester Dental Clinic, Dr. Andrea, via email, and asking her if she would be interested in me possibly working there. And she did reply with a lovely email. I actually brought it today. But when I applied for the job, I never mentioned my vaccine status because it's not really anyone's business. So then, when she replied back to me, she already knew my vaccine status and would not hire me. And I have the email [Exhibit TR-26a]: would not hire me solely based on the fact that I wasn't vaccinated. So that was one.

Alison Steeves

Would you like to read the email?

Amie Johnson

Yeah, sure I can. She says, "Thank you for reaching out to me regarding our soon-to-be-vacant dental hygienist position. I do apologize for my late response." Because it did take

her a few days. "At this point, I am unable to offer you a position with us. Professionally, I have to consider the reality of alienating patients and staff because of your vaccination status," which I had never told her, so I find that very interesting. "Unfortunately, Nova Scotia seems to stand alone as the world moves on. Personally, I could not disagree more with the public health protocols, having sat on the Return to Work Committee for COVID-19 on behalf of the NSDA. I am absolutely appalled at what has transpired in our once-free profession. We are beholden to ridiculous public health directives. The hypocrisy of mandating vaccines and masking in dental office defies logic, common sense and science. It did at the onset and most certainly does not presently. I admire you for your courage and your stance on personal freedoms and standing up against tyranny. I am sorry for this, that it cannot work out for us at this time. Wishing you all the best, Dr. Andrea."

Alison Steeves

So supportive of you—

Amie Johnson

Supportive of me, but wouldn't employ me.

Alison Steeves

And again, there were no mandates. She wasn't required—

Amie Johnson

No, and again, Dr. Zink when she fired me, and Dr. Andrea as well. These are their sole ideas or opinions because the Dental Board does not regulate vaccinations.

Alison Steeves

And did you try—

Amie Johnson

So the third dental office in my area is Mahone Bay Dental. So in November of 2022, they had a vacancy come up. So I went in for the interview, and three days later I was offered the job via email. And she sent me the contract. We worked out all the details. I was set to start December, I think it was the 17th. And on December 10th, she called me because she heard through the grapevine that I was unvaccinated. Because during the interview, it was not discussed. During the contract that she had given me and sent to me via email, not discussed –

[00:15:00]

but she had heard that I was unvaccinated. She wanted to confirm that, and of course I'm not going to lie about my status. I'm not ashamed of it, nor embarrassed, although it is not anyone's, you know: it's not their business.

But so she said, "If it's true," and I said, "Yes, it is." And she said, "Well, I'll still offer you the job, but I'll put you in a three-month probationary period. And if patients will continue to see you knowing of your vaccine status, and it all works out, then I will offer you a full-time job." And I said, "No, thank you." And I walked away.

Alison Steeves

And why did you say, "No thank you?"

Amie Johnson

Well, first of all, again, it's not anyone's business what my vaccine status is. Second of all, I didn't want to be put through that torture again. And like I said, I see 10 to 15 patients a day, not knowing, is this the patient that's going to go to—her name is Dr. Sarah Fakhraldeen—go to Dr. Sarah, and say, "Hey, I don't want to see her anymore because she's unvaccinated." So yeah, I was really reluctant to do that. So I said no. And I declined.

Alison Steeves

So you've worked as a dental hygienist for 22 years.

Amie Johnston

Yeah.

Alison Steeves

How long have you been in Chester?

Amie Johnson

Twenty-two years. Well, actually I grew up in Chester, but moved away for a few years, and then after, when I got my job.

Alison Steeves

And is there anywhere else in Chester you could work as a dental hygienist?

Amie Johnson

Those are the only dentist offices within a half an hour. So yeah, I'd have to start traveling. And again, I was spoiled rotten for 22 years. I walked to work.

Alison Steeves

So outside the workplace, did the vaccine passports have much of an impact on your life?

Amie Johnson

Absolutely, besides the obvious of not being able to go to the gym or the movies or restaurants and things like that. But more importantly, in my house, over that period, we missed two family funerals and two weddings.

Alison Steeves

And can you give a few more details about that?

Amie Johnson

Sure, well, one of the funerals was my husband's uncle, who was like a father to him, who's very special to us. Coincidentally, he did pass away within a week of his second shot, but we were unable to go to the church service. They asked my husband to be a pallbearer, but when they found out that he was unvaccinated and we were unable to go to the church service, obviously he couldn't do that. They did have a graveside service, so we were able to go to the graveside service because it's outside, and this was actually last February of 2022. So we did go to the graveside service, but we offended family members by going, by being present. It has created a huge rift in our family. There are family members that don't speak to us any longer over us going to the funeral. Yeah.

Alison Steeves

So they were upset that you went to the outdoor service.

Amie Johnson

Again, you know, the misconception that just because we're unvaccinated, we're spreading this horrible disease to everyone, right? And it's really sad. And you know, if you look at the numbers, people that are vaccinated are the ones getting COVID, currently. And I go back to my own experience at my work office. You know, it's okay for a triple-vax person to get COVID, but it's not okay for me to get COVID, or even be around people.

Alison Steeves

So would you say that the measures impacted relationships in your life?

Amie Johnson

Absolutely, it did, yeah. Yeah, unfortunately.

Alison Steeves

Do you have children?

Amie Johnson

I do, I have two children. They're both grown. And this has in fact affected them as well, very much so. My daughter, in September of 2021, started her first year of university at Dalhousie. She was accepted into the Bachelor of Science program, the accelerated program, and within weeks of her starting, they mandated that all nursing students had to be double vaccinated. So she chose not to get vaccinated. So she left the nursing program and switched to a Bachelor of Science. And her hopes were then to be a naturopath. And shortly thereafter, Dalhousie decided that all students had to be double vaccinated, so we were kind of in a bit of a dilemma there. But then they transitioned to online learning. So she was able to do all her courses online. So we were happy with that. But then she started receiving letters coercing her, threatening her to get double vaccinated or she wouldn't be able to complete her year at school [Exhibit TR-26b]. And it turns out they came true. So she lost all of her tuition money. And she wasn't able to get the credits.

[00:20:00]

Alison Steeves

So they just told her to leave.

Amie Johnson

Yeah. She wasn't able to go to in-person to Dalhousie to write her exams. So she did the courses all year long online. And then when at the end of the term, when she came to do the exams, they wouldn't make special accommodation for her because she was not able to be on the premises without being double vaccinated.

Alison Steeves

Would that affect her transcripts?

Amie Johnson

Yes, she did get fails, like F's. But they said that, if you come back and take that same course again, they would replace the failure. So yeah.

And so my son and my husband, they own a construction company called Nauss and Son Construction. They were also— It was the fall of 2021; they were doing a project on an Airbnb owned by Colin and Karen McDonald in Chester. And it was a large project: they intended to be there probably about five months. They were about halfway through, and it was right before Christmas of 2021. And the manager of the property, his name is Victor Lovett, he heard apparently through the grapevine that my husband and son were unvaccinated. And he arrived on the job site, livid, irate. Kicked them off the job site, told them to take their tools and that they were fired. So you know, it's very difficult living in a small community because everyone knows everything and the defamation of character as well that people talk behind— And my husband and son being self-employed, you know, we worry about their business. Jacqueline, my daughter, has now since opened up her own business, Coastal Charcuterie, doing charcuterie boards. And you know, she's doing really well and really successful, but you wonder at what point sometime that might come back, again.

Alison Steeves

And Amie, I just have one final question.

Amie Johnson

Sure.

Alison Steeves

Do you regret your decision?

Amie Johnson

No, not at all. My health is far more important than any money. And again, I'm at the age that I'm approaching 50. So I was in a position that I was able to stick to my guns and my morals and make a choice for myself and my health and my family. But I feel horrible for people that are younger, or even older, that have to feel the pressure to cave to that coercion. And I'm not going to say that maybe when I was in my late 20s, early 30s and had

two small kids and great big mortgage and car payments that I might have caved as well. And I was just really fortunate that I was in a position that I was able to, you know, continue to stick to my moral standards.

Alison Steeves

Thank you, and I'll turn it over to the commissioners if you have any questions.

Commissioner Massie

Well, thank you very much for your testimony. I have a question about your clinical, the dentist: Were they asking, for a patient to be treated, that they show vaccination?

Amie Johnson

No. At the dental office you didn't have to be vaccinated to come. Because again, dentistry kind of falls under health care, but it doesn't, so we did not ask people their vaccination status. And all people were treated equal.

Commissioner Massie

Okay, thank you.

Alison Steeves

Thank you, Amie.

Amie Johnson

Thank you.

[00:23:26]

[00:00:00]

Ches Crosbie

Good morning. Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Kathy Howland

Good morning. Yes, I do.

Alison Steeves

Good morning, Kathy. Can you please tell us your full name, where you're from, and your occupation?

Kathy Howland

My name is Kathy Howland. I live in Meductic, New Brunswick, and I'm an education assistant.

Alison Steeves

How long have you been an education assistant?

Kathy Howland

Since 2018.

Alison Steeves

So approximately five years—four or five years?

Kathy Howland

Yes.

Alison Steeves

And what does an education assistant do?

Kathy Howland

I focus on primarily special education students: students with Down syndrome, autism, different learning abilities, ADHD students.

Alison Steeves

And you help them with the schoolwork that they're doing in the classroom, is that it?

Kathy Howland

Yes.

Alison Steeves

And can you tell us a bit about your current position?

Kathy Howland

I've been in my current position for the past two years. I'm working currently with children that have not had a diagnosis, but they are, we are quite sure, on this spectrum of autism. And I have also had, the past couple of years, a Down Syndrome student.

Alison Steeves

So you were working in this position when you became eligible to take one of the COVID-19 vaccines?

Kathy Howland

Yes.

Alison Steeves

And did you take one of the vaccines?

Kathy Howland

I did.

Alison Steeves

Which one?

Kathy Howland

I took the Pfizer vaccine.

Alison Steeves

Do you have the batch number by any chance?

Kathy Howland

I do. It is FF5109.

Alison Steeves

And when did you take the first vaccine?

Kathy Howland

I took the first one on November 3rd, 2021.

Alison Steeves

November 3rd. And why did you choose to take the vaccine?

Kathy Howland

It really wasn't a choice. I worked for the Province of New Brunswick, and they mandated that if I was to continue in my position as an education assistant, I would have to have the COVID shot.

Alison Steeves

Did you speak with your doctor prior to taking the vaccine?

Kathy Howland

Yes, I did.

Alison Steeves

And can you speak a bit about that conversation?

Kathy Howland

I called her and actually asked her if she could give me a letter pausing the process. At that time, I wanted to wait until the Novavax vaccine had been approved and I had read several articles that said that was going to happen. So her response to me was, "No, I can't give you an exemption for the vaccine." I tried to explain to her that I didn't want an exemption. The Novavax vaccine was non-mRNA and so I just wanted to hold off until that became approved and see where that went. And her response was, "Listen, there won't be any problem with the Pfizer shot. Just go get the damn shot."

Alison Steeves

And how long has she been your family doctor?

Kathy Howland

She has been my doctor for probably 10-plus years.

Alison Steeves

Did you find that interaction or that behavior or treatment sort of distinct from the way you had interacted with her in the past?

Kathy Howland

It was awful. Like, I was so shocked that my only response that I had to her after that little outburst was, "Okay, then. I guess that's where we'll leave it."

Alison Steeves

So she seemed upset that you were trying to delay taking the vaccine that was available to wait for another one.

Kathy Howland

Yes, yeah, she was not open to that at all.

Alison Steeves

So you went and got the shots. Do you recall who administered the vaccine to you?

Kathy Howland

Yeah, it was a pharmacist at the Guardian drugstore in Woodstock.

Alison Steeves

And did the pharmacist advise you of the potential side effects of the vaccine?

[00:05:00]

Kathy Howland

No. I asked if she had heard about any side effects. And she said, "Well, there's just a sore arm and maybe a fever, but nothing really serious."

Alison Steeves

Standard side effects. And did she give you an individual assessment based on your sort of personal medical history to see if the vaccine was right for you?

Kathy Howland

No.

Alison Steeves

So after you took the first shot, did you experience any symptoms?

Kathy Howland

Not really with the first shot. Just a bit of a sore arm. It was the second shot.

Alison Steeves

And when did you take your second shot?

Kathy Howland

I took my second shot on December 1st, 2021.

Alison Steeves

Okay, so almost a month later?

Kathy Howland

Yes.

Alison Steeves

Did you experience symptoms after your second shot?

Kathy Howland

Yes. I took the second one on December 1st. December 3rd, when I get up to get ready for work that morning, my ears were plugged full. My left ear was painning quite severely, and I had this awful ringing in my ears. It was so loud. And so I had to miss work that day. The following day, Saturday, December 4th, I ended up going to Emergency because of my symptoms.

Alison Steeves

So you spoke with the health care practitioner about the symptoms?

Kathy Howland

Yes.

Alison Steeves

And did they find anything?

Kathy Howland

No. He looked in my ears, he said, "I can't see really any infection or anything." So he gave me eardrops and a nasal spray and sent me on my way.

Alison Steeves

And did your symptoms persist?

Kathy Howland

Yes.

Alison Steeves

Did you eventually get any further testing done to assess sort of what was wrong with your ears?

Kathy Howland

I did. I talked to my family doctor, and she stopped the eardrops and the nasal spray. Because when your ears are already full, she didn't think that it was appropriate to add more to that. So then she referred me to an ENT.

Alison Steeves

Okay, and did you also get an audiology report?

Kathy Howland

I did.

Alison Steeves

Okay, and did you give me a copy of this audiology report?

Kathy Howland

I did.

Alison Steeves

Did you happen to have it in front of you?

Kathy Howland

I do.

Alison Steeves

So this is Exhibit TR-0005A?

Kathy Howland

Yes.

Alison Steeves

Perfect. Okay, and do you mind if I read from a bit of the finding here?

Kathy Howland

Not at all.

Alison Steeves

So it says, "Hearing sensitivity, left ear: mild to moderately severe sensorineural hearing loss, and right ear: mild to moderate sensorineural hearing loss." So stronger hearing loss in your left ear, but hearing loss in both.

Kathy Howland

Right.

Alison Steeves

So had you had an audiogram done in the past that they were able to compare this to, I assume?

Kathy Howland

I did.

Alison Steeves

So they found that you'd had some significant hearing loss in both ears. And then it also adds, "ENT consult." Did you end up seeing an ENT as you had said?

Kathy Howland

I did see an ENT.

Alison Steeves

And do you have a copy of your ENT report in front of you?

Kathy Howland

I do.

Alison Steeves

So your audiology report was January 14th, 2022. And then February 16th, 2022, you have your ENT report from River Valley ENT. Is that correct?

Kathy Howland

Right.

Alison Steeves

Okay and that's Exhibit TR-0005. And do you mind if I read from that report as well, a few excerpts?

Kathy Howland

Not at all.

Alison Steeves

So the ENT wrote, "I saw Catherine today in my otology clinic. She has an interesting history. She had her second dose of her Pfizer COVID vaccine December 1st, 2021. Within 24 to 48 hours, she started noticing fullness, pressure, and discomfort in both ears, worsening tinnitus, and subjective hearing loss." And speaks about your audiogram, acknowledges the hearing loss and there is nothing else, no history or nothing, to explain it. And then he adds, "In summary, this is a patient with bilateral sensorineural hearing loss with left isometric sensorineural hearing loss." And adds, "This may represent a vaccine side effect."

Is that correct?

Kathy Howland

Right. That is correct.

Alison Steeves

So you have tinnitus and hearing loss in both ears.

Kathy Howland

Yes.

Alison Steeves

And did you and your ENT discuss the potential relationship with your COVID-19 vaccine?

[00:10:00]

Kathy Howland

Yes, we did. And he said it was quite possible. But he is prevented by coming right out and saying that. The government has stopped the doctors—apparently, from what I've been able to learn—has prevented the doctors from actually attributing vaccine injuries to the COVID-19 shots.

Alison Steeves

So he expressed that concern, that he was not permitted to directly attribute it as a cause?

Kathy Howland

Yes.

Alison Steeves

Okay, and so he put it in the report though, just as a potential effect.

Kathy Howland

Yes.

Alison Steeves

And have you spoken with your family doctor again regarding your diagnosis? You mentioned she sort of accepted there could be a link with the vaccine?

Kathy Howland

Yes, she did. She said that she had read some articles that did say that people were having problems with the vaccine and that their symptoms were hearing loss and tinnitus. But she, again, would not put that down on paper for me.

Alison Steeves

So the doctor who told you to go get the shot and not to wait for another shot that you had been waiting for was now acknowledging that you could have developed tinnitus and hearing loss based on having taken it.

Kathy Howland

Right.

Alison Steeves

Okay, so Kathy, can you speak a bit to what it's been like living with tinnitus and hearing loss? This report was approximately a year after your second shot, a little bit more. So how has that been? How has it impacted your life?

Kathy Howland

It's been difficult. I've always been a social butterfly, an extrovert, and I have completely flipped because it is so hard to be in crowds or around a group of people because I don't hear well. Background noise is particularly annoying, so you can imagine being in my job with a classroom of children, especially elementary kids. They're very boisterous and can be loud, and so I've withdrawn a lot and I've struggled with depression because I do miss those gatherings. I did direct a group of 30 booklists with a live band, and I can no longer do that. Because it's just too hard to be in a room with a lot of music. It's overwhelming, and my ears close up even more, and the tinnitus rings even louder. As far as my family goes, they don't believe that I would actually have been hurt by a vaccine, so that's another hurdle that's been difficult.

Alison Steeves

So you used to be quite involved in music. You said you directed a group of music and now it's too painful for you to be sort of surrounded by that many people in that level of noise. Is that correct?

Kathy Howland

Yeah. I can't, I just have a hard job with it now at this point.

Alison Steeves

And how has it affected your relationships? You said family members are doubtful or skeptical?

Kathy Howland

Yeah, my parents are very skeptical. My sister is very skeptical. In fact, they're just like, "Well, I mean, you're getting older. You're going to lose your hearing anyway." And I'm like, "Not necessarily, I was fine." And they just don't want to believe that it was part of the vaccine because they've all had several shots.

Alison Steeves

And so do you feel that you can't speak comfortably about this issue in social circles or in certain groups?

Kathy Howland

I can't talk about it. No, people: they shut down. If I say anything like, "I'm sorry, I can't hear you, I had a vaccine injury." And I'm not going to hide behind that; I'm not going to stop with, "I'm sorry, I can't hear you." I want to tell people that this is what this vaccine has done to me and thousands of other people.

Alison Steeves

And has this experience impacted your mental health at all?

Kathy Howland

Yes, I have become very isolated by times. I force myself to be out in a group of people because I know what's going to happen. The tinnitus is going to get louder. My ears are going to get stuffier.

[00:15:00]

But I don't want to become isolated altogether because that's not healthy either.

Alison Steeves

And what would you say has been the hardest aspect of this experience?

Kathy Howland

I think part of it is my parents not believing that I could possibly be injured by these COVID shots because they have so much faith in the government and the shots. And then another thing is my job. I love my job. I love my kids that I work with, and it's so hard to hear their voices. And I work mostly with literacy, trying to work with the kids to bring up their literacy skills so they can do math easier, science. Anything is based on literacy, so we will want them to be right in the top drawer. But if I can't hear whether they are saying a *D*, a *B*, a *V*, or a *T*, it's just crushing to lose that ability to know what those kids are doing and be able to help them. I just don't feel I can do my job as well as I did before.

Alison Steeves

Thank you very much, Kathy. I have no further questions, but the Commission might. I'll just give them a minute.

Commissioner Drysdale

Thank you for your testimony. I have a couple of questions. And perhaps you said them, and I missed them. And that was, I understood that you had your second audio test in and around January 4th of 2022?

Kathy Howland

Second audio test. I'm just looking for the date here. It was the 14th of January 2022.

Commissioner Drysdale

I can't read my own notes. There is a one there. Now my real question, though, is: what was the date of the first test, the record test you had prior to that?

Kathy Howland

I do believe that there was a previous audiogram on file from 2002, which showed normal hearing.

Commissioner Drysdale

Okay. One last question. I believe you said that you had a discussion with your family doctor with regard to this being a potential vaccine injury. And I believe I heard you say she thought that was a possible side effect?

Kathy Howland

Right. She had been reading some literature online that things were starting to come out that it was a potential side effect.

Commissioner Drysdale

Do you know whether or not she made a report to the CAEFISS [Canadian Adverse Events Following Immunization Surveillance System] system on that?

Kathy Howland

That, I don't know. I've got some paperwork to go in to her next week, but I really don't know if she reported that to VAERS [Vaccine Adverse Events Reporting System] or not.

Commissioner Drysdale

Okay. Great. Thank you very much.

Kathy Howland

You're welcome.

Alison Steeves

Thank you, Kathy.

[00:18:31]

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 6: Alison Petten

Full Day 2 Timestamp: 02:57:13–03:23:16

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Alison Petten, thank you for attending. Do you affirm you will tell the truth, the whole truth, and nothing but the truth?

Alison Petten

Yes, I do.

Ches Crosbie

Thank you.

Nicolle Snow

Thank you. Good morning, Ms. Petten. For a little bit of background, Ms. Petten was a last-minute substitution witness, and so for that reason we are not going to go through direct examination. Ms. Petten has a story here to tell, and it's an important story. Ms. Petten is going to be speaking on four different topics: informed consent, appropriate techniques for intermuscular injections, collection of data, and nursing standards and ethics. I'm going to let you have the floor.

Alison Petten

Okay, thank you very much. I really appreciate the opportunity to be here today. I'm here partly because I love nursing, and I get a little emotional about this. But I'll calm down once I get going. Many of my colleagues can't be here, either because they're afraid to speak publicly, or because they're exhausted, or they're at work, or maybe they're getting a break. I have had the privilege of working four streams of nursing. I've been a clinical nurse most of my career and an educator, an administrator; and I've also had some involvement with research projects and program evaluation. I currently work as an educator and health consultant. And I've been a registered nurse for 40 years—and a really good one. I love what I do and I love teaching all around Nova Scotia. I try to be kind and helpful and non-judgmental and I think, because of that, people tell me stuff. A lot of people know me in health care and I've been hearing a lot of very disturbing stories over the last few years.

I'm here because we made some serious mistakes, and we need to do better. And I know that we can. I'm not interested in furthering the blame and shame that has gone on. I think it's important that we reflect and examine and evaluate what's been done so that we can figure out how to do things better and not just see who's at fault. I'm not usually a rebel. I can be a little—but not overly. I actually kind of like rules. We need policies and protocols and guidelines and laws to guide us and support us, but we need to follow them, and they also need to make sense.

So as I talk about these four things, informed consent, intramuscular injections, collecting data about possible adverse effects, and nursing and our code of ethics, I'd like to spend a little more time on nursing and the code of ethics. But I'll try to be brief as I go along, and I invite you to help me with my time because, I know.

Nicolle Snow

I will.

Alison Petten

Yeah. And if I talk too fast, you can slow me down.

Nicolle Snow

Okay.

Alison Petten

With informed consent: I guess I would like to convey that, with 40 years in nursing, I'm blown away. To me, informed consent, I thought, was a basic foundational secure piece of the healthcare system that we weren't allowed to mess with. For 40 years, I'm not allowed to touch people hardly. I'm not allowed to put something on someone's body or in somebody's body without them understanding it and choosing to accept it. Unless the person doesn't have capacity to do so, and then there's a process we go through with that. Information is required. When you look at the definition of informed consent, coercion is not allowed. People are not allowed to be punished for the choices that they make with healthcare. There's not supposed to be negative repercussions for their choices. With regard to mandates, quite honestly, I never dreamed that we would do that.

And especially with the high vaccination rate that we had—with all that blame and shame and encouraging people to get vaccinated. We had a very high vaccination rate, so I'm not actually sure why they were mandated at all really. People wanted them. Before we heard messages about unvaccinated people being racist or misogynist or having unacceptable views, people want drugs. Look at the TV ads! You know, there's new drugs out there to help you with your COPD [Chronic Obstructive Pulmonary Disease],

[00:05:00]

your breathing problems. And in order to decide you're going to have them you're being told that you might have headaches or high blood pressure or a heart attack or sudden death—but people have the information and they can make those choices and they sell the drugs. It happens.

We had nurses giving vaccinations to nurses who were crying because the nurses knew enough to know that we didn't know enough about these vaccines. You couldn't get an exemption for love nor money in this province. I only know of one individual who got an exemption, and that was after their first vaccination—after they regained consciousness several days later. We know there are a lot of people for whom this vaccine was not a good idea. The chemically sensitive, the neurologically vulnerable, and many others; but I probably shouldn't spend much time on it because other people are. We heard doctors telling their patients, "I don't think this vaccine is a good idea for you, but I'm not allowed to give you an exemption." Doctors were prevented from practising medicine and providing appropriate care for individuals according to their individual situation.

Yesterday, I learned that 114 Nova Scotians died from COVID—I think in the first two years. I'm not positive, but I'm pretty sure that I could find you 114 people who either died or aren't sure how they're going to live because of vaccine injuries. Some of those people chose, but some of those people didn't feel they had a choice, so it wasn't informed consent in that case. And I think it's interesting and very sad to see that we are noting now: we have more COVID deaths after people have had two or more vaccines. So not my area of expertise, but it does seem like maybe they aren't working. So that's informed consent.

I'd like to talk about the appropriate technique for intramuscular injections. I teach this stuff, and I teach to aspirate. Shall I just explain briefly what that means?

Nicolle Snow

Yes, please.

Alison Petten

So normally, when we're giving somebody an intramuscular injection, if we're using the deltoid, we have to make sure there's enough muscle there that we can actually get into a muscle; we're not going to hit bone. We landmark to find bone and the right place to inject. And then when we quickly inject the needle, we hold it steady, and we pull the plunger back just a little bit, create a little negative pressure to see if a little blood comes back into the syringe. If blood comes in the syringe, that means I'm not in muscle, I'm in a blood vessel. So I have to remove, pull the needle out, put pressure there so they don't get a bruise and whatnot, throw that out, and then I have to draw up and landmark and inject in a different site. Because if I go ahead and give that injection, I will be giving it intravenously. And if I give a medication intravenously, usually it's with a lower dosage. So the way these vaccines were developed and the research that was done around them was around them being given IM. So I was quite taken aback to see that in Nova Scotia and across Canada—and I understand from the CDC [Centre for Disease Control and Prevention], because I did some research to see what I could find out was happening now—they are saying it's not necessary for vaccines.

Nicolle Snow

What is not necessary?

Alison Petten

It's not necessary to aspirate—not necessary for vaccines. I found this out a handful of years ago because, as I said, I teach this and I want to make sure that I'm staying current and whatnot, and what I found out was there's no research around that. The wording is

there's no evidence to support that aspiration is necessary, but there's also no evidence to support that it's not. And if I don't aspirate and I inadvertently give a medication into a vein, I could cause an overdose because we have a different dose. So for example, with morphine, if I'm giving it IM, I might give 5 to 10 milligrams. If I'm giving it IV, I give maybe a half to 2 milligrams. So it is important that we aspirate.

Maybe they're not concerned about overdosing with a vaccine, but it wasn't intended to go directly into the bloodstream. It was supposed to get there gradually, from the muscle.

[00:10:00]

And the only reason I can really think of for them wanting to do that, that would be a good reason, would be because of wiggly children. Most of the vaccines that we give go into young children. And no young child wants to have a sharp piece of metal in their body for very long. And they're wiggly. So maybe that's why, but I didn't find any rationale documented anywhere for that. It only takes a few extra seconds to aspirate. What takes longer is if you are in a vein, then you have to throw that away and draw up a new one. So you have a little bit of wastage and a little bit more time. But that's important.

Nicolle Snow

Okay. I'm going to give you the 10-minute warning.

Alison Petten

Thank you. My son wanted me to tell you that he was taught in paramedic school to aspirate. And then suddenly when they rolled out the vaccines, it doesn't matter. So he is rightly disgusted because it does matter.

With collecting data about possible adverse effects, a lot of people are talking about that in a variety of ways. So I think I will just tell you what I thought and what I expected, and it didn't happen. I first thought, uh-oh, that was fast. This is new technology. These vaccines are so new and different, they had to change the definition of "vaccine" in order for them to meet that definition. But I thought, oh my, we're in a pandemic. We have to do things differently. I suppose that we have to—and there was no talk of mandate at that point. But I thought, as long as we are collecting data about possible adverse effects and we're ready to pull the plug, I guess we have to do this. And honestly, I've known for years that we're not good at reporting adverse effects for drugs and whatnot. I think it gets reported maybe about as much as sexual assault: like, 10 per cent or less of adverse effects for drugs and vaccines actually gets reported. And this is after 40 years of nursing I know this.

I expected that we were going to do this amazing rollout of how to use the adverse event system following immunization forms. I thought they'd be on telephone poles almost. I figured every health professional in Nova Scotia—because we all are regulated—we'd have someone that can send us an email. I figured every nurse was going to get a copy of that form and be told how to use it. I figured they were going to revise the form and make it more user-friendly, make the process easier. I figured they're probably going to get the public to complete their own, because busy health professionals could be doing something else. None of that happened. And the way that it's supposed to work is we don't analyze what we submit. If there's an adverse event that happens following immunization, it's not supposed to be analyzed first. It's supposed to be submitted.

Nicolle Snow

When you say analyze, do you mean for the causal connection to the vaccine?

Alison Petten

Yes.

Nicolle Snow

You just report it regardless.

Alison Petten

We report if it's following—yeah. And if it's a very serious one, then they're supposed to investigate. That's my understanding: it's supposed to be investigated right away if it's serious. And if it's not serious, then they just put it in the data, and if a pattern emerges, then they investigate. But if you don't collect the data, you don't get to see the pattern. And I think that's what happens.

Nicolle Snow

Yeah.

Alison Petten

I'd like to talk a little bit about my profession. I might cry, but I'll get over it, so just bear with me. I live and breathe my standards of practice and my code of ethics. Nursing is hard, but I love it. It's important work and I've been proud to do it. Nurses are supposed to be critical thinkers. We're supposed to have awesome knowledge, skill, and judgment. We're not allowed to just follow orders. Leadership is expected and required of us. It says so in our standards of practice, which are legislated documents, and our code of ethics. So legislated: to me, I understand that means it's law. This is what we're supposed to do. We're supposed to also work within our scope of practice, which means: as a registered nurse, I'm only allowed to do what I have the knowledge, skill, ability and judgment to safely, ethically, compassionately do for an individual or group.

Yes, most people are familiar with nurses caring for sick people and people who are injured and people who are dying, but we also are required to do health-promotion and disease-prevention as well. I expected public health education to not be just,

[00:15:00]

"Stay home and wait for your vaccine and wear a mask when you go out and have distance."

I expected we would also encourage people to support their immune system—let people know, the best way to fight off a virus is to have a healthy immune system. Fear does not make your immune system stronger; it makes it weaker. We could have done things like promoted better nutrition, hydration, stress management, mindfulness, fresh air, connecting with people. We could have been checking vitamin D3 for people to see if they needed more vitamin D to be optimized. So there are a lot of things we could do: helping people to avoid sugar and alcohol, just letting them know, you know, just make other choices when you can. But instead, we were vaccine-waiting.

I want you to know that the Code of Ethics for registered nurses in Nova Scotia—I'm going to quote from it two things. It says, "In anticipation of the need for nursing care in a disaster or disease outbreak, nurses assist in developing a fair way to settle conflicts or disputes regarding work exemptions or exemptions from the prophylaxis or vaccination of health care providers." That's for every registered nurse in Canada. This code of ethics also says, and I quote, "When in the midst of a disaster or a disease outbreak, nurses advocate for the least restrictive measures possible when a person's individual rights must be restricted." We didn't do that. And I've given you a copy of the Code of Ethics [Exhibit TR-24].

Nicolle Snow

I do. Yeah, I do have a copy of that. Thank you. You can enter that.

Alison Petten

The Nova Scotia College of Nursing is the regulatory body for all nurses in Nova Scotia. And I'm going to quote once again and read, if you bear with me: "In Nova Scotia, all registered nurses and nurse practitioners are accountable to practice nursing based on that Code of Ethics, developed by the Canadian Nurses Association. The Code of Ethics is a resource to help you practice ethically and work through ethical challenges that arise in your practice setting with individuals, clients, families, communities, and the health system." That didn't happen either. In August 2021, I heard that there was talk of maybe mandating vaccines. So in August 2021, I sent an email to my nursing regulator, because my understanding is that they exist for the purpose of protecting the public from nurses. I sent them an email basically saying, Public Health needs our help. I'm concerned that they might mandate, and these vaccines have not had long term studies. We don't have enough information, blah, blah, blah. And I have given you the information.

Nicolle Snow

I have that email, which we will enter into evidence [Exhibit TR-24a]. Okay.

Alison Petten

I basically got a pat on the head. We back-and-forthed a little bit, but I was told they're not experimental and we're not going to mandate. All nurses have them, but we're going to follow what public health says. After that, I phoned the Canadian Nurses Association, because they are the people who have provided the code of ethics for nurses. And what really troubled me at the time, and still, is that I phoned, because I was afraid to email. I was somehow afraid to have an electronic footprint just by asking some questions, and I realized at that point that we'd really lost the ability to advocate, and yet we are required by law to advocate.

The next thing was in February 2022. In collaboration with some other nursing colleagues, we submitted four resolutions to the Nova Scotia College of Nursing so that we could have some discussion. We thought maybe they'll never get past, but at least we could have some discussion and some debate, because that hasn't been happening at all. The four resolutions: One was about aspirating to avoid injecting directly into the bloodstream. Another was about reporting adverse events. We wanted them to make sure nurses knew they had to do that. Another was advocating to not mandate vaccines for children and adolescents, and another was advocating to end the use of the mandates and the passports in Nova Scotia.

We got nowhere with that. Basically, they were polite and let us know that really it would be a nursing association that would deal with such things. But in Nova Scotia we don't have an association anymore.

[00:20:00]

We just have a little bit of a Facebook page presence, but we don't— So it was like you could go there, but we didn't have "there" to go. I felt like I had exhausted what I could do through the processes that were established for nurses. I emailed and I phoned MLAs, MPs, the Governor General, the Prime Minister's Office—and I did get a couple of calls back, but more pats on the head and we'll do what public health says.

Nicolle Snow

Thank you, Ms. Petten.

Alison Petten

Could I just— Could you—?

Nicolle Snow

Yeah, you're actually out of time, but can you wrap up very quickly?

Alison Petten

Okay, I'll just quickly read this. In closing, thank you. I can't believe that we got to this in Canada. I'm trying to understand how we got here, and one of the things I think happened was it was a lot about fear. I think we need to have information and not use fear. We had processes in place to guide us, but we didn't use them. I think that was because politicians took over healthcare, and they were guided by the pharmaceutical industry, not health professionals and scientists, and leaders who developed the guidelines for just this kind of situation. Politicians are about power, and the pharmaceutical industry is about profiting. Neither is about health.

This pandemic response was managed by politicians who Canadians have allowed to have too much power. They followed recommendations by the pharmaceutical company who made too much profit and cut corners and did lousy research. This inadequately researched vaccine is now in the childhood immunization schedule in some places. I'm not sure if it's in Nova Scotia, but they were talking about that. I think politicians acted outside their scope of practice. If I did that as a nurse, I'd be in trouble. They practice healthcare without a licence. Surely that's not legal. They do not have the knowledge, skill, ability, and judgment to safely, ethically, and compassionately tell health professionals what to do, who to do it to, and how to do it. If they were nurses, I would submit a complaint to their college stating they acted outside their scope of practice.

Nicolle Snow

I'm going to stop you there to see if we have some questions from the panel. Thank you.

Commissioner DiGregorio

Thank you for your testimony. I had a couple of questions around your thoughts on informed consent. First of all, I'm just wondering if you've had any formal training on it. Is there anything as part of your nursing training?

Alison Petten

Oh, yes. Yes, in nursing school, through my diploma program, also through my baccalaureate program, and reinforced during orientation for any job that I had.

Commissioner DiGregorio

Thank you. And do you know if there's anything about informed consent in the nursing code of ethics that you've been talking about?

Alison Petten

Oh yes. Yes, it's required. We are not allowed to provide nursing care without informed consent. And if a physician was to prescribe something that I thought was not appropriate for somebody—maybe a physician prescribed something like 100 milligrams of something, and I know this person has chronic renal failure and that's too high a dose for them—then I'm not allowed to give it, and I'm required to question them. And if they say, "Oh, give it anyway," then I have to go over their head.

Commissioner DiGregorio

Thank you. One other area you spoke about was about gathering information and adverse event reporting. Can nurses complete adverse event reports?

Alison Petten

My understanding is they can, but what I've seen in practice is that we typically don't. So usually it's physicians who do, but if you read the instructions online, you know any health professional is able to do it. I had assumed during the pandemic, we'd really make sure every all the nurses knew you can do that, and this is how you do it. And we made it easy for you.

Commissioner DiGregorio

You yourself were never asked to prepare one or you never actually prepared one?

Alison Petten

I did submit a couple for a couple of clients who had problems that they had reported to their doctors, and their doctors said that they weren't going to report it. And I asked the clients if they wanted me to do it for them.

Commissioner DiGregorio

Okay. Thank you.

Commissioner Massie

Maybe a quick medical question about aspiration, because I've seen a lot of recent literature on that. I was not aware of that really before. In your best, I would say, professional opinion, would you say that the lack of aspiration—in other words, the direct injection in intravenous—could be actually the source of many of the side effects that we've seen?

[00:25:00]

Alison Petten

In my own opinion, I think that it's possible. And I've had some other nurses share with me, they're wondering: "Do you think it's possible that with some of the things we've heard about young men and athletic young men with big biceps, they're going to have bigger blood vessels?" We're wondering, is it possible that maybe we're hitting a blood vessel and giving the vaccine directly into the bloodstream by mistake and we don't know? And then they maybe develop more of the cardiovascular problems or the sudden issues. But I don't know that. But it's something I wonder.

Commissioner Massie

Okay, thank you.

Nicolle Snow

Thank you, Ms. Petten.

[00:26:02]

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 7: Elizabeth Cummings

Full Day 2 Timestamp: 03:23:40–03:41:04

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Elizabeth, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Elizabeth Cummings

Yes, I do.

Ches Crosbie

Thank you.

Nicolle Snow

Can you state your full name?

Elizabeth Cummings

Yes. My name is Elizabeth Cummings.

Nicolle Snow

And Ms. Cummings, where do you come from today to be here?

Elizabeth Cummings

I come from Cole Harbor, Nova Scotia.

Nicolle Snow

Now I understand that you received two Pfizer shots, one in May and the other in July of 2021.

Elizabeth Cummings

Yes.

Nicolle Snow

Why did you vaccinate?

Elizabeth Cummings

I'm vaccinated because I take care of both of my elderly parents. One is ambulatory and one is not. At the time, Dr. Strang and Ian Rankin had advocated that it was proper to protect our older community by vaccinating if you were going to be around the elderly. And I absolutely, without question, took their directive and did my part.

Nicolle Snow

Did you have any adverse reactions following the first shot?

Elizabeth Cummings

No, I did not.

Nicolle Snow

And did you have any adverse reactions following the second shot?

Elizabeth Cummings

Yes, I certainly did.

Nicolle Snow

What happened?

Elizabeth Cummings

Well, the first shot was fine. It was just like a sore arm, but the second one: I had the sore arm while I was sitting there in the 15-minute time-out period. And I started to develop a headache there, and I started pressing my temples and I'm like, "Oh, that's strange." So I went home and by the time that evening had hit, it hit my neck and my whole head, like around the base of my neck, and it started to spread across my skull. It incapacitated me for three days. I could not move. And in addition to that headache was a nerve pain that was, surprisingly, just on the left side of my body. And it was confusing because it was literally the left side of my body.

Nicolle Snow

Do you know which arm you had the shot in?

Elizabeth Cummings

I had that in my left arm.

Nicolle Snow

Okay.

Elizabeth Cummings

So the headache, like I said, lasted for three days. And the nerve pain was constant. And then that ramped up over a couple of months. But then into the fourth day afterwards, the headache had just subsided—so thankfully that went away. And then I was given a day with just the nerve pain, and then all of a sudden, for the first time in my life, when I haven't even had a cold sore, I developed shingles. It spread all over my neck, which you can still see some of the scar from that, and it went across my chest, and it was blistering. It was pretty bad.

What I did for that was I took my top off, and I couldn't wear clothes. It was too uncomfortable. I washed with soap and water, peroxide, alcohol for five days, and then finally that subsided and went away. But the nerve pain continued, and I tried to deal with it myself by yoga, stretching. I knew it wasn't normal to have that kind of nerve pain; it wasn't a pinched nerve, because my skin—all of my skin hurt too. If I was rubbing my pants or my shirt against my skin too much, it became very raw.

Nicolle Snow

Did you see anyone for this?

Elizabeth Cummings

I looked, but you couldn't at that time. They were taking elderly patients and they were— You couldn't see anybody. There was nobody to see. You had to deal with it yourself, like there was not a lot of—

So then by the time October hit, I was in so much pain at that point that I went to the chiropractor. And I talked to him about it and I said, "You know, I got nerve pain but, confusingly, I've got skin pain too." After about five times, I limped very badly out of the last session that I had with him. And I thought, okay, I can't do that again. That's not going to work. This is the fifth such session; it's actually made things worse. Then I called my doctor that just started to take patients back, but they were only taking the elevated cases that were in-house visits.

[00:05:00]

The receptionist gave me a phone call appointment. Then, when I made the phone call appointment, my doctor said, "I can't give you anything without giving you a physical exam because you're talking about physical pain." And I said, "Well, this is just the way I was directed." Then I had to wait even longer, until November had hit. And I went in, and I talked to him about the symptoms that I was having from the vaccine, and it happened immediately. And he did acknowledge the fact that nerve pain was one of them, and he gave me a prescription for pregabalin. So I took that, then I went to a follow-up visit with him. And then at that follow-up visit, I asked for an exemption, because at that point, they started talking about boosters. And I was afraid that I was going to get a job and they were going to mandate this booster or require me to have a booster, so I wanted to be on the exemption list.

Nicolle Snow

Were you able to secure the exemption?

Elizabeth Cummings

No, I was not. He told me that— He picked up a piece of paper in his office and he said that that piece of paper said that, unless I had an overnight visit in a hospital from a side effect, I could not be put on that exemption list.

Nicolle Snow

And did you speak with him about whether or not to complete an adverse event form, or did he speak with you about that?

Elizabeth Cummings

No.

Nicolle Snow

You don't know whether he did?

Elizabeth Cummings

I didn't know what that was at that point.

Nicolle Snow

Okay, all right. And there were no indications that he filled one of those out for you?

Elizabeth Cummings

I am unaware if he did. I don't know. He does all of his little paperwork, but I don't know.

Nicolle Snow

And are you still on the pregabalin for the nerve pain?

Elizabeth Cummings

Yes, I unfortunately am in the middle of a relapse right now. Unfortunately.

Nicolle Snow

And what, if any, other measures did you take to address the concerns that you had about the vaccine?

Elizabeth Cummings

Well, the only recourse that I had at that point— I guess what happened was, I noticed in March of 2022 that there was a Pfizer dump of the safety data. So at that point, I read the cumulative 5.3.6 safety events, and I noticed— Like, I'm not a doctor, I'm just an electrician. I don't really understand much, but I do understand adverse events. And when I read that

cumulative report and I saw the nine pages of adverse events, I became very alarmed. And herpes zoster; there was also meningitis, and there were certain neuralgias. And I thought, that's everything that happened to me—like everything! I got really, you know— I felt kind of betrayed.

What I did was, I tried to put it where I thought my complaint was supposed to go. I sent a complaint to Health Canada. Because Health Canada, if you look on their website, they have statements that they approved the Pfizer vaccine, that they deemed after a stringent—what do you call it—analyzation of it, that it was safe to use. And they did that in October 2020. So I thought, that's where I needed to go, to complain to the fact that I took two Pfizer vaccines and I became injured from the second one. What they did was they returned my email saying that I should have had a complaint with the pharmacist, because I asked the pharmacist about an insert. And the second Pfizer vaccine, I asked him if he had any information with an insert, and he said that there was no information. And they told me that I needed to contact the Nova Scotia College of Pharmacists to make a complaint, but I found that confusing because he didn't make the insert. Like, I found that strange.

Nicolle Snow

Let's go back to your visit with the pharmacist. Is that who administered the second dose? A pharmacist?

Elizabeth Cummings

Yes.

Nicolle Snow

You were asking the pharmacist for the insert with the ingredient list?

Elizabeth Cummings

I asked him about the safety data.

[00:10:00]

And any kind of information about the vaccine itself, because I was starting to see some alarming things online that were concerning me. And after he told me that there was no insert, I asked him what his thoughts were. And the only response he gave me was that he didn't know whether he was going to vaccinate his 13-year-old daughter or not. So I had to make the decision then. There's like, a 15-minute window to get your vaccination. You're huddled in and then you're huddled out.

Nicolle Snow

He didn't give you any other information on possible side effects.

Elizabeth Cummings

No, no. But I did ask.

Nicolle Snow

Okay, back to your story.

Elizabeth Cummings

Fast forwarding to the complaint, because I put all of that in the complaint to Health Canada. In addition to that complaint with Health Canada, I had said that—

Nicolle Snow

Also, just to go back: Health Canada placed it back on the pharmacist to say you should have had the discussion with your pharmacist?

Elizabeth Cummings

Yes. And these are all in those documents that I had sent you in a zipped file [16 exhibits: TR-25, TR-25a through o]. Their response to that along with my complaint. But in that complaint, I had said that it was a trial vaccine, that I wasn't given an exemption, that I bled from the PCR tests, that I was masked over and over and over again, which was harmful to me. And one of the two most important things that I put in that was that they allowed the authorization, because that's the whole reason I went to them, was because they authorized the use in Canada. And then the last thing that I closed within the letter was informed consent. Saying, you know—and I even embedded the link to the Pfizer documents in the email—"Had I been given that information—" Because you state that you've reviewed this, then if I had been given this informed consent, I would not have taken that vaccine.

Then the response they gave me besides that was that I basically needed to go to VAERS [Vaccine Adverse Event Reporting System], which was the Canada Vigilance [Program], to fill out my adverse events. I was like, "Okay, I'll do that, what is this?" So I studied it.

Nicolle Snow

Are you talking about the vaccine injury support program?

Elizabeth Cummings

The VAERS, yeah. They sent me to the Canada Vigilance VAERS. I had to figure out how to fill out that paperwork. So I did: I put in my lot number, and I put in what I was prescribed and they asked me if it was reoccurring or not. I had to put unknown because I didn't know at that point. And then that was it. It stopped there. So there was no recourse. It was just, you're injured, you're done.

Then interestingly enough, July 11th came, and I noticed a Dr. Philip Oldfield had advocated that he had already talked to Dr. Tam and the Board of Physicians, I believe in Ontario, and that he was given no information. They weren't responding to him, so he decided to elevate his complaint to the International Criminal Court. And he was asking Canadians that were injured if they would call or email the International Criminal Court and explain their injuries. I did do that. In the subject line, I put his complaint number, gave them the exact complaint that I gave to Health Canada. And I told them that I wanted to either make a complaint against— I said Health Canada, et. al., because I didn't know who that encompassed. And I said that I wanted to add to his complaint, and if that wasn't satisfactory, that we could make another complaint with crimes against humanity. For the

informed consent, for all the things that I had already outlined, but the vaccine-injured as well. And I had to follow up twice. I didn't get a response from that either.

In closing, I've been an advocate for people that have been vaccine-injured and the people that were mandated from day one. And I think we've all went through a period where loss of friends— They think that we're conspiracy theorists. And I've had people say to me, "Before, you know, you were a rational human being. You *were*—"

[00:15:00]

Nicolle Snow

Suggesting that you're not that now.

Elizabeth Cummings

"But you're no different than a Trumper now." And I'm like, "what does President Trump have to do with me as a Canadian? I don't understand what the correlation is here. I'm complaining about being vaccine-injured, and you're calling me Trump. Unacceptable."

Nicolle Snow

And so how are you doing now with respect to your condition?

Elizabeth Cummings

Well, I mean, it has its ups and downs. I had the original prescription, then I had to get it refilled. So that was December 2021. Then I had to get another prescription because I had two bottles there. Then I had to get another one in the summer. So June, July, I had to get another batch. And then just recently, I had to get another. So now, unfortunately, I'm going to have to look at this personally as something that's chronic, that's reoccurring. Because now it's over a year and a half and it's still going on. And it's uncomfortable, it's very uncomfortable. I can be sitting there, and the pain is just— I'll have to get up, because if I'm still, if I'm moving in a wrong direction, it'll inhibit me lifting. I was a robust, a very healthy individual before this. So not being able to lift 50 pounds for me, that hurts my position. I have an interview next week, and I'm worried that I'm going to have to self-disclose that I may not be able to pick up an electrical panel to drill it in the side because I can't lift it now if I have another relapse.

So you know, everybody's got their story and, fortunately, I've got my life. I know there's a lot of people that don't.

Nicolle Snow

Yeah. Well, thank you so much for your testimony, Ms. Cummings. I'm going to turn you over to the board. They may have some questions.

Commissioners

No questions.

Nicolle Snow

All right. Thank you kindly.

[00:17:23]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 8: Dr. Joseph Fraiman

Full Day 2 Timestamp: 04:38:17–05:47:28

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Chad Horton

Just one moment, Dr. Fraiman. Yes, he has been affirmed. Would you like us to start over? No?

Dr. Fraiman, we had a technical difficulty a moment ago, so we're now streaming. Can you please, for the benefit of the Commission and for our audience, provide us with a brief overview of your education, training, and experience?

Dr. Joseph Fraiman

My name is Dr. Joseph Fraiman. I am an emergency physician today and my medical licensing began with medical school at Cornell Medical College. I did my residency at Charity Hospital in New Orleans, Louisiana. I still work in the Louisiana region. I'm a former medical manager of the Louisiana Urban Search and Rescue Disaster Task Force. And I'm also a clinical scientist specialized in analyzing medical interventions for harm and harm benefit analysis.

Chad Horton

Can you just expand on that a little bit, Dr. Fraiman, where you say that you're a clinical scientist who specializes in harm-benefit analysis. What is the background associated with that area of specialty?

Dr. Joseph Fraiman

That's the area of research that I've been involved in since residency. I'm here today, basically, as I'm the lead author of what's become a paper with a large impact that reanalyzed the messenger RNA COVID-19 vaccines' serious adverse events.

Chad Horton

Can you tell us, Dr. Fraiman, when that paper was published and who, if there are any, the co-authors might be?

Dr. Joseph Fraiman

Yes, there are six. We're an international team. Some are from Spain, Australia, California. We have some in Baltimore. One of the authors is a *BMJ* editor. Another author is one of the top epidemiologists in the world. He has written a book on epidemiology. Another is a former NIH [National Institutes of Health] associate director of clinical research.

Chad Horton

Okay. And I understand, Dr. Fraiman, that you prepared a presentation [Exhibit TR-0011] to assist in your examination today. And if you have that ready to go, I would invite you to begin.

Dr. Joseph Fraiman

I do, but I need to be given a screen share option. I can start without it, as we figure out the technical here.

Chad Horton

One moment.

Dr. Joseph Fraiman

In the Emergency Department, I believe it's important just to understand the experience that I'm given and what I've been witnessing through the COVID-19 pandemic. Where I work is a rural Louisiana hospital in Cajun area, which I understand is the long-lost cousins of the Acadians up north and from your region. And it's my pleasure to have worked with them. I drive an hour and a half to work out in that region, because I really enjoy being the doctor of these patients.

March 2020, Louisiana was hit really bad with the first COVID surge, and we saw a large number of hospitalizations and death. Working in the emergency room during this period was a horrifying experience for myself and my nurses. Typically, when someone inside the hospital gets ill, there's an emergency. At nighttime, I'm the only physician in the hospital, and I am called up to the room with something called a rapid response. It's an automated electronic voice that comes over the loudspeaker and we have to go and resuscitate them. This happens normally once, maybe every three shifts

[00:05:00]

that I would experience that in normal times. During COVID-19, during the first surge, we were going to these two or three times every shift. It was quite exhausting to see, emotionally, the amount of death that was occurring during this time.

But I want to point out during this time, when I was going to work, I would look at the news and see, "Oh, hospitalizations, they're rising." And then I would come into work and they were rising. Deaths rising. Same for cases. And then they were decreasing again. Then for the second surge, it was a very similar experience in the Emergency Department. But these metrics that we were using to count hospitalizations, I can't say that they were accurate because I don't know that. But I do know that, when they said they were rising, they were rising. And when they were falling, they were falling. It was almost like looking at the weather on your phone before you go outside, and it feels exactly like the weather that you just looked at on your phone. And that's the anecdotal experience that I feel like is

important to understand. Because we see so many patients, when you see these patterns, they should fit exactly what we're being told is happening. Because we see enough patients that the anecdotal experience should match it.

Chad Horton

I'll tell you, Dr. Fraiman, you can screen-share now if you like. Just to contextualize some of your commentary a moment ago, you referenced the first surge and the second surge. Can you tell us when those times were? I understand your evidence is that you did see an increase in hospitalizations and deaths during what you characterized as the first surge and the second surge. When were those surges?

Dr. Joseph Fraiman

Yes. The first surge was March 2020. The second was in the summer, and then the third was in the winter.

Chad Horton

All of 2020? Yes, okay. Continue sir.

Dr. Joseph Fraiman

Of course, let me screen-share now. I'm here to talk about the COVID-19 vaccine, and let's begin with what we see is the randomized control trials. This is the *New England Journal [of Medicine]*'s publication of Pfizer's trial, and that's what I'm going to be focusing on, but the Moderna trial is very similar. We got this. This is one of the most amazing results that I've ever seen, and it's quite impressive. This is the reduction in symptomatic infections. You can see here, this blue line is the unvaccinated; and you see here, the vaccinated, they just stop getting symptomatic infections. This is an impressive finding.

But, at the time, I was actually not satisfied so much with it because I would have preferred they showed a reduction in hospitalizations, given that was, I believe, the most important concerning thing. But actually, because I've been researching with this vaccine and really going deep into this, I have found that in this study, there was a reduction in hospitalization in the original trials. It's just very difficult to find, and they don't really report on it. But if you look into this emergency use authorization, the review memorandum on page 30, and the supplementary appendix for Moderna's New England trial, New England Journal, you can find what the hospitalizations were. And we did see it. There were not that many hospitalizations in the placebo group, but there were zero hospitalizations in the vaccine group, and we got a hospital reduction of 2.3 for 10,000.

We're seeing what we want to see. The vaccine is reducing hospitalizations in the clinical trial.

Chad Horton

Dr. Fraiman, can you just get a little closer to your microphone or just project your voice a little bit more?

Dr. Joseph Fraiman

Yes, can you hear me better now?

Chad Horton

One moment, yeah. Go ahead, sir.

Dr. Joseph Fraiman

Okay, so here we have it for Moderna. More people were infected in the placebo group. Again, no one was hospitalized when these vaccines went for authorization.

Chad Horton

Okay, so just to help everybody understand: the slide that you just showed us, the two previous slides, where it says “vaccine zero,” that means that zero of the vaccinated group were hospitalized. And then I believe for Moderna, it was nine in the placebo group and that would mean that nine people who received placebo, the fake vaccine, did go to the hospital.

Dr. Joseph Fraiman

Yes. That’s exactly what I’m saying.

Chad Horton

Okay.

[00:10:00]

Dr. Joseph Fraiman

For death reduction, there were not enough deaths in either group to determine if it was reducing COVID-19 vaccine from COVID-19 deaths. And here you can see this is their table. It’s about equal. But then we moved into what would be called the observational data, after it was authorized. Then again, we’re seeing impressive numbers here for hospitalizations and death. Ninety-five per cent reductions essentially, all around the board. This was a pretty well-cited study.

But I also put this study up here to bring up another point, because this observational study also was heavily critiqued. Because when you do an observational study, you try to get rid of all the confounders, which are the things that are associated with the vaccine, like for example, people being older who got it. If you just compared that, you would end up with the wrong answer. So you need to control for all the different things. And for this study, they did try to do that, but they missed something. And that was the number of tests that were done. It turns out that 18 per cent of the tests were done in the vaccinated and 82 per cent were in the unvaccinated. That imbalances the groups. Now, I’m not trying to say that that means that the vaccine doesn’t work, just that that changes exactly what we’re doing. And if you adjusted for that, it would show the vaccine efficacy somewhere in the 75 to 80 per cent range. Which is still great. We’re still getting what we want to see.

But the point of this is that, generally, with observational data, after we try to attempt to identify all the things that we could adjust for, for confounding, they tend to overestimate benefits a bit. And that’s just something to think about when we start looking at the trial data—as the observational data—moves through time. So here, I just wanted to talk about what happened in the ER after the vaccine came out.

Chad Horton

Just a moment, Dr. Fraiman. When you say what happened in the ER, are you going to be speaking about your own direct observational experience?

Dr. Joseph Fraiman

Yes, my own experience. And what we saw in my hospitals was basically: after January 2021, we went months without seeing a vaccinated person have an infection or be hospitalized. It was looking very good.

I remember actually when the first vaccinated breakthrough infection occurred. And it was in April of 2021, and the whole hospital— We were all shocked to see it, the first one.

Then we all know kind of, the effects waned. Then we started the boosters. What I want to point out also is: during this time—I'm a witness in multiple hospitals—it became a little difficult to say how exactly how well the vaccine was reducing hospitalizations. There was some mis-categorization in what I was seeing, in that if a patient received a vaccine outside of the hospital system, there was a good probability they weren't recorded as vaccinated. You could have a vaccinated person in the hospital that is being thought of as unvaccinated in the global, national way we're counting vaccinated versus unvaccinated. It was systematically biased in that you would never have an unvaccinated person hospitalized be called a vaccinated person. The only way the mis-categorization would happen was in one direction. I don't believe this was purposeful. I just think that this was a systematic problem. And this has been reported in in many countries that this problem occurred.

Chad Horton

Just a moment, Dr. Fraiman. Just so I can understand. You're saying that the only way, within the system that you worked in, that somebody may be recorded as being vaccinated is if they in fact received their vaccination in the hospital, and then it would have been documented as such. Is that correct?

Dr. Joseph Fraiman

That's not the only way. It also could be entered manually.

Chad Horton

Okay.

Dr. Joseph Fraiman

In one hospital, for a while it was difficult to enter it manually. We didn't know how to enter it manually for several months, but eventually we learned how to enter it. But the problem is, if you are relying on this manual entering of it, then you're going to still end up with a systematic problem unless you're operating at perfection.

Chad Horton

Okay let me ask the question a different way, Dr. Fraiman. What sort of vaccinations may have been occurring that would not find their way into the system and database?

Dr. Joseph Fraiman

Ones that were performed in tents, where they're giving out COVID vaccines.

[00:15:00]

In New Orleans, they were giving them out in bars. There was a campaign of shots for shots and they're giving out shots to get people to take the vaccines. And these didn't necessarily get into the system very quickly. There wasn't a way to put them in.

Chad Horton

Okay, so as a result of these non-recorded vaccinations, you would have patients going into the hospital and being admitted, and they would be recorded as not having been vaccinated because they may have been vaccinated in a way that wasn't recorded, correct?

Dr. Joseph Fraiman

Yeah. That's exactly what I'm saying. I also want to be clear: I'm not saying that this shows that the vaccines weren't working or anything like that. I'm trying to point out that we're losing some of the reliability of the metrics of hospitalization and vaccine status.

Chad Horton

Now, to the extent that you can comment on this: What sort of proportions, if you have any awareness of this, might we be talking about between appropriately-recorded vaccine recipients versus individuals who receive the vaccine in a manner that would not have been cataloged?

Dr. Joseph Fraiman

I don't know. I've seen many examples of it, but it wouldn't be possible for me to give a realistic answer.

Chad Horton

Would a significant number of the population have been receiving the vaccine outside of the hospital setting, where it wouldn't have been recorded?

Dr. Joseph Fraiman

The majority.

Chad Horton

Continue.

Dr. Joseph Fraiman

Let me pull my screen-share here up a moment. Now that's our observational stuff here through the early days. And I want to return us back to the clinical trials to look at harm. This is what we did with the study that I was referring to before. Here are my esteemed colleagues who I worked on this with, and what we did is we looked at serious adverse events.

The term “serious adverse events” was defined the same by both Pfizer and Moderna: it was death; life-threatening hospitalization; disability; or a physician considered it serious for some other reason. That’s what the large paragraph down there is. What I want to be clear is, the term “serious,” the definition is true to its nature. All of these would be a serious outcome.

To analyze this for Pfizer, for example, we had to go through the FDA [Food and Drug Administration] briefing. Also, we used the Canadian one at some point to double-check that everything was the case. This is what a table looks like here. There’s no information you glean from that, but I just want to show you this. It’s a list of each individual serious adverse event. Here is acute myocardial infarction, and the number of times it happened in each group.

Chad Horton

What is acute myocardial infarction for the layperson?

Dr. Joseph Fraiman

That’s a heart attack.

Chad Horton

Okay.

Dr. Joseph Fraiman

There’s all different types of disorders here. And we went through this whole table that goes down for pages. We simply added them up for each group: the vaccinated and the placebo.

Chad Horton

Okay, this slide here. I want to ask you a question about this, Dr. Fraiman. Here, it says any event 103 at the top. We have 103 total events. Now you were just speaking about acute myocardial infarction, and there were three. So as a layperson looking at this, am I correct in understanding that we have three acute myocardial infarctions out of 103 total events? And one event of cardiac failure, congestive one, et cetera? They all fall within the purview of those 103 events.

Dr. Joseph Fraiman

I’ll explain that 103: “any event” is the number of participants who experienced an adverse event.

Chad Horton

Okay.

Dr. Joseph Fraiman

And that’s actually where I’ll be going right now. Because if you add the number of serious adverse events—what we did here—and we found this. Where I want to focus is, we’re

going to look at the Pfizer data here. And what we see is— Actually, I want to go back here, because this is what you were talking about: we found 127 instead of 103, and 93 from the placebo. And what this difference looks like is there's an additional 18 events per 10,000 participants in the vaccine group. And here, right here, this is called a confidence interval. That means there's a 95 per cent certainty that it's happening in between—

[00:20:00]

That if we did the study again, 1.2 to 34.9 events would occur per 10,000. And what that 95 per cent certainty gives us is what people would refer to as statistical significance.

Chad Horton

Okay, just a moment Dr. Fraiman. In the study, we have 18 adverse events per 10,000 vaccinations is that correct?

Dr. Joseph Fraiman

Additional events.

Chad Horton

Okay, and when you say confidence interval, you're saying if we did that study again, that number 18 would fall with 95 per cent certainty between 1.2 and 34.9, is that correct?

Dr. Joseph Fraiman

Yes.

Chad Horton

Okay.

Dr. Joseph Fraiman

Which means that if we did the study again, we could be 95 per cent certain that we'd find an increase in serious harm. And now this risk ratio here is 36 per cent. That is a 36 per cent higher risk of serious adverse event. And that rate, the 18 per 10,000, is one in 555. So one serious event happened for every 555 people in this trial. That is quite a high number for serious adverse events from a vaccine. Typically, we have withdrawn vaccines for one in 10,000.

Chad Horton

Okay, Dr. Fraiman. Again, as a layperson: Is it one serious adverse event for 555 people vaccinated or 555 shots received?

Dr. Joseph Fraiman

People in the vaccine group.

Chad Horton

Okay.

Dr. Joseph Fraiman

It's not per shot.

Chad Horton

Thank you.

Dr. Joseph Fraiman

People have asked us: When we did this study, what type of serious harms are we talking about? That's quite a difficult question. Let me show you one way that we try to look at this. There's something called these Adverse Events of Special Interest, which is a list created by this group, the Brighton Collaboration, endorsed by the WHO.

Chad Horton

And the WHO is the World Health Organization.

Dr. Joseph Fraiman

Yes, the World Health Organization.

Chad Horton

Okay, continue.

Dr. Joseph Fraiman

They figure out what are the adverse events that are likely to be caused by the vaccine so that we know what to look for when we're studying it. And we took this list of these adverse events that are likely to be caused by to pay attention to, and we chose just those. This is what it ends up looking like. It's a little confusing here, but I just wanted to show you the whole thing. I'm going to pull this together to explain it. What we see here, this is the Pfizer trial, and the differences in events per 10,000. What you see is a lot of small numbers per 10,000, but they're all—almost all—positive. There's only one, two negatives, a handful of zeros. Out of 15, ten are positive.

Chad Horton

What does positive and negative mean in this context?

Dr. Joseph Fraiman

Thank you. Negative would mean that they happened less in the vaccine group. For example, here they have acute liver injury that happened slightly less in the vaccine group. And we expect this to jump around all over the place, but we should expect the negatives to be about comparable to the positives. Here we're seeing lots of small differences, all like about one in about 10,000.

Except for, here is a little higher. That's the coagulation disorder, which was higher in both Pfizer and the highest one in both Pfizer and Moderna. These include blood clotting, diseases of blood clotting, and diseases of bleeding. The reason I pulled this all together here is to show why the serious adverse events are increasing. It's not one type of harm, it's increasing in multiple different places, but very small amounts, about one in 10,000. But when you take one in 10,000, 10 times, that becomes one in a thousand.

What we're seeing here is lots of these small harms, but we are not certain exactly which ones—just that the coagulation disorders are coming up a little bit more. But we don't have power from the studies: There's not enough people, there's not enough events. But when you add them up, you can see the difference between the groups. And here we did this for both Pfizer and Moderna, and we combined them. And again, we could see when they're combined, the adverse events of special interest for Pfizer and Moderna are increased.

[00:25:00]

And here we're seeing this 12.5 in 10,000 increase, or 43 per cent increase.

Chad Horton

Can you go back? Can you go back to that slide for a moment? So it says mRNA vaccines and serious AESIs. What is an AESI?

Dr. Joseph Fraiman

Sorry, that's the adverse event of special interest. The ones that the Brighton Collaboration said created a list of the potential serious harms that we needed to basically pay attention to and potentially could be related to the vaccine.

Chad Horton

Okay, what this says, Table 2, serious adverse events, how I read this is: between the clinical data from Pfizer and Moderna, you are seeing 12.5 serious AESIs per 10,000 participants, is that correct?

Dr. Joseph Fraiman

That is correct. And that's about 1 in 800. I think we're looking at the numbers that are probably within that range. The 1 in 555 we saw: it justifies their serious adverse events. Here we're seeing 1 in 800, we're in the same range. But I think the important thing here is not just to focus on the harms. You have to put them together. And so ideally, we would have an all-cause hospitalization chart. But, as I said before, the hospitalization data wasn't really part of their study. You had to look really hard to find it, and this simply wasn't part of the study at all. It wasn't reported. It's a little unusual, but—

Chad Horton

What is all-cause hospitalization and why is it important?

Dr. Joseph Fraiman

That means if you were you hospitalized for any reason. If you're looking at a COVID-19 hospitalization, or what about a person who had a heart attack and had COVID-19. You're

not certain even if it was COVID-19 that caused it, or if the vaccine caused a heart attack. What you want to see with all-cause hospitalization is that the vaccine reduces all-cause hospitalization. Because, on the other hand, if you increase it, that means serious harms are causing hospitalizations. If you decrease all-cause hospitalization, it means the vaccine is reducing hospitalizations enough to give you that benefit that's outweighing the serious harm that it's causing.

Chad Horton
Understood.

Dr. Joseph Fraiman

Now, since that wasn't there, we use the method that essentially creates something like that, in a way. We wanted to compare these serious adverse events of special interest with hospitalization reduction. Earlier, I showed you the hospitalization reduction was there for Pfizer. It was around 2 in 10,000. And this is what we're seeing from the clinical trials, is that there were about 10 serious adverse events of special interest per 10,000, and hospitalization reduction was 2.3 for Pfizer, and 15 versus 6.4 for Moderna.

I know that this looks bad and scary. I don't want people to walk away from this saying that our study proves the vaccine is causing more harm than benefit. That's not what it's doing.

I think it's important to put this into context. And for that, it's to understand the limitations of what this analysis gives you, and how to interpret it. When we published this study, we received a large number of critiques. We were fact-checked by multiple fact-checking organizations, and they mainly got their sources from scientists, bloggers, and YouTube videos. These critiques, while they would say that they were debunking our article, that's not actually the case. They were offering critique. That's what we call that in science, a critique, which raised limitations. And we appreciated their critiques, and we incorporated them when we published initially as a preprint, and then later as a peer-reviewed publication. We incorporated these limitations, and we thought it helped us understand how to interpret this data. I think to go through them will be valuable here for you.

For example, one thing that they had said was that it's not possible to do a proper harm-benefit analysis with only two months of data post-vaccine. I and the co-authors completely agree with that. But there's nothing that we could have done to avoid it. That's just the data that existed from the clinical trial.

[00:30:00]

The larger question is, if it's not proper to do a harm-benefit analysis with only two months of data, then why did our governments decide to authorize a vaccine without the ability to do a proper harm-benefit analysis? And why is it two months not enough time? The point they were raising is that if the trial went longer, there would have been more infections. If the trial went longer, there would have been maybe a surge of COVID-19, and this would have led to more hospitalizations. They also said: if the people were sicker, if they were older, there would have been more hospitalizations.

This is all true, and it brings to the point that the hospitalization rate of their population is a big part of hospitalization reductions: the vaccine efficacy and the hospitalization rate. You need both. Now, on that limitation they point out, though: It also goes the other direction. If you have a population that's been mostly infected, as much of our population has, you get

less hospitalizations. If you have variants such as Omicron, which cause less hospitalizations, or a variant like Omicron that has reduced vaccine efficacy because of an immune escape, the virus now knows how to get around the vaccine better than the prior strains.

That is a problem, but it shows what I'm trying to say here. It shows the fragility of that harm-benefit analysis. It can swing towards harm or benefit depending on the situation, on the hospitalization rate or the vaccine efficacy, which are changing through time. And with Omicron, we're going to return back and see what I witnessed in the emergency room.

Chad Horton

And when was the time frame of Omicron? Can you remind us just so we can contextualize what you're about to say?

Dr. Joseph Fraiman

It's about 2022, or late December 2021 is when it started. I would say about February is when it became 100 per cent the dominant strain in the United States.

Chad Horton

Okay.

Dr. Joseph Fraiman

When this occurred, we started seeing something that was a bit problematic for hospitalizations. Well, not problematic: it was great in the sense that we weren't really seeing many at all. And the last hospitalization that I've seen for COVID-19 that was a clear symptomatic case was in February of 2022. Over a year ago.

Chad Horton

Wait, just a moment. Dr. Fraiman, are you saying in your capacity as a physician, the last time you saw a COVID hospitalization was February of 2022?

Dr. Joseph Fraiman

Yes, for the one that was a clear syndrome of COVID-19. There could have been a patient who had a heart attack. Was that caused by COVID? I don't know. But it didn't look like the COVID-19 from the prior, where they had this classical syndrome where they would become very short of breath. And that's the reason we were taking them into the hospital generally.

So it could be that someone was an asthmatic, and they're having an asthma attack and they have COVID-19. It would be difficult to distinguish between the COVID-19 and the asthma attack. But what's important to understand here is, I admitted a lot of people to the hospital this year who had COVID-19. But this is incidental, most of it. And some of it could be relevant. It's difficult to tease it out. I know that this sounds crazy to some people, but all my nurses would tell you the same thing. I've asked ER doctor friends—maybe a handful of people have admitted one or two or three that are clear cases. I want to pull up this video here. Let me share my screen here with you. Can you see the video?

Chad Horton

Yes, sir.

Dr. Joseph Fraiman

Okay, this is the CMO of Los Angeles County Hospital talking about Omicron infections [no exhibit number specified]. I believe this was in July, August:

[Video clip of Dr. Spellberg, CMO of Los Angeles County Hospital]

It's like two months of the same. You can see LAC numbers on the graph. It's just plateaued and it's not going down. It's sort of a trickle up a little bit, not much. It's just been like that. We're getting thousands of cases going across the county. The numbers of LAC COVID positive tests have continued to go up. But this isn't because we're seeing a ton of people with symptomatic disease getting admitted. On the bottom graph it's the same thing. We're seeing a lot of people with mild disease and urgent care needs. You could go home and do not get it.

[00:35:00]

All those who are admitted, 90 per cent of the time, are not admitted due to COVID.

Chad Horton

Okay, Dr. Fraiman. No, our audio was not great, so just a couple of things. Who was the individual who was speaking?

Dr. Joseph Fraiman

His name is Dr. Spellberg. He's the Chief Medical Officer of L.A. County Hospital.

Chad Horton

Okay, and I'd just like you to summarize for the Commission and for the audience what that gentleman said, because our audio was quite muffled.

Dr. Joseph Fraiman

I'm sorry for that. Now, what he's saying here, using this graph, is that during Omicron, 90 per cent of his COVID admissions were not due to COVID-19. Ninety per cent of them in his hospital: they were incidental. And he's not alone.

Chad Horton

Okay, Dr. Fraiman, when you say incidental, am I correct in understanding that they've gone to the hospital for some other reason, but they just happen to be COVID positive? Is that what you mean by incidental?

Dr. Joseph Fraiman

Yes, I'll give you an example. A person who's missed dialysis. They come in and they need to get emergency dialysis. We test every single person who gets admitted to the hospital and a lot of them started coming back positive. Then you go back and ask the person, "Hey, do

you have a cough or anything like that?” They would answer, “Now that you say it, I do have a little sore throat.” That’s what we were seeing. It’s incidental, it’s unrelated to their hospital admission.

For incidental hospitalizations, in Denmark, they did a great job trying to figure out how many there were. It’s difficult to figure it out but their estimate was about 75 per cent. So 25 per cent to 35 per cent are actual COVID-19 in their estimates. This other hospital said 90 per cent of people who are admitted right now with COVID-19 are not actually in there for COVID-19. Now this is a disaster for our metric. The best metric to measure this vaccine’s efficacy is we need to know hospitalization rates and mortality rates. With a metric where 75 per cent to 90 per cent of them are incidental, it makes it incredibly unreliable.

The other thing that I wanted to point out is that I have also seen people with prior infections become infected again. I don’t have a memory of a prior infection being hospitalized, but it’s quite rare in general. Here we have a meta-analysis looking at this. There is about 90 per cent protection against hospitalization during Omicron. That’s 40 weeks after infection, that’s how far these studies went. The point is: it’s highly protective for a very long time and nearly our entire population has been infected at this point.

Hospitalizations during Omicron are important because we need to know the hospitalization rate, because that affects that harm-benefit analysis that we were talking about.

There’s a study out of Southern California Kaiser system. Of 4.7 million people there were 200,000 or so infections. They said, “After infection, what’s your likelihood of being hospitalized?” And they looked at Delta versus Omicron. Here’s your likelihood with Delta and here’s your likelihood with Omicron.

Chad Horton

All right, you’re talking about likelihoods and cumulative probability percentage on the vertical axis. Does this mean 0.5 per cent of what, or 1 per cent of what?

Dr. Joseph Fraiman

People who were tested positive.

Chad Horton

Okay so 0.5 to 2 people who tested positive for COVID-19 would be admitted to the hospital, is that correct?

Dr. Joseph Fraiman

Yes.

Chad Horton

Okay, and days on the horizontal axis is how many days post what?

Dr. Joseph Fraiman
I believe it's infection.

Chad Horton
Okay.

Dr. Joseph Fraiman
It's a Kaplan-Meier curve, so each time that there is an infection, it makes it jump up.

Chad Horton
Okay, and what is the difference between the red line and the blue line?

Dr. Joseph Fraiman
The red line is Delta. The blue line is Omicron. So the hospitalization rate is much lower. Also keep in mind that 75 to 90 per cent of those are incidental, okay? Then when we look at the serious outcomes: ICU mechanical ventilation, mortality approaching zero, it's difficult to distinguish the two.

Now, everyone should sit back and look at this and, actually, you can smile. This is actually really great news.

[00:40:00]

But our mortality rate is difficult to discern from Omicron today.

Chad Horton
It is difficult to discern mortality from Omicron, because why?

Dr. Joseph Fraiman
I'm saying it's so low. It's close to zero. People were infected with Covid 19. This is the percentage of the Omicron people who die after infection. It's very low. It's lower than Delta, much lower. It's— This is about 0.07. I think this was 0.01. I could be wrong on that, but I believe it was about a seven-fold decrease in death with Omicron in this study. And we also must look at vaccine efficacy to figure this out.

Here's one study from *The Lancet*. They're showing vaccine efficacy against Omicron now is around 30 per cent. I want to show just the CDC, because I think that they're considered a reliable source on this. They're saying that, at first, we're getting about 60 per cent efficacy. Over 120 days we're seeing around 29 per cent. We need to be aware of this big issue here. Twenty-nine per cent: when you get to that low of an efficacy it just becomes pretty unreliable. Remember, when I looked at the 95 per cent efficacy and I said that you if you miss one of these confounders—and you likely will—it will change results. But, if you have 95 per cent, it's okay if you drop to 75 to 80 per cent. We're still seeing a pretty large benefit. Here, if you drop, you can hit zero easily.

We're trying to figure this out in the setting of these massive number of incidental hospitalizations. We're really driving blind here, and we do not know at all how effective

these vaccines are anymore. All we do know is that, from what we were dealing with before, when they were tested, we know that the hospitalization rates are lower. We know that we can't rely on it particularly well. But we do know that it's lower and we know that the vaccine efficacy is lower. When you have that level of uncertainty, and when we looked at that harm-benefit analysis and how fragile it is, that creates some serious problems. We need to take this seriously that we saw serious harm increases. It appears that they're happening in both trials. We're flying blind and the differences between the harms and the benefits are small. This is going to be impossible to figure out with observational data moving forward. We have no chance of doing this. I believe we will remain in uncertainty.

I want to point out that people are claiming certainty: that they know the vaccine benefits are outweighing the harm. I don't see how that's possible. I don't know what metric they're using to measure. I just pointed out: you can't even rely on the hospitalization data. But we can figure this out. It's not hopeless. There's really one way to figure this out. We have the tool, and we need a double-blind randomized trial to figure this out.

Chad Horton

What is a double-blind randomized clinical trial, for those of us with no medical training or who are not research scientists?

Dr. Joseph Fraiman

This is when we randomize people to two different groups. Remember the confounding that I was talking about? The problem with observational data is because different people end up in different groups for various reasons. Here, you randomize them so that you get rid of those differences. When there's any difference between the group, you know that the cause of it is the intervention. To use all-cause hospitalization: that would ensure, that would make this whole process easier, so I don't have to talk for one hour explaining how we get this. We could just see the vaccines reducing all-cause hospitalizations. That means it's doing better than if it wasn't there. Doing this currently with observational data on hospitalizations with unreliable metrics: like I said, we're driving blind, and we could potentially be causing harm. We could potentially be doing benefit. I don't know the answer, I'm uncertain. But I know how to get the answer, and this is how we would obtain the answer.

[00:45:00]

Until then, I would have trouble recommending the vaccine, when I don't have a level of certainty that I could promise to get the benefit. That's what I really wanted to get through here today.

Chad Horton

Before I turn you over to the panel for questioning, I have a couple of points of clarification for myself, Dr. Fraiman. I would ask you to go back to the two slides that show instances of harm versus benefit. And there were two slides in succession.

Dr. Joseph Fraiman

Okay, I know, from our study.

Chad Horton

Yes. Thank you. I just want to understand this correctly. So we have 10.1 adverse events of serious interest for 10,000 individuals who received the vaccine. Correct?

Dr. Joseph Fraiman

Yes. Serious adverse events.

Chad Horton

We have 2.3 individuals we believe were kept out of the hospital per 10,000 individuals who received the vaccine, correct?

Dr. Joseph Fraiman

You know, I may have an error here. It says hospitalization reduction. It should say COVID-19 hospitalization reduction.

Chad Horton

Yeah, that's what I understood. So is my understanding correct in that sense?

Dr. Joseph Fraiman

Yes.

Chad Horton

Okay.

Just a minute, Dr. Fraiman, I'm not finished. In the next slide, I believe, is the same analysis for Moderna, correct? Yes. Okay. And 15.1 serious adverse events risk, 15.1 events in 10,000 individuals who receive the vaccination versus—we believe—6.4 individuals per 10,000 vaccine recipients were kept out of the hospital due to COVID-19.

But what I'm understanding you saying is that these are the ratios that you were able to extract from the clinical data, but the clinical data is only based on two months of information. Correct?

Dr. Joseph Fraiman

Yes. We authorized the vaccines quickly because we saw the benefit. They were authorized and the blinding was taken away and they gave the vaccine to the placebo group. We have a very short amount of data that's reliable.

Chad Horton

I'm going to ask you if you can comment on this or explain this to myself or the Commission or the audience. When I hear that the clinical trial was two months, and this is the result of that clinical trial, where does the determination that these products were safe and effective come from?

Dr. Joseph Fraiman

I don't know the origin of the term safe and effective, but it's not a term that I would use to describe a medication.

Chad Horton

Would that be considered a scientific assessment?

Dr. Joseph Fraiman

I don't think it is. "Safe" implies that there's no risk. Safe means that there's no chance of harm. It doesn't mean that harm is happening. You have to know that if something's safe, that means you've studied it well and that you are certain that there is no harm from it.

Chad Horton

Okay.

Dr. Joseph Fraiman

Breathing air is safe, but driving drunk is not safe. Even if you don't crash when you drive drunk, it's not safe. You can die. If you drive home drunk, it doesn't mean that what you did was safe; you must know that there is no chance of risk.

Chad Horton

Can we objectively say, based on this admittedly flawed two months of data that we have— Because you discussed some flaws in the timing and in the methodology. And if we can extrapolate: the chance that you will sustain an adverse event of significant interest is more than twice the chance that you've been kept out of the hospital as a result of this Moderna injection. Is that what this table is telling me?

[00:50:00]

Dr. Joseph Fraiman

That's what it's suggestive of, but I wouldn't think of it in that way. Remember those confidence intervals. We have to think about this range of possibilities here and so it's possible the harms are a little bit less, or it's possible they're a little bit more. This is just the two months of data. We'd have more if there were older people in the trial, or if it was running for longer, you could have had more hospital reduction. There's some variability here. I wouldn't conclude that our study is proof that you're twice as likely to have a serious adverse event.

Chad Horton

Now, this data that you analyzed, was this data available to the bodies that would have been responsible for approving these vaccines?

Dr. Joseph Fraiman

The original data that I ran through with the Pfizer data, anyone could have done. We only added the serious adverse events. We found that they were higher in the Pfizer trial.

Anyone could have done that at the time and shown that there was a 1 in 555 chance of a serious adverse event in the vaccine group. They did not analyze them in that way; they analyzed slightly differently a participant. The problem was, so you saw earlier, you saw there was 103 versus 83—and that ends up not being significantly different. You can see that here, 103 versus 81. It's a 20 per cent increase.

But the problem is that if you experienced a serious adverse event, you were also twice as likely to experience multiple in the vaccine group. So it leads to just more events in the vaccine group. I think that anyone could agree that it's worse to have two people have a serious adverse event than one person have two. At the same time, I think we can agree it's worse for one person to have two serious adverse events than to have one. So these two metrics of measuring participants or number of events—they're both important values to look at. And we did. The regulatory bodies, Pfizer and Moderna, they didn't look at it. They didn't count the number of events; they only counted the number of participants.

Chad Horton

Okay, Dr. Fraiman. I'm going to open you up to any questions that may be posed by the panel.

Commissioner Drysdale

Hi, Doctor. I've got a number of questions. I'm not a doctor, so forgive me if I don't word it exactly right. The data that you presented to us, and not your analysis, but the data itself: Was that the data that the approval bodies had in order to arrive at an approval for this? Was this the study that was used by the authorities to approve the vaccines?

Dr. Joseph Fraiman

Yes. This is page 87 of the FDA briefing for Pfizer. It's the advisory committee meeting for the FDA. It's called the VRBPAC [Vaccine and Related Biological Products Advisory Committee]. This is in their page 87 in the FDA briefing for Pfizer.

Commissioner Drysdale

Understood. Some of the things that we've been hearing from some of the people who have testified over the last number of days is that they got a shot, they had a reaction the next day, they went to their doctor, reported the reaction and the doctor said, "Oh, that's not in the list, that's not associated with it." And my question to you is, since this is a new vaccine altogether and we don't know what the risks really were, how would that doctor in my example make a decision that it was or wasn't caused by the vaccine? And more importantly, when I look at the list in the raw data and it lists what they felt the adverse reactions were, is that a parsed list?

[00:55:00]

And I'm not saying it was parsed for a nefarious reason. Did someone make a decision that something happened to someone but that's not because of the vaccine, and move on?

Dr. Joseph Fraiman

In that list, if you had an event, they were blinded in the study. So if someone came into the hospital with a heart attack, you would get listed in there—no matter if they thought it was

from the vaccine or not. That's the advantage of the double-blind trial. What you're talking about, if the doctor is not thinking that it's from the vaccine, they're still supposed to report that to our system.

Commissioner Drysdale

Right. And if this is a double-blind trial, if someone went into the hospital with a heart attack, did they count it as an adverse reaction? Or did they say, "We don't think that was an adverse reaction," so they left it off? Do you know what I'm trying to say?

Dr. Joseph Fraiman

It would be on the list. If they had any serious event, it should be on their serious adverse event list. If it's happening in the placebo group or in the vaccine group, it should be in both.

Commissioner Drysdale

Okay, I understand. And also, the slides went by a little quickly for me but we talk about adverse reactions and we talk about reduction in hospitalization. But for me, if an adverse reaction could be death, I would want that parsed out separately. Certainly, it might have reduced my hospitalization, but I'd like to know what my comparison of death as an adverse reaction versus death from being in the hospital was.

Dr. Joseph Fraiman

I agree. The problem is that we didn't have the data to do that from the clinical trial. There was no difference between deaths in the groups. So yes, that would be ideal if we had a mortality benefit, or just an all-cause mortality. Are you more likely to live or die with this vaccine? That would obviously be excellent, to have that information. But we didn't have that in the clinical trial, so we couldn't study that.

Commissioner Drysdale

Circling back to where we started: we've got data that we don't quite understand how we would make a safety recommendation on, with all this missing data. Safety isn't just that a group of events happen, but the severity within the group of events. I'm an engineer, and if I were designing a building, an event might be cracked drywall. But another event might be the floor collapsed. What's the result of grouping this all together and not understanding the severity risk or the severity of a failure? It seems to me that there was no way they could assess that.

Dr. Joseph Fraiman

They can in some ways, but some ways not. The serious adverse event definition is designed to kind of do that. That would be the floor collapsing. I'm sure there's multiple other serious things that can go wrong with the building. If it got the label of serious, it was considered serious by death, hospitalization, or permanent disability. In that is a wide variation of things. One of them could be a stroke and the other one could be a bad case of diarrhea that needed to be admitted to the hospital for extra fluid. You're still being hospitalized for it. The same is also true with COVID-19: there's going to be a wide range of COVID-19 hospitalizations. There'll be some mild cases that get discharged the next day; they were just admitted for observation. Then there's some who are going to be intubated

and have a breathing tube placed. Both hospitalizations and serious adverse events have a range of badness. Their minimum is somewhat comparable in that they both should be considered serious.

[01:00:00]

Commissioner Massie

Thank you very much, Dr. Fraiman. I have a couple of questions regarding the ratio you came up with. Because I noticed in one of your slides and I had read that previously in your paper: when you compare the placebo from Moderna and Pfizer, it seems that, for some reason, the placebo in Moderna is about twice as high in terms of adverse events of serious interest, special interest, compared to Pfizer. Given that the numbers we're reporting all together are about in that range, would you have any idea why there would be such a difference in the placebo between the two different clinical trials?

Dr. Joseph Fraiman

Yes. The whole purpose, I believe, of the randomized control trial is that we randomize it so that both groups are the same. But what looks like happened in the Moderna trial is their group was a little bit sicker, a little bit older, maybe just more fragile in one way or another. So they ended up having higher hospitalization rates for COVID-19 and they had higher overall adverse events and higher hospitalization rates from COVID-19. Which is what I think you would expect with a population that's just a little bit more sickly. The key is that they're randomized so that both the vaccine and the placebo in any one trial are compared. You compare the same level of fragility with the ones that got the vaccine and the placebo. That's the advantage of a randomized trial.

Commissioner Massie

Coming back to the placebo, I mean, these were double-blinded random clinical trials, right?

Dr. Joseph Fraiman

Yes.

Commissioner Massie

So I'm wondering, in terms of the placebo again: in the mRNA technology, this is an emulsion because of the lipid composition of encapsulating the mRNA, and it has an appearance of somewhat opalescence compared to, say, water or saline. I'm just wondering if they use saline in the placebo, whether the people that were actually doing the injection couldn't be aware that in one case it was the placebo and the other case it was the vaccine? Do you have any information on that? Because I haven't seen anything.

Dr. Joseph Fraiman

There is. I believe what you're pointing out is, was there unblinding in the trial? And did the people who got vaccinated realize they got the vaccine and did the placebo realize they got the placebo? Is that what you're asking?

Commissioner Massie

Yeah, I'm asking because saline is very different from the vaccine itself. If you look at the bottle, it's pretty obvious.

Dr. Joseph Fraiman

Yes. It's reported that people in the vaccine trial were also in Facebook groups together. They were all talking to each other. We know that, after the COVID-19 vaccine, over half of people get pretty serious, severe symptoms like fevers and headaches and they feel lousy. A lot of people can't go to work the next day. The people who got the vaccine felt that and the people who got the placebo didn't. And it seems like from their messages in Facebook groups that probably a lot of them did sort of know which group they were in. Which is bad. That is a problem for unblinding, but it's still the best that we got for understanding these vaccines. I agree that could complicate it for interpretation of the data.

Commissioner Massie

Maybe one last question to wrap it up. Given the level of data that the regulatory agency was exposed to in order to make a decision, and when you looked at the overall benefit or advantage of the vaccine and the potential for serious adverse reaction: Was there enough data to really put forward the vaccination campaign, given that we don't know about what would happen even in six months or one year from now? Because at this point the data was two months. So if you go with the precautionary principle, with that part of the equation in terms of recommending to go ahead with vaccination, and still today, to promote the vaccination in the Omicron phase—?

[01:05:00]

Dr. Joseph Fraiman

I think that, at that time, there was a difficult decision that had to be made. The emergency use authorization was given at the time because of the seriousness of the pandemic that was going on. There were some chances that were taken by approving it early, before we had all that data, because there was a hope that it was going to save lives. I think at the time it was a difficult decision probably to make.

In 20/20 hindsight, I know for sure that I would very much have liked a better clinical trial to know what's going on. It may have been short-sighted to get the vaccine authorized and then realize we are now stuck in this pool of uncertainty on this vaccine. There are some different ways that things could have gone. I have trouble faulting people when I think back to the emotion at that time. How desperate people felt, the fear that they were having from this disease and the possibility of the hope that this vaccine offered. I can't give an answer if it was the right or wrong thing.

I personally wouldn't have voted for it, at least for people under the age of 65. I would have wanted much more data on people under 65. For people over 65, I would have been hard-pressed to have voted against it. But that choice also wasn't given in the FDA, to only give it to one group. So I think it's a difficult question. I don't see why we approved it in people under the age of 65, when we had the time to do further studies. And it wasn't as much of an emergency in that group. I think that maybe we confused the public with the kind of public health messaging that maybe overestimated the risk for people in that age group.

Commissioner Massie

In the current situation with Omicron and where we are at with all the people that have been previously infected, would you recommend that the general vaccinations should be suspended?

Dr. Joseph Fraiman

I believe that we need to explain to the public where we are on our certainty level on this vaccine. Does it mean that some people could still make the decision with that uncertainty and choose to take the vaccine? That's also difficult to say, but I don't think that we should be recommending it widespread to everyone ages six months and up, or continuing to boost indefinitely without knowing if the harms and benefits, which one is higher. And continuing that with no end in sight doesn't seem like a reasonable plan.

Commissioner Massie

Thank you.

Dr. Joseph Fraiman

And do you have any more questions? I can't hear.

Chad Horton

That will be everything Dr. Fraiman, thank you.

Dr. Joseph Fraiman

Thank you very much.

[01:09:15]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 17, 2023

Day 2

EVIDENCE

Witness 5: Paula Doiron

Full Day 2 Timestamp: 05:48:00–06:18:03

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Paula Doiron

I do.

Alison Steeves

Can you please state your full name, where you live, and your occupation?

Paula Doiron

Paula Doiron. I'm 48 years old. I'm from Moncton, New Brunswick, and I work in a nursing home.

Alison Steeves

And what's your role in the nursing home?

Paula Doiron

I was a cook, but I demoted my position to custodian when I got ill.

Alison Steeves

Okay, so you were a cook and then became a custodian in the same business.

Paula Doiron

Yes.

Alison Steeves

And how long have you been working there?

Paula Doiron

Seven years in all. One year with the new position.

Alison Steeves

And are you currently going to work?

Paula Doiron

Not presently, no, I'm on sick leave.

Alison Steeves

And when did you go on sick leave?

Paula Doiron

October of 2021.

Alison Steeves

You were there in 2020 and 2021 up to that point throughout the height of the pandemic?

Paula Doiron

Yes, I was there during the beginning of the pandemic, yes.

Alison Steeves

And can you describe what it was like to work there prior to the pandemic, like before early 2020?

Paula Doiron

I really love my job. It's a good work environment, but we were very short staffed, so we had a lot of complications before the pandemic with keeping staff. So this means that the residents don't always get the proper care and attention that they need or want. Before the pandemic, we have a pretty big facility. There's three different wings. They have access to a great big common room that they could go have activities in, have bingo nights; their families would come visit, and they were able to be everywhere in the nursing home.

Alison Steeves

So there was a lot of social interaction among the residents?

Paula Doiron

Yeah. Once a week there would be entertainment that would come in, bands that would perform for them, music.

Alison Steeves

And in your role, did you interact much with the residents?

Paula Doiron

I did, yes.

Alison Steeves

So you observe their day-to-day. And how were the relationships among staff members and sort of that atmosphere?

Paula Doiron

It was good. A lot of people are tired because you're short-staffed, but we always kept busy and jovial. It was a good work environment.

Alison Steeves

And can you talk about how things changed around 2020, when the government started implementing COVID-19 measures? How that changed in the nursing home for staff, for residents, and sort of what specific measures you saw being implemented.

Paula Doiron

In the beginning, it was very chaotic and disorganized. For a long time, we didn't have PPE, so we were very anxious, but everybody was healthy. We sanitized our hands and after a while they started introducing the vaccines.

Alison Steeves

I just want to take you back to even before that—like sort of, say, March 2020, around that time, with nursing homes being sort of one of the hardest-hit. I believe around that time, they had locked down and prevented visitors from entering.

Did you see some of those types of impacts taking place early on?

Paula Doiron

Right away, we locked down. Families weren't allowed to visit anymore. The residents all were set into their assigned wings, so they didn't have access to the big common rooms. The entertainment was done. So they got segregated more into their specific wings. The families couldn't visit anymore. Families would come visit through the windows. That was sad.

Alison Steeves

Did you see the impact on the residents from these measures?

Paula Doiron

Yeah, it was hard for them because that's what they live for, to see their family, and the activities. So yeah.

Alison Steeves

So before they would have had fairly active days, be out and about.

Paula Doiron

Yes.

Alison Steeves

And were there always activities to be scheduled every day?

Paula Doiron

Yeah, yeah—in each wing, there's activities every day, but the common room was like the bingo night, and bingo was their favourite activities.

Alison Steeves

And where would they eat? Would they usually eat together?

[00:05:00]

Paula Doiron

They ate in their wings. Every wing has an eating area for each wing, so that's more like satellite common rooms.

Alison Steeves

And during the lockdowns, how did that change?

Paula Doiron

During the lockdowns, they could still. But after the vaccines and stuff like that, staff members were diagnosed with COVID, so they actually put the residents into their tiny little rooms, so they wouldn't be contaminated.

Alison Steeves

So the protocol was, if somebody tested positive for COVID, there was kind of further segregation.

Paula Doiron

Yeah, further segregation in their specific little rooms.

Alison Steeves

And were they permitted to leave their rooms?

Paula Doiron

No, they were not. They couldn't go in the dining rooms anymore and their assigned wings, or they couldn't visit each other anymore. They were in their little rooms.

Alison Steeves

Did that affect their roommate situations?

Paula Doiron

Most of them have their own personal rooms, but there are a couple of residents that share rooms that have two living areas in it.

Alison Steeves

So they went to be in their rooms on their own, but no visitors.

Paula Doiron

Correct.

Alison Steeves

For how long? If someone tests positive, how long would that sort of lockdown last for?

Paula Doiron

I believe the first one was for until Public Health said that it was okay to keep them out of their rooms, but at one point they were put into their rooms for almost two months.

Alison Steeves

So around January 2021 when they rolled out the vaccines: elderly and people working nursing homes were first in line, or close to first of line, correct? To be eligible to take the vaccines?

Paula Doiron

Yes, we were.

Alison Steeves

Did you notice the introduction of the vaccine and discussion of the vaccine have further impact in the nursing home?

Paula Doiron

A lot of us were very happy that we were first, because we wanted to get back to normal. We wanted to see the residents get normalcy again, so most of us were very eager—but not everybody.

Alison Steeves

And was everyone very eager to take the vaccine, or were people outspoken about their choosing not to take it, and did that sort of have any impact on—

Paula Doiron

No, they only became outspoken when it became mandated.

Alison Steeves

And can you elaborate. How did that change things?

Paula Doiron

We lost some staff members. They decided against the shots. We were already short-staffed. This means that we're shorter staffed. Less assistance for the residents.

Alison Steeves

And were there any issues prior to the mandate of staff or residents being concerned about who was vaccinated, who was not vaccinated?

Paula Doiron

Well, everybody kept their distance. I remember one of our coworkers: she hadn't been vaccinated yet. It was starting to be mandated and she was sad. She was on the fence on what to do. And just people kept their distance from her. One day, I just went up to her and I gave her a hug and I said, "I accept you for whatever you decide." But it was sad to watch them being outcasted.

Alison Steeves

And how was morale at this time? How were people feeling?

Paula Doiron

Anxieties. Anxieties. Always busy because, when you're short staffed, you're doing the job of more than one person. You're doing a two-people job. So you don't really have time. You're just kind of on autopilot.

Alison Steeves

And did you decide to take the COVID-19 vaccine?

Paula Doiron

I did, yes.

Alison Steeves

And you took another shot that year as well?

Paula Doiron

Yes, yeah. I took the flu shot, 2020, before the rollouts of the COVID. I figured I was adding that to protecting the residents.

Alison Steeves

And then how many COVID-19 shots did you take?

Paula Doiron

After the flu shot, I had three Moderna.

Alison Steeves

Moderna. And when did you take those?

Paula Doiron

The Moderna were in 2021. So the first one was in January, the second one February, and then I had my booster in November.

Alison Steeves

And where did you take the COVID-19 vaccines?

Paula Doiron

The three first shots that I received, including that flu shot, was at my place of work because we have nurses there. It's a hospital, so it was done there.

[00:10:00]

And my booster was done at a drugstore.

Alison Steeves

And who administered the shots?

Paula Doiron

Nurses, where I work. And at the drugstore, it was an attendant.

Alison Steeves

And did any of these people speak to you about the potential risks of taking that flu shot and the vaccines?

Paula Doiron

No, they did not. I had no idea that it was a gene therapy. I thought it was a vaccine. Also, I figured if I got sick, that I would get assistance, get medical help. And I had another thing, but I forget.

Alison Steeves

Why did you think that if anything went wrong, you would have support?

Paula Doiron

It's common sense. If you harm somebody, you're going to help them.

Alison Steeves

With any of these vaccines, did you experience symptoms afterwards?

Paula Doiron

I did, yeah. I experienced with the flu shot, 2020. The night when I got home, I was fine. When I went to bed, my legs started pulsing. I fell asleep. When I woke up, I woke up with a horrible headache. My neck was so sore I wasn't able to lay on it. And it felt like a flashing light had gone in my head. And I was also having issues breathing.

Alison Steeves

And that was the evening that you took the shot.

Paula Doiron

That was the evening of yes, yeah.

Alison Steeves

And did you speak to health—

Paula Doiron

I fell asleep. The next day I felt a bit better. I didn't think— It took a couple of days. For three nights, my neck was really sore. I wasn't able to lay on it.

Alison Steeves

And did you see anyone about those symptoms or get a diagnosis?

Paula Doiron

No, I didn't. I just—

Alison Steeves

And had you experienced similar symptoms in the past?

Paula Doiron

No, no ma'am.

Alison Steeves

And then did you mention a booster. You also experienced symptoms?

Paula Doiron

The booster: I had a reaction with the booster as well. That one was worse. When I had my booster, three weeks after, I had to go to the ER. My head and my spine felt like it was on fire, and I was having issues breathing. So 8-1-1 suggested I go.

Alison Steeves

Did you say head or neck, sorry?

Paula Doiron

My neck, my head, and my spine felt like it was on fire. My neck felt like it was melting.

Alison Steeves

And what happened at the Emergency Room?

Paula Doiron

After the booster, it dawned on me that, because I'd been feeling ill for a while— It dawned on me that this was possibly because of the vaccines that I'd been receiving.

At that point I'm like, "I'm going to go to the ER and I'm going to ask them if it's normal to have a headache and a sore neck at the same time." I looked it up and they say, "You'll have the sore arm and you could have a headache." But the sore neck and sore head were indications that it could have been Guillain-Barré syndrome, meningitis, Parsonage Turner Syndrome, SIRVA [shoulder injury related to vaccine administration]. So I did a bit of research before I went. When I got there, the triage nurse— I asked her if it was normal to have the headache and the sore neck, and she didn't answer me, and she gave me a really dirty look. When I got with the ER doctor, I asked him, and his words to me were, "What do you have against vaccines?" And then I told him, "Well, I've had four in the span of 14 months. There's something wrong with me." But they wouldn't answer my questions.

The next day, I figured I'm going to go ask the pharmacist. I was picking up my prescription. I thought maybe the doctor and the triage nurse were having a bad shift, so I'm like, "I'm going to go speak with the pharmacist." And I asked the pharmacist, "Is it normal to have the sore neck and the headache, or the headache." And then he asked me what side I had received my injection, and I told him it was the different side of where I was hurting. And then his words to me were, "I'm not buying it." Like I'm trying to like sell him Tupperware or something! And then I asked him about the 2020 flu shot recall.

[00:15:00]

Because I had found information that this flu shot had had a recall. And he looked at me; he's like, "I'm too busy. I'm not talking about this with you right now."

Alison Steeves

Did they run any tests at the ER?

Paula Doiron

When I went to the ER, I had to beg for testing. At that point, I'd already done a bit of research myself, and I was concerned. And I asked him if I could get an MRI. And he told me that I didn't need that. He did authorize an X-ray, so I received the X-ray that evening. And then after the X-ray from my results, he came and he told me that the MRI would be approved, because he had found some issues in my neck.

Alison Steeves

Okay. And did you provide me with a copy of the MRI results?

Paula Doiron

Yes.

Alison Steeves

Okay. Do you have that in front of you?

Paula Doiron

I sure do.

Alison Steeves

So that is Exhibit TR-0006b. And it reads, "The impression as moderately advanced C5-6 degenerative disc disease. There is severe disc slash Luschka joint osteophyte narrowing of the right C6 neural foramen. There is mild central canal narrowing at this level." Is that correct?

Paula Doiron

That's correct.

Alison Steeves

And the recommendation was surgery consultation, correct?

Paula Doiron

Correct.

Alison Steeves

And did you have the surgery consultation?

Paula Doiron

I did speak with my family doctor after he received these results, over the phone. And my family doctor told me that a surgery wouldn't be approved for me. I asked to be transferred or referred to a neurologist. He said that there's a big waiting list. It would be about three years. And I said, "well you, you can put me on the list, I could get worse by then." And he's

like, “yeah, I’ll put you on the list, but they’re not going to approve this type of surgery for you.”

Alison Steeves

And what was his suggestion?

Paula Doiron

I would have to live with it.

Alison Steeves

So in 2020, you took the flu shot. You experienced severe symptoms that persisted, and then you got your two Moderna vaccines. And then when you had your booster, you had more severe symptoms. Were they sort of different symptoms? Did you say they exacerbated the original, or it was completely different?

Paula Doiron

After the booster, it was different. That’s when I started getting, like, body jolts. I started having menstrual issues. I also had brain zaps, brain fog, fatigue. I had to take three naps a day, and nerve pain, a lot of nerve pain. And the sensation of my legs, the pulsing, has never gone away.

Alison Steeves

And had you had any issues in the past or any pre-existing conditions that would explain any of those symptoms?

Paula Doiron

No, the only issues I had in the past: I had asthma, I have a bladder condition called interstitial cystitis, and I was on antidepressant.

Alison Steeves

And what made you think there could be a connection with the vaccines?

Paula Doiron

Well, I’m having all these issues with my neck a year after. And when I received that flu shot and other shots, I was always having a sore neck. I kind of put two and two together that—

Alison Steeves

And how did you feel about the response you received from the various healthcare providers when you inquired about that connection?

Paula Doiron

It's very frustrating. I think I deserve to be treated better than that. I did my part, and I actually mentioned this to the ER doctor. I said, "You know, I did this to protect others and residents, but now I'm injured and somebody needs to protect me."

Alison Steeves

And do you know if any of the healthcare professionals you spoke with filed an adverse event following immunization form?

Paula Doiron

No, they did not.

Alison Steeves

And Paula, you also had a gene analysis done. Is that correct?

Paula Doiron

Correct, yes.

Alison Steeves

So that's Exhibit TR-0006a. And do you have that in front of you?

Paula Doiron

I sure do.

Alison Steeves

Can you explain? So who provided you with this gene analysis?

Paula Doiron

This was done with a naturopathic doctor.

Alison Steeves

And how did they do it?

Paula Doiron

It's with your saliva sample, so they're able to see your gene makeup. And I was explained that I have a mutation, a gene, that's actually very sensitive when it comes to vaccines.

Alison Steeves

And that's the MTHFR [gene], is it?

[00:20:00]

Paula Doiron

I had the worst one she told me.

Alison Steeves

So these notes, the handwritten notes on the results: is that your handwriting?

Paula Doiron

That's my handwriting, yes.

Alison Steeves

And when did you write that?

Paula Doiron

As she was explaining to me, because I need to take some vitamin B, I guess. So I just dabbled.

Alison Steeves

So that supports that you might be at risk of having bad reactions, to suggest the possibility?

Paula Doiron

Yes.

Alison Steeves

And had you had any bad reactions with vaccines in the past?

Paula Doiron

Well, I didn't think so but now that I'm looking into past, I had received a vaccine as well in 2005 while I was pregnant. It was a DTaP. And not long after this DTaP, I had massive muscle and joint pain to the point that I was on the couch for a month. I went to the hospital then and the doctor at the time told me that it was from— I was newly pregnant, and I was expanding, so I would get muscle sores and aches. But I was so sore that I was on the couch for about a month. And I think it was five months after, my water broke early, and my son was only alive for one day.

Speaking with the doctors then, they said, "We can't explain why these things happen. We don't know why." And now that I see these type of— This type of documentation, it kind of makes you wonder if that's the case? I'm not saying it is, but unfortunately, I can't go speak with a doctor and say, "Hey, is this what happened to my son?" Because I don't think they would be honest with me.

Alison Steeves

In terms of the impacts that these symptoms have had on your life, you're currently on sick leave due to these symptoms?

Paula Doiron

I am, yes.

Alison Steeves

And when did you go on sick leave in relation to the various vaccines?

Paula Doiron

It started October, 2021. I tried to return to work a few times, but I was getting more sick.

Alison Steeves

And was that before your booster?

Paula Doiron

This was before the booster. Yeah, I actually got my booster as I was on sick leave because I didn't know that I was having issues with the previous vaccines at that point. It only clicked in when I got my booster.

Alison Steeves

And what has the financial impact been of being off on leave? Are you getting benefits or disability, or—?

Paula Doiron

No, I'm not. Right now, I'm kind of living on my credit card. My brother is helping me as well. I got help in the beginning: I think it was 15 weeks for EI for a sick leave. But once that ran out, I tried to go back to work and I couldn't. So I've just been footing the bill.

Alison Steeves

You tried to go back to work when your benefits ran out?

Paula Doiron

I did, yeah.

Alison Steeves

And what happened?

Paula Doiron

I couldn't move for a long time. For months, I was on the couch. I couldn't even walk. I would walk kind of hunched over. I'm just starting to be able to walk straight now after a couple of years.

Alison Steeves

And how else have these symptoms and your diagnosis impacted your day-to-day life?

Paula Doiron

I used to be very active. I used to be very happy and social. I'm not so much anymore. I'm isolating more now.

Alison Steeves

And why is that?

Paula Doiron

I've lost connections with some of my family, my friends. I've tried to reach out to explain to them what's been happening to me, and they have blinders on. They don't want to speak to me about it. They've kind of disconnected from me.

Alison Steeves

And has this experience impacted your mental health at all?

Paula Doiron

Yes—yeah, it has. It's made me very anxious. I mean, I'm doing research now, and I'm seeing these doctors come up with heart attacks, cancer, and I'm still trying to figure out what issues— I have some diagnosis, but I know there's still something wrong with me. I still—

Actually, in a couple of weeks from now, I have someone that's going to go through my blood work. And there's discrepancies in my blood work as we speak and my urine sample. So yeah, I'm anxious. I don't know what's wrong with me. And it's been two years of being sick and I'm having to run around, "Please, someone help me."

Alison Steeves

And how are your symptoms today?

Paula Doiron

I'm still sore. I'm still sore. It's chronic.

Alison Steeves

Has anything helped?

Paula Doiron

When I was at my worst, I did do ivermectin. It cleared my spine and my head from burning within two days of using it. I've used it a bit more since, but it doesn't— I think it was a one-shot deal.

[00:25:00]

But I've been on supplements, and DMG [dimethylglycine] is one that's been a big game-changer for me. I'm trying to go all natural, and I'm slowly healing. I'm not worse.

Alison Steeves

And do you have any idea if or when you might return to work?

Paula Doiron

I'd like to return in May, but the last couple of days I've been in a flare-up, so we're going to see how that goes.

Alison Steeves

What would you say has been the hardest aspect of this experience for you?

Paula Doiron

Getting treatment, getting taken seriously, my relationship with my family members and friends. And I had to leave a three-year relationship because he didn't believe me that I was going through these issues, and I started going public to warn others. And his words to me were, "I can't go out with a conspiracy theorist." So I chose my health over the relationship. So yeah, I've lost a lot, but I've gained a lot too.

Alison Steeves

What do you mean by you've gained a lot?

Paula Doiron

I've gained a lot of knowledge. I've gained that I need to take my instincts. I need to follow those because in the beginning, I think I was on the right path, but I let people convince me to do something. Yeah, so follow my own instincts. And just—I met a lot of great people too, and there's a lot of good people out there. And there's a lot of people like me that's injured as well.

Purple is kind of— If you see a Facebook profile picture and there's purple in there, reach out to them, because they're probably injured like me and we're all in the same boat.

Alison Steeves

Thank you, Paula. I have no further questions. I'll just turn it over to the Commission.

Commissioner Drysdale

Thank you. You did an excellent job of describing for us what you've been through. But I want to go back just a little bit, because there's some people that really haven't talked about it. And that was the patients, the people in the elderly residents. I don't know a lot about that. That's what my question is going to be, you might not know some of these answers.

Are the residents highly regulated by the government? How they take care of the residents? What are their ratios of staff?

Paula Doiron

Where I work, yes. It's supposed to be regulated, but we can't keep staff. Nobody wants to work for very long. I work there and I'm one person, but I have to do like a two-person job,

because there's not enough people that want to work. And you're working with sick people too. Like, their needs need to be met. Personally too, they deserve a bit of attention. And you can't even give them that attention of a conversation for two minutes because it's so busy that you kind of have to brush them off.

Commissioner Drysdale

Were there never inspections of the facility to ensure that the residents were getting the care that they were supposed to be getting?

Paula Doiron

Yeah, no. We do get some inspections, but not about the care. No, I don't remember any.

Commissioner Drysdale

When you were talking about them going into lockdown— I think you said that there were times when the residents were locked up for months at a time, I think there was several months—

Paula Doiron

It was almost two months.

Commissioner Drysdale

Did the workload on the staff as a result of that go up or down?

Paula Doiron

It was probably the same because, for the nurses, they have to suit all up with that gear, so it was more strenuous actually. And for the nurses as well—

Their food was being served in their rooms as well. I worked in the food department, so we make their trays. And then, usually they have a common room that they can go eat, where now it was like the nurses were having to go bring the food to them, and not so much us. So it probably caused more work.

Commissioner Drysdale

Well, you know, with people being locked up for a long period of time, especially elderly people, did you notice an effect on their mental health and happiness?

Paula Doiron

Yes, it was heartbreaking.

Commissioner Drysdale

Did the regulator come in and assess that at all?

Paula Doiron

No.

Commissioner Drysdale

Did anybody ask questions about that?

Paula Doiron

I wanted to ask questions, but when you ask questions, "We're just following public health."

[00:30:00] [The livestream was inadvertently cut off at this point.]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 2

March 17, 2023

EVIDENCE

Witness 10: Chief Greg Burke

Full Day 2 Timestamp: 06:18:20–06:56:40

Source URL: <https://rumble.com/v2djjsi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Chief Greg Burke, do you affirm that this eagle feather symbolizes your direct connection to the Creator for your people, and you hold it in the spirit of honor and truth to your ancestors who have passed, and to your ancestral spirits who are here today to guide you and protect you, that the evidence you shall give in this matter shall be the truth, the whole truth, and nothing but the truth.

Chief Greg Burke

Je vais, I do. Wela'lin.

Criss Hochhold

Thank you, Chief Burke. For those of us that don't know you, can you please state your name and let us know where you're from?

Chief Greg Burke

Chief Greg Burke, originally from Cape Breton, Glace Bay. Don't hold that against me, though. I run a financial practice in Halifax. I live outside of Halifax now and my office is in Bedford. My name is Chief Greg Burke.

Criss Hochhold

Thank you. Can you tell us a little bit about your background, Chief Burke?

Chief Greg Burke

Well, you don't want to know it all, but I just want to share with you that I do have four years of nursing at Toronto East General, and I'm just not another head in the crowd. So going through this was very difficult for me knowing that the knowledge that I had through my training—that I worked in the OR, cardiac arrest unit. We did training in pathology as

well as the OR, so I'm well versed—not only in our Constitution or my treaty rights, but I'm also well versed in the medical field in sterilization.

Criss Hochhold

Chief Burke, I understand you've had some significant health issues fairly recently—pretty much at the onset of COVID—that are not COVID-related. Can you tell us more about those please?

Chief Greg Burke

Yeah, I diagnosed myself with cancer back in 2019. Our medical system being what it is, what I told my doctor—I guess maybe I shouldn't have directed the doctor—but I told him I wanted to go to a private clinic and get an ultrasound done and get my bloodwork done. It all came back negative, so I went on my way, thinking I was getting old, I guess, and figured it was just an old age thing.

In January 2021, I went to him and said, "I definitely have cancer." I said, "I have to get a colonoscopy done," so I had a colonoscopy done. I ended up with surgery in April of 2021, followed by eight treatments of chemo, which ended on December 24th of 2021. Following that, when they did the CT scan, they found three blood clots in my lungs due to the chemo treatment, so they had me on a high dose of blood thinners from January through to June.

Criss Hochhold

Were you on any medication for your cancer?

Chief Greg Burke

Yeah, I had the eight treatments of chemo, as well as they gave me dilaudid, which I didn't use. I didn't need dilaudid, and through my surgery I didn't need dilaudid. Although, they told me to take it. They said opioids get a bad rap, but for some reason I didn't have pain. But I took the dilaudid home with me. And, of course, they give you all kinds of mouthwash to kill the lumps and bumps that get in your mouth, and the lumps and bumps that get all over your body. So you know—yeah, I was on medication as well as the blood thinners.

Criss Hochhold

You said you had lumps and bumps all over your body. Can you tell us more about that? That's related to the medication?

Chief Greg Burke

Yeah, it was hard to describe. It got to the point where it got so bad that I couldn't touch myself, actually. Because there were, like, little hives, millions of little hives all over your body.

[00:05:00]

And the chemo treatment causes tissue damage. So even as I sit here today, my feet are on fire from the tissue damage as well as tissue damage on your hands. Someday maybe they'll get back to normal. But as I was explaining to you, Criss, even today I struggle trying to take the top off plastic Tupperware.

Criss Hochhold

Did the medications affect your cognitive abilities at all?

Chief Greg Burke

Well, combined with the operation and the chemo treatment, you end up with chemo fog brain they call it.

Criss Hochhold

What does that mean? Can you explain that a little bit further? What do you mean by that? What happens?

Chief Greg Burke

Well, a cop asked me that, and he said, "What do you mean by chemo fog brain?" The best way I can describe it is, it's not like you're drunk, but it's almost like you're in a daze, like you're stupid. So your reaction time and your thinking time isn't sharp. You do everything slow. You move slow. You talk slow. You react slow.

Criss Hochhold

So it takes you a little bit longer to process information, when you were having a conversation sometimes, depending on it at that time?

Chief Greg Burke

Yeah, you have to compress it and then react.

Criss Hochhold

Because of the chemo treatments that you went through, and the diagnosis of the blood clots in your lungs, were you given a medical exemption, for example, for wearing a mask?

Chief Greg Burke

Well, when I started the chemo treatment in June of 2021, they gave me a yellow card. I'll just show that to everybody if they're not familiar with it. This is a "go to the emerge." card. There are all kinds of warnings on it—if you're having a heart attack or high blood pressure or fever, whatever, I override everything in the emerge. other than a car accident.

And because of this, you're very susceptible to bacteria or whatever. Everything I know about wearing the chin diaper, working in the O.R., what people were wearing was really a joke to me. And when I seen people wearing it, I felt sorry for them, knowing how dangerous it was for their health.

Criss Hochhold

I'm just going to quickly forward the commissioners that exhibit Chief Burke is referring to. There are a number of them, and the labels will be TR-0010, as well as TR-0010a through e. Those will be the exhibits that we're referring to.

Chief Burke, I'm going to fast forward a little bit. I want to take you to an incident on February 9th, 2022, at approximately 3 p.m. Can you tell me about that, please?

Chief Greg Burke

Sure. Well, because I wasn't wearing a mask—I didn't wear a mask at any time in hospitals. I was there every 14 days to get my blood checked to make sure my hematology was good and white cells were fine.

Actually, I'll share something with you: it's when I first arrived there to get my blood checked to take my first treatment of chemo. There was a lady there, said while I was going to the washroom—I didn't hear her say, but my wife heard her say: "You make him wear a mask." And the oncologist came up to my wife with the mask not sterilized. You know, if you're going to touch these things, you have to be sterilized, you've got to scrub up. Anyway, the oncologist said to my wife, "Could you get your husband to wear a mask?" And Susan said, "Good luck with that." When they asked me, I said, "No, I'm not going to wear it." I said, "It's on your finger. You're not sterile, so I'm not going to touch it."

And I went into several stores. And of course, when I explained to them my condition, they were okay with it.

Criss Hochhold

And you went into Canadian Tire. Now, I really just would like for you to talk to us about what happened up until the interaction with the owner, because I would like to show a video for that particularly.

Chief Greg Burke

Yeah. I went into Canadian Tire, as Criss said, on February the 9th.

[00:10:00]

It was around quarter to three. And I was going to return an item, and I walked up to the return desk. There was a huge plexiglass on the return desk, a girl behind it wearing a face mask. And I put my item down and she said, "You've got to wear a mask." I said, "I don't wear a mask." She said, "Do you have an exemption?" I said, "Yeah, I do have an exemption." She said, "Well, I can't wait on you." I said, "Why not?" And she said, "Well, you're a danger to my health." I said, "You're behind a plexiglass wearing a mask. How am I a danger to your health?" And she said, "Well, you're a danger. I'm not going to wait on you." And she walked away from me, and I said, "Well, can I speak to the manager?"

And bear in mind here, I've got chemo brain. So it's almost like you're in sort of a dream here. So she picked up the phone, and I stood there probably for five minutes, six minutes waiting for the manager to show up. Everybody was calling. The girls at the cash register were trying to get a hold of a Mr. Keating. And while I was leaning against the railing, this individual—did you want me to go further with this?

Criss Hochhold

Nope, I want you to go right up to the point that you're going through now.

Chief Greg Burke

This individual showed up, and he kind of towered over me, and he started—

Criss Hochhold

One second, Greg, I'm going to stop you right there. Unfortunately, I don't have HDMI capability on my side, so I need to walk over to Chief Burke to show you the video on the laptop.

Chief Greg Burke

Did you want me to keep explaining?

Criss Hochhold

I'm going to play the video. And when I play the video for you, you can watch it. You can narrate it.

Chief Greg Burke

So Criss asked me to narrate this for you while it's on the screen. So you can see me, I'm up at the desk.

Criss Hochhold

I'm putting the arrow to Chief Burke, as you can see there. He's the gentleman in the blue.

Chief Greg Burke

I noticed that gentleman in the blue kept looking at me because I didn't have a mask.

Criss Hochhold

I'm just going to skip forward just a little bit until the interaction occurs. Because now you're waiting for a few minutes.

Chief Greg Burke

Okay, so she's waiting on me there, or telling me that she can't wait on me. I asked to speak to the manager. So she disappeared there, and she went on the phone to call the manager. And I stepped back, and you see me leaning there while I'm waiting. And I waited, and I waited, and I waited. And there, this guy shows up. He never asked me who I was, or what I was doing there, nothing. He just immediately started saying, "If you're not going to wear a mask," and he's screaming, "leave the store!" And you can see his hand gesture.

You can see me asking him to calm down because he's white-faced, dry-mouthed, and very confrontational. I'm saying, "I just want to explain something to you." He said, "No, I'm not going to listen to you. If you're not going to wear a mask, get out." And you see him shaking his head back and forth, saying no. And that's when he gave me three options. First option was, I can do my business out on the street. Second was, I can do it online—this is returning an item now. And the third, I can wear a mask. And I immediately said to him, "No, that's not an option. But let me think of my other option." And I put my head down to figure out,

"How am I going to do this outside? They've got to bring the machine out." This was how my brain was working that day.

And then when I left, I didn't notice he went to the other side. And when I raised my head to ask him how I was going to do it outside, he immediately said— Okay, you see him grabbing me there. Immediately said, "If you're not going to wear a mask, I'm going to throw you out." And I said, "What do you mean? Like, you're physically going to throw me out?" I couldn't believe he said that. He said, "That's right." I laughed at him, and I started to leave. And I said, "That wouldn't be a good idea." But I wasn't referring to that I would knock him out, which maybe I should have.

[00:15:00]

What I was referring to was my health. I'm on high a high dose of blood thinners, I'm suffering from chemo brain fog. And I'm not myself, so that's what I am referring to.

I think that triggered him. And that's why he grabbed me. And I pushed him off me and I was warning him not to touch me. But he came at me again and I pushed him off again. And he backs me up to the return desk. I thought that I grabbed him to hold him off—obviously, the video, I didn't do that. But I did warn him. I said, "Look, don't you dare touch me." I said, and this is the way I said it, because I'm not an excitable type of individual. There, he grabs me again. And I had to push him away again. And that's where I told him, "Don't touch me, I can hurt you. And believe me, I can hurt you." So at that point, he's hollering, giving directions to call the cops.

Right about now, I'm very nervous. I'm not afraid of him. But I'm nervous of him doing something that I'm not expecting, and he'd get the advantage over me. Because if you know anybody on blood thinners, you get cut, you're going to bleed pretty bad. So that was my worry there. And I told him, "Well, I'm going to call the cops. You go ahead. I'm going to have you charged with assault."

While I was leaving—Criss is not showing that—but as I was leaving, he kept following me. I said, "Don't follow me." Because I was worried that he was going to jump me from behind. And anyway, I went out into my car. And I waited in my car. I called 911 when I was in my car. And he came out. And I thought, okay, he's come to his senses. He's going to come and apologize.

Criss Hochhold

I'm sorry Greg. I thought I pressed play to finish the video and I walked away. My apologies for that.

Chief Greg Burke

Okay. So he's giving orders to the girl to call the cops, and right about now—I don't know, this guy is unpredictable. I mean, he's crazy. His eyes were like that, coming at me.

Criss Hochhold

Chief Burke, I know that the video is still playing, and we can probably switch off that. Thank you again because you do exit the store at that point in time. The lady that walked off: She at this time is actually calling 911 and the audio recording for that is available to the commissioners. It is one of the exhibits. As well as, Chief Burke, after the confrontation,

and you went outside, I know the store owner followed you, but what happened outside of the store? Did you call anybody?

Chief Greg Burke

Yeah, I called 911 and told them that I've been assaulted, and I want charges laid against the— I thought he was the manager. I didn't know he was the owner.

Criss Hochhold

For the commissioners, that 911 recording is also part of the exhibits that you can listen to. After that, what had taken place? Fast forward to when the police officer arrives. What happened then?

Chief Greg Burke

Yeah, I was talking to two RCMP officers that were in the parking lot at the time. They were on their coffee break and we were chatting. I waited about 15-20 minutes and this Bedford cop showed up. He asked me what was going on. I said, "Go watch the video and come back and talk to me." Which he did. He went in and he come back out. It was a beautiful day, and he was wearing one of those N95 masks. And I thought, "Oh boy, this is going to be good for me." They called the right guy.

So anyway, he went in and he came out and he said, "Yeah, I watched the video." He said, "Yeah, he grabbed you, but you defended yourself, I'm not going to charge him, I'm not going to charge you." And I said, "You're not going to charge me? I defended myself." He said, "Well, he's allowed to do that." Yeah. So the Bedford Canadian Tire store: bring a bodyguard with you because they're allowed to grab you.

Criss Hochhold

Chief Burke, excuse me, please. Keep it down please, thank you. Chief Burke, the interaction with the police officer: Can you tell me specifically about that? What was the conversation you had with him and what was the result of that?

Chief Greg Burke

Well, it wasn't much. After he said that he wasn't going to charge me, he said, "I'm going to give you a ticket." I said, "a ticket for what?"

[00:20:00]

He said, "for not wearing a mask." I said, "a ticket for not—" I'm thinking, what ticket? And he walked away, and didn't ask me what transpired inside, nothing. And he went to his car, and I waited and waited in my car.

And then I went over to his car in probably about 15, 20 minutes. I said, "What's going on?" He said, "Well," he said, "I'm having difficulty. They change the rules all the time, so I got to find out if I'm charging you with the right thing or not." So he said, "I apologize for taking so long, but here's a ticket for not wearing a mask." And I said, "Not wearing a—what the heck?" And I look: it was \$2,422, something like that.

Criss Hochhold

So the interaction with the police officer resulted in you receiving a fine for not wearing a mask. Did the officer at any point ask you if you had a mask exemption?

Chief Greg Burke

No.

Criss Hochhold

So there were no inquiries whatsoever about what transpired inside? He went inside the store and he felt satisfied with what he observed to issue you a fine but not proceed with anything else?

Chief Greg Burke

Yeah. But I found out later, when I tried to force him to put an assault charge on this guy. When I spoke to his sergeant, his sergeant said, "Well, I read his notes and I don't see that we should file assault charges. It's not going to go anywhere."

Chief Greg Burke

And I said, "You read my notes?" He said, "Well, yeah." I said, "He didn't take any whatever from me. He didn't take any statement." He said, "Well, we got it on—" I said, "Well, he didn't even talk to me about it." So he said, "I'll send over an officer now."

So anyway, where was I?

Criss Hochhold

Chief Burke. I would like to stop this one here because we have another very important incident that we definitely have to get to.

Chief Greg Burke

I just will say this, that the cop lied to Canadian Tire and told him I was banned for six months. He never ever put a ban on me for six months. So this guy was a loose cannon.

Okay.

Criss Hochhold

So thank you. I now want to fast forward you 30 days to an incident on March 9th that you were also involved in. Can you briefly describe that for me?

Chief Greg Burke

Well, that was actually 30 days after the Canadian Tire assault. So Canadian Tire was February 9th and this is March 9th. And there was a homeless guy that I knew from years ago living in his car, so I thought I'd go and buy him supper. It was a late evening, so we went to A&W. I walked in, and the girl said, "you got to wear a mask." I said, "I don't wear a mask," and she said, "well, you do your order by the plexiglass." So I ordered for both of us and all of a sudden, this guy comes out—you can tell he was a migrant—he comes out of

the door like a cannon had shot him through the door and started screaming for me to wear a mask. And I said, "well I got my order, it's right there." And he kept saying, "you got to wear a mask." He was screaming, he was really upset. I said, "well, do I wear a mask if I sit down?" "No." I said, "well I'll sit down, and you can bring it." No, he wouldn't do it. I said, "how long you been in the country?" He said, "three months." I said, "Did they teach you anything about the Canadian Bill of Rights?" "I don't care about your Canadian Bill of Rights." I said, "If you don't care about my Canadian Bill of Rights, you go back to the country where you don't have rights." Anyway, he said, "Well, I'm calling the RCMP." I said, "Go ahead." I said, "Give me my money back." He wouldn't give me my money back, so I said, "When the RCMP come, I'm charging you with theft, because I want my money, I'm leaving. Now." And this is the way I was talking.

Criss Hochhold

I'm sorry. I hate to interject, but in the interest of time, can you take us to the moment outside, when the police arrived, regarding this incident?

Chief Greg Burke

Yeah, I'm not a long-winded person but I'll try to be short. As I was leaving, two RCMP officers were walking in, and they said, "What's going on?" I said, "I came here to order food. They took my order, then he wouldn't give me my money back, and I'm just about to leave." He said, "Let's go outside and we'll talk about it." I said, "okay." We go outside, and he said, "Do you have your ID?" I said, "yeah." "Show me your ID." I said, "Did I break the law?" He said, "no." I said, "Well, you don't need my ID. I'm leaving." He said, "no you're not." I said, "I'm detained?" "No." I said, "Well, I'm leaving." "Give me your ID." "No." So that went back and forth.

As this was going back and forth and I was trying to explain to the RCMP the rights and the laws

[00:25:00]

this little RCMP officer is coming across the parking lot. He immediately grabbed me and tried to throw me up against the wall. He said he was going to charge me with resistance. I said, "I'm not resisting." I said, "You can handle my arms." I said, "Just relax." I said, "I'll give you my arms if you want to handcuff me. You want to go down this rabbit hole, let's go down this rabbit hole." So I helped them handcuff me from behind and then he started pushing me towards his car. I warned him not to push me and he didn't push me after that. And we get in the car.

Now, you have to appreciate, my skin is still hurting from the chemo treatment. He was helpful, he helped me get my legs in the backseat of the car. Because if anybody's been in the backseat of the RCMP car, they're like getting in a coffin. So anyway—

Criss Hochhold

Chief Burke, I want to just really touch upon when you had that interaction with the one police officer. You were having a conversation about the masking situation when an officer approached, came across in the parking lot and basically put his hands on you to affect the rest. They did tell you that you were under arrest at any time before they laid their hands on you, before they touched you?

Chief Greg Burke
Sorry. Repeat that again?

Criss Hochhold
When the second officer came and who then physically tried to take control of you, did he advise you that you were under arrest at that time?

Chief Greg Burke
No, no.

Criss Hochhold
How much force would you say—I know it's difficult to gauge, but when he tried to gain control of you, was there a struggle? Is that why he was saying, you know, stop resisting? Were you struggling? Were you resisting the officer?

Chief Greg Burke
Yeah, he tried to slam me up against the brick wall. That's what he tried to do, and I tried to prevent it because I didn't want my face to go into the brick wall because I'm still on blood thinners.

Criss Hochhold
Right, so then you were cooperative, and you allowed him to put the handcuffs on?

Chief Greg Burke
Yeah, and I wasn't combative or saucy or anything. I was just standing up for my rights.

Criss Hochhold
Were you handcuffed in the front or in the back?

Chief Greg Burke
Back.

Criss Hochhold
And then he pushed you towards the police car?

Chief Greg Burke
Yeah. Yeah, he pushed me several times.

Criss Hochhold
Okay. What did you say to him when he was pushing you?

Chief Greg Burke

I told him not to push me again.

Criss Hochhold

And then you walked to the police car, and he put you in the back of the police car. And he assisted you putting your legs in, because the backs of police cars are very, very small.

Chief Greg Burke

Confined, yes.

Criss Hochhold

Thank you, yes. What happened then?

Chief Greg Burke

He read me my rights and asked me if I understood them. And I said, "I understand the rights," but I don't understand why he read them. And I said, "what are you charging me with?" He said, "creating a disturbance." I started laughing, I said, "The only fools that created a disturbance is the little guy that got shot out of a cannon there, and you." I said, "I didn't create this disturbance."

And so we had a conversation about the handcuffs. I said, "Look, you got to take these off." I said, "I'm not a threat to you." I said, "I never was a threat to you." I said, "I don't know why you're overreacting the way you are, but," I said, "let's go down this rabbit hole."

So while we're having this conversation, the Mountie that initially spoke to me came and they had a powwow in the front of the RCMP car. And then the guy that put the handcuffs on me, he said, "I'm going to give you a ban for six months." And of course—I was teasing him—I said, "Oh my god, I'm going to starve to death. I'm not going to get out—" You know, I was basically being a smart ass, but I thought he deserved it.

When I get out of the car, I tried to ask him a legal question about showing your ID. Finally, after four or five attempts, he finally answered my question. And I asked him, I said, "if I'm walking down the street at 3 o'clock in the morning, do you have the right to pull me over? Although I'm not committing a crime, do you have the right to ask for my ID?" He said, "If I'm suspicious, I can." Now that's totally wrong.

So anyway, the two of them are under investigation.

Criss Hochhold

Chief Burke, I will eventually get to that, that's okay. Once your interaction ended, you were given a piece of paper, which you understood to be basically a *Protection of Property Act* notice banning you from entering the A&W, that location?

Chief Greg Burke

No onion rings for six months.

Criss Hochhold

I'm sorry?

Chief Greg Burke

No onion rings for six months.

[00:30:00]

Criss Hochhold

But you were banned from the property for six months?

Chief Greg Burke

That's correct, yeah.

Criss Hochhold

And did the officer open a piece of paper that he served you with and did he explain that to you?

Chief Greg Burke

No, he folded it over and gave it to me.

Criss Hochhold

Okay, so it was folded over, and he gave it to you, and he told you that you were banned verbally for six months. Was there anything within that piece of paper?

Chief Greg Burke

Yeah, I discovered after I opened the paper, there was a ticket for not wearing a mask: \$2,422.

Criss Hochhold

Did the officer inform you at any time that you were being issued a citation for not wearing a mask?

Chief Greg Burke

Never. Neither one of them. And in fact, the ticket was written by the other Mountie, not by the Mountie that handcuffed me.

Criss Hochhold

Okay, as I understand it and what you've already said about it—

Chief Greg Burke

And oh, by the way—none of those RCMP officers were wearing a mask.

Criss Hochhold

The interaction you had with the officer outside of the store: They were not wearing a mask?

Chief Greg Burke

None of them were wearing a mask. In the store or outside.

Criss Hochhold

When you say “in the store,” did an officer have occasion to go inside the store? Did an officer go inside the store to find out what happened?

Chief Greg Burke

I don’t know. The only time I seen the girl and the initial constable was when I was leaving. I don’t know if they went back in.

Criss Hochhold

But that’s the initial contact inside the store—both of those officers came inside the A&W not wearing masks when you were there.

Chief Greg Burke

Correct.

Criss Hochhold

But you were issued a citation for not wearing a mask in a store, although they were not either when they entered the store.

Chief Greg Burke

Neither one of them wore a mask.

Criss Hochhold

Thank you for that. Chief Burke, I’m going to keep it short, but you’ve already stated as part of your testimony that you’ve made a complaint against these RCMP officers. You’ve made a public complaint?

Chief Greg Burke

To Ottawa, yes.

Criss Hochhold

Can you give me a brief overview of that?

Chief Greg Burke

Yeah, I called the sergeant to my house. He was a real nice guy; we had a good conversation. He was shocked that I was given a ticket without my knowledge. He said, "we don't do business that way." He wanted me to lodge a complaint with Ottawa, which I did. It's still under investigation. The constable that is taking care of it on the local area has found the initial RCMP officers in six violations. The one that handcuffed me is under 12 violations. And they've asked me what I wanted done. And I said that I want the two of them fired.

Criss Hochhold

Thank you. Thank you for that Chief Burke. And in the interest of time, the documents are included and I will just defer to the commissioners for any follow-up questions.

Chief Greg Burke

Yeah, just one other thing that we didn't touch on, Criss. He told me that— While I was in the car and he told me he was going to ban me he did say that he wasn't going to charge me. I said, "Yes, you are." So we had a little argument back and forth that I wanted him to charge me.

Criss Hochhold

To put that in context, that would be your interaction with the RCMP also at the A&W, when you were placed in the back of the police car.

Chief Greg Burke

Correct.

Criss Hochhold

And what were you arguing for to be charged with?

Chief Greg Burke

Well, he was going to charge me with disturbance, and then he said he wasn't going to charge me. And I said, "No, I want you to charge me because we're down this rabbit hole. So I want you to charge me." He said, "No, I'm not going to charge you." And I said, "Why not?" He said, "I'm not going to charge you." That's where we were.

Criss Hochhold

Thank you.

Chief Greg Burke

Thank you.

Commissioner Drysdale

We're running out of time, but I judge you as a pretty amiable man. You're social, and you're communicative, and I have a feeling that you're well-known in public to your community.

Chief Greg Burke

Yeah. My wife doesn't want to go out with me because—

Commissioner Drysdale

Join the club! The question I have for you is: Have you had people react to you this way before? Before this whole pandemic did people generally react in this way to you?

Chief Greg Burke

Never. Never. I'm not a confrontational person, although I've never, ever backed away from a fight.

[00:35:00]

I've been an enforcer on the ice all my life, you know. And being brought up in Glace Bay, you know somebody looks at you— You know, coal mining town, you're fighting all the time.

Commissioner Drysdale

Then Canadian Tire happened and that was an incident. And A&W happened so it's not an isolated incident.

What do you think motivated these people to treat you this way—apart from the fact you weren't wearing a mask? Why would they why would they react to you this way?

Chief Greg Burke

To sum it up, I would say the lack of knowledge, number one, the lack of education, and the influence that the medical health department and the politicians had on people by manipulating them.

Commissioner Drysdale

When you say the influence that the politicians and the media had on people, exactly what do you mean by that? What kind of influence?

Chief Greg Burke

Well, you had politicians that were passing laws that— You know, we got a young girl in here that she protested against Dr. Strange, or Strang, and she ended up in jail for six days. And the person that wrote that law, Brad Johns, who's the Minister of Justice, happens to be one of the most crooked people. I don't care about being so—

Commissioner Drysdale

Well, I think I've got my answer, but thank you very much.

Chief Greg Burke

Oh, you're welcome.

Criss Hochhold
Thank you, Chief Burke.

Chief Greg Burke
Yeah. Wela'lin. I want to thank everybody for coming here. I was impressed.

Criss Hochhold
Just one second, Chief Burke. We do have one more question, I believe. Sorry about that.

Commissioner Kaikkonen
I just wanted to ask if the two fines have gone to court, and what was the outcome? Or was it stopped when you did the investigation against the RCMP?

Chief Greg Burke
Sorry, I didn't hear you.

Commissioner Kaikkonen
I just wondered if there was any follow-up in court with the two fines. Or if the accusations—or the charge that you laid against the RCMP officers—if that has stopped the court action? I'm just wondering where it went from here, if there has been any follow-up?

Chief Greg Burke
My Canadian Tire ticket will be addressed on June the 1st at 6 o'clock. The RCMP ticket, I'm going to have to check on that. Criss and I had a conversation about that. He asked me if I went to court over that. And I said it was one of the stipulations—I asked the sergeant to drop it, given the fact that that it wasn't presented to me.

Commissioner Kaikkonen
Thank you.

Criss Hochhold
Thank you very much, Chief Burke.

Chief Greg Burke
Wela'lin.

[00:38:20]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 2

March 17, 2023

EVIDENCE

Witness 11: Sabrina McGrath

Full Day 2 Timestamp: 07:14:50–07:28:49

Source URL: <https://rumble.com/v2djisi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Thank you everyone. We're going to resume the proceedings. The next witness is Sabrina McGrath. And Ms. McGrath, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Sabrina McGrath

I do.

Ches Crosbie

Thank you.

Nicolle Snow

Good afternoon, Ms. McGrath.

Sabrina McGrath

Hello.

Nicolle Snow

Ms. McGrath, I understand you're here today to testify with respect to the loss of your employment due to provincial COVID mandates.

Sabrina McGrath

Yes.

Nicolle Snow

Okay, where were you working?

Sabrina McGrath
Nova Scotia Liquor Corporation [NSLC].

Nicolle Snow
All right. And that's a provincial government job?

Sabrina McGrath
Yes.

Nicolle Snow
And what were you doing there?

Sabrina McGrath
I was manager for the last three years. And three years previous to that—or two years previous to that—I was assistant manager.

Nicolle Snow
Okay, and were you represented by a union?

Sabrina McGrath
Yes.

Nicolle Snow
Did your collective agreement provide for any sort of vaccination status as part of the terms of your employment?

Sabrina McGrath
No.

Nicolle Snow
And what position? Sorry, you indicated you were a manager. Were you a valued employee for the Liquor Commission?

Sabrina McGrath
I was. Just the year previous to being placed on unpaid leave, my store had won top-performing store, so it recognizes overall sale results in leadership

Nicolle Snow
And that reflects on you as manager of the store?

Sabrina McGrath

Yes

Nicolle Snow

All right. And any anything else with respect to your value to the store you were working for?

Sabrina McGrath

Yes, I received model performance on my latest PA, performance appraisal, which is a very rare— It's very rare to get that because I just don't give them out to just anybody. I did a pretty good job to get it.

Nicolle Snow

Nice. And so, what year did you have that, the model performance?

Sabrina McGrath

2021.

Nicolle Snow

Okay. What mandates and protocols did the Nova Scotia Liquor Commission adopt?

Sabrina McGrath

We did masking, Plexi[glass], six feet distance, and then the latest was the vaccine mandate.

Nicolle Snow

And when was the vaccine mandate brought in?

Sabrina McGrath

We knew about it in October, but it was implemented January 15th.

Nicolle Snow

In October, they delivered the message to the employees, but it was going to be effective January 15, 2022?

Sabrina McGrath

Yes, for current employees. Anyone that was new to the corporation had to be done by November the 1st.

Nicolle Snow

It had to be done, meaning—

Sabrina McGrath
Fully vaccinated.

Nicolle Snow
All right. And were they required to show proof of that?

Sabrina McGrath
Yes, there's a declaration form that had to be filled out.

Nicolle Snow
And with respect to the deadline of January 15, 2022 for the existing employees, was proof required?

Sabrina McGrath
Yes.

Nicolle Snow
And what was going to happen if proof was not required? I'm sorry, I phrased that wrong: What was going to happen if proof was not provided?

Sabrina McGrath
People would be placed on an unpaid leave of absence.

Nicolle Snow
Okay. Was the adoption of this vaccination mandate contrary to some of the earlier views held by the employer?

Sabrina McGrath
Yes.

Nicolle Snow
In what way?

Sabrina McGrath
Well, in May of 2021, there was an occupational health and safety meeting. And at that meeting, vaccinations were brought up. And the response was vaccination is not required by law. It is an individual choice. Therefore, employees are not required to be vaccinated to be in the workplace.

Nicolle Snow
Okay. And were you reading from the minutes from that meeting?

Sabrina McGrath

Yes.

Nicolle Snow

All right. And, those minutes have been delivered for filing as an exhibit, but we don't have an exhibit number yet [Exhibit TR-22d]. How did you feel about the vaccination mandate?

Sabrina McGrath

I was 100 per cent against a vaccination mandate. I think everyone should have the choice as to what they put in their body, and it shouldn't be a choice as to keeping your bodily integrity or losing your job.

Nicolle Snow

And so how, if at all, did the environment in your workplace change after the vaccination mandate was announced?

Sabrina McGrath

We recently had a new regional manager, Kim Jackman, and she came into the store about the first of November. And we had a cut-out of Dana White—he's a UFC [Ultimate Fighting Championship] person—promoting his new liqueur. When she came in and she seen it—a lot of stores had it, it wasn't just our store—she demanded we take it down immediately because he was anti-vaxx.

Nicolle Snow

Okay. And was there anything on the poster that was related to vaccinations?

Sabrina McGrath

Just a picture of him. That's all.

Nicolle Snow

And he was promoting his own product, his own product liqueur.

Sabrina McGrath

Yeah.

Nicolle Snow

Anything else?

Sabrina McGrath

Yeah, that same regional manager—it was 7 o'clock on a Friday—she came flying into the store. And she was being aggressive because she had reports that we had anti-vaxx propaganda up in the store.

[00:05:00]

Which we absolutely did not. But she went through the store with a fine-tooth comb. Didn't find anything but she made us take a poster that we had up at the front of the store down. It was handmade by our team. It was just telling the pouring amounts, the proper pouring amounts, but it said "Cheers to Pour Choices" on it. So that's what she had us take down, just in case that's what people were complaining about.

Nicolle Snow

Okay, and so the "Cheers to Pour Choices" was with respect to the portion amount that you might be consuming of alcohol.

Sabrina McGrath

Right. Because we want to be socially responsible and making sure that people are ingesting the right pouring amounts.

Nicolle Snow

All right. Anything else?

Sabrina McGrath

Yeah, I was having a conversation with an employee from another store on LinkedIn, and he wrote a comment—because we have been discussing the mandates and things like that. He wrote a comment to me saying, "I thought you were leading your store to becoming fully vaccinated, not becoming fully unemployed."

Nicolle Snow

Okay. And that was in the context of some conversation you were having with him about the mandates?

Sabrina McGrath

Right. Yeah. And then he deleted me.

Nicolle Snow

And then what?

Sabrina McGrath

He deleted me.

Nicolle Snow

Okay. Did you acquiesce to the mandate to vaccinate?

Sabrina McGrath

What's that?

Nicolle Snow

Did you go ahead and vaccinate due to the mandate?

Sabrina McGrath

No. No, I did not.

Nicolle Snow

And what happened as a result?

Sabrina McGrath

I was placed on unpaid leave.

Nicolle Snow

And when did that happen?

Sabrina McGrath

January of 2022.

Nicolle Snow

Okay. Did you ever go back to the Nova Scotia Liquor Commission?

Sabrina McGrath

No, we had the option of going back in May on the contingency that we fill out a vaccination declaration form.

Nicolle Snow

All right. Tell us about that form.

Sabrina McGrath

It's just a form to say whether or not we were vaccinated. They still wanted to know. We could go back into the workplace being unvaccinated, but they wanted to know whether or not we were. So we still had to attest to our status.

Nicolle Snow

Okay. So at that point the mandate to vaccinate had been lifted in the store?

Sabrina McGrath

Yes.

Nicolle Snow

Had it been lifted generally in the province?

Sabrina McGrath

It had been lifted in the province seven weeks before. The NSLC extended theirs for another seven weeks.

Nicolle Snow

Okay. During that period you were off—you said from January 2022 through to May—did you have any other source of income?

Sabrina McGrath

No.

Nicolle Snow

And did you apply for EI, employment insurance?

Sabrina McGrath

Yes, yes, I did.

Nicolle Snow

What happened with that?

Sabrina McGrath

I was denied.

Nicolle Snow

On what basis?

Sabrina McGrath

Service Canada deemed it as misconduct.

Nicolle Snow

And what were they calling misconduct?

Sabrina McGrath

Not following the vaccination mandate.

Nicolle Snow

Did you file an ROE with Service Canada for your application?

Sabrina McGrath

Yep.

Nicolle Snow

And did the ROE say anything about misconduct?

Sabrina McGrath

No, it just said unpaid leave.

Nicolle Snow

And so, were you able to determine how someone at Service Canada found that there was misconduct related to the vaccine policy when that was not on your ROE?

Sabrina McGrath

They said they called the NSLC. And when the NSLC told them it was mandate-related, they put down misconduct.

Nicolle Snow

Okay. Did you apply for a reconsideration of that decision?

Sabrina McGrath

I did.

Nicolle Snow

And what happened?

Sabrina McGrath

Denied.

Nicolle Snow

And you have a union?

Sabrina McGrath

Yep.

Nicolle Snow

Or you did have a union. Did you go to your union at all?

Sabrina McGrath

I did. I went before the, before it was even mandated. Once we found out it was going to be mandated, I went to them right away.

Nicolle Snow

That was October 2021 when you learned about it. Okay, so you went to your union and what happened?

Sabrina McGrath

They would do nothing. They said the employer was allowed to mandate vaccinations.

Nicolle Snow

And did they base that on any particular opinions?

Sabrina McGrath

They just said case law.

Nicolle Snow

Okay. And so, was there an indication that they went for legal advice or anything of that nature?

Sabrina McGrath

They said that they went to legal counsel and asked legal counsel and that's what they said.

Nicolle Snow

And so, the determination was that they felt you would lose, so they may as well not fight it for you.

Sabrina McGrath

Yeah.

Nicolle Snow

Did you have an opportunity to see whatever legal advice was provided to the union?

Sabrina McGrath

No.

Nicolle Snow

Did you ask for it?

Sabrina McGrath

I did ask for it.

Nicolle Snow

And what happened?

Sabrina McGrath

They denied my request, saying that they don't provide union members with that information.

Nicolle Snow

Okay. Did you bring any other grievances?

Sabrina McGrath

There was a grievance in April, but the union approached me about that grievance. It was the time period between when the government ended their mandates and the NSLC kept theirs for an additional seven weeks. The only period of time that the NSGEU [Nova Scotia Government and General Employees Union] was willing to grieve was that time period.

[00:10:00]

Nicolle Snow

And what happened with that grievance?

Sabrina McGrath

For me, I was—it was withdrawn because I was no longer working at the NSLC. So they withdrew mine, but other people got something.

Nicolle Snow

Okay. And so that was for the people who were placed on leave without pay: the grievance was with respect to that short period that they should have received their pay.

Sabrina McGrath

Right. Just that seven weeks, yeah.

Nicolle Snow

By that time, you had left your employment altogether. Okay. And so, you were on leave without pay for a period of time.

Did termination happen at some point?

Sabrina McGrath

They deemed me as being resigned from my position. If I didn't fill out the declaration form by June the 12th, I was considered to have been resigned from my position.

Nicolle Snow

Okay. And why were you opposed to filling out the declaration form?

Sabrina McGrath

Because it's still giving out my medical information. I would have done it before if that was the case, right? There was no point in doing it that late.

Nicolle Snow

Did you take any other positive action to try to combat the mandates and your concerns?

Sabrina McGrath

I did. I emailed the Premier, Tim Houston. No response from him—even now. And I wrote my HR and a few senior VPs. I emailed them all.

Nicolle Snow

And what happened with those emails.

Sabrina McGrath

As far as the senior VPs, no response from them. HR responded within a day saying that the appropriate people would see my email. And then I received a response on January 13th, which was two days before the mandate.

Nicolle Snow

And what was the general substance of your letter to Mr. Houston?

Sabrina McGrath

Just explaining why. Why mandates shouldn't be implemented. Especially when it comes to losing your job. A lot of people got it just to keep their job and that's forever in them now, right? I mean, people did it to keep their job. At the end of the day, you're still dispensable, you know. Like, you can get that to keep your job and they can still let you go, so then you would have done it for nothing.

Nicolle Snow

And the substance of your letter, your emails to HR?

Sabrina McGrath

Pretty much the same. A lot of it was copy and paste.

Nicolle Snow

OK, all right.

Nicolle Snow

You brought with you today—so there's the minutes we referenced. You brought with you also your 2021 annual performance check. You talked about your good performance appraisal. We have that with us, which will be entered as an exhibit [Exhibit TR-22a]. You brought with you today your e-mail to Tim Houston and your termination letter from the

Nova Scotia Liquor Commission. You brought with you today your response from Service Canada declining your claim and the reasons why they declined it, as well as your response from the union with respect to your grievance and your communications to HR. Is that correct?

Sabrina McGrath

Yep.

Nicolle Snow

OK. And those I believe are scanned. We don't have exhibit numbers yet, but they will be filed. All right, those are all my questions.

Thank you for testifying. And we'll wait a moment to see if there are any questions from the commissioners.

Sabrina McGrath

Okay.

Nicolle Snow

All right, thank you very much, Ms. McGrath. Thank you. Thank you.

Sabrina McGrath

You're welcome. Okay.

[00:13:59]

Ches Crosbie

You have the choice of swearing on the Bible. I believe there's one on the desk.

Pastor Jason McVicar

I'll just let my "yes" be "yes." So you just ask me and I'll say, "yes." I don't need a Bible to—

Ches Crosbie

All right. So I'll just follow the usual format I have been following and ask you to affirm that you will tell the truth, the whole truth, and nothing but the truth.

Pastor Jason McVicar

Yes.

Ches Crosbie

Thank you.

Criss Hochhold

Good afternoon.

Pastor Jason McVicar

How are you?

Criss Hochhold

Can you please state your full name for us?

Pastor Jason McVicar

Sure. My name is Pastor Jason McVicar.

Criss Hochhold

Where do you live?

Pastor Jason McVicar

Just outside of Charlottetown, Prince Edward Island.

Criss Hochhold

And what do you do for a living?

Pastor Jason McVicar

I'm a pastor.

Criss Hochhold

Pastor McVicar, you are living in PEI at this time. Where were you prior to moving to PEI?

Pastor Jason McVicar

Well, I'm from New Brunswick, and for 11 years I did ministry in New Brunswick Fredericton.

Criss Hochhold

You were a pastor at a ministry in Fredericton?

Pastor Jason McVicar

Yes, for 11 years.

Criss Hochhold

For 11 years? Can you tell me more about your time at the church in Fredericton, please? And specifically, I'm interested in incidents that happened to you regarding your status.

Pastor Jason McVicar

Sure.

Pastor Jason McVicar

With regard to COVID and the pandemic and everything, my experience is pretty unique in that I minister to a lot of people who— The church existed in a low-income area. When the mandates all came rolling out and the lockdowns came, there were a lot of people who were adversely affected by all that stuff.

And so I was ministering to a lot of people and people are in really hard ways. I was dealing with people who were struggling with suicide. I was struggling with domestic abuse from the lockdowns, people just being locked up together—it was mostly older people who were doing that—and extreme loneliness from the older community as well. So I'd seen firsthand kind of the negative effects of all the policies that were coming down from the government. It never really affected me. Our family was fine. We just rolled with the punches as they came.

It wasn't until the end of September when the mandates for the vaccine came into effect. And Dorothy Shepherd, on behalf of the Government of New Brunswick, had approached the faith communities and had approached churches. And basically, in an effort to get the vaccine uptake to 90 per cent, they wanted churches to promote the vaccines among their congregation. They encouraged vaccine mandates. Then the government had implemented a policy that said if churches would require proof of vaccination, they could operate full capacity—no restrictions, no masking, nothing. But if they weren't going to implement the proof of vaccines, then they would have to go back to their operational plans.

And that's when my experience went from ministering to people who were struggling with these different mandates and these different policies to just being on the receiving end of some of those negative outcomes. It all began October 3rd. So short, but very little, I'd say eight days after Dorothy Shepherd had approached the churches, I had received a letter from our board basically making my vaccination status the new measure of my ministry and my character. And they had included in this letter— Well, they had indicated that the vast majority of the congregation and the vast majority of the board felt that vaccination was the only way out of this pandemic. And that my opinions with regard to the whole pandemic, but mostly my refusal to receive the vaccine, was causing huge troubles in the church.

And I'll just read you some quotes to give you an indication of how they redefined—not redefined, they just made it the measure of my ministry and my character, the fact that I wouldn't get vaccinated. So in terms of ministry, they said, quote—

[00:05:00]

"That I was exercising poor judgment and a lack of discernment, that I had created deep wounds in your flock, that I had created barriers to you being able to teach, nurture and guide, that it was a lapse of wisdom, that it was a portent of future errors that could affect you on the pulpit, that it was an erosion of trust and confidence, that it was creating division in the congregation, and that there was a need to repair and rebuild the congregation."

Criss Hochhold

Just for the Commission, the document Pastor McVicar was referring to has been entered into electronic evidence and will be available to you [Exhibit TR-0012].

Pastor Jason McVicar

In terms of my character, the letter went on to say that I was placing my physical health before that of the congregation, and that I was placing my own physical health before that of my own children and the children in the congregation.

Criss Hochhold

Before this, Pastor McVicar, I just want to ask a question. Because you had been there at that for about 10 years?

Pastor Jason McVicar

Yes. Well, this was actually the anniversary of my 11th year, that all this was happening. But it was 10 years. It was really good years. No conflicts, no— like, there just there were no issues whatsoever.

Criss Hochhold

So the board now attacked your character rather significantly, and—

Pastor Jason McVicar

They just redefined it. Because 10 years, it was fine. Like, had a great relationship with the congregation, good relationship with the board. It wasn't until my refusal to be vaccinated that suddenly my character and my ministry took on this whole new light.

Criss Hochhold

So in the 11 years prior, you've taken this parish, this community of faith and you've built it. And what did you build it from, and how did that come about?

Pastor Jason McVicar

Well, they'd had a tumultuous period where it was basically just a mass exodus of their congregation. And I had come about two years after that had happened and they were down to—I'm not even sure—it was around 20 people or something like that. And over the years we were just rebuilding, and we had gotten it up to— Well, just prior to the pandemic it was around 45-50 people. And then the pandemic came and just had crazy swings after the pandemic.

Criss Hochhold

So you had a significant increase from when you initially took it over until the end.

Pastor Jason McVicar

Yeah, we were making good progress.

Criss Hochhold

You said— During that time, had the board ever had any other sanctions or complaints about how you led the ministry, how you interacted with the members?

Pastor Jason McVicar

No, nothing formal. There is, like, differences of opinions about little things, but it's all— No, nothing formal. No reprimands, no anything. Literally no conflict with congregation.

Criss Hochhold

So no poor judgment and no lack of discernment?

Pastor Jason McVicar

No. Everything that was laid out in this letter was purely related to the vaccine, had nothing to do with my actual ministry.

Criss Hochhold

When you say it was purely in the letter—actually, it had nothing to do with the ministry.

Did the board present you with any evidence from the congregation to support the allegations that they've levied against you?

Pastor Jason McVicar

No. Well leading up to it, I wasn't shy about my opinions outside of the church setting about how I felt about all these restrictions and how I felt about the vaccine. And so, we disagreed on that. And there was constant pressure— Once the vaccines came into effect, there was constant pressure from the board, especially for me to get the vaccine. And I refused for the longest time.

It was mostly just because I was so healthy, all the evidence that I had seen in terms of pure numbers. I didn't watch TV, so I wasn't really subject to all the fear-mongering that was going on. I went to the government website and just read the numbers. So I made my choice based on those numbers. So the pressure was constant. It wasn't until the government kind of approached the churches that it went from just them disagreeing with— I had no idea that they felt this. I knew they disagreed with me and I knew that it was frustrating for them.

They had required three things of me in this letter. They said that they wanted me to outline steps that I'll take to create a path to healing the wounds described above. And they wanted me to detail how I would perform my pastoral duties.

[00:10:00]

And they wanted me to elaborate on what I could do to ensure the congregation's physical health—again, because I'm unvaccinated and apparently dangerous. And so, I wrote them a letter. I just answered their three questions. I let them know that as far as the steps that I'll take to create path to healing, I didn't know the congregation— I knew they had problems with how I was—with my views. I didn't think it would affect my pulpit or my ministry at all. I just thought it was a disagreement about a worldly matter. But I had no idea the congregation, that they were—

So anyway, I wrote them a formal response. I said, "As far as healing the wounds, I don't know who's hurt, I don't know who's so offended." Like, "All of these things that you're putting before me, I don't know who I would approach. I don't know who— It feels like nobody's coming to me with this stuff."

I had no idea that people took so much offense to the choice that I made.

Criss Hochhold

The congregation didn't, again, didn't—

Pastor Jason McVicar

Yeah, there's no indication. Again, everybody— I knew that I was the minority view. I just had no idea that it was the measure of my ministry and my character at that point. And I said that I just had no idea how I would heal wounds that I didn't know existed. But I also say— As far as the second one, they said they wanted me to detail how I'd be able to perform the pastoral duties.

It was simple: the government had laid it all out and they had given us an ultimatum. They said, "If you require vaccination—and you require proof of vaccination" that "you could operate full capacity." I said, "I won't be vaccinated, so if you're going to require proof of vaccination, I can't even minister so that'll take care of that. But if you don't, if you take option B, we'll just do what we've always done. We'll do the operational plan." Which I wrote.

Criss Hochhold

So they gave you the ultimatum that essentially you need to get vaccinated. If not—

Pastor Jason McVicar

No, they never once said I have to get it, they just they kept asking and asking and asking. And the way the letter was written, it was obvious that that was the outcome they were going for. What they were trying to portray was that my ministry was in shambles. What they were trying to portray was that my ministry was going to be impossible without vaccination.

The other thing that they asked was to, "elaborate on what you can do to ensure your congregation's physical health." I just I told them that was absurd. Like, you guys can't ensure your physical; you can't ensure, neither can I. Nobody can ensure people's physical health. I told them I would do the things that I have been doing. I'll abide by all of the actual practices that we had implemented, the operational plan. I'll do the physical distancing when it's required. I'll do the masking when it's required.

Even when it came to my vaccination status, I was always very forthright with people. I put the ball in their court. I wanted them to know that if they were uncomfortable with my vaccination status, I had a colleague, a pastor friend who would be more than willing to minister to them in person if they wanted. Like, everything was in place to, as far as— **Even though I didn't believe that stuff about me being more dangerous, if they felt that way, I accommodated them.**

Criss Hochhold

So you took steps, you said, for people that were not comfortable with you. You said a one-on-one.

Aside from having a congregation on your typical Sunday, church time, you also provided services to people on a one-on-one basis?

Pastor Jason McVicar

Oh, yeah, I did a lot of counseling. There were corporate ministries that I would engage in. So I would do the Sunday service: preaching, teaching, I'd be on the stage with them leading in worship and stuff. And then there'd be the Bible study, and then we had a prayer group as well but I didn't lead that. I had somebody else leading that. And the rest was all one-on-one stuff. A lot of people from the community—especially when COVID hit, there were a lot of people. Once word got out that there was a pastor in town that would hear you out instead of wait for their turn to tell you why you're wrong about the vaccines, they started coming to me. And that's when I started dealing with people who had such crazy struggles. And plus, it was the neighborhood I was in. I was already very well-known, very well-liked in the community, and people were in and out all the time.

Criss Hochhold

Did you advise the board members that you had made arrangements for a vaccinated pastor to take over counseling or other sessions for you if the person you were going to see wanted counselling?

Pastor Jason McVicar

Yeah. Well, when they had written that letter and I wrote my response. At the end of the response, I told them. I was like, "It's very clear from this letter there's nothing good is going to come from me defending myself.

[00:15:00]

And you've already made it super clear that my judgment in this regard has put me in a place where my ministry is not even— Like, if this is the new measure of my ministry, you shouldn't want me to be your minister." And so, I said, at the end of that letter, I was like, "I don't see a path forward." I basically said, "It seems to me that nothing short of me taking ownership, taking responsibility for all of these so-called hurts and all of these—"

Criss Hochhold

How about I read it? Pastor McVicar, I have it right in front of me. I can read it.

Pastor Jason McVicar

What's that?

Criss Hochhold

I said, I have it right in front of me. That way you don't need to try and refer to memory?

Pastor Jason McVicar

Sure.

Criss Hochhold

Again, this is entered as an electronic exhibit [Exhibit TR-0012i]. And it's, quote: "To be frank, your letter strikes me as unrealistic, unreasonable, and unfair. It's clear to me that nothing good will come from me defending myself, and by your own account, nothing good

will come from me exercising my own judgment when it comes to these vaccines. For this reason, I believe it is time for us to discuss how we can part ways in a way that keeps both parties (the board and myself) above reproach.”

Criss Hochhold

What was the result of your reply to their letter?

Pastor Jason McVicar

Well, they had called it a closed-session meeting. So I went to the meeting. It was just the board and myself. They took my phone, because they didn't want it recorded. Anyway, it was one of the craziest things I've ever experienced in terms of— I consider it to be abusive. It was, just, they took turns basically reiterating everything they had written in the letter, but it was so much more. Anyway, it was, it was—

Criss Hochhold

What happened within the meeting? Can you give us a brief summation of what happened? And how did you feel about it when you were there? Were you heard?

Pastor Jason McVicar

Oh, yeah. I considered it abusive, to the point where—

Criss Hochhold

Abusive, sorry?

Pastor Jason McVicar

I just let them say their piece after a while. I didn't say anything after a while. And when they were done, I reiterated that I wouldn't be getting my vaccine and that they need to deal with that, that they seem to be hyper-focused on this idea that I can be convinced. It was funny, like even at that time, it wasn't even that I was refusing the vaccine entirely, I wanted to see how the winter played out. Because Omicron was already happening in Europe. Like all these numbers were rolling in, and I was like, “I don't even want to revisit the issue until the spring time.” I said, “For now I'm not going to get it, and you need to deal with that, and you need to decide what you want to do. Because it sounds like if you really believe what you wrote in this letter, I'm not fit for ministry. If this is the new measure of my ministry and character, I'm not fit. And so, you need to deal with that reality.”

After that they asked me to leave the meeting and I did. And I waited that night for, kind of, confirmation of what they had decided—and I didn't get it until the morning. And they had decided that they didn't want to do anything rash and so what they would do instead is they would move everything online, except for the prayer group, because I wasn't part of the prayer group. So they moved it all online. They asked me not to meet with anybody in person, especially unvaccinated people.

Criss Hochhold

I'm sorry. You were unvaccinated yourself and they asked you not to meet with other unvaccinated people?

Pastor Jason McVicar

Yeah. They ask me not to meet with anybody in person. Basically, self-isolate.

Criss Hochhold

Okay, so was there a reason given why you shouldn't meet with—?

Pastor Jason McVicar

No. Because at this time everything was starting to open up a little. Everything was open in the government, everything was open in businesses, everybody. It was only our church. As far as I know, there was no other business, no other church, no other government entity that was shutting down. It was just our ministries that were going to shut down. So they shut it all down, asked me not to meet people in person, so I did everything online.

And after that— I'm kind of losing my train of thought here.

Criss Hochhold

So you left the meeting. You were waiting to hear something back from the board that particular night to see how you are moving forward.

Pastor Jason McVicar

Yeah. They wanted to shut it down for four weeks, and they started kind of piling on these restrictions. And so, I had assumed that was a response to my letter. Because in the letter, I had responded to them saying, like, we'll just do ministry the way I've been doing ministry. We'll abide by the government's policies, and we'll just keep rolling forward with our operational plan. And when it's open, we'll be open. And when it's closed, we'll be closed. And we'll do what we've done for the past six months or four months, or however long it was when we had the operational plan in effect.

And so, they started piling on all these new restrictions of their own accord.

[00:20:00]

Just based on their own opinions of so-called numbers. And I had moved the online, especially for church. I moved it ahead an hour, because nobody else in the city was closed, so I wanted to take my family to church. And so, I moved the livestream ahead an hour and I took my family to church. And I got an email that afternoon, I think it was, from the board asking why I had moved the livestream ahead an hour. And I told them I wanted to take my family to church. After that, I received another letter reiterating those three things. Again—they asked me again, "We want you to," you know, "tell us how you're going to protect the congregation. We want you to tell us how you're going to do ministry." So it's essentially, like, "Here's a whole bunch of new restrictions. Now how are you going to do ministry?"

Criss Hochhold

Pastor McVicar, ultimately, what was the outcome of the conversations in the meetings between you and the board?

Pastor Jason McVicar

At the end of the meetings, I wasn't going to resign, because I didn't think I did anything wrong. If they were going to make this the measure of my ministry, I wanted them to fire me for it. Like, if this is the new measure, you're going to have to deal with it. Like, you're going to have to be the ones who initiate all of this. And so, at this point, I'm just—I've lost 20 pounds. I'm a guy who can't afford to lose 20 pounds. Like, I was the most stressed I've ever been in my entire life. My ministry was in shambles, as far as I knew. So I decided I'd call a congregational meeting, because it was clear they were trying to force something but they weren't going to be the ones who wanted to initiate it. I wasn't going to quit. And so, I wanted a congregational meeting. I wanted to bring them into it and say, you know, "Is it appropriate for this to be the new measure?" If they agree, then vote me out. If you disagree, let's move on, and let's put this behind us.

Criss Hochhold

And the meeting that you're referring to, congressional meeting, what is that comprised of?

Pastor Jason McVicar

Anytime you have a decision that needs to be made that affects the whole congregation, you bring the congregation together with the board and you talk about it. You work it out. You hash it out. You create the agenda. You create the documents you need. And so, that's what I did. I had emailed the board and I told them, "I'm calling a congregational meeting. I need you guys to provide these documents." I was like, "I need you guys to be the ones who call the meeting, because you guys have been speaking on behalf of the congregation. You've been acting on their behalf, so you guys are going to be the ones to do this."

And they denied that. They said, "No, we're not willing to call a congregational meeting." I told them, "You need to revisit the Constitution." I'm like, "I gave you the option to do it, because you've been talking on behalf of the congregation. But I'm calling a congregational meeting one way or another." They said no. They said they wanted to have another meeting in person. And I said no, I wasn't going to do that after the last meeting. I was like, I've been advised by people not to ever put myself in that position again.

Criss Hochhold

Pastor McVicar. Sorry to interject, but in the interest of time, you ultimately decided to part ways with this church.

Pastor Jason McVicar

At that point, I was just done. I was, like, I can't do this anymore. It's too stressful—my wife, my family, all of it was brutal. It was the most brutal thing I've ever experienced, so I just wanted to be done. So I didn't even get to the congregational meeting.

I called up my father-in-law, who's dealt with this stuff before, and got him to mediate a mutual parting of ways, a mutual agreement to terminate the contract. So fast forward to—I forget the exact date. I'm signing this contract and I'm getting a bunch of text from the congregation congratulating me on my new endeavors. I'm like, "What are people talking about?" And I got several of these texts as I'm signing this document. Finally on my way out, I get another text from somebody asking me if this was really a mutual agreement—like, if the agreement was actually mutual. And I said, "no." And they said, "Do you want to talk?"

So, I got together with them, and they showed me the newsletter where they announced my parting of ways [Exhibit TR-0012g].

Criss Hochhold

I can read that out actually.

Pastor Jason McVicar

Yeah, could you read that? Yeah.

Criss Hochhold

That's right. And that was on October 27th. The letter—the parting ways that the board chose to award—was as follows: “Jason’s contract has ended by mutual agreement, as he has accomplished all that he can in this ministry, and he will now move on to new endeavors. We thank Jason for his years of service and wish him all the best in his future plans.”

[00:25:00]

Pastor Jason McVicar

So they just flat out lied to their congregation. And I kept on getting these texts and these messages congratulating me. So I didn't know how to correct them because I didn't want to be—anyway. So it was just this big mess. And ultimately, over time, and talking with people had discovered that nobody knew. It was just these individuals on the board were acting on their own—their own accord. The congregation, 100 per cent on the deck, had no idea that any of this was even happening in the background. So I had been misled by this letter that had portrayed my ministries in total shambles. Like the congregation was completely in the dark. And now they had lied to the congregation about the nature of my leaving.

Criss Hochhold

So Pastor McVicar, what I hear you saying is that they've lied to you and they've lied to your congregation.

Pastor Jason McVicar

Yeah. Like, I never would have entered into mutual—if I had known that, especially after talking to people face to face from the congregation, that even though they disagreed with me, **this never would have been the approach they would have approved of.**

This never would have been the way they would have wanted it done. I never would have entered into those— Like, my ministry was destroyed over this stuff. And, I never would have gone down that path.

Criss Hochhold

Thank you, Pastor McVicar. Unfortunately, we are out of time. I would like to defer to the commissioners for any follow-up questions.

Commissioner Massie

Thank you very much for your testimony. I'm religious, but I'm not practicing like a pastor.

Pastor Jason McVicar

That's how everyone who is not religious talks to me. They always put that caveat.

Commissioner Massie

I'm a believer. I'm a believer, but I'm a scientist, and I have a hard time to wrap my head around what you're telling me. Because it seems to me, based on the level of understanding from your people on the board, that I don't think—correct me if I'm wrong—that they have a deep understanding of the science behind what they are promoting.

Pastor Jason McVicar

Well, one of them was a pharmacist, so he had some understanding, but most of them are just lay people.

Commissioner Massie

Would it be fair to assess that this is more based on faith?

Pastor Jason McVicar

Trust. They gave implicit trust to the people who are talking on TV.

Commissioner Massie

Okay. I'm not a scholar of the Bible, but my understanding is that the reason why humans are alive today is because they benefit from a God-given natural immunity. Have they ever heard of that?

Pastor Jason McVicar

They saw it in me. I never got sick. I never got COVID.

Commissioner Massie

So it seems to me that what you are experiencing—correct me if I'm wrong—is a struggle of faith between two different beliefs: belief in natural immunity, God-given natural immunity, and I can assure you, there's a lot of science behind it—

Pastor Jason McVicar

I don't want to speculate on beliefs or anything like that. In the end, they just followed through on what the government put out there. And they did it in what I consider to be a super unethical way, and it kind of blows my mind that they would do that. Never in a million years would I have thought that would have been the way— But I don't know. I don't know what their beliefs are. Like, their motivations, their intentions, that stuff is God's territory. All I care about is what they did.

Commissioner Massie

So what is your option moving forward for your ministry or other ministry?

Pastor Jason McVicar

I'm in full-time ministry now. We ended up moving to Prince Edward Island to be closer to my wife's family. And from the moment I got there, I was filling pulpits, preaching, and I was asked to apply to a few different churches. And I was super frank. I was like, I'm not dealing with this stuff ever again. I told them, "If I put my name in, you got to tell your congregation exactly where I stand on all this stuff. I'll never preach it. I'll never be—I'll never be heavy handed. I don't care what people believe about this stuff. They make their own choices. I just want to be left alone with mine."

I wanted them to understand. I was like, "You just got to make sure they know that I'm not vaccinated. I probably never will be vaccinated, not with this mRNA stuff. Because in the end, nobody cared." There were several churches who were asking me to apply, even knowing that.

Commissioner Massie

Okay, thank you.

[00:30:00]

Criss Hochhold

No, there are more questions coming.

Commissioner Kaikkonen

I was just wondering—there's a couple of questions I have. The first one: is there anything in your contract with the church in Fredericton that would suggest this may be a problem if your faith goes against what the world is promoting?

Pastor Jason McVicar

Actually, I stayed away from faith statements about why I wasn't being vaccinated. So there's nothing in the contract that would say anything like that. And I stayed away from it. Because, speaking from a place of faith, the Holy Spirit informed the decision I made, but I never appealed to that because I can't. I can't. It's an appeal to an authority you can't confirm. So, I just never did, I stayed purely with the numbers. "I'm healthy. I don't need the shot. They don't stop infection. They don't stop transmission, so you're no more protected with me vaccinated than unvaccinated." Those are my two reasons for not— Yeah, so, I stayed away from it.

Commissioner Kaikkonen

Okay, my second question is: Do you know if the government offered financial incentives to set up church buildings as vaccination centers?

Pastor Jason McVicar

No.

Commissioner Kaikkonen

You're not aware?

Pastor Jason McVicar

I'm not aware, no, and nobody ever approached us—or at least, not that I was aware of.

Commissioner Kaikkonen

I believe that some of the arguments for churches closing fell to Romans 13. I believe that's right. I'm just wondering what your thoughts are when Christian churches or faith groups would raise the first couple of verses in Romans 13 as an argument for following the leadership of our secular governments.

Pastor Jason McVicar

I did. And we did: We implemented the operational plans. We followed everything. There was no mandate for the church. Nobody mandated anything within the congregation and the government didn't mandate anything for us. So that's not an argument.

Commissioner Kaikkonen

Okay, and then my final question is, you suggested that the mandates in New Brunswick were decreasing at a time that these restrictions within the church were increasing. I'm just wondering: At any point in this journey that you've just gone through, did you feel like the health authorities or the province were targeting the church or that there was religious—?

Pastor Jason McVicar

Oh, they definitely targeted the church. For one—I don't know what it was like in other provinces, but I know in New Brunswick—a huge portion of the unvaccinated population were from the faith community. And Dorothy Shepherd approached the faith community specifically, asking that they promote vaccines to their congregations and encourage them to require proof of vaccination in order to boost those numbers to 90 per cent. So they most definitely targeted the churches.

Commissioner Kaikkonen

So are you aware of other churches that went through this same struggle between the congregations and the ministers as a consequence?

Pastor Jason McVicar

There was only one other church that I knew of that went down the road that my church went down. The rest just navigated it fine. Actually, the church that my family and I landed in after all of this stuff, they were the exact same scenario as us. Their pastors were unvaccinated. They just handled it in a way more mature way.

Commissioner Kaikkonen

Thank you.

Criss Hochhold

Thank you, Pastor McVicar. I appreciate your time this afternoon.

Pastor Jason McVicar

Thank you.

[00:34:01]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 2

March 17, 2023

EVIDENCE

Witness 13: Bliss Behare

Full Day 2 Timestamp: 08:04:40–08:16:22

Source URL: <https://rumble.com/v2djjsi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Mr. Behare, you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Bliss Behare

Yes.

Ches Crosbie

Thank you.

Alison Steeves

Can you tell us your full name, where you're from, and your occupation?

Bliss Behare

I'm Bliss Behare, I'm 18 years old, I'm from Baie Verte, New Brunswick, and I'm a seasonal kitchen worker.

Alison Steeves

And when did you graduate from high school, Bliss?

Bliss Behare

I graduated June 2022.

Alison Steeves

So you were in high school during the height of the pandemic roughly, early 2020 to spring 2022?

Bliss Behare

Yes.

Alison Steeves

Can you tell us a bit about what your life was like before that time—before the pandemic started?

Bliss Behare

Prior to COVID, I was really active in my community both within school and outside of it. I campaigned for the Green Party. I organized and spoke at protests for the environment. I was part of art groups and I performed at music festivals. Within school, I was part of band, choir, eco groups. So between those social activities and school, that was mostly what my life consisted of.

Alison Steeves

So then in 2020, when we begin to hear about COVID-19, were you concerned?

Bliss Behare

I was never concerned for myself, given that I'm a young healthy person, but I was possibly concerned for my parents as they're middle-aged.

Alison Steeves

And when the vaccines came out, did you choose to take any of the available vaccines?

Bliss Behare

I did not.

Alison Steeves

How come?

Bliss Behare

I've always been raised to be skeptical about vaccines, so to me it's a case-by-case situation. And having seen that the process was rushed, I wanted to wait at least a year to see the rollout of the vaccine. But before I had time to make my own decision, it was mandated. And once it was mandated, I knew I would never accept the shot because I would never accept a forced medication.

Alison Steeves

What sources did you consult in making your decision?

Bliss Behare

There were a few sources. I did consume both mainstream media and also alternative views on YouTube, such as doctors like Vinay Prasad, and I spoke about that with my

parents and all that information. I also spoke to my nurse practitioner, and I asked her about risks because I'm transgender and I take testosterone and I'd heard about young men having higher cases of myocarditis. So I was concerned about that, and she dismissed that and told me there was absolutely zero risk and that I should just get it. So I found that discomfoting, and so given all those different forms of information, I made my decision.

Alison Steeves

Why did you find that discomfoting?

Bliss Behare

Because I know that there is at least not zero per cent risk, and it was at least more than that, So I wanted her to at least give me more information, but she wouldn't really speak upon the matter much.

Alison Steeves

So in fall 2021, around the time that Nova Scotia announced that there would be a vaccine passport for several services and other things, what grade were you in?

Bliss Behare

I was in Grade 12.

Alison Steeves

And did you observe any impact in school life, in the atmosphere in school, in the school setting at that time after the announcement?

Bliss Behare

Yes, so nothing was really noticeable, people didn't want to talk about it, but once the mandates were in place—once unvaccinated students were banned from extracurricular activities—the issue was just brought forth right to the front of the stage. And it sort of outed unvaccinated students to all the rest of their peers.

Alison Steeves

And did that sort of create any tension in the school?

Bliss Behare

It did for me. I didn't know any other unvaccinated students, but I wanted to avoid being outed so I dropped out of school and switched to online classes.

Alison Steeves

Were you registered in any activities at that time, for the fall?

Bliss Behare

I was registered for theater, art club, music, so yeah, a few things.

Alison Steeves

And outside the school? Anything outside the school?

Bliss Behare

Nothing at that point.

Alison Steeves

And so you dropped out of school to avoid being outed because you were worried about how you would be treated if people knew your status?

Bliss Behare

Yeah, I knew that I would meet a lot of negative reactions, so I did want to avoid that.

Alison Steeves

And exactly when did you drop out?

Bliss Behare

I would say sometime in October.

Alison Steeves

And can you list sort of what type of activities you had intended to do, or that you would normally do around the fall at that time?

Bliss Behare

Yeah, there was a lot of things. Usually, I would have been preparing to perform at the music festival for the Royal Conservatory of Music. I was probably going to have another art show that was outside of school.

[00:05:00]

I was going to participate in theater and likely organize eco protests as well, so kind of the regular things I would have always done.

Alison Steeves

And so you were not allowed to participate in any of those things at this point.

Bliss Behare

Yes.

Alison Steeves

And what was that like? How did that feel?

Bliss Behare

It was very isolating, and it was just incredibly lonely.

Alison Steeves

At this time, what were you seeing in the media or on social media about vaccine-related topics or people who choose not to take the vaccines?

Bliss Behare

I saw a lot of hate and contempt for unvaccinated people. Every once in a while, when I'd scroll through, I would see videos that said unvaccinated people deserve to die, that they are idiots, that they're just unlikable people that take up space. One person said they were glad that we were banned from things because they didn't want us to be around, so things of that nature.

Alison Steeves

And was this sort of in the main internet or were you seeing any of this sort of coming from the mouths of people you knew?

Bliss Behare

It was primarily online, yeah.

Alison Steeves

And how did that make you feel?

Bliss Behare

For me personally, I was pretty hypersensitive, so I felt physically shaken. Even sometimes for two days, I might have a migraine or feel very nauseous sometimes.

Alison Steeves

Yeah, just witnessing sort of the types of things people were saying.

Bliss Behare

Yeah.

Alison Steeves

Did your decision not to take the vaccine have an impact on any particular relationships in your life? Friends or family?

Bliss Behare

I would say that it had an impact on every single relationship in my life except that with my parents. But besides that, everyone looked at me differently and could hardly look me in the eyes, frankly. So a lot of interaction was cut back because of it.

Alison Steeves

Do you have any specific examples?

Bliss Behare

So there was one person who I had reached out to after I dropped out of school to meet up with. I told her that I was unvaccinated because I knew it would come up anyways, but she told me that her mom banned her from seeing me.

Alison Steeves

After you told her you were unvaccinated, she—

Bliss Behare

Yeah.

Alison Steeves

And how did that feel?

Bliss Behare

That was really disheartening because I know that most young people didn't want to know me at that point because of my status. So I was excited to hear that she didn't judge me on the matter, so it was really disappointing to learn I lost another friend.

Alison Steeves

So she had originally known and was fine with it, but then later on had told you that she was no longer allowed to hang out with you.

Bliss Behare

Yeah, that's what she told me.

Alison Steeves

Have these measures impacted other aspects of your life?

Bliss Behare

I would say it impacted every aspect except physical. So primarily, social aspects were the hardest, such as losing all the groups that I was a part of. But also financially because my father was put on leave without pay. So as a family, we struggled. And as far as my future, that was also impacted as far as university and just any sort of future plans that I had after high school.

Alison Steeves

And why were those impacted?

Bliss Behare

I was generally banned from universities, and any connections I'd made with people, say like in the art or music world, was cut off.

Alison Steeves

And can you describe a specific day or instance that was particularly challenging in all of this?

Bliss Behare

One of the hardest days for me was when my mom and I were discussing university opportunities. And I was on and off negative about it, but I generally really love education, so I was excited, and we discussed a particular university and we're starting to get inspired by it. But then we went online to look up the COVID policies, and we found that I was banned not just from the physical classroom, but also banned from online classes. So that was disappointing.

Alison Steeves

So at this point in time, with everything up in the air, no indication of when these requirements are going to end, what was your outlook? How were you feeling about the future?

Bliss Behare

I felt like I was in despair. I felt very bleak. I really felt, especially considering there was more threats and more possible exclusion, I felt that there would never be an end to it. And because I felt that way, because I felt like our future, not just personally on my note but as a country, our future was bleak, I did feel fairly suicidal because it seemed that it would never end.

Alison Steeves

Now that many of the measures have lifted and they're sort of less focused on COVID, would you say your life has returned to normal, or would you say that you experience any ongoing impacts?

Bliss Behare

In some ways it definitely has gone back to normal, which I'm grateful for. I have a job; I'm going to college and those were things that I wanted. But internally as far as my mindset, I think I'm changed forever.

[00:10:00]

I think I may never ever trust my government again or trust any institution in Canada unless I see justice and restitution. But I'm still grateful for the physical things that have changed, such as the mandates lifting.

Alison Steeves

And I wanted to ask, is there any particular activity that was particularly painful or difficult for you to be excluded from, or were there any particular instances of not being able to participate?

Bliss Behare

The hardest for me was music because for me, and for most people, music is about playing music with each other and collaborating, and it's a very beautiful experience. So my tutor who I had who taught me clarinet for about seven years said we can no longer do in-person classes together. That was very rough for me especially. Also, I couldn't perform at the music festivals or anything like that, too.

Alison Steeves

That was that tutor's personal choice or was it a requirement?

Bliss Behare

For my tutor it was personal choice.

Alison Steeves

Is there anything else you'd like to add?

Bliss Behare

I guess, I would just say that, although in those moments I felt that there was really no hope, having seen the convoy and having seen movements like this, like the National Citizens Inquiry, I am given a lot more hope.

Alison Steeves

Thank you, Bliss. I'll turn it over to the Commission.

Thank you.

[00:11:38]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 2

March 17, 2023

EVIDENCE

Witness 14: Joe Behare

Full Day 2 Timestamp: 08:16:38–08:33:00

Source URL: <https://rumble.com/v2djjsi-nci-truro-day-2.html>

[00:00:00]

Ches Crosbie

Mr. Behare, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Joe Behare

Yes.

Ches Crosbie

Thank you.

Alison Steeves

Can you tell us your full name, where you're from, and your occupation?

Joe Behare

Joe Behare. I'm from Baie Verte, New Brunswick, and I'm a civil servant in the federal government.

Alison Steeves

And how long have you worked for the federal government?

Joe Behare

Twenty years.

Alison Steeves

The same department or you moved around?

Joe Behare

I did one brief stint in another department just during COVID.

Alison Steeves

So primarily in the same department?

Joe Behare

Yes.

Alison Steeves

And you were in this position in 2020–2021?

Joe Behare

Yes

Alison Steeves

How would you describe your experience working there prior to the pandemic and up to that point?

Joe Behare

It was positive, you know. I enjoyed my job. I had become a manager in my department and built up some good relationships both with colleagues and with clients. So it was very positive.

Alison Steeves

And in 2020, as you began to hear about COVID-19, were you concerned?

Joe Behare

With COVID? Again, not for myself. Maybe for others like my wife and my mom, but not overly concerned, no.

Alison Steeves

So when the vaccines became available, did you take one?

Joe Behare

No.

Alison Steeves

At what point did you realize that your decision not to take the vaccine might cause problems for you?

Joe Behare

I didn't— Right up until the time that I was put on leave without pay, I didn't believe that—I couldn't believe that anything would be done that I would be negatively impacted.

I did see that there was a lot of negative stuff in the media and even in personal interactions that I'd had. But I didn't think, you know— I didn't think I'd lose my job.

Alison Steeves

And do you recall when the federal government announced the mandates for federal workers?

Joe Behare

I remember my wife saying she'd read something in the paper about this being talked about sometime in September—I guess, or so—of 2021, maybe October. I don't remember when the election was at that time—sort of right after the election.

I remember saying to her, "There's no way that's going to happen. I've got a union and we have courts in this country. We've got a Charter of Rights. They can't do that."

Alison Steeves

So you weren't concerned?

Joe Behare

Not really, not at first. Not when I heard that, no.

Alison Steeves

And the time that they officially announced the mandate, were you working in the office?

Joe Behare

No, at that point nobody was. At that point I was on a secondment agreement with another department and the office was in Dartmouth. I was in Baie Verte. It's a two-hour drive away, so there was never a question of being in an office. We were all working remotely at that point.

Alison Steeves

And did you inquire as to whether you'd still be subject to the mandate even though you were not going into the office? Did you request accommodation on the basis that you were not going into the office?

Joe Behare

Yes. I mean— I did sort of— I did try and make a case that this was not a matter of workplace safety, and so there was no rationale for a mandate. There was some case law as well by that time that sort of backed up my point. I didn't expect to be accommodated, but I still made the case.

Alison Steeves

And what was the response?

Joe Behare

“Sorry, this is the policy. There’s no accommodation.”

Alison Steeves

Had you offered to do anything such as masking when you go in, or social distancing?

Joe Behare

Sure. I did note that we were working remotely. But if I was required to go in the office, I said, “I’ll do tests. I’ll do tests at my own expense. I’ll wear a mask, et cetera.” Everything like that.

But that wasn’t the point of the policy. The point was to try and coerce you into taking the vaccine. So it wasn’t about being healthy or public health, that wasn’t what it was about.

[00:05:00]

Alison Steeves

So you offered to do testing as well and still—

Joe Behare

Yes, if I ever had to attend at the office—which, by the way, I never did.

Alison Steeves

So you were ultimately placed on leave without pay?

Joe Behare

Yes.

Alison Steeves

And can you tell us a bit about the day when you were placed on leave?

Joe Behare

So the day was November 17th and that was to be my last day.

I remember working in the morning to finish up doing something and then sort of leaving— Or thinking that in the afternoon I would take some correspondence, some personal emails, some phone numbers, and contacts off of my computer and from my files at work. I’d kind of planned to do that: that’s why I didn’t do it in the morning, because I had other things to do from a work perspective.

But then, when I went to do it, I was completely locked out of the system. My phone was wiped. It was almost like I was cancelled. So I couldn't get any of those things done. I didn't have any access to things like my leave balances or, even later, any of the HR stuff I needed like T4s, stuff like that.

Alison Steeves

So they had locked you out before you had even left?

Joe Behare

Yes. But they did it in such a way it was very, kind of pre-emptive. They didn't even wait till the end of the day. I assumed I had until the end of the day, which would have been four o'clock.

It felt very punitive that it was done in that fashion.

Alison Steeves

And how were you feeling that day and that night after being placed on leave from this job you'd been working at for 20 years?

Joe Behare

I mean, again, like I said: I didn't believe it would happen until it happened. People were telling me, "Oh, there's no way they can do that. Don't worry. That's not going to happen." But by then, I thought that it would happen.

So it felt very— It felt real when it did happen. The aftermath was quite— It was probably the most shocking day to realize that I was in fact left without pay and just at that time of year too.

Alison Steeves

Are you unionized?

Joe Behare

How do you mean?

Alison Steeves

Do you have a union, sir?

Joe Behare

Oh, yes. Yes. Sorry, I thought you said something else.

Alison Steeves

No. And did you talk to your union about filing a grievance?

Joe Behare

Yeah, so at first, the union declined to represent people like me. They said they were in agreement with the policy. But a bit after that, there were a few cases that came through in the courts that basically said workers were working from home; it wasn't right that they be subject to a mandate; that the employer didn't own them. And, you didn't sign away your rights when you've signed a labour contract.

So the union kind of changed its mind and said it would represent us on a case-by-case basis. And I filed a grievance at that time against the policy. So that would have been early December.

Alison Steeves

Have you had any results from your grievance?

Joe Behare

No, and it's been over a year. Obviously, everybody is dragging their heels on it. Even though the collective agreement has set time limits for responding to first, second, and third level grievances, they didn't respond. They still haven't responded to the third level grievance. I kind of didn't expect anything from those grievances. I wanted to take this to a labour relations board, but the process is that you had to go through the first stages of grievance.

And like I say, the whole process should have lasted, according to the timelines, maybe a month and a half or two months. It's been probably 14 months, and I still haven't got a response to the third level grievance. So obviously they're trying to sort of drag it out and hope that I go away and get tired of it.

Alison Steeves

So when you went on leave, how long did you think you would be on leave for?

Joe Behare

Seven months.

Alison Steeves

That's what you expected?

Joe Behare

Oh, I didn't know how long it would last. I expected that that was the end of my job. But I kind of—as I said, I didn't do anything other than file the grievance. I didn't quit.

Alison Steeves

Right, so you were on leave, you weren't expecting to go back, but you had no idea when you might be able to go back if you wanted to?

[00:10:00]

Joe Behare

Right, if I wanted to.

Alison Steeves

Were you receiving any pay at this time?

Joe Behare

No pay or anything like that, no.

Alison Steeves

So did you eventually get any other income during this time?

Joe Behare

I did eventually get another job—a five-month contract—with a company in Ontario. I worked remotely and that was some time in February. So that was good. It didn't pay as much but I liked the job and I liked the people that I was working with.

Alison Steeves

What would you say the financial impact has been of being off your federal government job?

Joe Behare

I mean, leaving aside the fact that I was working at that other job, which kind of defrayed a little bit of the financial impact; it was sort of the equivalent of being fined \$60,000 or \$70,000, right? That was the income that I didn't receive during that time.

Alison Steeves

This alternative job, it was significantly less?

Joe Behare

Yeah, it was less. I mean, that put a dent in it. But we went through our savings quite a bit. Also, all through the months of November and December of '21 and January of '22, we were without an income.

I was looking for work, but it was hard to find work at that time—especially if you were unvaccinated. So, I didn't know. You know, that's when we were going through our savings.

Alison Steeves

Did your decision or your views on this matter impact any friendships or relationships with family at this time?

Joe Behare

Unfortunately, yes, it did. Because, as I said, some friends were very supportive, but others were not. I can't really unsee that now. People who thought that it was okay for this action to have taken place, and to me, I can't forget that they felt that way. I had some arguments with family members as well, and that's kind of put a strain on our relationship.

Again, people want to get past it now and say, "Oh yeah, that was then, but get over it." But I can't unsee what I saw. Yeah.

Alison Steeves

Would you say that the vaccine passports had a significant impact on your life in any way?

Joe Behare

I wasn't able to easily travel. For example, my mom is elderly and not well. She lives in Ontario, so I couldn't hop on a plane to see her. I did go by car a few times, but there was always the worry that you'd get stopped at the provincial border to check your passport and things like that. So there was that: the inability to travel on public transportation. I couldn't visit my daughter, who lives in the States.

There was this feeling of social exclusion as well, which was kind of harsh.

Alison Steeves

You're in a small community, correct?

Joe Behare

Yes.

Alison Steeves

So did you feel the impact within the community?

Joe Behare

Yes, especially in the small town that's right near us. There was this one incident: My wife was on this group for the Green Party, and she made a point about unvaccinated people being sort of excluded and how that was—And how the candidate should be standing up for them as well. Somebody posted, "Well, you know, Meg, we all know you're unvaccinated and I saw you at the market the other day with no mask on," it's an outdoor market, "and it's disgusting."

It's quite hurtful in a small community to have people call you disgusting.

Alison Steeves

So during that time that you're on unpaid leave indefinitely, couldn't visit your mother and ostracized by the community, how was your outlook for the future at that time?

Joe Behare

To echo what Bliss said, I felt very— I felt alarmed at what was happening in our country, and I felt like the fact that seeing people going along with this in a public way, but also what the government was being able to do with seemingly no checks from the courts— Or the Charter didn't seem to matter. I was alarmed and had a fairly dark view of what was going on and I could see that other people were too.

[00:15:00]

The mood in society in general that I saw was depressed. It was a dark time. We even talked about: Where can we go that's better than this? Is there any other place?

For the first time ever, I contemplated leaving my country, which was pretty despairing.

Alison Steeves

Is there anything else you'd like to add, Joe?

Joe Behare

No, I mean, just that I think— I think that it's great what you guys are doing here, giving people a chance to go on record and say what has happened. As we move on from this, we run the risk of forgetting what actually—how it was in the darkest time. So it's good to just put it on record and remember. So thank you for the opportunity.

Alison Steeves

Thank you. I'll turn it over to the commissioners. Thanks very much.

Joe Behare

All right.

[00:16:22]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

EVIDENCE TRURO HEARINGS

**Truro, Nova Scotia, Canada
March 16 to 18, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 3

EVIDENCE

Witness 1: Dr. Laura Braden (Parts I and II)

Full Day 3 Timestamps: 00:07:15–01:19:09/01:42:38–02:17:05

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

PART I

[00:00:00]

Ches Crosbie

Dr. Laura Braden, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Dr. Laura Braden

I do.

Ches Crosbie

Thank you.

Nicolle Snow

Good morning, Dr. Braden. Thank you for being here to give your testimony.

Dr. Laura Braden

My pleasure.

Nicolle Snow

Now, I know that you've prepared a detailed slideshow. And you're going to start with your qualifications, training, and experience. So I'm going to let you get right into the slideshow. I'm going to try not to interrupt. And if I do from time to time, it will probably just be to explain in simpler terms because I know you have a complicated slideshow. So it may be just to explain in simpler terms what you're talking about or to have you do so. So I'm going to go ahead and let you take the floor.

Dr. Laura Braden

Thank you. And again, it's a pleasure for me to be here today.

Yes, so my name is Dr. Laura Marie Braden, and I have a doctorate in molecular biology with a focus in molecular biology, cell biology and transcriptomics, genomics, functional immunology, proteomics et cetera. So my education and experience started with a degree in cellular molecular biology. I then did another one in neuroscience because I just couldn't get enough of school and that was followed by a doctorate, as I mentioned, at the University of Victoria in BC, which is my home province.

In my doctorate, I specialized in molecular immunology, with a focus on host parasite interactions. Really understanding the interface between host and pathogens, and these pathogens included virus, bacteria, and parasites. And I used techniques in molecular biology to get a better sense of these interactions. These techniques included transcriptomics, so learning how RNA expression impacts this; genomics, so the genes; functional immunology, so really getting a sense of how cells in the immune system interact with hosts and parasites; and histopathology, microscopy, et cetera.

I was then recruited to come to PEI, the East Coast, and that is my home province now; I'm a proud Islander. And I did my first post-doctoral fellowship in pathology and microbiology. I did another one again in immunology, again really focusing on understanding how the host and the parasite or the pathogen interact. I then got my big girl job—you say that after you do your postdoc—with a private biotech firm. But I maintained a tight connection with the academic world because teaching is a passion of mine; communicating science is a passion of mine. And I had an adjunct—there's a spelling mistake there, I apologize—an adjunct professorship in the faculty of veterinary medicine in pathology and microbiology.

So getting into what my career was up until 2021: I was the senior research scientist and program lead in molecular biology and biotechnology. I was in charge of development of novel biotechnology solutions, genomics, transcriptomics, again histopathology, functional immunology. And a really important piece of this, which is what I'm going to focus on a little bit later in my talk, is that I have an extensive experience in the GLP environment. And what that means is good laboratory practices, which is what regulatory compliance is all about. So, I know what it takes to go through a proper rigorous regulatory compliance approval process with the FDA and the Health Canada. And so, I have familiarity with regulatory compliance processes, the approval process of new products, and most importantly, what quality control and quality assurance means.

Nicolle Snow

Wow. Okay. Great. So we're in for a science lesson today.

Dr. Laura Braden

Yes. Okay, so number one—I already mentioned it's an extreme pleasure to be here. You know, as we got through the beginning of the COVID crisis, from the very beginning there were red flags for me. And as someone with the understanding and education of, number one, how to read science. Science is hard to read, scientific papers are hard to read. It's very exhaustive. But with our training, we learn how to do so. I know how to interpret data; I know how to read data. And so, things were popping up that didn't sit quite right. So it was sort of a professional obligation of mine and those in my profession, I feel, to question the,

quote-unquote, science. Because that's what scientists do: we never stop questioning. Until 2020.

[00:05:00]

I'm going to highlight a few things here in the slide and then move on. There's a lot to talk about. With the brevity and in the interest of time, I would like to focus on a few things.

The first ones I've highlighted here. So number one, at the very beginning, there were genomic sequences that were published on COVID that contain some very interesting inconsistencies with the whole concept of natural origin. I also want to talk a little bit about **masking and the inconsistencies in the scientific data to support indiscriminate masking of** healthy people, asymptomatic spread, and also the use of PCR. I use PCR every day of my life in my career. I troubleshoot PCR. I was talking with the technical support teams of the major biotech firms who were supporting PCR in my lab: I know how to use PCR. And I have some things to say about that. I'm not going to go too much into it, but there was also this demonization of early treatment strategies to control the virus. Never before have we never treated the virus. You always treat the sick people; you don't send them home. And there was this demonization of early treatment strategies with safe generic drugs that was very upsetting and inconsistent with science.

And finally, I want to point out the last piece here. This whole concept of this novel technology that, in my opinion—which was my initial and very adamant concern—that there was a lack of quality assurance and quality control to ensure there was no contamination in these products. And I fail to this day to see rigorous testing to demonstrably justify its widespread use.

So I'll move on. The first thing that I saw was early sequence data in 2020 that indicated there were novel genetic inserts in the sequence. And what that means is— We were told from the very beginning that this was a natural born virus that was a zoonotic, so it transferred from a bat to a human. They published the sequence in January of 2020, and then a paper came out, a preprint. So because there's so much data, we have to get the data out as fast as possible. Preprints are when the authors want to get the information into the realm without going through the exhaustive process of peer review, which can take many months. So a preprint, you have to keep in mind, hasn't gone through the rigorous testing of peer-review process, but it's open science: They want comments. They want to get a discussion going, which I will emphasize is the tenet of science. It's open discussion and discourse. So they want to get this done.

Okay. There was an early sequence analysis indicating there were these interesting novel genetic inserts. And this caught my attention because these inserts showed significant **similarity to HIV-1 sequences that were never present before in coronavirus. And that was very interesting to me as a scientist, and I wanted to talk about it. And I was, of course, silenced from my peers, saying this was ridiculous. These sequences, I'll show here. This is a 3D generation using bioinformatics tools that you can put in a sequence of a protein and you get a rendition of what this protein looks like. So this was the spike protein from this paper. This is the paper from Pradhan et al. Uncanny similarity of unique inserts in the COVID-19 spike protein to HIV-1, gp120, and Gag. And that's just a lot of talk, saying we found similarities in COVID to HIV. That's interesting. Let's talk about it.**

The really important piece of this, of course, is that these sites that they found are the sites I've highlighted here in red—that are the binding sites. These are the binding sites of the protein, meaning those are the pieces of the protein that would interact with human cells.

So if those are interesting or different and unexpected, let's talk about it. That might be something to talk about, right? Interestingly enough, those particular proteins that are similar in HIV-1 are Gp120 inserts that facilitate or allow interaction with CD4⁺ T cells. So this was indicating that SARS-CoV-2 could interact with not just the ACE2 receptors, which we've all heard about, but also T cells. And this is a paper talking about it.

Okay. So in addition, they also found the furin cleavage site, and I've highlighted those here in green. These are the furin cleavage sites. They again were not present in any other coronaviruses, so this was an interesting finding.

[00:10:00]

And these also facilitate nuclear transport, and we're going to get into that in a little bit later, but they were different. And they also show that these particular furin cleavage sites were key to pathogenesis. This is what made COVID-19 pathological to humans. So instead of discussing this and engaging in discourse, which is typical of science, this paper was withdrawn over a weekend, and it sort of disappeared into the ether, and we never saw it again. And this was very concerning to me because this contradicts the typical process for discourse after publication. If there's a paper that's published, and there's other authors that have an issue with that, generally what happens is that there's interactions, there's comments, there's letters to the editor, et cetera, but instead of any of that, it was just mysteriously withdrawn.

Nicolle Snow

And so, if I understand what you're saying, Dr. Braden, there's early evidence that the signatures on the virus were man-made or synthetic?

Dr. Laura Braden

That's correct.

Nicolle Snow

And that did not support the theory that it came from bat to human.

Dr. Laura Braden

No. And that evidence continues to accrue. Many papers in the last couple of years have shown that, including a paper by a group of authors that have shown other endonuclease signatures that are recombinant in nature. And so, let's talk about that. And also, there's evidence coming out, of course, in the U.S., about this whole concept of lab-made origin. So instead of discussing these potentials in 2020 as a group of peers, people who brought that up were censored. They were taken down off social media sites. And of course, the papers were withdrawn, which is completely antithetical to science.

I'll move on. So the next thing that really bugged me was how they figured we would stop a mosquito with a chain-link fence. And that's tongue-in-cheek, of course. But it was the indiscriminate masking of healthy people that never made sense. And it didn't make sense to a lot of people. But those of us who worked in Level 3 biolabs, work with viruses, know how these things work. It didn't make sense even more. Yet we saw our colleagues go along with this narrative, which was especially concerning.

So we heard about the masking and how it doesn't make sense in a number of ways. It wasn't supported by science. Public Health said you need to follow the experts and trust the science, and masking is the best way to stop the spread. If you're working with virus, you need to have negative pressure rooms. You need to have flow hoods. You need to have full body suits, proper respirators, not a bedazzled cloth mask. That does not work.

And even then, we know from previous scientific research: this doesn't stop the flu, which is droplets. How could they imagine that masking would stop aerosols, which is COVID? So, it didn't make sense. But then it didn't make sense intuitively. And then large, randomized control studies were then published, one of them being from Denmark, the famous DANMASK study, and then the Bangladesh study. They showed no impact on risk reduction. This is the one from Denmark. And then we finally have, over the last couple years, despite the evidence that they don't stop spread, the meta-analysis by the Cochrane collaboration showing no impact. And I'll quote from the lead author, "The pooled results of the studies did not show a clear reduction in respiratory viral infection with the use of medical/surgical masks." So I'll move on from that.

Nicolle Snow

Just to summarize: it sounds as though the medical professionals who were indicating we needed to wear masks were ignoring this science.

Dr. Laura Braden

They were. So the next point: moving the goal posts, as they did constantly. This one, that there's sick, perfectly healthy people. And what I mean by that is—asymptomatic people were told that they were sick because they tested positive using a PCR test. And it is my professional opinion that this was used by the media and health bureaucrats to perpetuate the fear in people. Public health, again, did not support this assumption with evidence of any kind. It was never proven that asymptomatic shedding resulted in infectious spread. And even the WHO, the World Health Organization, admitted it was rare. One of the biggest studies to sort of conclude that asymptomatic spread wasn't a thing was a Chinese study, this was published in Nature. Out of the 10 million PCR tests they conducted in Wuhan, 300 of those 10 million were asymptomatic. And out of those 300, 190 people already contained antibodies, so they had already been infected.

[00:15:00]

And out of the 300, none—not one person—produced a live virus in the lab setting, demonstrating high cycling of PCR was generating false positives.

Nicolle Snow

Okay, so the false positives were used to support the asymptomatic spread narrative.

Dr. Laura Braden

Correct. And I'll go through that a little bit more in detail here. I will be clear: PCR detects nucleic acid; it does not detect disease. Never before in my training have we used PCR to show that an animal was sick. PCR is a good diagnostic tool that is always followed up with a confirmatory test of some kind. In a virus setting, if you test an animal and it is positive for PCR—and I will also mention here within the realms and the linearity of the test itself,

which is an important part—you always confirm with either a bacterial culture or a virus culture of some kind.

That was not done in this case. Diagnostic tests need to be interpreted in the context of the patient: So whether or not this person already had COVID, if there was a presence of antibodies already in their blood, meaning they already went through the infection and they just have residual DNA because, again, PCR tests for nucleic acid. Do they have symptoms? Are they sick?

It has been shown conclusively over and over again that high cycles over 30 is detecting such low levels of viral RNA, it does not indicate infectivity. And that's what they showed with the China study from the slide before. Viral shedding occurs after recovery. DNA is sometimes sequestered, and RNA is sometimes sequestered by our immune system cells weeks after the virus is gone. Is that what is being detected here? We don't know because they never conducted culture-based methods to confirm the person actually had infectious viral particles. They use PCR cycled at ridiculously high levels, and what I mean by that is the test is only designed to confirm the presence of nucleic acid within a certain range. And that range really shouldn't be considered past 30, 35 cycles. Yet across Canada, provinces were cycling routinely 40, 45 cycles. That is inconsistent with the science, based on the test.

Nicolle Snow

And so that's where the false positives come from.

Dr. Laura Braden

Correct.

Nicolle Snow

These are healthy people that may have had the virus at one point. The signature, if you will, is still in their system. And so because they're cycling is so high, it's magnifying, revealing that signature.

Dr. Laura Braden

Precisely, yes.

And I've mentioned this point previously: PCR detection of viruses is helpful, but it does not detect infectious virus. And this has been shown exhaustively in the literature with many other viruses—that viral RNA can be detected long after the disappearance of the actual infectious virus. And actually, in Portugal, there was a Lisbon Court of Appeal that concluded the PCR test is “unable to determine, beyond reasonable doubt, that a positive result corresponds, in fact, to the infection of a person by the [SARS-COV-2] virus.” And that's very important. This precedent was being set across the world, yet Canada was not following the contemporary science.

And the next slide is an example of a FOIP [Freedom of Information and Protection of Privacy] request, kindly given to me by Dr. Jessica Rose, from the Newfoundland Public Health showing the threshold is 45 cycles. And that to me in my professional opinion is abhorrent. And it's hard to find every single province across Canada, but I know that PEI was cycling to 40, I know that Ontario was cycling to 40, so we can assume the rest of provinces followed the same trend.

Nicolle Snow

And that would not be the standard, to be cycling at that level?

Dr. Laura Braden

No.

All right. So those are the pieces that I wanted to talk about in terms of the mandates.

Now I want to get into the quality control and quality assurance—or lack thereof, in my opinion. For an experimental product, we would expect rigorous quality control and assurance that the product we are receiving is consistent, it is transparent, we know what is in it. The necessary steps to approve this gene therapy, which is what it is, were rushed, incomplete, or simply ignored.

The precautionary principle was thrown to the wayside.

[00:20:00]

For example, there was no genotoxicity studies conducted because they felt it wasn't needed. And I am assuming that by the end of my presentation, you will disagree with that statement. The biodistribution studies that had to be FOIP'ed—because they didn't want us to know where it went—were extremely underpowered and lacked relevance. There was no quality assurance from sponsors. And when I say sponsors, in the regulatory realm that means the pharmaceutical companies of Pfizer and Moderna, they are the sponsors. There was none from them on very important considerations, including the potential for contamination.

This would include the RNA quality—they're injecting RNA, so we expect the quality to be consistent and high—batch composition, protein identification, any of those things. There was no quality assurance about the fragmentation of RNA. RNA can be fragmented. What does that mean? You will learn.

And Pfizer knowingly allowed contaminants, a potential danger. And you will see why.

Finally, the production process lacks fidelity and transparency. What is an injection? How do we know it's consistent from person to person lining up? How do they know that every single injection contains the exact same thing in each lot? We don't know that.

So before I go on, I want to get us all on the same page because there's going to be some technical discussions that I'm going to bring up, and I want to make sure everybody is up here. So I apologize that this is technical. I'm going to try my best to explain this.

The first thing I want to talk about is the process of reading DNA. DNA—so this is a cell. DNA lives in the nucleus: this is the brains. This is the double-stranded DNA. All the red bits here are genes. These are the pieces that make our proteins. When your body or your cells want to express a protein, the DNA is transcribed into RNA. At this point, there's many different processes to snip the RNA pieces. There's height to make it high quality. There's all these little checks and balances in your nucleus. It is then shuttled outside of the brains into the body: this is the cytoplasm of the cell. The mRNA is then translated into protein. The protein is then—so proteins are not single-stranded, they're globular. There's many domains: primary, secondary, tertiary domains. All that happens, folding, and then you have your protein.

Nicolle Snow

Can I just summarize what you said to see if we've got that. So you basically explained the process of converting the DNA into mRNA, which happens in the nucleus, the brain of the cell. Then the mRNA is converted into protein. And I know you use different words for that. But that's essentially what's happening within the cell.

Dr. Laura Braden

In a very simplified version, but yes.

Nicolle Snow

Great.

Dr. Laura Braden

Correct. All right, the next lesson: What is a plasmid?

A plasmid, you may have heard about a plasmid. What is a plasmid? What is a vector? It's a piece of DNA that can be used to transfer foreign genetic material into cells. So in molecular biology if we want to express or we want to produce a protein, we can take the piece of DNA that we want. In this case—let's say it's a virus DNA—we want to express the spike protein. We use molecular scissors to cut that gene out of the DNA. And then we insert it into this plasmid or vector, the red part. And so, you can see here, we can insert the gene of interest into the plasmid and use molecular glue. That's a simplification, but it's literally how it works to glue those pieces together. Then we have this plasmid that is a circular DNA. And we can transfer that into bacteria.

Plasmids live in bacteria, ubiquitously in nature. That's where they're from, bacteria and archaea. And there's some very important characteristics of plasmids. Number one, they can replicate on their own. They often contain genes of interest that will help bacteria survive. So if you've heard of methicillin-resistant staphylococcus aureus, MRSA, that's because they've attained antibiotic resistance from a plasmid and now those bacteria are resistant to those antibiotics. This is a very important characteristic.

Also very important, the double-stranded nature—so these are double-stranded—makes them stable. They do not degrade easily, and they replicate easy.

[00:25:00]

Okay. So just to recap: You want to express a protein of interest. You cut it up, you put it in a plasmid, and you put the plasmid into bacteria, and you grow the bacteria up rapidly, and you get many, many copies of that plasmid.

Nicolle Snow

And that's how you're making spike mRNA.

Dr. Laura Braden

That's right. So now: How did they make the spike injectables?

So we've got our plasmid that has our piece of spike in it. They're transferred to *E. coli* here. So these are the little plasmids. They're transferred to the *E. coli*. They're then fermented or grown rapidly in vats: hundreds of litres of bacteria growing in media that they like. They have all their nutrients. They're growing rapidly. With them, their plasmids are growing. Then, we can harvest. This is from Pfizer. I should mention this is the process detailed from Pfizer itself on how they made these injectables. So then they harvested the plasmids: you break apart the bacteria and you harvest the millions and trillions of plasmids. Then you need to cut up the plasmid because you need to get the DNA out, the red piece, the spike protein DNA. So, they cut them. They linearize the plasmid; that's an important piece.

They then use something called in vitro transcription. So if you recall what I said, transcription is when you go from DNA to mRNA. So in vitro, meaning it's in a tube—this is not in a cell—they add the DNA that they've now taken out of the plasmid. They add a bunch of enzymes and things, and they are looking for this mRNA: this is what is going in the injections. They then purify. All of these pieces, I should mention, by Pfizer's own lips: this is intense rigorous testing to ensure there's no contamination in every one of these steps. That they've linearized all the plasmids. That they've turned all the DNA into mRNA, and if there's any that's left—under their words—they digest it. They get rid of it. They purify the mRNA so that all they have is that mRNA for spike protein that they then add to the lipids to make our delivery mechanism then—the lipid nanoparticles with mRNA.

Nicolle Snow

Okay, can I summarize that? I'll try.

Dr. Laura Braden

Please.

Nicolle Snow

I regret skipping science class now. So the bacteria, or the plasmid, is used for replicating the DNA.

Dr. Laura Braden

Correct.

Nicolle Snow

Okay. And once it's replicated, that is supposed to be filtered out. The plasmid or the bacteria is filtered out, leaving pure DNA. Then the DNA is converted into the mRNA using the process that you showed us earlier happening in the cell.

Dr. Laura Braden

That's right.

Okay, so now that we're all at the speed on that, what did they tell us? They being the sponsors, Pfizer and Moderna: What happened during injection?

So they told us— Okay, so here's the lipid nanoparticle. You can just blow this up, please. And they injected it into the deltoid, and it stays in the deltoid: that's what they told us. And

at that point, in cells of the muscle in your deltoid, this is a cellular rendition of what is happening. So I'm just going to use my laser pointer here to show you.

This is the lipid nanoparticle with mRNA. It is taken into the cell here. This is the cell. You recognize the nucleus, here's the nucleus. The delivery of these mRNAs are turned into spike protein. Some of the spike protein is cleaved, proteolytically cut up into tiny little bits. Some of it is taken to the outside of the cell. The end result is—spike and spike peptides, or tiny bits of spike protein, are exposed to the immune system of the person to induce production of antibodies specific to those peptides or protein fragments, thus inducing immunity. This is what they told us would happen.

And based on data that has accumulated over the last few years, data that has been the result of FOIPs—or court-ordered discovery of documents that were otherwise going to be hidden from the public for 75 years. What we can say is happening is number one: the injections do not stay in the deltoid. And this is based on data that was under a Freedom of Information request by Dr. Byram Bridle from a study that was conducted in Japan. The distribution of these LNPs go throughout the body. That is clear. They go into very sensitive organs. They do not stay in the deltoid. And not only do they go throughout the body, but they accumulate.

[00:30:00]

What do I mean by that? That means that over—I'm going to just highlight here some tissues that are sensitive: liver, adrenal glands, your spleen, ovaries. Over time—

Nicolle Snow

One moment. I just want to make sure we're still streaming and everyone can see, so we'll just pause for a moment. Okay.

Dr. Laura Braden

Over time in these sensitive organs that I've highlighted in red, the LNP— So this is a distribution study where they radioactively labeled LNPs, and over time, were able to quantify where they went. And they show accumulation over time in these sensitive organs.

In addition, this study was based on a single dose injection. So based on this study, Pfizer concluded that it stayed in the arm. It is not relevant to the true vaccine regime: Because there's only one injection, it is not biologically relevant. They didn't do a second injection and see if there was further accumulation. They just looked at a single injection, and I'll tell you the number of rats in this study was three. For every time point, they looked at three rats.

Now, one of the most concerning pieces from this data set is with respect to the ovaries. So Dr. Jessica Rose took this data and plotted it. And you can see here that, after 48 hours, it continues to go up. This is the LNPs over time: The x-axis here is time. The y-axis here is concentration. Over time, it accumulates in the ovaries of rats. Why did they stop at 48 hours? Why wouldn't they continue until it plateaued, like what would be scientifically rigorous and ethical? They stopped at 48 hours. So, we aren't able to see what would happen. But if you were to take this and extrapolate based on the degree of increase from the data to 48 hours, this is what might be happening. But we don't know. So we have to just base this on our own integrity. Again, why was this data only shown in 48 hours? Sample size of three.

And importantly, this study was done in a non-GLP environment: the only study from the Pfizer dossiers that were not done in accordance with regulatory compliance, which is necessary for this type of approval process. They did it in a non-GLP: meaning none of the processes were vetted. They weren't under strict operating procedures. That's a huge concern for someone who came out of that environment.

Nicolle Snow

Is that a quality assurance issue?

Dr. Laura Braden

A huge quality assurance issue in my opinion, yes. So that was the first thing that we know is happening.

The second: spike peptides share significant similarities to human proteins. Now, what do I mean by that?

Remember this picture here, how the spike protein in the cells of the body is either cut up with tiny little scissors and taken to the outside of the cell or full proteins are taken to the outside of the cell. When proteins are cleaved or cut up, the results are peptides. All proteins have peptides that make up the larger protein, and they all share similar peptides when you cut them. This is a very simplified explanation, but the point I'm trying to make is— There is a huge concern for the development of autoimmune conditions when the body is instructed to create antibodies against a peptide, in this case spike, that shares very strong similarity to human proteins. There is a huge concern for autoimmune development in that case.

Nicolle Snow

And so, the concern is that the spike peptide will be attacking human protein because it's so similar?

Dr. Laura Braden

Very close. The concern is the antibodies produced by the recipient, by the human, will be against peptides that are also in spike—but also endogenous, also in the human. They share similarity to human proteins. And 27 of those share similarity with proteins involved in fertility and development of the fetus.

Nicolle Snow

And so, what might that mean?

Dr. Laura Braden

That would mean that the body will be producing potentially antibodies against proteins that are critical for human development.

[00:35:00]

And that is a concern that should have been addressed, in my opinion.

Nicolle Snow

So development of the fetus might be seen as a foreign body.

Dr. Laura Braden

Correct. Placental development, decidualization, all those things that are critical components.

Nicolle Snow

And that could lead to miscarriages?

Dr. Laura Braden

It could lead to a lot of things that I wouldn't be able to speculate on. But that should have been done. That is part of the quality assurance that wouldn't have happened. Those are studies that needed to be done.

So, I'll recap: Not only are the LNPs going to important tissues such as ovaries—and we're seeing data in real time right now that they also cross the placenta, that's a big concern—but then the proteins that are being expressed share significant similarity with human proteins.

Nicolle Snow

Is it possible the manufacturer may not have known that?

Dr. Laura Braden

In my opinion, there is no way that they wouldn't have known that. This is part of rigorous primary research that would have happened in a room full of very, very well-paid scientists over many months. Anybody in first-year biology can put in the sequence of the spike protein and find out what similarities peptides would share.

Nicolle Snow

Thank you.

Dr. Laura Braden

What else do we know? We now know that unlike what Pfizer and Moderna have said, the spike protein and the mRNA enter the nucleus or the brains of our cells. There was assurances that this wouldn't happen, but recent reports show the nuclear presence—so again, where the DNA in our cells live, that spike protein and spike mRNA localize to the nucleus. And my question is: Why is this research being done three years after the rollout of these injectables?

And this is the paper. So one of the conclusions from this paper— And if you recall, one of the pathological characteristics of spike protein is the presence of the furin cleavage site; it's one of the things that make it so pathogenic to humans. It is also a nuclear localization site, meaning that that particular sequence facilitates, helps the mRNA go to the nucleus. And that was a surprise to these researchers. This publication was from January 2023.

Nicolle Snow

That's not supposed to happen.

Dr. Laura Braden

Not what they told us what would happen, no.

Nicolle Snow

Yeah. Okay. All right, so the spike protein that's contained in the injection is landing in the nucleus, which is the brains of the cell.

Dr. Laura Braden

That's correct. And I'll just bring up this, which was on the CDC website: you can go back to the "wayback-when-machine" and find this yourself. Of course, this has been taken down.

One of the things that they say is that these injections do not impact or interact with our DNA. And that is no longer what they claim. And this is a paper showing that—and I want to impress on you—what this means is that the spike protein and mRNA go to the brains. This is the brains right where our DNA lives. And this is showing you a picture of that data. What you're seeing here are cells under fluorescence microscopy. The blue staining is the nuclei; the green staining is the protein, the spike protein; and the red staining is the spike mRNA. And you can clearly see, and this has been replicated, a clear association with the nuclear envelope—so, what wraps our DNA in the nucleus as well as inside the nucleus of the cell.

I'll move on. What else do we know? The spike mRNA is reverse transcribed in human cells, and I will explain what that means. This is happening. So this paper here was published last year. And it was conducted in liver cells: so, this is not in humans, this is in vitro. And it shows that there's intracellular reverse transcription of the COVID injectable mRNA vaccine in vitro in a human cell line. And this is happening as quickly as six hours.

Nicolle Snow

Sorry. Is in vitro in a petri dish?

Dr. Laura Braden

That's correct. And you know, this is not happening in a human. But this type of information is critical. And these are the original experiments that needed to happen because if you see some kind of trend like this, that begs more questions. That's a huge red flag:

[00:40:00]

wait, it's reverse transcribing. And in addition to that— So reverse transcription, for everybody who is listening, is when mRNA is turned into DNA: we are going the other direction now. And this is facilitated by very important enzymes called retrotransposases. And the one that in humans that they found to be associated with this is something called Line-1. This particular enzyme is really important—and you'll notice a trend—to

embryogenesis and development of the fetus, development of people. Okay. And it is being exasperated: it is going up in expression after injection, after exposure to these Pfizer products.

Nicolle Snow

So I think I'm going to try to simplify that. Does this mean that the spike mRNA that we said is landing in the cell is then being converted to DNA, back to DNA?

Dr. Laura Braden

This is saying that is potentially happening.

Nicolle Snow

Yeah, what's happening in that Petri dish.

Dr. Laura Braden

Exactly.

Nicolle Snow

Which would be good quality assurance, I would think, to do that sort of research when you're developing the product.

Dr. Laura Braden

Correct.

Furthermore, in another study they found that that enzyme, Line-1, mediates—so it facilitates—reverse transcription of the SARS-CoV-2 virus into the genome. This is in cells of humans, this is in a Petri dish, these are human cells. This paper is where this could be found. So, the virus is being turned into DNA and going into the genome of the people cells. Sorry, that sounded quite— So, not only is it being reverse transcribed into DNA, but with the virus, it's being reverse transcribed and then inserted into the genome.

So I just want to quickly go back to this picture because I don't want to lose people. This is very important that everybody understands: reverse transcription is when you go from the RNA back to the nucleus. Line-1 is the enzyme that facilitates this. There's others, but this is the main one. And so, the concern is, not only is it going to the nucleus, as we've shown, but **the potential for it to be reverse transcribed into DNA and then furthermore integrated into the genome is there. This is a concern.**

What else do we know?

The products do not contain what we were told they contain. What you are seeing here is from a dossier. This is Pfizer's data showing the RNA integrity of what was being produced commercially. There was some documents that were leaked, so to speak, after the European Medical Association met with Pfizer. They had major objections because they found inconsistencies in the quality of RNA that was being produced for their clinical studies versus the quality of RNA that was being commercially produced and therefore used for widespread inoculations. There was inconsistencies.

And what does that mean? That means that the length of the RNA, the integrity of those messengers that were being injected, varied. It was inconsistent. It varied from batch to batch. And that is unacceptable quality control or quality assurance when you're considering what those things actually do. And this picture shows that. So what we should see here is just a single, very strong peak. This is showing the volume or the quantity of RNA, and it should be a beautiful peak. There shouldn't be any other peaks; there shouldn't be shoulders; there shouldn't be anything like that.

Nicolle Snow

So, the shorter peak is the shorter RNA.

Dr. Laura Braden

Is the impurity. Yeah.

Nicolle Snow

And that's a truncated piece, like that part of the message is missing, as you said.

Dr. Laura Braden

That's correct. So the per cent RNA integrity is not even close to 100 per cent. And it was closer to 55 per cent in some commercial batches. So, if this is true, we do not know what is being made in the cells after they have been injected, and the physiological impacts of this is unknown. There is no way to predict. And every single vial has a different concentration of RNA that's complete RNA. In addition to that—

So I mentioned this was leaked from the EMA. This was raised as a major objection.

[00:45:00]

And the level that was set originally was 70 per cent, which is still interesting that 30 per cent impurity is somehow acceptable. The original level was set at 70 per cent. Because Pfizer couldn't meet that, instead of increasing their quality assurance, they just reduced the acceptable background to 55 per cent. So they are okay with 45 per cent of the injections containing—who knows what.

And I'll quote from the objection: "The possibility of translated proteins other than intended spike protein resulted from truncated and/or modified mRNA species should be addressed."

And I mentioned this— Fifty-five per cent intact RNA is the new acceptable limit. So that's a concern. Truncated mRNA species is known. They are known to be potentially pathogenic. They could have unknown physiological impacts. Our cells have checks and balances to make sure that that message from the DNA to the RNA to the protein has high fidelity: is translated; there's no mistakes; there's no mutations. If this truncated mRNA is then allowed to reproduce in our cells, what is the protein impact of that? What impact does that have on the cell? Are there misfolded proteins? Misfolded proteins are a huge concern. And that's what this is talking about. If the RNA is not intact, what is the protein that's being produced?

And that was the objection raised to Pfizer. And Pfizer submitted some very interesting digitally sort of mastered proof that nothing nefarious is going on or the proteins are what they say they are. And that was just unacceptable because it was digital protein verification. They didn't give actual data to show what those proteins are. There's never been sequencing done on the proteins. There's never been crystallography done on the proteins or any of that—confirmatory steps necessary to show people, to show the public and assure them that those truncated mRNAs are not going to be a problem.

Nicolle Snow

So the truncated RNAs then, they have a partial message. So that's confusing the body or the body is— We don't know what the body is going to pick up from that in terms of messaging.

Dr. Laura Braden

Well, the message could be read. But as I mentioned: so, recall, the proteins are translated and then there's all this protein modification and their globular and all these domains. If it's a partial message, that protein could just be partially—who knows what it interacts with. There's the potential for interactions that we don't know about is very, very high.

Nicolle Snow

Okay, and so it's a matter of waiting to see how that evolves in the body.

Dr. Laura Braden

Yes.

Finally, there has been data in the last month that has been rigorously, in my opinion, confirmed to show the injections contain double-stranded DNA contamination from the plasmids. So if you recall in the process map, and I won't bring it up again: the plasmids were linearized. The DNA is then transcribed into mRNA, mRNA into the injections. That entire process appears to be contaminated. The researchers, Dr. Kevin McKernan et al. and his team, have taken it upon themselves to sequence what is in the vials. Because we were never given sequencing data; it continues to be hidden from the public. So they did it using Illumina sequencing: they did RNA-Seq, DNA-Seq, Nanopore sequencing. They have exhaustively repeated the data. Because the concern is very real, so they wanted to make sure it was what it is.

And they found, without a shadow of a doubt, double-stranded DNA contamination in the injections. They had two vials of Moderna; they had two vials of Pfizer. Contamination was present in all of the vials in various amounts. In addition, they found contamination of plasmids that contained the antibiotic-resistant gene from the original cloning experiments. Neomycin and Kanamycin, the sequences are there for those particular resistant genes. And regulatory authorities have said there is an acceptable limit of contamination by double-stranded DNA. One molecule of DNA for every 3,000 molecules of RNA.

[00:50:00]

What they found is orders of magnitude higher than that, number one. Number two, they found intact plasmids. And I'll show you what that means. If there's no questions to that slide, I'll move on.

Nicolle Snow

No.

Dr. Laura Braden

So this is the RNA integrity plots from those vials, showing shoulders here—again, what are those? We are not sure.

Nicolle Snow

The shoulders is that the shortened—

Dr. Laura Braden

Those are truncated, and in some cases, elongated versions of mRNA.

Nicolle Snow

Okay.

Dr. Laura Braden

So I just want to recall. Plasmids: What are we talking about? They are circular DNA. They are highly transmissible and replication-competent, meaning they can replicate all on their very own. They are used in molecular biology to produce proteins of interest; in this case, it's spike protein. They are often associated with *E. coli*. That was the original bacteria that they were using to reproduce these plasmids. They contain their own promoter. They contain the interest. So here's the promoter: This is ensuring that it is replicated. So it promotes the gene of interest. This is where the spike would be. A bunch of other things. They need to be able to select that those bacteria containing those plasmids are actually containing what they think. And they do that using antibiotic resistance. So if you put this plasmid in a bacteria, you know it contains it because the bacteria will survive in the presence of that antibiotic. And in this case, it's Neomycin and Kanamycin.

So remember this diagram. These are the potential areas of contamination that I have circled here in red. According to Pfizer, the linearization of the plasmids occurred earlier in the manufacturing process. And then after this step, there's rigorous testing to demonstrate they are linear. That is not— There is circular plasmids present in these vials. And importantly, this step is considered by regulatory authorities to be a critical quality assessment, meaning this is a critical point to ensure there is no contamination. I emphasize that because of the importance of what we are discussing here. It is critical.

Nicolle Snow

And I'd like to summarize that because it is an important point. So the bacteria and the plasma that was used to replicate the DNA, we talked about that process earlier—which is supposed to be filtered out—was not filtered out in these samples that the scientists examined from Pfizer and Moderna.

Dr. Laura Braden

There's contamination. Yes.

Nicolle Snow

And that's the contamination you're speaking of. So it's that bacteria and plasmid that is in the injection, which is not supposed to be there.

Dr. Laura Braden

Correct.

Nicolle Snow

Okay.

Dr. Laura Braden

Here are some maps, the next two slides. The only thing I want to impress upon you is that not only are there plasmids present in the vials, but the plasmids are different. There's different sequences. Some have really long spikes, some have different— There's just different contamination. It's not like there's a consistent plasmid in every one. It's not like there's consistent sequences of the double-stranded DNA. It varies.

Nicolle Snow

So that would be from batch to batch.

Dr. Laura Braden.

That's correct. Pfizer and Moderna, same thing.

So, to confirm that the plasmids were what they saw on the sequencing data, they took the vials and they digested all of the RNA out of it so that all they would have left is double-stranded DNA if it was present, meaning plasmids potentially. They then exposed that double-stranded DNA to *E. coli* in a flask of medium. *E. coli* are really good at taking up plasmids, so if there's plasmids in what they just put in there, they will take it up. They then took that bacterial medium, plated it on plates, agar here, that contains antibiotics. If they were to find bacterial growth on these plates, that would demonstrate there were plasmids that were replication competent in those vials, number one; number two, that contained antibiotic-resistant genes. And they found that in both Moderna and Pfizer. And you can see that here with colonies of bacteria growing on these plates.

Nicolle Snow

And how is that important that it's in— And maybe you're going to get to that.

Dr. Laura Braden

What that confirms is that not only were they finding plasmids, they were circular, they were replication competent, and they were able to grow in antibiotic media. Now, if you imagine that those injections are going into the human body. And we know that they go all over the body, including the GI tract, and those plasmids are then—GI tract being your

colon and everything, where you have tons of bacteria growing, that's your microbiome—and those plasmids are replication competent,

[00:55:00]

it follows they could get out and they could get into the bacteria of the human, thus transforming their microbiome with potential antibiotic-resistant genes. That is a huge concern that is unacceptable quality control.

These sequencing results of the contents of injectables found multiple versions of expression plasmids in varying degrees between vials. These are viable. There is inconsistent contamination to which people were not given informed consent.

I realize we are getting up there in time, so I will try to go a bit faster if that's required.

Nicolle Snow

No, it's pretty fascinating, so—

Commissioner Drysdale

We have time.

Nicolle Snow

Okay. Keep going. Yeah, we do.

Dr. Laura Braden

So I would just like to summarize this independent product analysis. And I would also like to say that it is unacceptable that this product analysis landed on the shoulders of independent citizen scientists and that this wasn't done by the sponsors because we wouldn't have known this was the case if Kevin McKernan and his team didn't sequence this. And I will also note, based on Kevin McKernan and his team, that they're trying to reproduce that with the original injectables. This is for the bivalent boosters that they are pushing on our children right now. That is what we are talking about.

Nicolle Snow

So, the contamination that they have identified is in the boosters.

Dr. Laura Braden

This is in the bivalent boosters that is currently being pushed on the public.

Nicolle Snow

And they haven't examined the original injections yet to say whether it's present.

Dr. Laura Braden

No, but they have high suspicions, based on earlier data, that they will find the same thing.

Nicolle Snow

I also meant to ask you whether this might contribute to the wide variety of adverse events we're having if there's so many different contaminants in the different vials, different levels of contamination?

Dr. Laura Braden

Unequivocally, yes.

So I just want to summarize this independent product analysis. They found double-stranded DNA contamination levels at up to, or maybe more than, a hundred-fold higher than acceptable limits. It's important to note: this has been under, for the last months, rigorous community discussion, scientific discourse, trying to reproduce data, trying to get at some very important questions in a way that is transparent to the public. Anybody can go and follow this stuff. They're trying to get it out in Twitter spaces; they're getting it out in their Substacks. Anybody can go follow them. And I would have to say, thank you very much to that team for doing this work.

They have estimated up to 35 per cent, again, being confirmed, of the nucleic acid in each vaccine as being expression vector. And most of this DNA is expression plasmid DNA: again, the plasmid being what was initially carrying out the reproduction of the spike protein. Interestingly, and very important: whenever you have presence of contamination like this, how can you assure the public that there isn't contamination of other bacterial-type associated things, like *E. coli* endotoxins.

So when you're growing up plasmids in *E. coli*, and you get evidence of plasmid contamination, then you must assume through logic that there might be *E. coli* contamination. So *E. coli* contains endotoxins. Endotoxins can cause anaphylaxis, TSS (toxic shock syndrome), among other things. So it's sort of like a canary, right? To see the plasmid present. Again, we don't know. But that's a concern. The plasmids carry antibiotic resistance—again, the potential to transfer that to humans is a concern. And while the bacteria are unlikely to express the spike protein, they can replicate the plasmid. So, the bacteria in our guts, if they get this plasmid, there is absolute certainty that they can replicate it.

Nicolle Snow

Okay, and does that mean that it's questionable whether the body will react properly to antibiotics if they need antibiotics for some condition?

Dr. Laura Braden

That would be my concern, yeah.

Nicolle Snow

Because the body would be resistant to it, to the antibiotic. Okay.

Dr. Laura Braden

So the next really important question that follows— And I'm taking you through this in a way that I've been following it because it's step after step. So the next question that I have: Is this contaminating DNA interacting with our DNA?

In molecular biology, it is sort of a known. It's a known phenomenon that when you have high amounts of double-stranded DNA present, it can enter the genome.

[01:00:00]

And it doesn't need those special Line-1 transposases to help you. It can just do it on its own.

Nicolle Snow

And the genome is?

Dr. Laura Braden

The DNA.

And this happens during cellular division: when your cells are splitting in meiosis and mitosis, this is when cells split into other cells; they grow. It's cellular division, okay? This is known to happen during that process. What are tissues in the human body that are highly divisive, that are dividing all the time? Liver, skin, your intestinal tract, sperm cells, egg cells, bone marrow, lymphocytes, the developing fetus. All of these tissues are under high rates of mitosis. And this is the paper showing transfected plasma DNA is incorporated into the nucleus during this process. So, we know that there's publications showing this. This is a known thing in molecular biology, that the double-stranded DNA can integrate into the genome during these dividing cell processes.

So in this instance, where we have potentially billions and trillions of double-stranded DNAs in the injectables that is contaminating, they are now going throughout the body, we know that. They're accumulating in certain very sensitive areas, we know that. And those sensitive areas are subject to high rates of mitosis. And now we're showing that high levels of double-stranded DNA are present in those injections in highly dividing tissues. The logic follows there's a potential for integration into the genome. Moreover, we know that the furin cleavage site acts as a nuclear localization site, getting the DNA into the nucleus of the cells. In addition, in those plasmids that they've sequenced, they found a sequence and they know that there's a special promoter called the SV40 promoter. And that's a promoter that is used in molecular biology to replicate plasmids because it works so well. It's like a supercharger replication, okay?

It facilitates nuclear entry as well, in addition to being an oncogene. Kevin and his team found evidence of the 72 base pair insertion in this promoter that, as you can see here, has a striking effect on gene expression. So this promoter turbocharges the plasmid replication. **And here is the sequence— And I apologize, you can't see, well maybe you don't want to see the letters. But basically, what this is showing in one plasmid, you see the evidence of the insertion of the 72 base pairs, and the other one you don't. So, it's just inconsistent. Some plasmids have it; some plasmids don't.**

Nicolle Snow

The SV40 is not present all the time.

Dr. Laura Braden

No, the promoter is; the supercharged insertion isn't.

Nicolle Snow

I see. Okay.

Dr. Laura Braden

So what is the SC40? It's a simian virus, that's what it comes from. It's a highly competent promoter sequence used for efficient replication. And the nuclear entry of plasma DNA requires this promoter to get in.

Nicolle Snow

Okay. Is it unordinary that that it would be used in this process?

Dr. Laura Braden

No, it is not. It's a really exceptional way. Way back early—before it's in the injection—that's an acceptable way. That's an acceptable way to replicate plasmids. We're not supposed to be injected with that, though.

Nicolle Snow

Yes, okay.

Dr. Laura Braden

That's supposed to be gone.

Nicolle Snow

That's for a whole entirely different science, not for use in the human body.

Dr. Laura Braden

That's correct.

So I want to just bring this all together. When I'm talking about the abhorrent, abysmal quality control and quality assurance that in my opinion has happened with these injections, it has resulted in every injection being a new event. When you go to the grocery store, you expect your milk to all be the same. When you take a Tylenol, you expect it to be 400 milligrams, not sometimes 900, and not sometimes 300, and not sometimes containing lead. It's quality assurance and control: that is what makes the world go round in **consumerism and commercial products. And that is supposed to be an accepted, sort of, standard and fundamental tenet for pharmaceutical drugs.**

In this case, this is not, in my opinion, the case. Every injection is a new event. You may or may not have spike of various lengths, mRNA of various lengths, double-stranded DNA of various lengths.

[01:05:00]

You have the SB40 promoter: sometimes it contains the turbo, sometimes it doesn't. Sometimes it contains the resistant genes for antibiotics. Who knows if there's endotoxins in there? Who knows where it's going in your body? That's a really important point.

And I wanted to recall, because yesterday— I've been watching this entire testimony. Yesterday, I apologize, I forget the name, but the nurse was talking about aspirating and how they don't aspirate anymore. And how every time someone is injected with one of these products, it either could get into the blood—maybe it doesn't; maybe it stays in the deltoid a little bit, who knows? Because it's not the same for every person. And this on top of it, the confounding impacts of these contaminants, makes it so concerning for me.

Nicolle Snow

So, it sounds as though the process is well outside any kind of reasonably accepted standard.

Dr. Laura Braden

Absolutely, yeah.

Nicolle Snow

And so, and I know you can't speak to whether the manufacturer would have known this, but ought they have known this?

Dr. Laura Braden

One hundred per cent. The onus is on them to know this. The lack of sufficient quality control and quality assurance by manufacturers that every injection is consistent, lacking contamination, and that the necessary checks and balances are undertaken to ensure there is no potential negative impacts on people, was not done.

The injectables are not a conventional vaccine. They are a gene therapy drug built on brand-new technology that lacks the assurances from quality control to ensure that it was consistent and lacked contamination. It enters the nucleus; it doesn't even provide immunity; and it persists in the body for months.

Why does this matter to us? That's why.

In conclusion, things are not what they seem. The origin of the SARS-CoV-2 virus, we don't know. The true numbers of actual infections—this is my personal opinion, based on my professional experience—this has been a CASE-demic. Mandates are justified by trusting the experts. They've never been supported by citations or references and were politically incentivized. Early treatment was treated as pseudo-science despite clear benefit. How many died unnecessarily? And finally, mRNA products are an abject failure. They are not safe, they are not necessary, and they do not contain what we think they do.

Nicolle Snow

Thank you, Dr. Braden. This is fascinating data and evidence. I really appreciate you putting this slideshow together. I want to take a moment because I think the audience and the people watching live stream should know a little bit about your personal story.

Dr. Laura Braden

So I think I've demonstrated fairly well that I've had concerns about multiple facets of the COVID crisis. I live in PEI, where every Thursday, we were told by Dr. Heather Morrison, the chief public health officer, that our children were going to die if we didn't vaccinate them. We were told that there was a huge risk to their health. We were told a lot of things. And for quite some time, I as a professional did not speak out publicly because we saw what would happen to you if you did.

After they started rolling out vaccines, injections, for the children, I decided that I had a moral obligation and a professional obligation to stand up and ask questions publicly. So in November of 2021, the International Day of the Child, I attended a rally in Charlottetown, Prince Edward Island, and expressed my concerns. Of course, back then we didn't know about all of what I just spoke about. But my concerns were with respect to the silencing of early treatments, to the fact that children were not at risk, and all of those things. And in December of 2021, I was fired.

[01:10:00]

I was terminated from my position and effectively cancelled from my career, for this.

Nicolle Snow

You've sacrificed a lot to speak up on behalf of others. And what was your position?

Dr. Laura Braden

So I was adjunct faculty in the Department of Animal Medicine at the University of Prince Edward Island. And I was also, as I mentioned, program lead and senior scientist in molecular immunology and biotech for the private company that I worked for. And at no point—during me speaking out publicly—did I ever mention my employer's name. I spoke as a private citizen with the education to back up the conclusions that I made. And I never once indicated who I worked for or that I was there on their behalf. I was never given any warning. I arrived to work on a Monday morning. My supervisor was there, who flew in from the U.S. They'd never allowed me to speak to defend my position. They escorted me out of the building. I was never given any severance or any of the like. They fired me for degrading COVID to be a bad flu, for calling ivermectin a potential early treatment, and for questioning the safe and effective nature of mRNA injections.

Nicolle Snow

Thank you, Dr. Braden. At this time, we are going to take a break. And we'll have you take the stand again after. And we'll let the commissioners have an opportunity to put some questions together for you; I believe that they will have some.

So we will have a ten-minute break? Ten minutes please, thank you.

[01:11:54]

PART II

[00:00:00]

Nicolle Snow

Dr. Braden, at this time, I'm going to turn you over to the commissioners.

Dr. Laura Braden

Thank you.

Commissioner Massie

Well, thank you very much for your excellent presentation. Full disclosure. My question will be from a base of knowledge. Because all of these nice cartoons she has depicted for recombinant DNA technology and stuff, I did that in my youth. We were the first lab in Canada to do a recombinant DNA experiment with resistance gene in bacteria, so I know that stuff. I was also, during my post-doc, the first lab in Canada to produce what we call a recombinant adenovirus, which is the basis for a number of these vaccines that are currently used in the industry, so I know the technology. And having worked at the NRC, I was also involved in the commercialization of these processes, so I know the scale-up of product from *E. coli* under GLP conditions, as well as the scale-up of recombinant adenovirus. The technology I contributed to develop at the NRC was licensed with a number of companies, one of which is known. It's CanSino. It's a Chinese company that has produced a recombinant adenovirus using our technology. And I know very well what it takes to produce a quality product.

So I have a few questions for you. The first one is— I've been reviewing exactly the same literature as you presented it in a very, I think, clear way for most people. If you look at all of the issues that you raise in terms of the quality of the product, do you think that it's because it was rushed? Or all of the issues that you are presenting can be corrected if the method is properly developed and the assessment is properly done?

In other words, do you think that these mRNA liposome vaccines can be scaled up under GMP process that would be according to the highest standard? Is it possible to do it if you would do the steps properly?

Dr. Laura Braden

In theory, I think that is possible. Putting it into context, with respect to this particular injection, injectables, I do not. And this is the reason: I have yet to see any evidence to support the use of full-length spike as an antigen for the human body because spike is a virulence factor and inherently an inflammatory molecule that has lots of issues. So I could see this being—you know, I'm not sure if that's addressing your question, Dr. Massie—I could see this being something, in theory, the process without rushing the system, with ensuring higher quality throughout the process, in theory, would be possible. My objection is to the gene of delivery.

Commissioner Massie

I have a more specific question about the issue of the double-stranded DNA plasmid that can potentially insert it into the genome. I know it's a recent paper that described the frequency, and I haven't read this paper in particular. So based on what you've read from that, could we anticipate that the frequency could be a concern in terms of what it could actually trigger—in terms, for example, of insertion of the SV40 promoter near potential oncogene. Like we have seen, for example, in the first gene therapy trial with the retroviral vector where they ended up with a fairly high number of insertions that activated oncogene. Is it something, according to what you've read and what we know right now, that is a likely possibility?

Dr. Laura Braden

Yes. In short, yes, and I'll explain why.

[00:05:00]

Like I mentioned, all of this sequencing of what's in the vials and the discovery based on your sequencing, and all the work that they're doing, is really happening as we speak. And if you think about what they're showing to be present, concurrent with this sort of explosion of deleterious adverse responses, such as what they're calling turbo-cancers, and you're seeing degradation of T cell populations and innate immunity suppression in people who are injected. That information and now you have what we're seeing: it's hard not to draw some sort of correlations between the two. It's hard not to do that. And we can't because we need more data.

However, what we know is, what you've just suggested, the SV40 promoter has certain impacts. In some vials, it contains the insertion; in some vials, it doesn't. It's very potentially possible that the double-stranded DNA is getting into the nucleus. Is it inserting? We don't know. Is that impacting on cancer pathways, we don't know. We do know that spike interacts with P53, which is part of the anti-cancer pathways in people. So there's all of these lines of evidence that are all converging. And of course, there's more data that needs to be generated, but it's hard not to draw those conclusions given what we know now.

Commissioner Massie

Maybe I'll just ask one last question. The analysis that was done by the independent researcher with the vial: it was my understanding, and maybe I didn't read that correctly, that in theory you're not allowed to open these vials to do these types of analysis. Is that correct?

Dr. Laura Braden

I can't speak to that. I don't know the answer to that.

Commissioner Massie

Okay.

Commissioner Kaikkonen

I have two questions. I understand that in vaccine research, the placebo used in the non-treatment groups is usually another old vaccine. Do you know what was in the Pfizer and Moderna COVID vaccine placebo? I think many people are assuming it was plain saline?

Dr. Laura Braden

That is the assumption. That is what we're understanding: that it's saline. And they have said it in some of the dossiers that I've read that the placebo is saline.

Commissioner Kaikkonen

And my second question is, can you speak to blood transfusions?

Dr. Laura Braden

I can speak to it from a concern— So I'm not a medical doctor, I've never done a blood transfusion. So I can't speak to it from that perspective. I can speak to it from a concern of the contamination and what is being delivered into our bodies and how the production of spike that we know is existing for up to 15 months, protein present in people who are injected, circulating in their blood. So from a concerned citizen perspective as well as a professional who understands molecular biology, it is of great concern for blood transfusions to not be screened for the presence of both lipid nanoparticles or spike protein. And in fact, as a mother, I would not let my child be transfused with blood unless it was proven to be clear of both.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

Good morning, Dr. Braden. I have a few questions, and my questions aren't as complex. I'm an engineer; I'm not a researcher or a doctor.

With regard to masking, you were talking about the difference between the virus being either aerosol or carried in fluid particles, and you'd said that COVID-19 was an aerosol-type transmission.

Are there any other known viruses prior to this that were aerosol transmission-type viruses?

Dr. Laura Braden

The other SARS, MERS, small RNA viruses.

Commissioner Drysdale

Okay, so that so that's not that unusual. It's not an unusual or a novel transmission.

Dr. Laura Braden

Not to my knowledge.

Commissioner Drysdale

Then I have another question related to that. Was there any pandemic planning done by Health Canada or the authorities in Canada anticipating a pandemic. And was there any investigation at that time as to whether or not a mask would be effective in preventing transmission?

Dr. Laura Braden

To my knowledge, there exists such a document. The publication, you'll have to double check this, it might have been in 2016.

[00:10:00]

And their conclusions were that masking would not help in a pandemic situation.

Commissioner Drysdale

And that was a Canadian report?

Dr. Laura Braden

It was a Canadian report, and I believe that Dr. Theresa Tam might have been an author.

Commissioner Drysdale

Ah. Okay. I have a few more questions, and you know it's been a long time since I've been in school, and I was more in physics and calculus than I was in biology. But just for myself: the reason DNA is so important in my understanding, and I know you'll correct me, but isn't DNA the blueprint that the body uses to create more cells or more tissue. It uses that as a guide? Is that the function of DNA?

Dr. Laura Braden

Correct. So in our cells, we have copies of genomes from both our mother and our father, both of which come together to create us. Those genomes are in our nucleus of our cells—sorry, those chromosomes, we have 46 chromosomes. In those chromosomes, which are tightly wrapped together to protect this very fragile blueprint of our bodies—it's wrapped in protein and other things in the nucleus. And it's protected in the nucleus because it is, number one, so important. We don't want deleterious mutations. We don't want things interacting with our DNA. It's housed in a very protected area to facilitate that. And because mutations, anything like that, we don't want to pass down to our offspring. And that's very **important when it comes to mutations or anything interacting with our DNA, which is why genotoxicity studies should have been done.**

Commissioner Drysdale

Yes. So again, just so I can repeat that. What you're saying is that the reason this is so important that you're finding that these particles are showing up in the DNA, is it's essentially, or could be potentially, putting instructions in there that wasn't before. So instead of when it goes to grow a new cell in the body, it's got new instructions and that cell isn't the way it was originally intended to be.

Dr. Laura Braden

In theory, we're following the trail of logic. Yes. There is a concern for integration of these exogenous non-human pieces of DNA now in our nucleus. We know that high levels of double-stranded DNA will insert on their very own, and there's a couple of other things that I've shown that are concerning in terms of the potential for integration. Now why is that important? Well, if these things are happening in germline cells such as sperm and egg cells, which we show the LNPs in the distribution of these injections go to, and this is happening in those cells, it is potential that that could be passed on to our offspring.

Commissioner Drysdale

Yes. I want to switch around a little bit.

Dr. Laura Braden

Again, can I finish? That it is a potential. I'm not saying that that is happening; nobody is saying that it's happening. But that is why these fundamental studies need to be done because that is a concern. So to evaluate that concern, you have these baseline studies and that was not done.

Commissioner Drysdale

So essentially, we jumped off the cliff without knowing what was at the bottom.

Dr. Laura Braden

With no parachute.

Commissioner Drysdale

With regard to the PCR testing: everybody's talking about that, and I've heard many medical people talk about the cycling. As I understand it, the PCR tests, some people called it a genetic replicator. And when you talk about cycles, is the cycles— Does it have a linear effect or is it an exponential effect? In other words, if I do one cycle or if I do two, is two cycles twice as many, or is it exponentially?

Dr. Laura Braden

It's exponential replication of nucleic acid. Every cycle, there is a doubling. So if you have n equals cycle, it's two to the power of n . So, if you, for example, run a PCR test for 40 cycles, and you started with one molecule of DNA, you will have two to the power of 40 molecules of DNA at the end.

Commissioner Drysdale

Right. So the cycling from 30 to 46—I just want to make sure everybody understands, as I understand your testimony—isn't just simply that it's 20 per cent higher, it's—

Dr. Laura Braden

Two to the power of 16.

Commissioner Drysdale

My next question I think was answered, and that was you were talking about—I was writing them down as you were speaking— But you were talking about how the vaccines were originally intended to be intermuscular, in other words, they weren't to be inserted into the circulatory system. And you said that there was evidence that it was getting out into all other parts of the body.

[00:15:00]

And my question had to do with aspiration. And if we're not aspirating, how much of that might be because of that as opposed to it just getting out?

Dr. Laura Braden

That is exactly one of the concerns. And that is from nurse to nurse, from high school student in some cases, you know whoever is giving the injection, the technique will be different, the potential will be different, and that is why it contributes to every injection being a different event.

Commissioner Drysdale

Okay. In the testing that Dr. McKernan that you had referenced? Was he testing from different batches of vials? I think you said they used two vials?

Dr. Laura Braden

Two vials from the same lot.

Commissioner Drysdale

From the same lot. So it didn't really indicate necessarily with the variation between lots. And am I correct in asking or assuming that these vials were also produced in different facilities? It wasn't just one big giant— Not for the testing, but the vials that were out being used in the public. Were they being manufactured all in one giant facility?

Dr. Laura Braden

From how Pfizer describes it—and there's a great article in the New York Times that worked with Pfizer to give a really nice overview of how they make their products—certain processes are limited to one facility. So for example, in the U.S., that's where all the plasmid is made and then linearized. And then that product is taken to another facility, Andover, for example. And then another facility, and then they come back for quality assurance, loosely termed. But all of the one process, is my understanding, happens in the same facility.

Commissioner Drysdale

Yes. I've got two questions that perhaps aren't fair—but I want to ask you because I want to know, and I think a lot of people here want to know.

From what I was listening to from your testimony, it appeared that there were massive failures or omissions in the initial conceptualization of the research. And then on top of that, there were massive failures of quality control in the manufacturing process. And then there were potentially massive failures in the actual implementation of putting needles in

arms without aspiration. So my question now is: If that is a reasonable interpretation of what you were talking about, have you ever seen that happen on this type of scale in the pharmaceutical industry or the health industry before in Canada?

Dr. Laura Braden

No.

Commissioner Drysdale

My next question is again a difficult one. Have the companies involved with this research and manufacturing and whatnot have any historic record of doing things that were perhaps not in the interest of the public?

Dr. Laura Braden

It is my understanding that Pfizer is one of the most sued-successfully companies ever in the world: I believe the lawsuits are up in the billions of dollars in litigation for various things that are available in the public sphere. But it is my understanding that that is the case. So, the answer is no, they are not; this is not a new one.

Commissioner Drysdale

I have many, many other questions, as I'm sure everybody in Canada does. But I thank you very much for your time and your expertise.

Dr. Laura Braden

You're welcome. Thank you.

Commissioner DiGregorio

I just have a few questions. Sorry, I keep not getting the mic close enough. And I apologize if these questions have already been asked and answered, and maybe I'm asking the same thing in a different way, but please bear with me.

So you spoke a little bit about the PCR not being a good diagnostic test and that it would always be followed up with a confirmatory test. Is there a confirmatory test for the COVID-19 that you would follow up after a PCR positive?

Dr. Laura Braden

Absolutely. So viruses in their very nature lyse, meaning they break up cells. And I've done this in the lab. In experiments where we've infected animals with a virus, you do a PCR to determine the level.

[00:20:00]

It is a good way to assess quickly if your animal is positive or not. Because you don't want to waste the time for the next step. If there's no virus present, you won't get a hit. And, by the way, we are using cycle thresholds of 30. You then take a sample of the relevant tissue, and you expose that tissue. In this case, it would be either spit or mucus or whatever for virus that's respiratory in nature. And you would expose that to a viral plaque assay, is

what it's called. And if there were virus present, you could visualize that underneath a microscope because there'd be clearings in your cells. So you would see the virus has lysed and broken open cells. And based on the number of those plaques—because we know that each plaque therefore equals X many virions—so, you can reasonably extrapolate how many virus particles are there. And that would be step two of the PCR to then confirm that there's virus present that is infectious.

Without that confirmatory test, you cannot say—especially when you're looking at asymptomatic, healthy people—that they contain an infectious virus.

Commissioner DiGregorio

Thank you, and do you know if that type of confirmatory testing was done in Canada as part of the PCR testing processes?

Dr. Laura Braden

There is no way that they did that with all the tests. There might have been one or two. I'm not sure if there ever was one. But with the responses that we were seeing and the testing that were being put out within hours, there's no way that they ran confirmatory tests.

Commissioner DiGregorio

And what about the rapid testing kits that people used and that were distributed? Would that have been a confirmatory test?

Dr. Laura Braden

No.

Commissioner DiGregorio

Thank you. I'm not finished, I'm just turning my page. So you've spoken quite a bit about the need for more experimentation and that some of the experimentation that you would expect to see is happening now, but did not happen earlier. And I'm just wondering what the sort of timing is to complete these types of experiments that are now happening and that we're seeing now, and whether they could have been done at an earlier time.

Dr. Laura Braden

We just witnessed within two or three weeks the entire sequencing and analysis of the genetic material potentially in these vials as well as other bacterial-associated assays that I showed you to show presence of plasmid. All of those necessary steps that should be happening within the manufacture process: there's other more eloquent and more high throughput ways to ensure quality, and that could have been done within days. Some of these things to ensure, for example, there's no double-stranded DNA—that's a couple hours. These aren't months out, and they're easy checks and balances, well, maybe not so easy. They're checks and balances that should have been done and are easily attainable with our given technology and molecular biology. These are not things that are out of the realm of possibility.

Commissioner DiGregorio

And so, the manufacturers were not— This is not testing that they would have performed as part of the development?

Dr. Laura Braden

I can't speak to whether they did. This is what the logic trail would make you do, but I can't speak to whether or not they did all those things. What they did claim, what Pfizer has claimed themselves, is that strict and rigorous quality assurances were made at every step along the way to test for these things. They say that. They tested: there was no plasmids. They tested: The double-stranded DNA was digested. The plasmids were linear. It was pure mRNA. The integrity was 100 per cent.

Commissioner DiGregorio

Thank you. When they made these statements that they had performed this testing, did you understand that that was testing on this particular injectable product, or would it have been based on perhaps past study of mRNA technology?

Dr. Laura Braden

This was with respect to this particular product.

Commissioner DiGregorio

And so, you spoke a little bit about reverse transcription, which I don't pretend to understand. But I think you explained it well enough that as a layman I got a general idea of it. And I'm just wondering if this was— Is reverse transcription an issue that was identified as part of the historical mRNA research, or is this something that has only been discovered since the COVID injectables have been rolled out?

[00:25:00]

Dr. Laura Braden

To my knowledge, there's no data pertaining to the potential for reverse transcription in human cells from mRNA technology. I could be wrong, but this is to my best knowledge. All I'm aware of is the first paper that looked at was this last year, which was on the liver cells.

Commissioner DiGregorio

Okay, thank you. I'm just turning my page.

I think you spoke at the beginning about your experience in GLP—you called it good lab practices. And I'm just wondering whether the proper implementation of good lab practices could have addressed some of the contamination issues that you've raised today. Maybe you've already answered this.

Dr. Laura Braden

I think it's a great point to hammer home. In a GLP lab environment, every single thing that you do is run by a standard operating procedure, an SOP. Those SOPs are vetted and assured by the regulatory authorities to do what they say that they're going to do. So

basically, what this enables for is—in a lab environment, every step along the way is consistently done over and over again the same way. You cannot conduct a study in a GLP environment without SOPs that are first concurred with by the FDA. The FDA and Health Canada ensure that GLP-run studies are done in this manner.

It is my assertion that, in order to run a GLP study, all of those SOPs and standard lab practices that are demonstrated to regulatory authorities need to be done. So to get to your question, is there ways where that could have been mitigated? Is that what you're—

Commissioner DiGregorio

Yes.

Dr. Laura Braden

Okay. If it was done in accordance and in compliance, no. The fact that there are these particular contamination signals and others indicates to me that they did not follow, they were not compliant.

Commissioner DiGregorio

Thank you. And one last question, just, if you could give us a— What would you recommend should have been done differently?

Dr. Laura Braden

Could you be more specific? In what aspect?

Commissioner DiGregorio

Well, what we're hoping to take from your testimony is an understanding of what has happened and an understanding of what could be done differently next time.

Dr. Laura Braden

What could have been done differently is that, at the outset of the COVID crisis, scientists could be allowed to talk to each other in an open public forum in a way that would encourage scientific discourse to understand the biological methods at play and how we could, as scientists, work together to make it go away—or to understand the insufficiencies and where data needed to be generated. Because of the censorship and silencing of people who asked questions, that entire discourse was essentially deleted. And that is one of the **most important pieces of this that I need for you to understand: scientists that went against the narrative were not allowed to speak.**

Commissioner DiGregorio

Thank you.

Nicolle Snow

So if there's no further— Is there a question? Oh.

Commissioner Drysdale

These are questions from the audience.

Commissioner Massie

I know we're running out of time, but there's one question which I think— Because you've said that you have expertise in immunology, I think it would be worth it to explain the idea of autoimmune reaction that might occur because the spike proteins share what we call epitope or sequences with a number of our own proteins. Because normally, my understanding is that we don't generate antibody or immune responses to our own protein because this would lead to all kinds of diseases. But why is it that having shared sequences between spike and our protein can actually lead to this process?

[00:30:00]

Dr. Laura Braden

Essentially, the injections are programming our cells to produce a protein that could then be displayed to our immune system on our cells. And they are using these receptors called major histocompatibility factors 1 and 2. And really, that part doesn't matter other than the fact that these receptors are there normally to show pieces of non-self to our immune system. So that our immune system can recognize whatever is attached to that receptor, oh dear, we'd better mount an immune response against it. And there's a number of different receptors that also do the same thing. Because this is so important, immunological responses by their very nature destroy what they're intended to destroy. Often with inflammatory diseases, collateral damage from inflammation that is left unchecked is how we get pathology, immunopathology. In a very similar way, when there are antibodies produced against pieces of our self, we develop antibodies to proteins of ourself, and then our immune system thinks our self is bad and to attack it.

So if the spike protein has peptides or epitopes that are similar to those of our proteins, and our bodies are thinking that they are bad and produce antibodies to them, that is the definition of autoimmune disease enhancement or progression. And in fact, one of the one of the proteins with the highest similarity is a protein called thrombopoietin, which is involved in the clotting cascade. So basically, the take-home message here is: the potential for autoimmune disease progression when the similarities in these proteins are so high is extremely concerning. And I'll finish the thought with— That is one of the basic fundamental tests that you would run when you're trying to decide on injecting people with a protein, if there are similar epitopes or antigens, and that is the biggest concern. That should have been done.

Commissioner Drysdale

There is a question from the audience, and it's a long one, and I'll do my best.

There has been some speculation here and elsewhere around the question: Were the problems associated with the COVID-19 injections reasonably attributable to a rushed process? Under normal circumstances, what would be an expected time period for a novel pathogen to be isolated in sequence, a suitable vaccine to be developed, manufacturing, storage, delivery, capacity to be expanded to produce sufficient vaccine vials, needle shipping boxes, et cetera in sufficient quantity to provide for billions of doses around the world?

Dr. Laura Braden

To my knowledge, 10 to 15 years.

Commissioner Drysdale

I have an additional question, I apologize. If I understood your testimony correctly, you were saying that some of these particles, or some of these revised DNA, were getting into the bacteria within the gut of people. So those bacteria now were carrying, I don't know how to call it.

Dr. Laura Braden

Plasmids.

Commissioner Drysdale

Aren't those bacteria in the gut everywhere? Like, if it's in the gut, is it possible that it's getting into the water supply and they're spreading? Do we know this?

Dr. Laura Braden

The theoretical concern is, absolutely. And no, we don't know this.

Commissioner Drysdale

Okay. Thank you.

Nicolle Snow

Dr. Braden, we thank you for your fascinating and interesting testimony here at the NCI hearing.

Dr. Laura Braden

Thank you and you're welcome.

[00:34:26]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Truro, NS

March 18, 2023

Day 3

EVIDENCE

Witness 2: Dr. Matthew Tucker

Full Day 3 Timestamp: 02:18:44–02:49:16

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Sir, do you affirm to tell the truth, the whole truth, and nothing but the truth?

Dr. Matthew Tucker

Yes, sir.

Alison Steeves

Can you tell us your full name, where you're from, and your occupation?

Dr. Matthew Tucker

My name is Dr. Matthew Tucker. I'm a family and emergency medicine doctor in the Annapolis Valley in Nova Scotia.

Alison Steeves

Dr. Tucker, can you please give us a bit of a background with regard to your work experience?

Dr. Matthew Tucker

I was in the Canadian Armed Forces for 21 years, including almost 10 of those years as a doctor. During most of that time as a doctor, I also worked regular shifts at my local emergency departments in three different provinces.

Alison Steeves

So you were in the military for 20 years, 10 of which you worked as a doctor. Are you now working for the military?

Dr. Matthew Tucker
Yes. As a civilian physician.

Alison Steeves
As a civilian physician?

Dr. Matthew Tucker
Yes.

Alison Steeves
Have you recently also been working in an emergency room?

Dr. Matthew Tucker
I was, during most of the pandemic. I took a break beginning in 2021.

Alison Steeves
And please note, Dr. Tucker's CV is Exhibit TR-13.

What is it like working as a military physician?

Dr. Matthew Tucker
It's great. I hope it doesn't sound overly sentimental if I say, I love the men and women in the Canadian Armed Forces. I have a very high opinion of them.

Essentially, what we do, is we do family medicine, in a military clinic, on a military base. A little bit of what we call occupational medicine as well. It's very interesting.

Alison Steeves
Who exactly are your patients? Is it strictly military personnel or families as well?

Dr. Matthew Tucker
In Canada, it's strictly military personnel. That's quite a large question, actually. Probably beyond the scope of this "thing." In other militaries and other countries, the doctors do look after the families and I wish we did, but we don't.

Alison Steeves
Over the past couple years, have you noticed any concerning trends in your patients' cases?

Dr. Matthew Tucker
Well, I think so. I had a conversation, actually, two conversations. Two different people I asked this question, recently. You know, hallway kind of conversations, at the place where I work. And I said, "Is it just me, or is it all we do these days, mental health things? Is people's

mental health worse than ever?” And both of these people said, “It’s not just you.” They see the same thing.

So in my opinion, this is very subjective; I don’t have statistics at hand, but it’s my opinion that there’s been a mental health crisis, where I work, for the past couple of years.

Alison Steeves

You’ve seen an increase in the last couple of years compared to your prior nine or so years of experience?

Dr. Matthew Tucker

I think so.

Alison Steeves

How many doctors work in your clinic right now?

Dr. Matthew Tucker

Not that many. There’s doctors and nurse practitioners. So maybe six clinicians in total.

Alison Steeves

Do you regularly meet to discuss cases?

Dr. Matthew Tucker

Yes.

Alison Steeves

Do you notice a trend in the cases arising for them, as well?

Dr. Matthew Tucker

I think so. I mean, let’s be clear here. It’s not that mental health issues are “new” in the military; military life has always been stressful for people. But I think it’s been a significant theme in the past couple of years.

Alison Steeves

Do you have any theories as to why you and your colleagues at the military are seeing this increase in mental health issues?

Dr. Matthew Tucker

Well, I do think that a lot of it has to do with the stresses of the COVID restrictions over the past couple of years.

Can I tell you guys a story, a personal story? It’s a true story. When I was a brand-new doctor—this was on a military base in Ontario—my wife and I were shopping for our first

house. We settled on a house and our realtor turned to us and said to my wife, "This is a good choice. This is a good neighborhood for you because 'I'm' going to be away a lot." I don't know why I didn't believe her, but at the end of four years, when we were leaving that place, I had been away from home for 11 months.

So these are the sorts of stresses that military people deal with. I think that every Canadian has had a lot of stress over the past couple of years. Most people report that they were affected by the COVID measures in some way. But I think that military people have particular stresses that affect them particularly. Like having to go away frequently. Like having to move around. And I think that the COVID restrictions were particularly hard during times like that. I think this was a trigger for a lot of anxiety and depression.

Alison Steeves

So the standard COVID measures that applied to everyone would have particular, unique sort of impacts on those who are used to travelling and being away from family, the way that the military would.

[00:05:00]

Dr. Matthew Tucker

I think so.

Alison Steeves

And can you elaborate a bit on the type of symptoms that patients present with when they have these mental health issues?

Dr. Matthew Tucker

Yeah, thanks for asking that actually. I'm sort of passionate about that question because I think that a lot of people, non-medical people— I think they don't know what the symptoms of depression are. Of course, the classic, the obvious symptom of depression is low mood. But there's quite a number of other symptoms that go along with depression and anxiety.

Things like not sleeping, not eating, low energy, not doing anything for fun anymore, feeling bad about things that perhaps aren't reasonable. And so, I've seen a lot of this lately. People afraid to go out in public, afraid to go to work because they're anxious. I've seen a lot of it lately.

Alison Steeves

Have any of the patients you've seen commented on the link to, sort of, the COVID restrictions or the impact of the COVID measures?

Dr. Matthew Tucker

Yes. Certainly, I've heard that sort of mentioned in passing by patients a number of times. I heard it explicitly, recently, because I asked one of them. I said to him, I said, "hey"— I've seen this person, who I've gotten to know as a patient over the past year or so, a person with significant anxiety. I said to this person, "Hey, listen man, I just want to ask you

something. This might seem like a random weird question but can I just ask you? Do you think that you had trouble with the COVID restrictions?” And his face lit up and he said, “Yes, that’s when all this started!” He said, “I was on a military base where I wasn’t allowed to go anywhere. My family wasn’t allowed to come visit me because of the travel restrictions. We had kids at home. We had no family support because my extended family is from out here, and we were on this base out here. We had an erratic sort of work schedule where it was ever evolving. That was very stressful.”

So I think, definitely, yes. These sorts of things were very stressful on our people.

Alison Steeves

Were there aspects of the military, were there certain measures in the military or unique kind of features of the military that would create sort of impacts on military members? Sort of things that, in the way the military operates, they would have specific measures that wouldn’t affect other Canadians?

Dr. Matthew Tucker

Well, I think I already mentioned those. The frequent travel. So imagine the stress not only on military members when they have to travel frequently. They have to self-isolate frequently before they travel anywhere. They’re worried about their families who are stuck at home with no support because of travel restrictions.

Alison Steeves

With COVID measures reduced now, have you seen a decrease again in mental health issues?

Dr. Matthew Tucker

Well, I think that’s a hard question to answer. I think on the one hand, yes. Many people are doing better now. Although I would say that I think many of those people are probably the people who would not have come to see me to begin with. I am still aware of a number of people, who I would say, the COVID measures, the COVID stresses were probably the straw that broke the camel’s back for these people. And they have not really gotten better, even though the world may be returning to normal(ish).

Alison Steeves

Is it your observation with anxiety and depression that, even if it’s caused by social determinants or external factors, that once it sort of takes hold, it can be hard to treat, even if those factors are—

Dr. Matthew Tucker

That can happen. Now frequently, it does get better. In medical parlance, we have this term called “social determinants of health.” And if you ameliorate the social determinants of health, it is true that people frequently get better. But everybody is different and it can be hit or miss.

Alison Steeves

As someone who spent 20 years in the military, can you speak to how a rise in mental health issues, anxiety and depression among military personnel, could have an impact on day-to-day military operations?

Dr. Matthew Tucker

Well, I think that's a fairly self-evident no-brainer. If people are sick, they can't go to work. They can't perform their jobs. It's going to affect the ability to carry out a mission successfully.

[00:10:00]

And I'll tell you something. Part of the reason that I'm passionate about this, part of the reason I'm passionate about our people's health is that—it's not a secret when I tell you this—that the military has a personnel crisis right now. A lot of people are leaving. A lot of people have left. A lot of people are very sick. And I think it's a fairly self-evident no-brainer that that is a—I guess you could say it affects the security of the country if people are too sick to perform the mission.

Alison Steeves

So you are seeing people leave due to those reasons, the mental health issues?

Dr. Matthew Tucker

Yes. I think so.

Alison Steeves

Dr. Tucker, during the pandemic, up until late 2021, you were also working part-time at the local emergency room in Annapolis Valley, correct?

Dr. Matthew Tucker

Yes ma'am.

Alison Steeves

This was not associated with your military practice, correct?

Dr. Matthew Tucker

Correct.

Alison Steeves

At that time, and of course you weren't there as long into the pandemic, so it's hard to compare, but did you also see a trend in rising anxiety and depression?

Dr. Matthew Tucker

I think so. When people come to the emergency department with mental health issues, it typically presents a little bit differently than it does at a family medicine or primary care clinic.

I find that typically, what will happen is, you'll pick up a chart and the triage notes will say that the person is there for something like "situational crisis" or "mental health crisis."

So what will happen is, you'll go see them and you talk to them, and it becomes clear that they're suffering from anxiety or depression, stress from whatever is going on in their life.

So during the COVID period, yes, I do think there was a certain amount of that. I do remember seeing several patients at the emergency department who I'd go see, and the triage notes said they were there for situational crisis or mental health crisis or whatever. And I'd go see them. And it became clear, that these people were just— They couldn't make it work anymore because, maybe the measures were affecting their job, there was financial concerns. Maybe their families weren't able to come visit them to help with their little kids or whatever. This was in the general public, and of course, the emergency department serves the general public.

Although, I will tell you something else, going back to the question about the military families. In case you don't know this, every community hospital that's close to a military base looks after military families all the time. And the reason for that is because these people move around all the time, so they don't have doctors, and so they go to their local hospital all the time. And I'm going to tell you something else. Military spouses basically deserve a medal for what they deal with, okay? You know, there's military medals; I think there should be a spousal medal for what they have to deal with. They put up with so much when their spouses are away.

Imagine this. Can you imagine this? Imagine you're a military spouse, okay? And you get uprooted from the place where you're from. Your spouse is stationed at a military base that's far away from where you're from. So you have to move to this place, where you don't know anybody and you've never been. And it's 2,000 kilometres, several provinces away from your extended family. And you don't know anybody. So you depend upon things like activities— You know, clubs, peer networks, your kids' school, churches, whatever. And then imagine that all these things are shut down, and you have nobody. You have nothing. And because of inter-provincial travel restrictions, your extended family is not able to come and look after you. So I would also see those people at the hospital, a couple times.

Alison Steeves

And you would see the mental health impact in some of those patients?

Dr. Matthew Tucker

Yeah, yeah.

Alison Steeves

Going back to the beginning of the pandemic, working in an emergency room, can you tell us a bit about what that was like, circa February 2020?

Dr. Matthew Tucker

A very interesting question because we did a— Everybody knew that this COVID thing was coming. And at the beginning, doctors, I think, didn't really know what it was. Didn't know what to expect. Didn't know what kind of symptoms to expect. And so, at my hospital, what they did was, they decided to organize some practice sessions. Which is always a good idea. They organized some practice sessions on how to deal with a respiratory emergency. So I went down to the hospital a couple of times. We did a couple of practice sessions about how to deal with a respiratory emergency, where we'd have a mock patient.

[00:15:00]

And I would participate in the team. And there would be your nursing team. And we did a practice scenario or two, okay? And we felt great about it. We thought, this is great. We're all practised up. We've got our skills all practised up. We can save people's lives if they come in. It's great. And you know what happened? Nothing. The patients never showed up.

So I'm going to say this. And people, especially people in other parts of the country or other parts of the world, they may have trouble believing this or they may think I'm misspeaking: I'm not misspeaking when I say, I worked regularly in the emergency department, once or twice a week, throughout 2020, throughout 2021. And I never met a single COVID patient until January of 2022.

Alison Steeves

So no flood of COVID patients?

Dr. Matthew Tucker

No. And the only reason I met them then in January of 2022, was because at Christmas time in 2021, the military people were finally allowed to go home for Christmas and so they came back with it.

Alison Steeves

Dr. Tucker, why did you feel that you wanted to come and speak here today at the National Citizens Inquiry?

Dr. Matthew Tucker

Well, I was asked if I would. And I thought to myself, I feel like there are a number of stories from Canadians that haven't been heard or are not being heard. Still not being heard. I think that everybody deserves to have a voice in the national conversation. And I thought that maybe I could shed some light on some voices that haven't been heard—just with the view towards improving our healthcare system and improving the lives of the people that I care about.

Alison Steeves

Thank you very much. I'll turn it over to the Commission if you have any questions.

Commissioner Massie

Thank you very much for your testimony. My first question would have to do with the condition of the family, around the military.

Dr. Matthew Tucker

Yes.

Commissioner Massie

How extensive could be the isolation, based on assignment, when they move from one location to the other? In other words, do they have the time to build a social network or are they moved constantly so they have to rebuild it all the time?

Dr. Matthew Tucker

That's a very good question. I could answer it at length; there's multiple components to that question. The short answer is, it depends, okay? Sometimes people stay in the same area, at the same military base for 10, 15 years. That's more common than it used to be; it's more common on certain bases. Sometimes, people move around every two or three years. So it all depends.

And I will tell you this though, based on my experience, this is my experience in being fluent with this culture. People usually say, as a general rule, that in the military, when you get stationed, it takes sort of a year just to get your feet under you with understanding what the amenities are in the local area. It probably takes two or three years to really start building relationships with other people to the point where you feel comfortable there. And so absolutely, that can be very difficult on families. And in particular, a lot of our military bases are located in smaller rural areas that might be even harder for people.

And so going back to the COVID stuff: If stuff is shut down, a lot of these military families, and I said spouses before, but it's also the kids. It's also the kids. It's very hard on them.

Commissioner Massie

I have another question with respect to the mental health issue. I know it's kind of difficult to define because it could have many different components. I know that you're not, in theory, in contact with families or the kids and so on. But have you noticed, or have you heard of, special conditions affecting the kids also of the military? Because of the isolation and travel restrictions was there something— And all of the other conditions that the kids were subjected to because of the lockdowns?

Dr. Matthew Tucker

Yes, yes. I think I said that when I was talking about seeing these families at the emergency department, I think I said spouses, but it's kids too. Kids will typically present in a different way. It may say behavioural issues, but that can encompass a variety of things.

[00:20:00]

You know, whether it's childhood anxiety, depression, ADHD that's not been properly diagnosed.

Commissioner Massie

I'm going to ask a sort of broad question. Knowing what you know now, from the experience of what happened over the past three years, what would you recommend we should have done differently with respect to managing this whole health crisis? I know it's a broad question, but—

Dr. Matthew Tucker

It's a broad question. I'm not sure it's my place to answer that question. I sort of felt like I came here to tell you what I've seen. I'm not sure it's my place to— I don't have all the information to answer the question. But I think my best answer to that, maybe, would be—I think the biggest recommendation that I would have made would have been to say, I would have liked to have seen everybody listened to.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

Good morning. I would just like to, kind of, further the comment that you made about— You alluded to the military personnel being in somewhat of a crisis in terms of, I guess, recruitment and retention, possibly?

Dr. Matthew Tucker

Yes, yes.

Commissioner Kaikkonen

So we know across the country, there's been a lot of connections with, you know— People are stepping back, this quiet quitting. And as a doctor, who would be seeing all of this and wondering as well.

From my perspective, I'd like to know, is there a way to counter the quiet quitting, this stepping back from working, being part of the community, volunteering? Do you have any kind of tidbits that would help people to step out from their homes and not be so fearful? Just from your perspective as a doctor.

Dr. Matthew Tucker

Can you elaborate on the question a little bit, like how to counter—

Commissioner Kaikkonen

We have this quiet quitting movement. There's a lot of employers who can't find employees. There's a lot of charities now who don't have volunteers. And it seems to be increasing; they call it the "quiet quitting movement." And it seems to be increasing in not just pockets of the country that had very tight restrictions, but it's spreading across the country. Even to those provinces that didn't have as quite—the restrictions were less than, maybe, the Atlantic region.

And I'm just wondering if you have any counsel, from a physician's perspective, of how we can counter that movement. And say that, "You have a place, you have a purpose in this world. You have a place that's important." The social fabric is dependent on people being participants.

Is there some way that you can add to that conversation that might actually encourage people who may be watching from online or in here? That they could say, "You know, I have been moving outside of the social fabric. Is there a way that I can participate, that I should be participating?" And maybe encourage those people who are listening. Particularly online because all of you did show up. But, you know, just to try to encourage people to move forward and maybe counter what seems to be happening and may increase and, actually, seriously disintegrate our social fabric. Thank you.

Dr. Matthew Tucker

Okay, I think that's a big question. I think you already answered some of it yourself. I think the very short answer to a very big question would be, you have to find a way to re-engage people with society. I think there would have to be a re-emergence of social cohesion, shared values, shared purpose. I suppose that efforts that would help, you know, build communities and bring people together would be the start to that.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

I have a number of questions myself, and there's two questions from the audience.

Dr. Matthew Tucker

Yes, sir.

Commissioner Drysdale

But first, before I start that, I want to thank you for your service: 20 years of service to our country. So you were with the Canadian Armed Forces for 20 years.

Dr. Matthew Tucker

Yes, sir.

[00:25:00]

Commissioner Drysdale

Would you say that the Canadian Armed Forces is effective at evaluating risk and solutions to unusual problems?

Dr. Matthew Tucker

In general, yes. I mean, listen— To a certain extent, that's not my place to comment on.

Commissioner Drysdale

No, but—

Dr. Matthew Tucker

I mean, the people that make these assessments, they would rely on a variety of metrics that I don't have access to. But I think in general, yes, that's part of what they do.

Commissioner Drysdale

That's part of what they do.

You also mentioned that in 2020, when the pandemic was first announced, there was uncertainty in, at least in your medical community, about what it entailed and what it might mean. And you did some tests, some practice runs, to see how you might handle that.

Dr. Matthew Tucker

That's right.

Commissioner Drysdale

How far into the pandemic was it before you or your colleagues began to understand that COVID was affected by the age? In other words, the risk to an 85-year-old might be less than the risk to a 19-year-old?

Dr. Matthew Tucker

How long did it take to realize that? I would say, I mean, I don't remember for sure. A lot of stuff has happened in the past couple of years.

Commissioner Drysdale

Sure.

Dr. Matthew Tucker

But I would say, you know, probably later in 2020, that started to dawn on us. But I mean, it was hard for us to realize that where I worked because we didn't see any of it.

Commissioner Drysdale

Right, right. But even where you were and you didn't see anything, I guess, with what you were hearing in the press and what you were talking to your colleagues about, they were starting to understand that it was related or it was vastly related to age, or it was riskier.

Dr. Matthew Tucker

Yeah. I would say sort of later in 2020 that that started to become clear.

Commissioner Drysdale

When did the Canadian Armed Forces require or mandate vaccines for members?

Dr. Matthew Tucker

In the fall of 2021.

Commissioner Drysdale

So in the fall of 2021, how many 85-year-old members are there in the Canadian Armed Forces, that you are aware of?

Dr. Matthew Tucker

So listen, they keep increasing the age where you're allowed to stay, but it's not to 85 yet.

Commissioner Drysdale

Being an organization, that's part of their task, and they do it very well, in my opinion, is to assess risk, understand unusual situations, and respond in an appropriate way. And if the information seemed to be available in 2020, and they didn't have members who were in that age group, do you have any idea why they would have mandated the unknown vaccine?

Dr. Matthew Tucker

I can't answer that question. That's way beyond my pay grade.

Commissioner Drysdale

Okay. I have two questions that were submitted by the audience. The first one is, and this might be a difficult one too. Knowing that we understand— This is a commentary following the witness that was on prior to you, Dr. Braden.

Dr. Matthew Tucker

Okay.

Commissioner Drysdale

"Knowing that we understand the spike protein that does cross the blood-brain barrier, is it possible, or should we be wondering, if this may also be contributing to the increased incidence of anxiety and depression?"

Dr. Matthew Tucker

I mean, my short answer to that is, maybe. Like any number of things, I think it requires more study.

Commissioner Drysdale

Okay. The last question is, "With regard to military members, who for either medical or religious reasons requested an exemption from the vaccine mandate," and I guess weren't provided with one, "how would that have contributed to their increased stress levels?"

Dr. Matthew Tucker

Well, it increased it. I mean, if you want to know, I certainly saw that sort of thing.

Commissioner Drysdale

Yes. Well, thank you very much.

Dr. Matthew Tucker

Okay. Can I just say one more thing? Are we done? Okay, can I say one more thing? I feel very strongly about this. I know the inquiry heard yesterday from some people who have been through some things that have led them to have had bad experiences with the medical system.

Can I just say, for the record, to those people, or to anybody else who may benefit from hearing this: That I don't think it's ever appropriate, in any medical context, for anybody to be belittled or laughed at or made fun of or dehumanized for their personal medical choices. Or for their anxieties and concerns about what's going on with them.

[00:30:00]

That's never appropriate. Everybody always deserves to be treated professionally and empathetically. And to those people who have had that experience, I just want to say I'm sorry to hear that you had to deal with that and I would never treat you that way.

That's it.

Alison Steeves

Thank you, Dr. Tucker.

[00:30:32]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Truro, NS

March 18, 2023

Day 3

EVIDENCE

Witness 3: Dr. Aris Lavranos

Full Day 3 Timestamp: 02:51:30–03:41:11

[00:00:00]

Ches Crosbie

Perhaps I would swear, affirm the witness then? Yes, sir, you affirm that you will tell the truth, the whole truth, and nothing but the truth.

Dr. Aris Lavranos

I do.

Ches Crosbie

Thank you.

Chad Horton

Good morning, sir.

Dr. Aris Lavranos

Morning.

Chad Horton

Could you kindly introduce yourself to the Commission?

Dr. Aris Lavranos

My name is Dr. Aris Lavranos. I have been an emergency physician for about eight years now. I have a very, very small sort of family clinic where I see patients in an outpatient setting, follow-up in the emergency department, which I've been doing for a couple of years, really in response to COVID. And I am just about to graduate from law school.

Chad Horton

Now, can you speak a little bit more expansively, Dr. Lavranos, about your history of practice and your areas of practice?

Dr. Aris Lavranos

Sure. So I did my residency and fellowship in Ontario between Kitchener-Waterloo, Hamilton, Collingwood, Southlake, sort of that area. I returned to Nova Scotia about six or seven years ago. I practised all over the province, practised in Digby, practised in Amherst, practised in Kentville, the IWK, Central Zone, Truro, travelled throughout the province. Over the COVID crisis, I practised mostly from Truro, occasionally in Kentville, the IWK, and [inaudible: 00:01:43] emergency departments.

Chad Horton

Okay, so when you say that you practise in emergency departments, would you be classified as an emergency room physician?

Dr. Aris Lavranos

Oh, yeah. And I did my family medicine training with a fellowship in emergency medicine, so a sort of subspecialty in that and that's what I did almost exclusively.

Chad Horton

And what does emergency medicine contemplate?

Dr. Aris Lavranos

The primary care in general sees everybody as their entrance way into the healthcare system. But generally speaking, the emergency department is the face of the hospital structure to the public. So one of the things that I often like to comment on—and I think some of my other colleagues have mentioned it already—is that public health decisions, the impact of those, is felt in places like the emergency department, perhaps predominantly in the emergency department. A lot of public health consequences aren't always amenable or agreeable to being seen and followed up in primary care in a family physician's office. So an acute case of sexually transmitted infection, acute case of a sick child who might not get in to a family medicine appointment, we see a lot of those kinds of consequences.

Chad Horton

Now, you just commented on public health policy a little bit and this is something that came up during the testimony of Dr. Chris Milburn. And this is on the record, on the public record in the news. But Dr. Strang I understand made some comments that, as an emergency room physician, Dr. Milburn should not be commenting on public health policy.

As an emergency physician, are you qualified to comment or have an opinion on public health policy?

Dr. Aris Lavranos

Yeah, absolutely, absolutely. I think stating anything otherwise is a little ludicrous. We see patients who are and are not wearing their helmets in bicycle accidents, right? Who are and are not wearing their seatbelts and this is all within the ambit of public health. You know, if we have epidemics or outbreaks of infections, infectious diseases, measles outbreaks, sexually transmitted infections— I mean, we are exposed to all of those things. And then, of course other consequences of sort of, let's say, more broad social determinants of health, which also falls in the ambit of public health. So for example, if smoking cessation improves, we do not see as many smoking-related issues. If, you know, children start vaping a lot more, we see a lot more evidence of consequences of vaping in children, and so on. So we are certainly exposed to all of that. And it would be within the ambit of anybody, let alone someone who has a public health background or understanding, expertise, as emergency physicians alone, to be qualified to comment on that.

Chad Horton

And for the record, can you confirm Dr. Lavranos that you've provided me with a copy of your CV?

Dr. Aris Lavranos

Yes, I have.

Chad Horton

Okay, and that will be entered as an exhibit for the Commission [TR-16].

Within the scope of your practice—and you've told us that you've covered a fairly wide geographical area of Nova Scotia—approximately how many patients would you attend with or otherwise treat in the run of a week?

[00:05:00]

Dr. Aris Lavranos

So it's a good question. Depending on the week, and how heavy I'm working, how many clinic days or how much schooling, or those sorts of things. But when I was working at my fullest, if I did three or four shifts, I worked more than most of my colleagues when I'm working full-time, I acknowledge that. I could see probably five or six thousand patients a year so that would probably be like the upper limits of what I would see if I was working full-time. So that's 18 to 20, 22 shifts a month, an average of 25 to 30 patients per shift. So it's a lot, yeah. It's a big number.

Chad Horton

And at the beginning of the pandemic, let's go back to early 2020, what were your professional plans?

Dr. Aris Lavranos

Sure. So even before entering— Sort of the idea of going into law, I liked the idea. I've always been interested sort of politically, administration-wise. And my idea was to find more training, leadership courses, certifications to try and bring back some of that expertise into the medical field. But certainly, never to stop practising clinical medicine. I love emergency medicine; I really, really love it, and I think I'm quite good at it. So I mean, there's a tremendous amount of meaning and reward in my life from that.

But then sort of going into law school, I thought I would bring back some of that legal training, do something college-related or administration-related. But as a consequence of the COVID pandemic, my life trajectory has changed dramatically, dramatically. So my pursuits now are— I've become very, very disillusioned with the practice of medicine in Canada generally, in Nova Scotia specifically. I think that a lot of the consequences and crises that we are seeing now could have been mitigated, at the very least, if not diverted outright. And so, I am pursuing a career in medical malpractice to try and hold hospitals and physicians accountable for the errors that lead to the crises we see.

Chad Horton

That's very interesting. And for the benefit of the Commission, can you just briefly talk about when you went to law school and why you did that initially?

Dr. Aris Lavranos

Yeah, so again, that was not the intention. I really, really enjoyed my advanced negligence course, I really enjoyed my tort course in first year. But I liked constitutional law, I liked administrative law, I liked the idea of supporting health care policy. You know, I contributed at least likely to Tim Houston's plan in Nova Scotia to legal bodies advocating for certain conservative platforms for health care. So that was kind of the direction that I was originally interested in. So the idea of medical malpractice was very, was new. That was later on, definitely.

Chad Horton

And a final question about that, Dr. Lavranos. When did you go to law school? When did you graduate, if you have graduated? And did you continue to practise medicine while you were a student?

Dr. Aris Lavranos

I did. I practised medicine throughout law school. I did sometimes, like, a reduced load. We consider 16-ish, 14 to 16 shifts to be full-time emergency medicine practice per month. I would do 6, 8, maybe even 10 in the month, depending on what the month was, so not quite full-time practice during school. During reading weeks, during the summer, it would jump back up to sort of a much more heavy, heavier workload. I started law school in 2020. But I worked throughout the pandemic; school hadn't started at the beginning of the pandemic, so I worked pretty intensely over the first nine months of 2020.

Chad Horton

And has that completed or are you still in that process?

Dr. Aris Lavranos

Yeah, so I'm still doing that. My law school has another six weeks or seven weeks of school.

Chad Horton

All right, we'll shift gears and go back to the pandemic itself and your experience as a physician. Now, based on your education training experience, in any medical literature you had read, what was your understanding on the front end of the pandemic of the danger posed to public health in Nova Scotia by COVID-19?

Dr. Aris Lavranos

Yeah, so I was definitely one of the biggest alarmists when it comes to COVID in the beginning of 2020. January 24th or the 26th, I can't remember which of those two, but I was on shift in Truro.

[00:10:00]

I was handing over to my chief, or they were sort of on shift with me, and Xi Jinping of the CCP had just announced that they were going to shut down the province of Hubei, Wuhan, whatever. And I had thought to myself, this is going to be peri-apocalyptic. For somebody in such a precarious position of power on the world stage to announce— The political ramifications of that, I thought that this was going to be massive. At that time, I was very much on board: "Two weeks to stop the spread," I thought it sounded insufficient. I thought that we really needed to have closed borders immediately. This whole idea of Trump having been racist for suggesting that and, "Oh, you should just go and eat at Chinatown," the Democrats were saying. I thought that this was not appropriate. I was, like, people are underemphasizing how dangerous this could be.

But that perspective only lasted maybe a couple of months. Once we started to see the zero-prevalence data that was coming out at the end of 2020, the beginning of 2021, that's when it was published. But the data that was out there beforehand—end of 2020, by Bhattacharya and Ioannidis—showed that it was probably nowhere near as fatal as we had thought. The Diamond Princess cruise ship was the first week of February, the second week of February. Nine hundred people of 3,000 contracted the virus I think, something like that. Maybe nine people or seven people died. So not nearly what we had thought or what we had expected.

These videos of people collapsing in China, largely discredited. The reports out of Tehran, largely discredited. Demographic data coming out of New York was very early on in the summer; I think it was like June or July of 2020. Thirty per cent, 35 per cent of all fatalities were happening from long-term care facilities with people who were extremely old and extremely co-morbid. So very quickly, I became sort of disillusioned with the idea of the alarmism and the hysteria that was sort of flowing around COVID.

Chad Horton

Just a brief point of clarification, Dr. Lavranos, for the audience. When you say individuals were largely co-morbid, what does that mean?

Dr. Aris Lavranos

Yeah, so I mean, like, there was this meme that went around when the CDC published the data showing that something like 94 per cent of patients who succumbed to COVID had 2.6 co-morbidities. So those are chronic conditions that stick with you. Now, appropriately a lot of push-back against that was, well, lots of people have co-morbidities. For sure. But the average ages of death were fairly advanced and patients were very co-morbid. And if you looked at the number of patients who were healthy who succumbed to COVID, it was a really much older population. So co-morbid means other medical conditions that could contribute to somebody's general frailty.

Chad Horton

Thank you, Dr. Lavranos. And you just touched on another point that has come up a couple of times. And I believe one of our commissioners asked about this. But can you briefly explain, as time went on, your understanding of the age stratification of risk associated with COVID-19?

Dr. Aris Lavranos

Yeah, so it was apparent that this was the single greatest contributor to co-morbidity as a risk factor for COVID morbidity or mortality. So prolonged stays in hospital, even if you survived, or passing away from COVID, it was by far the most important. And I would say probably summer/fall of 2020 is when that was, kind of, very well understood—very well understood. There are other co-morbidities that sort of came out, right? Like, early on, the whole idea— Because it was a quote-unquote, “novel virus.” I mean, at least clinically it was a novel thing. I mean, we’ve heard a little bit about the immunology, virology component about it. Coronaviruses are well understood and well-known for a very long period of time. But at least this was a novel virus, even clinically.

And so, the idea was initially a respiratory-predominant kind of concern. And then it became a little bit more of a coagulopathic concern: that what we thought was actually lung harm turned out to be microangiopathic clot disease, renal failure, heart attacks, that kind of a thing. So our nature, our understanding of it evolved and with that, the co-morbidities that could lead to consequences of that also evolved. But age was certainly the biggest risk factor by far. So several orders of magnitude. If you are 80 years old versus 8 years old, it is a massive difference, like, thousands and thousands of times more lethal for the aging population.

Chad Horton

Now, I want to ask you, Dr. Lavranos, about what you personally observed within your capacity as an emergency room physician as the pandemic evolved throughout 2020.

Dr. Aris Lavranos

Yeah, so, in—

Chad Horton

And just a moment, I apologize for interrupting you doctor. I'm specifically asking about COVID illness.

Dr. Aris Lavranos

Yeah, okay. That's what I was going to follow.

[00:15:00]

Okay, so with respect to COVID specifically, I've seen very, very, very little COVID—very little COVID—over the COVID crisis. If we exclude the last six months; if we look at up until Omicron, let's say, I probably saw 10, maybe 12 people with COVID. Almost all of them had survived. I was seeing them post, right? Like, I saw one person who was sick. They were not sick with me, actually; they became sick later. But I'd see nobody sick with COVID, like having to intubate them, resuscitate them, or anything like that. I never saw anybody like that. I saw maybe a handful of people who had COVID who came in: runny noses, coughs and coughing, sneezing, kind of typical respiratory tract infection sicknesses.

Chad Horton

Well, in the many hospitals that you've worked in, as you explained earlier, did you witness any overburdening of hospital resources as a result of COVID admissions?

Dr. Aris Lavranos

Certainly not, certainly not. It was a bit of a joke in the hospital. In Truro, when I was there, we had our COVID unit stocked and ready. We had a COVID physician on all the time, bracing, waiting. Those physicians were starving for work. They would come down and see patients in the emergency department and call. "Do you have any business? Do you have anybody with COVID around? Do you want us to come and see someone? Oh, that sounds like it could be COVID. Do you want me to come and see them?"

So, it was— No, I never saw it. I never saw any overwhelming of hospital resources.

Chad Horton

And, this is a somewhat redundant question, but I think it's an important question. Do you have any awareness—or can you speak up to today regarding the ultimate mortality numbers appropriately attributable to COVID-19 in Nova Scotia?

Dr. Aris Lavranos

Without having sort of the data here in front of me, the numbers are very low, I would say that. Maybe even extremely low, I would say that. The average age of death in Canada is not much different than it is anywhere else in the world. Tends to be much older, much more co-morbid people. And I mean, like, Nova Scotia, we are older than other places in Canada, there's no doubt about that. So actually, we're considerably older compared to Alberta, and so our risk compared to other provinces is probably a little greater to that extent. I mean, at least colloquially I find, in Canada, it tends to be one of little bit of a "heavier set" provinces. So obesity tends to be a risk factor as well. So in that regard, we're probably a little worse

off than the other parts of Canada. But generally speaking, case fatality rates in Nova Scotia are just like they are everywhere else: very, very low.

Chad Horton

Now, would you have been in a position within your capacity as an emergency physician to observe the impact of anything you would attribute to COVID-19 policy or public health policy?

Dr. Aris Lavranos

Yeah, big time. Definitely. And so, this amazing commentary back and forth between Dr. Chris Milburn and Dr. Strang is interesting to me because we do see that a lot. So deaths of despondency and conditions of despondency—which is substance abuse, substance misuse, suicidality, depression, mental health collapse—is just skyrocketing, absolutely skyrocketed. So from a personal point of view, over the last two and a half, three years, it is alarming, distressing, the amount of those kinds of things that we have seen. So I have just dozens and dozens of examples. Dozens of them.

I'll just relay a few of them that I recall. Two senior citizens, one lady ultimately passed away in hospital. The last thing that she said to me coming from a long-term care facility is, "I'm just so lonely." And that was the last thing that she said alive. I had an elderly gentleman from a long-term care facility, lovely gentleman. I had seen and known him a couple of times before. He really, really regretted going into a long-term care facility just before the pandemic started. He said that he feels like a prisoner, not allowed to leave, not allowed to go out, not allowed to do things. He's like, "I would never have done this. This is unimaginable."

I had an absolutely lovely physiotherapist who came in: two kids, struggling at home, kids aren't in school, husband was a trucker, gone a long time. She was absolutely hysterical in fear over the risk that the virus posed to her, which was very, very low, exceptionally low to a young, healthy person, no co-morbidities.

[00:20:00]

Hysterical with that, asking for anxiolytic help for her anxiety or depression.

The number of patients we've seen who don't have access to their physicians for chronic care, whether it's cardiologists, nephrologists, hematologists, rheumatologists, whatever specialist they are. Number of patients who have come in with surgeries delayed, someone needs a gallbladder out, comes in much sicker because their gallbladder surgery has been delayed. Diagnostic imaging: I've been waiting for an MRI for nine months; it's been put off. My pain, my concern, my fear is getting worse. Missed screening appointments for cancers—loads of that.

And then perhaps worst of all, alcoholism. You know, I'm used to seeing a very slow steady state of alcohol-induced liver cirrhosis over the course of a year. I don't know, probably I see five or less patients. And there were some months over the COVID crisis that I would see five in a month. It was just really, really alarming. A couple of them, one of them I ended up following very closely. Liver transplant. Everything, sort of, fell apart as a consequence of loss of their regular routine, loss of their regular work functioning, loss of their regular

recreation, contact with their loved ones. So I mean like people sort of succumb to their vices of choice.

But the worst of it by far was during my shifts at the IWK. I can't attribute all of this to COVID policy. But I mean, the evidence is overwhelming that, you know, children not being in school, not being exposed to their extracurriculars, not being in touch with the rest of their family units, not being in touch with the rest of their friends, in a household that the parents are struggling more and more financially whereas their co-morbidities are also worsening. So this is not conducive to mental health in a child. And so, when I was at the IWK—especially during end of 2020/2021, somewhere around there—just the amount of mental health use at the IWK was just skyrocketing; emails being sent out, requesting help from the physicians in the emergency department to offload some of the burden from the mental health team as they were seeing such massive volumes of mental health issues.

Meanwhile, there's no COVID in children that we were seeing. Like children were not coming in, you know, like flooding the department with COVID or were super sick with COVID. Or other things, right? Like not having, you know, regular school-based accidents or other extracurricular accidents, or, you know, all the sort of bread-and-butter things that we would see in a pediatric emergency department. Volumes were much, much, much reduced, whereas mental health was skyrocketing.

And it's an interesting thing—sorry to keep going here—but it's an interesting thing because you think to yourself that, well, at least the regular infectious disease patterns were reduced, and that's pretty good for children, right? And the answer seems to be, well, no, because you've got to pay the piper at some point. And the question is, how much interest do you owe? And so, what we're seeing in the last year with children flooding the emergency department sick, right? Just flooding and calls, like, we've never seen anything like this. We can't keep up, and Advil shortages, Tylenol shortages, all those sorts of things. So I mean, the immune debt that follows from all of this are consequences. So we're still seeing the consequences of these kinds of COVID policies, for sure.

Chad Horton

Okay. And I do not want to put words in your mouth, but I just want to make sure that I understand your evidence. When you talk about “immune debt” and an escalation in children's hospitalizations now, am I understanding correctly that what you're saying is—because they were isolated and they weren't regularly exposed to germs or pathogens, that they have weakened immune systems?

Dr. Aris Lavranos

Yeah, I mean like that's kind of the theory of it, right? Well, I guess there are two ways to look at this. One would be this sort of, like, let's say, economic component of it, right? Like the numbers of it. So if one per cent of children who contract viruses are going to get really sick and need to be admitted—and normally that's a slow simmer all the time—well, when they all get sick at once because they all return, even if it's still one percent, the absolute number has risen a lot. So that's one component of it.

The other component is, there's probably some cross immunity between viruses. So you know, in 2020 or 2021, you get a little bit of a runny nose or cough or sneezing from some coronavirus or parainfluenza or adenovirus or whatever. And then, a month or two months

later or six months later or a year later, you get something that is similar in nature. Well, maybe you have a little bit of some cross immunity and so it kind of helps buffer things.

So I mean these are sort of, like, theoretical things.

[00:25:00]

There's no RCT to try and figure out how that's going to work. But certainly, you've got to pay the piper at some point. And so, a slow simmer, I guess, would be what's most preferable.

Chad Horton

Okay. Just a final question in connection with what you just said. And I want to make sure again that I understand you and that the Commission understands you appropriately. What you describe as escalation in pediatric admissions, is it currently related or not related to the COVID-19 virus?

Dr. Aris Lavranos

To my knowledge, it is not. To my knowledge, it is not. I mean like, certainly, there could be. But I mean, the most recent major issue was not associated with the COVID virus, no.

Chad Horton

And one more point of clarification, Dr. Lavranos. When you were speaking, you indicated that there are many issues associated with delayed care. What was the cause of delayed care? You reference diagnostic imaging, you reference surgeries, you reference access to specialists, and some other things. Why was that access inhibited?

Dr. Aris Lavranos

A tremendous amount of resource allocation to preparation and, sort of, shoring of resources in anticipation of COVID harm. For example, I mean, the amount of patients that we see from family physician referrals because of virtual care who were not seen, were not examined. You know, like, we do not have heart rate; we do not have somebody referring somebody who was listening to their chest, you know, felt their pulses, checked their fluid status, those sorts of things. So I mean, we still have a flux of patients who are not being physically seen and who are, at best, being virtually seen, right? So we see all of those kinds of patients.

And then, I mean, there was a big report that came out maybe last year. Sixty-five million dollars over a four-month period were paid to specialists to help support their incomes because they were not seeing patients at the usual rates that they would normally see. So I think that it was several hundred physicians who qualified for that. I think, if I remember correctly, it was over 400. So 400 physicians over four months are getting paid 65 million dollars to support their incomes for not seeing patients. And this is because rooms are being taken for COVID or wings are being taken for COVID or nursing demand is being moved, or whatever the case might be, right?

And so, that has consequences. And the evidence out there for this—apart from, you know, personal experience—is striking. It’s alarming. How much weight gain have people had? How much worse is their hypertension? How much worse is their diabetes? Did somebody have a heart attack that went missed, that ultimately became heart failure because they didn’t want to come in? Did somebody’s diabetic ulcer worsen, progress dramatically, because they were not seen? So these kinds of things are happening all the time as a consequence of— I mean, “neglect” is too harsh a word, but as a consequence of the reprioritization of resources.

Chad Horton

So everything you’ve just described— I think it would be fair to characterize them as negative. The things that you’ve described, would you attribute these negative contingencies to the COVID-19 virus or to public health policy related to COVID-19?

Dr. Aris Lavranos

Right. So looking at what the case fatality rate is, what the demographics of greatest concern, the co-morbidities that are of greatest concern, certainly there could have been— And when we knew this, there could have been a very different approach from a policy point of view to mitigating the harms of the virus. And this has been championed, suggested many, many times by elite physicians, physician groups, states all over the world. So, I mean, the Great Barrington Declaration certainly argued for a focused approach to prevent lockdowns, so the protecting of the most vulnerable.

Did we have a prolific education campaign from public health so that we could educate people on who is at highest risk? I mean, like, certainly by the end of January? No. We did not have public service announcements, town halls advertising and educating the public as to what are the biggest risk factors, the top five risk factors; who is most likely to succumb; and then measures that they can take to protect themselves. We didn’t have anything like that. We had lockdowns of businesses across the board.

So that is a very heavy-handed and, in my estimation, ridiculous approach to what we knew about the virus, even at the end of 2020.

[00:30:00]

Chad Horton

All right. We’re getting close. We have about four minutes left, but there’s something I would like to get into with you if I could. When the vaccines started to roll out, the COVID-19 vaccines, Pfizer, Moderna, et cetera, as an emergency room physician who practised throughout a significant portion of Nova Scotia, did you observe any adverse events associated with these vaccines?

Dr. Aris Lavranos

I did. Yeah, I did. That, in my estimation, were as a consequence of the vaccines. Now, I should say that vaccine policy is one of the COVID policies that I was most, most concerned about and I spent a lot of time in law school sort of researching, studying, and writing about. The rate of adverse events from the vaccines that we saw—that I saw—were much,

much greater in scope than I saw as a consequence of the virus itself. Now, that's my anecdotal experience. I have to admit to that, there's no doubt about that. But that doesn't mean that that would be the case across the board, right? Like, from that I could not say that by conclusion the vaccines are unsafe. I couldn't say that off of my experience.

However, you've got to know that these are exceptionally safe—radically, like, near-certainly safe—in order to have mandates. That is the issue to me when it comes to vaccine policy. It's not the supporting, the encouraging of vaccinations. It's not the addressing of vaccine hesitancy. It's not the mitigating of vaccine harms. If you are going to prevent people from circulating in society; if you are going to attach stigma to a personal health decision; if you are going to label these people as denialists, misogynists, racists, whatever you want to call them; if you are going to inflame society— And we have seen the consequences of that repeatedly throughout history, right? Repeatedly. Whether it was the syphilis epidemic; whether it's HIV epidemics; whether it's abortion options and choice— The stigmatization, criminalization of health care choices has recurrently in society been a major fault. That is a huge public health consequence of messaging. And so, to inflame those tensions, to drive that divisiveness in society in order to push the vaccines, you've got to be really sure that they are, quote-unquote, "safe and effective." And they need to be both: safe and effective. It's insufficient to say, "Well, they're perfectly safe, so who cares? Just give it." Because if they're not effective, then what's the point? You're still taking a lot of harm without the benefit.

Chad Horton

A couple of follow-up questions on that, and I will try to be brief. So you indicated that you observed adverse events, which you attributed to the vaccine.

Dr. Aris Lavranos

Yeah.

Chad Horton

Was there discussion between you and your colleagues about those observations? And what I'm asking you is, was it your sense and experience that you are not alone in what you were seeing?

Dr. Aris Lavranos

Oh, yes, absolutely. Yeah, the evolution of thought in my department was remarkable. So we have about 20 or 25 physicians. What started off as about one or two physicians kind of talking quietly—hushed tones, emails and messages back and forth; concerns about COVID policy; about what is the actual fatality rate; what are the co-morbidities; what is the messaging like, and so on—kind of really started to grow over the course of the two or three years.

And then as vaccines came out, there was a little bit of, "Well, you know, we've got to do everything we can, get everybody immunized," and so on. And you know, "COVID still poses a major risk." But then you start seeing a couple of more issues, like, you know, the whole myocarditis, pericarditis. It's like, "Well, you know, actually, I don't usually see a lot of myocarditis, but I saw two or three last month," or "Well, yeah, you know, I don't see a lot

of pericarditis, but I'm seeing quite a bit of it this month." And you start talking to another one of your colleagues who had [contested that], you're like, "You know, I saw a lot more than I'm used to seeing too." And then you start wondering, did I see this in the context of COVID waves in the past? Not really. And so, these kinds of conversations certainly were happening a lot.

Chad Horton

Okay, on that point, two more questions: Did you receive any education or training regarding the monitoring or the reporting of adverse events associated with these vaccines?

Dr. Aris Lavranos

Any training with the monitoring or reporting, no. No, no, not at all. We got a couple of, as I recall, a couple of flyers saying, you know, "You've got a report." There was I think an email or a post-it note that said, "Please document vaccination status on every chart," so that you can collect data from that point of view.

[00:35:00]

And then because of a really astute and dedicated physician who I work with, we had the link to the reporting address: an electronic link to the reporting address posted around our doctor's area. The link was about that long, would have taken half a minute to a minute to type, just really cumbersome. Very difficult process.

Chad Horton

And if you did report an adverse event, how long would that have taken to go through the process?

Dr. Aris Lavranos

For an event? I think, probably somewhere between five and fifteen minutes, probably five to fifteen minutes, I would guess.

Chad Horton

What is the significance of that within the context of working in a hospital in Nova Scotia?

Dr. Aris Lavranos

In an emergency department? I think that any of my emergency physician colleagues who are here would attest that that is almost prohibitive. It is far, far too cumbersome, far too cumbersome. Yeah, very, very difficult. Labourious.

Chad Horton

And a final question on that point: What were your observations regarding the attitude and culture in hospital regarding reporting adverse events associated with the COVID-19 vaccines?

Dr. Aris Lavranos

I think the vast majority of people would hope that someone else would report it if it turned out to be such an adverse event. So I think that the majority of my colleagues knew it had to be done, but didn't think perhaps, like: "Well, maybe the emergency department, maybe right now is not the best time. Maybe I'll get to it later. Oh, the patient was admitted, hopefully it'll happen. Oh, they're going to get followed up from a family physician or a specialist." Hopefully, somebody else would go about it: I think that was my general sense of the culture of what it was like.

Even the ones who were most diligent, who were, like "I've got to do this," even they found it difficult. Because I mean, 15 minutes, if you were going to do that, let's just say twice, three times a shift: 15 minutes is definitely enough time to see one patient. So that means that that physician would see maybe two or three fewer patients that shift, just as a consequence of having to go through this reporting. And so, two or three per shift may not seem like that much, but there are many physicians who are working in the department at a single time. So if we have, you know, six, seven, or eight shifts, now that's suddenly 24 patients we did not get seen over the course of a day as a consequence of having to make this reporting. If that's the numbers, give or take, that we're looking at.

Chad Horton

I could talk to you all afternoon, Dr. Lavranos. One more question. It was suggested by a witness yesterday, a nurse with, I believe, 40 years experience: that the under-reporting of adverse events associated with the vaccines was in her estimation a significant issue. Do you agree with that statement based on your experience?

Dr. Aris Lavranos

Yeah, it's a really good question. Because, on the one hand, under-reporting might be a problem, absolutely. On the other hand, you might have over-reporting by some or by individuals, right? And so, the signal is very, very noisy. There's no doubt it's very noisy. The adverse reporting system is not great. I think that there are still other ways of looking at what are the potential consequences that are probably better. So if diagnostic codes for people coming in can be measured, monitored—so like, how many people had a heart attack in January of 2018—we could find that kind of the data, right? And then how many people had a heart attack in January of 2019, and then in 2020, '21, '22? So you have sort of bigger systems that can look at this.

The problem is at a much smaller, narrower focus, you can't really look at it in, perhaps, acute real-time and respond as quickly as you should. So I mean, one of the take-home messages of the pandemic certainly would be to increase the reliability of such a reporting system. Right? If for example: only physicians had access, you needed to have a physician code to register, the system was a lot more streamlined, maybe you could electronically tag a patient's MRN number or their health card number and just, like, easily auto-populate some kind of a form. So it's definitely room for improvement, is what I would say.

Chad Horton

Okay, Dr. Lavranos, I will turn you over to the Commission, and I have some questions to provide to them I believe from the audience.

Dr. Aris Lavranos

Thank you.

[00:40:00]

Chad Horton

Alright. Now, does the Commission have any questions for Dr. Lavranos?

Commissioner Massie

Yeah, thank you very much for your testimony. One of the questions that I have, you mentioned that, initially, in the community of doctors you were working with, there was just a few that were sort of aware that maybe some things were not going on as they were presented by the health authority. And with time, with the practice, they evolved.

What would you say now, currently, is the level of awareness of your colleagues in the small group of people you were?

Dr. Aris Lavranos

I would say from, in the group that I talked to and work with closely, I would say nearly 100 per cent. Nearly 100 per cent. So I would say of 20 physicians, 19 of them sort of look back in hindsight and think to themselves this was not— This was not very well managed.

Commissioner Massie

And I guess the corollary question is, how many of them are willing to speak up?

Dr. Aris Lavranos

Me. I think just the one, yeah. I have other colleagues who have helped me write letters. So we wrote a letter to the NSHA [Nova Scotia Health Authority] [Exhibit TR-16b] [Response, Exhibit TR-16c]. I had a meeting with Dr. Strang in 2021. I wrote a letter to Tim Houston and the government [Exhibit TR-16a], and I've had many colleagues who have written and signed the letter with me. But this was largely sort of like a personal communication, kind of a sense of anonymity. So how many would be willing to sort of like sit here where I am sitting? It's just me. The rest of them, too concerned about fallout, too concerned about reputational damage, that sort of thing.

Commissioner Massie

So I guess my question is that— Because of this issue of repercussion to speak up, from your personal path, I guess, why is it that you are coming up and expressing yourself on those issues? Knowing fairly well that it could actually turn out into some consequences which are not very good.

Dr. Aris Lavranos

I've got a lovely family. I love my wife very much. She understands, supports me. I am privileged enough to work in an environment where, you know, knock on wood, my job

security is still pretty high. I am already having sort of a transition point into a different industry. And the competition that it has and the open-mindedness that it permits is different than healthcare. But all of those things aside, there's that great Alexander Solzhenitsyn quote that says, "Let the lie come into the world, let it even win, but not through me." So I take this to heart. I think that it's really, really important. The spirit of the truth is really important to embrace and to promulgate. So any consequences that come from speaking the truth are consequences that are worth following. So you know, I'm okay.

Commissioner Massie

And maybe one last question. Given that it's been reported, I think fairly broadly, that the number of therapeutic interventions of different types—as early or sometimes later-on treatment—could actually have a big impact on the outcome.

[00:45:00]

And yet it's still fairly, I would say, suppressed in practice for a number of reasons.

Do you expect that eventually we will come to terms with that, and the health authority will start seeing that these treatments need to be freely authorized and let the doctors practise medicine?

Dr. Aris Lavranos

Yeah, it's a great question. It's actually a big question. My short answer is, I don't think so, no. I don't think that that is likely to happen. I think that there are too many— There's too much of a bureaucracy, too much of an administrative state. Whether it's the College, whether it's guidelines that are produced by healthcare bodies like, for example, the Canadian Thoracic Society or the Canadian Cardiovascular Society. And then there's too much industry and bureaucracy involvement to allow that kind of— And it's just, generally speaking, not really the approach that we have in Canada. So it would take huge shifts to do it.

On the topic of therapeutics more broadly for COVID, just like I had mentioned about the vaccines, you know. The vaccines: I think it would be disingenuous for anyone—anyone—to say that they met our expectations. They most certainly did not meet our expectations. I think everybody would agree to that. Certainly, transmission changed dramatically—their impact on transmission.

I wrote a huge paper in law school, the impact on transmission was very well understood. I was showing some of my colleagues the data last night. Very early in 2021, like January, February, March, you probably thought to yourself, "Oh my God, this is something that we could really hang our hats on. This is something very impactful." But by June for sure, when it comes to transmission, there was a huge study that was done—70 countries, 3,000 counties—showing that there was basically no association between COVID rates and the vaccines. That was published by Subramaniam. The data was released, I think, in August, but it was published thereafter. So that was one of them. Obviously, Israel, you know, the Northeast of the US—so the evidence was overwhelming.

Anyway, my point of all that is to say that even if something is not super efficacious, if it's safe, it's okay to have a conversation about its utility, right? Like give it a go. And with vaccines or with therapeutics, it's totally okay.

So my big issue with the therapeutic conversation early on is that maybe azithromycin, maybe hydroxychloroquine are not panaceas. Maybe ivermectin is not a panacea. These things have been around for a very, very, very long time, and we understand their risks and benefits. And if I was going to prescribe azithromycin—which I do all the time, every week; I would say every week I prescribe azithromycin—and I think to myself, what are the pros and the cons? What are the risks? Who should I give it to? Who should I not give it to? And we give it out.

I don't see much fault in such a system that we've embraced for—ever.

Commissioner Massie

Thank you.

Commissioner DiGregorio

Thank you for your testimony today.

Please correct me if I'm wrong, but I think I heard you say that, early in the pandemic time you were very concerned about the potential dangers, and that later on you developed concerns about health issues going undetected because of an allocation of resources having been put towards COVID units that maybe were not being used as busily as expected.

What's your view on when a reallocation of those resources that were put towards the COVID units should maybe have come back to focus on other health areas?

Dr. Aris Lavranos

I would say probably by the end of 2020, there was sufficient global data to know what was the risk posed. And I think that the strategy could have been much, much better implemented by the end of 2020.

Commissioner DiGregorio

Thank you.

Chad Horton

Thank you very much, Dr. Lavranos.

Dr. Aris Lavranos

Thank you very much, thank you.

[00:49:48]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie

Dr. Davidson, while you're assuming your position there, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Dr. Dion Davidson

I do.

Ches Crosbie

Thank you.

Chad Horton

Good afternoon, Dr. Davidson. Before we get into your examination proper, could you kindly provide the Commission with an overview of your education, training, and experience?

Dr. Dion Davidson

My name is Dr. Dion Davidson. In summary, I'm a vascular surgeon and critical care doctor. I went to medical school in Saskatchewan. I went on to do eight years of general surgery and vascular surgery training after that. My family and I moved to Nova Scotia here to a relatively smaller town in 2005 with a relatively larger hospital, so a regional hospital that had a vascular surgery program. And I've practised in Nova Scotia ever since, basically as a community vascular surgeon and ICU doctor.

Chad Horton

And for the benefit of our audience, what is vascular surgery?

Dr. Dion Davidson

Vascular surgery is the surgical procedures but also a lot of medical management and other aspects of diseases that have to do with arteries and veins, to put it simply.

Chad Horton

And do you have any other areas of interest with respect to your involvement in medicine beyond what you've just described?

Dr. Dion Davidson

As I said, I am or I have, for most of my career, been an ICU doctor as well. For most of my career I served as one of the attending doctors in the ICU at our regional hospital. So I have an interest in critical care; I've worked in that area as well. In addition to sort of community vascular surgery, what we do as vascular surgeons, we do a lot of surgeries on carotid arteries in the neck in order to prevent strokes. We do a lot of surgeries and various procedures for arteries in the legs to relieve pain and prevent amputations. And we repair abdominal aneurysms and other types of aneurysms to prevent rupture and death. So that's kind of the core, I would say, of a community vascular surgery practice, so all vascular surgeons do a lot of that.

In my case, I've also taken a special interest in what's called chronic venous disease, which is a bit of a different offshoot, kind of a less dramatic offshoot of all that. Not life or limb threatening but certainly very common and kind of underserved in the medical community. So those have been my areas of interest. That's what's taken up a lot of my career. I've contributed to two different national committees developing guidelines for carotid artery surgery to prevent stroke and with respect to chronic venous disease as well.

Chad Horton

Well, this is my assumption, but I want to get this on the record. As a layperson, when you tell me that you're a vascular surgeon, my presumption is that perhaps there may not be a great many vascular surgeons practising in the province of Nova Scotia. Are you able to tell us how many vascular surgeons were practising at the start of the pandemic in early 2020, including yourself?

Dr. Dion Davidson

It's maybe not quite as simple to answer as you might think. I'll say that, at the beginning of the pandemic, there would have been five to six full-time vascular surgeons, maybe four to five full-time vascular surgeons. For example, my partner in the Annapolis Valley is also a general surgeon, so he maybe wouldn't be termed a full-time vascular surgeon, and there was some of the same sort of thing happening in Halifax. So it would be a number something like that. And that would be to cover vascular surgery for Nova Scotia and PEI.

Chad Horton

In your practice, how many patients could you expect to treat in the run of a week?

Dr. Dion Davidson

Again, not super easy to answer, but I'll say, in terms of new consults and follow-ups in a given week, maybe 50 to 80, something like that.

[00:05:00]

And then maybe another 10 patients I would provide minor surgeries for, such as wound debridements. Wound debridements would be an example, some minor office procedures. And then, maybe anywhere from one to five bigger surgeries per week that might be sort of planned surgeries during the day, and then, maybe more urgent surgeries during the evening or night time.

Chad Horton

And do you have any experience as an educator?

Dr. Dion Davidson

Yes, I would say I've spent a lot of time in education of nurses, medical students, general surgery residents, family medicine residents as well, in terms of lectures. And then for their electives, accompanying me in clinic and in the operating room. And kind of how we do it as doctors is teach as you interact, as you're working.

Chad Horton

Now, at the beginning of the pandemic, let's say early 2020, what had been your plan for both yourself and your family with respect to your professional future in Nova Scotia?

Dr. Dion Davidson

Before the pandemic, we were dug in. We had been there for, I guess about 15 years at that point, my wife and I. We had raised our three daughters there. I was a really hardworking vascular surgeon. My career and my profession took up obviously most of my life. And my wife became a prominent community leader and businesswoman, including helping the Nova Scotia Health with efforts such as recruiting doctors into the community and things like that—a lot of other volunteer-type work. Two of my daughters were still in the Annapolis Valley at that time. So before the pandemic, we had no plans to ever go anywhere. We were dug into Nova Scotia, specifically the Annapolis Valley. Our plan was to stay there forever.

Chad Horton

Okay, and we'll get into your experience throughout the pandemic in a moment. I just want to bring us up to the present and ask you, Dr. Davidson, what are your plans professionally for yourself and your plans for your family currently?

Dr. Dion Davidson

Well, I've resigned my position, kind of at the tail end now of a long and awkward process of resigning. And my wife and our youngest daughter and I are moving out of Nova Scotia.

Chad Horton

Why is that, Dr. Davidson?

Dr. Dion Davidson

We're moving because, I mean, to put it simply: we're moving because of the public health response to the COVID pandemic.

Chad Horton

We'll come back to that. Now can you speak to any experience or qualifications you have with respect to the review and interpretation of medical research literature?

Dr. Dion Davidson

Yeah, I'm not an epidemiologist, but I'm a doctor. And a major aspect of medical school education is the concept of evidence-based medicine. We're taught quite extensively from a very early point how to interpret scientific papers—we're talking about research methods and biostatistics—so that we can, throughout our careers, be able to look at the scientific literature and know what to look for in terms of quality of scientific literature, what it's trying to say, what it's actually saying, what data means. So that's a major component of medical school education. And almost every doctor, almost every day, to some extent, has to assess the medical literature and interpret it. In addition, I took some additional biostatistics classes during my surgical training. Yeah, I mean, maybe no more than any other specialist, but it's certainly part of what we normally do as doctors is review scientific literature.

Chad Horton

Do you have any specific education or training with respect to medical ethics?

Dr. Dion Davidson

It'd be the same answer. I guess the short answer is, not in addition to what we are taught as doctors from a very early point, before we're doctors. A very early point in medical school and all through medical school, principles of medical ethics are strongly emphasized.

[00:10:00]

I mean, not only that, but they come up every day and with every patient to a certain extent. So I also don't have a PhD in philosophy, but I would say that I'm very knowledgeable about the basic premises of medical ethics.

Chad Horton

Can you talk about the concept of informed consent as it applies to the practice of medicine?

Dr. Dion Davidson

Yeah, informed consent is a major cornerstone of medical ethics. And I don't know, maybe it's more obvious to some than others. But obviously, it is a principle that we never as doctors, ever, ever, force a medical intervention on someone. History is replete with examples of times where doctors have done that. And those very sad episodes in history are sort of in the background as we talk about consent. Consent needs to be free—free of coercion—and informed in order to mean anything.

Chad Horton

And does that principle apply to all medical interventions in Canada?

Dr. Dion Davidson

Does it apply? I mean, historically it would have applied, I would say. One would think, and I think we all would have said before the pandemic, that the threshold for even considering contravening the ethic of informed consent should be extremely high.

Chad Horton

As we entered the pandemic in early 2020, what was your understanding of the danger posed to public health in this province by COVID-19?

Dr. Dion Davidson

Well, I was as concerned as anybody else about COVID-19. Similar to Dr Lavranos' testimony, in early 2020, nobody knew much of anything about this virus, except that it was really serious and that it could be a catastrophe. So I was very concerned about it; I took it very seriously. I started to work with other doctors in our hospital—and again, a lot of this will sound familiar from Aris's testimony—in trying to learn as much as we could about it with the limited information that we had at the time, and then trying to prepare for these waves of critically ill COVID patients that surely were going to be coming to our door. So that concern and fear took up—and trying to prepare—many months going into and through the summer, for sure.

Chad Horton

Okay I'm going to touch on something you just said or perhaps we can expand on it. So you indicated that you were very concerned, like many people were, during the early stages of the pandemic. What was your observation during the early stages of the pandemic regarding the allocation of in-hospital resources?

Dr. Dion Davidson

Well, I think, again, we were all very concerned. We didn't have much data, but we were concerned enough, early on, that we all agreed that we needed to be ready and that it was probably appropriate to slow the hospital down as much as possible. So one thing that was certainly very prominent in our hospital, which has a relatively big surgery department, is that elective surgeries were halted for months. So elective means surgeries that aren't urgent were just deferred. Put on hold. Not done.

Chad Horton

Now when you say surgeries that were not urgent, is that the same as surgeries that were not important? Or are those two different things?

Dr. Dion Davidson

Yeah, certainly, two different things.

Chad Horton

So could an elective surgery still be an important surgery?

Dr. Dion Davidson

Oh, for sure. Yes. I mean, no surgeon should be doing any surgery they don't think it's an important surgery to do.

Chad Horton

Okay, so you've discussed the allocation of in-hospital resources. Shift gears a little bit. What were your observations in hospital with respect to COVID-related illness during the initial stages of the pandemic?

Dr. Dion Davidson

Yeah, again, similar to what Aris was saying: we were geared up and spun up. We were getting ready. I was part of teams of people that where we were trying to develop these protocols about how we would safely intubate patients in respiratory distress and safely get them to the ICU.

[00:15:00]

Including the possibility of emergency surgical airways, if that was going to be needed. And really, certainly, in the early months, there was very little of that. Very few, very small numbers of critically ill COVID patients at first. It's hard for me to kind of remember the exact timeline. But certainly, for the first several months, there was a lot more sort of preparing than there was actually looking after critically ill COVID patients.

Chad Horton

And I think you just referenced critically ill COVID patients, how about during the initial months of the pandemic COVID admissions generally?

Dr. Dion Davidson

I wouldn't have been involved. I would only be involved if they were ICU patients, so there probably were some. My impression was that, again, for several months, it wasn't nearly the numbers that we feared that it would be, even the less sick.

Chad Horton

So you had spoken earlier about your significant apprehensions at the front end of the pandemic. Did your level of apprehension or your areas of concern evolve over time, and if so, how and why did they evolve?

Dr. Dion Davidson

Certainly. I mean, as with many other people, as the spring turned into the fall, we had more data. And it became evident pretty quickly that, again, the virus was serious, and it could be very serious for certain people, but we were getting a very clear picture of who was most at risk. And as we've heard, age was the major factor for that. Comorbidities such as obesity and diabetes played a role as well, but age was certainly the major risk factor. And I feel like that was becoming very clear, certainly as 2020 turned into 2021. So I was becoming, I guess, less concerned that the virus was going to be a world catastrophe. I'm still taking it seriously but less concerned about that.

Chad Horton

And where you're talking about age being a significant factor, is that the idea that Dr. Milburn and Dr. Lavranos described as age stratification of risk, as it relates to COVID-19? Is that the concept?

Dr. Dion Davidson

Yes, exactly. You know, the concept that if you're a healthy child— I mean, there's no such thing as zero in medicine, but if you're a healthy child, your risk of a bad outcome from COVID approaches zero. If you're 80 years old, you're at much higher risk, like a thousandfold risk.

Chad Horton

Okay, what's your understanding of the risk for a healthy adult, somebody who wouldn't be medically classified as elderly? If that's an appropriate classification.

Dr. Dion Davidson

Again, by now there's very good data, even on a decade-by-decade basis. It would be hard for me to give you a number, but for the average healthy 40-year-old, your case fatality, certainly your infection fatality number, is low, less than 1 per cent.

Chad Horton

Is that 1 per cent relative to infections or 1 per cent relative to the population?

Dr. Dion Davidson

Certainly, IFR (infection fatality rate), even the case fatality rate, was probably about that. I don't want to overstate it.

Chad Horton

Sure. Okay, so I believe that you said a few moments ago that the risk posed to children is close to zero. Did I hear you correctly?

Dr. Dion Davidson

Yeah.

Chad Horton

Okay. In light of that perspective, what was your sense of locking down schools or locking down society generally?

Dr. Dion Davidson

Well, yeah, that was my first major crisis moment, I would say. So like everybody else or most people, I understood and probably even supported the idea of two weeks to flatten the curve.

But even then, and certainly as that became two months to flatten the curve and extended longer, I was increasingly distressed about the idea of wide society lockdowns. And for all the reasons that I'm sure, even at that time let alone now, would be obvious to everybody in this room. And it boggled my mind why public health wasn't discussing the potential dangers—not potential dangers but dangers of wide society lockdowns, in terms of rationalizing why they were recommending that.

You know, the downsides are obvious. And you know, again, Aris talked about this.

[00:20:00]

You've heard it before, but the missed cancer screening, the missed cancer diagnoses, the patients staying at home and not seeing their family doctor to manage their diabetes and their blood pressure—all of the strict health downsides should have been obvious. And then the society downsides: children not going to school, not getting the development that they get from going to school, older people dying alone and away from their loved ones.

Again, it was obvious to me, and I have no special insight into this sort of thing. I know it was obvious to many people. Why it wasn't being publicly discussed was very distressing to me. And why, month after month, it was decided that this one virus—which was now just one more way among a thousand other ways that we could die in life—why that one virus was the only thing that public health was concerned with. I just didn't understand that at all, and it really distressed me.

Chad Horton

In your professional medical opinion, was there any medical or scientific evidence that you were aware of during that time that suggested that these ongoing lockdowns should have been or remained implemented?

Dr. Dion Davidson

Not on an ongoing basis. You know, again, we were getting more and more data about who was at risk and who wasn't. The downsides of lockdowns, if they weren't obvious before, I think were becoming more evident. So certainly not on an ongoing basis. There were preeminent, very prominent PhD epidemiologists from Harvard, Oxford, Stanford, who took a step to organize and gather other preeminent PhDs and other researchers and scientists from around the world to suggest that wide society lockdowns were a bad idea.

And they base this on very old planning: that before Covid, somewhat further back in time, the approach to pandemics it had been agreed would be focused protection of those at most risk. It was only with Covid that was actually this new idea that you had to shut down the entire society because of this one virus. And their ideas made a lot of sense to me. I didn't understand why they were being demonized in the public and among this new public health establishment and in the media.

And then, as time wore on, we had glimpses into what other jurisdictions were doing. Countries like Sweden, states like Florida and Texas were not widely shutting down. Or you know, they were undertaking more humane versions of that, again more focused and shorter lockdowns and their age-adjusted mortalities were no worse. In some cases, they were better than areas like New York or California—or Nova Scotia, at least later on—that were undertaking these draconian lockdowns.

Chad Horton

Were you aware of any debate or discussion happening either in hospital amongst your colleagues and leadership or in the public health sphere in Nova Scotia regarding whether these ongoing lockdowns were appropriate? Was it a matter of discussion and debate that you were aware of?

Dr. Dion Davidson

Well, as I said, I was actually very disappointed that it wasn't a matter of public debate. And it wasn't even anything that public health was bringing up, which I would have thought would have been public health's job. So certainly not at that level. In terms of otherwise—Other than me just grumbling and complaining and others sort of agreeing—you know, my colleagues around me sort of agreeing that there would be downsides—there really wasn't a lot of discussion about it, not nearly enough in my opinion.

Chad Horton

You've just discussed your views on the lockdowns. As time wore on, did your concerns begin to evolve or did you have other concerns?

Dr. Dion Davidson

Well, I had other concerns. You know, elective surgeries don't apply so much to vascular surgery. A lot of what we do is life or limb threatening more immediately, if not emergently. So you know, I was still operating, my practice was continuing.

[00:25:00]

And then, in addition to all that, I was trying to help prepare and trying to learn more about COVID. So I was very busy. I carried on. I hoped that public health knew what they were doing in terms of the lockdowns. But as time went on, I was just more and more suspicious of that. I'm not sure if that answers your question or not, but that's how that evolved.

Chad Horton

Absolutely. How about based on your education, training and experience and your understanding of clinical literature, how did you feel about the vaccine rollout and/or the implementation of vaccine mandates?

Dr. Dion Davidson

Yeah, so that was the next point of concern for me. So when the vaccines were being developed, I remember being somewhat concerned at the speed at which it was happening. As you've heard, it would normally take multiple years—five years, ten years minimum—to get a vaccine to the point of new pathogen-to-public rollout.

Donald Trump's administration authorized Operation Warp Speed. And the whole idea of that was that there weren't going to be these normal regulatory processes. They were going to cut the red tape so that these vaccines could be developed more quickly. Which is great if everything goes well, but that means, by definition, you don't have the long-term data, especially in terms of safety. So I had some concern about that. The randomized trials came out, and to be honest again, I was busy. I scanned them and in retrospect, I did not read them critically enough, but they seemed to be saying good things about the mRNA vaccines.

And then public health, obviously, was all in. They were immediately safe and effective. It was amazing the confidence with which they could tell us that these were safe and effective vaccines based on two randomized trials and a couple of months of data. But again, I was busy and I was naive. I should have questioned things more at that time. But I assumed, hoped, that the powers that be knew what they were doing in terms of pushing these vaccines. So I myself, I got vaccinated. I got the two primary vaccinations, mRNA vaccinations in early 2021.

Chad Horton

I'm just going to ask you one question about what you said. You talked about cutting the red tape and pushing the vaccines out, and you mentioned two months of data, trial data. With your experience as a physician and a surgeon, and you also indicated, "I should have read the studies more carefully." Based on your experience and where we are today, do you believe that that was a responsible statement? A medically responsible statement or a socially responsible statement to characterize those interventions as safe and effective?

Dr. Dion Davidson

No, I think that's an irresponsible way to describe almost any medical intervention, let alone a brand-new technology that had been studied in two randomized trials with a couple of months of data. We never talk about medical interventions like that. I never sit down with a patient who has a problem and I have a surgery that maybe could fix that problem. I hope it would, I think it will. I never just sit down with them or stand up with them and say, "This is safe and effective, do it." That's never how we talk about things as doctors. Ever.

You talk to the patient about what's happening with them, what their options are. And maybe even I give a recommendation, but I also talk to them about the risks of what I'm proposing and the potential benefits. And it's always, always up to the patient. And if the patient decides against what I'm recommending, you stick with them and you try something else. You never just say, "This is safe and effective; do this, take this." That's never how we talk about medical interventions.

Chad Horton

Well, I thank you for that doctor. A logical corollary to what you've just said is, or the next logical question then, given what you've just expressed to the Commission: How did you feel about the mandates themselves when the vaccines actually became mandated in this province?

Dr. Dion Davidson

Well, so that was the next issue. It's one thing to heavily promote a medical intervention like that to the public. And you know, there's arguments to be made, certainly that that shouldn't have happened.

[00:30:00]

To then force people to take that intervention is a whole new level. And I really couldn't comprehend that the discussion was even being undertaken. By then, we had even more data about what was happening with the virus. And it was serious; the virus was serious. I'm not a COVID denier. I eventually, later on, helped look after extremely sick patients in

the ICU who had COVID. And so, I don't deny that: for a relatively small number of people, it is a very serious disease and it can cause death. There was no doubt about that.

But again, by then we had much more data about who was at risk and who wasn't. We had much more data about the magnitude of mortality that COVID was bringing us. And even at that point that mandates were being discussed, we were starting to get data about how the vaccines did little or nothing to reduce transmission of the disease.

So as Aris was saying earlier, in order to even contemplate a mandate where you're forcing someone to take a medical intervention on pain of losing their job or they're being able to participate in society as they normally would— In order to even think about that, it would have to be an infectious disease situation where the pathogen is so serious and the intervention is so safe and so effective that you can then contravene this extremely important ethic of informed and free consent. So at that point, it did not seem that any of those criteria were being met.

The data was becoming more clear to the extent that it was being admitted on American national television by the CDC and Anthony Fauci that the vaccines were, first of all, losing their effectiveness even in contracting COVID fairly early, within four or five months. We all saw the 95 per cent effective go down to 50 per cent effective over the next few months. But more importantly, they were admitting that they did little or nothing to reduce transmission of the virus. And so then, in my mind—and I challenge anybody to tell me how this cannot be—the whole argument for even considering forcing vaccination on someone is null and void.

Chad Horton

Changing topics here a little bit, Doctor. As the vaccines were rolled out and as we got into a vaccine mandate situation here in Nova Scotia, did you have any direct or indirect experience with adverse events in your medical practice with respect to the COVID-19 vaccinations?

Dr. Dion Davidson

Yes, I did. And you know, just to clarify, the term is not adverse event due to vaccination. The term is adverse event following vaccination or following immunization. And the whole point there is that it's extremely difficult to prove that any adverse event is because of a vaccination. But that's part of the point of encouraging, or what we should have been doing is encouraging, people to report adverse events happening after. And there was not the sort of burden of proof for health care professionals—for example, nurses or doctors—to know that an adverse event was because of the vaccination. We are supposed to be reporting **adverse events, whether we think they have any relationship or whether we can sort of explain any relationship or not.**

I certainly had first-hand experience of at least—I have to be careful about patient personal health information—life-threatening, and many more cases of more minor thrombotic events, shortly after vaccination. And when I first saw those, that was my first introduction into the online adverse events reporting system that you heard about. I must say: I think Aris left, but he must be many orders of magnitude smarter than me because I don't know how you could get through one of those reports in five minutes. I mean it took me 45 minutes; it took me 10 minutes just to figure out the links on the website to try to get to the five-page PDF that you'd have to fill out. I found it—and I spoke to many other people that

agreed with me—a very cumbersome, very awkward process to report an adverse event occurring after a vaccination.

[00:35:00]

Chad Horton

Would it be your opinion that the way that the reporting system was set up, that it could potentially impair the reporting of adverse events, or otherwise inhibit the reporting of adverse events?

Dr. Dion Davidson

Yes. And in addition to that is the whole issue of communication with us as health care professionals. We were relentlessly bombarded with how great the vaccines were, that they were safe and effective, safe and effective a thousand times a day, this oversimplification of this new medical intervention.

And informed by our various regulatory bodies—the College of Physicians and Surgeons in my case—that if we did not publicly voice support or if we publicly voiced anything other than support of public health’s statements about that, that we would be disciplined or that we would face disciplinary measures. So not only is the mechanics of reporting the adverse event very cumbersome and time consuming, the overall messaging, I can tell you, was not, “Be sure to look out for these adverse events.” I think I saw one email during those years. And again, that was after the newspaper article that you heard about, that it felt like public health was forced to say something about this adverse event’s reporting system.

So every day, relentless: “vaccines are safe and effective.” Maybe one message about reporting adverse events.

Chad Horton

I’m going to ask you this in a general way, Dr. Davidson. Is it your opinion that the messaging that you just described had a dissuasive effect on the reporting of adverse events?

Dr. Dion Davidson

I don’t know how it couldn’t have.

Chad Horton

And I’m going to back up just a little bit. You had mentioned thrombotic events. For those of us who aren’t physicians, what is a thrombotic event? And just so everyone can remember, Dr. Davidson, I believe your evidence was you observed an increase in thrombotic events as an adverse event post-vaccination. Is that correct?

Dr. Dion Davidson

That’s correct.

Chad Horton

And what is a thrombotic event?

Dr. Dion Davidson

Simply put, it is blood clots forming in blood vessels. In my case, you know I saw a couple in arteries but more so in veins.

So much so that it did lead me to change my practice, my office practice, where I provide relatively minor venous procedures to advising patients about more anticoagulation or medications that would reduce their risk of clots in the superficial veins and the deep veins, which could potentially be life threatening.

Chad Horton

Did you prescribe interventions in connection with adverse events post-vaccination?

Dr. Dion Davidson

Not specifically procedures for those clots—you don't really do procedures in the midst of an acute clot—but just the additional blood thinners, anti-coagulants to prevent them.

Chad Horton

So prescriptions. Yeah. Okay. And I've just been told that we're nearing the conclusion of our time, so I'll try to get through the rest of this quickly. But as a physician and surgeon with, I believe, based on what you had said—that I think you came into the province in 2005—by my counting that would give you approximately 18 years' experience as a physician and surgeon in Nova Scotia. Correct?

Dr. Dion Davidson

Yes.

Chad Horton

Yeah, okay. So as a physician and surgeon with 18 years' experience practising in Nova Scotia specifically, is it your opinion that the implementation of vaccine mandates was a necessary public safety measure?

Dr. Dion Davidson

Vaccine mandates were an unnecessary public safety measure.

Chad Horton

Okay. And similarly, is it your opinion that the implementation of vaccine mandates was a reasonable public safety measure?

Dr. Dion Davidson

No, they were not a reasonable public safety measure.

Chad Horton

Final question, Dr. Davidson. You indicated that, based on your experience, you were leaving the practice of medicine in Nova Scotia. You shared with us what I believe any layperson would believe is a fairly impressive history and list of credentials. What I'd like to ask you, sir, is what does your departure from medicine mean for Nova Scotians?

[00:40:00]

Dr. Dion Davidson

It's a difficult question to answer. I mean, certainly, you know, it would be true to say that I have been a hard-working community vascular surgeon. I do a lot of call coverage, or I did, before I was in the process of resigning. I do a lot of call coverage in terms of frequency of call coverage, covering the western zone of Nova Scotia for general vascular surgical sort of concerns and urgencies and emergencies. As I said, I was one of the attendings in the ICU. So I had a very busy practice, was a real hard worker for sure.

And so, you know, when someone like that resigns, it certainly leaves at least somewhat of a hole. And you know, in my case specifically: So it means that the remaining vascular surgeons, first of all, until they can find a replacement, will be working harder. There is a shortage of vascular surgeons around the world and across Canada, and I don't know how long it will take to recruit another vascular surgeon. Patients will wait longer. I think in particular some areas that unfortunately are chronically underserved, like diabetic foot infections and some of the aspects of chronic venous disease that I was talking about, that I spent more time on—those patients, I think, are going to be quite ill-served until and whether that gap is filled. Yeah.

Chad Horton

All right. Those are my questions, sir. I will turn you over to the Commission. Thank you.

Commissioner Massie

Thank you very much for your testimony. I have a question. I realize that you're very busy, so you didn't have the time maybe to do the critical analysis of the literature, so you decided to take on the vaccine. Was it because you were influenced by the environment, or was it something that you wanted to do initially because you wanted maybe to protect vulnerable patients in the hospital?

Dr. Dion Davidson

I'd say a little of both. I mean, you know, again, I just sort of trusted what my bosses and elders were telling me, right. I mean, ostensibly, public health should know more about all this stuff than I do. And even though some of it didn't make sense at various junctures, at times it's much easier just to accept what you're being told and do what you're told rather than do your own research, do your own reading. So we were told the vaccines were safe and effective and we should get them. So I just got them. At that time. Not since.

Commissioner Massie

And did you encourage people in your family to also get vaccinated?

Dr. Dion Davidson

No, I wouldn't say so. I'm just trying to think back to that time period. I didn't necessarily encourage my wife to get vaccinated, I left it up to her. And I think I might have encouraged my parents to at least consider it. I don't remember ever being so— I was never aggressive about it, but I think I may have encouraged my parents to consider it at the time.

Commissioner Massie

Thank you very much.

Commissioner DiGregorio

Thank you for your testimony. Just a few questions. You spoke a little bit about the cumbersome reporting process for adverse events. And I'm just wondering if you have any thoughts or recommendations on how that process could be improved upon.

Dr. Dion Davidson

Yeah, I mean, not specifically. Along with all the other things, I'm not an IT specialist. But it seems to me, it would be quite simple to make the process—the mechanics of that process—a lot more straightforward. First of all, in terms of, "Here's what you click on. Here's a few boxes to click. Now you can scan a QR code." I mean, surely things like that could be brought into play.

But even, again, more importantly than that, I would say, would be that overall messaging—that this is our responsibility as health care workers to look out for these adverse events. We don't have to prove that they're because of the vaccination. The whole point is that this is a screening system. And that and along with every email that said that the vaccines are safe and effective should have been a line right underneath saying, "And by the way, it's your responsibility to look out for adverse events and report those as well." So those would be two, I think, fairly simple recommendations moving forward.

[00:45:00]

Commissioner DiGregorio

So would that include maybe part of the education and training that doctors receive?

Dr. Dion Davidson

Yeah, I suppose. But I mean, it wouldn't take much education and training. It's like one sentence.

Commissioner DiGregorio

And one other question. You mentioned that you have resigned and that you're leaving Nova Scotia. I'm just wondering if there is something now that Nova Scotia could do that would prevent you from leaving.

Dr. Dion Davidson

Yeah, I mean, I don't know. I guess, a complete turnaround of public health and its attitude toward the public. And some overtures that they're going to seek to be more holistic and humanistic about their approach to things like this.

Yeah, I don't know. Maybe. I'm pretty far down the road of leaving, but you never know.

Commissioner DiGregorio

Thank you.

Commissioner Drysdale

I have a couple of questions, Doctor. Thank you for your testimony. First question was— Do you know of any other professionals currently leaving the province of Nova Scotia for these types of reasons?

Dr. Dion Davidson

That's a very good question. At least a couple have left. But also, I know of dozens that have— You know, I heard the term quiet-quit recently. So I know of dozens of doctors and nurses who have taken leaves of absences, have downsized their practice. And some of these are people that were basically fired for not getting vaccinated. And even now, two years later: even now, we have all this data about how the vaccines don't reduce transmission. Even to this day, you can't work as a health care worker in Nova Scotia Health unless you got those two vaccines, two years ago.

So I know of dozens of nurses and doctors who aren't working because of that. A few that actually even got vaccinated but just like me, just got sick of things, and so they've retired early and are in the process of moving away. So I guess the short answer is, yes, I know about others.

Commissioner Drysdale

This question might seem odd. How much did you know about mRNA technology prior to you taking the vax yourself?

Dr. Dion Davidson

Not much at all. You know, as I said, scanned the RCTs that were done at that time. And then, you know, maybe a quick internet search here and there about what this technology was. And that was about it.

Commissioner Drysdale

But were you aware of it being a novel technology to be used on the population?

Dr. Dion Davidson

Well, mRNA technology, the technology, the idea is not new per se. I mean it was, I don't know, 10 years ago or whatever that it came about and it's been used in very limited ways over those years. So it wasn't new in that way. But I was aware that this was obviously the biggest application that had been made of mRNA technology. And in that sense, it was new.

Commissioner Drysdale

It's just the reason I asked that question is because you're right: as I understand from previous testimony, the mRNA technology has been around for quite some time. But this, as I understand, was the first time it was introduced in mass to the human population.

Dr. Dion Davidson

It was my understanding as well.

Commissioner Drysdale

And considering that it had never been done before, you would have thought that there would not just be the standard review process in place, but it would be an additional process.

Dr. Dion Davidson

One would have thought.

Commissioner Drysdale

You know, I have another question that's a very short one. And I can't imagine you can answer this, but my question to you is, why? Why did this happen? Why did we— And I think you were here earlier and listening to the testimony, but we heard from Dr. Braden about—this is my words, not hers—the breakdown in the process from conceptual science to production of product, to putting it in arms. And there seemed to be a breakdown in the entire system from top to bottom. Even after it went into arms, the reporting of adverse reactions or even the reporting of efficacy seemed to all break down on this.

Dr. Dion Davidson

How did that happen?

[00:50:00]

Commissioner Drysdale

How did that happen? Why? Or why did it happen? Perhaps those are two different questions.

Dr. Dion Davidson

From what I understand, there was somewhat of a new public health elite that emerged early in the pandemic. And they became obsessed with this one virus—with some good reason, it was bad—to the negation of literally every other public health concern.

And then it became political, and then it became tribal. So that you were either on team “coronavirus is going to kill us all, and everything and anything that we need to do to stop it or that could even possibly stop it, is justified” or you're on “team critical” of all that. And I think just many public health officials chose their team. Many doctors chose their team, and they just stuck with it, no matter what the data said. And that carried through the entire pandemic. People chose their team, they chose their tribe, and they just stuck to their guns, no matter what else came up.

Commissioner Drysdale

Thank you.

Commissioner DiGregorio

Sorry, I just have one more question that I forgot to ask you. How long did you train to become a vascular surgeon?

Dr. Dion Davidson

So medical school for me was four years. It is for most people four years. And then I trained in general surgery first and then vascular surgery. That was a total of eight years after that.

Commissioner DiGregorio

So 12 years. Is my math okay there?

Dr. Dion Davidson

From the beginning of medical school till the end of my surgical training was 12 years. And I did, you know, four years of university before medical school, so 16. A lot of years.

Commissioner DiGregorio

And did I hear you correctly say that there is, not really a shortage of vascular surgeons, but that you are in short supply?

Dr. Dion Davidson

Yeah, there is a shortage of vascular surgeons. I mean, there's a shortage of any number of specialties around the world and doctors in general, right. But certainly, specifically vascular surgery, yeah.

Commissioner DiGregorio

Thank you.

Dr. Dion Davidson

You're welcome.

Ches Crosbie

Thank you, Dr. Davidson.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 3

March 18, 2023

EVIDENCE

Witness 5: Ellen Smith

Full Day 3 Timestamp: 05:10:20–05:28:15

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Alison Steeves

[mic not on]

[00:00:39]

Ellen Smith

... a homemaker, presently.

Alison Steeves

Could you tell us a little bit about your family?

Ellen Smith

Yes, my husband and I have lived here for 22 years this summer. We have two adult children living with us currently. One is our 28-year-old son who has minor special needs and our daughter who has Downs Syndrome, and she will be 25 this summer.

Alison Steeves

Back in late 2019, early 2020, can you tell us about your day-to-day life for you and your family, sort of what was your daily routine?

Ellen Smith

Certainly. My husband was going to work in office in the town of Summerside, and he would drop our daughter off daily at a day program for handicapped adults, which she attended from roughly 8:30 to 3 o'clock every day. I was basically the glue to hold this all together. I believe our son had just moved back in with us and was trying to get into the armed forces to train as a financial officer.

Alison Steeves

How long had your daughter been in this day program?

Ellen Smith

In the day program, since she graduated from high school at age, almost 18. So it would have been several years earlier, three years roughly.

Alison Steeves

So she knew the routine pretty well and the people that work there.

Ellen Smith

Absolutely. It was a very small program, and so there were only small numbers of people in the program. She became princess to them very quickly. She was a very young client compared with most of the attendees.

Alison Steeves

And you said your daughter has Down Syndrome, correct?

Ellen Smith

Yes, she does, as well as some other comorbid diagnoses. She has sensory integration dysfunction, and although she's never been assessed, we think she's inherited some of my husband's diagnoses. We see her ticcing and she doesn't have great attention skills. So we think she has ADHD as well.

Alison Steeves

Would you say that routine is pretty important for her?

Ellen Smith

Absolutely. Any medical professional would attest, and any parent of a special needs child or an adult would attest to the fact that they need predictability because they don't cope with change. They don't learn as quickly new routines. So any threat to that routine over a longer period of time can really compromise their stress levels.

Alison Steeves

So in 2020, when PEI began implementing COVID-19 measures, did that impact your daughter's routine?

Ellen Smith

Oh, absolutely. She wasn't allowed to go to her day program for quite a while. I began to see her having signs of mild depression. She would occasionally have crying jags or be overly sensitive to normal comments being made in our day-to-day lifestyle. She just seemed to be more mooney, that's a good English word to use. Yeah. And of course, that affected us as her parents. Generally, when you have a special needs child, you're already stressed to the max. There's a lot of detail involved in that which I won't bore you with.

Shortly after we moved here, for example, the IWK (Izaak Walton Killam Hospital for Children)—that'd be 22 years ago—sent us a letter saying that anybody who had a child who'd had open heart or brain surgery would be traumatized and would become hypervigilant about their health, their mental state, their emotions more than the average parent. So not only were we dealing with the grief associated and the stress associated with having a special-needs, delayed child, but the medical condition that she had been through or the surgery had compromised our state of mind, as well. So if anything happens to her that affects her emotional state or her physical health, both of us are deeply affected by that. That's just been since the get-go.

Alison Steeves

So to be clear, your daughter had had heart surgery, very young?

Ellen Smith

Yes, at 10 weeks of age, yeah.

Alison Steeves

And your observation was that this sort of information pamphlet was correct for you and your husband? The impact was that—

Ellen Smith

Oh, absolutely, absolutely. It gave us a reason to pat ourselves on the back because we knew then we weren't crazy.

Alison Steeves

So every time any sort of slight change or health issue made you hypervigilant, it was kind of an increased impact?

[00:05:00]

Ellen Smith

Oh yeah, the slightest little thing. And certainly, I as her mother because I had been taking care of her, more hands-on than of course my husband was because he was the breadwinner, and still is. So it definitely affected me. And I know it affected my husband.

Alison Steeves

And how long did these impacts, these changes in your daughter's mood, last?

Ellen Smith

There's still some residual effects. To this day, a couple years after she was able to go back to her program, if we have a snow day or if there's any kind of cancellation that's out of the normal routine, she seems a little concerned, a little anxious. And I often have to reassure her that it's just because of the snow and they just cancel schools because it's not dangerous to drive, et cetera, et cetera. And then she seems reassured.

But I don't remember her ever questioning that. In fact, previous to this time, she would go, "whoo-hoo, day off!" You know, like a typical teenage kid would.

Alison Steeves

So since the pandemic you've noticed that if there's a change in routine or if there's a cancellation in her day program, it's more stressful for her?

Ellen Smith

Yeah, if it's out of the normal routine like, you know, Christmas holidays. Gosh, I'm trying to think what else they get off regularly. I guess that's about it really. And she's so excited about Christmas that that was never a big issue for us so, or for her. But definitely now, I see a difference in her behaviour. Yeah, if there's snow.

And it's funny, I just noticed that this winter. I don't know if I was even cognizant of it last year. We were too concerned about other issues of course. But it's definitely affected her. I'd say her state of mind hasn't completely recovered.

Alison Steeves

And you mentioned your husband's diagnosis. Can you speak about that?

Ellen Smith

Yeah, absolutely. He was diagnosed several years ago at a private clinic in the U.S. with ADHD. I'm just looking at my notes: a learning disability, OCD, a post-concussion syndrome, a tic disorder, and a mood disorder. He does deal with some chronic anxiety on top of all that. And he was given some trials with pharmaceuticals since that diagnosis. But what we discovered was, for example, for one of the diagnoses, if he was given a drug, it would exacerbate the symptoms of one of the other diagnoses. So we learned over several months—well actually a couple of years—that that wasn't going to work. So we've developed kind of a naturopathic approach to it of supplements, vitamins, exercise, fresh air. And it seems to kind of keep everything at bay.

At the beginning of the lockdowns, when he had to work out of the home, and Michaela was home, that's our daughter, he started having sleep problems. And that's a first for him. He's not a young man; he's 66 now. He would have been in his early 60s during the lockdowns, of course. And he got a sleep medication. But after trying it for several months, it started making some of his symptoms worse, as well. So we slowly had to kind of ease him off of that.

And to this day, he's still having—not as bad sleep problems, but he still has trouble getting to sleep and staying asleep at night. And that was never really an issue with him up to that point, he usually just as soon as he hit the pillow. And I would know, obviously, because I could see that. So yeah, this is all brand new for us.

Alison Steeves

What aspect of the COVID measures, do you think, impacted his sleep? Or what was the connection?

Ellen Smith

Well, just the stress, just the stress. I mean, the lockdowns were frustrating having to wear masks everywhere.

He had had some nursing training. He did quite well in the academic end of it. He's a very bright man. And we both were privy to the fact that, for example, with the vaccines— I'm sorry, I'm getting confused here.

If a person had had vaccines, according to standard immunology that was known at the time and now, if they work, then if you're exposed to anything that you're immunized for, you should manifest little or no symptomology.

So if you're carrying that virus or disease, certainly that would be more of a danger. So it made sense to us that a vaccinated person would be more of a danger to other people if they were carrying. And we had— Sorry, go ahead.

Alison Steeves

No, sorry. Had your husband's routine changed as well, then. He was impacted?

Ellen Smith

Yes, he had to work at home. He still is, as a matter of fact. He's a federal government employee. So he wasn't getting out and being exposed to, you know, getting back and forth to work or running errands on the way home. Things like that that had been part of his life.

And just the stress of not knowing what the heck is going on, you know, in our world.

[00:10:00]

I mean, we all were following everything. And I just saw his behaviour go from sort of in control to worse. And it's kind of been worse since then. Like he's more difficult to deal with since that time. It's not as bad as during the lockdowns, certainly. But he's still— His symptoms just seem to be worse at times than I remember in previous years. And that's hard on the family. It's hard on the children. It's hard on me, certainly, you know.

I have to make up any deficits, and I can't work outside the home. I haven't been able to for quite a few years because of his disabilities as well as our daughter's. But, yeah, we're all feeling it, definitely, you know. My own mental health has been compromised. I see my sleep disruption happening more regularly than it used to up to that point, as well.

Alison Steeves

And you spoke a bit about the vaccines. You're referring to the COVID-19 vaccines?

Ellen Smith

Yeah, absolutely. At first, we thought we weren't going to take them, knowing what we knew and a little bit of research we'd been doing. But then his job required him to take it in order to keep being employed by this particular department.

Our daughter had to be vaccinated in order to return to the day program, eventually. The first year wasn't such a big issue because there was no vaccine available, and we had to just

deal with it. But once it was available, they were insisting, absolutely, that she had to have this.

So I decided I'd better too because our in-laws, my husband's family members, his sisters insisted that we wouldn't be allowed to visit his mother in Nova Scotia unless we were all vaccinated. So we just said, "Oh the heck with it, we'll do it." And we did.

Alison Steeves

And when did you take the COVID vaccine?

Ellen Smith

I was probably the last person in our family to take it because I wasn't being forced to keep a job or anything. My last one—and I only took the first two, I haven't taken any subsequent boosters—I believe it was either late November or early December of 2021. And I had the usual side effects from the first one, with a little bit of fatigue and sore arm, stiff arm for a few days.

The second one, as soon as the pharmacist gave me the shot during that process, it was like liquid fire going into my arm. And I said, "Ow," quite loudly. I said, "That really hurt." I said, "Did you break the tip of the needle or something?" And the guy who gave it to me, the pharmacist, he didn't seem to be concerned in the least. He just put the Band-Aid on it, you know, alcohol swab and the Band-Aid. And just said, "Wait 15 minutes in the store so we make sure you don't have any kind of bad side effect immediately." And I didn't and went home.

And I had the usual symptoms I had with the first one: the fatigue and the sore arm for a few days. But since that time, regularly, I've had either a sharp, fiery pain right on the spot where the vaccine went in, or like, an achy feeling. And that happens several days a week, some weeks worse than others.

Alison Steeves

So that was approximately over a year ago now?

Ellen Smith

Sorry?

Alison Steeves

That would be over a year ago now, from the time that you took the second vaccine.

Ellen Smith

Yeah. Well, I had it, what? November, December, so a year and a third, roughly. Yeah.

Alison Steeves

And how soon after you took the vaccine did you start having those symptoms?

Ellen Smith

Oh, right away, within the first two or three weeks. I just figured it was taking longer to get rid of the initial side effects from, you know, which we were told to expect. But it just never went away with me completely.

Alison Steeves

So it's still bothers you today?

Ellen Smith

Yeah, oh yeah. Like today, it's just like, I've had a really good sleep last night. But it's still like— It doesn't hurt to touch; I can actually bump into something. But it's almost like there's a piece of something in there and it hurts. The needle pin, which it doesn't have, of course, because it would get infected. But other days, it's like, achy. So I can feel it from the inside. But to the touch it doesn't hurt, which is really bizarre.

Alison Steeves

And did the pharmacist speak with you about that this could happen or any potential side effects?

Ellen Smith

Not at the time, no. Well, we had to sign paperwork that asked us if we had an allergy to one of the components of the vaccine that was kind of unusual or rare or whatever. And of course, I wasn't aware, so I said, "no." But, other than that, no. I had just read online what to expect. So when it happened, I wasn't alarmed. But the fact that it's continued with me, you know, not to the same degree as the first few days. But it's just there all the time, and I find that so strange.

Alison Steeves

Would you say that your concerns about sort of these post-vaccine symptoms and lockdowns have impacted any of the relationships in your life? You mentioned family members who were insistent that you get the vaccine.

Ellen Smith

Right. Well, I've never really shared that with any of my in-laws because they'd probably accuse me of being crazy.

[00:15:00]

Or having a big imagination.

My immediate family know about it. I haven't gone to a doctor because I figured, what are they going to do? They're going to remove the spot or do a biopsy? I mean, my experience is a lot of doctors are just trying to keep their job, so they're doing what's demanded of them, I think, unofficially.

When my husband asked for— For example, my husband could never take the regular flu shot every year because he's allergic to egg whites, the albumin, the protein, the egg white.

And up to that point anyway, a lot of the vaccines for flu, regular flu, I believe involved the use of the egg white. At least the old ones did. So he was never able to take that. It could be a life-threatening thing; his throat would close over.

And he didn't know that the new vaccine wouldn't be created that way. So when he went in to ask his doctor for a medical exception, his doctor—who was from Iran or Iraq—gave him a story, about, “Well, in my country, a couple of hundred years ago, there was a gentleman in charge, their leader, who wanted to have marital relations with every single woman in the land. And so, everybody just went along with it or their head would be chopped off.” And I said, “Oh, well, that's an interesting analogy.”

Alison Steeves

That was his response when your husband asked about getting an exemption?

Ellen Smith

Oh, he absolutely refused. He said, “No, I can't do it.”

Alison Steeves

Ellen, what's been the hardest part of all of this for you?

Ellen Smith

Not knowing if it's going to continue again. Or if this is going to happen to a more severe degree. You know, if governments are going to work against their populations, I guess, in such a blatant way. I mean, you'd have to be a fool not to recognize that this stuff happens behind the scenes all the time and has been going on since the dawn of man. But the fact that it's come out of the closet so blatantly. And they're no longer even trying to hide what they're doing. Scares the you-know-what out of all of us in our family, I guess.

I don't trust the people in charge as much as I used to. I was never a naive person who believed everything that came down the pipeline. But I figured the truth is somewhere in the middle. But boy, I've gotten a lot more skeptical since all of this took place in the last two or three years.

Alison Steeves

Thank you, Ellen. And I'll turn it over to the commissioners if you have any questions.

Thanks very much for sharing your story today.

Ellen Smith

Absolutely, my pleasure.

[00:17:55]

NATIONAL CITIZENS INQUIRY

Truro, NS

March 18, 2023

Day 3

EVIDENCE

Witness 6: Scott Stephen Spidle

Full Day 3 Timestamp: 05:28:30–05:48:58

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Thank you, Mr. Spidle. You affirm that you will tell the truth, the whole truth, and nothing but the truth.

Scott Stephen Spidle

I do. Yes.

Ches Crosbie

Thank you.

Alison Steeves

Can you state your full name and where you're from?

Scott Stephen Spidle

Scott Steven Spidle from Annapolis Valley here in Nova Scotia.

Alison Steeves

Scott, I understand that back in early 2020, you had a very bad case of COVID. Is that correct?

Scott Stephen Spidle

Yes, that is correct.

Alison Steeves

And when exactly did you contract COVID?

Scott Stephen Spidle

It was about the first or second week of February.

Alison Steeves

What were your initial symptoms?

Scott Stephen Spidle

Initial symptoms were just normal flu-like symptoms.

Alison Steeves

How did you know it was COVID?

Scott Stephen Spidle

After the first week, about when those flu symptoms went away, I started experiencing shortness of breath and chest pain and also of course spoke with my family doctor about this. And the testing at the time had just started, and even in the mainstream media they reported issues with the testing, including both false positives and false negatives. And so, she expressed concern with the accuracy of the testing. So that wasn't really relied upon.

And also, upon one ER visit, the doctor who was seeing me—at that point it was basically standard protocol to test anybody in the ER, especially if they exhibited these symptoms. When the nurse started to prepare the test kit, the doctor turned to the nurse and said, "Don't bother with that." And at that point I was consulting with them with my symptoms, and along with the self-treatment I was doing. And he agreed that the treatment I was using was good; he reiterated that and that he believed I had COVID as well.

Alison Steeves

So your family doctor and also an ER doctor assessed that you most likely had COVID. I understand that these symptoms persisted off and on over a long period of time. Is that correct?

Scott Stephen Spidle

Yes, that is correct.

Alison Steeves

So how many trips did you end up making to the emergency room with these symptoms?

Scott Stephen Spidle

The symptoms continued to get worse. Shortness of breath, mainly. I got to the point where I could hardly breathe. And so, yeah.

Alison Steeves

At any point where you offered any treatment?

Scott Stephen Spidle

Not really. Like I say, that one doctor in the ER, he basically just said to keep using the self-treatment I was using.

Alison Steeves

What was the self-treatment?

Scott Stephen Spidle

I was using vitamin D, vitamin C, vitamin E, zinc, honey and green tea, and tonic water with lemon juice.

Because at that point, hydroxychloroquine was beginning to be spoken about as a treatment and it appeared quite evidently that that was not going to be available to us here in Nova Scotia or myself. So through my own research and people I know in the military, they suggested tonic water, as it contains quinine, which is basically a predecessor of hydroxychloroquine.

Alison Steeves

And did that help with your symptoms?

Scott Stephen Spidle

Yes, once I started putting those kind of meds and treatment to me, it still kept getting worse but not as rapidly.

Alison Steeves

So did your COVID go away?

Scott Stephen Spidle

It did eventually. I did also receive a rescue inhaler on another ER visit, which was basically a shot in the dark by the doctor. That doctor had actually believed that I was experiencing anxiety and gave me Ativan pills, sent me home with those. And I was so furious with that visit that I actually used the Ativan pills that night because I was so upset with how I was taken care of at the hospital.

Alison Steeves

So how bad did your COVID get? This was going on for how long?

Scott Stephen Spidle

Approximately four to five weeks from beginning to end. Like I say, it got to the point where I literally couldn't breathe. I only live about five, ten minutes from the hospital and one night I end up calling 911 because I didn't feel like I could drive that far in a car.

Alison Steeves

And after several months, what ended up happening to you?

Scott Stephen Spidle

I ended up having chest pain and shortness of breath slowly start to come back again, off and on. And then I woke up one morning and I could hardly get out of bed because of back pain. The shortness of breath was not as severe like it was previously, when I was very ill. So I wasn't sure what to make of it. I sort of just sat outside in a lawn chair in the morning for about 10 minutes and see how I felt with some fresh air. And the pain was still there significantly. So I drove myself to the hospital that morning.

Alison Steeves

And what happened at the hospital?

Scott Stephen Spidle

They quickly identified one of the lungs had fully collapsed. So the doctor told me that he would have to perform a chest tube.

[00:05:00]

And he strongly stressed that my informed consent would be required for him to do the procedure. And so, he did that, and shortly thereafter, he said that he wanted to send me back home with the chest tube. And I live alone, so I expressed to the nurse that I did not feel comfortable going home alone with this chest tube. And at this point, there was a shift change happening in the ER, and the nurse had spoken with the doctor coming on shift about my situation. He then shortly came to speak with me and said, "No, we're not going to send you home. We're going to transfer you to Halifax for emergency lung surgery in two days."

Alison Steeves

So you were admitted to the hospital at that time, in the Valley?

Scott Stephen Spidle

Correct.

Alison Steeves

And can you tell us about your experience in the hospital after that?

Scott Stephen Spidle

I was in the ER at Valley Regional for about three to four days. I was on morphine and meds at that point, so my mind was a little cloudy. I don't remember exactly how long it was. But on, I believe it was Day 3, my eyes began to hurt and I just by chance happened to wipe my forehead and it was just slime from sweat accumulating on my forehead. I did not receive any personal care at all. The only time a nurse or anybody came to see me in my stretcher bed was to provide morphine or medication. I had to request a face cloth to clean my face.

And then, I believe it was the next day—because I was only there three or four days—they requested an X-ray. And since getting physical medical records from my doctor, where it stated they requested a mobile X-ray, where they bring the X-ray machine to your hospital bed or stretcher, and that's not what happened. The nurse was a student nurse, I guess she

overlooked it or didn't understand the request, but she unplugged my chest tube from the vacuum line on the wall and then took me in my stretcher, ER stretcher, to the X-ray department.

The wait in the hallway alone—sedated, unplugged from my chest tube—it was only a few minutes, but within that short time I could feel in my chest like the air being let out of a balloon. And when the X-ray tech came out, he looked at me and I looked at him and I said, "They just unplugged my chest tube and I think my lung just collapsed." And he said, "Are you serious?" I said, "Yes." And I was just, you know, on morphine; it didn't seem like a big deal to me at that moment. So he rushed me into the X-ray, did that, rushed me back to the ER, then the nurse came, plugged my chest tube back into the wall.

And then after about five or ten minutes, what had just happened sort of registered in my mind, okay. And I started yelling, "Help me, they're going to kill me, I need a doctor." And after yelling that three or four times, it was only a few moments, the ER supervisor and a respiratory specialist came to my side. They assessed me and realized the lung had collapsed and, despite being plugged back into the vacuum line, it was not coming back up. So they just decided that they'd have to do another chest tube, which is a very painful and horrifying experience, really. And they had to do another one because they had to use, I guess, a larger diameter one so they could create more vacuum in my chest cavity to allow the lung to come back up.

After that, I had a very serious conversation with the two of them about how that should have never happened, which they agreed. It was shortly after then, maybe an hour or two, actually before then, the supervisor called a meeting at the nursing station—because of my condition, they had me right in the section there in my stretcher, right there in front of the ER nursing station, so they could keep close eye on me. And so, she called a meeting with the nurses after this happened and basically told them, "You know, if you have questions, have patience, wait and ask; take your time instead of making mistakes," more or less.

Alison Steeves

So when you were admitted, Scott, to stay, you were told in two days you'd be going to Halifax for lung surgery?

Scott Stephen Spidle

Correct.

Alison Steeves

How long did you end up staying in the hospital before going to Halifax?

Scott Stephen Spidle

More than two weeks. And just add to that meeting, when that was said and my situation was mentioned, the nurse who had unplugged my chest tube said, "Oh, well." And I almost flew off the handle. Except immediately a nurse, an elderly nurse who clearly been a nurse for a long time, turned to her and said, "You can't be like that."

[00:10:00]

Alison Steeves

Had you been hospitalized before, Scott?

Scott Stephen Spidle

Yes, I actually have two autoimmune conditions, which put me at high risk for COVID and one of those is ulcerative colitis. So I've been hospitalized two or three times for that for quite an extended period of time.

Alison Steeves

How would you compare the level of care you experienced and witnessed in this visit that we just spoke about compared with in the past?

Scott Stephen Spidle

It was a black and white difference, totally different. A lot of the doctors, but mainly the nurses: they seemed scared or apprehensive of being near patients. It was very odd and, like I said, that was right at the beginning of all the hysteria and all the hype.

Alison Steeves

So Scott, you've had this horrible experience with what you and your family doctor and at least one ER doctor felt was COVID, and it resulted in significant lung damage, correct?

Scott Stephen Spidle

Yes, they actually end up having surgery on both lungs because the other lung was in the same condition, on the edge of collapsing. And the surgeon had said that it took about 30 years off the life of my lungs.

Alison Steeves

So then when a vaccine emerged against COVID-19, were you eager to take it?

Scott Stephen Spidle

No.

Alison Steeves

Did you take the vaccine?

Scott Stephen Spidle

No, I did not.

Alison Steeves

Why not?

Scott Stephen Spidle

Well, numerous reasons. One being that I had survived COVID, and I believe natural immunity was longer lasting, more effective than the vaccine. I also had concerns about the safety of the vaccine, even before it was rolled out. And also, in the fall of 2021, when it was really getting rolled out, I had two loved ones die shortly after receiving their injections: one within 48 hours, massive heart failure with no previous heart conditions, and the other one over the span of about a month in the hospital, with all their organs shutting down and the doctor saying they didn't know why. So I was quite apprehensive to getting the shot.

Alison Steeves

How did you feel when provinces across Canada and the federal government started implementing vaccine mandates and passports?

Scott Stephen Spidle

I thought that was extreme. I'd even use the word tyrannical. I mean, it was a clear, extreme violation of our basic rights and freedoms. And it caused, I mean, we've heard numerous testimonies here: the effect it's had on people's lives, their families, relationships, employment, you name it.

Alison Steeves

Are you familiar with the truckers' Freedom Convoy that went to Ottawa in January 2022?

Scott Stephen Spidle

Yes.

Alison Steeves

Can you speak a bit about your experience with the convoy?

Scott Stephen Spidle

Yes. I missed the convoy here from Nova Scotia to Ottawa in the first week due to continuous lung issues with long-term problems. And eventually, a few friends here from the province returned after being there and participating in the convoy. And at that point, I was starting to feel better. I was no longer short of breath, no more chest pain, and wanted to go. And they said, you need to be there because they knew my position and how I felt about things.

So they went back up and took me up there with them. And we booked reservations at an Airbnb for a week. Of course, at that point, nobody knew how long it was going to last. And it was probably the greatest time in my life, especially after the previous two years. There's so much love and joy, as I cry and hug every single day. A friend of mine who's had numerous friends who were truckers out there, and one of them told me— The first day I got there, he's chatting with me. And he said his eyes hurt from crying so much, of just happiness and just relief and being around people and just a sense of normality again.

Alison Steeves

How long did you end up staying at the convoy?

Scott Stephen Spidle

Right till the very end, that Sunday morning.

Alison Steeves

So you were planning to stay a week. Did it end up being longer than that?

Scott Stephen Spidle

Yes, well, like I say, we had reservations for a week. And it was time to go home and they were heading back, and I told them the night before that I had to stay. It meant that much to me. And to that point, prior to that, a few days before— When I arrived in Ottawa, the fencing was still up around the War Memorial. And I was there when the veterans took down the fencing. And it wasn't like the media said, it wasn't a bunch of protesters tearing it down. It was basically all veterans: people stood back and allowed the veterans to do it. And they orderly removed the fence and stacked it neatly to the side and then negotiated with the police

[00:15:00]

in terms of carrying out a watch duty at the War Memorial to make sure nothing happened to it. Because of course, at that point, the police were quite lacking resources in terms of men on the ground. So the veterans agreed to take on that role.

Alison Steeves

Did you find that the media portrayal of what was happening in Ottawa was accurate?

Scott Stephen Spidle

Not at all, not at all.

Alison Steeves

So reports that the protesters were racist, white supremacists, hateful people. For example, Ottawa City Councillor Catherine McKenney, in an article—and this is Exhibit TR-14—one article in *Ottawa CityNews*: “Ottawa City Councillor Catherine McKenney issued a statement on January 26, 2022, that stated, in part, ‘several members of this group are connected to militant, racist, sexist, and homophobic groups, and they are not here to only raise voices against vaccination mandates, but to also fuel hatred against the very fabric of our society.’”

Do you feel that is an accurate characterization of what you observed and experienced at the convoy?

Scott Stephen Spidle

No, I would say that is the complete opposite of what the atmosphere and the people that were there are doing. There's actually a very large presence of Christians, religious people there, along with Indigenous people. And leading up to that point, we had dozens of churches across the nation being burned and vandalized. And to have those two communities come together, it was very nice to see. And there was people there from every walk of life. And also, the professional class: I met with numerous doctors and lawyers there. Actually, at the War Memorial, I actually spoke with a— He didn't say what sport, but

he was clearly, he was like seven feet tall, built, you know. And he said he was a professional athlete; I assume a hockey player. I sort of know the image; I played hockey for 25 years. And he said he was fully supportive of what was happening.

Alison Steeves

Do you have anything to add about the people that you met at the convoy?

Scott Stephen Spidle

It was— sorry.

The veterans were like the heart and soul largely of what was happening on the ground. That moment when they removed the fence and I was there and helped a veteran remove the flowers from the fence. And—personally, and to a lot of others—that was the highlight of the whole event. They, actually, because of long family history, they took me into the fold of the watch duty afterwards and I participated in the night watch duty, which was a very surreal experience being in the nation's capital. It was very quiet, dark, with the monument lit up and yeah, it was pretty special. Like I said, there's a lot of doctors, nurses; there's just everybody you could imagine.

Alison Steeves

What did this experience mean to you?

Scott Stephen Spidle

A great deal. Personally, I'm the kind of person— I believe, you know, our forefathers, fathers, and grandfathers, they fought and died to protect and preserve our rights and freedoms. And here we were as a nation and across the world largely sacrificing our rights and freedoms to save lives. So it was like everything was upside down.

Alison Steeves

Thank you, Scott. Those are my questions. I'll turn it over to the Commission.

Commissioner DiGregorio

Thank you for sharing your story today. I just have one question around the vaccine mandates and I was wondering if you ever asked for or obtained an exemption?

Scott Stephen Spidle

No, I did not. I did not have a need for an exemption.

Commissioner DiGregorio

Thank you.

Scott Stephen Spidle

I did not have a need for an exemption for myself personally. But I did help others with the religious exemptions, providing them with the sources to acquire that.

Alison Steeves
Thank you, Scott.

Scott Stephen Spidle
Thank you very much.

Oh, if I could just say one more thing. When I was in— They moved me up to a step-down unit when I was in Valley Regional. And I was there for an extended period of time. And there was a nurse who'd come on shift after being off for a weekend. And this was about a week and a half into it. And when she came in, she said, "What are you still doing here?" And then we had a chat. She went to go find answers. And I could hear her outside the room, just outside the door, right, speaking with who I assume is her supervisor. And she asked why I was still waiting. And her supervisor said that was an inappropriate question for her to ask. And she responded by saying, "If he ends up in ICU, it's not my fault."

[00:20:00]

And if that nurse is out there, thank you. And please reach out to me if you can.

Thank you.

[00:20:27]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Ches Crosbie

Ms. Blauvelt, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Janessa Blauvelt

I do.

Ches Crosbie

Thank you.

Christina Lazier

Good afternoon, Commissioners. For the record I'm Christina Lazier. I'm Atlantic Regional Counsel with the NCI.

Would you please state your name and spell it for the record?

Janessa Blauvelt

Janessa Blauvelt, J-A-N-E-S-S-A B-L-A-U-V-E-L-T.

Christina Lazier

Thank you.

At this time, before we get into the actual testimony of the witness, I would like to ask that the Commissioners take judicial notice of certain pieces of legislation and certain public health orders. So I'll just make a list. These will be provided to you for your reference documents. There's a screen right in front of me here, so it's difficult. I can't see the commissioners.

So I would ask that you please consider and review the Nova Scotia *Health Protection Act*; the Nova Scotia Communicable Diseases Regulations made under sections 74 and 106 of the *Health Protection Act*; the Nova Scotia *Personal Health Information Act*; the *Hospitals Act*; the Nova Scotia *Health Authorities Act*; the Nova Scotia *Emergency Management Act*; and all declarations of state of emergency.

The original declaration of state of emergency, which was issued by the Minister of Municipal Affairs, the Minister responsible for the *Emergency Management Act*, on March 22nd, 2020: that was the first declaration of state of emergency in Nova Scotia. And all the subsequent declarations: they were renewals of the original declaration, and they continued every two weeks for a full two years. So the last of the declaration of state of emergency expired on the 21st of March 2022.

Also please take note of the *Nova Scotia Human Rights Act* and the *Canadian Constitution* and *Canadian Charter of Rights and Freedoms*.

Similarly, as we have had witnesses from the other Atlantic provinces, I would ask that you consider the similar health legislation and emergency management legislation and human rights legislation from Newfoundland and Labrador, New Brunswick, and Prince Edward Island.

Furthermore, to the list I would add, in the case of Nova Scotia, 97 iterations of the one section 32 order issued by the Chief Medical Officer of Health, Dr. Robert Strang. Section 32 of the *Health Protection Act* of Nova Scotia is what gives Dr. Strang the authority to issue orders for public health in the context of communicable disease.

It will be important for the Commissioners to become extremely familiar with the provisions, and the order which was issued. The initial order was issued by Dr. Strang on the 24th of March 2020, and every subsequent iteration through to July 6th, 2022. Please consider all the iterations. There are 97 in total. And it is important to note that the July 6th, 2022, iteration of the public health order pursuant to section 32 of the *Health Protection Act* is still in place now. Embedded in those *Health Protection Act* orders, section 32 orders, are protocols and directives.

I would ask that the Commissioners give particular attention to the COVID-19 Mandatory Vaccination Protocol in High-Risk Settings, the first of which iteration was issued on October 6th, 2021. That's the COVID-19 Mandatory Vaccination Protocol in High-Risk Settings. It was originally issued on October 6th, 2021.

[00:05:00]

And it has subsequently been amended. There are other iterations of it, and they will be provided as well. Also, the COVID-19 Proof of (full) Vaccination for events and activities. Those protocols were embedded in the chief medical officer of health's orders. But they appear as separate documents, so I'm just wanting to make sure they don't get lost in the shuffle, so to speak. Thank you.

Ms. Blauvelt, can you please tell us where you live?

Janessa Blauvelt
In Yarmouth, Nova Scotia.

Christina Lazier

And what is your occupation, please?

Janessa Blauvelt

I'm an LPN, licensed practical nurse.

Christina Lazier

What are the duties of an LPN?

Janessa Blauvelt

I provide safe and ethical care to my patients under the direction of the RN and attending physician. Some of my duties would include medication administration, IV insertion, wound dressing, personal care, et cetera.

Christina Lazier

And in what settings would you typically work as an LPN?

Janessa Blauvelt

I worked at the Yarmouth Regional Hospital as a float nurse, so I worked on all the departments.

Christina Lazier

Okay. Did you work at any other location as an LPN?

Janessa Blauvelt

I did. I worked in long-term care as well.

Christina Lazier

Okay, and thank you. You're not working currently as an LPN?

Janessa Blauvelt

No, I lost my job in the mandates.

Christina Lazier

When you say, "the mandates," what are you referring to, please?

Janessa Blauvelt

The forced vaccination policy that was put out by my employer and the province.

Christina Lazier

And who was your employer?

Janessa Blauvelt
Nova Scotia Health Authority.

Christina Lazier
Thank you. When did you first begin working at Yarmouth Regional Hospital?

Janessa Blauvelt
I started in May of 2008. I worked in housekeeping for a number of years, and I built on my education—started in 2016. I started my upgrading and I took a counselling course and then I started my nursing career in 2018.

Christina Lazier
And where did you do your nursing training?

Janessa Blauvelt
At Nova Scotia Community College in Yarmouth.

Christina Lazier
When did that begin?

Janessa Blauvelt
2018 to 2020.

Christina Lazier
And when were you to have graduated under the normal course?

Janessa Blauvelt
I would have graduated in June of 2020.

Christina Lazier
Okay, and did you undertake your studies with Nova Scotia Community College through June 2020?

Janessa Blauvelt
Once the emergency measures were put in place in March of 2020, we got one week of our last clinical in, and then we were pulled out. And there was a lot of uncertainty for almost two months of how we were going to finish our clinical to be able to graduate.

Christina Lazier
What was the implication of being pulled out, as you call it, from your clinical? Maybe you can explain that.

Janessa Blauvelt

Well, that is when you put everything together and you really put your skills together; that's where you get your hands-on training. So it was a very important part of the whole thing. It's where it brings it all together and you get to utilize all your skills that you've used.

Christina Lazier

So you started your program, I believe it was in September of 2018?

Janessa Blauvelt

Correct.

Christina Lazier

And your clinical placement began in, was it March 2020?

Janessa Blauvelt

Correct.

Christina Lazier

And you were in that one week before you were pulled out. So who pulled you out of that program?

Janessa Blauvelt

The College decided to pull us out.

Christina Lazier

And I don't mean to mislead: It's not that you were pulled out of the nursing program altogether but that you were removed from the clinical placement which was where? Where were you at?

Janessa Blauvelt

At the Yarmouth Hospital.

Christina Lazier

So what was the implication for you of being pulled out of the clinical, which was the most important, as you were describing, aspect of the training and hands on skills?

Janessa Blauvelt

Well, we found out after being in limbo for quite some time that we were going to finish our clinical online virtually. So we didn't get any of that experience there—the hands-on experience. And we did not complete it until August 2020.

Christina Lazier
And then did you graduate?

Janessa Blauvelt
I did, with honours.

Christina Lazier
Thank you.

So in March 2020, what was it that happened that caused your school to pull you out of the clinical placement?

[00:10:00]

Janessa Blauvelt
The public health emergency that was put in place by the province and Dr. Strang and the risk of contracting COVID in the hospitals.

Christina Lazier
Is that something that was communicated to you by your employer? Sorry, not your employer, but the Nova Scotia Community College: Is this the understanding that you gained from them?

Janessa Blauvelt
Yes.

Christina Lazier
Okay. I would like to make note and ask the Commissioners to take judicial notice of the fact that, in Nova Scotia, the Minister of Health never issued a public health emergency. Under the *Health Protection Act* there is provision—I believe it's section 53—for the Minister of Health to declare a public health emergency, but in Nova Scotia that never happened.

The only state of emergency that was ever declared was by the Minister of Municipal Affairs under the *Emergency Management Act*. There were declarations of state of emergency, and you will read them, and you will see that the presence of COVID-19 in the province was the rationale for the declaration of state of emergency. But it was not the Minister of Health who declared a state of emergency at any time.

So that was your understanding from your school?

Janessa Blauvelt
Yes.

Christina Lazier

The reason why they pulled you out, okay. So what then happened in August 2020? You had graduated. Had you invested financially in your training?

Janessa Blauvelt

Yes. Yeah, I have a substantial student loan.

Christina Lazier

Okay. So were you eager to get to work at that point?

Janessa Blauvelt

Yes.

Christina Lazier

Were you able to get a job at that time?

Janessa Blauvelt

Yes, I started working in a long-term care facility. I still continued working in housekeeping as well. And then I started my full-time position at the Yarmouth hospital as a float nurse in December of 2020.

Christina Lazier

Okay. So how long were you working at both the long-term care facility and the Yarmouth hospital?

Janessa Blauvelt

I worked in the long-term care facility from October 2020 until April 2021. And I was employed with the Yarmouth Regional Hospital since May 26, 2008.

Christina Lazier

And when you were employed with the Yarmouth Regional Hospital, your employer was Nova Scotia Health Authority?

Janessa Blauvelt

Correct. Yes.

Christina Lazier

So what changed for you in the summer— I'll take you to the summer of 2021. What happened in the summer of 2021?

Janessa Blauvelt

Well, there was a lot of talk about the forced vaccination. I had started researching early on in the pandemic, pretty much March of 2020, when it came out. I woke up within two months as to what I believed was really going on. And I knew that this vaccination, this novel vaccination, was not anything that I wanted to take. There was a lot of division amongst the co-workers in the workplace surrounding the vaccine.

Christina Lazier

In what sense was there division?

Janessa Blauvelt

Well, there was a couple times where I was working—one in particular—where a co-worker had said in front of other co-workers that anyone that was unvaccinated deserved to work the COVID unit. And that they hoped that the unvaccinated person would get COVID first, as well as their family.

Christina Lazier

And how did this make you feel, these conversations?

Janessa Blauvelt

Unsafe. It made me feel— I don't know, a bunch of different emotions, like I didn't want to be there, like I didn't fit in.

Christina Lazier

What did you observe in the hospital in the summer of 2021 in relation to the incidents of COVID appearing among patients seeking treatment at the hospital?

Janessa Blauvelt

We had no COVID patients at that time. We had a COVID ward that was ready to go, and nothing.

Christina Lazier

And how had it been since you had been at the hospital in 2020 as well?

Janessa Blauvelt

No COVID patients.

Christina Lazier

So did you inquire— In your words, you mentioned this forced vaccination. What were you referring to when there was talk about forced vaccination?

Janessa Blauvelt

It was just going around amongst the co-workers and mentioned, you know,

[00:15:00]

through nurse managers and whatever, that it was going to be mandatory. Or there was talk that it was going to be mandatory, to have to take the vaccine to keep your employment.

Christina Lazier

And when you're talking about the vaccine, what vaccine are we talking about?

Janessa Blauvelt

The mRNA COVID vaccines.

Christina Lazier

So were you concerned when you heard talk of a forced vaccine?

Janessa Blauvelt

Yes, I was.

Christina Lazier

And what, if any, steps did you take to inquire of your employer or your union about such a policy if it were coming into place?

Janessa Blauvelt

I had spoke to my educator that I did not wish to get this vaccine. I was not taking this vaccine. And they told me at that time that it would not be able to be forced on anybody.

Christina Lazier

So who was your educator?

Janessa Blauvelt

At that time, her name was Hannah Stanwood.

Christina Lazier

And was that a clinical person or an administrative person?

Janessa Blauvelt

Like an administrative educator. They go round to the floors and update you on policies and stuff like that.

Christina Lazier

So that was someone you inquired of. Did you inquire of anyone else?

Janessa Blauvelt

Well, I made it clear to my nurse manager that I was not taking this.

Christina Lazier

And what response did you get?

Janessa Blauvelt

There was really no support. It was— They were following what they were being told.

Christina Lazier

Is that what your nurse manager expressed to you? I need to understand a little bit more about the conversation you had, what you were left with in the way of an answer.

Janessa Blauvelt

Basically, that I did not have a choice if I wanted to keep my job.

Christina Lazier

So what communication did you have from your employer formally with respect to vaccination with COVID-19 vaccines?

Janessa Blauvelt

Well, we found out on October 1st of 2021 that the COVID vaccines would be mandatory by November 29th, 2021. And we did receive email confirmation.

Christina Lazier

And I'll enter into the record as Exhibit 1, the Nova Scotia Health Authority notice to Ms. Blauvelt that she would have to get vaccinated or lose her job.

What did receipt of that notice do to you?

Janessa Blauvelt

It made me spiral out of control and go into a grave depression and anxiety. And my last day worked was actually October the 1st. I worked in the emergency department. That night too, I had a co-worker say that anybody that did not take the vaccine was being selfish because we were in a pandemic, and we were putting others at risk.

Christina Lazier

Were comments like that reprimanded or dispelled by senior supervisors or other people in the administration or clinical staff?

Janessa Blauvelt

Well, I never reported it or anything.

Christina Lazier

So on October 1st, you had a shift. I'll indicate to the commissioners that October 1st, 2021, is the first date on which a proof of vaccination mandate was issued in Nova Scotia. And it's contained in one of the section 32 orders of that date.

So you went into mental health crisis. Is that fair to say?

Janessa Blauvelt

Correct.

Christina Lazier

And what did you do?

Janessa Blauvelt

I reached out to the crisis response team.

Christina Lazier

And who would the crisis response team be? What is that?

Janessa Blauvelt

It's a mental health department that's within the outpatient department in the hospital.

Christina Lazier

And did they see you?

Janessa Blauvelt

They did.

Christina Lazier

And what happened?

Janessa Blauvelt

They put me in contact with a psychiatrist.

Christina Lazier

And how soon did you get to see a psychiatrist?

Janessa Blauvelt

Right away.

Christina Lazier

Would it have been within days of October 1st?

Janessa Blauvelt

Yes.

Christina Lazier

Within a week of October 1st?

Janessa Blauvelt

Yes.

Christina Lazier

Okay. And following consultation with that psychiatrist, what was the result?

Janessa Blauvelt

He put me off work for three months due to the stress and anxiety, low mood, the depression, and the stressors, financial stressors, all that stuff that were—

Christina Lazier

And I believe that the formal notice from the doctor was actually in the form of an attending physician report, an APR form, as it's known.

[00:20:00]

Janessa Blauvelt

Correct.

Christina Lazier

Nova Scotia Health Authority, and so that will be entered as Exhibit 2. And would you please turn to that document now? And what exactly did the doctor put in the form of a reason for putting you off work?

Janessa Blauvelt

Stress due to the mandatory COVID-19 vaccination mandate at work. And the symptoms: anxiety, low mood, panic attacks, lack of energy, poor concentration.

Christina Lazier

There's some dates on that form referencing the 15th of October 2021.

Janessa Blauvelt

Correct.

Christina Lazier

Do you understand what those dates reference?

Janessa Blauvelt

That may have been the day that I seen him in his office, but I did see him through the crisis response before that date.

Christina Lazier

Okay. And so, for how long did he put you off work?

Janessa Blauvelt

For three months.

Christina Lazier

While you were off work, did you receive correspondence from your employer or your union?

Janessa Blauvelt

Yes.

Christina Lazier

And what correspondence did you receive?

Janessa Blauvelt

We had to fill out the Nova Scotia Health COVID-19 Immunization Disclosure form.

Christina Lazier

So you say "we," are you referring to a group or yourself?

Janessa Blauvelt

All the employees.

Christina Lazier

I see, okay. So you received that same correspondence asking you to fill out a COVID-19 immunization disclosure form?

Janessa Blauvelt

Yes, and the advice by my union is that I should do it.

Christina Lazier

And so COVID-19 immunization: Is that how it was discussed in your workplace, that COVID-19 vaccines would immunize you against COVID-19?

Janessa Blauvelt

Yes.

Christina Lazier

So did you comply?

Janessa Blauvelt

No. Oh well, I did with the form, but I did not comply with the mandate, no.

Christina Lazier

And when you filed the form, what date was it on which you filed that form? I'm believing it was October 24th?

Janessa Blauvelt

The 24th of October.

Christina Lazier

And how long did it take them to respond to your disclosure form?

Janessa Blauvelt

October 31st, my religious exemptions were all denied.

Christina Lazier

Okay. Was any reason given in that denial you received on October 31st?

Janessa Blauvelt

No.

Christina Lazier

So you mentioned exemptions. At what point did you take any steps to obtain an exemption from this policy requiring COVID-19 vaccination?

Janessa Blauvelt

Well, right away I started, but I got one October the 23rd. It was a sworn affidavit by a lawyer, and then I had a handwritten one that I had did out and one from my pastor, as well.

Christina Lazier

And what did you do with those three documents supporting what you were hoping would be a grant of an exemption?

Janessa Blauvelt

Well, I had to attach them into this email, this COVID-19 disclosure form.

Christina Lazier

And did you?

Janessa Blauvelt

I did yes.

Christina Lazier

So that, already? Oh, my goodness, my goodness. Rapid fire, okay. Another gear. All right. Thank you, Commissioner. Exhibit 3 will be COVID-19 Immunization Disclosure forms and the exemption letters that had been submitted.

The response you received from your employer was a denial, am I correct?

Janessa Blauvelt

Correct.

Christina Lazier

Did you at any time contact the Nova Scotia Human Rights Commission?

Janessa Blauvelt

Yes, I did.

Christina Lazier

And what assistance were you looking for from them?

Janessa Blauvelt

Well, I was hoping that they would uphold my right to my God-given right to my body and my personal choice and my creed.

Christina Lazier

And when was it you contacted them?

Janessa Blauvelt

In September 2021 I started writing them when the word was going around.

Christina Lazier

And what timeframe did they give you that you should receive some response from them?

Janessa Blauvelt

Four to six weeks.

Christina Lazier

How long was it before you heard from them, the Nova Scotia Human Rights Commission?

Janessa Blauvelt

They did write back asking for my exemptions in November.

Christina Lazier

In November of what year?

Janessa Blauvelt

2021. I attached them all, and then I did not hear back until a year later, November of 2022.

Christina Lazier

And at that time, did they confirm that an investigation would be undertaken?

[00:25:00]

Janessa Blauvelt

No.

Christina Lazier

What was the nature of the response?

Janessa Blauvelt

That it was a complaint process and they said, "Thank you for your patience."

Christina Lazier

I'll note that Exhibit 4 is an email from the employer, Nova Scotia Health Authority, communicating denial of Ms. Blauvelt's requests for religious exemption to the COVID-19 vaccination.

And Exhibit 5 is the email stream between, correspondence between Ms. Blauvelt and the Commission about her request for a religious exemption. I'm going to ask—

I'm going to check with the timekeepers. I understood that the break was going to be forfeited so that we could continue with her. Thank you. Because these exhibits only became available today so we would have to take an extra 10 minutes in any event.

So did you make other efforts to pursue the answers to your concerns?

Janessa Blauvelt

Yes.

Christina Lazier

And to whom, in the way of public officials, did you write?

Janessa Blauvelt

I had wrote my local MLA, Zach Churchill. I wrote the Member of Parliament, Chris D'Entremont. I wrote Dr. Strang. I wrote Tim Houston and the health minister.

Christina Lazier

Would that be Michelle Thompson?

Janessa Blauvelt

Correct.

Christina Lazier

Exhibit 6 will be correspondence with public officials. Did you get an answer from any of them?

Janessa Blauvelt

The only one that I did get a response back was from the health minister, but it wasn't signed by her. And it did not address any of my questions. It just said that the reason why they were continuing to keep the policy in place was to protect the vulnerable population.

Christina Lazier

Was there any science supplied?

Janessa Blauvelt

No. Just that they continued to listen to the science, basically. There was no evidence really given.

Christina Lazier

And you then corresponded with your employer, I understand, in the way of a conditional acceptance.

Janessa Blauvelt

Correct.

Christina Lazier

And what was the nature of that document, conditional acceptance, to get vaccinated?

Janessa Blauvelt

Well, yes, I outlined the possible adverse effects and reactions to the vaccine, and if I was to get the vaccine and was compromised or injured in any way, if they would support me or take liability.

Christina Lazier

And did you get a response to that conditional acceptance letter that you provided?

Janessa Blauvelt

I did. They said that they received it and that they were considering it with their colleagues with people services. And I did not hear any more about it.

Christina Lazier

Exhibit 7 will be that conditional acceptance letter and the employer's response.

We do have a few more questions if I may beg the patience of the Commissioners.

I understand that you and other employees of the Yarmouth Regional Hospital initiated a process of notice of liability, which was then served on Tracy Unger, Director of Employee and Labour Relations. Is that correct?

Janessa Blauvelt

Correct.

Christina Lazier

Exhibit 8 will be notice of liability and the affidavit of service of the bailiff who served that notice of liability on the Director of Employee and Labor Relations. It was received by an assistant of hers. Again, any response from that?

Janessa Blauvelt

No.

Christina Lazier

And you're a member of the CUPE union, or is that correct?

Janessa Blauvelt

Correct.

Christina Lazier

And did you grieve your matter?

Janessa Blauvelt

I did, yes: December 14th of '21.

Christina Lazier

Okay. And so, you sent, I understand, your grievance to union local president Carl Krause and union rep Andrew Baxter to initiate your grievance because your request for exemption had been denied. You received a response to that on July 18th, 2022, I understand?

Janessa Blauvelt

Yes.

Christina Lazier

Sorry, what you received was a meeting with the senior human resources consultant of your employer.

Janessa Blauvelt

Correct.

Christina Lazier

Yes, and did that bring satisfaction?

Janessa Blauvelt

No.

Christina Lazier

You were then denied your grievance. I understand it on September 13, 2022. Is that correct?

Janessa Blauvelt

Correct.

Christina Lazier

Was that step three response?

Janessa Blauvelt

Yes.

Christina Lazier

Yes, okay, has anything further happened with respect to your grievance?

[00:30:00]

Janessa Blauvelt

No, I was just told that the union had the right to vote what case went to arbitration and what case did not. And I have not heard anything more.

Christina Lazier

Do you know whether your collective agreement includes a provision for voting on whose matter goes to grievance?

Janessa Blauvelt

I was not able to find that in the collective agreement.

Christina Lazier

Exhibit 9 will be the grievance form and correspondence with the union. Exhibit 11 will be the collective agreement.

So with respect to grievances and so on: Were you aware of the arbitration decision of Yvonne Mackey?

Janessa Blauvelt

Yes.

Christina Lazier

And who's Yvonne Mackey?

Janessa Blauvelt

She is an RN at the IWK.

Christina Lazier

Okay, so I'll ask the tribunal to take notice of the arbitration decision of Yvonne Mackey. That will be provided as Exhibit 10.

Yvonne Mackey is a nurse with the IWK, Izaak Walton Killam Children's Hospital, and she requested a religious exemption and was denied. Her matter was grieved. Her matter did go to arbitration, and she won. And it was noted that her employer violated *Human Rights Act* in not granting her the exemption that she requested based on her religious beliefs.

So what is the state of your employment now? Your career?

Janessa Blauvelt

Well, I'm not allowed still in this province to work in my profession. I've been considering moving out of province, so I can continue to work.

Christina Lazier

As it is now, the ongoing public health order, section 32 order, requires for you to return to work that you would have to be vaccinated with COVID-19 vaccines. Is that correct?

Janessa Blauvelt

Correct.

Christina Lazier

And you did, I understand, recently have a conversation with—or attempt a conversation with—Karen Oldfield of the Nova Scotia Health Authority?

Janessa Blauvelt

Yes, it was called the Community Conversation at the Rodd Grand Hotel in Yarmouth.

Christina Lazier

And also, Michelle Thompson, Minister of Health and Wellness, was there on January 18, 2023?

Janessa Blauvelt

Correct.

Christina Lazier

And what happened there?

Janessa Blauvelt

Well, I had the chance to speak. They did not answer any of my questions. I was very passionate. I told them how it affected my life. I asked them how long they planned to keep us on unpaid administration leave. And actually, the microphone was taken out of my hand, and they told me that's enough.

Because I had one more question that I wanted to ask. And the question being that most health care workers only received the two shots in 2021, early 2021. According to their very own experts and their good science, the very small amount of immunity wanes within four to six months. So technically, these employees are no longer considered vaccinated according to their science. So why are they allowed to continue to work, while I continue to be punished and not allowed to work in my profession?

Christina Lazier

And I will just note for the commissioners' sake that the definition of fully vaccinated is in Part 1 of the July 6th, 2022, order. You'll find definition of what is fully vaccinated and the fact that health care workers such as an LPN do fall within that definition of the application of that requirement for vaccination.

I'll leave it to the commissioners to have any questions. I should note that those are all the exhibits at this point.

Do you have any questions, Commissioners?

Christina Lazier

Thank you, Ms. Blauvelt.

Janessa Blauvelt

Okay, thank you.

[00:34:16]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 3

March 18, 2023

EVIDENCE

Witness 8: Josephine Fillier

Full Day 3 Timestamp: 06:48:16–07:07:50

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Our next witness is Josephine Fillier, who will be appearing virtually. Josephine, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Josephine Fillier

I do.

Ches Crosbie

Thank you.

Criss Hochhold

Hello, Josephine.

Okay, can you please tell us your full name, where you live, and what do you do?

Josephine Fillier

My name is Josephine Fillier, and I am from St. John's, Newfoundland. I am a stay-at-home mother to three children.

Criss Hochhold

In your submission to National Citizens Inquiry, you advised us that you received the vaccine in 2021, is that correct?

Josephine Fillier

Yes, June 18.

Criss Hochhold

What prompted you to get vaccinated?

Josephine Fillier

Well, basically at the beginning of COVID, everything was locked down. And I was doing my high school diploma, trying to get it after 13 years of being a stay-at-home mom. And I had to quit because the kids went online and I had to help them with their online studies and I couldn't focus in my house, doing my work. So I became like depressed, isolated, and all these things.

So when the injections came out to get, the Atlantic bubble was closed, and my partner was in Niagara Falls, and it would be my first trip off the island, so I decided to leave. He paid for the trip, and I went to Niagara Falls. But to get it, I had to get the COVID injection into my body because I was in fear that the government would come to my house. And there was all kinds of fear—online, in the news and everything—at the time.

Criss Hochhold

So Josephine, it sounds like you were quite apprehensive about getting the vaccination, is that true?

Josephine Fillier

Yeah, I had severe anxiety attacks. Like, I've been struggling with depression and anxiety since I was a little girl, but it was very manageable. I was on antidepressants and anxiety meds and they helped me out a lot. But my intuition, I guess, told me not to get this COVID injection. I knew something was off about it anyways. But since I was in fear and I really wanted to go visit my partner, who was in a different province, and I didn't want to isolate away from my children for two weeks upon arriving home, I ended up getting it. And I knew it was the biggest mistake of my life.

Criss Hochhold

Josephine, where did you go get the vaccination?

Josephine Fillier

At the Village Mall, here in St. John's.

Criss Hochhold

Do you remember who administered it to you?

Josephine Fillier

It was an LPN—Faye Chidley.

Criss Hochhold

Before administering the vaccine, did the LPN explain the potential risks and/or benefits of the vaccination for COVID-19?

Josephine Fillier

No, basically all they said was that I would have a fever and a sore arm. And they told me to stay for about 15 minutes just to make sure I didn't have a reaction. So I took my paper that had my lot number and the stuff to do in case you have, like, a fever or sore arm or anything like that and I just sat down. And then I was fine after 15 minutes, so I went home; I took the bus and I went home.

Criss Hochhold

Prior to the vaccine, did you have any health issues? Were you an active person? Were you eating healthy? Can you describe your lifestyle a bit to us and how that's changed since then?

Josephine Fillier

Well, before, I was a very outgoing active person; I wasn't in fear of anything. I was like, you know, a bubbly type person. And I have ADHD, so I'm always active; like, I wake up in the morning and I can go, go, go all day long. It runs in the family, so my mom is like it, my sister is like it. So ever since then, I've had to basically slow down a lot. Because if I exert myself much, I feel like my body is shutting down.

Criss Hochhold

Okay. Just for the Commission's records, the vaccine itself was Pfizer.

Josephine Fillier

Yeah, I had one dose.

Criss Hochhold

One dose. Do you have the lot number on you, Josephine?

[00:05:00]

Josephine Fillier

Yeah, I keep checking it, to see if there's any adverse side effects. So it's FA 9093.

Criss Hochhold

Josephine, what happened after you received the vaccine? Just refresh my memory with that because you said you went home, you were fine at first.

Josephine Fillier

Yeah, well, I was fine. It takes me about 45 minutes to an hour to get the bus from the mall to my house. And prior to the vaccine, I had a bruise in my right thigh and it never healed fully. So when I went home, I was laying down on the couch and I noticed that there was a severe burning pain in my leg. And I thought that something was seriously wrong. That I was clotting maybe, maybe something was going on with my leg. And so, I put my feet up on the back of the couch just in case, to elevate my feet. And it just escalated from there.

Criss Hochhold

How do you mean escalated?

Josephine Fillier

Basically, the burning never went away; even 20 months later, it's still there. It escalated to crawling sensations, like, I had bumps on my legs, which are still there today. I had swelling and internal vibrations, and then I had lumps all over my legs, on the back of my thighs and on my shins.

Criss Hochhold

Josephine, with all the symptoms that you're showing, did you report those to a health care professional—to your doctor—or did you go to the hospital?

Josephine Fillier

No, I actually went to my doctor. He's been my doctor for 23 years now. He knows my entire medical history, my mom, my sister, all of our kids. And he gaslit me the entire time.

I was telling him about the lumps on my legs and he just told me to get compression socks. I told him about lumps in my scalp, in my head, that were very painful. And this remark was really, really upsetting because he told me that if I didn't look for lumps, I wouldn't find any. And I thought that, you know, if you check lumps—you have to check your body, you have to be self-aware. You have to understand your symptoms in case it could be, like, you know, a tumour or cancer or something. So once I noticed that there was lumps on my legs, that was the first indication that something was going on with either my lymph nodes or my blood vessels.

Criss Hochhold

Then how long after the symptoms appeared did you contact your family doctor? I'm trying to understand: From the time you received the vaccine to the time the symptoms appeared and then you reported them to your physician, to your family doctor, how much time had lapsed?

Josephine Fillier

Maybe a month or two because I got it June 18, 2021. And then around the beginning of August, I made my first appointment, and then he basically brushed it off. So I just, you know, went home. And the fall came and then the winter came, and more and more symptoms started happening.

Criss Hochhold

Do you know if your family doctor submitted any of your symptoms to the CAERS system: the Canadian vaccine reporting system? Are you aware of any of that?

Josephine Fillier

The CAERS? No, I had to do that myself. Like I said, he was gaslighting me. He even said to me that it is not connected to the vaccine, the COVID injection. Because he knew of somebody who impersonated someone and took 77 injections, and they're fine.

Criss Hochhold

I believe that reference is in regards to a person in Germany, and it was reported in the media, who took a number of extra vaccinations in order for the benefit financially. Whether it's proven or not, I'm not certain of.

[00:10:00]

Josephine, your family doctor didn't accept the symptoms that you were showing physically. Not only from a psychological perspective, perhaps due to anxiety or depression or heightened anxiety, because of what you've written from the research, but you actually had physical ailments, physical symptoms, and your doctor was completely dismissive of that. Did you seek a second opinion? Were you able to perhaps go to the ER or the hospital to speak to another physician about that?

Josephine Fillier

No, because, like I said, this doctor has been my doctor since I was 10. I literally trusted him with my entire life. Like, I didn't know about the injections; I didn't know about anything at this time. I just knew that something was wrong with my body, and I needed to find out what it was because I did not feel well at all. I felt like I was dying.

Criss Hochhold

Did your doctor run any tests on your blood, for example, or any other tests to ascertain, to see what potentially, if there's an issue?

Josephine Fillier

Yeah, I actually had to have a severe mental breakdown in his doctor's office about a year ago in order for him to do anything. But he gaslit me so much for a long time. And then I had to, like, literally cry out for help saying, "I know something is wrong with me. I need help."

Nobody believed me because my own partner didn't believe me; my family didn't believe me; my friends didn't believe me. And I needed some help. I felt so alone and I needed a professional at least to acknowledge me. And so, he ended up getting me a referral to a neurologist. He gave me blood work for just, like, you know, regular calcium, proteins, and all this stuff. And then that came back normal. So then, somebody told me to get a D-dimer test done. So I went back a couple of weeks later, got that done, that came back normal.

Then I was suffering with vertigo this summer just past, in 2022. And I felt like I was drunk. And I'm taking care of my kids and I was feeling so sick for a week. And I couldn't walk, I felt really unwell. So then he got me a CRP test done to see if I had chronic inflammation and that came back normal. So I just saw my neurologist on Thursday past, and he now told me that it could possibly be this dysautonomia, and it's an autoimmune response to the vaccine. And then he told me that I need to get an MRI done and I need to get a lot of blood work to see if it's an autoimmune response and to also check for connective tissue damage.

Criss Hochhold

For the commissioners, the lab report as well as the outpatient specimen collection requisition would be exhibited as TR-21, TR-21a through to f. TR-21, TR-21a through to f. That also includes the immunization record.

Josephine, how did it make you feel when, bearing in mind we were becoming a bit of a national—

I'm going to skip forward just a little bit in the interest of time because I think we have an understanding how you were feeling at the time and everything you went through.

Did you go to the Freedom Convoy?

Josephine Fillier

Oh yeah, I found out about the convoy on Saturday and then everything was planned for me to leave on Monday in order to go to the Trucker Convoy.

Criss Hochhold

Thank you. What happened as a result of your attendance of the Freedom Convoy?

Josephine Fillier

Well, I took myself off of my medication because I no longer trusted pharmaceuticals because of my injury. And so, I also took my children out of school for those two weeks while I was gone because they just came back after another lockdown and I didn't want to put a mask on their face. So I ended up going to the Trucker Convoy and my social worker, who has been involved with my file for a while, she thought I was having severe mental breakdown.

[00:15:00]

So when I came back February 7th into Newfoundland, on February 8th she came and told me that they had to remove my children until further investigation.

Criss Hochhold

When were the kids removed from your custody?

Josephine Fillier

February 8th, my two boys.

Criss Hochhold

Of last year, of 2022.

Josephine Fillier

Yeah.

Criss Hochhold

We're sorry to hear that. And you're working on this actively to regain custody of your children?

Josephine Fillier

Yeah, well, my oldest has come home as of December. But my youngest is having some behavioural issues at school, so my social worker wants to make sure that I am, you know, okay with my mental health and he has support and I have support before he can return home. But he's in the process of transitioning back.

Criss Hochhold

Very good. Just a couple of more questions. You said that you've come off medication earlier this year. Can you just briefly describe what medication you were on and what it was for?

Josephine Fillier

Well, I don't remember the name of my antidepressant, but I was on antidepressants. And then I was on lorazepam for my anxiety because I was in abusive relationships and had childhood trauma. So I have severe PTSD from all of that. But everything was fine; it's just that, since I got this injection into my body and I knew something was seriously wrong, I no longer trusted pharmaceuticals or doctors.

Criss Hochhold

You said you've had anxiety and depression since childhood, which you also said got heightened because of the vaccination. How was your mental health affected after you received the vaccination? Did your symptoms increase or did they stay about the same? What happened?

Josephine Fillier

My symptoms seriously increased from, basically, depression and anxiety to severe panic attacks where I felt like I was having a heart attack constantly. I had chest pains, electrical shocks in my chest. I had chronic fatigue and anger issues and then basically just escalated from that to—

I had a tremor in my leg last April, because I was out for a walk and I became chilly. And my right leg, when I came home, I put my feet on the heater like I normally do to warm up and then my leg just started shaking uncontrollably. It's basically affected my entire nervous system. I have severe nerve pain, like my feet go on fire, and it's mostly my right leg. That's what I don't understand. Like, I guess since I had the bruise there. With my research, the spike protein possibly started, like, attacking that one part of my body and then it spread throughout my entire system. But even now, my neurologist checked my leg, and he said **that my right leg is much more weaker than my left leg. So I have a severe pain all the time, like, numbness, my foot goes numb, it goes on fire. Crawling and pins and needles, shooting pains, stabbing.**

Criss Hochhold

Thank you, Josephine. I really appreciate it. While I do have more questions, I do not have more time. So I'm going to refer to the commissioners for any follow-up questions.

No questions. Thank you, Josephine. I really appreciate your time.

Josephine Fillier
Thank you.

[00:19:34]

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 3

March 18, 2023

EVIDENCE

Witness 9: Linda Adshade

Full Day 3 Timestamp: 07:08:15–07:28:15

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Linda Adshade

I do.

Ches Crosbie

Thank you.

Criss Hochhold

Can you please tell us your name, where you're from, and what did you do?

Linda Adshade

My name is Linda Adshade. I'm from Oxford, here in Nova Scotia. I worked with the Nova Scotia Health Authority [NSHA] from 2009 until, let me see, probably October of 2019. At that point, I took a position with public health. Please don't shoot me.

Criss Hochhold

Linda, I understand you've had a lengthy career with Nova Scotia Health Authority, but I'd like to focus on your most recent role with NSHA. Can you tell me how you came to be in the position, what the position is, and what it entailed?

Linda Adshade

So there was a broad letter sent out; they were looking for many people to come to work with them for the lab results. So you had the negative and you had the positive lab results.

Criss Hochhold

Sorry, negative lab results for what?

Linda Adshade

Oh, sorry, for COVID-19.

Criss Hochhold

COVID-19 tests that people—

Linda Adshade

Yes, the PCR tests, sorry. So I was put in a position to look after the negative lab side of it. So when I went there, I actually started off doing the vaccine clinics. Was pulled from there to go back to work remotely from home. They made me the supervisor of about five people at that time.

Criss Hochhold

Okay, so if I understand correctly, you had a different role. They advertised this role specifically that deals with COVID-19 test results.

Linda Adshade

That's correct.

Criss Hochhold

And you assumed that role, and it was completed remotely. You did not have to attend the office.

Linda Adshade

That's correct, yes.

Criss Hochhold

So can you tell me more about— What do you mean you received, or you were in charge of, the negative tests? And what was the overall purpose and scope as well, please?

Linda Adshade

So I would get all the information in the morning. Then my staff would call all of the individuals on the list to give them their PCR test results. And we only dealt with the negative side. That's the only people that we called.

Criss Hochhold

Okay. So that means, if I understand correctly, people throughout the province would attend testing centres. They would get the COVID vaccine tests done—the swabs or whatever the case may be—and then you would receive the test, the lab results.

Linda Adshade
Right, that's correct.

Criss Hochhold
And would that include, then, contact information for the individuals?

Linda Adshade
Yes, that's correct.

Criss Hochhold
Okay, and what would you do with the test results?

Linda Adshade
So with the test results: So in the morning, I would get this huge, huge file. Of course, you can imagine how many people are being tested. Once I got that file, I would then take the file and separate it. I would keep all of the data for myself. I needed that information to deal with situations, but my staff only received the negative lab results. So they would have the name, all of their information, so that we could confirm, you know, "May I speak with so-and-so. Could you please give me your name, your date of birth, health card number," anything along those lines, just to verify. Then we would give them the test results.

Criss Hochhold
Okay, and you said you received a big file in the morning that included all test results.

Linda Adshade
That's correct.

Criss Hochhold
So that would be negative as well as positive.

Linda Adshade
Positive, yeah.

Criss Hochhold
But you were focused for your role only on the negative aspects that you would then disseminate to your staff who'd make the contact with the people.

Is there anything that you can tell us how that data that you received in those spreadsheets was related to information that was given to us on the televisions, through the media or through the government messaging?

Linda Adshade

Okay. So I started thinking to myself, "Wow, they seem to be like saying there's all these cases; I don't get it." So again, it came on an Excel spreadsheet. I was able to take out the positives from the negatives so that I only ended up with the positives. When I counted those up each day, to the end of the week, they didn't match what they were telling us on TV—not even close. They were saying thousands of people. There were not thousands of people in the run of a week.

[00:05:00]

They were off by hundreds. Not by two or three, hundreds. I started thinking, "Okay, this is crazy. They're lying to people."

Criss Hochhold

So based on the numbers that were shown on TV, it did not match up with what you had in front of you. You literally had the actual figures in front of you that they would have used to compile the numbers shown to the people in the province and around.

Linda Adshade

Yes, that's correct.

Criss Hochhold

Did you take any steps about that? Did you follow up on that, or was this really more you were gravely concerned but— How did you feel about that then?

Linda Adshade

Well, I was upset because they were lying to the people. They were lying to us. They were lying to everybody. I didn't take it up with my management or my supervisor because I was met with a lot of resistance prior to that for my opinion on the vaccine.

Criss Hochhold

We'll get to that, too.

Linda Adshade

Yeah.

Criss Hochhold

Okay, so thank you for that. To summarize, your role as a supervisor gave you access to all the data, all the tests within the province—the entire province.

Linda Adshade

Yep. The entire province.

Criss Hochhold

And the Province inflated grossly, according to you, the numbers that they gave to the people in terms of how many people tested positive for COVID-19 in relation to how many actually tested positive.

Linda Adshade

Right.

Criss Hochhold

Thank you.

Josephine [sic], now I'm going to move away from that, and let's talk about your story a little bit as well because it is also very important. Your job that you had as the supervisor for negative COVID-19 testing, you mentioned it was done remotely. Were you able to do that entirely remotely, or did you need to go to an office at any time?

Linda Adshade

The only time I would have had to go to the office was to pick up equipment. But other than that, I worked remotely just from my kitchen in my home.

Criss Hochhold

And what happened that changed your employment status? Did you receive notification from the province in regards to your vaccination requirements because mandates were coming in?

Linda Adshade

Yes.

Criss Hochhold

For Nova Scotia Health Authority workers, employees—not just health care professionals, but all employees for the health authority.

Linda Adshade

Right.

Criss Hochhold

Were you affected by that?

Linda Adshade

Yes, I was. Yes.

Criss Hochhold

Okay. I'm going to enter Exhibit TR-17, which is a letter, an email that was sent out. I just want to read just a short excerpt from that, if I may. The date on this is November 30th, 2021, at 10:29 a.m. It was sent by the COVID-19 policy request, and the subject was "Viral Vector Offer of Vaccination."

"Dear NS team member. You're receiving this letter as you have submitted an intent to decline COVID-19 vaccination or an exception request (medical or Human Rights) that has been declined or remains on review. COVID-19 vaccine core planning team and Nova Scotia Health Occupational Health, Safety & Wellness team are continuously looking for ways to support health care workers impacted by the provincial mandate for those working in high risk settings." So I'm just going to focus on those three little words to that: "high-risk settings." How high risk of a setting was your home?

Linda Adshade

Well, let me put it to you this way: I live in the middle of absolutely nowhere. So unless a bear had COVID and come into the home, that's the only way.

Criss Hochhold

But so because you— It was really a rhetorical question in a sense, wasn't it?

Linda Adshade

Sorry.

Criss Hochhold

No, no, that's okay, I wanted an answer. But they sent an email out to health authority employees specifically addressed to those working in high-risk settings. Yet your role was not in a high-risk setting because you had no contact, ultimately—I'll sum it up—with the outside world. Because were you working from home remotely with no need to attend the office?

Linda Adshade

No.

Criss Hochhold

I won't read the rest of it, but it will be there for the commissioners. I take it you received that letter because you showed an intent, or you gave them notice, that you were not planning on getting vaccinated. Is that correct?

Linda Adshade

That's correct. Yeah.

Criss Hochhold

Did you feel that you had enough information about the vaccine, about its safety and efficacy before making that decision?

[00:10:00]

Or what prompted you to turn away from the vaccine?

Linda Adshade

There were several things. Basically, that it was rolled out so quick. My understanding is a vaccine takes years to— Not that I'm a doctor, nurse, scientist, or anything, just from understanding, it takes many years to produce a vaccine. I felt that this was too quick.

Fifty years ago, my mother was given a drug when she was pregnant. It affected me that I had at the age 22 cervical cancer from this drug that she took. It also affected my daughter who also has precancerous cells. It can also affect my grandson. So I have a little issue with trusting that stuff without actually doing some good research. When I did all my research and looked into it, I did not feel comfortable at all.

Criss Hochhold

You had obviously a very, very serious experience as a result of that. Do you remember what vaccine your mom got that might have caused, that might have been responsible for that?

Linda Adshade

I'm not sure. I believe.

Criss Hochhold

Okay, that's fine. So based on that, you made a decision: I'm not going to; I just don't trust it. And you said that you've done some research about this vaccine. Because of that decision, did you submit a letter of exemption or any other documentation to your employer advising them of your hesitancy?

Linda Adshade

I did not. Again, I've worked in about eight different areas of the hospital. I also worked at the doctor's office at one point. Not that this came from a doctor but told by some of the staff was, "Don't even ask. Nobody's getting them."

Criss Hochhold

So your belief was, well, I was talking to people, colleagues and workers, and they said, "Don't bother." So you chose not to.

Linda Adshade

That's correct.

Criss Hochhold

You received this email about the need of vaccination. Can you tell me about that experience that led to your suspension or termination of employment with the Nova Scotia Health Authority?

Linda Adshade

So I had my manager ask me several times, about getting the vaccine. I told her, "You knew from the start I'm not doing this." So she said, "You know that you will be put on unpaid leave, which could lead to termination if you don't take this vaccine." And I said, "I'm well aware of the consequences."

Criss Hochhold

So you had a conversation with your supervisor about the vaccine, your hesitancy, and you were advised of the potential consequences.

Linda Adshade

Mm-hmm.

Criss Hochhold

Did you have an experience with your supervisor, or a specific chat with your supervisor or manager about getting vaccinated. And that supervisor then would go and get the vaccine in order to make you feel safer about its safety? Can you tell me more about that, please?

Linda Adshade

So I was talking to her one day about my hesitancy and explaining, "You know, things just don't seem to be adding up." She goes, "Well, I'm going to get mine this afternoon. My first one," you know. "When I get back, I'll touch base with you." Because I was a supervisor. So she said, "I should be back by four o'clock, at least." Getting on to six o'clock, I still haven't heard from her. Finally, she calls me and she says, "I am so sorry that I ran so late. I got my vaccine and I got facial paralysis and had to go to the doctor."

Criss Hochhold

How did that make you feel?

Linda Adshade

I was like, okay, that determines it 100 per cent for me.

Criss Hochhold

So you had no support from your employer in regards to the vaccine hesitancy. Not because you submitted a letter, but because you chose not to— And also not to speak up because you were under the belief that they were not going to be receptive anyhow.

Linda Adshade

Right.

Criss Hochhold

In the interest of time: How were you then, I guess, laid off or terminated? Can you tell me, as we move forward, how that would happen, please? Thanks.

[00:15:00]

Linda Adshade

So I think my last day with public health was 27th of November of '21. So I was thinking to myself, okay, I'm possibly going to starve to death here. So I decided, "Okay, I guess I'm going to take early retirement." I still had three years to work to get my full benefits. Unfortunately, I don't have my full benefits.

So basically, they just told me, "As of December 1st, you're done." So I got up on the 1st of December to collect all my information off of the computer, and they had literally stripped me of everything. I could not get into my email, I could not check my pay, I could not look at anything.

Criss Hochhold

So you were locked out effectively. Was that a deadline for the vaccination requirement, or was that when you said, "I'm going to take early retirement and that early retirement is going to be effective on December 1st."

Linda Adshade

No, because it didn't become effective until January.

Criss Hochhold

Okay, so you were locked out of the system a little early.

Linda Adshade

So I was just stunned. And I even called and said, "Can I not just get my email about my pay?" "Nope, you are done," and basically, "don't contact until you're vaccinated."

Criss Hochhold

How has this impacted you financially? The early retirement—because it doesn't sound like you wanted to retire.

Linda Adshade

No, I didn't.

Criss Hochhold

How did that affect you?

Linda Adshade

Well, we are just living on my husband's income at this time, thank God. He's a good worker. He's a good man, so right now we're living on his income.

Criss Hochhold

Once again, while I have more questions, in the interest of time, I will ask the commissioners if they have any questions.

Commissioner DiGregorio

Thank you for testifying. I just had a question about the numbers that you were talking about at the beginning of your testimony. And I was just wondering how you know that the numbers you were getting every morning were for the entire province.

Linda Adshade

Because we called the entire province. So that's what they indicated when you first started working. You would receive all of the data of all of Nova Scotia. We called everywhere in Nova Scotia; it wasn't just within our area. We called right across Nova Scotia. So all the results came from the testing that was done here.

Commissioner DiGregorio

Thank you.

Linda Adshade

You're welcome.

Commissioner Massie

Yeah, on the same topic, what was the gap you would see between what you could see on the Excel sheet and what was published? Was it a significant gap in terms of the numbers?

Linda Adshade

I would say anywhere from two to four hundred, possibly. Is that what you're meaning?

Commissioner Massie

I mean, was it a two-fold more, or— Because 200 is an absolute number. Is that what you're saying?

Linda Adshade

No, it wouldn't be an absolute number. So I would say that probably, I don't know, they were reporting 25 to 30 per cent more than what was actually there.

Commissioner Massie

Okay, so it's an increase of about 25 per cent.

Linda Adshade

Yes, I would say, yeah.

Commissioner Massie

Okay. And any information on the cycle threshold on these Excel sheets, or is it blind?

Linda Adshade

They were sent to you every day, every morning at 8:00.

Commissioner Massie

No, I'm talking about what was the level of amplification they were using to get the positive. Was it like fixed 40-45 cycle, or you don't have information on that?

Linda Adshade

I'm not sure on that, to be honest with you.

Commissioner Massie

You don't have this information.

Linda Adshade

No, I don't have that information.

Commissioner Massie

And how long was that reporting or communication to the public maintained? Was it stopped at one point? What was the time frame? It was since the beginning of the pandemic, and then it went on until—

Linda Adshade

It was still going on when I left in '21. They were still reporting. Is that what you mean?

Commissioner Massie

Yeah, yeah. And it was going on after that.

Linda Adshade

Yes.

Commissioner Massie

Good, thank you.

Criss Hochhold

Thank you so very much. I appreciate your time.

[00:20:00]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

Ches Crosbie

Katrina Burns, do you affirm that you will tell the truth, the whole truth, and nothing but the truth? Thank you.

Katrina Burns

I do.

Ches Crosbie

Thank you.

Alison Steeves

Can you please tell us your full name, where you're from, and your occupation?

Katrina Burns

My name is Katrina Burns and I'm from Truro, Nova Scotia and I'm a substitute teacher.

Alison Steeves

And how long have you been a teacher?

Katrina Burns

I've been a teacher for about seven years now.

Alison Steeves

Has that been in the public system?

Katrina Burns

No, I originally started out in the private school sector and then moved into Halifax Regional Centre for Education [HRCE] in 2020.

Alison Steeves

Okay, so you did approximately five years in the private system and then you switched to HRCE in— When did you start at HRCE, sorry?

Katrina Burns

I started in September of 2020.

Alison Steeves

Okay, so going back to the pre-pandemic era, sort of late 2019, early 2020: Can you share a bit about what your life was like back then, family, community, et cetera?

Katrina Burns

We were just a basically normal family who had just had our second daughter. I had my second daughter September 22nd of 2019. And we had planned to do— With my first daughter I had gone out. I had done every activity possible, from stroller boot camp to play groups. And then, with the birth of my daughter, obviously then came COVID and we were on lockdown essentially right away.

Alison Steeves

And did you know your neighbours pretty well at that time?

Katrina Burns

Very close with our neighbours, very, very close.

Alison Steeves

And you're in Truro now, but at that time—

Katrina Burns

I was in Hammonds Plains.

Alison Steeves

Hammonds Plains. And how long had you been living in Hammonds Plains?

Katrina Burns

Seven years.

Alison Steeves

In the same community?

Katrina Burns

In the same community.

Alison Steeves

And then you started at HRCE in which month of 2020?

Katrina Burns

Well, it would have been August. This is when the teachers usually go back.

Alison Steeves

And what was it like starting there?

Katrina Burns

So I had gone into the public school system as a substitute. So when they originally started in 2020, they had sectors of places where you were allowed to go to sub. So there was about, I think, 30 schools in my section that I was allowed to sub at. I kept it narrowed down to two schools. And I was lucky enough to get a job every single day at those two schools. But a lot of people had a problem or a difficult time finding employment during the time because of the limitations of where they were able to sub.

Alison Steeves

So over the course of the 2020 school year, you are subbing between two separate schools.

Katrina Burns

Yeah.

Alison Steeves

And you substituted pretty much every day.

Katrina Burns

Yeah.

Alison Steeves

The place that you worked in 2021, did you continue doing that?

Katrina Burns

Yeah. So I ended up falling into a long-term sub position, which was a maternity leave at one of the schools that I was subbing at. And then that's where I had started of September 2021, in a Grade 2/3 class.

Alison Steeves

And you had been subbing there at the same school the year before.

Katrina Burns

Yes.

Alison Steeves

Can you tell us a bit about your class that year in September 2021 and the school you were working?

Katrina Burns

Yes, so I was at a school named Sycamore Elementary in Sackville, and it was a lower income school with a lot of kids who had diverse needs. The class I was getting was a particularly difficult one, with multiple students who had anywhere from behavioural needs to severe learning disabilities.

Alison Steeves

What grade was it?

Katrina Burns

It was a 2/3 split.

Alison Steeves

And so, do you feel that in the course of your time teaching there that you were able to make some progress, build some good rapport with the students in that class?

Katrina Burns

Absolutely. So from day one I started my class similar to another teacher who was actually here, where we would kind of talk to each other about how we were feeling. We weren't able to have any kind of physical contact, but we would be having conversations in the morning about how we're feeling coming into the class; how we're feeling about our day; and kind of what our day would look like so that they were prepared throughout the day for their transitions.

Alison Steeves

And so, you started in 2020. There had already been shutdowns the year before, and so the COVID protocols were sort of in place. We were about six months in, I think, at that time.

Do you recall what sort of COVID measures were implemented in your school?

Katrina Burns

Absolutely. So when I was originally subbing in 2020 and started out, there were many different protocols in the different schools.

[00:05:00]

So some schools went as far to have walkie-talkies, so you could communicate if a child either fell on the playground or needed some assistance. That way, someone from the office would come and escort the child back to the office to kind of be looked at. That way, it would keep kids from transporting through the school so much. And we could keep transmission down throughout the school. There were other schools who almost barely had any kind of protocol. And then Sycamore did have the same kind of protocol where it would be a class going down on one side, another class coming up the other, sanitizing as soon as they came into the classroom, or left or went to the washroom and came back in. Even if they had just washed their hands in the washroom, it was still sanitizer to come back into the classroom.

There was also, if there was any sign of sickness, it was a call up to allow the principal to know so that we could then call their parents to get them to be picked up.

Alison Steeves

Were the kids subject to masking and social distancing?

Katrina Burns

Absolutely. So desks had to be— When I had gone into the 2/3 class, we were allowed at that point to put the desks kind of together, but they had to stay in those groups. There was no travelling around the classroom unless they had the mask over their face. They were able to bring their mask down while they were sitting at their groups. And I did have an area set up in my classroom beside the window for the summer months when it was really, really hot for the kids to go down and pull their mask down so that they could sit and get fresh air in the morning.

Alison Steeves

So based on your personal observation, how did those measures impact the daily life for students and teachers at the school?

Katrina Burns

It was so hard to go in in the morning and see all of these kids with a mask up over their face and struggling to breathe, and struggling to kind of express themselves. It was almost like they had become kind of emotionless to what was happening around them. You had some kids who were so worried about getting COVID and spreading it to family members that they were just panicked as soon as they came in.

You had kids who were also against the mask because, obviously, they had heard their parents talking, and they would fight you on the mask. And it was constant that we would have to remind them to pull their mask up over their face and that they had to follow the rules in school that we were mandated to follow.

Alison Steeves

Would you say that the kids generally kept their masks clean and sterile?

Katrina Burns

No.

Alison Steeves

When the COVID-19 vaccines came out, did you take one?

Katrina Burns

I did not.

Alison Steeves

And why not?

Katrina Burns

I had just felt really off about how fast things were coming out and how much pressure they were putting on people to go get a vaccination. Like, there had never been that much pressure put on any other kind of, like, flu vaccine or anything like that before. So I had not— Like, it just seemed kind of fishy to me that we were pushing people to go do this and even against their will, even when they were asking for exemptions.

Alison Steeves

Did you feel pressure to take the vaccine?

Katrina Burns

Absolutely. There was pressure on all ends: from my family, from family friends, from people at school to just everyone all around me seemed to have kind of— Like, our neighbours as well became people who would just constantly be reminding us like, “Oh, well, you could just go get the vaccination. It’s easy. You could go get it, and then all of this would be over.” So.

Alison Steeves

Did you start noticing any differential treatment on the basis of this decision?

Katrina Burns

I did especially for my six-year-old. We grew up in a community where we all had kids together. And it became part where there were bubbles and my six-year-old daughter would sit in the window and stare out at her friends playing, and she wasn't able to go play with them.

Alison Steeves

Did you notice any differential care in the healthcare system?

Katrina Burns

Yes, so around October of 2021, I had been driving with my husband and I felt a sharp pain just shoot down my left arm. And then it came to a point where I couldn't breathe. And we had to pull over, and I couldn't catch my breath. My heart was pumping from my chest and so we went to emerge. I have a vast history of heart problems, everywhere from heart problems to blood clots to aneurysms in my family, including my father who had his first heart problem at 27 years old. And I'm 33, just for reference.

[00:10:00]

So I had gone in, and once we got to the hospital, there was screening for COVID. And I'm standing there clutching my chest asking to be helped, and the woman went through the protocol and got to the question about whether or not I was a vaccinated individual. And when I said that I wasn't, it was at that point where she proceeded to then stop and tell me that her father-in-law was not vaccinated and was against the vaccination and decided, after she had a long talk with him, that he would go get it. So therefore I should go and get it because I'm just hesitant on the vaccination. As I'm clutching my chest thinking that I'm having a heart attack.

Alison Steeves

In the fall of 2021, when Nova Scotia announced the Nova Scotia COVID-19 mandatory vaccination protocol in high-risk settings, indicating that teachers would be required to have two COVID-19 vaccines, what was that like for you? What were you feeling?

Katrina Burns

At this point, I was incredibly worried for my future. I knew that I wasn't going to get the COVID-19 vaccination, especially after having gone through what I went through at the hospital. It just kind of reconfirmed that it wasn't something for me. If I wasn't going to get the care at that point, if something did happen when I did take the vaccination, I wouldn't have the care at that point either. So at that point, I just felt that I couldn't go through with it.

Alison Steeves

Were you worried about your job?

Katrina Burns

Very much so. But I was also more so worried at that point about the 21 kids who were sitting in a classroom, who also needed to have that constant or consistent support and the constant reassurance from someone in the morning that they were going to be there and be that support for them. Some of these families were children who didn't have the proper support at home or the proper care at home and who needed someone there. And then there were other kids who struggled very much with bullying and were coming back to school and struggling with their reading and their writing and needed that support. So it was these 21 kids who weren't going to have that support from me that I was giving them. And I didn't know whether or not my replacement would give them the same amount of care. So I was worried about losing my job, and financially it obviously put a strain on my life; however, I was more so worried about the 21 kids that I was teaching.

Alison Steeves

Did you attempt to get an exemption from your employer?

Katrina Burns

I did, so I had sent in an email explaining why I felt that I couldn't get the COVID-19 vaccination and I was denied the exemption.

Alison Steeves

Did you provide me with a copy of that response from HRCE?

Katrina Burns

I did, yes.

Alison Steeves

Do you have that in front of you?

Katrina Burns

I do.

Alison Steeves

So it's Exhibit TR-0007b. Do you mind if I read an excerpt from their response?

Katrina Burns

Mm-hmm.

Alison Steeves

"So, after careful consideration, I have concluded that the information provided is not sufficient to support the need for an accommodation. Further, I note that your position as a teacher requires that you interact directly and in close proximity with students. As such,

even if you are entitled to an accommodation, Halifax Regional Centre for Education could not accommodate it without undue hardship.”

So they felt you had insufficient information. And they state that even if you had sufficient information, they would not grant an exemption.

Katrina Burns
Mm-hmm.

Alison Steeves
Did you also inform your employer that you would be willing to wear a mask or test regularly as an alternative to vaccination?

Katrina Burns
Absolutely. So I had gone in every day wearing a mask, even though it was the most horrendous thing to try and teach with a mask on, especially when you’re trying to teach kids who are trying to read. And I did tell my employer that I would test every single day if I could keep my position.

Alison Steeves
And what was their response?

Katrina Burns
No.

Alison Steeves
Did you also provide me with a letter of support from one of your students’ parents addressed to Tim Houston, Zach Churchill, and Robert Strang, expressing their discontent with the mandates on account that their child was losing you as a teacher?

Katrina Burns
Yes.

Alison Steeves
And you have a copy of that in front of you?

Katrina Burns
I do.

Alison Steeves
So that’s Exhibit TR-0007a. And do you mind if I read an excerpt from there?

Katrina Burns

Sure.

Alison Steeves

"To Tim Houston, Zach Churchill and Robert Strang. Today I received notice that my eight-year-old son's teacher will be removed from her position due to this unethical, unnecessary and illegal vaccine mandate being forced on all Nova Scotians by your government.

[00:15:00]

"I am irate. Katrina Burns is one of the best teachers my child has ever had. She is irreplaceable. Yet you now unwisely and unjustly cause her to have to be replaced."

Can you tell me a bit about this student?

Katrina Burns

So he was a young boy who had had trouble in previous years with being bullied, and his mom had removed him from school in pre-primary. But then he wanted to go back to school and get to know some of his peers and kind of socialize with peers, so he had decided to come back to school. He had struggled very much with reading and his writing, and, in the short time that I was with him, he made leaps and bounds compared to what he was. And he loved coming to school, which was vastly different from his previous years. So that made all of the difference in the world for him to come in every day and be as happy as he was.

Alison Steeves

Was this the only parent who had expressed support for you at this time?

Katrina Burns

No. So I was made to stay and go through all my parent-teacher interviews, which were all phone interviews at this point, and then afterwards was able to allow parents to know that I would no longer be their child's teacher. And I had so many parents reaching out to ask, like, "What can we do? Who can we contact?" And given the response that I had received, I said, "Unfortunately, I don't think there is anything that you can do, but I appreciate very much the support."

Alison Steeves

Did anything change your employer's mind?

Katrina Burns

No.

Alison Steeves

So you were placed on unpaid administrative leave.

Katrina Burns

I was.

Alison Steeves

When?

Katrina Burns

For December 1st was the— So November 30th was my last day of work, and December 1st I was completely done.

Alison Steeves

Do you recall when the the vaccination protocol was announced?

Katrina Burns

I feel like it was October 6th that it was announced.

Alison Steeves

So approximately early October, you find out that you're going to be placed on unpaid leave indefinitely, and then you stay in the school and you work there for approximately two more months. What was it like working there during that time, knowing that?

Katrina Burns

So I kind of kept my vaccination status hidden as long as I could, just to avoid any kind of bullying or kind of different treatment from the staff. Again, I worked at a very lovely school for the most part. Everyone was COVID conscious, but they didn't kind of judge me any differently once they found out. So I took the time to kind of let them know myself. The people who were very COVID conscious and were constantly checking numbers and constantly following all protocol to make sure that they didn't get COVID kind of stood back a little bit further from me. But there was never a point where they kind of treated me too much differently. They would just keep their distance.

Alison Steeves

Can you describe what it was like for you to leave school on your last day before your leave?

Katrina Burns

So the last day of work— The last week I was at work, I was asked to train the person who would be taking over for me and to kind of help them with some of the needs that were in the classroom. So I spent the week packing up my classroom, and if anyone is a teacher in here, they know how much stuff teachers accumulate over the time. So I spent that week unpacking my classroom, but still leaving stuff so that there was a bit of normalcy for the kids. And then, come the last day, it was a very emotional thing for especially my classroom because they couldn't fully understand why I was going to have to leave. And they didn't

fully understand why I couldn't just stay and teach them, even though I wasn't vaccinated, because I still followed all of the rules.

Alison Steeves

What impact did this have on your life, this experience?

Katrina Burns

So, my life has drastically changed compared to what I did before. I was very much, I guess, what you could call a rule follower. I didn't go against the grain at all. I thought that I would have this wonderful life where I'd become a permanent status teacher. My husband would work. We'd make money, and our kids would grow up. And now we're living on one income.

[00:20:00]

We've moved out of the community that we were living, and sold our first house and moved to Truro. We have lost family members. We have lost friends of family that have been family friends for 24 years since my dad passed.

So to say that it's had a mass effect on my life would be, like, a valid thing to say. It's been horrible. My mental health has struggled incredibly. My kids have struggled. We've missed out. I had to miss out on dance recitals. I had to miss out on first-time things for my six-year-old daughter, so it's been horrible.

Alison Steeves

Do you have any final words, Katrina?

Katrina Burns

I just— I was very hesitant to come up and speak just because I've kind of stayed hidden for a little while, especially with the move. I had a lot of, kind of, backlash when it came to my choice and why I wouldn't just go with it. But I feel like it's very important to make note that I was classified in with a group of people just because they were fighting for a right, and I was then called a misogynistic racist. And if you know— Like if the people who know me, know that that's not who I am. That's not who I am as a mother. That's not who I am as a daughter. That's not who I am as a wife or as a teacher. So to be classified as that and to be treated the way I was treated by people who were a part of my life for so long is insane that this is has happened.

Alison Steeves

Thank you, Katrina.

Commissioner Massie

Thank you so much for your testimony. You started to mention that you used to be a rule follower. That's by temperament, I suppose. So have you now come up with being more questioning about rules?

Katrina Burns

Absolutely. Especially with the time at the hospital where things were just dismissed, I definitely question a lot more. And especially when it would come to my kids, there's definitely a lot more question when it comes to vaccinations. Even my hesitancy to go to a doctor if my kids are sick or if I'm sick is huge at this point.

Commissioner Massie

There's also another thing I missed in your— Maybe it's just me: When you went to the hospital, did they end up treating you properly?

Katrina Burns

So no. I didn't get into that part, but I was brought in and I went to triage, set down, and the nurses were whispering behind triage. And then I heard them say, "She's unvaccinated." So at this point, they handed me the little monitor to put on my finger. And then they proceeded to put their gear on. And then threw my identification bracelet at me, instead of handing it to me or putting it on. Asked my husband to leave, who had driven me in there and I live with. And then they brought me into the main area of the QE2 to kind of check my heart. But then again said, "She's unvaccinated," so moved me to another area.

The room that I went into had a bed with dirty linen all over it. And the nurse took the linen, threw it to the side and then told me to remove my shirt. Then another doctor came in, slapped the monitor on my chest then ripped it off, and security escorted me down to a room that had plastic boards up the middle of the walls. And then signs posted all over that said, "droplet exposure." They then allowed my husband to come back in, but had him fully dressed in mask, headgear, a gown, and made him sit six feet away from me.

They then came in. They took my blood. They then administered a COVID test. They took the COVID test right away, stuck my blood on the door. And every nurse or doctor that came in had to put on new gear and take off the gear as they left the room. I saw probably two nurses and then the doctor came in. The doctor disregarded all of my conversation about how I was feeling, proceeded to tell me they would not be sending my blood for any testing. They would send my COVID test, however, and I would hear back about my results from my COVID test. And then sent me on my way.

Commissioner Massie

Is that normal protocol?

[00:25:00]

Katrina Burns

It doesn't seem normal. My dad, as I mentioned, had multiple heart attacks. And when he went in, they did test his blood because usually the heart attack had passed by the time he got there. So I wasn't oblivious to that having to be done, but he told me that he would not be sending in my blood work.

Commissioner Massie
Thank you.

Alison Steeves
Thank you, Katrina.

Katrina Burns
Thank you.

[00:25:58]

Final Review and Approval: Jodi Bruhn, August 3, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Ches Crosbie

Mr. Desrosiers, do you affirm that you will tell the truth, the whole truth, and nothing but the truth?

Kirk Desrosiers

I do.

Ches Crosbie

Thank you.

Criss Hochhold

Can you please tell us your full name and where you live.

Kirk Desrosiers

Kirk Desrosiers. I live on the South Shore, Northwest Cove.

Criss Hochhold

What was your occupation?

Kirk Desrosiers

I worked for a company called Admiral Insurance. I was a facility specialist for just a little over 13 years now.

Criss Hochhold

What does that mean, facility specialist?

Kirk Desrosiers

Dealing with the property itself within the building, contractors, vendors, health and safety, IT support and ergonomic assessments.

Criss Hochhold

Okay. And you were a volunteer in your community?

Kirk Desrosiers

I do lots of volunteering in my community, yes.

Criss Hochhold

Okay, but particularly, do you volunteer as a volunteer firefighter?

Kirk Desrosiers

I do, yes, for District 1 Blandford.

Criss Hochhold

I want to talk a little bit more about your volunteer firefighting. As a volunteer firefighter, for you specifically, what was your role? What were you doing there as a volunteer firefighter?

Kirk Desrosiers

Well, a particular role like that is a lot of extensive training and a lot of studying and learning about the equipment and the apparatuses on the fire trucks, and a lot of dealing with the medical calls and learning about medical procedures.

I was studying for the MFR, medical first response.

Criss Hochhold

Okay, excellent. Within that capacity as a volunteer firefighter, not only did you receive a lot of training, but did you suit up and attend calls, fire calls and calls of that nature as well?

Kirk Desrosiers

Starting off, I was just still training. I wasn't a full firefighter, but I would wear the gear and do drills and training exercises.

Criss Hochhold

Okay. For those training exercises that you did, when you say full gear, what does that mean? What do you mean the full gear? Does that mean you get the helmet, the mask?

Kirk Desrosiers

You get the helmet, the full wardrobe, the tank, the scuba gear they call it—all the apparatus, all your equipment.

Criss Hochhold

How much weight would that be?

Kirk Desrosiers

Well, it's a little over 75 pounds.

Criss Hochhold

Seventy-five pounds, so you'd have to be in pretty good physical condition to strap on this apparatus, suit, and then conduct exercises and that as well?

Kirk Desrosiers

Not so much physical—I guess in one aspect you would have to be physical, but strong. Because, like I said, depending on the extra equipment that you have to carry, depending on the type of call or emergency you have, it could be overwhelming.

Criss Hochhold

So in order to become a fully qualified firefighter, you said you had to undergo testing. Was there a test you did in 2021 in order to, you know, proceed in those qualifications?

Kirk Desrosiers

Yes, in order to be a volunteer firefighter, you have to go to a doctor and do a full physical assessment to make sure that you're mentally and physically able to carry out your duties.

Criss Hochhold

What's the test comprised of, the physical?

Kirk Desrosiers

Like, check your heart. Measure the stress on your heart, do little treadmill tests; make sure that you don't have a hernia, any things like that. They check your blood pressure and make sure that it's normal and make sure that there's no issues with, like, breathing.

Criss Hochhold

What was the result of that test?

Kirk Desrosiers

I was good. Perfect.

Criss Hochhold

Clean? Clean bill of health, good to go?

Kirk Desrosiers

Filled out all the forms, gave me the clean bill of health, sent it off to the firehouse.

Criss Hochhold
And that was in early August of 2021?

Kirk Desrosiers
It was, yes.

Criss Hochhold
Ok. So you were fit for duty.

Kirk Desrosiers
I was fit, yeah.

Criss Hochhold
Then you gave some consideration to getting vaccinated shortly after that, is that correct?

Kirk Desrosiers
Well, not shortly after that. For the longest time, I was sort of speaking against it. I didn't think it was safe enough. I was really terrified and nervous. I didn't want to put that in my body because I just felt it was too soon to take something like that without extensive testing. So I tried as long as I could not to take the vaccination.

[00:05:00]

Criss Hochhold
But you decided against it and you did take it?

Kirk Desrosiers
At the end, yeah, I did. It was mostly due to peer pressure, the media, the medical doctors: everyone was telling me that I have to take it.

Criss Hochhold
Okay. So you went and got your first shot. How long after your— I'm going to put it in context for time: How long after your firefighter physical tests did you get the first shot?

Kirk Desrosiers
The first vaccination was August 16th, and I got my physical August 17th.

Criss Hochhold
So very, very closely together, obviously.

Kirk Desrosiers
Yes.

Criss Hochhold

Just for the record, the lot number would have been— This is a Pfizer vaccine?

Kirk Desrosiers

It was Pfizer, yes.

Criss Hochhold

Do you have the lot number in front of you?

Kirk Desrosiers

The lot number for that one was FA9099.

Criss Hochhold

Now, before you received the vaccine, who administered it for you and where did you go?

Kirk Desrosiers

The first one I got was at the drive-thru setup over in Dartmouth, at the Dartmouth Hospital.

Criss Hochhold

And do you remember who gave it to you? The person?

Kirk Desrosiers

I don't, unfortunately, no.

Criss Hochhold

Okay, well, that's okay. Whoever administered this to you, did they warn you about potential risks, side effects, benefits of getting the vaccine?

Kirk Desrosiers

At the time, they briefly said some stuff. I couldn't really remember. I don't know if I was just panicky or scared; it just happened so quick, and then they told me just pull over and **stay in the parking lot for 20 minutes while someone looked after me.**

Criss Hochhold

And how did you fare after the first shot? Any issues?

Kirk Desrosiers

No issues, no symptoms, nothing. I was perfect after that. Like it didn't even happen.

Criss Hochhold

Wow. And then you decided to get a second shot as recommended.

Kirk Desrosiers

Yeah.

Criss Hochhold

When was that?

Kirk Desrosiers

That was on August— No, sorry that was September 13th.

Criss Hochhold

So roughly a month after the first shot.

Kirk Desrosiers

Yes.

Criss Hochhold

Give or take a few days. And that was also Pfizer?

Kirk Desrosiers

It was Pfizer, yeah.

Criss Hochhold

And do you have the lot number in front of you?

Kirk Desrosiers

That one was FA9091.

Criss Hochhold

I'm going to ask the same thing as well for your second shot. Where did you go get that?

Kirk Desrosiers

That one was at the Superstore.

Criss Hochhold

And who issued that to you? Who gave you that?

Kirk Desrosiers

Unfortunately, I don't know.

Criss Hochhold

Was it a pharmacist?

Kirk Desrosiers

It was a pharmacist, yeah.

Criss Hochhold

He was the pharmacist at the Superstore.

Kirk Desrosiers

It was, yes.

Criss Hochhold

Did the pharmacist talk to you about potential risks or harms or benefits of the vaccine?

Kirk Desrosiers

No, nothing at all.

Criss Hochhold

Did you have to sign a form?

Kirk Desrosiers

I did, yeah.

Criss Hochhold

Do you remember what the form said by any chance, or did it lay things out for you? Or was it just a consent form to receive?

Kirk Desrosiers

It was a consent form for them to administrate it.

Criss Hochhold

Yeah. You don't remember how many pages there were or what the consent form said?

Kirk Desrosiers

I do believe it was just one page. But it was mostly, they were like, "Sign it or you're not getting it." Like, "We got to hurry up and move along," kind of ordeal.

Criss Hochhold

Okay, thank you. Did you have any issues after the second shot?

Kirk Desrosiers

Well, after the second vaccine, everything was the same as the first. Everything was going good: no signs, no symptoms, everything was okay. Except on September 22nd, and that would have been a Wednesday, because I woke up and I was really kind of out of it. I wasn't feeling right, and I thought it was just because I was overworked at my job and doing the training. I was just tired and sore. I was having trouble breathing. I was like, "Ah, it's the middle of the week. I'll just push through and see what happens." But I remember waking up that day and it felt like someone was sitting on my chest.

Criss Hochhold

Did you do anything about that? Or what did you do after that?

Kirk Desrosiers

No, I just played it off as, "Oh, I'm just getting run down with everything I've been doing at my company and at the firehouse." So I just thought, "Oh, I'm probably just getting a cold," or I was thinking, "Oh, maybe it's symptoms from the vaccine." Maybe it was like, if you get a vaccine you get like cold symptoms, I didn't really know. But that day, I just drank a French vanilla just to warm up my lungs to try to help myself to breathe.

Criss Hochhold

You know, Kirk, I'm just going to back up just a moment here. There is one question I'd like to ask as well, just in regards to the conversation you had with the pharmacist.

[00:10:00]

Considering you were a volunteer firefighter—you know, pretty good shape, carrying heavy equipment, right? Potentially having a life—pulling somebody out of a house, of a car, operating the equipment. Given your age and your health, were you given then a personal risk assessment by the pharmacist? Like, to let you know of your chance of becoming seriously ill or dying should you contract COVID-19?

Kirk Desrosiers

Nothing like that, no.

Criss Hochhold

Nothing like that. All right. Because you'd be one of the fitter people really around in the community, at the very least, because of the duties you would have to perform. So there was no consideration given whatsoever.

Kirk Desrosiers

Nothing like that, no.

Criss Hochhold

Thank you. Now we're going to move forward once again. So you had all these symptoms that you kind of just chalked up to work-related: I'm stressed, a little bit of this. So you carried on and you went to work that day.

Kirk Desrosiers

Yes.

Criss Hochhold

Can you tell me more, just what happened I guess throughout the day, just briefly? And then what happened after that?

Kirk Desrosiers

Well, it wasn't just that day, it was over time. I just kept thinking, "Oh, it's a chest cold." And it was probably within two weeks time frame of going back and forth to work and doing my training. And I said to my partner quite a bit, "I got this chest cold in my lungs, but I don't have a cough." And we did some research—and she goes to a naturopath—about taking elderberry. It's supposed to be good for your lungs. So I tried that, and it seemed to be okay. But it was one of the last days at work, I remember: I was doing a lot of activity and it was all day. I was lifting stuff that's about 50, 60 pounds all day long. And then I just started sweating, and I felt a really bad pain. And I just couldn't catch my breath and I had to leave.

Criss Hochhold

Did you go to the hospital right after that because of how you were feeling?

Kirk Desrosiers

No, I went home and I just laid down, took a nap, and it seemed to be passing me. Except for the sore lung feeling. And I decided that night to go to the firehouse for training, just because it was mostly just learning exercises; it wasn't physical hands-on. So I was like, I'll go there tonight and learn some stuff.

Criss Hochhold

Okay. And once you got to the firehall, can you tell me what transpired there?

Kirk Desrosiers

Yeah, it was quite early as I got there, because I was still kind of overwhelmed a bit. But it was basically— We're just going around at the fire trucks and checking all the storage compartments. So if there was a scene where I was located, if one of the firefighters said, "I need the fire axe," I'd know to go to compartment 10 on the truck to hand it to him. So it was just cataloguing items on the truck.

And then we started to do the MFR—medical first response training. And the training that we're doing that night was checking blood pressure. And the first one was just the automatic, where you put it on, you push a button, and it just reads the systolic and diastolic pressure for you automatically. But I remember the fire chief that night said, "Well,

if you do get a medical call, what I want you to do first is use the manual—the one that you—”

Criss Hochhold

The little pump.

Kirk Desrosiers

Yeah. And I said to him, “Well, that’s good, Chief, but I don’t know anything about that or what to listen for, the blood coming or going.” And he goes, “Well since you asked about it, why don’t you be the guinea pig; you be the volunteer to sit up front and show everyone?” So I sat there and one of the EMTs put the cuff on me and his face just blanked out white. And he got right nervous. And I was like, “What’s wrong?” And he read it and it was 157 over something. And he goes, “That’s really high. What I’m going to get you to do is just sit in the corner away from everybody and just try to calm down, and I’d like to read that again.”

So it was about 45 minutes and then he came and got me and asked, “Can I do your blood pressure check again?” And the second time he did it, it was 187 over something and he goes, “That doesn’t seem right because you’re just sitting here relaxing.” And I go, “Well what do you think?” And he goes, “I got to get you to the hospital immediately.” And I’m like, “Oh-ho-ho, well, let’s not go immediately.” I said, “I have a pain in my lungs for a while. I think it’s just a cold and that’s interfering.” He’s like, “No, you could take a stroke or a heart attack at any second.”

So I remember Tami, my partner, came to pick me up and rushed me to the emergency room. I got there, we walked in, and they asked, were we vaccinated and stuff. And I was like, “yeah.” They took me aside.

[00:15:00]

And Tami, unfortunately, my partner, she wasn’t vaccinated then. And they almost physically took her out of the hospital and wouldn’t let her come in at all. She had to wait out in the car. And I first sat there after they kicked her out, and I was alone waiting for someone. Finally, the nurse came over and got me, and she put the blood pressure on me, and it read 212 over 137. And all I remember is getting thrown in a wheelchair, and they dragged me off to different rooms. The first room was the EKG, and then they rolled me down to another room and said, “We’re just going to put you on the monitor and check everything.” And then one of the nurses noticed, “Your oxygen level is, like, extremely low.” And I’m like, “Okay I didn’t know that it was low. I’m just doing my thing.”

So another doctor came in, and they were assessing the monitors that I was hooked up to. And one of the nurses was like, “Oh, you just got high blood pressure because of the work you’ve been doing at the firehouse. Once it goes down a little bit, we’ll send you on your way. You’ll be fine.” And I kept telling her, “Well, does it have anything to do with a chest cold?” Because I had pain in my lungs and it was getting quite severe. She’s like, “Oh no, that’s just because you’re doing extensive work, and it’s just your muscle’s sore.” And I’m like, “Well, a sore muscle doesn’t have anything to do with my breathing. Like, I’m having trouble breathing.”

So the other doctor that came in the room was like, “Oh yeah, we should look into it a little more.” And he’s like, “I’ll be right back. I’ll get you prepped for some tests.” Then another

doctor came in, and she was asking me some questions. And I was like, "Yeah, I had a pain—it was almost two weeks now. And it's like I'm having trouble breathing, and obviously now I got the extreme high blood pressure due to it, which I never had in my life." And she goes, "Oh, it fits the time frame." And I'm like, "Doc, what do you mean time frame? Time frame for what? Me coming in tonight?" She's like, "No, time frame for your vaccine." And I didn't mention anything then to the doctor. And I was like, "Well, what do you mean?" She said, "When did you get your vaccination?" I was like, "My second vaccination was September 13th." And she calculated in her head for a minute and she goes, "Oh, that's a few weeks off." That's right where—that lines up with what we see.

Criss Hochhold

What happened after that?

Kirk Desrosiers

And I'm like, "Well, what do you mean, what you see?" And she goes, "Well we're seeing people with blood clots." She goes, "Don't be alarmed. I'm going to do some tests with your blood and just check." And she said at the time, "We're going to check for a coagulation agent in my blood." So she drew my blood and I was nervous. Because when they took my blood before, it was in the cup pretty quick, the little tube, but this was like motor oil, like it was really thick. So I was kind of sweating nervous because of that.

So she came back with the tests with another doctor. And she's like, "Yeah, we're correct. You do have blood clotting agents in your blood." And then she said, "Don't worry about that. You don't have to be alarmed. Such per cent of people have that, but it doesn't affect them." I'm like, "Well obviously I'm being affected in some way." So she goes to the other doctor, "Let's get you in a wheelchair and we'll take you up to get x-rays." So I went and got a chest x-ray and then I came back to the room waiting for tests. And then another doctor I never saw came in with two other doctors and they were talking amongst themselves looking at the chart. And they said, "Yeah, we find there's some stuff in your lungs." I'm like, "okay." And they're like, "Yeah, blood clots." And then they didn't really give any other information on that.

And then the other doctor that was late coming in, they were obviously having a little chat, he said, "We got to get a CT scan." That's where you inject the dye into your body. So again they threw me in a wheelchair and took me up there. And I remember as I was going up, I was thinking to myself, "Well, this is crazy." Like, I was terrified. You go in somewhat not feeling all right, but it seems like it was getting worse as soon as I got in there. Because one of the doctors that was in the room was like, "have oxygen on standby." And I'm like, "Oh my lungs are going to collapse on me. I'm not going to be able to breath." But they put me back in the room. And each time I did a test, it was two hours. And then my cell phone died. So I was in the room for, all together, 15 hours without my partner and I couldn't contact her.

Criss Hochhold

Fifteen hours. They were running tests.

Kirk Desrosiers

Yeah.

[00:20:00]

So, after the doctors came back into the room, the one doctor that wanted the additional tests— I can't really explain the words that he used, it's from memory, but he said—

Criss Hochhold

Summarize it for us.

Kirk Desrosiers

He said, "extremely large quantity of blood clots in both my lungs."

Criss Hochhold

So you went from having a clean bill of health, testing to be a volunteer firefighter, everything is great

Kirk Desrosiers

Yeah.

Criss Hochhold

to all of a sudden severe issue with lung clots and within weeks of receiving the second dose.

Kirk Desrosiers

Within two weeks of the second vaccination. Yeah.

Criss Hochhold

Within two weeks of the second vaccine. What happened after that? Did they do further testing? Did they put you on medication, what happened?

Kirk Desrosiers

No. After they showed me the test and told me that, my partner, she was panicking. Finally, she called every floor, every office, every room, and one of nurses came in said, "you Kirk Desrosiers?" I'm like, "yeah." "Your wife's trying to get in touch with you, and we'll charge your phone." So they charged my phone. I talked to her and she was upset and crying, thought I'd died because my phone died and I told her I had blood clots.

Criss Hochhold

No answer, yeah.

Kirk Desrosiers

But they kept me in for another little bit. And they said, "Oh, you're going to be fine in a couple months. Just take the blood thinners. We'll get you in touch with hematology; everything's going to be fine." And I knew it wasn't going to be fine because one of the

doctors that was standing behind that doctor was just shaking his head, like, couldn't believe that the other doctor was telling me it's going to be okay. But after I talked to my partner, she was concerned that it had something to do then with the vaccine. Especially when the doctor said, before I even mentioned it: "It suits the timeframe."

Criss Hochhold

So do you know if the physicians that you were dealt with or your main physician there, did they enter anything into that, once again, this vaccine reporting system, to CAERS?

Kirk Desrosiers

Well, that was it. Tami told me to talk to them and I had the phone on speaker phone. And I said, "Well, the doctor knew." And obviously, I put two and two together just like that doctor. Like, this has something to do with the vaccine. All of a sudden, I got all these blood clots. So I asked the doctor that told me to go for the X-rays and the CT scan, I'm like, "Are you going to fill out the adverse reaction, that I had a reaction to the vaccine?" And his words to me was, "It takes too long, we're not going to do that here."

So they didn't fill out anything there.

Criss Hochhold

Okay. We're getting a little bit short on time, Kirk. And there's a lot more that we would like to get to, but I need to shorten it up a little if we can.

Kirk Desrosiers

Yeah.

Criss Hochhold

This happened in September of 2021. We are now in March 2023, a year and a half later. What have the long-term implications been on you since that incident at the hospital till today?

Kirk Desrosiers

I'm taking Xarelto. It's a high milligram of blood thinner. The specialist said, where it is affected through the vaccination, they have no idea how long I'll have to take these blood thinners—if it's only for a short period of time or if I'll have to take it for the rest of my life.

Criss Hochhold

So your specialist made the correlation to your blood clots to the vaccine?

Kirk Desrosiers

Yeah. The hematology department at the Dixon building put two and two together, filled out the forms and sent it off to, I think they said Health Canada, something like that. But I talked to them. I gave them the batch numbers and stuff like that.

Criss Hochhold

Okay.

Kirk Desrosiers

But I'm also taking now, because of that, two different types of medications for high blood pressure.

Criss Hochhold

How has this affected your quality of life?

Kirk Desrosiers

Till recently, I'd have to say I didn't have any quality of life. Since October 19th on, I'd say for the first six months after that, my health deteriorated so bad I was bedridden for six months. Couldn't do anything. That affected my mental health. I ended up putting on over 70 pounds I'm still trying to get off me because I'm not being active. Because talking too long or walking too long or doing anything: It's too much on my body. I can't breathe. My lungs are on fire. I'm sore to this day.

[00:25:00]

It's like someone's sitting on me all the time.

Criss Hochhold

It's a long road to recovery.

Kirk Desrosiers

It is, yeah.

Criss Hochhold

Because we have your spouse coming up as well, I'll leave some of the questions that I would have for you in regards to the financial hardship, I will pose those to her instead. Okay? Thank you, Kirk.

Kirk Desrosiers

Thank you.

Criss Hochhold

I'm going to see if the commissioners have any questions for you.

Commissioner DiGregorio

Thank you for your testimony. Just one question, and I hope you don't mind me asking: How old are you?

Kirk Desrosiers
Forty-three years old.

Commissioner DiGregorio
Thank you.

Kirk Desrosiers
Yeah. Thank you.

Criss Hochhold
Thank you, Kirk.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 3

March 18, 2023

EVIDENCE

Witness 12: Tami Clarke

Full Day 3 Timestamp: 08:21:20–08:36:23

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Tami Clarke, do you undertake and affirm that you will tell the truth, the whole truth, and nothing but the truth?

Tami Clarke

I do.

Ches Crosbie

Thank you.

Criss Hochhold

Can you please tell us your name? We know where you live, because of Kirk. Your name and occupation, please.

Tami Clarke

My name is Tami Clarke, and I'm a coordinator for Public Works.

Criss Hochhold

I'm going to do a continuation really, right from Kirk's testimony. Because you are his spouse and the significant health issues that Kirk had would have had an impact on you as well.

Tami Clarke

Yes.

Criss Hochhold

How were you affected by Kirk's health issues? I know it's a very broad question, but how were you affected? We can imagine the distress you went through at the time that he was at the hospital.

So I'd like to focus more on the time since then. How has that impacted you and your quality of life and your relationship?

Tami Clarke

I had to receive the vaccine, both vaccines, after he had his blood clots in his lungs in order to keep my job, so—

Criss Hochhold

I'll get to that.

Tami Clarke

Okay, so my quality of life in general?

Criss Hochhold

Yeah, just with Kirk. And then we'll talk, I want to get to that.

Tami Clarke

I'll wake up in the middle of the night to see if he's still breathing. I'm nervous to leave the house sometimes because I don't know if he's going to be okay. He's different because he doesn't socialize as much, or he's not able to do the physical things that he'd like to do or talk for long periods of time.

Criss Hochhold

What impact does that have on you and your relationship?

Tami Clarke

I feel overwhelmed. I feel anxious. I feel depressed. And I feel alone.

Criss Hochhold

Tami, who were you working for when Kirk received his vaccines? Who was your employer at that time, do you remember?

Tami Clarke

The Province of Nova Scotia.

Criss Hochhold

In what capacity, what department for the Province of Nova Scotia where you working at?

Tami Clarke

Education and Early Childhood Development.

Criss Hochhold

When the requirement came out for the vaccine, bearing in mind that Kirk had effects from the vaccination, what were your thoughts to the vaccine requirements?

Tami Clarke

I didn't want to have that vaccine.

Criss Hochhold

Did you reach out to your employer and see regarding those mandates? Did you send any emails or letters?

Tami Clarke

No, I didn't. I just asked my director at the time if there was any exemptions for someone who would feel traumatized by taking a vaccine that their partner had that affected them so much.

Criss Hochhold

Did you send an email on November 19th to the NSGEU [Nova Scotia Government Employees Union] asking the union not to mandate vaccines?

Tami Clarke

I did.

Criss Hochhold

What was the response to that?

Tami Clarke

They said as long as the employer has a policy that clearly states what they're going to do about vaccines, that that was all they were going to require.

Criss Hochhold

The contract that you have, the Province and your role with the Department of Education, did that have any mention of vaccination requirements?

Tami Clarke

It did not.

Criss Hochhold

What was the reason given by your employer for requiring employees to be vaccinated?

Tami Clarke

So that we didn't spread COVID-19 to others.

Criss Hochhold

I'm just going to think about what specifically was your role within the Department of Education.

[00:05:00]

I know you said educator, but can you be more specific? Can you elaborate on that please?

Tami Clarke

I was a coordinator for the transcripts and international programs. I was only dealing with the people in my group, and there was three of us all together and no members of the public whatsoever.

Criss Hochhold

So you had three of you working together as a group in an office setting.

Tami Clarke

Yes, in an office of three to four hundred people approximately.

Criss Hochhold

But how many for you, you said in a group of three?

Tami Clarke

Just three for us in my division, specifically.

Criss Hochhold

Okay.

Tami Clarke

Including myself.

Criss Hochhold

So there was really no reason given for them why they required the vaccination other than nothing at all? No reason other than just that you need to get this done?

Tami Clarke

It was just so that we don't get COVID-19 or spread it to people around us. And that we are civil servants, so we are the people who the province would look to for direction, I suppose.

Criss Hochhold

Did you seek an accommodation for a vaccine? I know you sent an email off to the NSGEU regarding asking them not to implement the mandates, but did you send any correspondence asking them for an accommodation?

Tami Clarke

No.

Criss Hochhold

How come?

Tami Clarke

I had people who I knew that were in my department and otherwise that had asked for accommodations, well, an exemption to the vaccine for religious reasons and reasons that were much worse than mine. Heart conditions and things like that. And they were all denied, so I didn't bother to go that route.

Criss Hochhold

So no accommodations or exemptions at that point then, you thought.

Criss Hochhold

So you felt you had choice in regards to getting a vaccination, for your employment?

Tami Clarke

My choice was either be vaccinated or be unemployed with no income.

Criss Hochhold

Which route did you choose?

Tami Clarke

I chose to be vaccinated.

Criss Hochhold

How did you feel about that decision?

Tami Clarke

I felt like my autonomy was taken away. I felt like I didn't have the freedom to choose what chemicals were in my body. And I felt like I was taking a drug that hadn't been tested and that I could die or have something that's long-term like Kirk.

Criss Hochhold

So you were scared.

Tami Clarke
Oh yeah, yeah.

Criss Hochhold
How long after—I guess to put it in perspective, with Kirk's health issues—did you go through this?

Tami Clarke
How long did I go through—

Criss Hochhold
When Kirk had health issue side effects, how long into his side effects, into his health issues, before you had to make a decision to get vaccinated? Is this early on after his vaccine injury?

Tami Clarke
It was about a month.

Criss Hochhold
About a month. So quite fresh.

Tami Clarke
So in November, I had to be vaccinated with my first vaccination and his condition was diagnosed in October, October 19th.

Criss Hochhold
So weeks, barely. Do you remember where you got the vaccine?

Tami Clarke
Yes. At the Independent Grocer in Hubbards, Nova Scotia.

Criss Hochhold
Do you remember who administered it to you?

Tami Clarke
I don't know her name, but I could find it. I think there's only a staff of under five there.

Criss Hochhold
Perhaps, do you know what the role was, a pharmacist?

Tami Clarke

Yes, a pharmacist.

Criss Hochhold

Were you advised of any risks?

Tami Clarke

Yes, I don't remember what they were. It was a short thing that they sort of did; I think it may have been a page. It was quite quick. Your choice was either say yes or don't have the vaccine.

Criss Hochhold

Just like Kirk, you're a young lady. Given your age and your health, did they do a personal risk assessment on you, from the pharmacist's perspective, in terms of a need of a COVID vaccine?

Tami Clarke

No, I do remember filling out a form prior to getting the vaccine that was a government form asking if I had any autoimmune issues. And I did tell them that I have Graves' disease, but they knew that. So I informed the pharmacist, without prompting, that I have that. And she said I was fine, good to go.

[00:10:00]

Criss Hochhold

No issues.

Tami Clarke

No.

Criss Hochhold

Do you remember which date you received the vaccines?

Tami Clarke

I received my vaccine on November—the first one, November 24th, 2021.

Criss Hochhold

Do you have a lot number with you as well?

Tami Clarke

Yes, it's FF5109.

Criss Hochhold

Did you have any symptoms, any signs, anything going on after your vaccine?

Tami Clarke

I felt traumatized by the vaccine, so it would be anxiety and—yeah.

Criss Hochhold

Any side effects from the vaccination other than the mental health side, the anxiety, the depression, potentially?

Tami Clarke

No.

Criss Hochhold

Thank you. You had to take a second vaccine as well.

Tami Clarke

I did. In order to go back to work again, I needed a second vaccination.

Criss Hochhold

And you received that when?

Tami Clarke

January 18th, 2022.

Criss Hochhold

Do you have the lot number for that as well, please.

Tami Clarke

Same. FF5109.

Criss Hochhold

Same lot number.

Tami Clarke

It was.

Criss Hochhold

About six weeks apart. Any signs of symptoms regarding the second vaccine?

Tami Clarke

Other than the feelings of anxiety and trauma, no.

Criss Hochhold

Tami, we only have a few minutes left, but I want to dig just two things. I cannot imagine what you went through. How did it make you feel having to go get a vaccination, knowing that your spouse had a significant vaccine injury? And your employer was unwilling to listen and nor apparently was the Province. How did that make you feel?

Tami Clarke

Horrible. I feel like there's no trust. I feel like there's a broken system and I am just a number. I don't feel like there's a human side of things and there was an agenda and it was just the agenda and not me. And, yeah.

Criss Hochhold

How were you guys affected financially with all this? Because Kirk is not able to work at this point in time. But I wanted to run over it if that's okay.

Tami Clarke

He had to go on unemployment insurance at first and then, in between unemployment insurance and the benefits from his workplace for disability, there was 120 days of no income whatsoever for Kirk. And for me, I was on short-term illness as long as I could be through my employer, but then it would go down to 70 per cent. And I was able to—I had to go back to work at that point. So we've had to determine which bills to pay. If we can afford to eat the same way. If we can visit our family at Cape Breton because we can't afford gas. Just lots of decision-making that we never had to make before.

Criss Hochhold

You've been able to find employment a little closer since then. Has the situation improved over the last little while? Is there a light at the end of the tunnel for you?

Tami Clarke

I'm closer to my home, so I don't worry for Kirk as much. Now that I have a new employer, I feel like they understand that sometimes I have to work from home if Kirk isn't feeling well because I just want to make sure that I can take him to the hospital if he needs to go. Yeah, I feel like it's a more positive workplace.

Criss Hochhold

So you have an employer that actually accommodated you needs.

Tami Clarke

Yes.

Criss Hochhold

We are slightly over time, so I'll stop my questions now. But I'll see if the commissioners have any questions. No?

Tami, thank you very, very much. I really appreciate you.

Tami Clarke

Thank you.

NATIONAL CITIZENS INQUIRY

Truro, NS

Day 3

March 18, 2023

EVIDENCE

Closing Statement: Ches Crosbie

Full Day 3 Timestamp: 08:36:25–08:47:16

Source URL: <https://rumble.com/v2dou14-national-citizens-inquiry-hearings-truro-day-3.html>

[00:00:00]

Ches Crosbie

Commissioners, that concludes the evidence for this first stage of three days of hearings here in Truro, Nova Scotia. There will be the next segment of hearings that's going to take place March 30th to April 1st in Toronto, Ontario. And in total, there will be nine [sic] sessions of the National Citizens Inquiry.

And I just remind everyone, folks in the room and everyone watching out there—those who may hear about the proceedings on social media or otherwise through their networks—this is a National Citizens Inquiry. It's about you, and it's for you. It is your inquiry. It therefore requires your interest. It's working for you. It's working to vindicate you. It's working to give you a voice, but it also requires your support. And I know that we all here at the National Citizens Inquiry thank you for all the support given so far, and we will need more as we travel across the country.

Commissioners, you did ask me to make a very short set of concluding remarks here, or summation based on the three days of hearing, and I'll do that. And the way I'd pull this together is, we heard basically three major themes coming out. One is fear, the other is truth, and the third I would call safety.

There's some overlap between fear and truth as themes because what we've heard about is **that the truth has been perverted and sometimes outright lies told. Outright lies have been told—big lies, but there are also smaller lies involved with exaggerating data. For example, there's Linda Adshade's testimony. She had access on a frequent basis, weekly basis, to the spreadsheets reporting the positive testing. And remember, the testing at 40 cycles: you're getting a lot of false positives there, so even the testing results were in a sense a lie to start with. But even built on top of that lie, she discovered, was a 25 to 30 per cent larger lie because what public health and the authorities were reporting to the public was exaggerated beyond what was stated in black and white in their own data, on their own spreadsheet. That's lying.**

Fear: Jordan Peterson told us that our leaders panicked and adopted a repressive authoritarian Chinese model for how to deal with this apparently new virus that was on the

go. They adopted an authoritarian communist model of how to deal with it out of panic and fear. And then they used fear to manipulate public opinion, to impose tyranny. Those are his words.

And Commissioners, I submit to you that what we've heard from many people in these hearings in the last three days shows us that this tyranny imposed from above by the leadership of the country—provincial, federal—resolved itself into smaller group tyrannies, group cruelties, and group punishments in the workplace and even in hospital emergency rooms and in the health care setting, where that should never, ever occur.

We heard from Shelly Hipson—her work extracting or crowbarring, or somehow or other, extracting data from various government departments—that, contrary to what we were told, that the hospitals were under tremendous pressure from COVID cases, that they were no more than 1 per cent of all hospitalizations. We've heard continual anecdotal evidence from the physicians who testified that they were waiting for COVID cases and went for stretches, even for a year and a half or two years. No COVID patients.

[00:05:00]

Yet we were told something different, weren't we? Why was that? Because the authorities wanted to perpetuate and inculcate fear in the public, in the citizens, in you, and to use that fear, as Peterson said, to use that fear to impose tyranny—tyranny on Canadians.

There were many smaller untruths or manipulations of the truth. For example, one you could call the sucker punch. And we heard a teacher today, Katrina Burns. She was told by her school board: even if you were entitled to obtain an exemption, we still wouldn't give it to you.

Now, on safety. I have to wrap this up, Commissioners, because it's late in the day and it's on a Saturday. But very briefly, Dr. McCullough told us 17,000 deaths are recorded in VAERS [Vaccine Adverse Event Reporting System]. And of course, he also indicated and others have said, and it's generally known that VAERS only records— A small percentage of the total actual number of adverse events get reported to VAERS. That's the US database for adverse events. And he told us that 5, 10, no more than 50 deaths, and even a large vaccine program in the past, has been deemed not safe and not effective and withdrawn. And yet, we have in the United States alone 17,000 deaths. That doesn't include—for the most part, Canada or countries outside the United States.

And Commissioners, we stopped AstraZeneca at one serious adverse event in 55,000. One in 55,000. We heard from an expert whose reanalysis of the data in the Pfizer and Moderna trials turned up a one in 550 serious adverse event rate. One in 550, and yet AstraZeneca was withdrawn at one in 55,000.

What is going on here and where are the heads of our leaders? Do they know what safety means? And yet they continue the rollout and the promotion of the mRNA product. But not just that. We heard from Dr. Braden, and she called it "abhorrent," I'm quoting her words, "abysmal," the quality assurance and quality control systems in place, or non-systems in place, for the manufacture of these injectable products, the mRNA products. They're not just deficient, incomplete RNA: They're heavily contaminated with truncated mRNA; double-stranded DNA; circular plasmids, which are replication competent, in other words, they can reproduce themselves; potential endotoxin producing *E. coli*; and DNA with a high rate or potentially entering the human genome through cells, in particular, with high rates of division.

Now, I don't know about you out there, but to me, that sure doesn't sound like something people should be getting injected into their bodies. Abhorrent and abysmal quality-controlled substances with unresolved issues, untested issues, and potential horrific consequences—not just in this generation but in succeeding generations.

And so, Commissioners, after three days of evidence, this is where we are and this is where the evidence rests. We'll hear more, I'm sure, in Toronto. Hopefully we'll hear from the authorities because we've sent out summonses to them: the public health officers, the politicians, those who've been telling us and repeating the safe and effective mantra for how long now? Years.

[00:10:00]

We've asked them to come and explain themselves and explain why this is safe and effective, and why they did the various things that they did. Why they perpetuated mask mandates, which by the way are still in effect we've been told, in hospitals here in Nova Scotia. And a vaccine mandate still in effect to work in hospitals here in Nova Scotia, which everyone now admits, including the makers of the vaccines, do not halt transmission or infection. Why?

Commissioners, on the face of the evidence we've heard so far, this is madness. I rest.

[00:10:51]

VOLUME THREE

| Witness Transcripts

Part 2 of 9: **Toronto, Ontario**

NATIONAL CITIZENS INQUIRY

EVIDENCE TORONTO HEARINGS

**Toronto, Ontario, Canada
March 30 to April 1, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 1

March 30, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 1 Timestamp: 00:39:54–00:56:14

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Commissioners, my name is Buckley, initial S. I'm attending as agent this morning for the Commission administrator, the Honourable Ches Crosbie. I do apologize that we're starting a little late today, we had some technical difficulties. I would like to address the people that are attending online, just to describe the NCI to them, and then I would like to inform you of how we're going to proceed today. And then just turn it over to you, if you have any comments before we call our first witness.

So for those that are watching online and are not aware of the National Citizens Inquiry, we are a citizen-organized and -funded group that just had this vision of marching across the land with a set of independent commissioners to inquire into how all levels of government handled the COVID-19 pandemic, with a view to getting to the truth, and with a view to permitting ordinary Canadians to tell their stories and start a healing dialogue in this nation. We are totally citizen-funded; we have no large donors or anything like that. It costs us probably about \$35,000 per hearing. So I'm going to invite everyone online to visit our website and to donate and keep this marching across the land.

I'd like to just turn then, Commissioners, to the witnesses that we have for you today. We have a set of expert witnesses that are quite diverse. We're going to be dealing with some medical issues today. We are going to be dealing with some scientific issues. We're going to **be dealing with some drug approval issues with a particular regard as to children. We're going to be calling an economic expert today.**

Some of the evidence that you are going to hear from these experts you are going to have difficulty believing; and the difficulty is not that you don't believe the experts. You're going to find the evidence difficult to believe because you do believe the experts are telling the truth. More importantly, we have a host of ordinary Canadians that have been brave enough to take the stand. And I have to report to you, Commissioners, that we had a number of lay witnesses back out of testifying out of fear. And that in itself is real-time evidence of the fact that, in Canada, people are still afraid to basically speak out against the government narrative, even if it's just sharing their own experience. And I hope you understand that the witnesses that have backed out from testifying had applied online to

the National Citizens Inquiry website seeking to qualify as a witness. They got through—we get so many applications that only handful get through our initial sorting process. They got through that process and each one that backed out had been interviewed at least twice by two different interviewers, and then late at the day: they were too afraid to attend today, and on the next two days, to give their testimony, because they were afraid of retribution. Some were afraid of losing their job, some were afraid of social pressure from their families and friends. And again, that speaks as evidence of just how divided we are.

And that got me thinking, because some of us have thought—you know, we've been divided into camps of the vaccinated and the unvaccinated, but I think it's more nuanced than that. I think it's really a division between people that trust the government and trust the mainstream media, that are supposed to be competing with each other, but surprisingly speak with one voice in echoing what the government's position is. And so we have a group of Canadians that trust the government narrative, and we have a group of Canadians that are skeptical of the government narrative. And what has flown from that is that those that trust the government narrative have tended to become vaccinated and those that don't trust the government narrative have tended to avoid vaccination where they could. And so when we think of the camps of vaccinated and unvaccinated, again I think it's more nuanced than that.

And I came to a realization as I was preparing to call witnesses for these proceedings, because I was interviewing witnesses that were vaccinated.

[00:05:00]

And I was interviewing witnesses that were unvaccinated. And the thing that struck me was how absolutely identical they were. I'm going to ask everyone watching to have an open mind because actually having an open mind is a decision. And if you have ears to hear, I'm going to ask that you hear. Because I think it will help us heal going forward if we understand that we actually have all had the identical experience.

So let me speak about the experience of the unvaccinated. I understand there's a whole myriad of experiences, but I think it's fair for us to say that a large number of people that we would call unvaccinated, or a large number of people that wanted to be unvaccinated but became vaccinated because they had no choice, they were coerced: this group believed that the vaccine was dangerous. They believed it was dangerous to themselves. They believed that it was dangerous to their loved ones. And when I say dangerous, I'm referring to literally an existential threat. I mean these people believed that they might die or be seriously harmed, or their loved ones, like their children, might die or be seriously harmed if they took the vaccine. Now, normally in Canada you wouldn't worry about having to take a treatment that you thought might be dangerous to you. But what happened was, the government did everything at every level—did everything that they could, with the aid of the media, to coerce the people that did not want to take the vaccine into taking it. And the vaccinated participated in that coercion.

I'll say that again: the vaccinated participated in that coercion. There was tremendous social pressure. Business owners made it a mandatory requirement to have vaccination. We put pressure on friends and families that are still divided to this day. So understand from the perspective of the people that we'll call unvaccinated, you became a threat to them. They were faced what they felt was a life-and-death crisis for them and their families. And if you want to get people, especially parents, very concerned and very emotional, you put their children at harm's way. So they had the experience—and we're just talking about the experience of both sides, understanding the experience—they had the experience of

facing a life and death situation, where the vaccinated were putting pressure on them and their families, and they felt threatened. They felt fearful. And then resentment came, and then hatred.

Now, let's talk about the experience of the vaccinated, because it's identical, except for the belief. But the experience itself was identical. And again, I understand that it will be a whole range of experiences and belief. But it's fair to say that a large group of vaccinated persons believed that COVID-19 presented a serious risk to themselves and to those important to them, including their kids. And when I say serious risk, they believed that they were at risk of death or serious harm, or their loved ones were at risk of death or serious harm. They were fearful. This was their belief. And then along comes the vaccine, literally like a messiah: it was their salvation. And it was put forward as a salvation. We have this crisis. We have this threat of death and serious harm, but we have the solution. We have a vaccine. If only, if only everyone would take it, we would be safe. But there was this group of people who we called unvaxxed, which in itself is a pejorative term. Our Prime Minister had some more colorful adjectives that I won't use.

But we had this group, this tinfoil hat-wearing, selfish, conspiratorial group that would not play along.

[00:10:00]

We would all be safe if we would get the vaccine, if we'd all do it, but this group wouldn't. So this group, in the eyes of the vaccinated, posed a serious threat to their personal safety and the safety of those important to them, like their children. And they were fearful. They were afraid. They became resentful, and they became hateful. They had the exact same experience as the unvaccinated had.

I think it would bode us well to understand, as divided as we are, that we've all had the exact same experience, and we absolutely need to come together. And that's part of what this National Citizens Inquiry is intended to do. We've experienced, with witnesses dropping out, that this division in Canadian society, this need to follow the government narrative, is still strong. Not long ago, we considered ourselves a country that cherished free speech. But there is an area of speech—because we still have free speech in a lot of areas—but where we don't have free speech, where your speech has a cost, is if you are now going to go against or participate in any activity that goes against the government narrative. And I think we need to understand that as long as we take that position, we're going to remain divided. Because that's what's dividing us.

It's somewhat appropriate that our first witness this morning is a Mr. Rodney Palmer, who is a former journalist and is going to be speaking to us about matters of journalism. And before we get to Mr. Palmer, we're going to watch a video clip of some of the news that in Ontario we would have experienced. Just to kind of bring us back, back in time, back to remember why we're here at the NCI now.

But before we do that, before we go into that clip, I'm just going to turn it over to the Commissioners, in case they have any opening comments or directions before we proceed.

Commissioner Massie

Good morning, everyone. My name is Bernard Massie, and I'm a scientist by training. As I mentioned at the Truro hearing, I decided to get involved in this exercise for a number of reasons. But if I want to summarize, the way I would frame it is that we human beings live

in a narrative. And the narrative is a kind of low-resolution representation of nature and reality. And the further the gap between the narrative and the reality grows, it has major consequences on our overall health and mental health. And what I found over the past couple of years was that the gap was really, really seriously big. And with my colleague Commissioners, I decided to get engaged in this adventure to try to write a new narrative, which we hope will be closer to reality. And from there, we can build a new reality, a shared understanding of the world we're living in, and live in a better, I would say, harmony with nature and our fellow citizens. Thank you.

Shawn Buckley

And I wasn't requiring the commissioners to all speak if they don't need to. Just if you had any opening comments.

Commissioner DiGregorio

I'd just like to thank you for your opening comments and reaffirm that we are here to hear Canadians, and to follow the truth and the evidence wherever it leads us, and keep an open mind.

Shawn Buckley

If we can start with that video and just bring us back to some of the things that we witnessed in Ontario while we were going through the COVID crisis.

[A video clip was played with Global News footage announcing the first cases and deaths relating to COVID-19 in Ontario. Transcripts of the audio content are below.]

[Video Clip] Global News reporter

Thursday, he was taken to Sunnybrook, where he was quarantined. At a news conference late this afternoon, Health Minister Christine Elliott said all of this should give people confidence that the system works:

[Video Clip] Christine Elliot, Minister of Health

"The patient was detected and immediately put in isolation. Lab tests were conducted and at the earliest signs of a presumptive positive case, Toronto Public Health launched extensive case and contact management to prevent and control further spread of the infection."

[Video Clip] Global News reporter

Toronto Mayor John Tory said in a statement: "Toronto Public Health is continuing to work closely with provincial and federal health colleagues to actively monitor the situation and respond as appropriate."

[Video Clip] Dr. David Williams, Chief Medical Officer of Health

Today, also, I'm sad to announce that we've had our first death [inaudible] related to COVID-19. And that tells us that, you know, while we haven't had any so far, it is a possibility we have been expecting to deal with during this time. So it's not unexpected. But it's still a person, the family and friends, and have our condolences onto the family and that. Because it still is a loss. And sometimes in some of these large events, we lose track of that. We want to make sure we remember that. Also, the number of cases in Ontario has risen rapidly. And over the weekend, we noticed that the cases moved from—almost doubled from 70 up to 80 up to 170. And that was a rapid rise.

[00:16:19]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 1: Rodney Palmer (Parts I and II)

Full Day 1 Timestamps: 00:56:18–01:50:53/08:37:09–08:54:18

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

PART I

[00:00:00]

Shawn Buckley

I'd like to call our first witness to the stand. It's Mr. Rodney Palmer. Mr. Palmer, can I have you state your full name for the record and then spell your first and last name?

Rodney Palmer

My name is Rodney James Palmer and its R-O-D-N-E-Y and the last name is P-A-L-M-E-R.

Shawn Buckley

Mr. Palmer, do you promise to tell the truth, the whole truth, and nothing but the truth?

Rodney Palmer

I do.

Shawn Buckley

Now, my understanding is that you have worked as a journalist in Canada for 20 years.

Rodney Palmer

Yes, I've been retired for about as long, but yes, I did. I worked very intensely as a journalist here in the country for a number of media outlets.

Shawn Buckley

And that includes being a general assignment reporter for *The Globe and Mail* newspaper.

Rodney Palmer

Yes.

Shawn Buckley

And you worked as a daily news reporter at the *Vancouver Sun*.

Rodney Palmer

I did.

Shawn Buckley

You worked as a producer and investigative reporter at CBC Radio and Television.

Rodney Palmer

Yes.

Shawn Buckley

You were the foreign correspondent and bureau chief for CTV News based in India, then Israel and finally in China, based in Beijing.

Rodney Palmer

Yes.

Shawn Buckley

Can you tell us about your involvement in reporting on the SARS outbreak in China? Because my understanding is you were there at the time.

Rodney Palmer

I lived in Beijing and worked for CTV News every day, and that's when the SARS epidemic broke out. I followed it extremely carefully. I went to weekly briefings with the World Health Organization. I went to weekly briefings with the China Foreign Ministry and we attempted to cover the story as best we could from there.

One of the significant stories that I worked on was the virus hunters. I thought this was a great phrase. What's a virus hunter? And this is a group of academic experts that come into a situation like SARS when it starts. And China allowed them to get as far as Beijing but they wouldn't let them come to Guangzhou, where it was believed that was the patient one. And what they were trying to find was patient one.

So I had a little bit of experience with epidemics, pandemics, when COVID started. And I started noticing that it was extremely different. I was watching it very carefully as the news was trickling out of China. It hadn't come to Canada yet but, when they shut down Wuhan, I knew that it was very, very different. This was something that had not occurred before.

Shawn Buckley

Now, I'm going to skip over, unless we have time later on, about your involvement with reporting on biolabs in Canada. But you've been asked to testify about the standard process of newsgathering versus propaganda at the CBC, and I'm wondering if you can tell us about that this morning.

Rodney Palmer

So to begin my presentation?

Shawn Buckley

Yes, please.

Rodney Palmer

I started noticing that something very different was happening at the CBC because I'm familiar with the process. I wanted to talk today specifically about the CBC, although what I'm about to say goes for most media, news media, in Canada. But the CBC is very different. If you're the *Toronto Star* or CTV News or any private entity, Global News, and you want to publish something that maybe isn't true or you want to take the position of a pharmaceutical company, you can do that. If you want to trick your viewers into believing something that isn't true, there's really nothing to stop them from doing that. However, the CBC is a public entity. We pay for it. It broadcasts on the public airwaves, and we expect them to tell us the truth because they've done it for 50 or 60 years.

So what I started noticing was something very different. About a week, maybe two at the most, into the emergency, there was a story on "The National" by Adrienne Arseneault, one of the greatest broadcasters we have, a national treasure. Adrienne has a particular ability to appear to be discovering the facts in the moment, even if it's take-20. She can do it every time. She's a genius at what she does. But she turned this ability against us.

I saw a piece on the 4th of April where she opens up and she's looking at her phone and she says, "What do you do if this happens? Somebody sends you a family text, say it's your father, and he thinks that the virus was manufactured by China." This is on April 4th, 2020. It says 2023 on the slide. That's incorrect. It was 2020. And I thought, well, wait a minute. How do you know it wasn't manufactured in a lab in China? What evidence does the CBC have 20 days into this, or 15 days into this, that this was not manufactured in a lab? There was an assumption that she put forth instantly. And then she went to an expert guest who said, "Well, don't embarrass your father. You'll just push him away."

[00:05:00]

You've got to bring him in and you've got to kind of convince him. And I thought, well, I'm a father. Who are you speaking to? You're telling my children not to believe their father. I have some expertise and some experience in this particular field. And I thought it was shocking that the CBC was trying to get in between me and my children. And the expert witness was from an organization called First Draft. And she simply says, "I'm from First Draft. We're a non-profit that helps people navigate misinformation on the media". And I think of non-profits, I think of the Cancer Society, the Diabetes Society. I don't think of a group of people who are attempting to change the minds of strangers from believing things that they don't want them to believe. I thought that was all very odd.

So I looked into First Draft and I saw that this organization was developed, and is developing, “new techniques and methodologies for investigating online spaces. Our latest approach revolves around the concept of recipes. As with food recipes,” says their website, “these steps give directions to investigators” or to reporters. So they give samples of what you can do. They say, “here’s an Investigation: How anti-vaccination websites build audiences and monetize information.” This is two weeks into the emergency. “Here’s the Recipe: how are these anti-vaccination websites funded?” Investigate the ad trackers with Gephi and DMI tracker tool. Now these are tools that they provide to, apparently, the CBC. Now there was a story that circulated later about anti-vaccination websites on Marketplace and how they make their money. So this First Draft group is now feeding the CBC their stories.

A second example: Pro-Russian networks are driving anti-Pfizer vaccine disinformation. Now, I don’t know why the CBC has to get behind Pfizer, which has paid out the largest criminal settlement in the history of American justice, but this is what this organization is saying: “Don’t be against Pfizer. The Russians are behind it.” The recipe was: “Track misinformation across platforms such as 4chan, 8kun and Reddit.” So they’re even telling them how to go after them, where to go after them. They’re directing the CBC. I was astonished that this organization was put forth as an expert on how to not believe your father, but not embarrass him at the same time. So this to me had nothing to do with newsgathering.

Ten days later, after the CBC did that story, the *Washington Post* did some real journalism. They pointed out that the State Department cables were sent from the US Embassy in Beijing to Washington in 2018, warning about the Wuhan Institute of Virology, that it was unhygienic. And in particular, they said there was “a serious shortage of appropriately trained technicians and investigators needed to safely operate” the Wuhan Institute of Virology. This is January 2018. And there were two cables sent, and the reporter saw one of them. “The first cable, which I obtained,” he says, this is Josh Rogan from the Washington Post, “warns that the labs work on bat coronaviruses, and their potential human transmission represented a risk of a new SARS-like pandemic.”

So not only at the moment when Adrienne Arsenault was telling you, “Don’t believe your father if he thinks it came from a lab,” it was not only probable that COVID came from the lab, but it had been predicted that it would happen two years prior by the US government. So how does Adrienne Arsenault say it wasn’t and don’t believe anyone, including your family?

Flash forward a year: *Vanity Fair* magazine, which is known for its excellent investigative reporting, published an extremely long and exhaustive piece where all they did was go online and look at publicly available scientific papers going back about a decade.

The first one in 2013 was by Shi Zhengli, who’s the director of emerging infectious disease at the Wuhan Institute of Virology. She’s known as the bat lady, and this is not a derogatory term. Actually, her scientist friends started calling her that because there was an outbreak of a SARS-like respiratory virus in a mine, and the miners died very, very quickly. And she is documented to having gone to that mine, scraped the bat guano off the mine, and brought it to Wuhan to examine.

In 2014, she began publishing about the coronavirus from Chinese bats. In 2015, there was another paper that *Vanity Fair* found where Shi Zhengli discussed successfully inserting a protein from this Chinese horseshoe bat virus into the SARS virus of 2002, creating a brand-new infectious pathogen. In 2015, this scientific paper was published.

[00:10:00]

***Vanity Fair* found it online. CBC could have found it, but they were too busy telling you don't trust anyone who believes this.**

In 2019, there was a paper actually published by one of the lab directors at Wuhan, outlining the safety deficiencies in the Wuhan lab where he worked. And in 2019, right around the time that the US government, the US embassy in Beijing was warning Washington about a potential SARS-like pandemic leaking out of this unhygienic lab, a number of the Wuhan lab scientists published a paper together describing genetically engineered rats that they had grown with humanized lungs and developed them in the Wuhan lab.

So this is a pretty hot smoking gun coming out of the Wuhan lab. There are three labs in the world working on coronavirus, according to the *Vanity Fair* investigation. Two of them in the United States, one of them is in Wuhan. If this thing started at a wet market outside the Wuhan lab, it was because one of the staff members of the Wuhan lab walked into the wet market and brought it there. That is the most likely scenario.

Now flash forward to this month, March 2023, US FBI Chief Christopher Wray says that China lab leak was most likely. The quote is, "The FBI has for quite some time now assessed that the origins of the pandemic are most likely a potential lab incident." So the CBC had no evidence that it wasn't. They wanted you to believe that it wasn't.

There's a definition of newsgathering, and you'll see interestingly that "newsgathering" is one word in the English language. It's not two words as it appears that it should be. And that's because it's very specific. It's the process of doing research on news items, especially ones that will be broadcast on television or printed in a newspaper.

Now, how much research was done by the CBC to determine, 10 days after the emergency, that it didn't happen in a lab? Another definition here is propaganda: "Persuasive mass communication that filters and frames the issues of the day in a way that strongly favors particular interests, usually those of a government or a corporation. Also, the intentional manipulation of public opinion through lies and half truths and the selective retelling of history." This is what was going on in that piece. That's why it felt so wrong to me because there was no news involved. There was only propaganda.

What the *Washington Post* did with its lab leak theory story, 10 days after the CBC said it wasn't from the lab, was newsgathering. It was investigative reporting. What the CBC did when it said, "don't trust your family if they think it came from a lab," that's propaganda. That's the difference in the definition of those two things.

The *Vanity Fair* piece: reviewing scientific publications for a decade, uncovering the fact that human lungs were engineered on rats in Wuhan lab in 2019 just before the outbreak, is newsgathering. Exceptional newsgathering, I'm jealous of how good that newsgathering was. What the BBC did reporting on the FBI, saying they've known for a long time that it came from the lab, was newsgathering. That's kind of news of the day, daily news. They said it. We're telling you they said it. What the CBC did by warning Canadians not to trust their fathers about a lab leak theory was propaganda.

March 4th, 2021, about a year after the emergency, the editor in chief of CBC News, Brodie Fenlon, wrote on his blog: "A recent survey found that about half of Canadians think journalists are purposely trying to mislead them." Well, that's because we're on to you. At

least half of us pay attention to our gut and we know that you are purposely trying to mislead us.

But Mr. Fenlon said that CBC is going to correct this. To promote trust in journalism, the CBC has joined four organizations. I didn't know that they joined these organizations until I began to look into this a little bit. One of them is called the Trusted News Initiative, which is designed to filter news through its own "Trust Filter System." Another one's called the Journalism Trust Initiative. It's basically the same name, but this one does more or less the same thing. Another one's called the Trust Project, and then Project Origin. Notice that none of these organizations have the word 'truth' in them. If you tell the truth consistently, trust is automatic. If you don't tell the truth consistently, you have to say things like, "please trust me."

I'm just going to quickly outline what these things are, because they're all basically the same thing. The Trusted News Initiative and the CBC announced together on the 27th, prior to the Adrienne Arseneault piece,

[00:15:00]

that CBC and Radio Canada are "joining an industry collaboration of major media and technology organizations to rapidly identify and stop the spread of harmful coronavirus disinformation."

I think the pandemic really started in China about four months prior to this, and four months prior to an unknown virus killing so many people, there is no disinformation. The scientists among our commissioners will tell you there is only information, and all information is critical at the beginning—particularly at the beginning. So immediately, they were in a position of pushing one side of the story. Stopping misinformation means censoring, censorship, pure and simple.

The Journalism Trust Initiative, a second organization that they joined, is run by an outfit called Reporter Sans Frontières, Reporters Without Borders. And when I was working as a correspondent in the Middle East, Reporters Without Borders would take the side of, say, a Syrian journalist who was writing something against the dictator Hafez al-Assad and maybe had been imprisoned, and they were trying to bring the attention of the world to this imprisoned journalist. That's the kind of excellent work this group did.

In 2020, it shifted completely to start something called the Journalism Trust Initiative, starting an algorithmic indexing based on their criteria to improve your revenues. Meaning if you run your news organization through their filter, they'll make sure that it gets up to the top of the Google page, so you'll get more clicks and more money will improve your revenue. **There was an incentive there.**

Project Origin is another one that is a collaboration between the CBC, the BBC, the New York Times, and Microsoft. And one of these organizations is not a news organization, it's a tech organization. One of the things they talk about here is that the "technical provenance approach, in conjunction with media education and synthetic media detection techniques" to help "establish a foundation of trust." Not truth, trust is what they're looking for.

One of their tools is called "The power of the machine—harnessing AI to fight disinformation." I can only surmise from this that Microsoft is using AI to identify anybody speaking words that they want to identify as to be censored or call misinformation, label misinformation, so you will agree with their censorship.

The next one is called the Trust Project. Now this one is largely tech. Craigslist, Google, Facebook, and Microsoft are involved, again, "Helping tech support trustworthy news." Helping tech. What do we care about tech and truth and news? How are they together all of a sudden? "We stand for integrity." They say: "Look for our 8 Trust Indicators. We built the trust indicators." So they have listed— All they have to do is tell the truth, they don't need no eight trust indicators. And interestingly, Google, Facebook, and Bing all use the trust indicators in display and behind the scenes. So somehow, they are censoring it before it gets to you.

These are the members of the Trust Project. Now, this goes way beyond the CBC. *The Globe and Mail* is also in there. CTV is a member. *The Walrus* magazine in Canada is supposed to be an independent thought magazine; they're part of this project. The Canadian Press. I put this up there to let you know that it is not just the CBC. The reason they all sound the same is because they're all part of this trust campaign.

But the CBC is also part of something else, it's something with just public broadcasters. It's called the Global Task Force for Public Media. "The Global Task Force exists to defend the values and interests of Public Media." Excellent. But it was formed to develop a consensus and a single strong voice among them. And that's the CBC, BBC News, ABC Australia, Korean Broadcasting—they joined recently—France Television, Radio New Zealand, ZDF from Germany and SVT from Sweden. Now, I can't imagine having worked at the CBC for almost a decade and being told every day, "Our job is to elevate the voices of Canadians on Canadian stories, to unite our vast country and make us all feel as one."

What single issue do we have with Korean Broadcasting when that is our mandate? What issue does Radio New Zealand have with Swedish television when their mandate is the same, to elevate their own people. This is a bizarre conglomerate of public broadcasters. And I would put forth to the panel that the public broadcasters are the ones that are not easily bought because the advertisers don't exist and therefore, they have no influence. So something else was done here.

[00:20:00]

Now the public task force is headed by our CBC president, Catherine Tate. She is the current president. Three months ago, she gave a speech at Simon Fraser University. The first word out of her mouth was "trust." "Trust seems to be in short supply." The next phrase is "disinformation," "conspiracy theories," "YouTube rabbit hole." This is the Trusted News Initiative mantra. This is what she was talking about at Simon Fraser University. She goes around, makes speeches and says, "Please trust us."

So let's get to what they do. In addition to the first piece that I saw on "The National" that rubbed me the wrong way, I listened to a piece one day in my car by Matt Galloway. Again, a national treasure. I love this guy. When I first heard him on CBC Toronto, I thought, "Oh my God, there's a future. He might be the next Gzowski." And then he turned on us.

He did a story on March 29th, 2021 where he interviewed a guy from something called the Center for Countering Digital Hate. And I thought this was going to be about anti-Semitism or something, digital hate. Instead, the guy said, "People who are recommending vitamin C intravenous and hydrogen peroxide nebulization are hate." And I thought, well, how is recommending health treatments— Vitamin C intravenous has been going on for 50 years. It's used in cancer treatment. It's used in all kinds of treatment. Hydrogen peroxide nebulization is a simple drugstore, hydrogen peroxide 3 per cent mixed with water and

vaporized into a mass so you clean out your nasal passage and stop viral replication and it's common. You can buy them.

So how are these things dangerous? How are they hateful? It was particularly interesting to me. But the expert guest went on to say that these people will kill. And he said that the hydrogen peroxide nebulizers, which are benign, are literally inhaling bleach. This was his words, literally inhaling bleach. It's actually not; it's actually literally a hydrogen peroxide nebulizer. It's literally nebulizing hydrogen peroxide. It's not literally inhaling bleach. Inhaling bleach is literally inhaling bleach. He lied.

So why is he lying to Matt Galloway? Why is Matt Galloway letting him lie to me on the radio? And I know it's a lie for a fact. The same guy from the Center for Countering Digital Hate, who also went on to say anti-vaccine misinformation is hate. Which I believe diminishes the power of that word for all those who have experienced it. He went on Marketplace to say this, but then Marketplace took it to the next level. They became a censor.

Marketplace reported 800 pieces of information to social media giants attempting to have them censored, claiming they were misinformation. And then they complained that the media giants only took down 12 per cent of what CBC said was wrong on the internet.

My questions are: Since when is the CBC deciding what misinformation on other media platforms is? What is it their business? They're the CBC. Do your job, pay attention to yourself. Why are you going out correcting, in your view, what's wrong with other media? How is the CBC or Marketplace or this reporter qualified to comb the internet for 800 posts and declare them to be false? We never found out in the piece. And who at the CBC is the arbiter of truth and misinformation on behalf of us Canadians, who like to decide for ourselves?

So I wrote a letter to the head of journalistic standards at CBC, Paul Hambleton, who has since left the position. I asked him to do three things for me please. I told him who I was and that I'd worked there and I named some people that we would know in common. And I said, "Please supply me with the policy at the CBC that describes the mandate to correct what you deem to be misinformation by other organizations. Please include the process by which information is deemed to be incorrect, and therefore requires correction or censorship by the CBC." And I asked to, "Please supply me with any other example outside of the COVID-19 story where CBC corrects what it deems to be misinformation on social media." Now he did reply to me, but he didn't answer any of those questions.

Another thing that the CBC has done very successfully is it's promoted a new identifiable group of Canadians and fomented hate against them: the anti-vaxxer. What is an anti-vaxxer? Who is an anti-vaxxer? Does someone whose partner had a severe reaction to the vaccine and was told they must get a second one if they want to keep their job? And then they had a worse reaction and this happened. And I've talked to people, I know it exists. Then maybe they don't want their kid to get it. Are they an anti-vaxxer? Do they need to have mental correction, psychological retraining?

[00:25:00]

What does an anti-vaxxer believe? We don't really know, other than it's bad and you should fear them, according to the CBC.

There was an interview with a Conservative member of Parliament named Marilyn Gladu from Sarnia, Ontario at a time when the House of Commons was about to reopen to parliamentarians and a number of the Conservative MPs had a very serious concern about the mandate against them. There was anywhere between 15 and 30 of them. They were starting a mini caucus of, I suppose, the unvaccinated. Now, Marilyn Gladu bravely took the interview with CBC about this because it was only going to go one way. And Katie Simpson, who— Again, an amazing journalist, I think Katie's fantastic at what she does— Pardon my language but she beat the hell out of this woman on the air. Everything that Marilyn Gladu said, which was reasonable and thoughtful, Katie responded: "Aren't you just giving air to the anti-vaxxers? Isn't this giving support to the anti-vaxxers?" The anti-vaxxer became the boogeyman in this story and Marilyn Gladu held herself extremely well.

At one point, Katie said, "Are any of your unvaccinated colleagues going to try to get into the House of Commons?" I thought, wow, you've just framed them as like break-in artists or petty criminals here. Marilyn Gladu answered, "Probably not. They need a passport to get in and they'll never get past the guard." And then she said, "Will you go to the Parliament?" And Marilyn Gladu very coyly said, "Well, show up on the day and see if I come." And she stopped the interview and repeated the question and said: "This is a matter of public safety. Are you going to come?" In that moment she framed every unvaccinated person, including her guest on the show, as a danger to public safety.

Katie Simpson had no evidence—and still has no evidence—that an unvaccinated person is any more likely to transmit COVID than a vaccinated person. And we now know that there's really no difference. If anything, if you have natural immunity, you're less likely to get it or spread it. She had no scientific evidence. She had no basis of it. That's because this was not newsgathering. She was practising propaganda.

An excellent example of CBC propaganda was a piece they had, "Meet the unvaccinated." Those people—who are these strange people? "Why some Canadians still haven't had the shot." The sub headline was: "Some suspect the science, some don't think they're vulnerable, and some just don't trust the government." There was no mention that the vaccines were not fully tested by the standards that vaccines have always been tested in Canada. No mention of that. People knew that but there was no mention that that's maybe why they didn't want to do it. There was no mention of the adverse reactions that were already at this point being reported on government websites, including deaths from the COVID-19 vaccines. They eliminated that side of the story. They suppressed one side. Because it wasn't newsgathering, it was propaganda.

On January 15th, 2021, the CBC published a story where they talked about a scientific paper that was written by a number of esteemed Canadian scientists and academics that the COVID-19 booster shots didn't work. They were only 37 per cent effective against Omicron. The story was then updated. Somehow, they shifted the data and it was a slight difference. The CBC story was: the original study was "seized on by anti-vaxxers—highlighting the dangers of early research in pandemic." In other words, "Don't trust the scientists. The anti-vaxxers will put their message out." This study found that the boosters only worked 30 per cent. They were only 37 per cent effective. The story goes on to say that the study was revised. But not before being spread widely on social media by anti-vaxxers, academics and the Russians. So we got some boogeyman in there, the Russians, but they're saying anti-vaxxers— This group they're fomenting hate against is equated with academics now. Now they're belittling the academics because they don't like what they're saying. Not because what the academics are saying isn't true, but the CBC has a different message for us.

This is the most mind-blowing part of this particular story. Bear with me here for a minute. When the findings were updated with additional data, they showed very different results, say the CBC. The researchers found that vaccine effectiveness was 36 per cent, even less, against symptomatic Omicron seven to 59 days after two doses. So after your second dose, you got about a month. And then it's only 36 per cent effective, with no protection after six months.

[00:30:00]

So they were no good six months later. By any measure of vaccine, they don't work, or our expectations of a vaccine, they don't work. But after six months—or after the booster, it was 61 per cent effective one week after the booster. Now notice, so that's the correction: instead of one week after the booster being 37 per cent effective, it was 61 per cent effective. This is a marginal difference. This is not a dramatic difference. It's particularly because there's a qualifying language. And I'm trained to recognize qualifying language because it's redundant and it should always be removed before broadcast. It used to be called "not ready for air," but now it's broadcast regularly. So 61 per cent effective one week after the booster. What about two weeks after the booster? They're not telling us. Maybe it went down to this 37, we don't know. Because they are selectively telling. This is—and the definition of propaganda—this is a half truth. It's not the whole truth.

This is a collection of headlines that were between May 2021 and September 2021. And I'll take you back to— This is the big push for vaccine mandates. The university kids all had to get vaccinated if they wanted to go to school. Government workers had to get vaccinated by around mid-September. I'll just read them quickly. A "psychologist explains vaccine hesitancy." "Experts weigh in on the possible factors behind hesitancy." "Black Canadians are more hesitant about COVID-19, survey says." "Vaccine hesitancy can make for awkward talks," like if you don't believe your father, "mediator says." "These people were vaccine hesitant. Here's why they changed their mind." May 12th, 2021. "CBC poll: Results give us an idea of who the vaccine hesitant in Alberta really are." Who are these strange people? "University of Calgary vaccine hesitancy guide gives doctors facts for struggling patients," who are struggling with whether to take the vaccine.

None of these offer a second perspective about why people might be vaccine hesitant. They strongly favoured one particular interest and that is defined as propaganda, not newsgathering.

The next thing that the CBC did in conjunction was the suppression of medicine. Ivermectin was shown worldwide to be effective, particularly in developing countries where they have it available because ivermectin is used there regularly. On September 2nd, 2021— again, right around the time when we needed to have no medicine because they wanted to force the mandate. This is from CBC broadcast, "Health Canada is warning people not to take a drug meant for horses and cows to combat COVID-19. Ivermectin is a dewormer in animals," and "can cause serious illness, even death in humans."

This is a lie that was told to Canada by the CBC on behalf of Health Canada. The fact is that ivermectin is human medicine. It's a miracle medicine, and its inventor was awarded the Nobel Prize in medicine in 2015. It says—and this is from the Nobel Prize website—he "cultured a bacteria, which produce substances that inhibit the growth of other microorganisms." Maybe, that's how it works. In 1978, he succeeded in culturing a strain called avermectin, "which in a chemically modified form, ivermectin, proved effective against river blindness and elephantiasis". In fact, it eliminated river blindness virtually in

South America through millions and millions of doses, and nobody dying from it like the CBC says you might.

And this wasn't just the CBC. This was a global push to suppress ivermectin. An attorney general in the state of Nebraska decided to do a legal opinion and sign his name to it, in which he said, "In the decade leading up to COVID-19 pandemic, studies began to show ivermectin's surprising versatility," which is why it's used for things other than river blindness. "By 2017, ivermectin had demonstrated antiviral activity against several RNA viruses, including influenza, Zika, HIV, and Dengue."

I covered a dengue epidemic in India in 1998, at which time the doctors told me the trouble with dengue versus malaria, where the symptoms are very similar, is there's treatment for malaria; there's none for dengue. And that was 1998. By 2017, they were realizing ivermectin was the miracle cure for dengue, or at least had been shown to have some positive results. Another review, says this state attorney general in Nebraska—and a review of course is a look at multiple, multiple studies. They review multiple studies and they come up with a final conclusion.

[00:35:00]

It "summarized the antiviral effects of Ivermectin demonstrated through studies over the past 50 years." It wasn't new and it wasn't deadly.

Shawn Buckley

Mr. Palmer I'll just let you know, we're about 10 minutes. Just to help time yourself. Thank you.

Rodney Palmer

Okay. So the Alberta Health Services on October 5th had published on their website that ivermectin is FDA- and Health Canada-approved for people. Not just cows and horses. It is used to treat parasitic infections, intestinal infections, and now even rosacea. The *Indian Express* wrote that the state of Uttar Pradesh, which has a population of about 250 million people, had dramatically reduced the COVID positivity rate and eventually—three months after this published article—reduced the COVID death rate to zero in Uttar Pradesh.

When a doctor named Daniel Nagase walked into an emergency room in Alberta and found three people dying of COVID—their charts showed that they were getting worse every day—he decided, based on the Alberta Health Services, based on these stories out of Uttar Pradesh, to ask them if they wanted to try ivermectin. It was their choice. They all said yes and they all got better. Then he was fired for doing that. He spoke out about that and somebody recorded it and put it on a social media and the CBC did this story: "Doctor who says he gave ivermectin to rural Alberta COVID-19 patients prompts a warning from the Health Authority for spreading misinformation." In the same story, he says, "the drug worked quickly, allowing all three to leave the hospital."

I called Daniel Nagase, Dr. Nagase. I interviewed him, and he said one of them was 90 and he went back to his nursing home. They almost got completely better within 18 hours. But another Alberta Health Services medical director barred the patients from getting any more of the drug.

Can you imagine? If you can't breathe and somebody gives you a pill and you can breathe, and another doctor comes in and says you're not getting any more? That happened. It's in this CBC News story. And they went after the guy who cured them. Dr. Nagase was removed from the hospital and relieved of his medical duties the following day.

The story here is that a doctor cured COVID with a pill that cost a nickel, that's already been working all around the world. We can all go back to our hockey rinks. We can all go back to our jobs. We don't need the experimental vaccine. There's a pill. All we have to do is put a good supply in every hospital in Canada. And if anybody gets sick enough that they can't breathe, they go into the hospital, they're administered ivermectin and 18 to 36 hours later, they're breathing and they go home. End. Of. Pandemic.

Dr. Nagase should be on a stamp. Twenty years from now, there should be a little vignette about that moment when he decided, "I'm going to try this drug and end COVID-19 in Canada." Instead, the CBC went after his throat. Because it's propaganda, it's not newsgathering. This is the photograph on the slide here of the ivermectin from the CBC website, under which the cut line says: "Ivermectin is used primarily to rid livestock of parasites." I'll draw your attention to the box in the photograph's hands and the yellow on the right-hand corner, where there is a picture of three human beings. This is international and multilingual. There's an adult and an adolescent and a baby. And the baby has an X through it because you give babies ivermectin in a liquid suspension so they don't choke on the pill. This is human ivermectin, photograph on the CBC website and they're saying it's for livestock. This is a lie, a half-truth, disinformation—propaganda brought to you by the CBC.

What the *Indian Express* did by telling what the Chief Minister said about ivermectin's success was newsgathering. What the CBC did saying ivermectin is for horses and cows and can cause death was a lie and it was only propaganda. There's no other way to describe it.

Quickly going, because I'm running out of time here, to the Freedom Convoy. I happened to be in Ottawa visiting friends. I had been doing some volunteer work with the Canadian COVID Care Alliance, which is an excellent group of scientists. I encourage everyone to look at their website if they're looking for truth instead of trust.

There's a photograph here of your witness standing in front of the Peace Tower in Ottawa looking down on all the Canadian flags, the Quebec flags, the Freedom Convoy. These are the photographs I took. Families, somebody holding the Charter of Rights. Freedom, lest we forget from the vets, and God Bless. This is what I saw and the very first report on the CBC was by an excellent reporter named David Common. And he's walking—you can look this up—he's walking through the crowd and he's feeling that positive energy and he can't even contain himself. He says, "It's a party, there's jubilation, thousands of Canadians protesting the mandates." That was day one.

[00:40:00]

On day two, these pictures emerged. Nazi flag, Confederate flag. The Confederate flag is largely meaningless in Canada because it doesn't have any history in our country, but it is a symbol of hate and it's used as a symbol of hate. When these photographs emerged, our Prime Minister came out and condemned the hateful rhetoric. He said he will not meet people who promote hate. So that was it.

If that's 100,000 Nazis out there, I don't know where we were hiding them before this day. But we had 100,000 Nazis according to the Prime Minister, who are promoting hate. End of story. No meeting, not going to discuss your issue.

So I did what any journalist would do and I looked for a reaction story. "The Prime Minister says this about you. What's your reaction?" I went up and I knocked on the very first truck that was very close to the CBC building, maybe about 200 meters from the CBC. I knocked on the very first truck and I interviewed the very first trucker.

[First video clip is played of Rodney Palmer interviewing truckers in Ottawa]

[Video clip] Rodney Palmer

What would you say to the politicians like Trudeau, Singh, the Mayor of Ottawa who say this is organized by the far-right extremists and the racists?

[Video clip] Trucker 1

I'd say you're all lying. You know you're lying. Look at me. Look right around in Ottawa. We are from every nation, every country, every background. Every colour that you can possibly find, you can find in Ottawa in the last couple of days. You know you're lying. And that's false.

Rodney Palmer

And like a good journalist, I went to the next truck. I didn't just take his word for it that he wasn't a white supremacist. I asked this man at the very next truck:

[Second video clip is played of Rodney Palmer interviewing truckers in Ottawa]

[Video Clip] Rodney Palmer

Is this a group of far-right extremists and racists?

[Video Clip] Trucker 2

That's just garbage. That's hogwash. Because they are people from all walks of life out here. I'm a man of colour. And I have every few trucks that go down, there's someone of colour here. There are people in the street that are coloured. I'm not too sure where they're getting that from or who they're looking at or who they're talking to, because this is nothing like that. Right? There might be a few folks here who want to spread a different agenda and try to tarnish what we stand for. But that's them seeing a far-right movement, that could not be further from the truth.

[Video Clip] Rodney Palmer

Why are you really here?

[Vide Clip] Trucker 2

I'm here to stand up for fellow truckers and push back. Because the government keeps pushing us, pushing us, and it's not democratic anymore. If the government will try to control the people and force you to do things against your will.

Rodney Palmer

Why weren't these guys on the CBC? It's their job to go out and do a live. It's not even hard, they just had to walk. It was right outside their door. I asked, I went out and I found another guy. Look at this guy. "Do I look like a white supremacist to you?" says this man of colour.

He is a very interesting guy. When he heard about the Trucker Convoy, he was living in Calgary. He got in the car with his wife and his very young child, I think his son was about four, and they drove all the way to Ottawa to support. But these three pictures were defining that movement: the Nazi flags and the Confederate flags. And I didn't see them. I was there those first five days. I didn't see any of these flags.

Rebel News, which is an alternative news, which was marginal because it's largely a conservative mouthpiece, I guess you would call it, trying to get rid of Trudeau and put a conservative government and that's kind of their position. But during the last three years, there's been more truth on Rebel News than I've seen on any other media in all of Canada. And I say that as an experienced journalist. Their intrepid reporter, Alexa Lavoie, who I think is one of the greatest investigative reporters in Canada today, noticed that these three pictures were taken by three different people. One of them by David Chan, a long-time liberal photographer. One of them by Andrew Mead, a known Trudeau photographer. And another by Randy Boswell, who's a reporter, a writer, I guess. But he writes a lot, oh, about misinformation, anti-vaxxers, conspiracy theorists, this is his—

So how did they all get in the exact same place? She noticed that the Peace Tower is in the same aspect ratio, the same distance, depth, as in all of the three pictures. All three of these people were in the exact same spot when that guy unfurled that flag. She was curious about that. These two pictures were the only ones seen of the Nazi flag. And the reason they're still pictures is because it wasn't unfurled long enough for any of the 10,000 cameras in the place to see it and film it. She went to the first one on the left, and she found that it's a little parkette setting. She found the setting and she noticed that it was nowhere near the protest. It was down on a little walkway. So this entire thing with all these flags was staged, according to the report.

The second one on the right is very interesting because the camera angle is from down below. And she tried to reproduce that camera angle, but she had to go down to the Rideau Canal, which was locked and closed because they do that every winter because of the snow, and it's for safety reasons.

[00:45:00]

So she wondered: How did someone get down to that spot in a locked and closed area at the moment that that flag was unfurled? And she pointed out that it was on the west wall of the Chateau Laurier Hotel next to the Parliament buildings, and that angled staircase only exists in one spot. And as soon as he's up to the pillar, he's on Wellington Street, and nobody saw the flag on Wellington Street, or filmed the flag on Wellington Street. So that was the moment that that flag was unfurled, and there was a photographer there at the moment to take the picture. So how did that get out so far?

She discovered— Alexa Lavoie of Rebel News discovered that the first person to tweet that picture of that nasty flag—it is a nasty flag, the Nazi flag—was Justin Ling, the CBC reporter. CBC website says Justin “is an award-winning investigative journalist who specializes in stories that are misunderstood.” Justin said he didn't want to reveal his source. Who sent him that photo? I've seen several of Justin's pieces and he almost never reveals his source. You have to trust.

Shawn Buckley

And Mr. Palmer, I'm going to have to cut you short.

Rodney Palmer

Do you want me to stop now?

Shawn Buckley

Yeah, and allow the commissioners— They might have a couple of questions for you and then we have to take a break.

Rodney Palmer

Okay.

Commissioner Drysdale

I have a couple of questions. And by the way, thank you for your testimony. I don't particularly understand how a newsroom works, particularly at the CBC, and you talked about a number of people. At the beginning, you talked about Adrienne Arsenault coming up with this particular piece. In your experience in a newsroom, would Adrienne Arsenault herself or any of those other people just come up with a story and go on air? Or was this directed?

Rodney Palmer

Every story at the CBC National is a collaboration by many people, and there's a hierarchy of decision-making. But a journalist— If I was in Adrienne's position, the buck stops there. "You want me to say this? Show me the evidence that it didn't come from a lab before I go on the air."

I was in a situation a couple of times at CTV where I was asked to match a story by a competitor and when I investigated it, I found it to be untrue by the people that were in that story. And I had to report back that "I can't go on the air with this story tonight because it's untrue." And they said, "Well, the CBC, or whoever, put it on." I said, "Well, that's their error and not mine. And let's move on to the next thing." The reporter is responsible for the words they speak.

Commissioner Drysdale

Another question. You know, you showed us these organizations, whatever they were called, Trust Initiative, et cetera. And there was one slide that you had multiple different broadcasters on it. I don't know how many of them there were but there were many, many of them. If I also understood what you were saying, a lot of these broadcasters worldwide **were saying the same things at the same time. When does an organization go from an association to a monopoly? And did you do any investigation into commonality and ownership across these different media platforms?**

Rodney Palmer

I didn't, no. But when they all follow the Trusted News Initiative, then you have a single point of information coming down. So now there's only a single point. It's kind of like when the World Health Organization is feeding its member nations protocols on what to do: If you wanted to corrupt all those nations, you would only have a single target. That would be the World Health Organization and then all information would feed down from there. So by joining this trusted news initiative, they're all collaborating on this single idea.

Commissioner Drysdale

Another question. Given the current, or the recent, rewrite of the *Canadian Broadcast Act*, do you think that this rewrite will promote independent journalism in Canada, or will it have some other kind of effect?

Rodney Palmer

I have to confess, I'm not familiar with the rewrite of the Broadcast Act. But independent journalism is not being promoted currently in Canada. In fact, all the money that's flowing to the various journalism organizations is not flowing to Rebel News, oddly enough. And they are the ones that I see telling the truth.

Commissioner Drysdale

You mostly spoke about the CBC. But the other private broadcasters in Canada: Were they promoting these same kinds of stories?

Rodney Palmer

All of them, virtually all of them—all of the mainstream media are. They're all hooked onto this same IV drip of trust over truth. I cut a lot of it out for time, apparently not enough.

[00:50:00]

But the *Toronto Star* did a number of particularly horrific stories, one of which was putting a nine-month pregnant woman in profile or photograph saying— The headline was "Pregnant and hesitant." And the story was about her journey to decide to vaccinate herself with this unproven vaccine that was never tested on pregnant women. And it was to encourage readers to vaccinate themselves if they're pregnant.

Another one they did was they falsified their identity in order to get an appointment with a doctor that didn't want to do an interview with them. And then they got a prescription for ivermectin under a false name and then went and fulfilled the prescription under a false name. And then reported the doctor to the College of Physicians & Surgeons and then went front page with the story. It's atrocious, absolutely atrocious.

Commissioner Drysdale

My last question is: In the hearings in Truro, we had a number of witnesses—extraordinary witnesses actually, extraordinary Canadians—who came forward from different areas, different employment areas. We had nurses, we had doctors, we had construction workers, **I believe, who were fired from their jobs for either resisting the mandates or not getting the vaccinations. Are you aware of this happening with reporters and journalists in this area as well?**

Rodney Palmer

I met one who approached me and said that they worked for a major media organization, and I think they said they had to take the time off. They basically had to go home and not be paid and then they were eventually let back in when the mandate dropped. But I don't know how many. That was one person who approached me and I don't know how many others there may be.

Commissioner Drysdale

Thank you very much. That's all I have. Anyone else?

Shawn Buckley

Mr. Palmer, thank you very much for your testimony.

Commissioner Drysdale

There's another, one more question.

Commissioner Massie

Okay, thank you very much for your testimony. I'm wondering: I mean, propaganda has been around for a long, long time, everywhere. But I think in my youth it was not, at least I was not aware of it as much as I am. You've been working in the news industry for a long time. When did you start seeing that we were going in that slippery slope of propaganda? And I guess the question I'm wondering about is, what's the exit out of it?

Rodney Palmer

When I first started noticing it, I showed you, was within days of the emergency. The exit out of it is a big, big question. Because the CBC has not missed the story. The CBC has betrayed Canada and betrayed Canadians by resting on the laurels of decades of hard-fought journalists who did their work and entire careers of investigative journalism. And they're using that to trick us. They morphed into propaganda in a moment of exception.

The beginning of COVID, we were all on board with, "Let's all go hide and stay home because we're afraid." But the period of exception is over. You could forgive them for allowing themselves to be an apparatus of the public health because it existed. It was a broadcast system that we could send messages to on a daily basis. And in a moment of exception, you could say, "Okay, we're going to let the CBC be the public health system right now." But the emergency is over, and the exception still exists. So how we get out of this I'm not sure. But there would have to be a wholesale redesign of the CBC because I think that it would be extremely difficult for the number of people in that organization to admit to themselves as they go to sleep at night, that they caused deaths by misinforming people and disinforming people. It's a very tough thing to get out of.

Shawn Buckley

And if I can just break in, Commissioners, we have Dr. Robert Malone coming on in five minutes and 24 seconds, and we should take a break before then.

And I mean no disrespect, Mr. Palmer, your evidence has just been fantastic. But if the commissioners agree, I think we should stand down for five minutes.

[00:54:35]

PART II

[00:00:00]

Shawn Buckley

And I'd like to recall to the stand Mr. Rodney Palmer. We didn't have time to finish him this morning because of another witness being scheduled in.

Mr. Palmer, I'll just remind you that you promised to tell us the truth this morning. And you still promise to tell us the truth?

Rodney Palmer

Yes.

Shawn Buckley

Okay, so I'll just ask you to pick up where you left off.

Rodney Palmer

Yeah, just to refresh: if we can get the PowerPoint going, I was discussing the CBC specifically as my role as a journalist there previously, and the difference between newsgathering and propaganda. And I'll just try to get control over this and then go down to the slide that I was at, which was talking about the truckers' convoy and the nature of the photographs. These three photographs that had offensive racist flags and those were the basis on which the Prime Minister said he would not speak to anyone at the truckers' convoy protest.

And Rebel News had done an investigation showing that the flags were there very briefly, if not for split seconds, and they were taken by photographers that had associations with the Prime Minister's office. And we got to the point where the Rebel News reporter identified that the first tweet of the Nazi flag was by a man named Justin Ling, who works for the CBC. And the second tweet was by Amneet Singh, who works with Jagmeet Singh. And this was very curious, because the source of who took that photograph was never given. And so, Rebel News had done this amazing report, and I encourage anyone to look at it. It's about 17 minutes long; it's by an excellent reporter named Alexa Lavoie. And they plausibly connected these racist flag photos to Justin Trudeau, Jagmeet Singh and a CBC reporter who's known for broadcasting propaganda against people who question the government's COVID response.

So where is the CBC on this story? Why aren't they telling this story? And I would say that they're too busy practising propaganda, while Rebel News conducted the most important investigative journalism in Canada. I have not seen a piece that's better than this in the last three years. And the reason this is important is because this was the Prime Minister's founding myth on which he declared the truckers' convoy to be racist. And this is what people across Canada heard. And I've had dinner with good old friends who say: "Damn those truckers, those racists, those Nazis." And I think, "Well, I was there and you weren't." But, you know, I like to keep my friends so I don't say much.

But this was a founding myth, it was a false myth and it set the tone going forward for the Prime Minister to refuse to listen, to speak, to hear what those thousands of people wanted to say and instead to invoke the *Emergencies Act* and have them cleared out violently.

Another thing that was really significant was that in December of 2021, a CBC reporter quit at CBC Winnipeg. And I had heard this interview on a podcast, where this reporter, Marianne Klowak, who had 35 years of experience— I don't have 35 years of experience. This is a senior reporter, a senior journalist at CBC Winnipeg. And when you're at a smaller city like Winnipeg and you've been 35 years in the CBC, you're a celebrity in your town. And people were coming up to her and saying, "Look at the vaccine injury, and I know somebody," and we're hearing these people, and these stories were coming forth to her. So she did an interview with a couple of them. And then she found the Canadian COVID Care Alliance, which is an independent group of scientists who are publishing the truth about the—for example, analyzing the Pfizer data that was put forth to promote the vaccines. And she put two of them into the story and it was about to go to air. And somebody said, "Well wait a minute, this isn't what we're saying, we're not saying the vaccines cause injury, we're saying they're safe so, we better send this down to the Toronto Health Department for approval."

And so somehow, the Toronto Health Department had editorial control over COVID stories at CBC Winnipeg. And it came back with, "Yeah, you can put that story up but you can't use those two doctors with the COVID Care Alliance, you have to use these other two doctors who will say the vaccines are actually safe and effective." Things like this were happening so much to this reporter that she took an early retirement and left the job that she had loved her whole life and the people who become your family and your employer. This happened. She's spoken about it publicly.

[00:05:00]

At the same period, CBC Manitoba published a story that said any claims that COVID-19 vaccines may have long-term side effects are completely untrue. They had a reporter with people on camera, on tape, recorded saying they were injured by the vaccines. They had two university professors, and these were top people. This was one at UBC named Stephen Pelech who—as I understand, he teaches pharmaceutical regulation and development. And another professor of virology at the University of Guelph who would actually receive money from the Government of Ontario to develop a COVID vaccine. These weren't just people talking through their hat; they were the top authorities that any journalist would go to for expert opinion. And at the same time, CBC Manitoba says that it's completely untrue. That's what they put on air. This is a lie. This is disinformation and this is propaganda by the CBC.

One of the ways that they do this is they have their regular experts. And these are just a couple of them: Tim Caulfield and Maya Goldenberg. You can hear them regularly on CBC reports. Tim Caulfield isn't even a scientist; he's a law professor at the University of Calgary. In April 2020, just when the emergency had been declared, he received \$381,000 in federal and provincial grants to combat COVID misinformation: \$381,000 and he gets to be interviewed on the CBC a lot. A year later, in April 2021, he received \$1.75 million from the federal health minister directly to counter COVID vaccine misinformation. I've seen public conferences that are sponsored and led by him about how do you trust the media, who do you trust in COVID. And it's all this propaganda about vaccine hesitancy, pushing vaccines.

And the other one: for example, Maya Goldenberg is a vaccine hesitancy expert. Who knew there was a psychological condition called "vaccine hesitancy?" I didn't know this. In April 2022, she received Government of Canada funding to study the politics of health and the root causes of medical distrust.

We distrust them because we're being lied to. It's that simple, I could save the money for them.

This is strongly favouring particular interests, which fits the definition of propaganda. Where they're not seeking other opinions to counter it, they're using the same people over and over, who are actually funded by the federal government to deliver a particular message. And they put them on as neutral experts and they don't tell the unsuspecting listeners to their dinner newscast that these people are actually paid to tell you what they're telling, they disguise it as news. They're disguising propaganda as news and this is happening daily on your CBC—even today.

By some miracle, at the end of January, three months ago, the CBC published a story that said that New Brunswickers, of all provinces, have reported more than a thousand adverse reactions to COVID-19 vaccines. Three hundred of them were serious. In the same story—this is called “burying your lead,” by the way, in journalism—in the same story, across Canada, 10,565 adverse events were considered serious in nature. I can imagine what serious is, but I actually looked up what their definition of serious is: It's death, life-threatening, hospitalization or permanent significant disability/incapacity or birth defect. Ten thousand, five hundred and sixty-five Canadians.

About a month later, 200 of them went to the CBC building in Toronto and plastered the front of that building with pictures of their faces, their names, and what went wrong because of the vaccine. This is an act of mild vandalism, where these people are saying, “Enough, CBC. Here we are, we exist, we're Canadians, we're injured and all along you're saying it's safe and effective and we're suffering because of it.” Ten days later, they still didn't publish a single story about all those people who went and plastered their faces on the front of the building.

On March 10th, I heard a very prominent show on a Saturday on CBC radio—called “Day Six” by, again, one of the most excellent broadcasters we have in Canada, Brent Bambury. Brent was doing a story on Saturday morning about a documentary called, “Died Suddenly.” This is by an independent journalist who's actually trying to figure out all of these sudden-adult-death syndrome, what's going on, and linking it to the vaccines. But instead of having the documentary maker on, he said the documentary maker who made that is a right-wing extremist and connected to conspiracy theorists. And he had a second journalist on from *Mother Jones* magazine. Together, they just disparaged him and defamed him and said he has links on social media to some untoward people and he's a conspiracy theorist.

At no point—I didn't even hear about this documentary until then. And I went and looked it up, and I found out they interviewed morticians about why people are dying suddenly.

[00:10:00]

At this same time, on March 3rd—so seven days before—the Canadian government updated its info-base to point out that a total of 427 reports with an outcome of death have been reported in Canada following vaccination. This is from a Canadian government website. While the Canadian government is reporting 427 dead Canadians, and somebody did a documentary about this, instead of having the documentary-maker on, Brent Banbury simply ignored that there's 427 dead Canadians from the COVID vaccine and called this guy a conspiracy theorist. That was his item. It was ridiculous, it wasn't journalism. It was intentional manipulation of public opinion, which is propaganda.

Here's one little story. Carol Pierce—this is in *SaskToday*. Carol Pierce on the right died during the 15-minute waiting period after she got her booster. At minute seven, she keeled over on the chair and died. Did Carol believe the vaccines were safe and effective? She must have, because she took three of them.

Part of the sea change that's happening now is happening in the United States, with the Children's Health Defense that's led by Robert Kennedy Jr. And he has launched a lawsuit. This lawsuit was filed on January 10th and it is a lawsuit against the Trusted News Initiative members: Associated Press, the *Washington Post*, BBC and Reuters are named in this lawsuit. And specifically, the antitrust laws in the United States have to do with the monopolization. And what they're saying is, by shutting out voices like the Children's Health Defense and other people who are legitimate alternative news organizations, you're making it so they can't make money. So they're not getting them on the lie or censorship; they're getting them on their inability to make money, which is against the law in America. And we'll see how this lawsuit plays out. Remember that the CBC is an active member of the Trusted News Initiative, and whatever is said about these four organizations in this lawsuit can go for the CBC as well.

One thing that we have in Canada, curiously, under our Criminal Code, is that it is a crime for the willful promotion of hatred. To identify a group as anti-vaxxers simply because they choose, for whatever reason they have, or they've been asked by their doctor not to take a vaccine, the CBC has actively promoted fear and hatred against these people. Specifically, the Code says anyone who "willfully promotes hatred against any identifiable group is guilty." One of the defences is that if the statements were relevant to any subject of public interest, which could be COVID, the discussion of which was for the public benefit, which they could argue, and if on reasonable grounds they believe them to be true. I hate to single out Brent Bambury because I think he's awesome; but seven days after the Canadian government published that 427 Canadians are dead from this vaccine, there are no reasonable grounds for him to disparage somebody who's pointing that out. They are actively, knowingly, intentionally, and maliciously promoting hatred against people who are unvaccinated in this country.

In my summation: Between March 2020 and the present, CBC is suppressing critics of government policy on COVID-19 response. They are misleading Canadians that COVID-19 vaccines are 100 per cent safe. They are falsely broadcasting that ivermectin is deadly to humans, when in fact it is a life-saving medicine, and has been proven so in their own stories, for COVID-19. And they're promoting an identifiable group that they call anti-vaxxers, fomenting fear and hatred against them, in order to get more of these deeply flawed vaccines into the bodies of more Canadians.

None of this is newsgathering, which we all expect them to do.

They are standing on the shoulders of decades of excellent journalism to trick us into believing they're telling us the truth, and this is happening on the very next newscast you'll listen to an hour from now. They're collaborating with the Canadian government, which is causing confusion. Because we believe the CBC to be telling the truth, it creates confusion. Canadians are not informed that the vaccines have caused permanent side effects in tens of thousands of people and the death of hundreds of people at least. And if we can go by what other people have testified, maybe one per cent of these have been reported, and the government is admitting to 427 dead Canadians. They don't say that at the beginning. The vaccines are safe and effective, although the government does report that 427 Canadians have died. What if they said that? What if they said every newscast, "the government admits that 427 Canadians have died of COVID" and it's on their website?

[00:15:00]

How would that change the notion of who's right or who's wrong when they let it go in their arm?

I would put forth that this confusion was made possible because of the CBC. In fact, the government rollout of the vaccines was impossible without the collaboration of the CBC. They took an exceptional moment to decide that they would not be journalists, that they would instead be public health messengers. But the emergency is over and the exception continues. An exceptional time could be allowed for forgiveness, but the temporary suspension of journalism at the CBC starting in March 2020 and the adoption of its new position of government public health messenger has failed to expire with the end of the emergency. And the result is that Canada's national broadcaster has morphed into a state broadcaster. I worked in countries where there were state broadcasters: China, Syria, Malawi, North Korea. It's promoting government policy without question, while censoring, belittling, and shaming learned Canadians who dare to object and attempt to inform us of the truth.

Bad journalism is incompetence, but propaganda is a betrayal. And that's what CBC has done. It's betrayed us all.

Thank you.

Shawn Buckley

I'll just ask if the commissioners have any questions before I dismiss Mr. Palmer.

Mr. Palmer, thank you so much for coming both times, both this morning and this afternoon. The NCI is very grateful for your testimony and the insights you've shared.

Rodney Palmer

And I'm very grateful for all of you for doing this. Thank you.

[00:17:09]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 2: Dr. Robert Malone

Full Day 1 Timestamp: 01:56:26–03:09:10

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. It's my pleasure to introduce our next witness, who is attending virtually, Dr. Robert Malone. Welcome, Dr. Malone.

And David, we don't have Dr. Malone on volume. Okay, we should be good to go. Can you just speak again for us, Dr. Malone?

Dr. Robert Malone

Test one, two, three.

Shawn Buckley

We can hear you. Dr. Malone, can I ask you to, for the record, state your full name and then spell your first name and last name for the record?

Dr. Robert Malone

My full name is Robert Wallace Malone, R-O-B-E-R-T M-A-L-O-N-E.

Shawn Buckley

And Dr. Malone, do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Robert Malone

I do so swear.

Shawn Buckley

And you had provided to me earlier a copy of your CV, which I've entered as an exhibit in this matter, [Exhibit] TO-23. And can you confirm that the CV you provided is accurate?

Dr. Robert Malone

It is accurate to the best of my knowledge.

Shawn Buckley

Dr. Malone, I'm going to ask you to just take a bit of time and share with the commissioners your involvement with the mRNA technology, your initial opinion about the mRNA vaccine, and whether or not you changed your mind about it.

Dr. Robert Malone

My involvement in the platform technology of the use of mRNA for a drug, or for vaccine purposes, begins in approximately 1987 at the Salk Institute Laboratories of Molecular Virology under Dr. Inder Verma, in which I was investigating the relationship of RNA sequence in structure to retroviral packaging. In order to do those studies, I needed to develop a system for producing large quantities of purified mRNA, which had the necessary genetic elements to ensure efficient translation.

So I developed that system for manufacturing purification and demonstration of the sequences necessary, and then tested that material—that composition of matter—for delivery into a variety of cells using all known delivery methods, including liposomal delivery methods available at the time, none of which were sufficiently efficient to allow any studies of gene expression off of such an RNA and verify the functional aspect of the RNA in cells.

And then had an opportunity to test a new technology that had been developed at Syntax Laboratories in Palo Alto involving the use of positively charged fats, otherwise known as cationic lipids, and their formulations to form self-assembling particles. These are referred to as self-assembling nanoparticles and are not liposomes. They're very different in composition, but they do involve lipids.

Once that suite of technologies was assembled, and even in anticipation of future studies in collaboration with Syntax, I filed patent disclosure for the use of mRNA as a drug in all of its applications from the Salk Institute. I believe that was 1987 or 1988. I have that document. And then it was countersigned appropriately by a postdoc in the lab and then showed that this would be reduced to practice for purpose of expression in all cell types identified at the **Salk Institute, including insect cells and human cells and a variety of other sources. And then demonstrated that this was able to deliver mRNA into embryos in *Xenopus laevis*—this is the African clawed frog model that's commonly used in embryology and create transgenic *Xenopus laevis* embryos, otherwise known as tadpoles. And then in chick embryos. There was an ensuing set of patent disputes between the Salk Institute and the University of California, San Diego, which I was a student at,**

[00:05:00]

and various professors asserting their primacy or involvement in the invention.

I left the Salk Institute with a Masters, having passed my PhD exams in lieu of a PhD, after developing PTSD and a nervous breakdown in the midst of the battles over my invention. I then joined a company called Vical, which was initially located across the street from the Salk on Torrey Pines Road in San Diego. And there had a series of additional discoveries having to do with both the delivery into mammals in a mouse model, as well as the use of the technology for vaccination purposes and its reduction to practice to elicit immune responses against influenza and AIDS or HIV antigens.

I then left Vical and went back and finished my MD and then returned to UC Davis as an assistant professor, obtained about a million and a half dollars in grants to pursue that research, and carried on with development and testing of a variety of cationic liposome formulations, including in collaboration with Boehringer-Mannheim and Promega. Some of those compounds ended up being marketed by Promega. Many patents came from that, including the nine original patents that were filed between 1990 and 1991 that cover the use of mRNA for drug delivery purposes as well as for vaccination purposes and the demonstrated reduction to practice.

So I am, in fact, the original inventor and played a key role in the series of inventions and am a named inventor on all patents relating to these initial discoveries. So that's my contribution. And for instance, these patents that are on the wall behind me are examples of those nine issued patents having to do with DNA and RNA delivery into mammals and cells for the purpose of eliciting an immune response. This is well documented in all those patents—which, by the way, were not cited by Moderna in their patent positions, nor apparently by CureVac or BioNTech. So there is a failure to cite prior literature on the part of all three of those companies.

Shawn Buckley

If I can just interrupt you—so with that background, with mRNA technology, can you tell us what your initial opinion towards the COVID-19 vaccines with mRNA technology was, and then if your opinion changed?

Dr. Robert Malone

My initial opinion about all of these genetic vaccines, as well as the standard vaccines that include full-length spike protein, is that they are encoding a toxin. I was very early in raising concerns that the spike protein from SARS-CoV-2 is functionally toxic. It is a toxin. And I was particularly alarmed by the reports I was hearing from Canadian physicians—who I will not name because they've been attacked by the Canadian government and had their offices raided—but they reported to me very early on about the enticement, coercion, particularly of children, to accept these products, and also the suppression of information about the adverse events.

My initial objections were that when I was notified by a CIA officer who was in Wuhan apparently on January 4th, 2020 of this novel coronavirus and the biologic threat that it represented, I performed—as is my usual practice because I am an experienced leader of teams in biodefense and a response to emerging infectious disease—I performed a threat assessment and determined that the most expeditious and highest probability pathway forward to protecting the population from death and disease due to this agent was to focus on repurposed drugs.

[00:10:00]

And my determination was: the normal pathway for the internationally-accepted pathway for development of a vaccine that was safe and effective would take far too long, typically many years. When I learned that these products were being advanced as gene therapy technologies, I was very well aware of the history of relative effectiveness and safety of adenovirus-vectored products, although concerned about such vaccine products employing a full-length spike protein, whether or not it has the two proline mutations that are in these current spikes that are used in the adenovirus-vectored vaccines.

And I was also concerned about the mRNA technology. In particular, it had a long history of inflammation, both within any tissues in which it was administered, and this had been my experience as an academic researcher. And one of the reasons why I had abandoned this technology was because I could not overcome the toxicity or inflammatory responses associated with these lipid mRNA particles, assembled particles.

Early on, when I learned that this was being advanced as the primary candidate by the United States and others, I contacted the University of British Columbia investigator who is behind the most important advances associated with these newer formulations—which are an improvement for in vivo delivery on my original technology platforms—and inquired of him: what was the full composition and nature and logic of the formulations that were being advanced clinically? And was reassured by him that the inflammatory problems that I had encountered had been resolved with these newer formulations and that they had solved the problem of tissue-targeting by identifying specific cationic lipid structures that would cause the formulations to remain localized in the draining lymph nodes from the tissues at the site of injection. So I was reassured that this was the case.

And then, as this new information came out as the vaccines began to be deployed—about the adverse events associated with them and the suppression of those adverse events in a systematic way by the Canadian national health service—that's when I really became more alarmed. And wrote a key paper—I think perhaps the initial paper—concerning the bioethics of what was being done and the failure to provide informed consent and to require informed consent in deploying these products, as well as the coercion that was being deployed by the Canadian government—by many governments, particularly in the West.

And then Dr. Byron Bridle identified the Common Technical Document [CTD]—is the regulatory term—which had been filed by Pfizer with many nation-states, including the Canadian government and the U.S. government. But [it] had been placed on a Japanese regulatory authority server and was identified by Dr. Bridle, who reviewed it and then asked for a second opinion from a news organization called Trial Site News that I had some affiliation with. Those documents were passed to me for my own review and assessment, as I'm a regulatory affairs and clinical research, clinical development, specialist.

And I was shocked by what I read, in that those documents clearly demonstrated a failure to comply with international and U.S. norms for preclinical assessment of vaccine products and preclinical assessment of gene therapy products—these all being based on gene therapy and so were gene therapy products, and remain so.

Shawn Buckley

Dr. Malone, can I just interject for a second? Because we're going to segue in a few minutes.

[00:15:00]

You were going to speak about what you describe as fifth-generational warfare. But before we go there, I'm just wondering if you could comment on Canada's policy of using these mRNA vaccines on children.

Dr. Robert Malone

So in my opinion, having studied the data, the risks of hospitalized disease and death in children are statistically negligible, approximating zero, very close to the asymptote of zero. So functionally, virtually no risks of the virus in healthy children. Healthy children handle this infection extremely well. But the risks of the vaccine, particularly the mRNA vaccine: all of the genetic vaccine products that express spike protein, as well as those that have pre-manufactured whole-length spike protein, have significant risks in children.

In particular, those risks are enhanced in young males. And in particular, there is a very clear, unequivocal, well-documented risk of myocarditis that, depending on the study—Clinical myocarditis event rate in young males is in the range of one in 1,000-1,500 to one in 3,000, depending on the study. And the overall event rate or serious adverse events for these products may be as high as one in 500; that's events that would cause people to be hospitalized.

And clearly, given that there is no significant clinical risk in children associated with the virus itself, the risk-benefit ratio of these products to the risk of the virus itself absolutely does not justify vaccination in children. And the data indicate that children can be damaged in their brains, in their endocrine system, in their heart, in their reproductive system, and in their immune system responses. Particularly there seems to be a dose-dependent effect of these toxicities in children and in adults. Over.

Shawn Buckley

Thank you. Can you share with us your recent conclusions and research into what you've termed as fifth-generation warfare?

Dr. Robert Malone

Yeah, give me a moment to arrange the screen, because I'm going to have to share the screen. One moment. I'm not very facile with changing the views, so it's going to take me a minute.

I usually have the organizers run the show.

[00:20:00]

Shawn Buckley

Would it be of some assistance to have our technical person contact you?

Dr. Robert Malone

No, it's a very idiosyncratic thing having to do with "where is my mouse" because I'm using multiple displays. There we go, swap displays. Now you should be able to see this, can you?

Shawn Buckley

We're still seeing you, yes, we're now seeing a meeting chat.

Dr. Robert Malone

Okay, you should be seeing the— So now I have to find; I had activated share screen.

Yes, so let's see, Zoom.

Shawn Buckley

It may have been on our end, and we just changed the setting, Dr. Malone, so if you could try again.

Dr. Robert Malone

Okay, one moment.

Shawn Buckley

There we go, it's showing your screen now.

Dr. Robert Malone

Good. Let's see if we can make this happen.

Okay, are you seeing a splash screen that says Fifth-generation Warfare and Sovereignty?

Shawn Buckley

Yes, we are, and that's on the full screen.

Dr. Robert Malone

Okay, so proceeding with that, then. I'm going to speak now about basically the psychological operations that have been undertaken by particularly the Five Eyes nations of Great Britain, the United States, Canada, New Zealand, and Australia, and their intelligence communities and military— [break in livestream audio at 0:23:07–12], referred in the industry to fifth-generation warfare.

In the COVID crisis context over the last three years, we have had clearly documented, **including in Canada, the deployment of military assets—ergo personnel and their technologies—on civilian populations under the logic that it has been necessary to coerce, compel, entice, and otherwise convince the civilian populations to accept these unlicensed medical products that are neither safe nor effective, that have been marketed as vaccines, but which do not perform as vaccines in the sense that they do not prevent infection, replication, distribution to third parties, disease or death associated with SARS-CoV-2 infection. And so in sum, what has been done to us in terms of the psyops and the general term or the technology deployed, is fifth-generation warfare.**

I'm going to introduce the audience in this testimony to fifth-generation warfare and its deployment during the COVID crisis. Fifth-generation warfare is termed a war of information and perception. In order to understand it, you need to understand that fifth-

generation warfare is not a fight over— It's not used for conflict over territory, but rather it is designed for conflicts to influence thought, belief, and emotion.

[00:25:00]

The first example of fifth-generation warfare in the modern era that was deployed was Twitter and Facebook having been deployed during Arab Spring in order to influence behavior of crowds during that social protest movement in the Middle East. It is not a perfect example of fifth-generation warfare because in fifth-generation warfare, the perpetrators, the opposition, is typically unclear. Fifth-generation warfare seeks to mask the involvement of whoever it is that's waging that conflict. But absolutely, fifth-generation warfare was a component of Arab Spring. And during Arab Spring, a key fifth-generation warfare device or weapon was deployed, and that is Twitter.

Twitter is both a weapon and a battlefield in the new world of fifth-generation warfare. Twitter is specifically designed and has capabilities to map and influence behaviors of individuals and crowds and down to the level of mapping their emotions, thoughts, opinions, and their ability to influence others. This is why you experience things like shadow-banning or amplification of a given tweet or message on social media: this is typically algorithmically-based alterations in the distribution of information and its emotional content to those that are participating in social media platforms.

Of course, all these social media platforms have the ability to precisely triangulate individuals in three-dimensional space because of cell tower triangulation and they are typically integrated in the intelligence community into functions such as Gorgon Stare; that provides extremely high-resolution imaging of individuals and can be used to target individuals both emotionally, psychosocially, as well as with kinetic weapons if necessary.

Over the last three years, Western governments, non-governmental organizations, transnational organizations, and the pharmaceutical industry, together with media and financial corporations, have cooperated via public-private partnerships such as the Trusted News Initiative to deploy a massive, globally-harmonized psychological and propaganda operation—the largest in the history of the western world. With this campaign, the governments of many western nation-states have turned military-grade psyops, strategies, tactics, technologies, and capabilities developed for modern military combat against their own citizens. This is well-documented and was predicted in a series of classic texts and also discussed at length in my latest book, *Lies My Government Told Me and the Better Future Coming*.

It's also these methods— [break in livestream audio at 0:28:09–13] COVID-19, the Great Reset, and the Great Narrative— Klaus Schwab being the leader of the World Economic Forum. Before fourth- and fifth-generation warfare, modern warfare was a duel on a larger scale or a continuation of politics by other means, with core elements of rationality of the state, probability in military command, and rage of the population, according to Clausewitz in his classic text, *On War*.

Today, in the context of fifth-generation warfare, there is no clear distinction between state, non-state, combatants, and civilians. And there is absolutely no boundaries in terms of ethics or rules of engagement. It is total, unrestricted warfare. It is clear that Western nations—as I mentioned, particularly the Five Eyes nations—have deployed this military-grade psyops technology on their civilians, in many cases through the operations of military operational groups that are trained in psyops. This includes, for instance, the 77th Brigade in the United Kingdom. That's now public information.

Many of this has come out through Freedom of Information acts and Twitter File disclosures. And it has really been a central feature of governmental efforts to manipulate populations and coerce them to accepting whatever the narrative is promoted by the government and the World Health Organization.

[00:30:00]

Just to put a pin on it, the U.S. government, through the Department of Homeland Security, has defined terms which are equated with domestic terrorism that relate to this. And those are: “misinformation,” that means any information being spread in public which is different from the approved narrative from the regional health authority—so, I guess that would be your NHS—and the World Health Organization; or in the U.S. that would be our Health and Human Services. Any information which is different from that approved by those agencies is defined as “misinformation.” If it’s spread benignly, through ignorance or whatever, that’s “misinformation.” If it’s spread for political intent, that’s defined as “disinformation.” If it is information being shared which is true, but causes concerns about government and government integrity, that is called “malinformation.” All three of those classifications in the United States are defined as domestic terrorism by the Department of Homeland Security.

In general, thinking about these concepts of generations of warfare as discrete entities is really misleading. They’re more like generations or gradients. First generation being, you know, sticks and stones and swords and mounted combat with lances. Second generation you can think of as the First World War being a great example and the American Civil War. Third generation employed the Blitzkrieg, which allowed the decentralization of command authority to the German army, which allowed them with even inferior technology to bypass, for instance, the Maginot Line in France. So third generation is mechanized warfare, focused on speed and maneuverability. You can think of the Ukraine conflict as an example of third-generation warfare in progress. Fourth-generation warfare was designed for asymmetric warfare against large state actors. We can think of this as terrorism, or we can think of it as insurgency efforts, such as for instance, the American Revolution against Great Britain is an example. But in the modern context, fourth-generation warfare deploys both propaganda and battles over territory, including use of kinetic weapons by the likes of Al Qaeda, the Taliban, various actors in Syria, and going back to the Viet Cong. I argue that the United States military has never won a fourth-generation conflict.

In order to try to overcome that problem of the advantages posed by internet and network effects and these insurgency strategies that are highly decentralized in terms of leadership, creating a situation where state actors face kind of a whack-a-mole problem, they’ve developed a fifth-generation warfare, which is based on information and perception manipulation. It does not typically involve non-kinetic weapons, and is not a battleground over territory but rather a battleground over your mind and its perceptions and its availability of information.

These new tactics have created a totally new battlescape here—one that is very Salvador Daliesque, in which it’s very difficult to understand the nature of the conflict, who the combatants are. And typically, the combatants that are propagating this information warfare into a population seek to become as obscure as possible and act with as little energy as possible. This is a very subtle manipulation of information. It is basically the modern epitome of psychological operations and the use of psychology to influence behavior of groups and populations.

As I say, it's very, very difficult to really come to grips with fifth-generation warfare as you begin to understand it. In particular, because there are absolutely no boundaries in terms of truth, ethics, of manipulation of media, integrity of information, social organizations, et cetera.

[00:35:00]

It is complete and total information warfare with absolutely no boundaries. This is what's been deployed against your population there in Canada.

This type of warfare targets the cognitive biases of individuals in organizations in a very strategic fashion. We're all familiar with trolls and bots, et cetera. But it's very different. It's concealed, it's impossible to attribute, and it focuses on the individual rather than on groups in many cases. It is truly a war of how you think. I argue that in the context of fifth-generation warfare, when it is being deployed by governments against their own populations, the concept of sovereignty is irrelevant. It is obsolete. It's an anachronism. There is no sovereignty in an environment in which everything which you obtain in your information space, all of your emotions, everything is manipulated towards the end of whatever the goals are of the nation-state. That is modern fifth-generation warfare, information warfare, and that is what's been done in Canada. It's well-documented.

These are key characteristics of fifth-generation warfare. I mentioned Arab Spring. The Israeli-Palestinian conflict was another example. The Havana syndrome—where we had diplomats in the United States in Havana, Cuba that experienced an unknown mental compromise or psychological state after deployment of some sort of unknown energy weapon—is a clear, explicit example of fifth-generation warfare. It was targeted, it was effective, and there is no knowledge of what caused that effect or who was deploying it on the American diplomats. Perfect example of fifth-generation warfare.

I mentioned the concept of sovereignty. What is world health when public health policy and pharmaceutical interventions are transformed into just another fifth-generation warfare weapon? How can a democratic system of government continue to exist if the existing leadership of a nation-state feels that it's acceptable to deploy these types of technologies on their own population? As I said, the idea of sovereignty becomes irrelevant.

These are examples in the lay press from Canada and the UK documenting the deployment of military campaigns involving fifth-generation psychological warfare and information warfare against the Canadian population. When you say, "conducting propaganda during the pandemic," this is fifth-generation warfare. This is what was deployed on you by your own military. This is from the Canadian Joint Operations Command, et cetera. As you notice in this article by David Pugano [sic, Pugliese], in one of your lay press publications, **"This plan devised by the Canadian Joint Operations Command relied on propaganda techniques similar to those employed during the Afghanistan war."** In other words, that's a euphemism. They deployed the fifth-generation warfare technology designed to combat the Taliban against you, the civilians of Canada.

Now this is an example of one of the battle groups in the United States, the 4th Psychological Operations Group based in Fort Bragg. This is a recruitment video just to give you a sense of the nature of this technology. This is the group that was developed from the ghost army of World War II that was used to fake the German army about the landing at the end of the war.

[Dr. Malone plays a recruitment video for the 4th Psychological Operations Group in the United States from 00:39:22 to 00:42:48. No exhibit number is available.]

Dr. Robert Malone

So I hope that convinces you that this is a real process, threat, and technology. As I mentioned, it's deployed in the United States, in Great Britain through the 77th Brigade—one of the members of the 77th Brigade is actually a member of Parliament—and obviously in Canada, as documented by your own press, and New Zealand and Australia, all part of the Five Eyes Alliance. There are a series of core technologies that are used. One of them is the OODA [observe–orient–decide–act] Loop, which is also a core strategy for instance in fighter pilots currently, in which there are very rapid response cycles to new information.

Another key technology and concept is the Milgram Experiment, in which people were subjected to shock—surreptitiously, not actually—and it demonstrated the willingness of individuals to deploy potentially life-threatening shocks if authority figures told them to. Another example is the Asch experiment, in which it was demonstrated that the effects of social pressure can cause a person to conform to the willingness or interests of authority figures or organizations. People are willing to ignore reality in order to conform to a group. This also relates to the work of Hannah Arendt, Joost Meerloo, and most recently Matthias Desmet involving mass psychosis or mass formation or mass hypnosis—are all three equivalent words.

Another example is the Operation Lockstep, the idea of using a pandemic to impose tighter, top-down control modelled after the Chinese social credit system, which has been foretold and evaluated in a variety of planning documents and analysis documents by the Rockefeller Foundation and the U.S. intelligence community.

[00:45:00]

I've mentioned Five Eyes Alliance multiple times here. I don't think I need to cover it again. You're aware that Canada is part of the most powerful and longest-standing intelligence organization in the history of the West. You may not understand that, for instance, Wikipedia is very actively edited by individuals who are tightly associated with MI5. What we have is reciprocal relationships between the Five Eyes Alliance countries in which, for instance, things that are prohibited from being performed by the Canadian intelligence service or the American intelligence service are performed as tasks by, say, Australian or United Kingdom intelligence services—which are not prohibited from taking those types of actions against civilian populations in other Five Eyes Alliance member states.

Another key concept is the Overton Window, which is the range of policies which are politically acceptable for discussion, known as the Window of Discourse. And fifth-generation warfare methods seek to actively manipulate the Overton Window for strategic and tactical advantage. So for instance, when you experience the “fact checkers,” or the censorship, shadow-banning, et cetera on social media because you are communicating something like the slide deck from the Canadian COVID Care Alliance that technically accurately discussed the nature of the Pfizer clinical trials: that is a clear example of third-party actors constraining the Overton Window, making it so that these things are not socially acceptable to be discussed. This is a key strategy and tactic in fifth-generation warfare.

Another one is the exploitation of cognitive biases associated and described as the Dunning-Kruger Effect, the relationship between average performance and actual

performance on a college. So self-perceived performance. In other words, the difference between what people think they are able to perform and their intelligence levels and their true capabilities. People have a strong tendency to always overestimate their ability to assess information and their own intelligence, and this is actively exploited using fifth-generation warfare technology.

Another example is bad jacketing or snitch jacketing. This is this common strategy that we're seeing deployed and has been deployed for decades—for instance, by the FBI to create suspicion and division within organizations that are resistance group. And what's done is to seed the idea that members of the group are bad actors, that they in some way are actually acting on behalf of a third party, typically the state or intelligence community. And so, this is often referred to as “controlled opposition.” That's the typical strategy that's propagated into a population: somebody who is being very effective as a leader within a protest group or organization, then rumors being spread about them that they are actually acting on behalf of the opponents, the state, or whomever.

And this is another video prepared by Mikki Willis that describes bad jacketing. It's called “Our Birthright,” and it's another example of the fifth-generation warfare technologies that have been actively deployed, including in Canada during the trucker strike event.

[Dr. Malone plays the video, “Our Birthright” from 00:48:57 to 00:55:35. No exhibit number is available.]

Shawn Buckley

Dr. Malone, can we just let you know that we're having trouble hearing the sound on this presentation?

Dr. Robert Malone

So sorry that you didn't get adequate volume. I hope you could understand most of that. The point is that these are the technologies that have been deployed and continue to be deployed against us. There are third parties that have been clearly identified as disruptors who were involved in disruption of the Canadian trucker protests as well as the American trucker protests. We do have infiltrators. They are using these technologies. They appear to be state actors that are working as subcontractors.

How can we defend ourselves against this? We can basically learn the technologies. When we do so, we become resistant to them, just like we're more resistant to modern marketing technology, which is very closely related. As we master the technologies and understand them more deeply, we can begin to deploy them ourselves rather than just being victims.

There are many offensive ways to use this, and there are many different offensive ways that they're used against us through chaos agents, generation of fake sock puppets, bot trolls, flash mobs, et cetera. And of course, the aggressive deployment of censorship, gaslighting, and other technologies, which are used particularly on social media and in corporate media, often with a sponsorship from governments—including your own government, as I've mentioned.

I conclude this talk, then, about fifth-generation warfare with the suggestion that you seek out the variety of different sources of literature that provide more information about this. And of course, we've written about it extensively in our book, *The Lies My Government Told Me*, as well as in our Substack, rwmolonemd.substack.com, if you wish to understand more

about fifth-generation warfare, nudge technology, and associated psyops that are deployed in Twitter and other social media platforms.

With that, I thank you for your time. And let's see, I need to stop sharing my screen.

Shawn Buckley

Yes, if you can return to view of you, I think our commissioners likely have a few questions for you.

Dr. Robert Malone

I'm trying to get there.

Shawn Buckley

There we go. We can see you.

Dr. Robert Malone

Okay, we should be back, and thank you for your attention.

Commissioner Massie

Thank you very much, Dr. Malone, for your fantastic testimony. When I understand it, you did a journey from the science and the technology and how the science and the technology is being deployed for all kinds of applications, some of which we can actually question, as you mentioned in the end.

If I can come back to science and technology—because I'm a scientist; I was working in gene therapy in the early nineties and I've been following your work. If we can come back to it— If we can explain to what extent the science, for example, of the mRNA technology has not been developed to the level that would justify its use in, I would say at this point, all kinds of application, including the COVID vaccine, but now they want to move it in many other types of applications— It is my understanding based on the latest result that have been published on the quality, or lack thereof, of the product produced at large scale under so-called GMP [Good Manufacturing Practices], which we can question the quality.

Do you think, based on your expertise on the technology, that this product can actually be produced anytime soon under large-scale and GMP quality, irrespective of what kind of vaccine you might be proposing?

Dr. Robert Malone

Okay, so your question is basically—to use regulatory terminology—you're speaking about adulteration, potency, purity, and identity of the medical product.

[01:00:00]

The biological medical product, which has been marketed to us as a vaccine. Do I understand you correctly?

Commissioner Massie

Yeah, exactly. My question is: In your expert opinion are we ready to produce these products under compliant GMP? And if not, what would it take to get there?

Dr. Robert Malone

We have been told that the products are compliant with GMP. But it has not been disclosed to the general public: the contents of the material and its composition, the manufacturing process, and I'm not aware of what the release criteria are. I do know that there have been multiple independent assessments. And let's park that for a minute, I want to come back to that. There have been multiple independent assessments that document, for instance, quite a significant concentration of contaminating plasmid DNA in these preparations, which suggests that the purification process to remove the plasmid DNA template for the manufacturing of the mRNA has been—the most gentle way I could put it would be “inadequate.”

Contamination of DNA in vaccines has long been a problem, no matter what the source. For instance, live attenuated or purified subunit influenza vaccines also have problems with contaminating DNA from cell lines or from chick embryos, for example. There is absolutely, based on the independent assessments, significant contamination of plasmid DNA. And it's been reported that that DNA, in the case of the bivalent products, includes a full-length plasmid that includes a simian virus—forty sequences, including promoter enhancers. And I'm not clear about replication origins.

In addition, it's very clear from the analyses that the mRNA transcripts present in these preparations of gene therapy products used for vaccination are often truncated. It's basically impossible with T7 RNA polymerase to prevent the premature termination of the growing chain of mRNA. So one ends up with a composition of matter that has significant contamination with sub-full-length transcripts, which may have their own biologic properties. And the proteins that they encode may have their own biologic properties.

In terms of the overall formulations, clearly this technology—developed at the University of British Columbia in large part—is not as advertised. It does not remain at the site of injection. It does not remain in the draining lymph nodes. It is not targeted. In fact, it is generally distributed throughout the body and seems to have some particular affinity as a formulation of the product for a variety of tissues and organs that are associated with significant pathology. And this includes brain, heart, and—most worrisome—reproductive tissues, including ovaries.

We have the inadvertent disclosure by a Pfizer global director recently, with Project Veritas, that Pfizer believes, for instance, that the reproductive complications associated with the vaccines—ergo, the dysmenorrhea and menometrorrhagia that women commonly experience—is actually due to damage to the, in their words, “hypothalamic pituitary adrenal gonadal axis.” That's another way of saying damage to the endocrine system. This is apparently a leading hypothesis at Pfizer for these female reproductive consequences. And of course, women are not the only ones that have an endocrine system. And this is not restricted just to adult females. Particularly worrisome is the prospect that these materials may be damaging the endocrine system of developing children, in my opinion.

We also have the toxicity, which is unresolved and never assessed to date,

[01:05:00]

of the pseudo mRNA itself. The composition of matter of this material that is being synthesized chemically through, basically, an enzymatic reaction substitutes the normal uridine for pseudo-uridine. Pseudo-uridine is a molecule present in very precise places in natural mRNA, but it is not typically incorporated into all of the uridine-coated components of the mRNA molecule or messenger ribonucleic acid molecule. Pseudo-uridine is typically very selectively modified in cells in our bodies rather than being incorporated wholesale throughout the RNA. This is the invention of Kariko and Weissman that's used in all of the marketed or distributed mRNA-based vaccine products.

And the reason why the pseudo-uridine was incorporated was because of the problem that I mentioned previously: these formulations are highly inflammatory. And the incorporation of pseudo-uridine into mRNA acts through various cellular signaling pathways to down-regulate inflammation and immune response. Unfortunately, that has two aspects. Down-regulating the inflammatory and immune response is good in the sense of reducing the effects of the formulation itself on inflammation, but bad in that it's nonspecific.

We do know that, for whatever reason, these products when administered—these biological medical products marketed as vaccines—are eliciting damage to immune responses. And we can observe that because one of the common adverse events is the reactivation of latent DNA viruses, such as Epstein-Barr virus, cytomegalovirus, and shingles of course—which are common adverse events associated with the post-vaccination syndrome.

In short, what we have is clear evidence of unresolved and inadequately-characterized toxicity associated with the delivery formulation—with the mRNA itself and with the encoded payload spike. None of these were characterized in the way that is normally prescribed in well-established regulatory processes, in terms of characterizing the potential toxicity of all components of a final drug product. And the presence of these contaminants of DNA and sub-transcript mRNAs are clear evidence of adulteration in the final product. Unfortunately, the contract clauses of Pfizer and Moderna have been such that there has been, in general globally, a restriction on the ability of national health authorities to perform lot release-testing and characterize these contaminants.

And so governments throughout the world and their regulatory authorities have basically caved to pressure from the pharmaceutical industry to bypass their normal processes in ensuring purity, potency, and lack of contamination in the products that have been administered—often through mandates or other forms of coercion or compulsion. They have bypassed their own norms and so we're not able to really verify in a rigorous way—in a way that would normally be performed—whether or not these products are adulterated. But the current evidence suggests that they are significantly adulterated and the data are clear that they are neither safe nor effective. Over.

Shawn Buckley

Dr. Malone, thank you. And do the commissioners have any other questions of Dr. Malone?

Yes, so there's another question. Dr. Malone, we are very tight on time, so I'll ask if you can be very succinct in answering the questions.

Commissioner Drysdale

Thank you, Dr. Malone. We've had a number of witnesses talk about COVID-19 and how they recognized at a very early point in the pandemic that the disease targeted—perhaps

that's not the right term. But certain people, certain stratifications of the population were more susceptible. In other words, if you were obese, or if you were elderly, they told us that you are more susceptible to the disease.

[01:10:00]

My question is really focused at the second part of your presentation. That is: When you talk about these fifth-generation techniques, are they stratified in the population? In other words, have you seen markers that show that it's more younger people, or older people, higher population-density portions of the country are more susceptible to this technique?

Dr. Robert Malone

This is not my core competence, psychology. This is not what I was trained in— Or psychoanalysis, others have had that training. I can tell you definitively that there was a study of a randomized clinical trial with the six-month follow-up of approximately 600 subjects in 10 different groups performed by Yale University—the funding for that was not disclosed—before the vaccines were ever available. It piloted various messaging strategies and tested whether they were effective at different populations, in terms of the messaging regarding generating a willingness to accept these vaccine products and to influence other parties to accept these vaccine products. I've documented that both in Substack—it's a published peer-reviewed paper—and in my book.

So there absolutely is evidence that these campaign tactics—of, for instance, speaking about guilt, social obligations, risks to the elderly and grandparents, et cetera—were absolutely tested in a randomized clinical trial prospectively, in order to generate the message content that was deployed throughout the Western world to convince, compel, and entice different populations to accept these products. And in particular, the logic that it was necessary to vaccinate children in order to protect the elders. Over.

Commissioner Drysdale

Thank you, Dr. Malone. I have nothing else. Anyone else?

Shawn Buckley

Dr. Malone, it's truly been an honor to have you join us today. And on behalf of the National Citizens Inquiry, we thank you so very much for attending and sharing with us.

Dr. Robert Malone

Thank you for the opportunity. I hope it was helpful, and I wish you the best of luck there in Canada.

Shawn Buckley

Thank you.

[01:12:44]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Toronto, ON

March 30, 2023

Day 1

EVIDENCE

Witness 3: Dr. Bruce Pardy

Full Day 1 Timestamp: 03:09:14–04:13:32

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness coming to the stand is Bruce Pardy.

Mr. Pardy, I'll ask you if you can state your full name for the record, spelling your first and last name.

Dr. Bruce Pardy

My name is Bruce Richard Pardy. First name is spelled B-R-U-C-E. Pardy is spelled P-A-R-D-Y.

Shawn Buckley

Bruce, do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Bruce Pardy

I do.

Shawn Buckley

Now, you had sent me earlier a copy of your CV, which we've kind of pre-entered as Exhibit T0-6. Would you confirm that the CV you sent me was correct and accurate?

Dr. Bruce Pardy

It is correct, thanks.

Shawn Buckley

Now, you are a professor of law at Queen's University.

Dr. Bruce Pardy

Correct.

Shawn Buckley

And you are the executive director of Rights Probe. And that's a law and governance think tank, and division of the Energy Probe Research Foundation?

Dr. Bruce Pardy

That's right.

Shawn Buckley

And then you're also currently a member of the Ontario Bar.

Dr. Bruce Pardy

Correct.

Shawn Buckley

Now, you've asked me to let the commissioners know—and this would be a lawyer thing—that you are not opposed to questions being asked during your presentation, because you're going to cover different subjects. And the commissioners might not be aware: judges interrupt lawyers all the time in court. So it's kind of the common thing.

You've been called to explain how the legal system enabled governments and public health authorities to put COVID measures in place. And would you please share with us your thoughts on that?

Dr. Bruce Pardy

Yes, by all means. Thank you very much for having me. Is there a trick to starting the PowerPoint? Do I just click on?

Okay, very good.

Shawn Buckley

You have it.

Dr. Bruce Pardy

Great, great, great, okay.

So I want to start with this thought, which is that the most powerful ideas are the ones you don't know you have. And one of those ideas is the problem here. I want to try to answer this question for us today.

During COVID, of course, people were told what to do and what not to do. They were told not to walk through the park. They were told to close their businesses. They were told their

kids couldn't go to school. They were told that they couldn't go into the store without a mask. They were told they couldn't have a job without a vaccine. And so on.

And during this period, people thought the law would save them. This seemed like society unravelling. It seemed insane. And they thought, "The law will save us. The law is solid. The law is written down. The law will bring this back." And it did not. Many people tried. They found a lawyer; they brought an action; they brought a challenge to this rule or that. And those challenges, for the most part, were rejected. And the question is, why?

And there may be many answers to this question, but I would like to suggest two. The first one is that this is a reflection of the triumph of the administrative state. That system of governance is based upon an idea. And that's the idea that I want to talk to you about, this is the important idea that we don't know that we have.

And the second reason is that the Charter that a lot of people put a lot of faith in did nothing to push back against this idea. In fact, in some ways—because of the way it is interpreted and applied now—the Charter, instead of opposing that premise, that idea, in some ways now facilitates it.

So the premise, this idea that is the problem, let's start with this.

Our law is based upon ideas.

[00:05:00]

Now it might seem that the law consists of books, of words. You go off to the shelf or onto the internet. And you open it up and you see what the words say. And that's the law. And that's true of course, to an extent. But the legal system is also based upon a certain number of ideas.

Here's one of the ideas. That the state is based upon three different branches: legislature; the administration or the executive branch, as it's sometimes called; and the courts. And one of the important ideas that we have had in our law for a long time is that these three branches of the state do different and distinct jobs. And one of the ways that we are protected from our state, from our own state, is that these three branches are distinct and they cannot do the job of the other. In other words, it prevents power from being concentrated in any one organ or person.

Legislatures legislate. They pass statutes that contain the rules. Courts take those rules and they apply them to particular cases. And the administration takes the rules that the legislature has passed and they enforce them, they carry them out. Now, one way to understand which part of the state we're dealing with at any particular moment is to think about it this way: We know what a court is. And we know what a legislature is. A court has a judge and a room, and it involves a dispute and evidence and so on. And a legislature has elected people and they pass statutes by vote. Everything else—everything else—is a part of the administration: the cabinet, the ministries, the departments, the agencies, the tribunals, the commissions, the law enforcement, and so on and so forth.

Now, here's a basic idea: The administrative or executive part of the state is authorized to do nothing unless the legislature has passed a statute saying that it can. And that's a great rule. That's a rule that the courts did enforce and still technically do enforce. But here's the problem: The ideas upon which our legal system is based are changing. They're evolving, if you like. But they're evolving in what I would consider to be a very dangerous way. Here is

now what is happening— And it's been happening for quite a while, this is not just a COVID thing. But it reached its height during COVID.

Here's what's happening: Legislatures, instead of passing statutes that contain all the rules, are now passing statutes that delegate rulemaking authority to the administration. It doesn't mean— I'm not suggesting that there aren't statutes with rules in them, that wouldn't be correct at all. But more and more, our statutes include sections that say, "and Cabinet can make regulations about these things." Or, "the Minister can decide this list of things." Or, "this public health official can do these things." Or, "this commission can do that." And the actual rules—the actual rules that apply to us day-to-day, more and more—are not in the statute. They are in the rules made by the administration.

Now you'd think, well, hold on, wait a minute. Surely the courts would prevent this from happening because now you're concentrating power. Now, the executive branch is doing the job of the legislature. But the courts have long said, "No, no, it's okay. Legislatures can delegate their rulemaking authority to the administration. And when they do so and when the administration makes these rules and does its stuff, what courts should do is to defer. We should give room to the administration,

[00:10:00]

to the officials, to the public health officers, and so on, to do their thing. We shouldn't look too closely at it because, after all, they are the ones with expertise and we in the court are not."

So here's what we get: You get delegation from the legislative branch, and you get deference from the courts. And what you end up with is an administration that has the following mandate: It has the discretion to decide the public good. And that is the idea that has triumphed. And that is the idea that triumphed during COVID. On steroids. If you like, this is the holy trinity of the administrative state: delegation, deference, and discretion. The discretion to decide the public good is the premise of the administrative state.

And here's the implication: When we talk about data, when we talk about medicine, when we talk about whether masking works, talk about whether the vaccines are safe and effective, we are arguing about, "What is in the public good?" That does not challenge the premise of the system that is in place. Here's what this premise means in a little bit longer detail: that individual autonomy must yield to the expertise and authority of officials acting in the name of public welfare and progressive causes.

So just very briefly, here's what I mean by a premise. This is just a very short thing about deductive reasoning, right? You start with a proposition: "Cats have tails." That's a premise. **You plug in a bit of evidence; sometimes it's called a minor premise, but a piece of evidence. You're trying to connect two things: the premise with a piece of information. And you get a conclusion. Simple enough.**

Here's the way the premise in this situation works. Here's the premise: Officials have discretion to decide the public good. Here's the evidence: Officials mandated a vaccine. Note the nature of this evidence. This evidence is not about the vaccine. It's not about its safety. It's not about its efficacy. It's not about whether it's in the public good. It's the evidence about what the officials with the authority did. If you put that premise together with that fact, what you get is the conclusion. The conclusion is: Therefore, vaccine mandates are in the public good. That's what follows from the premise. And you cannot

attack that conclusion without attacking the premise. And attacking that premise, for the most part, has not been done.

Why is that? Because the premise is very deep. We have lived with an administrative state for decades. People think that's what government is. If you went up to people on the street and you said, "We shouldn't have officials with the ability to decide the public good," they would look at you like you were from a different place. Like, "What are you talking about? I don't understand what you mean. That's what government does."

And I'm here to tell you: that is not necessarily what government does. It is what it does now; but it is not the only way to design your government. And the fact we have designed our government in this way has led to this problem. And there is no way to avoid the problem again, the next time, unless the premise is challenged.

So here's what I mean about all of the issues that so many people have been talking about.

[00:15:00]

The masking. The lockdowns. Do lockdowns work? Did they work? Did they stop the spread? Did they cause more harm than good? Did social distancing have a rationale? Was six feet right, or should it have been five or seven? Was there any data? Was it ridiculous or not? Do masks work? What's the data? What are the studies on masks? Is it as ridiculous as it looks to be, or is there something to it?

What about the vaccines? Were they tested properly? Do they cause these problems? Do they actually stop the spread? Do they actually stop the severity of symptoms? All of these questions—they're very important questions, to be sure. Very valuable to know about what the actual information is on all of these questions. But all of these questions are trying to debate, what is in the public good? And to concentrate on that is to miss the problem.

The problem is not the last part of that statement; the problem is the first part. You must challenge the premise that our government officials have the expertise and authority to tell us what to do in the public good. Because that is the idea that is now running the show.

In other words, it would be a mistake to think of this COVID debacle as a matter of a collection of bad policies. Now, they were, in my opinion, for sure. But that's not the real problem. The real problem is that the officials inside the state were able to produce a set of bad policies. If government officials have unchallenged authority to decide the public good and thereby to override individual autonomy, bad things inevitably follow. What they can do, they will do. And in a sense, what happened during COVID was the culmination of this trend, if you like—this evolution of the nature of the administrative state. If you like, it was the pinnacle achievement of this managerial state apparatus. It was a great opportunity for people who have authority to manage society, because that's what they think they're for.

Now, as I say, COVID was not the first time. These things have been in development for decades. Decades. Over a long period of time, these things have come forward. But COVID may have been the most extreme example, certainly in living memory. So that's part one. That is the problem about the premise. That is the idea that's leading the charge, the idea that must be challenged.

And part two is: Well, what happened to the Charter? I thought the Charter was there to protect my individual rights. It looks like it should, it's a roster of what appears to be individual freedoms: freedom of speech; freedom of religion; freedom of conscience;

freedom of assembly; freedom of association; the right to equality; the right to life, liberty, and security of the person. What happened?

Well, the way our Charter reads combined with the way, over a long period of time, the courts have interpreted those words, means that the Charter does not now prevent the administrative state from overriding individual autonomy in the name of public good. Now occasionally it will. In the law of course, you can't make blanket statements about things because cases go this way and that. But if you look at the trend over time, the Charter now is as much a legitimizer of the administrative state as it is an opposer of it.

And note this: This administrative state I keep referring to, this managerial governance mechanism,

[00:20:00]

or collection of agencies and departments and people who manage society, is explicitly provided for in the Constitution nowhere. Our Constitution does not say we shall have an administrative state. It doesn't prohibit it. It doesn't prevent it. But it doesn't prescribe it either. It has just grown up over time.

So the Charter is not a foundation. Unlike what many people think, and understandably so, the Charter is not the foundation of our legal system. Instead, it is merely a gloss, if you like, on what the legislature and the executive branch can do.

Now it used to be—and some would argue still is, and that's a fair argument—that the foundation of our legal system was both the common law: that is, law developed on certain subjects by the courts over a long period of time, from case to case to case to case. The law of contract, the law of torts and negligence, the law of property are still largely common law subjects. In other words, you can't find the whole law by looking in the statutes. And the other foundation is the "separation of powers" idea that I referred to at the beginning: the legislature does this; the administration does that; and the courts do this. And they should all be separate to protect us all from their domination. Today though, for the most part, I would contend that even though those ideas are still around, they have been put aside in terms of their hierarchy in favour of this primary idea I mentioned to you earlier, which is this holy trinity of the administrative state: delegation, deference, and discretion.

So what about the Charter? Well, two things I want to say about the Charter. Number one, these COVID rules and the people who put them in place got around the Charter by going around to the back door. And b), I want to talk about the courts a little bit. But let's do the first one first: going around the back door.

What I mean is that some things are able to be done indirectly that are not able to be done directly. Here's an example. Let's say that a province had put in place a mandatory vaccine policy. I mean, actually mandatory. I don't mean a passport. I don't mean at your workplace. I don't mean for school. I mean actually mandatory in this sense: "If you do not get a vaccine," the rule says, "we will fine you or put you in prison." Okay, well, now that is an actual mandatory vaccine. And we have section 7 in the Charter. Section 7 says, "Everyone has the right to life, liberty, and security of the person." Security of the person will include the notion of bodily autonomy. It's where in the Charter you will find the idea that you have the right not to give consent before medical treatment. A medical practitioner and the state need to get your voluntary informed consent before they can apply treatment. Okay.

If we had a mandatory vaccine, an actual mandatory vaccine? That—you'd like to think, I would think—would violate section 7. That would be unconstitutional. But that's not what we had. We had something much more clever. We had a collection of policies put forward by, enacted by, directed by, promoted by the agencies of the administrative state that said, "Listen, you can do what you want. You don't have to get a vaccine. But by the way, if you don't get one, you might not be able to have a job. You won't be able to fly on a plane or a train. You maybe can't go to a restaurant. Maybe your kids can't go to school.

[00:25:00]

But it's still your choice. We're not requiring you to get one. We're not coercing you." And they're right. In the strict legal sense, that is not unlawful coercion.

Why? Because they're not making you—with the force of the state, with fines or imprisonment. It doesn't fit within the idea of unlawful coercion. The argument that they were making about this does fly. It fits within the gaps in the Charter. So those people who thought, "Well, we have security of the person in section 7, they can't make me take a vaccine." And those people are right. They can't make you take a vaccine. But they can set up consequences if you don't, and thereby avoid the Charter protection. Compulsory vaccines are likely a violation of section 7. But vaccine passports probably are not. And that's what the courts have said. And this is just one example of going around the back door, of doing indirectly what cannot be done directly.

Let me give you a concrete example of how this works outside the COVID situation. And this is going to sound banal, but it's abstractly similar, so you can see it. Let's say a province creates a rule that applies to all retail establishments—stores and restaurants and so on—that says, "You cannot go into the establishment, a public commercial establishment, without shirt and shoes." Some people might say, "Well, hold on, wait a minute, I have rights. I have Charter rights. I'm being made to wear something that's a violation of my person. My clothing or lack thereof is an expression that violates my freedom of expression." And so on and so forth. You can see the argument that for someone who doesn't want to wear a shirt, this is actually a violation of their choice.

But of course, this is not going to work, because there are rationales for the rule. The rationales are public decency, public health. We don't want you walking around in a restaurant without a shirt on—just not going to look good and it might be unhealthy. There's going to be a social consensus and a legal rationale for having the rule. Therefore, you're not going to be able to reject it. The answer's going to be, "Look, you don't have to go to the restaurant if you don't want to wear a shirt." And that's exactly the kind of argument you heard with the vaccine passports: "You don't have to have one, just don't go. Now, the fact that you can't basically do anything without the vaccine is not our problem. Because it's a series of choices. And the Charter does not entitle you to be free of consequences," is the way that they would put it.

So here are the other kinds of rights in the Charter that have been tried as arguments against various COVID rules: freedom of assembly and speech, conscience and religion; mobility rights in section 6 for the refusal to take the unvaccinated on planes and trains; freedom from arbitrary detention [for] the mandatory quarantine hotels that they ran for a while. For the most part, these didn't work. And of course, even if they had worked— And sometimes they worked. Sometimes you had a rule that so plainly infringed one of these rights that the court had to say so. And then found another reason why it was still okay.

And this is the main reason, this is the famous section 1 of our Charter. This is the “reasonable limits” exception. These rights and freedoms guaranteed in the Charter are “subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society.” Now, that’s wide enough to drive a truck through if you want to. And some courts used that exception to say that even though this rule—

[00:30:00]

For example, there were rules prohibiting gathering for church services at the same time some stores were open, because gathering in stores is one thing that the state approves of and gathering in churches was another thing that they didn’t want to happen. And those rules clearly infringed your right of assembly, perhaps your freedom of religion and so on. The court said, “Well, they do, but it’s a reasonable limit because of the situation that we are in.”

And for the most part— And I want to be clear that courts don’t act as a monolith. No one sends a memo from on high to all the judges and all the courts saying, “Here’s the attitude you should take about this.” That’s not the way it works. And I’m not suggesting that all the courts and all the judges are all thinking the same way. That wouldn’t be correct. But if you look at the pattern, for the most part I would argue that courts largely embraced not only the premise of the administrative state, but embraced the government COVID narrative. And you can see that if you take a wander through the various cases that have been tried over the past two or three years. You’ll see that in their decisions. In black and white, they have said things that have suggested that they are totally on side with the danger that has been portrayed, that the virus poses, and the efficacy of the various rules that have been tried and put in place.

Here are just a couple of— I’ll just take you through some examples. This is just to give you a flavour of the approach that many courts have taken.

Here’s a case from Manitoba: “[T]he factual underpinnings for managing a pandemic are essentially scientific... [and] fall outside the institutional expertise of courts.” We don’t know how to do this. And we don’t want to do it: “it is not an abdication of the court’s responsibility to afford the [public health officials] an appropriate measure of deference.” There’s the deference I was speaking of. There’s the deference that makes the administrative state powerful. Courts don’t want to deal with this. The judges don’t have the expertise in these subject areas and the officials do. That’s the rationale.

Here’s another one. “[L]ike times of war... pandemics call for sacrifices.” This court is equating COVID with being at war. And during times of war governments are entitled to expect sacrifice from their citizens. In other words, “You will do as you are told, because **we’re in a crisis here. And we are not going to tell the government not to do what it wants to do.**” That is a reflection of the premise of the administrative state.

And note this— necessity. Necessity is so often the rationale for putting public welfare ahead of individual autonomy. You can find necessity pretty much anywhere you look if you want to find it.

“If some are unwilling to make such sacrifices ... [the Constitution] will not prevent the state from performing its essential function of protecting its citizens from that risk.” And note the end there. It is not a given that the job of government is to protect citizens from risk. That is the job of the administrative state. But it is not the job necessarily of any government organization, of any conception of what government’s supposed to be.

There is the big idea that we don't know that we have. The idea that government has the job of protecting its citizens from risk. That is part of the premise that must be challenged. I would say, in my opinion,

[00:35:00]

that the role of government is not to protect citizens from risk and that that function is the citizens' job to do on their own. But if you accept that premise then you get the COVID regime.

Another example. This is a case from Nova Scotia dealing with protests outside against lockdowns. "[Protesters] are uninformed or willfully blind to the scientific and medical evidence that support those measures." Now, of course, we have a pretty good idea now that actually that's not true. In fact, it might be actually the reverse, that the protesters actually had it exactly right. But that was not acceptable then. Why? Because of the premise—because officials had said, "We're going to have lockdowns." And officials have the authority, expertise, and discretion to decide the public good. There's your logic. If the officials have said so then that's the conclusion: Therefore, the protesters must be wrong.

This is not based upon evidence from the court—or induced in the court. I mean, there was evidence. As there is in any case, you'd hope to have conflicting evidence. It's the purpose of experts coming into a courtroom: I think this, I think that. Those two things conflict. The job of the court is to resolve that conflict and decide whose makes more sense. But in so many of these COVID cases, the court would be inclined to dismiss the evidence of those who were challenging the rules and to embrace those producing evidence on the part of the government. So the protesters show "a callous and shameful disregard for the health and safety of their fellow citizens."

Just two more—and then I'm basically done. And if there are any questions, I'd be happy to take them.

I'm able to take judicial notice. Now, here's a very interesting thing: In a number of cases, especially family law cases, a number of courts took judicial notice. Judicial notice means a judicial conclusion of facts not based upon evidence. Judicial notice is a thing. It's designed to allow a court to assume certain facts as true even though there's no evidence—because those facts are so notorious that nobody would spend time debating them. "The sky is blue." A court can take judicial notice of the fact that the sky is blue. Who would say otherwise? But the efficacy and safety of the vaccine was at least in part the issue in the case. And yet, in these cases—at least a handful of them—courts took judicial notice of the safety and efficacy of the vaccine precisely because they did not want to delve into the evidence.

And finally, here's a really neat one. This is from an Ontario court. "The measures"—the COVID measures that are being challenged in this case; the COVID measures themselves, the ones that say, "can't do this, can't do that, must do this"—these "measures protected the constitutional rights of those individuals to life and security of the person." You see now how the Charter is being exactly turned around. Instead of protecting you from the tyranny of the state, the Charter in this paragraph is now being used as a rationale and justification for why the state must come down and tell you what to do in order to protect your neighbours.

So maybe I'll stop there.

Shawn Buckley

Professor Pardy, before I let the commissioners ask you questions, I wanted to ask if you could also comment perhaps on the doctrine of mootness and how that has been applied to thwart some Charter cases.

Dr. Bruce Pardy

Sure, yeah. Mootness is this idea: Courts are tasked with resolving live disputes. If you went into a court today and said, "You know, I've always wondered about this question. What would happen if—?" If you did that, the court would throw you out because it's not a real dispute.

[00:40:00]

It's theoretical and therefore moot. It's a waste of judicial resources and time. It's got to be concrete; it's got to be a real thing. So mootness comes along when a dispute that was real at the beginning becomes theoretical because something changed. The rule, for example, that was being challenged was repealed, taken away. The person with the problem doesn't have the problem anymore because the rule is gone. And on that basis, courts will dismiss suits that are moot if the rules are withdrawn.

However, the problem with doing that is that you essentially give a licence to the government to bring the rule back. If you do not resolve the legal question about whether the rule was constitutional to begin with, then it's still an open question. And a few months or a few years down the road, the government could say, "Well, we didn't get into trouble the first time. Let's do it again." Or even more— In an even more sinister way if you wanted to go this far, if you were the government, you could think, "Well, you know what? If we just keep playing this mootness game, we can put on the rule for as long as it takes the case to get to court. Before we get to trial, we'll just take the thing away. It'll therefore be moot. The thing will be dismissed for mootness. And therefore, we can put the rule back on." Sort of a cat and mouse game. That's the kind of reason why courts have the discretion to hear a case which is technically moot. And they often do. But in this COVID era, some courts have declined to do that. For the reason, I would posit, that they don't want to. They don't want to be the ones to decide the COVID question. And understandably so.

Here's one of the mistakes that people who have opposed COVID rules have made, in terms of their thinking. They thought, "This is crazy. Something strange has happened to society. I'm going to take this mess to the court to have them sort it out and put things back together again." You are essentially asking the courts to serve a political function. Courts don't want to do that. They don't like to get involved in politics to that extent. Predictably, the situations in which they've been tried to be given that mandate, they've backed away from it. And I quite understand that. But I think that's the story on the mootness.

Shawn Buckley

Thank you, Professor Pardy. I'll allow the commissioners to ask you questions. When you conclude, if you can give your thoughts of perhaps how this could be changed to prevent the administrative state. But we'll let the commissioners ask you questions first.

Commissioner DiGregorio

Thank you, Mr. Pardy, for your testimony today. I wrote down a hundred questions but wanted to hear your presentation throughout before I tried to put them in some order that

will help us to take this—what you’ve told us today—and develop it into recommendations in our final report. And so that’s kind of how I’m framing the way I’m going to ask these questions.

In trying to pinpoint where the problems are that we can address, or provide recommendations to address, I heard you talk about an issue with the role of delegation from the elected legislation to the unelected administrative regime, let’s say. I heard an issue with the courts providing deference to the administrative state. I think I heard you talk about potentially the Charter being too weak to have protected rights robustly and that it could be overcome indirectly. I’m just trying to think about, on each one of those levels, what we could recommend.

And if I start with the delegation problem: Do you think that what’s needed is a different standard, maybe legislative standards, as to when and how delegation can be given from the elected legislature to the unelected administrative state?

Dr. Bruce Pardy

The short answer is, yes. And thank you for the question. In a way, this is the question.

There is at least theoretically a doctrine, a non-delegation doctrine, which we don’t have in this country. The Americans do have a form of a non-delegation doctrine in some places. It’s not robust, but it does exist.

[00:45:00]

In this country, we have essentially had the rule that a legislature can delegate its powers any way it likes as long as it maintains the right to take them back.

A better rule, in my view, would be a non-delegation doctrine that said the following thing. This work, by the way, has been done by a fellow named James Johnson, a very thorough legal scholar and researcher. He’s made this case in an article, amongst other places, in the *UBC Law Review*. But he says this: “Legislatures should have the job of articulating the substance of the rule.” In other words, our MPs and MPPs are elected to make policy decisions. That’s legitimate. And as long as they make those judgment calls, that’s fine. Those judgment calls between “this” and “that,” about where the line should be drawn; what the considerations are; what values or virtues are going to be reflected in the rule: that’s a legitimate thing for elected officials to do. Because they’re elected, they have democratic legitimacy. But the job of making that call, making that difficult political call about where to draw the line, the substance of the rule should be made in the legislature. So if the people don’t like it, number one, they can see it being made; and number two, they can kick the bums out next time if they don’t like it.

What should not happen is that the statute should avoid having to make the hard call and send it off to some dark room in the back. Where you can’t see the rule being made, sometimes you don’t even know what the effective rule is. Okay? That’s the essence of the non-delegation doctrine. It should be sunlight; it should be democratic. It’s not that the governments can’t make policy choices; it’s that they’re not being made by the right body. And that’s the essence of a non-delegation doctrine.

Commissioner DiGregorio

Thank you. So then, moving on to the issues we've seen with the courts throughout the pandemic, you identified—I think quite rightly—that there's been a lot of deference given by the courts to the decisions that have been made. And in terms of thinking about recommendations we could make to maybe strengthen the role of the courts, do we need statutes that set out perhaps better standards of evidence that are required before deference is provided? Maybe rules around when judicial notice can be taken, do we need to strengthen that area?

Dr. Bruce Pardy

Yes and no. Certainly, rules of evidence are within the realm of the legislature to act upon.

But there are some things about whether courts should get deference and the nature of judicial review and so on that the courts are going to view as in their area and not the legislature's. In other words, we have—and quite rightly and good that we do—we have a tradition of judicial independence. And the courts as an institution, again quite rightly, are going to look askew a little bit at legislative attempts to curb what it is that they can do when they review the very legislation that they are asked to do.

In a sense, it's a constitutional dilemma. You want these three separate branches to do their job. And you want them to do it properly. We see a problem about how they're doing that job independently. And yet when one branch comes along to try and tell the other branch to do their job properly, that's interference with that branch by the first branch. So I don't have a simple answer to your question. It's a very good question. It's worth looking at the degrees to which legislatures could stipulate the legal rules about evidence to be applied in a court. On the other hand, the rule of judicial review, the constitutional standards for assessing when deference is going to be given and so on, is largely common law in the sense it's developed by courts. And we should probably be careful about treading on that territory.

Commissioner DiGregorio

Thank you. Lastly, I'd just like to ask you about your views on the Charter. And I think I heard you essentially say that a lot of the rules that were put in place did not violate the Charter. I think that could probably be argued both ways by many lawyers. But let's accept that perhaps that is the conclusion that the courts will reach.

[00:50:00]

Is it then your opinion that our Charter needs to be changed or revised?

Dr. Bruce Pardy

Oh, I think our Charter needs to be revised. Yes, definitely. I think it has proven to be inadequate to the task that people expect of it. I think the prospects for revising it are very, very poor. And I would even be reluctant to go down that road because once you open it up, you are also subject to the forces that might want the Charter to be more what it's becoming instead of less. In other words, a Charter looks like a roster of individual rights and freedoms. Over time, it is probably less of that and more of a progressive blueprint for common interventions.

For example, the way that the Supreme Court over a period of decades has interpreted section 15(1), which is the equality provision: from one that I read as providing in section

15(1) a requirement for equal treatment in the law, the Supreme Court has basically said that 15(1) and (2) together require substantive equality. Now, that is a real conflict in vision. If we opened up the Charter, I would be concerned that we would go further down that road instead of back to the one that I would like to see.

Commissioner DiGregorio

All right, thank you. I'm going to stop my questions there.

Commissioner Drysdale

Thank you for your testimony. Like my colleague, I have a hundred questions. And although we have the ability to ask those hundred questions, I don't think anybody would stay for them. But I have a few questions. And we've talked about—or you've talked about—the three branches of government, if that's the right term. You know, we often talk about another branch of government unofficially. And I ask this question because when I look around this room—and I looked around; I did this as well in our last hearing and I will do it in every hearing—I only see a very thin representation from that other branch of government. And I'm talking about the press.

Dr. Bruce Pardy

Right.

Commissioner Drysdale

But in my mind, there's another component as well and that's the component of the people. I start to look at the participation in our political system. And I start to look at the numbers of people that vote or don't vote and the number of people that get elected by acclamation in our country. And I also look at the incredible power of each of the leaders of the two or three political parties we have. In other words, the candidate doesn't even get to run unless they're vetted by that.

So having said that giant mouthful, how do we re-engage the public? How do we re-engage the press in an honest and open way? Big question, but would you agree that that's kind of the fundamental of getting change? Because if you're not holding the big stick, they won't make the change. And you can only hold the big stick if you can engage the population. Is that a reasonable statement?

Dr. Bruce Pardy

Yes, absolutely it is. But it's also all tangled up, the problem that is, right? Because it's not just a case of electing the government that you will solve the problem. Because the idea is deep enough so that the particular stripe of party that's in power doesn't actually change the game. Elections and democratic participation and so on is very important, but it's not the whole story either. I'm afraid I think it goes back to the set of ideas people carry around.

Let's talk about the press for a minute. For some reason, we have come to the idea—a lot of people have, I think, in the here and now—that the job of the press, whether or not it's the legacy press or the new independent press or for that matter just people online, that their job, their responsibility, is to tell the truth. In fact, that if you are speaking— Whether it's in a forum or online or as the case may be, that if you are not speaking the truth that you are

not really exercising your free speech legitimately. And that's, in my opinion, completely wrong.

[00:55:00]

Free speech, upon which our press traditions are based, is not based upon truth. As soon as you have the idea that people have to speak the truth to be allowed to speak, now you've got a real problem. Because now you have to define what the truth is. And the only party able to do that is the government. So now you have free speech that's supervised by government approval of what you're saying. That's the opposite of free speech.

You're allowed to say what you think, not because it's true, but because it's what you think. And that's got to apply to the press too. And the job of a free citizen in a democratic country is to take all the things that they hear from everywhere and to understand that it might not be true and decide for themselves what is. And that's just one of the many ideas we have to get embedded into our people again.

Commissioner Drysdale

I have another one. And I very much enjoyed your talk, and I learned a lot from you. But my question to you is: Would you consider what happened here, in your opinion, to be a significant breach of at least what Canadians' perception of their freedom is?

Dr. Bruce Pardy

I think it was a breach of their perception, yes. Part of what happened during this period, if I can put it this way, is a lot of Canadians discovered that their perception was wrong. And that's a hard lesson. We've been assuming that the system works in a certain way and that we have certain rights and freedoms. It says so in the document. Why wouldn't we believe in it? And then this thing comes along and you find out that what you thought is not true at all. So if there's any silver lining to this period, it might be that the curtain has been pulled back on the way the thing actually works and what it actually means. And having discovered that, now's the time: if we don't like what we see, got to fix it.

Commissioner Drysdale

Next question has to do with— This is going to sound odd, but why are you here telling me this? The reason I say that in the way I'm doing it is because, if reasonable people consider what happened to be a fundamental challenge to what we understand our country to be, why is the head Solicitor General of the country or the Supreme Court Justice not sitting in that place to explain it to us as Canadians? Rather than—and not to be insulting but, you know—a university professor or a lecturer?

Why is a Supreme Court justice not sitting here telling me what it is?

Dr. Bruce Pardy

There are many ways to answer that question. Here's one of them. Number one because it would probably be out of line for them to do that. But also, because—and I don't want to speak to every single one of them—a lot of them will believe in the premise I discussed. They really do think that it is the job of government to protect us and to manage society. It is the job of public servants to fix social problems. That's part of the premise. And if you were to stand up in public and say, "No, no, no, no, no, no, no. Governments and their

officials should not be primarily involved in bringing the power of the state to bear to fix social problems and keep people safe.” Okay? Now I’m talking heresy. Absolute heresy. Certainly, amongst that population of people who are, after all, involved in their careers in that enterprise: if you were to be a person with prominence in that area and stand up and say that, you will be undermining the whole machine.

Commissioner Drysdale

My last question is, what is the standard for the courts or the police when it comes to making a ruling like you talked about the ruling at Gateway Bible Baptist Church [*Gateway Bible Baptist Church et al. v. Manitoba et al. (2021)*] in Manitoba?

Dr. Bruce Pardy

Right.

Commissioner Drysdale

So they make a ruling.

[01:00:00]

And then evidence becomes public shortly thereafter that proves that ruling incorrect. What is the process? Can the courts readdress that on their own? I’m wondering what the process is.

Dr. Bruce Pardy

Yes, it’s very unusual to go back to a case. The general rule is that once a decision is done, it’s done. In very narrow circumstances, in certain kinds of cases, if new evidence does come to light— For example, let’s say somebody has been convicted of a crime and is in in prison and new evidence comes to light. There’s a process for applying to reopen the situation. But in general, of course, that is not what’s done. The new evidence becomes relevant to the next time around if that issue should rise again. But for the most part, a case is a finished case.

Commissioner Drysdale

Thank you.

Shawn Buckley

I see we have another commissioner.

Commissioner Massie

Just one question.

Shawn Buckley

And I do too. I’ll let you go first. Professor Pardy, we clearly did not give you enough time.

Commissioner Massie

Thank you so much for your presentation. It really helps me to understand a lot of situations we're in. I just want to come back to your administrative state, which is probably prevalent in all of the Western society.

Dr. Bruce Pardy

Absolutely, yes.

Commissioner Massie

And to me, I've been living in the administrative state during my career. One of the things I've always struggled with is that there seems to be a disconnection between authority and accountability. Is there a way to reintroduce true accountability within the administrative state?

Dr. Bruce Pardy

That's a very good question as well. You would think—you would like to think that authority would come along with accountability. Those two things should really travel together. But they often don't. And part of the reason for that, and this is reflected in the law, the way the courts have developed it as well, is: if you are trying to sue the government for negligence, for example, you are able to sue them for operational failures. So let's say the government has adopted a policy of paving roads in a certain way, in a certain place, in a certain frequency. And they fail to do that properly. The road isn't well done; there's potholes; it's dangerous. And you have an accident on the road because of their failure to carry out the policy. You can do that. You can hold the government liable for its negligence, as long as it's an operational failure. You generally cannot sue the government for its policy decisions. If the policy creates bad outcomes, there's no cause of action.

And that makes sense in a way, for this reason. All policy decisions create some bad outcomes for somebody. That's the nature of a policy decision. It's a matter of weighing costs and benefits and drawing a line somewhere. And some people are going to be on one side of the line, and some people are going to be on the other. So, it'd be very problematic for us to say you can sue them for policy decisions. That probably won't work, right? It's part of the democratic process to give the elected officials, as I said before, the power to make those kinds of policy decisions. And you would never be able to sue a legislature for the policy that it put inside a statute that was properly passed. That just wouldn't go.

Shawn Buckley

Because of time I'm going to defer on my question. We must take a lunch break. But Professor Pardy, I want to thank you on behalf of the National Citizens Inquiry for coming, for sharing your thoughts. I think I speak for the commissioners and everyone present that you have made us think about things in a different way and we thank you for your contribution.

Dr. Bruce Pardy

Thanks for having me.

[01:04:18]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Marc Auger

It's Marc with a C, M-A-R-C, Auger, A-U-G-E-R.

Shawn Buckley

And Mr. Auger, do you promise to tell the truth, the whole truth, and nothing but the truth?

Marc Auger

Yes, I do.

Shawn Buckley

Now, you were a professional firefighter for 30 years.

Marc Auger

Yes.

Shawn Buckley

And I want to say you had the good fortune of retiring just as COVID was hitting, but—you retired just before COVID hit.

Marc Auger

Yes, I did not have to deal with any of that.

Shawn Buckley

Right. But you had to deal with your father, Pierre. Can you please share with us what your experience was with him and the different COVID policies?

Marc Auger

Yes, my father had early onset dementia and he could not live on his own, so he moved in with my sister and lived with her for about three years. But on June 7, 2021, we had to admit him to long-term care. And that was at the height of COVID when there was a bunch of mandates and restrictions. I was his power of attorney and at times I was not allowed into the home to visit him and it made my job as a power of attorney very difficult.

Shawn Buckley

Now, when he moved in, were you allowed in that day?

Marc Auger

The day he was admitted to the long-term care, yes. I had to go in to fill out a bunch of forms.

Shawn Buckley

Okay, so you were allowed in that day but then you weren't allowed in after that.

Marc Auger

Yes, there was periods of times I was not allowed in.

Shawn Buckley

And what was the reason you weren't allowed in?

Marc Auger

At that time, I was unvaccinated.

Shawn Buckley

And how did that make you feel?

Marc Auger

Segregated, very segregated. I don't think I should have been prevented from going into the home just because of my vaccination status.

Shawn Buckley

Right, so I mean, even if you tested negative, their policy was that you couldn't go in?

Marc Auger

Well, at the time, there was no testing when he was admitted. Later on, they did bring in rapid testing; and since I was a primary caregiver, I was allowed to get back in and see him on November the 23rd. And the frustrating thing for me is to this day, when I go visit him in long-term care, I still have to rapid test. Everyone rapid tests before they can go in and visit.

Shawn Buckley

So you mean in March 2023?

Marc Auger

Yes, I was there last week and everyone who goes to visit in a long-term care home has to rapid test.

Shawn Buckley

So he went into long-term care on June 7th of 2021. You weren't allowed back till November 23rd 2021. Did you notice a difference in your father when you were allowed back?

Marc Auger

Yes, I did notice. When I was in to visit him, his dementia declined. And I'm convinced that the decline was due to him being basically locked in his room. They received all their meals in the room. I couldn't come and visit. My sister could visit because she was vaccinated. And she had to try to explain to my father why I could not come in and visit him.

Shawn Buckley

Now, after you started being able to visit him, did you notice a change? You were able to start visiting again in November and you'd noticed a decline.

Marc Auger

Yes.

Shawn Buckley

Did anything happen after you started visiting him?

Marc Auger

After I could go in and visit, the very first time I saw him, he didn't even recognize me. And then after a few visits, he could recognize me, but it was like every time I went, there's different rules. So sometimes we'd have to meet outside. They'd have a table set outside and he would be in his wheelchair on one side and I'd be on the other side of the table, masks sitting outside, trying to carry on a conversation with someone with dementia. It was very frustrating.

Shawn Buckley

Now, I want to change subjects. You went to the hospital back in October of 2021.

Marc Auger

Yes.

Shawn Buckley

Can you tell us about that experience?

Marc Auger

I ended up showing up at a hospital on a Friday night with severe abdominal pains.

[00:05:00]

And after a bunch of tests, I was diagnosed with appendicitis and I needed emergency surgery to remove my appendix. I was admitted to the hospital at that time, and I was laying on a bed, a stretcher in the hallway. And as they were doing the admitting to the hospital, the nursing team was doing all the paperwork and they said part of being admitted to the hospital and needing surgery is we have to do a COVID test. But they weren't concerned because they knew I was fully vaccinated. And once I informed them that I was not vaccinated, the whole demeanor changed. The nurse left the bedside, came back and said, "We have now found a room for you." Originally, they told me I'd have to spend the night in the hallway on a stretcher because there was no rooms.

Shawn Buckley

So can I just break in? What you're telling us is— You're told you got to basically spend the night in the hallway on a stretcher—

Marc Auger

Waiting for surgery.

Shawn Buckley

When they think you are vaccinated. But the minute they find out you're unvaccinated, they found a room immediately.

Marc Auger

Yes, I was rolled in on the stretcher into a single room, you know, glassed-in room. And that's where I spent the night: in this glassed-in room on the stretcher. They didn't even transfer me onto a hospital bed. I spent the night on the stretcher.

Shawn Buckley

Now, were you tested for COVID during your stay?

Marc Auger

Yes, they did the test. Once they knew they were admitting me, they did a test and the test did come back negative.

Shawn Buckley

So the hospital knows that you do not have COVID.

Marc Auger

Yes.

Shawn Buckley

So did the treatment improve when the test came back?

Marc Auger

I felt very segregated. I was in a room by myself, had to wear a mask the whole time I was in this room. And one of the most disturbing parts of it was, through the night I had to get up and go to the bathroom. And there wasn't a bathroom in the room. So I got up off my bed, went down the hallway to the bathroom. When I came back, I noticed there was a yellow Post-It Note stuck on the glass lighting door and it had one word written on it. "Unvaccinated."

Shawn Buckley

And how did that make you feel?

Marc Auger

Not very good.

And it just sort of— I was on my own, you know. My wife could come in and see me. She went home for the night but she was in in the morning again. But she was the only one that was allowed in.

Shawn Buckley

Did you get much nursing attention that night?

Marc Auger

I only recall a couple times the nurse came into the room to check on me.

Shawn Buckley

Now, you're waiting for surgery.

Marc Auger

Yes, I had surgery the next day.

Shawn Buckley

And this is emergency surgery?

Marc Auger

Yes, they had to call in a surgeon and an anesthesiologist and two surgical nurses to do my surgery, and I was the only surgery done that Saturday.

Shawn Buckley

Am I correct in suggesting to you that this was a life-and-death situation?

Marc Auger

That I cannot answer, but I was in a lot of pain and they told me that they had to come out. So that's why they did it the next day.

Shawn Buckley

Right. Now, you were telling us that at the hospital, you were treated differently once they found out you were unvaccinated. Has your status changed, your vaccination status?

Marc Auger

Yes, I did get vaccinated. I 100 per cent regret that decision I made. I was not anti-vaxx, I was vaccine-hesitant. And the reason I was vaccine-hesitant is I have had two bouts of pericarditis in my lifetime: once as a teenager in high school and once in my 20s as a firefighter. And both times it was very painful and I required medication to get over the pericarditis. And I started doing research at the very beginning of COVID and what I could find out—it seemed like it was very hard to get information—but I did find out that the mRNA vaccines and the AstraZeneca vaccines both had possible side effects of heart inflammation, and I wasn't willing to take the risk.

So I researched Johnson & Johnson.

[00:10:00]

And at the time, Johnson & Johnson was purchased by the Canadian government, but they did not release it to the provinces. So I basically waited until it was available in Ontario before I considered taking it.

Shawn Buckley

Sorry, I turned my mic off.

Did you feel that you were perfectly free to take the vaccine or not take the vaccine?

Marc Auger

No. To this day, I feel like I was 100 per cent coerced into that decision. Mainly because of the experience I had in the long-term care home trying to look after my father, and the experience I received at the hospital as being an unvaccinated patient needing surgery.

Shawn Buckley

What happened when you were vaccinated?

Marc Auger

I was very hesitant at getting vaccinated. The last vaccine I did receive was a shingles vaccine and I did have a reaction to that, which was another reason I was vaccine-hesitant.

But I just felt like I was being coerced into doing this because if I wanted to do anything, I had to be vaccinated.

So I got vaccinated on December the 23rd, and the next day I felt like I got run over by a truck. I was in a lot of pain. I have arthritis. It just seems like my arthritis flared up. For the first week, I was in a lot of pain. Then ever since then, my arthritis has been worse. I've talked to my doctor about it, and my doctor has no explanation. She just suggested to increase my arthritis medication.

Shawn Buckley

And so this was a sudden change?

Marc Auger

The day after being vaccinated, I was sore for a week. Like it was hard getting in and out of bed, walking up and down stairs; everything hurt, just hurt. And then for the first year, my shoulders—I had a hard time sleeping on my side, my shoulders would hurt. It's been progressively getting better because it's been well over a year, but I'm still not back to the way I felt pre-vaccination.

Shawn Buckley

Now, you have not gotten your second shot.

Marc Auger

Well, that's one of the reasons I did decide to go with Johnson & Johnson because it was a one-shot vaccination; you're considered fully vaccinated. And it was a viral vector vaccine, which was closer to the flu shot, which I have received before and didn't have reactions to. But one thing that really frustrates me is when you see anything in mainstream media, they always talk about two shots. To be fully vaccinated, you need your two shots. But Johnson & Johnson wasn't that way—at one shot you're considered vaccinated—but they never talk about it. Why did the government push the mRNA vaccines? Did they want multiple shots? I don't have the answer.

Shawn Buckley

Mr. Auger, you've had several experiences concerning government policy decisions on COVID. What would you think we should do differently if we were to face this again?

Marc Auger

Everything. To me, anyone who spoke against it was silenced. There should have been more open conversation about getting vaccinated and not getting vaccinated, side effects. It just seemed very rushed to me. And the government just kept moving the goal post, you know? It was, "Get your two shots, you're done." "Now, get a booster," you know? "Now, mix and match vaccines." It just—it was like the science was changing constantly and they didn't really have the science to back it up. It just kept changing, it just happened too quickly.

Shawn Buckley

Thank you Mr. Auger I have no further questions. The commissioners might have questions.

So we're good. Thank you so much for your testimony.

Marc Auger

Thank you for the opportunity.

[00:15:00]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 3: Catherine Swift

Full Day 1 Timestamp: 05:09:14–05:38:20

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness today is Catherine Swift. Catherine, can I get you to state your full name for the record and spell your first and last name for the record?

Catherine Swift

Catherine Susan Swift, C-A-T-H-E-R-I-N-E, S-W-I-F-T. Like Taylor.

Shawn Buckley

Thank you. And Catherine, do you promise to tell the truth, the whole truth and nothing but the truth?

Catherine Swift

I do.

Shawn Buckley

Thank you. And I'll say it's nice to finally meet you in person; we've spoken several times on the phone. Now, you are currently president of the Coalition of Concerned Manufacturers and Businesses of Canada [CCMBC].

And I need you to speak, not nod, because we're being recorded.

Catherine Swift

Yes, I am.

Shawn Buckley

Can you just give us a brief idea of what the CCMBC does?

Catherine Swift

We're basically an advocacy organization for businesses. We started off exclusively representing manufacturers, but in the last couple of years we've branched out to other sectors of the economy. Most of our members are still in Ontario, but we do have some elsewhere in Canada. But we're still largely Ontario-based. And basically, we just advocate on the issues that are most important to business at any given time: taxation, regulation, red tape, energy. Energy issues have been huge lately as manufacturers in particular consume quite a bit of electricity, for example, and other energy sources. But there's a whole range of different issues that we end up getting involved with and we're quite independent relative to other business organizations. Most business organizations are somewhat financed by government and they often end up more as a representative of government than they actually end up as a representative of business. So we very deliberately don't do that.

Shawn Buckley

And you used to be at the Canadian Federation of Independent Business?

Catherine Swift

Yes, I was the President and CEO of the Canadian Federation of Independent Business for 20 years. And I was Chief Economist there, and some other positions for another seven— So I was there almost 30 years.

Shawn Buckley

Right. And prior to that you were in government and banking; you have a long history as an economist and then running basically, business organizations.

Now, you have surveyed a number of the CCMBC members to get their feedback on how government COVID policies affected them. Is that correct?

Catherine Swift

Yes, that's correct.

Shawn Buckley

And we've invited you here today to share with us what businesses are reporting back to you. So please do share with us what you've discovered.

Catherine Swift

Yeah, I sort of divided the responses I got. I surveyed about 23 businesses total. And I divided the responses into the really common ones that virtually everyone had and some of the more anecdotal stories that might have been unique to one business or two businesses.

In terms of the common issues, the three most common issues: I would have to say the number one issue was issues with employees. Now, there was quite a diverse range of issues with employees and that's not surprising. In these types of businesses— I might add that most of our members are probably small to medium-sized businesses, so the business owner typically has a lot more interaction with the employees than you'd find in a big corporation, where people don't even meet the CEO in their entire careers and whatnot. So

they have more of a personal connection with their employees. And the number one issue was the government assistance discouraging employees from working. Despite how many measures the employer may have put in place to— And people were scared, let's face it, there's no question about that. But no matter, employers tried to do their best to have their employees realize they were running a very clean, very safe workplace in all kinds of different ways.

But the fact that the government assistance— And not just the magnitude but also the duration of the government assistance because it went on and on and on long after— Really, there was a big concern about COVID. And also, the fact that there was very little— and we know this from other sources—very little qualification for these monies. They were basically distributed very freely. And we know a lot of 16-year-olds that never worked in their life got CERB [the Canada Emergency Response Benefit] and whatnot. But that was frustrating for employers.

Most of these businesses—in fact, almost all of them—stayed operating. They were all designated as essential. So they weren't closed. Of course, the closed businesses had a whole different set of issues.

[00:05:00]

But those employee issues were very extensive.

Naturally, there were a lot of cost increases that businesses had to comply: putting partitioning in, changing the spacing of employees in their workplace. Some of the employers had vaccination within their workplace, if that was possible. Others facilitated employees getting to vaccination if they wanted it. And so there was an increased cost. And there were some government programs that were supposed to cover some of those increased costs. But most of them didn't find them sufficient or found they were just so difficult to apply for, they just got frustrated and said, "Forget it, I'll just absorb the costs of that." So the employee issues were very, very extensive.

One other factor I heard was the demonization of unvaccinated employees within the workplace and how it was divisive within a workplace for that reason. And one business gave me the example that they happened to have a union and the union couldn't decide whether they were going to defend the unvaccinated. One day they'd be on their side, then the next day they'd be vilifying the unvaccinated and siding with— And they said it was just so chaotic and divisive for that business. It really was problematic for the operation of that business. So that was kind of an odd result that happened there. So that issue.

And I don't know if you want me to get into all the anecdotal stuff now, or exactly how you want to, because there were a number of—

Shawn Buckley

I actually think when you're on a topic, that might be helpful. You're talking about employee issues and some specific examples on how the benefits basically were too generous and too long. That created, I presume, employees quitting or staying at home rather than coming to work, so some examples on that would be helpful.

Catherine Swift

Yeah. Well again, a lot of people decided they liked staying home. And again, that's understandable, and that was facilitated obviously by the benefits, and so the difficulties in operating were problematic. There was also the case that when the money was sloshing around so very liberally—literally and figuratively—that people found they would know in their neighbourhood, say, that somebody was getting benefits. And everybody was sort of aware and almost competitively comparing what was going on. Because some businesses, if they could afford it, actually shut down for periods of time. And that would naturally mean that our members' businesses were looked upon as problematic because they kept operating. And so there was a number of really interesting, I guess, impacts there.

Some of the employers were of course trying to support their employees as best as possible. And they did feel, and I suspect you've heard this from other people, that the alarmist news—constant drumbeat of alarmist news, death counts every day, and all this—was way over the top. In the case of media, you can expect that but governments were very unhelpful as well. They sort of went to the extreme instead of possibly being a little more moderate in their approach.

Something also with the CERB benefits that was commented on, and partly the notion of them going on longer than they really needed to: They seemed to be very politicized as well. A lot of employers felt they were more a tool for the government to try to gather votes than to actually be necessary. And actually—of course a lot of money was spent as well, a lot of tax dollars was spent—they almost weren't even pandemic-related anymore. They became a political tool to encourage people to vote Liberal. In terms of—

Shawn Buckley

Can I just stop you there, I just want to make sure that we understand what you're saying. Can you share with us maybe a conversation or two? You don't have to disclose the person or persons, but I just want to make sure we understand. Because I believe you're saying that business owners are reporting back to you that, at some point, having to take these measures felt more like a political exercise than a public health exercise. And I think that's an important point for us to understand.

Catherine Swift

Yeah. Well, it was just that they lasted much longer than— They were renewed and then of course we did have a federal election in 2021. The linkage with that federal election seemed to be pretty direct, so that was the sense that a lot of businesses had.

[00:10:00]

I just want to mention the other two of the big three, so to speak: naturally, supply chain. Everybody knew there was massive supply chain problems: costs increased dramatically, tripling, quadrupling costs for materials and, if you could get it at all, things like lumber, steel and so on. Also, naturally personal protective equipment [PPE], sanitizer, all of those kinds of things were difficult; and everybody I think faced that.

One of the almost funny stories was that a number of businesses found toilet paper was being stolen out of their business washrooms, so they had a terrible time trying to keep toilet paper in the washrooms. One business in particular said he just decided he would he would give employees so much toilet paper every week and they were responsible for

keeping it because it was just getting crazy that he couldn't keep toilet paper in the washroom. I thought that was a totally unexpected outcome, at least in my view.

So yes, the supply chain problems were extremely problematic. And interesting enough, a lot of them are just starting to be resolved fairly recently. So even though we think the pandemic has been largely—the worst part's been largely—over for a year or so the problems continued with things like the supply chain.

Shawn Buckley

Can you give us an example?

Catherine Swift

Well, lumber quadrupled, for example. A lot of the manufacturers naturally use a lot of those types of materials as inputs. It was massive price increases or just unavailability, period. Naturally that meant they had to either slow down their operations or temporarily postpone, and so on. So that really affected people a great deal and increased their costs, and they couldn't necessarily increase their prices to accommodate that.

The other big issue was transportation-related, and this was very much a policy driven problem. Because, for example, a lot of these businesses do business in the U.S. And U.S. truck drivers were about 50 per cent vaccinated. So when they imposed those constraints at the border that the truck drivers—sitting in their cab alone all day, not probably seeing hardly anybody—needed to be vaccinated, that immediately took a whole pile of these truckers right out of the equation. I heard of many, many businesses that did business in the U.S. that couldn't get somebody to ship to the border from the US because they would mostly be American truck drivers.

Shawn Buckley

Can I interrupt you? At the time we never imposed a requirement on Canadian truck drivers driving within Canada to vaccinate, did we?

Catherine Swift

Not domestically, but to cross the U.S. border we did.

And another interesting observation that one business made was he believes the government overstated the extent to which Canadian truck drivers were vaccinated. You might recall there was talk of 90 per cent or so, so the government said, "Well, this policy won't be horribly damaging because most, the vast majority—" He felt it was probably more like 60 per cent that that was actually true about. And we never really saw any reputable data on that. So there was no one to sort of challenge it one way or the other.

But naturally, the fact that Canadian truck drivers all of a sudden also needed supposedly to be vaccinated across the border caused an awful lot of problems in addition to the U.S. situation. Again, we saw— One example I actually heard quite frequently was costs for say, a load, like one tractor-trailer, went from about \$1,500 to about \$8,000. So that was a very significant increase. And it was just shortages. There were just shortages of drivers, that was the problem there. And that was 100 per cent policy-created. That didn't have to happen.

Those, I think, were certainly the big three issues that virtually all businesses faced in one way or another.

Another complaint we heard quite a lot of was about the programs that were directed to businesses themselves. Some of them were wage subsidies to retain employees. But one thing that really was problematic for an awful lot of businesses was that the government—notably the feds, sometimes Ontario was involved as well, and sometimes other provinces, but it was notably the federal government—was paying companies to manufacture, say, PPE.

[00:15:00]

Because there were shortages, because they didn't keep sufficient supplies in the various government agencies that are supposed to do that. And I heard a number of examples. There was one particular example that 3M was given \$40-odd million, it was big chunk of money split between Ontario and the federal government. There were all kinds of smaller firms that easily could have done that. 3M, it was to make N95 masks. And 3M, they built a whole new facility to do this when existing Canadian companies were well capable of doing it, but they weren't Liberal enough. They didn't have that partisan connection. They didn't donate to the Party. I also heard that there was an auto parts manufacturer that was paid to switch production to masks. And again, it was ridiculous. There were already firms out there that could easily have ramped up production, but they weren't in the right riding. It was a partisan decision not a sensible health-based or sensible business decision. So that was a very common issue I heard as well.

And also, just eligibility. We know this because we've seen some case studies about how businesses didn't need the money, but nevertheless were still giving out bonuses; so highly profitable, but they were accepting government money. And there was such little oversight on the part of government to the individuals and businesses that they were shelling out money to that much more got spent. And obviously, this had competitive implications for businesses as well. So sometimes their competitor would get some contract which made utterly no sense, and it would damage someone's business as a result.

Something we did as an organization actually was: we shared a lot of information among members. Sometimes, some particular commodity that was in demand, one happened to have a stockpile of and could help others and so on. And we also attempted to deal with the Ontario government in particular in terms of trying to suggest some best practices. Because a lot of these policies made zero sense from a business standpoint. They didn't consult business, they just put in some top-down kind of policy—obviously without thinking about it very much. And it caused all kinds of problems. This 3M example of the fact that they built this new factory: a neighbouring business actually had to shut down twice at a very inconvenient time—and they wouldn't change it—to permit this new plant to be connected to the electricity grid. So that's just, again, a particular example, but they weren't listening to business at all. They were just applying these policies willy-nilly over the top and often in a kind of way that made people even more worried than they had to be.

This is also another red tape-related issue: some businesses were required to do daily assessments, temperature-taking and that kind of thing, and actually filling out paper. And some of the businesses said, "Where did all this paper go? I can't believe anybody actually looked at it because it was just so voluminous." It just seemed like a stupid policy to be doing, as they felt that it wasn't even getting used by government once it was done. The inconsistency as well—this is something for the future. Every government in Canada was doing different stuff and there was no commonality. Businesses that operate in more than

one jurisdiction had different rules apply to them and it was absurd to try to implement all these different kinds of rules. In future, businesses [sic] should get their act together and coordinate policies and have consistent policies—instead of making businesses jump through all these hoops that are different depending on where you're located. So that was another factor.

We had a number of comments on the healthcare system in general. One business actually had an employee that was ill, couldn't get treatment in the hospital, and passed away when normally that particular health issue should have been treatable. This business owner very much felt—obviously the person lost their life—and they felt that if times had been normal and the hospitals hadn't been so inefficient, then they would have been saved.

Another gave the example of one of their senior employees whose mother ended up having to go into a hospital for some reason, caught COVID when she was in hospital, and passed away. And the woman was so worried because this had happened to her mother that she retired much earlier than she was planning to do.

[00:20:00]

And the business lost a senior valued person as a result. So the problems in the healthcare system obviously had a pretty big effect on businesses, as it did on all of us.

What haven't I touched on here? I guess some of the other anecdotal issues that I can mention: I had the complaint frequently that the federal government in particular, but some of the provinces as well, and much of the media reporting, created almost a hysteria. You would think a government role would actually be to calm people down, but no, it seemed to be quite the contrary. And because none of them looked like they had any clue what they were doing, even though they all have departments that are supposedly tasked to deal with this, it created more problems than it solved. One business mentioned that they happened to have an engineer employee, but he became so absolutely paranoid that he poisoned the entire workplace for this particular business and created an awful lot of problems, and that was just one person.

Another story that was, again, a little bit strange was that people were so worried about coming to work but then they'd encounter each other in the local Walmart. Because they didn't know what to do with their time, so they'd go out shopping or something like that. That was interesting. And the fact that a number of them said some of their suppliers were small firms; and even though they weren't at-risk businesses, they were nevertheless shut down. It infuriated them to see the Walmarts and the Costcos and the Home Depots and so on remaining open when some of their smaller suppliers that they dealt with for ages were closed, or were shut down, and there was absolutely no reason that should have happened. **So that was another problem that arose.**

One business mentioned that— You know the old adage that 20 per cent of the people do 80 per cent of the work? He said, during the pandemic, it became more like 10 per cent of the people did 90 per cent of the work because of all the changes. A lot of businesses were still looking to hire even during the pandemic because they were losing some employees to various things. But they were competing with government that was basically paying people to stay home.

Another interesting observation was that in 2020, for a few months, the CRA told businesses that they didn't have to make source deductions. It was supposedly to provide a break, I guess. But of course, they were ultimately due and they had to catch up later. And

so businesses had problems after the fact because naturally, they had to pay a lot more for those source deductions than they would have had to if they'd been able to just do them on their regular monthly basis or quarterly basis, depending on the size of the business.

I think those are most of the main points that I found with my interviews of these different businesses. Perhaps there are some other questions that you might have?

Shawn Buckley

I'll open you up to the commissioners. I did want to ask because you're well-positioned to answer the question: **What do you think government should have done or could have done differently to make things more reasonable for these businesses?** I get the impression from your evidence that there was a lot of frustration that things didn't seem fair or thought-through. I mean, even just small suppliers being closed and yet bigger suppliers, where you'd think people would be more at risk, being left open. I'm just curious what your thoughts would be.

Catherine Swift

Yeah, I think there's a few things that governments could do better. Again, consulting with business to see what would work for them. Not that that would be a perfect solution, but they virtually did no consultation with business. In our particular case, we were providing government with information as to best practices, what we thought would be better ways to do it. They did none of it. There was clearly no responsiveness to that. So that was obviously a problem because I think they could have had a lot better policies if they'd listened to business.

The consistency issue: Why couldn't governments get together and do things comparably in different parts of the country,

[00:25:00]

municipal, federal, and provincial? So that they didn't impose different rules all the time, much of which didn't seem to make any sense at all. The partisan element of it definitely came into play. Granted, to be fair, of course none of us— You had scientists disagreeing with each other, you had doctors disagreeing with each other, and the so-called science on it was not settled, I guess you could say. But often political considerations seemed to override the science that they did know about. So that would be something: In future, try to justify these things, not just throw everything at the wall and see what sticks.

But most of it is really consulting instead of a top-down approach—just talking to people and being responsive, of course. **Because that one person that just asked them to delay the closure of his plant by a week and they couldn't do that. Why not? That kind of thing, to me, just seemed utterly ridiculous. They put a major cost on his business because of having to shut down at a very, very bad time for that particular business.**

So those are certainly, I guess, some of the main things that could and should be done better next time. It's funny too because when you think: what we initially heard in the pandemic was it was no big deal. And, "Oh, we've dealt with SARS. We dealt with SARS back in 2004, so we're all equipped." But there's departments in every single government whose full-time job is to deal with this and clearly none of them were doing their job. None of them were doing their job. So going forward one would hope there's better oversight of

that and that people will actually have sufficient PPE, for example, in storage and be much better prepared for these kinds of issues.

Shawn Buckley

Thank you. I'll open it up to the commissioners for questions.

There's no questions, okay. You were too clear and succinct, Catherine. Thank you very much. I just I had one follow-up question, because you indicated, "We had communicated to government." I assume you're talking about the CCMBC. Do you recall what some of the communications were to the government?

Catherine Swift

Yeah, actually, I'm going to provide those to you. I've been collecting them the last few days because people had to go back in their history. But they were some of the things that I've mentioned: the notion of having consistency in policies. Giving firms notice too—that was one. You can't implement something in five minutes reasonably. So giving firms notice if there were significant changes, which there were throughout.

There were some programs that intended to compensate businesses for things like having to put in partitions. I know one firm said they put in automatic doors so that nobody had to touch anything, accommodations like that. Make those programs simpler. Because they were so convoluted to deal with an awful lot of businesses just said, "Forget it. I'll just spend the money, because this is so ridiculously bureaucratic to have to deal with it." So simplifying that would be a good example.

But I'm going to be able to send you some stuff once I sift through all these emails that I've gotten from people.

Shawn Buckley

Super, so we'll add that then as exhibits when you collect those [no numbers available].

Well, Catherine, thank you very much for attending. On behalf of the National Citizens Inquiry, we thank you very much for your input.

Catherine Swift

Great. Thank you.

[00:29:06]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 6: Elizabeth Galvin

Full Day 1 Timestamp: 05:38:20–06:03:19

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness is Elizabeth Galvin. Elizabeth, I'll ask you to start by stating your full name and spelling your first and last name for the record.

Elizabeth Galvin

My name is Elizabeth Galvin. And it's E-L-I-Z-A-B-E-T-H, and Galvin is G-A-L-V-I-N.

Shawn Buckley

I'll also ask you to move the microphone a little closer because you have a soft voice. And I'll ask if you promise to tell the truth, the whole truth, and nothing but the truth today.

Elizabeth Galvin

I will.

Shawn Buckley

Now, you're here to share actually a very sad story about three different young ladies. And so, can you share with the commissioners what I'm referring to?

Elizabeth Galvin

My daughter, Danielle, died by suicide in January 2022, a day after her 20th birthday. The week before that, another second-year student at the University of Guelph died by suicide. They didn't know each other. At the time, the University of Guelph administration had closed their campus to in-person learning, campus activities, even though the university had mandated students be fully vaccinated before starting school that year. Their decision followed Doug Ford's decision—

Shawn Buckley

So I'm going to just ask you not to read. And I—

Elizabeth Galvin

Sorry.

Shawn Buckley

And you were going to tell us about three young people.

Elizabeth Galvin

Yes.

That same week, a 20-year-old young woman in Mississauga named Suri, she also died by suicide alone in her apartment. Because at the time, our province was locked down again for— Doug Ford's administration said two weeks. And then maybe three weeks, maybe longer. So that was the atmosphere when these three young women died by suicide.

Shawn Buckley

Now, just so that the audience and the commissioners understand: These three young women basically would have been of the same cohort, graduating from high school at the same time?

Elizabeth Galvin

Yes, so in March 2020 when it all started, these girls were all in their last year of high school. Now Grace, who was in second-year university at the same time that my daughter was, she was from the U.S. But Suri was from Ontario, from the south. And so, they were—

The high schools, if you remember back to March 2020—all the schools were closed. Just slammed shut one day. These Grade 12s finished the last three and a half months of their school year learning virtually. After a couple of months, they had almost no instruction. What the teachers did was they used their marks up to March 2020 to figure out their final marks. These were the kids that were preparing to go to post-secondary school in the fall. Their last year of high school, they had no prom, no graduation, no Grade 12 end-of-year, end-of-high-school trip. Nothing. There was nothing for these kids. They had an online graduation. We tried to make it as fun as possible, but—

Shawn Buckley

How did your daughter respond to— Because, I know I had a daughter and she was so excited about the high school graduation. And planning parties with her friends and the dress and the whole thing. How did Danielle respond to basically losing out on something that most young ladies look forward to for years?

Elizabeth Galvin

Well, she was sad about it. It was isolating. We were all very isolated at the time, if you remember. And so we just had a family, you know, event. We watched it on— It was a virtual graduation. The school did a video and they streamed it and we watched that. But

she was thinking ahead to the fall. And we all thought that by September things would be back to normal, so we just tried to concentrate on looking ahead.

[00:05:00]

Shawn Buckley

So in March, when they're closing down the high schools, Danielle had to be making a decision right around then about the following year, didn't she?

Elizabeth Galvin

Yeah, I think February 1st is the deadline to apply for post-secondary. Going into the summer though, there were not a lot of jobs for these kids because so many businesses were shut down, as Catherine talked about. She was actually looking forward to working at Ford, where her late father had worked for 20-something years and that would have helped her to save money for post-secondary. But they weren't hiring students that year. So she had two minimum-wage jobs, but one of them was at a dry cleaner's and it closed down. So she only had one minimum-wage job.

But June 1st is an important date.

Shawn Buckley

That's when she had to make a decision.

Elizabeth Galvin

June 1st is the deadline for the Grade 12s—was that year—to accept offers from universities. At that time, the universities had announced their intentions for September: what it was going to look like; whether it would be virtual learning or in-person learning; and more importantly, whether their residences would be open. Residence is such an important part of going away to school to spread your wings and meet other people and, you know, mature. McMaster announced they wouldn't open their residences. Queen's announced that they would open their residences, but only to single rooms. So those first-year kids knew that they may or may not get a room at Queen's. Western University and Guelph University announced that they would open their residences fully.

So on June 1st, by midnight, we had to make a decision. Danielle and her sister and I sat there going back and forth. Danielle's older sister was going into fourth year at Western. So Danielle couldn't decide between Western and Guelph. But a really important part of that decision was residence. And she decided on Guelph. So that was that.

Two days later, Guelph University came back and said, "Nope, we're not opening our residences." What happens when you accept an offer through the Central Application Centre is all the other offers are rescinded. What these kids were accepting and buying: they were buying an education. They weren't going to get the product that they thought they were going to get. And it was two days after that very important deadline. So I started—I called the university, I called my MPP, I called the Minister of Colleges and Universities. I'm like, "Can they do this?"

When I talked to somebody at the University of Guelph, they told me that the Wellington-Dufferin-Guelph Health Unit advised them not to open their residences, so they didn't. I

don't know why the Wellington-Dufferin-Guelph Health Unit was running Guelph University. But apparently, that was it.

Shawn Buckley

So—

Elizabeth Galvin

And the Minister of Colleges and Universities— Went to my MPP, Effie Triantafilopoulos, and she talked to the Minister on my behalf, Ross Romano. And we were told—

Shawn Buckley

I'm going to ask you not to read please. Sorry.

Elizabeth Galvin

That the Ministry does not usually interfere with the operations of colleges and universities. So no standard.

Shawn Buckley

So basically, it was a bait and switch for Daniel. She chose Guelph because they were representing that the residences would be open and she can have that experience.

Elizabeth Galvin

Yes.

Shawn Buckley

She chooses. As soon as you choose, that's it—you're pulled out of the system. She couldn't choose to go to Western after that. And then two days later after her choice, they basically say they're closing the residence.

Elizabeth Galvin

Yep.

Shawn Buckley

Now, you fought and fought and fought and got her into residence. But it wasn't normal residence, was it?

Elizabeth Galvin

I got a group of parents together and we lobbied the university and got a meeting with one of the vice provosts, lovely woman. And some of the kids in that group of families that we were talking with each other—some of them just said they're not going to go to first year. They're going to postpone it a year. Some students tried to get into other schools. Some of them were successful, some of them weren't.

Shawn Buckley

Liz, it's just that I'm looking at the clock and we have six minutes. So I want you to just focus on Danielle's experience when she went in September, 2020.

[00:10:00]

Elizabeth Galvin

Okay. So September, 2020, first-year university was like this: no frosh week, no clubs or sports, no in-person classes—it was virtual—no varsity sports. But no discount on any of the fees. They paid their full fees to go. Residence itself, she was in Lenox Addington. Two kids at this end of the hall, two kids way at the other end of the hall. It was like *The Shining* hotel. Long, dimly-lit hallway with closed, locked, unmarked doors. Only two kids to a bathroom. The cafeteria in that residence was closed.

But education delivery was even worse. Four out of five of my daughter's professors did not deliver a virtual lecture. They basically sent them emails, told them what to read, told them what book to buy and read, and, you know, "The test is on Thursday, good luck." She was forced to do a lot of self-learning. No discount on tuition—I'm not sure if I mentioned that. By comparison, Western University, where my other daughter was going, that school mandated that their professors provide a virtual lecture to their students; all the profs had to do that. And they did. And it was much better. And the residences were fully functional and everybody was fine.

Shawn Buckley

Liz, what happened in November 2020?

Elizabeth Galvin

In November 2020, while Danielle was living in this bleak residence—it was so, just, Deadsville. She attempted suicide. She left a message to a friend who found her. Anyways, was rushed to Guelph Hospital. I get a call. My other daughter and I—because she was learning virtually as well, so she was at home—we went running up there. And the hospital wouldn't let me in "because of COVID." They wouldn't let me in. My 18-year-old daughter is in a life-or-death situation, and they wouldn't let me in. And they would barely talk to me. They couldn't talk to me and tell me what was going on because she was 18.

I didn't know what to do. We stood in that parking lot at three in the morning just—Anyways, eventually, we went home. But nobody would talk to me about, and tell me what to do, and give me some guidance. They released her in less than 72 hours. I've since obtained the file from the hospital. Every— Every time they could check it off, it said, "danger to herself," "danger to herself," "danger to herself." Yet they released her. I just— I don't know why. I've made calls in to them; I'm not finished talking to them yet. But they could have put her into an inpatient program called Homewood. And they didn't.

Christmas comes. She comes home. She decides she's going to move out of that residence. She's going to move to another residence. At the time, Guelph was slowly bringing kids into the residences one by one, but there's only a few hundred students on campus. Wasn't a lot.

Shawn Buckley

Liz, can I get you to stop looking at your notes. I know you're nervous, but—

Elizabeth Galvin

So she moved into East residence, which are townhouses that can house four kids. But it was just her and one other student in this residence at the time. So the campus is still really quiet and sort of dead. And the campus police were given the authority to give out tickets to students who were out of line. At the time, there were various rules, if you remember. All the different regions had different rules of gatherings: you could have five; you could have ten; you could be inside; you could be outside. So it's very confusing.

She turned 19 in January and celebrated her 19th birthday with one other kid. So two weeks later one of the rules changed; it did in our area, we could have five people. So they had a get-together, a party, as people do, with five students. The campus police gave them all COVID fines of \$880 each. Very stressful. They didn't know how they were going to pay this. So that— That was very, very stressful.

First year ends, they come home for the summer. She comes home for the summer, same job situation. So many things were closed. She couldn't get a very good job. She's working, you know, a minimum wage job again. And then the kids have to look for someone to room with in second year. The difficulty was, you know, over 4,000 kids are learning virtually, so it's hard to meet other people.

[00:15:00]

Most of these kids just had to answer an online ad, roll the dice and move in with somebody in September. Her friend that she was supposed to move in with hated University of Guelph so much that she quit and transferred to Windsor, where she could live at home. Because it was just so depressing there. And all the while, the media is bombarding us all with this— all these cases, everyone's sick. And just causing all this fear and stress and anxiety. And it just— It did not help her mental health, or the other two girls.

So September, second year. I'm almost done.

Shawn Buckley

September, what happens there? She moves in with somebody. She—

Elizabeth Galvin

In second year, she moves into a house with a family friend whose son was off-campus. He needed a room; he moves in there. And then two more people move in who are strangers. So not ideal. And then in-person classes resumed, sports resumed. Varsity sports started up again. But she wasn't the same. That last year and a half had taken such a toll on her mental health that, looking back now— I can see it did on me, too. I mean, I took a leave of absence from work, just from stress. And I was trying to find ways to help her because I didn't know what to do. I didn't get any guidance from these health professionals. But I can see now, looking back, she'd given up at that point.

So September, she's in school and classes are on. But we were always under the threat of, "It might close down again, it might close down, if the numbers go up." In December, we got vaccinated; we're fully vaccinated. Christmas was spent not with family because I caught Omicron. But my two daughters living in the same house didn't catch it and we were all fully vaccinated. I don't know, that's when I caught it. So we didn't see our family again. That was the third year in a row we didn't have Christmas with our family.

Shawn Buckley

Can I just stop you just so people understand. So Danielle came home for Christmas to be with the family, but because you had COVID, you guys couldn't spend Christmas with the family.

Elizabeth Galvin

Yeah. I mean, the media was—they'd say, the numbers were ramping up. And Omicron. And don't be around people. And so, to be safe, we didn't go and get together with our family.

Shawn Buckley

And were you guys able to be with family the year before at Christmas?

Elizabeth Galvin

No.

Shawn Buckley

So this is the second year in a row.

Elizabeth Galvin

It was actually the third year. But that's because one of my brothers-in-law was not well. And that's when the rumours of COVID were starting, in December 2019.

Shawn Buckley

So what happened in January then of 2022?

Elizabeth Galvin

Oh, January. The government locked us down again. And the University of Guelph followed suit right away. Even though these kids were all fully vaccinated, healthy, young people, they shut it down again. I wrote to everyone. I wrote to the Minister of Health; I wrote to the university; I wrote to my MPP; I wrote to many people. I wrote to the Provost, Charlotte Yates.

Shawn Buckley

I'm just going to stop you about that and tell us about— Just focus on Danielle, not what you did for the university. And I'm sorry, it's partly because we're out of time. But I also want you to focus on the story.

So in January basically, things are shut down again. And you're telling us: at the University of Guelph, you had to be fully vaccinated.

Elizabeth Galvin

Yeah. You had to be fully vaccinated to go to school that year, 2021-22. But they closed the campus down anyway and—

Shawn Buckley

How did Danielle respond to that?

Elizabeth Galvin

Well, she was isolated. They were isolated. They're in their rooms, in this house with three other students who were just as isolated. You could see them. They were so withdrawn. She just, you know— When you're alone in a room and you're by yourself, and it's— You have a lot of time to think.

[00:20:00]

It just would have been better if they had been on campus and doing things and being with other people. They needed it at that point. They're, you know— all of the kids.

On January 17th, while the students were learning virtually, the University of Guelph called a snow day and cancelled classes. A week later, they were still not allowed back in the classrooms. And that's when we lost Danielle.

Shawn Buckley

Now you've thought about this a lot. And we're trying to ask all witnesses how things could have been done differently. And I think you have a special insight into how young people were affected by this. So please tell us your thoughts on how you think things could have been done better or differently.

Elizabeth Galvin

Well, the stats that came out— Do you mean the stats that I found?

Shawn Buckley

You can tell me whatever you want about how you think things should be done differently.

Elizabeth Galvin

Well, as early as 2021, I read an article that anorexia cases had doubled. Suicidal thoughts had tripled. Forty per cent of parents observed a deterioration in their children's behavior and mood. Sixty per cent of parents met the criteria for depression themselves. Opioid deaths were up 80 per cent. And eating disorder program referrals were up 90 per cent from the year before.

Shawn Buckley

These types of things you were reading, did they match what you were seeing with Danielle and her friends?

Elizabeth Galvin

They did in my case. And then part of it is sort of looking back and just knowing that three young girls—two 20-year-olds and a 19-year-old—committed suicide in January. They were so distraught. They just couldn't go on any further. I mean, that's evidence that these lockdowns, they didn't work. They hurt people. And that can't happen again.

And yes, I have some recommendations that I'd like to make, if I could. Number one, I think the Canadian Media Fund needs to be abolished. I think that the media was not reporting—The way they reported the numbers weren't percentages of people or ages of people. It was just these numbers, these high numbers all the time. And it created a lot of fear and panic and anxiety.

Number two, family members must not be barred from entering a public hospital when their loved one is in a life-or-death situation, no matter what. A perfectly healthy person like me should not have been locked out of that hospital that day. I would have been able to talk to those professionals and gotten some advice on what to do. And if a person is deemed a danger to themselves by medical professionals in a hospital, they should not be released.

Number three, I think the federal government should come up with a Bill of Rights for Canadian students that guarantees a certain standard of education services that they are paying for. If they're not going to get what they're paying for, they should get some of their fees back.

Number four, unelected bureaucrats and local public health units should not be allowed to dictate everything that happens in our society without public input and debate. Businesses—and colleges and universities are considered businesses—must be allowed to make their own decisions.

Shawn Buckley

And Elizabeth, do you have just one more? Because we are so, so over time.

Elizabeth Galvin

I do. I just have one more. Young healthy people can't be shut out of schools as long as they were ever again. When it became evident that young people were not at great risk but they were suffering mentally—and then especially after they were vaccinated—they should have been allowed to go back to in-person learning.

It's proven that these lockdowns affected their mental health, social and educational development. And we're still feeling the effects today.

Shawn Buckley

Thank you. Commissioners, do you have any questions of Elizabeth?

Elizabeth, thank you for sharing your story. I know that took a lot of courage. And on behalf of the National Citizens Inquiry, we thank you for your testimony.

Elizabeth Galvin

Thank you for having us.

[00:24:59]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 7: Oliver Kennedy

Full Day 1 Timestamp: 06:03:19–06:16:08

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness is Mr. Oliver Kennedy.

Oliver Kennedy

Afternoon.

Shawn Buckley

Mr. Kennedy, can you start by stating your full name for the record, spelling your first and last name?

Oliver Kennedy

My name is Oliver Kennedy, O-L-I-V-E-R-K-E-N-N-E-D-Y.

Shawn Buckley

And Mr. Kennedy, do you promise to tell the truth, the whole truth, and nothing but the truth?

Oliver Kennedy

I do.

Shawn Buckley

Now, you are a recreational therapist.

Oliver Kennedy

Correct.

Shawn Buckley

And you've worked 20 years at that job. You're no longer there but you're going to tell us about that. So tell us what happened.

Oliver Kennedy

I worked for my employer for close to 20 years as a recreation therapist, working with seniors and disabled individuals. And in the end, I was terminated from my position for not taking a COVID vaccine.

Shawn Buckley

Now, can you tell me basically, a little more detail. So why didn't you want to get the vaccine?

Oliver Kennedy

To me, things felt very rushed. It was something that— Being in the healthcare setting, I understand informed consent. And it was just something that at the beginning, when the vaccines came out, it seemed very much like a choice. And even though things were rushed, it was a quickly-produced vaccine. I wanted to do as much research as I could on it. And it just seemed that a lot of the data I was looking for was just not available, either publicly or from my employer when I asked for it. So that's what sort of led me to vaccine hesitancy, as others have mentioned. And it was just something that I wanted something to be safe in my body, that I understood. And I couldn't find any information really that would allay any of my fears that I had, and nobody could provide it for me.

Shawn Buckley

Now, before it became a mandate at your place of employment, did the culture change? Did people start interacting with you, basically, about whether or not you should be getting the vaccine?

Oliver Kennedy

Yeah. I had managers who at first said that there'd be no coercion, no bullying in the workplace, and that they'd see to it that people would get fired if they were bullying people into getting vaccines. But by the end of it, she was coercing me by yelling at me to get a vaccine. And it was very unfortunate, because it was just a period of a couple months between her telling everyone you couldn't bully someone to then becoming the bully herself.

Shawn Buckley

Can you just describe for us briefly what some of that bullying looked like?

Oliver Kennedy

Well, in one case, it was another employee who had just come into work and walked right by me and remarked how the unvaccinated were the reason why we were still in this pandemic. And she knew I was unvaccinated. She didn't see I was sitting there. But at the same time, there were lots of people who would make those small comments and just sort

of decide for you that—or decide themselves that—you were the bad person for not doing this. Whereas you were just sort of, as I said, waiting for more information to make an informed decision when you could. But that never really happened.

Shawn Buckley

Did you have an incident with your immediate supervisor where, basically, she shouted something out for all the staff to hear?

Oliver Kennedy

Okay. I didn't know if we were going to go there, but yeah, she just said, "Go get a fucking vaccine, Ollie." And I was shocked by this because she had an open-door policy; it was at a nursing station. And as I left her office, everybody who was in that nursing station was looking right at me and had heard exactly what had been said. And they were shocked. I was shocked myself because, again, after being told nobody will be bullied into getting a vaccine, the very same person who did that was the one telling me to get a fucking vaccine.

Shawn Buckley

Now, the person who said they wouldn't bully you—

Oliver Kennedy

Sorry?

Shawn Buckley

That's the same person who said no one would get bullied?

Oliver Kennedy

Correct.

Shawn Buckley

Okay. My understanding is, it was October of 2021 when your employer made it mandatory to be vaccinated.

Oliver Kennedy

Correct.

Shawn Buckley

And then, so you were suspended for a period of time?

Oliver Kennedy

Yes.

Shawn Buckley

And how long were you suspended before you were terminated?

Oliver Kennedy

December 3rd, I believe, was the day I was suspended from work. And then that continued up until, I believe, early February when I was terminated over a Zoom call.

Shawn Buckley

Over a Zoom call. And what was the reason given for your termination after 20 years?

Oliver Kennedy

For willful misconduct for not getting a COVID vaccine.

Shawn Buckley

Now, is there a consequence to being fired for willful misconduct when somebody like you might go to employment insurance for benefits?

Oliver Kennedy

Well, that's what I did. I held off, thinking that they would bring me back to work between December and February. But once they did terminate, that's when I did go and apply for employment insurance.

[00:05:00]

And it has been an uphill battle completely doing that. From being told that I'm not looking for work and I'm not qualified— I'm not looking for qualified work because I chose not to vaccinate—that was very difficult. Because, while I was out looking for work as hard as I could, and then to be told that I was limiting my work because I was not getting vaccinated to go find those jobs: it was really difficult to hear an employee from the Government of Canada telling me I was being denied benefits for that reason. And in my initial refusal of benefits, I then did appeal the decision. And at this point I was then again denied benefits, to which I again appealed the decision. And recently in March I've just had my Social Security Tribunal, and I'm currently waiting on the decision for that.

Shawn Buckley

Okay. Now, did your decision not to get vaccinated affect you in any way socially?

Oliver Kennedy

I have very few friends now. Out of all my friends, I'd say about 95 per cent of them have decided that I'm not a good person anymore. A lot of the folks that I used to work with and hang out as well won't return my calls, and I'm considered persona non grata. My family for a while did turn their backs on me—and that really hurt. You think you've got someone who's going to be in your corner all the time. The only person who's been in my corner the whole time has been my wife. And it's difficult losing all your friends that way, especially when you're still in chat groups with people where they're calling you all kinds of bad

things, while they're listening to a narrative and thinking that they're better than you because they're simply following what someone else told them to do.

Shawn Buckley

Right. Now, you also had an experience concerning seeking a surrogate for getting a child. You don't have to talk about that, but you want to talk about it?

Oliver Kennedy

My wife and I, we were looking to start a family. And just the way biology goes, we couldn't conceive together. So we were looking for a surrogate. And that, I'll tell anybody, is an expensive and heart-wrenching process. But I wouldn't discourage anyone if that's the route you decide to go. But to find a surrogate can be a very, very difficult endeavor. You're competing with lots of other people in your same situation. There are no regulations. And sometimes it's the Wild West involving money, commitments, and whatnot. And to find and come to an agreement with a surrogate can be a very arduous process. And for my wife and I over the period of COVID happening—because COVID started just as we were finally getting to the point of finding a surrogate—it's been very difficult.

We lost three surrogates total because of COVID. One was at the beginning and she was worried about the health ramifications of coming from Alberta to Toronto. And that's understandable. This is someone who was going to do us a very nice and amazing solid—a service. And because of that the reason she decided not to help us is acceptable: she had her own family to think about.

However, after taking more time to match with other surrogates, we did lose two surrogates after that. Because when the topic of vaccination came up, when it was in the first week, where the person simply stopped returning our calls after having matched and started doing legal work, which is very expensive to redo— And it was something that my wife and I thought that we should make sure that this person understood that that's where we were. And while we were wonderful people up until that point all of a sudden, we were no longer, and weren't getting any communication. And then that did happen again with the second match where, again, we look at each other saying, "We're not terrible people." But this is the way people I guess think we are, because of the way the narrative has been painting us.

Shawn Buckley

Now you had an encounter with your doctor. You were trying to get an exemption. Can you tell us about that conversation?

Oliver Kennedy

Yes, so I contracted COVID in December after being suspended. It was around Christmas time, and my wife and I both had COVID and we both recovered by New Year's. So while being on suspension, I spoke to my doctor and I said, "Well, okay, I've got antibodies now." And he agrees, "Yes, you've got antibodies and you should be fine." I said, "I'm healthy and I'm ready to go back to work, so can you write me a note then that states that Mr. Kennedy has antibodies much like any COVID vaccine and should be allowed to go to work?" The whole idea of this is what mankind's been doing for how many thousands of years.

And my doctor took one look at me and he said, "What do you want, me to lose my license?" Because even though he did agree with me and has agreed with me on many points—we've disagreed on other points as well—

[00:10:00]

he agreed that I did not have enough information to make an informed decision. And he said, "What are you going to do?" He says, "If you decide not to take the shot, you're going to lose your job. At the same time, I will not write you a note that says that you do not need a COVID vaccine," because he did not want to lose *his* job.

Shawn Buckley

And then my last question is, what do you think should have been done differently by the government?

Oliver Kennedy

I heard other folks say everything and I concur. It's just a matter of, where do you start? The muzzling and the quieting of people who simply had another viewpoint—whether it was scientific, medical, social, nobody really got listened to. And it was sort of "my way or the highway." It seemed that that was dictated at so many different levels. The question was, whose way still is it and which highway are we going on? Because between the different directives from provincial, municipal, federal, public health, nobody really knew what was going on. The left hand didn't seem to know what the right was doing. And that was still very apparent even when I was working. Everybody was sort of, "Let's see if this works, let's see if that works." And while trying to lead and show that they knew what they were doing, you could see: at some points, nobody knew what they were doing.

To admit that, I don't think we're ever going to see. But to maybe put safeguards in place so that people have to at least test what they're going to try on us. Because lockdowns—don't think those worked. Vaccine—don't think it worked. There's so many things that you can look at what people in charge did—and they didn't work. And each time it was an, "Oops, well, we tried our best." Sometimes trying your best isn't good enough if you're hurting people. And there was a lot of hurt done to people. And I'm not the worst done by, but at the same time, I've been hurt. And I think that if nothing does change, people will keep getting hurt.

And so yeah, I'm not quite sure what more to say. Because, they've done wrong, they didn't get it right. But they still seem to have their head in the sand thinking that if we keep doing the same thing, we'll get it right.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions. Thank you.

Oliver Kennedy

Thank you very much.

Shawn Buckley

Thank you for your testimony. On behalf of the National Citizens Inquiry, we appreciate your testimony, Mr. Kennedy.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 8: Richard Lizotte

Full Day 1 Timestamp: 06:32:07–06:55:57

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Welcome, Richard. And I'll ask if you can speak very loudly, because you're sounding quiet.

Richard Lizotte

Okay, how about now?

Shawn Buckley

That's a little better. And I'll ask if you would be kind enough to give us your full name for the record, spelling your first and last name.

Richard Lizotte

Sure. My full name is Richard Lizotte, R-I-C-H-A-R-D, L-I-Z-O-T-T-E.

Shawn Buckley

And Mr. Lizotte, do you promise to tell the truth, the whole truth, and nothing but the truth?

Richard Lizotte

In the name of my Lord and Savior Jesus Christ, I affirm to tell the truth.

Shawn Buckley

Thank you. Now you worked for your whole career as a paramedic, and now you're retired.

Richard Lizotte

That's true.

Shawn Buckley

And you're here to tell us the story about your older brother, Jerry.

Richard Lizotte

That's true.

Shawn Buckley

Can you tell us about Jerry, and we'll just maybe back up to when COVID started, hit in March of 2020?

Richard Lizotte

Sure. I can tell you a brief history of his health prior to his vaccinations. He was 85 years old and very vibrant. In fact, you'd never guess he was 85. He exercised every day. He had a stationary bike in his living room. He watched sports while he did that—45 minutes every day. He went to the coffee shop 5 days minimum, 5 days a week, sometimes 6 and 7. He met all his peers, his coffee buddies, there and they chit-chatted. He was heavy into bluegrass music, loved sports, and he lived a pretty vibrant life.

Shawn Buckley

Was he on any medications?

Richard Lizotte

He was briefly on blood pressure medication in 2017, and then his blood pressure was under control mostly through exercise and diet. And no, he was on no medication.

Shawn Buckley

Okay, so when COVID hit, he's not on any medications. Is he seeing his doctor for any reason at that time?

Richard Lizotte

No. In fact, he didn't like going to see doctors. So you can probably count the number of medications that man had on your two hands in his entire life.

Shawn Buckley

Okay, so what happened as COVID went on?

Richard Lizotte

Well, his first vaccine was on February the 27th of 2021. And very shortly after that vaccine, he lost his taste, which was something very critical to him because he loved to eat. And he lost his taste and his smell as well. He never really talked about his smell so much,

but his taste of course—that was very important to him. All his coffee buddies and himself, I think they went to every restaurant in Chatham, Ridgetown, Blenheim, Wallaceburg. They ate out a lot, plus he loved my wife's home cooking, so the taste thing was a real concern for him. That was the biggest change after the vaccine, number one.

Shawn Buckley

And how significant was that—the change? Like, I think you gave an example of salt and sugar.

Richard Lizotte

Yeah, we tested him. This was probably a few months after his vaccine. We tested him and he could not tell the difference between salt and sugar. So that affirmed to us he was really accurate in not being able to taste.

Shawn Buckley

Okay, and what happened with the second shot? And I'll just ask, do you recall what brand of vaccine it was?

Richard Lizotte

Yes, it was Pfizer.

Shawn Buckley

And were all the shots Pfizer?

Richard Lizotte

Yes.

Shawn Buckley

So what happened with the second shot? Do you recall when that was?

Richard Lizotte

Yes. Vaccine number two was June 16th of 2021. And shortly after getting that, we noticed—and it was a slow progression, but definitely a progression—his cognitive functions started being affected. His memory wasn't as good. He showed a little more **disinterest in things**.

Shawn Buckley

Now, can I just stop you about his memory? When you say a slow progression, are we measuring in months? Are we measuring in weeks?

Richard Lizotte

I would say, after his shot, we probably noticed it about a month later. His first sign of some cognitive function delay, and then it just progressively got worse.

Shawn Buckley

Okay. And so describe that, give us some details about that.

Richard Lizotte

Well, he was always pretty sharp when it came to sports and remembering records and statistics and stuff like that. He began just not remembering those things. And events even in our own family life, he just started not remembering those things. And, yeah.

[00:05:00]

That was a big thing for him. And even his bluegrass music, which was his entire life, he just started not remembering the bluegrass festivals and concerts that he went to in Kentucky and Tennessee and all through southwestern Ontario.

And like I said, this was a progressive thing. We noticed it about a month into his second vaccine, and then it just continually got a little worse as time went by.

Shawn Buckley

Did anything happen to his appetite?

Richard Lizotte

Well, of course. When he couldn't taste anything. I remember we used to have him over quite often for supper, and he used to always comment on my wife's cooking. He didn't comment anymore, because he couldn't taste his stuff. And he stopped going to restaurants because he's "Why would I spend money?" He says, "Everything tastes the same anyways." So right away, his socialization started dropping right then and there; going to restaurants less and even started going to the coffee shop less, which was a real indication to us that something's not right.

Shawn Buckley

What about his mental state, his mental health?

Richard Lizotte

His mental health, he was so fear-mongered by COVID, that was the thing that— He was so fear-mongered that that became his whole life. I know he and a lot of his peers, they practically locked themselves in their homes and apartments, ordering food out, they were so fearful of this. And my brother slowly stopped watching as much sports and concentrated more on CNN, CBC, CTV, and just COVID-related. And, he became so fixated on that— And you know, constantly washing his hands. And he just wore a mask even to leave his apartment to go down the hall to put his garbage away; he'd put his mask on, nobody around. So he was really fearful of COVID.

Shawn Buckley

Now, do you remember when he had his third shot?

Richard Lizotte

Yes, his third shot was December 1st of 2021.

Shawn Buckley

And what happened after that?

Richard Lizotte

There was a sharp decline in his health after that. We noticed that his legs started swelling. Total apathy, he was energy-less. He had abdominal discomfort. His abdomen actually became distended. We kept telling him he should see the doctor, but he didn't want to see the doctor. But it got so bad that he agreed to go. I took him on December 21st to see his family doctor.

Shawn Buckley

What about his colour?

Richard Lizotte

His colour was very pale—very pale. And he had lost weight prior to the distended stomach, because you couldn't tell he'd lost weight when the stomach was distended. But prior to that, he started losing weight. That occurred before the third vaccine; he actually started losing weight. And then after the third, he was so pale, it was really quite awful. And then of course, he started having swelling in his legs and his distended stomach.

Shawn Buckley

So you took him to a doctor?

Richard Lizotte

His family doctor, yes.

Shawn Buckley

And what happened?

Richard Lizotte

Well, I regret this. I went to all his appointments for the last years, even his orthopaedic surgeon—he had a knee surgery in 2016. I went to all of them. This particular one, I did not go in. I was having some little problems myself with shortness of breath. They insisted I wear a mask. I wasn't wearing a mask. I told my brother, "You're going to be okay to go in by yourself?" And he said, "Sure." And he wasn't looking very good then. So he went and he came back after the appointment. And the doctor had given him an over-the-counter medication for cramps, because he was complaining of cramps, for his stomach. And he told me, "He said I'm good to go. He said, 'I'll see you in a year.'"

Now, I think he probably misunderstood the doctor, because this was December. I think the doctor probably meant I'll see you in the New Year. But he took it as I'll see you in a year.

And he was so disappointed, he said, "That's it. I'm not seeing this guy anymore." So that's what happened there.

[00:10:00]

Shawn Buckley

What happened after the doctor's office? What did you observe with your brother's condition?

Richard Lizotte

Well, man—he started declining really quickly. And he didn't want to see his family doctor. He didn't want to go to the hospital. I thought to myself— "Listen, you saw a cardiologist a number of years ago for a brief period of hypertension." And he saw him once a year, just as a checkup, and it was all flying colours, no problem. I says, "What if I call him up and I kind of make it—it wasn't a fib, but—kind of try to make it look like it was a heart problem with the swelling of the legs." I kind of suggested maybe CHF, congestive heart failure. So as soon as I mentioned that, the secretary says, "Yeah, you better bring him in."

Shawn Buckley

And I'm just going to back you up because you said he continued to decline. Can you give us some specifics perhaps about his belly and his legs, for example?

Richard Lizotte

Yeah, for sure. His legs kept swelling. His distended stomach kept increasing. Severe constipation. He had almost zero appetite, he forced himself to eat. In fact, we almost forced him to eat something. And more pale: he became a little bit more diaphoretic and sweating.

Shawn Buckley

Can you tell me about the fluid in his legs and what was happening there?

Richard Lizotte

Well, it was just a build-up of fluid. There was just a build-up of fluid. And prior to us taking him to the cardiologist, there was even some weeping. We noticed in his bed there was some wetness, and we thought he had voided himself, urinated, and he said, "No, no, no, I'm fine." He was dry there. We noticed that there was some weeping from the skin of his legs.

So that was really triggering us that he didn't want to see his family doctor, so let's see if we can see the cardiologist, and maybe through him, we can get a little bit better result.

Shawn Buckley

What happened at the cardiologist?

Richard Lizotte

Well, we brought him to the cardiologist. And unfortunately, he didn't show up that day—for whatever reason, he probably had a legitimate reason—and we saw a nursing

practitioner and she was very good. She took one look at my brother and said, "Oh, he's in big trouble." She ordered some Lasix right away—fluid pill, 80 milligrams a day—and she ordered an ultrasound of the abdomen and an x-ray. And she said, "Yeah, your brother is in deep trouble." So we couldn't get it done the next day; the second day is when we took him in. It was a Friday, I remember that. And we took him in to get the x-ray and the ultrasound, and that took a whole day to get that done.

We brought him home; we fed him supper. He lives in Chatham. We came back home to Wallaceburg and by the time we got home, there was a message from the cardiologist—not from the nursing practitioner but from the cardiologist, who had seen the report. And he said, "I've got to see your brother right away. I have him in for Monday morning." So then we brought him in Monday morning and actually saw the cardiologist.

Do you want to know what happened then?

Shawn Buckley

Yeah, and you can take your time. I appreciate this is difficult.

Richard Lizotte

Okay, no problem. On that Monday morning, we brought him in. It was January the 17th and the cardiologist was quite shocked because he hadn't seen him for a while, how bad he really was. By that time, we had brought in a wheeled walker. And so he brought that in. The doctor told him he had multiple lesions on the liver, and probably some kidney involvement. So my brother then asked him, "Is it cancer?" And the doctor kind of hesitated, kind of shrugged his shoulders a bit and says, "Well, kind of." My brother took that as he's got cancer. I remember him telling the cardiologist, "It happened so fast."

And the cardiologist then said to us, "I really shouldn't be involved in this. I'm a cardiologist. I shouldn't be really doing this." "Perhaps this would be better done through your family doctor."

[00:15:00]

"However," he says, "I've seen Jerry for a number of years, and I just can't believe the change in him." He says, "I'll order some home care for him. In the meantime, I will try and contact a colleague of mine in London, who's a specialist. It might take me a while to get a hold of him, and I'll let you know how I make out."

So we left. We brought him home. The very next day, home care called. And they said, "We'll send someone to assess you on February the 10th," which was 23 days after the doctor had asked for home care. We knew that he's probably not even going to make it to February 10th, which he didn't. He passed away February 4th.

My wife and I took sole responsibility for his home care, where we looked after him food-wise and personal hygiene-wise. We got to the point where we couldn't even manage him. He still didn't want to go to the hospital. He still didn't want to see his family doctor. My wife was looking after him in the bathroom, and I thought, "Well, let's try something." I called his family doctor up, and the Lord was really good because I actually got to talk to him. And I said to the doctor, "Would you mind talking to my brother, because he's not listening to us." So we brought the phone in the bathroom and he talked to the doctor. And the doctor said, "Jerry," he says, "I want you to go to emerge." And he says, "We'll make

arrangements and we'll have you admitted." So that was enough to convince my brother to go.

We had to call an ambulance for him. And we brought him to emerge. And I was in emerge. with him for eight to nine hours and they did all kinds of tests. And they kept saying they were going to admit him but they didn't. And finally, it was approaching midnight and they said, "Well, you may as well go home. When we get a room for him, we'll let you know."

The next morning—it was mid-morning, probably 10-ish—we called and he was still in emerge. And they hadn't found a room for him yet. They said, "As soon as we get a room, we'll call you." Well, by mid-afternoon, there was still no call. So we phoned emerge. and that's when they said oh yeah, they'd found a room for him up on the fourth floor. And I said, "Okay, I'll be up to see him." And that's when they told me, "No, you can't." I says, "What do you mean I can't?" And they said, "Well, it's COVID protocol for this hospital."

Shawn Buckley

Had you not had you not been with him in emergency just for like eight, nine hours?

Richard Lizotte

That's right. That's right, I was. So when they told me that, I really couldn't believe what I was hearing. They said "No, it's our hospital COVID protocol." I said, "Is it because I'm not vaccinated?" "No, no, no, nothing to do with that," they said: "Vaccinated, unvaccinated, nobody's coming into the hospital." I said, "Well, is there a way I can talk to him?" And they said, "Oh yeah, we can try to arrange that."

But that day was far spent. It was the next day that we talked to the staff. And the staff, the first thing they said to us was, "Your brother's giving us a hard time." First of all, that's never been his nature. Now, I know he's very personal and perhaps he didn't like the fact that somebody was giving him a bed bath or whatever. But they said, "He's giving us a hard time." And that's when I said, "Well, my wife and I are healthcare professionals." I said, "Let us come in and we'll gown up, we'll mask, we'll do whatever we have to do. And we can settle him down and give you a hand." "No—protocol for the hospital is you cannot come into the hospital." So I said, "Well, I'm going to have to talk to the administrator." And I tried to call the administrator, but they referred me to a patient liaison person. And she was very nice, very kind, very polite, but she in no uncertain terms said, "I'm sorry. You cannot come in to see your brother." And hey said, "Well, maybe we can connect with Skype." And every time we tried to do the Skype it never worked.

Then we tried talking to him on the phone. And by that time, he had declined so much he couldn't hear us. He was only giving me one-word answers to any of my questions. We tried to tell him that we're working behind the scenes so that we could go and be with him.

[00:20:00]

And it went on like that for seven days, until we got a phone call on the 31st saying that they had moved him to palliative care and that we could come up to see him. But we would both, my wife and I both, have to have a COVID test—a negative test.

The very next day, I went to get my COVID test. My wife couldn't get hers before the day after. As soon as I had a negative test, I went up to see him. I was quite shocked that he was completely unresponsive. And he never spoke another syllable till his death. For the next

two or three days, my wife and I spent all our time there. We prayed with him, we read scripture to him. We sang hymns to him. We knew that hearing was one of the last senses to go. We don't know what he was able to take in, but we never heard another word from him. I was both his power of attorney for health and the executor of his will. I wanted to know if there was any last wishes. We never got to do that.

Shawn Buckley

Mr. Lizotte, we thank you for sharing that story, and I'll just ask if the commissioners have any questions of you. And there are no questions. Is there any last thing that you'd like to share with us?

Richard Lizotte

Yes, I can tell you as a paramedic, and my wife's an RN, an emerge. nurse, both retired now: There is never a reason for a family member not to be with a dying family member. None. Zero. There's isolation attire that could be used. There's never a reason for this. Ever. I've dealt with infectious patients throughout my career: TB patients, HIV, AIDS patients, bacterial and viral meningitis, MRSA [Methicillin-resistant Staphylococcus aureus]. There is never a reason why somebody who is properly attired in isolation attire, they can't be with their dying loved one. Never. Never.

So this was beyond all comprehension for me. I could not understand this at all. If they would have asked me to wear a hazmat suit to be with my brother, I would have worn one. Whatever it takes. To me, this is next to criminal. And if something like this ever happens again, something has to be done.

My brother never saw a familiar face for eight days until he became unresponsive. That's all.

Shawn Buckley

Thank you. On behalf of the Citizens Inquiry, I'd like to thank you for sharing your testimony. And I'm sorry that it was difficult, but we definitely appreciate you sharing your brother's story.

Richard Lizotte

Thank you.

[00:23:50]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Shawn Buckley

Vicki, I don't know if you can hear me. But if you can, if you can turn your camera on, that would be great. And also, your mic.

Vittoria McGuire

All right. Okay.

Shawn Buckley

There we go. We can see you and hopefully you can see us. I'd like to start by asking you to tell us your full name for the record and then spell your first and last name for the record.

Vittoria McGuire

Okay, it's Vittoria McGuire, V-I-T-T-O-R-I-A- M-C-G-U-I-R-E.

Shawn Buckley

And I'll ask if you promise to tell the truth, the whole truth, and nothing but the truth.

Vittoria McGuire

I will.

Shawn Buckley

Now, you've got a full 21 years working as an RPN. Not a regular RPN, but you were a full-scope RPN, which is something quite different than a regular RPN. Am I correct about that?

Vittoria McGuire

Well, just working to full scope—that I had additional courses, I could take blood and help out with things that. Yeah, worked to full scope.

Shawn Buckley

Right, okay.

Vittoria McGuire

Just did everything that was required and asked of me.

Shawn Buckley

Life has a lot of irony and no good deed goes unpunished, but my understanding is this: In December of 2019, just before COVID hits—you've worked for 21 years for the hospital—you get an award from the hospital, the award of excellence for nursing.

Vittoria McGuire

Yes, I did.

Shawn Buckley

Yeah, so—

Vittoria McGuire

Quite the irony, yeah.

Shawn Buckley

So just before all this starts, you're basically being recognized by your employer as an excellent nurse and actually being given an award—the only one getting it that year.

Vittoria McGuire

I'm not sure about that, but I was given the award for having the hospital values of compassion and cooperation, respect, professionalism. So yeah.

Shawn Buckley

Now when COVID hit, you took it very seriously. And can you share for the commissioners and the spectators basically the steps you took in your own home to ensure that everyone was safe and that?

Vittoria McGuire

Yeah. With watching what was going on on TV—and there was a lot of fear actually surrounding the whole thing. And having it, you know, come towards our hospital, our communities. We ended up putting up a tent on our front deck so that I would be able to protect my husband, who has diabetes, and I wouldn't bring anything home. So we had a tent erected on our deck. And I would come home and strip in the tent outside in March

and place my clothes in a bag and get a housecoat on, go into the house, clothes into the washing machine, housecoat into the washing machine, jump into the shower and made sure that I stayed in a separate room, just to make sure that I didn't bring anything home and infect anybody.

Shawn Buckley

So basically, so you slept in a different room than your husband—

Vittoria McGuire

Yes.

Shawn Buckley

Just to make sure that your family was being protected.

Vittoria McGuire

That's right.

Shawn Buckley

Now, you said there was a lot of fear at the beginning. Can you tell us about the fear in the hospital that you worked at?

Vittoria McGuire

Well, there was a lack of PPE [personal protective equipment] and the nurses actually purchased facial shields themselves. We were thinking that we're going to be having this wave come and that we weren't going to be prepared for it. So yeah, there was a lack of N95s, so when we would come in to the hospital—

Shawn Buckley

And we're just waiting a second. You froze, and we're just waiting for you to unfreeze.

[00:05:00]

Vicki, I don't know if you can hear us, but we're having that experience of freezing, so we're just going to check a couple of settings for a second.

So perhaps what we'll do is, we have another witness here who is in person, Mr. Remus Nasui. Remus, can we get you to take the stand, and we'll try to get Vicki back on.

Oh, I'm sorry, we're back on?

Vittoria McGuire

Okay, does that work?

Shawn Buckley

Yeah, sorry, I don't know what happened there. You just froze. But you were basically talking about the culture in the hospital, that nurses had purchased their own face shields, and then you froze. So if you can kind of just pick it up from there. And then where I want you to go next is, tell us what you were thinking at the beginning and then whether your opinion changed. Because you're taking big steps at the beginning: you're changing in a tent; you're sleeping in a different room; you're telling us about fear in the hospital. So if you can carry on.

Vittoria McGuire

Yeah, the lockdowns happened, so there wasn't really many people in the hospital—like visitors and whatnot. The hospital became quite quiet. And so there was a lot of downtime, and what we were expecting to happen didn't seem to come to fruition. We had seen other places, you know, that the pandemic—the waves were coming in and people were so busy. And time was passing and I didn't really see it happening.

Shawn Buckley

Okay, so just so that I understand it—because I think most of us are watching the news and we're being told that the hospitals are being run.

Are you telling us that wasn't the experience you were having?

Vittoria McGuire

No, not at the beginning. Like I said, in the lockdowns, the hospital was quite quiet. We were receiving a lot of accolades. We had, you know, people were supporting us a great deal with pots and pans banging. We had emergency vehicle parades come by the hospital. We had people donating food and it was wonderful feeling like such a hero. And like I said, we were just waiting on pins and needles for this thing to hit.

Shawn Buckley

Okay, and then basically the vaccine mandates came.

Vittoria McGuire

Yeah. It was slowly coming into—I mean, we worked for a year and a half without anything, with concerns to vaccines. We worked together side-by-side for a year and a half and it was fine. It wasn't anything out of the ordinary that we were really experiencing. And then, I would say, the government came up with the mandates pushing the vaccine. I guess it was in September that the mandates came out, but the hospital was already starting to prepare people for taking the vaccine. It seemed to be that was the route that we were going to take. I remember seeing a CPR course that was available in-house and that was in the spring. And to attend it you had to be vaccinated. So actually, that was before it was mandatory. So I was seeing the direction that was being taken, that they wanted to get the vaccine into everyone.

At that point, I remember talking to a union representative. And I had said to them:

[00:10:00]

“Are you going to represent me if I decide not to take this?” And she actually kind of laughed at me. Because I had said, “if I get fired for not taking this.” And she had actually started laughing and she said, “Oh, it’s not going to get to that.” And yeah, sure enough, it ended up that direction.

Shawn Buckley

Did the hospital try to communicate with you by email and social media and things like that about the mandate? Or the vaccine?

Vittoria McGuire

We were getting a lot of emails. I remember that there was also, like, an early bird— If you got vaccinated early, you could get into an early bird prize. They had furniture and cash prizes if you had gotten your vaccination early.

Shawn Buckley

Just wait. I just want to make sure that I heard you correctly. Are you saying that your employer, who is a hospital, had an early bird draw for staff so that if you got vaccinated early you were put in a draw to win prizes, such as furniture or cash?

Vittoria McGuire

That’s right.

Shawn Buckley

Okay. Were there other things that the hospital did to try and encourage you to get vaccinated?

Vittoria McGuire

There were emails that came regularly saying that that was the best route to go.

Shawn Buckley

Did you see anything at the hospital that would suggest that vaccinated and unvaccinated people were being treated the same? Or differently?

Vittoria McGuire

Not with co-workers. Like I said, we worked side-by-side for about a year and a half with no issues. It wasn’t until I started seeing, like I said earlier, about having to take a course to participate that I had to be vaccinated. So that’s when I started to see that.

Shawn Buckley

What about with patients that were vaccinated and unvaccinated?

Vittoria McGuire

I know that there were some incidences where patients had asked for a vaccinated nurse. Only one that I know that was close to me—it was a co-worker—and she had said to the patient that— She didn't reveal her status. And she just said to the patient, "We're not going to play this game," and shut it down.

Shawn Buckley

Now eventually you got suspended. Can you tell us about that?

Vittoria McGuire

That would have been October 12th, when the hospital became 100 per cent vaccinated for staff. There was an unpaid leave of absence for all employees that were not vaccinated.

At that point, we had left the hospital. They had shut down our capabilities to use our emails, computer. We couldn't get in to see our pay stubs or our schedules. So we were totally shut out from the hospital for those three weeks.

Shawn Buckley

Okay, you say "we." You mean you and fellow healthcare workers?

Vittoria McGuire

Those that decided not to take the injection at work, yeah.

Shawn Buckley

Okay, did some of the ones that you know then change their mind?

Vittoria McGuire

Yeah, there was a campaign that started from the hospital over the course of the next three weeks. Purolator would pull into the driveway and deliver a package coming from the hospital stating that we were being non-compliant; that this was continued disciplinary actions; that if we didn't show proof of vaccine, we would be terminated; that our actions were on our personal files. And yeah, we had a certain date—I believe it was in November sometime—that we had to come up or that termination would occur.

[00:15:00]

So yeah, a lot of people did end up going back to the hospital after that period of time.

Shawn Buckley

Okay, and you didn't and then you were terminated.

Vittoria McGuire

Yes.

Shawn Buckley

Were you able to get EI?

Vittoria McGuire

No. Actually, everyone that was terminated tried. And everyone was refused, everyone was refused. So there was no safety net for the people terminated. Even though we paid into the system for many years, that safety net was not available to the people who refused taking the injection.

Shawn Buckley

Now, once you were terminated and you couldn't get EI, did you experience any stigma for being what I call an anti-vaxxer?

Vittoria McGuire

Well, there was a lot of names, yes. A lot of names, prejudice, you know, like you said, "anti-vaxxer." It was a difficult time, that period. I didn't even tell people that I was terminated. I told people that I took early retirement, which I did. I took my pension at a reduced rate. But I was embarrassed. I was embarrassed that— Yeah, all these labels.

I was in the job that was into service of others and always helping others. And receiving that award I kind of think tells you how much I loved my job. And so when I was in need, it was just like there was no one there for those people that spent a great deal of their life helping other people.

Shawn Buckley

Were there any effects on your mental health?

Vittoria McGuire

Everyone that was terminated had the sleepless nights. And your world changes on it, your world changed on a dime. Which is— You understand that, but to accept it is a different thing. So yeah, there's a lot of anxiety. How are bills going to get paid? How, you know— I heard a lot of parents who had small children, even the whole family unit suffered a great deal. Why is mom so sad? Yeah, just— People ended up having to sell their homes. Some people sold everything and left Canada. So yeah, it was a very difficult couple of months afterwards. We were part of the Ontario— Oh goodness, I can't even think of the acronym right now.

Shawn Buckley

United Ontario Healthcare Workers?

Vittoria McGuire

Thank you, yes. We were part of that. And we had a chat group, so we were helping each other out. People would— If they had extra of something they would help each other out. And it was a good place for people to help voice some of their anxiety. So...

Shawn Buckley

If we ever face something like this again, how would you suggest that things be done differently?

Vittoria McGuire

Well, most definitely. Decisions were made—a lot of decisions were based on fear. And I think that that was the worst part of it. Healthy, good, smart decisions never come from that place. The crisis seemed to build and everyone had angst and were anxious. And decisions were made because they felt pressured. I had a nurse tell me that they took the injection and felt violated but they were the only breadwinner in their home. I had another nurse tell me—a single mom---that she didn't have the convenience of having convictions, you know. People did things that they didn't want to.

[00:20:00]

And again, it was pressure and coercion.

We really did have to, I think, slow down and look at both sides of a story. There can't be just one view. And being able to look at something from both sides: as a nurse, one of the most important things you can do is advocate. If something wasn't working for your patients, you would voice that. You would go to the doctor. You would say that this isn't working, the treatment or drug. But you had a voice and you were able to, like I said, advocate and show a different perspective.

But it didn't seem that you were allowed to in this—

Shawn Buckley

And Vittoria, you froze again. And I'd say we were at the end of your evidence. If you can hear us, I thank you on behalf of the National Citizens Inquiry for attending. And I can say that your evidence was very helpful.

[00:21:19]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 10: Deanna McLeod

Full Day 1 Timestamp: 07:18:25–08:21:15

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Deanna, can you hear me?

Deanna McLeod

I can. Hi, Shawn. How are you?

Shawn Buckley

I'm well. It's good to see you. I'm going to ask if you could, for the record, state your full name and then spell your first and last name for the record.

Deanna McLeod

My name is Deanna McLeod, and so you want me to spell it now?

Shawn Buckley

Yes.

Deanna McLeod

Okay, so that's D-E-A-N-N-A, McLeod is M-C capital L-E-O-D.

Shawn Buckley

And I'll ask, do you promise to tell the truth, the whole truth, and nothing but the truth?

Deanna McLeod

Yes, I do. To the best of my abilities.

Shawn Buckley

Just to introduce you to the commissioners, you've studied immunology and psychology at McMaster University?

Deanna McLeod

Yes, that's correct.

Shawn Buckley

And then you worked in the pharmaceutical industry for ten years in medical, in marketing and sales, and you specialized in the field of oncology.

Deanna McLeod

That's correct.

Shawn Buckley

You became concerned with the tendency towards biased reporting by some pharmaceutical companies.

Deanna McLeod

That's correct.

Shawn Buckley

And then you actually founded an independent medical research firm in the year 2000 to assist clinicians in preparing objective, evidence-based guidelines [CV is Exhibit TO-5].

Deanna McLeod

That's correct.

Shawn Buckley

And your company is called Kaleidoscope Strategic. So it's an independent medical research firm.

Deanna McLeod

That's right.

Shawn Buckley

And since March of 2020, you became very interested in COVID science. And my understanding is that your team has spent more than 3,000 hours conducting COVID-related research.

Deanna McLeod

At the very least, yes.

Shawn Buckley

Okay, you smile, so it's been more. We've asked you to come here today to share your research concerning children and vaccinations, and my understanding is you have a presentation to do for us.

Deanna McLeod

Yes, that's correct.

Shawn Buckley

I think screen share is enabled, and if you would like to—

Deanna McLeod

Okay, let me just see. Let me know when you can see my screen here.

Shawn Buckley

And we can see your screen, and we've got it on full screen with a slide that says, "It's time to stop the shots."

Deanna McLeod

Fantastic. So let me know when you'd like me to start.

Shawn Buckley

Oh, you can start right away.

Deanna McLeod

Okay, well, thank you very much for having me. It's a real privilege to be testifying at this Inquiry. And what I'd like to do today is walk through some of the data related to use of the COVID-19 vaccine, specifically in children, and children will be defined as anyone less than 18 years of age. And presently, I'm just going to summarize really quickly some of the NACI [National Advisory Committee on Immunization] recommendations.

Children 16 years and older were lumped in with adults, and the vaccines were rolled out right at the beginning in early 2021. And then subsequently, Health Canada approved the vaccines for children 12 to 15 years old, followed by children 5 to 11 years old. And finally, **most recently, children 6 months to 4 years old. So that's referring to the primary series, which is the initial two doses for everybody above five years. And for those less than five years, it's three doses.**

And so NACI, which is the group that basically creates the guidelines for immunization in Canada, also recommends boosters in children five years and older—preferably the Omicron booster. And most recently, their guidance specified that a spring booster might be necessary for those who are immunocompromised. So basically, our health authorities in Canada are recommending not only the primary series for most children but a series of boosters as well depending on how old they are, and especially use of this Omicron booster.

What I'd like to do today is to walk through the clinical data that supports those recommendations. Our firm specializes in analyzing clinical trials. And what we do is we see if the data, the rigour of the data, supports the recommendation. So we'd like to walk the group through this type of analysis today.

When we're looking at children, one of the things that we really need to remember is that they have a number of quality life years ahead. And so when we're thinking about use of an agent, what we really want to do is we want to make sure that it's been rigorously tested for safety.

[00:05:00]

Because if there is something that is unsafe, it has the potential for injuring a child, and they would lose a lot of quality life years. That would be more quality life years lost, than, for instance, somebody who has one year to live who's injured by a vaccine. That would also be a loss but not to the same degree as, for instance, a six-month-old who's injured by a vaccine. So the precautionary principle and a lot of the rigour and testing was put in place whenever we had thalidomide—which was approved as something safe and appropriate for morning sickness—and we only found out that it actually caused considerable harm to the unborn child, which was only really recognized whenever they were born. And there were quite a few deformities, especially in their hands and legs.

The other thing that we want to consider when we're looking at these COVID-19 injections is the type of product they are. These are considered gene therapy, and so they're gene-modifying products. And if you look at the FDA [U.S. Food and Drug Administration], what they'll do is they'll say that for gene therapy—and this qualifies because it teaches our cells to produce a protein via mRNA—that the types of side effects that could happen with gene therapy as a class are broad and difficult to predict. And therefore, 15 years of safety testing is recommended for gene therapy products. What we're going to be looking at is: Are the trial designs that were proposed for these vaccines rigorous enough to identify all of the different safety issues that could arise from using gene therapy?

And finally, at the time when these vaccines were being approved for children, we knew that there were rare side effects—one of the most concerning of which was myocarditis. And so because you can detect myocarditis at a subclinical level by measuring troponin, we'd want to see rigour in testing—both clinical in the sense of symptoms, but also a lot of lab-testing in order to see if there's any type of side effects that are occurring that aren't quite clear from a clinical perspective. And so we'd want to see rigour in testing in terms of a lot of subclinical testing—i.e. tests of troponin levels, inflammatory markers, all sorts of different things—because we know that we're dealing with gene therapy, and we also know that we can expect certain types of side effects.

When you're conducting a clinical evaluation, basically the first question that you answer is: Do they need them? And so when we're talking about kids, if we realize by looking at the data that they aren't needed, then that would be the very first reason why we would not proceed. Because you should never give something that isn't needed. That would be applying the principle of minimal intervention. The second thing that we'd want to look at is: Do they work? If they don't work, then again, you don't give them to anybody. And finally, we'd want to make sure that they're safe. And again, safety being particularly important in this particular context, because children have so many quality life years ahead of them, and we definitely don't want to be injuring anybody.

So let's ask the first question: Do they need them? This is basically a plot that was taken from the Canadian COVID-19 Immunity Task Force. And in this plot it basically shows that at this point in the pandemic—we're three years in now and Omicron, which is a highly contagious variant, has been circulating widely for quite some time—they found that if you did antibody testing or seroprevalence testing, that 80 per cent of children in Canada now have antibodies, which basically confirms that they've contracted and recovered from a COVID-19 infection. We can expect, based on any principle of vaccine or natural immunity, that these people would have some degree of immunity to SARS-CoV-2. Now we know that children were never really at risk of COVID-19 because there were very few severe cases of COVID-19 in children and almost no deaths whatsoever. So we know that they're quite healthy. And now we know that they also have widespread, long-lasting, and robust immunity.

How robust is their immunity? This is a study, and I'll just walk you through this one table. This is a publication that was published by *The Lancet Microbe* and it was a retrospective study from Qatar.

[00:10:00]

And they were basically comparing natural infection—which is what we talked about the children having—versus the Pfizer vaccine, versus natural infection, versus the Moderna vaccine. Both of those vaccines were promoted as having about a 90 per cent efficacy. What we want to know now, what this study is going to show us, is how much more efficacious is naturally acquired immunity than these two vaccines? And so when they conducted the study, what they found was that when you compared naturally-acquired immunity to the vaccine immunity, the people who had naturally-acquired immunity had a 53 per cent reduction in the rate of infection compared to vaccines. So this is much more effective than the actual vaccine. And when we do cancer research, if you have a hazard ratio of 0.47, that's a very, very potent intervention and that would be highly recommended.

Now, what they also looked at were cases of severe, critical, or fatal COVID-19. And what they found was a hazard ratio of 0.24. That means that the people who have naturally-acquired immunity are 76 per cent less likely to get an infection compared to the vaccine arms of the study. What this is showing beyond a shadow of a doubt from an observational study is that the naturally-acquired immunity is much better than vaccine-acquired immunity.

And therefore, based on these two slides, the fact that kids are not at risk in the first place; second, that they have extensive naturally-acquired immunity as shown by seroprevalence tests by the COVID-19 Task Force in Canada; and the fact that studies show that naturally acquired immunity is much more effective than vaccine acquired immunity, we would **basically say to the first question that, no, there is no need to vaccinate children based on a lack of need.**

So then let's go on to the second question: Do they work? And now when we're looking at clinical evidence, not all the science is the same. And I know that throughout the pandemic, many people have said, "We need to follow the science," as if there was one science and one answer. But the truth of the matter is what you need to do is you need to kind of prove that something is better than something else. And the best way to do that—the most reliable and the trusted way of doing that—is a randomized controlled trial, which would be considered Level I evidence. And when you have randomized controlled trials and you have that level of data, then you're able to say that something causes something else. Any other level of data—for instance, these types of studies down here—you would have to hesitate

in a causal relationship. Because you can show an association, but you can't show that something proves something unless you've randomized it and you've controlled for baseline influences.

Let's look at the type of study. There's a lot of observational trials that are out there. And that's where they look at real world data and they say: "We deployed this vaccine at this point and the rates of hospitalization are lower." But observational studies can't actually prove that something works because correlation does not equal causation. Again, you need to have a randomized controlled trial. And because naturally acquired immunity is the current standard, in the sense that children have extensive naturally-acquired immunity, we'd actually have to compare the vaccine to somebody with naturally-acquired immunity to figure out if the vaccine would be beneficial at this time. And because children are not—The only risk that they have is hospitalization, we'd want that to be the main endpoint, and we'd want to make sure that it would address hospitalization in a post-Omicron era.

And so we basically need to show a study that compared the vaccine to naturally-acquired immunity, looking at hospitalization as the main endpoint, at a time when Omicron is circulating widely. And if you provide descriptive statistics—which is, basically, you might randomize something but you can't statistically prove that something is better than the other—then that isn't sufficient proof to prove efficacy.

So here is what our team thinks would be the ideal trial to prove that COVID-19 vaccines are beneficial for children in Canada at this time when Omicron is circulating widely. You basically want to look at children who are at risk of severe COVID-19 only,

[00:15:00]

because healthy children are not at risk of severe COVID-19. You want to do it during the time when Omicron is circulating widely. Because it is a gene therapy, you'd want to make sure that the population size was enormous, 80,000—the original trial was probably about 40,000; that it was randomized; that you compared the gene therapy to naturally-acquired immunity; and that you looked at hospitalization. And that you followed this for 15 years, as per the gene therapy guidelines from the FDA.

But again, when we're looking at the vaccine trial design for the COVID-19 vaccines, we see that the studies were conducted in a pre-Omicron era, which basically makes them clinically irrelevant for a post-Omicron era. They were conducted in children who were healthy and had no prior COVID-19, which doesn't reflect at all the children today. The population size was very small for their main endpoint; it was less than 500 children per cohort. And instead of comparing the gene therapy to naturally-acquired immunity, they compared it to the use of the vaccine in young adults.

So what they actually compared for their primary endpoint, or their primary comparison, was the gene therapy versus the gene therapy. And that's called a "no-lose trial design." When a company basically wants to show that their trials are positive, they'll do a non-inferiority trial against their own product because they want to stack the comparison so that if they felt that they would lose to naturally-acquired immunity, they would choose the comparative that they know that they can beat or be equivalent to. This is not a surprising trial design for a company that basically wants to make sure that they get positive trial outcomes.

And again, what we'd want to see is hospitalization as the endpoint, but what they actually looked at was neutralizing antibody titers. And I don't want to bore you with something

that's too complicated, but basically a neutralizing antibody titer— What they're doing is considered a surrogate or a correlate of prevention. They're going to argue that because the antibodies change then there's some sort of level of immunity, and therefore that immunity would extend, for instance, to lower rates of infection perhaps, or lower rates of hospitalization.

But according to the *New England Journal of Medicine*, a recent article published there, they've argued that in the post-Omicron era, antibody levels are not a surrogate or a correlative prevention for hospitalization and so it should not be used.

They had a component of the trial design where they did compare the gene therapies to placebo. But one of the things that should be noted in this particular area is this is descriptive statistics and they can't be used to prove superiority of the vaccine, even though the rates of efficacy were rated and we were told that it was superior to the placebo. Because they didn't do any statistical treatment on this data, you can't actually use that as proof of superiority, again.

So at this time there is no trial that's in existence that shows us that this COVID-19 vaccine is superior to naturally-acquired immunity—the current standard—and that it is able to reduce hospitalizations or severe COVID-19 in a post-Omicron era. Because there are no trials that actually address the question that we need to know, which is the clinically relevant question, we could probably stop our analysis right now and say that there is no data available to support the use of these COVID-19 vaccines at this current time, which is the post-Omicron era, addressing the issue in question, which is hospitalization in children who have naturally acquired immunity.

However, we will go and look at the results of the trial. We're going to be looking at descriptive statistics. This is what the regulators and health officials use to support the recommendations for use. Right now, we're going to be looking at 12- to 15-year-olds and 5- to 11-year-olds. And, basically, what we see is that the COVID-19 vaccines have little to no clinical benefit. So although there were many that argued that the vaccine was 100 per cent effective, that was a relative risk reduction comparing zero episodes of symptomatic COVID in the Pfizer injection arm versus the placebo arm.

[00:20:00]

The absolute benefit made available to children was 2 per cent.

So only 2 per cent of the children who actually received the vaccine benefited from it, whereas the rest of them did not benefit from it. When you see an absolute risk reduction that's that low, you have to question whether it's really worth pursuing. And again, we **know that children don't have severe disease. This is just a runny nose or a fever, and that's not something that we necessarily have to treat with children because it isn't severe. And if we do look at the number of severe cases, you can see that there were no severe cases in either group, i.e. children are not susceptible to severe COVID. And that applied for the 5- to 11-year-olds and the 12- to 15-year-olds. So here we have no benefit in terms of severe disease, and only a minimal absolute benefit in terms of mild disease. We look at the younger cohort, the initial trial design was to be giving them two doses. And whenever they completed the protocol-specified two doses, the relative risk reductions were 14.5 per cent and 33.6 per cent for the two cohorts, which basically means that the vaccines didn't work.**

What they did was what we would call a "fishing expedition," where they changed the protocol so that it could be adjusted to be positive and so they added a third dose. In our

particular area, if you see somebody who makes this post-hoc adjustment, you basically throw the data out and you don't regard it—because you can almost make anything look positive if you work at it hard enough. So here they added a third dose, and again, only about a third of the children continued on to the trial to get that third dose. And when it looked at symptomatic COVID-19 cases, there was only a difference of three cases between the two groups. So you've given the vaccine to all of the children in the vaccine group and there's only a difference of three cases which, again, was touted as an 82 per cent benefit, but really was only a 2 per cent absolute risk benefit. And again, here in the six months- to two-year-olds with the third dose, there was only a difference of one infection between the two of them. They called that a 76 per cent relative risk reduction or called it efficacious, but really, it was only a difference of about 1 per cent between the two groups.

In terms of severe cases, I would argue that there probably were no severe cases, although there might have been one that was considered a severe case in the placebo arm, although it wasn't confirmed. So again, you have less than 2 per cent benefit for treating all the children.

So again, if you were thinking about the principle of minimal intervention, you would say: Is it warranted to give a vaccine or a treatment to all the children when it really only benefits a very small amount? At that point what we would probably suggest is that you would treat the children who have difficulty or who might be more susceptible—or treat them, period—and you would probably opt out of a preventative approach in this particular case.

I'm just going to zip through this slide here.

One of the things that is also really important is they did a point-in-time comparison. They only really ever measured the antibodies about a month afterwards, and they measured the symptoms about seven days after the second dose. But what they failed to do is watch how the benefit changed over time. And so here is probably one of the better studies. It's a *New England Journal of Medicine* publication. It's looking at the six-month follow-up after a fourth Pfizer vaccine dose in adults. We're going to argue that probably the efficacy of these things is going to be similar. Its probably going to see similar waning in the children as you do in the adults.

In this particular study, what they saw was that the benefit peaked at four weeks. Remember, they've only identified the benefit at seven days. Three weeks later, they basically see that the benefit has peaked. It's at its height. And then it wanes slowly afterwards. So by 13 weeks, it's basically gone completely.

[00:25:00]

Here we have a benefit that helps 2 per cent of children seven days only after they get the injection, but is gone probably within three weeks later and might even become negative over time. And so again, I don't think that we have sufficient efficacy data to show long-term benefit for these particular vaccines.

Because the vaccines wane, the boosters are required. And because we're now in a post-Omicron era, we've been proposed that the Omicron booster is the solution to the problem of waning efficacy. So this is basically the results of the BA.1 Omicron booster trial, which was used to support the recommendation for use of these vaccines in children—this particular vaccine being the Omicron booster. And in this middle panel here, what you can see is that 78 per cent of the participants had no previous infection. So again, because most

children today have had a previous infection, the results of this trial are probably not very clinically relevant, but they were used to support the vaccine. So let's just take a look at them.

Our regulators argued that the level of antibodies were higher for the Omicron booster than they were before they received the booster—on day 29 after their booster. You see this jump in antibody levels like this and that the antibody levels for the Omicron booster jumped higher than they did for the regular booster. And therefore, they argued that the Omicron booster was more effective than the regular booster. Now again, if we go back to what we know about correlates of prevention, it is clear that antibody levels are not a correlate of prevention for hospitalization, for instance, or even symptomatic COVID-19 in a post-Omicron era. So therefore, all that we can say based on this is that both groups got antibodies after they received the injection. And we can't infer anything regarding the actual immunity.

However, they did happen to measure the immunity in this particular study. And what they found is, in the group that had lower antibody levels, they had 1.5 per cent infection rates. And in the Omicron booster arm, they had higher rates of infection following those antibodies. This goes to prove that antibody levels are not a correlate of prevention, and that there were higher rates of infection on the arm that was the Omicron booster arm. And regardless of the results of this trial, i.e. showing higher rates of infection and not being a correlate of prevention, our health authorities went ahead and approved this particular thing for children without any specific testing in children. This actual study was run in adults. So the study, in my mind, would be negative. It would not be applicable to children, and yet our regulators—and particularly NACI—recommended these agents in children.

So on to the next question. I would say for the question where it says "Do they work?" the answer probably would be that there's insufficient data to support the fact that they work. And until they prove that it works, then we should assume that they don't work. In terms of safety, again, when we're looking at new agents, what we want to see is pre-clinical testing. And the one thing to note about these particular agents is that the normal type of testing that you would do—the rigorous pre-clinical testing for the COVID-19 jabs—were not done.

In terms of oncotoxicity, we want to make sure that it doesn't cause cancer; reprotoxicity, we want to make sure that it doesn't cause infertility; and genotoxicity, we want to make sure that it doesn't harm your genes or your genome. None of these tests were done. The thought of giving these to children without having done these basic tests is very disturbing.

And if we look at the clinical testing that was done, we would want to see extensive testing. Because, again, we're looking at gene therapy, and the FDA recommends up to 15 years of safety testing for gene therapy. We know that inflammation is a known side effect, whether it's myocarditis or pericarditis or encephalitis or any of a number of different inflammatory reactions that we've seen associated with this. So what we want to see is clinical testing,

[00:30:00]

in the sense of monitoring of a broad range of symptoms. But we also want to see subclinical testing. We'd want to be measuring troponin levels to see if there's any cardiac damage. We'd want to see D-Dimer levels to make sure that there's no coagulation occurring. We want to see C-Reactive Protein to make sure that there's no inflammation.

But, when we looked at these studies, what they did was they basically measured reactogenicity, which is COVID-like symptoms, for seven days only after receiving the injection. And then if somebody had a severe or serious symptoms, they would follow that person for up to six months. And when they basically recommended that these particular COVID-19 vaccines be released to market and used in children, only two months of data had been collected. So that's two months of data out of the 15 years that should be done for gene therapy. And even within that context of running a study for two months, they only actually looked for side effects for about seven days. And so that would be nowhere near sufficient to be able to characterize the side effects profile of something like a gene therapy over that time. And they did not look at subclinical testing, so there could be damage that isn't clinically obvious yet that's occurring. And knowing the mode of action and how these COVID-19 vaccines work, it would have been important to do that type of testing.

I'm just going to pause right now and say that if I see this type of negligence in terms of safety testing, I would probably assume that there's an entity that is benefiting from promoting these particular vaccines that has an alternative agenda—that isn't the benefit of children—in mind. And that would be something where you would tend to see minimal safety testing or misreporting of safety testing, and you'd see the benefits exaggerated and the safety issues minimized in this particular scenario. And I would probably say that what I'm seeing here fits that particular profile of somebody minimizing safety issues and maximizing efficacy beyond what's actually true.

So again, when we were talking about what they monitored very closely, they looked at COVID-like symptoms for seven days following the shots. In the left-hand panel, they looked at pain at the injection site. And on the right-hand panel, they looked at systemic events—so those are those flu-like symptoms that you'd expect when you get COVID-19. Now, I just wanted to remark that after these injections— After the second injection, and these types of side effects occurred both at the first injection and the second injection, what you see is almost 80 per cent of the kids having pain in their arm where the injection occurred—probably about 30 per cent of them having significant pain in their arm and probably about 1.5 per cent of them, or 1.5 in 100 children's arms, were so sore that they actually couldn't use them the next day.

So now if we think back to the fact that only 2 per cent of the children actually had a runny nose, the only benefit for the vaccines that was shown is that 2 per cent of them had less of a runny nose than the other ones. Here we are giving 1.5 per cent of the children, almost the same amount of children, a sore arm to the point where they can't use it. If you look at fever, another 2 per cent of them had a fever greater than 40 per cent, which is actually very serious. In terms of fatigue, another 2 per cent were so tired they couldn't get out of bed and couldn't carry on their daily activities. They may have required medical care or a visit to the ER, or the hospital because of it. And again, 2 per cent of them had very severe headaches and 2 per cent of them had chills.

So for a 2 per cent benefit in reducing COVID-19, which is what an ARR [absolute risk reduction] of 2 per cent is, you also caused 2 per cent increases in severe outcomes for these children. And now it's difficult to say whether this was all the same child or different children. But it could be that they are 2 per cent of different children, so the net could be as high as 8 per cent severe outcomes in different children for a 2 per cent benefit.

Again, if we were to consider that right now—just the clinical benefit ratio considering the risks over the benefits—you would probably say that at this point, it's negative already. However, it's important to look at the overall. Remember that they were following severe and serious adverse events for a month to six months. And at the two-month follow-up for

this particular trial, we noted that the severe adverse events for children who received the Pfizer jab versus the placebo were higher. There were seven severe adverse events in the COVID vaccine arm versus two in the placebo arm. So that's a relative risk increase of 249 per cent. And if we look at serious—which is basically people who have to be hospitalized, inpatient hospitalization, have life-threatening, maybe death, or even being permanently disabled—again, you have more of those in the Pfizer COVID-19 jab arm than you do in the placebo arm. And that's a relative risk increase of 299 per cent.

So again, coming back to our original focus, you have children who are not at risk of severe COVID-19. You can see that they didn't have any COVID-19 severe cases in the actual trial. But here you can see that those who were vaccinated were 12- to 15 years old, actually had more severe and serious events occur to them than they did from COVID-19 at all. So what I would argue here is that the vaccine is less safe than not having it at all, or than naturally acquired-immunity and letting children handle it on their own.

Again, our regulators are recommending booster shots to these children. This CDC [Centres for Disease Control and Prevention] graph basically shows the side effects that you get with each dose of the vaccine. So this is the first dose. This is the second dose. You can see that 80 per cent of children, or greater than 75 per cent of children, for the second and the third dose—the third dose being the booster—have side effects or systemic reactions that are serious enough that at least for the third dose, 26 per cent of them can't carry out their daily activities. Twenty percent of them are unable to go to work or school after they've received that third dose. And 1 per cent requires medical care.

Again, if we were to go back and think about naturally-acquired immunity and the fact that it's much superior to COVID-19 vaccines, then we would say it's not needed. If we looked at whether the vaccines are working, we'd probably say they aren't. But one of the things that's very clear is each time we give one dose to a child, we actually cause a severe amount of adverse events—to the point where 20 per cent of them are unable to go to school following the injections.

So let's talk about myocarditis. This is a well-recognized side effect of the COVID-19 mRNA vaccines. At this point, there's as many as 1 in 5,000 males aged 12 to 24 that can get myocarditis after the second dose. We now know that that's an underestimation because there are studies now that look at troponin levels. And I think it's 1 in 300 people who get the COVID-19 vaccine actually have elevated troponin levels, meaning that it's a sign of cardiac harm.

We do know that severe myocarditis weakens your heart and that your heart muscle can't regenerate. And it could affect the transduction of the heart and therefore result in severe outcomes, especially with exercise or exertion. The mortality rate is up to 20 per cent higher for people who have myocarditis at six and a half years. This is nothing to disregard. And especially if we're thinking about injury in young children and the fact that they're going to rely on a strong heart for the rest of their life: any type of damage that occurs presently might have unknown consequences long term.

The last thing that I'd like to touch on is excess death and all-cause mortality in Canada presently. These are data pulled from Stats Canada. What we can see is leading up to the pandemic, or the COVID-19 crisis, there was no excess death. So that's this looking down here. And with lockdowns, when lockdowns were initiated, in the age group of zero to 44 years,

[00:40:00]

there was an increase in excess death that was timed after the lockdowns. Here we can see that the first dose of the COVID-19 vaccine was administered to people generally speaking, so that would not have included children. And then a second dose was administered here. And with this second dose, what we can see is another increase in excess deaths across Canada timed with the second dose of the vaccine.

Now, it's hard to prove that this was related to the vaccine, but we do know that the excess death is occurring in those who are zero to 44 years, which is the segment of children, and that it is timed with the vaccine. If you look at the number of COVID-19 deaths in that age group, you can see that the deaths are minimal compared to the excess deaths during that time. What we would do is we would look at that and would say that that's a concerning signal. There's a temporal association that would need to be investigated and proven to be untrue, or that we'd want to see extensive safety testing before we would move forward with recommending a vaccine that had this type of association in children.

So just winding up: Do they need them? No. Do they work? No. Have they been proven safe? No.

And these are the countries that at this point in time have basically chosen to not pursue COVID-19 vaccination in children and young adults. Among those are a bunch of studies from Europe—again, England, Australia has made those changes. And more recently the World Health Organization has categorized—as of yesterday—children as a low risk of severe COVID-19 and therefore do not recommend vaccinating them moving forward.

The question that I have at this point is: How is it that our regulators are recommending these types of treatments with data that clearly does not support their recommendations?

One of the things that we do when we're looking at data that looks like this, where the efficacy and the safety have not been sufficiently supported, is we look to see if there's any conflicts of interest in the people who are responsible for making those decisions. Dr. Carolyn Quach-Thanh is the NACI chair at the time the COVID-19 vaccines were approved. Those would be when COVID-19 was declared and the COVID-19 vaccines were approved. One of the things that we noted was that she received a \$2.6 million grant from the CIHR [Canadian Institutes of Health Research] to study various aspects of COVID-19 right when the pandemic was declared. And she's gone on to receive more than \$10 million in grants to study COVID-19 and various topics since the time of the pandemic. And so I would probably argue that that's a lot of money going into somebody's research career on a product that may or may not be beneficial for children.

Dr. Shelley Deeks is now the NACI chair and she was the co-chair at the time that the COVID-19 shots were approved. And she received a \$3.5 million COVID-19 readiness grant before we even knew whether the vaccines were going to be beneficial in adults, before we had any phase three data. So again, it would seem difficult to me to think that people whose careers are focused on studying COVID-19 and COVID-19 vaccination would be able to objectively evaluate data on these particular vaccines and their benefits.

I'm just going to end with that there and turn it back to you, Shawn. We've covered a lot of data there. But I think that there's enough to say that it's questionable as to why these vaccines were ever really approved in this particular cohort of children at the time that they were.

Shawn Buckley

Yeah, and I'm curious Deanna, because you had hinted during your presentation that you kind of questioned who benefited from this. You were basically saying that the benefits were exaggerated and the opposite with the safety concerns.

[00:45:00]

And you're kind of teasing us to suggest, I believe, that it would be Pfizer. Or do you think that legitimately the approval bodies are compromised in this situation?

Deanna McLeod

I think that the manner in which the trials were conducted and reported basically maximized benefits and minimized safety. But it is our regulators and our health officials who are responsible for identifying these things and for basically ensuring that we've got data that proves benefit before moving forward. So I would say for sure that Pfizer and Moderna basically presented the results in a manner in which it would further their financial gains and that the people who should have been catching these things weren't catching these things. I also wonder what other interests are at play in our regulators and in our health officials that they would go forward with these types of recommendations based on this particular level of data. It's very concerning.

Shawn Buckley

Now, you've presented us with an analysis of the data by the pharmaceutical companies. Have you looked at adverse reaction reports in either Canada or other countries? Because my understanding is that Canada is getting a reputation for under-reporting adverse reactions.

Deanna McLeod

That's a great question. I tend to stay away from relying on adverse event reporting from Canada. I know that they basically say that the passive surveillance system that they have in place is sufficient to detect safety issues and that they're monitoring it very closely.

However, there's a few problems with that. One: it's passive surveillance and therefore it under-reports the level of adverse events. It was never designed to be able to characterize the safety profile of a gene therapy. If you send somebody home and you tell them that the vaccine was safe and is no problem, then the last thing that they're going to be looking for is safety issues or adverse events reporting.

What should have been done is you should have been under clinical supervision, carefully monitoring people for any type of adverse events—and a broad spectrum of adverse events because we know that we're dealing with gene therapy, which causes inflammation and spreads throughout. And that the lipid nanoparticles bring the mRNA material all through your body, and that the mRNA produces a spike protein which produces inflammation. We should be expecting to see inflammation throughout the whole body. So you should have a safety protocol that is rigorously and actively monitoring that type of thing.

To think that a passive surveillance system would be adequate for that purpose is laughable. And you know, if we did look at the VAERS [Vaccine Adverse Events Reporting System], the adverse events reported in and around the COVID-19 vaccines compared to all

other vaccines for the last 30 years is not even comparable. There's been so many adverse events reported through these types of systems that, you know, it's almost shocking.

Shawn Buckley

Does that still apply for children or are you referring just to adult numbers?

Deanna McLeod

I haven't teased it out for children specifically but you can expect that if you see the same drug being used in adults as in children, that you would see a similar profile. Although the dosing is slightly different for children, I don't think that the actual profile of the vaccine would look very much different.

Shawn Buckley

So would it be fair to say that, as far as Canadian statistics go, we have in no way a reliable reporting system for vaccine injuries outside of the clinical trial data?

Deanna McLeod

That's correct. In fact, our firm compared the rates of adverse events reported through CAEFISS [Canadian Adverse Events Following Immunization Surveillance System] to the actual clinical trials. And whereas the clinical trials were catching 70 per cent adverse event reporting, CAEFISS captured about 0.1 per cent. So that's like— Not even 1 per cent of the actual side effects were being captured by that system.

[00:50:00]

Shawn Buckley

Is there a country that you would think has the most robust adverse reaction reporting system for children? And if you have an opinion on that, can you share with us what that country's data is showing?

Deanna McLeod

Yeah, again, I stick to what you can prove, which is stuff that you would see in a randomized controlled trial. And so I haven't spent too much time looking at passive reporting systems, because they're very difficult to interpret and it's difficult to use them to prove anything. However, again: I would go back to saying that the UK Yellow Card system is probably one of the better ones. You do see the same spectrum of adverse events as you would with adults but with a heightened adverse event reporting in and around myocarditis and pericarditis, especially after the second dose in young men. Especially when you mix doses—particularly when you give Pfizer and then Moderna, or Moderna then Pfizer.

Shawn Buckley

Right, I'm going to ask the commissioners if they have any questions for you. And there are questions for you.

Commissioner Massie

Thanks, Deanna, for your very well-crafted presentation. I have a couple of questions. The first one is about— I understand the challenge to demonstrate the efficacy of vaccines because, unless you have a very good animal model that would be fairly representative of what would happen in humans, you cannot purposefully infect people to see whether the vaccine works. So you have to rely on surrogate markers. In this case, it seems that there's been a lot of emphasis put on antibody titer. And if I'm not mistaken, when you look on the FDA side, this spelled out specifically: that the antibody is not a good surrogate marker for protection against infection. So why is it that we keep seeing that in all of the presentations from the company?

Deanna McLeod

That's an excellent question and I'll answer it from a research development and an accelerated approval scenario. In cancer, which is where I work, again people look for surrogate markers. Because, again as you mentioned, you want to be able to identify benefit early and have it point to the ultimate benefit that you want— So for instance, response rate might be considered a surrogate for survival in cancer. But in order to establish a surrogate, you need to clinically validate it and you need to make sure that it's the case across different settings and in this particular scenario, across various variants as well.

Although there was quite a bit of testing done in the original trials where they felt that it was valid in the sense that the antibodies could predict symptomatic COVID-19 in the pre-Omicron era—and I would probably argue that that's not the case in the post-Omicron era—they now acknowledge that it isn't a correlate of prevention, which is the proper terminology for it in the vaccine world. And it isn't a correlate of prevention for hospitalization in the post-Omicron era. To your point: this antibody testing that perhaps they used because they wanted to find a surrogate is not validated. And it has not been validated, so they cannot use it. But, why have they been using it? I think that when I see this type of thing, it's because regulatory bodies have bowed to the pressure of somebody in order to expedite approval.

If you want expedited approval of something, if you want to have accelerated approval—get it to the market much more quickly—you tend to rely on surrogate markers. And so I would probably think that there is some sort of organization, entity, that is highly motivated at getting these vaccines to market as quickly as possible. I know that there's quite a few people who are considering this perhaps a global goal—to be able to work together to get things to the market much more quickly. But I think that that's only a benefit if you've done the rigorous testing that you need to make sure that these things are safe and effective.

[00:55:00]

Because, if we're getting things to market that are harmful, and we're making sure that they're in the arm of every single person on the planet and it hurts them, especially our children and our future, then that's of grave concern.

Commissioner Massie

I also have a question about the documentation you've presented. I know that you have done a more extensive analysis on the conflict of interest. I think you did a presentation on that which was more detailed, if you want. Because one of the questions that I had is: Is there any sort of practice or regulation that would prevent the people that are called on in

our institutions to qualify the relevance of any medical treatment— Would have to actually be shown to be exempt of conflict of interest? It's probably not enough just to declare it at one point. Is there something that is preventing these people from acting there? Obviously, it doesn't seem to work if there's anything. Are you aware of anything like that?

Deanna McLeod

Well, I think that whenever conducting conflict of interest work— And we have another presentation at the Citizens Inquiry here coming up that will delve into that in a little bit more detail and you can go on the Canadian COVID Care Alliance to see a more detailed analysis as well— But, on that note, I think that the normal way that you look at conflicts of interest is to simply look at: Has a pharmaceutical company that stands to benefit from positive recommendations—in this case, it would be Pfizer and Moderna—have they directly paid anybody who's involved in the decision-making? In our particular situation, NACI would be the body that's responsible for the independent evaluation of the COVID-19 vaccine data and formulation of recommendations; and those recommendations are then taken into consideration by each of the provincial authorities that make recommendations. So I would probably put them as responsible for things in Canada. And if you did look at strictly Pfizer or Moderna giving them money, there is definitely some level of conflict of interest.

But the thing that we noticed the most is that the conflicts of interest are coming from a global level. They're being channeled down through traditional funding levels, for instance, with the Tri-Council [Government of Canada research funding agencies]. However, the research agenda is being set by global bodies, for instance, GLOPID-R [Global Research Collaboration for Infectious Disease Preparedness], which is a global research network whose membership are vaccine manufacturers and NGOs that have a pro-vaccine agenda. And so what you see is the projects that are being funded and the people who are being rewarded for positive recommendations around COVID-19 vaccines are those that are in line with those global entities.

I would probably argue that you have somewhat of a hijacking of our healthcare system through even normal funding means, for instance through Tri-Council funding, because they have bolted on to the research agendas and goals of these international organizations, for instance, the World Health Organization and GLOPID-R. And therefore, you can see a vaccine readiness grant of \$3.5 million going to the person who's going to be deciding whether the COVID-19 shots should be approved in Canada.

Why is she getting ready for COVID-19 vaccines before we even know that they're safe and effective? Why is anybody considering them? The amount of money that went through our government to people to decrease vaccine hesitancy leading up to the rollout of these **COVID-19 vaccines was incredible. Why were we telling people to not be hesitant around COVID-19 vaccines before we knew that they were safe?**

These are, I think, really important questions that we need to be answering: **Why were we having such a pro-vaccine stance and why were the studies designed to make the vaccines look so favorable? And why didn't our regulators stop these vaccines because they didn't have the sufficient level of safety and efficacy data needed—especially in children? Those are the questions that I think need to be pursued and investigated a lot further.**

[01:00:00]

Shawn Buckley

Deanna, finally just add to what you're saying is: As you're aware, the regular drug approval test in C.08.002 of the drug regulations was abandoned for COVID-19 drugs. And the interim order that substituted the regular objective test of safety and efficacy and produced a subjective test did something also interesting: It exempted the government and COVID-19 drugs from several provisions of the *Food and Drugs Act* and Regulations. And one of the regulations prevents the importation of a drug if there isn't a drug approval. And that was exempted. So Her Majesty purchased a large amount of these vaccines and was permitted to import them and distribute them to the provinces while waiting for herself to approve the vaccines. So it was kind of a classic conflict of interest, where the minister was allowed to purchase and import and distribute while she waited for her servants to approve them. There's just so many interesting things about this rabbit hole.

Deanna McLeod

I think—I'm very hopeful this Inquiry will serve the purpose of evaluating all of these things. Because one of the things that we need to really be mindful of is, if a pharmaceutical company sees that this tactic has been successful, I will guarantee you that this is not going to be the last time we see it. The onus is upon us to identify how it happened and to stop it from happening in the future or we're going to have—you know, once the fence has been breached, or once the wall has been breached, you can expect the hordes to enter. I think we need to repair the wall or this won't be good for our children—or anybody else moving forward.

Shawn Buckley

And I'll ask the commissioners if they have some more questions.

Commissioner Massie

Would you make your documents available so we can actually review them in more detail?

Deanna McLeod

Absolutely. Yes, no problem.

Commissioner Massie

Thank you.

Shawn Buckley

Deanna, if you can forward them to me, I'll just have them enter it as an exhibit so that the commissioners can review your slides [no exhibit number available].

Deanna McLeod

Okay, well thank you very much.

Shawn Buckley

And there doesn't appear to be any more questions. On behalf of the National Citizens Inquiry, we thank you for your presentation.

Deanna McLeod

Okay. Thanks very much for having me. Have a great day.

Shawn Buckley

You, too.

[01:02:50]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 11: Remus Nasui

Full Day 1 Timestamp: 08:22:21–08:37:09

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Remus, we're sorry that we're running a little behind today. But I ask if you could state your full name for the record and then spell your first and last name for the record.

Remus Nasui

Thank you for having me. My name is Remus Nasui. First name spelled R-E-M-U-S. Last name spelled N-A-S-U-I.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Remus Nasui

I do.

Shawn Buckley

Now, my understanding is that you've been a paramedic since 2002.

Remus Buckley

That's correct, yes.

Shawn Buckley

But you were working for a district that, at the end of the day, did not require vaccination.

Remus Nasui

They did not force us. They gave us the option to test.

Shawn Buckley

Right, okay. So you haven't lost your job?

Remus Nasui

I did not, no.

Shawn Buckley

But you did come down with COVID and now you have natural immunity.

Remus Nasui

That's correct, yeah.

Shawn Buckley

But despite the fact that you didn't lose your job, there was a difference in how you were treated. And I'm wondering if you can share with this Inquiry the difference in how you were treated.

Remus Nasui

Of course, yes. We were given the opportunity to continue employment, as long as— Initially, during the second wave, the Delta wave, after the vaccines were rolled out and vaccine mandates became more and more prevalent, we were given the option to do a RAT [rapid antigen] test once a week. And we had to submit that prior to coming to work to be allowed to fulfill our shifts.

After the Omicron wave came, we were required to do a test prior to every shift. And these tests only applied to unvaccinated paramedics. Despite knowing that people who took the vaccines could still get infected and transmit the disease to others.

Shawn Buckley

Now, did you find there was a difference? You're at work, you're in your paramedic's uniform, and you were able to basically, I assume, go wherever you want.

Remus Nasui

That's correct. During work, I was able to attend any venue or I could get on a plane or a train. I could go into an arena, a restaurant, a gym, if I was required to provide care. Then as soon as I finished my shift and went home, I was basically treated like a leper. I was unable to enter any venue because I did not have a vaccine pass.

Shawn Buckley

So you kind of experienced two worlds whenever you are on shift as a paramedic.

Remus Nasui

That's correct, yeah.

Shawn Buckley

Can you give us some examples of how it affected you, not having a vax pass?

Remus Nasui

Well, it prevented me from travelling abroad to visit my father when he got sick. My family got kicked out of the recreation centre that we attended for about two years prior because we were not vaccinated.

Shawn Buckley

I'll just flesh that out a bit. So your father was sick. Am I correct that you're an only child?

Remus Nasui

That's correct. I am the only child, yeah.

Shawn Buckley

And it was somewhat serious. It was a blood clot and he—

Remus Nasui

That's right.

Shawn Buckley

So how did that affect you not being able to go and care for your father?

Remus Nasui

It was tough.

Shawn Buckley

And then you spoke about this club. You're not allowed to go. Are other family members that are not vaccinated allowed to go to this club?

Remus Nasui

My son was under 12 years old at the time and he was part of the tennis team—the elite tennis club there. So while me, my wife, and my daughter were kicked out, my son was allowed to continue attending the club.

Shawn Buckley

Same household.

Remus Nasui

Absolutely.

Shawn Buckley

So one member of your household could go and attend.

Remus Nasui

That's right, yeah.

Shawn Buckley

And then come home.

Remus Nasui

Yep.

Shawn Buckley

But no one else from the household could attend.

Remus Nasui

That's correct, yeah.

Shawn Buckley

Now, did the culture change at work? After the vaccines and before the vaccines?

Remus Nasui

Yeah, I would say it changed dramatically after the mandate rollout took place. The mandates and the vax pass really created a lot of division in the company. The majority of employees took the vaccines. I think it was either following the vax pass or an interview by our Prime Minister in Quebec, where he labelled the unvaccinated as racist,

[00:05:00]

misogynistic, extremist, that the attitude changed significantly even within my company towards those who did not take the vaccines.

Shawn Buckley

But specifically, how did it change? When you went to work, how did your coworkers treat you differently?

Remus Nasui

Well, within my company specifically, there were co-workers that approached management to refuse working with unvaccinated colleagues. There were other co-workers that posted online things like, "I hope that the unvaccinated colleagues get sick with COVID and do not get quarantine pay." Which was our policy in our service at the time: we got 14 days off with quarantine pay. And just generally speaking, an animosity towards people who chose not to do the right thing.

Shawn Buckley

And how did this make you feel?

Remus Nasui

Awful.

Shawn Buckley

Now, you have some unique experience. You lived in a communist country.

Remus Nasui

I grew up in a communist country, yeah.

Shawn Buckley

And then following that, you moved to South Africa while there was still apartheid.

Remus Nasui

That's correct. I got there at the end of apartheid in 1991.

Shawn Buckley

And so having had those lived experiences, how did you feel about the vaccine passports coming out?

Remus Nasui

To give you an example, when I lived in South Africa at the end of apartheid, before the transition took place, black people who lived or worked for white households were bussed in at the beginning of the week. And they would spend the next two weeks in the household there—with their employer-master basically relationship. And then they were given two, three days every two weeks to go spend with their families back in their home. But while they lived on-site in the white household, they were allowed to go and pick up items if the household needed them in the stores, in the city. But in order to be allowed to do that without fear of arrest, they had to get a permit from their household owner that allowed them to leave the household and go into the city to purchase items. So they had to get basically a pass.

Now, seeing that experience and knowing that that's wrong because it's a discriminatory experience based on race—and we know it's not right to discriminate based on race, religion, political ideology, gender—I think it's really wrong to discriminate against people based on their medical choice. And it kind of reminded me of that. Because without a vax pass, here you were not allowed to enter a variety of places. In fact, you were really unwanted.

Shawn Buckley

Now in your job as a paramedic, my understanding is that after the vaccines were rolled out in—I guess that would be 2021—you noticed a change in both the number of calls and the type of calls. Is that fair to say?

Remus Nasui

Yeah, I would say that the change started in— Probably towards October, November of 2021. And then it accelerated in 2022.

Shawn Buckley

And what was the change?

Remus Nasui

I noticed a significant increase in calls for palpitations, chest pains, an increase in sudden— well, in cardiac arrests, first-time seizures. A lot more calls than I was previously used to.

Shawn Buckley

When you say first-time seizures, what do you mean?

Remus Nasui

I mean a person that's had a seizure for the first time in their life. Despite living 30, 40, 50, 60, 70 years of their life without any seizures prior. No seizures disorder.

Shawn Buckley

Is that uncommon?

Remus Nasui

In my experience, yes.

Shawn Buckley

And when you were talking about cardiac issues, can you kind of give us a feel for how much of an increase you experienced?

Remus Nasui

Well, prior to 2021, I would probably come across a cardiac arrest once a week to once a month.

[00:10:00]

And during 2022, when the booster rolled out, it became almost a daily occurrence for a while.

Shawn Buckley

So you went from once a month or once a week to basically a daily occurrence.

Remus Nasui

That's correct. Some days more than one.

Shawn Buckley

What about your experience with people that have died? Did the death rate change in your experience? Because in your job you see deaths and you attend at death scenes.

Remus Nasui

Based on what I saw in 2022, I saw a lot of the cardiac arrests that occurred that I attended to did not respond to our normal treatments.

Shawn Buckley

Now, my understanding is that for the health authority that you work at, in the paramedics, there are roughly about 750 employees.

Remus Nasui

That's correct. Approximately—between 750 and 800, yeah.

Shawn Buckley

And of those roughly 400 are males.

Ramus Nasui

I'd say, yeah, that would be a fair estimate.

Shawn Buckley

Now, before the vaccines, can you share with me roughly how many of those came down with COVID and what the outcomes were?

Ramus Nasui

To my knowledge, during the first two waves, which was the original and Delta, approximately 70 paramedics caught COVID. As far as I know, they all recovered and they're all back to work.

Shawn Buckley

Now, what happened after the vaccines rolled out to those 750 paramedics?

Remus Nasui

Well, in our company there's one case that I do know of where a gentleman in his 40s, after his booster, developed myocarditis within about two days. Ended up in the hospital. That's one out of 400 in males.

Shawn Buckley

Are there any other irregularities that you became personally aware of?

Remus Nasui
There are, yeah.

Shawn Buckley
Okay, what percentage would have gotten COVID after the vaccinations?

Remus Nasui
During the Omicron wave, at least 70 per cent of the company got COVID. At some point, or other.

Shawn Buckley
Seventy per cent of 750 employees.

Remus Nasui
Yeah, that includes part-timers as well. Some people work full-time and then there's a group of part-timers as well. It's fairly significant too. They work in other services as well.

Shawn Buckley
Now, having experienced what you experienced, what would you suggest that we do differently if this ever happens again?

Remus Nasui
I would like to see bodily autonomy respected. I would like to see no discrimination based on personal choice. I would like the public health authorities to consider other opinions by other academics. Case in point being the Great Barrington Declaration, which was co-authored by a professor from Stanford, a former professor from Harvard, and a professor from Oxford, which took into account the high-risk groups and how to protect them while allowing society to continue their life. Without restrictions or mandates. I would also like to see Public Health Canada run the pandemic themselves, without World Health Organization recommendations, like one-size-fits-all. Because that's not right. And that's not science.

Shawn Buckley
Thank you. I have no further questions. I'll ask the commissioners if they have any questions. No questions.

Remus, on behalf of the National Citizens Inquiry we thank you so much for coming today and testifying.

Remus Nasui
Thank you.

[00:14:48]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 12: Leanne Duke

Full Day 1 Timestamp: 08:55:00–09:21:06

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

You can please bring up Leanne Duke, who should be on Zoom. Leanne, can you hear us? Can you give us your camera? There you are. And give us a sound test.

Leanne Duke

I can. Can you hear me?

Shawn Buckley

We can hear you. I'm wondering if you can adjust your camera. That's a little better. And we apologize that we've kept you waiting. These things are sometimes hard to time.

I'd like to start by asking if you could state your full name for the record and then spell for the record your first and last name.

Leanne Duke

My name is Leanne Duke, L-E-A-N-N-E D-U-K-E.

Shawn Buckley

Leanne, do you promise to tell the truth, the whole truth, and nothing but the truth?

Leanne Duke

Yes.

Shawn Buckley

Now, my understanding is that you are an office manager; you deal with financial reporting and accounting and payroll and human resources and health and safety.

Leanne Duke

Yes.

Shawn Buckley

So you've got quite a mixed bag. And my understanding is that you're here today to tell what happened with your father, Wayne Duke, when the COVID pandemic arrived and we started having restrictions on us. So can you basically start with explaining that you were his primary caregiver and what that means?

Leanne Duke

Yes, I was my dad's primary caregiver. He had advanced Parkinson's disease and advanced dementia. He was living in a retirement home at the beginning of the pandemic.

Shawn Buckley

Okay, and what type of care did you give to your father?

Leanne Duke

When he first went to the home, they were supposed to take his care over, but there was a lot of problems with that. So I would go in every single morning, Monday to Sunday, and I would provide his medical care. He had a tube that went into his stomach. There was a hole which was called a stoma; and so the pump would diffuse medication into him consistently throughout the day. The stoma required proper cleaning every morning and night. So every morning I would go in. I would provide his medical care. I would also clean his room. I would trim his nails, shave him, cut his hair, clean his dentures, stock the Depends in his drawer.

Shawn Buckley

In addition to having the stoma, your father had another condition that made cleaning his room very important. Am I right about that?

Leanne Duke

Yeah, that was his Parkinson's. He had advanced Parkinson's, so he couldn't have anything in front of him. His room had to be—the floors had to be free of objects. His furniture had to be around the perimeter of the room because if anything was in front of him, like directly in front of him, his whole body would freeze and he would fall.

Shawn Buckley

My understanding is, especially with regards to the stoma, you attempted to train the staff at the facility but they just were not up to the task.

Leanne Duke

Yes.

Shawn Buckley

So when you say you went in every morning before work, this was essential care that you were providing.

Leanne Duke

Yes.

Shawn Buckley

And then you're telling us you went every night for two or three hours.

Leanne Duke

Yeah. Every night before the first lockdown, I would go and do his medical care every morning. And then I would drop his dog off, who would stay with him for the day. And then as soon as I was done work, I would go and I'd sit with him and hang out with him for two or three hours every night before I went home.

Shawn Buckley

Now, the first lockdown, in my understanding, came March 31st, 2020. Can you tell us about that experience and how it changed things?

Leanne Duke

I received a call on March 31st. It was probably around lunchtime. From the owner of the home and she said I was no longer allowed in to provide his care and his dog was no longer allowed to be there either; she said, "when you're done work, you need to come get his dog, and you can no longer come in in the mornings to provide his care."

I was locked out from March 31st until— October 21st was the day I was allowed back in.

Shawn Buckley

And then when you were able to attend back on, well let me just back up.

[00:05:00]

Even though you weren't able to attend after March 31st, you were allowed to take him to medical appointments, am I right?

Leanne Duke

Yes, so all social absences were not permitted. They weren't allowed to go out for social absences. But if they required a medical absence, I was allowed to take him to his medical appointments. He had a lot of medical appointments because, in two and a half years, he lost 17 dentures. So that required a lot of appointments to replace those.

Every time I would take him out, I would check his stoma and it became extremely infected. And also, when I would be talking with him on the phone, he would be wincing in pain all the time telling me how bad his stomach hurt. And not once did the home ever contact me

as his power of attorney for care—as his substitute decision-maker—to notify me of the state of his stoma.

Shawn Buckley

Okay, now you had actually documented what you're speaking about by taking photos of his stoma. Am I correct with that? And David, can you help me? I've got this up on the computer. Can you pull that up?

Leanne, my understanding is these are all photos that you've taken.

Leanne Duke

Yes.

Shawn Buckley

I'll scroll down— Well, actually I'll scroll up. You had typed in there, "This is how the stoma always looks in my care," and that's the top picture.

Leanne Duke

Yeah, so that's how the stoma is supposed to be.

Shawn Buckley

When you describe that, there's literally a tube going into his belly; there is a tube going into his belly here.

Leanne Duke

Yeah.

Shawn Buckley

And that doesn't look inflamed, or it doesn't look dirty at all.

Leanne Duke

No, and that's how it always looked when I was doing his care every morning.

Shawn Buckley

Okay, I'm going to scroll down to some other pictures you've taken. And you've typed into this document, "These are pictures taken of his stoma during the first lockdown. I took these pictures when I took him out to medical appointments."

Leanne Duke

Yes.

Shawn Buckley

We will enter this as an exhibit so that the commissioners will be able to refer to this whenever they want [no exhibit number available]. But how would you describe the difference in these pictures, just for the record?

Leanne Duke

His stoma was just oozing all this discharge and pus. You can see what—they call it a skin tag, which developed right around the hole. That was very inflamed and large. And I'll also say, once I was allowed back in on October 21st—within one month, I pretty much had his stoma looking back to normal. But it was like this during the entire first wave's lockdown.

Shawn Buckley

And I'm just going to scroll down. There's another photo and you have typed on here, "This was the stoma on March 26, 2022, when the home changed his plan of care from cleaning his stoma morning and night 14 times a week down to three times a week."

Leanne Duke

Yeah. And the home told me that his stoma was not infected with this picture on that day. They told me there was absolutely no infection and his stoma was fine.

Shawn Buckley

So not only are you seeing his stoma in just an awful condition, but he's reporting to you on the phone when you're having phone conversations that it's uncomfortable?

Leanne Duke

Yeah. He wouldn't say it was directly related to his stoma; he had kind of lost that capacity. He was just— You'd be talking with him and he would just start wincing in pain, like "ohh." He'd constantly be making those sounds when I was talking to him on the phone. And I'd ask him what was wrong. And he said it was stomach pains.

Shawn Buckley

Okay, now you had said earlier in your testimony that you weren't able to drop his dog off every day. So can you explain for the commissioners what the routine was and tell us about this dog. And then tell us about the effect of your dad not being able to have the dog every day.

Leanne Duke

It was very detrimental to him. So going to a home obviously wasn't my first choice but he required care 24/7. And it was a very big adjustment to him. So being able to drop his dog off and have his dog spend the day with him— In spite of his Parkinson's he would still go out walking every day. He would take his dog on these walks every day. And he had a background in training dogs.

[00:10:00]

He would sit there and he would train his dog in his bedroom. And he just really enjoyed spending time with him. And when his dog was no longer allowed to go to the home to be with him, he kept thinking that he had his dog and he'd lost him. And so he would actually start wandering.

There was a time one night—it was around midnight—I got a call from the home that my dad had run out and he was looking for his dog at midnight. Because he kept forgetting that his dog wasn't allowed there and he kept thinking he lost him. There would be other nights I'd be talking with him on the phone and he'd be all depressed. And I'd say, "what's wrong?" And he said "Well, you lost him." And I would say "I lost who?" And he said, "Well, you lost Ozzie," his dog. And I would say, "No, I didn't lose him, he's here with me." But he couldn't comprehend because he wasn't seeing his dog every day. And he became extremely, extremely depressed.

Shawn Buckley

Okay. And my understanding is your dad had basically a walkout unit with his own door to the outside. So even though he had his own door to the outside, they wouldn't let you drop his dog off for the day?

Leanne Duke

No.

Shawn Buckley

Now, when you were able to come back in October 2020, that was because they made an exemption for essential caregivers?

Leanne Duke

Yeah. So it was in September of 2020, I believe, the government classified essential caregivers and said they could no longer be restricted from providing care. The home finally let me back in in October to start providing his care again. When I was allowed back in to provide his care, they said, "You can just come in your dad's patio door in the morning." At this time, public health was saying if a caregiver was providing any type of care and you were in a certain proximity, you had to wear face goggles; you had to wear gloves; you had to wear a gown and a mask. And there were also all the screening questions you had to do. I can say: not once during that time that I was coming in his patio door did the home ever screen me, did they ever ask me for my weekly PCR test result. And they were also the ones that were supposed to provide the gown, the gloves, and the eyewear. **And not once did I ever wear anything like that while he was at the retirement home. I would just wear a mask and do his medical care every day.**

Shawn Buckley

So this home that wouldn't even allow you to drop his dog off at his door, when you were allowed to return back, didn't comply in any way with the testing, screening, and PPE requirements at the time.

Leanne Duke

Exactly.

Shawn Buckley

Now your dad eventually got moved to long-term care. Can you tell us about that?

Leanne Duke

Yes. His dementia was getting worse and the retirement home was quite negligent. On September 1st, 2021, he got a bed in a long-term care home. Before he went to the long-term care home, I had told them I'm not vaccinated. The director of care said, "Oh, that's not going to be a problem. You're still going to be allowed in." From September until December, I would go in every single night. Well, actually in the first month that my dad was there, I was going in every morning, every night after work. And then I'd go back in at 10 o'clock to train the nurses on his care, so they took over his stoma care. Then come October, I was just coming in every day after work and I was taking him out walking. He had a high incidence of falls, so they confined him to a wheelchair. So he wasn't allowed to walk anymore. And I was very worried that he would quickly lose all his muscle mass. So every single night after work, I would come in and I would walk him in the parking lot. I'd come in and, I'd say, 90 percent of the time when I would get there, he'd be sitting in wet briefs. So I would have to change him and clean him up, put new pants on him, and then we'd go out walking in the parking lot every day.

Shawn Buckley

And did a point come where you were no longer able to take your father out?

Leanne Duke

Yes. On December 10th, I got a call in the afternoon,

[00:15:00]

that, due to my vaccination status, I was no longer permitted entry into the home. And it wasn't even in the government directives until December 15th. So December 15th, the government followed suit and they banned all unvaccinated caregivers from long-term care.

Shawn Buckley

Were you able to have him for any short-term absences after that time?

Leanne Duke

From December 10th until December 29th or 30th, the home and the directives allowed social absences at that time. But if I took my dad out on a social absence, when he returned, they required him to be antigen-tested upon return. And then he had to have a PCR test on day three and a PCR test on day five.

Shawn Buckley

Because of his dementia, that was problematic, wasn't it?

Leanne Duke

Yes, and his Parkinson's, he was constantly moving around. He had constant sudden movements. And there's a lot of literature on the negative effects of swabbing individuals with dementia. It can be a very scary experience for them. So Christmas Day, my dad was technically still allowed to have a social absence. But prior to this, the activity director from the home called me and she said, "due to your vaccination status, if you take your dad out for Christmas, he will be required to be isolated for seven days in addition to all the testing."

It was a very hard decision to make. I said to myself, "This could be his last Christmas, you never know. So do I leave him in there so that he doesn't have to go through the testing and be isolated for seven days, or do I take him out?" And I decided to take him out because, like I said, if this was his last Christmas and he spent it alone, it would just kill me inside. So I took him out. And he was very despondent, however. On December 10th, when I was no longer permitted entry, within three days, he lost his ability to communicate. He became completely despondent. He just— He gave up. There were so many lockdowns during the three years and this was it for him. He just completely gave up. When I brought him out for Christmas, he had no interest in opening presents. Mentally, he didn't really seem to be there. He was just despondent. He didn't care about food, which, if you knew my dad, he loved food. And he didn't care about food. He didn't care about his dog. He was just—he wasn't really there mentally.

So I brought him out for Christmas and then the next day, I called the home and said, "I'd like to speak with my dad." And the nurse told me, "You can't speak with your dad. He's in isolation." And I said, "Well, surely you have to have a cordless phone." And they said, "No, we don't have a cordless phone here." I said, "You cannot lock my father up for seven days in a room and completely deny him access to even speaking with his family." So I spoke with the administrator, which is the owner, and also the director of care, and they said that they would get a cordless phone. But during that next week they never told all of their staff. And so I would call in and the staff would tell me they didn't have a cordless phone. And I would say, "You do have a cordless phone."

So that week, I was only able to speak to him about three times, while he was completely isolated in his bedroom. And also on the Saturday, I was telling him, "You have one more day; you're going to get out of isolation, you have one more day." On the Sunday, I called him and the nurse said to me, "I'll bring the phone to him." And I said to her, "What do you mean you'll bring the phone to him? He's supposed to be out of isolation." And the nurse said, "Well, didn't you hear? The entire home is in lockdown."

My dad ended up spending a month straight locked in his bedroom all by himself. The effects of that mentally— He wasn't there anymore.

Shawn Buckley

Right, he wasn't able to recover from the isolation.

Leanne Duke

No, like I said, he lost his ability to communicate. In mid-February, social absences were permitted again, so I could at least get him out of the home, and take him home.

[00:20:00]

During the entire time when it was permitted. I would take him home every Saturday and have lunch with him and spend the afternoon with him. So once that was permitted again in February of 2022, I would bring him home. He could no longer feed himself, so I'd make food. I would have to feed him. He couldn't communicate, he just completely gave up. I couldn't walk him anymore. He had completely lost all of his muscle mass. Because the home would tell me that for them to have somebody walk him, due to health and safety reasons, they needed two people. But they were short-staffed all the time, so they didn't have two people to take the time to walk him. So during the time I wasn't coming in, he completely lost his ability to walk, to communicate, to feed himself, everything.

Shawn Buckley

So he's a completely different man.

Leanne Duke

Yes.

Shawn Buckley

My understanding is, you were able to take him out for short-term absences, but from December 10, 2021, you were not allowed in. But then you were allowed in after he died.

Leanne Duke

Yes, so he suddenly passed away on September 17, 2022. I had not been allowed in the home from December 10 until September 17. And it was very difficult. How do you fulfill your power of attorney duties when you cannot see what's going on inside the home? The day after he passed away, I called the home and said, "I need to come and collect his belongings." And the home said, "Yes, you can come in to get his things." So my mom, my friend, and myself—we went there on September 18. And the home let all of us in. None of us were screened. None of us were tested. There was no documentation whatsoever. They just let the three of us go in, take his things, and go.

Shawn Buckley

So this home that was so concerned about you showing up even if you were tested and screened had no concern with the three of you going in and wandering around the facility.

Leanne Duke

Yeah. And on that note as well, I'll also say: during that time from February 22, 2022 until the day that he passed, I was not allowed inside the home. There came a point when I couldn't get my father into my car anymore. My friend would try and help me but we were both getting hurt. My dad was getting hurt, so I could no longer get my dad home. There was no accessible community transportation in my town due to the pandemic. So I couldn't get my dad home with accessible transportation. I was, however, permitted outdoor visits with him. So, I would go and I would have an outdoor visit with him. Not once did they test me. I was never screened. My father wasn't screened after our outdoor visit, yet we would be in the same proximity had I been in the home, or had I taken him home on a social absence where he was being required to have all the testing.

Shawn Buckley

I'm going to ask you: Having experienced all of this, if we were ever to face a situation like this again, how do you think we should have done things differently?

Leanne Duke

There are so many reports that are written by many levels of government. There's the National Seniors Council, the Chief Science Advisor. There's also the Patient Ombudsman, who has released all these reports as early as 2020. And in these reports, they stated the importance of continued access to caregivers, to the effects of the lockdown.

The government has not listened to any of the scientific evidence that came from these reports that talk about the detrimental effects on our seniors. There's the *Long-Term Care Act*—

Shawn Buckley

I do have to stop you, just because we're about nine minutes over. And like yourself, we've had another witness that's been waiting for a couple of hours. But is it fair to say that you're of the strong opinion that there's just no way that caregivers should be separated from loved ones?

Leanne Duke

There's not. A time when they're in a long-term care home is when they need their family the most.

[00:25:00]

My dad was already suffering from a disease that was taking away his body, that was taking away his mind. And then the government took away his family and his support and he had to go through that alone. I would like to say that the government needs to treat our seniors with respect and without discrimination because they deserve to enjoy equal opportunity and be able to live fully in the life of the province, in the life of Canada, the same way as every other Canadian has been afforded.

Shawn Buckley

And, Leanne, I'll just ask the commissioners if they have any questions for you. And they do not. On behalf of the National Citizens Inquiry, I thank you so much for sharing this story. I don't know if you can hear, but the audience is clapping.

It's just so very important to hear from people like you. And thank you so much for sharing this with us.

Leanne Duke

Thank you.

[00:26:06]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 1

March 30, 2023

EVIDENCE

Witness 13: James Paquin

Full Day 1 Timestamp: 09:21:14–09:30:15

Source URL: <https://rumble.com/v2fgrx6-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

We just have one more online witness, Jamie Paquin. Jamie, if you can hear me, turn on your camera.

James Paquin

Yep.

Shawn Buckley

We can't see you yet.

James Paquin

How's that?

Shawn Buckley

There we go, and my understanding is you are in Japan today.

James Paquin

That's right. Tokyo. Bright and early.

Shawn Buckley

I'm going to ask you to start by stating your full name and then spelling your first and last name for the record.

James Paquin

James Robert Paquin, J-A-M-E-S-P-A-Q-U-I-N.

Shawn Buckley

And Jamie, do you promise to tell the truth, the whole truth, and nothing but truth?

James Paquin

Yes, I do.

Shawn Buckley

Now, you were in Japan when COVID hit.

James Paquin

That's right.

Shawn Buckley

And you're there because you run an old Canadian wine business in Japan.

James Paquin

Yeah.

Shawn Buckley

Now, can you tell us how the Canadian COVID measures impacted your business?

James Paquin

For our business, we had a lot of logistics problems. So that's the first major hurdle: shipping containers were extremely expensive. Then the inflationary measures that were brought in. Also, disruption of supply chains increased the price of the goods significantly. There were bottle shortages, many wineries upped their prices significantly. And at the same time, the yen to the Canadian dollar dropped dramatically. So we probably ended up, in one swoop, in a large container order, losing about \$50,000 due to those factors.

Shawn Buckley

How did it affect you personally, the Canadian COVID measures?

James Paquin

The Canadian Charter-violating restrictions on travel made it practically impossible to go back to Canada. I haven't seen friends or family since 2019. And as you know, none of this was based on science or previous measures to deal with the virus. So facing fines of up to a million dollars or three years in prisons for violating an absurd two-week quarantine while people with vaccines who are positive for COVID could stroll into the country made it really treacherous to think to go home. And even the financial cost of spending weeks doing that, before you could even start a visit, made it impractical.

So these measures have robbed me of three years of friends and family. And they've also caused huge rifts in family relationships because of the propaganda on the Canadian side that has really damaged a lot of people.

Shawn Buckley

Can you share some details about that?

James Paquin

Yeah. Very early on— I have an academic background and I also saw that what they were saying didn't make very much sense. So I started following a lot of the academics who were producing the data, like the infection fatality rate being lower than influenza. I knew the games they were playing with classifying COVID deaths based on PCR tests. And I had looked at the all-cause mortality rates that weren't increasing in most places. Japan had the lowest death rate in 11 years in 2020, actually.

And then the Japan side: We weren't subjected to things like bubbles, mandates, travel restrictions, and all of that. We were living— They did implement some sort of disruptions to the restaurant trade, trying to get restaurants not to serve alcohol in the evenings, but these were largely violated. You know, I could go to restaurants packed with people. They closed gyms for about six weeks but, after that, we were all able to go back.

Shawn Buckley

Can I just probe you a little bit more so I can understand the differences with Japan? Are you saying they didn't do a general lockdown in Japan?

James Paquin

Yep. For about six weeks in March they did things like put tape on play devices at parks. But you could still use the parks, people were just largely ignoring that. They got people to work from home quite a bit.

[00:05:00]

But stores and everything were still open. Like I said, the gym was closed for about six weeks and then reopened. And my wife and I just traveled domestically. We'd go down to Okinawa, the Southern Islands, multiple times. Various smaller jurisdictions would get worked up and they'd try to get people not to visit, but these things were all largely voluntary. And so we were living in a very different sort of world. People weren't being yanked out of other people's homes for gatherings and these sorts of insane things. And all the while, anyone that wanted to could just look at the data and look at these shady practices they did with the PCR testing schemes. It was largely a facade.

I was communicating all the data to the friends and family in Canada. But when you're on a 24/7 psychological operation with the media doing the government's bidding, they were basically impervious to facts, just like we've seen with the arguments about mass formation psychosis and this sort of thing. I could show them the data but it just bounced right off. And eventually you have people just— They're just—the cognitive dissonance that they face when you present them with this, they just want to shut down and they refuse to discuss it. So there's a lot of family members I know I'm going to have trouble with when I go back.

Shawn Buckley

So basically, there's some family relationships that right now are broken.

James Paquin

Yeah, either in that zone of where I know if I bring up the topic of COVID, we're going to have issues and they're going to want to retreat from it. And you can tell there's a silence on that side because they suspect that if they do talk with me, that it's going to be brought up.

Shawn Buckley

Right, so there were no mandates in Japan.

James Paquin

No, nothing that would be remotely close to what was going on in Canada. And if you look at the world data site, interestingly, there's continual gradual increases in COVID deaths in the last two years—not in 2020. After each booster round, you see these continual increases in the daily death rates. But in 2020, there was virtually no—like I said, the lowest death rate in 11 years in a very elderly society and that was without having the sort of severe measures that were imposed on Canadians. We weren't hiding in our basements for a year and a half out of any sort of imposition by the government.

Shawn Buckley

Right.

James Paquin

A lot of masking, a lot of masking. Which is still an obsession in Japan because of the conformism here, even after the government told people a year ago to take them off the outside and then March 11th, they said they're completely voluntary. I haven't worn one for ages but my gym used to force us until March 1st. And I would put up a fuss there and demand that they show me some data, but that's all about conformism in Japan. People will sit in restaurants for hours in the most tight confines. You can't even find restaurants as densely packed in Canada as they are commonly here. And people will be there with no masks for hours and then they'll slap one on when they go outside. It's just social theatre.

Shawn Buckley

Okay. I have no further questions for you, but I'll ask if the commissioners have any questions for you.

James Paquin

OK, thanks.

Shawn Buckley

And they do not, so Jamie, we'll let you go. On behalf of the National Citizens Inquiry, thank you so much for sharing with us today.

James Paquin

Yep, thanks for your time.

NATIONAL CITIZENS INQUIRY

EVIDENCE TORONTO HEARINGS

**Toronto, Ontario, Canada
March 30 to April 1, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 2

March 31, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 2 Timestamp: 00:33:40–00:54:19

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Commissioners, my name is Buckley, initial S. I'm attending this morning as agent for the Commission Administrator, the Honourable Ches Crosbie. We welcome everyone to the second day of the Toronto hearings of the National Citizens Inquiry.

For those watching online that are not familiar with the National Citizens Inquiry, we are a citizen-organized, a citizen-run, a citizen-funded organization, and our goal is to hold hearings across the country. We've started in Truro, Nova Scotia two weeks ago. We're now in Toronto. We're going to Winnipeg, Saskatoon, Red Deer, Victoria, Vancouver, Quebec City, and then we're going to end in our nation's capital, Ottawa. And as we go, we are planning on just having the momentum grow and grow and grow.

We want all Canadians to be participating in this dialogue. We want all Canadians to have the freedom—and I choose that word carefully—the freedom to simply share their stories without fear. So that we can come together to discover what happened, and together figure out how to do things better the next time. I am inviting you to please go to our website, nationalcitizensinquiry.ca. We have a petition. Sign it, so that we know that you're supporting us, you're supporting this initiative. We ask that you would donate. As I say, we are citizen-funded. We don't have a single big donor. We're relying on small donations from the citizens to drive this forward. And it gives us freedom to move by doing this, but it only works if you participate. So I invite you to do that.

Commissioners, before we begin, I just wanted to share a few words about something a witness said yesterday. And then my thoughts on it, which I think are important for us going forward.

We had Dr. Robert Malone testify yesterday. And part of his presentation involved psychological operations being run by military, including the Canadian military, against citizens. If I recall correctly, he brought up four or five news articles about this happening in Canada by our authorities. He showed us some clips and gave a presentation that indicated that we literally are in a battle for our minds—for our minds. And that we won't know that they're in our minds. We won't know that we're being influenced and being

captured. One of the things that they do is they play on our emotion. This has divided us. But one of the things is that when you see a tactic, when you can finally identify it, it gives you the ability to basically neutralize it.

I wanted to speak about just basically this tactic of influencing our minds so much that we become strongly emotional about a subject.

I had an experience about seven years ago where I was getting to know some new people, and the topic of climate change came up. They were voicing a specific side of the climate change argument in a very strong way. And I just suggested that there's more to that story; there's another side. These two people literally exploded on me. They started yelling. They literally started yelling. They were so emotionally invested in their narrative that they had an emotional reaction. Now, that is the sign that you're captured, your mind is captured. Whenever you find yourself on any topic that comes up and now you are strongly emotionally invested, understand that the emotion closes your mind.

We have these terms: "open mind," "closed mind," "change your mind." Do you know that when you change your mind— We've all had this experience where we believed a certain thing. And then we learned different information, and we believe something else. Well, in our mind, actually,

[00:05:00]

the neurons get rewired to say that something else is now your truth. We literally do "change our mind." And I think that term, "having a closed mind," is true.

When you feel strongly emotional on a topic, you are not willing to listen to the other side because you're experiencing strong emotion. Who does that hurt? Does that hurt the other side? The only person that isn't willing to receive new information when you're feeling strongly about something is you. Let me say that again: The only person who is not willing to hear new information when you're feeling strongly about a subject is you. Surely, it doesn't help you if your mind is closed to new information. Receiving new information doesn't mean you need to change your mind. But if your mind is closed, that means your thoughts are captured, because you are incapable of hearing new information that would permit you to choose to change your mind. So if you have a strong emotional reaction to any subject, understand you are captured: your thoughts are captured, and you are not free to think differently.

Now, when we are captured, we literally can't see it. So this morning, when I'm talking or just kind of thinking about what I wanted to introduce this, or how to explain this topic, the idea of stock market bubbles came up to me. For those of you who don't know what a stock market bubble is, that's where the prices of stocks are just getting inflated and inflated and inflated for no good reason.

If we use the dot-com bubble—you just start a website and have a business idea and all of a sudden, you're getting all this venture financing. But you're not making any money, you're not selling a product. But these stocks just kept going up and up. It was a bubble. People with experience in the stock market will know the phrase—or the axiom—that people inside a stock market bubble can't see the bubble. Afterwards, they understand there was a bubble, but while you're in it you just can't see it. Your mind is closed. You're just caught up in this euphoria. But it's being able to understand that we get captured— I'm just using it as another example of how we get captured.

Now that I've set this up, I want to introduce the most important part: I want to talk about vax passports, and I want to talk about digital passports. Because we think of vax passes and we think of digital passports as things, as maybe actions, but they are messages. They are messages.

I don't know how many here, because he's a little dated, remember the Canadian philosopher Marshall McLuhan, in his famous phrase, "the medium is the message." Now, he was speaking in the television age. And his point was we've gone from print to a video medium and a radio medium. And we're getting messaging. But actually, it's the medium itself which is also the message that is communicating to us. So TV captures you in a different way and has a different message.

He was gone before we hit this smartphone age. It's funny— I'm one of the few people in the world now that does not carry a cell phone. And I can be in a place like an airport with, you know, 500 people, and I'm the only one looking up. It's happened to me where literally, I've scanned the room and out of hundreds of people, I'm the only one looking up. And we all know with the younger generations that now they're thinking differently because the medium has changed that generation. The medium is the message.

The digital passports, vaccine passports are a message. They are not a thing. They are not an action. They are a message. And let me explain because they're a mechanism of control. They are message to control—and you'll understand after I finish my explanation. And I'll use Alberta as an example.

[00:10:00]

We're here today on March 31st, 2023. If we were just to back up 14 months in Alberta, which is not long ago, we were separated into two groups of people. We had vaccinated people. We had unvaccinated people. We were having to wear masks. Unvaccinated people could not go to, let's say, their child's hockey game. They could not go to a restaurant. They basically were limited to accessing essential services—those being grocery stores and gas stations and the like. Now, people in the vaccinated group—and I've heard them say this—they actually felt that they were in a better situation. They actually felt that they had privileges that the unvaccinated people didn't have. And they didn't understand that actually they were in a worse situation than the unvaccinated people, because they were receiving a message that the unvaccinated people were not receiving.

To put this into context; Prior to this COVID adventure and prior to these mandates, all of the vaccinated people were free. When you're free, you don't need anyone's permission to do something. So the vaccinated people prior to the passports: They were free to go to their child's hockey game. They were free to go to a restaurant. They didn't have to ask anyone's permission. They were just free to do it. They wouldn't have even thought of it. The idea of asking for somebody's permission, or the idea of going through a police-state ritual to be able to do something like that, was foreign to them.

But now that they were vaccinated and they had their identity papers—they had their vaccine passport—they were now able to participate in the message: the police-state ritual of going to a restaurant and showing their identification papers. Now, here's the message. And police-states do this not because they need to know that you went to the restaurant, not that they need to know you went through a roadblock, not that they need to know you went to your child's hockey game. That's not the real purpose. The real purpose is to send the message that they are the master and you are the servant. Because you are not free to go to your child's hockey game unless you show your identification papers, which gives you

permission from your master to enter the rink. Do you understand? A vaccine passport—a digital passport—is not a thing. It is not an action. It is a message.

You know, go back to Nazi Germany or Stalinist Russia, where they had roadblocks and you had to show your papers. It wasn't about controlling your access. Did they really care that you went from one part of the city to the next? They knew where you lived. They knew where you were going to go home for supper that night. But by having you participate in that police-state ritual: Every time it happens, at a subconscious level, it sends the message that you are the servant being granted permission by your master to participate in whatever privilege you are now being granted from your master. And it reinforces that you do not have the "right" to do what your master is allowing you to do—if you participate in the messaging.

And so going forward— We've just had this experience with vaccine passports where people would be bragging online digitally about, "I can go to the restaurant," and this and that. And rubbing it in the face of unvaccinated people that couldn't go anywhere, not understanding that the joke was on them. Because every time they were doing that, they were participating in the message that they were the servant, that the state was their master. And that whereas they were free to do this before, they are now accepting as the message that it is now a privilege—not a right, it is a privilege—being granted to them from their masters.

[00:15:00]

We have to start thinking philosophically about what these things mean. We are going to be asked, going forward, to accept digital passports. Major grocery store chains are already starting to put turnstiles. I've seen it in the Edmonton area where I live. That's part of the vaccine passports where, for simple things, we're going to have to start showing these IDs, for our safety, to help the government, for whatever reason it's going to be. But it's actually not about that. It's not about contact-tracing. It's not about safety. It's about the message. The passports are the message. And we have to understand that to protect ourselves from accepting the message. Even if we find ourselves in a situation where we haven't been able to resist them, understand that they are a message—so that you do not subconsciously find yourselves in the situation where you believe you are not a free human being but that you are a slave being granted permission from your master.

I didn't mean to get so dark, but I think it's really important to speak about this. We had Professor Bruce Parry yesterday talking about how we have arrived in an administrative state as opposed to a democratic state. And going actually back down to philosophical principles. Professor Parry did us a great service by showing us something that we didn't see before. Because he was pointing out that we can argue about things like: Was masking in the public interest? Were mandates in the public interest? Were lockdowns in the public interest? But the real issue is: Why did the health authorities get to decide what was in the public interest?

So you know, we have to start paying attention in a different way to what's going on and questioning what things mean. Because if we don't understand what's going on, we can't decide what we're going to do about it—because then our minds are captured.

Unless the commissioners have some comments to start our day, we'll call our first witness. I think we're good to go. And I'd like to introduce, we've got—

Oh yes. I'm sorry, we're going to watch a video first. And then we'll call our first witness, thank you.

[A video clip was played of Global News footage of a press conference held by Doug Ford, Premier of Ontario, announcing renewed lockdowns in Ontario.]

[Video Clip] Doug Ford, Premier of Ontario

Good afternoon. I know we are all eager to get things back to normal, and no one wants to get the economy going and get people back to work more than I do. And that means having a responsible plan. It means taking the best scientific advice and working together with our partners....

Yeah, so our chief medical officers are in contact with all the other chief medical officers, including the one in Toronto. I'm in close contact— I had a good conversation with Mayor Tory. You know, we don't make a move in any region without the full consent of the local chief medical officer and, most times, the local mayor. So Travis, we would be able to answer that probably a little better in the next few days. And that would probably be a good question for Mayor Tory to answer, and the chief medical officer of Toronto to answer.

[Video Clip] Unidentified Reporter:

Hi Premier. You just mentioned the people trying to work hard to put food on their table, and following up on Randy's question, what's to say that they wouldn't or shouldn't just start ignoring emergency messages? We saw over the weekend protests throughout the province. Massive protests in Toronto over two days. We've seen the Trinity Bellwoods Park before. We've seen weeks of protests outside Queen's Park with no enforcement. The Prime Minister even took part in a protest with no social distancing. Not everyone was wearing masks and there was no enforcement. Yet steps from there, a restaurant gets fined for letting people eat on their patio. So if there's not enforcement of the rules for everyone, why should business owners say, "You know what, I'm going to keep listening to the Premier, to the Province, and sacrifice my livelihood when others aren't?"

[Video Clip] Doug Ford, Premier of Ontario:

I understand the question, and for the most part, the vast majority of the people are listening. And as for the protest, people are hurting. You know, certain communities are hurting out there.

[00:20:00]

I understand the protest. And I understand a lot of them were social distancing and some weren't. But they're in pain right now, and collectively as a province, we're all going to work together to fix that. As for the Prime Minister being out there, you're going to have to ask him that question. But I truly believe in the people of Ontario, and the people of Ontario have stuck with us. We're on the same team. And yes, there's been a few incidents. But the vast majority of the people across this province have been working well together with us. As I always say, we're all in this together, so we'll get through it together too.

[00:20:39]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

March 31, 2023

Day 2

EVIDENCE

Witness 1: Rick Nicholls

Full Day 2 Timestamp: 00:55:10–01:24:34

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Genevieve Eliany

I'll ask the first witness to state and spell his name for the record, please.

Rick Nicholls

Thank you very much. My name is Rick Nicholls, R-I-C-K N-I-C-H-O-L-L-S.

Genevieve Eliany

Could you promise or affirm to tell the truth, please?

Rick Nicholls

So help me God, yes, I do.

Genevieve Eliany

Great.

Mr. Nicholls, if you could start with a general introduction of who you are and your role between 2011 and 2022, please.

Rick Nicholls

Happy to do so. I was elected first to the Ontario Legislative Assembly in October of 2011. And I served three terms, ending obviously June 2nd of 2022. Throughout those three terms, for the first ten years, I was a member of the Progressive Conservative Party of Ontario and held numerous positions. First, in opposition as different shadow cabinet ministers. But also in my second term, I was appointed one of the deputy speakers in opposition for the Ontario Legislative Assembly. And then later, in my third term, I was appointed the Government Deputy Speaker for the Ontario Legislative Assembly.

Genevieve Eliany

Thank you. We'll start with your general position on vaccines. Could you tell us about your hesitancy?

Rick Nicholls

First off, I want to make it very clear that I'm not an anti-vaxxer. However, having followed reports of what was happening around the world and the vaccine injuries and even deaths that were being reported, I had made the decision, along with my wife, that we would not have this substance injected into our bodies. Simply because of the fact that we weren't certain of what the outcome would be. And I held true to that and maintained my integrity throughout the entire ordeal.

Genevieve Eliany

How did you voice your concerns with the legislature when you were at work?

Rick Nicholls

Well, first of all, we would have caucus meetings and throughout those caucus meetings at various times there would be the Chief Medical Officer of Health for Ontario, started with Dr. Williams, and then after he had retired, Dr. Kieran Moore. And they would be giving presentations, as well as other doctors giving presentations, to caucus. And there was an opportunity, because it was all on Zoom, to ask questions. I would ask questions about the efficacy of these particular vaccines—especially having heard of the injuries that were being reported throughout the world and even within the province themselves. And of course, some people even more locally were experiencing side effects from these vaccines, but no one would ever come forward and say, "Well, it was the vaccine that caused that."

Genevieve Eliany

How would you describe the general response to your concerns at the legislature?

Rick Nicholls

Well, you know, I think it was mixed. I think it was mixed. There were several opportunities where I voiced my concerns. And sometimes— As you know, on Zoom you can have a full picture of everyone, or most people anyway, sitting in and listening to the Zoom. And there was one individual, who was the campaign manager for Re-elect Doug Ford 2022, who was sitting in on the caucus meetings. And one time I recall when I was asking questions of the medical advisor or the medical people there, I caught him just kind of shaking his head as if to say, "I totally disagree."

Other than that, I would have sidebar conversations with some of my other colleagues and some were supportive. There were a few that actually said, "Yeah, we did not want to get the vaccine," for various reasons—for their own personal reasons.

Genevieve Eliany

What were the consequences for you personally with the Conservative caucus?

Rick Nicholls

Well, obviously, I had been approached. I recall one day, I was driving back from the legislature back to Chatham, which is my hometown. And I received a phone call and it was Premier Ford. We talked and his basic comment to me was— Because he had known that there were a number of caucus members and myself that were vaccine hesitant, not wanting to get vaccinated.

[00:05:00]

He called me and he basically said, “Rick, please do me a favour, get vaccinated.” To which I responded and said, “Premier, that’s going to be a little challenging for me, a little bit difficult for me.” And I gave him my reasons, to which he replied, “Look, I don’t need an answer right now. By all means think it over and let me know.”

Well, then I proceeded to get a phone call the following day from one of the pollsters from the Party. And then on the Monday I received a phone call from the campaign chair for the for the PC Re-elect Doug Ford campaign. Now this gentleman was also a co-founder of a company called Rubicon Strategies, who by the way— They’re a lobbyist firm and they represented Big Pharma. Pfizer was one of them; Johnson and Johnson AstraZeneca were others. And he said to me— In a very unapologetic way, he said: “You’ve got 72 hours. You either get vaccinated or you will be removed from the PC caucus.”

And I thought—wow. I said, “You’re threatening me? You’re an unelected official and you’re threatening me?” I said, “Well, I’ll tell you what I’ll do. I will talk to my doctor and see whether— To get his input.” Well, of course, he basically said the following day, “Rick, you know, you’re healthy, you’re good, the vaccines are safe and effective, I see no reason why you shouldn’t get vaccinated.” To which I responded, “Well, thank you very much. I hold a different opinion.” And so that was on the Tuesday.

On the Wednesday, I drove up to Toronto and prepared my notes. And on Thursday, I went before the cameras in the media studio at Queen’s Park and very succinctly and very directly made the comment that I would not be receiving these vaccines—fully knowing, as had been indicated earlier in the week, that if I didn’t get vaccinated by Thursday, 72 hours, I would then be removed. And of course, I knew what the consequences would be. I was good at my end. And unfortunately, the government was good on their end. And about 5:30 a press release was put out, stating that I had been removed from caucus.

Genevieve Eliany

Ultimately, you ended up leaving the Conservative Party, is that right?

Rick Nicholls

That’s correct. When I was removed from caucus, I then sat across the aisle as an Independent. And that was my stand for several months until I was approached by another conservative party. I had many discussions with them, and decided to support their leader. And then I joined the party and was appointed as deputy leader, and that was the Ontario Party.

Genevieve Eliany

[Inaudible 00:08:02] ... It was like, sitting across from your former colleagues in the legislature?

Rick Nicholls

Yes, I was. And it's interesting: at first, everybody had to wear a mask, except for one day. You could still talk with a mask on but I didn't like that, because it sounded very muffled. But it's interesting how even when someone has a mask on, you can kind of read body language and facial expressions. And I was seeing a lot of serious looks from my former colleagues as I sat in opposition as an Independent, and then as a member of the Ontario Party. And that, to me, spoke volumes. But I was the one that put my political career at risk by holding on to my integrity and staying strong and realizing that I wasn't alone.

There were millions of people throughout Canada, as well as even in the States, that sent emails. And I had phone calls from people standing by and saying, "Rick, we support you. We admire your courage." I thought, well, I just want to do the right thing—not just for myself and my family but also for others who were feeling the same way. We're, as one might say, somewhat vaccine hesitant.

Genevieve Eliany

Would you say that your colleagues—or that you had the impression that your colleagues might be fearful that, if they spoke out, they would suffer the same consequences that you suffered?

Rick Nicholls

You know, that thought has gone through my mind quite often. And of course, sometimes people will put money or careers ahead of doing the right thing. And so they claim that they received the vaccines: two shots, and some three, and maybe even four.

[00:10:00]

But sadly, I've talked to many people who have come up to me afterwards and said, "Rick, you know, I got the two shots, but I am not getting any more shots." Because more and more data was coming out. Despite the fact that the Minister of Health would continually say to me when I would challenge her in the legislature during question period— You know, the canned phrase was: "These vaccines are safe and effective, protect your family, protect your friends, get vaccinated."

Genevieve Eliany

We'll shift gears now to some of your direct legislative experience. Can you tell us where and when orders and bills were generally discussed?

Rick Nicholls

Initially, bills are discussed in caucus and they're brought forward. But it's kind of like at a 5,000-foot level and, generally speaking, the minister presenting the bill—that would be a government bill—would give an overview of what it is and capture the highlights of that particular bill. Then after the presentation was made by a minister, then everyone in caucus had an opportunity to ask questions. And then once that was sufficient, then after that the bill would be read for the first time, introduced in the legislature, and then there would be debate at second reading. And then from there, after the debate there would be a vote. And assuming usually government bills always pass, they would then go into committee and hopefully come out of committee with even stronger recommendations to

make the bill even better. Then it would come back for a third reading and that's the final reading. There'd be debate and then a vote.

Genevieve Eliany

You mentioned the readings. Can you comment on how the timing of readings changed during the pandemic?

Rick Nicholls

Well, that's an interesting question. A lot of times— First of all: the government, the *Emergency Act* as an example, and that's the one that I got very vocal about sitting in opposition. That particular bill passed the second reading. And there was a timeline on that, that said that basically, from a previous reading: they had to extend the *Emergency Act*. And the date, I believe, was around December the 1st. So this is now taking place about a week before and, interestingly enough, in an evening sitting where there's not many MPPs there, just those who are on house duty. And I wasn't on house duty but I stayed in my office because I felt that something might be up that week. And I was late in my office on Monday night and Tuesday night. And on Wednesday night, suddenly I hear the Solicitor General come on and she starts talking about a bill. And I went, why would she be talking about a bill at third reading? Then it occurred to me that she's talking about this motion to extend the *Emergency Act* into—I believe it was late March of 2022. So I had some red flags pop up in my head. I went down, sought clarification, went back up to my office. And at that point in time, I finished up my notes because I wanted to speak to it.

And I got there— Had I been 10 seconds later— Because if no one stands to do further debate on a particular bill, then the speaker is then asked to ask three times—further debate; further debate; and then, further debate. And no one else stands, it forces a vote. And of course, I walked in. And if I'd been 10 seconds later, I think I would have missed out on the third further debate. I got there at the second one. I got over to my seat and then I stood and I had an opportunity to raise my concerns as to why I would not support the extension of that particular motion. I also made it very clear that— Since the Minister of Health was constantly saying these vaccines are safe and effective, I raised the issue that if they are that safe and effective then they should not give Big Pharma what I would call—if you want to use the Monopoly example—a “get out of jail card free” card. Because right now under those orders, Big Pharma were protected. Any vaccine injuries or deaths that occurred, they could not be sued. So I said, “Well, if you're so confident, then remove that from the bill.” That didn't happen.

[00:15:00]

After I was finished, no one else stood up and that forced a vote. The procedure is the speaker says, “All those in favor say ‘aye,’ opposed, say ‘nay.’” I said, “nay.” I was the only one that said, “nay.” He said, “I heard a ‘nay,’ I heard a ‘no.’ In my opinion, the ‘ayes’ have it.” Had there been five people—myself and four others—stand that would have forced a recorded vote. Unfortunately, I was the only one there that opposed it. Therefore, the bill passed third reading on a voice vote.

Genevieve Eliany

We've heard that you didn't get much notice about this debate. How much time typically did MPPs have to review new orders and legislation and anything that was to be passed in the House?

Rick Nicholls

Well, the House leaders—both on the government side and in opposition—are given a heads-up as to what bills are going to be introduced. Typically, it's somewhat short notice but at least the House leaders— Especially in opposition, they let their people know so that those who want to speak to it can speak to it and get their speaking points all in a row and can present during debate.

Genevieve Eliany

But was there time to review the legislation in detail?

Rick Nicholls

No. Oftentimes, again, during a caucus meeting, details are brought forward and a review. If, for example, in opposition—if the opposition requests a meeting to review the bill, that is often granted. But then shortly thereafter and then suddenly during proceedings, when the speaker asks for orders of the day, that's when a particular bill is introduced and they start right into debate on it actually at second reading.

Genevieve Eliany

And of course, ultimately, you're always told how to vote by the party, right?

Rick Nicholls

Yes, we are. We are. Typically, it would be political suicide for someone to oppose. Now, that's not to say that— There were times, even when I was in opposition, where the government would bring forth a bill— That would be the Liberal government at that time. And there'd be a number of us actually in caucus say, "No, we can't support this particular bill." So then, and I remember our leader at the time said, "Well, look, it would look bad on us if a bunch of us stood in favor, and we had a number of caucus members stand opposed. So do us a favor, just don't show up for the vote." And so that was often the case for that. But when in government, if someone was vehemently opposed to a particular bill then they would be asked not to show up for the vote.

Or sometimes— It happened actually with one individual: No one knew that this individual was vehemently opposed to a bill that was being brought forward. It wasn't the bill that we're talking about now. And this individual silently voted against it because we had— Because of COVID, the voting structures were different. We had to go into our various east wing, west wing, to vote. We just kind of walked through when the clerks would check our names out. This individual went on the "nay" side and voted—but then also issued a press release indicating how they were opposed to this particular bill. Well, that basically spelled the demise of this individual from caucus. Well, that person was removed as well, but for different reasons.

Genevieve Eliany

Okay, thank you very much. We're out of time, so I very much appreciate your testimony today. Thanks again.

Rick Nicholls

Thank you very much. Thank you for the time.

Genevieve Eliany

I believe we may have a question from the commissioners, is that right? Before you leave us, Mr. Nicholls, one moment. Apologies, Commissioners.

Commissioner Kaikkonen

Good morning. I just have a quick question. The Solicitor General that you're referring to, is that Sylvia Jones?

Rick Nicholls

Yes. That's correct.

Commissioner Kaikkonen

Did Sylvia Jones, in discussions with caucus,

[00:20:00]

ever speak about the people who were demonstrating out of her office, outside her office repeatedly, who were opposed to vaccines? Did that ever come up in her decision-making powers?

Rick Nicholls

Unfortunately, I don't have an answer for that. I do not know for sure. I know that there were demonstrations and a number of ministers were being targeted. She may have been targeted but I don't recall her specifically talking about the protesters outside of her office.

Commissioner Kaikkonen

So basically, just as a follow-up, her decision-making was coming from the health folks—her peers in the health and not necessarily her constituents?

Rick Nicholls

Yes, I'm confident of that. As a matter of fact, even locally for myself, I had constituents that voiced concerns. Some were definitely in favour of it but there were also many that were fearful. I didn't think that it was appropriate that even businesses who had no medical background would in fact mandate these vaccines for people that didn't want it. Vaccinate or terminate: that was the way it went. I was totally against that. To me, that was coercion. And people lost their jobs because of it and that just is not right.

Commissioner Kaikkonen

And you would also know that Sylvia Jones is not a medical doctor?

Rick Nicholls

That's correct. She is not. She and the Minister of Health, Christine Elliott—who by the way is not a medical doctor either—but she was the Minister of Health, were very close throughout the entire COVID. Because the rules, sorry, the responsibilities, of the Solicitor General and of course the responsibilities of the Minister of Health. But again, they were

taking their lead from the Chief Medical Officers of Health, Dr. Williams and Dr. Moore. I also firmly believe that the College of Physicians and Surgeons were muzzling doctors and saying, "This is what you're going to do. This is how you're going to do it." And I believe that they in fact were providing some direction to the Chief Medical Officers of Health as well. There's a lot of advisors out there— But what I found was that with many people, you try to talk to them about it. And I have an adage and it's called, "Don't confuse me with facts. My mind is already made up."

And there was no real discussion about whether or not these mandates were going to be well-received. Obviously, they weren't. because there was demonstrations going on throughout the province, actually—even after I was removed from caucus.

Commissioner Kaikkonen

Thank you.

Rick Nicholls

Thank you very much.

Commissioner Drysdale

Good morning, Mr. Nicholls. Thank you for coming here to testify. I have a few short questions.

Rick Nicholls

Certainly.

Commissioner Drysdale

How long were you a sitting member of the Ontario legislature?

Rick Nicholls

Well, from October of 2011 through to August 19, 2021, when I was removed from caucus.

Commissioner Drysdale

And you said that you were a member of caucus. For my information and perhaps for some of the folks listening, can you describe to me what you mean by caucus?

Rick Nicholls

Okay, those are the elected MPPs who were in fact—who won their seat sitting as a member of the Progressive Conservative Party of Ontario. That's caucus. Every MPP of the party, they comprise caucus. They are elected officials. But every once in a while, there'd be some unelected people in there sitting in on those meetings as well.

Commissioner Drysdale

You had mentioned to me that, or you mentioned in your testimony, that you felt your position was threatened by an unelected official.

Rick Nicholls

That's correct.

Commissioner Drysdale

In your time in the legislature, was that a common practice—for unelected officials to come in and threaten your position as an elected official?

Rick Nicholls

Well, I can't speak for others. All I can do is speak for mine. And I certainly didn't appreciate the coercion, the threats from this unelected official telling me that if I didn't comply with getting the vaccines— By the way, his company— Although he had stepped aside as the co-founder and president of Rubicon Strategies, he in fact was very, very threatening. And as a result, I had to deal with that. And I was not about to comply to his direction.

[00:25:00]

He's not a medical doctor either.

Commissioner Drysdale

You were elected in a certain riding, or a certain area in Ontario, to represent the people of that riding. Is that not correct?

Rick Nicholls

Yes, sir, it is. Chatham-Kent—Leamington is my riding. I proudly represented the people even after I was removed from caucus, after August 19, 2021. I continue to do my very best to support the people, the constituents in my riding.

Commissioner Drysdale

Well, having said that, you had also said that when certain bills were coming down the pipe—and you may be opposed to those bills—and being on opposition, seeing as you're the elected representative in your riding: How is it that members can say they represent the people in the riding when the party tells them how they will vote universally? In other words, are you representing the party or are you representing the people?

Rick Nicholls

Therein is the million-dollar question. Again, so what would happen is that when a bill is presented to caucus, there are talking points that are also provided. And those talking points assist greatly in the preparation of the big talking points. And of course, it's up to the individual—that being the elected official, the MPP—to basically "sell" those talking points. Not only in debate. Obviously back in my riding, I had great staff and we would have meetings. And I would say, "Okay, here is how we're going to present this or talk about it." But there were times when some of those talking points, I didn't agree with. And candidly, between myself and maybe a person I was talking with who was quite upset, I'd have a candid discussion with them regarding those talking points.

Commissioner Drysdale

The last question. Just before you came on, we listened to a video by Premier Ford. And I believe he said in that video that they would not go against any directives or information they got from the health officers. As a member of the caucus, do you recall being involved in any discussions where the caucus weighed the risks and benefits of the vaccine, the lockdowns, the mandates, et cetera? You would expect health officers to make a certain decision or a certain recommendation. And then you would expect the politicians to review the social, financial, economic implications of those, debate them, and then make a decision as to adopt them or to adopt modifications or not to adopt them at all. So were you involved in any of those risk–benefit conversations?

Rick Nicholls

Well, again, one of the things that I would challenge during caucus meetings was the efficacy of the vaccines. I challenged on several occasions the reasons: Why are we subjecting 12- to 17-year-olds with this vaccine? When we're seeing two things: first of all, younger people don't necessarily normally come down with COVID. And I would challenge them: Why are we doing it? What proof do we have that these vaccines are safe and effective? Where are the trials? And I would just get some answer that, as far as I was concerned, I wasn't satisfied with. And then when they also all of a sudden wanted to go down to the 5 to 11-year-olds—Oh boy. I'll tell you I questioned that and challenged the doctors in our in our caucus meetings. But, again, it would seemingly fall on deaf ears. It's the old story: Don't confuse me with facts, our mind is made up.

Commissioner Drysdale

Thank you very much for your service and your courage in coming and representing the people of your riding and the people of Ontario.

Rick Nicholls

Thank you, sir. I truly appreciate the kind comments. Thank you.

[00:29:24]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 2: Lynn Kofler

Full Day 2 Timestamp: 01:24:34–01:43:36

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

If you could please state your name and spell it for the record, please.

Lynn Kofler

Lynn Kofler, K-O-F-L-E-R, L-Y-N-N

Geneviève Eliany

And do you promise or affirm to tell the truth today?

Lynn Kofler

Absolutely.

Geneviève Eliany

Could you tell us what your professional training is?

Lynn Kofler

I am a registered nurse.

Geneviève Eliany

And where were you working, without naming the institution, during the pandemic?

Lynn Kofler

I was working in long-term care.

Geneviève Eliany

Can you tell us about some injuries you witnessed which appeared to be correlated to the administration of the vaccine?

Lynn Kofler

Yeah, we had large numbers of the residents with extremely painful arms for, like, days and days. They couldn't even lift their arms and stuff. We had to prop them on a pillow. We saw some patients break out in these huge boils. This one gentleman had boils all over his back. He was on four different types of antibiotics and nothing would help. And on time I left, he was still dealing with at least two that were still there, that we had to dress and clean every day.

Geneviève Eliany

How long were you working in this long-term care home?

Lynn Kofler

I have been working long-term care for four years.

Geneviève Eliany

Can you comment on how many deaths there were in your stay at this long-term care home?

Lynn Kofler

Well, my last long-term care home, which is shocking for me: the building holds 55 residents and they keep a book and a log when people pass. And there were 34 deaths out of 55 in a one-year period I was there.

Geneviève Eliany

Was that higher than what you had observed in your previous years working in the long-term care?

Lynn Kofler

In all my years of nursing, period. I've never seen that kind of death rate.

Geneviève Eliany

I understand that you worked nights and you were receiving communications and faxes. Can you tell us about what you learned from this correspondence?

Lynn Kofler

Sure. Because I was working night, I would get all the faxes and have to file them all. But I would frequently get the fax that came from the government and it would list the local, the area of our group, all the nursing homes. And which ones were in lockdown, which ones were in lockdown for COVID and which ones were in lockdown for influenza or any other

reason. I found, every time I got those, our nursing home was in COVID lockdown; only we never had one case in the whole full year I worked there.

Geneviève Eliany

To be clear: Again, the faxes and the correspondence were reporting that your institution was closed for a lockdown, even though there was no COVID that you knew about.

Lynn Kofler

Right, and sometimes we weren't in lockdown. On occasion, we had to be in lockdown because we had some false positives for staff or patients. but after a two-week period, the lockdown would be gone until the next occurrence. But there was never COVID in the building.

Geneviève Eliany

What impact did you see on the residents with respect to lockdowns and lack of visitors?

Lynn Kofler

Oh, it was really hard to watch. They had to stay in their rooms. They ate out of paper plates, paper cups, plastic cups. They were no longer allowed to go to the dining room. They were no longer allowed to participate in any activities: crafts, music, anything. They were literally in their rooms for the whole two-week lockdown periods, which there were quite a few when I was there.

And they had no socialization. Just whoever was in their room but frequently they're not always— You know, we have dementia patients and that kind of thing, so it's not like real company. It's not like getting out and talking and having conversation and being able to interact with people. That was a huge impact.

And we found there was an increase in confusion, actually. Because frequently, they didn't know what was happening and they'd be all stressed and they'd walk out of the room and then they'd have to be put back in the room. It was really hard to watch.

I know that some patients we saw just stopped eating; they stopped getting out of bed. And I really believe that they more or less died because they had no clue why family members weren't coming. Where are their grandchildren? You know, where are the people who love them? And they could not see them at any point.

[00:05:00]

Geneviève Eliany

Let's speak about your personal experience. As far as you can tell, when do you suspect you first had COVID?

Lynn Kofler

I first had COVID actually February 2020, before the thing was announced. And I knew I had COVID because I had six years of never had a flu or a cold. I take a lot of vitamins. I take

vitamin D, C, all those; I was already taking them. So they had prevented colds for a long period of time for me.

But when I got what I perceived was COVID, I was flat out for three days. I, like, couldn't even move off the couch. And then after three days, I was fine. I was up and about and I didn't have the headache, didn't have the sore throat or anything like that. I was fine.

Geneviève Eliany

And I understand you refused the vaccine, is that correct?

Lynn Kofler

Yes, I did.

Geneviève Eliany

What were some of the reasons that you chose not to receive it?

Lynn Kofler

Well, I have health issues and I had tested positive for lupus two years ago, so they're monitoring that. I have other autoimmune issues that really prevented me from wanting to take the risk of putting anything in my body that might increase my symptoms or make my issues worse.

Geneviève Eliany

How did your refusal impact your ability to work?

Lynn Kofler

Sorry?

Geneviève Eliany

How did your refusal impact your ability to work?

Lynn Kofler

Initially, the nursing home was— I was fine. I worked in COVID right up until October 9th, 2021. I worked all through there. I worked large amounts of hours. I mean, I felt like I was never home, but they started saying stuff like, "Okay, with the nursing home: owners of the nursing home are looking to get everybody vaccinated." So that was the first step.

Then the next step was: those who weren't vaccinated now had to do this little online course, that they told you all about COVID and all that stuff. I mean, we are registered nurses, I think we understood that. They put us in front of that and it went through the whole list of what it was. And at the bottom it says, "Are you now willing to get the vaccine?" To which, of course, we all went, "No." I don't know why they thought that that little teaching session would help us—but anyway.

And then the next thing that kept occurring was we didn't get discreet letters. We would walk into our lockers for the morning shift and the letters would be pasted on all the people who weren't vaccinated, saying that we had until October 9th, 2021.

Geneviève Eliany

When were you put on leave?

Lynn Kofler

I was never put on leave. I just never got any shifts after October 9th and was requested not to return.

Geneviève Eliany

And ultimately, what happened to your nursing license?

Lynn Kofler

I had my nursing license for a while, but now it is—I relinquished it, because I turned 65 on February 4th. In order for me to get back into nursing, in case they open the door again, I would have to go through remedial stuff: more work, courses, all that kind of stuff to get up and running again. So the time period for me, it's not possible for me to work in nursing again.

Geneviève Eliany

Did you consider trying to find work in other areas of health care?

Lynn Kofler

I did and every area of health care I was not allowed to work there.

Geneviève Eliany

And you weren't allowed to work because of your vaccination status, just to make it clear.

Lynn Kofler

Exactly. Yeah.

Geneviève Eliany

Okay. Ultimately, what did you do to support yourself?

Lynn Kofler

I was 10 months unemployed. I withdrew money from my RRSP, I withdrew money from my tax-free savings. I cancelled all my magazines, my cable TV, anything I could scale down on. I started selling my stuff on Marketplace and made it through the 10-month period. And I was constantly applying for jobs locally, in Coburg and Port Hope—and not getting any response. I felt it probably was due to the fact that I was overqualified for minimum wage jobs and that I was too old.

Geneviève Eliany

Do you regret your decision?

Lynn Kofler

Do I regret my decision to not get the vaccine? Absolutely not. I think it was the right thing to do. For me.

Geneviève Eliany

And if you can make recommendations on how,

[00:10:00]

let's say, specifically the circumstances and the management of the situation could have been better handled in long-term care, what would some of those recommendations be?

Lynn Kofler

In regards to myself, or in regards to the patients and all that?

Geneviève Eliany

You're welcome to comment on the patients, but since you were staff there, with respect to management of the staff.

Lynn Kofler

Right. I think that, first of all, nursing— I've been a nurse for 40 years. So in a 40-year period, we all knew that we're working under stressful situations, always short-staffed. And they were constantly calling you to come in and you rarely had a day off. But that just meant that when we were short-staffed, then the patients got less attention. Frequently, if it was their bath day, for example, they would skip it and hope that the next day they'd have enough staff to actually get the person bathed and cleaned and stuff. So that was kind of tough, but that's a normal part.

But I found it really hard to— When I began to talk to other nurses about the things I had been learning about COVID and why I had chosen not to vaccinate, I went to work and there were two days in the week that I had shifts and all the others were gone. Normally, I look at my schedule and the whole entire thing is full. I phoned up my manager and I said, "What's going on?" And she said, "We heard you were going to the rally in Ottawa." And I went, "Excuse me?" "You were telling people you were going to the rally in Ottawa." I said, "I never ended up going, but that was the plan. I just never had enough time off to go."

And under that condition, because of that—that I wanted to go to the rally—they took away my shifts. Even though they were short-staffed, they still took away my shifts as kind of a punishment. And then once they discussed it with me, they brought all the shifts back because I didn't go while I was working with them.

After I got let go, I definitely went to Ottawa just for the day—to see. I wanted to see for myself what it was really like, what was really happening up there.

Geneviève Eliany

Is it fair to say that you'd never lost shifts before because of political beliefs?

Lynn Kofler

No, never, no. No.

Geneviève Eliany

Certainly sounds unusual.

Lynn Kofler

Yeah, it does.

Geneviève Eliany

We'll see if the commissioners have any questions for you.

Lynn Kofler

Sure.

Commissioner Drysdale

Thank you for coming down. Are you aware of the adverse reactions reporting system in Canada, sometimes called CAEFISS [Canadian Adverse Events Following Immunization System]?

Lynn Kofler

No, I am not.

Commissioner Drysdale

You mentioned that you noticed some of the residents in the long-term care facility were having soreness of arms and whatnot. Do you know whether anyone was making reports to higher-ups about those reactions to the health department, or—?

Lynn Kofler

Well, those issues were spoken of from shift to shift, but I don't think they were ever really documented or ever really catalogued in any way, shape, or form.

Commissioner Drysdale

Okay. You mentioned the conditions in the facility with the lockdowns, or lockdowns for various reasons. And the patients were in the rooms, they couldn't get out, they had no social interaction. Did the Province of Ontario provide any oversight, any regulation, any inspection of these facilities to see the conditions that were going on and to make comment? Or did they provide any guidance to lockdowns and social interactions?

Lynn Kofler

Well, I had overheard that there was a Ministry person in the office with the Director of Care. I happened to be in the other room on the computer and I heard them talking, but I didn't specifically hear what they said. But it was obvious that the Director of Care had to do what the Ministry was telling them and I was quite surprised that the Director of Care had no response, but kind of like a "yes, sir" response.

Commissioner Drysdale

I understand that—that the direction on how to lockdown was there. But did anyone from the government come into the facility to actually check with their eyes to see the condition of the patients and what the effects of those lockdowns were on those residents?

Lynn Kofler

I'm not sure. I saw that lady come but I wasn't sure if she was there to assess the residents or the conditions or anything. I'm not sure why she was there.

Commissioner Drysdale

Do you have any idea how many staff in the facility were treated similar to you?

[00:15:00]

In other words, lost shifts or left the facility due to this issue?

Lynn Kofler

There weren't a huge amount of staff in there. It was a 55-patient unit but when I was asked to leave, there were also at least four others who were asked to leave. And in an institution that small, that was a big chunk.

Commissioner Drysdale

Well, you had mentioned earlier that you're always understaffed. And if you lost four staff due to this issue, how would that affect the care the residents were getting?

Lynn Kofler

I'm sure it was even worse than usual. I know before I left, I had to train the person who was going to replace me. I know for a fact that these PSWs [personal support workers] especially were fast-tracked in their coming to Canada actually; and also fast-tracked into education in order to work as a PSW. Which made the staff who were already PSWs and working their butt off angry because they were getting so much more pay and they didn't even have to take the long courses that they had to take to become PSWs. They were six-month online course and then they were in the building.

Commissioner Drysdale

Are you describing a somewhat toxic situation in the facility with staff angry, short of staff, patients locked into their rooms for days or weeks on end?

Lynn Kofler

Yes. Definitely, yes, and the stress on the staff was pretty— You could feel it in the air. And they were always being called to come back in on their days off. And so there was a lot of resentment, a lot of stressed-out people. It was just too much to cover everything.

Commissioner Drysdale

Thank you very much.

Lynn Kofler

You're welcome.

Commissioner Kaikkonen

Good morning. I just have a couple of quick questions on the online course. Who was the author that would have been responsible for that online course?

Lynn Kofler

The author?

Commissioner Kaikkonen

Yeah, who. Was it the government?

Lynn Kofler

I think it was a government form, a little course that we had to take. If it wasn't government, then it would have been by the owners of the nursing care facility.

Commissioner Kaikkonen

Was it accredited do you remember?

Lynn Kofler

I'm sorry?

Commissioner Kaikkonen

Was it an accredited education piece or was it just something that had been put together?

Lynn Kofler

No, it was just something they put together so that we could become "more informed" and be convinced that it would be better for us to take the vaccine than not take it.

Commissioner Kaikkonen

And my second question is: You may not have been working at this time, but I believe the media had this blitz in the middle of COVID about the military having to go into nursing homes. Did you experience or hear any information about that?

Lynn Kofler

I heard about that, but that was more in the Mississauga area and I work in the east. I live in Cobourg, so I work in nursing homes in that region.

I heard about the military coming in and saying how bad the situation was. I can tell you just from my own experience: I worked most of my career in hospitals and with the VON [Victorian Order of Nurses] community. And at the end of my career, I've been doing long-term care. And it is not a good picture, I think. I went to 10 to 12 nursing homes as an agency nurse and I can tell you that probably, there were three good ones and the rest were all just struggling, I think. And the patients were not getting top quality care at all.

Commissioner Kaikkonen

Thank you.

Lynn Kofler

You're welcome.

Geneviève Eliany

Thank you very much for attending today.

Lynn Kofler

Okay. Thank you.

[00:19:02]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 3: Thomas Marazzo

Full Day 2 Timestamp: 01:43:44–02:28:50

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness today is Mr. Tom Marazzo. And Tom, I placed a couple of sheets of paper on that thing there for you, that will be exhibits.

Thomas Marazzo

Okay, got it.

Shawn Buckley

And I'll, for starting, ask you if you will state your full name for the record and then spell for the record your first and last name.

Thomas Marazzo

Okay, Thomas James Marazzo T-H-O-M-A-S M-A-R-A-Z-Z-O.

Shawn Buckley

And Mr. Marazzo, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Thomas Marazzo

I do.

Shawn Buckley

Now, my understanding is that you were a combat engineer for the Canadian Armed Forces for 25 years.

Thomas Marazzo

I started off in the reserves in high school. I was infantry and then after I graduated college in '90, I joined the Regular Force in 1998 as a combat engineer officer until 2015.

Shawn Buckley

And then you have a bachelor's degree, basically in software—that's what it's called.

Thomas Marazzo

Yes.

Shawn Buckley

And then you went on and got a Master of Business Administration.

Thomas Marazzo

Yes.

Shawn Buckley

And when COVID-19 appeared on the scene, you were a teacher at Georgian College in Barrie, Ontario?

Thomas Marazzo

Yes.

Shawn Buckley

Now, what happened as COVID came along in 2020?

Thomas Marazzo

The world lost its mind and its ability to do basic critical thinking. So you know, I kind of was keeping an eye on this from afar. I knew something was up. I was watching what was happening in China and around the rest of the world and I was closely listening to the way the media was presenting it. So I think immediately I was skeptical of what the public was being told. And when the media says, look left, I always look right. Because in my experience, they really just can't be trusted.

I was teaching in class full time for about six months and then, six months into it, COVID hit and the first lockdown happened. And so we had to transition to online learning for—I was teaching online for the next 18 months. But I could see that there was this with the other post-secondary: Western University implemented a vaccine passport and then Seneca College implemented a passport as well.

You were seeing these stories of students all over the place. They weren't even allowed to register for online learning if they didn't get the vaccine. There was a lot of— My entire time with COVID nothing made sense. Nothing at all. In terms of what the media narrative was, they were scaring the crap out of the public at every possible opportunity and they were always talking about case count, case count. And it's like, so what? Case count is a

meaningless number. It's just meant to fill people with fear. And for me it just didn't seem to have an effect. Other than I was baffled by the illogical aspect, you know? The case count numbers were only meant to scare the public.

Shawn Buckley

Right. Now eventually—because you kind of intimated you saw something coming. So eventually a vaccine mandate was imposed, am I right?

Thomas Marazzo

Yes.

Shawn Buckley

Tell us how that came about and how you responded to that.

Thomas Marazzo

Well, I had been sent a text from one of the coordinators of the programs that I was teaching in and he said, "You know, Seneca just implemented a passport." And when Seneca College does it, usually the other colleges follow suit. And I had been stockpiling as much money as I could, knowing that I was probably going to be affected by this. And so students registered for school. And then, just before school started, the President put out an email, basically threatening people with very strong aggressive language, saying that if you didn't get this vaccine, you were no longer employed. At the time, I was a member of an organization called Police On Guard. I was eligible because I was retired military. But there had been— Some of the police officers that were retired were in the group, were actually sharing a lot of the case law and putting together some really helpful documents. So I went in and I researched it.

[00:05:00]

And when the President sent out the email threatening everybody's employment, I basically did a "reply all," so I copied the President, the Vice-President, the VP of HR, all the deans that I personally knew, and as many faculty as I could find.

Shawn Buckley

And this actually ran into the hundreds, didn't it?

Thomas Marazzo

Oh, it was; yes, a couple of hundred for sure.

Shawn Buckley

I apologize to the audience: I can't draw this document up because of the format I copied it in. But Commissioners, I've given you two pages and the first one is Mr. Marazzo's response, which is Exhibit TO-17 in these proceedings. And Mr. Marazzo, you have a copy. That is the email that you sent in response.

Thomas Marazzo

Yes. My intention was to basically say, "How is it exactly that you believe you're going to get around all of these specific laws?" And there was no response right away, but then one faculty member just replied—hit a "reply all," and said, "Please take me off your distribution list."

Shawn Buckley

Okay. So you send this email and one person replies first, saying, "please take me off your email."

Thomas Marazzo

Yes. "Take me off of your distribution list," yes.

Shawn Buckley

And this was a "reply all," wasn't it?

Thomas Marazzo

Yes.

Shawn Buckley

Okay. So what happened after the first?

Thomas Marazzo

So then shortly after another faculty, same thing: "Please take me off your distribution list." "Please take me off." And so after about the tenth, one of the other faculty said, "As much as I'd love to see you guys read all your comments, could you just hit 'reply,' so I don't have to spend all day long deleting all of your emails?"

Shawn Buckley

And this was an email sent, as you say, to several hundred people.

Thomas Marazzo

Yes, several hundred. One of the faculty responded to him and said, "No, I think we should stand together in unity against this guy." And then immediately after, they all jumped on board, including the dean of the faculty I worked in, the coordinator, some of my other colleagues that I work closely with teaching. Every five to ten seconds, I was getting another email, "Please take me off your distribution," "Please take me off your distribution." After a while I just stopped looking at it because I was getting these things coming in every, you know, five to ten seconds from another person.

Shawn Buckley

Basically, what this was: Because you were taking a stand and basically questioning the legality of the vaccine mandate, all of the people in this email chain made a point of publicly shaming you.

Thomas Marazzo

Yes.

Shawn Buckley

How did that make you feel?

Thomas Marazzo

I was kind of—at first it didn't bother me too much. But then I was starting—I was actually quite shocked. Because these are the types of people that like to profess that they teach their students critical thinking. But yet, I outlined all of this legislation in front of them and it didn't seem like any of them actually had the ability to exercise critical thinking. So I was—I was embarrassed actually, I was embarrassed for them. And I know that sounds maybe a little bit arrogant on my part, where, you know, I'm the lone person criticizing the vast majority of the faculty. But I kind of laid it all out for them. All they had to do was take a look at it. And instead, what they did is they went with groupthink and their own fear and they just started piling on one person who's standing alone, who is waving a warning sign for them. They didn't care. They were just trying to virtue-signal to the Dean that they were on board with this stuff.

Shawn Buckley

No, but personally, how did it make you feel? You felt embarrassed for them, basically, in having to do this virtue-signalling. But how did it make you feel that basically, one after another was participating in an act designed to shame you publicly?

Thomas Marazzo

I think I transitioned very quickly to surprise, to shock. I was a little bit angry that not one of them had the courage to actually back me up. Like, there was a couple of them that sent me private emails saying, "Hey, I understand, good." But they weren't going to come forward. They weren't going to stick their neck out. They were perfectly happy to see me stick my head out. To be honest, I started to get quite angry about it, that I wasn't getting any support from any of them.

[00:10:00]

I mean, just the law of large numbers: I should have got somebody doing a "reply all" and saying, "Wait a minute: maybe this guy's got a point. Maybe we should be discussing this." And nothing.

Shawn Buckley

So let's just put this into context. I mean we're basically talking about faculty members at a university. Is that right?

Thomas Marazzo

Yes—or a college.

Shawn Buckley

Yeah, okay a college. But these will be people with Master's degrees and PhDs that have been taught to think critically. And they are your colleagues.

Thomas Marazzo

Yes.

Shawn Buckley

You're one of them, and some of them will be your friends.

Thomas Marazzo

Um hum.

Shawn Buckley

Did any single one of them stand up publicly for you?

Thomas Marazzo

No, not one.

Shawn Buckley

Now, getting back then. So you send this email and you're publicly shamed. How did Georgian College respond to your email?

Thomas Marazzo

I was summoned to a virtual meeting. First off, I was ordered to remove the email by the VP of HR. But I didn't see his email till later on and didn't matter anyway, because he had directed the IT Department to take down my email. Then I was summoned to a meeting on the Friday. This is the first week of school, so by the first Friday, classes had already started. That Friday, I was summoned to a meeting, asked some questions, and then told that I would have to come back to another meeting Monday morning. Monday morning, I believe 8 or 9 a.m., first thing in the morning— And the union rep was there, the union president was actually on the call, but you'd never know it because he didn't say a word. And I was informed that I was being fired for cause. So I was fired and I haven't had a job since that time.

Shawn Buckley

Now, David, can I have you— I've got on this computer a copy of that termination letter. If you can pull that up on the screen for the online audience to see. And Commissioners, you have a paper copy in front of you [Exhibit TO-17a].

Mr. Marazzo, so you've sent an email. And my understanding is— And I'm just reading from the second paragraph: "Your actions are in violation of the College's Employee Code of Conduct, the Appropriate Use of Email and Anti-Spam Compliance Policy and the Information Technology Acceptable Use Procedure."

So you didn't have a student or anyone complain about your behaviour.

Thomas Marazzo

No, all my teaching ratings were really high.

Shawn Buckley

So basically, you were getting fired for—by your email—basically stating that there are other laws and things like that should be considered before a mandate is imposed.

Thomas Marazzo

Yes.

Shawn Buckley

Now I want to segue into another topic because you found yourself involved in the Trucker Convoy.

Thomas Marazzo

Yes.

Shawn Buckley

Can you tell us how you became involved and what your role was?

Thomas Marazzo

I was following it just like everybody else on social media. And through a friend of a friend basically, I ended up on a phone call with a guy named James Bauder, who's with Canada Unity. And the intention of that call was, I thought, just to give some advice. Because as a former military, this was quite a normal. This would have been easy for anybody with some experience in the military. I had taken the call with the expectation that I would just give some advice. And within 15 minutes of that call, James had just said, "Would you mind just coming to Ottawa?" Because I was only in the Kingston area, so for me to go to Ottawa was maybe a two-hour drive. So within three hours of that phone call, I found myself in Ottawa. And I walked into this conference room with a whole bunch of truckers, a couple of Ottawa police, and next thing you know, I was there for 22 days.

Shawn Buckley

And that was to the very end.

Thomas Marazzo

To the very end, yes.

Shawn Buckley

And my understanding is that you became a spokesperson for the Truckers Convoy.

Thomas Marazzo

Yeah, on occasion. I didn't do too much of the public stuff. And it was never my intention, that just kind of— The longer I stayed at the Convoy, the more my role started to evolve.

Shawn Buckley

Now, you came after a couple of days. My understanding is that the Truckers Convoy lasted for 24 days in Ottawa.

Thomas Marazzo

Yes.

Shawn Buckley

And you were there for 22 days.

Thomas Marazzo

Yes. Two days after is when I arrived.

[00:15:00]

Shawn Buckley

Can you share with us— Because some of us weren't there and I don't think we appreciate the size, the number of Canadians that got involved, can you share with us basically the size, including on weekends?

Thomas Marazzo

Well, the weekends was the big swell. That is when the general public that were not working during the week would come and bring their families, bring their kids, and participate in the activities there in Ottawa. It was like Canada Day: every weekend was like Canada Day. And you know, at one point I would estimate that there was probably 100,000 people that showed up on one of the weekends. We had a stage sound system and people were giving speeches. There was lots of activities. So the influx on the weekends was much greater than during the week. But I would think, on weekends you were looking at about a hundred thousand people would come into—down to Wellington.

And of course, then there were truckers. Finding the exact number of truckers was always a big challenge for everybody. But if you just look at some of the video you could see there's a lot of trucks that showed up to Ottawa.

Shawn Buckley

And we're talking thousands, we're talking trucks in the thousands.

Thomas Marazzo

Well, that originally travelled across Canada, yes. But when they arrived into Ottawa, I would estimate somewhere around a thousand in the whole Ottawa region. Because there were trucks that were out at various different locations, not just in the downtown core.

Shawn Buckley

Now, being involved—because you were involved with the leadership, and that’s how you became a spokesman at times—what was your understanding of the goal of the Truckers Convoy?

Thomas Marazzo

Well, after over two years of all these protests that were going on across the country, everybody who protested was literally being either ignored or arrested for protesting. When the mandates came out for the truckers, the truckers took it upon themselves and said, “We’re ending these federal mandates. That is our objective, is to go to Ottawa and make them listen, because they haven’t been for two years. So the goal is to end the federal mandates—and all of them.” It was the mask mandates, vaccine mandates, lockdowns, you name it, travel restrictions, this cross-border issue. So for the truckers, they were allowed as unvaccinated to travel into the United States, drop their load. But when they came back, they were required to quarantine for 14 days. So how do you do a cross-border trip and then come back and have to quarantine in your home, place yourself under house arrest for 14 days, and still expect to make a living? They couldn’t do it. And it was a significant portion of the actual industry.

Shawn Buckley

Now, my understanding is this protest is right on Parliament Hill. I mean, it’s at the seat of government.

Thomas Marazzo

Yes.

Shawn Buckley

And you’re telling us they wanted to have a dialogue with the federal government. Am I correct? You basically did a public statement asking the Prime Minister to speak to you and the truckers.

Thomas Marazzo

Yes, several times.

Shawn Buckley

And am I correct that even the Ontario Provincial Police called on the federal government to speak to the truckers?

Thomas Marazzo

Yes, there was an engagement plan that was drafted by the OPP. And I heard this testimony directly from the person who wrote it, I believe he’s an acting inspector, Marcel Beaudoin of the OPP [Ontario Provincial Police]; he’s the Liaison Team Leader for the OPP. And he had drafted an Engagement Plan. It was presented to the federal government the day before they invoked the *Emergencies Act*.

So they were briefed on the 13th of February. And then the next day they invoked it and it completely ignored any form of engagement.

Shawn Buckley

Now, I assume—I mean, we've got on weekends 100,000 people on Parliament Hill. We have trucks all around Parliament Hill and in other parts of Ottawa. This is going on for 24 days. I assume, as a spokesperson who actually had been authorized to issue a public statement for dialogue, that all of your time was taken up speaking with the federal government to kind of deal with these issues.

Thomas Marazzo

That would have been great.

Shawn Buckley

And you laugh. Tell us what really happened there.

Thomas Marazzo

The highest ranking non-elected person I ever spoke to was Steve Kanellakos: he was the City Manager of Ottawa. And I met with him on two separate occasions. But we never met with the mayor. The highest-ranking police officer I ever sat in a room with was an inspector.

[00:20:00]

And he didn't really participate much in that meeting. But my day-to-day conversations were no higher than the rank of sergeant with the Ottawa Police.

Shawn Buckley

Okay, so I just want to focus us. Because this likely is the largest protest, well, definitely in my lifetime and likely in your lifetime. And the object is to have a dialogue with the federal government. Did a single federal government person speak with you or the truckers?

Thomas Marazzo

The Member of Parliament, the Conservative Member of Parliament for Tamara Lich's riding, I believe, had a conversation with her. But they're not the government. They're just as powerless to get anything going on with the federal Liberals, the government in power. There was nothing. We never met with any of the Liberal Party. We were trying to back-channel and maybe get some help from the Conservatives to arrange some sort of meeting. Never happened, we never— And we expected, actually— Because the Liberal government had had a previous history of engaging with other protests. And again, the OPP testified at the Public Order Emergency Commission that their expectation was that the Liberal government was actually going to reach out and talk to us. And they didn't. There was literally no dialogue between us and the federal government or the Ontario Government.

Shawn Buckley

And that would be for the full 24 days?

Thomas Marazzo

The full time.

Shawn Buckley

Before the *Emergencies Act* is invoked, not a single dialogue with the federal government?

Thomas Marazzo

Nothing, nothing at all.

Shawn Buckley

What is your worst memory? Well, let me just back up. What was your impression? You were there for 22 days. And we've heard that the Prime Minister is basically disparaged. We've seen pictures of Nazi flags—just a few handful. An immediate person spoke to that yesterday.

But what was your observations of how people were behaved, and basically the entire atmosphere and behaviour? How would you characterize it?

Thomas Marazzo

Well, up until the last two days—the 18th and 19th of February—up until those two days, everything really was more of a festival, party-type of an atmosphere. And people were being very responsible in— For example, we shovelled the roads, we shovelled the sidewalks, we collected garbage and on occasions we did first aid. We always kept safety lanes open, despite what any media outlet tells you. We worked really hard to make sure that EMS was always able to get through any portion, and they did. There was testimony of that as well, that we actually accomplished that. But overall, it was a friendly environment. If you ever even talked to some of the people that went there, it's a constant theme: that it was such a truly Canadian experience and it didn't matter over ethnicities, races, religions, creeds, anything.

It was ordinary Canadians from east to west that were there being Canadians. And they were putting their foot down and saying, you know, "We're going to be here, we're going to be non-violent, we're going to be peaceful, we're going to try to make the best of a situation, because we'll be here for a long time. But we're not going to be aggressive, we're not going to be violent." You know, we were even donating food to homeless shelters because we had so much support that we were sharing it within the community. We were not a threat to businesses; we were actually asking for business owners to open up so that we could shop in their businesses. We were trying to support that community.

But overall, our intention was never to go and put pressure on the residents of Ottawa, it was just the government and that's what we were there to do. And, you know, it was a very, very peaceful, very fun experience for a lot of people—very fun.

Shawn Buckley

Now, you understood that the *Emergencies Act* was invoked. And my understanding is you basically gave a public statement and you had a dialogue with the OPP to basically permit a staged withdrawal, without the need for what we all witnessed—thank goodness, because people could live stream.

Thomas Marazzo

Yeah, so on the 19th, the morning of the 19th, I had a meeting in my hotel with several truckers that were in various leadership positions. And we made the decision to recommend to the truckers to peacefully withdraw from the city. And we chose that language very specifically,

[00:25:00]

because we wanted to obviously instill the idea that we're still going to be peacefully interacting with the police. Despite the day before, where the police were exceedingly aggressive and the whole situation had been violent.

So even on the second day we were emphasizing peace, but we were recommending that the convoy withdraw from the city. At 10:03 that morning on the 19th of February, I made a call to the OPP. I was pretty emotional about it because I had just finished watching a lot of the video footage on the news of people getting beaten. And I was there when Candace was run over by the horse and the other man. I was standing 15 feet away—so I witnessed this violence myself. And I wasn't too happy about the veterans getting beaten by the police as well, at the National War Memorial. I made the call to the OPP and I said, "Look, we're recommending that they leave. But you need to move the concrete barriers and allow us to get fuel into the trucks." Because we were boxed in, we couldn't actually move. We couldn't leave if we wanted, unless people literally walked out of the city. So we said, "You need to move the concrete barriers and you need to let us get fuel into the truck, so they can drive out."

But we were recommending that the drivers, the truck owners, leave the city. And he said "Yeah, I'll pass it up the chain." And nothing happened. No concrete barriers moved and people were continuously beaten and arrested.

Shawn Buckley

Okay, so I just want to be perfectly clear. You were personally involved in trying to make arrangements with the police for the truckers to withdraw their trucks from downtown Ottawa.

Thomas Marazzo

Yes.

Shawn Buckley

And this was all done in an effort to forestall unnecessary violence against Canadians that you had witnessed the day before.

Thomas Marazzo

Yes.

Shawn Buckley

And there was no answer or no response.

Thomas Marazzo

No. We were starting to see some of the leadership of the convoy get arrested anyway. By that point, Tamara had already been arrested, Chris Barber had been arrested. I think Danny Bulford, who's retired RCMP, was already arrested and in custody at that time. Which was why on the last day I was the one who gave the public statements saying—because I was the last one left that the public would recognize and maybe listen to.

Shawn Buckley

Right. Now, you spoke about what happened at the War Memorial. Can you describe that? I'm going to play a video. And there's a person in the video and I want you to share with us your knowledge and relationship with that person. But please explain to us in detail who was at the War Memorial and what occurred.

Thomas Marazzo

So as the convoy went on, more and more Canadian military veterans—in a lot of cases, combat veterans—started to arrive in Ottawa. And they spent time mostly concentrated at the National War Memorial because, for a time, there was a big steel fence around the memorial and the veterans were quite upset about this, because it wasn't being cleaned off with snow. It was being kind of neglected. I was there as well when the veterans took down the steel fence. The police came in, they thought that the monument was kind of, you know, not being taken care of. But as soon as they came in, they saw all the veterans. We said, "Look, we're going to put a 24 and 7 guard on the memorial," and they did. So the veterans, for two weeks, had a 24 and 7 vigil on the National War Memorial, protecting it. And that's kind of the ground they typically stuck to.

But after the *Emergencies Act*, when the police started to do their raiding, the veterans formed a wall and they linked arms and basically said, "We're not going to move off this piece of ground." They're not going to fight, but they linked arms and they were resisting—peacefully resisting. One of the individuals, Chris Dearing: he was a wounded Afghanistan vet. Two others of his colleagues were immediately killed. He was blown up in a LAV-3 IED explosion that sent the vehicle 100 feet into the air, flipped over. The turret fell out, Chris fell out. He was badly, badly injured—luckily not killed. But he was there. He arrived and one of the veterans told the police, "Look, when you come up, this guy here: he's in bad shape. He's a wounded veteran, he's in really bad shape."

[00:30:00]

Well, they rolled through and at one point they just grabbed Chris right out of the line, right out of the chain, and two of the police started beating him on the ground.

Shawn Buckley

I'm just going to stop you. So Chris is a war veteran that served this nation in Afghanistan.

Thomas Marazzo

Yes.

Shawn Buckley

And he witnessed two of his fellow soldiers being killed in action.

Thomas Marazzo

Yes.

Shawn Buckley

And he himself was wounded and has problems to this day because of that.

Thomas Marazzo

He has many physical problems. He's not very employable right now, but— You know, he's not a large person. But he was certainly not a threat to any of the large police officers and if you show the video, you'll see the difference in size.

Shawn Buckley

And I will. But before I do, I saw some other videos. And I saw that Chris was wearing three medals—

Thomas Marazzo

Yes.

Shawn Buckley

On his jacket, that don't show up in this video. So he's a decorated war veteran.

Thomas Marazzo

Yes.

Shawn Buckley

I'm just going to play this video and it's short. I'm going to play it twice because it's so short. But I just— I just want the people of Canada to see how we treat decorated war veterans.

Thomas Marazzo

To be clear too: all the veterans that were there were wearing their berets and their medals. So they were easily recognized as Canadian veterans.

Shawn Buckley

And the police were told that in any event.

Thomas Marazzo

They were told.

Shawn Buckley

And you told us that they were told that Chris actually has some physical issues.

Thomas Marazzo

Yeah, specifically Chris was pointed out.

Shawn Buckley

In this video, Chris is basically the gentleman in the brown jacket being dealt with by the police?

Thomas Marazzo

Yes.

Shawn Buckley

Can I have the screen please—thank you.

[A Global News video clip is played of the final Friday of the Trucker Convoy, depicting police beating Chris Dearing, a Canadian war veteran who was wounded in Afghanistan.]

What was your experience of the police during those last two days?

Thomas Marazzo

Very, very mixed. At one point I was there— Like I mentioned, I was there on the line when the horse came through and ran over the two people. I remember there was a large group of OPP standing there. I walked over and I was looking at them, and I kind of started yelling at them saying, “Thank you, thank you, you got to be proud of yourself for stealing the future of my kids and your kids too.” And they looked at me— They looked at me as if, though, you know, “If I could shoot this guy and get away with it, I’d drop him right now.” That was the impression I got. I didn’t see people that had any shame in their eyes, I saw people that were getting geared up to go in and beat people. That’s what I saw. I had very mixed emotions because on my one-on-one dealings with specific individual officers, it was very good, not all. Then when we got to that— And what’s interesting is, none of the police that we were interacting with the previous three weeks were the ones that were on that line. They brought in new people from other jurisdictions that had no ties, no relationships, hadn’t been in Ottawa, to come in and start mass-arresting people.

Shawn Buckley

And as my final question before I give commissioners the opportunity to question you, is: What happened to your bank accounts, and what was the effect of that?

Thomas Marazzo

My bank account was frozen, along with approximately 280 Canadians. I was not informed that it would be. I was not informed that it was frozen and I was never told when it would be returned to me. It was credit cards, banks, joint accounts, any financial asset that I had. And my ex-wife was notified by her financial institution that they were looking at hers.

[00:35:00]

It’s recently been disclosed in the media that all of our information was shared globally to banks—including China, India, France, U.K., Wall Street. All of our personal information

was shared and they were told, "If you're doing banking with these people, cease doing banking with them."

Now to be clear, there was never a warrant for my arrest. I was never charged. I've never been convicted. My son has a heart condition. And if we didn't have cash, we would not have been able to purchase his heart medication. You had to have cash to actually buy this. They didn't give any consideration to anything like that. Nothing, there was no information that we knew about. Next thing you know, rumour started that bank accounts were frozen. And, you know, I was one of them. And on top of that, now I'm being sued for \$400 million for my participation in the convoy.

Shawn Buckley

Well, welcome to your Charter-protected right for freedom of expression and freedom to assemble. I'll open it up for the commissioners if they have any questions for you, Mr. Marazzo.

Commissioner Kaikkonen

Good morning. I just would like to go back for a moment to the faculty union. And I see in your email that you have listed a number of legislative pieces. Usually, unions stand up for the minority voice to some extent. I'm just wondering, in this case, you said the union member remained silent.

Did you have any thoughts about that or any follow-up conversations with the union that would suggest that they were silent for a reason or being silenced by the administration?

Thomas Marazzo

There was nothing offered. I was in a pre-meeting before all this had happened. There were several people on the call and I remember specifically asking the union president in this call: If something like this were to occur, would they represent us as individuals, or would they look at it almost like a 'majority rules' kind of a thing? And his response was to the negative. He did say, "We'll take it as a case by case," but then he immediately shut me down and told me that that question was inappropriate to ask in that meeting. And one of the other people participating, a faculty member, asked me a question about my original question. And he shot her down and said, "that's inappropriate for you to talk to the other faculty member in this Zoom meeting."

I did go to arbitration after, but that's a whole other story. I did lose the arbitration because I couldn't attend the arbitration. But my feeling was that the union did— I did threaten to go, what is it—DIF? I can't remember the acronym, for when you don't feel that the union is actually representing you. I did suggest to them that I was going to do that. I did indicate to the union that I was considering suing the College. They said, "You can't because of the collective agreement." And I said, "Well, I'm actually considering going after you guys first, so that I can then go after the school." And I did have lawyers that were gearing up to do that. But, you know, I've only got so much bandwidth and I'm pretty exhausted after a year and a half of this. So on that particular issue, I've walked away, but I think there was a few lawyers that really would have liked to pursue that.

Commissioner Raikkonen

Thank you.

Commissioner Drysdale

Good morning, Mr. Marazzo. Thank you for coming and telling your story. I have a few questions. The first is, I'm quite familiar with that area in front of Parliament on Wellington Street where the War Memorial is. And I'm assuming, like in most places in Canada when I look around, there are video cameras everywhere. Even in this hotel: when I'm in the elevator, there's a video camera watching me. Most of the videos that I have seen that were related to the convoy were videos shot by individuals with phones or whatever.

Do you have any idea what happened to or where the video from—I have no idea how many, but—what had to have been hundreds, if not thousands, of security cameras in the area recording?

[00:40:00]

Thomas Marazzo

Yeah, that was an issue that we had raised right at the beginning. When the lawyer or the legal team showed up from the JCCF, we started to inquire as to: Why are all of these CCTV cameras turned off? Why are they not—there's no public access? Because some of those cameras all across the country, which is really interesting: because all across the country, there are zones that have CCTV along the highways. And as the larger portions of the convoy were traveling across Canada, they were shut off. So when the convoy actually arrived into the city of Ottawa, all those CCTV cameras were no longer streaming for public consumption. All of those cameras were completely turned off, which was really bizarre to us, because we were kind of anticipating that in the future, we may need to see some of that footage. It was never activated, which is bizarre.

Commissioner Drysdale

You also mentioned an incident with regard to the horses and the trampling of one of the protesters. Are you aware of any type of independent investigation that's been carried out of the police actions and/or their messaging that was going on at that time surrounding that incident?

Thomas Marazzo

I'm not aware of any investigation into that incident.

Commissioner Drysdale

Are you aware of any other internal or public investigations of the actions of the police during the last two days of the protests?

Thomas Marazzo

No, I'm not.

Commissioner Drysdale

One last question. Concerning your statement about the 280 Canadian bank accounts who were frozen: I'm assuming that—and this is none of my business, you can tell me that if you wish—but I'm assuming that you are not using digital currencies and you're using ordinary money and bank accounts and ordinary identification cards yourself, like most Canadians?

Thomas Marazzo

Yes—and I’m absolutely against digital ID, as somebody who has experienced the current mechanisms to go in and attack people’s financial assets right now, even without digital ID. So digital ID is a step beyond what— I think every Canadian in this country should be outright rejecting the idea of these CBDCs, any form of digital ID, any form of currency like that in that manner. I think that Canadians should keep an eye on that every single day and get updates on it.

Because even under the current system, it took nothing for the government, without any criminal charges, to completely remove my ability to access my own financial assets. So I carry cash now. But I haven’t worked in 18 months, so I don’t have a lot of it.

Commissioner Drysdale

But the government didn’t act alone. I’m assuming that your bank account wasn’t with the Government of Canada, it was with a private institution. I’m assuming that your credit cards weren’t with the Government of Canada, and it was a private institution. How do you account for the incredible cooperation that was between the banks, the government, the credit card companies, and employers—whoever else was involved with that?

Thomas Marazzo

Well, that’s an interesting question, because it wasn’t just the banks that were ordered to seize the accounts. It was also the insurance industry, as well as, I think, more the equity market, like the big trading firms. Everybody was ordered to do it. It was the insurance company—the life insurance companies and stuff, and house insurance and all that—that said, “No, we’re not doing that.” So it’s interesting because there’s this kind of thought that the banks were compelled to do it legally, and if they didn’t, they’d be in breach. But the same order was given to the other forms of financial institutions, but they pushed back. Because if you would have frozen or taken away or removed somebody’s house insurance, then they’d be in default of their mortgage. And so they pushed back and said, “No, we’re not doing it.” And it’s funny, because the bank industry has more money than God. I think they can afford some lawyers to have tied this up for about a week or two until this was settled and not gone after people’s bank accounts. But they did it anyway.

It’s because there’s only five chartered banks. Well, no—I guess the credit unions, the credit card companies, they all did it. It was just the two other industries or sectors that didn’t do it. But the banks were right on board with it.

Commissioner Drysdale

That’s all the questions I have. Thank you very much.

Shawn Buckley

There being no further questions, we’ll let you go. Thank you on behalf of the National Citizens Inquiry for testifying, Mr. Marazzo.

[00:45:06]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 4: Laura Jeffery

Full Day 2 Timestamp: 02:29:20–03:12:55

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Ms. Jeffery, can we begin with you stating your full name for the record and then spelling your first and last name for the record?

Laura Jeffery

My name is Laura Jeffery. It's spelled L-A-U-R-A J-E-F-F-E-R-Y.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth today?

Laura Jeffery

Yes, absolutely.

Shawn Buckley

Now, Ms. Jeffery, my understanding is that you are quite a senior embalmer as far as embalmers in Canada go.

Laura Jeffery

I'm the best-kept secret in embalming.

Shawn Buckley

You have been working as a funeral director, and that includes embalming, for 27 years now.

Laura Jeffery

Yes.

Shawn Buckley

I did the math and that would mean you started roughly in 1996.

Laura Jeffery

I'm an old lady.

Shawn Buckley

I started practicing law in 1995.

Laura Jeffery

Well then, you're an older fellow too.

Shawn Buckley

So we share a long career. And for the past five years, my understanding is you would average roughly about 170?

Laura Jeffery

Yes.

Shawn Buckley

I guess I don't know what you call it.

Laura Jeffery

I would embalm and care for 170 people that required embalming. I would care for many more that maybe we weren't embalming, but I would care for them as well.

Shawn Buckley

Right, because if somebody is being cremated then they don't go through an embalming.

Laura Jeffery

No, that's not necessarily true. It doesn't matter if you're buried or cremated, it depends on what you're doing beforehand.

Shawn Buckley

Okay. Now, when COVID came along, my understanding is that you were working at a place which cared for approximately 600 deceased persons a year?

Laura Jeffery

Yes.

Shawn Buckley

And COVID hits, so we're in, I guess March 2020. And a year and a half goes by—

Laura Jeffery

Yes.

Shawn Buckley

And you're still with this organization that cares for roughly 600 deceased persons a year. How many deaths did you see attributed—not caused, but attributed—to COVID?

Laura Jeffery

Seven.

Shawn Buckley

And were there other comorbidities involved?

Laura Jeffery

Of course, yes. Routinely, the COVID cases that I would see would be people that had been suffering dementia for probably quite some time and living in a nursing home facility, and that's fairly typical in the winter. We would see that with any virus or any cold maybe that was going around because those people are very vulnerable.

Shawn Buckley

Now, what did you observe about the death rate when COVID swept through this land?

Laura Jeffery

Ah, nothing. There was nothing to observe. Nothing changed.

Shawn Buckley

So nothing changed?

Laura Jeffery

Oh, well, that's not true actually. Lockdowns created a situation where suicides and drug overdoses escalated dramatically.

Shawn Buckley

Now, what about the first lockdown?

Laura Jeffery

The first lockdown wasn't as obvious. There may have been the odd unusual death. But, I mean, that also could have just been normal timing—because the first lockdown was the pajama party, right? The second lockdown was the problem. In the second lockdown, the escalation of suicide deaths and drug overdoses was obvious. Young people, middle-aged people.

Shawn Buckley

And as an embalmer, you're aware of cause of death when you're treating somebody.

Laura Jeffery

Yes. I mean, I don't always look, but sometimes you're very aware. You can't miss it.

Shawn Buckley

Okay, So the suicides and drug overdoses—

Laura Jeffrey

Yes.

Shawn Buckley

They're obviously increasing in number in the second lockdown?

Laura Jeffery

Second lockdown, yeah.

Shawn Buckley

Now, my understanding is that you had a very unique experience with a nine-week period with a specific type of death. Can you share with us slowly what you witnessed and just how unusual that was?

Laura Jeffery

Okay, so in nine weeks—so one a week for nine weeks—there were middle-aged women that were well-settled in their lives mostly, who didn't want to stay on earth anymore. So they left. By their choice and their hand. They had children, they had spouses, they had homes, but the second lockdown was too much for them. So they left. And we cared for them. And it was awful, to be honest. Like, each week, one person would do that for no reason. They had children.

So that was hard.

Shawn Buckley

These are mothers with children?

Laura Jeffery

Yeah, average people, average people. Yeah. I mean, it could have been me, right? Except that I don't have kids. But in a general sense, yes: it was a middle-aged woman that had children ranging, I found, aged maybe 10 to 20.

[00:05:00]

And then you're looking at that middle-aged woman, right? And she has a home and a husband and children. So that happened.

Shawn Buckley

Had you ever, in your career, seen a suicide death from that type of person before?

Laura Jeffery

No, no, no, no, no. Women don't do that.

Shawn Buckley

So this—this just stuck out like a sore thumb?

Laura Jeffery

Mm-hmm. Everybody noticed.

Shawn Buckley

Now, my understanding is that you started seeing changes after the COVID-19 vaccines were introduced?

Laura Jeffery

Yes, yes.

Shawn Buckley

Can you tell us about that?

Laura Jeffery

It started in January 2021. At first, I was seeing an anomaly in what we would call "return." You have to understand a little bit about embalming. In embalming we have a vat and then there's a hose and the vat has a pump in it. And what we do is we use the human circulatory system that God gave us. So we go into that circulatory system; generally, we start at the carotid, right? That's a major artery that goes not only to your brain but also to the top of your heart. And it pumps the fluid through. And then the return would be people's blood that's pumped back out through the venous system. And we open that and let it release. The concept is to put preservation in and take out what would not preserve a body long term, so that we can present a person that is reasonable to their appearance that they should be, right?

When I was seeing the return, I started to notice anomalies in what the return was. So that went on for about three or four months. And the return was more viscous. And it's not like I hadn't seen that before, but you didn't see it consistently—in every single person, right? Now I'm seeing it every single person.

Shawn Buckley

You'll have to explain to us what "more viscous" is.

Laura Jeffery

Viscous—Thicker. Darker. Sticky. And that return—well, what I call return—it's return blood, right? So that return blood was stickier, thicker, darker. Then I started seeing the return blood would have little, little, tiny, tiny pieces of clot in it, and the clot would be like a currant jelly clot. But it's tiny pieces, like pinhead-sized, but it was almost like polka dot coming out, right? Polka dot pattern, sticky, viscous, thicker blood, darker. And then these little pieces of clot that kind of looked like a polka dot pattern sticking to the embalming table. And of course, that goes down the drain, right? But it was just different. There was something different. I would call it maybe "dirty blood" if you want to make a sort of a basic example, right?

The blood was dirtier, and at first— I'm really conscientious, right? I notice things and I'm known for that. At first, I was sort of like, "This is weird," but I'm an embalmer. I'm not a scientist, I'm not a doctor, right? I'm an embalmer. But I notice things and a lot of people do, and a lot of people don't. But in retrospect, there's an awful lot of people in my profession that are also saying the same thing. They won't tell you that in person; they certainly wouldn't go public like this, but that's what they're telling me.

Shawn Buckley

Did you see changes in persons that were dying after the vaccines were introduced?

Laura Jeffery

Yes. It was kind of horrifying—well, it is horrifying. There was an escalation of middle-aged people's deaths, like, just average Canadian, came home from work, had dinner with the family and died suddenly at home. So that went on for maybe a good month and a half, and usually an evening call—what we call a night call. You would send a removal team out: two people because they're going into someone's home. Usually, a night call or a night removal would be in the middle of the night. Like it might start at one o'clock in the morning. You might get one, you might not, right?

Then there was a lengthy period of time, like many weeks, where these middle-aged people were dying kind of like, right after dinner at their house with their families present. And they weren't being investigated. They were coming to the funeral home and I was looking at this, and I'm like, "This should be investigated because it's an unusual death. It's an unexpected death." But no, no, it wasn't investigated. It was almost like they dialed it in and brought the person into our care at the funeral home. And then didn't worry about them.

Shawn Buckley

So there are a couple of things there. You were telling us that typically a call is around 1 a.m. or after 1 a.m.

[00:10:00]

Laura Jeffery

Yeah—like middle of the night. If you're going to have a night call happen, for some reason it always seems to be that one o'clock in the morning kind of time frame.

Shawn Buckley

And prior to the vaccines, roughly how many would calls would you guys have on a night?

Laura Jeffery

You could get one in an evening, you could get two, you could get none. And then for a while there, it was every night; one, two, even maybe three, always completed before 11 o'clock at night. My removal staff were loving that because they weren't getting called out of bed, right? Yeah, they thought that was marvelous. And I was saying, "Why can't you see the pattern?"

Everything's a pattern. Like, we're not really all that different. None of us are. We think we are, but we're not. When we die, or when we breathe, or when we're born, there's patterns. And as soon as you see an anomaly in a pattern, you should be going "Why is there an anomaly?" But nobody was asking, "Why is there an anomaly?" And then—I'm a funeral director and it's not my job to ask, "Why is there an anomaly?" But I was asking, "Why is there an anomaly?" in my mind.

I started asking my co-workers, "What did you see? Where were you? What was it like?" Family there, after dinner, average people, average home. It was an anomaly, a big one—obvious one. But it was like everybody had blinders on. I don't know why nobody noticed. But I noticed. I was rather concerned.

Shawn Buckley

Now, my understanding is that early on you had an experience with a 47-year-old man that seemed unusual. Can you tell us about that?

Laura Jeffery

Yeah, so— Okay. You have someone that's so healthy, you can't miss it. Healthy. If that gentleman walked in the room right now, we would all turn our heads and say, "My goodness, what a good-looking man." Healthy, strong, fit, tall—huge, healthy person. Gone. Right away, just— And his family told us that his death was investigated. And his family told us point blank he died from clots. That's what they were told.

Shawn Buckley

And had you ever seen a person that age and that fitness that had died of blood clots?

Laura Jeffery

Had I ever seen that before?

Shawn Buckley

Yes.

Laura Jeffery

Heavens no. No, no—too healthy. No, no, not healthy people.

Shawn Buckley

Okay, so that's why that sticks out in your mind as it was so unusual.

Laura Jeffery

It sticks out in a lot of people's minds, I'm sure.

Shawn Buckley

Now did you start seeing any—basically, scarring or anything like that on shoulders?

Laura Jeffery

Yeah. For a long time, people were coming in with a little Band-Aid, right? And I kind of go, "Okay Laura, it's just a Band-Aid, ignore it even though—" It was just unusual deaths with a Band-Aid. That's how I'm supposed to look at it because I'm not a doctor, I'm an embalmer. But the reality is I'm looking at this and I'm going, "Yeah, there's a little tiny Band-Aid on everybody's shoulder." So that tells me. I mean Band-Aids—they last, what, two or three days if you're lucky, right? So that tells me there is a problem.

Shawn Buckley

And what were the ages of these people coming in?

Laura Jeffery

Oh, full range.

Shawn Buckley

Full range?

Laura Jeffery

Yeah. Actually, at that point— To be more clear, at that point people were— I would say it was retirement age at that point. Because I was seeing people that were like maybe 60-something, older, with the Band-Aid.

Shawn Buckley

Now, earlier you were telling us changes that you saw in the blood.

Laura Jeffery

Yes.

Shawn Buckley

You were seeing little clots and you've seen color changes. Was there also something else happening that you were starting to observe?

Laura Jeffery

Yeah. And that's what everybody wants to hear about, right? So first, like you said, the viscosity changed—which means the color is going to be deeper. There's a stickiness, it's been termed dirty blood. There's small micro clots in the return and the odd time there was like, a rainbow slick, right? Remember the '80s, they had those rainbow slick dresses or oil slick dresses, I think they called them. You would see that on the odd occasion, which is really weird. And nobody can put their finger on it, that's the weird thing.

In the spring of 2021—we're talking April, May—so four or five months after the rollouts of the gene therapy, right?

[00:15:00]

The first time I saw it I thought it was a parasite. We have something called drainage forceps. I use a pair, generally speaking, that are about this long and that have a handle port. You can squeeze them like tweezers, right? So curved tweezers, think of them that way. I use that to pull anything out of the way on the venous side of the body, where you're draining the return blood. And all of a sudden, I was having trouble. I couldn't understand. Then I pulled it out and I went and I kind of— You can turn the drainage forcep and you can see what's in it. I'm sort of like this and I see something that I thought was a tapeworm. Which was weird, because tapeworms shouldn't be in a circulatory system. And then I'm looking at this and I'm thinking, "Is this a parasite?" Because a tapeworm's a parasite; that looked like a parasite. And it was at that point, maybe, like three, four inches long. That's a small one. But at that point, that was a huge one for me, because I'd never seen this before. This was a whole new anomaly.

Shawn Buckley

I just I just want to make sure. At that point you had been embalming for a quarter of a century, 25 years.

Laura Jeffery

Yeah, with a heavy focus on it.

Shawn Buckley

You had never seen anything like that in your career?

Laura Jeffery

No—absolutely not. Blood clots are sort of in a few categories. There's currant jello blood clots, there's chicken fat blood clots, there's just sludging, which is thicker blood in general. And then there was this anomaly, which I thought was a parasite but it's not.

Shawn Buckley

In what percentage? So this starts in April, May of 2021?

Laura Jeffery

Yes.

Shawn Buckley

Once you saw your first one, how common was it to see this?

Laura Jeffery

It just kept happening. It was everybody. So there was that.

Shawn Buckley

And how much of this would you find?

Laura Jeffery

Over time it got bigger. When I first started seeing it, it would be small, right? Then, when I started seeing it near the end of my time frame there, if you were to take a small side plate, like a bread plate, and put spaghetti on it and kind of heap it, that could happen. Yeah. And they were longer and longer and then the integrated jelly clots at the end of course adds to the confusion. Like, if you were thinking it was a parasite, the integrated jelly clots were always at the end.

Shawn Buckley

Can you explain what you're talking about when you say "integrated jelly clot," just so that the commissioners—

Laura Jeffery

Okay. Have you ever seen those erasers that you push out and they're like a pen, but they're a circle? They're round, cylindrical. You think of one of those but then it maybe has a couple of little tentacles of eraser coming out the end. Then there's a blood clot that is integrated into the end of those tentacles. It felt like it was a parasite that was feeding off a blood clot that it created in the body. When you think of a parasite, you think— Because it feeds off of something, right? Then you see the jelly clots at the end of this parasite. You see those and you think, "Are they feeding off us as humans? Out of our circulatory system?" Because they always had the currant jelly integrated at the ends. It's something to see, let's put it to you that way. It's horrific.

Shawn Buckley

I'm going to show some photos now. Just so that nobody believes that you took these photos, these are photos you basically had an embalmer from elsewhere share with you. So that for the purposes of this presentation, you would be able to show us what you're talking about.

Laura Jeffery

Yes.

Shawn Buckley

David, could you pull up this computer screen please?

Laura Jeffery

Yeah, that's it [Exhibit TO-27].

Shawn Buckley

Am I correct that this is basically what you would be pulling out of bodies? I appreciate this isn't an embalming that you did, but this is typical of what you would see?

Laura Jeffery

Yes, that would be. If you were thinking that I started seeing this anomaly in the spring of 2021, then I would have been seeing that closer to the end of the year. Because that's a fairly large amount. It's unfortunate it's not stretched out, but you can see where the currant jelly clots are: the darker pieces that are integrated into the white fibre mass. That's what I call them. I call them "white fibre masses," because they are fibrous. They are stretchy kind of. And you can't break them easily, you need to cut them, the white fibre branches.

[00:20:00]

So it's like an exact duplicate or a cast of the inside of an arterial system.

Shawn Buckley

Just so I'm clear—

Laura Jeffery

Yes.

Shawn Buckley

And it's clear for everyone else, where are these coming out of?

Laura Jeffery

Everywhere.

Shawn Buckley

No, no, but what part of the body?

Laura Jeffery

Everywhere, everywhere, everywhere. I had to change how I embalm because of these. I have a routine now. Well, I did, I don't have it anymore. I don't have to do it anymore. But I had a routine. I would go into the carotid artery, where we always start embalming on an average case. I would go into the carotid artery and I wouldn't even try to put the cannula in, which is what comes from the pump, the vat. There's a hose and there's a cannula. It's a little crooked piece. It goes into the carotid artery. I wouldn't even try to put it in. Why would I bother? It's plugged anyway.

I would open the carotid artery like normal. I would take a small pair of forceps and go in and pull. And I would find what I call "the fish." I named everything because that's, I guess, how I function. But yeah—I would pull what I call the fish. And the fish would be an exact cast of the inside of that person's artery. It usually was approximately this long and it sits here. So if we go in here, half the fish would be towards the head and half the fish would be towards the heart. Then once you pulled the fish out, you could put the cannula in, you would start the embalming.

And what I quit doing— Quite often, we like to back-pressure the human circulatory system to allow more fluid to go into the body and go everywhere, like right to the toes, right to the fingers, right? I would instead not back-pressure. I would open the venous system fairly quickly after starting injection and start pulling return—because I would see what that picture was. That's what I would start to see fairly quickly into the embalming. I would be looking for it because I knew it was coming. When you know something's coming, you have to change how you care for somebody and you have to change your approach and your perspective. Embalming that normally would take a couple of hours were now taking like three or four hours because there was a lot more work involved.

Shawn Buckley

And I just wanted to clarify. When I say, "where are these coming from?" it's from the circulatory system.

Laura Jeffery

Yes, yes.

Shawn Buckley

Okay. So we're looking at this one. I'm just going to pull up another one [Exhibit TO-27a].

Laura Jeffery

Yeah, that's small compared to some of them. But you can see there that those have been washed off. You're seeing what I call the white fibre mass because I didn't really have a name for it. And if you were to cut those, there's no hole in the middle, they're solid. A lot of people were thinking that they were the lining of the circulatory system—somehow it was lining. No, no, no, no, no, it's plugging. I mean, a technical term would be the clot, right? But I hesitate to use that because people assume it's a blood clot. This is not a blood clot. This is something else. This is something new.

Shawn Buckley

And I'm just going to go to the next photo [TO-27c].

Laura Jeffery

Yep. Right.

Okay, so those are some skinnier ones. Because you can see that they were branchy and they were down into smaller parts of the circulatory system, so they're closer to the capillary beds. And you can see that the fellow that took these pictures and was doing the work, he has been keeping samples. I didn't do that, but he has. You can see that the color has changed a little bit in those ones. Because, if you look, the fluid that they're in is a type of embalming fluid, but it's to maintain— You can keep them long-term, samples. I think that's maybe what he was doing there.

But if you look closely, you'll see that the ends of those fibre masses are quite small, very tiny, tiny. And that's because their branch is going into very tiny vessels in the human body, so they're really small. They're everywhere.

Shawn Buckley

Now, before COVID, I expect that there would be a certain number of autopsies done.

Laura Jeffery

Yes.

Shawn Buckley

And after COVID, I'm asking if there was a change in the number of autopsies and can you please tell us about that?

[00:25:00]

Laura Jeffery

The concept was, "Autopsies are too dangerous because there's a virus that's going to kill everybody, so we have to not worry about these things. We'll do them if we absolutely have to." But they just didn't do them. I guess it would set the concept in people's minds not to do them, right? So, "Oh, well, it's pretty obvious why this person passed away. We'll just write that on the paper."

Shawn Buckley

Just so that I understand because you're describing types of deaths that you hadn't seen before—such as middle-aged people just dying after supper in front of their family, so at a different hour.

Laura Jeffery

Right.

Shawn Buckley

So these are unusual deaths. And is it your evidence that there were not autopsies being done to explain this change in pattern?

Laura Jeffery

Yes, I felt that they were kind of dialed in. We'll just sign this piece of paper and dial it in. But again, it goes back to— It has nothing to do with each individual, right? It does—I mean each individual is very important—but there's a broader spectrum.

It's like, if you see an anomaly in a pattern, whose job is it to call that out? Because it's not my job. It's someone that's got a much higher pay grade and much more power than I would. I'm just an embalmer, why am I here? There should be other people here.

Shawn Buckley

But you do know if a body has been autopsied or not?

Laura Jeffery

Oh, very clearly, yes.

Shawn Buckley

So you're able to tell us about it. So actually, were there fewer autopsies done?

Laura Jeffery

Way less—yes.

But you have to put that in perspective too. If I'm talking about a change in the pattern—and that change means I'm seeing deaths that should have been investigated and they're not being investigated—then really, there would have been an escalation in autopsies, not a decrease. So I'm seeing a decrease from the norm, but then we're not in the normal zone because there are more deaths that should have been investigated. So now, there should have been more autopsies than previous to COVID. That's the difference.

Shawn Buckley

Right. So basically, we were doing the exact opposite of what we should have been doing?

Laura Jeffery

Yes.

Shawn Buckley

Now, I'm wondering if you can also tell us: you saw a change concerning deaths of babies?

Laura Jeffery

Yes, I did.

Shawn Buckley

Can you tell us about that?

Laura Jeffery

Well, I was used to caring for maybe three to five babies in various stages of gestation, so the whole pregnancy. I was used to seeing three to five—maybe a month, maybe two—but quite often three to five. And then that just stopped. There weren't any babies anymore.

Shawn Buckley

When did that stop?

Laura Jeffery

I would say February of 2021. It was wintertime.

Shawn Buckley

Now, you did get one that caught your attention coming in after the vaccinations started. Can you tell us about that?

Laura Jeffery

I don't think I can tell you about that, I'm sorry. That's over the line.

Shawn Buckley

That's fair enough. Okay. But would it be fair to say that you had not seen anything like that before?

Laura Jeffery

No, I had not.

Shawn Buckley

Okay. You're telling us basically: you're having the normal course of events pre-vaccine, three to five babies a month?

Laura Jeffery

Yes. And then none.

Shawn Buckley

And then none. For how long were there none?

Laura Jeffery

Up until recently, so like two years almost.

Shawn Buckley

For two years, all of a sudden, you're not receiving a single baby?

Laura Jeffery

Keeping in mind, I worked in a very large community, right? And then I have a friend who works in a very large community and he hasn't seen any babies until recently. But then you have to remember—I have a friend who works in a very small community and he saw an escalation, a dramatic escalation. It's like the small communities got a different memo than the big ones, how to care for babies during COVID.

Shawn Buckley

Right. Can you expand on that? I don't understand. There's been a change; where do you think the change—

Laura Jeffery

A social worker at the hospital would help a family that lost a baby. It wouldn't matter how old the baby—like how far in gestation the baby was. If someone went to the hospital and a woman was having a baby and the baby didn't live, then in larger hospitals they have a social worker to assist that family. And the social worker would spend time with the family, time with the baby, give them pictures, give them footprints, and then ask them, "Would you like us as the hospital to care for the baby or do you have a funeral home that you would like to care for the baby?" Then the social worker would liaise between the family and the funeral home so that we would care for the baby. Then that didn't happen anymore for almost two years. But then in a smaller town where they don't have a social worker that liaisons between the family and the funeral home— Right?

[00:30:00]

There was an escalation of small babies going through that funeral home for a period of time.

Shawn Buckley

I have a friend that works in healthcare who has reported to me in Alberta that when an expecting mother's child has died in utero, rather than the hospital taking the child out, that they're being now sent to abortion clinics. Have you heard of anything similar happening in Ontario?

Laura Jeffery

I'm an embalmer, not an abortionist.

Shawn Buckley

Okay. Now, my understanding is that you also saw a change in your clientele that would speak perhaps to fatigue. And I'm wondering if you can share that.

Laura Jeffery

Okay. I think I've told you that I'm well-known for being very conscientious and very visual. Like, I do a visual interpretation. And you can learn a lot from looking at a person's body. They can't talk anymore but their body does. Fingernails, hands, scars, haircut, sometimes clothing would give an indication of who a person was, right? And what I started to notice was, over time, people that I was caring for and embalming— Because I can only speak to

the ones that I embalmed, but over time, you would see that fingernails that normally had been manicured were splayed, split, broken, and dirty. Toenails, same thing. The pedicure would still be there. Like the nail polish would still be there, but grown out probably about three months and not trimmed. You could see that the clothing was loose-fitting, unkempt, maybe had some food spilled on it, and not kept tidy. Hair was grown out. You could see maybe they had highlights or something and they had not maintained those. And that was during a time frame that we were open for business, so to speak, in Ontario. This was sort of a consistent thing. You would see that.

I think people just got tired. When you're not feeling well, you get tired. I was used to seeing unkempt hair or personal care at a lower standard with people who were maybe suffering with cancer, a long-term illness, because they couldn't do it for themselves, right? And now I was seeing it for people that were at home, not ill—you know, no illness. Not an expected death but you were just seeing that people were just unkempt. They just weren't quite maybe what they should have been.

Shawn Buckley

And then the last area I wanted to ask you about—

Laura Jeffery

Yes.

Shawn Buckley

Do you have any thoughts on how we could have managed this situation better, but in relation to your area? I think an obvious one would be there should be more autopsies when there's a pattern change. But are there any other thoughts that you might have?

Laura Jeffery

Well, yeah. On a professional and personal level—because I pay taxes too, like everybody else, right? Our system relies on medical care and medical personnel. If those personnel are restricted in what they can look at, what they can say, what they can surmise, what they can investigate, then we're not being cared for. Our community isn't being cared for. Our province isn't being cared for. Because you're taking the opportunity for people who are forward-thinking to do their job. So when you take the opportunity for forward-thinking people to do their job away and we're just like monochromatic people, I guess—there's no intellectual thought process or investigation. If you take that away, then people die.

Or did it happen because the people that should have been doing that job were afraid? Did it happen because they felt that they were duped as well? I don't know what was going on with coroners but I would say that they should have noted the anomaly, right? And maybe they did inside themselves but I haven't seen any reports where they're saying, "Oh, dear, we have a problem." And then the pathologists: Where were they? Autopsies were less but they weren't that much less. And if that's the case, then if the funeral director can see, then why weren't they seeing it? Because, I mean, I was seeing these fibre masses left—for lack of a better word—left dangling out of arteries that the pathology department had cut. That's their job. But I would have to take that out in order to embalm that person.

[00:35:00]

And they were long. They were— It's horrific. It was absolutely horrific. I'm at the point where I don't think I can do what I did for a year anymore because it has affected me. I can do my work—but not at that level ever again. Never. Because I don't need the aggravation that it causes me. It's not nice.

Shawn Buckley

Thank you. Now, those are my questions. We'll open it up if the commissioners have any questions for you.

Laura Jeffery

Yes.

Commissioner Massie

Thank you very much for your testimony. Of course, I mean, the structure you were seeing there: it's very difficult to know exactly what it is and how it came about. I've seen video on that and I'm wondering myself what it could be. You're not aware of any people that would have tried to investigate?

Laura Jeffery

Oh, people have investigated it already; yes, of course.

Commissioner Massie

And what is it that they typically found? Because when you mention parasite, for example: to me, it means that this is not human material. It's foreign.

Laura Jeffery

I'm not a scientist. I can't investigate that but I can send you in the right direction to look. In my profession, there are a few people that have been quite dedicated to finding out: What is this? And of course, that's the first thing that went through my mind, too: What is this? Because this is new. If you're extremely curious, which you should be, then you maybe want to review what Dr. Ryan Cole, who's a very dedicated pathologist in the U.S., has to say about that.

But it's not for me to tell you what that is, because I don't know. I'm an embalmer, right? I won't tell you what he thinks it is. Look it up.

Commissioner Massie

My other question is about the timing of having these people—in terms of the COVID unfolding and the vaccine rollout and so on. Have you seen a sort of coincidence of having more of these events when the vaccination rollout was more intense? Or is it totally unrelated?

Laura Jeffery

They go hand in hand. It goes hand in hand.

Commissioner Massie

And do you see, now the vaccine has been reduced, that a lot of people are no longer taking it—

Laura Jeffery

Oh, yeah. Yeah.

Commissioner Massie

Have you seen a difference in your daily work?

Laura Jeffery

I can't actually speak to that because I don't embalm regularly anymore. For the past, I think we're at nine months now, I haven't been in that environment. So I can't tell you, I don't know.

Commissioner Massie

Okay, thank you.

Commissioner DiGregorio

Thank you for coming today and sharing your testimony. Bernard asked a few of my questions. But just to make sure I was listening correctly: These white fibrous masses, you had never seen them before?

Laura Jeffery

No. They don't exist before 2021, spring of 2021.

What's really weird is, the embalmers that I have talked to, none of us can nail down a date. Because we didn't log it. We just went, "Huh, that's weird" and then carried on. And then we started to go, "Huh, that's weird" all the time, so none of us sort of logged it. I've had many talk to me and they've said, "Hey, Laura, like, when did you start seeing that?" And I said, "The best I can tell you is spring of 2021." And they say, "Yeah, me too."

Within the profession, specifically embalmers, there's kind of like this curiosity of the timing of events. But when it comes to the timing of events, I've now spoken with Canadian directors across the country. I anticipate to be speaking to more—specifically, those that embalm. But more and more. And they won't say it in public. I'm the only one that'll stand up and say this in public, which is terrifying, to be honest. They're telling me that they saw exactly what I've discussed today. Like, "Okay, we started seeing middle-aged people that just died suddenly and that particular anomaly. We saw babies." We had different stories about the babies depending on the size of the community they lived in. But they saw that as well. "Yes, we saw these fibre mass."

[00:40:00]

These fibre masses show up in the spring of 2021, but not every single embalmer will tell you that. And then there are funeral directors that don't embalm too, right? They're not in the prep room every day. So that put me in an unusual position within the industry.

Then there are also funeral directors that have very small funeral homes, and they do all parts of funeral service for a funeral. Those people would be more likely to express it but they live in a smaller community. They are more likely to see an escalation—because not only do they live in that community but they know those people and they love them, right? So they take it more to heart as well. They're more conscious. It's kind of an interesting industry that way.

Commissioner DiGregorio

Thank you. When you do an embalming do you prepare a report, or anything like that?

Laura Jeffery

Yeah. An embalming report I don't think is mandatory per se, but a lot of funeral directors do an embalming report. It's well-suggested—Afraid an authority might come at me now. But anyway, yes, I prepared reports and I don't have access to those anymore.

Commissioner DiGregorio

What is the purpose of the report? Is it for—

Laura Jeffery

It's a long-term report. If there was an issue where someone was disappointed in the effect that we created on their loved one, then the report could be looked at and there would be— Just an example. A woman had an unusual arm positioning. Well, that was her arm positioning, not what we did, right? So I marked on the report and then when there was a, "Hey, you know we weren't really happy with how mom's arm was," we opened the report. There it is, there was an issue because of something that happened to her prior to our caring for her. So that's just an example. It's very rare for me to ever go back and look at a report—like very rare, never pretty much. They just get filed.

Commissioner DiGregorio

Just to change gears a little bit, early in your testimony you talked about an unusual nine-week period in which you saw a lot of middle-aged women who had ended their own lives.

Laura Jeffery

Yes, it was awful.

Commissioner DiGregorio

I wasn't sure what nine-week period that was.

Laura Jeffery

Second lockdown.

Commissioner DiGregorio

Second lockdown. Okay, thank you.

Shawn Buckley

Thank you. I believe those are the questions of the commissioners. Ms. Jeffery, the National Citizens Inquiry thanks you so much for coming and attending and sharing this very important information with us.

Laura Jeffery

Okay. Can I just make a quick statement? Short, short.

Shawn Buckley

Sure.

Laura Jeffery

If you're a funeral director or an embalmer and you've been concerned about this for the last two years or so, if you would like to reach out, I've set up a Gmail account and you're welcome to reach out there.

I don't know who would respond but it's concernedfds@gmail.com. It's C-O-N-C-E-R-N-E-D-F-D-S at Gmail dot com. And you know, maybe we can talk about this. Thank you.

Shawn Buckley

Thank you, Ms. Jeffery.

[00:43:35]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 5: Sean Mitchell

Full Day 2 Timestamp: 03:29:29–04:27:19

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

I'd like to introduce our next witness, Mr. Sean Mitchell. Sean, can I get you to state your full name for the record, spelling your first and last name?

Sean Mitchell

My name is Sean Mitchell. S-E-A-N M-I-T-C-H-E-L-L.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Sean Mitchell

I do.

Shawn Buckley

Now, my understanding is that from 2009 to 2022, you were a paramedic.

Sean Mitchell

That's correct.

Shawn Buckley

And for the years 2016 to 2022, you were an advanced care paramedic.

Sean Mitchell

I believe that was 2017 to 2022.

Shawn Buckley

Thank you. Now, when the COVID pandemic hit us back in February of 2020, what was your mindset at that time?

Sean Mitchell

In late 2019, early 2020, my mindset— We were told in late 2019 about an atypical pneumonia. We were getting emails from our management about that, didn't really think much of it. Into 2020, January, world news was starting to report about a possible outbreak in China. So there was some fears and concerns as it progressed through into February and March. So yeah, once March hit and there was a declared pandemic, there was definitely some concern. There was a lot of confusion. But yeah, early on in 2020, it was concern and confusion.

Shawn Buckley

Did your opinion change, and if so, when?

Sean Mitchell

My opinion did start to change a little bit as time progressed. Once there was more and more information out there about what we were dealing with—and what we were actually dealing with—I kind of started to relax and not be so concerned about the severity of the virus that we were dealing with. We'd seen call volumes drop off drastically in early 2020.

Shawn Buckley

So just hang on a second, because my understanding is that Canada was suffering from a severe COVID-19 pandemic in early 2020. You're telling us your first responder call rate was dropping?

Sean Mitchell

Yeah, that was my experience and that was confirmed by our management.

Shawn Buckley

Can you give us some numbers and kind of flesh that out for us a little more?

Sean Mitchell

So as far as call volume, numbers-wise— On a personal level, I think it's important to preface, I worked in the region of Durham. I was at the time a part-time paramedic. I was around bases from Newcastle to West to Pickering and all the way up to Beaverton. So a large demographic and population densities were varying.

On a typical shift prior to the pandemic, I would expect to have four, five, six calls to service—depending on which station—all the way up to eight or ten calls for service where we'd actually see a patient. During the early months of the pandemic—March, April, May, June—it was more like two, three calls for service some shifts.

Shawn Buckley

Can I just stop you there? I mean, that's literally down two-thirds.

Sean Mitchell

My experience was, early on, we just weren't getting as many calls for service.

Shawn Buckley

So in the spring of 2020, when Canadians are told that we're in an absolute crisis and that our hospitals are full—"Don't go to the hospital"—your call volume has dropped by two-thirds.

Sean Mitchell

On a personal level during— Yeah, certain days, we would see a fraction of the calls that we would be used to seeing during a typical cold and flu season.

Shawn Buckley

And how long did that last?

Sean Mitchell

I would say it was very noticeable early on in the pandemic because that was your typical higher volume calls—typical cold and flu season. My experience was kind of—October to March, end of March, early April. So early on it was very distinct, but the lower call volumes lasted up until the following cold and flu season.

[00:05:00]

Shawn Buckley

Okay. So the flu season, which some people call low vitamin D season, basically starts in the fall—October, November—and runs to the spring. Was it any different in 2020 than in previous years?

Sean Mitchell

In 2020, yeah, it was— Like I had said earlier, call volume was less than 2019. Seemed less than 2018. We were spending a lot more time at the ambulance stations and not as much time stuck in the hospitals and responding to calls.

Shawn Buckley

Okay, so the media was telling us that our hospitals were full. What was your experience?

Sean Mitchell

Early on in the pandemic, the same time period—March, April, May, June, right till 2021—I experienced very little offload delay compared to the year previous and compared to the year 2021. Our wait times to get our patients offloaded onto a bed were a lot less. The hospitals didn't appear as busy in the ambulance areas where we'd wait to be triaged and

wait to offload our patients. Nor did they seem to be as busy in the waiting area where the public would access the hospitals.

Shawn Buckley

If I can ask you a direct question: Have you ever seen the hospitals as empty as they were in the spring of 2020?

Sean Mitchell

In the Emergency Department—that's specifically what we see—no, not in my career.

Shawn Buckley

Okay, so in your career—and you started in 2009—you had never seen the emergency rooms as empty as you saw them in the spring of 2020.

Sean Mitchell

I had never seen so few patients seeking medical care as I did in 2020. That's correct.

Shawn Buckley

Now, you indicated that you work for the Region of Durham. And you have provided to the NCI a document called "Comprehensive Master Plan for Paramedic Services, Region of Durham," titled August 13th, 2001. And that document in its entirety will be made available to the commissioners.

David, I'm just going to put a document on my screen I'm hoping we can pull up. I'm pulling up from that document. As I say, the full document would be Exhibit TO-1. But this is page 25 that I'm pulling up from here. And when we look at this what my understanding is: This basically shows ambulance use. So this is basically numbers of calls. Is that correct?

Sean Mitchell

It just says, "Demand by Year." So it's a percentage increase of calls.

Shawn Buckley

Right. Now, if we look at year 2020 and we go down to the bottom, where it says "Annual % of Change," so 2020: that's the year where we're in the COVID pandemic. We don't have any vaccine to protect us. We have the least natural immunity because as people get infected, we get more natural immunity. The average daily demand went down 0.7 per cent.

Sean Mitchell

That's correct.

Shawn Buckley

And that's in line with what you experienced. You saw a drop in demand.

Sean Mitchell

I did see a drop in demand.

Shawn Buckley

And now, if we move over to the next line, it's average annual change and the average from 2016 to 2019. So the average annual change, the average is an increase of 4.7 per cent.

Sean Mitchell

Yes.

Shawn Buckley

There's not an increase, according to this, between 2019 and 2020. There's actually a decrease. But it might be more significant than minus 0.07 per cent because we would anticipate, with population growth and the like, for there to be an increase of 4.7 per cent.

Sean Mitchell

As shown in the years prior.

Shawn Buckley

Now, I want to pull up another document. Can you tell us what this document is?

[00:10:00]

Sean Mitchell

This is just a standard communication from the chief of our paramedic service.

Shawn Buckley

This is basically your boss and the person that communicates what's happening to the paramedics.

Sean Mitchell

Yeah.

Shawn Buckley

And this is a letter sent out to all of the paramedics, so you get a copy of it.

Sean Mitchell

That's right, it's an email.

Shawn Buckley

It's dated March 20th, 2020, and you would have received it on that date.

Sean Mitchell

That's right.

Shawn Buckley

And it starts: "Thank you all for working through another challenging week. Luckily, call volumes continue to remain down, but I know that won't last forever." So basically, your boss is saying something that confirms what you're telling us, is that in the spring, in this case March, call volumes are down.

Sean Mitchell

Yes.

Shawn Buckley

And commissioners, this forms part of the official record as Exhibit TO-1jj [listed on the NCI website as Exhibit TO-1a].

Now my understanding is that, in 2020, your department was actually supposed to receive an additional ambulance.

Sean Mitchell

We were supposed to receive additional staffing in, I think, the second quarter of 2020, yeah.

Shawn Buckley

And did you receive that?

Sean Mitchell

No, we received another email similar to the last one, saying that they were going to defer adding the additional staffing because of low call volumes.

Shawn Buckley

So just so that we understand, your department was slotted to get an additional ambulance because of anticipated demand and that is put off in the spring of 2020 because demand was so low?

Sean Mitchell

That was what the email said, yeah. And that's my understanding. It was deferred until a later time.

Shawn Buckley

Now, I didn't live in the Durham region, but I expect the media would have reported that ambulance use is down and so it's being deferred; they're not getting their new ambulance. Is that what you were hearing in the media in the spring of 2020?

Sean Mitchell

That is not what was stated in the media at all. I had actually asked my management staff to be transparent with the public and report, to try to ease anxiety within the public. And that conversation just didn't go anywhere. So no, the media wasn't reporting on any of this.

Shawn Buckley

How was the media reporting at that time?

Sean Mitchell

At that time—I'm going to just class that "early pandemic"—it was fear.

Like I said, we were able to spend more time in our ambulance stations than we would normally. Most ambulance stations seemed to have CP24 on loop, and it was just total fear mongering. Like, it was telling something that I wasn't seeing in reality and my co-workers weren't really seeing. I think there was a lot of unknowns at that point. But what the media was saying and what reality on the road as a paramedic and a healthcare provider—it just wasn't lining up. It wasn't the same.

Shawn Buckley

Right. You told us earlier that basically, the call volume in spring of 2020 was down by two-thirds. Would I be correct in saying that never had you been able to spend so much time basically just at the unit, not out in an ambulance?

Sean Mitchell

Like I said, we spent a lot of time at the stations, not moving around. A lot of reflect on that is, when it is busy, they juggle ambulances around. So say, if all the Oshawa crews are out, they'll move resources from one station to the other. So in past, a lot of time was spent in trucks just moving from station to station, maybe not seeing a patient.

But yeah, because there just systemically seemed like not as many patients calling 911 and not as many calls for service, we weren't spending that time in the truck either. So yeah, we were able to be at our stations.

Shawn Buckley

Right. Now I want you to kind of turn our minds then to staff issues. The call volume is down, but my understanding is actually some of the policies created some staff issues. And can you speak to us about that?

Sean Mitchell

Yeah. Early on in the pandemic, there was a lot of confusion, I guess. Or the Ministry of Health, which kind of dictates our ambulance call,

[00:15:00]

our CAC—our communication centre that dispatches us out—the Ministry of Health is in charge of that. And they had a screening process where they would ask the person calling

911 a series of questions. And how those patients answered those questions would dictate whether or not the patient was high-risk COVID, screened positive or negative.

Shawn Buckley

And can I just stop you? If you were in a high-risk exposure situation, what were paramedics required to do after that?

Sean Mitchell

A high-risk exposure would be somebody that's probable COVID-19 and had, like, a breach of their personal protective equipment. If we were notified of a high-risk exposure, usually it would be days after, we would have to isolate for—I believe at that time, it was 14 days.

Shawn Buckley

Would a high-risk exposure also include if you weren't told by dispatch that this was high-risk and so you didn't put your PPE on and then later found out it was high-risk?

Sean Mitchell

Yeah, that was kind of early on, where dispatch was including travel. You could answer "yes" to a lot of questions regarding, like, fever, shortness of breath, cough. But if you answered that you hadn't travelled in the last 14 days, you would automatically have been screened negative, when there was information out there that community spread was already happening.

So there were times where myself and co-workers were dispatched to a call that the person was a probable COVID-19 and did test positive after, where dispatch said the patient didn't screen positive. So paramedics would walk into a scene, they would have contact with that patient, then find out that, yeah, maybe we should put some protective equipment on because this person has a cough, shortness of breath, febrile. We would just get COVID positive or COVID negative.

Shawn Buckley

I just want to make sure that everyone understands what you're saying. So somebody calls in and they're being screened and they're asked, "Do you have a fever?" "Yes." "Are you coughing?" "Yes." "Did you travel in the last 14 days?" "No." So they're classed as basically negative.

Sean Mitchell

Early on, yes, that's right.

Shawn Buckley

Then you guys would show up without putting PPE on, and the person has a fever and is coughing.

Sean Mitchell

Sometimes, yes. I did bring this to my management's attention. And in the communication that I got back from my management, they acknowledged that, yes, the Ministry of Health screening process has been causing problems. They haven't really evolved with the knowledge of the virus.

Shawn Buckley

Okay. Am I correct that this policy, as long as it lasted, created a bit of a shortage because then the paramedics had to go in quarantine?

Sean Mitchell

Yeah, if a paramedic did have a high-risk exposure—meaning they didn't have PPE on and the person was likely or confirmed COVID-19—they would have been told to isolate and monitor their symptoms if they had any. Or let them know if they had symptoms. And then they were, I think, directed after that, if they did have symptoms, to undergo a PCR test.

So yeah, there's only so many paramedics in our service. The more that are told to isolate and not come to work, it developed staffing challenges.

Shawn Buckley

Okay. And that was independent of whether or not the paramedic was actually sick.

Sean Mitchell

Yeah, to my knowledge, that was just like a high-risk exposure.

Shawn Buckley

Now, in the year 2020, which is the year we're speaking about— And just to set the stage. So we're in the pandemic. We'd have the least natural immunity. There is no vaccine at all. What was your observation on our paramedics actually getting sick and dying because of COVID or any other reason in 2020?

Sean Mitchell

Paramedics were getting sick. I do know that there were paramedics that were confirmed, did have COVID. I do not know of any paramedic in my service that died of COVID-19. So paramedics were getting sick, but not in any greater extent than I have seen in the past.

[00:20:00]

Perhaps even to a lesser extent.

Shawn Buckley

Okay, so compared to other years, there was no meaningful change that you saw.

Sean Mitchell

Not that I saw, no.

Shawn Buckley

Now, you sent an email, and I can't pull that document up for the public. But you sent an email to your supervisor, Troy—do you pronounce it, Cheeseborough?

Sean Mitchell

That's correct, Cheeseborough.

Shawn Buckley

On March 24th, 2023. And the commissioners have a copy of this and it's going to be part of the record as TO-1KK [available on the NCI website as Exhibit TO-1b]. Anyone can look that up once it's posted as part of the record.

Now, this is at the beginning of the pandemic. And I just want to draw your attention to the last paragraph—and specifically the second sentence. And I'm going to read it to you and then ask for your comments. But basically, this is your boss sending an email to all of the paramedics.

Sean Mitchell

I just want to confirm that's the March 7th, 2020, email?

Shawn Buckley

Oh, yes, I'm sorry. I'm looking at the date that you sent it to me, so yes March 7th, 2020. Thank you for correcting me.

He basically writes to all the paramedics: "Remember not to get caught up with social media as not all that information is accurate and only serves to increase concern. Coronavirus has been around since the late 60s so the only thing new is an enhanced ability to screen for it and the global scale which it seems to have taken."

Now do you remember receiving that email?

Sean Mitchell

I do.

Shawn Buckley

And basically, did you interpret that as he's saying, "Calm down, this is early on in the pandemic?"

Sean Mitchell

Yeah, I do. Because, like I said, early on in the pandemic, there was concern. Paramedics have families. I had a pregnant wife that's also a paramedic in the same service at the time. We were hearing about PPE shortages. There was an email that he had sent out saying, "We're well-supplied; don't worry about that." There was all sorts of information going out on the media. And this was him reassuring us that we're in good shape; it's going to be okay.

Shawn Buckley

And basically, to ignore the social media where people are voicing concern about this.

Sean Mitchell

Yeah.

Shawn Buckley

Now, my understanding is that you guys were also getting weekly reports for the Durham Region for the first couple of months of the pandemic.

Sean Mitchell

That's right. It was like a COVID report that would just say case counts in Durham region, potential cases counts, that sort of thing.

Shawn Buckley

And did they basically match what you were seeing?

Sean Mitchell

For the most part, yeah. The reports we were getting were pretty low numbers, really, for the amount of COVID positives that we were having. There was nothing to really compare that to. We'd never gotten any kind of weekly statistical update in any years prior about, like, flu-like symptoms or sicknesses. So they kind of match. The numbers of us—population around 700,000—were pretty low, I thought. So yeah, I'd say they match.

Shawn Buckley

I'm just going to pull up one of those reports. And I apologize for the audience that it's not the clearest. Mr. Mitchell, you have a paper copy and the commissioners have a paper copy. But for those viewing online and in person, in that first box, the very bottom line—so this is a report. And RDPS, that just basically refers to the paramedic service that you belong to.

Sean Mitchell

That's right.

Shawn Buckley

And it's a situation report as of March 26, 2020. And the last line in that first box says, "37 cases in Durham region. Thirty-one are on self-isolation, and five are hospitalized. One death." Now, my understanding is that the population of Durham region is roughly about 688,000 people at the time?

Sean Mitchell

Somewhere around there, yeah, just under 700,000.

[00:25:00]

Shawn Buckley

Right. So I'm just going to go with the 688 figure, because that's what you told me in an interview. And so if we have 37 cases divided by 688,000, we basically end up with 0.00005 per cent of the population is being reported as a COVID case.

Sean Mitchell

Yes.

Shawn Buckley

And does that kind of match what you were seeing?

Sean Mitchell

Yeah. Like I had said before, we weren't really seeing anything out of the ordinary for this time of year. Like, we were definitely getting respiratory cases that we'd respond to. But whether they were COVID or not— I've seen COVID cases that we were told were COVID cases, but it wasn't an eye-popping number of them. So yes, I'd say that this matches my experience.

Shawn Buckley

Is the population of Durham in lockdown on March 26, 2020? Do you recall?

Sean Mitchell

I don't know. I know that the pandemic had gotten declared around that time, like March 20th. I don't know when lockdowns started. I'm not sure.

Shawn Buckley

Right. Where I'm from in Alberta, I think we started with "two weeks to flatten the curve" in March. And I learned that my education was wrong in elementary school because I thought a week was seven days, but I'm wiser now. Do you recall, was a similar thing happening in Durham? Or you're not sure if there was a lockdown?

Sean Mitchell

There was a lockdown. I just don't know if the lockdown was on March 26. But yeah, around that time we were in lockdown as well.

Shawn Buckley

With the media reporting— I had gotten the impression from an earlier interview that really the media in the Durham region: they were painting kind of an extreme case, like there's case after case after case after case. Was the media reporting that you were seeing consistent with a .00005 per cent case rate?

Sean Mitchell

No.

Shawn Buckley

What was your impression of the media reporting at the time?

Sean Mitchell

At the time, my impression was that this was the deadliest virus that could hit humanity and we should all be afraid. Like I said before, I just was not seeing that in my profession and responding to patients.

Shawn Buckley

And then, for anyone who wants to view this, once it's up, it's going to be Exhibit T0-1GG [available on the NCI website as Exhibit T0-1e].

So we were talking about 2020. Now, in 2021, we had rollout of the COVID-19 vaccines. My understanding is it was released in January 2021. Did you see a change, let's say, in hospital use, into 2021?

Sean Mitchell

So the following cold and flu season—starting November of 2020 into early 2021—that's where I definitely started seeing kind of a return back to normal call volumes, where we were getting your typical calls for service and hospitals were starting to get busier. Offload delays were starting to increase into late 2020, early 2021.

Shawn Buckley

Right. Were they higher than normal prior to the vaccine release?

Sean Mitchell

Yeah, they were definitely higher than 2020, absolutely.

Shawn Buckley

Right, so that's into January, February of 2021?

Sean Mitchell

That's right.

Shawn Buckley

Was there a change in the type of call? Let's move into the spring of 2021. A year after the pandemic starts, are you starting to see a change in the type of call?

Sean Mitchell

Yeah. So along with the increased call volume, we were starting to see changes. A lot of mental health problems, starting to see more opioid and drug-related—kind of like social calls. I was starting to see some events that were concerning with younger people and medical events that way. We started getting correspondence in 2021 about—I don't want to say assaults, but aggression towards healthcare workers and paramedics.

Shawn Buckley

Can I just stop you? You were talking first of all about a change in calls in younger people.
Can you give us the age range?

Sean Mitchell

Late 20s, early 30s, 40s, healthy individuals

[00:30:00]

that had no real medical history, that were feeling the need to call 911 for legitimate medical emergencies.

Shawn Buckley

And were you seeing a type of injuries that you hadn't seen before for this age group?

Sean Mitchell

I was seeing symptoms and I was seeing medical findings more often that I didn't see in those age demographics in years prior. There were a number of cases that come to mind. But I was seeing younger people my age—a little bit younger, a little bit older—that were having cardiac-like symptoms, having neurological-type symptoms that they'd never had any history of. They were young, healthy individuals.

Shawn Buckley

So as far as the neurological-type symptoms, can you share with us what you were seeing?

Sean Mitchell

I was seeing stroke-like symptoms, so unilateral paralysis, facial droop, slurred speech, muscle spasms on certain parts of their body. I've seen a number of narcolepsy-type things where patients were just falling asleep, like at a gas station, at a gas pump in their driver's seat of their car, or sitting with their son and daughter at the kitchen table and falling asleep and just not being able to stay awake. I've seen cardiac concerns—

Shawn Buckley

Just before we go to the cardiac, so you're talking about basically young to middle-aged people falling asleep at the gas pump in the driver's seat or falling asleep while they're eating a meal with the family. Had you ever seen anything like that before?

Sean Mitchell

Never in my career.

Shawn Buckley

So not only have you never seen that before, but now this isn't an atypical call. You're getting calls—plural—with this type of thing.

Sean Mitchell

Multiple calls. Like patterns of similar calls within similar demographics. And once history-gathering developed with those patients, finding a common denominator of recent vaccination.

Shawn Buckley

And then the stroke-like symptoms that you spoke about, like slurred speech and twitching muscles and the like: Had you been seeing those types of symptoms in this age group prior?

Sean Mitchell

I have, prior to this, seen those types of symptoms in younger age groups but not to the frequency and extent that I was seeing it at that time.

Shawn Buckley

Okay. You were also speaking about cardiac problems in this age group. Can you share with us what you were observing and also whether or not it was a change?

Sean Mitchell

I was observing younger individuals, athletic individuals that, when they would exert themselves— One that comes to mind was a hockey player that was 33 years old. Any time they would exert themselves, they would get crushing chest pain. It would last for two or three days. They couldn't be physical.

We were seeing pericarditis come up on our 12 electrocardiograms. We were seeing younger, like, ST-elevation MIs [myocardial infarctions]. Yeah—like a lot of concerning cardiac-type calls that were happening in a demographic that you wouldn't really expect to see it as frequent as I was.

Shawn Buckley

So it was a change from previous or pre-vaccination years?

Sean Mitchell

That's correct.

Shawn Buckley

What about— Were you having to respond to calls where people were not alive?

Sean Mitchell

Yes, yes, we were responding to VSA calls as well, which is vital signs absent.

Shawn Buckley

And was there a change in the calls where a person has already died by the time you've arrived?

Sean Mitchell

As far as numbers— I wouldn't say there was too much of a change, as far as the amount of VSAs that I responded to. I did notice that there were some younger VSAs, which isn't out of the ordinary. But there were some younger ones, a few more than I would expect. But as far, like, more or less: I would say it was pretty consistent with the years prior to the pandemic.

Shawn Buckley

And as far as the changes you've told us, so you've seen these neurological calls and these cardiac calls

[00:35:00]

in a younger age group than you had seen before. How were paramedics responding to this?

Sean Mitchell

Just like they do for any call. They get a call for service and they respond and give the best patient care that they can.

Shawn Buckley

Now, you became concerned about this, so you basically spoke to one of your supervisors.

Sean Mitchell

Yeah, after a number of patients that I kind of thought were attributed to vaccine injuries or having some sort of problem with the vaccine, I did contact a quality development co-worker of mine. And they're responsible for basically everything with gathering data, gathering information, educating paramedics on trends. They were the ones sending out the reports of COVID case numbers.

I reached out to him in order to just see, first off, if anybody else had reported concerning trends and if there was some way that we could capture just on our electronic call report when a person was vaccinated—like what date, time, with what vaccination. And that was it, just a checkbox, just to be able to collect data and drive data to see if maybe there's some sort of correlation between the two. He'd forwarded my concerns up to all of our managers, upper management, because at this time I wanted to kind of remain anonymous. Because that's just the way that I felt was the best way to go given the workplace environment. And there was no response from management. I think there was one road manager that got back saying something, but—

Shawn Buckley

I'll just shorten this a bit. My understanding is that over a period of maybe eight months, you followed up and you followed up and basically, there was no change to require reporting.

Sean Mitchell

That's right. There was no change, we were told.

Shawn Buckley

But just to make sure that I've understood your evidence correctly: you're seeing these changes and because of that, you're thinking, well, we should be documenting on a report we have to do anyway. Let's add a box for vaccination and just a few details so that we can see if the change is related to the vaccination.

Sean Mitchell

That's right.

Shawn Buckley

And you had approached management, made several efforts, and at the end of the day, there was no change. Paramedics were not requested to change their reporting at all.

Sean Mitchell

That's right.

Shawn Buckley

Now as 2021 went on, what happened to the call volumes?

Sean Mitchell

In 2021, call volume returned back to kind of what it was pre-pandemic. It was busy. We were having more down-staffed vehicles. We were having a lot longer times on offload delay. This was confirmed not just like, my experience, but this was confirmed in multiple emails from our managers—just acknowledging that, yeah, in fact, in 2021, offload delay time had doubled.

Shawn Buckley

What happened when— You call it the flu season. Into the winter, so October, November, maybe December, you're well into the flu season of 2021. What was basically the hospital situation at that time?

Sean Mitchell

At that time, it was busy. Yeah, people were coming to the hospital for all the things that they went to the hospital for prior to the pandemic. It was busy. It was chaotic, offload delays; the hospitals were busy.

Shawn Buckley

So there was no increase because of the vaccinations?

Sean Mitchell

I can't say why there was an increase. There was a definite increase from 2020 to 2021. I can't say for sure why.

Shawn Buckley

Okay. Now, were the paramedics in the Durham region required to get vaccinated?

Sean Mitchell

Yes. Yes, they were required. In September of 2021, a policy came out—a number of policies came out between September and December of 2021. But a policy came out that correlated with the Ministry of Health Directive Number 6. And it originally had stated that covered organizations had to have a vaccination or an immunization policy for COVID-19. And as that living document progressed,

[00:40:00]

the Region of Durham Paramedic Service, as well as the entirety of the Region of Durham staff, was required to either get vaccinated or lose their job.

Shawn Buckley

Basically then, in 2021, was your understanding that the majority of paramedics did get vaccinated?

Sean Mitchell

That's my understanding, yes.

Shawn Buckley

In 2021, after the paramedics start getting vaccinated, did that basically create a situation where they were less sick? There was less off time because they had been vaccinated and protected from COVID-19?

Sean Mitchell

I don't think so, no. I think that sick time was getting worse in 2021 compared to 2020.

Shawn Buckley

Okay, so was that your observation?

Sean Mitchell

That was my observation, yes. And like I said, management had confirmed, thanking paramedics for taking overtime shifts to cover vacancies. So our managers did acknowledge that in a December 2021 email.

Shawn Buckley

Now, I'm going to pull up for you another document. I've just got the first page here and I'll scroll down. I can advise people that the entire document is an exhibit [Exhibit TO-1f] but I am, just for brevity, reproducing what would be page 18 [Exhibit TO-1c].

This is the consolidated financial statements for the Regional Municipality of Durham for the year ending December 31st, 2021. So people can see that at the top in blue is number 6,

Employee Benefits and Post-Employment Liabilities. And if we go down, there's a section at the top, Liability for WSI [Workplace Safety and Insurance] Benefits. Do you see where that is?

Sean Mitchell

Yes.

Shawn Buckley

And if we go down to where there's a line, the last line, there is benefit payments.

And when you go to the top of the document—and I apologize for those in the audience, I haven't scrolled up—this is in thousands of dollars.

So if we look at the year 2020, benefit payments—so actual payouts to paramedics—that 5,986 is actually 5 million 986 dollars paid out to paramedics for WSI benefits. And WSI benefits are basically workplace injuries, right?

Sean Mitchell

That's right, work.

Shawn Buckley

If you are injured at work—in BC, where I practice, it's Workman's Compensation. But in Ontario, it's WSI.

Sean Mitchell

Yeah. And it's not necessarily like a physical injury. It could be, like, emotional or—

Shawn Buckley

Right, right.

But if we go to the year 2021— So 2020, that's where we're in the pandemic, there's no vaccine, there should be less natural immunity. We have \$5,986,000 paid out. But if we go to 2021, where we now have the vaccine rollout, we have \$9,202,000 payment. And if you do the math, that is exactly a 65 per cent increase in basically what would be the equivalent of off-time for workplace injury in the year 2021. Does that match with your experience?

Sean Mitchell

Yes, it matches. The year that vaccines were made mandatory, increased WSI benefits were paid out.

Shawn Buckley

I'll just ask. Because my understanding is— As you know, you were a little critical about they're not being reporting and then there being an imposition of a vaccine mandate. My understanding is that you actually lost your job because of that.

Sean Mitchell

That's correct.

Shawn Buckley

So would you have any recommendations on how we could do this better if we ever faced a similar situation?

Sean Mitchell

Yes. Early on in the pandemic, we were—it was frontline this and frontline that, frontline workers, essential workers.

[00:45:00]

Nobody listened to the frontline workers. I tried multiple times to bring concerns to management and facilitate it up through the chain of command. And nothing. It was either ignored or just nothing was done. So we need to listen to the workers and the people that are on the ground and doing the work and living it day-to-day, that have been experiencing this for years. And it wasn't being listened to at all. We weren't being listened to.

It was all— Our managers had an opportunity. All the statistics were there in our paramedic service. All the statistics are there in hospital corporations to show the call volumes, early on in the pandemic, the first year of the pandemic, were low. And all the statistics are there to show that in 2021 and 2022, it substantially increased. If we want to manage another event like this properly, we need to listen to the boots on the ground.

Shawn Buckley

Thank you. Those are all the questions I have. I'll open this up if the commissioners have any questions of you.

Commissioner Massie

Thank you very much, Mr. Mitchell, for your testimony. I have a question related to the last answer you provided about the recommendation that the management or administration should listen more to what you have to contribute. Is it something that was part of the culture before the pandemic? Or is it something that was in other words, lost during the pandemic management? Or is it just a trend that was there for a long time?

Sean Mitchell

I think it's kind of a trend that's been there for a long time. The public doesn't know anything about statistics and call volumes. There's been a significant lack of resources, in at least Durham Region, for a number of years that started long before the pandemic. And the statistics are there to show it. The report that I had given Mr. Buckley kind of outlines this systemic problem.

But I brought forth to my management, during, I guess, late 2020: Why aren't we using the statistics to try to bring calm to the public? Why aren't we saying, "We're not overrun, we have resources, we have proper protective equipment, the hospitals are in good shape?" Like, why aren't we using and being transparent with the data that we collect every day? And I just got a political answer to it and nothing was ever really done.

I think that had there been transparency with our service, and with our profession, and with the hospitals early on, we wouldn't be seeing problems that we're seeing today and that we were seeing in 2021—with violence towards paramedics, violence towards nurses, violence towards first responders. A lot of members in the public realized that they were being lied to during the pandemic. And there was nothing that my service did to try to reassure the public. And I think that's very unfortunate. So a systemic problem of our management system not reporting on anything.

Commissioner Massie

So is it your observation that now management starts to realize that and they have a plan to fix it?

Sean Mitchell

I haven't been at the workplace since January of 2022. I'm not really sure that they have a plan. The report that I submitted—the master plan—was the first step in kind of acknowledging the trends that were going on long before the pandemic, about staffing shortages, about down-staffed ambulances, about all that stuff. So they have done some things to try to at least support their effort towards council to obtain resources. But as far as being transparent to the public, I don't know if they're doing anything.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

Thank you for your testimony.

I'd like to just go back to the emails. Let's start with the March 7th email. This is coming from the Durham Region Health Department. I believe that that was the time that churches were being told that they had to close and that small businesses

[00:50:00]

could have a maximum of five people entering their business places. So you were being told at that time, just let me get this right: your supervisor wants to remind everyone PPE is only required on calls at a given meeting. The criteria are determined immediately upon your assessment to meet the criteria. And then if I jump to the last sentence of that paragraph: "The most important factor to consider is to ensure good hand washing with a minimum of 20 seconds or aggressive scrubbing with a good soap." And then on the March 20th email, going into long-term homes: "I would like to suggest to all that, in the event you are responding to any long-term care home, you take the opportunity to wear a mask, gloves, and eye protection on all calls to long-term care. Facilities accounts should only be required if you intend to perform—" and it continues on that.

From your experience as a paramedic, and just looking at the public policy that came down, would you think it was an unfair statement by the provincial government to actually close small businesses and churches, for example, when you're only being advised that a good strong hand washing is a good response?

Sean Mitchell

I think that, yeah. I don't want to get into public health stuff really, because that's not my area of expertise. But it was pretty obvious early on, from emails and from experiences that we had, that the severity of COVID-19 wasn't as severe as we were being made to believe. And we were responding to these long-term care facilities and it was sad at times. We were responding there, not always for serious medical calls, but, yeah, you'd see individuals locked in their rooms. What was going on at that time was not right.

And it just kind of goes along with— They didn't really know what to do, it seems. Because every week we were getting conflicting things from the week prior, like: Should we gown up? Should we be reusing our PPE? "Put them in this bin, so we can wash our single-use PPE." "No, don't do that." "We're going to use aerosolized procedures, like ventolin." "No, don't do that because you're at increased risk." "Don't intubate people when they need it because you're at increased risk."

Those weekly COVID reports not only gave the case counts but they also gave directions on what we were to do or not to do, and they were just— It was all over the place. So I don't know if locking down businesses was the right answer. I don't know if locking down long-term care facilities was the right answer. If things were going to get in there, they were going to get in there. And typically, like every other cold and flu season we've had, long-term care facilities are on "outbreak," they call it. So it's not unusual for long-term care facilities to be placed on outbreak or different floors on outbreak. That's just standard procedure. This one was just more extreme.

Commissioner Kaikkonen

I want to thank you for your honesty.

Commissioner Drysdale

We heard from previous testimony two weeks ago in Truro that the government in fact had a detailed influenza pandemic plan in place called, if I recall, the Canadian Influenza Pandemic Plan for the Health Sector.

Being a paramedic, I assume that means you're in the health sector.

Sean Mitchell

Yes, it does.

Commissioner Drysdale

Were you aware of this detailed report?

Sean Mitchell

No, I was not. Like I had said, we were getting correspondence through email in late 2019 about atypical pneumonia. But yeah, we were made aware of no such national plan.

Commissioner Drysdale

One question of curiosity for myself: When you were to wear PPE, what PPE were you wearing to protect yourself from the breathing in of the COVID virus?

Sean Mitchell

Like I said earlier, it kind of changed back and forth, what the requirements were. I utilized for the most part of the pandemic—it's called a P100 mask.

[00:55:00]

It's like a rubber thing that goes over your nose, mouth, and jaw. And it's got two pink filters, so that's kind of the best protection that we were issued. N95 masks were used. We were supposed to wear goggles and safety glasses at times. We were supposed to wear gowns and Tyvek suits at times. And then other times, they told us not to do that. So it was kind of all over the place. But as far as inhaling virus particles when doing patient care, with a suspected COVID-19 case, we were to use N95 or P100 masks, and then use surgical masks in the trucks and at stations.

Commissioner Drysdale

Right. And the one mask you described, I guess is what they described as a respirator. And I noticed that today you're sporting a very fashionable beard, like myself.

Sean Mitchell

Thank you.

Commissioner Drysdale

How are those masks sealed around someone with facial hair, beard, mustache, etc.?

Sean Mitchell

So they aren't, they aren't. So yeah, they don't seal properly. Every two years our service is required to undergo mask-fit testing, so physiological changes as people age or gain weight, lose weight, just to keep on top of that. And we have a policy that says you're to be clean-shaven. Now if you're a supervisor, clean-shaven means you can have a goatee around there. If you're a paramedic, that kind of depends. But proper PPE, you're supposed to be clean-shaven.

Commissioner Drysdale

Are you saying that even when they dictated a certain PPE, like a respirator, they weren't necessarily enforcing the correct way to use it?

Sean Mitchell

They had a big scramble for mask-fit testing as the pandemic rolled out, because they hadn't done it for longer than the two years they were supposed to. There is a policy in place that says you're supposed to be clean-shaven to maintain a proper seal. Some supervisors would enforce that and some wouldn't.

But for the most part during the pandemic, at the start of the pandemic— Like I said, people were afraid, so they were doing everything that they could protect themselves and protect their family.

Commissioner Drysdale

Thank you very much.

Sean Mitchell

You're welcome.

Shawn Buckley

There being no further questions, Mr. Mitchell, on behalf of the National Citizens Inquiry, I'd like to thank you for coming and testifying today.

Sean Mitchell

Thank you for the opportunity.

[00:57:50]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 6: Natasha Petite

Full Day 2 Timestamp: 05:21:14–05:37:07

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Natasha, I'd like to begin by asking you to state your full name for the record, spelling your first and last name for the record.

Natasha Petite

Sure, my name is Natasha Petite, N-A-T-A-S-H-A P-E-T-I-T-E.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Natasha Petite

Yes, I do.

Shawn Buckley

Now, Natasha my understanding is that you have a disability, and you simply cannot wear a mask.

Natasha Petite

That is correct.

Shawn Buckley

Can you describe for us basically how that came about, because— I'll just back up. My understanding is you used to work in the oil patch in Alberta.

Natasha Petite

Yeah, I worked in the oil and gas industry in mainly Fort McMurray, Alberta, for ten years.

Shawn Buckley

And you worked in dangerous environments where you had to wear a mask.

Natasha Petite

Yeah, we had to wear, like—there's the half mask with a P100 filter respirator. And then there's the full face and sometimes we had to do full face and under Scott air-supplied breathing.

Shawn Buckley

Right. And the point I'm just trying to make is, it's not like you're mask averse or anything like that.

Natasha Petite

Exactly.

Shawn Buckley

You've professionally worn lots of masks. But something happened and now you truly have a disability and can't wear a mask.

Natasha Petite

That's correct.

Shawn Buckley

Can you share with us how that came about?

Natasha Petite

In 2018, I was living in Quebec and I was in a car accident—it was January 24th, 2018—in which I'm actually lucky to be alive today. I was trapped in the car for about 45 minutes. I had the air knocked out of me. Some of my teeth were smashed and pretty much from that day, I have lost feeling in several different parts of my left leg. I have memory loss issues, herniated discs in my neck and my back, major depressive disorder, anxiety, and ADHD recently diagnosed.

Shawn Buckley

Sorry, you haven't gotten into it, and I don't need you to. But is it fair to say also, you were in a prolonged situation where it was difficult to breathe?

Natasha Petite

Yes.

Shawn Buckley

It was enclosed, there was smoke all about—and that is part of the reason why you just simply cannot wear a mask?

Natasha Petite

Yeah, actually, I do have PTSD from the car accident and I have been in trauma therapy for the last five years before that. Basically, I cannot have anything on my face, around my face. If it's minus 40 outside, you will not see me with my face covered because it just sends me into panic because I can't breathe. My breathing feels so restricted that I just— I'll have an anxiety attack.

Shawn Buckley

And you had a medical exemption for this.

Natasha Petite

Yes.

Shawn Buckley

For a mask, a legitimate one.

Natasha Petite

Yes.

Shawn Buckley

During any masking mandate.

Natasha Petite

Mm-hmm.

Shawn Buckley

Okay. Now, my understanding is, you had been on a career path in law enforcement.

Natasha Petite

Mm-hmm.

Shawn Buckley

And I'll ask this, when you go mm-hmm, we're not sure if you're saying "yes" or "no," so please use words.

Natasha Petite

Yes, sorry.

Shawn Buckley

So you were a corrections officer?

Natasha Petite

Yes.

Shawn Buckley

And your plan was then to work from corrections into probation?

Natasha Petite

Yes.

Shawn Buckley

And then into parole?

Natasha Petite

Yes.

Shawn Buckley

And then segue into basically helping veterans and first responders who have PTSD and things like that, and help them cope. You had this all planned out, basically spending your entire career in law enforcement.

Natasha Petite

Yes. I wanted to be in law enforcement since I was ten years old.

Shawn Buckley

Yes, so a childhood dream for you.

Natasha Petite

Yeah, it was a dream.

Shawn Buckley

Yeah. Okay. Now, Christmas Eve 2021. Can you please tell us your story?

Natasha Petite

I was actually back in Cape Breton, Nova Scotia visiting my mother for Christmas, my family. And my mother and I went to Walmart at approximately 12:30, 1 o'clock in the afternoon to get some last-minute Christmas items.

And the lady at the door said, "Excuse me, you have to wear a mask." I told her I was exempt and she said, "I know," because she had seen me there actually two days prior. I was there on December 22nd and nobody said anything to me about it. So she said she had to call the manager and I said, "Okay, you call the manager, do what you have to do."

I was approached by the first manager, who told me, "You have to put a mask on or leave the store." I told him I was exempt and he said, "Where is your medical documentation?" I said, "Excuse me?" I said, "You can't ask me that. You're not my doctor. You're not a medical professional and you cannot ask me for my documentation." He made a comment of accusing me of lying or like, "How do we know you're not lying?"

Then he got the second manager who came and said the same thing: "You have to put a mask on or you have to leave." I said "I'm not going anywhere. I have a medical exemption." He also asked for my medical exemption letter,

[00:05:00]

and I told him the same thing, "You cannot ask me for that, you're not a medical professional." They told me they had called the non-emergency police. So I said, "You do what you have to do, and I'm going to do what I have to do, and I'm going to continue my Christmas shopping."

So about 15 minutes later I was in the water aisle and one officer showed up and she said, "You need to put a mask on or leave." And I said, "Well no, I have a medical exemption." She also asked to see it, in which I explained to her that she is also not a medical professional and she does not have authority to ask me for such documentation. From there she said I need to put a mask on, again, or leave.

I questioned her about her mask because she was wearing one of those— It's like a stretchy bandana that she just pulled over her face. I made a comment about her mask not actually being a mask. From there we were just arguing back and forth; she called for the second officer.

The second officer arrived and he said the same thing: "You need to put a mask on, or you need to leave." I told him the same thing. I said, "I have a medical exemption. and I can't wear a mask." He asked me for the note. I told him, "I don't carry something like that with me and you can't ask."

So we argued back and forth and he said, "You know, wearing a mask is a mandate and you need to wear it by law." And I said, "Well no, by law, I don't. I do not have to wear it because a mandate is not a law, it's a recommendation, and I was recommended by a doctor to not wear a mask." So he called for officer number three.

Officer three came and he basically came right in there and said, "You're coming with me." I said, "I'm not going anywhere with you." He said, "You need to put a mask on or you need to leave right now." I said, "I don't need to do anything and I'm not going anywhere. I didn't break any laws. I'm here shopping like everybody else, and I have the right to do that."

Again, there was a back and forth, arguing over mandates and laws and who was right, who was wrong. I had just turned to reach for my cell phone. I thought this might be a good time to turn my camera on. And as I did that, officer number three grabbed my arm; the second officer grabbed this arm; I went forward into the shelving, which essentially bruised my

ribs; and then we wrestled, probably, I don't know, for a good minute; and they threw me down to the floor—my face at the floor. I'm sorry—my face hit the floor.

Shawn Buckley

Take your time.

Natasha Petite

And I knew there was somebody trying to hold down my feet. And my mother was with me. My mother yelled out, "She's a trained corrections officer," just to give them a heads up. So someone was trying to hold my feet. And officer number two was to my right side. Officer three was on my left side.

And I did, like, what we would call "the turtle." It's where you tuck everything in. It makes it harder for them to detain you. So that's what I did. And officer number two had slipped his arm underneath me. And he placed me in the choke hold, which— The choke hold is illegal in Canada since 1979. And I couldn't breathe. I kept trying to say that I couldn't breathe.

I told him I couldn't breathe. And he said, "If you can scream, you can fucking breathe." I really couldn't breathe. And I was having an anxiety attack at the same time because I couldn't breathe. I was having an anxiety attack and I couldn't breathe. And I could see stars. I knew I was passing out. I knew I was going to pass out. I talked to myself and, as hard as I was fighting, I said, "Natasha, you need to either give in or you're going to pass out."

I struggled so hard I ended up urinating myself.

So I gave in. My mom told them—sorry. My mom told them that I have issues with my shoulders and stuff from the accident so they used two pairs of cuffs because I can't put my hands behind my back. They flipped me over. And I was sitting on the ground, struggling to breathe, they told me to get up.

[00:10:00]

And I'll be 100 per cent honest, I said, "You fucking took me down, you can fucking pick me up." And they picked me up and took me out to the police car.

Shawn Buckley

Can I just stop you? Were they told anything about your medical condition before they took you down?

Natasha Petite

Yes, because they were all asking to see my medical documentation and I wouldn't show it to them. I said, "It's none of your business, but if you must know, I said, I was in a car accident in 2018." And I said, "I have physical and mental disabilities."

Shawn Buckley

So they were told before they physically took you to the ground.

Natasha Petite

Yes.

Shawn Buckley

That you have both physical and mental disabilities—

Natasha Petite

Yes.

Shawn Buckley

That would complicate them taking you to the ground.

Natasha Petite

Yes.

Shawn Buckley

Okay, I'm sorry to interrupt. So you're telling us they'd now handcuffed you in front?

Natasha Petite

Yeah, they handcuffed me. One officer was on one side, one was holding my arm on the other side. And they took me out to the car. And I told the officer that had me in a choke hold, I told him that my cuffs were too tight; they were digging in my hands. And he didn't say anything. And I repeated myself and I said, "I know you heard me." And he didn't say anything. I said, "Well, why won't you loosen my cuffs?" And he was standing, like, right here, really, really close. I asked him why he wouldn't loosen my cuffs and he looked at me and he's like, "Because you're a fucking bitch."

Shawn Buckley

And what did you do in response to that?

Natasha Petite

I asked the girl that was with him, officer number one, I said, "Did you hear that, rookie?" Because I knew she was very new. I said, "Did you hear that rookie? What he said?" And she said, "Nope." I said, "Yeah, I thought so."

Shawn Buckley

Right, so basically you were confirming that the other officer, the young officer, was going to cover for the older one.

Natasha Petite

Yeah.

Shawn Buckley

So carry on. What happened after that?

Natasha Petite

After that, they placed me in the back of the police vehicle. Probably, I would say probably a good 20 minutes I waited. Then they took me to the police station, into lock up, and took all my belongings from me, and took my jacket off. They took the cuffs off. I asked for my cell phone right away to take pictures of my hands but I wasn't allowed to have access to it at that point.

And the senior officer, which would be officer number two, he said: "We're going to let you go today. There won't be any charges. You won't have anything on your record." And I said, "Well, I would hope not. Because I didn't break any laws and I'm not a fucking criminal."

So from there, my brother came and picked me up from the jail. And I didn't bother— I didn't go to the hospital or anything because I know they probably would have called the police again over a mask. So I just went home. But I do have pictures, I have photos. They busted my lip. I had a bruise here on my head, a bruise this side of my neck. I had lockjaw for about three days. I couldn't open my mouth because of the choke hold.

Shawn Buckley

Did you have a conversation, because my understanding is that you were taken to the police station by the first officer. Did you have a conversation with the first officer on the trip to the police station?

Natasha Petite

I did, yes.

Shawn Buckley

Can you tell us about that?

Natasha Petite

She told me that she had a three-year-old nephew who had asthma and even he wears a mask. And people like me were the reason why people were dying.

Shawn Buckley

Now, I'm curious. Because I'm just guessing that on Christmas Eve, Walmart is just packed with people. There must have been a whole bunch of people watching these three officers take you down after you explain to them that you have physical and mental disabilities. What can you tell us about— First of all, was there a crowd there, and what can you tell us about that?

Natasha Petite

Honestly, it was like I was a spectacle. There was people lined up from the beginning of the aisle right out to the door. And I was yelling when I was going out. I'm like, "How can you

people stand there and watch three police officers on one woman who has disabilities? How can you stand there and watch this and not say anything and not do anything?" And I asked them, "What happened to humanity? What happened to people's morals and values?" It was absolutely, just— I can't even really, like, explain the feeling. It was humiliating, degrading, embarrassing.

[00:15:00]

Shawn Buckley

And thank you for sharing. We can see that it's difficult. I don't have any further questions. And I'll just ask if the commissioners have any questions.

Natasha, it's very important that people like you tell us their stories. On behalf of the National Citizens Inquiry, I'd like to thank you for sharing your story with us.

Natasha Petite

Thank you for doing this.

[00:15:52]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 7: Tamara Ugolini

Full Day 2 Timestamp: 05:37:40–05:59:15

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Could I ask you to state and spell your name for the record please?

Tamara Ugolini

Yes. It's Tamara, T-A-M-A-R-A, Ugolini, U-G-O-L-I-N-I. And before we proceed further, I just want to make a note of clarification here that I am a journalist who has been reporting on the National Citizens Inquiry and I plan to continue doing that work. However, I'm here this afternoon in my complete personal capacity.

Geneviève Eliany

Thank you. Do you promise to tell the truth today?

Tamara Ugolini

I do.

Geneviève Eliany

We'll start with an incident that happened on the beach with your family. Can you tell us what happened and how many of you were out?

Tamara Ugolini

So the first incident happened on the beach. There's a beach where I live called Pebble Beach. And in the end of March 2020, or perhaps even the very first few weeks of April 2020—I can't recall exactly when this happened but it was when we had restrictions on outdoor gatherings of five people or less.

I had taken my four children—we've since had another child but at the time I had four children; and myself, so that was five, including my youngest sister, who we lived with at

the time; so five children total plus myself, six people—to a beach to throw some rocks because there was literally nothing else to do. The playgrounds were closed. The schools were closed. The swimming lessons ended abruptly. The membership that we had just purchased a week prior to the local YMCA was null because that was also closed. There was literally, quite literally, nothing else to do. So we got to the beach to throw rocks in the water and we ran into some friends who also were doing the same. And the children hadn't seen each other for, at this point, it was three or four weeks because of the school closures. And so they ran over and they're like, "Hey, our friends," none of which we've seen for nearly a month. And we had a brief conversation. The mom was really nervous because she's like, "Oh, wait, we can't even be talking outside. We're going to get in trouble for this." And I thought, okay. I didn't really give it a second thought, but you're right. So she continued on, and my kids continued to throw rocks in the water.

I took up exercising on a log because, again, everything else was closed; there was no way to engage in any sort of physical activity, so I was doing some of that. An officer approached me from behind, tapped me on the shoulder—I didn't even see them coming, and wasn't obviously expecting that to happen—and asked me if the children who were in my care at the beach were all mine because we were over the five allotted people outside together. And I basically told the officer that was none of her business but that we all lived in a house together and was obviously very shocked as to what she was asking me. And I said, "And what brings you here?"

She alluded to the fact that someone in the apartment dwelling adjacent to where we were had seen that there was some sort of gathering happening and called the police. She was hoping at that time that the person who called would be satisfied that the police were responding to the call. She issued me, I suppose, some form of a warning and then she left. And we continued to stay at the beach.

Geneviève Eliany

I understand that you'd looked into the property lines. Can you tell us about that?

Tamara Ugolini

Yeah, so there was another incident: the culmination of events that led to my questioning some of the arbitrary closures that were happening in my local municipality, the Town of Cobourg.

My husband and I had lost a business very early on in the pandemic. Just to kind of give some context here, we had executed a five-year plan: We re-mortgaged our house, we consolidated all of our debt, we took out all of the equity that we had built up in our home. And we started a business that took several months longer than we anticipated to get off the ground. It was a construction-type industry.

My husband had been operating a hydrovac excavator. The context here really lends to why I was engaging in the advocacy work that I was in this particular instance that you're asking me about. My husband had been working as a hydrovac excavator.

[00:05:00]

And they use heavy pieces of equipment, large hydrovac trucks, to excavate and dig underground to expose things like utilities, gas lines, water mains. He was working in the utility industry, so they were doing installations for things like Rogers Communications and

Bell Fibre Optics. We purchased this large piece of equipment, about half a million dollars, in November of 2019. And we didn't realize at the time that financing would take so long to go through because obviously construction—especially tunneling underground in December and January in Canada—is very tough. December and January were really a hard go for us with nearly \$20,000 worth of overhead on this particular endeavor, which would have been fine, because the money coming in would have easily offset that.

February was still a little bit tough, but March 2020 was his best month worked. We thought, "This is great. If this continues, we'll be able to pay off this vehicle a lot sooner than we had originally anticipated, get out of this one-year rent-to-own contract, bring our expenses way down, and the rest will be gravy." We planned this out. We rented our house out. We moved in with my father. We did all the things over a five-year plan to execute this business endeavor.

And then April of 2020, the Ford government instituted further restrictions on construction. And the company that my husband's company was subcontracted to, which was Rogers Communication, shut down their construction across Ontario for one month. At that point we only had one month worth of overhead left. So that month, those four weeks, turned into six weeks. And then when things started to slowly come back a little bit in his industry in May, he was working one to maybe three days a week, not enough to give us that threshold of meeting that overhead expense. And so by June of 2020, we made the extremely difficult decision, with literally nothing left— We had nothing to fall back on, all of our savings were gone, the equity in our home was used. We made the very difficult decision at that point to give back this truck and end our contract there, which had a ripple effect for that company. But it was at that point that I decided we had nothing left to lose anymore.

I had been delegating at our town council meetings. I had been reaching out to our MPP and eventually even our MP. I had been petitioning the Town, who went above and beyond the provincial regulations and arbitrarily closed all of our green spaces. They restricted access to the Northumberland Forest, which is hundreds of acres worth of forest. They closed down our local public beach, arbitrarily above and beyond the provincial guidelines, without a bylaw, without any sort of legal check or balance put in place to do so. I had been petitioning them and delegating and asking questions and never receiving any answers. Either I was completely ignored or they were responding to me, "noted and received."

So by June, we had lost our business. Still these closures remained. My children had no access to any of the normal amenities that, you know, our tax dollars go toward funding; they were really suffering the effects of isolation, as were we all. And so I decided to engage in an act of civil disobedience. When the town continued to keep restricting access to this shore and the public beach—they weren't paying attention, they weren't answering my questions, no one was listening to any of my concerns and the concerns of other people who I had met along the way expressing the same—I decided to walk the shoreline in defiance of their arbitrary closure.

Now for the lot lines, I want to mention that I had researched the roll call numbers and where the town's property ended and where it began. And I discovered that the town doesn't actually own a segment of the sand, and of course, they don't own the water. So there's riparian rights that are involved here when you're looking at a shoreline—a fluid moving thing that doesn't have a defined lot limit. So I strategically entered the water from the pier, which is on Crown land—the town does not own that property, they could never have restricted access to it. And I walked the beach shoreline. In doing so I think that there was calls put to bylaw and/or the local police. They met me on the opposite side of the

shore and they proceeded to tell me that I would be hit with an \$880 COVID-related trespass fine, to which we bantered a little bit back and forth about the fact that

[00:10:00]

I was not on any Town of Cobourg property. I was not trespassing and I never actually entered any area of the sand, which they had—in my still-to-this-day opinion—unlawfully restricted access to. One thing led to another. I refused to identify myself to receive that fine and it resulted in me being arrested. I was handcuffed. I was detained. I was put in the back of a police car. And I was brought down to the local jail where I was held for about an hour and a half in a jail cell after being fingerprinted and mug-shotted for walking my local shore in defiance of arbitrary COVID restrictions—when no one could answer me whether or not outdoor viral spread was a documented scientific thing, which to this day we know it is not.

Geneviève Eliany

Did any of the officials seem to have an idea of the lot lines you were referring to?

Tamara Ugolini

I had been asking the town what justification they had to close this shoreline, where their lot lines ended, if they had the lawful authority to impose this sort of measure. Again, my communications, my questions, my delegations, were met with the response that it was “received and noted.”

Geneviève Eliany

Now, we’ll shift back to the business losses, which you’ve already explained a little bit. We heard that you surrendered the heavy equipment in June 2020, right?

Tamara Ugolini

Yes.

Geneviève Eliany

Can you comment on whether or not the company that you purchased the equipment from was at all flexible, and what kind of circumstances you could observe them to be in?

Tamara Ugolini

The company was primarily based out of the United States, which didn’t have at that time the same level of restrictions that we had. But they had a satellite office here in Ontario. And they gave us a little bit of flexibility in terms of making the payments because there were some months where we said, “We need a few extra days,” But there is an interest factor on a late payment like that and then, when you’re dealing with an overhead charge of \$13,500 and change, the interest adds up very quickly. So it wasn’t long that we could sustain something like that. And we also had to come up with the bulk of the purchase price by November of 2020 to meet that contract deadline of buying the rent-to-own vehicle outright, which we would have done easily and happily had that March 2020 same level of invoices been continuing on throughout the next six, seven months.

The company that we had been on this rent-to-own contract, the gentleman that we were dealing with directly here in Ontario: his job was commission-based. And so when he had these vehicles out on rent-to-own contracts, or on leases, what have you, he received a certain percentage of commission on those vehicles.

And it was very difficult for us to decide to give back this truck because the bulk of the financial fallout of that really fell on this particular gentleman. All of the trucks he had been receiving commission on were coming back to the lot. And he expressed to us privately that he was really concerned that he would be losing things like his home and his livelihood and other things to do with his personal life and his family. So we started to see, really, the ricochet effect. And we held on to the vehicle for longer than we probably should have because we didn't want to negatively affect this gentleman, who we'd developed rapport and a relationship with. So that was a really, really difficult part of the decision as well: was knowing that it would harm other people too.

Geneviève Eliany

Did you apply for any business grants from the government or elsewhere?

Tamara Ugolini

So that was— Another part of this puzzle is that in order to apply for the grants that were being rolled out at the time, you had to show one year of tax returns. We had just begun our business in November of 2019. We didn't have any form of record-keeping or paperwork to show at that point, nor did we really have any form of invoicing. November was a really tough month. We were just working out all the kinks of the business and of the vehicle. And December of course, with the nature of our country and winter and digging underground and Christmas, it was not fruitful for those two months. But regardless, you needed a full year's worth of tax returns to even apply to these business grants. And even if we were able to, I don't know how we'd ever repay those grants, given the situation that we were in,

[00:15:00]

with the rental of this vehicle and not having consistent work from April onward.

Geneviève Eliany

Ultimately, how did your family survive financially?

Tamara Ugolini

Well, I was primarily a stay-at-home mom at that point as well. And I ran a small graphic design business, which I had mostly shut because I was helping my husband do all his advertising work and I was doing the bookkeeping for him. And I also served on the side, evenings and weekends when my husband was at home. I was a server at a local restaurant and that was completely gone. I actually worked the St. Patrick's Day before the shutdown happened and I thought, "Wow, if there's this crazy viral threat, I really hope I didn't pick it up at the bar I just worked all weekend, touching people's cutlery and glasses and being in close contact with intoxicated people." But if it weren't for the fact that we rented our house out and moved in with a family member, we also would have lost our home. It was by the grace of God, really, that that didn't happen and we set ourselves up for the success of getting this business off the ground. No one would have ever foreseen that a mere six

months later we'd be facing unprecedented lockdowns and closures and economic sanctions by our own government.

But then my husband— It was really hard. It was obviously a dream of his, so it was really difficult for him, that drive back to take the vehicle back. He then went to work again in the industry for “the man,” not for himself anymore. And over the next 14 months he worked his way up in his company doing the same line of work. He was one of their most reliable workers. During this time, we had a baby also, a little surprise pandemic baby, who we love dearly. And so this company that he had been with since the time of our business loss even sent us—when we had our baby in March 2021—a small monetary congratulations with a little bib.

Then seven months later, when the COVID mandates came out in September of 2021, my husband was terminated from his job in October of 2021 for refusal to divulge and disclose his personal private medical information. He repeatedly inquired with his supervisors, the human resources people deploying this policy indiscriminately onto their workers. And I want to remind everyone that a hydrovac excavator works primarily outside and alone. He was not in close contact with anyone throughout any length of time, any day, and they were never able to ascertain the policy. They were never able to answer our questions on if this was reasonable, if it was justified, if there were any form of accommodations that could be exercised to ensure that he was keeping everyone else safe while still remaining gainfully employed. It even came down to the point where, in an email, one of the people involved in this situation told him that the policy was about vaccine uptake and not immunity.

Our family— At that point we had already moved back into our home and we were trying to regain some financial security. And at that point our loose plan was—because I was still on maternity leave with a seven-month-old at home in addition to our other children—our loose plan was that he would take the remainder of my maternity benefits and I would transition to work full-time. And it would get us through the winter months until the construction industry picked back up again in the spring and he would be in a better situation to get another job.

But then they put on his ROE [Record of Employment] that he had, I think it was Code M: that he was in noncompliance with a workplace safety policy and he would not be eligible for government assistance. So I immediately pivoted— And thank goodness for my line of work I was able to pivot and go to work full time, but we were down our main breadwinner's income. And to this day, in fact these past few weeks, we have been discussing the very real possibility that we will be selling our home and moving back in with our family member because we can no longer sustain ourselves and stay afloat.

Geneviève Eliany

Can you comment on ongoing childcare issues since you had to pull the kids from Montessori?

Tamara Ugolini

When my husband lost his job—our children had been attending a private Montessori school. And they had been attending there for the duration; we've been with the same provider for approximately 10 years. At the time, we had to obviously cut major financial commitments way back.

[00:20:00]

So we made the decision to remove our children from this facility. And since that time, we have been unable to secure any form of reliable, consistent childcare. Our two older children now go to conventional school, despite my convictions otherwise. And we struggle to this day, to this week, to have gainful, readily available, consistent, reliable childcare because we've since lost our space in that other school where the younger children would have been grandfathered in.

Geneviève Eliany

Do you expect that you'll both be able to return to full-time work unless you secure full-time childcare?

Tamara Ugolini

That's part of the piece we're trying to figure out currently. So for anyone who says that COVID is over and the worst is behind us, there are still people out there suffering the fallout of these misinformed policies.

Geneviève Eliany

Thank you. We'll see if the commissioners have any questions for you. No questions. Thank you so much for attending today and telling us your story.

Tamara Ugolini

Thank you.

[00:21:37]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 8: Michael Alexander

Full Day 2 Timestamp: 05:59:46–06:46:51

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Good afternoon. Could you tell us your full name and spell it for the record, please?

Michael Alexander

My full name is Michael Ian Beardall Alexander. I usually go by Michael Alexander and my last name is spelled A-L-E-X-A-N-D-E-R. And it's Michael M-I-C-H-A-E-L.

Geneviève Eliany

Thank you. Do you promise to tell the truth today?

Michael Alexander

I do.

Geneviève Eliany

Tell us a bit about the type of work you do. You're a lawyer, but specifically, what kind of cases have you been taking on recently?

Michael Alexander

Yes, I'm a lawyer. I'm trained in Canada and the United States. Recently, I've been representing doctors and nurses all across the country—primarily doctors, though—and have been defending them against charges that they have been spreading misinformation and harming the public by making comments that are contrary to the public narrative around COVID-19. Many of these doctors have already been suspended. Attempts are now being made to revoke their licences permanently. I am raising defences based on public law and the Charter of Rights and other basic principles in attempt to vindicate them and vindicate their right to speak freely about public matters.

Geneviève Eliany

And to be clear, these investigations and prosecutions are conducted by the regulatory colleges, is that right?

Michael Alexander

That's right. We have something called self-regulation in Canada. So there's legislation in each of the provinces that establishes a college, which is an administrative body that regulates the practice of medicine. These are not private bodies. They are in fact public bodies, since they are created in and through legislation. In Ontario in particular, the legislation is very clear that the Minister of Health is the boss of the various health colleges. So these are public bodies and they have two aims: they are to prevent patient harm and to establish standards of practice and competence for the profession.

Geneviève Eliany

And those two aims, is it fair to say, is ultimately to protect the public?

Michael Alexander

That's correct. In fact, the legislation here in Ontario says that the College is to act at all times in the public interest.

Geneviève Eliany

Let's talk about how the role of the colleges—in your view and certainly your legal arguments—has shifted through the pandemic. Can you give us some examples of investigations that were unusual and handled differently?

Michael Alexander

Well, that's a really nice question because, in some sense, the investigations have not been handled differently. What the investigations have done, they have highlighted existing problems and faults in the system and ways of exercising power that have been going on for three decades. We have in my opinion a chronic abuse of authority by the college system in Ontario and in other provinces. What has happened now is that they've just upped the level of abuse and lawlessness in pursuit of their objectives. So I can give you particular examples of what some of my clients are facing to illustrate that, unless you would like me to go somewhere else.

Geneviève Eliany

No. A couple examples would be great, just to illustrate what's happening.

Michael Alexander

All right. The College posted a statement here in Ontario. The College of Physicians [and Surgeons of Ontario] posted a statement to the effect that a doctor may not say anything contrary to public health policies and recommendations. A very clear restriction on freedom of expression, which is otherwise guaranteed to us under the Charter of Rights. And that's called a "statement" on the site. It's not a resolution passed by the College Council under the legislation— Every college has its own council of members of the profession and they have the right to vote on various things and establish policies.

So this is not a policy established by the College. It's not based on the legislation itself. There's no reference to the legislation. It's also, as far as we know, not a directive from the Ontario government. It's just a posting on the website, a statement endorsed by the registrar, Dr. Nancy Whitmore, to the effect that doctors may not say anything contrary to public health policies and recommendations. So all of my clients are being prosecuted for saying something contrary

[00:05:00]

to public health policies and recommendations.

But what's quite extraordinary about this is that the College can only order an investigation and proceed with a prosecution if it establishes "reasonable and probable grounds." That's the legal term. It's the criminal standard for conducting an investigation and a search and seizure. In Ontario, you cannot have an investigation, a search and seizure, and prosecution unless you have reasonable and probable grounds to believe that somebody has done something wrong, has actually committed an act of professional misconduct. So the problem here is that a statement—the decision not to follow a statement, which is merely a guideline—is not an act of professional misconduct. So to conduct an investigation because somebody didn't follow a guideline is quite extraordinary. It does not meet the standard of reasonable and probable grounds.

And what's even more extraordinary about this is that the College claims the right actually not to even make a reference to the guideline in the investigation order. So they write these orders in such a vague way—as we go further down the line in prosecution, they essentially can accuse the doctor of anything. And they can also conduct a search and seizure at the patient's office without any boundaries set by the order because it's so vague. So this is what is called a fishing expedition.

This all goes back to how the investigation is ordered and the reference that is made—or, in this case, not made—in the order. That's where the problem begins. The College of Physicians is acting without authority but yet somehow under the colour of authority.

Geneviève Eliany

I just want to pinpoint a few issues that you've raised before we move on to how the courts have dealt with judicial reviews of some of these complaints. You've highlighted that the difficulties with the colleges and some of the prosecutions have existed for decades now. When was this first detailed in a report and what were the main findings of that report?

Michael Alexander

Well, back in 1999, 2000, Michael Code, who at that time was recognized as a leading lawyer in the areas of constitutional law and criminal law, conducted an investigation that was commissioned by a group of doctors and patients. Michael Code by the way is now Justice Code and a professor at the University of Toronto Law School. So Mr. Code, as he then was, was given 10 patient files by this group of doctors and patients. Mr. Code had never practiced before in the area of regulatory law, had never represented doctors. So they asked him because they wanted a lawyer who would look at this with fresh eyes, without any preconceptions. And they provided 10 files from College prosecutions where they believed that doctors had been subject to the abuse of power and unjust prosecutions. And he drafted a report that's available online for anybody who would like to look. It's sort

of a riff on Boris Yeltsin and the idea of Glasnost. It's called, "Medicine in Ontario Needs Glasnost" [Exhibit T0-24e]. It Needs Openness.

And he concluded that none of these prosecutions were justified, that they all involved the abuse of power, and that many of them were conducted without establishing reasonable and probable grounds to initiate an investigation. All the problems that he highlighted in that report still exist today, 23 years later. I fought trying to vindicate the findings of his report for doctors back in the 2000s. I was not successful in that. But now I'm back at it. I'm taking a second run at the College and I'm still using the insights of the Glasnost Report. Because we now are going into three decades of, in my opinion, unlawful conduct and the abuse of power at the College of Physicians and at other colleges in the province.

Geneviève Eliany

He also highlighted that many of these investigations were brought against individuals or professionals practicing at the cutting-edge branch—these are his words—of their field. Often difficult fields like pain management, where there aren't that many solutions. Have you observed the same thing with respect to physicians and protocols for COVID?

[00:10:00]

Michael Alexander

There was a real hostility at that time to doctors who were attempting to innovate in medicine, who were addressing difficult problems such as the one you alluded to—pain management, where medicine had kind of come to the end of its rope. And so the College was very intolerant towards doctors who were attempting to establish new methods of treatment and experimenting with methods of treatment. Of course, with the consent of patients always in these cases. And they were actually hostile to innovation in medical science. And so that's partly what led to this report.

As to whether that's going on today, that's less of a problem today. Because, as a result of the Glasnost report, the Ontario government passed a new version of the *Medicine Act*. In 2000, they established a provision which allows doctors in Ontario to use non-traditional methods or modalities to treat patients as long as the risks of using non-traditional treatment are not greater than the risks of conventional treatment.

So that was a very big step forward for medicine in Ontario. But I can say, after this was established in 2000, I was representing doctors who were still being persecuted. And a whistleblower came to my group and said that there was a hit list within the College of doctors who they still wanted to eliminate because they were regarded as dangerous innovators somehow. Even though they were acting, in our view, consistent with the new legislative provision in the *Medicine Act*.

What's going on today has less to do with innovation in medicine than a turning back of traditional medicine. And for instance, it's always been the case. In fact, it's a fundamental right in Western medicine that, once a medication is approved by the government—in this case the federal government, Health Canada—once it approves a medication and puts it on our approved list of medications, any doctor in the country can prescribe that medication on an off-label basis. So in other words, you might have a medication that, I don't know, was for a certain kind of allergy. But doctors may determine through their own experience that it may be effective in treating other problems that people may have. The reason that you have an off-label right to prescribe medication is that with the authorization comes a

side effect profile. So if a doctor can see what the side effect profile is, then he or she is in a position to measure that profile against the needs and the conditions of a particular patient.

So let me bring this back to COVID-19. Health Canada issued a safety alert regarding ivermectin. It's still there on the site—and said that ivermectin was never authorized to treat COVID-19. And so the College here in Ontario took that to mean that this is no longer an authorized medication. And now you will be prosecuted if you prescribe ivermectin, or any other Health Canada approved medication, for the treatment of COVID-19. And what Health Canada doesn't tell you, and what the College doesn't tell you, is that Stromectol, which is the brand name for ivermectin as an approved medication, is still on the Health Canada database. The authorization has not been modified in any way. And so the safety alert is actually just an alert. It has nothing to do with the authorization. Any doctor in the country has the lawful right to prescribe ivermectin for the prevention and treatment of COVID-19. Again, it goes back to the fundamental right in Western medicine to prescribe on an off-label basis.

So the College is proceeding against my clients, some of whom have prescribed ivermectin, but they have done so completely in accordance with the law and the authorization around this medication. Yet the College is trying to take away their licences for doing so.

Geneviève Eliany

This is very much a continuation of the theme you have explained where policies, statements that are certainly not law or regulations, are being prosecuted as law.

Michael Alexander

Yes. And you know, we have to make a distinction here. We're supposed to be in a society that's governed by the rule of law. I've actually never been a straight rule-of-law guy, I'm kind of a justice guy.

[00:15:00]

Sometimes the law is just, sometimes it's not. But we do prefer the rule of law to the rule of tyrants and autocrats and people with very subjective ideas of how we should conduct ourselves. So the rule of law is very important.

But what the colleges have done is they have published statements and established policies and issued guidelines. Well, the Ontario Court of Appeal has said that a statement, a policy, or a guideline is not a law; it's just a recommendation. And yet, the colleges are treating these guidelines and recommendations which they post as if they have the force of law and as if they can be used as a basis for investigating and prosecuting doctors and other health care professionals. So it's a very troubling situation because essentially what we have—in particular with the College of Physicians—is bureaucrats simply inventing the law and then using it to prosecute doctors and rob thousands of patients of medical care.

Geneviève Eliany

So once someone has been found guilty or there's been a misconduct finding against a doctor or nurse or other health professional, they have the opportunity to bring a judicial review. And that's something that you've been involved in as well, correct?

Michael Alexander

Yes, that's right.

Geneviève Eliany

And how have the courts been treating these judicial reviews?

Michael Alexander

Well, what is going on in the courts is deeply troubling.

In Ontario, if a doctor, for instance, has been suspended—well, let me take a step back here. The courts will review the decisions of administrative tribunals. And all these colleges have tribunals and they make findings against doctors. They are discipline tribunals. They make findings as to whether a doctor, or another health care professional in other disciplines, has committed an act of professional misconduct. And they can revoke a license, or they can levy fines. The powers are very substantial.

The courts have taken the view that, "We prefer to see a final decision from a tribunal before we address an appeal of that decision and review it to determine whether it was properly decided." There is one exception, though: you can get into the system here in Ontario and have the Divisional Court review a decision if someone's licence has been suspended. And that's true in the case of my clients.

So I went to the Divisional Court with one of my clients, Dr. Luchkiw, who had her license suspended. Which robbed 1,700 patients of care, 20 per cent of whom were in palliative care. And all they had with Dr. Luchkiw was the mere suspicion that she may have written one medical exemption for COVID-19 exemptions. I brought this to the attention of the Divisional Court. Now, the Supreme Court of Canada made a very fundamental and important decision in public law in 2019, in a case called *Canada (Minister of Immigration and Citizenship) v. Vavilov*. It's referred to generally as the *Vavilov* decision [Exhibit TO-24h]. And in *Vavilov*, the Supreme Court says that when the courts are reviewing the decision of administrative tribunal, they must hold the tribunal to a very high standard of review when we're talking about basic statutory terms in the legislation that empowers the body in question, and if we're talking about well-understood legal concepts and terms. So you don't defer to the expertise of the body around things like that. They have to actually get the right answer in matters of law.

In this case, I am challenging whether the College had reasonable and probable grounds for actually initiating the investigation against Dr. Luchkiw—and by extension raising the question of whether they ever had the right to suspend her licence. If the Divisional Court were going to follow the ruling of the Supreme Court of Canada, then it would have to examine what "reasonable and probable grounds" means in our legal system. There are obviously criminal precedents for this. It's the term that's used in criminal law, as you know.

[00:20:00]

It's a well-understood concept, a concept in Anglo-American law. And the Divisional Court essentially refused to do that and just deferred to the College's interpretation of reasonable and probable grounds. I found that shocking. So the court found against us, even though there is an Ontario case called *Cezanne*, which the Ontario Court of Appeal issued in 2012, which is quite clear. It made very clear that this term, "reasonable and probable grounds" is

the criminal standard and there are many precedents which would inform us as to what that means. That was pretty well ignored by the Divisional Court. In fact, it was simply ignored.

And so now I'm asking— I'm seeking a motion [Exhibit TO-24a]. I've issued a motion document to have the Ontario Court of Appeal grant us leave to have this whole issue of reasonable and probable grounds addressed at the level of the Supreme Court and the Ontario Court of Appeal's previous decisions. But the court has discretion on whether to grant us leave. And so I have no idea whether this problem is going to be addressed. It will be very troubling for us if the court refuses to address it, because then we would never have access to go to the Supreme Court of Canada to ask the court to enforce its ruling in *Vavilov* against tribunals in Ontario.

Geneviève Eliany

If there's no court enforcement, ultimately it will worsen the college behavior. Isn't that fair to say? They'll be able to continue applying suspicious or poor standards without effective judicial review.

Michael Alexander

Yeah, you're essentially letting the colleges off the leash. You're not going to come in. I mean, nothing could be more fundamental than that you must meet the standard of reasonable and probable grounds to initiate an investigation. If you're not going to police that then you're essentially saying, "You can do whatever you want." I mean, it's essentially a blank cheque to oppress, intimidate, and tyrannize members of the health professions.

Geneviève Eliany

You've mentioned one case and you've named this case. Would you say that this is a pattern in Divisional Court? Or is it an outlier that you're working on?

Michael Alexander

I have to be careful about what I say. Because, as a member of the bar, I must—particularly if I'm criticizing a court—I must make very clear reasoned arguments. But I think it would be fair to say that the Divisional Court has essentially given up on its mandate to review the decisions of administrative bodies in Ontario. It is true that specialized administrative bodies deserve a certain degree of deference in the way they make their decisions. For instance, if I brought a case to the Divisional Court and said, "I want you to review how the College made this decision about whether a doctor should prescribe a certain type of anesthetic for laparoscopic surgery for heart valve replacement." Right, so yeah—maybe the court should think twice about whether it has the expertise. And it perhaps should recognize that there are a number of different decisions that the College might make or maybe that they shouldn't even be reviewing the College on that point.

There is some role for deference when taking a look at what a specialized body does and how it makes decisions. But the Supreme Court has said there should be no deference, as I've said before, when it comes to well-understood legal concepts and terms. And the problem with the Divisional Court is not just that it seems to be ignoring the Supreme Court, but it has established a doctrine of deference that is so encompassing and so broad that really, its whole mandate to review the decisions of these tribunals is really just now non-existent. They're essentially just rubber-stamping whatever the colleges do in these

kinds of matters. And so I would never advise a client today that we should go to the Divisional Court to solve their problems. I would say, "Well, we have to go to the Divisional Court. And then we have to hope that then we can go to the Court of Appeal and get what I believe to be a more nuanced and responsible reading of the duties of the court in this situation."

Geneviève Eliany

Let's chat about *JN v. CG*. Why don't you explain what kind of case that was?

Michael Alexander

This was a case decided by Justice Pazaratz in the family law courts [Exhibit TO-24f],

[00:25:00]

over a year ago.

This involved a case where you had two parents: the mother had custody of two children, they were separated or divorced. And a dispute arose between the parents as to whether the children should receive the COVID-19 injections. The father wanted them to receive it, the mother did not. So this had to be dealt with in the context of the court under family law legislation.

Now, neither the mother nor the father introduced expert evidence. The father produced printouts from the Health Canada website, essentially provided government information about the injections. And the mother provided some reports and studies by people like Dr. Tess Lawrie, Dr. Robert Malone, the founder of the mRNA technology that's been used in these injections. So she provided some kind of expert evidence, because they're not bringing forth experts. Now as you know, in a case like this, if people are not providing expert witnesses, the court is limited to the information that the two parties put in front of it and must make a decision based on that.

Justice Pazaratz was quite influenced by the fact that the mother had read the Pfizer monograph that comes with the injection. And it listed over 24 possible side effects and could I just read what those were? So the mother brought that forward and said, "I have concerns that my kids might be subject to some of these side effects." So this is in the case itself, this is quoting directly from the Pfizer monograph. These are the possible side effects: "difficulty breathing, swelling of your face and throat, a fast heartbeat, bad rashes all over your body, dizziness and weakness." And then there's a second list: "chest pain, shortness of breath, feelings of having a fast beating, fluttering, or pounding heart, severe allergic reactions, non-severe allergic reactions such as itching hives or swelling of the face, myocarditis, pericarditis, injection site pain, tiredness, headache, muscle pain, chills, joint pain, fever, injection site swelling, injection site redness, nausea, feeling unwell, swollen lymph nodes, diarrhea, vomiting, arm pain."

I might mention in relation to myocarditis, when this is mentioned in the press, it's kind of mentioned in passing. The doctors I represent have impressed upon me that if a child gets myocarditis, the inflammation in the heart actually destroys heart cells, which can never be replaced. It actually destroys nerve cells that are responsible for the beating of the heart. And 50 per cent of those children—and this would include adults as well—will die within five years of having myocarditis. So this is a very— This is essentially a death sentence for some people.

The judge was quite persuaded, just on the basis of the possible side effects, that the mother had legitimate concerns. And he actually decided this matter in favour of the mother and was not persuaded that the government printouts dealt in as much detail with these problems as the mother had in the materials that she addressed.

Geneviève Eliany

Unlike the Divisional Court cases that you've mentioned, would you agree that this case is an example of the judiciary pushing back? And even the language of the text is unusual? It made it to social media, which is unusual for case law. But the judge expressed frustration that people couldn't ask questions anymore.

Michael Alexander

Right. And right at the very beginning of the decision, he makes an extraordinary attack on the idea of misinformation. Perhaps I could read what he said here, because I've used it in my own cases. He says, "is 'misinformation' even a real word, or has it become a crass, self-serving tool to pre-empt scrutiny and discredit your opponent, to delegitimize questions, and strategically avoid giving answers? Blanket denials are almost never acceptable in our adversarial system. Each party always has the onus to prove their case, and yet 'misinformation' has crept into the court lexicon: a childish but sinister way of saying, 'you're so wrong, I don't even have to explain why you're wrong.'"

Geneviève Eliany

What happened with the JN case at the Court of Appeal level?

Michael Alexander

It was overturned by the Court of Appeal [Exhibit TO-24].

Geneviève Eliany

Did they have any commentary about it?

Michael Alexander

It's an extraordinary case, in particular because one of the judges presiding was the new Chief Justice of the Court of Appeal.

[00:30:00]

Well, first of all, the Court of Appeal said that the mother's evidence about the side effects should not, essentially, have played a role in the decision. The Pfizer monograph should not have played a role in the decision. Because in drawing attention to those side effects, the mother was holding herself out as an expert witness, and she was not qualified to be an expert witness. Think about that for a moment: the Court of Appeal has said that you have to be an MD or have a PhD in science to understand words like vomiting and diarrhea, swelling of the face. So that's one way in which the decision was attacked.

It was also attacked on another ground. Essentially the court did something— Like, I've been reading cases since 1980, for 43 years. I entered law school in 1980. And the court

came up with a new principle I've never heard of before, which is that government should always be given the benefit of the doubt. So it said that the government—and not just in relation to COVID—but the government has experts and it does analysis. And so if you come to the court and you want to challenge a government decision—in this case one which supposedly comes from Health Canada and the Ministry and experts are involved and so on—the burden is on you to rebut the presumption that the government is right.

How is that possible? I mean, we're supposed to have equal justice in our system. There is supposed to be no bias in the system in favor of either party. There's nothing more fundamental to adjudication in our court system than that. But if you decide to challenge the government on a point now, the Court of Appeal is going to say, "No, we begin with the assumption that the government is right and you, the citizen, you are wrong."

There's no authority for this proposition. In fact, what the court does by way of authority is very troubling. It quotes a provision from the *Evidence Act* to the effect that if the government issues a decision or makes a statement and actually publishes it officially in a document, in the Gazette, where you find new legislation, or through a statement by a ministry, you can take that to be confirmation that the statement was made. And they take that rule and they transform it and interpret it to mean that if the government publishes a statement, you can also assume the veracity of the statement. So it's not just that the government's made the statement, but that the statement is true. That is not what the rule says. This is such a misapplication of this basic rule of evidence that— I mean, if you wrote this on a first-year law school exam, you would flunk.

Geneviève Eliany

That's very true. They've made hearsay admissible for the truth of its contents, which is contrary to very basic law.

Michael Alexander

There's just one other thing they did, which is quite extraordinary. Which is, you know, they did say that— Essentially, they took it as a matter of judicial notice that the vaccines are safe and effective. In other words, that is a fact which is beyond dispute just because that's what the government has said, right? So this is where the assumption in favour of government comes in.

But they cite a case for that authority, which has recently been cited in Saskatchewan—also a family law case. And in that case, the Saskatchewan Court of Appeal was very clear: they took the very opposite position. They said you can never assume that what the government has said regarding the safety and well— You do not have to take at face value the statement **by the government that the vaccines are safe and effective. For two reasons. First of all, that "safe and effective" conclusion is only made within certain parameters. And you, as a patient, may fall outside of those parameters or boundaries. So this kind of statement can never be treated as absolute. The second reason that they gave for not taking this as, so to speak, a judicial fact, is that we know that governments can get it wrong. And they pointed to the thalidomide disaster. So the government assured people that thalidomide was safe and effective until there were thousands of deformed babies. And so they took notice of the fact that you can never assume that government is right.**

So how the Court of Appeal can take this case from the Saskatchewan Court of Appeal,

[00:35:00]

which is contrary to what the Court of Appeal here in Ontario is trying to prove, and use that as authority is to me astonishing. Absolutely astonishing.

Geneviève Eliany

Just to give the public, if you're able to answer, an idea of litigation costs. Let's say a parent, a regular citizen, wanted to litigate this sort of issue to rebut the benefit of the doubt that the government has about a vaccine issue, let's say. How much would it cost to get to the Supreme Court?

Michael Alexander

Hundreds of thousands of dollars. Just representing three clients of mine, who I'm representing on a pro bono basis. Mostly I've represented them using my own savings, but I have received some public donations. But in representing them over the past—well, let me say, representing them just since June 23rd, I mean, I did an invoice recently, just to give us some idea of what the actual costs have been. So billing at my normal rate since June 23rd, the cost for defending three doctors before the colleges would be \$1.2 million.

Geneviève Eliany

Do the doctors' insurance, the malpractice insurance and so on, not cover any of the legal fees?

Michael Alexander

Well, this is another story in itself. You see, all doctors in the country pay into an assurance fund, it's called the Canadian Medical Protective Fund. And so it's referred to as the CMPA, Canadian Medical Protective Association. You pay those annual fees and you have lawyers at your disposal at a number of very high-level firms across the country who will defend you on malpractice litigation and they will also represent you if you have problems with the College.

But the CMPA will not defend doctors vis-a-vis the colleges based on a defence of the doctors' Charter rights or based on the defence that the College is not acting within its jurisdiction. So if I could put that in layman terms: essentially the insurance lawyers for the doctors will not challenge the framework for decision-making that is given to it by the college. It won't use the Charter to challenge the framework; it won't use the legislation to challenge the framework. So it negotiates within a framework that is already unjust and abusive.

Now, most doctors in this country don't know that. Some eventually find it out. But they cannot get a copy of the insurance policy where the CMPA has secretly decided that they will only provide a partial defense of doctors vis-a-vis the colleges. Okay. And so doctors can only get an adequate defence, with all of their rights fully pleaded before a college, if they hire an independent lawyer such as myself.

Now, what's going on here is quite extraordinary, you see, because there's a kind of collusion going on here. Because if the CMPA does not solve the major legal problems around these College investigations of prosecutions, it can keep on billing. And the College likes that. In fact, they endorse the CMPA, and they refer you to the CMPA whenever you get into trouble because the College gets to build up its resources if no problems are solved. It

gets to hire more lawyers. It gets to go to the members and the government and ask for more money. So they both have their little fortresses and they do battle, but it's a faux battle. And it's good for everybody except doctors and patients.

Geneviève Eliany

And the insurance is mandatory, is it not? Much like it is for lawyers, I would think?

Michael Alexander

It's mandatory to carry. But in some provinces, you need not carry it with the CMPA. You can get an alternative policy, but most doctors don't know that.

Geneviève Eliany

Right, the College won't be telling them.

Michael Alexander

The College certainly will not be telling them.

Geneviève Eliany

All right. I'm sure the commissioners have a number of questions for you. I'll turn it over to them.

Commissioner DiGregorio

Thank you for coming today and sharing your testimony with us. We heard from a witness yesterday about some of the extraordinary deference the courts have been giving to the administrative state, which I think probably is along the lines of what we've been talking about today with the tribunal that the doctors are dealing with. And I'm just trying to think about it. I asked our witness yesterday what the recommendation was to deal with

[00:40:00]

the problem of courts paying too much deference— And what I heard was that it would be very difficult to deal with because the deference comes essentially from the common law and from the Supreme Court of Canada case of *Vavilov*, which you referred to today. Which, as you mentioned, gives a very high standard of review when you're dealing with questions of law but has a very high standard of deference actually to administrative tribunals, the standard of reasonableness, when they're dealing with their own matters of expertise. And so presumably—and you can correct me if I'm wrong here—they've been applying this reasonableness level of deference in your cases, where the doctors are being prosecuted.

Michael Alexander

Right.

Commissioner DiGregorio

So I guess, what would be a solution to getting the proper level of deference applied in this type of situation?

Michael Alexander

Right. Well, I think that the Divisional Court has willfully misinterpreted *Vavilov*. I mean, I find Ontario has not dealt with the full consequences of this decision. It's a very long, complicated decision. It's almost 100 pages. I spent quite a bit of time studying it with my junior. It takes a lot of study to get it right. But the problem is that there doesn't seem to be the will in Ontario to, in fact, apply what the Supreme Court has said about these important matters going to core legal issues or straight legal issues—which considerably reduces or eliminates this doctrine of deference in the review of administrative bodies. I think, properly understood, *Vavilov* gives the citizen and regulated persons a much greater opportunity and more power to have decisions reviewed on the standard of correctness. Which is to say it's got to be right or wrong—either way, right?

And another thing that *Vavilov* does, which very little notice has been taken of, is, if within your statutory scheme there's a statutory right of appeal into the court system from a tribunal decision, that court must decide—or must review—your case on the standard of correctness, not reasonableness. In other words, you have to get every issue right. And that's quite an extraordinary ruling because that means, if you're back here at the tribunal stage, you better try to get it right on the standard of correctness. You can't be sloppy about how you're making your decision because if you say, "Well, we can make this decision in a number of different ways on statutory right of appeal," the court will come in and say, "Hey, wait a minute, you can't do that." So this has thrown a wrench into the administrative state that has not been fully dealt with. And I would say that there's enormous denial about what it really means.

Commissioner DiGregorio

And so is it your view that, if these cases you currently have were able to be appealed up to the Supreme Court of Canada, that the *Vavilov* case would actually result in the standard of correctness being applied?

Michael Alexander

On these issues of law in which we're fighting, I absolutely believe that to be the case.

Commissioner DiGregorio

So it's not that there's an issue with *Vavilov*, it's just the misapplication of it by a lower court.

Michael Alexander

Yeah, I would say so. We should be in a better position than we are.

Commissioner DiGregorio

And, sorry, did I just hear you mention that if there was a provision in the legislation that applied the standard of correctness, that that would also perhaps have a different result?

Michael Alexander

No, I believe the Supreme Court in *Vavilov* has said that. So for instance, in the *Regulated Health Professions Act*, there's a statutory right of appeal into the court system. So in the

statute, it says, if you don't like the decision your tribunal is made, you can appeal into the Superior Court—or it's actually into Divisional Court—to have it reviewed. But what *Vavilov* says, in the statutory regimes where there is a statutory right of appeal, then when it goes into the court system, it's not a reasonableness review, it's not a deferential review, it is a correctness review.

Now, the issue to be decided there is whether there's any deference that can be accorded to, say, the example I gave earlier about the use of anaesthetic. Like, maybe there are some small cut-outs here where some deference will be shown. But the standard will be, on appeal, correctness. Which means the tribunal has to get it right. If they don't get it right, then the court will correct them. I mean, it's no different than a high school math test or a chemistry test. You've got to get the right answer and, if you don't, you will be corrected.

Commissioner DiGregorio

Thank you. And I was surprised to hear that you need leave to apply to the Court of Appeal in these cases and—

Michael Alexander

Right.

Commissioner DiGregorio

I'm not an Ontario lawyer,

[00:45:00]

I don't practice in this area. So maybe you can just explain that to me.

Michael Alexander

Yeah. So normally, for instance, if you have a trial, you're at the trial level in the court system on Ontario; and you lose, you have an automatic right of appeal to the Ontario Court of Appeal. And then if you don't like what the Court of Appeal says, you can apply to be heard by the Supreme Court of Canada—although it only takes 10 per cent of the applications it receives every year, so your chances aren't very good. But that's how the system works. But if you appeal into the system under the category of judicial review and you don't like the decision that the court made on that review, then you actually have to bring a separate motion to persuade the Court of Appeal that it should actually hear you on the issues. And then if you're successful there, then the Court will review the lower court's decision.

Commissioner DiGregorio

And does that come from the rules of court?

Michael Alexander

No, that's been around for a long time.

Commissioner DiGregorio
That's common law?

Michael Alexander
Yeah, it's in the rules of civil procedure.

Commissioner DiGregorio
Okay. Thank you.

Geneviève Eliany
Thank you very much, Mr. Alexander, for explaining some of the difficulties with the courts and legal decisions.

Michael Alexander
Thank you. I apologize for being a bit halting in some of my comments. There are so many complications in how this has unfolded, it's just very difficult sometimes to just get it out clearly and cleanly. And particularly with people watching us, you know—get it out in a way that people can actually understand what these technical issues are about. So I hope I accomplished that today.

Geneviève Eliany
You certainly did. It's difficult to simplify these issues.

Michael Alexander
Thank you.

Geneviève Eliany
For the benefit of the commissioners, I can advise that all the cases, including the Glasnost Report that was referred to, they're exhibits [Exhibits TO-24, TO-24b to TO-24h].

[00:47:05]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 9: Cindy Campbell

Full Day 2 Timestamp: 06:47:20–07:46:05

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Could you state and spell your name for the record please. Or should we wait for the fourth commissioner to return? No? Okay, very well. If you could state and spell your name, please.

Cindy Campbell

My name is Cindy Campbell and that is C-I-N-D-Y C-A-M-P-B-E-L-L.

Geneviève Eliany

Since you're in person, you may notice that I'm not always looking at you and it's because of the Zoom screen of course, so I hope it won't be too distracting for you.

Cindy Campbell

Don't worry.

Geneviève Eliany

I understand you were a nurse for a very long time, for 30 years, is that right?

Cindy Campbell

Correct. Twenty-eight years to be exact.

Geneviève Eliany

And you have an unusual balance of frontline skills and academia. Is that fair?

Cindy Campbell

Correct.

Geneviève Eliany

Okay. Why don't you tell us about some of your work in academia?

Cindy Campbell

Sure. So just to detail a bit about my education, I started as a Diploma Nurse from Mohawk College in Hamilton and then got my Bachelor of Science in Nursing from the University of Victoria. Then I went on to complete a Masters in Science in Health and Aging at Queen's University. I went on as well to do some—two actually—very competitive RNAO [Registered Nurses' Association of Ontario] Advanced Clinical Practice Fellowships. And on my first one, I published a paper: "Training of Endoscopy Nurses." And then in terms of my academic components at work, I did go on to be an educator; but prior to that I always very much prioritized my frontline contributions. I found that that was essential and often a lot of a disconnect with, let's call them the "higher-ups, is that they didn't really have that frontline long-term experience. That's sort of the engine of the hospital that I always probably found the most rewarding of my work.

Geneviève Eliany

By frontline you're referring to hospital work, that would be about the ER and in the operating rooms?

Cindy Campbell

Correct. Now, I was in perioperative services. I'm a certified operating room nurse and I also held certification from the Canadian Nurses Association in gastroenterology. And I was able to work across— I was the only nurse in my hospital actually that could work across all divisions of perioperative services, so I could work in the OR, our recovery room area, and also in our endoscopy unit.

Geneviève Eliany

Going back to your fellowships: You mentioned them very humbly, but these fellowships were through the Registered Nursing Union of Ontario?

Cindy Campbell

The Registered Nurses' Association of Ontario. The RNAO. Yes.

Geneviève Eliany

Thank you for that correction. And my understanding is that it's quite rare, or it's a privilege, to do these fellowships?

Cindy Campbell

They really are. They tend to be very, as we said, very competitive. And you really have to have a really well laid-out application package. And also, you really have to have the support of your hospital behind you, so the hospital has to really endorse what you're

doing. And you also have to be a respected employee to have established that rapport and trust to go ahead and be granted one of those. So it's a combination of the application and the hospital end.

Geneviève Eliany

One of the fellowships was with respect to the knowledge or the practice gap for new graduates. Is that correct?

Cindy Campbell

Correct.

Geneviève Eliany

Okay.

Cindy Campbell

My hospital was concerned. There's sort of a quite established body of evidence in the nursing profession of sort of a well-identified practice gap with recent grads. And this is that they are lacking—through no fault of their own—but they're lacking in a lot of the clinical skills and some of the coping mechanisms and that kind of thing, to endure when they get thrown into, so to speak, a full-time job. So this particular fellowship was to try to interview different levels—whether that be university profs, nurse educators, frontline nurses—and to try to devise ways that perhaps as the hospital we could move forward to better support our new grads transitioning to practice.

Geneviève Eliany

So that will eventually take us to some of our later discussion on the effects of the pandemic.

[00:05:00]

Let's set the stage with respect to the hospitals early on in the pandemic. What was happening both in the ER and in the operating rooms? How busy was the hospital?

Cindy Campbell

Now again, I can only speak to what I would have witnessed as an OR nurse at that time. I was actually casual at that period. It was just before I was doing some of the fellowships. I was casual in my ambulatory surgical unit. That unit was closed and we were told we were going to all be put into the main OR. And from my perspective of what I saw there— Now to be fair, I didn't come in that often during the pandemic, proper, at the beginning. That was because at the beginning I was told I would be needed to cover a lot of sick time and that I would be trained with all the other nurses to be redeployed potentially in need units across the hospital. But that never happened. I rarely came in to cover sick time. And in terms of going to the other units, I also was never redeployed there. And the majority of the staff I worked with, from what I'm understanding, were not either.

What I think people didn't understand about the pandemic is: let's say you were to take an area like the operating room. We had, let's call it, 16 rooms. When you start closing those

rooms down to, say, emergency rooms only, which is what they did— So let's say that was, I forget—let's call it five ORs functioned out of 16—you now have a surplus of staff. Because again, you can't just tell people not to come in when they have been booked or guaranteed work—part-time or full-time staff. So that had excess staff in the OR alone. And then the recovery room is also staffed to accommodate that number of patients, which was dramatically reduced. And then so on throughout the hospital. There's ambulatory clinics that were staffed with nurses that were also closed down.

So in actuality, from what I was seeing, there was a lot of excess nurses that were often being used to do quite menial jobs. Not menial, important—but jobs that wouldn't necessarily have conveyed what the nurses at that time were being depicted as being, quite stressed out and overworked. A lot of them were doing testing, surveillance of people coming into the hospital, that kind of thing. And I did note that the staff rooms were amply full of staff. And just, like when you see those videos of the staff dancing and doing the conga lines and the pillows in their pants and stuff and goofing around, that would have been a fantasy for me in my work, to be able to have that much time. Never in my history of work would we have been able to have danced around. Never.

That's not to say that a lot of nurses did not work very hard, but certainly I suggest that not all the nurses deserved the accolades of the heroes that they were getting at that time.

Geneviève Eliany

On the few times you were called in to work, how busy were the emergency rooms as far as you could observe? I know it wasn't your ward, but I understand you had to walk through there.

Cindy Campbell

Yeah, so what I observed of the ER— And again, to be fair I was not in there with any significant regularity, but all I can do is compare it to what I was used to. My unit used to be attached to the ER, so I would often go in there for supplies or to send samples, specimens, that kind of thing. And the ER prior to the pandemic resembled what I would call a war zone. It was beds in the hallways, every cubicle full, the nurses super busy. And in the times during the pandemic it was, compared to that picture, very calm: beds not full, cubicles not full, nurses sitting more and having a bit more time by all appearances. And again, nowhere nearly the pictures that I was expecting or what I was used to.

Geneviève Eliany

Now, of course, that changed as the pandemic advanced.

[00:10:00]

What happened with respect to staffing levels once the vaccinations became required?

Cindy Campbell

Well, again, that's kind of difficult to say, only because of what was happening during that time. Don't forget, unvaccinated and vaccinated nurses were working shoulder to shoulder and there was no issue. And they were hailed, as we said, as equal heroes—the vaccinated and unvaccinated were both hailed as heroes.

In terms of what happened to the staffing, those numbers really were not declared. The hospital did not announce their official numbers. And again, I think what a lot of people aren't understanding when they're told about losses in health care is they're not given an accurate picture. We hear people like Doris Grinspun from the RNAO disqualifying and just dismissing this as a small, few number. Meanwhile, what they're not telling people is that the hospital at that time said to nurses and everyone, "Hey, if you want to leave right now, leave. And we won't put a black mark on your record and we won't report you to the College." Because it is process that every time a nurse is terminated, that report would go to the CNO [College of Nurses of Ontario]. And of course, justifiably, that worries and concerns a lot of nurses. So a lot of nurses resigned and possibly even—I can't say it was equal number or even more, I don't know—but let's just say that anyone younger-looking, to keep working in the profession for numerous reasons, would have much more taken the opportunity to have accepted the resignation route versus the termination route.

And there was another field, of course, of people who took early retirement that I've heard of. They did that way out as well. They'd had enough. And another group took leaves. And that's another segment that is also typically not captured in apparently these tiny numbers discussed in the press.

Geneviève Eliany

My understanding is that apparently at Hamilton Health Sciences—and that's a very large health network—the retirement rate was 30 per cent.

Cindy Campbell

Well, apparently, over 2022, it had a 30 per cent increase. And Hamilton Health Sciences is an interesting one, just to sort of give an example of potentially some numbers that were lost here. I'm not saying they were all lost to mandates but in September of 2021, Hamilton Health Services listed about 700 vacancies. Then that is when they started threatening the policy. They brought it in officially in January. And a recent report coming out of that same health network reports staff vacancy now of 1,500 staff—so that about doubled their vacancy rates since then plus potentially, they had the retirement rate go up as well.

Geneviève Eliany

We'll take a step back to some of the medical recommendations from Dr. Kieran Moore and what the hospitals did. Can you tell us what the official guideline from the Chief Medical Officer in Ontario was with respect to vaccine mandates for staff and what the hospitals ended up doing?

Cindy Campbell

Yeah. And that's kind of the puzzling part here. Our Chief Officer of Health, in a Directive 6 that he put out in August of 2021, had an accommodation for unvaccinated workers to keep patients safe and protected. And that was to do regular antigen testing.

And it was potentially at that time, to sort of give a bit of a timeframe: in July of 2021 you have the CDC [Centres for Disease Control and Prevention] acknowledging that there has been sufficient data to show that there has been vaccine breakthrough reinfection and that evidently the vaccinated, once sick, were carrying the same viral load as the unvaccinated. And that is why you saw the CDC's mask recommendations change.

[00:15:00]

For a little while it was, “Hey, the vaccinated don’t have to mask,” to suddenly, “They do have to mask.” So they knew something, as did Kieran Moore, as did the hospitals: that this vaccine was starting to show some inabilities or limitations to quite live up to the standards of a newly vaccinated individual. So as we said, the hospitals went ahead. And instead of listening to Moore’s accommodation, they followed the Ontario Science Table. And the Ontario Science Table allotted for no accommodations. It was either vaccinate or nothing. They took much more the militant stance versus the offering workers a choice.

Geneviève Eliany

Before we move on to the choice issue, while these policies and mandates were in place for staff, my understanding is that unvaccinated visitors were allowed into the hospital. Is that right?

Cindy Campbell

There was a time when, sadly, they were not, but the policies did change. And over the last, thankfully, several months, even longer, they did stop them. And there are certain hospitals like St. Joseph’s Hospital in Hamilton, where I believe that the unvaccinated visitors were allowed—in the process when they were firing people as well. So that was definitely an inconsistent application of the policy.

Geneviève Eliany

Yes, apparently, visitors somehow become more important than nurses, which is peculiar.

Cindy Campbell

Correct.

Geneviève Eliany

So going back to the choice. Often, people will say that immunizations, vaccinations are nothing new for staff in healthcare. Can you comment on how it’s true that there are policies and requirements, but on choices that exist for all the other vaccinations?

Cindy Campbell

Yeah. So again, that’s another bit of a massaged fact. There are in fact required vaccines to obtain jobs at hospitals. But when I hear Anthony Dale, CEO of the OHA [Ontario Hospital Association] speak, he mentions things like TB, hepatitis, and measles/mumps/rubella [MMR]. To clarify some of those: TB is not a vaccine requirement, that is done by a skin test that is taken. Hepatitis: the majority of hospitals that I know of, it’s a recommendation, not a requirement. And indeed, things like MMR and chickenpox often are requirements. However, they allot for natural immunity, so they allow staff to show proof of antibodies, proof of past infection. And that is not the case in COVID of course, even though now they have good evidence to show that natural immunity is indeed as strong as, if not possibly stronger than, two vaccines. But natural immunity is completely disqualified in this case.

Also in hospitals, they used to—when I say used to, they still claim to but their past behavior shows they are not—give religious or creed exemptions. An interesting case in my

hospital is that I had a colleague start working in the OR, I believe it was about six or eight months prior to the pandemic. She submitted a religious exemption for MMR vaccine and the hospital accepted it and had her working in the hospital. That same nurse was fired for the same religious exemption just that short window later. And hospitals also used to accommodate medical exemptions without a near threat of death, which now appears to be the standard for COVID. And time and time again, there's nurses who had to leave nursing because they've had quality medical concerns, that their doctors confirmed were indeed warranted an exemption. But every doctor said, "I cannot write this for you, I will lose my license." And that is unprecedented.

So again, it's this lack of choice that is concerning in a democracy and in Canada.

[00:20:00]

We have an interesting arbitration finding out of British Columbia. That was, the Health Services Union there put forward a— They challenged a mandatory mask or vaccinate policy. And this was where they offered the choice of, "You can take a vaccine or you can wear a mask—an influenza vaccine or a mask." That policy was won by the employer but the arbitrator had some pretty clear words about choice. Throughout his findings, it is consistent that he emphasizes the dignity of choice over receiving a medical procedure. He confirms that if the mask was being used for the sole purpose of increasing vaccination rates, he would be very concerned. And that would not be something that would be within the letter of the law. Again, he consistently speaks about policy that had to be not arbitrary but logical, reasonable, fair, and equitable of course. And interestingly enough, one of the expert witnesses for the hospital, Dr. Van Byunder, I believe his name is, said: "You know, we really want to give our people a choice. We have many valuable people with religious concerns that may not want this vaccine and we want to give them the choice of a mask."

In this case, with COVID vaccines, we had the choice of taking testing. And again, that would have been the humane, dignified way to do things, but that was rejected. And again, the Ontario Science Table put forth some very puzzling data. For example, in the height of being just about to begin their terminations at hospitals, they put out a report about the risk of burnout to the healthcare workforce, and how that burnout was getting to be to unsustainable levels, and that likely it would cause again an unsustainable hospital workforce. They also said that hospitals must take every measure they can to secure staff, to reduce turnover, and to reduce overtime, that kind of thing. So from this corner of their mouth, they're saying, "Stop burnout. It's dangerous. It's going to cause our system to collapse." And this corner of their mouth, they're telling the hospitals to terminate nurses.

If I could go on, I found it very again, shocking from the Ontario Science Table. Here, if you can read their letter to Ford in support of mandatory policy, it is a very—wow—shocking read. I wonder if all the people standing behind the Science Table actually even read this document. It begins by saying, "We know staff turnover is a problem and we don't want it, but we know that vaccinated [sic] staff are going to get really sick all the time and they're going to cause a lot of burn-out to the vaccinated that, of course, are never going to get sick and are going to stay there working. So you're better to fire them than let them have sick time." And that's very rich, because data from FOIs [Freedom of Information requests] submitted to these hospitals showed that staff illness rates in hospitals with mandatory policies in place went through the roof in January with Omicron. Also B.C. shows: at one point they were talking again about record-breaking staff illness; 28,000 staff was off in one week in B.C., a province with a mandatory policy. So this showed not only some of the limitations of the vaccine to control Omicron, but that the policies in fact had some pretty questionable outcomes, potentially.

Geneviève Eliany

It was so bad in B.C. based on what I've read—and I believe also in a few small towns in Ontario—that hospitals closed in rural areas.

Cindy Campbell

Yeah, that's very concerning.

[00:25:00]

And again, all of this speaks to the necessity of these hospitals to have done risk assessments, to have figured, "Okay, how is what we do to our staff going to impact public safety?" And we all know now that apparently our livelihoods, our children's education, and everything appears to now be tied to hospitals—sustaining hospitals, hospital resources. So to have hospitals fire trained, experienced staff and potentially lead to some pretty serious concerns that happened as a result: I mean, we have a *Toronto Star* article that speaks about an analysis that showed a staggering number of closures across the province. The nursing shortage by ER doctors was described as brutal. Some said that the healthcare networks were on the verge of collapse. And like we saw with that data from Hamilton Health Sciences, the vacancy rates went through the roof.

The more concerning part is that these hospitals—and maybe not even call them hospitals anymore, I think what we have to start doing is making the CEOs that did this accountable. These CEOs knew well that there were already significant vacancy rates at their hospitals when they put in these policies. And that subjects their patients potentially to some pretty serious quality and safe care concerns. And these CEOs also— Their responsibilities now, like we said before, with the functioning of healthcare to their community, they need to start realizing that their obligations extend beyond just their walls. They can no longer when they make decisions like that, just say, "Well, this just affects our patients and our staff." Now we know that we're intimately tied to hospitals and keeping hospitals going. As we said, I think that if they had been following proper, well-established standards around developing policy, that starts always with a risk analysis. And I would argue that these institutions likely did not do that. And that put the public at risk. It put their patients at risk.

And the risks from these kinds of policies are numerous. Another major risk that is never discussed is the risk of demoralization of staff that felt as if they were coerced to vaccinate. And what do you do to staff, or how does staff react, when they come back into a workplace setting where now they feel depersonalized, they feel detached from their employer, they've lost their support. You now have potentially higher absenteeism rates, staff that just are not invested any longer. Again, burnout and leaving the profession if they felt violated like that. I read a report out of New York state when they put in their mandate and it bragged that they had 55,000 workers fold in the last week. That's nothing to be proud of. That is shocking to do that when they had a choice. And no one is not honoring a nurse's responsibility to protect patients. Of course they have to and they have to play a role in that. But there are many non-pharmaceutical, reliable, safe, consistent ways that healthcare professionals can protect and it does not have to be a vaccine. And that was acknowledged by our Chief [Medical] Officer of Health.

The other major risk is financial risk. And that one should have stopped this immediately on that alone. You know, when you do a financial risk analysis, your first option is to look at the least costly ways to meet your objective. And the least costly way clearly would have been again to have offered antigen testing. What they're facing now is costs of retraining. And I was reading some material from human resource expert and to replace a mid-level

employee, you're talking about potentially around 150 per cent of their yearly salary to do that.

[00:30:00]

When you start getting into specialized knowledge, you're now looking at even upwards of sometimes 400 per cent of their yearly salary. And when you look at some of these nursing jobs or some of these, again, other skilled workers at our hospital: this is extremely specialized knowledge that they had. They fired ICU nurses with 30 years experience. They fired NICU nurses with tremendous experience. And that is criminal: what they have potentially done to patients that could have benefited from those nurses' care. Also, replacement costs: they have reports that they were hiring agency nurses at incredibly inflated rates, paying double time, time-and-a-half. And then they've got union arbitrations to manage. So to a universal healthcare system that was already in crisis long before the pandemic, this alone is a very reckless act on behalf of the CEOs—doing this without properly looking before they leapt.

And that's what I would argue that they did. They did not, in my opinion, look at the proper thresholds—particularly with a vaccine that has, what is now being revealed to be rather significant limitations, and the evolving nature of this pandemic.

Geneviève Eliany

For the staff members who were reluctant to accept a vaccine because they don't like the mRNA platform, were they offered what I'll describe as an old-school vaccination based on an inactivated virus? We know that both China and India have those vaccines. Was that ever an option?

Cindy Campbell

At our time, when our nurses were fired, that was not an option. To my understanding, it was just the mRNA at that time. There has been since a Novavax vaccine that has come out. I'm not sure quite of its platform that it uses. But at that time, we only had those options.

Geneviève Eliany

Thank you. The Novavax, I believe, is just a lab-made spike. It's not the full inactivated virus, but we won't get into that.

Cindy Campbell

Okay.

Geneviève Eliany

Now, let's get back to the realities of the staff shortages. What's the approximate average age range of the members that you've lost? You've commented on experience but what age range would you say?

Cindy Campbell

Well, you know that's kind of a significant thing that just I've sort of—I've just been talking to a lot of people and trying to get lots of qualitative, good, rich data from some of these

people who have been fired. And it tends to be that a lot of them were in kind of that sweet spot where the public could have probably got at least five, ten years out of some of these very experienced nurses, who just thought, “No, we’re not doing this anymore.” Our data shows us clearly that before the pandemic, we had an aging workforce. And already at that time it was a significant amount of the staff. They already knew these nurses were 50 and over and that we’d be facing a nursing crisis once we start losing these members. So to hold on to those old nurses, for lack of a better word, was imperative. But rather than hold on to them this would have pushed them aside. And lost them.

Geneviève Eliany

Can you give us a sense of the geographical origin, where the nurses came from, in cases of sort of more vocal nurses who resisted the mandates?

Cindy Campbell

When you say, “where they came from,” do you mean the hospitals or the—?

Geneviève Eliany

I didn’t word that very well. I apologize. So which countries did these nurses come from? The ones who protested the most?

Cindy Campbell

Well, again, hard to say. Generally, the U.K. seemed to have had quite a good pushback. The U.K. dropped their policy. And actually, it was interesting because the House of Lords in the U.K., they had a ruling that they rejected mandatory policy.

[00:35:00]

And the reasons were that “the potential benefits of the proposal were disproportionately small given the subsequent costs for recruitment and the disruption it would have to the health service.” And they stated they would have to be provided with very strong evidence to support this policy.

So again, in terms of nurses that were fighting back, I think it was consistent across many countries, so hard to say just one, but—

Geneviève Eliany

What about immigrant nurses here in Canada? Like the Chinese nurses? Like the ones from Eastern Europe?

Cindy Campbell

That’s a really good point. Because I think what I took issue with a lot with this was, as a nurse, I look at populations. And we’re all taught this: to always look at the lived experience of people and where they come from. And perhaps instead of the name-calling and hate-mongering, I’m just going to call it, that has been going on when someone declines a vaccine, to look at some of where they came from. And so you have to look at their backgrounds. Now, we know Canada is a country of immigrants. We welcome people who escape communism, authoritarianism, dictatorships, and they came to Canada for freedom.

Instead, they got told that they would have to take a vaccine against their will. And these kinds of populations, they stood up in my hospital. I had a nurse who had arrived from China just several years earlier and she just said, “You know, Cindy, this is not what I came to Canada for. I came here for freedom and now this is happening.”

I have a very sad story of a Serbian family from Hamilton. Both of them went through the Serbian War, they came to work in Hamilton Health Sciences, and both of them lost their jobs. And they were literally in PTSD from this. And people can mock as they will on the other side but these are really painful experiences as to why people decline vaccination. And you know, we also have demographics that have generational trauma—well-earned mistrust of the pharmaceutical industry and of health authorities. Black populations and non-Caucasian populations that were experimented upon and those kinds of scars do not go. So to suddenly again name-call them and cast them out and fire them—that is again completely unethical and nothing you would want to see from a health care professional. We also forget about the lived experiences of people who suffered from abuse as children, and they have a very visceral reaction to having someone take away their freedoms. And they are not misogynists; they are not racist; they are not white supremacists. These are real people with genuine psychological reactions here. Very many stood up. A lot of the nurses in my hospital were from Eastern Europe. Again, they know what communism looked like; they know what that looks like and that’s how they interpreted it.

They were a large majority of the group that was terminated.

Geneviève Eliany

It is my understanding that you’re no longer working in the nursing profession. Is that correct?

Cindy Campbell

I am not. I was terminated along with my other colleagues. I have religious beliefs and creed that did not allow me to take a COVID vaccine. But of course, just like every other nurse, my exemption I put in was denied.

I think a particularly troubling fact with my hospital, that’s Mount Sinai Hospital— They put in the mandate, the firing date was November 11th. And I think that that was extra shameful. That was a day that commemorates our country’s freedom, what our soldiers died for. And for a hospital to do that just shows another level of insincerity, inhumanity, and disrespect.

Geneviève Eliany

You’ve mentioned that there was a lack of transparency across the system with respect to the number of staffing losses.

Cindy Campbell

Correct.

Geneviève Eliany

What do you see as a solution to bring about accountability to get that data?

Cindy Campbell

Well, you know, it's interesting.

[00:40:00]

FOIs have been filed to various hospitals and many are refusing to give that data. So I'm not sure if we ever will get transparent numbers on that. But when you look at—I think UHN [University Health Network] admits to saying, "We lost about 1 per cent of our staff." And when they say that they would likely mean 1 per cent, again, were terminated, not all the other things we talked about: the resigned, the leaves, the retiring, the cascade from there. But when you read again, human resources material: when you lose specialized talent and specialized knowledge like that, even 1 per cent is enough to send a system that's already depleted, already has staffing issues, into chaos. And I would argue the numbers are much higher than that.

The Ontario Science Table, again, in the letter that they wrote and that I found had lots of gaps, they said, "Don't worry. Hospitals around the country and the world haven't had any problems. They all say they're going to lose a lot of staff, but they haven't had problems." Meanwhile, they cited an article that was in *The BMJ* from Italy. And Italy reported with their nationwide mandate, which they have since dropped, that they lost between 10 to 15 per cent of their staff, medical staff. And that is crushing losses. And the Science Table published that as though that was okay. That tells me that either they've never worked the front line in decades and they have no idea what losing 10 per cent of an already depleted, stressed unit would do, or they simply didn't even read their evidence. They then also cited, again, an American hospital that lost 2 per cent; but we know that 2 per cent would be, again, a serious blow on its own. New York state, when you look into their numbers a little more: their home health care division lost 8 per cent of their health care staff—it wouldn't be nursing, it would be a bunch of health care workers under that—but that's 8 per cent in that area. And it's interesting because the *Wall Street Journal* had an article on March 6th that lamented that New York citizens are now at risk because of staffing shortages and because many of the New York divisions are not meeting their performance targets. And meanwhile, I would argue that likely the home health care that lost 8 per cent of their staff is one of those that are not meeting their targets and putting the citizens at risk.

So certainly, as we talked about, the numbers are important to know. And I think we need transparency and accountability from CEOs that decided to go with the Ontario Science Table over Kieran Moore. Kieran Moore, on March 11th, was at Queen's University and had made another statement to reinforce his beliefs. And he said that his intention was to never have a mandatory vaccine but instead a mandatory policy—and that he did endorse accommodations. Those of course, as we know, were not done—despite that Ford made a public statement. At the time that all of the NDP party and Liberal Party, et cetera were trying to get him to put in a provincial policy. He stated that he would not risk the loss of tens of thousands of health care workers of Ontario because it would put the citizens at such risk. And the interesting part is, back to my thing about risk-benefit, the Ontario government did a risk-benefit assessment. And Christine Elliott admitted that they did a risk assessment and that they found that the risk of losses of health care workers would have been what she quoted as "very significant." And Dubé from Quebec also canceled their program of mandatory policy provincially, saying that the effects would be devastating. I suggest that—as we said, what we are seeing—they were likely correct. And their numbers very well could have been correct. And it did in fact have a devastating effect on our ERs, our wait times.

[00:45:00]

It's just going to make more and more cancelled, potential cancelled surgeries, more delays to diagnostics. Any time you lose valuable staff in an area that is so vital, you are putting citizens at risk.

Geneviève Eliany

Before I turn it over to the commissioners, I was supposed to ask you this in the beginning. Do you promise that everything you testify to today is the truth?

Cindy Campbell

I do.

Geneviève Eliany

Thank you. We'll see if the commissioners have any questions.

Cindy Campbell

Thank you.

Commissioner Drysdale

I believe I heard you say a number of times that some nurses were seeking religious exemptions to this vaccine.

Cindy Campbell

Correct.

Commissioner Drysdale

My question to you is: Is it not true that most of these nurses had previous vaccines? And what was special about this particular one that would have made a religious exemption, or the consideration of a religious exemption?

Cindy Campbell

Sure. Well, you know again, not all of them did have these vaccines—like the one I talked about. I had a woman who had, again, refused it on the exact same grounds. And often people too—just because they may have started without a religious belief, doesn't mean over the years that those religious beliefs do not form, and that they do not come to their God or their belief system in another way. I don't think it was meaning that for just this particular vaccine, potentially, but that may have applied for other ones; I don't think that we know that. I think that what was wrong, though, is to follow the direction only of a mere mortal man that may run a church and say that this is not acceptable for vaccines.

I think that in Ontario the standard is "creed," and creed can extend to all kinds of facets of your belief systems. It doesn't necessarily even have to be religious per se; it doesn't have to be tied to a religion. You could have had people with a lot of underlying creed—genuinely strongly, sincerely-held beliefs—that did extend into other areas beyond religion. And again, if there was a safe accommodation, that should have been afforded to

them, I would say. No one's denying, as we said, the obligation to keep the public safe. And there are reliable ways to do that, as Kieren Moore did confirm.

Commissioner Drysdale

I want to be clear—at least, maybe I misunderstood—but when exactly did the dismissals happen?

Cindy Campbell

Oh, interesting. I found that they really followed a pattern. They started around, let's call it, October 2021. And they were still actively going on until the end of April 2022, across different hospitals across Ontario. And the interesting part of that is that Kieran Moore, on February 3rd, declared that two vaccines weren't cutting it; it wasn't doing enough. And that you were starting to need boosters. But the interesting part is that none of these hospitals—and I'm not going to say none, the ones I know of—have not as yet put in a booster mandate. To me, the policy objective has to be consistent with the measures applied. So if their policy objective is indeed patient protection and they have not yet put in boosters, that to me looks like a glaring inconsistency. You also have the Ontario Science Table, on December 15th, declaring that this is a three-dose vaccine. And all the hospitals that apparently followed the Science Table with such diligence did not follow them any longer on that one.

In terms of the timing of the policy, it is important, because some hospitals were putting these in as—clearly, two vaccines were no longer giving the protection that was needed. So it would appear more to me that the policy objective was not patient protection but rather it was 100 per cent vaccination rates. That seems what their policy was. And when you talk about patient protection, you've got some interesting gaps there: at the end of January, hospitals bringing back COVID-positive staff to work before they'd finished their isolation periods.

[00:50:00]

So that looks like another inconsistency to me of the commitment to protection. And the fact that they knew the vaccines were—some people had vaccines on board for well over a year, even a year and a half, and they hadn't had boosters. Those people technically would have been safer testing if protection was truly their objective. They would have been probably safer doing antigen testing, arguably.

So yeah, there's some—

Commissioner Drysdale

Part of my reason for that question is I also think I heard you say— And it may have been some other witnesses because we've had a long line of witnesses. I thought I heard you say that of course, the vaccines came out in Canada end of December, beginning of January 2021. If I understood this testimony correctly, they were already becoming aware of what you call breakouts in early or mid-part of 2021, three or four months after. A breakout means that you got the vaccine but you still got sick.

Cindy Campbell

Correct.

Commissioner Drysdale

So they knew that the vaccine at that time wasn't providing protection, but they were still firing people for almost a full year after that.

Cindy Campbell

Yes, this is the concerning part. It appears that and as we said: the vaccine has I'm sure helped many populations. But the concern is that it is not of the caliber of this sure-fire, sterilizing vaccine that you would expect to justify this degree of heavy-handed mandate. Especially with what was going on in the community and what was going on with some of the evidence. Especially in light of Omicron. Omicron really brought down its very short-lived, it appears, protection from that one—that likely waned within several months. And again, should have been doing testing then or implementing boosters. And when they don't, that's when it starts to look a little suspect.

Commissioner Drysdale

Also I thought I heard you say that the requirement for hospital stays or people coming to hospitals was seen to be going down because— And they were closing down ORs and they were doing all kinds of other things. And of course, they were letting staff go and there were some COVID infections coming in, I'm guessing. So there was a devastating effect on the hospitals, not only because of the disease but also because of the actions or policies taken here. If you're letting go— I can't remember if you gave a percentage, but if you're letting go your most experienced staff, that's going to have a very long-term effect.

And my question to you, after all that, is: Has our medical system, have our hospitals, recovered from this?

Cindy Campbell

You know, it doesn't appear— If you were to look at vacancy rates alone, just that data that I said out of Hamilton Health Sciences where they're now at 1,500 vacancies, that would still indicate— I would think that they are still at quite a serious gap, a serious deficit there. And nursing shortages are well-established in Canada well prior to the pandemic. Canada has one of the lowest, let's call them "per capita nurse" of the world and Ontario has some of the lowest there. And they know that nursing staffing levels are consistent with less medical error, better patient outcomes; adequate staff is associated with all of those good things. As soon as you start to deplete staff, you start to get into problems and patient threats to their—again, their health and well-being, when you start depleting those numbers.

So to me, they knew that already well before. They knew there was vacancy rates. They knew this was still in an ongoing pandemic and they still chose to deplete those nursing rates and staff rates even less.

Commissioner Drysdale

Thank you.

Cindy Campbell

Okay.

Commissioner Massie

Thank you very much for your very detailed presentation. I hear you say that for some of the vaccines that are required to work in medical institutions,

[00:55:00]

natural immunity can be recognized if you haven't been vaccinated but you can show that you've been exposed. So I'm wondering—given that in COVID, natural immunity somehow has been put on holiday or something; it is no longer on the table—I'm wondering about what was the specific recommendation or scientific rationale for the Science Table to dismiss the validity of natural immunity for COVID?

Cindy Campbell

Yeah, that again is another one of these head-scratchers. We know that as we said, they've recognized it up till now. Now that's not saying that they won't recognize it in the future. But at this point, yes, they are still actively firing. I even heard of a nurse still getting fired last week from Trillium Hospital in Mississauga. And these are, again—more than likely, most citizens of Ontario have been infected and have a degree of natural immunity. But it's utterly, it appears, disqualified on this one. It's either get a vaccine or don't have a job.

That's the thing when I talk about choice. In some sick, perverse way, these people that argue, "Well, you still have a choice: you can get a vaccine or don't work." That's not a choice. And we know—and they know—that economic stability is a social determinant of health. And they also know that there is a high correlation with unemployment and all-cause mortality. There's a systematic review that found there was a 63 per cent increase of death associated with unemployment. So they know all of these things. And yet they see it fit to tell someone they have to choose between their job or their livelihood, or their job or feed their family, or their job or pay their bills. And I find that— Again, all of these things all just seem to lack humanity. Tremendously.

Commissioner Massie

You also mentioned that there were a few hospitals in rural areas that were closed.

Cindy Campbell

Correct.

Commissioner Massie

Do you know whether they were closed? Most likely because they were short-staffed, but was it due to the fact that in these in these areas where maybe the number is not as high, the level of people that would no longer be available because they didn't take the vaccine was somewhat higher? Is it a reason why it happened?

Cindy Campbell

The only thing I have heard of is closure due to staffing levels. So again, we don't know—I'm not suggesting that every staffing issue is to do with the mandate. But I am suggesting that it played a role—and an unnecessary role. I can't comment on the other facts of what closed some of those ERs, but the only thing I consistently keep hearing is staffing, staffing, staffing.

Commissioner Massie

Thank you.

Geneviève Eliany

Thank you so much for your testimony today and for your time today.

Cindy Campbell

You're welcome.

Thank you guys. Thank you everybody.

[00:58:45]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 10: Dr. Heather Church

Full Day 2 Timestamp: 07:46:10–08:05:21

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[0:00:00]

Geneviève Eliany

The next witness is definitely virtual. I see that she's being queued up here. Heather, are you with us?

Dr. Heather Church

Yes, I'm here. Sorry.

Geneviève Eliany

Great. I know we're running a bit late so let us know if you're having any difficulties. Could you spell and state your name for the record please?

Dr. Heather Church

My name is Heather Church, H-E-A-T-H-E-R C-H-U-R-C-H.

Geneviève Eliany

Do you promise to tell the truth today?

Dr. Heather Church

I do, yes.

Geneviève Eliany

Now, you are a health sciences professor, and you taught Pandemics and Society. Is that right?

Dr. Heather Church

Correct.

Geneviève Eliany

That was the name of the course?

Dr. Heather Church

Yeah. Pandemics and their Impacts on Society.

Geneviève Eliany

Great. And you also completed a PhD dissertation about health equity impacts of public policy?

Dr. Heather Church

Correct, yeah.

Geneviève Eliany

And until the COVID mandates came along, you were teaching at a university, right?

Dr. Heather Church

Yeah, I submitted against my will to the vaccine mandates and did teach until I went on sick leave in August 2022. And I've been off since then. And I just received confirmation of a diagnosis a couple of weeks ago, that it was vaccination-related.

Geneviève Eliany

So let's discuss that vaccine injury. Your main reason for being reluctant, as I understand it, was that you already had a mild traumatic brain injury, right?

Dr. Heather Church

Correct. And that puts me at higher likelihood of neurodegenerative disorders—but also earlier age of onset thereof. I also have a family history of neurodegenerative disorder, so that's two strikes against me. And my concern was the cumulative effects of strikes against me earlier. I don't have any more room to add injury to my neurological system. And so I was afraid because these have not been tested for neurological effects. And at the time that the mandates were implemented, they were only in Phase II of the four-phase clinical trial process. So I just felt that there wasn't enough known about the risks. And since I was at low risk for COVID, it didn't strike me as necessary. But also at that time too, there was already evidence demonstrating that the vaccines wouldn't prevent transmission, so it really was just a personal choice.

Geneviève Eliany

We won't dwell on this point, but can you confirm that you tried to have both a religious and medical exemption approved by your employer and you were unsuccessful?

Dr. Heather Church

Yes, that's correct. I submitted a religious request for exemption and with that I had to sign a sworn affidavit and it was rejected. And I was told that it was—that my position was politicized. And when I asked my union for assistance, they upheld the decision.

So then I also sought assistance getting a medical exemption. I went to my family doctor and I took in a stack of peer-reviewed journal articles to support my point. And he wouldn't even look at them. He told me that the College had banned them from providing exemptions for anything but anaphylaxis, myocarditis, and pericarditis—wouldn't consider it, wouldn't hear me out, and yeah, frankly, behaved very unprofessionally. Then, when I explained this to my union again, they told me that they didn't believe that doctors had been banned and to try again.

Geneviève Eliany

You've since been diagnosed with an auditory processing disorder. And we've heard that you've been on sick leave since August 2022. Can you describe the everyday effects of the injury?

Dr. Heather Church

Okay, so for clarification, the Auditory Processing Disorder, that was with a neuropsychological assessment that was conducted where she identified a few impairments: some fine motor coordination, auditory processing, and some memory issues.

[00:05:00]

All came out as impaired. She couldn't tie it to the traumatic brain injury because those symptoms would have shown up at that time. But that was three and a half years before getting the vaccine. And I didn't have those problems until the day after getting the vaccines.

For the auditory processing piece, the issue is that I don't filter out sounds naturally. So people who don't have impaired auditory processing are able to filter out environmental sounds. For instance, if you're at a restaurant, someone's laughing in the background, you hear a fork drop on the floor, it doesn't impede your ability to communicate or to continue doing what you're doing because your brain's naturally filtering those noises out. So you're attending to only the sounds that you need to hear. And my auditory processing now is impaired.

In addition to that, since getting the doses, I also had what's described as bounding heart rate. So it would be where—just intermittently and unpredictably—I could see my pulse just bonking out of my neck. And it was really hard and really scary. So I gave up exercise. I used to be a very active person and I gave it up because I was afraid. And I've since been diagnosed with what's called postural orthostatic tachycardia syndrome, or POTS. And what that is is basically, when you change positions from reclining or sitting to standing up, you get a clinically significant elevation in your heart rate. So it's a 30 per cent increase in your heart rate.

I've also been diagnosed— It's a separate diagnosis by a neurologist as well and it's called, it's a big one: distal chronic-acquired demyelinating polyradiculoneuropathy. I don't really understand that one yet. I had to go to the States to get that diagnosis because I've been on

a waitlist since September to see a neurologist here in Canada. And the earliest appointment I can get is August 28th, 2023.

Geneviève Eliany

And what will happen if you are unable to get a Canadian confirmation of the American diagnoses?

Dr. Heather Church

Well, currently I switched from short-term disability in November, so I'm now considered long-term disability. But my long-term disability provider rejected my claim, stating that they didn't see that there were limitations that would impede me from doing 60 per cent or more of my workload. And WSIB [the Workplace Safety & Insurance Board] would also need a Canadian-confirmed diagnosis and recognition of vaccination causation for it to be considered a workplace injury.

And my contract ends in June but I'm not employable at the moment. I'm injured. And I'm going to have lifelong issues, including the distal chronic-acquired demyelinating polyradiculoneuropathy. If not treated early, it has a one in three chance of ending up being wheelchair bound. And I don't even know what early treatment means because I can't access anyone who has that knowledge.

Geneviève Eliany

Can you describe your average day now? How do you feel and what kind of symptoms do you have?

Dr. Heather Church

Tired, sad, chronic headache, chronic pain. I have incessant tinnitus that just is all through my head. Dizziness, nausea. My limbs feel heavy. I'm tripping over things; I'm fumbling things with my hands. I feel incompetent.

Geneviève Eliany

When you participated in a one-day training about a week ago—and take your time—how did you manage that day and how did you feel afterwards?

Dr. Heather Church

I didn't do well. I tried it. I wanted to see if I could work a full workday. I couldn't sit still. I couldn't pay attention. It was awful. It was really well done. The people were lovely.

[00:10:00]

But I crashed. And this is the problem. Even just going to church or going out with my parents to a restaurant, I get so tired and so withdrawn that I cannot function. I can't communicate because I'm just so busy trying to focus and pay attention to what's important and not pay attention to everything else. I can't keep up.

My parents actually did notice that I withdrew into myself. And they thought that I was unhappy with the meal or unhappy with the setting. It wasn't that at all. It was, just, I was overwhelmed. I couldn't handle it.

Geneviève Eliany

What kind of treatments, if any, have you tried?

Dr. Heather Church

Well, I started out seeing a psychologist and I initiated that in July last year and started seeing her in August. But she's also—I did the neuropsychological assessment with her and maxed out my benefits at that point using that. And then had to pay an additional \$2,500 on top of that. So I haven't been able to access anything.

But now I do have benefits. But since I don't have any disposable income, my parents have loaned me money so I can start paying for things like physiotherapy. I have made a referral to a neurological rehab clinic in Burlington, so hopefully that will help. And I'm resuming my psychology appointments next week.

Geneviève Eliany

I understand that you filed some complaints, both against the College of Pharmacists and against your doctor. Have you seen any lights at the end of the tunnel with respect to those complaints?

Dr. Heather Church

No, no. I filed a complaint against the doctor for his unprofessional behavior, which I frankly think is malpractice. But I don't know that for sure. And the College contacted me and asked me to indicate dates when I could have a phone meeting. At that point, I just didn't have the wherewithal. And so I asked them to just provide the information because they just wanted to have a meeting to explain the process. I said, "Well, just provide me with a write up of what it is, because surely you do that for people who are nonverbal and can't participate in a telephone meeting." And I never heard from them again.

So then two months later, I emailed them and asked what was going on. And they said that the registrar had closed the file.

Then, with the College of Pharmacists of Ontario, I filed a complaint. Because on the consent form there were only two options: if you wanted to receive your confirmation of vaccination by text or by email. And so I created another box and checked it and wrote beside it, "I do not consent to digital communication of my private and confidential health information. Please send it by mail only." And I ended up getting text messages from the pharmacy notifying me when it was time to get my second dose, notifying me when it was time to get boosters, notifying me of sales they were having. So it was even promotional content; they didn't separate out promotions from health information.

So I filed a complaint against them. I filed a complaint with the Information and Privacy Commissioner of Ontario, who has noted that they were in their right to do so. But I still challenge that because there's no reason that I should be getting text messages about sales that they're having. And I'm still awaiting a decision by the College.

Geneviève Eliany

Thank you. I'll turn it over to the commissioners to see if they have any questions.

Commissioner Drysdale

First, thank you for coming out and talking to us about this most intimate issue that you have and having the courage to stand up in front of us, in front of all of Canada. My first question has to do with— I believe that prior to this, you were a professor teaching a course in pandemics and the effect of pandemics on society?

Dr. Heather Church

Correct.

Commissioner Drysdale

In your class, or in your studies preparing for your class, were you aware of any nationwide pandemic plan or reviews of different options that may have been contained in that plan?

Dr. Heather Church

Yes, so I did look at the SARS response and that sort of thing. But we also covered historical pandemics as well.

[00:15:00]

And I was trying to sort of avoid—initially, the first couple years I taught it I wanted to avoid getting too deep into COVID because I felt that there was a lot of hysteria around it and I didn't want to drive that fearful narrative. But then in the second year of teaching it I had a day where we were just talking and the students were hungry for the other side of the story. So we started talking about the other side of the story. After that, the students really opened up to me about their own experiences and about—you know, thanking me for being a safe place to talk. So we discussed science and it was all science-based that we were discussing.

But yeah, sorry, I've gone off track. Sorry, what was the question?

Commissioner Drysdale

Don't worry, I'm always off track. Really, specifically, what I meant to ask you was: Were you aware of the Canadian Influenza Pandemic Plan that was in place? And I believe one of the authors was Theresa Tam.

Dr. Heather Church

Yes, I am aware of it. Yeah. We didn't cover it in that class though.

Commissioner Drysdale

Okay. Do you know whether or not your adverse reaction has been registered in the CAEFISS [Canadian Adverse Events Following Immunization Surveillance] System in Canada?

Dr. Heather Church

I'm still in the process. I need to get that Canadian confirmation of diagnosis before I can submit it. I've started the paperwork for the AEFI [adverse event following immunization]. And so Public Health is awaiting my diagnosis and the paperwork for that before they will process.

Commissioner Drysdale

So that's been in process now for a year or better? How long has that been in process?

Dr. Heather Church

I think I initiated it—I don't remember when I initiated that. I guess it would have been November or December 2022.

Commissioner Drysdale

You talked a little bit about your experience in getting the vaccine. And if I understood you correctly, you got it in a pharmacy.

Dr. Heather Church

Correct.

Commissioner Drysdale

Do you feel that the pharmacist, or whoever administered the vaccine, had given you all of the information about the risks and benefits of this vaccine so that you could form an informed consent when you received it?

Dr. Heather Church

No. I got the provincial little write-up, but a) they're still experimental, so there's not enough information to make an informed decision. But b) on the consent form, another thing was the pharmacist had already digitally checked off the null box in the adverse reaction section of the consent form, which I thought was weird. But there's also no information about what to do if there is an adverse reaction and what those adverse reactions will be.

Commissioner Drysdale

Normally, when you purchase a drug in the restaurant— Or sorry, it's the pharmacy. Sorry. Normally, when you receive a prescription drug, there's an insert in that prescription drug that describes to you— Even whether or not the pharmacist goes through it with you, there is an insert that tells you all of the risks and issues concerning that drug. Were you given access to any kind of an insert or information bulletin directly from the manufacturer of the vaccine prior to taking it?

Dr. Heather Church

No.

Commissioner Drysdale

Thank you very much.

Geneviève Eliany

Thank you very much for sharing your story today with the National Citizens Inquiry. It's very much appreciated and I hope that you find some treatments that will help you.

Dr. Heather Church

Yes, thank you very much. And thank you for this opportunity.

[00:19:11]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 11: Dr. Wesley Mack

Full Day 2 Timestamp: 08:05:38–08:41:50

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Dr. Mack, can you hear me?

Dr. Wesley Mack

Yes, I can, thank you.

Shawn Buckley

Can you turn your video on? There we go. And then maybe tilt your screen a little better.

Dr. Wesley Mack

Very good. Thank you.

Shawn Buckley

I'd like to begin by asking you to state your full name for the record and spell your first and last name for the record.

Dr. Wesley Mack

Sure. Wesley, W-E-S-L-E-Y. Mack, M-A-C-K.

Shawn Buckley

Then, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Dr. Wesley Mack

I do.

Shawn Buckley

Now, my understanding is you have a Master's of Education in Administration.

Dr. Wesley Mack

Yes, that's right. A B.A. for my undergrad, basically in music education, and a Master's of Education in administration.

Shawn Buckley

And you also have an honorary doctorate degree.

Dr. Wesley Mack

I do.

Shawn Buckley

Now, you've got, basically, a career that is church-related, as I understand it.

Dr. Wesley Mack

Primarily, yes. In a variety of capacities, actually. But yes, primarily interrelated with church and what we would refer to as parachurch and national media. There are several different elements combined with that. But it relates to what we would refer to as the ecclesia, the community of believers or the church at large.

Shawn Buckley

Right, indeed. And one of your achievements is you spent quite a bit of time developing a Christian school system in Hong Kong, both primary and then secondary.

Dr. Wesley Mack

Yes, right. My wife and I both have educational backgrounds, a background in education administration. I was asked to go to Hong Kong to basically take over a system that had a number of elementary students—3,500 elementary students—coalesce that into a school system. And then to develop and build a school for them to progress to. It culminated in a school for 1,200 students. It was called United Christian College, with two other organizations in Hong Kong.

Shawn Buckley

And we don't need a whole lot of detail there. I'm just trying to establish that you are really plugged into the church system. And then I was going to move you to— You've been living in the Toronto area now for quite some time. But instead of being involved in one church, you actually had, prior to COVID, been heavily involved in three churches. Am I right about that?

Dr. Wesley Mack

Yes. I should expand that little bit. I've been involved with the national church scene for a number of years, ever since coming to Toronto from Hong Kong. And that includes media, it

includes having actually been present in meeting pastors, speaking in over a thousand churches nationwide, literally from coast to coast.

So yes, I have a comprehensive view— fairly comprehensive view of the national church scene.

Shawn Buckley
Right.

Dr. Wesley Mack

I do have fairly close connection with three churches in the metropolitan Toronto area. They'd be described as what we'd refer to— One of them in particular is a megachurch; the other two are large facilities, which previously have had full capacity in the range of 1,500 to 2,000. The megachurch would have a weekly attendance of somewhere between four to five thousand.

Shawn Buckley

And you are actually friends with the pastors in all three churches and would have what in the Christian world would be known as an elder role for those pastors.

Dr. Wesley Mack

Yes, that would be that would be a good description. Being able to spend time with these three individuals on a personal level. Being able to share with them their ministry objectives.

[00:05:00]

Being able to provide some counselling perhaps from time to time, that kind of thing.

Shawn Buckley

Okay. And these were three churches that were very important to you and they were important for you and your wife to attend.

Dr. Wesley Mack
Exactly.

Shawn Buckley

Okay. So now COVID comes along. We're in the year 2020. Can you tell us what happened to churches in Ontario, and those three churches in particular?

Dr. Wesley Mack

Yes. Let's back up just a little bit to begin with. What is a church? A church is a fellowship of believers that come together under common cause. Those causes are generally born out of fellowship; it's born out of the desire for teaching and for learning from their scriptural backgrounds. Also, the desire for spiritual nourishment on the part of interaction with co-

worshippers as well as from the pastoral community. And then, as an outgrowth of that, obviously a community outreach into the communities, whether it's community support, providing support systems for the community, and so on.

So it historically in Canada, as in other countries, has played a significant role in the communities that they have been developed in. Our personal opportunity here in Canada has been really involved in all of those aspects. And we have seen, as a result of the lockdown that took place, a drastic decline in all of those aspects of fellowship, of—

Shawn Buckley

Well, let me just back you up if I may.

Dr. Wesley Mack

Sure.

Shawn Buckley

My understanding is that churches in 2020 were shut down for a period of time in Ontario. Is that correct?

Dr. Wesley Mack

Yes. Perhaps just a brief—I was going to give you a rather lengthy, but we'll combine this. March the 16th, 2020, the provincial government closed all of the churches, schools, day cares, recreational facilities, bars, restaurants, et cetera. The interesting thing there is that they allowed big-box stores to remain open. Facilities like the local liquor board, the LCBO in Ontario, abortion clinics, a variety of special interest groups that were allowed to continue to remain open. But churches were closed on March 16th of 2020. March the 18th, the federal government closed all the borders for Canada. So that shut down all kinds of things. It also affected us because our children live abroad.

Then, moving quickly, in December of— Well, on occasion, they would allow a bit of flexibility. They would allow 10 people to meet in September of 2020. Ten people to meet in small groups: obviously that was ridiculous in terms of church attendance. Then in November of 2020, this provincial government established a five-tiered colour system where they would allow certain groups to open in different capacities based on the colour of their zone. Toronto, the GTA area, was designated a red zone. And so the entire GTA, including the churches I have described, were under the red zone restrictions and in total lockdown.

December the 26th, 2020, the provincial government again reverted to a complete total lockdown of everything.

In January of 2021, there began to be some resistance to that. Some pastors rebelled, started to allow small group meetings in their churches. A couple of pastors were arrested and fined.

[00:10:00]

In fact, it has resulted in hundreds of thousands of dollars worth of fines that have been placed on a couple of these pastors.

Interestingly, March 7th, 2021—so that's almost exactly one year from the beginning of the church lockdown—the Archbishop of Toronto issued a letter to Premier Ford personally, and it was published widely, making a strong appeal for the church to be allowed to open, especially for the Easter services. The response to that was that on April the 7th, 2021, Premier Ford and the Province issued another complete lockdown. And everything went back to the original state.

Then over the next year, they did allow a progressive opening. At first, it was 15 per cent of your capacity. Obviously, if you have a 1,500-seat auditorium, a 2,000-seat auditorium, that makes no sense at all. Then they allowed only vaxxed people to come in—

Shawn Buckley

Can I just stop you?

Dr. Wesley Mack

Sure.

Shawn Buckley

Was that actually a government requirement or was that just a recommendation?

Dr. Wesley Mack

It was a requirement.

Shawn Buckley

So an actual government requirement that to go to church in Ontario, you had to be vaccinated.

Dr. Wesley Mack

Exactly. Yes. And you had to wear a mask as well. Everyone. And you had to be seated six feet apart in the auditorium. And there was a pew— You had to have a vacant pew between each of the occupants as well.

Then they began to allow a percentage based on your size of your auditorium. And they began then to allow non-vaxxed people to attend. But they had to sit in a secluded section of the auditorium. They could not be in with the general vaxxed populace. So for example, in one of the churches we attend, the large 2,000 seat auditorium, we would go for the services. We are unvaxxed.

We made the decision not to be vaccinated for a variety of reasons. We had done extensive research into the mRNA vaccination, in particular, and made a decision that we would not. Earlier we had contracted COVID and got excellent care in our local health facility. We were hospitalized for two weeks. And then, as a result of that, even our doctors recommended that we did not have to be vaxxed because of the natural immunity that we had coming out of the COVID experience.

However, again, back to the church, we would be able to attend but we would have to sit in a secluded area that was designated for non-vaxxed.

Shawn Buckley

I just want to make clear. So that was one church. But was that a government recommendation that they be segregated or was that a decision of the church?

Dr. Wesley Mack

It was a strong recommendation. Whether or not it was actually a written mandate, I'm not sure, but it was strongly recommended by the provincial government.

Shawn Buckley

And then am I correct that two of the other churches excluded non-vaccinated persons for a period of time when it was not a government requirement?

Dr. Wesley Mack

Exactly. Yes, that is true.

Shawn Buckley

Okay.

Dr. Wesley Mack

I continue with the progression. April 15th, 2022, Easter services: this was the first time when the provincial government then did allow churches to open to the general public. Some of the churches still at that point maintained the six-foot separation between parishioners and the vacant pew between the people within the auditorium.

[00:15:00]

However, the provincial government did allow for full Easter services to be held April the 15th, 2022. And that was exactly two years and one month from the total lockdown.

So in effect the churches were, for all intents and purposes, shut down for over two years. Let me just state, this was widely broadcast internationally. We got a lot of international attention from Canada to the international world as a result of that. To the point— And of course, that also included the arrest of a number of well-known pastors in Canada; the confinement of these pastors, some of them actually in solitary confinement.

Shawn Buckley

Now, Dr. Mack, I want to focus you a little bit off of the history and more on your personal experience.

Dr. Wesley Mack

Let me just make one statement.

It got to the point where the state of Ohio, which is a conservative state— But the state of Ohio actually drafted a bill that they took before the state senate as a result of the publicity that came out of the experience of the churches in Canada. And they voted on this petition, which was sent to the international court. As of that petition, which was overwhelmingly

voted in the positive by the state senate of Ohio, Canada is now on the international freedom of religion list as being a country that does not adhere to freedom of religion for their Christian community. That is how serious it became internationally: the exposé of everything that was taking place within the church community.

Shawn Buckley

I want to turn now to kind of your personal experience and then your thoughts on the effects of others.

Dr. Wesley Mack

Sure.

Shawn Buckley

For a period of time, once the churches were allowed to open, but the government was strongly recommending that only vaccinated persons be allowed, two of the three churches that you had been a vibrant part of basically excluded you and your wife.

Dr. Wesley Mack

Yes, yes. The regulations were such that we were not able to attend any of those churches.

Shawn Buckley

Right, but it wasn't government regulations. Because they were allowing people back in churches, but they were recommending that only vaccinated people be allowed. Right?

Dr. Wesley Mack

That's right.

Shawn Buckley

Okay. So two of the churches chose to exclude unvaccinated people.

Dr. Wesley Mack

That's right.

Shawn Buckley

And I'm wondering— I'm asking you, what the effect of that was on you and your wife?

Dr. Wesley Mack

Thank you. Obviously, it excluded us from the fellowship with fellow believers. It did not allow us to participate in the normal function of a church community. We had to revert, as many hundreds of thousands of people did, to receiving our inspiration from church services online or through television.

Subsequently, there are many friends that we haven't been in touch with for several years. As a result of that, we have felt that we have not been able to contribute to the church community. And within our own family experience, we maintain a regular—what would I call it?—a worship experience ourselves. We have devotions together. But we obviously miss that opportunity of interaction with the fellow believers, interaction with the church communities, the opportunity of contributing to the church communities. And one of the real detriments is the decline of the church. And this really affects me in particular because I know the church well, nation-wide.

[00:20:00]

I know the churches in the Greater Toronto Area very well.

Shawn Buckley

And what's happened to them?

Dr. Wesley Mack

Well, to be very honest, there are some who have had to close their doors. And there are actually— Some of the churches have had to sell their buildings because they simply could not maintain the expense of maintaining their buildings without the natural flow of income.

The pastors have gone through a great turmoil personally and their families. There are a number of pastors that I know of who have left the ministry as a result of that: because they felt like they no longer had the opportunity of ministry to their people.

Attendance has been greatly reduced, even since the opening of churches. Entire denominations that I'm in touch with have publicly stated that their attendance is less than 50 per cent of what it was prior to the lockdowns. The national average actually is— They are saying it is between 30 and 35 per cent in many of the denominations across Canada. Now, there are some very special and unique opportunities that independent churches in particular have been able to increase their attendance. And we're grateful for that. But, by and large, the average church has lost at least 50 per cent of their regular attendance during this lockdown period of time—some of them as much as reducing it to 30 to 35 per cent.

Shawn Buckley

So what do you think the long-term effects are going to be, then, on these churches being able to stay afloat and continue on?

Dr. Wesley Mack

Very good question. And a difficult one to answer because it depends largely on the leadership within the local church. It does depend somewhat as well on the denominational leadership and the vision that they have maintained. The more independent churches seemingly have been able— Many of them have been able to survive this fairly well and are progressing. Whether this is a movement away from the traditional church into a more independent church, that is a possibility.

But there's no question that the lockdown had a serious deleterious effect on the entire church community across Canada with, as I said, many churches having to close. They have

suffered financially. Whether or not they are going to be able to recoup that and move on and progress from here is a very, very serious question, particularly in the financial climate that we're in. With all of the effects of the federal regulations and so on, people do not have the kind of money that they once had to be able to contribute to charitable organizations.

Shawn Buckley

And I'm just going to cut you a little short because I think you've made the point that they're struggling financially.

Those are all the questions that I have for you, Dr. Mack. I mean, I have actually a whole bunch of more questions, but we don't have time for them. I'm just going to ask the commissioners if they have any questions of you. And they do, so just sit tight.

Dr. Wesley Mack

Sure.

Commissioner Kaikkonen

Hi, my question is around the church organization. You mentioned a cross-section of three churches. Who exactly made the decision to follow the mandates? Was it the board? Was it the leadership within the church? I'm just wondering whether it's maybe the minister and the elders. Who decided that—when the Ford government said that we had to follow these mandates—we simply had to follow the mandates, that we didn't have a choice?

Dr. Wesley Mack

Thank you. A good question. The churches that I'm familiar with, they actually set up a separate commission within the church structure

[00:25:00]

that was designated as those responsible for the response to the COVID lockdown and to make judgment as to whether to open, when to open, according to the provincial regulations. So it did not fall primarily on the pastor themselves in the three churches that I am more closely associated with. And again, prior to this, they were very large churches. In fact, all three of them are considered to be the largest of their denomination and independent churches. All three of them are considered to be the largest churches in Canada. The pastors did appoint, or select, a group who were responsible for making those decisions. And they're the ones who got all of the regulations, maintained the church response to those regulations, and followed through with advising the congregation as to what those regulations were and how they would work with them.

Commissioner Kaikkonen

So just to continue on that thought. Was there any point where somebody within the congregation, whether it be the committee or somebody outside of the committee, decided that the mandates were not constitutionally accurate? Was there anybody who said, "No, I think we're just going to stay open." And how would that appear in terms of the congregation?

Dr. Wesley Mack

Not in those three churches. There were churches in the Toronto area that made that decision. The Province moved in with force and closed those churches down. There is video of literally police forces moving into those churches during their worship service and shutting down the service and actually manhandling the people out of the congregation. Particularly the pastors and taking them away, as being arrested.

So yes, there were churches—there was actually police presence that moved in, took charge of the church, shut the church down, and arrested the pastors.

Commissioner Kaikkonen

So in essence then the pastors were considered like criminals in the performance of their duties?

Dr. Wesley Mack

Yes, exactly. In fact, if I may divert just for a moment, one pastor that I have had communication with, actually he and his family came to Canada from a communist-controlled country in order to get away from the dictates of the communist country. He was put in prison, confined in solitary confinement for 40 days. He has publicly stated that the treatment that he received at the hands of the police in this situation is worse than what he experienced under communism. Now, that's his personal experience; it certainly isn't across the board, but it did degenerate to that degree.

Commissioner Kaikkonen

So then, when the mandates changed from being full closure to five in attendance, did the church push back and have five in attendance? Or did they just remain closed, each of these churches?

Dr. Wesley Mack

No. The three churches remained closed.

Commissioner Kaikkonen

And the communication that came from government: Was there a response from each of these churches back to government to advocate for their constitutional freedom and right to practice religion or their faith, in whatever form that looks like?

Dr. Wesley Mack

Yeah, that's an exceptionally wise and astute question. The response to the government, very honestly, has been less than biblical—if I may say so. The only public response that I know of that there has been, that was made public, is the response a year after lockdown

[00:30:00]

by the Archbishop of the Catholic Diocese here in Toronto, who wrote a public letter condemning the Province's lockdown of the churches and making a personal appeal. The archbishop himself made a personal public appeal to the Premier to please open the churches—particularly for the Easter services—and to allow people to return to their

congregations. As a result, as I indicated, a month later the response was the province initiated, again, a complete lockdown of everything across the board.

Commissioner Kaikkonen

I have one final question. When it came to the Ford government and the Health Minister deciding that we were going to cancel Christmas, did the churches respond at that point to the Ford government and say that Christmas should continue?

Dr. Wesley Mack

Not officially. No, I am not aware of any official response from the church community. The churches basically went along with the mandate. And that's regrettable. But that is the case.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

Actually, Dr. Mack, I have a question that came up during that questioning. My understanding and—where I'm going to go is, just to ask if you can comment on basically, the effect this would have on Christian believers, by just emphasizing some things that are important for them for assembly. But tell me, my understanding is that corporate worship is just so essential in the Christian church. So actually, Christians coming together, being together to worship. Is that a fair statement?

Dr. Wesley Mack

That is one of the primary reasons for church. The very name church, *ecclesia*, indicates a coming together of the community in fellowship and worship and being together for a time of fellowship. I mean, that's the term. Not being together is totally contrary to Christian doctrine. It's totally contrary to biblical instruction. It's totally contrary to historic practice. And if I may add, it's totally contrary to the rights and privileges of the Canadian populace as outlined in the *Charter of Rights and Freedom*.

Shawn Buckley

Right, but just avoiding the legal thing, it's important for Christians to get together and worship. It's important for them to fellowship. It's important for them to pray for each other and actually help each other.

Isn't the church—the Christian church is meant to be a community where, basically, they love each other in a way that follows Christ's example.

Dr. Wesley Mack

That is the primary function of the church. Absolutely. Without that fellowship, without that community, without that ability to be able to pray together, to worship together, to sing together, to hear the Word together, to fellowship together, to share their burdens, their heartaches, their joys, whatever. That is the function of church. Without that—

Shawn Buckley

Right. So do you have any insight, then, to the impact on then those Christians in Ontario that were not able to participate as a church for largely a two-year period?

Dr. Wesley Mack

Yes. It's been devastating. People, well—have gone through all kinds of experiences. We have friends who have gone into deep depression as a result. They have lost their sense of community. They've lost their sense of being part of a meaningful relationship with others. Pastors who have literally just given up their life's goal, their mission in life as a result of it. But yes, it has had a devastating effect on the entire— And that's reflected in the response since the lockdown has been lifted to people going back. People have just, in many cases, given up on the whole concept of community and being together and have drifted into other areas of interest.

[00:35:00]

But no, it's been devastating on the community at large and on the individuals to—to a serious degree, in many cases.

Shawn Buckley

And I'll stop you there, just because we're really short on time, unless there's any further council questions. So Dr. Mack, on behalf of the National Citizens Inquiry, I sincerely thank you for giving us this insight and testifying today and sharing with us your thoughts on the effect on the church.

Dr. Wesley Mack

Thank you so much. And may I just take a moment to congratulate the National Council on doing this inquiry.

We applaud you for your efforts in making this a national response to this. And thank you for allowing us to express our individual personal situations. This is very meaningful to us personally, but also to everyone nationally. Thank you for doing this.

Shawn Buckley

Thank you, Dr. Mack.

[00:36:12]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 12: Randy Banks

Full Day 2 Timestamp: 08:42:12–08:48:40

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Good afternoon, Randy. Thanks so much for your patience. I'll ask you to state and spell your name for the record.

Randy Banks

It's Randy Banks, R-A-N-D-Y B-A-N-K-S.

Geneviève Eliany

Do you promise to tell the truth today?

Randy Banks

I do.

Geneviève Eliany

We're going to focus on only one aspect of your testimony. Could you tell us about how difficult it was to do your job and the poor service you felt you were giving, especially when you were ministering dying people?

Randy Banks

Okay, so likewise, I'm a pastor in a small midwestern Ontario rural church. And I was able to make quite a bit of identification with the previous speaker. However, we experienced this, I think, a little differently perhaps than in the city.

The main thing for me is I'm a pastoral caregiver. It's probably the strength of my ministry. And that was the ministry that suffered the most. And by pastoral ministry, I mean hospital visitation, long-term care visitation, home visits for people who are housebound. So that's what I mean by pastoral care and that's a strength area for me.

And essentially, for the longest time, I wasn't able to do it. I wasn't able to go in hospitals, wasn't able to go in retirement homes, long-term care facilities. And certainly, would go into very few homes unless I was absolutely invited to go into them because people were afraid to have anyone in their house, even their minister. So I really felt that that was the area that really suffered the most; and it really showed up especially in terms of dying and death.

I was allowed in for a couple of palliative patients for a very short time. But I certainly felt like I was an intruder—kind of in the way, it wasn't really necessary for me to be there. And then it also showed up especially at funerals. Funerals were also struck by capacity limits, whether they were inside or outside. As few as three at one funeral—outside. And at one point, 10 was the number the funerals were capped at no matter where they were being held.

And I just felt like there was no way I could minister to the quality that I had been used to as a pastoral caregiver in those situations. Some of them still haunt me very much. I feel like I couldn't do for the families what I wanted and needed to do for them. They got short-changed. And I don't know who cared that this was happening, but certainly I did. And there's no going back there, none of these things can be righted.

Some of these people were going to have celebration for life services afterwards, but it's stretched out for so long that most of them have given up on that now. It's been so long. So that's the main area that really hit me.

Geneviève Eliany

Can you tell the story of trying to minister the man—a dying man—through a window of a nursing home?

Randy Banks

Oh, yes. That was in June, thank goodness, because it was good weather—hot weather, but it was certainly not bitter cold and snowing. But at that particular home at that time, that was the only way that I could visit with this dying man, who was by that time unconscious. He wasn't conscious, but his wife was present in the room. And the window was open, so you could talk through the screen. And I think there was a couple of family members there as well. And I was trying to talk to her and pray through the screen. And I couldn't see him, only his feet at the end of the bed. And she was hard of hearing, so she wasn't really getting what I was saying. And I just felt like it was just an awful situation to be in and minister; I never envisaged anything being like that.

And he did die. And his funeral was one of those that only 10 people were allowed to be at.

Geneviève Eliany

In terms of a shift in attitude, you mentioned that your services are less prioritized now. How long could you spend in the hospital or in a care facility with a person before the pandemic? And how did that change during the pandemic?

Randy Banks

Oh, what an interesting question.

[00:05:00]

Because I've been saying to people lately— Now that I am allowed back in hospitals and retirement homes with testing and mask-wearing and so on, I've been saying to people, "I remember when I used to be able to walk up to this retirement home door or this hospital door"—well, not so much the hospital but retirement home—"and walk in like I owned the place." You could go there and talk to anyone, go from room to room, spend as long as I needed to or wanted to, as long as people wanted me to be there. Felt very welcome and not in the way.

And hospitals— Of course, I didn't quite have that attitude towards hospitals; I couldn't just walk in like I owned the place. But certainly, there was no limit of time in hospital and retirement home visits for me to be there. Because it was valued. The visit of a pastor was something that was valued and cared about.

Geneviève Eliany

Thank you so much. I'll turn it over to the commissioners to see if they have any questions. There are no questions.

Thank you so much for your patience today and for telling us about your experiences.

Randy Banks

You're welcome. Thank you.

[00:06:28]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 13: Meredith Klitzke

Full Day 2 Timestamp: 08:49:35–09:02:24

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Could you state and spell your name for the record, please?

Meredith Klitzke

My name is Meredith Klitzke, M-E-R-E-D-I-T-H K-L-I-T-Z-K-E.

Geneviève Eliany

Do you promise to tell the truth today?

Meredith Klitzke

I do.

Geneviève Eliany

I understand that you're suffering from a vaccine injury. Can you tell us about why you ultimately decided to accept the vaccine?

Meredith Klitzke

My initial thoughts on this were, "Absolutely not." My gut instinct told me not to do this. However, I was faced with a health concern at the time. I was faced with a possible diagnosis of multiple sclerosis. I had had an MRI and they found lesions on my brain.

So unfortunately, I was still watching mainstream media and listening to the press conferences. And having it drilled into my head on a day-to-day basis, if you're immuno-compromised, you're at such great risk. And of course, my thinking was going that way at that time. I reached out to my local health unit, I reached out to the MS Society, both of whom stressed beyond belief the importance that I go and do this.

I still wasn't convinced. And one day in June of 2021, I went to meet a woman who I had known since I was a teenager. I actually referred to her as my little mom. I met her for lunch on a patio and probably the second question out of her mouth was, "Have you got your second shot yet?" And I said to her, "I haven't got my first." You would have sworn I had told her I had the plague. She proceeded to berate me. She stated she couldn't believe that she was there with me, if her husband knew that she was there with me, that she wouldn't be able to see the grandkids. It was horrible. I asked her if she needed to leave. She said no. The lunch continued. The conversation mellowed. I ended up confiding in her what I was dealing with. And she proceeded to lay into me again how irresponsible it was. She stated that her son was a doctor, her sister was an ICU nurse. That doing this was so detrimental. I mean, this was a woman that I trusted and I knew for a very long time and ultimately, it made me question my own judgement.

So I made the appointment and I went. And I sent her a text message saying it was done. She asked me when the next appointment was. I told her it was scheduled for two months later. She said, "Oh, you can cancel that, they've made it so you can do it even quicker now." And I said, "No, thank you." I still at this point was not comfortable with the decision that I had made. I had even said to my husband on numerous occasions, "I don't think I'm going to go back."

And then I kept seeing the news and reading the tickers and just waiting— Because it was going to be months and months for a neurology appointment. And so I went. Ironically, it was on Friday the 13th of August of '21. I took the second shot and within two weeks everything changed.

In hindsight, I actually had problems after my first one, but I didn't put two and two together. I started to deal with the corners of my mouth cracking and pain in my hip. But it was the mouth that was bothersome. And I mean, I had to cut food into tiny little pieces because I couldn't open it. I thought, "Oh, we're just— We're outside in the sun and the wind and—" you know, dry, whatever. I made excuses. But then after the second shot, within two weeks, my lips swelled right up. They just started shedding layers of skin. I developed tremors on my left side and muscle spasms on my left side.

The inoculation essentially put me into menopause. And I'm now dealing with that—having to see a gynecologist on a regular basis. Because I went for a year being tested, had my hormones tested, stating I was post-menopausal, going from completely normal schedules, and now I'm also having breakthrough bleeding after 13 months. They don't know what's going on. I'm passing all sorts of bizarre clots and nobody can seem to tell me what's happening.

I still have to go for a nerve conduction test. That's been a four-month referral that I still haven't even got the appointment for yet.

[00:05:00]

Geneviève Eliany

How much weight did you lose as a result of the swelling in your mouth?

Meredith Klitzke

With the mouth, between my dentist and my family doctor, they're referring to it as Burning Mouth Syndrome. So it's like— Everything that I ate, it was like I was drinking

Tabasco sauce. Even yogurt. All I could do was suck on ice cubes in that first month. I lost 25 pounds. It was a few months before I could really ingest anything. It was awful. It still is.

Geneviève Eliany

How much have you spent approximately on treatment costs?

Meredith Klitzke

I am probably myself close to \$10,000. And sadly, that's low compared to what some people have had to spend. I'm in a course— Sorry.

Geneviève Eliany

Oh no, that was just the chair moving. Please finish.

Meredith Klitzke

I'm in a course. One of the girls just stated the other day, she's close to \$25,000. I know people who have had to sell their homes to try and care for themselves. So we get no assistance and the Vaccine Injury Support Program, which I've applied for, I heard from finally in January. And that's going to be a 12- to 18-month process, when and if you get approved.

Geneviève Eliany

What happened on the work front? Are you able to work?

Meredith Klitzke

I could probably do some part-time work. It's hard—I would probably be limited to home or something in very, very short shifts because the tremors and the spasms— You don't quite know when they're going to come, when they're going to happen. I also have periods of extreme exhaustion. They seem to be narrowed down to later in the afternoon but it varies.

Geneviève Eliany

You had a store, didn't you, that you closed? Can you tell us about the specialty store and when you closed it?

Meredith Klitzke

I had a boutique for 16 years. We mainly did bras and shapewear and swimwear. We did proper fittings. I actually carried a size range of 28 to 56, double A to N. And I'm also a certified mastectomy fitter.

I had decided prior to the pandemic— My husband had a really bad accident a number of years ago and it was very much of a struggle. And we decided we wanted to do something together. So I just decided in February of 2020 that it was going to be time to move on and I made the announcement that I was going to close the store. Then, of course, March 17th, I believe it was, we got shut down. And of course, that makes it very difficult to liquidate

inventory. So I'm still sitting on boxes of merchandise that I can't get rid of. I have it online; but, you know, you sell little bits and pieces here and there.

My husband and I had planned on getting into real estate and flipping homes. He's a contractor. And then the market went crazy and you're shut down. And then this happened and I don't know where I go from here.

Geneviève Eliany

Did you have any success filing an adverse event form?

Meredith Klitzke

I was able to get an AEFI [Adverse Event Following Immunization] form filled out. I have been one of the luckier ones, in that I'm maybe shooting at about 50 percent with doctors being— No, probably less than 50 percent, maybe 40 per cent of physicians that I'm dealing with that have been supportive.

My family doctor did fill out the AEFI form. It was submitted to Public Health. What I didn't realize was that just because your doctor fills out the Adverse Event from Immunization form does not necessarily mean that it's accepted. So even people that have had them filled out doesn't necessarily mean that they're reflected in Health Canada data. What happens is your AEFI form goes to your local medical officer of health. That medical officer of health then assesses your form and decides whether it is legitimate and whether it gets forwarded on to Ontario Public Health.

So a physician who has never met you, has never examined you, probably wouldn't know you to pass you on the street, is the one who decides your fate. I was able to confirm when I found that out because I wanted to know.

[00:10:00]

So I reached out to the Health Unit and the health nurse contacted me back. She said "Yes, it did get forwarded on." I said, "I would like written confirmation of that, please." So I did get an email stating the date on which it was received and the date that it was forwarded to Public Health [Exhibit TO-19a]. So it should be recorded in the government data. However, things appear to be removed periodically. So I have not followed up on that any further.

It's been hard. I mean, I know because I run in circles where I have met a number—and I would say into the hundreds—of injured people. I only know of one other person that has been able to successfully get one of these filled out. The Harvard Pilgrim study that ran in the early 2000s—that stated that only, on average, 1 per cent of vaccine adverse events are actually reported—I would say is very true. That's in my experience.

Geneviève Eliany

Thank you. That completes my questions. We'll see if the commissioners have any questions.

Commissioner DiGregorio

Thank you so much for sharing with us today. I just had one question about— When your AEFI form, I think you said, gets assessed by a local health officer before being forwarded on, were you spoken to by that officer as part of that process?

Meredith Klitzke

No, they have no contact with you whatsoever.

Commissioner DiGregorio

And you didn't receive any update on what the processing status was or when it was forwarded?

Meredith Klitzke

I have the email that states: "the AEFI report was received on the 5th of May 2022, reviewed by the Medical Officer of Health, completed, and filed with Public Health Ontario on the 9th of May 2022." I guess it was a four-day process. But no, they have not been in contact with me. The Health Unit has not been, the Medical Officer of Health has not been. As I said, I'm now dealing with the Vaccine Injury Support Program. They're in the process of gathering my medical records from what I understand, but it will be a 12- to 18-month process.

Commissioner DiGregorio

Thank you.

Geneviève Eliany

On behalf of the National Citizens Inquiry, thank you so much for sharing your story.

Meredith Klitzke

Thank you.

[00:12:48]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 14: Kimberly Snow

Full Day 2 Timestamp: 09:02:50–09:10:50

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

Kimberly, can you hear us?

Kimberly Snow

I can.

Geneviève Eliany

Great. Could you turn your video on, please?

Kimberly Snow

Oh, okay. There we are.

Geneviève Eliany

Thank you so much. Could you state and spell your name for the record, please?

Kimberly Snow

My name is Kimberly Snow, K-I-M-B-E-R-L-Y S-N-O-W.

Geneviève Eliany

Do you promise to tell the truth today?

Kimberly Snow

I do.

Geneviève Eliany

Thank you so much for your patience, I know we're quite behind. You worked at the management level of retail. Correct?

Kimberly Snow

That is correct

Geneviève Eliany

And can you tell us a little bit about your role at the corporate offices?

Kimberly Snow

I worked for TJX Canada. I held a director-level position overseeing the workplace services department for their head office in Canada.

Geneviève Eliany

Can you tell us about their vaccine mandate?

Kimberly Snow

Yes. So we, at the corporate office—I was working from home over a two-year period. And when the pandemic hit, everybody went home and we had to learn to work in a new way.

And it wasn't until, I would say, late 2021 that the U.S.—the corporate headquarters in Boston—started considering putting some kind of vaccine mandate in place. And in fact, they did by September of that year. And they were discussing whether they were going to do this in Canada. Based on the culture that TJX embodied— And that was one of the things I absolutely loved about this company, was the values that they held, the respect, the kindness and respect that they promoted. The education on diversity and inclusion in that company was, you know, something I'd never experienced in any other company before. And on the committees that I was sitting on and participating in, I started seeing that this was something that Canada was considering as well. They started discussing this at the leadership level. And I could see that it was heading in the same direction for Canada, that they were going to probably implement the vaccine mandate as well.

And, you know, they started taking surveys. I think they were trying to get a pulse from the employees to understand whether or not people were already vaccinated; if they were to put a mandate in place, how many people would actually get vaccinated; and then how many people, what percentage would be left that they would have to deal with as far as paying some kind of severance out.

It wasn't until a week before Christmas—in December 2021, I think it was—that they finally announced that they were putting this in place. And anyone that did not comply with the vaccine mandate by February 28, 2022 would be terminated. So there was time for us to look for jobs. But you still had that time period to make a decision and become vaccinated and you could still keep your job.

Geneviève Eliany

Can you tell us about your experience with your attempt to get a conscious belief exemption?

Kimberly Snow

Yeah. So, you know, they did allow us the opportunity to provide an exemption. For me, it was a conscious belief exemption that I wanted to apply for. I had been working with the people in HR for many years—for the six years that I had been there. And then all of a sudden, I had to sit through questioning from my colleagues based on criteria that this company had set to determine whether the beliefs that I had in place fell in line with the criteria that they had identified to satisfy the requirements to remain at the company to keep my job—you know, whether my beliefs fell in line.

And I had conversations; I had emails back and forth. I was very open in communicating that I was not in agreement with what they were doing. And I had to go back and give them some kind of background on my beliefs and sort of prove that I was not in agreement with vaccinations.

I had stopped vaccinating my daughter when she was younger. I had to get exemptions for her to go to school.

[00:05:00]

And I had to provide all of this evidence to them. And it didn't help, they didn't—I was still denied. I'm not aware of anyone that submitted any kind of exemption, whether it was for medical or conscious belief or religious or anything. There was no one in that I was aware of that was approved for the exemption at all.

Geneviève Eliany

And to make matters worse, it was people that you worked closely with who questioned you, right?

Kimberly Snow

It was humiliating. You know, you're working with these people in a professional manner. And they're questioning the validity of your beliefs. And you're trying to explain to them something very personal about what you believe, things that I hadn't shared with these people. And of course, it wasn't necessary. But I had to come forward and try to justify that the beliefs that I had were valid and should qualify for this exemption, of which they did not approve. But it was a very humiliating process.

Geneviève Eliany

Were you ever called back after your termination once the mandate ended?

Kimberly Snow

No. No, I was not.

Geneviève Eliany

It's curious because retail of course didn't have the shopping passes, or the vaccine passports to enter the store to shop. So the office—the corporate staff, as you're explaining it—had to be vaccinated. But unvaccinated shoppers were welcome to attend the stores.

Kimberly Snow

And in fact, when they did put the mandate in place for the corporate office, it was a requirement for the corporate office and management level only. There was no requirement for store employees. In the 500-plus stores we had across Canada, there was no requirement for the store employees, unless you were in management, to be vaccinated. The vaccine mandate did not apply to them, nor did it apply to the distribution centres that handled the merchandise and processed the merchandise—except for management. There were thousands and thousands of employees that worked at these distribution centres. It did not apply to them. I mean, that was so illogical.

Geneviève Eliany

Yeah, it makes no sense. That completes my questions. We'll see if the commissioners have any questions for you.

Kimberly Snow

Thank you.

Geneviève Eliany

They're shaking their heads. Thank you so much for sharing your story with the National Citizens Inquiry.

Kimberly Snow

Thank you so much.

[00:08:00]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 15: Greg Hill

Full Day 2 Timestamp: 09:10:58–09:33:37

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Geneviève Eliany

The next witness is Greg Hill. Great. Thank you for joining us and for your patience today. Could you state and spell your name for the record please?

Greg Hill

Greg Hill. G-R-E-G H-I-L-L

Geneviève Eliany

Do you promise to tell the truth today?

Greg Hill

I do.

Geneviève Eliany

Can you tell us a bit about your career, your profession, and explain what Free to Fly is?

Greg Hill

Sure, well thanks for having me on. It's an honour to be here with so many other courageous Canadians that have stepped up over the past couple of years.

I started my flying career in the military. I spent 20 years in the regular force and then roughly another 12 years in the reserves. That enabled me to see all sorts of parts of the world, oftentimes not at its best. But I did get deployed all over the place, including several tours to Afghanistan. And then I started with the airlines back in 2006. And I've been there ever since, aside from a year where I did not work due to the vaccine mandate. I assumed that would probably be the end of my career. But since the mandate was suspended last June, I've been back working since roughly September of last year.

So Free to Fly, I won't get into too much detail with it. But as we saw, the government started to talk—make noise about a vaccine mandate. I assumed it would probably be coming for aviation first of all, just given the nature of our travels about the world and otherwise. So it started with a handful of pilots and then morphed into— Now it's over 40,000 aviation professionals and passengers. Many of those are disaffected passengers that were unable to travel during the period of that vaccine passport.

And so we continue our work advocating for both the freedom to fly, of course, but also the freedoms more broadly of every Canadian coast to coast, as well as for safety within the aviation sector.

Geneviève Eliany

Can you tell us a bit about the health standards and the safety obsession of airlines before COVID?

Greg Hill

Sure. Aviation went through a difficult period, I would say, back in the '70s primarily. I won't get into all the nitty-gritty of it. Those of you who are familiar with aviation will know some of the details. But it went through a spate of crashes and otherwise—a lot of that coming out of just the way that we were operating. People in multi-crew aircraft acting like single pilots; single pilot commanders ignoring others in the flight deck. Things like attention-tunnelling, excessive professional courtesy, something we talk about where there's so much deference to those in authority—being the captain, typically—that people won't even speak up when things are going sideways. Overconfidence, et cetera, et cetera.

So the sector completely changed the way they did business through things like crew resource management, communication, enabling an environment where you could ask questions, where you could speak up when things were going sideways.

So that evolved and expanded into things like what we call SMS, which is safety management system. And that's become really a gold standard globally. And in their own words, it ensures the effectiveness of safety risk control. So it's an environment where you can identify hazard; you can report on that. It encourages input and response from those in positions of authority.

So even here in this country, we've got statements from some of our major airlines, one of which states: "For over 25 years, our culture has put safety at the forefront of every decision we make, and we're proud to continue that legacy." Another airline: "Safety first, always. In partnership with our employees, we'll conduct business in a manner that ensures the health and safety of employees, customers, the general public," on and on, "meeting our obligations under all applicable regulations."

So that's the industry as a whole. And then when we bring it down kind of to the grassroots—as far as pilots go, there's numerous things that have been in place, really, for decades. So when it comes to things like medicine: As pilots, when we fly in a crew environment, just to give you maybe some context, we're not even supposed to consume the same meal in flight for fear of—if the fish is bad—ending up incapacitated in flight. Or even over-the-counter medication when it comes to things like cold and flu and otherwise, we're supposed to check with a doctor before we do that.

Or on Transport Canada's website, there's been a statement that's been there for a very long time that said, "Medical trials are not compatible with aviation medical certification." So that's been there.

[00:05:00]

And as far as our health on an ongoing basis, for decades, it has been in the Canadian Air Regulations section 404 that pilots are required annually to have a medical, or, if you're over a certain age—it used to be 40, now it's 60—every six months an in-person medical, which includes an ECG [electrocardiogram]. So that's a little bit of context. Obviously, it's not the full picture, but that gives you a baseline of where I would say we used to be.

Geneviève Eliany

What happened during the pandemic? Let's start with the medicals. How did the frequency of those medicals change?

Greg Hill

Well as far as the medicals go, when COVID hit, initially you had people that were starting to expire on their medicals. So initially, it was that they would extend the expiry date. Which, it's the cliché that we all say, "Well, you know, it made sense at the time. It was a confusing environment. We weren't too sure what to do." So that was the way it went for much of 2020.

And then as we moved into 2021, they brought about telemedicals, essentially. And so they exempted pilots from that section of the Canadian Air Regulations, enabling them to do two telemedicals in a row. So that means that you've got an ability for people to go 36 months without doing an in-person medical at all, including an ECG or otherwise.

There's been a fair bit of noise made about some of the things that are happening in the States with ECGs and the parameters widening. But I like to point out—well I don't like to point out, but I do point out—that here in Canada, unfortunately, during this COVID era, we pushed it to a worse scenario where we're not even required. And this was during the season when much of the nation had gone back to at least some semblance of normalcy, where you could go and sit and watch a Leafs game with 20,000 people—which I think is fantastic—but you weren't able to go and sit in a clean and quiet airline office with your doctor and make sure you're healthy. So I don't want to go on and on about that point. That's certainly one piece of it and I can speak to where we're at with that now, which I think is important as well.

But during the actual—I would call it during the "mandate era," we saw all sorts of things happen that were of great concern. And we tried to approach that as the calm professionals that we like to be as pilots, where we mainly are looking to mitigate risk and get people from point A to point B in a safe and calm manner.

Geneviève Eliany

How were your concerns received by Transport Canada and unions and airline management?

Greg Hill

Right. Well, stepping back to what I just said, we tried to approach this as professionally as possible. We wanted to ask good questions. We wanted to think ahead. We wanted to seek to mitigate risk. So we partnered at one point with the Canadian COVID Care Alliance, because I know as much about medicine and vaccines as some of these scientists would know about flying an instrument approach in an airline. And so we sought to bring in their expertise. So they very kindly prepared a document. We sat down and talked to them. And they said very clearly, "Of any profession in the country, flight crew are probably the ones we're concerned about the most. Because you fly in a unique environment. You sit for long, long periods of time, which elevates some of these vascular and cardio type of risks."

So we put together a document so that we weren't just sitting down and talking to our managers or otherwise from what we gleaned ourselves on the internet, although I think there's plenty of good information out there. But we presented this document to a couple of the largest pilot unions in the nation, a couple of the largest airlines in the nation. And here we are a couple years later, and I still haven't heard anything back as far as this goes.

It really— And I'm sure you've heard this repeatedly as you've done all sorts of conversations along these lines: there wasn't a willingness to listen. But the concern within the aviation environment is— One of the analogies I like to use is, we try to approach it the same way that we fly airplanes. So we queried, for instance, Transport Canada. We started talking about, "What happens if I lose my license?" Because if a pilot loses his ability to fly with his medical, it's essentially the end of his career. So myself and a couple others started asking, "What happens?" And the answer, to make a long story short was, "Well, you're at risk of COVID far more than you are from these vaccines." To which I said, "Well, based on what long-term studies?" Because it's been very clear—and this is from the manufacturer's own FDA [Food and Drug Administration] briefings—that there was no proof of any help as far as transmission.

[00:10:00]

That the long-term studies had not been done. And then people started asking about this line that I'd mentioned, about not participating in medical trials.

When we asked these questions, which was during the week of the 13th of July 2021, that statement had been on the internet for years and years. The very next week, if you use the Wayback Machine, it simply disappeared. There was a ton of activity on that particular page. And that inconvenient truth, to summon a little Al Gore, was simply removed. Which is greatly concerning. We have never in aviation simply ignored difficult circumstance.

This was when I pushed back with my managers and said, "If I was flying an airplane and I was running a little bit late, and I ran up to the aircraft, and I said, 'Listen, the risk of a catastrophic engine failure on takeoff is sub, sub, sub 1 per cent'"—because it is—"so I'm not going to do a walk around; I'm not going to check the maintenance records; I'm not going to program the aircraft or brief. I've done this a bunch of times; I'm quite confident that we're safe,' and I just took off, it would very quickly be the end of my career."

And yet those within the aviation community— And it's not just my managers, I push this all the way back up to Transport Canada because these were the questions that were being asked. The statement was, basically, "It's safe and effective. Just get it." And the option was you either get it or you lose your job, similar to many others.

Stepping back to what I was talking about in the '70s, where we were crashing airplanes planes for operating in ways that were reckless and not really investigating, this was even some of the same sort of concerns. There's sort of a radical statement in aviation that if you start querying the guy you're flying with and things are starting to go sideways, it just seems like he's not listening, you say, "This is stupid!" to try and get their attention. And this was really what we were trying to do. But at the end of the day, it wasn't listened to.

And the part that I think was particularly frustrating for many of my colleagues as well is that, throughout this era, the airlines had put in writing, "Testing is an excellent option to keep you and your colleagues safe." Some of our guys and gals were flying back and forth to China and other places picking up PPE and otherwise. And they were told—along with the travelling public—and I do think it's true: "The risk of transmission is exceedingly low. It's very rare to contract COVID while flying. Keep flying, there's no need to quarantine or otherwise." And then, when the mandate came out, suddenly we were such a dire risk to our colleagues that when we had to turn back in our passes and our iPads and otherwise, when we were put out of work and expecting to be terminated, we weren't even allowed to walk in the building to truck them off. We had to leave them either curbside or mail them in. So there's a level of hypocrisy as well as just a complete decoupling of common sense from policy.

Geneviève Eliany

I understand that you've had a number of calls with pilots who are likely vaccine-injured. Can you tell us a bit about those calls?

Greg Hill

Right. So I guess this is where we are at this point. We're in what I would call the "post-mandate era." Some of us are back to work, there's others who did not get their job back. But as you mentioned, I personally first-hand spent hours on the phone with vaccine-injured Canadian airline pilots. Just based on my role, they feel comfortable calling and talking to me. They don't feel so comfortable raising their hand in other means because, again, that medical is the tenuous thread that keeps you in an airplane.

Some of these are more minor on the spectrum. Again, I'm not a doctor to speak to where they fall on the spectrum exactly, but things from issues with vision to hearing, you know, to feelings of paralysis in different parts of your body, to what seem to be symptomatic of something like myocarditis, chest pains, and otherwise.

And so we've tried to be very vocal with this but we've tried to do it in a way that's collaborative as well. And I brokered a coalition with a number of other groups similar to **Free to Fly in the U.S., Australia, the U.K., Germany, Switzerland, various spots in Europe.** And we put our signatures on a letter we sent to Transport Canada. We just said, "Listen, we want the safety of the travelling public. We want to collaborate with you." So we asked questions as far as: What was done to determine the safety and efficacy of these prior to rolling out the mandate? Are you tracking things like adverse reactions amongst crew? Are you tracking how many planes were flying around single-pilot versus multi-crew?

We sent that letter. We waited maybe a month. I think a month and a half. We sent a follow-up.

[00:15:00]

It was over three months before Mr. Algahabra finally responded with a collection of speaking points, essentially saying, "Health Canada has approved these vaccines. They're safe and effective." And that was really as far as it went. So concerning for sure because the role of an organization like Transport Canada is to ensure the safety of the travelling public. And it does not appear that this is where we're at.

When we talk about things like vaccine injury amongst flight crew, and this is pilots as well as flight attendants. You can go online and look this up in something called the CADORS: the Civil Aviation Daily Occurrence Reporting System. So it's not me that's picking it off the internet or otherwise, you can go and read the reports yourself. And pilot incapacitation has been an issue for years and years, but of course we're concerned about where we're going with these jabs.

So I like to be solution-focused. And then the concern here, stepping back to what you'd asked earlier, is: What can we do about this? What we can do? And the only backstop is properly screening pilots before they go flying or as part of their annual medicals. And I think this should go further, as far as things like D-dimer tests or even cardiac MRIs, which may be a pipe dream here in Canada. But instead, where we're at now is Transport Canada just recently, March the 1st, unbelievably—and we're the only nation I know of (and I've checked) globally that's doing this—has now allowed telemedical to continue until 2025. A pilot can go—again—up to 36 months, the third medical they do have to do in-person, without doing an in-person medical.

And sadly, two weeks after they did that the Transportation Safety Board, which is an independent organization, put out an accident report that happened in late 2021. A gentleman flying a private aircraft sadly crashed in Alberta. And it was determined that he'd had a heart attack as part of that crash. Now, the interesting and tragic part of all of that is the fact that he was an airline transport pilot, he was a commercial pilot. And he had attested his health earlier in the year.

And this is the thing: the justification now is flexibility. But we have never in aviation set flexibility on top of safety. We have preached against it for years and years. You're told not to do things like "get-home-it is," which is a word for, "it's the last leg of being on the road for four days and you start rushing and forgetting things." Safety always is paramount. And yet here we are permitting this telemedical business to continue.

So I feel it's important— Not to keep hammering the same point over and over again but in order to be solution-focused, I think we've got to figure out, what do we do about it? We've got to screen people properly. And yet here we are with this past three years. And you and I have just discussed a trajectory of sorts where we started with one thing, and you would have thought, by 2023, when we're at least ostensibly trying to get society back to some sense of normalcy—

We're continuing with policies that are antithetical to everything we stand for in aviation. And so you have to ask yourself: What is really going on at the policy level with a lot of this?

Geneviève Eliany

Thank you. That completes my questions and I'll see if the commissioners have any questions for you. There is one.

Commissioner Massie

Well, thank you very much for your very interesting testimony. I was wondering about the testing of the pilots. I think it makes sense that you would want to do in-person medical exams. What would be the consequences for pilots that undergo such an exam, would have conditions that would prevent them from further working as pilots because of disability that would disqualify them? What would be the consequence for them and for the— I guess, the vaccine mandate that actually put them in that situation?

Greg Hill

Well thanks for the question. The issue with all of this, and it's not unique to aviation of course, is trying to prove causality. And unless you baseline your health before taking the jab, which I know a few people have done, it's difficult to prove that causality. Now, I know that sounds a little bit—

[00:20:00]

I mean, we're all seeing massive amounts of things happening that we have not seen in the past. So it's very difficult with a straight face to try and claim that this is just a normal circumstance.

The unique thing, again like I said, with a pilot, is that— And pre-COVID, typically if you'd gone into your annual medical and said, "You know, Doc, I'm getting chest pains once or twice a week during the evenings," you'd be grounded pretty quickly while they at least investigated that. But folks that I've talked to have raised some concerns and they've really had to push to go and do things, like stress tests to try and— And when you've got a pilot that's essentially seeking to ground himself, you're living in an upside-down world, at least as far as aviation goes. Because it's very difficult to keep men and women who are passionate about flying out of an airplane. And particularly when their ability to pay their mortgage or otherwise is attached to it.

I'm not sure if that answers your question. But the long and short of it is— And if you go and read something like the civil aviation medical examiners' handbook, there's guidance there for the Transport Canada doctors. It says quite clearly that it's difficult sometimes to get pilots to be honest about their health. It's kind of laughable to read it because it says very clearly, "you're the last line of defence here with making sure these men and women are safe getting in an airplane." Because they're oftentimes not going to be super honest because they want to keep flying. Which again is an argument for ensuring that they are in an office and not doing a subjective, "I feel fine."

We have to go in a simulator at least two or three times a year to essentially make sure we're competent to fly an aircraft. And I said to managers and otherwise, "Why are we allowing what we're allowing with telemedicine?" I can't just phone in and say, "I'm a great pilot. If I lose an engine on takeoff, I can assure you 100 per cent it's going to go super well." I have to get in a simulator and prove that with my hands and my feet. And when it comes to the health aspect, I don't think we should be attesting to how we feel either. I think we should be ensuring that we've got that backstop for safety.

Commissioner Massie

Thank you very much.

Geneviève Eliany

Thank you so much for your testimony and all the work that you're doing with Free to Fly Canada. Have a great evening.

Greg Hill

Thanks so much for having me.

[00:22.39]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 2

March 31, 2023

EVIDENCE

Witness 16: Ksenia Usenko

Full Day 2 Timestamp: 09:33:58–09:50:47

Source URL: <https://rumble.com/v2fm8wg-national-citizens-inquiry-toronto-day-1.html>

[00:00:00]

Shawn Buckley

Hello, Ksenia, how are you?

Ksenia Usenko

I'm good. How are you?

Shawn Buckley

I am well. Can I ask you to please state your full name for the record, spelling your first and last name for the record.

Ksenia Usenko

My name is Ksenia Usenko. First name is spelled K-S-E-N-I-A. Last name U-S-E-N-K-O.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth today?

Ksenia Usenko

Yes, I do.

Shawn Buckley

Now, you have been basically, a nurse for 15 years.

Ksenia Usenko

Yes, yes. I've been a nurse for 15 years.

Shawn Buckley

And you worked on a rehabilitation unit?

Ksenia Usenko

Yes.

Shawn Buckley

Now, when we started introducing the vaccines, I think that was in January of 2021, did you see any changes in the rehabilitation unit?

Ksenia Usenko

Not right away. But a little bit later I started seeing some trends in patient population and their conditions. They were somewhat— If you look back on when they got their vaccines, it seemed that it was pretty recent for some of the patients.

Shawn Buckley

And what were some of the changes that you were seeing?

Ksenia Usenko

I have seen some families, actually one family who within, I believe it was three to four weeks after their second vaccination, both of them were septic. And I know it could be coincidental. The major one that I've noticed was thrombocytopenia, which is low platelet count on the majority of patients that have been vaccinated that I've seen.

Shawn Buckley

Right. So just so I understand. So when you say a lot of patients, how many patients would you—are we talking about?

Ksenia Usenko

So normally we would have four to five patients during the day shift and about six patients—six to seven depending how many staff members are present—in the evening. And at night it would be eight—

Shawn Buckley

Right. But I guess I'm trying to find out, when you're talking about a low platelet count, how many patients are we talking about?

Ksenia Usenko

Altogether?

Shawn Buckley

Yes.

Ksenia Usenko

I have not counted. But I think the majority of my patients that I had during that period, their platelets were low. And for people who had surgeries, could be related to that. But a lot of them were significantly lower than what I've normally seen.

Shawn Buckley

Okay. And when you say a low platelet count, that's a low white blood cell count?

Ksenia Usenko

Yes. That's responsible for coagulation, one of the cells.

Shawn Buckley

Now, you came across an unusual blood clot in a couple of patients. Can you tell us about that?

Ksenia Usenko

This was significant for me because I've never seen that before. Out of five patients that I had, two of them had blood clots. One person had a blood clot in her arm, the other person in his foot. And none of them had—normally you would see it, well, it's a rare appearance. Even in surgical patients. But both of those patients did not have any surgeries prior, so they were more medical patients.

Shawn Buckley

Okay. And were you aware of their vaccination status?

Ksenia Usenko

Both of them were recently vaccinated.

Shawn Buckley

Okay. And you had never seen that before.

Ksenia Usenko

No. The only time I've seen somebody getting the clots spontaneously—well, somewhat spontaneously—is a person who was a smoker and was on birth control at the same time. And I've only seen it once.

Shawn Buckley

Now, you made a decision about vaccination.

Ksenia Usenko

Mm-hmm.

Shawn Buckley

And what was that decision?

Ksenia Usenko

I wanted to wait and see. And then after seeing all of these health concerns, I decided not to get it.

Shawn Buckley

Now, were you treated differently at the hospital?

Ksenia Usenko

If I would bring up what I'm seeing with my eyes in the conversation, some of my colleagues would just leave the conversation. They didn't want to hear it.

Shawn Buckley

They'd literally leave the conversation.

Ksenia Usenko

Sometimes, yes.

Shawn Buckley

Okay. Did you have to do any different testing or were there any other requirements for you to continue working?

Ksenia Usenko

Yes, I had to do the antigen test once a week. And I can't remember exactly when I started, I want to say it was September 2021, until I was terminated.

[00:05:00]

Shawn Buckley

Okay. And that termination, when did that happen?

Ksenia Usenko

On November 3rd, 2021.

Shawn Buckley

Okay. Now before that, did you have to go through some mandatory education on vaccination?

Ksenia Usenko

We had an online sort of video with information to make an informed decision about vaccines for ourselves. And this was for all the healthcare professionals who were either not showing their status of vaccination or people who already showed their status. And I actually brought a picture of it. And on one of the slides, it stated that it's 100 per cent effective at preventing hospitalization and death from COVID-19.

Shawn Buckley

So just wait a second. I want that to sink in for people. So you're telling us this is the hospital requiring you to go through an education program.

Ksenia Usenko

Yes.

Shawn Buckley

And the object is to help you make a decision on whether or not you want to get vaccinated.

Ksenia Usenko

Yes.

Shawn Buckley

And one of the slides—and you brought a picture—says that the vaccine is 100 per cent protective, basically preventing death and hospitalization.

Ksenia Usenko

Yes. That's what it states.

Shawn Buckley

And you can leave that with us, so that we can enter it as part of the record today?

Ksenia Usenko

Sure [Exhibit TO-25].

Shawn Buckley

Okay, thank you. And I'm sorry to interrupt you, but I just found that so important. Did you also have to sign something when you were taking that course?

Ksenia Usenko

At the end of it, I had to sign—it's kind of like a declaration of your vaccine status. So to show that even though you got the information, maybe you changed your mind to go and get the vaccine. Or if you didn't change your mind, you just declared that you, at this point, still declined it.

Shawn Buckley

Now, did the hospital also communicate to you by way of email concerning whether or not you should be vaccinated?

Ksenia Usenko

There was multiple emails. And I'm not sure if it went to everybody who worked in the hospital or just targeting the people who have not specified their status. But I received multiple emails from the director of occupational health in the hospital, asking to show them what your status is. I just didn't reply.

Shawn Buckley

Now, you've already told us you were terminated. But can you tell us basically how that came about? How did they go about doing this?

Ksenia Usenko

Well, there was emails stating that if you don't declare your status or if you decline the vaccine or unless you have an exemption, you would have to—you would be terminated. So there's been multiple emails warning you about it. And I just couldn't believe that it's actually possible, that they actually are going to go this far to do it. In my heart, I just thought it can't be possible. Number one, we don't know enough about this product. What I'm seeing— From what I observed, there's clearly problems. I also couldn't believe that, knowing what biomedical ethics state about informed consent, this would be a decision-maker for your employment. And to this day, it still haunts me that they actually went ahead and did it.

Shawn Buckley

Now when they terminated you, what were the reasons that they gave for your termination?

Ksenia Usenko

The reasons for termination was— There was three. But the one that really kind of put into perspective of who I was as a nurse, the word, "disobedience."

Shawn Buckley

I'm sorry?

Ksenia Usenko

The word "disobedience." That's stated on my termination letter.

Shawn Buckley

Right. Did they also indicate something about whether or not it was professional misconduct?

Ksenia Usenko

Yes, they put that there as well.

Shawn Buckley

Okay, so I just want to understand. Here you had worked actually for that employer for 14 years, am I correct?

Ksenia Usenko

Yes.

Shawn Buckley

And the only issue is you chose not to take a vaccine.

Ksenia Usenko

Correct.

Shawn Buckley

And on your termination letter, they called you disobedient.

Ksenia Usenko

Correct.

Shawn Buckley

And they stated explicitly that you were guilty of professional misconduct.

Ksenia Usenko

Yeah. That's correct.

[00:10:00]

Shawn Buckley

So whether or not you take a medical treatment is now an issue of professional misconduct for nurses?

Ksenia Usenko

It appears so, yeah.

Shawn Buckley

Okay. How did this make you feel? And I'm sorry that—

Ksenia Usenko

I feel—and I stated that on my termination meeting—I feel dehumanized.

You know, I immigrated to Canada for a better life. And I wanted to help people and I still do, with all my heart. And to have somebody tell me that I'm just disobedient because I refuse something that is still under research? At the time, when I received this education, I actually had a patient who had two vaccines, went to ICU for COVID-19, and was recovering after being at ICU and had multitude of different problems in his health. He would probably never be the same. And he was fully vaccinated.

So to state that it's 100 per cent effective, I just couldn't believe it. I saw it with my eyes that it's not true.

Shawn Buckley

Now you were telling us about some changes that happened after vaccination. Would it be fair to say that you were having concerns that there were adverse reactions occurring, that were showing up at the hospital?

Ksenia Usenko

In my opinion, yes.

Shawn Buckley

And did the hospital know how to report adverse vaccine effects?

Ksenia Usenko

Well, I made sure that on that floor, we had those forms. At the time, I was a safety rep. But during my meeting of termination, I asked them how come there was no education on those forms: the Adverse Event Following Immunization Forms. And I had to repeat that question three times. Because the panel that was terminating me, they didn't know what I was talking about.

Shawn Buckley

They weren't even aware that there was a form to report adverse vaccine effects.

Ksenia Usenko

Correct.

Shawn Buckley

And who was on that panel, like, what were their qualifications or positions?

Ksenia Usenko

One person was human resources; the second person was my manager, who was an occupational therapist; and the third person was a union representative.

Shawn Buckley

Now, having had this experience—so seeing things at the hospital and having to go through this course and be getting emails and being treated differently and then being fired—what was the effect on you of these actions?

Ksenia Usenko

It's still affecting me, as you can see. It breaks my heart that it's possible in—in any country. It affected my relationships, even with some family members.

It's just sad. It's heartbreaking to know that this is possible in such a developed country, and for a product that we still don't know enough about.

Shawn Buckley

If this ever happened again, what do you think we should do differently?

Ksenia Usenko

I think we should do what we did with the flu. We opened extra units. We had extra staff, and we, you know, tested people and made sure that they got the help they needed with all the resources that are available. And I don't— Maybe take more precautions around more vulnerable people who are susceptible to this particular illness.

[00:15:00]

I don't know. There's many things that could have been prevented. And hearing all the people speaking here today and I've been watching the ones you did in the Maritimes. And, you know, all this harm and suffering would have been avoided. Well, maybe not all, but at least some. So yeah.

Shawn Buckley

Well, Ksenia, I don't have any further questions for you. I'll ask if the commissioners do. And they do.

Commissioner Drysdale

I just wanted a little clarification on a point. When you said they terminated you and they put on your termination notice, professional misconduct was one of the items?

Ksenia Usenko

Yeah.

Commissioner Drysdale

Did the nursing association not approach you and ask you anything about that?

Ksenia Usenko

Not yet.

Commissioner Drysdale
Sorry?

Ksenia Usenko
Not yet.

Commissioner Drysdale
Do you expect them to?

Ksenia Usenko
We'll see. Time will show.

Commissioner Drysdale
Thank you.

Shawn Buckley
Thank you, Ksenia. We don't have any further questions. But on behalf of the National Citizens Inquiry, I'd like to sincerely thank you for coming to testify. And if you can leave me that document you have where you basically have a photo of them claiming that the vaccine was 100 per cent effective in preventing deaths and hospitalizations, we'd like to make that part of our record.

Ksenia Usenko
Yep. Thank you. And thank you all for doing what you're doing.

[00:16:49]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE TORONTO HEARINGS

**Toronto, Ontario, Canada
March 30 to April 1, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 3 Timestamp: 01:11:21–01:35:11

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. For those watching us live online, we apologize that we're a little behind today. We had some exhibits that we had to get arranged for one of our early witnesses.

We welcome everyone back to the final day of our Toronto hearings. Commissioners, my name is Buckley, initial S. I am attending this morning as agent for the Commission Administrator, the Honourable Ches Crosbie.

Before I give my opening remarks I'd just like, for those online, just to share quickly about the National Citizens Inquiry: We are a citizen-organized, a citizen-run, a citizen-funded initiative. We don't have a single large donor. We're doing this all on our own, almost exclusively by volunteers that are attending and participating to make this happen.

And what we want is to start a national dialogue. We want basically the entire nation to share with us in this experience of hearing each other's stories and, through hearing each other and understanding each other, coming together again. Because we've become a very divided nation. We also want to learn from this—learn what happened in a fair and impartial way. And we want to know how to do things better. We anticipate that this will be a tremendously useful experience for us as a nation going forward and we're very proud of **what we're doing.**

I will ask that you go to our website, National Citizens Inquiry. We have a petition. Please sign it so that you become part of the group that is endorsing this project. And we also ask that you please donate. As I say, we don't have a single large donor. This is all done by donations from people like yourself. And to keep this important initiative going, we need your donations. Now, I'll switch to my opening comments before we start calling witnesses.

Yesterday, I had spoken a little bit about some tactics that are used to influence and control us. And I cautioned you that if you ever start feeling very strong emotions on any topic, that you need to be careful, that likely your mind is closed, which only affects you. It means

you're totally captured if your mind is not open to new information and new ideas so that you can reconsider your position—not necessarily change your position.

Today, I want to talk about perhaps the most important way that populations are manipulated and controlled. And that is when we are manipulated into giving up our personal responsibility for our actions. Now, everyone has a sense of right and wrong: every single person in this room, every single person watching. When I was preparing this morning for this address, I was thinking of C.S. Lewis's book *Mere Christianity*, where at the beginning, he's making the case for the existence of God. One of his points is that every single religion, every single culture, has a moral code. And when you compare them, they are strikingly similar or identical, which is a curious thing. With all the different cultures and all the different religions that, in effect, we have the same moral code. We know right from wrong. Now, that can be used against us.

For instance, we are social creatures. One of the things we fear the most is being excluded from our tribe. I mean, in my age cohort—it might have been different for younger generations—

[00:05:00]

we all remember in gym class when they were picking the teams. You didn't want to be picked last because you would feel shameful. We want to have a nice car, a nice house, so that we appear successful and worthy to our peers. This need for social approval is one of the strongest drivers in our lives.

So one of the most terrible things we can do to a person is to shame them publicly. I consider that in most cases to be an act of violence, although you're not actually hitting people. And so right now, especially online, we live in a culture of social shaming. We have this cancel culture where we're so willing to viciously attack people online. But understand we do that because of our sense of right and wrong being turned against us. We will attack somebody because they're wrong. They're morally wrong.

Do you recall the testimony of Tom Marazzo yesterday? So he gets this email from the dean to about 200-plus faculty members informing him and everyone else that these vaccine mandates are coming down. And he responds to this email. And we have it as an exhibit where he's basically explaining, you know, there's some legal problems with this and some other considerations. And perhaps, you know, others should join with me in a conversation about this. And then, one by one, people started, "reply all," "please take me off your email list." And after this went on for a little bit of time, one person piped in and said, "Can you guys just reply directly to Tom so that I don't have to get all of your emails? You're filling up my email box." And somebody else chimed in and said, "No, we need to do this publicly to shame him." And then, one by one, they're all asking him to take them off his email list.

That was an act of social shaming because these people believed they were doing right. Now you're never doing right when you're committing an act of hatred. This is done out of hatred and spite. And I view that as a violent act. And those of us listening to Mr. Marazzo yesterday would agree. But I'm using it as an example of how this sense of right and wrong can be turned against us. And we are capable of being manipulated into doing unspeakable evil.

And again, I just prepared this this morning after I woke up. But the examples that came to mind were Rwanda—the genocide in Rwanda. And I mean, that happened in our lifetime. And it is unspeakably evil what happened. Nazi Germany is one that easily comes to mind.

It was unspeakably evil what happened. What about Stalinist Russia, these terror states? Or East Germany at its worst, where once the Stasi files were opened, people were shocked at which friends and family members were reporting them to the secret police. And these people were all manipulated into believing they were doing right.

Now understand that the terror states, the police states, the unspeakable evil that happens: it all depends on your cooperation. The leaders are few. The leaders can't do this. The leaders cannot conduct a police state. It all depends on your cooperation.

Now I'm going to say something really important, and you need to remember it if you're going to have any chance of being free going forward. And what that is, is that you need to understand that you—you are the police state. Let me say that again. You are the police state.

[00:10:00]

There can be no police state without your cooperation. And we become the police state because individually, we give up responsibility. We give up our personal responsibility for what we do, for our actions. And it's a well-known concept for those that want to manipulate us.

When I was trying to think of examples this morning, Dostoyevsky came to mind. In his novel, *The Brothers Karamazov*, there's a section with the Grand Inquisitor where Jesus has come back during the time of the Spanish Inquisition and he's having a conversation with the Grand Inquisitor. And the concept comes up that if you can take away from citizens their personal responsibility, you can get them to do anything for you.

A really good example of that is— There's a well-known lecture given by Himmler, the head of the SS. I believe it was before the Night of the Long Knives, to encourage the troops to go and do what he wanted them to do, which was to murder a whole bunch of people. And he literally said to them, "It's not you pulling the trigger, it's me." He was taking away their personal responsibility for the acts that they were being asked to go and commit. And you see, he understood. If he took the responsibility for what they were doing, they would do unspeakable acts that they would not do if they were taking personal responsibility.

It's why in the Nuremberg trials, we had to establish the legal principle that following orders is not an excuse for torture and murder, because we are psychologically wired to do unspeakable things if we are not personally responsible for what we are doing. So if they can take away your personal responsibility, you are controlled.

And we are. In Canada, we are doing unspeakable things. I've already brought up Tom Marazzo in this email shaming that we heard yesterday. What about the video that he showed us about the police pulling veterans? Wounded and decorated veterans, who are telling the police, "We are not acting violently, but we're standing here." As they were legally entitled to do. And we watched one of them basically being pushed to the ground and kicked by the police. And we're allowing this to happen.

What about Mr. Palmer, who testified about the media? He basically told us that the CBC is engaged in propaganda. That the CBC is engaged in deliberately manipulating us to accept vaccines, to basically take a medical treatment that is turning out to be tremendously dangerous. Is that not an act of violence? And yet it is happening even now.

What about Natasha, the person who is mentally traumatized, PTSD, and is physically disabled? Cannot wear masks, she legitimately cannot wear a mask. And this is a lady that used to wear the big masks on the oil fields all the time. And she's taken to the ground by three police officers in Walmart, knowing that she's disabled, while a crowd watches and does nothing. The crowd was the police state. The crowd, you: You are the police state, participating in this social pressure and shaming.

How many people have told us that they've taken the vaccine out of social pressure? How many people have told us that their families and friendships are divided because of social pressure?

What about the evidence that we're hearing? In Truro, where we heard a doctor, he submitted 10 adverse reaction reports as he's required to by law. And instead of those reports being submitted, he's professionally disciplined. And we're hearing at these hearings how adverse reaction reports, which are meant to be an early warning system—They should be bending over backwards to send those to Health Canada and have the media report them so that we can determine whether we need to look into things.

[00:15:00]

But they are being deliberately suppressed by several groups: the media, the medical establishment, the government. This is happening today.

What about vaccinating kids? Anyone looking into this even on a cursory basis, you don't need to look at Dr. Deanna McCloud's presentation to know that there's hardly been any testing. And to say that they're safe and effective is just a very difficult thing for anyone to credibly try to assert. And there is zero risk to children. Zero risk. We've heard that evidence. But we're already experiencing significant harm.

Now, I ask you, if that is true—and everyone in this room believes it to be true—how is it that this is not criminal negligence? Our parents now, they should be asking themselves the questions: Are we committing criminal negligence? Should we be criminally charged and jailed if we vaccinate our children? Doctors and pharmacists should be asking themselves: Are we committing criminal negligence if we vaccinate anyone, but definitely a child, and if we encourage and pressure some parent or caregiver to vaccinate a child? What about the media that is pushing vaccinations on children? Didn't our public health officer, Miss Tam, have a little Christmas call with Santa Claus or Mrs. Claus? Basically, you know, don't get on the naughty list; get vaccinated.

How can this be happening in Canada at this time with what we know? How can public health in every province still be vaccinating children? You know, if it looks like a police state, if it smells like a police state, if it tastes like a police state, maybe it's a police state.

We have just gone through mandatory masking. We have gone through lockdowns. We have gone through social shaming and division like we have never seen before in this country. We have treated unvaccinated people as if they were lepers. We restricted their rights. We shamed them. There was talk about not even allowing them to go for essential services. There were talks in some provinces of criminalizing it so there would actually be penalties on them. There was talk of putting unvaccinated people in camps. And I see people nodding their heads. They heard that, too—in Canada.

But what shames me most about being Canadian is that we have undertaken these actions with more gusto and more support than any other police state that I am aware of. In a lot of

police states—don't tell me in Stalinist Russia or East Germany that the citizens were enthusiastic and supported what was going on. It was quite the contrary. But here we are, doing it with gusto and still in full deception mode.

Our government is not sharing with us the truth. The medical establishment is not sharing with us the truth and the media is not. And this is happening today because we are not taking personal responsibility for our actions. It is happening because we, right now—you—are the police state. You are the ones participating in the actions. It's not the leaders doing this. You are doing this. Media, you are doing this. Journalists, editors, you are doing this. Doctors, pharmacists, every citizen that's shaming and shunning and closing your mind, you are doing this.

And the tactics to get you to do this is to put you in a state of fear, which they've done. And to convince you that this is for the greater good. You see, if you're doing things because it's necessary for the greater good, you're not taking personal responsibility for your actions: "We don't have any choice. This is for the greater good."

[00:20:00]

Do you understand what I just said? The greatest danger to us as a society, to a free and democratic nation— Our greatest danger is you not taking personal responsibility for your actions. And if you are convinced that you should be taking actions for the greater good, you have just committed the greatest act of treason that you can because you have abrogated your personal responsibility to the government. It is the tactic that is being used. You are being told, "You are not pulling the trigger; I am pulling the trigger. You do what we tell you to do because it's necessary for the greater good." We cannot succeed as a free nation unless, as citizens, we take personal responsibility for everything we do.

When I was probably about 12, I attended at the public library in Saskatoon and I saw a World War II film that changed my life. It was somewhere in Eastern Europe. It was filmed by a German soldier just filming what that soldier's unit was doing. And what that soldier's unit was doing was, they rounded up a bunch of town folk, lined them up against the wall, and shot them in a firing squad in retribution for partisan attacks. So this was murder of civilian population. There's no sound. And you know on these old black and white movies you got the lines, the whole thing.

And so we see basically these town people being lined up against a wall—like, literally a wall. It wasn't a field; it was a wall. And the soldiers all lined up. You can't hear anything, but you know the order is "raise your rifles." And all the rifles get raised except one. One German soldier did not raise his rifle. And again, there's no sound, but you see the officer walk up and have a conversation with this soldier that refused to raise his rifle. And then I saw something that changed my life. The soldier laid down his rifle and walked to the wall with the villagers. And then the order was given, and the rifles were raised again. And everyone along that wall, including that soldier, was shot.

Now we all know that our nation is changing. We all know that things have now gotten out of our control, and we have a decision to make. You can't avoid it any longer. You can't say, "Oh, I'm going to stick my head in the sand and the world's going to be okay next week, next month, next year." It's decision time. And so the decision you have to make is: Which type of soldier are you going to be? Are you going to be one of the many soldiers that raised their guns and fired because they were ordered to do so? Or, are you going to be that soldier that laid his gun down and walked to the wall?

And I'm sorry that I got emotional, but we are dealing with very serious matters. And this inquiry is dealing with very serious matters. And I guess we've seen a whole bunch of witnesses get emotional, so we have to forgive ourselves also.

We are going to have another day today that changes our lives. We're going to have another day where we have brave Canadians risking retribution for speaking to us. We're going to have some experts give us insight that we didn't have. And so unless the commissioners have any questions or anything to say, I will introduce one of our volunteer lawyers and we'll commence.

[00:24:20]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 1: Jay McCurdy

Full Day 3 Timestamp: 01:35:45–02:40:52

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Allan Rouben

Mr. Jay McCurdy, I believe, is going to be appearing virtually.

Jay McCurdy

Hi there.

Allan Rouben

Mr. McCurdy, how are you?

Jay McCurdy

Good, how are you, Allan?

Allan Rouben

Very good. So tell us a little bit about yourself. How old are you, what do you do, what's your educational background?

Jay McCurdy

I am an elementary school teacher completing my 24th year in education based in London, Ontario at the Thames Valley District School Board. Forty-eight years old. Third generation educator. Grandmother was a kindergarten teacher; mother was a high school English teacher for 30 years. Brother's a teacher, so it's kind of a family trade, if you will.

Allan Rouben

And what grades do you teach?

Jay McCurdy

I teach grades 7 and 8 predominantly. Outside of one year of 24, I taught high school. I trained for high school with my intermediate senior qualifications but ended up landing in a grade eight position and I haven't turned back since.

Allan Rouben

And in a nutshell, what's the subject matter you want to talk about today?

Jay McCurdy

Well, you know, in large part with this whole inquiry and the whole COVID conversation—and I appreciate every aspect of it and I agree with 95 to 99 per cent of all of the testimony that I've seen and in large part, all the conversations that are dissenting conversations—I just really feel like something's missing from the conversation, and that's a child-centered conversation.

It's egregious to me that we're— Even myself at times, I feel like I'm being selfish in talking about how has COVID has affected me, how has COVID has affected my parents, who are close to 80. Nobody is emphasizing the children. And it's— To me, it's egregious that we're not having a conversation about the impacts on children. Children are the future, they're the primary resource. If we don't have children then I don't think we have a future as a country, as a nation, as a planet.

And I would like to emphasize that portion of the conversation: How important children are to the future. And it's just mind-blowing to me. I mean, my career has been spent— I mean, I love children. I have a son and a stepson and, watching them go through COVID, there's a level of selfishness to this that really bothers me in terms of the adults having the conversation about themselves. And I guess I'm being extremely selfish. If I sound holier than thou that some people are not talking about the children, then forgive me, but I'm very passionate about this.

Allan Rouben

I think you're referring to the impacts on children from the steps that were taken with respect to schools.

Jay McCurdy

Yes. The schools primarily, I can speak as a sort of frontline worker on the ground. But also, just the greater impacts of the COVID restrictions: the lockdowns, for example, and then the aftermath of COVID, violence in schools and such.

Allan Rouben

And stopping extracurricular activities and social interactions—correct?

Jay McCurdy

Oh, a hundred per cent. A thousand per cent. I'm heavily researched on this. I mean, when I come across an article or come across any sort of literature on this, it perpetuates and sort of validates everything I've been experiencing. My observations, my understandings of the

impacts, the negative impacts on children. And I live it day-to-day as a teacher; I see those as corroborated with umpteen articles, research evidence, and so forth, right? So I have sort of two perspectives: sort of a top-down one and a sort of an on-the-ground, face-first.

Allan Rouben

All right. And so in your specific school board, we know the lockdowns started in March of 2020. Give us a little bit of the chronology there in terms of what was happening.

Jay McCurdy

Well, the lockdowns started in March of 2020; I think it was March break. And the Ford government sent us out for the duration of the school year. So we had a— You know, that was when COVID first hit and everybody was sort of wondering what the level of severity of the threat was. And understandably so. We got sent online. And there was a whole thing with that, how difficult that is in terms of logistics.

[00:05:00]

But that happened in the spring of 2020. And there's all sorts of challenges with that. Some of the literature, if I can just reference, I've got a few pieces. I don't have screen-sharing capability but I would like to share a few items that corroborate. As I said, it's what I perceived as the challenges of remote teaching at the time.

As I was sitting in front of a computer trying to remotely teach for the first time, it was a new skill set that we were being asked to administer. This first document here, I'll just hold it up quickly, is the Science Table. It was the advisory panel that Doug Ford had sponsored, published on June 4th of 2021. I guess this would be reflective of the challenges of remote learning. So there's a passage here. And ironically, the Science Table if you're familiar, did recommend— Ontario was one of the highest; in terms of jurisdictions, the province of Ontario was locked down four times in total. More than I believe, any jurisdiction in the world. So this is where it becomes a problem for Ontario-centric conversations. And that's why I've experienced such impacts from this.

I'll just read quickly from the Science Table Advisory Panel, comprised of many researchers and such. Impact on educators:

These policy changes had direct and indirect effect on students' classroom context and their teachers. In general, the strongest in-school influence on teachers' learning is their teacher. Teacher effectiveness is deeply shaped by **the context in which they work. COVID-19 has radically disrupted these contexts with considerable impacts on teachers' work, as well as their own health and wellbeing. Teachers have needed to dramatically change how they teach with limited time or specific training. They're supporting students, many of whom themselves are under exceptional stress. Furthermore, they assume responsibilities associated with ensuring safety in their school under conditions that were considered by many to be unsafe.**

This is not a teacher— I'm not trying to, but this is sounding like a teacher-centric conversation. I'll just jump to my other passage quickly here:

As well as learning to teach remotely, all teachers had to shift much of their teaching to a virtual environment, at least during the worst periods of the pandemic. This meant having to acquire or increase their own digital proficiency, which ranged from mastering technical tools to developing pedagogy, such as managing group work, assessments online. It also meant developing digital proficiency with learning among their students and trying to cultivate capacities for self-education, self-determination among these learners, so they could work independently at home while their teachers were working with other students, or while teachers, students themselves were working on asynchronous tasks.

That comes from the *RSC Children and Schools During COVID-19 and Beyond: Engagement and Connection Through Opportunity* publication 2021. So yeah, that was the challenges.

Allan Rouben

All right, that was from the teacher's perspective as to the challenges that were faced by the teachers. Let's look at the—

Jay McCurdy

Yeah. And I'm going to leave that quickly. I just want to say: that was a very disruptive thing. For the government to pretend that online remote learning was effective—the efficiency and effectiveness of that was awful.

And so that's the beginning of it: pretending that it was okay.

Allan Rouben

All right and so we were talking about the spring of 2020. Just give us the overview from spring of 2020 until today, let's say. What time period were the children actually in school for that, let's say, three-year period?

Jay McCurdy

So we were off for the remainder of the school year in 2020. In the school year 2021, we had a delayed entry in the fall. We did come in, I think, in late September. We were off twice that year in the school year. We had a delayed Christmas break. So we were in school with strict COVID measures for the fall, heading up to the Christmas break. And then they extended the Christmas break, if you will. I have my stats here. I mean, in total, I can tell you that Ontario students were out for 28 weeks, which is an incredible number. We had a **four-week extension after the Christmas break—that would be in 2021. And then later that year, they delayed the spring break, the March break. We had a large break until April. I don't know the exact date, but they delayed the March break until April.**

[00:10:00]

And we were off again for the balance of that year.

And then the fourth and final lockdown came in the following school year. So 2021/22, they extended the Christmas break by, I think it was eight days. So in total—over the span of COVID, spring '20, and two school years subsequent to that—you're looking at 28 weeks of

remote learning. And that's remote learning, you know the challenges of that. And then I can also speak to what I call pandemic teaching, which is at school.

So 28 weeks in Ontario, the damage from that remote learning is— I mean, the stories that came from colleagues, the challenges with remote learning, the impact on families trying to manage their children at home. As a teacher myself, with a son who was in grade six, seven, eight at the time, and trying to help him with his work. Again, I coped. I'm competent, I coped. But families that were disadvantaged: the literature says that in large part, the communities with low access to internet, low-income communities, had virtually no experience with online. I mean, it's egregious to think that everyone is sitting here with internet connection and access to computers and laptops, and in a large portion of the inner-city schools, Toronto and so forth, it was virtually non-existent.

So again, to pretend that remote learning was at all—

And again, I'm just going to jump ahead for a second here. Later on I was hoping to talk about Sweden, for example: school age children were not locked down at all, not once. There were different approaches with this around the world. North America, Canada specifically and the United States, it seemed like the Western approach was a bit over the top. And if you look back over to Sweden: Sweden recently had a commission that reflected on the formalization of the government lockdowns in Western countries versus Sweden. Sweden's was more informal: Mask if you want to mask, distance if you want to distance, don't go to work if you're sick versus the mandated directions from our governments. They didn't close schools down in Sweden. It did not happen at elementary schools.

So you have very extreme in Ontario versus at the other end of the spectrum in Sweden. And if we look at the data— The commission from Sweden, I'll hold this up right here [Exhibit TO-9b]: "Sweden's no-lockdown COVID strategy was broadly correct, commission suggests." So they reflected on whether their approach was okay or not. And essentially, they're saying it was just fine. I mean, the stats on their deaths originally—they didn't lock down—might be a bit higher. But if we talk about even the stats after the fact—we can talk about excess deaths and that whole conversation—are really low in Sweden. So there's a whole other conversation there.

This other research paper here, the *International Journal of Educational Research* talks about learning loss. No learning loss in Sweden during the pandemic versus the literature that talks about the learning loss because of the lockdown in Ontario. So there's sort of two ends of the spectrum. And I mean, we can argue where that perfect, that sweet spot would have been for locking down the children and not locking them down and so forth.

Allan Rouben

Well, let's get to the learning consequences insofar as the remote learning was concerned and the closing of schools. So tell us, from your personal perspective, what were you seeing with your students?

Jay McCurdy

A large proportion of disengagement. For example, as a grade eight teacher, I would have close to 30 students in my class. And I saw a participation rate of 50 per cent maximum, even stooping to—

Allan Rouben

Sorry, when you say participation rate, are you talking about showing up or participating in the events in the classroom, remotely?

Jay McCurdy

Well, both, I suppose. Showing up means, you know, if you have a Meet like we're having right now, a Google Meet where I'm instructing, you might have 50 to 60 per cent in terms of showing up for attendance in that class. In terms of submitting assignments, if I had posted an assignment, you're down to a third, somewhere in the third range, 30 per cent that would hand in something.

There was a difference in 2020. There was a messaging that the children found out about that it didn't matter. The direction from the Board is that—and this is problematic for this to get out maybe into the public—assessments didn't matter. The philosophy was do no harm. For example, if students didn't participate, didn't submit their assignments, their marks could not go down. They caught wind of this. Students were choosing to go outside and play instead of doing schoolwork and knew their marks wouldn't go down.

[00:15:00]

So when that messaging got out, participation in 2020 was low. Later in the pandemic, when we understood that we might be going back online and doing remote learning, assessments evaluation would count a little bit higher. But in 2021—I spoke to the spring and the summer—participation rates were still 50 [per cent], maximum 50 in terms of handing assignments in. And sorry, at that time the messaging was, "Assignments will count towards your mark and your mark can go down." So very low participation rate overall for all sorts of reasons I can imagine.

Allan Rouben

And what about the actual learning from the fact that this was being done remotely? How did that impact on it from your perspective?

Jay McCurdy

The quality of learning was atrocious, I can imagine. The importance of in-school learning is—I mean, the data suggests how important it is, how important the teacher is, how important social interaction is at school. It's pretty much, it's everything. It's critical: extracurricular activities, the socialization of children.

I was talking to a colleague the other day. We had a reflection on this. If an adult—university- or college-age students are taking online courses—I took online courses to further my education. We have learned to be learners through the school system leading up to a point. The social interaction that children receive from school, you can't underscore how important it is. It's critical. It's fundamental. It's how they learn to interact socially.

The outcome of this I see on a daily basis, in terms of what was taken away, the opportunities. Imagine 28 weeks. We're talking about 28 weeks removed with remote learning. What about pandemic learning when the students were forced to, in the school year 2021, distance during the whole year? It was distancing their desks apart. They were in cohorts on the schoolyard where they couldn't play with their friends. You would have two classes, for example, partnered up on our schoolyard. And this is a large schoolyard.

Some schools, I can imagine, have zero capacity for this; I'm not sure how they managed this restriction. Two classrooms would partner up and play on one part of the yard and two other classrooms would partner up and play on the other part of the yard and they could not interact. It was a strict rule that students— So imagine your best friend is in cohort B and you're in cohort A and you can't walk over across a line to go talk to your best friend, who's been cohort-ed and they've been segregated from you. Just little things like that. I mean, the psychological damage. And some of the students being far too young to understand, "Why can't I go talk to my friend?"

Inside the classroom. you've got limits on how you can teach during the pandemic, what you can use as materials. I can't run science experiments. Computers had to be covered with cellophane and wiped down with spray after use. In gym class you could only play the games where the kids were distanced apart. They couldn't actually come in contact. I could go on all day long with just those. Like I said, as a teacher, you're experiencing the children: how they were being asked to learn, the conditions of which were atrocious for learning. Wearing masks the whole time. It's a whole other thing, right? It's sometimes arbitrary.

I can tell you a quick story about masking. Masking was enforced incredibly for the two school years— 2021 and 2022, was enforced strictly for three quarters of that time. It was in the spring of 2022 where the students could, we could de-mask and the regulations were lessened. I'd often see staff members yell at students for not having their mask on, "Get your mask on." Masks would slip down so they're constantly being told, "Get your mask up." During the eating time, of course, masks can come off and they can eat, but they can't talk. If they were talking, they would get yelled at by the supervisor. You can't talk. You're either eating or you're talking. If you're talking, your mask is on.

That's, for almost two years, a hard thing for a little kid to navigate, you can imagine. Stressful for the teachers to feel like they had to enforce that the whole time. And those are just sort of minor things, but very major things. The outcome of that, I feel, has been deeply felt by the students and their age of development. Not understanding what was going on, why, and being so fearful the whole time. As we all know right now, the case fatality rate for children is incredibly low. They were never at risk. I think after two years in the pandemic, there were 20 Canadians under the age of 20 that had died from COVID. To this day, it's under a hundred and some of those cases,

[00:20:00]

we know, were "died with COVID" and "died from COVID." Whatever that means, anyway.

Allan Rouben

So as you're seeing the students coming up now into your grades, what are you observing in terms of their skill levels, their learning levels? Are they where you would expect them to be for that grade level?

Jay McCurdy

Far behind. Far behind where they're supposed to be. And this is where, in my 24 years of teaching, if you were running an experiment, if you were controlling variables— I've only taught grade seven and eight for 23 years, so for 23 years I've taught this age group. If you're running a controlled experiment, I can speak to: What are the differences you see, and are they causal or correlational or coincidence? This is where I would say the anecdotal

data backed up with the research says that the lag in the skill sets is there—in terms of academic lags, of course.

We're trying to catch young children up with just learning how to read and write at a basic level. At an intermediate level, where I'm at, it's learning skills in large part, what I'm seeing. I'm seeing a lack of resiliency, problem-solving, coping, levels of confidence. Their ability to, if I were to give them a mundane task, persist with it and work through it. The learning skills lag and deficit is immense. I struggle with it every day; I'm looking to still give accommodations. The help that I have to give to children, the extra help that I have to give to them to move through a given task, the extra time that I have to give to them, and just their ability.

I'm just finishing up a unit on— For example, right now we're doing angles; we're doing angle relationships. I teach, let's say it's a two-week unit on that. And then I'm pretty old-school, I give a quiz. And the acquisition of the information, the knowledge, how to learn would be— I mean, it's just a certain sort of expectation that I have versus— I teach for two weeks and I administer a quiz and it's just not there. They're not acquiring the knowledge at the same rate. They're struggling. Even with test-taking there's anxiety, massive amounts of anxiety with test-taking—so many things that I'm seeing in terms of that.

And then on a social level, you can imagine, the violence is up in schools. That was another aspect I was going to speak to: their ability to relate to each other or the lack thereof will equate to conflicts, of course. And as a teacher, there's all sorts of fights going on in the schoolyards every year. Kids are kids and that's how they learn too; they learn through conflicts, right? So it's important to know how, if you got into a fight, why you got into a fight. You learn from that. You learn what mistakes you made as an individual, how to reconcile that. And make up and move on, sort of thing.

I'm seeing a higher prevalence of interactions that come from nowhere. A basketball game on the yard breaks into a fight. I teach grade eight, straight grade eight this year. And I tell my boys— I'm a basketball coach, we actually had a very successful season. We won our West region with first place gold medal, so very proud of that. But on the yard when they're playing ball, the slightest things turn into a conflict or a fight. I'm just constantly dealing with that. And I say, pre-COVID, that instance of two boys posturing one another after a basket is made wouldn't have turned into a perhaps a fight or something like that. On a grander scale, especially in the Toronto board, they're dealing with high levels of extreme violence in the school board.

Anyway, I'll stop there, Allan, and let you continue.

Allan Rouben

In terms of the learning deficits, what in your view is the primary reason for that?

Jay McCurdy

Without a doubt, just all of the closures of schools. I can speak to Ontario. Like I said, 28 weeks of remote learning comparative to three years in the pandemic. Collectively, I'm looking at everything compressed into three years of the education system being affected and altered as deeply as it was.

The evidence is in front of my face every day. And I talk to colleagues and they're talking about the problems at school that we're seeing and everything. And my response is, "Well,

what do you think is going to happen if you enact these measures? We're living through this for the first time. So you can either correlate this—you can say there's a causal connection, that the students are suffering and lagging and violence is up because of COVID—or, no, it's some other variables at play here."

[00:25:00]

I think it's clearer than clear. I mean, to me it's clear: the disruption in the system and the disruption of learning and the disruption of social gatherings and the normal life that children were expecting to experience. You don't have to be a rocket scientist. You don't have to be a research scientist to see that, of course this disruption in their social lives, primarily even in their academic life, was incredibly damaging.

My son had his 13th birthday turning into a teenager. What was the gatherings? You couldn't gather at that point. I mean, you're having a special birthday for my son and it's a COVID birthday. It's no one; he can't have a birthday party. And that's fine, he had lots of birthday parties leading up to that. But imagine the young children: their first birthday party, their fifth birthday party, how important that is.

Watching the little kindergartners around the school. We had an assembly yesterday. We're having assemblies for the first time in the last year, where the school gathers in one area. I was up in front of the school presenting. And down in front, you have the young kindergartners and they don't have their masks on and they're looking up all bright-eyed and wonderful and they're just so happy to be there. And it's just amazing. That experience was stripped from them for two full years, pretty much. How can you argue that wouldn't be problematic or detrimental to their growth and development? It's pretty clear, actually.

Allan Rouben

You were obviously concerned about this as it was going on. What about your colleagues? What was the talk within the teacher community as opposed to the administrators? What was the feeling amongst the teachers so far as you're concerned?

Jay McCurdy

I would suggest that it was sort of— I mean, we're kind of like frontline workers. I don't know if there was on a day-to-day basis much reflection, it was just "get through the day." It was a lot of stress. COVID teaching was very stressful, especially in the school year 2021 and even the fall of 2021, the next school year. Getting through the day was just like a triage. It was just, "Get through the school day; we all know just how challenging it is to teach under COVID conditions and restrictions and limitations in the school setting."

What you're used to being able to do versus what you're being coerced to do—just such a challenge. I mean, we were all thinking it. We were all living it. I don't think there was much discussion. It's not even close in terms of equating it to healthcare, what it would have been like to work in a hospital, during the heavy waves perhaps, where the stress level on the nurses and such and the system is collapsing because there isn't enough staff, right?

And another thing that happened, basically, was that during COVID, the stress levels of teachers went up and a lot of teachers retired early. They went up on stress leaves and such. So we were living it and we weren't discussing it too much, but it's almost like you wink and nod to your colleague and say, "Here's another COVID day." We have a board in our office where there's an absentee board. And you can walk in on any given day and see

which staff are off and who's filling in for them. Something that became sort of very patterned during COVID is that the board would be full. It would be long, full, and you would have multiple staff off during any given day because of various reasons. Maybe they had COVID, maybe they were sick, but other parts where stress leaves were high. It was basically triage in the school system for a better part of two years.

And we're just coming out of that now. In terms of, like, the system not collapsing. And this is just one school and one school board. I'm in London: I can't imagine what it was like in other jurisdictions like Toronto. There were just two references here in my papers that I wanted to find quickly in that regard too. There's one reference quickly in terms of, I call it the "system damage.: This is, again—this is coming again from the Science Table COVID-19 Advisory Panel. By the way, this was something the Ford government had their hands on prior to the final and fourth lockdown in 2022.

And in this document, they were advising the Ford government not to lock us down for the fourth time. This panel, this paper basically was the proof in the pudding that we should avoid lockdowns at all costs with children. And we've already had three. But he disregarded that and locked us down for the fourth time.

So back to the system damage, this is from page eight in that paper. This would be probably, I think, an elementary perspective, where there is a higher proportion of female teachers.

A highly feminized workforce, educators as a group were particularly affected by carrying responsibilities for their own children at home while continuing to work.

[00:30:00]

A national survey suggests that teachers have experienced considerable stress and burnout during COVID-19. There are further reports of teacher shortages resulting from leaves and attrition from the profession in light of COVID-19 context. As a result of these shortages, exceptional measures, such as allowing student teachers temporarily teaching certificates and, in some cases, hiring non-teachers were undertaken. There may be long-term effects on the profession in terms of the teacher supply.

And I've got a quick story for you. One other reference very quickly from an article in the *National Post*, author Paul Bennett, speaking to violence in schools, February 27th, 2023. I'm just going into the fourth page. I admit this is U.S. perspective: "Amid fears of a national U.S. teachers' shortage, the National Education Association now claims that half of all **American teachers have reported considering or actively planning to quit because of deteriorating school climate and safety.**" It says, "So far, this has not reached that crisis point in Canada's systems." But I would argue that it has.

One quick story. I think it was a couple of months ago, I had a supply teacher come in. And this is how bad it is right now. Teachers' colleges are now a two-year program. They're pulling teacher candidates from the programs, either first or second year, and employing them as supply teachers. And even worse than that, we've got— I know in Toronto, my brother teaches in Toronto, and it happens to be that they have pre-teachers' college candidates. So you've got someone just in an undergrad degree, let's say third or fourth year with an undergrad. I don't know who comes in the room and I don't know who asks the question, "Would you like to go teach in a school, tomorrow?" And so this wonderful

young lady came in and gave it her best, but had no business being in front of the kids that day. You can imagine. Just— They're trying to close the gaps there. Healthcare is even worse. Teaching is right behind, probably.

Allan Rouben

Sounds like it's a vicious circle.

Jay McCurdy

Absolutely.

Allan Rouben

What are some of the other system impacts that you're seeing and have observed?

Jay McCurdy

System impacts: the two just are the resources, like I had mentioned, just maintaining the school's integrity, the school system integrity with having enough quality staff and teachers in front of the children. That's still very prevalent and pervasive. The only other—well, the other system damage, like I spoke of, was the violence in schools where the stress on the system right now is difficult.

Administrators are really struggling to balance the proceedings of their school in terms of administering education every day. And it's managing the building with just the prevalence of misbehavior. In an elementary school, we might not use the word— I mean, we can use the word "violence," but we're talking about children having temper tantrums and throwing chairs. And there are staff getting hit with chairs; there is staff getting hit with items. And some of these special needs' scenarios are sort of extreme but administrators are having a heck of a time trying to sort of navigate and mitigate the outcome in terms of how the children are coming out of COVID.

I just think that the system damage is that there's just pressure to keep the school healthy, the school systems healthy, so that learning can happen. I mean learning is critical. And learning is being compromised right now with the collective stress of the children and the collective stress of the adults combined with, sort of this misbehavior. It is just making teaching and learning challenging on a day-to-day basis. And it's very challenging. Like I said, I'm very experienced at my job and I'm seeing younger teachers not equipped to cope with this. And younger and younger administrators not equipped to cope with managing it as well in terms of the higher level of misbehavior and violence in the schools.

Allan Rouben

Have you heard of or been party to any discussions from officials in the Ministry of Education where there is some sort of recognition or acknowledgment that locking down the schools, closing them down and moving to remote learning, was a problem—was something that shouldn't have been done? Is there any sort of talk like that?

Jay McCurdy

Yeah, we're not seeing anything. I'm not seeing anything from our jurisdiction in Ontario on a board level or provincial level. The only thing I was able to— I was curious myself about

this, was from the United States. There's an article here I can show from the *Wall Street Journal*. It's from the union.

[00:35:00]

It's written from the *Wall Street Journal*. Author, sorry—

Allan Rouben

Right. I've given that to the commissioners. One of them is an editorial in the *Wall Street Journal* from November 2nd, 2022 [Exhibit TO-9a]. And I'll just read the opening sentence. "Believe it or not, American Federation of Teachers Chief Randy Weingarten, on Monday, tacitly acknowledged that keeping schools closed during the pandemic was a mistake. Miracles happen apparently."

But what is being mentioned here is that Ms. Weingarten and her colleagues, and needless to say, the same is true in Canada: they were the ones who were pushing for this with the greatest enthusiasm from day one, right?

Jay McCurdy

From the union perspective— There's a whole another can of worms there, where they're trying to protect their members. I would imagine many teachers wanting the schools closed down permanently, just in fear of COVID.

Some of the research says that in large part, COVID wasn't transmitted in schools, it was transmitted through community. Meaning that children who picked up COVID got it from their homes. They didn't get it at school. So the union perspective, the union approach in terms of their messaging would have been, "Let's protect our members. And the best way to protect our members is to not be at school at all."

But now, that article you referenced there, I have that article. Sorry— There was another article referenced in *The Atlantic* by Emily Oster. Oster cites school closures as one example. "There's an emerging, if not universal, consensus that schools in the U.S. were closed for too long. The health risks in school spread were relatively low, whereas the cost to students' well-being and educational progress were high." That's pretty much the snapshot right there.

Allan Rouben

It seems to me that the thinking that went into this is quite similar to the thinking that went into COVID policies generally, which was: there wasn't any real assessment of the costs versus the benefits. Is that a fair statement?

Jay McCurdy

That's absolutely my mantra. My mantra has been cost-benefit analysis from day one. The cost-benefit analysis in terms of the perspective of the child. In the context of learning, they spend a lot of time at school, so it's important that that experience is on the table for them, but just generally on a societal level as well.

The cost that we ask students to do through the pandemic: like I said, case fatality rate, COVID infection rate was low with children. It has been proven that they lack the ACE2

receptor in the nasal cavities for COVID to even sort of stick. And when they got sick, they didn't get that sick at all. In fact, post-COVID, the RSV [respiratory syncytial virus], that respiratory illness— I mean, my anecdotal evidence says it took down a lot of kids with a lot more severity than COVID did during COVID.

But yeah, like, in terms of the greater societal level, the damage is there over that time. Cost-benefit: it's just unbelievable what we asked the kids to do. And what we took from them. From a child's perspective, you should be working as a society to protect your children. I mean, we should think about that, right?

One evidence piece I wanted to reference here that speaks to that. There was— Some of you Commissioners might be familiar with the Great Barrington Declaration, co-authored by three significant doctors. One of them, Dr. Jay Bhattacharya, was a professor at Stanford. He's got a PhD in economics and focuses on health economics. I watched a podcast with him recently where he referenced a— Not sure if he was an author, a researcher, last name Christakis, in a pediatric journal. This is citing data: "From the spring 2020 closure, it is estimated that 5.5 million life years have been taken from children."

From that particular time frame is a very staggering stat: you're taking life years away from children. My father, who's 79 years old, had a stroke about six months ago. My father lived a long, full life. It's tragic when anyone's life ends and it's sad. But you know, he's now 79. And Pops has lived a long, amazing life.

[00:40:00]

And it's difficult watching him in the aftermath of his stroke. But, you know, he's lived his life. These children haven't lived their lives yet. It's just mind-blowing to me what we've done, the damage that we've potentially done.

Without that calculation, Allan, what you said about that cost-benefit? In my opinion there was zero cost-benefit done. Absolutely none.

Allan Rouben

What's really troubling about this, it seems to me, is that the children can't advocate for themselves. Collectively, adults are the decision makers. And it's hard not to reach the conclusion that we've failed our younger generation here. What do you say?

Jay McCurdy

I think we've failed them in every way possible. I can't imagine failing them any more than we have. I don't know. It sounds very pessimistic and extremist to say this, but we have a struggle in front of us right now. I'm not making this up, I'm watching it. I'm just wondering what that long-term impact's going to be. Longitudinal studies and such that are going to be able to even correlate this and say, "How are we going to be able to look back in 10 or 20 years in terms of economic activity in the GDP and say it was because of COVID?"

Of course, this is happening. There would be no admission of that anyway. It's going to be blamed on other variables and factors 10, 20 years down the road. But I just really have a gut suspicion. I have lots of papers sitting around me right now that are studies and professionals that say this is going to be a problem. Very smart people that are acknowledging it as opposed to not acknowledging it. I think that's important, that if we could—

My takeaway with this is not make this mistake again. We might be paying a large price for this down the road. It's inevitable. It's going to come at us and we'll just have to manage it. But we better not do this again the same way. There needs to be a cost-benefit analysis at the very least and a conversation where all stakeholders are allowed into the conversation. It's not just the government dictating. It's everyone having a voice. And that's why I really appreciated being able to testify here: It's giving the average citizen that voice. There are a lot of us that are highly intelligent that are in this room today that have a lot of perspectives and a lot of stories. We don't need to do [inaudible] research papers to understand this has been impactful in a negative way across all sectors, across the economy.

I have a friend who lost his job from COVID. I have watched small businesses close during COVID. You don't have to look at papers to see it. You just look out on your front stoop and look outside and see the damage in your neighbourhood, your community.

Allan Rouben

There were some personal perspectives that you wanted to share. Is there anything else that you wanted to say on that? Tell us about the impacts of— You talked about the impacts of remote learning but what about the masking when the kids were even in the classroom? What do you see as the impact of that?

Jay McCurdy

Well, the masking was a symbol of fear, so there's a psychological impact. We sort of sent this message, "We're going to go to school and we're going to wear masks. And be careful, if you catch COVID, it's very dangerous. Something can happen to you." When the data came in—like I said, in 2020—and then a lot of the research, medical research scientists started collecting the data and the hospital data came in, it became evident that COVID wasn't directly a threat to children.

But the masking at schools when it's a room full of children: if I'm not sick, if I'm not symptomatic—and this whole nonsense about carrying COVID asymptomatically, I don't buy it—if you're not symptomatic, I'm pretty sure you're not going to get it. But that's my personal perspective. But the symbolism of the masking was pervasive because of, I think, the fear. Children are like, "Why are we wearing masks? What's going on here?" It's just—Outside of trying to teach with the masks on. Listening to children talk and trying to teach with a mask on and the limited sort of sonic experience, we'll call it, was challenging. But when masks came down, I watched staff actually berate children: "Get your mask back up!" Right? That's a whole other component. But the damage of the masks, I don't know. It was a symbol of fear.

[00:45:00]

Here's sort of an anecdotal observation. After the mask restrictions were lifted, children still continued to wear masks, in large part, in the school setting. Still fearful of— I can imagine their parents may have said, "you need to wear a mask," but a lot of children chose to wear one. Higher grade students—grade 7, 8—were still wearing them for some time. I was of the mantra, "It's time to take them off. It's time to breathe. It's time to see your face. It's important. So take them off, take them off." I mean, I wasn't pushing it, I was just sort of advocating for it and sending subtle messages that it was important.

I'll just read a quick excerpt from this article, it's from the American Institute of Economic Research. I've got page 5 of 11, just a quote about masking that I sort of highlighted:

Concerns are being raised regarding psychological damage and why a mask is not just a mask. There's tremendous psychological damage to infants and children with potential catastrophic impacts on the cognitive development of children. This is even more critical in relation to children with special needs: those within the autism spectrum who need to be able to recognize facial expressions as part of their ongoing development. The accumulating evidence also suggests that prolonged mask use in children or adults can cause harms, so much so that Dr. Blalock states, 'the bottom line is that, if you are not sick, you should not wear a mask.' Furthermore, Dr. Blalock writes, 'by wearing a mask, the exhaled viruses...'

Okay, we won't get into that part.

But the psychological damage: I have a stepson who has special needs, diagnosed with autism disorder, who basically stopped going to school because of mask-wearing. He was unable to attend school and wear a mask. It wasn't possible for him to do that; he couldn't wear a mask. It's a sensory issue, it's, you know. So school was taken away from him because of a mask and that's factual.

Allan Rouben

I wonder if there's any questions from the panel.

Commissioner Massie

Thank you, thank you very much for your testimony. I have two questions. First one is: In your experience as a frontline teacher, can we get out of all of the damage that was done on the kids unless the institution is willing to admit that this was wrong? How can you convince kids that wearing masks is not "no longer necessary," but was never necessary in the first place? Is that something that you think is possible within our current school system?

Jay McCurdy

I think it involves conversations. I think it involves information and there's a lot of information flying around. You know, information can come from studies like this. Information can come from various sources. It's a conversation, an acknowledgement of—maybe going back to the cost–benefit, I'm not sure. Like Allan had mentioned, the adults that are in charge have an obligation. The students themselves are going to take a lead on the adults. So it's a reflection. It's a cost–benefit that needs to be reflected upon and in the future needs to be done.

For example, in the future, if something comes along: Remember what masking did to children before. Do we really want to do it again? We can't go back in time and change what happened. But one of my things moving forward is ensuring that these sorts of things don't happen again unless they're absolutely necessary and we can prove it. And not—it's just messaging, it's like a top-down, "Thou shalt mask."

My information tells me that even in jurisdictions like Sweden, masking was optional. Just let citizens decide to wear a mask. People can wear a mask if they want to wear a mask but,

you know, the forcefulness of it is damaging, right? So just a reflection, just an honest reflection and conversation. There's lots of studies out there that say masking is ineffective. So let's just grab onto those studies and perpetuate the information as not disinformation, but actual studies. So just keep studies. Be open, be mindful to competing studies and be open and mindful to the conversation. That authoritarian sort of approach is not really a pleasant approach at the end of the day.

Commissioner Massie

My other question is: I think I heard you say that the damage, if you wanted the learning, was probably more profound for students that had more difficulty of learning or because they could not access as readily good internet or other technology or support from family or community. So these children are probably more at risk to suffer the long-term consequences of the lockdowns and all of the measures.

[00:50:00]

So is there a plan that is put in place right now by the institution in order to address this need that was created by the lockdowns and all of the measures that probably affected even more this population of students that have issues with learning?

Jay McCurdy

Well, because we're in a crisis of funding— I think, in large part, money can solve a lot of problems. If you have the resources. Human resources have to be in place I guess, first. And right now, there's a lack of human resources, right? There's decline in the— People are leaving the profession, teachers are leaving. So are we going to be able to replace the workforce? Right now, it's not looking so good. Like I said, we're bringing in the university students that may or may not even become teachers and throwing them in the classroom to basically, perhaps try their best, but in large part maybe babysit for the day.

My wife actually works with special needs. She's an educational assistant, and they're highly trained professionals who have different sorts of degrees. They can have PSW [patterns of strengths and weaknesses], they can have child psychology, for example. There're all sorts of different educational sort of skill sets they bring, and highly trained and skilled professionals.

So my wife for example works with high-needs children. And so with being off a few times and watching the replacements that are coming in: they call them "paid volunteers," which doesn't make sense. I know they're volunteering, but they're getting paid. Our board has brought in basically, people off the street that want to make some money and work with **children that—you know, may provide a background criminal check and maybe they love children and want to help out. And that's fine. But these workers are coming in and they're replacing the professionals who have the credentials and experience and education with zero credentials, experience, and education. And have no business working with those children. It basically becomes a babysitting role.**

And it becomes a safety issue. Because in large part the training of an educational assistant deals with high behavior and mitigating damage when special needs children are having, let's say, you know, a bad day. So the damage can be confounded when you have people that don't know what they're doing trying to manage a situation that's problematic. And now you have two problems on hand, right? Instead of one.

So I don't see the human resources right now. I'm not sure how we— With the baby boomers, we can get into a demographic conversation about our aging population. But I'm not sure we're going to be able to find the human resources in terms of education and even health care and other sectors. I'm not sure. Look outside in the community, all the help wanted, all the unemployment signs. Help here, help everywhere, right? So it's not being fulfilled. And then from a money standpoint, I mean, you can—

Allan Rouben

Let me stop you, Mr. McCurdy, because I think we're running out of time and some of the other commissioners might have some questions. So if you don't mind, let's get to those.

Jay McCurdy

Not a problem.

Commissioner Drysdale

Good morning, Mr. McCurdy. Thank you for coming and appearing before us. I have a few questions and some of them are related to testimony we heard from previous witnesses. We heard testimony from witnesses that were attacked. There was one yesterday who was shopping in Walmart, and she reported how she was attacked and people stood by. There was one in Truro, where a gentleman went into a Canadian Tire and was attacked.

I wonder: You talk about fear in the children. To my mind, these attacks—these reactions by people, including our officials and police, were due to what I would call "terror." You talked about fear in the children but, in my mind, there's a difference between fear and terror.

And the adults were experiencing terror in the way they acted towards their neighbors, to their families. But adults have certain capacities and certain experiences that would allow them to hopefully temper those emotions. So what levels of terror or fear did you see in these children who did not have the capacity to temper that?

Jay McCurdy

Well, that's a very interesting observation you've made there. I haven't thought of that. It sounds very valid to me. That's certainly possible, what you said, the capacity to handle your emotions. We've learned, as we were all in development, how to handle our emotions and cope. So maybe you're seeing a lag in a sort of, I don't want to say, ability or skillset, but yeah— Reacting and having that emotional overlay of being, living in constant fear.

[00:55:00]

So perhaps you're seeing inability to cope and that's just playing out in real time in terms of excess incidents of violence in the school setting. Just maybe they're exercising this and it's just coming out—everything's coming out right now. Whether they're contemplating, "I'm doing something bad" or not. It could just be pure energy coming; it was contained and now the energy's coming out. It's not good energy.

Commissioner Drysdale

In your class or in your school or with colleagues that you have discussed, have you noticed any perceptible increase in suicide, self-harm, with the kids following the lockdowns and return to school—or during the lockdowns?

Jay McCurdy

I can't speak to that data. On a personal level, I do see a larger proportion of what I would consider despondent children, who look like they're struggling in terms of depression. And that translates into absenteeism rates as well. So I'm seeing a higher-than-average absenteeism rate. Children that are still sort of disengaged from school and despondent when at school. So there's certainly a larger proportion of those children that are struggling on a day-to-day basis and struggling to be at school, to get to school. So as I said, there are some stats there that are coming out of the pandemic. They're still certainly struggling on an emotional level. Absolutely.

Commissioner Drysdale

Were vax mandates imposed on teachers?

Jay McCurdy

Not in my jurisdiction. With Thames Valley, they were not. And I think the only jurisdiction in Ontario was Toronto, teachers were mandated.

Commissioner Drysdale

Okay. Did the administration or the government, to your knowledge, come to the teachers themselves or teacher's organizations and review with them what they were considering as mandates prior to implementing them? In other words, did you have a say?

Jay McCurdy

Well, no. Of course, I just think that was one of my biggest concerns, was having a voice. No, it was directed. It was all top-down direction, "Thou shalt." And a lot of pressure. I mean, there's peer pressure. There's also pressure from your employment, messaging from your employers about "This all needs to be followed and strictly followed" and so on and so forth. So that's a lot of psychological pressure in and of itself, to be told, "This is how this is all going to play out." All the restrictions, all of the COVID sort of overlays like I was talking about. The hand sanitizing, for example, and the mask wearing, the keyboard covering, the keyboard wiping down, and all those sorts of things. It's just sort of like a memo: "This is the memo and we're all to follow it." From a managerial level, you're looking at risking probably disciplinary if you walked outside of those expectations.

Commissioner Drysdale

My last question: I have two sons who are teachers and I know that on a regular basis, they go for additional training. They don't call them this anymore but they're in-service days and they go to take courses. Prior to 2020 pandemic, did any of the teachers receive any training with regard to potential pandemics and what should be done to reduce spread? And were you made aware of any pandemic planning that was in place prior to 2020?

Jay McCurdy

Absolutely not. That would have been virtually impossible, right? I think on many fronts. It was almost like this was all after the fact, right? The pandemic is in place and let's figure out how we're going to— Yeah, I mean, moving forward maybe it's something where we should reflect on this and say, "Hey listen, next time, here's again what we do what we don't do."

No, it was just thrown at teachers like: "This is what we're doing, we're walking into school, and we're"—I'm spray-painting dots on the ground with a spray paint can out front of my portable so the students can stand on these dots and be two meters apart. And when they get inside the desks are supposed to be two meters apart and masks will be on. It was all just real time, figured out on the fly, which for teachers was stressful.

Yeah, you probably heard stories, considering your children are teachers. It's like, "you need to just figure this out, teachers, and you need to just make it happen." And I'm not a health care professional. My skill set is limited to what I have. But just enacting and following through and trying to make sure all of these requests, I will call them, were followed—was challenging in and of itself right. So very stressful, for sure.

Commissioner Drysdale

Thank you.

Commissioner Kaikkonen

Good morning. I have so many questions I'm not really sure where to begin. But the line that we hear from the school boards in Ontario is that, "Well, we've lost two years of learning to COVID."

[01:00:00]

I'm just wondering: As a teacher, do you believe that we will ever recapture those two years of learning that these children have lost?

Jay McCurdy

My perspective and answer to that is that I don't think it will be recovered wholly. I think there's going to be a gap, always be a gap. I don't know how you can close that. I think that this is why I'm so passionate. I think that the formational years of a child, let's say they say the most important years in the life of a human is between zero and five, for example. I'm not a psychologist. I can only venture to say that the damage that was done, the COVID babies and such, I don't think you can recover that wholly. I just— It's my gut feeling.

From an adolescent standpoint, there was one study that I read that said that the most damage to the adolescent age group was age 15 to 18, somewhere in that range. Where the psychological damage on them was greater than other age cohorts. And you could probably make an argument that every single kid, no matter their age, experienced that. I don't know. I mean, people can say, "Yeah, we'll close the gaps. Everything will work out. They'll be fine." "Kids are resilient," is the one I hear all the time. You know, "Kids are resilient. You know, they'll get through it, we'll be okay." So you can downplay all of this and say, "They'll be fine. It'll all just work out in the end." But the problem with that is that you can't project into the future and then look back and then change it. If you find results you don't like and

agree that we messed up, you can't go back in time and fix it. That's the problem, is that it's a catch 22 or something like this.

Commissioner Kaikkonen

And in terms of going forward, we have school boards at this point in Ontario who have decided that the last set of standardized tests that were given to the students will be the new bar, the new standard for education going forward. Do you see some serious issues with that mindset? That we're just going to take the bar that comes after COVID as opposed to standardized test results that came before COVID? In terms of our long-term research into how our children are faring and how their reading and writing skills are being projected going forward?

Jay McCurdy

Well, we have to absolutely maintain the pre-COVID bar. We have to. I mean, we can't lower the bar, we have to put it back up. And that's what I've been trying to do in my classroom. I've slowly been— So the analogy would be like high jump or, moving into track and field season, would be to lower the bar down so that everyone can have success. But as they build their skills, because we've lost our practice with skill building, you've got to raise the bar back up slowly. What I've been trying to do is raise it up incrementally. But my goal is to have that bar back up to where it was before.

I mean, if I can talk 10 years from now and say, "Do I have that bar back up to where the bar was pre-COVID?" Will it be 20 years? How long will it take me to have that bar back up where it can be that high and the kids can attain success? So right now, the bar has to be lowered for all sorts of reasons, but there needs to be a concerted effort to decide that bar has to be back up to pre-COVID standards for all sorts of reasons.

Commissioner Kaikkonen

And my final question is: Do you think you'll get an apology from Education Minister Lecce or your school board or school boards collectively or the Ministry of Education for what they have done to these children?

Jay McCurdy

Well, I don't think there will be an apology. Of course, I don't expect that. I would like a "thank-you" in some form. Some sort of thank-you for helping to weather the storm. I'm just one frontline worker. A thank-you to everyone for keeping up with the effort and not giving up on the children in the system. A large thank-you would be in order, I think. That would go a long way. Apology won't happen.

Commissioner Kaikkonen

Thank you.

Allan Rouben

Mr. McCurdy, we had asked witnesses who gave evidence to swear in. So if you don't mind, I'm just going to swear you in. So do you swear that the evidence you've given is the truth, the whole truth, and nothing but the truth, so help you God?

Jay McCurdy
Absolutely.

Allan Rouben
Thank you very much, and thank you for coming today.

Jay McCurdy
Thank you, Allan. And thank you for allowing me to speak. I really want to thank the Commission also and the whole Inquiry for what they're doing. They're giving voices to the average citizen. I think that's critical. I think it's imperative that the more people that can talk and we can have just a large conversation. And I guess the healing can start and we can move forward in a more productive fashion instead of being so divisive and contemptible. So thank you very much for running this Inquiry, and thank you for allowing me to testify. I greatly appreciate it.

Allan Rouben
Thank you.

[01:05:07]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 2: Julie Pinder

Full Day 3 Timestamp: 02:40:55–03:03:18

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness is Julie Pinder, who will be attending virtually.

Julie Pinder

Hello?

Shawn Buckley

Yes, Julie, can you turn your camera on please?

Julie Pinder

Yeah, I can. There we go. Hi there.

Shawn Buckley

Thank you. We can see you. I'd like to start by asking you to state your full name for the record, spelling your first and last name for the record.

Julie Pinder

Sure, it's Julie Pinder, J-U-L-I-E P-I-N-D-E-R.

Shawn Buckley

And Julie, do you promised to tell the truth, the whole truth, and nothing but the truth?

Julie Pinder

Yes.

Shawn Buckley

Now your screen is shaking. Can you set your camera down. That's a little better. And I understand that that's—

Julie Pinder

How's that?

Shawn Buckley

That's much better. Thank you.

Julie Pinder

Okay, sorry.

Shawn Buckley

Now, I understand that you have received two doses of the vaccine?

Julie Pinder

Yes.

Shawn Buckley

And I'm going to ask you what led you to make the decision to become vaccinated.

Julie Pinder

The first vaccine, I wanted it because I was scared of COVID and I wanted to do my part. So yeah, I went on ahead and I did the first vaccine. I didn't expect it to hit me the way it did, really. Second vaccine I feel like I was coerced into taking it.

Shawn Buckley

Okay, now— And I'm just going to stop. Your screen is still shaking. I don't know if your hand is on the table or if there's something else that we can do. You're using a cell phone, I presume.

Julie Pinder

Yeah. Here, let me see what I can do here. Try to lean it up, I'm sorry. Okay, is that better?

Shawn Buckley

That is that is much better, thank you. So the first shot—you basically were afraid of COVID.

Julie Pinder

Right.

Shawn Buckley

Could you tell us who was it that was making you afraid of COVID? I mean, what were you seeing and hearing that gave you that fear?

Julie Pinder

The media. It was all over the place. I pretty much believed that, you know, this miracle vaccine was coming and it was going to save us all and we'd be fine. And I kept hearing that the vaccine was safe and effective. So at that point, I wanted to do my part. I was scared of getting COVID.

Shawn Buckley

Okay, and then my understanding is you had your first shot on March 1st of 2021.

Julie Pinder

Yes.

Shawn Buckley

So you were fairly early on in the queue. Can you tell us what happened?

Julie Pinder

So my first shot, I came home and I was really extremely tired but it kind of felt like an anesthetic type of tired. My eyelids swelled up. I had a rash from my neck down to my feet, pretty much. I was itchy everywhere. And it just knocked me out. I want to say the rash lasted quite a while, it just kind of slowly went away.

But then I started noticing that my heart rate was elevated. I used to wear a Fitbit and I was tracking my steps. I'd look at my heart rate and it'd be up as high as 140 beats a minute and then it would drop back down again. And that was kind of continuous. So at one point I just thought my Fitbit was broken and I stopped wearing it.

I also developed weakness behind my ankle bones and I assumed I needed new work boots. So I did that and then I started wearing ankle braces at one point. I never connected the heart rate and the ankle weakness with the vaccine.

Shawn Buckley

Right. Did you seek medical attention for these effects?

Julie Pinder

Between the first and the second one, I think I did a few times because I was also experiencing cramping in my lower calves. Nobody put two and two together at that point.

Shawn Buckley

Okay. Now, my understanding is: because of these complications you were reluctant to have a second shot.

Julie Pinder

I was, yeah.

Shawn Buckley

But you did attend at the pharmacy to get a second shot. And I'm curious why you were kind of willing to do that again after what you had already experienced.

Julie Pinder

Well, I had a brief conversation with my head of health and safety at work. The place where I worked at is extremely hot.

[00:05:00]

And we had to wear face masks all day. I had asked him, "Once we're fully vaccinated, are we going to have to wear these masks?" And he said, "No, no, not once you're vaccinated." And I said to him, "Well, what about the people who don't want to get vaccinated?" Because there are a lot of people there. And he said, "Well it's going to be mandated, so they're not going to have a choice, we won't have to worry about it."

And also, I was hoping that I could travel. I had booked a trip to the Bahamas that just obviously didn't happen. So for those reasons. At that point, I was scared to take it, I'm not going to lie. I still at that point thought I was doing what was needed of me.

Shawn Buckley

You mean kind of the societal expectation that you do your part?

Julie Pinder

I saw a shift in the attitudes of Canadians towards people who were unvaccinated. People were turning their backs on the unvaccinated. I mean, I—people had really horrible, not-so-nice things to say. Everybody that was hesitant to get a vaccine became treated like an anti-vaxxer. And apparently. Sorry, I'm trying to—

Shawn Buckley

Just carry on. I'm sorry, I didn't mean to interrupt.

Julie Pinder

You didn't want to be—you just didn't want to be associated with somebody who didn't have a vaccine back then because of some not-so-nice things that were said, as far as I'm concerned, by our Prime Minister.

Shawn Buckley

Right. And I just want to make sure that I understand, basically, what was pressuring you because you clearly didn't want to be vaccinated. So basically, there was social pressure from Canadians and there was—

Julie Pinder

There was social pressure. When I went in and talked to the pharmacist and I told him how things had went down, he didn't want to give me the second dose. What he did was he had me tell him what my reaction was. So I told him what my reaction was. And at that time, I didn't even tell him about the elevated heart rate or the ankle weakness because I still hadn't put two and two together there. And so he decided that he didn't want to give it to me without a doctor's note from an immunologist.

I had taken that letter to my local hospital thinking that, you know, maybe there's an immunologist there and they can book me the appointment. We can find out if I'm allergic to anything in it. And instead, the nurse set up a consultation with an ER doctor. So the ER doctor came in and the first thing he said to me is, "I am not giving you an exemption if that's what you're here for." And I said, "No, I just want to make sure—"

Shawn Buckley

I just want to stop you there. So you hadn't even explained to him why you were there or any reasons for or against an exemption. And the doctor tells you, before you guys have any conversation, that he's not going to give you an exemption.

Julie Pinder

That's right.

Shawn Buckley

What was kind of the demeanour and attitude of this doctor and how you were treated?

Julie Pinder

You know, oddly enough, he was really soft-spoken. I think he was trying to come off as kind. But to me it was arrogant. Yeah—I mean, that's all I can say about that. He right away just, you know: "I'm not giving you an exemption." I started to express concern and he told me I should do my part, be a good citizen. Then he said to me, "Do you have any children or elderly people in your family?" And I said, "I have a new grand baby." And he said, "You don't want to be responsible for killing your grand baby."

And so obviously at that point—I think that was probably the only thing that could have been said to me to go back and get the second vaccine. When I saw the pharmacist again, it was the same pharmacist. He said to me, "Are you sure you're okay with this?" And I said, "No, but the doctor made it sound like I'm going to kill my grand baby if I don't do it." And so he gave me the second vaccine. But I feel like he was uncomfortable with it and he didn't want to. And you know, I kind of wish he had've stuck to his guns.

[00:10:00]

Shawn Buckley

And so what happened?

Julie Pinder

I was fine for the 15 minutes that I sat with him. Then on the way home, I could taste metal in my mouth. My right arm felt really heavy. I kind of wondered if maybe I was having a heart attack, so I pulled over, I drank some water, and I thought, “No, you know what, I’m just paranoid. I’m having a panic attack.” Because, you know, I was scared to have the second vaccine.

Another thing the doctor had told me was to take a Benadryl and I’d be fine—I forgot about that. I bought Benadryl from the pharmacist. I came home. I started to get that really, really deep feeling of tiredness again. I took the Benadryl and I went to bed.

I woke up at some point to use the washroom. And I knew I needed water. My head was pounding and I had lost the vision in my right eye. But I was so tired I didn’t even care. I just went back to bed. I want to say the migraine probably lasted another day. And then I woke up at one point and the headache was going away, my vision was restored. And I thought, “thank God, that’s over and done with.”

Then, I want to say, within a week after that, I started dropping things. And it just progressed from there. My hands, when I started this, looked normal. So they went from normal to skeletal looking within a matter of, I want to say, two or three months. I started dropping things. My sense of perception was off. I’d go to open a door and I’d completely miss the door.

I continued to try to work. The cramps in my calf muscles got really, really bad. It felt like all the muscles over top of my kneecaps had bunched up and in my upper thighs. And I remember doing reports at work and I’m holding a pen; I’m trying to make numbers and it’s like my brain just wouldn’t connect. I just couldn’t do it. At that time, I had a week off work and I thought, “Okay, well, I have a week to get better.” I just assumed I would get better.

Instead, things just progressively got worse. I started to be able to feel where I was losing the muscles in my body. To me, it felt like it went from my ankles up into my knees, my thighs, my trunk, my back, my neck, down my arms, and into my hands. And so I went to my local hospital and I spoke with a doctor there. And he told me that sometimes people are getting something called Guillain-Barré syndrome and that he would test me for it. He did blood work. He came back. He told me I was fine. I later found out that’s not even how you test for it, you have to do a spinal tap. So I feel like I was deceived just to get me out of the hospital.

I then started having issues with swallowing—

Shawn Buckley

Can I just stop you? When you’re presenting at the hospital— And this is in St. Thomas, am I correct?

Julie Pinder

Yep.

Shawn Buckley

You’re telling them basically what you’ve just told us, all of these symptoms.

Julie Pinder

Yes.

Shawn Buckley

And so they do a test for one thing. It's not that and so they just send you home without anything further?

Julie Pinder

Yes. I told that doctor that I was losing my muscles. And that was it, he'll do blood work. From there, like I said, things were starting to progress. I started having issues swallowing. I started having issues with my thought process. I knew I was losing my muscles rapidly. And so my husband took me to London Health Science Centre because we knew there were neurologists there. And I was seen by a neurologist in the ER. And he took a look at my hands and he said, "Yeah, something's going on here." And he admitted me. The next day, a neuromuscular doctor came in. And she basically argued with me and told me what I was experiencing wasn't happening. I couldn't walk a straight line, I had no balance, they saw that. I'm assuming my blood pressure was low because I had a nurse ask me twice if I was dizzy. And she had me do a genetic spit test. She also told me that I should protect the muscles in my arms by wearing hockey equipment to bed.

[00:15:00]

And I think at that point I had asked to see a different doctor, who was no longer at that hospital. And of course, that took a little bit of time. But yeah, I was sent home like that in active muscle atrophy.

Shawn Buckley

So did they do any follow-up with you? Because they basically told you that you're not experiencing what you're experiencing.

Julie Pinder

No. I was passed off to a different doctor, who has done nerve conduction studies. And has said, "Yeah, you're getting weaker." I've had several blood works done, I've had the genetics testing done, I've had an MRI, I've had CAT scans. And I feel like they just keep looking for autoimmune diseases that I don't have.

Shawn Buckley

Are any of them considering that it's a vaccine injury?

Julie Pinder

I did have an appointment with a rheumatologist who said, "I don't know what the big deal is." She believes it's a vaccine injury. I also saw a spine surgeon who looked at my MRIs and she said there's nothing that she can see that's wrong with my spine except for the normal aging stuff. I think she had said that she agrees that it was a spine injury. I know she said that she can't think of anything that can make your muscles waste that quickly.

Shawn Buckley

Now, you said she thinks it's a spine injury. Did you misspeak there?

Julie Pinder

Oh, yes, I misspoke. She did not think it was a spine injury. Sorry.

Shawn Buckley

Now, you applied for long-term disability. What happened?

Julie Pinder

Yep. I have in the past reacted neurologically to nitrofurantoin. And I think, once I got better, they just left it there. I also had issues back then, like, not nearly this severe. But because of that, they say "pre-existing," and that's just what insurance companies are like. So even though they have the rheumatology report, that's just what they're like.

Shawn Buckley

Right. So how has this affected you financially?

Julie Pinder

My husband also has— He was one of the unlucky people who got a specific batch number of AstraZeneca from the Baltimore plant. He has heart damage and now he's working two jobs. And it's impossible to get compensation from the Vaccine Injury Support Program, from what I understand. Even to get my paperwork, I had to get my MP involved. I kept repeatedly phoning them, sending emails; they didn't even send me the paperwork. And now, I'm just hesitant to do it because I feel like they're going to just be like the insurance company. Well, they're going to just try to disprove it.

I mean, it takes almost a year in Canada just to get an MRI, right? So how are people supposed to function like this? I was told I could apply for my CPP disability but that takes up to eight months. And I mean, quite often, I've heard they deny you the first time.

So—yeah, there's nothing really set up for people who are injured instantly.

Shawn Buckley

If you could share one thing with your fellow Canadians, what would your message be?

Julie Pinder

Don't get it. Because there's nothing— It would be different if they were doing studies or if they cared. I was told by my MP I'm just somebody who happened to fall through the cracks. You know, I mean, I've lost my job.

[00:20:00]

I'm trying to gain back my health.

Don't do it. Until this government is willing to step up and help people and stop trying to divide us, I'd stay the hell away from it. I guess my big concern now is you have a whole bunch of people who have been injured by this vaccine. We're being censored online. If I put anything on, for example my Facebook, I get a warning for false or misleading information. Even if it's pictures of my own vax injury. We've been called liars by people who had it and had no issues with it. The people who were anti-vaxx or against it telling us that we deserve what we got because we didn't listen to them. We can't get treatment by doctors and this government isn't supporting us.

Shawn Buckley

Okay, I'm just going to ask the commissioners if they have any questions of you.

Julie Pinder

Sure.

Shawn Buckley

And the commissioners don't.

Julie Pinder

Okay.

Shawn Buckley

Julie, on behalf of the National Citizens Inquiry, I truly thank you for sharing your story. It's so important that people like you let everyone know what's happened and what your experience is.

Julie Pinder

Can I just say one more thing quickly?

Shawn Buckley

You certainly can.

Julie Pinder

So my concern is: if this vaccination can do this to adults, I can't even begin to imagine what it can do to a child. You have children who are getting myocarditis— I don't understand, you know. If given the choice between getting COVID or getting myocarditis, I'd take my chance with COVID. It doesn't make sense to give children this vaccine to keep an 80-year-old, say, off a ventilator. It makes absolutely no sense to me.

And that's where I better leave it, because I get from upset to angry.

Shawn Buckley

Thank you again, Julie, for sharing with us.

Julie Pinder
Great, thanks.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 3: Catarina Burguete

Full Day 3 Timestamp: 03:17:40–03:35:07

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Allan Rouben

Can we get your name, please?

Catarina Burguete

Catarina Duarte Burguete.

Allan Rouben

And we've been swearing in witnesses, so Ms. Burguete, you swear that the evidence you're going to give will be the truth, the whole truth, and nothing but the truth, so help you God?

Catarina Burguete

I swear, so help me God.

Allan Rouben

Thank you very much. Tell us a little bit about yourself.

Catarina Burguete

I am 51, I am a mother of four: three girls and a boy ranging in age from 21 to 13. My husband and I own a business in the hospitality industry. I am a retired healthcare professional. I retired to raise my children a long time ago. During the pandemic, when they were short of PSWs [personal support workers]: because of my background we could quickly train, and I went to work in long term care.

Allan Rouben

What is it that brings you here today?

Catarina Burguete

Today, like everyone else, I just feel it's important that our stories get told. And I would like people who maybe aren't aware of the consequences, of what some of us went through, to listen.

Allan Rouben

And so you mentioned about your children. What are the impacts of the last few years? What has that been on your children?

Catarina Burguete

Well, all four of them have felt the impacts in very different ways. So early on—my husband is a retired scientist and with my background in health care too—we questioned everything. We've always been like that anyway.

So for the kids, if I start with my oldest, who was in third-year biology at Queen's University, we made her aware that the vaccine had no long-term safety data and that we did not want her to take it. We showed her the information and we held our breaths and we let her decide for herself what she wanted to do. There was a very real threat that she'd be kicked out of school. And she was. We are grateful that she decided she wasn't going to take it but it was very difficult.

Allan Rouben

What happened to her, exactly?

Catarina Burguete

So ironically, the January before she was dismissed from university, she got COVID from a fully-vaxxed friend. And we tried to say, "Well, what difference does it make? This friend is allowed to return after the Christmas break. She is not. They've both had COVID. She's fully recovered now." Anyways. So nope, there was none of that. She had to come home.

She went through a very difficult time with, maybe not depression, but feeling very low, being ostracized by friends who were afraid. Her roommates made her life very difficult. Somebody who'd always been popular just couldn't believe that her friends would turn their backs. These kids were ruled by fear, total fear.

Allan Rouben

Did your daughter know if she was going to be going back to school?

Catarina Burguete

She had no idea if she would ever be able to go back and she was devastated.

Allan Rouben

What ended up happening?

Catarina Burguete

So she came home, she worked, and then the mandates were dropped. And she was allowed to return in September of—this previous September. Of course, now she's a semester behind, so she's going to have to go back and finish to get her degree.

Allan Rouben

And your other children, what grades are they in?

Catarina Burguete

So my middle two were in high school throughout, and then my youngest is now in grade seven.

Allan Rouben

What did you see in terms of the impacts on them?

Catarina Burguete

Oh, mentally, huge. We've heard this morning about all the crazy school requirements and the cohorts and not being able to socialize,

[00:05:00]

and the fear that was instilled in all these children. And of course, they felt they had no social lives. It was depressing: they didn't leave their rooms, they had no sports, they had no outlet, no clubs, no nothing.

Allan Rouben

In your school district was it mostly remote learning over the last three years?

Catarina Burguete

Remote learning, yep. Luckily a very good friend of mine is a retired high school teacher, so she was able to help my teens. And my son, I said, "No, you're not logging in; we're going to homeschool for the time that you're meant to be online."

Allan Rouben

From your personal viewpoint, what did you see in terms of the effects of remote learning?

Catarina Burguete

Well, if I focus on my youngest son, there's no socialization, there's nobody to play with. He had a diagnosed speech impediment and luckily, we were fortunate enough that his speech therapy could continue online. When he did return to work and they were meant to be masked, I said no. I mean, show me the data that a masked child with a speech impediment isn't going to be adversely affected. And it didn't exist. So we were given an exemption. He was the only one in the school of 250—he's got a spine of steel—he was unmasked.

The following year, I was no longer able to just say as a parent, “My child will not be masked all day.” And that we had to use his speech impediment as the reason for them to tick that box.

Allan Rouben

I’m guessing that was a bit of a struggle to get that exemption.

Catarina Burguete

I think they knew we weren’t going to back down as parents and they were happy to have the out. I felt for other parents who I’d heard from who didn’t have that excuse, and I hated to use it as an excuse. No child should be masked six hours a day, never mind an hour a day. Yeah, I hated to use his disability as an excuse but in the end, I had to.

Allan Rouben

And tell us a little bit about the impacts of mandates and COVID policies generally on you.

Catarina Burguete

Well, on me, because I was working in long-term care, we were being tested every day. And it came through the pipeline—even though I had started, I had trained as a PSW through the pandemic because they needed us—it was coming through that you were going to have to be vaxxed. And by then, my husband and I were pretty sure; well, we knew right away that we were not going to do that.

He’s a retired scientist and I’ve worked in healthcare. And it was just insane to me that a rushed product, for which we now know there was ample evidence that didn’t even stop transmission, and that carries huge risk, could be mandated for anyone. So I said I wasn’t going to do that. And I tried to find ways around it. I said, “I will submit to testing before every shift.” I said, “You know, there’s evidence of a really good prophylaxis coming out of South America.” No, it was just, it was a non-starter. There was no way. It’s the vaccine or you’re out. And the irony is, all of my colleagues in long-term care are tested every single shift.

Allan Rouben

So you lost your job?

Catarina Burguete

I lost my job.

Allan Rouben

When was that?

Catarina Burguete

October of 2021.

Allan Rouben
Have you gone back?

Catarina Burguete
No, it is a county-owned facility, and our county still has a COVID vaccine mandate.

[00:10:00]

Allan Rouben
And I understand you're a churchgoer.

Catarina Burguete
Yes, I am a singer too. And I sing in a few different choirs and I sing in our church choir. I also worked very part-time in our church office.

But through COVID, choirs were devastated. We weren't allowed to sing as a group. And they asked for volunteers to maintain the music in ministry, which I did. Nobody else volunteered, everyone was too afraid. I said I'd do it.

And then when choirs were allowed to resume, there was a catch. And you had to be vaxxed. So the people I had stood beside for ten years, twice a week, every week, said nothing. They watched me walk away.

Allan Rouben
So you couldn't sing either?

Catarina Burguete
No.

Allan Rouben
Today?

Catarina Burguete
Today, it's okay. I can sing, but only in selected choirs, because some choirs require more protection, I guess. And so it's okay to sing in my church choir every Sunday, just like it is in, I assume, every church in the diocese.

However, for some years, I had sung in a diocesan choir, which brought together people from all over. And we did some big events. And in that particular choir, you must be vaxxed.

Allan Rouben
You mentioned about a business that you and your husband own?

Catarina Burguete

Yep, we own a business, we own a brewery. And so early on— My husband is a retired scientist. He actually happens to be a yeast specialist and RTQ [Real-Time Quantitative] PCR specialist. He performed PCR tests hundreds of thousands of times in his postdoctoral research.

But in the beginning of the pandemic, we thought, well, you know, we have to do our bit. We're going to help. We have to do our bit. And he ended up making hand sanitizer when there was a huge shortage. We donated about \$30,000 worth of materials and he made the hand sanitizer and donated it all to local— There was a charity set up that was trying to get PPE and supplies to local hospitals, doctors' offices, and businesses.

Allan Rouben

So this was in the early days of the pandemic?

Catarina Burguete

Yes, yes.

Allan Rouben

And was your business—did that remain open?

Catarina Burguete

Well, because alcohol was essential, we were allowed to keep the bottle shop open, so people could come in and they could buy. But we couldn't operate the bar. You couldn't come in and sit and have a beer. You could come buy it and take it home. So I mean—and the other thing is, the pubs and restaurants are closed. So we had nobody to sell to. So our business suffered like everybody else, pretty much.

Allan Rouben

And from a social perspective in your community, how would you say you and your family had been impacted?

Catarina Burguete

We've lost a lot of friends, but we've made so many more friends. We discovered—at our lowest and like many people, feeling so low, just like a cloud over your head constantly—we discovered an underground of people who were suffering in all sorts of ways. And we started to meet. I mean, this was during lockdown, too. It was all secret.

It's just crazy to think about it now, but I found a lifeline. And I still remember showing up to that first meeting and I couldn't believe it. I couldn't believe I wasn't alone. We all told our stories. And we all had to park, like, far away, so that neighbors wouldn't report you. And those people are some of my best friends now.

[00:15:00]

Yeah. A really dark time, really dark time.

Allan Rouben

Do you feel like you're coming out of it now?

Catarina Burguete

Yes. Yes, things are somewhat back to normal. But like many people, I struggle with the idea of forgiveness. Because forgiveness does not happen in a vacuum. It requires an apology. It requires a sense of what was done wrong, an acknowledgement of what was done. And reparations, whatever they may be. And a system put in place so that it won't happen again.

Allan Rouben

We talked in the education sector earlier with Mr. McCurdy about acknowledgements by officials and it doesn't seem like that's occurred. What have you seen, if anything?

Catarina Burguete

Nothing. Nothing. No one's apologized. No one. Not on a personal level. Actually, that's not true: I've had one or two people on a personal level apologize. And I am so ready to forgive on any other level, though no one's apologized. No one.

It needs to start from the top down, from the politicians. Public health needs to be gutted. Reprehensible. And they need to apologize. They need to pay for what they've done. But I'll take an apology, any day.

Allan Rouben

I wonder if any of the commissioners have any questions?

Thank you very much for coming.

Catarina Burguete

Thank you. Thank you so much.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 4: Dr. Eric Payne

Full Day 3 Timestamp: 03:36:15–04:32:36

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Allan Rouben

Good morning, Dr. Payne.

Dr. Eric Payne

Morning. Can you hear me?

Allan Rouben

Yes, we can, and we are seeing some of your slides coming up.

Dr. Eric Payne

That's perfect.

Allan Rouben

Before we get to that, can I swear you in, which we've been doing with the various witnesses. So do you swear that the evidence you give will be the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Eric Payne

I do.

Allan Rouben

Thank you. And you're joining us from Alberta, I believe, right?

Dr. Eric Payne

That's correct. I'm in Calgary.

Allan Rouben

And tell us a little bit about yourself.

Dr. Eric Payne

Well, I've got a summary of my academic background up here on the right. I am a child neurologist, Canadian-trained, worked in the States as well at Mayo Clinic for six years before being recruited back to the Children's Hospital to help build a neuro-inflammatory program, as well as my epilepsy surgery and ICU-EEG experience. We returned— We being my family, I have three small children as well, eight, six and four. We moved back to Calgary from Rochester, Minnesota a month before the pandemic started.

Allan Rouben

It says there that you were a pediatric neurologist at the Mayo Clinic for six years before you came back.

Dr. Eric Payne

That's correct.

Allan Rouben

What did that involve?

Dr. Eric Payne

Yeah, that was an outstanding experience. There's not a better healthcare delivery model system in the world, in my opinion, than Mayo Clinic. I had the ability to just focus almost entirely on epilepsy, both adult and pediatric, and I was very involved in helping to develop and run their ICU-EEG [electroencephalogram] monitoring program. So we hooked patients up who are critically ill in the ICU to EEG to look for seizures and prognosticate outcomes.

And so you know, my youngest two were actually born in the States. They're American. We had a really, really good experience and really only decided to move home to Canada when University of Calgary and the Alberta Children's Hospital came soliciting once again—you know, about six months or a year before I came—to sort of say that they had an open job coming up. And they wanted to write that job based on my credentials, which they did.

And as a result of a three-year starter package that was very generous with funding, as well as protected research time, which was going to be 50 per cent of my time, we made the decision to move to the family at that moment.

Allan Rouben

And that was in the spring of 2020.

Dr. Eric Payne

That was in February 2020.

Allan Rouben

February. Okay. All right. So what happened next, from your perspective?

Dr. Eric Payne

Well, with respect to the COVID stuff—I have a slide here on ethics—really where I got involved with this was a letter that I wrote on September 15, 2021 to the College of Physicians and Surgeons in Alberta. Because they were openly contemplating whether or not to tie our medical licences in the province to the COVID vaccination.

And at that same time, Alberta Health Services [AHS], who was my employer—or one of them anyways, University of Calgary as well—had made the decision late August that they were going to implement a COVID-19 vaccine policy. And that if you were not going to capitulate, that you were going to get locked out and lose your job.

So I wrote a letter, you know, 18 pages with about 80 references, every bullet point backed by a fact, a data point. And that letter ended up going viral, I guess. I put a copy of it, as you can see up here, on the JCCF website because people were manipulating versions of it when it first got out.

Allan Rouben

Sorry. What is JCCF? Apologies.

Dr. Eric Payne

JCCF is the Justice Centre for Constitutional Freedoms. So they were one of the only lawyers or law firms that were willing to talk to someone like myself, who was looking to fight back against these, what I felt to be, very unconstitutional mandates.

But more than that, the science at the time in the fall was incontrovertible. We knew that these things didn't stop transmission. We had all these long-term concerns. They failed to show us the bio-distribution data about where this thing goes when it travels in the body. There were a lot of concerns. And we also knew who was at risk. And as somebody who is a healthy 40-year-old, I was not in that high-risk category. So we wrote this letter and these are the main bullet points that I argued in that letter.

[00:05:00]

And then a few weeks later, I got onto a podcast, a Shaun Newman podcast. Mainly because, one, this version of the letter was never meant to be distributed; this was written specifically to 15 physicians on the Council of the College and I felt that it was a little bit too complicated for layman interpretation.

So I got on the podcast to explain it. I also wanted to explain to my colleagues where my head was at. Why, all of a sudden, someone who they had gotten to know for a very long time, because I trained here for eight years— They knew they were getting somebody who cared a lot about their patients and was going to work hard. So I tried to explain to them where I was coming from. But very quickly after this, things went sideways. I've still not received a response from the College. So that letter that I wrote to the College has never received a response.

I sent it to the CEO of Alberta Health Services at the time, Dr. Verna Yiu. She forwarded it to Dr. Mark Joffe. Dr. Joffe is now the Chief Medical Officer of Health appointed by Premier Smith. And he wrote back to me thanking me for my letter and concerns, that they were going to continue to go with the international community. And suggested that if I had concerns about the mRNA vaccines, that I consider taking one of the DNA vector vaccines like the AstraZeneca. And of course, the AstraZeneca got removed from the shelves a few months later because of an increased incidence of clots and bleeding.

After my letter sort of went around, there was another pediatrician at the Alberta Children's Hospital who wrote a letter as well. And so this article in the *Calgary Herald* was sort of slandering what we had talked about—misrepresenting, of course, what we talked about. And one of their go-to individuals for misinformation here in Canada is an individual by the name of Timothy Caulfield, who just won the Governor General's Award for fighting COVID misinformation as a matter of fact. He's also a member of the Pierre Elliott Trudeau Foundation. And so he made this comment that calling into question the safety and efficacy of the vaccine was like "denying the pull of gravity."

But since that time, experts such as Dr. Byram Bridle as well as Dr. Steven Pelech have tried to sit down and just have a discussion about the science. And these articles here speak to those efforts to try to have a debate and discussion. But Mr. Caulfield, who is apparently an expert on COVID misinformation, refuses to sit down even two or three years out on this, which I think tells us quite a bit. And as a result, moving forward, AHS moved to take immediate action. So these are the actual cut-outs from the letters.

They took immediate action on December 13th at 12 o'clock. They let us know. That deadline got pushed back a few times, but I think at 11 p.m. that night, we got the email that we were officially being locked out the next morning. And then the very next morning, December 14th at 8 a.m., the College sent in two investigators to go through my records in front of my colleagues, looking for vaccine exemption letters.

They had, I guess, received a complaint or had concern that I might be writing vaccine exemption letters. So as you can see here, they went through letters from September on. They went through 82 patient records. They found a handful of vaccine exemption letters that I had written for select patients. And they ended up concluding that these were well-documented and valid and that there was, as they say, insufficient evidence found to suggest that I wasn't compliant.

And at the time, the College was telling physicians—I've got this on video—that the only exemption that you can write is if somebody has an allergic reaction or myocarditis after the first. There were no exemptions before the first. However, if you went to their website, there were exceptional circumstances. You had to document them properly. So that's what I did. But that's why everybody had such hard times getting these letters. And the reality was, even once the letters were written, I had colleagues here who had two exemption letters from physicians, and they were still fired from AHS.

On January 6th, the University of Calgary sent me a letter stating that they were not going to renew my contract. I had a signed three-year letter of offer, including three years of start-up funding for the 50 per cent, 45 per cent protected research time. And they specifically said in the letter, you can see that in quotes: "removed from my education activities by the Cumming School of Medicine due to non-compliance with the University of Calgary's vaccination directive."

And so that was January 6th. And then February 28th, they dropped the policy. So I was officially non-compliant with the University of Calgary's policy for two months. And then Alberta Health Services dropped the mandate in July. I was allowed back into the hospital six weeks after they locked me out. Because at that point, they finally decided that they were going to allow testing.

[00:10:00]

And so before I went to the hospital every day, I had to go to the pharmacy and pay for a test so I could go into work. But fortunately, I was right guessing that was going to be very temporary. And that lasted just a few months and I was back without testing. What's gone on since that time was, as a result of removing my quite lucrative salary contract, they've allowed me to continue on a fee-for-service basis in the hospital while I continue to diminish my clinical time. I've started to see patients in the community.

But just before Christmas, I was made aware that they were advertising for the job that they had removed from me. And so I decided to put my name back in the application. And I just found out a couple of weeks ago that they're not going to consider my application to move forward with that application; they're going to interview four other individuals. All excellent, I know three of the four of them, three of them are still in fellowship training. So they're not even consultants. And the other one is a general neurologist. So you know, not the same skill level or research background or experience.

And I still have two complaints against me outstanding with the College with respect to misinformation. One is related to the original letter itself. The one that I wrote to the Council, I've never received a response for. They have informed me a year and a half out that they have hired an expert third opinion. They can't find, I guess, anything scientifically wrong, so they've asked for a third opinion. And then, from what I understand from other doctors in Alberta who have gone through this with the College already: first of all, getting an outside contractor to look into this is very abnormal for them. But there's a company that they've hired for a couple of physicians. And it's a group of ex-RCMP officers who are now investigating whether or not I spread scientific misinformation when I wrote a letter to my college seeking discussion and debate about something I was very concerned about safety-wise.

The other complaint came from a colleague at my hospital, who I've known for a very long time—someone who showed the intestinal fortitude and the character of courage to just write the complaint behind my back and never actually approached me with any of these concerns. I just, all of a sudden, have a complaint from them. So that one's still open for misinformation as well.

Allan Rouben

So if I can just stop you there and summarize where we are at: you were effectively recruited by the Alberta health officials because of your expertise, recruited away from a job you loved at the Mayo Clinic. And then were promptly let go because for a period of six to eight weeks, you were not in compliance with the vaccine mandate. Is that it?

Dr. Eric Payne

That is correct.

Allan Rouben

Okay, you can continue.

Dr. Eric Payne

I thought at this point I would sort of focus on the four main points of my letter, just showing very briefly. I got a lot of slides but I'm going to go through them—not to explain everything but people can take screenshots and it's going to be there for posterity.

But the first point was that September 1st, so 15 days before my letter, the CDC [Centers for Disease Control and Prevention] decided to change the definition of a vaccine. Because these genetic jabs were not vaccines and so they had to change the definition. They weren't preventing disease. They weren't providing immunity, so they changed it to providing some temporary protection.

We also knew at that time—this is CDC data here—I mean, you know, age was an incredible predictor of who was going to get injured. So here I am within the 20- to 49-year-old group and I've got a 99.98 per cent chance of survival. We knew this within three months before it even sort of arrived on our shores officially.

And if you look at the Canadian data—this is on the Canadian publicly-available data—you can see down here: This is age and this is the number of cases of COVID over time, deaths “with” or “from” COVID. Keep in mind that at least 50 per cent of these are going to be with and they didn't actually die from COVID. This has been acknowledged by multiple public health officials many times. But as of May 13th, 2022, there were a total of 40,000 deaths in Canada in three years. And half of those were with and not from.

So we've had 20,000 deaths in Canada in three years from COVID, and 97.1 per cent of those have occurred in those over 50. If you look at the breakdown in Alberta, just focus on the summary here: Albertans over 50 years have comprised of 70 per cent of all COVID related hospitalizations, 70 per cent of all COVID related ICU admissions, and 96 per cent of all COVID-related deaths.

If you look at it divided by pediatric data, fortunately this thing has not been affecting kids. We didn't have any deaths in Alberta until the fall of 2021. So this was a full year and a bit, after the pandemic,

[00:15:00]

just as the vaccines were starting to roll out. We have five cases of death. I know three of them died for sure with and not from COVID. I don't know all five of them, but this is the **total number. This is the number of kids that got hospitalized out of all of this, total on the ICU and five deaths.**

In one of those, the very first death as a matter of fact, our former Chief Medical Officer of Health, Dr. Deena Hinshaw, got on and held a press conference to indicate to families that we had just lost the first child from COVID and then promptly sort of encouraging families. That was right at the time they were both to push the vaccines in the 5- to 11-year-olds and then had to retract because a family member pointed out that the teenage boy had been suffering from stage four brain cancer and had died with and not from COVID. So she apologized and retracted that.

And this is not surprising. This is October 26, 2021, right at the time my letter went out. This was Pfizer's own modeling data that they submitted to the FDA. And they predicted that if you vaccinate one million children, so two shots fully vaccinated, you're going to save maybe one life. But you're going to cause somewhere between 34 and 17 cases of excess myocarditis in the ICU. And we know that probably 15 to 20, maybe up to 50 per cent—depending on the study of people who have ICU myocarditis—die within five years.

So based on their own modeling, before this thing rolled out in kids, before the Canadian government approved this, this table showed you that they were going to kill more children because of ICU myocarditis than save from the vaccine. And this doesn't include any of the other side effects. We were told, as you guys all remember:

[The witness plays inaudible video clip of Dr. Rochelle Walensky]

Allan Rouben

We can't hear.

Dr. Eric Payne

Oh, you guys can't hear that.

Allan Rouben

We can't hear that clip from Ms. Walensky.

Dr. Eric Payne

Okay, so that's—

Allan Rouben

The gist of it is that we were told that the vaccine would prevent you from getting Covid, yes?

Dr. Eric Payne

Yeah, that's right. I'll have to figure this out because I've got other short videos too. But she was telling us that you're not going to get it. If you get it, you're not going to spread it to other people. And then we had— And hopefully, let's see if you guys are— If I just do this, you guys may be able to hear this now.

[The witness plays an inaudible video clip of Dr. Anthony Fauci.]

No, that's not going to work. So this was Fauci saying the same thing. And these are all the people that said that.

But the key to what was taking place here was that in the official trials that were done—and they came back telling us that this was 95 per cent effective or 100 per cent effective in the teenagers—what they were providing was the relative risk. They were not providing us with the absolute risk. The absolute risk from these trials actually showed that if you had 100 per cent chance of getting COVID, these things reduced it by 1 per cent. So the number

needed to vaccinate based on these numbers showed that you needed to vaccinate 125 people or 200 people just to prevent one case.

So there was no chance that vaccinating everybody was ever going to solve this endemic virus. And this is a quote from a document from the FDA [Food and Drug Administration] itself, saying that it is actually unprofessional to just provide the relative risk and not provide the absolute risk.

This is a document that was pushed around in Canada, including the children's hospital that I worked at back in June in 2021, stating here that the vaccine was 100 per cent safe and effective based on the relative risk in those children. But they also suggested that we had no concerns for long-term risks. And I was able to confirm via email with the pediatric infectious disease doctor who was helping push these things: At the time that they were sending this to families, they only had eight weeks long-term data in adults. They didn't even have eight weeks in kids at that point.

The major integrity issues with respect to the Pfizer original trials as well, there's a whistleblower who is currently suing them. And it's incredible what they were getting away with.

Hopefully, you guys are able to hear. You guys can't hear that, can you?

[The witness plays an inaudible video clip of Bill Gates.]

Allan Rouben

No, we can't.

Dr. Eric Payne

Okay, so that's Bill telling us that these vaccines are not good at infection-blocking and preventing the disease. So he, right after making this statement, sold off a whole bunch of his Moderna shares with a pretty good upside to them.

Here is the Alberta public health data, and this is the kind of figure that I have in some of my expert opinions that are before the court with respect to COVID.

[00:20:00]

But this is the Alberta data over time, COVID cases. Two doses is in the green, three doses is in the red, one dose blue. And so what you can see: May 2021, September '21, here we are at the Omicron, right during the truckers, in Ottawa in January of 2022. And if you had had two doses, you were twice as likely to get Omicron. And that is relative to 100,000. So this is not the absolute numbers, this is relative numbers.

This continued. And you can see here, as of March 13th, the three doses were most likely to be getting COVID by the Alberta data. And it was at this time that Alberta took this number off the website. Now certainly, there is more uptake on the third shot among elderly people, so that for sure is a part of this, but it does not account for all of it.

Here's the Ontario data: same thing, fully vaccinated, absolute risk right around January '22, more likely to get COVID if you had two shots. Relative to vaccine status per 100,000, the double-vaxxed were more likely to get Omicron last Christmas.

This is the U.S. data, looking specifically against Omicron coming out this fall: zero per cent effectiveness is here. And you can see that over time, across all age groups, this became negative effectiveness over time.

This was a prospective study just done at the Cleveland Clinic in the fall, where they looked at the bivalent effectiveness in 50,000 of their own healthcare workers. Note that they didn't even force their healthcare workers to all take the shot because they had some people with zero doses to study. But what this showed very effectively was a dose-response curve. The most likely person to get COVID Omicron this last fall was four doses, then three doses, then two doses, then one dose, then zero doses.

This video, I think many people have seen this one as well: an E.U. parliamentarian asking a Pfizer executive if they had had any evidence that the vaccine stopped transmission before they rolled this out. Which, I think, most people thought that of course they have evidence that this had. She chuckles and says, "No, we didn't have any evidence to show that this stopped transmission. We had to move at the speed of science." Whatever that is.

So right around that time, the naysayers here will say, "Well, it still does something against serious illness and disease." But in March 2022, this was the data available publicly in the U.K. And nine out of 10 COVID deaths were in the fully vaccinated. So U.K. and Israel were about three to four months ahead of us on this, so you could just look to see what was going on there to predict what was coming in Canada, which was why, when I wrote my letter in the fall, I already had Israeli data that showed that two doses comprised 60 per cent of the ICU admissions in September. So there was no way even against serious illness and death that this was going to do what they were saying it was going to do.

Here's B.C. data showing the same thing. Ninety-three per cent of the COVID-related deaths in March were in the vaccinated—85 per cent, 82 per cent of hospitalizations. And this is despite the fact that only 50 per cent of people in B.C. had taken three shots. Proportionally speaking, the triple vaccinated are most likely to die from COVID. That's in B.C.

This is the Alberta data, same thing. Three doses, 50 percent—this is hospitalizations. So you can see 81 per cent of the hospitalizations were in the vaccinated. And then in deaths, this is July 4th, 2022. Seventy-three per cent of the deaths in Alberta occurred in those who were with two or more shots. And this data is important, especially in the context that we only had 39 per cent uptake on three shots.

So this is right here at the Omicron, when it came out at Christmas time in 2022. And right when everybody who had taken two and three shots got COVID anyways, a lot of them decided that they weren't going to take three shots. So we haven't gone past 40 per cent uptake. It's plateaued since January of 2022. And in response to those numbers, AHS has taken— **The Alberta government has taken the cases by vaccine outcome, death, hospitalization, and cases itself. You can no longer get that anywhere in Canada, basically.**

This is Paul Offit. And he's a member of the FDA that consistently— He's a pediatric infectious disease doctor who consistently voted "yes" for the vaccines. And he's saying that he would have voted "Hell, no" if he could have said, "Hell, no," instead of just "No" to the Omicron boosters, because of the complete lack of data associated with that.

And then what we've seen here in the last six months is that because of the efficacy data and lack thereof, multiple jurisdictions are taking this from their shelves. France just removed this. Denmark stopped recommending these back in March, a long time ago—

sorry, September 2022. England. Here's Florida removing these from those under the age of 40.

[00:25:00]

Here is the Danish health minister saying it was a mistake to recommend COVID-19 vaccines for children. Here is a health official from Quebec recently stating that they're not going to recommend boosters, only for the vulnerable, specifically drawing attention to the fact that natural-acquired immunity with respect to COVID actually exists. And those who have had it—given that about 95 per cent probably of us, based on serology studies have had it—there's no reason to boost everybody with it.

And then just this week the World Health Organization, of all people, is now no longer recommending this for those who are not at risk. You know this clip. If you haven't seen it—it's really too bad that the voicing is not working here—this is Anthony Fauci years and years ago being asked specifically on camera about a woman who just got influenza, just got the flu, and whether or not the person who just got the flu should also get vaccinated against the flu. And he says, "If she has really had the flu, then she does not need to be vaccinated."

The best vaccine is in fact being infected with the virus. So that was pre-COVID, that was the brain on pre-COVID. And then all of a sudden, right as these vaccines were coming in, we know by serology, by the summer of 2021, that probably 50 per cent of the population had been exposed to COVID. The idea that you would expose 50 per cent of your population to an experimental genetic jab if they had protection from already getting it didn't make any sense. So they had to tarnish that long-held medical established fact that, yeah, 2,000, 4,000, 6,000 years of human existence and we're here because of our immune systems.

Dr. Paul Alexander put together 160 research studies over the last few years showing a superiority of natural-acquired immunity post-COVID infection to the vaccine.

And here's a recent paper that just came out earlier in February. I'm not going go through it but basically, it was a meta-analysis of all the best data. And as a result, showing for sure that there is better robust protection. Even if you get reinfected—like with Omicron if you got, say, the original virus or alpha or something like that—you are protected against serious illness still with these numbers. And that led to actually the mainstream picking this up recently. So you know, what was actually interesting about this study was it was funded by the Gates Foundation. So they really have to acknowledge this now for that to come out that way.

But nonetheless, here is, "Three Years Late, *The Lancet* Recognizes Natural Immunity." And **this is one of the points that I was apparently spreading misinformation for when I wrote that letter in September. Here's the *New York Post* stating the same thing.**

These are two short videos talking about vaccine-induced enhancement. The idea that being vaccinated against certain viruses: with subsequent exposure to that virus, you can get increased infection, or you can get enhanced infection as a result of that. And it's well known.

I had written about this because we had about a dozen papers where animal models had gotten respiratory viruses. And subsequent to getting the vaccine, subsequent exposures, the animals all died due to antibody-dependent enhancement. And this is Dr. Fauci explaining exactly that: that there is this issue with vaccine-induced enhancement. The FDA

knew that it was a risk with the COVID vaccines. So they were watching for it apparently, but they haven't really been documenting any of this.

And we can get this through antibody-dependent enhancement: immune imprinting, where your immune system gets biased towards the first version of what it sees. And then it can get exhausted by all these subsequent boosters. And Peter Hotez has been one of the most vocal pro-COVID vaccine people on CNN, everywhere. But this is a testimony from him. This is really remarkable testimony as a matter of fact, back in March 2020. He himself had done vaccine research with the coronavirus and had found that vaccine-induced enhancement was an issue. And he specifically talks about an RSV [respiratory syncytial virus] vaccine where children died as a result of vaccine-induced enhancement.

And so it is an absolute concern. It was a concern. Everybody knew that it was a concern. And if you look across here now, we've got clear evidence in the peer-reviewed literature that that has taken place. That antibody-dependent enhancement has happened with Omicron, the antibodies that are being generated are not neutralizing, meaning not cancelling, the virus itself. We knew this at the time I wrote my letter.

This is the paper with respect to the Delta variant that was present in Fall 2021. Again, showing there is infection-enhancing antibodies that's been detected. And this is one of the things that I know; this was quoted as well. But look at the date that this was submitted, November 2019. So pre- this rolling into our shores, as far as we've been led to believe. Although now it's been even recognized by the former CDC director and in peer-reviewed literature. The virus was in circulation in the fall, for sure in Europe.

But anyways, here is the woman, Zhengli Shi, who's colloquially known as the Bat Lady. In their lab, they actually induced enhancement of coronaviruses.

[00:30:00]

Before this thing got out and infected everybody, there were people playing with antibody-dependent enhancement of the coronavirus itself. And now it's widely acknowledged. What was previously conspiracy theory with respect to this thing having been generated in the lab. now I think everybody has acknowledged that it was definitely created.

The COVID genetic jabs and distribution, it's a huge issue. Because there isn't a single drug that we get that I can't look up what happens to it in your body, how long it takes for that thing to get metabolized, where it gets metabolized. And for whatever reason, that was not present with these vaccines, these genetic jabs.

And we knew that they were being housed in a fat ball, the mRNA ones were. So because of that, my thought was that this could get everywhere. We were specifically told that this produces a spike protein, but that spike protein gets tethered to a cell membrane and as a result, can't circulate in the body. And then gets recognized, destroyed; you build up an immune response and then it's gone.

Now the Canadian government is recognizing on their website. It was a conspiracy to suggest it could circulate in the fall, when I wrote this. But now the Canadian website is acknowledging that this can exist for days to weeks. It can actually exist for many, many months. There's evidence that it can even exist beyond a year.

And this point about, "This does not get into the cell nucleus," and whatever—that may not be totally true. We've got this paper by Alden et al in a cell model of HUH7, which is a liver

cancer cell model, showing that it activated a reverse transcriptase, meaning the mRNA became DNA. And then they found the spike protein inside the cell nucleus. So we need to know more about this, but this idea that this doesn't get in and it's been debunked—that's also nonsense.

This was the only data that I had in September that was really— This was obtained through access to information and this was in rats. We knew that very quickly, 0.25 hours, one hour, 48 hours, that this circulated everywhere. It was in brain, eyes, heart, kidneys, reproductive organs. That was back— Japanese Pfizer data. We've also got the data that was submitted to Australian authorities from Pfizer, showing, once again, this also gets into the bone marrow. I mean, it goes all over the place. And the uptake in the reproductive organs as well as the brain: it's very, very important.

Now, it's also been found in the breast milk. So whether that's meaningful or not, they fact check this and denigrate it, but the reality is they're finding it in people's breast milk. So to suggest that this thing doesn't travel would be misinformation itself right now. Another study showing that it circulates for at least 15 days.

Here's an adult who got the vaccine and then developed encephalitis and status epilepticus. And they found the spike protein—not the virus and envelope protein but just the spike protein—in the cerebral spinal fluid. So it has the ability to get into the spinal fluid. And it can get in and affect myocarditis. So here it is where the patients who have clinically-evident myocarditis are more likely to have detected spike protein in their body.

Here's an autopsy series where patients who had undiagnosed myocarditis— All these patients dying in their sleep, it's apparently rude to ask if they were vaccinated. Having said that, we all know that myocarditis and one of the presenting symptoms for myocarditis can be death. This has been identified. On pathology, they found spike protein in the heart.

And here's just the two studies I mentioned. One about the breast milk, but two, we also know that it can impair temporarily semen concentration and motile count. And they say temporarily because they only look for a couple of months and they stop looking. So we don't know how long that actually affects things.

Just sort of wrapping up here. Getting into the severe side effects and death, this was a tour by Dr. Hoffe and Dr. Malthouse. These are all people who were injured by the vaccine who showed up to this tour. These are not rare.

The Vaccine Adverse Event Reporting System, which is a self-reporting system by physicians and patients in the U.S. and internationally, it's now got over 2.5 million adverse events reported with respect to these vaccines, including 44,000 deaths. And this is likely an under-representation of at least a factor of 10 to 40.

Here is all the Vaccine Adverse Event Reporting System over decades. So here is all vaccines all put together. And this is the adverse events. And then, here's the COVID vaccine. So the COVID vaccine in the first 18 months accumulated more vaccine adverse events in the reporting system than all vaccines put together in 40 years. And juxtapose that with, you know, previously these things being removed from the market after just 15 cases of a bowel obstruction.

The European Union has got a database as well. They've documented 46,000 associated deaths and 4.6 million injuries. The World Health Organization has got a database as well. This also shows the same thing.

[00:35:00]

So as of November 12th, 2021, there were 2.5 million adverse events in the World Health Organization's VigiAccess database, compared to under a million adverse events for all vaccines put together in 40 years.

This is an interesting safety database that's housed by the CDC. And for whatever reason, the CDC went to court to try to prevent its release. It's supposed to be publicly available data. They prospectively enroll patients getting vaccinated and they're supposed to report what their symptoms are on a prospective basis over the next few days. And this system showed that 7.7 per cent of everybody who took a shot—this is everybody; this is not just self-selection bias; everybody who took a shot regardless of symptoms had to add this thing in—almost 10 per cent had to go get medical attention and one of the four were missing work or school. And as I say, the CDC tried to hide this data.

The FDA tried to hide Pfizer's data. This is three-month data that we have now by Access to Information. In the first three months of the vaccine rollout—this is before it came to Canada—they had already documented 1,223 associated deaths. And the six-month Pfizer data, which if you haven't looked at the Canadian Covid Care Alliance's video, "More Harm than Good," I highly recommend it because it's extremely well done. But this is probably our best data at six months. It's actually the trial data, so they're actively followed to find the side effects. And they tried to hide this for six months. And when we got access to it, we found that injuries short-term were higher. And there were actually six more deaths in the vaccine arm at six months than there were in the placebo arm. And so there has absolutely never been any peer-reviewed, any quality phase three trial data showing that these things prevent serious illness and death. Even the original Pfizer trials, we're just looking at the presence of illness.

Allan Rouben

Sorry, Dr. Payne, we're running out of time. I'm wondering if I can just stop you and turn things over to the commissioners and see if they have any questions, if you don't mind.

Dr. Eric Payne

No problem. Yeah.

Commissioner Massie

Well, thank you very much, Dr. Payne, for your very nice overview of the COVID vaccine science over the past three years. I'll have two questions. First question is, knowing that the vaccine is not sterilizing the propagation of the virus, and also knowing that coronaviruses mutate, is it your expert opinion that the mass vaccination was contributing to the extension of the wave of new variant as we saw over the years? Also given the fact that when you look at countries where vaccination rate is fairly low, it seems that the pandemic had subsided much, much earlier than in other countries.

Dr. Eric Payne

Yeah, thanks for the question. There's no doubt in my mind that that's the case and it's not just my expert opinion on this. I was able to cite a paper from immunology and virology experts in the *New England Journal of Medicine* back in the fall of 2021, where in that well-respected journal they were warning about aggressively vaccinating in the middle of a

pandemic using a non-sterilizing vaccine, that you were going to put evolutionary pressure on the virus to mutate into something that we weren't going to be able to deal with. And so this was warned by some very smart people like a year and two years prior, and the evidence as it came out showed this. And the antibody-dependent enhancement papers I showed you show specifically that there are facilitating or enhancing antibodies that are circulating with respect to the Delta and Omicron variants. So I don't think there's any doubt that that's happened.

Commissioner Massie

My other question is relating to a sort of confirmation in the real world that the vaccine does or does not prevent hospitalization or death. It seems that it's very challenging to get the data in any jurisdiction about the actual vaccine status of people that were hospitalized for COVID or died from COVID. Do you have any sort of hope that this will happen somewhere, sometime?

Dr. Eric Payne

Yeah. So you're right. Given the limits— I thought I had a full hour to talk, so I'm sorry I went over. But the reality with respect to the death data is that they were playing with the numbers in different ways using time denominators that reflected one year of acquisition when we didn't even have the vaccine for six months of those, putting all the deaths in the unvaxxed category.

[00:40:00]

There are ways that they manipulated it. But as I pointed out, by the time we got to Christmas 2022 last year, every single provincial database— I only showed you a few and I only showed you a few of the studies. But multiple countries all pointed out the same thing, that you were more likely to get Omicron if you had more shots. And this has continued to be the case over the last eight months, with more studies like I showed. To the point where, as you're suggesting, they've taken that data off, right? Because it's so terrible. And I think frankly, with the evidence that they're sitting on, it's beyond terrible. You know, there's a criminality to sort of hiding this data. You're not providing informed consent anymore.

Do I have hope that we're going to see? I think we have more than enough information already to pull these things off the shelves across the board. Any positive benefit from serious illness and death was temporary, and it was against the earlier variants. That is completely flipped now. You're more likely to be sick with COVID if you've had more shots. That's already the case.

And so I understand why they put that away. But I don't feel like we need more. What we do absolutely need with respect to the long-term data is that we need to be counting the beans in terms of who's been vaccinated and gets ill and who doesn't.

Recently, just two weeks ago, the German health minister who oversaw COVID acknowledged that there was at least a one in 10,000 risk of serious adverse illness and injury after the vaccine. He knew this even when he said that these things were safe and effective. He acknowledged that he lied about that in order to avoid vaccine hesitancy. But he also acknowledged that the injuries that they're seeing are not the same as those post-COVID. And I'm seeing these people in my clinic now as well. A lot of them, like 25 per cent it seems, have got permanent injury from this. And it's a different injury.

By not talking about it, we're not looking at, one, acknowledging people that are suffering—people who went along with what they were told to do. But we're not looking for solutions to try to help the people that have been injured. I have colleagues who literally, even though the Canadian government has paid out for Guillain-Barré syndrome, still do not put the vaccine on their differential for Guillain-Barré syndrome. You know, despite that data.

So we absolutely need to be following this prospectively to sort of figure out what's going on. In terms of my hope for it, I won't hold my breath.

Commissioner Drysdale

Dr. Payne, thank you very much for your testimony. A lot of information you provided us with. And I sometimes find in these technical discussions that meaningful points are missed by folks like myself who aren't medically trained.

But one item that you mentioned and I wanted to ask you for a little clarification on, is: you had one slide where you talked about the vaccines. And you said—I believe you said—that they had reported the efficacy in the 90, 95, 97, whatever it was, percent range. And you called that relative efficacy. You also talked about— You compared it to another number, which I believe you called absolute efficacy. And I'm curious if you can explain to me and the audience exactly what the difference is between relative efficacy that was used in promoting it and the concept of absolute efficacy.

Dr. Eric Payne

Yeah, sure. So we're talking specifically about the relative risk reduction about an intervention versus the absolute risk reduction from an intervention. So the relative risk in the trials, I'll round the numbers in the original trials. There were, like, 40,000 participants in the original trials—20,000 received placebo, 20,000 received vaccine.

In the Pfizer data, the numbers were something like: Among those who received the shot— And keep in mind, you're not fully vaccinated until you're two weeks post your second shot and I've got data showing they are actually increased risk of getting COVID before your two shots. But nonetheless, it's not just saying that definition. They showed that there were about 183 patients in the placebo arm during that 40,000-patient trial who got COVID. Positive test, mild symptoms.

There wasn't anybody in that 40,000-patient trial who ended up going to emerge. even, let alone needed to be admitted to the hospital. When they compared that to— Say there was about three or five patients in the vax group who got it, they compare relative to that. You know, 183 in the placebo arm got the virus.

[00:45:00]

But only five in the vaccine arm did. So they compare those two and the relative number to 183 versus five. Here you get that 95 per cent.

But if you actually look at it in terms of the trial itself, which was 40,000 people, and you look at it that way, then you get your absolute risk reduction, which is one per cent. Right? And this is a very common way that pharmaceutical companies are known to play with the numbers when they're advertising to us. It's because we know that this is misrepresenting the actual numbers and the risk that people like the FDA here put in manuals that it's unprofessional to not provide the absolute risk reduction.

Once you have the absolute risk reduction number, you can calculate something called the “number needed to vaccinate.” Which is, how many people do I need to vaccinate in order to avoid one case of COVID? And based on these absolute risk numbers, you were looking at somewhere between a hundred and 200 people to prevent one case, for something that had already affected 50 per cent of the population in the summer.

So there was no chance that this was ever going to stop or lock things down. We had somebody under oath in our case against AHS. One of their experts suggested we could just get everybody vaccinated and we’ll stop the pandemic. It’s a complete lie. It’s been shown to be completely not true as well, but it’s because of these types of things.

Commissioner Drysdale

So that when they talked about then and they gave a relative number, an ordinary person like myself who’s reading that, who feels that then I’ve only got a 3 per cent chance—or sorry, I’ve got a 97 per cent protection—is really being misled, I believe is what you’re telling me.

Dr. Eric Payne

You’re being enormously misled. I mean, the proof is in the pudding. So while all these people here on the left told you that there’s no way that you’re going to get it, you’re not going to spread it to anybody else. And then when that proved wrong, they told you, “Well, you’re not going to get seriously ill.” And when that proved wrong, they just took the data down. The reality is it was only lowering your risk of getting the disease by one per cent.

Commissioner Drysdale

You know, I’m an engineer, so I think of things in hard terms. And if I think of this in a hard term and I’m trying to evaluate two cars driving down the road and they’re driving side by side at 300 kilometers an hour, their relative speed is zero. So if I give you the relative speed of those two cars driving side by side at 300 kilometers an hour, you have no idea of what risk they have and what speed they’re actually driving. Is that correct?

Dr. Eric Payne

Yeah, that’s a great analogy. That’s exactly it. And they purposely pumped that. I mean, I showed you the one-page poster that was posted in the Emergency Department at our children’s hospital and throughout Canada, where they were telling the 12- to 18-year-olds that there was 100 per cent effectiveness with this shot, when we already knew it wasn’t a 100 per cent effective in the adults.

So this has been misinformation from the start. And these absolute numbers, that was available; I wrote that in my letter. This was clear to people who wanted to pay attention to it at that time.

Commissioner Drysdale

Dr. Payne, we heard from another witness in Truro, Nova Scotia. And that witness talked about the vaccine itself and the technology of the vaccine. And they talked about many of the things you talked about, about the spike protein showing up in different things and penetrating the cells.

But they also talked about a study with regard to the purity of the vaccines that are actually utilized. And they talked about the fact that the vaccines were supposed to be injected in such a way that they never went into the vascular system or the circulatory system. And what that other witness talked about was that they were supposed to aspirate on the injections. And they stopped doing that.

So my question to you on that is: are you aware of those other issues—the manufacturing issues, the actual injection issues—and do you have any comments with regard to that?

Dr. Eric Payne

Yeah, that's, I think, one of the things that blows this wide open. Because right now the vaccine companies have got immunity. We're not even allowed to look at the contracts that they've signed with the countries. However, if there was fraud involved then they don't get immunity. So with respect to what you're saying, the production: not only did they ramp this thing up fast but they had to produce it in high quality substances quickly. And that didn't happen. And there's a huge amount of literature to show that.

[00:50:00]

But just to give you the basics on this thing: the vaccine is supposed to carry the genetic information to produce the spike protein. And what they had to prove, the companies, is that it actually produced the spike protein. And it had to produce the spike protein at a certain length. And you can measure how long proteins are in something called a Western blot. You can see how these things are actually being produced. And there were limits. At least 50 per cent of what was being produced had to be normal-sized spike protein.

I have looked into this pretty carefully and I used to do Western blots when I was a grad. When I was back in high school even, I was doing Western blots. But it looks like they cut and paste the Western blots, Pfizer did. Meaning that there's not actually any proof that they're consistently able to produce reliable spike protein. And proof of that is in the Vaccine Adverse Event Reporting System that I suggested.

So not only did people put in their adverse events but they also had to put in the drug identification number, what the actual batch number was of their vaccine. And there are studies right now out there in the peer-reviewed literature showing that there are some batches that were associated with much higher injury than others.

You can go to a website called "How Bad is my Batch," type in your batch and see. Some of those were much higher. Does it mean that some of them were maliciously formed? I mean, my impression, from what I understand from the people who know this manufacturing stuff the best, is that a lot of people got lucky and got a vaccine that just wasn't potent as a result of the fact that you're not consistently generating enough spike protein.

What you said about the injection part—and I'll leave it at that—is that, yeah, if you give this as an intramuscular injection, hopefully most of it does stay—a large part of it stays in the arm. However, if by some chance you get this into a vein, you get this into a blood vessel by accident, you could be injecting this right into the venous system. And that's why people pull back on the needle, to make sure that they don't, and make sure that they're not blowing it into a vessel when you do that.

Has that happened? Does that account for maybe why some people had really fast anaphylactic reactions or other things? Maybe. Most people would not have had that

injected by mistake into their vein. But the bigger issue is the quality of reproduction generated from this genetic recipe for the spike protein. And that quality doesn't seem to be there. And there's pretty convincing evidence that there's some fraud involved in terms of producing Western blots that met the FDA standard to allow this to get into the U.S. as Emergency Use Authorization, that were, in fact, copy and pasted.

Commissioner Drysdale

Thank you, doctor. I have a thousand other questions for you but I can't ask you a thousand other questions.

Allan Rouben

Dr. Payne, I know you didn't get to all of your slides. Is there anything in your slides that you didn't get to that is really important, that you wanted to highlight? Or did we cover off most of it?

Dr. Eric Payne

Well, we got through everything almost. I was specifically asked to make some comments about masking. And if I can just say two words about masking, I would like to.

Sorry, as you go through all these here. But in November 2022, I wrote an article for Brownstone called, "Time to Unmask the Truth" with Dr. Paul Alexander. And it's a short article, but there's, like, 60 references in it, all showing that there is not a single policy-grade level data randomized control trial meta-analysis to show that masks actually do anything to prevent transmission of influenza or COVID.

I sent this copy of this letter on November 25th to our Chief Medical Officer and health authorities in Alberta at that time. I followed up with a letter in December because there was new evidence showing that, once again, these masks don't work. And now we've got a meta-analysis that was in the *Cochrane Review*, here, looking at all this. And they've tried to attack this. But nonetheless, the summary point that they can't state is misinformation is that there is zero policy-grade data to support masking—especially our children. Here's Fauci talking about how masks don't work, "might catch some big droplet if," but that's not there.

And then you've got someone like Dr. Kieran Moore in Ontario, who on video is telling parents that if their child, a two-year-old, wakes up sick in the house, they should put a mask on them. And meanwhile he's out partying at the Top 50 Most Influential without masks at a time that he's telling everybody else. So the hypocrisy that we've seen has been **difficult on the masking. It's been varied across the board about what these masking rules are from one jurisdiction to the other. And as a result of the pressure he got, I think, from being caught, he ended up changing his tune.**

[00:55:00]

And now he actually acknowledged that there can be negative effects of the masks themselves.

As a pediatric neurologist, what I want to say is: this is intrinsic. Kids need to look at your face when they're learning to speak. You can almost see them mimicking that as they're forming words. There's lots of studies to show that that's the case. And the CDC, for the first

time in over 20 years, decreased how many words a child should know at a certain age. You know, you're supposed to know so many words, a couple of words together by age two, so on and so forth.

Kids were falling behind so much so as a result of what's gone on with the lockdowns and masking that first year that the CDC is now allowing for kids to know much less words—six months as a matter of fact. And so, there's no doubt that these things can cause harm.

We know that these things get disgusting and kids have got their hands on these things all the time. And now we've got, many, many policy-grade studies all showing minimal to no effect of masking. So it's time to move on. And when and if ever we get another pandemic around, the idea that we should mask again is nonsense.

That's all I want to say about masking.

Allan Rouben

Thank you very much for your evidence. Thank you.

Dr. Eric Payne

Thank you.

[00:56:21]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 5: Colleen Brandse

Full Day 3 Timestamp: 04:32:45–04:46:58

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness is Colleen Brandse. Colleen, can you start by stating your full name for the record, spelling your first and last name?

Colleen Brandse

Colleen Brandse, C-O-L-L-E-E-N B-R-A-N-D-S-E.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Colleen Brandse

I do.

Shawn Buckley

Now, my understanding is that for 28 years you worked as a registered nurse in the province of Ontario.

Colleen Brandse

Yes.

Shawn Buckley

And when the COVID-19 vaccines came along you were hesitant. Am I right about that?

Colleen Brandse

Yes, I was.

Shawn Buckley

Can you share with us the steps you took because you were hesitant?

Colleen Brandse

Well, I was diagnosed with T-cell lymphoma in February, 2021. And I knew as a nurse that that's my immune system. And I knew enough—my gut had told me and I knew enough—that I didn't really feel comfortable taking something that wasn't tested and proven and that was new.

So I thought— Well, my GP had mentioned that I should take it and I said, "I'd prefer to wait to talk to the oncologist." I waited and I spoke with her in June and she said, "I'm telling everybody to get it." And I said, "So you don't think that I'm going to have any adverse reactions? That's my immune system." She said, "No, you'll be fine." And she recommended I take them three weeks apart.

Shawn Buckley

Okay, so armed with that information, what did you do?

Colleen Brandse

I did what she said. I trusted her. So I took my first on June 7, 2021. And three weeks exactly later, I took my second.

Shawn Buckley

And what was the result of that?

Colleen Brandse

Well, my first injection, I had some tingling in the face and weird sensations, but it went away. So I thought, "Okay, well, that's just anxiety, you're nervous." And it resolved within a half hour or so. I thought okay, I'm fine; it's just anxiety. I'll get the second shot in three weeks. So I did.

Initially, I was fine. And then two weeks exactly to the day I started developing shooting pains in my feet, which eventually led to numbness and foot drop, numbness up my legs. And a month or so later, I was still questioning. I had a CT of the spine to make sure that I didn't have any issues with my spine that was causing it. I had seen a foot clinic. They kind of didn't feel that it was related to my spine and explained it and I agreed. So my eyebrows were starting to get raised at that point. Then about four weeks, five weeks later, my vision went in my right eye. And then my cousin had the exact same thing. And I knew at that point: okay, this is definitely the vaccine.

Then come December I had a lot of different things. There's way too many to even list because every system has been affected. I ended up with mottled legs, they're still mottled; pericarditis; increased shortness of breath; worsened vocal cord paralysis, where I almost

had to have a trach done. I have double-brain aneurysms that were unable to be surgically repaired that needed urgent surgery because I've been gaslit and nobody will help me.

I guess that's probably what I found the most difficult about this whole experience, is not only the physical, the isolation, loss of family, friends, people telling me I'm nuts but as a nurse, to go to hospital after hospital or specialist and plead with them to help me so I can get my brain surgery done and have nobody help. It's just been— There's no words.

Shawn Buckley

Can I just, and I don't mean to interrupt, but you worked in the hospital system for 28 years.

[00:05:00]

Had you ever seen patients being turned away that needed surgery like you needed?

Colleen Brandse

No. As a matter of fact, I've used that as an example. I've said, "People used to go to the ER for a bladder infection." And how is it— One thing that raised a red flag to me initially was when they were telling people, "If you have symptoms, go home. Don't come back with your symptoms until you can't breathe." Well, by then you're dead almost. And that just didn't, I just couldn't understand. So I don't know, I think that the gaslighting and the amount of lives that have been lost and that will be lost—mine possibly and pretty much will be—is absolutely devastating when a lot of them could have been helped.

Shawn Buckley

Can I ask? You've used the term "gaslighting" a couple of times, and can you explain for us what exactly you're referring to? Give us some examples?

Colleen Brandse

Yeah. Well, I've been to the ER a few times. And when I presented my neurological issues, symptoms of having TIAs, which is a warning to stroke, of course they rushed me right to the back. They were going to do everything. When I showed them my mottled legs and voiced concern about blood clotting, as soon as the doctor asked me when it all started and I mentioned the vaccine, I was done and out of there within a half hour.

Shawn Buckley

So I just want to make sure I understand. I've got two questions, but the first one is, can you explain for us what you mean when you say mottled legs?

Colleen Brandse

Typically, before somebody passes away, within hours to maybe a day or two, you'll notice that their legs—quite often it starts in the knees—will get like a veiny look. But not just like a varicose vein, it's everywhere.

Shawn Buckley

Okay, so you were seeing that on your legs. That's what you mean when you say you had mottled legs.

Colleen Brandse

Yes.

Shawn Buckley

Now, I just want to make sure I understand what you're saying. So you attended at the hospital, you were just telling of this time and they're taking you very seriously. You've indicated to them you may be having a stroke. You've gone to the back. There's this concern about mottled legs. But as soon as you mention that you think that it's connected to the vaccine, the treatment changed?

Colleen Brandse

It absolutely did. I was sent home within a half an hour when a CT should have been done. They should have ran way more tests to find out if I had what was called anti-phospholipid syndrome, because you're high risk with clot issues. Plus, I had had a pulmonary embolism when I was 29. So that should have automatically been a, "Whoa, let's check this girl."

Shawn Buckley

Right. You had the misfortune actually, because of your career as a nurse, to understand that you were not being treated properly.

Colleen Brandse

Absolutely. And I thought that might carry a little weight, but apparently it didn't.

Shawn Buckley

Now, my understanding is also your family has been affected by the vaccine. Can you share that with us?

Colleen Brandse

Sorry—

Shawn Buckley

No, take your time, please.

Colleen Brandse

Excuse me. In July of 2021, my husband was diagnosed with bowel cancer. He had surgery. They said they got it all. They were pretty sure. July 2022, he had his one-year follow-up. They said he was clear: no cancer, bloodwork was good, CT was good.

Around the same time, I get a call from my son that he's at the hospital and he's had chest pain and that they told him that it was probably anxiety. I said, "Do not leave the hospital,

Connor, without a CT and a D-dimer.” So they did that. And it ended up he had a pulmonary embolism. He’s 23. Around the same time, two weeks give-or-take—I can’t recall right now, I’m too nervous—my husband had the same with multiple blood clots.

[00:10:00]

And that was the same month that he was roughly cleared of his cancer. It was, give-or-take, a few weeks either way. Then within five months, my husband—at Christmas, December 20th, 2022—was told that he had stage four liver cancer that had metastasized from the colon.

Shawn Buckley

And both your husband and your son are fully vaccinated with the Pfizer vaccine?

Colleen Brandse

Yeah, my son has two and my husband had three.

Shawn Buckley

I’m sorry that this is so difficult and we so appreciate you sharing with us. Can you tell us the impact that these vaccinations have had on you and your family?

Colleen Brandse

There’s not enough time. There really isn’t. There’s so much that I could go on and on about. I mean, I worry about getting a call that my son, who’s 23, he thinks he’s invincible. He’s at that age. He’s working out, he’s playing hockey. I keep waiting for the phone call. Because he’s not totally compliant with his meds. Now my husband’s getting chemo and now will have to have chemo for the rest of his life, which, by the looks of how he’s doing right now, it’s not looking good. I’ve got him on other stuff and I’m doing what I can to try and reverse and have a miracle come. I live in fear of what my future is going to be. Because, I mean, I might lose my home.

There’s so much, but I am just devastated. I’m devastated how our government knew that there was issues and still allowed the people— And to now even continue after they know what’s come out. I could see if, you know, Pfizer or Moderna had produced a product that it was an emergency and they had to get it out and they weren’t quite sure. But I mean, it has been known now for well over a year that there’s people dying—and in way higher numbers than are ever reported.

I’ve reported myself. And I was told by the health unit nurse that they determined all of my issues were pre-existing. I said, “Well, I figured that’s what would come back.” It’s criminal.

And I can’t even get a doctor that can diagnose anything. I just got an appointment for a neurologist to do my EMG testing, which is your nerve testing, to diagnose me with small fibre neuropathy. And that’s not for two years. I mean, I’ll be dead by then. Or could be—I shouldn’t say that.

Shawn Buckley

Thank you, Colleen. I don't have any further questions for you. I'll ask if the commissioners have any questions. The commissioners don't have any questions.

Colleen, on behalf of the National Citizens Inquiry, we sincerely thank you.

Colleen Brandse

Thank you. And I thank you for coming and listening.

[00:14:13]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 6: Jason Kurz

Full Day 3 Timestamp: 05:38:50–05:59:18

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Geneviève Eliany

Good afternoon, Mr. Kurz. I will ask you to state and spell your name for the record, please.

Jason Kurz

My name is Jason Kurz, K-U-R-Z.

Geneviève Eliany

Do you swear to tell the truth today?

Jason Kurz

I do.

Geneviève Eliany

You're before the inquiry to tell us about your termination with Ontario Power Generation, OPG. Can you tell us first what your role was with them?

Jason Kurz

I began working in the nuclear industry back in around 2002. I was a Certified Red Seal 309A Construction & Maintenance Electrician. I joined OPG through the building trade unions and performed work as an electrician under the BTU [Building Trade Union]. After some time and achieving some radiation qualifications, I was more eligible to apply for some full-time postings, and I was hired in 2005 as an instrumentation and control technician at Darlington Nuclear Generation Station in Bowmanville, Ontario.

I spent a number of years as an instrumentation and control technician, and my career saw me move through a few different areas inside the corporation. After a number of years working in the fuel handling department, I became what some people would call an expert

in the fuel handling processes and systems and the maintenance involved in keeping the reactor fuel handling systems operational as a control technician. And then I moved into assessing, which was planning the work, making sure that the parts were ordered, making sure that the pertinent drawings were assembled into a package that was clear and comprehensible for the maintenance workers.

After that, I moved into writing procedures for the organization as a fuel-handling control technician. After some time, I felt that my career growth was being stunted, so I started to look for opportunities outside of the union I had belonged to at that time, which was the Power Workers' Union. I began looking for opportunities to experience some personal growth and career development. And I started to apply for positions that were in a separate union in the house under OPG. That union was called the Society of the United Professionals.

Geneviève Eliany

I'm going to interrupt you for a moment. Could you tell us what your most recent role was? I'm trying to zero in on that.

Jason Kurz

Understood. The position that I was terminated from, the title of the position is Work Control Team Leader. I was specifically under the Projects and Modifications Organization for Ontario Power Generation, and that was essentially a coordinator role for a team of between 50 to 80 project managers.

Geneviève Eliany

My understanding, from what you previously described to me, is that you coordinated the installation and the safety of the installations made when the reactors are running. Is that correct?

Jason Kurz

The position that I held was referred to as IPG work control. So what that means is that the projects that I was helping monitor for milestone adherence were projects that were going to be installed as the reactor was still at power and still generating electricity.

Geneviève Eliany

It's fair to say that this role you had is quite specialized, is it not?

Jason Kurz

Extremely specialized, yes, that is correct.

Geneviève Eliany

So once the pandemic started, you were working remotely from home?

Jason Kurz

Yeah, that's correct. When I entered the role, I had just come out of a previous rotation in which I was with the Radiation Department in an oversight capacity. That rotation had ended. I went back to my home position, which was a nuclear refurbishment training. And I had applied previously for this position with the Work Control Organization, with the Projects and Modifications Team, and I was interviewed and accepted into that role on a temporary basis, what they call a rotation. And the rotation was due to be 18 months, but they hired me before my rotation was up on a full-time basis because they were pleased with my efforts.

Geneviève Eliany

Okay.

Ultimately, OPG of course, like most government institutions, instituted a number of COVID mandates, correct?

Jason Kurz

Correct.

Geneviève Eliany

And you were required to both mask and be vaccinated, is that right?

Jason Kurz

Initially, what they did was they took the workforce that was able to work remotely and they actually accommodated and made every concession that they needed to in order to minimize the amount of people that they had working on-site at the beginning.

[00:05:00]

And so when I took the job, I actually started the position from home in my kitchen. I learned the entire role from the comfort of my own home and functioned that way accordingly until they started to call people back into the office.

When they decided it was time to start bringing the workforce back onto OPG's site, what they did was they had written up a policy, a COVID policy, that in my opinion was overreaching and discriminatory. And they tried to force everybody into compliance with that. The policy included vaccination as an expectation. If you were not comfortable with getting vaccinated, then you were expected to— I'm sorry, the COVID policy stated that their expectation was that all employees were vaccinated and that the employees would reveal their vaccination status in the OPG database, which is private medical information. And if you were not willing to disclose your vaccination status, or if you did disclose your vaccination status but you were not vaccinated, then OPG's policy was then that you would have to be undergoing testing. And yes, that was the policy.

Geneviève Eliany

Again, to be clear, you were working from home. But once 50 per cent of the staff was being called back, this is when the masking and the testing and of course the vaccination requirements were in place, is that correct?

Jason Kurz

I believe so, yeah.

Geneviève Eliany

Okay. Now, you refused to be vaccinated and ultimately you were terminated. When were you terminated?

Jason Kurz

December, I believe, 29th of 2021.

Geneviève Eliany

So end of 2021. And can you comment on what was happening with the policies at the end of 2021? Were they still as strict at the time of your termination as when they were instituted?

Jason Kurz

Well, okay, so there's a lot to cover there, right? I was placed on six weeks' unpaid leave prior to my dismissal. They were attempting to force me to comply with the policy. And they put it in writing essentially that if I would just comply with the testing requirement, then all of this could go away. My position was that Ontario Power Generation does not have the authority to mandate that I undergo any medical procedure of any kind as a condition of my employment if it's not part of my original work contract, which I agreed to when I agreed to work with Ontario Power Generation.

And so during the course of the time where I was placed on six weeks' unpaid leave, they started to back off on some of the policies and procedures. I wasn't onsite anymore. They had deleted my corporate account. I had no access to any inside information with respect to what their timelines were, only through some friends and some co-workers who were keeping in touch with me. And they started to step back on the requirements for disclosing vaccination status and wearing masks. In the end, I was terminated and lost my career and now, it's like nothing ever happened. Now, it's like the pandemic never happened. People don't have to declare their vaccination status, to my knowledge. I don't think they wear masks anymore.

Geneviève Eliany

So let's back up a little bit. It's clear that you didn't want to be vaccinated. You were terminated because of your non-compliance but the way you were treated was different than perhaps others. My understanding is that the company or OPG found out that you were involved in freedom efforts. Is that fair to say?

Jason Kurz

It's fair to say that, yes.

Geneviève Eliany

And you feel that you were singled out because of their knowledge?

Jason Kurz

I do. I do feel singled out. When I started the role, I had one particular section manager whose name began with an L. He took me into the office. At this time, they were starting to integrate the workforce back onto site. We were working onsite 50 per cent of the time and 50 per cent from home. And he took me into his office with a union representative and he stated that I had been spotted on television at a freedom rally,

[00:10:00]

and that I was not social distancing, and that I was a potential superspreader, and essentially directed me to no longer attend these types of events.

I told my section manager at that time that while I was on site, working in the industry and on the job, I would maintain the utmost professionalism as a nuclear professional. But when I was outside of work, I would conduct myself as I see fit. And I felt that the Freedom Movement was very important for our children because I didn't want to place my children in a situation where an employer is allowed to dictate to them that they must undergo any type of medical procedure. So I was very involved in the Freedom Movement. I was spotted on the news. And then from that meeting, I was directed to work from home 100 per cent of the time until further notice.

Geneviève Eliany

But despite your ability to work from home, your employer was still unwilling to make any COVID accommodations for you?

Jason Kurz

That is correct, yeah. They refused to accommodate in any way. And even when there was a bit of a wave with the way that the corporation had treated the supposed pandemic— There was a time where they brought the workforce back, and then when Omicron came out, they started sending people home again. And at that time, there was one gentleman from the union, Joe, who had sent an email to the upper echelons of management stating that since OPG saw fit to send remote workers back home to work remotely again, why don't we let Jason come back and continue performing the role that he had been providing previously? No response.

Geneviève Eliany

Let's discuss your termination letter [Exhibit TO-20]. It's an unusual termination letter. I am a criminal lawyer but it still strikes me as unusual. Of course, you were terminated. And **OPG, as you indicated, wasn't willing to have you back. But the letter also states that you're now ineligible to perform work either directly with OPG or indirectly through any contractor that carries out work for OPG.**

Tell us about the impact on your career given this paragraph.

Jason Kurz

It's hard to quantify the impact on my career. I've been in the workforce since I was 16 and worked very hard to get where I am, where I was, constantly seeking self-improvement and development. And I had finally landed the job that I truly felt I was built for. I was helping in a meaningful way. The projects that I was helping to navigate through the scheduling

system that's in place in that nuclear station: people have to understand that every one of these projects was in response essentially to the disaster that happened in Fukushima. And they were all highly vetted, multi-million-dollar projects, extremely important for public safety, plant safety, equipment safety. I felt like I was doing something that I was built for.

I was an award-winning employee and then the only thing I refused to do was concede my medical autonomy over to the company. And when I got fired and they put that letter out, they essentially stated in black and white—and they put it in writing—that their intention is to sabotage my entire career in the nuclear industry by stating that no longer would I be allowed to enter any OPG site or property. But they also said I would not be, as you read, eligible for employment by any vendor or subcontractor that provides work for Ontario Power Generation.

And I wonder what gives them the authority to tell Black & McDonald or Ken Adam or BWXT or Cameco or any of these other wonderful companies that I cannot be hired by them when I have almost 16 years of CANDU nuclear experience. And I've been a single point of contact during outages in the OCC, you know.

Sorry, I'm getting emotional.

Geneviève Eliany

That's okay. You'll have to get some legal advice on it. But another point in the termination letter is that you've also been given a trespass notice. You can't even attend the building, can you?

Jason Kurz

That's correct.

Geneviève Eliany

Do you know anyone else who is terminated in the same way from OPG?

Jason Kurz

To my knowledge, I am the only person who is terminated by Ontario Power Generation under the circumstances of refusing to recognize the authority of their COVID policy.

Geneviève Eliany

Let's touch on the financial impacts on your family.

[00:15:00]

Jason Kurz

The thing that made the people concede and give up— In the beginning, there was a fight. In the beginning there was a lot of people— There were hundreds of people that belonged to a group and we would discuss and share ideas and share our own legal research with each other. And in the end, the company has a pretty big carrot to dangle. The position that I held, just like almost any other position with Ontario Power Generation, was very well-paying. It included one of the best benefits packages that you could get in Canada. The

pension was top-notch. It's basically a dream job, especially for somebody such as myself who came from blue-collar construction trades and was just seeking a way to develop myself. And so because the people around who worked for that corporation saw what happened to me when I dug in my heels and I said that OPG does not have the authority to mandate a medical procedure as a condition of employment, a lot of people conceded—some quickly and some not so quickly. But in the end, they've got that: they'll take away your lifestyle.

You asked me about the financial implications. I went from making a certain amount of money that my family had grown accustomed to and lived accordingly with. And I'm not going to cry the blues about that. But I will say that now, here I am two weeks away from turning 50 years old, I am back on the tools as an electrician. I am making less than one third of the money that I used to make. I have no vacation. Every penny that we spend is hard fought for, strictly counted, and impactful on our family's finances. And no pension and no benefits.

Geneviève Eliany

I understand that your children wanted to follow in your footsteps. How are they thinking of their future now with respect to employment?

Jason Kurz
