My kids were always inspired by the career that I had developed and the lifestyle that my wife and I were able to provide. And so they trusted me to direct them and help them navigate and make life choices that would set them up for success. So their intention was to essentially follow in my footsteps as intelligent young women. They were both considering entering the nuclear industry as nuclear instrumentation and control technicians.

My oldest daughter actually started the first year of college for that course. And during that time, COVID was in full swing. And my children were not interested in learning the trade from the kitchen table. It's not something you can learn from a kitchen table. You know, they've been sending kids home and they're trying to teach them this stuff off of a computer. And it's sort of like learning how to be an automotive mechanic over the computer at your kitchen. So she placed her college on hold until the restrictions had let up. And then shortly after that time, my children and my wife got to witness how OPG treats employees that fail to concede their medical autonomy over to the company.

Geneviève Eliany

And one final question: I understand that you've had some contact with former colleagues. And what did they report back to you about how your role or position has been filled?

Jason Kurz

When I was in that role as a work control team leader, I absolutely loved that job. I just felt like I had meaning. The job had meaning. And it was a lot—and I took on more than I should have. In addition to the responsibilities that I was doing, I also was asked to speak at senior work management meetings to present the status of the projects that were on the plan. This is a nuclear station. I mean, these things are planned out 52 weeks in advance. Every penny is accounted for. Every document has to be signed on time. Every single one of these milestones, it was my job to make sure that they were all being met. And when they weren't being met, we had to make sure that they were going to be met, and that there

were forms to go along with that. It was a lot to keep track of. It was very high pressure. It was very, very stressful for some people, but I was built for it, and I loved it.

And since I have left, I've heard that they've not recovered, but I can't say that that's a fact. I've heard that things are certainly worse off than they were when I was doing all the things that were expected from me, plus the extra things I was doing that were asked of me.

Geneviève Eliany

Thank you. I'll see if the commissioners have any questions. No questions from the commissioners.

Thank you so much on behalf of the National Citizens Inquiry for your testimony today.

Jason Kurz

Thank you.

[00:20:28]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Moderator Statements: Shawn Buckley (Parts I and II)

Full Day 3 Timestamps: 05:33:53–05:38:50/05:59:20–06:09:23

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

PART I

[00:00:00]

Shawn Buckley

Commissioner, as best I can answer that question for you, I am aware that the NCI has sent out summonses. So if you examine the rules, the Council Administrator, who is the Honourable Ches Crosbie, has the right to issue summonses to witnesses. Now, because we are not a government inquiry, we are not a creature of statute, we cannot compel witnesses to attend. A regular inquiry can issue summonses and if witnesses don't attend, they can be arrested and brought. We don't have the ability to do that. So we've modified a regular summons so it indicates that they are being summonsed. But we have to be fair to the witnesses and indicate that there are no civil or criminal liabilities if they fail to attend.

Now, my understanding is that both the Maritime ministers of health and public health officers and those for Ontario have been sent summonses: I believe the Nova Scotia or the Maritime ones by registered mail and email where we had emails. I believe also by registered mail for Ontario. I can't say for the rest of Canada, but we're not there yet. I can say that the summonses also are very flexible. So it's not like we're inviting them to attend for three days in Nova Scotia or these three days in Toronto. We make it very clear that we are going across the country for two months and that they're free to attend virtually at any **of the hearings. And the summons also indicates that we can schedule just a time for them to have a virtual attendance, in front of the commissioners virtually.**

To my understanding, we have not received a single response.

Now, the NCI has tried to get the mainstream media to cover us. And we actually have had at least two mainstream media pieces attacking two of the three people that are identifiable as involved with the National Citizens Inquiry, because they are named directors for the non-profit that handles our funds. But there's no such thing as bad publicity because that signals to the governments, both provincial governments and the federal government, that we exist. And we know that they know. I am aware that the Council Administrator has been in contact with several politicians federally and provincially to discuss us.

I also know that slightly before the Truro hearings and since, we have exploded on social media. And we are being throttled on TikTok and hampered on Facebook. And I think YouTube took us down. But my understanding is, and I could be corrected: I know that right after the Truro hearings, for the four weeks prior to that, we had 1.18 million hits on Twitter. And I think in the last 10 to 14 days, we've had a million hits on Twitter. So surely to goodness the governments are aware of us, the public health officers are aware of us, and the ministers of health are aware of us. And so Commissioner, I sincerely apologize that we have failed to secure the attendance of a single public official, but it's not for want of trying. And we do intend on publishing on our website the summonses, or a list of who summonses have been sent to, so that the public can be aware that we are doing our best to be an open and fair inquiry where all sides can be heard. Because our object is to get to the truth.

And that's the only way I can answer that, Commissioners: I apologize.

Commissioner Drysdale

I would like to request from the Commission to make those lists available and submitted of the people that we have approached and asked to attend, to make them available to the commissioners and to be entered into the testimony.

Shawn Buckley

I will ask those that would be tasked with that, which would be the Council Administrator, to ensure that that occurs. And perhaps maybe what we'll try to do is, maybe on a two-week or monthly basis, update that list as part of the record.

Commissioner Drysdale

Thank you very much, Mr. Buckley.

[00:04:57]

PART II

[00:00:00]

Shawn Buckley

Commissioners, before we start with the next witness, I've been advised that the question that you asked me prior to this witness—because we had this power outage—was not being recorded properly. So I've been requested, just so that we have a record of your question and answer, and that people that are viewing online understand that a question and answer was asked. I'd ask if you could re-ask the question, and I will attempt to answer it in a similar fashion.

Commissioner Drysdale

The commissioners and I have had a number of concerns and we just wanted to recap what that was. And that is that the NCI, the National Citizens Inquiry, has scheduled to hold nine hearings across Canada, which are located from coast to coast. And in each one of those

hearings, as it has been this week in Toronto, there's three days of testimony. We've completed the initial hearing in Truro, Nova Scotia a few weeks ago. And now we're in Toronto on the third day of the hearings. And we've heard extraordinary Canadians telling us their incredible stories. And we've heard from a wide variety of Canadians from across the spectrum: from doctors, lawyers, working people, working fathers, mothers, grandmothers, nurses. But the one group that we have not heard anything—

[loud microphone noise]

Shawn Buckley

Sorry. I was turning that off, by the way.

Commissioner Drysdale

As I said— You know, there's one group that we have not yet heard from. And that is a group of people who actually planned, formulated, carried out these directives and mandates that have affected every single aspect of Canadian society.

And my question is, Mr. Buckley, what efforts have the National Citizens Inquiry taken in order to bring these people here and testify in front of Canadians?

Shawn Buckley

Commissioners, I'll do my best to answer that question. My understanding is, first of all, the National Citizens Inquiry has done its utmost to try and become visible to Canadians and to the government and to basically all of the political parties by holding press conferences and the like. We modelled the rules of this Commission. We hired a lawyer, an independent lawyer, to draft the rules, which were modelled on the rules of other commissions that are statutory-based commissions, where the government basically creates a commission. And those commissions have the power to force witnesses to attend. And there can be criminal and civil sanctions if witnesses don't attend. So by law, they have to.

We are not a government inquiry. We are a citizen's initiative and we lack the ability to compel witnesses to attend. So we have amended our summons so that it's clear that there is no civil or criminal liability to the person who we send a summons to, to attend.

My understanding is that for the Maritime provinces, for the Truro hearings, we sent summonses out to the public health officers and the ministers of health for the Maritime provinces by way of registered mail. And I believe, where we have e-mail contacts, we try to do that and that the same has occurred for Ontario. I cannot speak for the rest of Canada **because this Commission is marching across— I can say that there had been an internal discussion. There was a concern that if we sent a summons, let's say, to a health official to attend in Truro or Toronto and we only have three days of hearings, that they might not attend and say that we did not give them enough notice, that they have busy schedules. So our summons is specifically drafted to inform every recipient that we are marching across the country until the end of May and that they are free to attend virtually at any of our hearings. And also, that we would make accommodation just to basically set up a virtual time for them to attend in front of you, if that was necessary. So those efforts have been undertaken.**

[00:05:00]

My understanding is that there have been discussions with various volunteers within the NCI and different politicians or political parties. My understanding is that a major federal political party has basically unofficially told their members not to have anything to do with us, which tells us that we are at the attention of elected officials. And although the mainstream media is not favourably covering, or covering at all, things like our press conferences or these hearings— Which I'll just editorially add is quite fantastic. Because I don't know of any other time, in any other country, where citizens got together, banded together to have such a comprehensive inquiry or an inquiry at all, anything like this. Even the fact that this is happening should be a major story, let alone the witnesses that are being called.

But the mainstream media has run two hit pieces on two of the three individuals that are publicly identifiable as involved with the NCI because they're directors of the non-profit company that handles finances for the NCI.

So from a social media perspective, we've been really hurt with Facebook censoring us and YouTube, and throttled on TikTok and the like. But Twitter isn't censoring groups like this right now. I know after the Truro hearings, on the Monday following, there was an internal meeting. And it was reported back to us by our social media team that in the 30 days prior, we had had 1.18 million interactions on Twitter. My understanding is in the last, I think it is, 14 days, we've had a million interactions on Twitter.

We're doing absolutely everything we can to be in the government's awareness. And we're doing that because we don't want this to be a biased inquiry. We want to hear both sides. We want them to attend. And I apologize that we have not been successful in getting any public officials to attend.

Commissioner Drysdale

But just so that I'm clear, we're holding 27 days of hearings in Canada, from coast to coast. And we've offered these officials that we've invited to attend an opportunity to attend on any one of those 27 days. Is that correct? In any one of the locations across Canada, virtually or in person?

Shawn Buckley

Yes, definitely. The summons is part of the rules. Anyone can go online. Our rules are public. My memory is that we make it clear that we're marching across the country, that they can attend virtually at any of the hearings. But in addition, that we would be open to scheduling a time available to them where we don't have a scheduled hearing, where you would also be attending virtually. So the object is to make it as easy as possible for a public official to attend because we recognize the importance to the commissioners.

Commissioner Drysdale

The commissioners would like to request that the list of those folks who have been invited to attend be entered into the public record.

Shawn Buckley

What I can do— Although I am a volunteer at the NCI, I can't say they do this or do that. But I will make efforts to try and have a list of people whom summonses have been sent to

entered as part of the record, perhaps every two weeks. If that would be agreeable to the commissioners.

And then my understanding also is, for the public—first of all, everything is entered as an exhibit unless it is confidential. So for example, if a witness is going to submit an autopsy report for a child, they might not want the public reading that. So it would be listed that we have it as an exhibit but that would be for the commissioners only to see. But providing something isn't marked "in camera," the public is free to access all of the exhibits we refer to. And so that would form part of the exhibits. And our intention in any event was to publish on the website the names of people to whom we have sent summonses.

Commissioner Drysdale

Thank you, Mr. Buckley.

[00:09:55]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 7: Scarlett Martyn

Full Day 3 Timestamp: 06:09:23–06:37:14

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

The next witness is Scarlett Martyn, and I will indicate that Scarlett is a person that has done some volunteering at the NCI. And I just bring that up because we don't want anyone indicating bias, and so we want that out in the open that she has done some volunteering.

What she's going to testify about today, she has testified in the past, which is videoed and available online before the NCI even existed, so I'm not concerned about her not being truthful in any way. And she's testifying about her personal experience and we're confident that the commissioners will find this to be helpful. Now, Scarlett, before we begin, can I ask you to state your full name for the record, spelling your first and last name.

Scarlett Martyn

Yes, it's Scarlett Martyn, S-C-A-R-L-E-T-T M-A-R-T-Y-N.

Shawn Buckley

And Scarlett, you promise to tell the truth, the whole truth, and nothing but the truth, so help you God.

Scarlett Martyn

I do.

Shawn Buckley

Now, you had—and I'm using the past tense—but up till the COVID adventure, you had worked for 24 years as a paramedic.

Scarlett Martyn

That's correct.

Shawn Buckley

And for part of that time, you worked as an advanced care paramedic, which enables you to deal with more critical procedures than a regular paramedic.

Scarlett Martyn

Yes.

Shawn Buckley

And in fact, advanced care paramedics are rare. I mean, a generous figure would be 10 per cent of the paramedics.

Scarlett Martyn

Yes.

Shawn Buckley

And so if there's a 911 call involving something like a cardiac arrest, something very serious, they will try and have somebody like you attend instead of a regular paramedic.

Scarlett Martyn

That's correct.

Shawn Buckley

And you were also on a special roster for dealing with disasters in the Greater Toronto Area. So if a big building collapsed or something like that, you were on a list to be called in.

Scarlett Martyn

Yes, I was on a heavy urban search and rescue team.

Shawn Buckley

And then when COVID hit, Orange asked if some advanced care paramedics would be willing to join their critical care paramedics to do high-level transfers, including COVID patient transfers.

Scarlett Martyn

Yes, as part of their surge capacity.

Shawn Buckley

And you volunteered for that.

Scarlett Martyn

Yes.

Shawn Buckley

And then there was a volunteer program where frontline responders were asked to participate in what was called CORSIP [COVID-10 Occupational Risks, Seroprevalance and Immunity among Paramedics], where your blood is taken on regular intervals to basically test for exposure to COVID.

Scarlett Martyn

Yes, I entered that study.

Shawn Buckley

And through that, you learned that you had natural immunity to COVID.

Scarlett Martyn

Correct.

Shawn Buckley

Which meant that you had caught COVID, and you had recovered from COVID, and you had antibodies to COVID.

Scarlett Martyn

Correct.

Shawn Buckley

Okay, and I'm going to stop leading you in a second. So you eventually got suspended for eight weeks, and then that was extended to ten weeks, and then a termination came. And I want, if you can share with the Commission, the reasons for your termination and also the process of your termination.

Scarlett Martyn

Sure. The reason for my termination was willful misconduct and for jeopardizing workplace health and safety. Previous to that, I had wrote a letter expressing my concerns to my commander, the city manager and the mayor, just expressing my reluctance to be vaccinated when I had concerns. Those concerns were met just with a couple-sentence reply, "Follow the policy." I was suspended and then terminated.

The termination was just done through the mail. My suspension was in person and the process was quite humiliating. At one minute, you're a valued resource, volunteering and working, volunteering to step up into a role. And the next minute, you're being terminated. And the letter was quite vicious. I didn't understand how it was insubordination and misconduct to ask questions, and I just wanted an accommodation. I offered to do testing or whatever it was to satisfy the safety needs. And this was at a time that we understood that vaccinated or unvaccinated could carry COVID, and I expressed my concerns.

In that meeting, I was suspended. My ambulance keys that I had drove to the meeting with were taken. My Ministry of Health ID was taken and I was drove back to the station by a supervisor to collect my belongings.

[00:05:00]

Shawn Buckley

And I just want to make sure that I understand. Because I expect that you would have shared with them that their own testing of you showed that you had natural immunity to COVID.

Scarlett Martyn

Well, it wasn't their testing. Paramedics were offered a lot of inter-medical studies or this or that, so it wasn't their own. But yes, I had expressed that it wasn't unsafe for me to work, and it wasn't protective to me with natural immunity.

Shawn Buckley

So notwithstanding that you had natural immunity you were terminated for not taking the vaccine for which you already were immune.

Scarlett Martyn

Correct.

Shawn Buckley

Now, I'm wondering if you can share with us what the culture was within the healthcare system at the beginning of the pandemic. So we would be talking about early 2020 and onwards.

Scarlett Martyn

At the very beginning of the pandemic— And I feel that I can really speak to this because paramedics don't just go to one hospital, we go to many. And then I was on a team that was going to hospitals kind of all over southern Ontario. At the very beginning of the pandemic, when it was announced, the hospitals were empty. Nobody was going to the hospital; they were all too scared. That's how people had time to do TikTok videos and such, because we weren't working.

I was doing call after call of sudden death, which is normal for my profession. But the stories were heart-wrenching because they were people that had chest pain or stroke-like symptoms or something serious for days but they were too afraid to go to the hospital for treatment because of the pandemic. I really feel, if these patients had've went for treatment **that they might be alive today. The public was so scared they did not want to call an ambulance.**

Shawn Buckley

Right. What was the attitude within the healthcare system at the beginning, so before the vaccine is out, about whether or not it was necessary to take the vaccine? Because we all heard it was coming.

Scarlett Martyn

Yeah, it was really socially acceptable at that time in my profession to say, “Oh, I don’t think I’m going to take anything that’s rushed to market,” because we see a lot of medication recalls that were once safe, then pulled, once safe, then pulled. So yeah, it was completely within our culture accepted to say, “Oh, I don’t think I’ll take it. I don’t think I need it. I’m low-risk. I’m not in the age bracket.”

Shawn Buckley

Now, once the vaccine was rolled out, did that culture within the healthcare system change?

Scarlett Martyn

Yes. It was like a switch and it wasn’t gradual. It was just like somebody flipped a switch. All of a sudden people were jockeying in line to get vaccinated. It wasn’t acceptable anymore to say, “Well, I think I’ll wait. I don’t think this is a good idea.” As healthcare workers, we could get it before everybody else, especially those working in the frontlines, and people flooded to do so. It was hard to find people that were still reluctant to get vaccinated.

Shawn Buckley

And did you observe any change within the healthcare system after the vaccines were rolled out towards patients?

Scarlett Martyn

The changes I saw were so profound that it’s disturbing to talk to about. But I think people need to understand. I saw colleagues that I respected, that are brilliant, turn into bullies. I worked up in the ICU transferring patients. And I would hear the chatter about, “Get this one out of here. I heard they were at a rally. So look at them now. I guess it serves them right. Maybe they’ll die.” And I heard these things day in and day out. I heard them talk about— We’re in every area of the hospital, right? So there’s the acute setting and all the different settings. I would know who in those 10 beds wasn’t vaccinated because they would be sitting talking about it.

And the care they received, the part that is most disturbing is not tangible. When you care about somebody, the way you interact with them, you put your hand on their shoulder, you move them gently. When you have hostility towards them, your chart still looks fine. You’ve still given them all the things you were supposed to do. But the way they were handled was different. It was rougher. You could feel the aggression.

[00:10:00]

And it was completely acceptable for them to sit around and talk about the anti-vaxxers that should just all die. “I don’t want anti-vaxxers getting health care.” “Why would the anti-vaxxers come up to the ICU?” “If the anti-vaxxers don’t want to take the vaccine, maybe we shouldn’t give them morphine for their broken leg.” It just went on and on. I witnessed my own colleagues on 911 calls badgering elderly patients that weren’t vaccinated. It had nothing to do with why we were there.

We’re called on people’s worst moments in their life, so we have to be mindful of that. But I’ve seen them standing there instead of treating what was needed to be treated— And not

always life threatening, they just needed something. They would say, “Well, what do you mean you’re not vaccinated? It’s been available. What would your reason be for not being vaccinated?” And if we can picture a towering person in a uniform in a position of authority talking this way to an 86-year-old lady lying on her couch with her stomach hurting, badgering her, it was absolutely appalling.

Shawn Buckley

You had given me an example when we were talking about a call that seemed to you to be a vaccine adverse reaction, where a lady had a shot and then she developed tachycardia and chest pain. Can you tell us about that call? Because I think it speaks to the change in culture.

Scarlett Martyn

Absolutely. I don’t know if I remember that specific one but there’s many. So in the field our job is to report what you tell us and then ask you more questions if we need to know them. Take a medical history. So it’s not our job to judge what we really think you’re telling the truth on. We just report it. When we would take these patients to the hospital and I would talk to the triage nurse for intake and I’d say, “This patient had chest pain after the vaccination. They’re quite worried that it’s a reaction. They’re tachycardic,” which is high heart rate, and being high as in 140 beats a minute—like, not just a little elevated with chest pain. The nurses would roll their eyes and huff and puff and go, “Oh great, we got another one,” you know, “Great, yeah, add that to the list.”

I can watch them because I stand behind where they’re reporting. It never gets typed in. What we say never got typed in for those patients. I never saw a single one say, “following vaccination.” And these patients were wrote off many times with anxiety. Sadly, as paramedics, because of the health protection laws, we don’t have an ability to follow patients beyond the emerge. So if they get admitted up to a medicine floor, we can’t call them up and go up and see them. So I don’t know the long-term outcome of these patients.

Shawn Buckley

Now, you were telling us earlier that when the pandemic started, it was slower. Can you give us some more details about that?

Scarlett Martyn

Yeah. I’ve worked in a busy city, so we don’t get a lot of downtime. It’s rare to have a lunch break. We do a lot of end-to-shift overtime. So it’s really, really rare for us to spend time in our station socializing or cooking. But at the pandemic, that was right at the beginning, it was just like everything got shut off. We were in the stations; we were watching movies; we were hardly doing any calls. And sadly, when we did get called out, it was usually a person that really should have called much earlier.

I remember feeling embarrassed when you’d get a knock on the ambulance door and it would be a restaurant owner delivering food to the health care heroes. And at seven o’clock at night in Toronto, people would come out and bang pots and pans. And we’re not heroes, right? We signed up to do a job. And pandemics are always part of health care. We’re all trained in it, right? We have PPE.

Shawn Buckley

Right. And you're describing to us—in any event at the beginning, it was slower than usual.

Scarlett Martyn

So much slower. Like, I was watching movies at work—series of movies.

Shawn Buckley

And had that ever happened before?

Scarlett Martyn

It had happened once before. With SARS. That was the only other time. And that only lasted—

[00:15:00]

The call-volume drop didn't last long.

Shawn Buckley

Now, I want to switch to a different topic. Because my understanding is, at the beginning of the pandemic, when we're all for the first time seeing all these numbers on TV of how many cases we have, that actually these cases at the beginning were not being based on things like PCR tests – in large part because they just weren't available yet. The system was having to gear up and get testing kits to the hospital. So can you share with us basically how would they classify somebody as a COVID case at the beginning?

Scarlett Martyn

Yeah. At the very beginning there wasn't the ability to do a swab, send it, have it back. There was no rapid tests readily available. So we would do a screening on a patient, which was just a sheet with 10 or 15 checkboxes. And those would be the inclusion criteria for suspected COVID—so just suspected. And these things would be like, abdominal pain, recent travel, and they changed almost every day. So you would have a checkbox: Have they traveled recently? Do they have vomiting, diarrhea, fever? Do they feel more tired than usual? Do they have pink eye? Many, many, many. And the list kept getting longer.

It's hard to find a patient that isn't more tired than usual, doesn't have any of this long list, so they would fail. So the fail would put them in a suspected COVID positive category. One patient I had had been in an assault and he had been whacked over the head with, I think, a bottle. Well, he had a headache naturally. We brought him in for assessment for a headache, and the nurse was filling it out. Once they screen positive, they have to try to find isolation. And I said, "We don't need isolation for this. This guy's headache started from the hit on the head." "Well, I know, but we can't override it." There's no professional opinion, so they couldn't override. So you had massive amounts of patients being categorized as probable COVID patients.

Shawn Buckley

And those patients then would also end up in COVID wards, which would be reported as full.

Scarlett Martyn

Some of them were just in-and-out emerge. patients and we lack the ability to really follow where they went.

Shawn Buckley

So just so I understand, let's say somebody's at the bar and they get in a fight and they get hit in the head. And they go to the hospital and say their head hurts. The screening nurse or person would have no discretion; that person would be listed as a suspected COVID case.

Scarlett Martyn

Yeah, because it's not on pen and paper anymore. It's an input into a computer. And I argued—well, not rudely—but I said, "This is silly. Like, this is—how could we possibly? Like, he didn't have a headache before; the headache started now. He's well. He has no other symptoms." "No, I know, but it won't let me check. And there's no field to add in professional opinion." So they just got all filtered.

I mean, it was really hard to find a patient that called an ambulance that would pass a screening.

Shawn Buckley

So are you saying that early on in the pandemic then, before they had rapid testing, almost every single patient brought in by ambulance likely would be screened as a potential positive?

Scarlett Martyn

Oh, yeah. It was a joke that maybe you could stub your toe and pass. If you only called for a stubbed toe, you could maybe pass the screening.

Shawn Buckley

Now you had a troubling experience where an inmate was admitted because of a headache. Can you share with us that story?

Scarlett Martyn

Yeah. All of these new procedures caused massive delays in patient care. And sometimes these delays cost people their life. Every hospital had a slightly different procedure for screening. I remember transferring a young gentleman and he had an arterial brain bleed. Time is never as valuable as it is when you're bleeding inside your brain from an artery and we were rushing him to one of the neurosurgery centers.

His condition started to deteriorate before we arrived, so the emerge. had sedated him and intubated him for transport. This was a gentleman that walked into the hospital with a severe headache. He passed the screening at the hospital, that would have been before a headache was added. So these screenings changed constantly, right? They would add in.

[00:20:00]

So he passed the hospital screening. And at the receiving hospital where he was to get treatment, he didn't pass the screening anymore because he couldn't answer questions.

Shawn Buckley

So I'm just going to stop you so people aren't confused. He goes to hospital number one with a headache. He's admitted at hospital number one, they determine that he's bleeding in his brain.

Scarlett Martyn

Yeah.

Shawn Buckley

And that's a life and death emergency surgery situation.

Scarlett Martyn

Yes.

Shawn Buckley

But that hospital doesn't do that emergency surgery, so it's arranged for you guys to transport him quickly to hospital number two.

Scarlett Martyn

Yes.

Shawn Buckley

But because time is so sensitive, hospital number one sedates him and intubates him so that the second hospital doesn't have to waste time doing that. It's an emergency.

Scarlett Martyn

Yeah, it is that. It's hard for us to do in the field. We can, but he was deteriorating so it was for airway protection if he deteriorates. Yeah.

Shawn Buckley

So now he's sedated by hospital number one and can't answer questions. And he arrives at hospital number two. And tell us again, what happened in hospital number two?

Scarlett Martyn

We have his screening from hospital number one in the charts. We have all the information we need and they stop us because, well, he fails the screening. And they're not really sure what to do now because they had him as a "passed screening" and now he fails. You know how things work: Nobody knows. Calls are made. Calls go up the chain, down the chain. We need another room. We need this. We need that.

And the clock is running and we're desperately trying to advocate for this patient to just go in. Let's just get the show on the road! And that delay continued on for a half an hour if not 40 minutes.

Shawn Buckley

And in your experience, what is the likely prognosis following a delay at screening for up to 40 minutes when somebody's brain is bleeding?

Scarlett Martyn

It's a very poor prognosis. It's not likely survivable with any quality of life.

Shawn Buckley

And do you think it's possible that could have then also been classed as a COVID death?

Scarlett Martyn

We did witness in the field strange things with classifications of COVID death, so it absolutely would not surprise me.

Shawn Buckley

Can you share with us some types of things that you saw being classed as COVID deaths?

Scarlett Martyn

Yes, I'll try to keep it— We were doing shift change one morning, so the night crew goes off, the day crew comes on. We take a report from the night crew. They had just come from a jumper and we said, "Well, we'll help you clean things up." It was just around the corner. It was from an eight-story building and they had told us about the call. There really wasn't anything left to transport.

Later that day, my partner and I received a call from Public Health that the patient, early that morning from that address, had been swabbed for COVID and tested positive. We looked back and I said, "Oh, that was the night crew that had the jumper." And I said, "I don't understand. What would you swab? Like, did you bring a spatula? This doesn't make any sense. That patient wasn't in a condition to swab." But they assured me that that was a COVID-positive case. You certainly don't have to have medical training to understand the cause of death from jumping out an eight-story building.

Shawn Buckley

Now, switching the gears again. After your experience of being terminated, you helped form a group called the United Health Care Workers of Ontario?

Scarlett Martyn

Yes.

Shawn Buckley

And my understanding is that group has over 3,000 healthcare workers as members.

Scarlett Martyn

Yes, just in Ontario.

Shawn Buckley

Oh, I guess it is the Healthcare Workers of Ontario. Do you have members from other provinces?

Scarlett Martyn

No.

Shawn Buckley

Okay. So you guys had taken various initiatives with the provincial government. But I'm wanting to share with us an initiative that was taken by the United Health Care Workers of Ontario concerning the federal government. You guys sent a letter to the Minister of Health.

Scarlett Martyn

Yes, we did.

Shawn Buckley

Can you just share with us why you guys sent that and what happened in response to that?

[00:25:00]

Scarlett Martyn

We had concerns on the frontlines with many, many things. One of our issues, biggest concerns, were around informed consent. And we believed that the public wasn't getting informed consent. They weren't getting informed consent about the risk of the COVID virus. We think that there is misrepresented data. We believe that there is a lot of fear, which led to people rushing out to get vaccinated and not understanding the new platform, the mRNA platform. We don't believe that anybody sat down and talked about the risk-benefits. And every medical procedure given is always, 100 per cent of the time, based on risk-benefit. **And this was just a very one-size-all approach.**

We approached them in our letter. And we had several questions, specific questions, that we wanted answered. And we even petitioned them in a letter. We had some of the top scientists across Canada help us form a vaccine safety-risk statement. So just like with any new pharmaceutical, a risk statement: "Might cause this, might cause that. We don't know about mutagenicity." Because there's nothing like that currently on the COVID vaccination. And we felt that that was important, not just for health cares, but for all Canadians to understand.

Shawn Buckley

And is it fair to say that you thought that such a letter and a safety-risk statement written by professionals and backed by 3,000 healthcare providers would warrant a response from the federal Minister of Health and Ms. Tam?

Scarlett Martyn

Absolutely. And we also got signatories of other public interest groups, so that we could present it. This isn't a small group of Canadians that want these answers. This isn't just healthcare. This is Canadians.

Shawn Buckley

And did you get a response?

Scarlett Martyn

No.

Shawn Buckley

And Commissioners, I'll advise you that that letter will be entered as an exhibit and available to you for your consideration [Exhibit TO-21]. And Ms. Martyn, I'll just ask the commissioners now if they have any questions for you.

No questions. Scarlett, on behalf of the National Citizens Inquiry, I'd like to thank you sincerely for testifying today.

Scarlett Martyn

Thank you.

[00:27:51]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

April 1, 2023

Day 3

EVIDENCE

Witness 8: Dan Hartman

Full Day 3 Timestamp: 06:37:35–06:46:35

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Allan Rouben

Afternoon, can we get your full name please?

Dan Hartman

Dan Hartman, D-A-N H-A-R-T-M-A-N.

Allan Rouben

And you swear that the evidence you will be giving will be the truth, the whole truth and nothing but the truth, so help you God?

Dan Hartman

I can't hear you very well.

Allan Rouben

Do you swear that the evidence you'll be giving will be the truth, the whole truth, and nothing but the truth, so help you God?

Dan Hartman

Yes.

Allan Rouben

So tell us a little bit about yourself.

Dan Hartman

My son Sean played hockey his whole life. It was his love, it was his passion, it was his favorite thing in the world. And to continue to play hockey in 2021, he had to be vaccinated.

Sean's biggest fear in the world was needles. He was terrified of them. It was his biggest fear. But he wanted to play the game he loved, so he took the vaccine. Four days after that he went to the hospital, to emergency. He had brown circles around his eyes. He was vomiting. He had a rash and an extremely sore shoulder opposite to his injection shoulder.

The doctor failed to do any blood work, he didn't do a D-dimer, he didn't do a troponin test. He gave him Advil and sent him home. On September 26, 2021, Sean went to play hockey that night, and everything seemed okay. He came home and went to bed. And on the morning of September 27, Sean was found dead on the floor beside his bed.

Allan Rouben

How old was he?

Dan Hartman

He was 17.

Allan Rouben

Tell us a little bit about your son.

Dan Hartman

The most beautiful boy I ever met, not just because he was my son. He was very polite. He was very respectable. He never back-talked me once. I never heard him swear once. He never had a drop of alcohol in his life, never had a cigarette. He loved watching movies. He loved music. He used to love wrestling so much when he was a little kid. He was just such a great kid, almost like an angel that's how special he was.

Allan Rouben

Did he have some idea as to what he wanted to do?

Dan Hartman

Well, he wanted to make the NHL hopefully someday, but he also knew that's a long shot. So he actually considered being an NHL referee just so he could be around the game.

Allan Rouben

What happened after he passed away?

Dan Hartman

I had to wait three long months for autopsy results. They did a complete autopsy with genetic testing and toxicology. And the cause of death is unascertained. They can't tell me why he died. They have no explanation why he died.

Allan Rouben

And what did you do next? What did you do next after that in that regard?

Dan Hartman

What did I do next?

Allan Rouben

Yeah, insofar as that conclusion was concerned.

Dan Hartman

I started a Twitter page to get support because I was completely lost and didn't know where to turn. And I've met some of the nicest people I've ever met in my life who support me and help me get through this. It's really hard though, every day is so hard. The hardest part for me is sleeping. I wake up every hour. I cry multiple times a day. I'm a truck driver, so I'm alone with my thoughts all day and I think about Sean so much. I can't listen to songs on the radio anymore. There's a whole list of songs I can't hear. And I'm taking anti-depressants and I'm in grief counselling now with other parents who have lost their children.

I will never do Christmas ever again. Christmas means nothing to me now. I will never see Sean get married. I will never meet what would have been his beautiful wife. I won't have any grandkids, ever. I can't live with the cause of death being unascertained because, in my opinion, the vaccine killed my son.

[00:05:00]

There's no other logical explanation. He was a perfectly healthy boy with no underlying conditions. And now I have to live without the most important person of my life. And every day is pure hell. Every hour, the only time I'm not in pain is when I go to sleep.

Allan Rouben

Tell us a little bit about the community of other parents that you have joined up with.

Dan Hartman

I speak with five other sets of parents around the world, who all lost their child after this vaccine. And all have cause of death unascertained, same as me. And some people think we're lying and they don't believe us and they think it can't be the vaccine.

Well, Dr. Ryan Cole from America has agreed to help me. He has Sean's tissue samples and he's one of only a handful of pathologists in this world who can prove vaccine death. And he's going to prove it for me. And I can't wait to tell all the people who doubted me that I was right. My gut feeling about Sean is right. I know it is.

Allan Rouben

And how did you get introduced to Dr. Cole?

Dan Hartman

Through my Twitter page. That's what led me to him. And I was watching so many videos of him explaining— It's very strange that Canadian pathologists aren't doing tests to determine vaccine death. To do that, you have to stain slides and you have to look for spike

protein. Dr. Cole has even told me he's offered to teach our pathologists how to do it, they just have to get in touch with him. It's a complex procedure but he knows how to do it. And I am quite confident that he's going to tell me that Sean died from the vaccine.

Allan Rouben

And you're awaiting his results as we sit here today.

Dan Hartman

Sorry, what was that?

Allan Rouben

You're awaiting his results as we sit here today.

Dan Hartman

Yes. He said it won't be too long because he's already done some initial testing. I can't discuss what has been found yet, but when the time comes, I will.

Allan Rouben

Thank you. Are there any questions from the commissioners? Just to wrap up, is there anything else you want to tell us about your son and your situation?

Dan Hartman

He was the reason I woke up every morning. He was the reason I went to work. I've been a truck driver for 18 years and I used to love my job. And now I hate going. I don't even care anymore. Sean was so special. It's so hard to describe. He wasn't like other kids. He was a shy boy, but such a good heart. He wouldn't have hurt anybody. And he was my only son and he was my reason, my love. And now he's gone. I believe they took him from me. I believe my son was murdered.

Allan Rouben

We're very sorry for your loss.

Dan Hartman

Sorry?

Allan Rouben

We're very sorry for your loss.

Dan Hartman

Thank you.

Allan Rouben
You're welcome.

[00:09:00]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 9: Dr. Irvin Studin

Full Day 3 Timestamp: 06:47:50–07:35:02

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Allan Rouben

Can we get your full name, please?

Dr. Irvin Studin

Irvin Studin.

Allan Rouben

How do you spell that?

Dr. Irvin Studin

I-R-V-I-N S-T-U-D-I-N.

Allan Rouben

And do you swear that the evidence you will give today will be the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Irvin Studin

I do.

Allan Rouben

Tell us a little bit about your work and educational background [Exhibit TO-4].

Dr. Irvin Studin

Thank you for having me first of all. And it's difficult to go after such powerful testimony. I've been following that story very carefully. My sincere condolences to the family.

I'm Irvin Studin. I chair the Worldwide Commission to Educate All Kids (Post-Pandemic), which was created in January of 2021 to address what I think is the major catastrophe of the pandemic period, amongst many catastrophes. And that's what happened to the young people, particularly in respect to education: the collapse of education across Canada in general, in particular in Ontario. I also preside the Institute for 21st Century Questions, which is a major think tank in Canada, and edit a magazine called *Global Brief*.

Allan Rouben

And before you got involved with that, give us some examples of the type of work you were doing.

Dr. Irvin Studin

I call myself a policy expert across a variety of fields, domestic and international alike. I worked for many years at the Privy Council Office, the Prime Minister's department in Ottawa. I was on secondment in the Prime Minister's department in Canberra and Australia at the start of my career. I was a professor at multiple universities, U of T, York, Singapore, Eastern Europe, so I have a variety of hats.

Allan Rouben

And your educational background, just what was the highest level of education that you had?

Dr. Irvin Studin

I have a PhD in constitutional law at Osgoode Hall, graduated in 2014. I have two degrees from the U.K., one from Oxford, one from the London School of Economics. I was a Rhodes Scholar. And before that my undergraduate was at the Schulich School of Business at York University.

Allan Rouben

In terms of the subject matter that brings you here today, how did you get interested in that?

Dr. Irvin Studin

I began to see children out of school from the late summer, early fall of 2020. And it took me several months to understand what I was seeing, and then on inspection of a larger hypothesis, to really be able to appreciate the extent of the catastrophe at our feet. Because I'm going to quote from some 19th century writers that had a felt appreciation of this catastrophe—but this was completely foreign to our Canadian understanding. That is, in a very advanced country, that degree of collapse for children and childhoods and education is completely foreign.

So I began to see them at my feet. There were three or four instances where it was very personal in my own networks. Then I began to inspect it across the country. And then we brought about 60 countries together. And we discovered a phenomenon that I'll explain when I get into the guts of my testimony, what we came to call "third bucket kids." That is, kids who were neither in physical school, classical school, the one all of us appreciated growing up. They were not in virtual online school. They were in no school at all. I'm

talking about zero school. I'm not talking about homeschooling, pod-schooling—none of these fetishes. I'm talking about the Dickensian condition of no school.

And I might surprise people by saying that, before the pandemic, 500 million children—who were after the school closed, out of school—were normal children enjoying regular schooling. After the pandemic, after the school closed, there were at least 500 million children around the world, the size of the European Union, ejected from schooling. And a lot in our own country. And then I'll go into that as we proceed, I'm sure.

Allan Rouben

All right. So you've talked about the buckets. What is the first bucket?

Dr. Irvin Studin

The reason I talk about buckets, colleagues, you might imagine three glasses like this. The first glass is physical school, the one that we all appreciated as common school—largely public school, but some private school—across the country until March of 2020. Physical school. The second bucket is virtual school, the one we imagined everyone pivoted to as soon as we shuttered the schools physically: the second bucket.

[00:05:00]

And there's a third bucket, which we didn't see, didn't appreciate, and still don't feel. And that is, I repeat, zero school. And this can happen at any age. It can happen at age seven and it certainly happens at older ages. And this is a phenomenon I'll explain, but these children are in no education or in deep under-education. And they never returned. They have not returned once the schools reopened or renormalized, for reasons I'll explain.

But the reason we talk about the buckets is because if I say "no school" to our Canadian mentality, it's lost. "What do you mean no school? You must be a critic of the education system. You must be talking about homeschooling, or the child is taking a break." I repeat, colleagues, fellow Canadians, fellow Ontarians, fellow humans: No. School. The kids were ejected from the first bucket to the third bucket, or from the second to the third bucket, through all sorts of very paradoxical phenomena that I'll explain.

It took us a while to study this. When we brought the 60 countries together, we realized that this is a phenomenon that is as common in India as it is in the United States, in Canada, in Britain, and so we had to divine this terminology to get it through our heads. Third bucket, no school. First bucket, school. Second bucket, virtual school. But the transition from the first bucket to the third bucket is very, very rapid. And third bucket is misery. **Third bucket is misery, because nobody's going to want—no matter what we tell ourselves online, no matter the delusions we recount to ourselves—no one is going to speak to a child who has a grade 7, 8, 9, 10 education five years from now when he or she is an adult, undereducated or not educated at all, in a post-pandemic world that is much more fastidious, much more cruel. And we've done this to these children.**

Allan Rouben

How did the children land up in the third bucket?

Dr. Irvin Studin

Yeah. Let me just quote quickly—I don't have the right glasses on—*Great Expectations* by Charles Dickens. Charles Dickens was, as you'll know, a famous 19th century writer who serialized books on the misery of children in Victorian England. And in *Great Expectations*, Pip, a miserable child, talks to Joe. He says:

“Why didn't you ever go to school, Joe, when you were as little as me?”

“Well, Pip,” said Joe, taking up the poker, and settling himself to his usual occupation when he was thoughtful, of slowly raking the fire between the lower bars: “I'll tell you. My father, Pip, he were given to drink, and when he were overtook with drink, he hammered away at my mother, most onmerciful. It were a'most the only hammering he did, indeed, 'xcepting at myself. And he hammered at me with a wigour only to be equalled by the wigour with which he didn't hammer at his anwil.—You're a listening and understanding, Pip?” “Yes, Joe.”

“Consequence, my mother and me we ran away from my father several times; and then my mother she'd go out to work, and she'd say, 'Joe,' she'd say, 'now, please God, you shall have some schooling, child,' and she'd put me to school. But my father were that good in his hart that he couldn't abear to be without us. So he'd come with a most tremenjous crowd and make such a row at the doors of the houses where we was, that they used to be obligated to have no more to do with us and to give us to him. And then he took us home and hammered us. Which, you see, Pip,” said Joe, pausing in his meditative raking of the fire, and looking at me, “were a drawback on my learning.”

So what happened as soon as we shuttered the schools in March of 2020?

Let me just tell you the extent to which we shuttered the schools. Ontario was the most catastrophic: March 17, 2020 to June 30, 2020. January 7, 2021 to February 10, 2021. April 19, 2021 to June 30, 2021. And the first two weeks of 2022. And in between, hundreds of ad hoc bespoke school closures, mostly dictated by Public Health. These were general school closures that I recounted, dictated by the Premier and the Minister of Education. The longest in North America.

As soon as we closed the schools, we said we're going online. But immediately, you have a contingent of children and families who have no internet access and no mobile access.

[00:10:00]

They're between 1 and 6 per cent of the population on Statistics Canada numbers.

Very well. That's your baseline ouster to the third bucket. That may grow over time as resources become more scarce. But what happens within the home when we imagine a child to be remote-learning? What if you're in an abusive home, like Joe recounts? You were a star mathematics pupil and that was your saving grace. You went to school. Now you're at home in an abusive home. And very well, you may be heroic for two weeks. But on the periods I described, that are catastrophically long, you're in the third bucket before long. And you're abused for two years in your home while everyone imagines that you're virtual learning.

Very well. You don't speak English or French. You're from a new immigrant home. Two years online, you're in the third bucket. You have a physical or intellectual learning disability. You're in the third bucket. Your family has no resources. You run out of money

during the pandemic. Or someone's got sick, you're off to work at 13, 14 years old. You're in the third bucket.

The most catastrophic category, colleagues, friends, fellow Canadians, Ontarians, is that of teenagers: middle schoolers and high schoolers who were in the second bucket for a while—that is, online learning—but realized that school began to lose its meaning. There were no walls. There were no boyfriends, no girlfriends, no sports, no spirit, no standards, nothing for which to compete. Nothing physical. Everything was virtual. And I'm a teenager. The cost of exiting the second bucket and going to the catastrophic third bucket is a matter of clicking off the Zoom call and I'm out. Nobody's aware I'm out. Few people are taking attendance and they're not taking attendance fastidiously. And nobody's looking for me.

At the very moment when my juvenile narcissism requires you to look for me— Because you'll recall when you and I were all in school, we knew of some kids who wanted to drop out, they'd announce it a month beforehand, "I'm dropping out." And you'd get five people crowding that person saying, "Don't leave, don't leave." Then the teacher would come. The boyfriend, the girlfriend would come, the friends. You'd get a hug at the door, the family would be notified, and someone would come and bring you back, most of the times.

This never happened. The cost of leaving the second bucket to the third bucket were zero, and the time period in which you're in the third bucket very, very long—especially in the teenage mind, when a month is infinitely long. Now, I wish to say clearly and I'm going to be undiplomatic, but in my world it's diplomatic: If I can forgive the initial school closures—because the entire world was improvising from March 2020 until about the spring, the northern spring, let's say even the summer of 2020—we can forgive those policy mistakes. And they were policy mistakes.

After that they became policy crimes. Because we closed when I and colleagues already were articulating, and then shouting from the skies, and then making personal calls and emails and interventions and media interventions: "Do not close the schools." This third bucket is catastrophically large. I put it to you that at the nadir of the closures, it was 200,000 kids across the country on a global student population of 5 million. Tens of thousands across Ontario. Because again, in a very degenerate way—and I repeat, I'm being diplomatic—intellectually degenerate way, we close the schools, and we close them, and we close them, and we close them.

In April of 2021, I'll never forget: the Premier said that the schools will be closed indefinitely. And my stomach plummeted. Because indefinite to us is understandable but for the teenager I describe, that has a zero-cost proposition to exit to the third bucket, indefinite means forever. There is no return proposition. Premier never said, "Hold your horses. Everyone's coming back in a couple of weeks and we want to educate you." We said, "No education in Ontario."

Allan Rouben

There was no hope.

Dr. Irvin Studin

There was no hope. There was no message and nobody was aware of the scale and the catastrophe, by the way, that awaited us and that now is befalling us. Because let me just put two signals—two key signals that any intelligent society would have understood—to not go down that path of deep school closures.

One, the third bucket kids will live miserably.

[00:15:00]

As a rule. There will be some exceptions. They will live miserably because they're undereducated, or uneducated in a world that is far more cruel and that needs, in many cases, over preparation. We've underprepared them and then we feed them to the wolves in this society that is post-pandemic. That is our fault. That is a crime of policy. What have we done? And now, as a collective, what have we done to the country? What kind of society and country? An intelligent country, one in which I'm proud to be a citizen, which I adored in my childhood, and one that I thought was the best place to inhabit as a child. I have a family of three children. What awaits is huge destabilization because these third bucket kids will become adults five, ten years from now.

And how will we live? We'll have a huge contingent of people who are uneducated, undereducated and will hit us upside the head and we'll say, "Oh my God, what have we done?" And they will in turn ask, "Why did you do that?" And I do not accept that these are bad kids or marginalized kids or they're from certain minorities. Not at all. I repeat: the child in Mumbai in India who could have been a physics star when the school closed could have gone and been married off. And that happened in huge numbers in India. But the same child here who was a soccer star or a bright light in English or mathematics that went home to an abusive home and for whom school lost all meaning—and there are plenty such stories—is also a third bucket child.

And they will look back and say, "I was on my way and you collapsed my childhood. And then you collapsed your future."

I'm here to deliver the message to say, this is what happened. It happened in huge quanta. It happened in one of the most civilized countries in the world. We owe a debt to these young people to find them and bring them back to school. I repeat, find them and bring them back to school and educate them properly. And the second is to never again, for the rest of the century, repeat that degenerate mistake of public policy. Never.

Those are the key to-dos, imperatives, that I wish to impart on this distinguished inquiry. And I thank you for putting it together.

Allan Rouben

Thank you for coming. Let me ask you, in terms of collection of the data for this third bucket, explain to us how you go about that.

Dr. Irvin Studin

Well, there are two ways. And the data are completely unofficial because they are not collected. And if they were collected, it would redound to the huge embarrassment of government, naturally. "What do you mean, we failed to educate?" "Ontario had no education in particular." "Come to Ontario, we promise not to educate your child."

The number is based on first of all, an indigenous—that is not "Aboriginal" indigenous—an indigenous calculation for Canada on the number of possibly-ousted children as soon as schools go online. Add to that different coefficients on abusive homes, on disabilities, on houses without English or French—and then we quickly get across the global student population of Canada, where Ontario has 2 million of the 5 million total student body of the

country, to a number of 200,000 in about January of 2021. It would have reduced as the schools began to open. But I maintain, it still is in the tens of thousands because our American colleagues had it in the millions. And on a 10 to 1 ratio, we then could triangulate. The U.K. had very similar numbers to us in terms of basic ouster but their school closures were not as long, so they're slightly smaller than us. And other countries without internet access, as soon as you went into the second bucket, had huge numbers. I'm talking about South Asia, parts of Africa, parts of Latin America.

But I wish to say, colleagues: I have First World colleagues on this commission who look at us in Canada as if we're Martian. "What do you mean you have failed to educate your children during the pandemic?" I say, "How many kids have you got in the third bucket?" They say, "Zero."

[00:20:00]

"How about you guys?" "Well, we have tens of thousands." How did this happen?

Well, first of all, we closed the schools for catastrophically long periods. Secondly, the norm of compulsory schooling and attendance collapsed. As soon as we went online, all those norms went out the window. And by the way, they are out the window in many cases still. Because within the second bucket—and I wish to address that quickly as well—within the virtual schooling world, the attendance norms were very, very variable.

And the final thing is that intelligent decision-makers understood that as soon as they closed the schools, there would be leakage from the school system. And you've got to plug that leakage quickly. And we didn't understand that. We were tweeting, tweeting, tweeting, and the school-closers—particularly the medical officers who were closing schools like it was going out of style—became online sensations. They were apparently saving our children and they were saving us.

And when we go back in time, when we go back and look on it, I wish for us to look at school-closers as a shameful category of decision-maker. You're a school-closer. You send children to misery. The schools should remain open always. Always, always, always, unless there's a foreign army at the gates. It's that central. We now understand it's that central, not just to the well-being of the child but to the functioning and survival of the society.

There are other countries that continued to educate their children, or even over-educate their children, during the pandemic. Their children will meet our children in life 10 years from now. And who will do better? And who will deserve to do better?

The second bucket: huge under-education for everyone else who stayed in the schooling system, who didn't collapse to the third bucket. Collapse of ambition, collapse of spirit, collapse of social interaction, socialization. You could be a child of wealth or of poverty in Ontario and Canada and go to any school and by and large, the final product is predictable: undereducation. Then you open the schools and the undereducation continues because we open the schools with low energy.

My final to-do is that within the schooling system that we've reopened, outside of the third bucket, for everyone who's remained: energy, energy, energy. We must overeducate the kids for all the learning that was lost on our watch. Because again, we're preparing them for something or we're not, or we're failing to prepare them. We're in a low-energy state right now. The schools are low-energy. The standards are low. We need to overcompensate. So that's the third to-do and that's a leadership question at the principal level, at the board

level, at the level of minister and deputy minister. Go, go, go. That's how a smart society behaves in reaction to the regress of the last two or three years.

Allan Rouben

You said that you and some of your colleagues were sounding the alarm. Tell us a little bit about that. And what does it say that that wasn't front and center in media and public discussion during that time period?

Dr. Irvin Studin

Can I be blunt? It means that the Canada that loved its children in my childhood is not such under pressure. Canada does not love its children under pressure. A captain of a ship— My wife gave me this example during the pandemic when, to my horror, I started appreciating the scale of this catastrophe. She said a captain, a leader, in the context of catastrophe puts his passengers and the young people to safety. He doesn't allow them to wallow in misery or allow them to feel his or her tension.

We did the opposite. We immersed the children in misery, in our own fears and our anxieties. We didn't save them. And in failing to save them, we haven't secured our future. So the message is: if we really want to be a country that loves its children, as I do—I love young people, I work with young people, not just my own children—we have to take the lessons of this period to heart for the rest of the century, if we make it that long. And we have to do right by those we've harmed in the last two or three years.

[00:25:00]

So I don't accept that this is a lost generation at all. That's Twitter-speak.

If we're a serious country, we say we made a mistake. The answer to a mistake in my world is remedy: immediate remedy. Find these kids. They're easily findable. They're on the attendance rosters across the schools and all the boards across the country. Find them, get them back to school, educate them, get them caught up, and some of them will be Nobel Prize winners. Failing which, we only have ourselves to blame. Many of them will end miserably and their misery will redound to the collective misery.

In terms of the leadership class: unfortunately, the pandemic proved that we have by and large, an accidental leadership class. Canada operates at all levels, across all parties, in all jurisdictions, with a transactional leadership class that presides over a system that's been built over a century and a half. A beautiful system. And when it collapsed, we didn't have the talent and the energy to resuscitate it.

That leadership class is still in place. Nothing's happened. No one's resigned. No one's gone to jail. There's no *mea culpa*. I've heard not a single speech, not a single speech by any leader across Canada saying, "Here are the major lessons of the pandemic, including in education." There is some revolutionary work happening in Alberta, but that's a separate point.

Allan Rouben

Have you heard any acknowledgement from any public official that acknowledges the consequences that you talk about?

Dr. Irvin Studin

There's been no public articulation of this tragedy. Because renormalization was a matter of simply opening the schools. We just opened the schools, so everything's back to normal. Imagine that every child with his or her lunch is back to school. They were just watching Netflix, I guess, for two years. But remember, a childhood is a limited period. So what you and I appreciate is two years of difficulty, for the child, is an irreversible passage of time. You're either educated in that period or you're not. And if your education collapses and life passes you by, you can't get caught up. That's the other thing we don't realize.

A child— I'll put a very concrete example to you. We get a call from British Columbia on the commission, earliest days. A grandmother says, "I have two brilliant children. They're stuck in the basement playing video games because the parents are in a COVID panic. They don't want them to leave. Everyone's going to die." And for two years, they were in the basement not being educated. And I didn't know the age of the children, let's say the child was 13 years old. And the world opens up and he or she is 15 or 16 years old, but with a 13-year-old education. And now scale that across the thousands, tens of thousands.

How does the system react to that? It's not reacting at all. We just said, "The schools are open," with low energy. "Everybody wear a mask, be safe, be vaccinated, zombie about." Not, "Let's go—we got a national mission to catch up." Not that. We're in defensive posture. So the child either never gets caught up, doesn't go back to school, or the general misery continues. And those stories are legion. Those stories are legion.

Allan Rouben

You obviously have a very high profile. You've been in the government, highly educated. What was the reaction from policy-makers when you were bringing this to their attention, when all this was going on?

Dr. Irvin Studin

I'm not going to impart educational lessons from my own story. I will impart sports stories because I was a good student but I was a very good athlete too—notwithstanding my present composition. I was a good soccer player. And I always say: in elite sport, there are nice people and then there are people you want to have on your team when the going gets tough. I think everyone understands that analogy. They're nice people when the going is generally good. Not on a rainy day.

[00:30:00]

And Canada is full of them. And in the leadership class, we're full of them. Too many were pretenders when the proverbial thing hit the fan. And I got to understand that personally because I was speaking to many of them. I said, "Where's the reaction?" The only responsible reaction from anyone overseeing any decision-making part of the education system—or the children's welfare system, or the childhoods of our young people—the only responsible reaction would have been, "Oh my God, reverse this mistake. Don't repeat it." Ours were the exact opposite.

I got stories from top decision-makers saying, "Irvin, I can't do this. I'm too busy with my own family. I've got to help my kids." These are top decision-makers. "Irvin, we have to close the schools. Full stop. There are other things at play that are more important, symbolic, medical issues. Twitter." Twitter fame is a big one. And the third category was complete intellectual incomprehension. We just could not go there. We couldn't imagine

what happens to our own children when we close the schools. We still cannot go there. We cannot accept that this has happened or we've done this. It's foreign.

That's why I say, of the 60 countries or so on the commission I chair, countries like India, Argentina, Jamaica, they get it. They live more at the cold face of life and death, even their children. But more advanced countries—U.K., Canada in particular—we can't go there. What I described in Dickens in the discussion between Pip and Joe is foreign but we've consigned many of our kids to the Dickensian condition. We've done it. These are acts of omission or commission, repeated, repeated, at length.

Allan Rouben

I have to say that the failure of leadership that you're describing is extremely discouraging.

Dr. Irvin Studin

I think that's diplomatic. I think that's diplomatic. I think we'll look back and say, "There were policy crimes that were committed." And that's a category that I— This is not under criminal law. These are policy crimes because first, they were problems of understanding, then problems of competence and, in the end, conspicuous acts that redounded to the harm of our children. And in all catastrophes, usually in wars over the centuries, you go back and say, "Well, what are the major lessons learned?" So the Geneva Conventions would have been born in the late 19th, 20th century, responding to things like chemical weapons and civil population rights. Those are lessons learned over the catastrophe of war.

Well, what's the lesson of the pandemic? The number one lesson: Never close the bloody schools, ever, never. I'm against closing them now on a snow day. Do not close them. People die as soon as you do. You don't believe it. They die. We must stop looking at our children as little munchkins, cute munchkins with lunchboxes that we're babying and worshipping in their cutest years. We owe them a duty of preparation. Beyond that worship of their beauty, we owe them a duty of preparation for tomorrow. I had that. I profited from that in Canada. I'm educated in the public schools of Canada—proudly. And I look back and say, "How could this have happened?" We destroyed something in an instant that was a huge achievement, a huge achievement. We regularized beautiful childhoods across Canada over many decades—with many exceptions, granted—but that was a regular system. And now we've regularized misery.

Allan Rouben

I'm going to ask the commissioners if they have any questions for you.

Commissioner Kaikkonen

Thank you for your testimony. I have a couple of questions.

[00:35:00]

I know that many of the school boards in Ontario have said, or at least suggested, that the reason they've abdicated their responsibility to the students is because they were dictated to by the health orders that came down from their particularly local health officers, and then by default the Minister and Ministry of Education, and then further, Doug Ford. What would you say to that?

Dr. Irvin Studin

Yes and no. In my earliest—I have a trilogy of calls for resignation in a number of articles publicly. My first one was for the resignation of all of the officers of medical health across Ontario for the reason of the school closures. There are other reasons, but that's for other testimony. But who was resisting? There were many protests. There were many attempts at public interventions. And I'm not talking about social media. I'm talking about physical protests, calling en masse. I cannot think of a single school board that heroically went against this, what I call "mania," this mania of closures.

It was a mania in the end. It wasn't conscious wisdom or anything like conscientious wisdom. Name me one school board where there was a strong voice saying, "We keep our schools open." Everyone fell into line or colluded with the mania. A mania, by the way, which was completely foreign. It was a mania. But this was a period of mania that was not foreign, it's not foreign to other societies. Ours had a different look, but it was very much a mania. All of them fell into line with that energy.

The school boards are just as guilty of a failure of leadership or duty vis-a-vis the children as are the medical officers of health, for sure. The only reason I would say that the school boards have a conspicuous responsibility is that they know something about the education system. Whereas all of the medical officers of health—I've spoken with many of them, I've lambasted many of them, I spoke with many of them on the phone, I corresponded—were people of average intellect who were completely accidental, who knew nothing about the education systems they were closing. At all. And wanted to know nothing about the consequences because it was complete abstraction.

This was a matter of a button. "We close the schools." Tens of thousands of applause: dah, dah, dah, dah. "And I'm closing my schools here." "And I'm closing my schools in Peel," "And I'm closing my schools in York." Who's next? And I'm just looking at the horror because I'm counting, first of all, the number of third buckets that result from that, the general undereducation, and the ease with which we put kids in a position of conspicuous misery.

Commissioner Kaikkonen

Thank you. My second question is about the move by school boards to go to the standardized tests that are post-COVID and use that as their standard for going forward in education. Do you have any thoughts on that?

Dr. Irvin Studin

I have no view on the standardized testing. I don't think it will get us anywhere one way or the other. My brief is for high energy.

You imagine that Canada was here before the pandemic across the systems in education, in business, in the social sector, national unity, internationally. And then we collapsed to here, okay? And when we reopened, we stayed here. We're here. We imagine intellectually we're here [highest], but the reality is we're here [lowest]. The only way we can get back up here is energy, energy, energy. That's the gap and you feel it around. People are driving more slowly, thinking more slowly. The news is more sombre. The politicians are less energetic.

And, of course, with the kids: The kids are less sharp. They're more depressed. They're less knowledgeable by far than we were in our generation. By far. I deal with them all the time, some of the bright ones. The only way to get back is not through one standardized test. It's energy, energy, energy. Educate them to the nines, for the next several years.

The only small brief I've added is that we should, where possible, add an additional year of schooling. Because they haven't had enough time to incubate before they go to post-secondary, or the work world, or vocational school. So the Grade 13 would have been an obvious thing—something they did in Jamaica. We could easily do that, but we don't think that way. We just open it up and it's status quo but it's status quo at a low energy. So we're graduating low energy people to a world that requires that much more. The gap is a gap of misery.

[00:40:00]

So energy, energy, energy. That's my only brief.

Commissioner Kaikkonen

Have you sent any of this information to or contacted them with your concerns—either the education minister, Lecce, or the school boards independently in this province?

Dr. Irvin Studin

Yes.

Commissioner Kaikkonen

And have you received a response from anyone?

Dr. Irvin Studin

In deeds, no. In deeds, no. In explicit terms, no. But implicitly there's an appreciation. It's just the gap between the appreciation and the action is huge because it's a mammoth task. We would have to go out and find these kids and then we'd have to educate everyone energetically. That's much more difficult than throwing \$200 million—I don't know, \$20 million to \$100 million—and saying, "That's our catch-up budget." It's very modest, I don't remember: a few hundred bucks per family for tutoring. Right? So that is the failure again in adult responsibility.

Let me just also refine a point. In January of 2022, it was one of the darkest professional periods of my life, where I was at a protest against school closures. The schools were closed once again, January 2022. They were closed again and we were at Queen's Park and five people showed up. And I swear at that point the Premier could have said, "Ontario doesn't do education, we're just cancelling that," and no one would have blinked.

There was no resistance. Because we were in a manic mode. It's a completely foreign intellectual condition, psychological condition. I don't believe that the right to education is enough. We have a duty; there's an adult duty. And why do I say that? I believe in rights first and foremost, but the rights are of the child. The child has a right to education. But if you take it away, is it for the child to litigate his or her rights? Who takes away the right to educate? The adult. Well, what's the role of the adult? The adult has a duty.

So the duty to educate is first and foremost. It's primary. And it falls on the adults. The right is for the child. Those two things live side by side but the duty is primary because we're adults. We failed our adult duty. So we failed. Very well. The adult responsibility, the adult reaction, a non-pretender reaction, is: "Oh my God, mistake! Let's fix it." And that's the only

way I think we can acceptably move on as a society that's not lying to itself. I'm for that path.

Commissioner Kaikkonen

And my final question is about individual assessments for students. When students are declared special needs, they're given an IEP [individual education plan]. And I'm just wondering, going back into the system now, do you see an increasing number of children, students at whatever age group it is, that will be labeled as special needs as a consequence of the two years of education they've lost?

Dr. Irvin Studin

I don't have that data.

Commissioner Kaikkonen

It's good data to look up.

Dr. Irvin Studin

I don't have that data. What I want to say is this: I presume, on the logic that there are all sorts of conditions that would have obtained and occurred over the course of those two or three years of second bucket, third bucket, undereducation, no education. Huge. And I imagine mental health is an important part of the Inquiry. But as I said, with duty being prior to rights: education is prior to mental health.

Do not give a child who has no education or undereducation mental health services or therapy. Give him or her an education. The mental health will come with an education. But a child who has no education is not looking for mental health services. Let us stop fetishizing that. He or she is looking for an education. The mental health part comes with an advanced society's services. We're not here to pooh-pooh our children and say, "Are you feeling okay as you come back to school?" Educate, educate, educate. They're resilient with an education, but they're not resilient without an education. So let's get that logic right as well.

Commissioner Kaikkonen

I agree, thank you.

[00:45:00]

Allan Rouben

Are there any final thoughts that you want to leave us with?

Dr. Irvin Studin

I still love this country. I still love this province. And I'm very grateful for having been raised here. Canada gave me a beautiful childhood. And I really struggled in accepting—starting with my own children, for other children—that we could have devastated beautiful childhoods with such levity. And my last two or three years, with many other colleagues,

have been spent fighting for what I think is the best look of Canada and a proper childhood in Canada. Not wealthy, not poor, just a proper childhood that prepares you.

I want to reinstate that. Canada is a beautiful place in which to be a child, in which to have a childhood, in which to move if you're from out of Canada, to raise children. But that requires work. We cannot tell ourselves stories. So we have a huge burden. But I want to say that if we put that work in—and it is work—we can bring light again to the children of the country. Because right now the picture can be very dark. And it offends me. And that's part of my—I'm not very sentimental but it offended me that we could have brought such darkness to otherwise regular children so quickly. And again, to open up the darkness is work, work, work. Work on the back of honesty. That's it.

Allan Rouben

Thank you very much.

[00:47:12]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 10: Dr. Mark Trozzi

Full Day 3 Timestamp: 07:44:41–08:43:16

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. Our next witness is going to be Dr. Trozzi, who's joining us virtually. And Dr. Trozzi, thank you for joining us.

Dr. Mark Trozzi

Thanks for having me.

Shawn Buckley

I'd like to start by asking if you could state your full name for the record, spelling your first and last name.

Dr. Mark Trozzi

Sure, my full name is Mark Raymond Trozzi, M-A-R-K and T-R-O-Z-Z-I.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Mark Trozzi

Yes, I do.

Shawn Buckley

Now, can you just briefly share for the commissioners your background? So just explain your credentials and who you are.

Dr. Mark Trozzi

Yes, certainly. So I'm a Canadian born and I've lived in Ontario my entire life. I graduated from University of Western Ontario Medical School in 1990. I've been practising predominantly emergency medicine since that time. I've also taught at several Ontario universities. I have a special interest in critical resuscitation and I've taught various forms of critical resuscitation and trauma medicine. That was my career up until the era of COVID.

I was, of course, a frontline emergency doctor when COVID was launched. And I continued working in the Emergency Department in multiple—including one which was designated as a specific COVID site. I continued that till the end of 2020. I maintained my oaths and my ethics throughout the entire time. I have never participated in nor promoted the injections and I continue to be very open and honest with my colleagues as well as my patients.

By the end of 2020, it became very obvious that the penetration of our medical system was so profound that I would have to actually do what I did, which is I resigned all my working positions, forfeited my income, sold our family home, and committed myself to what I would describe as continuing to be a real doctor, like I know others have. I have just committed myself to making sure that Canadians had access to the truth and to doing everything I can to help right what is wrong and return basic ethics, human rights, and the rule of law to Canada and other places around the world. That has been failing, in my opinion, since COVID began.

Shawn Buckley

Well, thank you. Now, my understanding is that you're here today to help explain to us your thoughts on the mRNA vaccines, that you've spent some time analyzing the Pfizer data and you have some thoughts on that. And I'm wondering if you can share with us your thoughts on the COVID-19— I'll call them "vaccines," but my understanding is you wouldn't necessarily call them that.

Dr. Mark Trozzi

No, I wouldn't. If I could share my screen, I've prepared a significant amount of material. And I want to go through it fairly quickly so that I can get everything in. And I'm going to start on some other issues before I lead up to putting the bulk of my time into the discussion of these injections. So if I may share my screen.

Shawn Buckley

It should be set up now so that you can share screen. We are seeing your screen now.

Dr. Mark Trozzi

Okay, great. So again, thanks for having me. I want to go a little bit into some of the foundational material. Because in my opinion— And I think just for the safety because we know that the truth-tellers are trolled and persecuted in the country, so everything I'm going to say is in my opinion— However, my opinion is very well-founded. I've been studying this for two years. I've become a steering committee of a global organization. I've worked with scientists and doctors from all continents. And I've been the lead now of a health and science committee, the World Council for Health, so I have done my homework.

So first of all, the question of pandemic. Because that's how this all started: we were told there was a pandemic. So what is a pandemic? I think that all of us, in our lay knowledge—

and this is a thing where I think we're all learning to use common sense again—I think we all know that a pandemic is supposed to mean a disease that spreads far and wide and kills a lot of people. Everyone catching a cold does not qualify, for instance, as a pandemic.

Now, we need to look a little bit at the organization, the World Health Organization, which is really the conduit of control that has been used by the perpetrators of the COVID crimes to impose this global agenda throughout the world. Which, no surprise, we see the same agenda in almost every country.

[00:05:00]

Now, back in 2009, the WHO declared a swine flu H1N1 pandemic. One of the results of this was that there were massive pre-orders of new vaccines for swine flu across many countries, with governments accepting liability for the damages of course because there was a pandemic. However, when the pandemic officially ended in August of 2010, it had caused only 18,500 deaths globally. Now, if you look at the definition, this is the definition of “pandemic” and the WHO also recognized the real meaning of words up until 2010.

As you can see, for something to be a pandemic, it requires that it has heavy mortality with orders of magnitude more death than a bad seasonal influenza. A bad seasonal influenza involves about 250,000 deaths. So orders of magnitude—meaning generally orders of 10—would be 2.5 million. However, when they declared the end of that swine flu “pandemic,” there was only 18,500 deaths. So by no means did it qualify as a pandemic. At that time, the Parliamentary Assembly of the Council of Europe launched an investigation into the undue influence of Big Pharma and the WHO for falsifying a pandemic to create a lucrative vaccine market for their partners in Big Pharma.

The WHO's response to this was to change its definition. They did not change my definition. I recommend people don't accept people just changing the definition of words like “pandemic” or “vaccine.” But they changed the definition. They just eliminated the part where it required that it was highly fatal and took many lives. And this basically paved the way for a new lucrative power-grab enterprise like the COVID-19 pandemic. In addition, we saw modelling that millions of people were set to die, and Neil Ferguson was the main author they used for these models. Neil Ferguson was used previously to do a similar sort of thing, which was to create models that weren't true.

One moment, just switching slides.

And then that brings us to the issue of PCR and “cases.” Of course, millions of people were swabbed and told they had COVID, even though they felt fine. Now, I'm going to be very brief on this: the PCR test, or PCR procedure, involves taking a sample which may have—like many things would, including some scraps off the floor—a bit of genetic material in it. And that genetic material is multiplied in orders of two. So when you run one cycle of a PCR, if you had one fragment, you would end up with two; and if you run a second cycle you would end up with four, and then you would go to eight, and sixteen, and thirty-two, and sixty-four, one-hundred-twenty-eight, et cetera. Anyone who knows what that curve looks like, every time you do another cycle, you double the sample. And so it becomes actually quite ridiculous at some point.

Now, the PCR was never meant as a test. The inventor of the test himself stood up quite strongly back in 2020 in this regard. But even if it were to be used as an augmenting device for diagnosing or suspecting a particular condition—be that, for instance, a coronavirus infection—25 cycles is about the limit. Countries like Canada were using 40 to 45 cycles.

And what that means is— For instance, one of the African leaders took one of the swabs and swabbed a papaya, a goat, and a quail, all of which came back as having COVID. So when we were told that there were tons of cases, and when many people were sent home to destroy their businesses, well, Amazon and the like did very well. This was a deception, in my very strong opinion.

And that led to the concept of “asymptomatic spreaders.” That people were walking around and, though they felt completely fine, they could actually spread this deadly disease and kill you. And we were all convinced of that. But when you look at death statistics, Canada was like really the rest of the world. If you looked at total death, you saw that in 2020, the same amount of people was dying approximately that had always been dying. There’s no spike there in total deaths. And yet we were told many people were dying of COVID. And I would call that the “death diagnosis deception program.” What that meant was, let’s say someone died of a heart attack or advanced cancer or maybe even crashed a motorcycle in some cases, and their nose was swabbed in the course of events.

[00:10:00]

And 45 cycles later: oh, my goodness, they had COVID. And there again, you had someone who died with COVID. So it wasn’t that we cured every other disease and that people only died of COVID. What happened was people dying from all sorts of causes were categorized as dying from COVID and that kept the agenda going.

Before we get to the injections, I want to touch on a few more things. The masks simply made no sense. First of all, the virus was much smaller than the pores in the mask and it would be like using chicken wire to catch sand. Secondly, having a moist, essentially cloth matter over your face as a facial barrier for long periods and rebreathing your own air and moisture, rebreathing your own microbes, is clearly something that should be suspected as not being good for us. We know, for instance, Chris Schaefer—one of the really good Canadians who stood up early, a mask expert—did tests. And it was very easy to see that people were ending up with lower oxygen levels and higher carbon dioxide levels, meaning that gas exchange in the body was compromised.

Dental disease was on the rise. In fact, the American Dental Association recognized that and made a statement of that when they first started seeing people again, when people were allowed to go back to them. Of course, this is what all of us in the Emergency Department had: these chronic facial rashes from wearing these facial barriers on a daily basis for long periods. And we must keep in mind the severe disruption of human social interaction, which I would say was an intentional thing because our facial expressions are a big part of how we communicate. For instance, looking at these people is a lot different when you can see their facial expression. And this was especially terrible for children.

That brings us to what I would more appropriately like to call “antisocial distancing” and “lockdowns.” Lockdowns is not a medical term. Lockdowns is a prison term. Antisocial distancing and lockdowns were very destructive socially. They were destructive economically. And they were terrible immunologically, both for individuals and in terms of herd immunity. This was clearly demonstrated when you look at a study in Wuhan that looked at more than 10 million people three months after they ended their brief lockdown. What they found, essentially, was there was almost zero COVID disease. In the 10 million or so people, there were 300 people that tested as positive for COVID on a nucleic acid screening program and there was zero indication that any of their contacts had contracted the disease from them.

In particular, children were at zero risk. Now, I'd love to go into this in some detail, but I'll show the heading of an article that's on my site that people can go to. There are many physiologic reasons that children had zero significant risk of serious disease or death. And in reality, they needed to encounter this infection for their own health, for the development of their own immune system—and not only for COVID, but for many things. And this is one of the reasons why we saw last year a 700 per cent increase in RSV [respiratory syncytial virus] hospitalizations of children in the countries that were heavily injected.

So when you look at the dynamics of herd immunity—which is, how it is that a cold goes around and then it's gone away and not everyone caught it?—the key really is you want healthy people to carry on with their lives. That includes children. Of course, they will contract the infection. They may show no symptoms or have a very mild disease. They develop immunity. And when enough of the healthy people are immune, the people who were at risk, whom you did protect—I wouldn't lock them up as we did to our grandparents—but that you do protect, they're then safe.

So really, the way for children to protect granny wasn't to stop hugging her. Their way to protect granny was to go out, play, continue their life, have a healthy immune system, help our society develop herd immunity, and then get on with things like you could see they clearly were able to do in Wuhan three months after the lockdowns had ended. And this is why my good friend Dr. Paul Alexander and myself published this back in 2021, "Why Children Should Be Free and Never COVID-Injected." And I'd recommend people interested in the subject to have a look at that. You can find that on my website, drtrozzi.org.

I want to skip through a few other quick things before we get to the injections themselves.

[00:15:00]

Suppression is, one of the reasons is we were all being herded towards these injections. And if you have a safe and effective treatment for a disease, it's really no longer a great emergency. And one of my friends, someone I had the honour of getting to know, Dr. Zev Zelenko was one of the first people in North America to be treating it. His use of hydroxychloroquine and zinc along with the azithromycin was by no means random. He was a smart man. He did his research. He did his homework. And you can find details on my website of why hydroxychloroquine and zinc work together to suppress the replicase enzyme that a coronavirus relies on in order to infect our cells and make us sick.

Of course, as it would turn out—and we would learn in terms of the antiviral part of treating COVID—ivermectin was even better. It's very safe, it's cheap, and we had pre-existing laboratory evidence of its profound action against many messenger RNA category viruses, which includes coronaviruses. And the studies were very extensive and so many studies have been done since this time. And in addition to that, many clinicians around the world in countries where the government did not impose this violation of patients' rights and doctors' rights to do their job—I've spoken with many of them. And the description of how well ivermectin works early in the treatment of coronavirus and how people can just start feeling better quickly—I've experienced it myself—rather than spiraling downward, until eventually they're admitted to hospital and still denied proper treatment.

There were so many cases around the world. One classic one was in Uttar Pradesh, one of the regions in India. In Uttar Pradesh, when they liberated the use of ivermectin, the hospitals went from full to empty in about two days. As well, this was no secret. And we have many examples of government communications recognizing ivermectin as a great antiviral for coronavirus infections. This one in particular comes from Major Murphy of

DARPA [Defense Advanced Research Projects Agency]. You can see that he is recognizing how effective, in this case hydroxychloroquine, but it was the same with ivermectin. And people that want to look deep into that can look into the work of, for instance, Project Veritas, James O'Keefe, Dr. David Martin, and others.

So ivermectin was really a great drug. It is a great drug. It's very safe, it's very effective. It doesn't have a patent, it's an old drug, and I think that's one of the reasons that it has been suppressed. And that's generally been the case. And we've seen over the last few years the suppression of good science and the promotion of fraudulent science. And particularly, anything that promoted safe, effective, cheap treatment of COVID infection with multi-sequential drug therapies was suppressed.

Case in point: A large group of us—I was honoured to be one of the co-authors working with Dr. Peter McCullough—published a detailed paper on early treatment of COVID in children. We did this not so much because we thought children needed it, because really, they generally don't, but we were trying to provide a path for parents to know, "Hey, if your kid were to get really sick, we could help, or here's a medical treatment to help." And believe it or not, though Peter McCullough pre-COVID was the most published scientist in the history of his field, that paper was ultimately rejected with no explanation.

And meanwhile, we had such ridiculous papers as— One paper published in a major journal said that the cause of heart attacks in the people who had been injected with the so-called vaccines was because people that were against the vaccines may have been afraid, and that made their arteries spasm. So we've just seen a plethora of garbage science in what used to be considered legitimate scientific foundations.

So in the context of all this, people were deceived and coerced or in my opinion, forced—whether to keep their homes or thinking that they were doing the right thing—into these injections which were misrepresented as safe, effective vaccines. And as I will show you, all three of those words are a lie: They are not safe. They are not effective. And they are not vaccines, in my well-founded opinion.

Regarding coronavirus infections, here's some important pre-knowledge that we had. There's a phenomenon called "antibody-dependent enhancement." And when you look at prior study in attempts to make even actual coronavirus vaccines (not genetic injections being misrepresented but even efforts to make vaccines against coronaviruses): because of the coronavirus' ability to modify its spike protein and evolve at a fairly rapid pace, you end up with a situation where you look at many different animals were studied.

[00:20:00]

And you could get to the point, phase 3, where you could test the animals' blood and say, "Oh excellent, they have produced antibodies to the virus." But when you went to phase 4 and you actually exposed them to the infection, what you found was a dramatically increased rate of death. In other words, the antibodies produced in response to vaccines against coronaviruses do not protect the person; they enhance the disease.

And another very important thing that we knew is a basic Golden Rule. This is a picture of Geert Vanden Bossche, PhD. And as he pointed out at the beginning, "What on earth are you doing? You never vaccinate your way out of a pandemic." And the reason this Golden Rule of vaccinology exists—even in the case where we didn't, in my opinion, have a true pandemic but even just an active infection—when you vaccinate into an active circulating

infection, what you do is drive the evolution of the virus. So you create many variants. And that is exactly what we have seen.

So what is a real vaccine? Let's talk about that. A vaccine involves taking the virus or pathogen that you're trying to vaccinate against. You generally weaken or fragment it and you inject a small amount, somewhere in the order of a hundred or a few hundred particles of that, into a person's muscle. And then that is carried to the local lymph nodes, where B-cells of the immune system produce antibodies and prepare the body. So in the future, were that to present again, they can produce the antibodies in a rapid fashion. Now, that's the science of it. How well it works is a bigger question. I think there's actually a lot of debate about pre-existing actual vaccines.

But what are these injections? And as I said, these are not vaccines. Now, again, just like the WHO changed their definition of "pandemic," the perpetrators of the COVID crimes against humanity think they have the authority to change the definitions of things. I think that's very dishonest, especially when you're in the middle of something.

So these injections—you could look at them—arise with genetic experiments. If you studied them enough and looked at the background enough, I think you would call them bioweapons. We know some of the ingredients because we could read the ingredients, for instance, on the authorization applications to the FDA, et cetera. But we've also come to learn that some of the ingredients they didn't just tell us because they say it's a trade secret. And they have a right to inject us with something that we don't even know all of what's in it. I personally think that is criminal.

What these injections are, are essentially two different main forms of Trojan horses. And by saying "Trojan horse," I mean something that can get into human cells but deliver a payload. In this case, the payload is artificial coronavirus genetic material. So when you look at the two different forms—of course Pfizer and Moderna, which most people have been injected with—what you see is something like this: these are tiny little pegylated nanoparticles. So "peg" means polyethylene glycol, that's those little curly tails you see all around it. And then you see that outer kind of orange membrane with its inward tail, those are lipid particles. And then within it is a payload of a patented messenger RNA, which has been modified in a variety of ways that make it hyper persistent and hyper toxic, creating a hypertoxic version of the SARS-CoV-2 spike protein as it was in the original man-made virus that we know as SARS-CoV-2.

Now, AstraZeneca and Johnson & Johnson, these guys took a slightly different approach. They also delivered genetic payload into human cells, but they used a virus to deliver it. They used a modified monkey adenovirus. And in it they put a payload of DNA, which is very unusual. Because what happens in this case is the DNA hijacks the cellular machinery, **which our cells use to make our messenger RNA, and makes messenger RNA, which then uses our cellular mechanisms to produce—instead of the parts of our cell that they should produce—this hypertoxic version of the SARS-CoV-2 spike protein. And that's that thing you see in all the pictures of the SARS virus with the spikes sticking out. And that's a toxin, and it's also how the virus adheres to human cells to gain entry and begin an infective process.**

So when you look at this, you can understand why I laid down my income, my home, and I refused to take a role in the COVID crimes against humanity. And I chose, as have many others, rather to fight against it. And you can see why this was the first thing I published in January 2021: "This is Not a Vaccine."

[00:25:00]

Shawn Buckley

Dr. Trozzi, can I just interject for a second? You were also going to later on speak about what you called basically a cover-up in Canada. We've got a limited amount of time today, so I'm just alerting you to focus.

Dr. Mark Trozzi

Okay, sure. I prepared for 40 minutes and we're getting through pretty quick. That's why I'm speeding through. How much time do I have left?

Shawn Buckley

Well, we're a little flexible, but we're showing about 15 minutes and 11 seconds.

Dr. Mark Trozzi

So far, or left?

Shawn Buckley

But we can go beyond that.

Dr. Mark Trozzi

I'm pretty quick. Thanks for making me aware.

Okay. So why did we know this wouldn't work? As I said, antibody-dependent enhancement: attempts to vaccinate against coronaviruses results in antibodies that help the virus, not the person. And as I mentioned earlier, antibody-mediated selection. That's the process where doing something stupid like this results in the injection victims being a place where coronavirus variants evolve. And that's what we've seen. And those variants are particularly dangerous to the injection victims.

There's more reasons we knew this would be harmful. The first is that the spike protein is a poison. That's not a secret. That was well-known, there's studies that go back. Just exposing a hamster to a little inhaled bit of spike protein will give them lung disease. And I mentioned ACE2 receptors: that's where the virus adheres. And when the spike protein is produced through cells throughout the body—and by the way, when I say throughout the body, I mean very much throughout the body—we were deceived and told they thought it **would just stay in the arm and the local lymph nodes. That's a complete lie. And the reason that is my opinion is that pegylated nanoparticles, by design, are meant to penetrate all tissue. They've been used experimentally in the past for treatments for brain cancer and things like that, to deliver chemotherapeutic drugs.**

So they used the delivery system that penetrates everything. By everything, I mean the blood-brain barrier, I mean the placental barrier, I mean the ovarian and testicular barrier, I mean into the unborn child, and even into the unborn child's brain. And after the spike protein has poisoned the tissue—whether by being produced there or travelling there in the blood stream and adhering to many tissues that have a lot of ACE2 receptors, like the hearts of young people, et cetera—then the immune system attacks it.

So now a person's immune system spends a lot of its energy attacking their own tissue. And that's what we see when we look at autopsies from around the world, where they're done. And by the way, in Canada, no one is doing proper autopsies, which involve immune-fluorescence-staining for spike protein, which reveals the harm.

Now, there's so much we could go into. I've made long documentaries on this but just quickly, there are other pathophysiologic pathways. Here's a few of them. Prion diseases: That's how these spike proteins can result in misfolding of proteins and lead to degenerative diseases similar to mad cow disease or Jakob-Creutzfeldt, so a long, slow neurologic deterioration.

We also knew there were specific reproductive proteins that resembled the spike so that the antibody that was generated against the spike could be generated against reproductive tissue. And this is probably one of the reasons we see such dramatic fall in fertility nine months after the injections rolled out and so many abortions, although there are other reasons.

Reverse transcriptase is a very serious concern. The body has a capacity—and we now know from studies on human cells that this happens—that some of this messenger RNA can actually be transcribed backwards into DNA and incorporated in the human genome, which makes us concerned about how hard it's going to be to get this out of some people, particularly for whom this is a predominant factor.

And then we have vaccine-induced AIDS: vaccine-induced acquired immunodeficiency syndrome. This is not HIV AIDS—that's caused by the HIV virus. This is caused by these injections. So very quickly, I want to explain this. In response to the massive production of spike protein by the cells of the victim throughout their entire body, the immune system produces massive quantities of adaptive antibodies against it as it existed in the original virus. These antibodies fail to prevent COVID and rather enhance infection. They place evolutionary stress on the virus, so that the variants evolve that are literally dangerous for the people, and they cause this quasi-autoimmune attack that I described. This mass production of bad antibodies and the quasi-autoimmune disease diverts so much energy of the immune system from being available to do other things that it's supposed to do. And that weakens the immune system for fighting all kinds of infections and cancer.

[00:30:00]

In particular, certain T-cells called CD4 cells, their levels plummet post-injection. And these are essential to preventing and fighting cancer. And that's why we see the massive rise in cancer. That's why we see people who may have been 10 years in remission suddenly come back with cancer. And it's severe and very hard to fight and people are often dead quite quickly. **We've got a new term in this area called "turbo cancers," and I've spoke with surgeons from around the world who've described some very bizarre tumors that they've never seen before, including breast tumors in young women and all sorts of things.**

So These misrepresented injections increase the risk of COVID disease. They enhance COVID infection. They drive the evolution of endless variants. They disrupt immune function leading to cancers and all sorts of other infections. They poison tissues with spike protein. And they trigger a quasi-autoimmune disease process which causes a plethora of different death and disease presentations, from heart attacks to blood clots, myocarditis in young people, abortions, infertility, organ failures, and much more. And unfortunately, even for an emergency doctor looking at the science back in 2020, this was really predictable.

And that is why, in June 2021, I published this detailed analysis of the dangers we're facing. At that point the injections in the U.S. data had already been associated with more death than the previous 13 years of all vaccines for all diseases, all combined, and all years combined.

Shawn Buckley

Dr. Trozzi, if I can get you to move on to the cover-up issue. Because we're particularly interested in that.

Dr. Mark Trozzi

Sure. Okay. And we're really at that point. Pfizer's three-month clinical trial results were available at the end of February 2021. And they showed a high death rate. They showed massive abortions in pregnant women. Canadian COVID Care Alliance did a great job analyzing this. So all officials in this country—especially people running medical regulators, health boards—had a responsibility to know that. And you would think, like 1976, that they would have. When 12 people died of heart attacks in the U.S., that '76 swine flu vaccine was immediately halted.

The U.S. data shows 45,000 deaths so far, and we know it's much higher than that. And yet we're still being told, "safe and effective vaccines." And there's that VAERS data showing just a massive spike: like, more death from these vaccines, multiples more deaths than with all vaccines for all diseases for 30 years. And you see the same in other countries, Canada is no exception. Here's Germany. As soon as they roll out the injections, deaths double two to three times and remain like that.

So what about Canada and its organized cover-up? There's elements to this organized cover-up. One of them is defining people as quote "unvaccinated" until two weeks after their second shot. So think about that. We know that COVID infection spikes in the first week after injection. We know that one of the high times for bad vaccine adverse events is very shortly following the injections, although people continue to get sick and die well past the year, based on German autopsies. So when someone goes into hospital in Canada and they said, "Oh, what's your vaccine status"? If they said, "Yeah, I had my second shot 10 days ago," they were marked off as unvaccinated. And that skewed the statistics.

Also what was shocking was, yes, in Canada, in theory, we have an adverse event reporting system for vaccines. But it's been completely suppressed. And on that note, I'm bringing it to the example of really one of the finest physicians in our country, Dr. Patrick Phillips, who just stayed on the job and did everything right—everything right. Including, when people came in a few days after one of these injections, he attempted to file an adverse event report. What happened? His reports were rejected, universally. Patients were sometimes called by the public health officer and told, "No, you didn't have an adverse event. That doctor was wrong." And the College of Physicians and Surgeons [of Ontario], who are deeply embedded in this crime: they launched an investigation for every single time that Dr. Phillips reported an adverse event.

So you can imagine: the result of that and other things is that ethical doctors have been excluded from health care in Canada, and the doctors are—

Shawn Buckley

Dr. Trozzi, can I just slow you down, because you're really hitting some important things. I just want to make sure that everyone understands. Your first point is: somebody could get their first shot. And how much time, typically, between the first and second shot?

Dr. Mark Trozzi

Several months.

Shawn Buckley

Okay, so somebody could get their first shot. And you're telling us that that there's a window after a shot where they could get COVID but that's going to be counted as unvaccinated until a full 14 days after their second shot.

Dr. Mark Trozzi

Yes, that's my understanding.

[00:35:00]

Shawn Buckley

Okay. And we actually had Dr. Phillips attend at the Truro hearings and share with what he's seen. It's just interesting that he's a Maritime doctor and you are familiar with him as an Ontario doctor. Did that story kind of resonate widely among medical circles?

Dr. Mark Trozzi

Yes. And one of the things that people need to understand about Dr. Phillips is Dr. Phillips is very scientifically astute as well as ethically astute. And so doctors around the country who were on the ball were following his work and were learning from him. So you know, him being the main sort of whipping boy for the College of Physician and Surgeons in Ontario is a very perverse thing. He's actually an excellent doctor. And a lot of us admire him and he's admired around the world too.

Shawn Buckley

But it served as an example to other doctors that they would be punished if they submitted adverse reaction reports.

Dr. Mark Trozzi

Yes. And so no one reports it who's still in the system. Anyone who has too much ethical backbone to go along with that is no longer in the system. They've been suspended, licensed revoked, investigated. There's lots of us like this. It's got to be a thousand-plus across the country. It's not a normal situation.

Shawn Buckley

But isn't it the law that doctors are supposed to submit adverse reaction reports concerning vaccines?

Dr. Mark Trozzi

Yes. The crimes involved in what's going on are extensive. And the College of Physicians and Surgeons in Ontario and other places are guilty of multiple crimes, and not the least is of violating even their own rules.

Shawn Buckley

Okay. And I'm sorry for interrupting. I'll let you continue. It was just that those were such valuable points you were making, I just wanted to emphasize them.

Dr. Mark Trozzi

Oh, I appreciate it. Thanks so much.

So there you have a little bit about why nobody reports adverse events. And Canada can generate some statistics that there haven't been much deaths associated with these injections.

Now, Alberta really became famous for this one. This province, of course, keeps statistics of death. People die, that's part of life. And in 2021, the number one cause of death in Alberta, according to the Ministry—which I can't blame on anyone, particularly in the current administration of the government—was “ill-defined and unknown cause.” Now, if you look in the books of Alberta, that popped up as a new, strange, minor cause of death in, I believe, 2019.

So suddenly, the number one cause of death in Alberta is, “uh, we don't know.” And that's when the injections are rolled out? And this got attention of comedians around the world as well. I came to realize that we were living in the age of the Sudden-Invented-Syndrome syndrome, where anything but the shots is the cause of death.

Shawn Buckley

And can I just ask: Did you say that what became the leading cause of death in Alberta didn't even have that classification until 2019?

Dr. Mark Trozzi

Yes. In 2019 it showed up as the cause of death of a few hundred. And then, by 2021, the new leading cause of death is mystery disease.

Shawn Buckley

So the leading cause of death in 2021, it was a new category basically invented in 2019?

Dr. Mark Trozzi

Yeah.

Shawn Buckley

Okay. Thank you.

Dr. Mark Trozzi
"Ill-defined and unknown."

Shawn Buckley
That's quite interesting.

Dr. Mark Trozzi

Yeah. So I'm getting really near the end of everything. But in addition to covering up the death and harms from the COVID injections—which at this point, I mean, it's very hard for us to calculate how many exactly, but definitely I think we're into millions of dead around the world. Twenty million is a pretty reasonable estimate, I don't have time to go into how that calculation and estimate was made. And more than 2 billion adverse events on the planet so far. Those are good guesses, calculations.

But what else is interesting is covering up the fact that, as I said, you're more likely to get sick with COVID if you've had these injections. And this is data from February to May of 2022. And if you look on the left, there is your case rate for people who've had none of the injections: two and a half times higher case rate for people who've had two injections and more than three times the case rate for people who've been boosted as well.

Now, again, what should the natural response to that have been? An emergency call for the halt of these injections. Instead, Canada stopped reporting vaccination status along with the statistics. So when they saw this going on they said, "No, no. No more reporting for vaccination status. We'll just report the cases." Now that is extremely perverse, because what that could mean is that these cases could be used to deceive more people into going and getting the injections.

[00:40:00]

And not realizing that you're way more likely to get sick with COVID if you've had the injections.

So if I could take another minute and a half, I'd just like to make a few somewhat closing statements.

Shawn Buckley
Yeah, please go ahead.

Dr. Mark Trozzi

So mistakes were not made. This was all by design. Question that, as you should. I refer you to a few things.

First of all, revelations that come from thousands of pages of Pfizer's submission to the FDA [Food and Drug Administration] for Emergency Use Authorization. Though they were approved in 108 days, Pfizer stood against a FOIA request and did not want to release those in total for 75 years. Now luckily that didn't happen. And there's an excellent organization called Daily Clout, spelt "daily" and then C-L-O-U-T, dot I-O. There's thousands of volunteers analyzing this mountain of documents, which are very deceptive, but do reveal a lot of what I'm saying.

Also, people should look at the work of the global intellectual property expert and researcher, Dr. David Martin. And he's exposed nearly, for instance, 100 patents on SARS-CoV-2 products that were produced over more than a decade prior to the launch of the COVID agenda; as well as revelations by James O'Keefe, Project Veritas, Karen Kingston, and others regarding communication and contracts within the DOD [United States Department of Defense], the NIH [National Institutes of Health], Anthony Fauci, Bill Gates, Eco Health, World Economic Forum, the notorious WHO director Tedros. And interestingly, you'll find that two Canadian names that come up an awful lot are Justin Trudeau and Chrystia Freeland. For that again, I refer you to those other sources.

Last thing I want to mention is the imminent crisis we face right now. The World Health Organization functions as a conduit for WEF, Bill Gates, Pharma. And the details of how that works: People are welcome to come to my site and spend some time on it but the WHO functions to manipulate and harm us on their behalf. And I cannot emphasize enough the need to defund, exit, investigate, and prosecute the WHO.

They currently have two fast-developing programs which will super-enhance their economic and political power. These are the International Health Regulations Amendment and the Pandemic Preparedness Treaty. So if anyone thinks the last three years have been awful— That's what they did with the preparation I showed, like redefining "pandemic." If they pass these amendments then they put themselves in a position to do far worse to us.

So that's everything I have to present today. I'm grateful for the opportunity and I'm completely open to questions.

Shawn Buckley

Great. I'll ask the commissioners if they have any questions. And they do have questions.

Commissioner Massie

Thank you very much, Dr. Trozzi, for your excellent presentation. There's a lot of information there. But I would like to ask you: in your best estimate—you've done a lot of research—how many doctors and scientists in Canada would be in agreement with what you're proposing, to ban these vaccines moving forward?

Dr. Mark Trozzi

Well, when I think of my colleagues in medicine in Canada, I can divide them into a few groups. I think a lot of doctors were brainwashed. And people have to remember: even smart sheep are sheep. There are quite a few of us who did our own study—you probably **are familiar and have probably heard from quite a few of them—and who made it an active role to stand against this and to make the sacrifices against them. You have doctors that quietly tried to work under the radar and eventually left their work. You have thousands who left their hospitals when they were eventually mandated to take the injections. So I am certain that there are thousands of doctors that would agree with me.**

Unfortunately, a lot of doctors in our country need to realize what's at stake. And they need to realize that protecting your career— I valued my career too. I valued my income, I valued my home, I had a good life. But when you look at where this goes, when you look at the agenda and recognize what it's part of—Agenda 2030, et cetera—everyone will lose everything in terms of freedom, human rights, and property.

I think a lot of doctors who— I've heard this story so often: people go to the doctor and say, "Hey, what do you think about the injections?" And the kind of honest ones say, "Ah, I can't talk about it. I can't tell you." Which is, of course, a violation of Hippocratic Oath, which is to use your own judgment.

[00:45:00]

So the violations of Hippocratic Oath have been massive.

Knowing what doctors really think is a little bit tricky because doctors have been given the carrot and the stick. If you went along with this, you made a lot of money. There were great billing codes, these injections paid phenomenally. And if you stood against it, you basically kissed your income and your old-style career goodbye. So that's the best I can give you to share insights in that. But I mean, for instance, the Canada COVID Care Alliance has over 600 doctor members. So there's thousands of us for sure.

Commissioner Massie

And worldwide, would you say that the number of doctors and scientists that would support a ban for the vaccine is much larger proportionally than what we find in Canada? In other words, do we have movement outside Canada that seems to be more active in that space?

Dr. Mark Trozzi

Oh, yes. For instance, there's petitions. One I'm involved in, 17,000 PhDs and MDs signed that. A group of us are being invited to speak to the European Parliament. This wave is cresting big time.

But unfortunately, the perpetrators are very well-embedded in government. Governments, for me, have pretty much lost their legitimacy for continuing with this because the science is very clear. You know, there's a reason Paul Alexander and others including myself have invited—on multiple occasions—these ministers of health to sit down and have a public debate with us. They will not show up. There is no debate. There's just an agenda that they're pushing. And I really think there needs to be arrests made on this.

Commissioner Massie

Thank you.

Shawn Buckley

There are some more questions, Dr. Trozzi. And then when the commissioners are done, I've got a question for you too.

Dr. Mark Trozzi

Thank you.

Commissioner DiGregorio

Thank you, Dr. Trozzi, for giving us your testimony today. I just have a few clarification questions on some of the information you presented. I believe just one of the last few slides

you showed us was data from the Canada Health website in February of 2022. Showing, I think, a number of cases broken out by vax status with three classifications—one being unvaccinated, the second one being two shots, and the third one being three shots.

Dr. Mark Trozzi

Yes.

Commissioner DiGregorio

And I'm just wondering whether those numbers—were those absolute numbers of cases by vax status or were those by thousand people?

Dr. Mark Trozzi

Those were case rates. It was the rate of infection per number in the group. So it really did reflect the relationship between your risk and the injections.

Commissioner DiGregorio

So it's not just the case that the lower number for unvaccinated is because there are a lower number of unvaccinated people, it's averaged out by thousand.

Dr. Mark Trozzi

Yeah, it was per thousand. It was a rate.

Commissioner DiGregorio

Thank you.

And then the other question I had had to do with— I've heard this before from others and yourself, about this definition of unvaccinated people as being people who are two weeks post their second injection. And I'm just wondering where that came from?

Dr. Mark Trozzi

For me, the source was checking with multiple nurses involved in triaging patients. So that became standard triaging procedure as I understand it, when people came into hospital. So people go into hospital, they see a triage nurse, she takes some notes and fills some things. One of the things she fills out is vaccinated versus unvaccinated. And people who were less than two weeks from their second injection were quote "unvaccinated." And so at least in some of the databases, counted as such.

Commissioner DiGregorio

Sorry, maybe I wasn't clear enough in the way I asked the question. And I'm sure that's entirely on me. Where would this definition have come from? Like, who has come up with this notion that that is what is "unvaccinated," that it's two weeks past the second shot?

Dr. Mark Trozzi

Well, that program was carried out in most Western injected nations. So I don't have the exact answer. I think that ultimately you would find that probably came from the WHO, but I can't confirm that at this point. But that practice has been reported in many countries from other scientists and doctors I've been working with.

Commissioner DiGregorio

Okay, thank you.

Dr. Mark Trozzi

Pleasure.

Shawn Buckley

There's further questions.

Commissioner Kaikkonen

I have a question. I'm just wondering, for the parents who are outside watching this or online, just wondering if you have any suggestions or counter-recommendations that you could give to them.

[00:50:00]

For preventing or countering the potential respiratory repercussions from masking? Maybe that didn't make sense, my brain's not working yet. But anyway, just: Do you have any recommendations that would possibly help parents?

Dr. Mark Trozzi

Yes. I'm not sure if you're asking specifically with regard to the masks. As you can see, my thoughts are that there's no significant advantage to having a piece of cloth burying your face all the time. It makes no sense. So a) I wouldn't mask my children, I consider it child abuse. In terms of keeping kids healthy? Well first of all I would avoid letting them be injected with any of this stuff whatsoever. It should be pulled from the market.

And then in general, keeping a healthy immune system. A healthy immune system is built. And it's funny, you know? If we had a legitimate health care institution at the beginning of this, this is the sort of advice we would have got, which is to stay physically active; to get lots of fresh air; to get exposure to sunshine or take vitamin D; to eat a healthy diet which involves lots of produce, organic produce, fruits, vegetables.

And then in the case of children—and I'd really love people to look at that—I presented, "Why Children Should Be Free and Never COVID Injected." And also, I've written articles and videos on the immune system and talked about what's called "original antigenic sin." So children need to be exposed to microbes. But microbes are evolving and humans are evolving, and we evolve together. When a child interacts with their environment—sticking dirt in their mouth and kissing the other kids and all the stuff they do—that actually allows their immune system to initialize itself at the point in history where it exists and to become compatible with the existing microbes. And then following that, the immune system, as we grow, can do a pretty good job of keeping up. As the microbes evolve, we evolve.

So removing kids from the environment, removing kids from each other, doing this sort of state-mandated, germophobic behavior is very dangerous. I think most of us are aware of the old stories where the kid whose mom bleached all the counters and wouldn't let him touch anything and washed his hands four hundred times a day, that was the kid with all kinds of allergies and all kinds of sicknesses, whereas the kids that rolled around the dirt were healthy. And that's just the way the immune system works. I mean, we live in a world swarming with microbes. And we're meant to and we need to do that in a natural way.

Commissioner Kaikkonen
Thank you.

Shawn Buckley

Dr. Trozzi, I had one final question for you. My understanding is that the vaccination uptake now in Canada has dropped significantly. And so we wouldn't anticipate seeing adverse reactions that follow quickly from vaccination.

Going forward, what do you think the prognosis is for Canada and Canadians that have been vaccinated? Would you anticipate that they would be getting better or worse? Or is it just unknown at this time because of the nature of the vaccines?

Dr. Mark Trozzi

Well, that's a good question. So there's a few caveats to that.

We've looked at variations in adverse event rates with different lots and different injections. And you know, this is a clinical trial: we're excluded from a lot of the knowledge. So some people, we believe, got a shot of saline; some people didn't get injected with the stuff. We've also learned that one of the things that causes certain lots to have much higher adverse events and death is the quality of manufacturing. If those little pegylated—those little polyethylene glycol chains around the sphere—if they're very equal in size, that stabilizes the nanoparticle. It makes the nanoparticle more effective at delivering its payload. And therefore, the higher quality injection you get, the worse off you are.

As well, these injections were delicate and had to be handled properly: I mean, stirring, temperature, all these things. And if you got lucky yours wasn't handled well. And instead of getting a full-functioning—as I would I think appropriately called bioweapon—injection, you might have got just some sludge that had fallen apart. So those are some of the perks that can happen.

When you get beyond that, when you look at, for instance Dr. Arne Burkhardt, Dr. Ryan Cole and others, the few pathologists in the world doing the right thing. Unfortunately, for instance in Dr. Burkhardt's case, more than a year ago he had 15 families come to him and say, "Listen, we have had a family member die. They were healthy before. We think the injection killed them, but we had an autopsy done by the government, the public health autopsy, and it said there was no relationship."

[00:55:00]

Now, those autopsies did not include immunofluorescence staining for spike protein. So you know, if you don't look for something, you won't see it. Dr. Burkhardt took those 15 cases as an initial case. His team analyzed their tissue and what they found was that there

was clear evidence that cause of death, in 14 out of the 15, was the injections. And that included people that died as much as a year after the injections. So for instance, when you look at the prion disease, that's a very slow-developing thing.

Now, the other thing though on people's side is: the scientists and doctors who stood against this, while we may not have the resources that we had before—we're no longer running the university labs; we're no longer running the hospitals for the time being—but we're working very hard on developing solutions. So for instance if one goes to the FLCCC, you can look at their protocols and advice for detoxifying from the spike protein and the injections. At the World Council for Health, we've also generated a spike protein detox guide.

Those guides are working very well. Interestingly, two of the most important things you can do: one is intermittent fasting. That increases the rate of what's called autophagy, or getting rid of bad old cell debris. The sooner we can get these poison cells out of the body, the better off we are. Ivermectin, the same drug that works for treating COVID infections, also has sequestered this poisonous spike protein, which makes it less likely to interact with our tissue. Ivermectin also stands quite high on the list. But there's a lot of things that could be done. There's more that is being looked into. I've been talking with an excellent Dr. Goodnow using a nutrient called plasmalogens and I know others are working on this.

So I would recommend to people, if you've had the injection, think about getting one of those protocols rather than waiting until you have a problem. The other thing that we're working on—we have it now available in a couple of countries in Europe but we will try to get it available elsewhere—is a simple test. For instance, a urine test where you can test your urine and see if you're producing spike protein and see how much of that spike protein you're producing.

The doctors who stood against this: we're still in the game. How bad it's going to be is partly going to depend on how successful we are and how much people take advantage of that. And as well, the sooner that we see the system turned into something legitimate again and we see— Rather than agenda-promoters running the College of Physicians and Surgeons, in my opinion, in a very criminal fashion, I'd like to see someone like Patrick Phillips or Dr. Kilian or Dr. Luchkiw, or any of the doctors who sit up and do the right thing. These are the ones who should be running our healthcare. And then we'll do a very good job of treating the injuries from these injections.

Shawn Buckley

Thank you. I think those are all the questions we have for you, Dr. Trozzi. On behalf of the National Citizens Inquiry, we thank you. We're very grateful for you taking the time and sharing your insights with us.

Dr. Mark Trozzi

Well, thank you very much for doing this. I feel that this is the first sign of legitimate government in a long time in Canada, is the people coming together for the people. So I'm really grateful that you're doing this, to all of you. And I hope it continues to go well. We'll continue to support it.

Shawn Buckley

Thank you.

[00:58:35]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 11: Vincent Gircys

Full Day 3 Timestamp: 08:43:16–09:32:40

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness today is Vincent Gircys. And Vincent, I'd like to start by having you state your full name for the record, spelling your first and last name.

Vincent Gircys

Vincent Gircys, G-I-R-C-Y-S.

Shawn Buckley

And Mr. Gircys, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Vincent Gircys

I do.

Shawn Buckley

Thank you. Now could you explain for the commissioners basically the experience you have as a police officer.

Vincent Gircys

Certainly. I am a retired member—a former member—of the Ontario Provincial Police [OPP]. I started my career with that organization in 1982 and I served this province in policing for a total of 32 years. I have 32 years of experience in policing—and that's different than some people, who have one year of experience repeated 32 times.

I have submitted my curriculum vitae here [Exhibit TO-26]. I believe it's with the group, and it's five pages long of courses that I've taken over the entirety of my career. I started my career in Toronto. Eventually, I became a member of the emergency response team for

the OPP, one of many. And at some point, I became involved in forensic investigations and forensic reconstruction. I did that for a number of years. And throughout the course of my career, there were a number of things that I had taken on. I never turned down any opportunities for training and I received a number of commendations throughout the course of my 32-year career and retired with the Police Exemplary Service Medal for my conduct.

I just want to say that there are many men and women in law enforcement. And the men and women of law enforcement are ordinary men and ordinary women just doing extraordinary things. And I'm extremely proud and happy to know that the men and women that I worked with within the service were what I believe to be the best of the best within policing services. And I've met many, many wonderful police officers over the course of my career that put themselves in harm's way and behaved very courageously.

So I'm very proud of the profession. But I see that a number of mistakes have been made over the last three years. Tremendous mistakes have been made. So I'm going to start off with a little bit more of an introduction into my background and then I'm going to tell my story. And then I'm going to get into the mistakes that were made.

Shawn Buckley

Thank you. Please proceed.

Vincent Gircys

"Whereas Canada is founded upon principles that recognize the supremacy of God and the rule of law." This is the first sentence in the Canadian Charter of Rights that was written and established in 1982, the same year that I started my career in policing. I was very familiar with the Canadian Charter of Rights. And I was issued, upon my probationary period when I first started with the organization, a Bible. I was issued a King James Bible. And the question needs to be asked: Why? Why was I issued a Bible? And that is something that I carried with me during my service and every time I testified.

And I have testified hundreds of times, actually thousands of times, in various courts. I became an expert witness in forensic reconstruction. And every time I testified, I did it by placing my hand on the Bible to swear an oath. I'm very familiar with the police oath that I've taken. And it is the same oath that all police officers in the province of Ontario take. The oath varies from province to province depending on the police services involved but, in Ontario it's the same oath. And my oath is to the Constitution in Ontario. I'm very familiar with it and I would hope that other police officers would be familiar with the oaths that they had taken.

It's very important, the first opening sentence of the Canadian Charter of Rights.

Shawn Buckley

And I know that you mean section 1. Or the part you just read, which is often omitted?

[00:05:00]

Vincent Gircys

The part that I just read because it is the foundational component. And that foundational component— People need to understand that our Constitution and our Charter is not a federal law; it is not a provincial law; it is national. It is agreed upon by the entire nation of this country. And it is our primary law. It is the most important law of the land.

My story started at the beginning of the pandemic, when I was present. A restaurant in Toronto serving brisket barbecue, known as Adamson's Barbecue, had been shuttered and shut down by 200 police officers and a team of horses that had come in to push back people and prevented that restaurant from staying open. I had already been following the science. I am very familiar and done my research regarding mask issues, regarding transmissibility and other issues, and I just could not comprehend what I was seeing with the amount of police deployment at that location. I've since become very active in speaking out against these types of measures that were taken against Canadians. Things continued to ramp up and get worse very, very quickly, as you well know. So I won't bother to get into those details.

I will say that over the last three years, I had two arrest warrants issued for me because I was in a park, outdoors, speaking to a group of people on two different occasions about the importance of our Constitution and the Canadian Charter of Rights and how they were being abused. These arrest warrants came just prior to, and just after, my attendance in Ottawa during the trucker Freedom Convoy that had arrived in Ottawa.

I attended there just to see what was going on. There seemed to be quite a bit of discussion about trucks arriving in Ottawa and it sounded exciting, so I attended. When I got there, I could see the level of deployment there that was taking place and I wanted to reach out and help in any way I could. So I took on various roles, one of them being a police liaison. I had received through the Ontario Provincial Police the Police Liaison Officer of the Year Award. I guess I did a pretty good job at it. And so I was also liaising with police services in Ottawa during the Trucker Convoy.

I did not go there by truck. I don't own a truck. I don't know how to drive a truck. But I was there strictly helping, acting in any helpful capacity that I could. The temperatures were very cold. Things were very disorganized, so I tried to offer some form of organization there. As a result, my bank accounts were frozen. And I eventually left at the end when things were dismantled. I was issued a fine for attending a church service and received a \$10,000 fine for doing so.

Shawn Buckley

Ten thousand dollars?

Vincent Gircys

Yes, the prosecutor was asking for a ten thousand dollar fine for my involvement in attending a church service in Aylmer, Ontario. And that was issued by the Aylmer Police Service. That matter has since been resolved but that was the fine that the prosecutor was requesting.

I must say, I'm very proud of a number of members of the Aylmer Police Service—at least six of them. I'm very proud that they have made the decision to quit within a one-year period. That is approximately 50 per cent of the number of officers that are employed by that police service. The amount of tyranny I saw come out of that police service towards the

Church of God in that town was deplorable and in complete violation of our Constitution and the Charter. Many criminal offenses have taken place by the police against the church, because it is a criminal offense to interfere with church service. That essentially is my story and I'm going to now get into the other aspects.

I had been asked in April of 2021 by an international organization known as Police for Freedom if I would join that organization. And I did so under the condition that I would not be silenced. I had belonged to another organization of police officers in this province and I felt that I wasn't able to speak freely, so I've since moved on. And I wasn't about to be silenced in discussing what I felt was very important to discuss.

So I am now the Canadian representative of Police for Freedom International.

[00:10:00]

And there are quite a few police officers that I am in contact with. I would say over the course of the last three years, I've been in contact with hundreds, if not a thousand or more police officers across this province and internationally that think in the same purview that I do. We share the same conclusions. And I'm going to go through those.

Now, when I would conduct a forensic investigation—and it doesn't matter if it's forensic investigation or just an everyday investigation within policing services—there is protocol that we follow. There's procedure that we follow and it's very, very simple. It's not rocket science. In conducting investigations, we look at other people's perspectives, other people's statements. We want to know what happened in any investigation. And in order to find out the truth—and the truth is a hard thing to describe, if you ask somebody like Jordan Peterson, he'll probably give you a one-hour explanation of what truth is—basically, the truth is what happened. That's it. In policing, we want to know what happened and we need to know what happened so that we can decide whether criminal offences have been committed and by who, and how, and why. So we need to answer a lot of questions.

And when we conduct an investigation, the best way to come up with the truth is to acquire as many statements—and I'll call them perspectives, as many perspectives as possible. Anybody standing in front of me looking at me has a view of what I look like. If somebody's standing behind me and they're looking at me, they have a different perspective. So ultimately, the more perspectives you can get on anything, or person, or issue, the better equipped you'll be to understand what is really going on.

It's also about collecting information. It's about collecting physical evidence, documentary evidence, testimonial evidence. And then we come up with our conclusions, ultimately. The more information that is available, the more accurate of a decision we could make and the **better understanding we have of what is real, what is really true, and what really happened.**

It is my understanding that there's nobody here present from mainstream media. Is there anybody? If you are, can you put up your hand? CBC, CTV, Global? No, I didn't think so. So evidence is also the absence of something. So when mainstream media is not here, that is evidence of something.

Now, I've done a Google search recently—yesterday, as a matter of fact—on the National Citizens Inquiry. I've done it through a number of browsers. If I search the National Citizens Inquiry, it will come up. But if you click on the “news” tab associated to these browsers and search over the last 90 days, nothing comes up. That's evidence of something. That's very telling.

So the media not present brings me to the issue of COVID-19 and other issues that are in the media that have, what I would call, a single perspective. Some call it a narrative, that's just a flowing individual path. I call it a single perspective. So on the issue of lockdowns that we faced, there was only one perspective that had ever been in the media. On the issue of mask-wearing, one perspective. On the solutions to this problem and the way out, one perspective. Vaccine acceptance, one perspective. Vaccine hesitancy, one perspective. Vaccine safety, one perspective. Vaccine efficacy, one perspective. Vaccine injury, no perspective, no comment, no discussion. Vaccine death, no perspective, no comment. Died suddenly, no perspective, no discussion.

So we see a lot of contradictions. There's certainly available data—data that I was able to find. And if I'm able to find it, I think just about anybody's able to find it. And it's not about what people knew; it's about what people should have known. I've seen this numerous times in the Ontario Provincial Police when it came to officers' disciplinary measures. Somebody should have done something; somebody didn't do something. And it really comes down to, if you didn't know, you should have known. It would have been your responsibility to know.

[00:15:00]

And in this case, in the medical profession, in the healthcare profession, it's incumbent upon those individuals within the profession to do their research and to know. And to look at other perspectives because they are available, and they were available to probably just about everybody here in this room. Those perspectives were very readily available. The information that was coming out was very readily available if you just chose to look. And of course, there's a much higher threshold and level of responsibility that comes with your position within health services.

The term that was used as "safe and effective" probably should have been "use at own risk," would have been more accurate to describe this product that had come out: this product with no known long-term data, not knowing what the content within the product is yet being pushed as safe and effective. My own personal physician was trying to shove "safe and effective" down my throat when I spoke with him. Certainly, he was not aware of the information that I was aware of; unfortunately, he was not interested in being aware of that information. The one thing that we did agree upon was that our trust in health care services in this province was paramount—it was very important that we trust health care services—and that there was nothing worse than forcing a jab in someone's arm to lose that trust.

So I had mentioned that I'm a representative of Police for Freedom, which is this international organization and consists of many police officers in Canada as well. I can tell you that we have incredible concern about the unfolding of these incidents. I fully concur with the comments made by Dr. Trozzi in his last testimony that he had just given. We are very much aware of the World Economic Forum, the World Health Organization, the CDC [Center for Disease Control and Prevention] working in conjunction with many other similar type organizations.

And it appears that Publicis and McKinsey are companies that are advertising PR firms and consulting firms that seem to be integrated with those organizations. The Brighton Collaboration is often mentioned in health care services in Canada as a reference to the Brighton Collaboration. But the Brighton Group, I believe, no longer exists and is now known as the Task Force on Global Health. Task Force on Global Health seems to be

working in conjunction with and reporting to and having discussions with CEPI, the Consortium of Epidemic Preparedness Initiative.

People listening to this testimony I'm giving might want to look up those organizations and see who they are. See how they are actually comprised of the pharmaceutical industry, the World Bank, the Bill and Melinda Gates Foundation, and so on and so forth—some names that keep coming up. And you know, there's a very incestuous relationship that ties those organizations to the Government of Canada, with certain members specifically that have already been mentioned.

The World Economic Forum Canadian leadership members is of concern. We know that Klaus Schwab, the head of the World Economic Forum, had made a comment that we have penetrated over half of the cabinet. And he said that rather casually and he seemed quite happy about that. The comment had come up once in Parliament asking the question relative to this connection. And immediately there seemed to be what appeared to be a comment or an excuse to some microphone-related problem. That question has never since come up by any party in Canada. It is very concerning, because it appears that there are members possibly in other political parties as well relative to the World Economic Forum and those things that go on in the World Economic Forum.

I'm not going to comment specifically on what things go on. But I will say that criminal conspiracies do happen. You are not a nut for calling something a criminal conspiracy. I've investigated criminal conspiracies and they're real and they really happen. Organized crime is not some old Italian guy in a wife-beater shirt talking about the mafia

[00:20:00]

or somebody in a leather jacket riding a motorcycle. Organized crime now is very sophisticated. And generally, those people that are very, very wealthy with incredible power and access are positioned very well to be very effective criminally. Is there any evidence to suspect reasonable suspicion of the need to investigate potential criminal conspiracy? Yes, we believe that there is. Absolutely.

So I'll say what gives me grounds to say that. Just relative to the vaccination roll-out only, I'll say that there was the promotion of "safe and effective" with no known long-term data. The contents were unknown. There's also injury and mortality rate data that was available early on in this that either you could have known, you should have known, and if you're in the healthcare system, the onus would have been on you.

At some point the death and injury rate became unusually high. And that flag, everybody in the healthcare system should have been aware of it, whether they say they were or not. **There appears to be cognitive dissonance on that issue. People are sticking their head in the ground like ostriches and not wanting to know, but unfortunately the data can't be hidden. The truth is there.**

Then there's the continuous use of the rollout of the vaccine when the available data is still known. Health agencies fail to notify the public. Infant mortality is increasing. Fertility rates are dropping. Menstrual cycles were affected. The media remains silent. And the media and the government relationship appears very suspicious.

During the Emergency Measures Act hearing that took place several months ago—the Emergency Measures Act hearing in Ottawa—Superintendent Pat Morris of the Ontario Provincial Police, who is in charge of intelligence for the Province of Ontario, made a very,

very interesting comment. One that I found resonates well with me—because I had made the same comment as well. He said, “I know what the government is saying, I see what the government is saying.” Essentially these were his words roughly: “I know what the government was saying, and I know what the media was saying, but the intel that was coming back to me”— This would be coming back to him from various sources on the ground, whether it is people reporting or interacting with other police agencies or whatever his format of intel was— He said, “My real intel was inconsistent with what they’re saying.”

So they know what they’re seeing. They know what they’re hearing by their sources, which is inconsistent with what the media is saying and with what the government is saying. We see that type of inconsistency over and over. So I do have a suit that has been launched with a number of other individuals against the Attorney General of Canada and the Ministry of Public Safety regarding my rights violations for having my accounts frozen in Ottawa. And I had indicated in my testimony there as well that when I was in Ottawa, I spent a lot of time walking the perimeter of what was going on and conversing among my colleagues there about what they’re seeing and what’s happening. And there were no concerns, no concerns of violence or these types of issues. But in the evening, when I would go back to my hotel room every night and turn on the TV and look at the CBC to see what their reporting was, I indicated that I was seeing an inversion of reality on television. And they didn’t seem to understand what I meant by that. And I said, “What I’m seeing on television is completely opposite of what I’m actually seeing there. The news is lying. They’re being deceptive.”

Shawn Buckley

So Vincent, can we get you to describe what you were watching on television and what you were seeing? Just so that it’s crystal clear for everyone listening to you what exactly what you are telling us.

Vincent Gircys

Right. So what I’m seeing are a bunch of happy people. Very happy. It’s a very positive vibe. A very positive environment. Everybody was happy, hugging. I mean, I’ve hugged more people than you can hug at a Greek or Italian wedding. There’s no doubt about the level of joy that people were displaying and having. I saw no violence and I saw nothing to be concerned about other than it was just a great time overall.

[00:25:00]

But what I’m hearing on the news, the reporting, was that there were acts of violence that were taking place. There was arson that was taking place. There was assaults and Nazis; **the people there were being labeled as Nazis and this type of thing. All of that reporting from the CBC was just completely false. It was just completely wrong.**

It didn’t surprise me because I was already familiar with that type of reporting from the CBC and our mainstream media. And essentially, I find the media is a propaganda machine. They have been paid very handsomely by a number of organizations, including the Canadian government. They are spewing propaganda.

But even worse, they are suppressing information that people should really know. So it’s a joint issue of propaganda being distributed, and censorship of the information that you should know, information being withheld.

So a number of lies that I found have been exposed in media over the last three years that are of most concern: The COVID-19 threat assessment, that COVID-19 was super, super dangerous and super scary, and you should all be locked up. That whole threat assessment and that whole narrative is a complete lie. That the mRNA gene therapy, the safety level of that, was a lie. That lock-down measures and the efficacy of the vaccine and the lockdown measures as well, separate categories there, was just a lie. Not required. And that there were no available therapeutics, as the media had stated, that was a lie as well.

In order to keep the lie going, I think it's important—it's critical to all those involved in what had taken place both in the medical profession and in government. In order to keep that lie going, it's an indication of a totalitarian regime, by definition. Clearly, we see if you can control the health care, if you're interested in firearms confiscation and you move in that direction, you censor people and control the media. You control the education and enable indoctrination. You control the currency with intended CBDCs, that's the central bank digital currency, controllable currency that appears is on the horizon. And if you control movement, fifteen-minute cities, that would be an ideal system for a totalitarian regime.

We know that the the initial lockdowns and the fear-driven mandates have resulted in, initially, a police state. And then it continued on to what we are becoming as a corporate, fascistic governance. There's no question. When the media works in collusion with the government and corporations, when they're all working together, that clearly is fascism at its best. And it appears that that is what is happening.

Now, I have what I would call a way out. And by no means am I suggesting that this is the answer, but it's the best I can think of. And this would be, in consultation with a number of other police officers in agreement, that establishing a national COVID-19 forensic task force that is completely independent of government interference, vetted by a judicial body with arrest warrant and search warrant authorization, would be a good start.

And I'll summarize what I find are the failings in the police community. They failed to adhere to established plans. In policing, we have a plan for everything. Our command staff is very well-organized and they plan for all worst-case scenarios. In the OPP, it's a common mantra to say, "Plan for the worst, hope for the best." We say that all the time and we believe in that. Plan for the worst, hope for the best.

And you can bet that there were pandemic plans in place already. Imagine spending a lot of time, money, and resources on planning for a pandemic: planning when things are calm, when heads are level, when you're not afraid, when you can liaise comfortably with the health agencies. You can liaise with all kinds of other agencies to come up with what you would say is the best plan you can possibly come up with. And then when a pandemic is introduced, let's throw that in the garbage.

[00:30:00]

And let's just wing it. While we're afraid and while we're scared, let's just forget about that plan we have.

No, we put that plan in place for a reason. It was the best thought-out plan and it was a very rational plan. Now, I'm not familiar with what the plan is but I do know that there are other people who are going to be testifying here as to the content and detail surrounding that.

The police failed to understand information. They accepted a single-sided narrative where additional counter-narrative information was available. How do I know it was available? Because I provided counter-information. And I did so by helping other people across the country that had compiled a number of reports, that appeared to be very concise and detailed with information.

A number of people across this country were distributing hundreds, if not thousands, of copies of actual information to police agencies, to health agencies, to government agencies. And they were documenting their service upon those agencies. And the police agencies failed to respond. They failed to understand their oath. They failed to understand section 52 of the Constitution and the ramifications. Section 52.1 of the Constitution essentially says, "Any law that is created, that is inconsistent with the Constitution, which includes the Charter, has no authority whatsoever."

Shawn Buckley

Vincent if I can help you out with that, I think the probably the exact quote is section 52(1): "The Constitution of Canada is the supreme law of Canada, and any law that is inconsistent with the Constitution is, to the extent of the inconsistency, of no force or effect."

Vincent Gircys

Correct.

The police service essentially over this three-year period became the Praetorian Guard, following political pressure and interference. Let me make it very clear that— Our system and the way it's supposed to work, I will try to describe it for you. If you can imagine a horizontal line, a membrane if you will. And on the top of that membrane, up above, is politics, the political sphere within this country. And below this membrane is civil service. And there is a membrane that separates the two. Civil service includes police services like the Ontario Provincial Police, the RCMP, and all other police services. And I would say that those services are pretty high up near the membrane. They're pretty high up in priority and importance.

And it's important that that membrane stay in existence because we can't mix politics with policing agencies. We need to have independence of the two so that we don't have corruption. But it appears that, over the years, that membrane seems to have torn and disappeared. There doesn't seem to be any service, any dedicated agency in this country to be actively involved in looking into allegations of crime. There's nowhere to go. There's nowhere, seemingly, to report these problems.

Shawn Buckley

Vincent, can I just interject for a second? Just because you're in contact with so many police officers, are you aware of any police investigations concerning potential crimes in this COVID saga that have been allowed to proceed? Because I understand people have made complaints to the police alleging crimes but my understanding is that most of them are stopped by management. Are you aware of any that have been allowed to proceed?

Vincent Gircys

No. I am not aware of anything being investigated. Not that I should be. It wouldn't be in my purview. But I know that many people have provided information and the least that you

should be aware of is some kind of a response. Some kind of a response notifying that, "We have that information. We're looking into it." And usually the police services would get back to you and say, "We might need some more information. Can you help us? Guide us? Direct us? Give us some more." Nothing. No contact. I'm not aware of any of it.

So it's imperative that we do the right thing.

[00:35:00]

I'm going to say: Do not fear doing what you know to be right. Fear the consequences of the fruits of failing to do the right thing.

And that concludes my testimony, unless somebody has some questions.

Shawn Buckley

I'll ask the commissioners if they have any questions.

Commissioner Drysdale

Good afternoon, Mr. Gircys. Thank you for your service to our country and for coming here and testifying today. I have a few questions, probably more related to policing because of course you had 32 years of experience as a police officer.

Yesterday—I believe it was yesterday—we had Mr. Tom Marazzo here testifying with regard to the truckers' convoy. And he described and showed video of an incident in front of the war memorial where police officers pulled aside and injured a veteran: took him to the ground, kicked him multiple times. He showed the video. It's in evidence here. And one of the questions I asked Mr. Marazzo was, "Was there any security camera footage?" The only footage that we saw was from participants, amateur people, with phones filming it. But in our nation's capital, in front of the Parliament buildings on Wellington Street, between where the War Memorial is, I asked, "Were there not security camera footage that could have been referred to?" Because I hadn't seen any of it. And his response to me was that he believed the cameras were shut off.

Do you have any information about the security camera footage?

Vincent Gircys

No, I do not. And you know, when it comes to security cameras, I have a rather sensitive spot to that—understanding the level of surveillance mechanisms that we already have in place in this country. And I certainly wouldn't be asking for more surveillance equipment. To answer your question, I'm not familiar with that. And to the point on that, we have seen a lot of police violence and brutality in the final phases when police moved in very heavy-handed in Ottawa. And there's no doubt in my mind that the tactical officers, the emergency response team officers that were responding, were not only ill-informed; they were provided, I believe, false and misleading intelligence.

And I say that because I watched the behavior of those officers. And, you know, police officers are not generally stupid people. And I'm not suggesting they're stupid, but they're put into a situation where they believe they can be harmed. They believe they need their weapons out. They believe that there is a serious threat against them. And I have to ask: Where did they get that information? Because all of the intel that I was aware of, and I got

to know, I can't say I knew everybody in Ottawa; there were hundreds of thousands of people there. But all of my observation continuously being inconsistent with what the media was saying, the media operating in collusion with our government, there's no question that there was false or misleading intelligence that was provided to those officers that were shutting things down at the end. And that's also consistent with the evidence of the Commissioner of the OPP and the Superintendent, Pat Morris.

Those two individuals from the OPP giving testimony seemed inconsistent. Because the Commissioner is saying he believed—and I'm not going to repeat his exact words—but essentially, he believed that there was perceived violence. And the Superintendent of Intelligence is saying he had no concerns. So where did the concerns come from? And I don't believe we've ever gotten an explanation. The closest I came to getting an explanation was, I believe, that during a debrief— One of the Ottawa police officers had said at some point during a debrief, shortly after things had shut down, that information came from something he saw on the CBC.

Commissioner Drysdale

Well, that's an interesting response. Because unlike the horses that were used in Ottawa, which have blinders on so they can't see where the police officer is directing them, the police didn't have blinders on. And I refer you to your earlier testimony where you said that you saw with your own eyes, by walking through the crowd, that it was peaceful. I think you said there was more hugs than an Italian wedding, and I've been to a few of those.

[00:40:00]

How is it that you were able to visualize and see the reality on the ground and these officers, despite being briefed but being present and having their own eyes open, could not see what you saw?

Vincent Gircys

Well, the best explanation I have for that is that I was walking those grounds for over three weeks. I was there for quite a long time. And the atmosphere and the mood never changed until the end, when the police came in to shut things down. Then I did see violence. And the violence came on the part of the police officers. And it is possible— And it is a realistic possibility that— Because of the uniform difference, it appears that the frontline officers that were working at the function on a regular basis were pulled offline at those last two or three days. And that a whole new contingent of officers coming from other parts of the country and the province were brought in, kept to the rear, and then marched out. And they never had the opportunity to see what was going on at the event but they were primed with various forms of intel that gave them the mindset that we're dealing with a lot of very crazy, violent people. And you know, I don't know what intel they were provided with. But they were certainly provided with some intel, I believe, that would have given them the mindset that they were dealing with a dangerous issue.

Commissioner Drysdale

So you're suggesting that they were just following orders?

Vincent Gircys

Yes, that's right. Absolutely.

And I need to finish with one final point. That these police officers— I've said at the beginning, they are ordinary men. They are ordinary men. In Germany, in 1942, there was a police battalion, PB101, and stories and books have been written about them. And it is called and they are referred to as the "Ordinary Men." It's ordinary men that can be provided with false information and misleading information, that can develop a very violent mindset against a group of people. And extreme, extreme horrific atrocities can occur and can be brought on, as example of Police Battalion 101, from ordinary men.

We all have that ability within us to do that if we're provided with extreme fear and false intelligence. And the greatest concern that I had over the last three years was, how far is this going to go? What are these individuals? What are these police officers going to be provided with? Which kind of information? How misleading is this going to go? How are we—the people who are concerned, pushing back, and protesting—how are we going to be treated if the lies continue, knowing that the police officers are ordinary men? And there's nothing in training that I've ever experienced to identify that problem and make police officers aware of what they could become.

Commissioner Drysdale

I'd like to know what is required in normal times for the police to initiate an investigation, a criminal investigation.

Vincent Gircys

That's a great question. I can tell you that, as a police officer, I cannot initiate an investigation without permission of my command staff when I was working. So you know, there are things you can do in policing. If you're given an area to police, you police it. You're given certain criteria of what the organization wants policed, then you police it. But for the most part, when it comes into something more extensive, you do need authorization from your organization, from your command staff.

Commissioner Drysdale

And I think you said earlier that to your knowledge—and of course you wouldn't have detailed knowledge of what's going on behind closed doors—but to your knowledge, the police have not instigated a criminal investigation concerning any issue with regard to the pandemic, mandates, and treatments.

Vincent Gircys

Again, I'm not aware of that. I haven't been provided with any information to believe that that would be the case.

Commissioner Drysdale

Just one question. Another question is:

[00:45:00]

You talked about the WEF. I personally had a meeting some time ago with a MP, Member of Parliament, Canadian Member of Parliament, who said to me the WEF is no different than the Lions Club. Do you believe that the WEF is no different than the Lions Club?

Vincent Gircys

No, sir. I believe that the WEF is an extremely powerful, influential, well-equipped, well-financed organization of the wealthiest, most elite people on this planet, working together with a number of other organizations and corporations. They are extremely well-organized and well-structured and well-positioned.

Commissioner Drysdale

You know, my last thing is: I'm sitting here and I've been listening to testimony for the last three days here. And I was in Truro prior to this and listening to testimony. And it shocks me to the core to hear people like yourself and other people making certain comparisons or analogies to what's going on in Canada, which include the *Schutzstaffel*, which is the SS, and other things in Germany.

We've heard that as a common theme: that people compare what's been going on in our country to that era. And it shocks me to death. I don't know if you have any other comment on that.

Vincent Gircys

My parents came from Eastern Europe. They lost their country. If they would have stayed, they would have been executed. They spent a year living in the forest in Western Germany fleeing from the Bolsheviks and fleeing from the Nazis. I understand what fascism and totalitarianism is.

Commissioner Drysdale

Thank you, sir.

Shawn Buckley

Mr. Gircys we are going to— I'm sorry, we have one more question.

Commissioner Kaikkonen

Thank you for your testimony. And I may be remembering wrong, but I do remember in 1982 when the Constitution was enacted, or the *Charter of Rights and Freedoms*, that all levels of government had three years at that time to bring their laws into alignment with the Charter.

If we fast-forward to where we are in terms of the Church of God, for example, in Aylmer, or the church in Kitchener, who also suffered huge fines and losses and then they went into court and had to deal with it at the court level: Do you have any idea how we can convince the judges that were responsible for those decisions that the *Charter of Rights and Freedoms* still stands as under the supremacy of God and rule of law in this country, as the supreme law? So that decisions that go against the freedom of religion, for example, in this case, will not take away from the churches but actually show how much churches in a community enhance that community going forward.

Vincent Gircys

Well, I think the only way to make a change at the judges' level is the judges are utilizing jurisprudence to make their decisions. That is, they are saying, "The pandemic was

extremely dangerous and we were all going to die. And you didn't do your part because we knew we were all going to die and you just weren't doing your part. And so there are limits to the Constitution and we don't think this was unreasonable."

I refer to that—and so do many others—as the Great Lie. And that great lie needs to be exposed and broken before we can see a change.

Commissioner Kaikkonen

Yes. I guess the irony in that mindset of the judges is that we're still all here and we're still all alive. Thank you.

Shawn Buckley

So Mr. Gircys, we will enter your CV as an exhibit with your permission [Exhibit TO-26].

Vincent Gircys

Yes.

Shawn Buckley

Thank you. And on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony today.

Vincent Gircys

Thank you.

[00:49:24]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 12: Maureen Somers

Full Day 3 Timestamp: 09:42:26–09:48:18

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Geneviève Eliany

Good afternoon. Could you spell and state your name for the record, please?

Maureen Somers

Maureen Somers. S-O-M-E-R-S.

Geneviève Eliany

Do you promise to tell the truth today?

Maureen Somers

Yes, I do.

Geneviève Eliany

I understand that you're a descendant of Holocaust survivors. Can you tell us about some discussions you've had with family members?

Maureen Somers

Well, for starters, I never imagined in my lifetime that I would be witness to a fascist dictate on the nation. And from what I have learned in history and from relatives who not only survived the Hungarian occupation by the Nazis, they also survived the occupation by the Russians; and from everything that I have learned from them as well as from my days in my history class—I was always told by our history teacher, "If you don't study history, you'll never know what's coming." Well, never in my lifetime could I imagine that I would see a fascist dictate on our nation. And by that, I mean, from what my relatives have described—fascism—the unvaccinated and the elderly in this country were treated terribly. That's fascism. The unvaccinated particularly have been treated horribly. They were pitted against the vaccinated. That's fascism.

Geneviève Eliany

I understand you're concerned for your grandchildren. Can you tell us about their concerns and how they experienced the pandemic?

Maureen Somers

I'm a grandmother to eight grandchildren. To hear one of my grandchildren in utter terror that their parents could die from a virus that he might bring home—or they might bring home—and the absolute terror that if their parents died, the question to me was, "Grandma who will take care of me?" And as a grandma, I reassured my grandchild not to be afraid. However, my fear, my biggest fear— Not COVID, nothing else that has happened. My greatest fear is that I may outlive a few of my grandchildren that were unfortunately vaccinated.

Geneviève Eliany

I understand your husband was taken to the emergency room for excruciating abdominal pain during the pandemic. Can you tell us about his experience?

Maureen Somers

Back in October of 2022, my husband arrived by ambulance to the emergency ward of our local hospital in excruciating pain. He was left in the ER hallway on a cold gurney. And the attending doctor, the ER doctor at that time, the priority was whether he was vaccinated or not. When he was questioned by the doctor, "What is your vaccination status?" and my husband replied that he was not vaccinated, then the interrogation started. That was the doctor's priority. "Why aren't you vaccinated?" My husband's response was, "I don't want the vaccination." "Why don't you want the vaccination?" "I told you I don't want the vaccination."

My husband's in pain. And that was the doctor's priority. And her comment and reply to his insistence that he did not want the vaccine—particularly not right then and there. She said to my husband, "Mr. So-and-So if you don't take this vaccination right now, you're going to be dead in two years." My husband said at that time, "My wife is on her way. She is my power of attorney. You can speak to her."

Well, upon my arrival that doctor couldn't be found anywhere in the ER department. Even though I requested to speak with her twice through the nurse, the attending nurse, we were abandoned by that doctor. She never returned. The attending nurse who was looking after my husband told him he would have to wait until the ER shift change and there would be a new doctor who would attend to him.

[00:05:00]

We waited an hour and a half for this new doctor to show up. Luckily, this doctor couldn't care less about his vaccine status, ordered tests immediately, and determined that my husband needed emergency appendix surgery, ASAP.

Geneviève Eliany

Thank you. I don't have any further questions for you. Perhaps the commissioners do.

Maureen Somers

Oh, I'm happy to report my husband is healthy and alive.

Geneviève Eliany

Thank you very much for your testimony today.

Maureen Somers

Thank you very much.

[00:05:52]

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 13: Dianne Spaulding

Full Day 3 Timestamp: 09:48:19–10:01:44

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Geneviève Eliany

The next witness, I believe, is Dianne Spaulding. Could you state and spell your name for the record, please?

Dianne Spaulding

Yeah, it's Dianne Spaulding. D-I-A-N-N-E S-P-A-U-L-D-I-N-G.

Geneviève Eliany

Do you promise to tell the truth today?

Dianne Spaulding

I do.

Geneviève Eliany

I understand that you suffered a vaccine injury. Can you tell us what those injuries were?

Dianne Spaulding

I received the AstraZeneca vaccine on April 23rd, 2021. The next three days, I had just some fatigue, bone pain, and a fever. But on the fifth day, I had a bleed on my lower arm. Where the injection was, it had a lot of swelling and redness and a rash. After that, I started getting pins and needles in my hands and in my feet. And they were going up my arms and up my legs. I started getting blurry vision. I was sitting on the couch. This was around the fifth day after the vaccine. And I had this earthquake feeling in my head. That's the best I can describe it, it just felt like an earthquake in my head. That quickly followed by this intense dizziness and disassociation feeling. The best I can describe that is a drugged feeling. My head just felt drugged. Like, I was there, but I wasn't there, kind of thing, like disassociation. I started getting internal vibrations in my chest. Light and noise sensitivity. I

had to constantly turn down the volume of everything and close the blinds in the house. I couldn't take any light or noise. I started getting very fatigued. I actually spent two months in bed: I could not get out of bed. I'd go to bed and wake up and think, "Oh my gosh, I haven't slept." So I just stayed in bed. I started getting bruising all over my body, head-to-toe bruising and petechiae, which are little, small blood dots on my skin.

Geneviève Eliany

We have some photos, so we'll walk you through the photos [Exhibits TO-10b to TO-10h]. Just one moment.

Dianne Spaulding

So that was that was my arm.

Geneviève Eliany

And that was the injection site, correct?

Dianne Spaulding

That's correct.

Geneviève Eliany

Okay.

Dianne Spaulding

That was the bleed on my lower arm, where the injection was.

Geneviève Eliany

So this was the same arm as the injection arm?

Dianne Spaulding

That's correct.

Geneviève Eliany

Okay. These were the spots that you tried to describe a moment earlier.

Dianne Spaulding

Right, the petechiae.

Geneviève Eliany

Is this some bruising?

Dianne Spaulding

Yes.

Geneviève Eliany

And this looks like it's a—is it your arm or your leg?

Dianne Spaulding

It looks like my leg.

Geneviève Eliany

Okay.

Dianne Spaulding

That was my chest.

Geneviève Eliany

Another bruise on your chest.

Dianne Spaulding

They were everywhere.

Geneviève Eliany

Again, your arm. And this is obviously a finger. What happened to your finger?

Dianne Spaulding

My fingers just started peeling.

Geneviève Eliany

Was there pain that went with this bruising and peeling?

Dianne Spaulding

No, not really. No, I mean, I would just wake up in the morning and look at my body, and it would just be full of bruising.

Geneviève Eliany

Again, some bruising. And it looks like there's a raw patch there. Can you describe that for us?

Dianne Spaulding

Yeah, probably like an eczema or something, like, yeah.

[00:05:00]

Geneviève Eliany

Did you ever have bruising or eczema like this before the injections?

Dianne Spaulding

Not the bruising. All my life I've had asthma and allergies, so I have witnessed eczema before. Definitely not the bruising. Yeah, I don't know what that was. A rash.

Geneviève Eliany

Okay, thank you.

Now you have an unusual story with respect to your hospital visits. Let's start with the first visit. So what was the diagnosis?

Dianne Spaulding

The first visit was when I had the bleed on my lower arm. Of course, I had heard on the news about the AstraZeneca cases causing VITT [vaccine-induced immune thrombotic thrombocytopenia]. So I was quite concerned about that, thinking that I may have that. I went to the ER. And the first thing they said is, "Wow, you've had quite the response to the vaccine." You know, like that's a good thing. And that was about it for that first visit.

Geneviève Eliany

At what point were you diagnosed with anxiety?

Dianne Spaulding

That would have been my third visit. I had more symptoms after that. I ended up having a hand tremor, a leg tremor, and a head tremor. And these head tremors were like Parkinson's. I couldn't control the tremors in my head. So yeah, that's when I went back to the hospital again. That was the third visit, I believe. They diagnosed me with anxiety. And they referred me for a psych consult. That ultimately led me to see a psychiatrist and place me on anti-depressants.

Geneviève Eliany

The psychiatrist also referred you elsewhere. What kind of paperwork did she provide you with and what kind of referrals did she make for you?

Dianne Spaulding

So she wrote me a letter of exemption against the second vaccine and to be able to use the amenities at our condo, such as the pool and the gym, because she felt that would be good for me to do that. I had a referral to a neurologist, a hematologist, a rheumatologist. And the rheumatologist basically just asked me why I'm there. He didn't understand why I was sent there. The hematologist was actually a phone call, it wasn't an in-person visit. And he asked me, maybe I'm "just clumsy?" The neurologist, actually, he acknowledged my vaccine injury. He actually said, "I have seen some cases come through that are presenting with an essential tremor, and that's what you have."

Geneviève Eliany

So you saw all those specialists in summer 2021, correct?

Dianne Spaulding

That's correct.

Geneviève Eliany

Okay. And ultimately, you submitted an adverse event form.

Dianne Spaulding

Yes, I did.

Geneviève Eliany

Did you receive any responses to that?

Dianne Spaulding

I was told to go and get the second vaccine.

Geneviève Eliany

Despite the exemption that you received from the psychiatrist, was it?

Dianne Spaulding

That's correct. Toronto Public Health told me to—suggested that I—get the second vaccine.

Geneviève Eliany

Now what happened in January 2023? And this is what makes your story quite different. You received a call from Mount Sinai Hospital?

Dianne Spaulding

I did. I had complained to the human resources at Mount Sinai Hospital for the treatment that I had received for the anxiety diagnosis that ultimately put me on antidepressants. And I had to wean myself off them. So yeah, they actually called me—that was in the fall—so I actually got a call in January from them with an apology saying, "We apologize for the way that you were treated and the way we handled the situation." You know, given the anxiety diagnosis.

Geneviève Eliany

And I understand they also told you that they had a board meeting about you? Is that right?

Dianne Spaulding

That's what he said, yeah.

[00:10:00]

Geneviève Eliany

Did you get a sense of whether there were many cases discussed? Or he just mentioned that you were part of this or you were discussed in this board meeting?

Dianne Spaulding

No, he didn't mention anything about other people, just me.

Geneviève Eliany

Despite the apology, were you successful in getting helpful conventional care?

Dianne Spaulding

Not from them. I lost my family physician over this because when she received the report from the hospital saying I had anxiety, she yelled at me and said, "Dianne, you have anxiety," and she hung up. So I lost my family physician over that.

I mean, I went home, and I basically went online and researched for myself. I found a lot of Facebook support groups with thousands and thousands just like me with the same, similar symptoms. That's where I found the FLCCC. And I found a local doctor here in Toronto that prescribed me ivermectin. And that's when I finally—I finally turned a corner. I was able to get out of bed. My tremors went away. My internal vibrations went away. Yeah, so that was about the only successful care that I received.

Geneviève Eliany

I understand the bruising and the bleeding remains a problem, right?

Dianne Spaulding

That's correct. The bruising, the blood dots—they seem to come out after a busy day, like if I'm being active at all. And the disassociation in my head, the fogginess, the brain fog—it just never went away. It's still there.

Geneviève Eliany

Thank you, we'll see if the commissioners have any questions for you.

Dianne Spaulding

I would just like to end my testimony with a quote. Dr. Zelenko, he said that he wanted the epitome of truthful messaging, that he wanted the truth like a mantra propagated. That's why I'm here today. To be seen, to be heard, to be believed. You know, the gaslighting, it has to stop. It's been really difficult. Thank you.

Geneviève Eliany

Thank you on behalf of the National Citizens Inquiry.

[00:13:25]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

NATIONAL CITIZENS INQUIRY

Toronto, ON

Day 3

April 1, 2023

EVIDENCE

Witness 14: Jan Francey

Full Day 3 Timestamp: 10:01:58–10:11:27

Source URL: <https://rumble.com/v2frcs0-national-citizens-inquiry-toronto-day-3.html>

[00:00:00]

Geneviève Eliany

Could you turn your video on please, Jen? Thank you. Could you state and spell your name for the record, please?

Jan Francey

It's Jan Francey. And spell my last name? F-R-A-N-C-E-Y.

Geneviève Eliany

And spell your first name please.

Jan Francey

Oh, Jan. J-A-N.

Geneviève Eliany

I know it seems simple. Do you promise to tell the truth today?

Jan Francey

Yes, I do.

Geneviève Eliany

I understand that you were also vaccine-injured. But let's start with why you were reluctant to receive the vaccination in the first place.

Jan Francey

Yeah, when I was 18 months old, I was hospitalized with severe encephalitis, and they didn't have a cause for it. They said it must have been mosquitoes. This was in January in Canada. And I mean, it was severe enough that my prognosis was very bad. And that was if I lived. And so I've avoided— I've gotten my tetanus shots but I haven't gotten things like flu shots because I just don't want to mess with those things. So I didn't want to get that because of that.

Geneviève Eliany

Okay. And ultimately, what made you change your mind?

Jan Francey

The vaccine passport. Winter was coming, I live in a shoebox. The thought of an entire winter sitting inside was— I was afraid I wouldn't make it through the winter. I live alone.

Geneviève Eliany

When you say you live in a shoe box—

Jan Francey

I don't have any family here.

Geneviève Eliany

Sorry, I didn't mean to interrupt you. I didn't hear what you said.

Jan Francey

The apartment is very small: it's one room; there's no balcony; it's maybe 200 square feet.

Geneviève Eliany

So what happened after the first injection?

Jan Francey

After the first one, I woke up and I didn't feel well. I felt nauseous. I was throwing up. I kept throwing up. But I also had, like, a sensation in my hands that wasn't right. It was like they were vibrating but they were also kind of numb. But there's also pins and needles. And that just continued and the throwing up continued. And then it came time to get the second one, which I had to get because I still wasn't a person in Ontario.

After the second one, everything got really bad. When I woke up the day after the second one— Uh oh.

Geneviève Eliany

We can still see you.

Jan Francey

Okay. When I woke up the day after the second one, all my joints were stiff. Everything hurt. The numbness and the vibration had gotten worse. And then, over the course of a couple weeks, the vibration could continue all night but they were everywhere. I could feel it in my gut. Everything was vibrating. I could not sleep. I felt like I was moving all the time. And then, yeah, things just kept worsening.

I developed Raynaud's. But I also couldn't feel my hands. I couldn't detect heat. I could pull things out of the oven without an oven mitt. You don't think about it because you don't feel any heat. You've done it already when you realize you've done it. I couldn't feel my feet or my face either. That went on for months. I couldn't feel the shower.

And then as time went on, I started getting a lot of symptoms in my head: my eyes, my vision went bad, my hearing. I couldn't tolerate anything. I couldn't tolerate light. I couldn't tolerate sound. I couldn't tolerate vibration. People talking, that was just way too much. I couldn't handle people talking. And then my neck started to get stiff. And I started to feel like my sinuses were being pushed down. I just felt like my head was going to explode. The pain was so brutal.

Geneviève Eliany

What happened when you tried to get help at the hospital?

Jan Francey

I went to the hospital in June last year, or July—July 4th. I was plastered in hives and giant lumps. We don't even know what I reacted to. And I had tried telephone appointments, which is what I usually relied on. And I'd gotten Rupall and that didn't do anything. So we tried to go to the hospital. Well, I'm mask-exempt due to PTSD. It was a trauma from a violent crime.

[00:05:00]

So I get in there and I have to deal with the security guard, who's not too bad. But he's pretty persistent, he wants to put something on my head. Then I get into triage and I have to show him my letter for my mask exemption. And then my partner, who's with me, has to show him proof of vaccination. And then we finally get through there and get sent to the next waiting room, when a nurse decides that she's going to attack. And I was humiliated in front of the entire waiting room. She would not stop. And I ended up leaving. My partner wanted me to stay because I was an absolute mess. The hives and lumps were everywhere. I was on fire. But it's just too much. How am I going to trust somebody who just screamed at me and humiliated me? Where's the care in that?

Geneviève Eliany

So ultimately, you did have an appointment with an immunologist. And what happened at that stage?

Jan Francey

That was after the hives, which I ended up on prednisone for through a telephone appointment. So they had set me up with them to figure out what was going on. So I started explaining what was happening to him. And I said, I get these—when it happens, like, I get

this vibration in my neck. He didn't think that it had anything to do with that. He didn't know why or what I reacted to or what was going on. And he suggested that I needed to see a rheumatologist and a neurologist.

Geneviève Eliany

Were any of them able to help you?

Jan Francey

This was a telephone appointment with the immunologist and nothing ever happened after that. I don't know how you get yourself a telephone appointment, I mean, with a specialist.

This appointment with the immunologist was set up by one of the other telephone doctors.

Geneviève Eliany

But did the immunologist not refer you to both a rheumatologist and a neurologist?

Jan Francey

I never got a call. No, nothing.

Geneviève Eliany

Okay, so you never received a follow-up, but that was his recommendation, right?

Jan Francey

Yeah.

Geneviève Eliany

Okay. How did this interfere with your ability to work?

Jan Francey

I was not working when it happened. So it didn't interfere.

Geneviève Eliany

Okay. Are you able to—

Jan Francey

But I couldn't work. There is no way that I could work now. I can't even stand up for 10 minutes without my heart—I have cardiac problems as well now. And I take a walk and my heart goes up to 140. So it's not a good feeling.

Geneviève Eliany

Did you have any success with the adverse events reporting system?

Jan Francey

Well, I got my first telephone appointment. Because I had my last shot November 11, 2021. And then in December, I called for an appointment. I had to wait till the 15th of January. And that doctor was terrified. As soon as I mentioned the vaccine, she started to stutter. I said, "I want to be exempted from more of this. I can't take any more of this." Because I was scared because they kept talking about more and more boosters. And I didn't want to not be a person, but I don't want to die either. So I asked her for an exemption. And she said, "No, no, no. No exemptions. The College said." Well, then I asked about reporting my injuries. She said, "There's no point in doing that because they just throw them away."

And she was right because I tried to self-report. Fast-forward eight months and Toronto Public Health just basically turned it into nothing. Sent the first doctor I talked to on the phone a letter saying, "You can decide if she's having another shot." And they also said that they don't write exemptions.

So then I wrote to the College of Physicians and basically demanded one and asked them who they thought they were. And I never heard back from them.

Geneviève Eliany

Thank you. I'll see if the commissioners have any questions for you.

No questions. Thank you so much for your testimony, on behalf of the National Citizens Inquiry.

Shawn Buckley

So that concludes the witnesses for today, and so we will adjourn the National Citizens Inquiry and reconvene in Winnipeg.

[00:09:29]

Final Review and Approval: Jodi Bruhn, August 16, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

EVIDENCE WINNIPEG HEARINGS

**Winnipeg, Manitoba, Canada
April 13 to 15, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[Technical difficulties]

[00:00:55]

Shawn Buckley

Thank you for joining us this morning with the National Citizens Inquiry as we begin our hearings in Winnipeg, Manitoba. For those of you that have been following us, we had three days of hearings in Truro, Nova Scotia. We've had three days of hearings in Toronto, Ontario. We are now in Winnipeg, Manitoba. We will be marching across Canada.

We're moving next week to Saskatoon, Saskatchewan; Red Deer, Alberta, the week following that; Vancouver, British Columbia, the week following that. We're then moving to Quebec City. And then we're concluding in our nation's capital, Ottawa, Ontario. For those of you that aren't familiar with the NCI, we are a hundred per cent citizen-organized, -run, and -financed group that just realized that we had to have an inquiry march across Canada, giving Canadians the opportunity to share their stories so that we could find out basically what has happened, what we have experienced; that we can come up with positive recommendations as to how to do this better; and more importantly, as this process has started, so that we can come together, listen to each other, and heal.

Now, I would invite everyone out there to join in and support. When I say this is citizen-run and -funded, I mean, we're not kidding. We don't have a single donor. We depend on people like you to donate. I think each hearing costs us roughly about \$30,000 to \$35,000 to run, and so we would invite you to go to our website and donate. We'd also invite you to plug us on your social networks and to push us out to your friends and family, to anyone that isn't part of the conversation about what happened. The mainstream media is not here, and they've not been here. And we anticipate that they won't be here. But we are growing at just an incredible rate online because you, the citizens, are making this happen. And we invite you to continue to participate in every way that you can. If you're a business owner and you have a tire shop and you have a TV in the waiting room, livestream us. When we don't have live hearings on, just stream one of the hearings that we have recorded on our website. But get the word out; get people involved in this conversation.

The thing that I can promise you about the National Citizens Inquiry, and those of you participating online, and those of you in the room with us this morning, is you cannot go through a day of this experience and not have your life changed. I attended at the Toronto hearings, and I am a changed person.

One of the things that shocked me as I reflected on that experience, as I reflected on the stories that I heard, actually, was the hatred. And I'm going to speak to you a little bit this morning about hatred—that's such a sharp word. But I have to tell you that I'm also going to be speaking to myself. Often, when we see something that's troubling us, it's also inside of us. And so I'll ask everyone to have an open mind as I speak about this. You can go and watch the Toronto hearings. We have them posted at the NCI site for everyone to see. We've got them on our Rumble channel. We had Canadians telling their story. And story after story, experiences of hatred surfaced.

[00:05:00]

We had stories from unvaccinated people speaking about things like social shaming. Do you remember Tom Marazzo? He's working as a college professor. And the dean sends out an email to over two hundred of the faculty and staff saying, "We're bringing in mandatory vaccinations." And Mr. Marazzo emails back in a "reply all," saying, "Well, that's basically all fine and good. But there are some other things. There are some rights [at play]. And perhaps we should be having a dialogue about this." And then if you recall his testimony, somebody in a "reply all" said, "Please take me off your email list." And then somebody else, and then somebody else, and then somebody else. And then, somebody on that list who is clearly getting too many emails chimed in and said, "Can we not 'reply all' so that I don't have to go through hundreds of emails?" And then another person chimed in and said, "No, we need to publicly shame Mr. Marazzo. We need to stand together in shaming this person." And so, it was "reply all, reply all," all day long to deliberately shame him. Now that is hatred.

We heard testimony about unvaccinated people literally being treated as subhuman by medical workers. We heard that from patients.

I recall Mr. Mark Auger who testified. He shows up at the emergency ward and he's being treated fine. He needs to stay because he needs surgery the following day. They don't have a room, "So Mr. Auger, you're going to stay on the gurney in the hallway in Emergency." And there's a conversation, and they find out he's unvaxxed. And all of a sudden, he's in a room. They don't even take him off the gurney to the bed. He spends the night on the gurney even though he's in a room with a bed. He's hardly visited at all. And if you remember, the shaming when he had to get up to go to the bathroom, and he comes back, and on the glass door is a sticky note with one word: "unvaccinated."

If you recall the testimony of Scarlett Martin, who is a paramedic, about, basically, the hatred in both the ICU wards and in Emergency towards the unvaccinated. And comments within the medical system like, "Well, the unvaccinated, they deserved what they got when they got sick." And we've actually all heard comments like that when we were in the midst of this, that "those unvaccinated, they deserved what they got." Now that, that is real hatred. And we heard comments that the unvaccinated should be denied healthcare. And we all remember that in the midst of this crisis, in the midst of this fear, in the midst of this hysteria in Canada, we would be hearing publicly— It put out that perhaps the unvaccinated should not be entitled to healthcare. So it's somewhat ironic that vaccinated people that are now injured from the vaccine are telling this Commission that they are,

basically, in effect, being denied healthcare—that that's been turned around. This is real hatred.

Let's talk about the hatred towards the vaccinated. We had witnesses take the stand in Toronto to speak about tremendous injury. People that are totally disabled, their lives are ruined, where it was difficult for us listening to the testimony, not to tear up, not to choke up, not to feel tremendous empathy for the suffering that they're going through. And yet, they described to us that when they show up to the hospital with serious injury, that they're just discounted: "Oh, you have anxiety. Oh, this is all in your mind." And then that basically they have to fight to get treated. They're not succeeding. They're basically being treated as second class

[00:10:00]

within the healthcare system that will not admit, that for some reason, the doctors and nurses— We can't admit that we are having vaccine injuries. And the doctors and nurses are telling people that they can't admit that. But it's one thing to be cowed to do dishonourable things from your professional organization because you're scared. But it's another thing entirely to not treat a person with kindness just because you're being bullied. And so what we have here is real hatred.

I think the thing that is most despicable with not treating vaccine-injured people with respect, and a couple of them said it on the stand, "Basically, we took one for the team. We were told to take the vaccine to protect everyone." Some were reluctant to do it, but they took one for the team. And now that they're disabled, the team is discarding them. And that is despicable.

We're talking about hatred. And when I'm thinking about how awful it is—how we're treating people that are vaccine-injured—I couldn't help but think of that video that we watched in Toronto where we have veterans at the war memorial when the *Emergencies Act* is being introduced. And we have all these police officers looking like stormtroopers, they're so geared up. And that one wounded war veteran—so served Canada; is wounded; we couldn't see in the video, but his medals were on his chest—being dragged to the ground and kicked by the police officers. In Canada. One of our war veterans. A decorated war veteran who is disabled because of his service. That's hatred.

So we're experiencing real hatred. And the fact that we've now moved into treating vaxxed people like lepers in the healthcare system is just despicable.

So I have two things to say to our health care workers who deny vaccine-injured people kindness and respect because these health care workers are not willing to take personal responsibility for their actions: **The first thing I want to say to you is you should pray. You should pray that you are never treated the way you are treating these people that are vaccine-injured. And the second thing that I'd like to say to you is, may "you" always be treated with kindness and respect. May you "always" be treated with kindness and respect. Because the only way for us to move forward—the only way for us to move forward—is for all of us to treat everyone with kindness and respect. There's so much hatred in this country that every one of us has different ideas of how we would like this to play out: We want justice. We want vengeance. And none of that is going to work.**

I think it was on day one of the Toronto hearings, I tried to point out that the vaccinated and the unvaccinated really had the same experience. And that the hatred that we have for each other has come out of a place of fear. And just to quickly recap. Understand that a

large number of the unvaccinated people believed that the vaccine was dangerous, believed that literally it could kill them or cause serious disablement to either them or their loved ones, like their kids. And the difficulty that they faced was, you have the government trying to force this on them and their family. And the vaccinated people participated in this social pressure. And the employers imposed these mandates, which they didn't have to, et cetera, et cetera. The vaccinated, in the minds of the unvaccinated, actually became a real threat to both themselves and their family. And when you feel fear, you become resentful, and then you hate. There is a lot of hatred

[00:15:00]

from unvaccinated people over what happened.

And the vaccinated had the exact same experience. They believed that COVID-19 presented a serious threat to themselves and their family—that literally they or their loved ones, like their children, could die or be disabled—and there was a solution. They believed the vaccine was the solution, and it would work. It would take away the threat if “only,” if “only” those unvaccinated people would play along and get vaccinated. And so, understand that to them you unvaccinated people were a threat. You were a real threat. And then the resentment came, and then the hatred came. And there was real hatred.

And so, we had two groups that started hating each other all out of fear, all having the same experience. But we have to forgive each other. Even if the other side doesn't owe us an apology, we have to forgive. And we have to stop hating. There is no other way.

You know, it's funny. We took a week off for Easter. The Easter story is all about forgiveness. And as I was preparing last night—I don't decide what I'm going to say in the morning until the night before or the morning of—I'm asking myself, “How the heck do I explain that we need forgiveness ourselves and we also have to forgive others? How do I explain that to people?” And then it came to me, of course, the parable of the master, the lord. And I'll just share it with you just because I couldn't come up with a better way of explaining the concept.

So for those of you who aren't familiar with the parable, I think it was Peter who goes to Jesus and says, “Jesus, how many times do we have to forgive our brother who sins against us? Up to seven times?” And you have to understand, when Peter's asking that question, he's thinking the idea that you would have to forgive someone up to seven times is really bizarre. Surely after three times we can kick that person loose and have nothing to do with them. So he's stretching it: he's saying up to seven times. And Jesus responds to him, and he wasn't expecting this. And He says, “No, no. You forgive them seventy times seven times.” Now Jesus wasn't meaning that after somebody's wronged you 490 times, you can stop forgiving them. Jesus was just making the point— There's actually no cut-off point where you stop forgiving people.

And then He tells this parable and listen carefully to this parable because it applies to Canada; it applies to our need to forgive each other. And He says, “There was this lord that decided to settle his accounts with his servants.” And I'll just use Canadian dollar figures. “He has this servant brought before him and says, ‘Listen, I've lent you \$150,000. And I want you to pay me back now. We're settling our accounts. I want you to pay back the money that I've lent you.’ And the servant can't. And the master says, ‘Well, that's fine. We're going to sell all your possessions, and we're going to throw you and your family in debtors' prison.’

“And the servant is realizing that his life is ending. He and his family are going to be thrown into prison, and they’re never going to recover from this. It’s done. So the servant does the only thing the servant can. He falls on his knees and starts weeping and begging and saying, ‘Lord, don’t, please have mercy.’ And the lord is moved with compassion and says, ‘Okay, I’ll forgive you. I’ll forgive you your debt. Off you go.’

“And this very same servant then comes across another servant that he had lent 1,500 bucks to and says, ‘Hey buddy, you owe me that 1,500 bucks, and I want it back.’” This guy’s just felt challenged about money. “And the other servant doesn’t have the money to pay him back. And so, the one servant says, ‘Well, I’m going to have you and your family thrown into debtor prison.’ And this other servant, she realizes her life and her family’s life is ending now.

[00:20:00]

“So she does the only thing she can do. She falls on her knees and starts begging for mercy. And this servant doesn’t grant it and says, ‘No. Off to debtors’ prison.’

“Now, some of the lord’s servants had seen this happen and reported back to the lord, who had forgiven this servant \$150,000, and has the servant brought back. And basically says, ‘I forgave you a large amount, and yet you wouldn’t forgive a little, so off you go to debtors’ prison.’”

And what this parable explains to us—I hope it helps us understand—we have wronged other people. And in this COVID experience, no matter where you are on the conversation, you have wronged other people and you have decided to hate. Most of us have decided to hate. And I’m speaking to myself.

But the second more important thing is others have wronged us—or we think others have wronged us—and we have to forgive them. This is the whole point. We are the only ones that can get rid of our hatred by forgiving them. We— We can stop hating. And we learned in Toronto that we have to, the amount of hatred that we have seen. We— We can choose to act with kindness because that’s what Canadians used to be about. We used to treat each other with respect and kindness. And so, I would like to announce to you today that “we” are free to be Canadians again. And by participating in this process, I hope that we will keep an open mind and an open heart and start treating each other like we used to before.

So those are my opening remarks, Commissioners. For the record, my name is Buckley, initial S. I’m attending this morning to assist with the Commission Administrator, the Honourable Mr. Ches Crosbie, who is present to help guide these proceedings today, and who I hope will be giving us a closing summary at the end of the day.

[00:22:32]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 1: Dr. Jessica Rose

Full Day 1 Timestamp: 02:06:11–03:30:40

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Shawn Buckley

And our first witness that we have attending virtually is Dr. Jessica Rose. And so, Jessica, can you hear us?

Dr. Jessica Rose

I sure can. Can you hear me?

Shawn Buckley

We can hear you very well. I just wanted to start by asking if you could state your full name for the record, spelling your first and last name.

Dr. Jessica Rose

My name is Jessica Rose. J-E-S-S-I-C-A R-O-S-E.

Shawn Buckley

Jessica, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Jessica Rose

I do.

Shawn Buckley

Now, my understanding is that you are a Canadian researcher. You've got a bachelor's degree in Applied Mathematics and a master's degree in Immunology from Memorial University of Newfoundland; you also hold a PhD in Computational Biology from Bar-Ilan University. And following your PhD, you have done two post-doctorate degrees: one in

Molecular Biology from the Hebrew University of Jerusalem and one in Biochemistry from the Technion-Israel Institute of Technology. Is that correct?

Dr. Jessica Rose

That's correct.

Shawn Buckley

And my understanding is you were also accepted for a two-month program as a senior researcher at the Weizmann Institute prior to the completion of your last post-doctorate degree.

Dr. Jessica Rose

Correct.

Shawn Buckley

And your most recent research efforts are aimed at, basically, what we call a descriptive analysis of the Vaccine Adverse Event Reporting System (VAERS). And you've analyzed this in efforts to make this data accessible to the public.

Dr. Jessica Rose

Yes.

Shawn Buckley

Now, you have sent us a CV, which I've had marked as an Exhibit WI-4. Is it fair to say that the CV you sent us is an accurate description of your experience in education?

Dr. Jessica Rose

If it's the one that I sent, then, yes.

Shawn Buckley

Okay, yeah. No, no, I promise you I didn't change it. So you've researched the effect of the vaccines. And you've done a whole bunch of research on the VAERS system. And we're inviting you to tell the Commission about your findings. So I just invite you to start **presenting your findings**.

Dr. Jessica Rose

Sure. I'm going to share my screen and so if you can just let me know if you can see my PowerPoint presentation [Exhibit WI-4g]. Can you see that?

Shawn Buckley

We can. We've got up there, "What dinosaurs would look like according to Neil Ferguson's models."

Dr. Jessica Rose

So first of all, I want to thank you for inviting me to provide testimony. Anytime I'm invited to speak or given any kind of platform to disseminate information is taken upon me, I always like to start out with jokes, just to lighten the mood because, yeah, we not only need to forgive each other, we need to forgive ourselves, and laughter is medicine.

I saw this on Flickr the other day, and it made me laugh so hard. For those of you who don't know, Neil Ferguson is the modeller for which his models basically were used as the justification to impose lockdowns on all of us. And if you read the articles that I've listed here at the bottom right, you'll see very clearly that he's kind of notorious for making bad predictions with his models. So it's kind of interesting that the policymakers went to this person in order to justify the lockdowns, isn't it? I thought this was hilarious, that this is what dinosaurs would look like according to his models.

And I needed to add this point as well: It's not really about the virus or anything. But it's relevant to what we've been going through in the past three years. It was very shortly, less than a day after you guys, the National Citizens Inquiry, posted that I would be presenting testimony here that somebody posted a Reuters fact check, which was basically a hit piece written on me with the claim that I was making false claims of death using VAERS data because I had not understood the data and that I was misrepresenting it. So whenever this kind of thing happens, sadly, I'm not a stranger to this kind of treatment at this point.

[00:05:00]

But it usually means that you're over the target. So well done to you guys. And I leave it to everybody listening to this live and afterwards to make up their own mind as to whether or not I'm misinterpreting any data here because usually what I do is I present it in its raw form.

So this is my background. I'm not going to dwell on this. I do have a few degrees. But the most important thing that people should know is that data analysis has always been a critical component in each of these fields and/or disciplines that I've participated in. Doing your experiments isn't enough. You have to be able to present them and analyze the data in a clear way to your colleagues. So this is very important.

I really need to reinforce the fact that we're dealing with products, in terms of the COVID-19 products, especially the mRNA, that were rushed through clinical trial testing. Normally, a conventional vaccine takes approximately 10 years to get to market, and we reduced this time frame down to less than a year. And these trials are basically the foundations upon which all the decisions were made and the mantra that we've been hearing for three years, "safe and effective," are based on. Not only that, but these are kind of the springboard upon which all subsequent trials were based on. And these trials are exceedingly bad. And they **not only do not provide evidence of safety and efficacy, they actually provide the opposite, in my opinion. I've gotten pretty deep into this data. The exclusion criteria list for the Phase III trial were huge. Basically, only people who were healthy and of a certain age requirement were allowed to participate. And so it's very difficult for me to understand how anybody could make claims of safety and/or efficacy when there simply wasn't enough time. Genuine safety testing was impossible. That is a fact.**

And furthermore, instead of a two-year follow-up, what happened in the case of the Pfizer clinical trial, number here [NCT04368728], is that the placebo participants were unblinded and injected with the product. So the placebo group was intentionally lost. And if you don't know what that means, it basically means that if you had any kind of trial or experimental data that was being collected, at some point, it's lost, at this point. Without a placebo group,

you have no comparison. So at this point, the whole thing should have been called off, if you ask me. There are so many stopgaps within the last three years.

I'm going to play this video and hopefully you can hear. This is Rachel Zhang.

[Played video clip of Rachel Zhang, MD, Team Leader, Clinical Review Staff, FDA]

[Video transcript]

"I'm not quite sure I'm going to address your question. But I guess it was the study P203, as I mentioned, because of the availability of an alternate COVID-19 vaccine, after a certain period of time, after basically end of May, we have lost the placebo groups. So we cannot really say anything about the duration [of the efficacy] because there's no more efficacy data, basically."

So exactly what she said is correct. If you heard what she said, she confirmed the fact that the placebo group was lost and that we can't say anything about efficacy after that. But what she missed out on saying is that we can't say anything about safety either.

So the biological products being rushed like this is absolutely unprecedented, and I'm talking about conventional vaccines when I say these words. It hasn't been done like this before. And the effects of doing this, this Operation Warp Speed rush-clinical-trial-thing in the context of novel transfection technologies is absolutely unknown. This is a fact. We don't know the effects. We should have done studies for years, perhaps even decades, to see if this was going to become a problem from a genomic point of view.

And just a really quick word on transfection for people who don't know: this is as opposed to exposure to foreign proteins, which is what conventional vaccines traditionally do. We either kill a virus or we send in proteins in a package, and the idea is to get the immune system to mount a response against these proteins. But that's very different from this, and I'm going to get a bit deeper on this.

This is deliberate introduction of nucleic acids that form, say, a modified mRNA, which is foreign, into the eukaryotic cells of the human

[00:10:00]

for translation by the human cells, by the host cells. This is completely different from anything we've done before. And if we have time at the end, you should ask me about this last step.

And my question here for anybody listening comes down to informed consent. I really would like to know how many people of the billions who are injected with these products knew that they were being injected with something that wasn't a traditional vaccine. I'd really like to know because I can pretty much guarantee that most people didn't. I don't even think people know today. A lot of even medical professionals, they don't know this because they're turning a blind ear to it when it's suggested to them because it's been made out to be some kind of conspiracy theory.

A very important point. And I will provide some background on VAERS, but I want to throw this up here. It's very important. We had enough of a safety signal from VAERS to stop the rollout of these products from a safety signal perspective in January. I'm talking like the first month after the rollout started in December 17th. So on the left here, these are absolute numbers, which I chose to show here because I want to reinforce that these are

people, not data points. We had almost 90,000 entries into VAERS spread across many age groups and almost 700 deaths. Now, the last time, to my knowledge, a product went onto the market and killed more than 50 people, that product was pulled. VAERS has functioned and does function as a pharmacovigilance tool in that when a safety signal is detected—Such as was the case in 1999 when a handful of intussusception cases was detected in VAERS, causality assessment was done, and the rotavirus vaccine was subsequently pulled.

So my question here—this isn't intussusception, this is death—what's the cut-off for the number of people who are considered allowed to die or become disabled or have neurological conditions or, et cetera, et cetera, before the product is pulled? An even better question might be: Why aren't we even asking questions? Why aren't the CDC, the HHS, and the FDA, the owners of this data, asking questions? Why aren't they doing the assessments that they always have been doing in the past, such as causality assessments or Bayesian analyses or PRR [proportional reporting ratio] studies? Why?

So I propose something here, if I may. Because VAERS was introduced 30 years ago as a trade-off for immunity from liability from pharmaceutical companies: We got VAERS. And they got immunity from liability. So if they are not, since they are not using VAERS as a pharmacovigilance tool now—they've waived this tool—then I propose that the immunity from liability also be waived. It only seems fair, does it not?

So VAERS is a pharmacovigilance tool. All this means is that the safety signals that might originate from VAERS are used in causality assessments or any kind of assessment in order to determine whether or not these safety signals comprise a danger to human health in the context of a product.

Now, one of the main problems with VAERS, contrary to what you might have heard, is underreporting. There have been studies done that actually claim that only one per cent of reports are ever filed to VAERS. That means for every 100 people who are suffering, only 1 of them might report. Now, I don't know if that's accurate in the COVID context, but you get the drift. There's only a percentage of people who are ever going to file a report to VAERS.

Now, this is a chart that demonstrates one of the things that I don't think you can confuse with interpretation. This is the raw data. I'm showing on the left the change, for some reason, in 2021 of the file size in VAERS. VAERS is a database that's very easy to access. You can just download CSV files, and they're of a certain size every week. Every week it's updated in megabyte format. So for the last 10 years, if you look at the file size and plot it like this on a two-dimensional plot—pretty simple—it's gone up a little bit over the last 10 years. And that makes sense

[00:15:00]

because there are more products on the market and there are more shots going out. So there's a proportional increase in the number of reports. Normal, right?

This, that you see in 2021, is not normal. Something is strange there. Something is different. Something is atypical. And there's no way to misinterpret this. This is just what it is. This is the signal that you just can't look away from once you see it. It has to be addressed in some way. And on the right are the number of VAERS IDs and, naturally— This is just for 2021 domestic data, by the way. It's far worse than this. You see the same, which isn't a surprise. So we have a 1,400 per cent increase in file size and 1,300 per cent increase in the number of reports in the domestic set. There's no interpretation required here.

This is the same data, up to date as of April 7th, distributed by age group. This is according to CDC age grouping. On the left, you can see the absolute counts. And, again, I like to show this because these aren't simply data points. These are people who have submitted reports of injury and/or suffering in the context of a biological product that was meant to be prophylactic for a virus that has a near-zero infection fatality rate.

And on the right is the normalized data. I think that's important to show so that you can see, within each age group, how many people per 100,000 doses, for example, were reporting. And I can tell you that the 0 to 4 age group, the reporting rate is going up faster than I saw it go up for all these other age groups. So something is going on there as well, which, again, needs to be addressed by the owners of the data. So there's no age group that is immune from damages and/or reporting.

So why are we seeing these adverse events in association with these particular shots? So a good question to ask is— What's in them? So the Pfizer and the Moderna products both have modified mRNA. They're modified in specific ways, which I'll explain very quickly and briefly. And basically, they're useless without these lipid nanoparticle envelopes. So this is a very important secondary technology that's novel in this context.

Moderna and Pfizer both have their own recipes for the lipid nanoparticles. They comprise four lipids each: two of which include the stealth PEG, polyethylene glycol molecules, which coat the surface, hopefully, homogeneously, so that it can distribute efficiently, and cationic lipids, which are notoriously toxic. It's been the bane of the existence of this industry to design cationic lipids for use in humans that aren't hypertoxic. So magically, just about the same time when we needed them, both of these companies developed ionizable cationic lipids—which they only become active at certain pH, that's the so-called magic—at exactly the same time, that are allegedly safe for use in humans.

Now, the thing about this is in all of my research, I couldn't find safety data sheets that actually explicitly state that either of these have a version that's safe for use in humans. I'm looking for those documents if anybody has them. These safety data sheets both explicitly state that these two products are not safe for use in humans or for veterinary use. So that's a big question mark for me. And I'm always an Occam's razor person. And PEG does have a well-documented allergenic profile in humans: it induces anaphylaxis. And cationic lipids have a well-documented toxicity profile. So, for me, that makes me ask more questions than just to become docile and accept that it's safe.

The modified mRNA is modified in very specific ways, like I said. And I don't want to dwell on this, but what everybody really needs to know is that these things are very stable and stealthy. There are many papers that have been published to date that show that these things are very durable and long-lasting in the human. They're optimized for maximum protein expression using codon optimization. They have long poly(A) tails and five-prime caps to optimize protein synthesis and durability. They also, you've heard this before, they have had their uridines swapped out for pseudouridines. And what this does, essentially, is allow these mRNAs to evade immune detection by evading toll-like receptors, which are these little molecules that detect danger signals.

[00:20:00]

So the bottom line here, without dwelling on this, is that these things were designed to be very stable and very durable and long-lasting.

And the by-product is this spike protein and a couple more modifications that included a couple of proline substitutions, which apparently made this version of the spike protein that was in the closed conformation— I guess they did this to ensure stability, again, durability, and so that maybe it didn't bind to ACE2? I'm not sure.

And again, I'm not going to dwell on this because I don't have time in this short presentation, but there are many insertions, let's call them, that raise question marks, such as the furin cleavage site, which makes this much more infectious. It also isn't found in the original version of SARS, which is one of the biggest question marks of all. It's surrounded by cutting sites, et cetera.

Oh, and by the way, I should mention that this has also been identified as a nuclear location site [NLS], which means that it allows for the translocation of this thing to the nucleus. And there's another published paper that shows that the presence of full-length spike protein in the nucleus prevents double-stranded DNA repair break.

So all of these papers, I think, that I've put here that you should all read. There are a number of different things that are questionable about this spike protein from the original Wuhan strain, upon which the spike in the shots have been mimicked after. So it raises serious questions about the way that spike is doing damage. And I'm going to get to a few of these if I have time.

Now, Laura Braden has shown you the figure on the right. We all know that the pharmacokinetic studies have been FOIA-requested that tested where these lipid nanoparticles and the PEG from the Pfizer shots go— And if they go these places, where they go and how they accumulate. So, shockingly, they do traffic to the ovaries and accumulate there. I'm not going to dwell on that. I've given many talks about the potential dangers associated with this. For the sake of time, I'm going to the left here and focusing on the liver. Because the liver is one of the organs where these things are found at the highest concentrations. I think second only to the injection site itself. And this is problematic.

And the reason it's problematic, it's for two big reasons I can think of off the top of my head. What you're looking at here are two systems that are in the human body that control blood pressure, electrolyte levels: in the case of the one on the left, which is the renin-angiotensin-aldosterone system [RAAS], and on the right is the coagulation pathway. So the liver is the source of many, many, many molecules and proteins that are absolutely essential to the closed loop functioning of both of these systems. My point here is if you happen to throw a wrench in either of these works, you're going to have clinical effects. That's a fact.

So the reason it's interesting—and I made a video about this you could watch on YouTube **about the RAAS on the left—is that one of the mediators, one of the molecules, which is essential to this closed loop system is ACE-II. It binds angiotensin II, which is another mediator, which converts to something called angiotensin-1-7. All you need to know about that is this ebb and flow of vascular constriction and dilation is regulated by these molecules. Now, imagine you have something, like a wrench, that you throw into the system that binds ACE-II. What binds ACE-II? Well, we know that spike protein binds ACE-II, don't we? We know that it binds in the form of the virus. Maybe it also binds in the form of the free spike that's manufactured by the body as a by-product of being injected with these products. I can very easily imagine that if you throw a wrench in this system, it could get dysregulated. I'm not saying that it does; I'm saying that it could and it needs to be studied.**

But more concerning is what might happen on the right because we're seeing massive numbers of reports of thrombotic events, clotting and micro-clotting. And it's also been documented that there are dysregulations in the clotting pathway itself in the context of the spike protein, either SARS-associated or these injection-associated spikes.

[00:25:00]

The liver produces prothrombin and all these other mediators, which subsequently make the ebb and flow system of the clots and the things that break down the clots. And that's just as important as the clots themselves. This is all normal stuff. But if you imagine that you throw a wrench in this system as well, and you have problems with the development of fibrin or the degradation of the clots, you can imagine that you're going to have thrombotic issues.

So there might be a common etiology here with regard to many, many, many of the adverse events that we're seeing submitted to pharmacovigilance databases that revolve around these potential dysfunctions associated with the liver. And the reason why I'm starting to think that this is absolutely the case is because the liver is the place where the lipid nanoparticles traffic preferentially and accumulate. And if they are, in fact, dumping their modified mRNA payload, and those mRNAs are getting translated into spike protein in copious amounts, I can't imagine that the liver wouldn't be affected. So this is my idea.

So the coagulation, clotting, and wound healing mechanisms might have their "off button" modified somehow by these spike proteins. So all of these factors that you can see on the left—the platelets and the fibrin and the clots themselves that are formed—are scaffolds, so to say, to make bridges across wounds that are induced by the presence of spike protein. For example, say spike protein gets embedded in whatever cells that are in proximity or they're mounted on MHC [major histocompatibility complex] molecules for targeting from the immune system for destruction. And you get this clotting happening. So imagine that you have a problem with that.

So I'll get back to that. But I want to interject another critical component of the liver, and that's a protein called transthyretin. Amyloidosis, one of the two main types, is caused when these transthyretin proteins that are made in the liver misfold. And this can have direct negative effects for the heart in particular—all sorts of organs—but I just wanted to throw this in here because I'm going to circle back to this at the end if I have time. And I just want to point out another essential protein made by the liver.

The liver is the big detox organ, by the way. This is a paper that has shown recently that spike mRNA is persistent in hepatocytes. Hepatocytes are the main cells in the liver. And wherever you have spike mRNA, there's going to be spike. And this is just one of many, **many, many studies that are going to start rolling in. Trust me, I'm going to circle back to that as well.**

But just to get back to VAERS for a moment, to put some numbers on this. This is just a sample of some of the keywords that I use like "hepato" and "liver" from VAERS to get an idea of how many reports are being filed by age group. And there are tens of thousands. Again, I want to reiterate here, if I haven't said so already, the numbers that I report never include an underreporting factor. So whatever you believe it should be from 1 to 30—41, whatever—multiply these numbers by that, and you'll get a more accurate estimate of how many people are actually suffering. So, again, I normalized the data on the right. And you can see that no one is immune. And the 0- to 4-year-olds are definitely involved here.

I want to, again, remind everyone that the fibrinogen, the fibres that make these clots possible, and the plasminogen—which is the precursor to plasmin, which is this very important molecule that degrades the clots once they're formed—are both made in liver. So if you have a defect in the production or distribution of fibrin, for example, you can have all of these listed clinical problems in this chart.

So I just want to give you an idea of some of the things that can go wrong in one of the parts of this pathway, the coagulation pathway.

[30:00:00]

And you'll see bleeding, amyloidosis, thrombosis, et cetera. These are just eight that are just pulled off of this chart. But everybody has to know that at this time point in VAERS, only in the context of the COVID products—there are four now—there are over 15,000 adverse event types listed. And that's of a possible 25,000 different MedDRA codes that you can choose from. And to put that into context, I went back to 2021: I pulled out all of the adverse-event types for the 14 flu vaccines that had been reported to VAERS that year, and there were just over 1,700 different types. And if you go and look at the COVID adverse event types for 2021, same thing, you find almost 11,000—it's well over 10,000. So there's 10 times more types of adverse events.

Shawn Buckley

Dr. Rose, can I just clarify something? So when you're showing us this figure of 15,000 adverse events just connected to the liver, that would just be, using some estimates, just one per cent of the actual adverse reactions connected to the liver?

Dr. Jessica Rose

Well, these are the types. And this is not just liver associated. These are all of the different MedDRA codes that are used—

Shawn Buckley

Okay, thank you.

Dr. Jessica Rose

to describe what that person might have been suffering from: So you can have death. You can have chills. You can have fever. All of these things are called MedDRA codes. So the most important thing to know here is that the range of reported adverse-event types is far, far, far greater than we've ever seen in the past for any and all of the vaccines combined, as a matter of fact. Which, also, this is evidence. It's not proof, but it's very strong, compelling evidence that there's something very different about these shots. And that probably is liver related. But this involves the circulatory system, the immunological system, every system you can think of is basically affected here in some people.

Just to put some numbers on this and to incorporate this underreporting factor, if I put a number on each of these eight adverse events here that are associated with clotting pathway dysregulation, you get something that looks like this on the left. And the reason I used an underreporting factor or URF here of 31 is because this is a calculation that I've actually made and published in a peer-reviewed journal article, which is based on Pfizer's Phase III clinical trial data and their rate of severe adverse event occurrence, which is 0.7.

So I calculated an URF of 31. So if you multiply these numbers, these absolute counts on the left, by 31, you get these numbers on the right. And so this is a much more realistic depiction of how many people might actually be suffering here. And it's not an exaggeration in my opinion. If anything, it's an underestimation. And nobody that I know looking at this data would argue with that. They're probably looking at these numbers now, and they're saying, "Wow, Jess, you really went under the line here." We're talking about hundreds of millions, I think, in total. So this is a serious problem.

Another paper was recently published that provided evidence that spike was directly responsible for worse clotting. And they propose that this has to do with some kind of dysregulation of plasmin. And again, this is the molecule that breaks down the clots. So we're talking about clots that are really resistant to degradation in the context of the spike protein. This is SARS and/or the spike protein associated with the shots.

There are two more papers that confirm this. The one on the left did a study that confirmed ARDS in influenza and ARDS, acute respiratory distress syndrome, in COVID. And this other paper did a similar analysis. And they both found that the clots that are produced in the context of the SARS or some sort of the spike protein are bigger and harder. And I'm wondering if, in addition to clotting dysregulation—something along the pathway that's being messed up—if this isn't being irritated, let's say,

[00:35:00]

by the addition of amyloids. And I'm going to get into what that means, and why I might think that. Because amyloids are proteins that are very, very degradation resistant. They're unwanted proteins, absolutely, misfolded proteins. We don't want them around.

And just to reinforce here. If these dysregulations and if these adverse events are actually spike-mediated—and there's a large community of people that really stands behind this now—in addition to lipid nanoparticle-mediated, this is really bad news. Because, like I said, there are published papers now that confirm that the spike and the mRNA are really durable and persistent. We found spike protein and mRNA up to 60 days in the germinal centres of lymph nodes. This is just when they stopped measuring, by the way. So keep that in mind. Not to freak everyone out. But when you hear people talking about detoxing from spike, it might actually be a really good idea for us to put our energies into doing this. Because this stuff seems to be really persistent. And it's very inflammatory and it seems to be very, very cytotoxic, as well.

We're not just finding it in the germinal centres of lymph nodes. We're finding them in epithelial cells. This is from a teenager, more recent. And everybody needs to watch Arne Burkhardt's presentation he gave at a recent conference in Sweden that I also spoke at and **look at his slides. He's got probably thousands of slides showing the presence of spike protein deposition in various and sundry places. And even earlier than that, this is Sucharit Bhakdi on the right here, presenting some of his work at a conference in Vienna. And it shows the presence of the spike proteins in the capillaries of the brain and the small vessels of the myocardium. He found it everywhere. So go watch that. There's a link at the bottom.**

And to bring this back to VAERS, I pulled out thrombotic events. And again, this an underestimate. I'm just giving you an idea of what we're seeing here. But we're well into the 100,000 mark, without the underreporting factor, distributed across all ages. No one is immune, not even the babies. So this is definitely a thing, let's say. These reports are very prolific. And beyond VAERS, beyond pharmacovigilance databases, all you have to do is talk

to clinicians or anyone on the ground, and you're hearing about this. It's ubiquitous right now.

But this is a worse situation than just dysregulation of normal functions if amyloids are actually involved here. I'm going back to this now. If these clots, the scaffold created naturally as part of the clotting pathway, are not being degraded in the first place because of some dysfunction in that mechanism and amyloids—which are basically just like additional pieces of glued fabric, like being thrown on a ball—you can imagine what's going to happen. That ball is going to grow, and it's going to cause physiological problems.

There's a paper that's been published, a material science paper, which is really interesting, that shows that amyloidogenic peptides are actually a part of the spike protein, which is quite alarming. It's been shown in this paper that there's an enzyme called a neutrophil elastase, which is the by-product of a particular kind of lymphocyte called a neutrophil, that can cut the spike protein into smaller peptides. And one of these peptides that they managed to find and investigate were amyloidogenic, which means that they cause amyloids. They are fibrils. They can create these plaques that are notoriously bad for human health. It's basically like out-of-control protein deposition wherever they are.

This is a little slide that I made. Sorry, there's a lot of information here, but it's pretty basic. On the right here, this is one of the peptides that they found as part of their study. So what a peptide is, is just a short chain of amino acids. So this spike protein on the left—this is a crystal structure of a spike protein—is what we call the quaternary structure. But it all boils down to this original chain of amino acids that you see in colourful beads here.

[00:40:00]

So if you have just a segment of this chain of amino acids, this is called a peptide. So this peptide is 10 amino acids long that they found. And it absolutely has amyloidogenic properties, and this came from the spike. So it begs the question: Is this what we've been seeing in terms of the emphasized problems with clotting? Because we have blood clots on one hand, which is this grape jelly stuff. And then we have proteinaceous collagen-rich deposits on the other. And we have these things together. So is this what we're seeing the embalmers talking about? I really have to wonder.

Shawn Buckley

Dr. Rose, can I just step in? So did you see the presentation of the embalmer, Laura Jeffery?

Dr. Jessica Rose

I did.

Shawn Buckley

There were some photographs shown, basically, I mean, they almost looked like earthworms or spaghetti. Is that the type of thing that you're now discussing?

Dr. Jessica Rose

Yes, that's the idea in my head. Now, I'm not an embalmer. I haven't seen these things with my own eyes. But what I have seen are white, rubbery, very, very strong, like rubber-band-strong things that the embalmers are claiming that they're pulling out of the bodies and

that are making it hard for them to actually do their work. Because something—not blood clots—is restricting the flow of the embalming fluid when they turn on their machine. And, so from what I understand, you have to actually physically cut open specific sites and take out these proteinaceous deposits, which actually fill the entire vessel cavity, before you can have the flow of the embalming fluid go through and flush out the actual clots, which are, you know, just jelly. So it's possible that that's what this is. I mean, I actually am pretty damn sure now that what we're seeing is systemic amyloidosis. It's fibrin-rich, collagen-rich, proteinaceous deposits wherever this spike is, basically. That's what I think is happening.

And just to reinforce that point. I think that's maybe why the range of adverse events that I was talking about—this 15,000—refers to just about any problem you can imagine having physiologically. The problems from the very beginning— By the way, when I was looking at this in January 2021, there's a systemic nature to the adverse events that are being reported. It's not exclusive to the cardiovascular system or to the neurological system or to the immunological system. I mean, the immunological system is the basis. But it's affecting everything. So it's like, what's the consensus here?

This is my last point, and this is just my own idea. Myocarditis is one of the things that has been my meat in all of this, in the descriptive analysis of VAERS data. I penned a paper with Peter McCullough that got force withdrawn. And, interestingly enough, this was five days before this open public hearing that I was speaking at. I'm not going to play this video now because I don't have time. But I've submitted it as part of my testimony [Exhibit TR-4f] so you can hear this, and it's also online. And it's interesting because this hearing was to provide an opportunity for us, the medical scientist research community, to tell the FDA why we shouldn't put these things in 5- to 11-year-olds.

And the main finding of the paper, besides a much higher background reporting rate of myocarditis in kids— So what you're looking at here are the myocarditis reports—the reports that were filed, diagnosis: myocarditis in VAERS—for all the people, all age groups, as per dose. This is dose one, two, three. And this is the Moderna, the Pfizer, and the Janssen products in this plot. So what you see here in green is something like a four times higher reporting rate of myocarditis in young people. This is a very, very, very compelling slide in terms of causality. Because if there was no effect, if there was no impact on subsequent shots, then we wouldn't see this difference. And this is not seen, and I looked, in any other type of adverse event; this is very unique to myocarditis in kids. And, again, I just want to reiterate: This is not a secret.

[00:45:00]

Everybody's talking about this, even the CDC has admitted that this is a problem. I think **they even have this on package inserts now. This is not a secret. This is well known. So this was one of the main findings that was in the paper that got published with Peter that was subsequently force withdrawn. By the way, it remains in limbo.**

Shawn Buckley

Can I just interject? I just want to make sure that everyone listening to you fully understands what you're saying. So you were co-author and the lead author on a paper with Dr. Peter McCullough, who is a renowned cardiologist. That paper was accepted in a peer-reviewed journal to be published and was published. But a few days before there is a meeting to determine whether or not these vaccines should be approved for use in children, the journal pulls your report or your publication from the journal.

Dr. Jessica Rose

That's right. So you can see that here. This is prior to the title being tagged with "temporarily withdrawn" and then, subsequently, "withdrawn" from this journal. And, yes, it was five days before the testimony. So I don't believe in coincidences. I think this was done intentionally. And the reason that was given was that it was their prerogative to do so. They said, at any point during the publication process, even in the final, final stages, they can decide not to publish. So that was the reason. There was nothing wrong with the science: Nobody argued that what we had said was questionable. Nothing wrong with the content whatsoever. And, wow, yeah, there were a lot of people who did hit pieces on this. So yeah, that's the story. And like I said, it remains in limbo.

And it's a real heartbreak for me because this had gained so much traction in the stages that lead up to final publication, like tens of thousands of people had downloaded it. It's something that everybody wanted to read about: the pediatricians, the researchers, the parents. I mean, the thing that breaks my heart the most is that people didn't have an opportunity to freely read this material that was peer-reviewed and make their own damn mind up. That's criminal. Because so many kids have been injected with this stuff because they thought it was safe and effective because of the hearing. They voted 16 to 0 that this was perfectly fine to put it into 5- to 11-year-old kids after this meeting, despite my testimony and everybody else's. Yeah, it's a tragedy. There's no other word for it. It's an absolute tragedy.

Shawn Buckley

Dr. Rose, I'll just let the commissioners know, this report titled *A Report on Myocarditis Adverse Events in the U.S. Vaccine Adverse Events Reporting System (VAERS) in Association with COVID-19 Injectable Biological Products* is entered as Exhibit WI-4c. So both you and people following the NCI can see that.

Dr. Rose, we're also going to enter as exhibits your report on the *U.S. Vaccine Adverse Events Reporting System (VAERS) of the COVID-19 Messenger Ribonucleic Acid Biologicals* [Exhibit WI-4b] and your report on the *Critical Appraisal of VAERS Pharmacovigilance: Is the U.S. Vaccine Adverse Events Reporting System (VAERS) a Functioning Pharmacovigilance System?* [Exhibit WI-4d] And I'll just ask— There might have been some changes in your opinion since you wrote those. Would you make any additions to those at this point in time or are they still, would be your full opinion?

Dr. Jessica Rose

Yeah, they're all valid. Who came up with those titles, though? That was me. I'm just making a joke.

They remain valid. The first paper that you mentioned is just my first descriptive analysis which showed two things: It showed that there were clustering of reports related to neurological and cardiovascular and immunological damages. That's what I was talking about before. From the get-go, I noticed that there was no organ system that was immune from damage here.

And the second one was a test of the pharmacovigilanceness of VAERS. I wanted to see what was going on with regard to reports that VAERS reports were going missing. And this was coming from people who had filed, who said, "Where's my VAERS report?" It's absolutely true. And I showed—go read that paper—that VAERS reports are just removed

[00:50:00]

following this extremely difficult procedure of getting a VAERS report filed and entered on the front-end system. I think everyone should go to OpenVAERS. This is a very good friend of mine who has written a lot of articles on the ins and outs of VAERS and how there are probably up to three sets of books of VAERS data. Please go there and read her stuff. I don't really have enough time to go into the details. But the VAERS front-end data set from which I'm doing my analysis is, again, it's an underestimate-galore of what's actually going on. It's a nice representation. It's a sample. We have 1.5 million reports, which is a nice-sized data set. But it's still just a fraction of what's going on. So go read those papers and go to OpenVAERS.

I'm going to close with my last point. I'm wondering if the myocarditis diagnoses being made— Because cardiac amyloidosis is very often under- and misdiagnosed. It looks a lot like myocarditis. Myocarditis is basically just a general descriptive term for inflammation of the myocardium, which is the middle muscle layer of the heart that allows it to beat. So if there was a further examination in the right way and the right testing was done to examine the nature of the scar tissue of the myocardium, I'm almost certain that we would find out that these myocarditis cases could actually be referred to as cardiac amyloidosis: deposition of fibrous tissue and scar tissue on the myocardium.

So this is just leaves rustling in the wind, some more VAERS data. But I looked in VAERS for reports related to amyloids, fibrin, and syncope, which is fainting, because amyloidosis, when there's heart involvement, is often associated with syncope or pre-syncope. So I looked at this. And I noticed something I don't notice when I look at many other types of adverse events or clusters and that's a clustering of reports in the younger age groups between 12 and 39. And so something's definitely going on here in our young people. And I don't think anybody can refute that at this point, either, because we're seeing a lot of young people, in fact, dying. And I'm wondering if the ones that are related to cardiac issues don't have, say, myocardial tissue replaced with scar tissue so that their little hearts can't beat anymore. It's just an idea. I'm not a cardiologist. But it's just one of the ideas that I had.

I think everybody needs to follow Arne Burkhardt's methodology. He's a pathologist and he's done brilliant work, like I've said. He probably has thousands of images of spike deposition in and around every single part of the body. He's doing autopsies. He's staining for amyloids. He's staining for spike-specific protein or spike protein deposition, and he's finding a lot. I don't have time to show you any of his work, but here's a link at the bottom where you can watch an entire presentation in Sweden. It was quite the honour to watch this live. I literally took a photograph with my camera of every single one of his slides. It was extremely compelling.

Shawn Buckley

Dr. Rose, we will enter your slideshow as an exhibit [Exhibit WI-4g] so that both the commissioners and anyone following the NCI can view that. I'm wondering if you would be open to questions from the commissioners at this time.

Dr. Jessica Rose

Yes, I'm done anyway. What perfect timing. Here's Buckminster Fuller, a slide, whom I love. So yes, I'm absolutely open to questions. Well done, Jess, good timing.

Shawn Buckley

Okay, are there any questions from the Commission? Yes, so there are.

Commissioner Massie

Thank you, Dr. Rose, for your very thorough and enlightening presentation. I have a number of questions. But I guess that we have to review your material in detail to dive deeper in a lot of the things that you're showing.

I'm a little puzzled by some analyses and studies that have shown that there are, indeed, in some studies, protection from COVID death

[00:55:00]

following vaccination, so if you just focus on cases where you could actually document, reasonably well, protection from death from the vaccine. And this argument is used over and over again as a line to promote vaccination and repeated booster, and so on. So what is your thought on these studies that have been done to show potential protection from death following vaccination?

Dr. Jessica Rose

Well, to be honest with you, the studies that I've seen—there are some coming out of Israel—they don't show that at all. As a matter of fact, what I've seen— Maybe I haven't seen the right study. But the studies that I've reviewed show more people are ending up in the hospital and dying in the group that were injected.

There are also a number of problems with repeat injections that are related to issues of tolerance by the immune system. It seems like there's a very clear story developing now that tolerance is being induced by repeated exposure to the spike antigen. And basically, what that means is that you're not going to be mounting any kind of immune response to that protein or anything related to it. So, basically, if you're exposed to this virus, challenged by it, then you're not going to mount an effective immune response. So I'm not sure I agree that these products have saved many lives. I'm much more focused on the damages that they've done. That's my meat. That's what I'm primarily focused on because I don't think that the people who were injured have a voice. It's been taken away from them, and I want to be a voice for them. So this is my focus. And I was going to say something else, but I don't remember.

Commissioner Massie

Okay. My other question would have to do with the cytotoxicity of spike, which is now, actually, I would say, fairly well documented by many, many reports. It seems to me that this knowledge that spike could be potentially cytotoxic was probably known somewhat in the scientific literature before we decided to go ahead. So why is it that it was dismissed or ignored?

Dr. Jessica Rose

I don't know. It's an excellent question. I can't imagine that the people who are working on this didn't hypothesize that—since the modus [operandi] of this technology is to induce an immune response, an inflammatory response against the spike protein—that they wouldn't have anticipated that wherever the spike was going to be presented on MHC molecules, or

embedded in whatever cell, that an immune response wasn't going to be mounted in order to kill those cells. And that would cause, in some people, hyperinflammation. I mean this comes back to the original trials where the exclusion criteria lists were so long. They discounted people with pre-existing autoimmune conditions, for example. And a lot of these have to do with hyperinflammation or a hyper-inflamed state. So it could be, this is one of the things that I've hypothesized, that we're seeing the worst effects of these products in people who had pre-existing conditions, like some kind of hyper-inflamed state, which a lot of people have.

I find it impossible to imagine that they didn't anticipate a potential problem or the potential problem that most people who are reporting adverse events are reporting on. And this is the systemic, notorious damage being done, say, to blood vessels or wherever the spike protein lands, like I said.

And just to reinforce this, we were explicitly told that the contents of the needle were going to remain primarily at the injection site. This was hammered home. And they also knew, I want to reiterate this and make this very clear—as we know from the FOIA-requested pharmacokinetic data and also from a paper, which you can find in the supplementary material in my slides, from 11 years ago that confirms that they knew—this is published in the literature that these types of lipid nanoparticles traffic to the ovaries in the same animals.

[01:00:00]

And the reason we do animal models is because we basically have the same organ systems. So traffics to the ovaries in Wistar rats or mice, probably traffics to the ovaries in humans. And low and behold, it does.

I know it's a long-winded answer. But there are a lot of things that they did know. And we know that they knew now because of forced FOIA requests. We wouldn't know half of what we know about the data or the studies that they did and didn't do if we weren't asking for this data that they don't want to reveal. So I dare say that there's a lot that they knew. There's a lot that they know now. And they're obfuscating from the public because it would be bad for the program.

Commissioner Massie

If I can ask one last question. What could be a little bit misleading is that spike will be produced from the viral infection and should you be unlucky and get the virus invading the blood circulation, you will get spike protein produced from the virus. So it could actually probably trigger all kinds of phenomenon [like] the one you're describing in the adverse event.

What would be, in your opinion, the differences between the spike protein produced from, say, an infection that is not properly controlled versus the spike protein that you are producing following the injection of the messenger RNA?

Dr. Jessica Rose

It's the scale. It's a very, very simple, quick answer. The transfection technology is designed to make massive amounts of spike protein. And with repeated injections, you're going to have massive amounts of spike protein being continuously produced. This is very, very, very different from being exposed to a virus with many, many, many different proteins. You

don't just have the spike protein. You have all these other proteins against which your body will form, say, antibodies and mount T-cell responses against. So you're going to have a robust, multifold fighting force aimed at a number of proteins. It's a systemic fight against a viral pathogen, let's say. You have the introduction of the virus. You have viral expansion. You have the immune response kicking in, and then you have the decline. So there's this natural process: this ebb and flow between the introduction of a foreign pathogen-like virus and the immune system.

This is not that. This is massive in comparison. There are many people who know the numbers. I don't know them off the top of my head. But it's multifold higher amounts of spike protein. It's a deluge. And in some cases, let's say it gets into the blood because the person wasn't aspirated and it disseminates everywhere. And wherever those lipid nanoparticles dump that payload, that spike protein is going to be manufactured. It's so, so, so different from the natural immunity course. Yeah, it's the scale.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Good morning, Dr. Rose. In your presentation, you talk about the VAERS system. In Canada, we have a system that most people have never heard of. It's called the CAEFISS system [Canadian Adverse Events Following Immunization Surveillance System]. And what we heard from previous testimony was that reports to the CAEFISS system were being screened or triaged, if you will, by public health officers. And doctors were suspended and punished for making reports to that CAEFISS system. Was that the case with VAERS as well, or are you aware of what went on in Canada with the CAEFISS system?

Dr. Jessica Rose

I am. It's appalling. But from what I understand, it was far worse in Canada. Now, that's not to say that this absolutely wasn't happening, not only in the U.S. but in the U.K. with the Yellow Card system, the EudraVigilance system for the EU, and the DAEN system in Australia. It's been kind of a global phenomenon where reporting adverse events is not only not the first thing that someone would do, necessarily—maybe it's because they just had a 14-hour shift in the ER—but because it was discouraged.

[01:05:00]

This is what I've heard from doctors in hospitals, the ones on the ground, and the nurses. **And nurses know everything. They're saying that they feel there's like an air of threat if you even suggest that someone might have suffered an adverse event in the context of this shot.**

So it was very highly discouraged to file a report. That's why it's kind of remarkable to me that there are still over 1.5 million in the VAERS system. And that's why I also made the comment about the fact that this might even just be the tip of an iceberg. I'm not sure how bad it is. But certainly, when you factor in the under-reporting factor, it definitely is contained within medical professionals being discouraged to report. There's also the human component. I mean, some people just will never be compelled to report something. Maybe they won't think of it. I mean, I'm vaccinated out the yin-yang for most things, not these things. But if something had happened to me, I can't think of something. But I never, never in a million years would have thought it was because of one of the vaccines I got. I'm

one of those people. I really empathize with this because I mean there's so many reasons why people wouldn't be reporting. But I can absolutely tell you that it was discouraged.

Commissioner Drysdale

Next question. You had referenced Dr. Braden, I believe, in one of your reports. And we had her give a presentation to us in Truro, Nova Scotia, some weeks ago. Some of the things that Dr. Braden talked about was— I don't want to put words in her mouth, but in my interpretation, a systematic failure from the system, from the theoretical point of view right up to application. What she was talking about was she questioned the mRNA technology itself. She questioned the manufacturing process in that she referenced a number of tests of the actual vaccines, which showed a number of foreign particles and all kinds of unknown things. I believe she referenced that there were portions—and this is an engineer talking, not a doctor—of RNA that had remained in the *E. coli* they used to create this stuff. And so there was a potential that this RNA had affected the genome, and it was in *E. coli*. And then the last thing she talked about, and you referenced a couple of times, had to do with the actual administration of the injections in that the manufacturer said that it was going to be intramuscular. But many of the injections were not aspirated. If I understand, aspiration is when you put the needle in, you pull the plunger back to see if you're in a vein or not, and if you're not in a vein, you go ahead.

Can you comment on how all of those different things might be contributing to the 15,000 or so different types or classifications of adverse events out of a total of 24,000?

Dr. Jessica Rose

Yeah, I sure can. And I love that you've put all this together because this is such a tricky pony. I mean, there are so many factors that could lend to the outcome. The predictability here is absolutely almost zero, in my opinion, because it's going to be based on the person's age, the person's immune age, what other vaccines they have, if they're on medication, if they have co-factors, how the needle went in, what was in that syringe, et cetera, et cetera, et cetera. There are so many factors that are going to lend to the outcome. I can't stress that enough.

So my idea of a worst-case scenario is this, that will bring up all of the things that you asked about. Aspiration, first of all, is when you pull back on the syringe, and if you hit a vessel, you're going to get some red. And that means you're in the wrong place, right? You don't want to inject it into the blood because that's not where it's supposed to go. It's supposed to go to the muscle, like you said. They were actually recommending, and by they, I mean the CDC on their website, not to aspirate. And I can't figure out why they would have been doing that because everyone should have been doing that. So what that would mean is that you would get dissemination of the lipid nanoparticles carrying the payload where they weren't supposed to go necessarily.

[01:10:00]

That's number one. That could be bad news in terms of adverse event.

Number two is this polyethylene glycol. This is the molecule that coats the lipid nanoparticle. And if it's coated homogeneously, which means that it's evenly coated around the whole surface, then it's going to be the nice slippery, little ball that it's supposed to be that can traffic to wherever and get wherever it's going optimally. So if for example, if you have a bunch of vials that weren't handled properly or in the manufacturing process, the

lipid nanoparticles weren't coated homogeneously, and you have, say, holes in the sphere where there's supposed to be PEG, that's actually going to bode well, in my opinion, for the person who's injected. Let's say that they got their injection into the muscle. Because those lipid nanoparticles aren't homogeneously coated, they're going to break down much easier at that site. So you're not going to have dissemination of either the lipid nanoparticles or the payload. That's number two. It's just an idea, but I think it has merit. There's a working group of German researchers who actually proposed this as well. It's in one of my presentations.

And as for contamination, a colleague of mine has recently been sequencing— He started with the bivalent products, the Pfizer and the Moderna, and he's moved on to sequencing the monovalent products and has found double-stranded DNA contamination in all of them. Not some, all of them. And what this double-stranded DNA contamination is, are the plasmids that are used in the production line to produce the mRNA. And what's supposed to happen at the end of the production line—you'll appreciate this as an engineer; there's like five steps that I showed in my slide—is that the mRNA is supposed to be purified. You're supposed to take that out at the end stage. It's expensive to do this. And because we have so many evidences now that good manufacturing processes weren't abided by, it's possible, I will say, I'll be generous, that the mRNA wasn't purified properly. That's exactly what this indicates because the presence of the double-stranded DNA is not explainable otherwise. It shouldn't be there.

And so we can't say definitively what the clinical outcome of that contamination is going to be. But we can say, based on his findings that he has recently put to preprint, is that the levels of double-stranded DNA that are "EMA permissible" far exceed any levels that they've written down in the literature. So we know that there's contamination of certain kinds. And it's kind of scary to think about. We know that corners were cut all along the way here. I mean, there just simply wasn't enough time to do everything right. That's a fact. But it's scary to think about what actually might be in the vials themselves.

I want to make one more point here. Even if everything was done perfectly and we had our homogeneously-coated lipid nanoparticles (LNP) with our full-length spike protein—I didn't even mention per cent RNA integrity here; I don't have time—which when delivered, translates to full-length spike, this is probably the worst scenario you can have because of the papers that have been released that show that the double-stranded DNA repair mechanisms are impaired when spike is found in the nucleus. And it does get trafficked there because of this furin cleavage site. So no aspiration; full-length spike protein; homogeneously-coated LNP; and somebody with, say, a pre-existing autoimmune condition or is hyper-inflamed and old, perhaps, infirm—this is the worst-case scenario, in my opinion.

Commissioner Drysdale

The last question and that has to do with— A previous witness had talked about the potential contamination of the genome. And I think you mentioned, yourself, about that this has been found in the nucleus of cells. If this has penetrated all of the organs of the body and if you're finding it in the nucleus of the cells,

[01:15:00]

can you comment on the potential for an effect on the overall genome?

Dr. Jessica Rose

Let me just say that I think the potential is there. The proof of integration is not there yet. But I have no doubt in my mind that this paper is on the way, based on the evidences that we've accumulated to date. I want to be careful here about what I say because I don't know yet. I don't think that it's impossible that germline integration is going to be something that we're talking about soon. I think that if it happens, it's going to be a rare event. But the thing about it is if it happens at all— Again, this is absolutely inexcusable because I cannot imagine that all of the brilliant minds behind this technology couldn't have anticipated the possibility here. If they knew about the reverse transcription, which has been shown—this is in the literature now that LINE-1, which is an endogenous retrotransposon in humans, can convert this mRNA back to DNA—then why wouldn't it be able to integrate? I mean, again, I'm not saying that we have definitive proof of that yet. But I wouldn't be surprised if that paper is in the pipeline right now.

Commissioner Drysdale

And I apologize. I said that was my last question. But it just occurred to me in listening to you. You know, I got up this morning and I looked at the news, and there was this incredible story about the James Webb telescope. And it was looking into the eternal reaches of our universe, and it'd taken in these incredible pictures of Jupiter, and it was gathering all this data that was so far away. And, yet, when we were in Toronto, we had an embalmer telling us about these fibrous masses in the veins and, to my knowledge and to the knowledge of that witness, no one had dived in like the James Webb telescope to find out what these things were. And my question is, do we not have the technology to go to a funeral home when someone's reporting this and take a sample and test it and tell me what it is?

Dr. Jessica Rose

And I have the same question. It's the same thing to me about the autopsies. I'm dying to know why we're not autopsying everyone now. Like, why aren't people whose kids are dying demanding autopsies? I mean, that's what I would do. This is like the microscope into the forensic data collection of why the person passed away. I mean, it's like the most important thing of all. So I can't answer you because I just don't know.

What I can suggest is that there's a movement to suppress this from being done, just like there was a movement to suppress autopsies from being done because it was "too dangerous" in the beginning. So okay, fine. We'll give you that, it was too dangerous back then before we had all this figured out, quote-unquote. What's stopping us now? I don't understand.

And there is one group who analyzed this proteinaceous stuff. And the only thing that I remember that they found is that they classified it as organic. And that makes a lot of sense to me because I think it's just collagen. So I mean, I'm not in a lab now. But if I was in a lab, that would be the very first thing I would do. I'm like, I've got to find out what this material is because, if it's collagen and it's just, you know, the natural things of the body in "on" mode, like I said, then, basically that confirms what I said. And then we can solve the problem.

Well, actually, the first stage of solving the problem is to stop injecting these things into people because they are causing problems in some people. And because we're not being allowed to acknowledge this or ask questions, we're not able to come up with viable solutions out in the open. I mean, we humans are so much better together. So you know,

even if the people who are promoting this stuff came to, so-called, our side and our brains got put together and we collaborated, we could solve this real quick. I'm the forever optimist.

Commissioner Drysdale

Thank you, Dr. Rose.

[01:20:00]

Dr. Jessica Rose

Ooh, he's a happy guy. Ooh, he's happy. That's my cat. He's very happy.

Shawn Buckley

We have one more question for you.

Commissioner DiGregorio

Hi, Dr. Rose. Thank you so much for your testimony today. I think I heard you say that a number of your studies involved you downloading a lot of VAERS data. And I understand that your expertise is in the VAERS data and not our CAEFISS Canadian database. But I'm just wondering if you know whether or not the same type of data is downloadable from the Canadian CAEFISS database.

Dr. Jessica Rose

I'm going on memory now. And I got to tell you my memory is not so good. I don't think so. Definitely, I know this: VAERS is the database that I chose because it was very accessible. You literally just go to the VAERS website and download CSV file, very large now. And if you're going to have a crack at this, I don't recommend using Excel because it gets stuck. I recommend using R. But as for the CAEFISS system, I'm trying to remember if I even tried, but if I did—I know that I looked at it once. I don't have a good answer.

Commissioner DiGregorio

And then my last question is about the VAERS database itself since that's where your expertise is. If you could make one improvement to it to help gather better data and do better analysis, what would that be?

Dr. Jessica Rose

Hand it over to different owners, that's what I would do. I was actually in a kind of task force at the very beginning of this to try and design a new system. And the fact of the matter is VAERS is very antiquated. The move to paper forms to online has been kind of, you know, it's a good attempt type-thing. All that aside though, like I said, it still works. It's annoying. It's underreported. But it still works.

The problem with VAERS right now is not all of those things. It's not the fact that it's antiquated. It's not the fact that it's underreported. It's the fact that the data they're in, the people they're in, who are filing reports, are being ignored. The people who own the data are not handling the data in an appropriate way. They're ignoring it. And not only that, but

there are smear campaigns out there against people like me who are, like, public citizens who are trying to bring this data to light. So that people understand, this isn't an interpretation thing. This isn't about, the fact that they've put so many shots into people. I've done a napkin math to show that that's not true. This is literally about the owners of the data not doing what they've always done.

Josh Guetzkow is a friend and colleague of mine. And he's done many FOIA requests to show that they're not doing PRR [proportional reporting ratio] analysis, which they've always done. They're not doing Bayesian analysis, which they said they would do in lieu of the PRR. And they're absolutely not doing causality assessments, which is like the main claim to fame here. I mean, it's absolutely ludicrous for anybody to claim that if you have half of any subset of adverse events, like death, being reported within 48 hours of injection, that there's no causal effect. I mean, come on now. Come on now. Why aren't the alarm bells being rung? And, clearly, it's because they're not motivated to do so. So long answer short, I would change the owners.

Commissioner DiGregorio

Thank you.

Shawn Buckley

Dr. Rose, I think those are our questions. On behalf of the National Citizens Inquiry, I sincerely thank you for taking the time to share with us today. Your testimony is appreciated.

Dr. Jessica Rose

Thanks so much. It was my pleasure. And yeah, let's keep talking.

[01:24:29]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 2: Dr. Jayanta Bhattacharya

Full Day 1 Timestamp: 03:43:12–05:07:15

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Shawn Buckley

We have joining us now virtually Dr. Jay Bhattacharya. Jay, can you hear us?

Dr. Jayanta Bhattacharya

Yes. I can hear you. Can you hear me?

Shawn Buckley

I can. I'd like to just start by asking you to state your full name for the record, spelling your first and last name.

Dr. Jayanta Bhattacharya

My name is Jayanta Bhattacharya, J-A-Y-A-N-T-A. Bhattacharya, B-H-A-T-T-A-C-H-A-R-Y-A.

Shawn Buckley

And Dr. Bhattacharya, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Jayanta Bhattacharya

I do.

Shawn Buckley

Now my understanding— And I think a lot of people are familiar with you. And I'll tell you, you sent us a rather impressive CV that we've entered as Exhibit WI-8b. But my understanding is that you are currently a professor at Stanford University Medical School.

Dr. Jayanta Bhattacharya
I am.

Shawn Buckley
You're also a physician.

Dr. Jayanta Bhattacharya
Yes, I have an MD.

Shawn Buckley
Yeah. And you're an epidemiologist?

Dr. Jayanta Bhattacharya
I publish and teach epidemiology, through for decades.

Shawn Buckley
And then you're a health economist?

Dr. Jayanta Bhattacharya
Yes, my PhD is in economics.

Shawn Buckley
And you are a public health policy expert focusing on infectious diseases and vulnerable populations.

Dr. Jayanta Bhattacharya
Yes.

Shawn Buckley
And you are one of the three authors of the Great Barrington Declaration.

Dr. Jayanta Bhattacharya
Yes.

Shawn Buckley
Now, we've invited you here today to speak about several issues. One of them is that you have participated in doing an expert report concerning a lawsuit in the province of Alberta. Can you share with us why you did that and a little bit about that?

Dr. Jayanta Bhattacharya

Yes. Well, it stems from the ideas in the Great Barrington Declaration. The primary goal that I had in participating in that lawsuit, which was a lawsuit aimed at changing the Alberta policy of lockdowns away from lockdowns toward a more focused protection policy, exactly was what we wrote in the Great Barrington Declaration.

The ideas of the Great Barrington Declaration are based on two incontrovertible scientific facts. The first is that there's a very steep age gradient in the mortality risk from COVID infection. It's older people who die at a thousand times or more higher rates of infection than young people. For children, especially healthy children, the risk of dying from COVID is vanishingly small. Whereas for older people, it's much, much higher. That's incontrovertible, I think, universally acknowledged.

The second fact—again incontrovertible, and I think universally acknowledged—is that the lockdown policies that we have followed, and Canada has followed, has caused tremendous harm especially to the lives of young people. I don't just mean economic harm. I mean health harms, psychological harms, a whole host of harms that will play themselves out over a long period of time and have already caused major health problems for the Canadian people.

So the right strategy, the Great Barrington Declaration, what it says is: let's use our resources to protect vulnerable older people from the disease while at the same time lifting lockdowns, which have caused so much harm to the lives of young people. It's the standard pandemic strategy that we followed for a century of respiratory virus pandemics before this one. And it worked.

So that was my main motivation for participating as an expert in that Alberta case, was to provide the scientific documentation for that strategy.

Shawn Buckley

I'll just ask, being that you started talking about those two things. You're saying the lockdowns, especially for the younger, were very detrimental on several levels, physical, psychological, social isolation. Can you just elaborate a little more on that so that the commissioners and the people listening understand exactly what you're referring to?

Dr. Jayanta Bhattacharya

Yeah, so I brought some statistics just to give some sense of it. But it's not possible to do it full justice because the extent of the harms caused by lockdowns on population health are so extensive. Just to give a smattering of the flavour of this. During 2020 and 2021 when the lockdowns were primarily in force, a lot of the emphasis was on making sure hospital systems and healthcare systems were not overwhelmed.

One way that this happened was by,

[00:05:00]

essentially, causing people to fear to come into hospital systems or being told explicitly not to come into healthcare systems for the conduct of basic preventive care.

So for instance, many people skipped cancer screening that's recommended: colon cancer screening, cervical cancer screening, a whole host of other recommended cancer

screenings, breast cancer screenings. As a result, many men and women will show up now with later stage breast cancer or prostate cancer, or whatnot, that should have been caught at an earlier stage. And they will die from it when they would have survived it had it been detected earlier.

Another major health harm from the lockdown policies has to do with mental health. There are reports from Canada from 2021, even as early as 2020, suggesting that the psychological distress caused by lockdown policies—the isolation from others, the disruption of normal rhythms of daily life—led a tremendous number of Canadians, especially young Canadians, to overdose with drugs. The rate of excess death among the young from drug overdoses in Canada increased sharply even as early as 2020, according to a Statistics Canada report that was issued in 2021.

The [CBC] reported that one in five Canadians need mental health services. The demand for mental health services in Canada climbed substantially even as wait times for specialists got longer and longer. So at the moment when Canadians needed the most help from medical health professionals, it was the least available because of the lockdowns.

The consequences are hard to summarize in a very, very simple way because the health effects of investments in health by healthcare systems is so important and so pervasive in life. And ending those or stopping those or pausing those even for short periods of time can have long term consequences on the health of populations. One measure of this— If it's possible for me to share the screen, I'd like to share one slide.

Shawn Buckley

Absolutely, you can share the screen. It should be set up for you to be able to do that.

Dr. Jayanta Bhattacharya

Perfect. So I'm just going to share one slide. One sort of summary measure of this is the cumulative age-adjusted, all-cause mortality rate in Canada. And I wanted to do a comparison country, Sweden, which followed much closer to a focused protection approach than Canada did. Much more aligned with the Great Barrington Declaration we discussed earlier.

The way that cumulative all-cause, age-adjusted excess mortality is calculated is you look at baseline mortality rates. In this case, I think from 2015 to 2019, in each country, adjusted for age so that you're comparing like with like. So older populations, of course, are likely to die at higher rates. And then, track over time from the beginning of the pandemic—here on the left side of the graph is February 2020, all the way to now—how much above that **baseline expected mortality rate you actually see. The red line here is Canada and the blue line here is Sweden: all-cause excess deaths, age-adjusted mortality rates. The Canadian all-cause excess deaths, sometime around May 2021, crossed the blue line, Sweden's all-cause excess mortality rate. And what you see is that the rate of death, the cumulative all-cause excess death in Canada as of the late 2022 was actually about 50 per cent higher than that experienced by Sweden, which did not impose the kind of draconian lockdown policies that Canada followed during the pandemic. It's almost a 50 per cent higher all-cause excess death rates.**

Now, most of that, I think, or much of that, is not actually due to COVID because the COVID rates in Canada were actually relatively well controlled. Most of that is due to lockdown harms, I think. Whereas Sweden—which didn't impose lockdowns,

[00:10:00]

had much more voluntary policies and a greater emphasis on focused protection of vulnerable older people, rather than trying to protect hospital systems—had much lower all-cause excess deaths because they invested in the health of the population, the normal investments in the health of preventive care, and so on, and didn't panic the population. And as you can see, the results over time: it's gotten worse and worse for Canada and better and better for Sweden.

Shawn Buckley

Now, I think in Canada we all recall actually the mainstream media criticizing Sweden at the time for the role that they were taking. I imagine that you saw similar reports in the United States media.

Dr. Jayanta Bhattacharya

I did. I saw in the United States media that the Swedish strategy was characterized as reckless, as just letting the virus rip.

Shawn Buckley

Right. But now with hindsight we can see that it wasn't reckless in any way.

Dr. Jayanta Bhattacharya

No. It was not.

Shawn Buckley

As I understand this focused protection: basically, this premise of the Great Barrington Declaration is once we knew that it was affecting the older populations, so we'd focus the resources there but not do things like lockdown younger people. Now in Canada, our media— And definitely children were being taught that they basically should be doing their part to protect old people. And I'm wondering if you can comment on the risk of children spreading the disease and whether or not it was proper to be locking down children.

Dr. Jayanta Bhattacharya

Absolutely. So first, from very early in the pandemic, it was clear from the scientific evidence that children were not super-spreaders. Children, of course, can get the disease and, of course, can spread the disease. They're not like perfect sinks in that sense. However, the risk of children spreading the disease is, in some ways, measured rates are lower than adults.

Let me give you two pieces of scientific evidence that were available from very early on in the pandemic. In Iceland, there was a study done in March 2020 where the scientific group sampled, I think, 12 per cent of the Icelandic population and did a test to see if the patients that they sampled had active cases of COVID, including sampling the standard PCR test to measure whether the virus is present. And then a nonstandard sequencing test to look at the virus and see what mutations the virus had.

They paired this with a very, very detailed contact tracing approach to see who the people that were positive had come in contact with. And from this kind of approach, you can distinguish whether somebody— Like if two people come into contact with each other, contact tracing normally can't tell who passed the virus to whom because you just know that these two people were near each other. And they may have been, of course, near other people. But with a sequencing analysis, you can say, okay, the two people that are in contact with each other, the viruses share the mutation patterns. So they may have passed the virus to each other. Whereas people who have very, very different, disparate mutation patterns of the virus that they have are unlikely to have passed the virus to each other.

The striking finding from this Icelandic study was that while there were many, many instances of parents passing the virus on to children, there was not a single instance in the study of a child passing the disease on to their parents. The children were not super-spreaders. Now, as I said, kids can spread the disease, especially older kids. Younger kids, I think, are less likely.

So let me talk about a second study, this time out of Sweden. Sweden even in spring of 2020 did not close its primary and early secondary schools. Every child under the age of 16, I think, experienced no disruption in their schooling at all because those schools were not closed in Sweden.

A study was conducted by Swedish researchers looking at the mortality rate of teachers in those schools relative to COVID mortality rates of other workers in the population. And what it found was that teachers actually had a lower risk of COVID mortality than the average risk faced by other workers in the Swedish population during that period. In a sense, working in schools protected teachers against COVID relative to the rest of the population, at least empirically based on that.

Based on these findings, it was really clear early on

[00:15:00]

that closing schools was a tremendous mistake, that it was unnecessary to protect older people in this way. Alternate policies would have been better to protect older people and would not have caused the harm to children. If I may, may I talk a little bit about what the harms to children actually are?

Shawn Buckley

Actually, please do.

Dr. Jayanta Bhattacharya

If you go back in the social science literature decades, what you find is a very common theme about how important investments in children are in terms of schooling. And it's not just that our schools provide education, which is important for future job prospects and so on. That's true, they do. But, in fact, they are absolutely crucial to the health of children.

In an immediate sense, schools are where many children receive much of the nutrition for the day. If you close schools, you reduce the amount of nutrition available to children. Of course, Ontario, I know, closed schools for a time.

The other thing is that, again, schools are places where social services are provided. Child abuse is often picked up at schools because it's teachers who see the results of child abuse and then report it to authorities. When you close schools, child abuse continues to happen. But you won't pick it up because the outside people who care about children aren't there to look.

So both of those things happened during the pandemic in places that closed schools. Worse nutrition for children, children skipping meals as a result, and also child abuse not being picked up and reported.

The long-run effects are even worse of closing schools. The key thing is that when you have children miss school for even relatively short periods of time in their lives, according to the social science literature, it has long-term negative health consequences. Children who miss school for even, again, in the social science literature, for short periods of time end up having shorter, less healthy lives because they lead poorer lives.

One estimate, published in the pediatrics literature early in the pandemic in the United States, found that just the American school closures in spring 2020, cost American school kids nearly five and a half million life-years in expectation over their lifetimes. So the consequences are not trivial. You're essentially taking life-years away from children and exposing them to abuse that needed to get corrected. Schools are absolutely vital and closing them was a tremendous mistake that harmed children.

Now, if I may, can I talk a little bit about the failure of focused protection in Canada? And I just wanted to bring up a couple of data points.

Shawn Buckley
Yes, please do.

Dr. Jayanta Bhattacharya

One from very early in the pandemic. A public health policy that's focused, that recognized the unique risk that the COVID posed to older people, would have moved heaven and earth to protect the lives of older people. Especially early in the pandemic when we didn't have very good treatments or vaccines, and whatnot.

The key idea was to find where the vulnerable older people live and devote resources to protecting them. Instead, what happened in Canada—not just unique to Canada but happened elsewhere as well—is that places like care homes and nursing homes where the most vulnerable older people lived became places where, essentially, of neglect and abuse. **And in fact, became places where COVID was spread.**

So in Montreal, for instance, the earliest days of the pandemic, there are reports—again, in the Canadian press—that the staff of nursing homes in Montreal abandoned their posts in part because they were so afraid of getting COVID. And left older patients with dementia to die from dehydration and neglect. You have, in many places in the United States—for instance, in New York, in Michigan, in Pennsylvania—you had governors sending COVID-infected patients out of hospitals early into nursing homes where, then, the disease spread rapidly, infecting the most vulnerable people.

The reason why this happened— It wasn't, I don't think, a criminal act. I think it was actually an act

[00:20:00]

as a result of ignorance about what to do about the most vulnerable people. Instead of making protection of vulnerable people the central goal—focused protection, the central goal of pandemic policy—instead, the goal was to empty hospital systems to keep hospital systems not overwhelmed. In a sense, we inverted the normal relationship between the public and medicine. Normally, you would think about people in medicine, public health, serving the public. But the rhetoric and the reality flipped, where the idea was that the public would serve healthcare systems. We recruited the public as a way to protect hospital systems, healthcare systems, rather than hospital systems and healthcare systems serving the public. And one consequence of that was that we forgot about focused protection and sent COVID-infected patients back to nursing homes, killing many people who would otherwise have potentially survived much longer as a result if that had not happened.

Let me give you one last data point from the Canadian experience that I know of. In Ontario, in the district of Haldimand-Norfolk Health, there was a health minister named Dr. Matthew Strauss who explicitly adopted the idea of focused protection: did not impose mask mandates; when the vaccine became available, prioritized high-risk individuals for the vaccines; put out centres for the infusion of monoclonal antibodies, an effective treatment for much of the pandemic; and made available antivirals rapidly as soon as they became available. As a result of his approach, which eschewed mandates—did not adopt any of the sort of restrictions that were imposed by much of the rest of Ontario—as a result, the age-adjusted mortality from COVID in Haldimand-Norfolk was actually 30 per cent lower than the rest of the province.

Focused protection works. Focused protection would have worked better in Canada than the lockdown-focused policy. And it would not have harmed the children in the way that they were harmed as a result of the lockdown policies that were followed.

Shawn Buckley

Now, you've spoken about restrictions on children, can you also comment on young adults?

Dr. Jayanta Bhattacharya

Yes, so there hasn't been as much attention paid to this, but I think it's quite important. The experience of young adults in society is tremendously important for the rest of their lives. In the 2008 recession, for instance, the joblessness among young adults resulted in long-term decreases in life opportunities for those same young adults, including worsening health. The kind of unemployment induced by lockdowns, which happened in Canada for years, has especially bad long-term consequences for young adults.

The importance of young adults to socialize with one another is critically important for their mental health. And there's evidence that as a consequence of lockdowns and the isolation of lockdowns, those kinds of mental health problems that I mentioned earlier—one in five Canadians needing professional help—those were exacerbated by the lockdowns, particularly among young adults.

The same thing, I think, is true to explain the rise in overdoses of illicit drugs in Canada. It's primarily young adults that face that. And again, it's not a surprise given the mental health consequences of isolation and anxiety caused by the lockdown policies that Canada followed.

Shawn Buckley

Another thing I wanted to ask you, before we move on to the topic, because I want to cover the topic of censorship with you and some of your experiences there. But in Canada, basically the federal government and every single province was very aggressive on taking measures to, I'll use the word, encourage, but really it was coercion to be vaccinated. And there was basically zero allowance for natural immunity.

[00:25:00]

And I'm wondering if you can comment on the policy of basically mandating vaccines and ignoring natural immunity and your thoughts on that.

Dr. Jayanta Bhattacharya

Yeah. So I think a couple of things about the science of the vaccines is really important to understand. To understand why those vaccine mandates were both unnecessary and a bad idea.

So first of all, as I've already mentioned, there is a very sharp gradient in the mortality risk of COVID. Now the vaccines, when the randomized trials of vaccines were conducted in 2020, what those randomized trials showed was that against a placebo group—a group that received a placebo rather than the vaccine—the vaccines protected people against symptomatic infection for about two months after the vaccination. That was how long the trials lasted before they ended. The median person was followed for about two months. So you have 95 per cent protection for two months against symptomatic infection. That sounds impressive and is impressive. But it's actually not the key epidemiological endpoint that you care about for a policy perspective.

From a policy perspective, there's two potential epidemiological endpoints you might care about separate from prevention of symptomatic infection. First is protection against severe disease: Does the vaccine stop you from dying if you get infected? The trial did not answer that question because it didn't have that as a primary endpoint. And it didn't have sufficient numbers of people enrolled to be able to answer that question with any statistical confidence.

Shawn Buckley

I just want to make sure that we understand what you're saying. So let's use the Pfizer trial as an example. You're basically saying they weren't actually measuring as an endpoint whether or not it would reduce serious illness.

Dr. Jayanta Bhattacharya

Yes. They didn't have that as a primary statistical endpoint. And they would have needed to design the trial differently to have that as a primary statistical endpoint. They would have needed either many, many, many more people than the 40-some thousand, whatever they enrolled, or they would have needed to primarily have conducted the trial in a high-risk population like the elderly. Both would have been defensible. Of course, the first would have been much harder. Instead, they had prevention of symptomatic infection.

Shawn Buckley

I think this is important to Canadians because we endured some pretty draconian lockdowns, some very significant messaging that, to this day, we are totally divided. And basically, it was to prevent us from getting seriously ill, including dying. That really would have been why people were participating in this. And you're telling us they weren't even measuring for those things as an outcome?

Dr. Jayanta Bhattacharya

Yeah, they didn't have that. They didn't power the trial to measure that as a primary outcome.

Shawn Buckley

And can I also just ask you. You use this 95 per cent figure. But my understanding is, is that that wouldn't be an absolute risk figure, that would be just a relative risk figure that was used?

Dr. Jayanta Bhattacharya

Yeah, so 95 per cent relative risk reduction. You know, that's actually pretty standard in vaccine trials, so I'm not terribly exercised by that. But the absolute risk reduction has to do with more than just the trial itself. So for instance, if the virus is not spreading in a population, a very highly efficacious vaccine will produce zero absolute risk reduction because there's, you know, just no risk in the population getting the virus. So the absolute risk reduction is both a function of the vaccine itself and also whether the virus is spreading when the measurement takes place.

Shawn Buckley

Right, okay. And then you were going to talk about natural immunity, but I didn't want to cut you short on the vaccine.

Dr. Jayanta Bhattacharya

Yeah. I wanted to get to natural immunity. I just wanted to tell the story about the vaccines because it's related. It's very closely related to the vaccine mandates and the lack of necessity for them.

I mentioned that it's symptomatic infection prevention. It didn't check for whether it prevented— The trial was not statistically powered to test prevention of death from COVID. On the other hand, you also could have used the trial to check whether the vaccine prevents you from getting any infection. Any infection, of course, is distinct from symptomatic infection

[00:30:00]

because you can get a non-symptomatic infection, asymptomatic infection.

You could also have checked to see if the vaccine protects against transmission of the disease. If I have the vaccine, although I may get sick, it might reduce the risk of my spreading the disease to others.

The trials did not check for either of those endpoints. So what we knew was two months of prevention of symptomatic disease. And that's it.

Now, the other thing about the trial that's important is that the trial explicitly excluded from its efficacy calculations patients who had already previously had COVID and recovered. That subgroup of the trial actually turned out to have almost no cases of COVID at all after they'd recovered. And so, they wouldn't have been able to find much effect of the vaccine in that group. And if you read the supplementary appendices in the vaccine trials, what you'll see is that those groups, while they were recruited in order to check the safety of the vaccine, were actually excluded from the efficacy calculations in the randomized trials that were published in 2020.

The reason is simple. There's a tremendous amount of evidence, again from 2020 on, that the patients who get COVID and recover have very substantial protection against both subsequent infection and also severe disease on reinfection. Now, what we've learned is that a new variant can escape that immunity. So that if you'd had COVID in the first wave in 2020, you may have gotten it again in 2021 during the time of a new variant, but the protection against severe disease is long-lasting. If you got COVID and recovered the first time, it's very likely that the second time you get it, maybe with a new variant, will be milder, at least less likely to produce severe disease and death than the first time you got it.

Shawn Buckley

So you're referring to what we would call natural immunity?

Dr. Jayanta Bhattacharya

Yeah. So I like to say recovered immunity just to distinguish— Sometimes people say natural immunity, and what they mean is that even before you're exposed, you have some substantial protection. And you do, but it's not the same kind of protection as you get after you've had COVID and recovered. That immunity is durable. And it's very effective against reducing the risk of severe disease and death upon reinfection.

Shawn Buckley

So using your term recovered immunity, you're saying that that's robust vis-a-vis significant disease coming forward. How would that compare with the protection offered by the COVID-19 vaccines? So going forward, are they providing a similar robust protection?

Dr. Jayanta Bhattacharya

Yeah, I think there's some scientific discussion and debate about exactly it. But I think the general consensus is that the amount of immunity provided in terms of reinfection risk is better if you've had recovered immunity than an immune naive person who just has the vaccine. And the protection against severe disease and death, I think, is at least as good as someone who's immune naive and has the vaccine.

Just to give one data point again on this. There was a study out of Bergamo, Italy, in 2021 that was published that looked at patients who'd had COVID in the first wave, during that big wave in Italy in 2020, and tracked them for a year. And only 0.3 per cent of that group was reinfected during that whole entire year after that initial infection.

That's better protection against infection than the vaccines, which in careful epidemiological studies done in places like Qatar and Sweden and elsewhere found that after two or three months, the efficacy against infection, even symptomatic infection, drops pretty substantially down to 20 per cent, sometimes near 0 per cent, maybe just three, four, five, or six months after you've had the vaccine. It's very, very common, then, to have had the vaccine and then gotten infected just a few months after you had it. That actually happened to me. I was vaccinated in April of 2021 using the Pfizer vaccine. And then four months later in August of 2021, I got COVID.

Shawn Buckley

So now, from a public policy perspective for trying to get the best health outcomes,

[00:35:00]

would you agree then that it would have been prudent to take into account recovered immunity and permit people to opt out of a vaccine mandate?

Dr. Jayanta Bhattacharya

Yes. And that's for a number of reasons. So first of all, before I answer that directly, if you don't mind, let me talk a little bit about why these scientific facts we just talked about means that the necessary conditions that you would want for a vaccine mandate are not actually there.

Now, I believe that the vaccine does reduce the risk of all-cause mortality. It wasn't in the trial. But there are a number of high-quality epidemiological studies done by people who are not affiliated with any of the drug companies. Very skilled epidemiologists, using careful cohort approaches, that demonstrate that the vaccine does reduce mortality risk from COVID, I think, for up to six or seven months after you've had it. So let's take that as given.

The right use then for the vaccine is to recommend it very strongly in the population that faces the highest risk from COVID, the elderly. The vaccine should have been used for focused protection of the elderly. That's essentially what Dr. Strauss did, for instance, in Haldimand-Norfolk. It's very important, then, from a personal health point of view that high-risk individuals get vaccinated. On the other hand, for low-risk individuals, from a personal health point of view, it's much less important that they get vaccinated because the absolute risk reduction for them—for instance, for younger people—is small. That means the expected benefit from the vaccine for a low-risk person is low just by the basic math of it, right? If you face a zero risk of dying from COVID, the vaccine produces zero benefit because you can't go below zero.

And on the other hand, the vaccine is not without side effects. We've learned, for instance, that the vaccine, especially in young men, produces myocarditis, which is the inflammation of the heart muscle. It can be a very serious condition resulting in death at, I think, at unacceptably high rates given the small benefit of the vaccine in young men, especially from the second dose or the boosters.

So from a private health perspective—private meaning from an individual patient's perspective—whether the vaccine is a wise thing will depend on how old you are, your health condition, a whole host of other things. Things that you normally would expect to be

able to talk to your doctor about and decide for yourself whether the vaccine is right for you.

On the other hand, from a public health perspective, if a vaccine does not stop transmission of the disease or only has a very limited effect on the transmission disease for a short period of time, well, the idea that you need to vaccinate other people so that I'm protected is just false. Now, normally with other vaccines, like the measles vaccine that does stop transmission, that idea isn't false. The protection provided by the measles vaccine against transmission means that when I'm around patients or people who've had the measles vaccine, I'm very unlikely to get measles because those people are not susceptible to getting measles. That's essentially a kind of herd immunity provided by vaccines. By the way, recovered immunity can provide the very similar kind of effect. But this vaccine, this COVID vaccine, does not stop transmission.

And in fact, in those same careful epidemiological studies that I just mentioned where they found reductions in the risk of mortality after the vaccine, they find that the protection against infection is very short-lived. And what that means, then, is that the public benefit—"public" meaning my vaccination protects you—is very, very limited from this vaccine. But that public benefit is a necessary condition, I think, for imposing a mandate. Because the idea of the mandate is that well, there are people that are not getting the vaccine endangering the public by not doing so. Well, that's just not true for this vaccine.

So if you are lacking in that necessary condition for the vaccine mandate, it's not wise public policy to impose it.

[00:40:00]

It's because it doesn't actually end up protecting the public, and the public thinks they are protected. But I think there are even broader, even deeper reasons why I think the vaccine mandates were such an unwise idea.

First, I think it created this idea that there was an unclean group of people walking around. It demonized people who, for whatever reason, chose against getting the vaccine. It essentially gave open season to discriminate against them: People lost their jobs. In Canada, unlike most Western countries, I think even in most of the rest of the world, unvaccinated individuals were not allowed to travel internally for years. That's a gross violation of human rights. And it essentially demonized people who, again, for whatever medical reason or whatever reason, chose not to get the vaccine. For those who chose not to get the vaccine, it should always have remained a private medical decision, given the epidemiological facts I've said. It should never have become an issue of public health in the sense of forcing them to get the vaccine. So it essentially created social divisions that were **absolutely unnecessary for public health to induce.**

And actually, the second knock-on effect of that is, I think, it undermined trust in public health and in vaccines more generally among a substantial fraction of the population. The vaccine skeptics movement that I've seen throughout my career has always been a relatively small group of people. What I've seen now in Canada and in the United States and elsewhere is that that group has grown very, very sharply. And they question not simply the COVID vaccine but other vaccines as well and public health more generally.

A lot of the protests, for instance, the truckers movement was induced by the civil rights violations on the back of these vaccine mandates that were put in place in Canada and the vaccine-related movement restrictions put in place in Canada. The same thing, by the way,

has happened in the United States. Although it didn't have movement restrictions of the same kind. We had vaccine passports, vaccine mandates, that have induced a very similar kind of entirely predictable reaction by people who were upset by this policy, an absolutely unnecessary policy from an epidemiological point of view. And we're going to be facing those problems for years and years.

Shawn Buckley

Now, I'd asked you generally about public health policy with the vaccines and taking into account recovered immunity. And I'm just wondering if I could focus you a little more then specifically with children. Because you were suggesting, I think you were suggesting, that the risk that children would face for serious illness or death from COVID is zero or for all intents and purposes non-existent. So from the individual perspective, the parents making a decision— Should I be vaccinating, not vaccinating? Clearly, you'd say, "Well, why would I do this?"

But you had spoken earlier, and I think this goes to the public health thing about protecting others, that children were also such a low risk for spreading the virus. So can you comment on those two things and then your thoughts from a public health policy. Because we're still pushing to vaccinate children quite aggressively in Canada. And so, we'd appreciate your comments today on our current policy.

Dr. Jayanta Bhattacharya

So I tend to have a philosophy that you should make those kinds of decisions in careful consultation with a physician to decide whether your child should or should not have any particular medical treatment. Parents should be involved. Physicians should be involved in that.

I think that the risk of mortality for a healthy child, while not zero from COVID, is very, very, very, very low. And so that means the benefit from the vaccine in terms of preventing those severe outcomes, again, is also very, very, very, very low for the vast majority of children. That is not to say that there may be some small numbers of children who have particular medical conditions that make the risk of dying from COVID or other respiratory infections higher. And maybe they might benefit from the vaccine relative to the risk they face from taking the vaccine.

So I think this should be a decision that should be made without pressure

[00:45:00]

by parents consulting about their children with their physicians. The role of public health, then, is to reassure parents that, while most of their children face a very low risk from COVID, it's important for the lives and the health of children to have their regular lives go again. That, maybe, if their child is immunocompromised or has some other particular medical conditions, to go seek advice from their doctor. I mean, that's the kind of reassuring advice I would have expected professional public health people to make regarding children.

The idea that there should be universal vaccination of COVID for children I don't think is aligned with basic evidence-based medicine practices. In evidence-based medicine, when you have an uncertainty, for instance, we don't know the full extent of the side effects of the vaccine when given to children—we do know, for instance, young men have higher rates of

myocarditis—and the benefit is low. Generally, the advice is that you would err on the side of caution and not give that therapy. I think that's likely the case for the vast majority of children, that it's not actually wise to get it. But there may be children for whom it is wise. And I think that the key thing there is you need to have those decisions made in careful consultation between parents and doctors.

Shawn Buckley

Now Dr. Bhattacharya, I want to switch gears just briefly, and then I want to allow time for the commissioners to ask you questions.

I want to switch to the area of censorship because for one reason or another, you have been kind of placed in the forefront. And I want you to, first of all, speak about what happened with Canadian media when you came out as one of the three founding authors of the Great Barrington Declaration.

Dr. Jayanta Bhattacharya

So almost immediately after we published the Great Barrington Declaration, I think less than a week or so after, the CBC held a roundtable with two or three scientists who really didn't like the Declaration. But I don't think they understood the Declaration. The CBC essentially allowed them to say on the air, paid for by the Canadian taxpayers, that the Great Barrington Declaration was calling for "letting the virus rip," essentially letting everyone get infected. And in fact, the Great Barrington Declaration, as I've said, was the opposite of that. It was a strategy of focused protection of vulnerable older people. The idea wasn't to let the virus rip. The idea was to let young people live their normal lives. It's very clear that when there was a threat to older people—when the disease is spreading rapidly or at high rates in the population—people would take voluntary action to try to reduce the risk faced by older people. And the Great Barrington Declaration is entirely consistent with that.

It was also consistent with devoting resources and ingenuity to protecting older people who faced a high risk. So for instance, deploying monoclonal antibodies in October 2020, those had just become available. Rapidly deploying them at scale, so that older people if they got sick would have access to them. That would have been a very wise thing to do. Again, entirely consistent with the Great Barrington Declaration. The idea wasn't to let the virus rip. The idea was focused protection of vulnerable older people.

In a sense, the CBC impanelled a group of scientists who slandered us, accused us, essentially, of wanting to kill people. And then, when a Canadian lawyer that we were in contact with complained, the ombudsman, the CBC, said, "No, it was a fair report" and **didn't allow us to have any response. So the Canadian people were robbed of the opportunity to understand what exactly we were proposing. And just to be clear, it wasn't just me. I teach at Stanford University. But, also, there was Martin Kulldorff of Harvard University, an epidemiologist and fantastic biostatistician. And then Sunetra Gupta of Oxford University. She's the professor of theoretical epidemiology at Oxford. And tens of thousands of other scientists and doctors, including a Nobel Prize winner here at Stanford, signed on to this. This was a major scientific proposal put out by credentialed scientists. It deserved a fair hearing, not a slandering.**

[00:50:00]

And the Canadian people were robbed of that opportunity by the CBC, which essentially impanelled slander against it.

You asked about censorship. You know, I think it's important for the Canadian people to know that this was a systematic effort, not just by the media but by government actors. There was a report in 2020, for instance, that the Canadian military used propaganda techniques on Canadian citizens to combat disobedience against lockdowns in 2020. The physicians' organizations, which license physicians and oversee the conduct of physicians in Canada, used its power to silence dissent by doctors. For instance, in Ontario, there's a doctor named Kulvinder Gill who posted on Twitter messages essentially saying that lockdowns were a very bad idea, that focused protection was a good idea. Entirely consistent with the science. And as a result, the CPSO, the College of Physicians and Surgeons of Ontario, has threatened her licence.

It was a systematic campaign by Canadian government and quasi-governmental organizations to silence dissent so that Canadians got the impression that there was no alternative to lockdown. When, in fact, the scientific community had proposed a very effective alternative to lockdowns that would have worked if it had been adopted in Canada.

Shawn Buckley

Now, my understanding is that you're involved in a lawsuit in the United States. So the State of Louisiana and the State of Missouri and other parties are suing the Biden administration over censorship issues. Can you briefly share with us some of the things that you've discovered about censorship and this COVID experience?

Dr. Jayanta Bhattacharya

Yeah, so the United States has done no better than Canada on this, in many ways worse. The lawsuit that I'm involved with is a federal lawsuit. It's still advancing through the courts. But what the judges allowed us to do is to depose a number of prominent individuals inside the Biden administration and the Health and Human Services bureaucracy of the United States, including Dr. Tony Fauci.

We've also had access through discovery to a huge trove of email communications between a dozen federal government agencies in the United States and social media companies, including Facebook, Google, Twitter, and so on. The content of these emails and these depositions reveal an enormous effort by the federal government to threaten social media companies from a regulatory perspective if they didn't comply with censorship demands. Often these emails have demands on people to censor, posts to censor, ideas to censor, all in the name of combating disinformation. But the disinformation that they're combating is often true information, including information, for instance, about the efficacy of recovered immunity or the harms of lockdowns and so on.

In the United States, this is, to me, a very clear violation of the American First Amendment right to free speech. And even more importantly than it violates a fundamental civil right, it robbed the American people—it robbed the world, frankly—of access to accurate scientific information that had it been available, we might have adopted very, very different policies. It created this impression, this illusion, that there was a scientific consensus around lockdowns that didn't actually exist. It's one of these things where if you'd asked me before the pandemic, could such a thing exist in the United States? I would have told you there's no possibility. The American First Amendment protects against it. But, in fact, it's true.

It's the American government that acted to make sure social media discussions about the efficacy of lockdowns, the harms from lockdowns, recovered immunity, the proper use of the vaccines, all of those discussions, essentially, were censored in favour of the government's favourite policies. Whereas prominent credentialed individuals who dissented against that government narrative were silenced or censored or smeared in other ways. It's an absolutely shocking kind of intrusion on the rights of the people of the world to have done this.

[00:55:00]

And I hope that when we win this lawsuit, this whole censorship regime can be dismantled.

Shawn Buckley

And I will indicate that you provided us with— I think people want to clap.

You provided us with a document called the "Plaintiffs' Proposed Findings of Fact" in support of their motion for a preliminary injunction. I'll advise the commissioners and those people watching that we've entered that as Exhibit WI-8 [*Bhattacharya-Missouri v. Biden* ECF 212-3 Proposed Finding of Fact]. And my understanding is that the court has accepted the plaintiffs proposed findings of fact as true.

Dr. Jayanta Bhattacharya

So far what we've had is a motion to dismiss by the government that's been rejected by the court in [primary part]. They haven't yet addressed the preliminary injunction. So that's still pending. But if you read the rejection of the government's motion to dismiss, it's a very favourable ruling in our favour, which seems, on its face, to accept much of that document that I shared with you. Those documents are based on true facts. Those are based on actual emails we've had from discovery. And they're submitted under oath by the Missouri and Louisiana Attorney General's office to the federal court.

Shawn Buckley

Okay. And before I turn you over to commission questions, I'll also just let you know that we've entered as Exhibit WI-8a, the Great Barrington Declaration. And we've entered your expert report on COVID-19 response in Alberta, Canada, dated January 20th, 2021, as WI-8c. And you did a supplementary report called *Supplementary Expert Report on the COVID Epidemic Response in Alberta, Canada*. We've entered that as WI-8d.

And I'll just let the commissioners know, although I'm going to turn you over to their questions. You're also part of a group called the Norfolk Group, which has gone through tremendous effort to list questions that should be answered, flowing from the world's experience on COVID-19. I think it's 80 pages long of questions. And we've entered that as [Exhibit] WI-8e. And you've participated in that initiative in helping to formulate those questions. I just wanted you to know that those will be before the commissioners for them to consider.

And so I'll ask the commissioners if they have any questions at this time. And they do.

Commissioner Massie

Well, thank you very much, Dr. Bhattacharya, for your very interesting presentation. I have a few questions, some of which are probably simpler. This whole notion that has been documented in Iceland and Sweden that the transmission from children to adults didn't seem to be that important— Is it something that is unique to this particular virus, or is it something that was known before? My understanding was that with flu, children can actually probably transmit it. So what's your take on that?

Dr. Jayanta Bhattacharya

So I was surprised by the result. I did not expect it. Because the general idea was that children actually do spread respiratory viruses at higher rates than adults spread it. It's not that children can't spread this virus; it's just that they're not unique super-spreaders. I think a lot of the school closures and restrictions on the lives of children was premised on this false notion that, like other respiratory viruses, they're super-spreaders for this one. But it doesn't correspond with the actual reality as measured in the studies that came out in early 2020.

And so, we shouldn't have acted as if that were the case. Restricting the lives of children was not a necessary precondition to protecting older people. Active focused protection measures were possible to protect older people without restricting the lives of children: that's the key thing. Children were essentially demonized, made to be seen as "grandma killers." And that was never the case relative to the scientific evidence.

Commissioner Massie

You've done a very interesting study early on to show that, in fact, the rate of the virus was much more prevalent than we initially thought. So is it possible that because children typically exchange their germs, if you want, more readily than adults— Is it possible that children would have generated a recovered immunity faster than adults because of the way they exchange?

[01:00:00]

Dr. Jayanta Bhattacharya

I mean, I think that's certainly possible. I think the key reason why children respond much less harshly to the infection by this is that children's immune systems essentially are pluripotent. They're designed to respond to new threats because almost every threat when you're a very young child is new. And so, they don't have the disease for as long; they're more likely to be asymptomatic. And it's very likely that they have it for a shorter time, and that's partly why they don't spread the disease.

You know, there's a really interesting study, which I didn't mention, but I think I wrote in one of my reports about the mortality risk faced by parents of young children. If you match them against adults of similar age who aren't exposed to young children all the time, they actually, in 2020, had a lower risk of dying from COVID. It's almost as if the parents are inoculated by the children with other, maybe, other coronaviruses. The mechanism is not clear. But the fact is clear that somehow children serve more of a protective role as opposed to a threat as far as infection from this virus goes.

Commissioner Massie

One of the things that actually triggered the mandate for the vaccine was the hope, I would say, that it would prevent transmission. There was no data to support that initially. And I'm not aware of any data showing that injecting a vaccine in the arm would actually prevent respiratory virus transmission. But then, when the Delta wave became pretty intense in the States, we had this statement by the CDC that the vaccine can no longer prevent transmission.

So is it because the initial strain, for whatever reason, was somewhat different and could actually be somewhat prevented by the vaccine? And the Delta was being more transmissible—then even more so when we saw it with Omicron—that the protection was completely overwhelmed by any possible way.

So do you think that this idea that the transmission was something that was potentially real from the get-go is something that was misleading—based on real-world data that we've got from epidemiology—and made us believe at one point that maybe it was working? What's your take on that?

Dr. Jayanta Bhattacharya

I mean, it's almost impossible to answer that question with any rigour because just as the vaccine was being released in December of 2020, the very first variant of concern was identified. I think it was the alpha variant, was what they called it eventually. The vaccine never was tested against transmission in the trials. That would have answered that question. And so, we don't know for certain if the vaccine would have prevented transmission for a very long time. We just know that it prevented symptomatic infection for two months.

What we do know is that the vaccine when it was used in the real world, within just two or three months after vaccination, the efficacy against infection dropped very sharply, again, in high-quality epidemiological studies. And so, the reality from the moment we started using the vaccine was that it wasn't, given the variant that was actually abroad in the world, it wasn't going to protect against transmission.

You could see this very early on in 2021. Heavily vaccinated countries and regions were experiencing big cases. I think the very first one I saw was in the Seychelles Islands. I think it was March or April 2021. They used the Chinese vaccine: they were 90 per cent vaccinated, or a very high per cent vaccinated, and they had a huge outbreak of cases.

There was another outbreak of cases in Gibraltar, again, heavily vaccinated; this time, I think, with the AstraZeneca vaccine. And of course, Israel in 2021 very quickly vaccinated a very large fraction of its population and then experienced a very large outbreak of cases. The evidence was there from within months of the vaccination campaign starting that the vaccine was not going to stop transmission, was not going to protect people from getting infected.

Commissioner Massie

In terms of protection against severe outcomes or death, we have indeed the study showing that the vaccine seems to have done a reasonable job. But with the, I would say, less virulent—or we think it's less virulent—Omicron strain, do you think that we have generated, or we can generate data to show that convincingly at this point?

[01:05:00]

Dr. Jayanta Bhattacharya

I think it would be very hard. I think a very large fraction of the Canadian population have been infected with Omicron. And as a result, most of the Canadian population— I mean all of them infected and recovered have recovered immunity. And so, with patients who have recovered immunity, the marginal benefit of the vaccine is going to be lower because the recovered immunity by itself provides a protection against severe disease and death.

There is a literature that suggests something called hybrid immunity: so if you're vaccinated and you have recovered immunity, COVID and recovered, you have a different kind of level of protection than someone who's just simply had recovered immunity or someone who simply had the vaccine. To me, these are like esoteric questions because the actual risk reduction from any of those is very, very high relative to the immune naive person. So that's why we're in such a different place now in April of 2023 than we were in March of 2020. Such a large fraction of the population has recovered immunity. Such a large fraction of the population has had the vaccine. We don't need to worry so much about COVID because of the durable protection against severe disease provided by those two facts. I think especially recovered immunity, it seems to me, is probably more important, but there are scientists that disagree.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Good morning. I have a couple of questions. And the first one is— You were talking about, I believe you said, that there's been some credible studies that seem to indicate that the vax does reduce mortality due to COVID.

And my question on that is— We've had a significant number of witnesses, prior to yourself, come on and tell us that there were issues with the vaccine from inception to putting it in arms. You know, non-aspiration. It was my understanding from the testimony that manufacturers recommended not to mix different manufacturers and that was done. There were issues with, or at least alleged issues, of quality control in the production.

And I would like you to comment on—in these studies that indicated or seem to indicate that the vaccine reduced the potential for death—were those production vaccines given to those test subjects the same as they were done to the general population? Or were they not necessarily the same production vial that Joe Black got at the pharmacy in Winnipeg?

Dr. Jayanta Bhattacharya

Yeah, so I can't speak to Winnipeg in particular. But I can say that the studies are based on population records. There are observational studies where they're tracking at scale regular people that had got the vaccine, for instance in Qatar or in Sweden or in Denmark or in Northern California where some of these studies were conducted. So it wasn't that they were like special test subjects. They were actually just regular people getting the regular vaccine.

I have seen, by the way, some of that literature, and some of it is actually quite concerning. I'm not surprised in some sense. The vaccine testing and the rollout was done at a very

rapid clip. Normally, something like this would have taken years and years and years of testing. And I can understand why. Like you have a big threat to especially vulnerable older people, you want to rapidly test and roll out a vaccine. That makes a lot of sense to me. And then it also makes sense that given the speed at which it's done, there are mistakes made that can happen and we learn things over time about how to administer, and so on. So none of that is surprising to me.

The key question to me is, given all of those mistakes, what effect did it have at the population level? Ideally, I would have liked to see a long-term randomized study done over, you know, not just where you track patients for two months but for a year or longer to see what the effects of the vaccines were, including the side-effect profiles.

That's not possible after December 2020, when they ceased those big large-scale trials. And we don't have any more of those large-scale randomized trials. The best we have available are these epidemiological studies that I cite in the Alberta report. And those are the kinds of studies that—

[01:10:00]

I work with the US Food and Drug Administration on vaccine safety, for instance. Those are very similar to the kinds of studies that I've done and conducted where the idea is to carefully match patients who've had the vaccine with patients who haven't as best you can, given it's not randomized. And then track them over time using passive data systems, like electronic health records, like medical claims. And then conduct this longitudinal analysis comparing the outcomes of patients who've had and who've not had the vaccine. That's essentially what those studies do. They're not perfect. They're not randomized. They're, unfortunately, the best we have.

Commissioner Drysdale

As a policy analyst—as you being a policy analyst, not me, by the way—my understanding of policy is when you examine issues or problems, you examine suggested solutions and, then, you try to understand how those solutions to that problem will affect the overall tapestry of our culture or our world in this matter. I mean, you know, we seemed to impose things that tugged on every fibre of our society. We locked people down. We isolated old people in old folk homes. We censored people. So we almost tugged on every single fabric of our society.

And my question to you then is, as a policy analyst, are you aware of any detailed cost-benefit studies on these things that were done in Canada or United States?

Dr. Jayanta Bhattacharya

No, none. And I think it was a malpractice, a public policy malpractice not to have done such a thing. Essentially public health acted as if all that mattered was COVID risk—and not just COVID risk but the spread of COVID—and adopted policies, tremendously destructive policies like lockdowns, like school closures without an eye toward any of the other so easily predictable social consequences and health consequences from those policies.

An honest and responsible public health considers both the costs and benefits, the harms and benefits from policies it recommends. It looks at public health holistically, holistically not in the sense that the World Health Organization only means it. Health is a very, very broad multifaceted thing. It's not simply the prevention of a single infectious disease. And

so, when you adopt policies that are aimed at simply the protection against a single infectious disease, you are almost automatically going to harm other aspects of health. And that's exactly what's happened.

Commissioner Drysdale

As a professional myself, I understand the importance of explaining to my client in terms that they can understand what exactly I'm talking about. You know, as a professional, yourself included, we can use all kinds of terminology that is normal to us that our clients can't understand. In this particular instance, and from what I observed, this was probably the most significant time where folks needed to understand what was going on in order to give informed consent. And you spoke a little bit earlier about efficacy and you talked about relative efficacy versus absolute efficacy. And you said, well, that was a reasonable thing to you as a professional. But what I'm asking you is— Do you think that the general public, when they were told that they [the vaccines] had a 97 per cent efficacy, understood the difference between absolute efficacy and relative efficacy?

Dr. Jayanta Bhattacharya

No, I don't. I think that a lot of times people use that 95 per cent number without actually telling people, as they should have, what the caveat is about that number. So for instance, I think the most important caveat is it did not measure 95 per cent efficacy against severe disease and death. It only measured efficacy for the first two months after the vaccination. Those caveats should have been told to the public at large.

You used the words informed consent. I think there was a mass violation of informed consent in the way that the vaccine was rolled out. The force applied to people to take the vaccines through the mandates: the social discrimination, the passports, and movement restrictions—all of that was a mass ethical violation at scale.

Commissioner Drysdale

Once again, as a professional, I'm trained to understand the difference between real risks,

[01:15:00]

weigh them against potential risks, and then decide on what an action is. And I thought what I heard you saying in a number of instances was that there were potential risks.

One of the previous witnesses talked about, and I apologize, I can't remember the name of the doctor who did the studies that said the whole world was going to die. Now, I'm **exaggerating that point. And then, there were studies by Pfizer that followed their test subjects for two months and then injected all of the placebo groups. So there was no placebo group past two months. There were doctors coming on TV that were telling us that the vaccines prevented spread when there was no studies on that. So to me, those were all potential risks.**

The absolute risks were you locked a child up in their bedroom for two months and they couldn't go to school and what the consequences of that might be. Or you took a dementia patient that we've heard testimony on in a number of instances where they just locked them up and abandoned them to die.

And I guess my question is— Is it not standard practice in public health or in the practice of medicine to understand the difference between absolute and relative risk and weigh those two things together and come up with an appropriate solution given those two different types of risk?

Dr. Jayanta Bhattacharya

In the public health world that I grew up in, I thought that was absolutely bog-standard. You would evaluate the evidence based on the quality of it: you'd prioritize high-quality versus low-quality evidence. You would try to understand the implications, the reasonable implications that could be drawn from evidence and not make inferences outside of what's reasonably inferable. If you had models, you'd check the models against reality to see if the models are actually doing well enough. You would think about a whole wide range of outcomes from a policy, not just simply the putative benefits of a policy but also the potential harms of the policy before you adopt it. All of these I thought were absolutely bog-standard in public health. And I think so many of those principles were thrown aside in the decision-making around COVID and COVID policy. It's been disheartening for me to watch as a public health professional.

Commissioner Drysdale

It almost seems that the fundamentals that we based our society on at almost all levels were ignored or trampled on here. You talked about censorship; you talked about public health, basic science. I'm a scientist, and in basic science, you observe something. You guess what you think it is. You do some testing; you develop a theory. And then you observe some more, and you take another guess. But science is a loop that keeps going round and round and round and round, the basic fundamental of everything in our technological life. And somehow, in this instance, we went around—we seem to have went around in a single loop. And then it became dogma. Is that something that you've observed before in your scientific career?

Dr. Jayanta Bhattacharya

Never. So my colleague, Martin Kulldorff of Harvard University, who co-authored the Great Barrington Declaration, at one point, I think in late 2020, he wrote that this was the end of the Age of the Enlightenment. And you know, at first, I thought he was being hyperbolic. But you know what? He was right.

Essentially, you had a scientific dogma, a relatively small, narrow-minded group of individuals with tremendous power who dominated the scientific life of the world for a time and didn't brook any dissent. When we wrote the Great Barrington Declaration, four days after we wrote it, the head of the National Institute of Health, Francis Collins in the United States, wrote an email to Tony Fauci calling me, Martin Kulldorff, and Sunetra Gupta fringe epidemiologists. And then calling for a devastating takedown of the premises of the Declaration.

I was subject to death threats, propaganda attacks, slander. I mentioned already the CBC slander, saying that I wanted to let the virus rip when, in fact, I wanted focused protection.

It was a systematic attack on the very foundations of science that operate exactly the way you say. You know, you have hypotheses. I would just add one thing to your excellent description of how science works with logic and hypotheses and experiment. It happens in conversation with others who disagree with you. In my experience in my scientific life, I've

learned a tremendous amount from people who disagree with me. It's how science advances. And when the disagreement results in an experiment where one idea is proved right and one idea is wrong, that's exactly how science advances. If you don't brook disagreement in science, you're not doing science.

[01:20:00]

Commissioner Drysdale

Yes, I mean, science is a combination of many minds, not one. And so that's the evolutionary process, if you will. If you're a single monolithic solution to a large problem, everybody's at risk by whether it's correct or not. You have multiple solutions and you have multiple opinions, you're protected. Thank you.

Shawn Buckley

Are there any more questions from the commissioners? There are, okay.

Commissioner Kaikkonen

When I think of the principle of content neutrality in defining the scope of section 2(b) of the *Canadian Charter of Rights and Freedoms*, as I recall, it's no matter how offensive or unpopular or disturbing a comment might be it still needs protection. But here we're speaking about a bias against truth. Can you comment?

Dr. Jayanta Bhattacharya

I have to say, in 2020, it seemed to me like the basic protections for free speech in the United States and Canada were essentially thrown away. The United States, the First Amendment seems to have made some comeback here. And I still have some hope that our lawsuit will succeed. I'm very worried about Canada. My experience in the Canadian lawsuits that I've been involved with—one in Alberta, one in Manitoba against the lockdowns, and then another in Montreal—I have seen very little inclination from the Canadian courts to protect those basic charter rights.

You're absolutely right. This is even more fundamental than somebody just saying bad words on the internet or something. Although I think those are free speech rights that ought to be protected.

What you have here is a fundamental suppression of scientific discussion. And it was a suppression both directly with direct censorship efforts but also by smearing and demonizing people who disagreed with the narrative. Credentialed people, doctors, scientists, where the idea was to—in the minds of Canadians just watching CBC—for them to think that, okay, these are the bad guys; the public health authorities who are making all these lockdown decisions are the good guys. And you should just ignore them because they're fringe, they're outsiders, they're somehow underqualified. Although, I mean, the key thing to me is that kind of idea is dangerous not just from a legal perspective—where you violate fundamental civil rights of peoples, which it absolutely is—but also from a public health perspective.

When public health authorities make mistakes, you have to permit dissent. You have to allow that kind of correction to happen. And if it's going to happen from the outside, where else would it happen if you have a monolithic public health authority that's speaking in one

voice? You can't simultaneously allow that public health authority then to control the organs of the media and allow it to demonize opponents, not with logic but essentially by drowning out or by de-platforming. But that's unfortunately what happened. And I think it harmed the health of Canadians.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

Dr. Bhattacharya, it appears that the commissioners are finished with their questions and I'd like to just on behalf of the National Citizens Inquiry sincerely thank you for taking the time to share with us. Your testimony is greatly appreciated as we jointly just try to find out what happened and figure out how to proceed and heal as a nation. So thank you so much for your contribution.

Dr. Jayanta Bhattacharya

Thank you so much.

[01:24:03]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 3: Deanna McLeod

Full Day 1 Timestamp: 05:43:22–07:18:47

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Wayne Lenhardt

Thank you, Shawn. I'm not completely up on your technology here, so this is going to be a virtual witness. Have we got that teed up, Shawn?

Shawn Buckley

Yep, she's right here.

Wayne Lenhardt

Oh, here she is.

Shawn Buckley

You start asking her questions, and she's good to go.

Wayne Lenhardt

Oh, there we go, yeah.

I have a CV for you, Deanna, and it's fairly impressive [Exhibit WI-7]. It goes back all the way to 1991 where you've published articles and done research and whatnot. I don't have your degrees though, so perhaps you could tell me what those are. And then we need to go through the little formality of swearing you in as a witness.

And it looks like you've got some interesting topics to share with us.

Deanna McLeod

Yes, for sure. So you asked about my educational background. So I studied at McMaster University, which is the home of evidence-based medicine and was trained as such. My focus was in immunology and cognitive psychology. So that's pretty helpful these days. And

I basically, instead of pursuing the degree of pre-med, which I trained for, or medicine, which I trained for, I actually shifted to the pharmaceutical industry and spent ten years there. So that's a little bit about me.

And did you want to do the swearing in?

Wayne Lenhardt

Okay, so the formality is, can you give us your full name? And perhaps spell it for us for the record.

Deanna McLeod

Sure. My name is Deanna McLeod. That's D-E-A-N-N-A. McLeod is M-C, capital L-E-O-D.

Wayne Lenhardt

Okay. And do you promise to tell the truth, the whole truth, and nothing but the truth during these proceedings?

Deanna McLeod

I definitely do swear to tell you the whole truth to the best of my knowledge and abilities.

Wayne Lenhardt

I see that you've given us six topics that you'd like to cover. I think we have an hour to do that. So one of them is Pfizer six month data; second is safety surveillance issues; trial data for children; omicron boosters; and conflicts of interest. So I think what I'll do is just turn you loose to give your testimony.

The commissioners may have some questions. So if you're going to change topics on us, perhaps we could stop and see if there are any questions. And if not, then we'll just proceed to the end of your time.

Deanna McLeod

Okay, well, thank you so much.

Wayne Lenhardt

The floor is yours.

Deanna McLeod

Okay, great, thank you. I'm just going to share my screen here. Let me know when you can see it.

So the topic that I'll be addressing today— I believe I'm going to be testifying a few times, but the one that the Inquiry had asked for me to look into today, or the one that I wanted to pursue today, was a combination of conflicts of interest as well as the safety of the COVID-19 vaccines. And I believe that there's been probably a number of presentations addressing safety: Safety issues, maybe in the form of a patient, somebody who's been vaccine injured.

Or perhaps a number of very capable scientists who've come in and looked at adverse event reporting databases.

What I'd like to do is, I'd actually like to dial back a little bit. My particular expertise in the last 20 years has been in preparing evidence-based guidelines. My firm, which I started in 2000, works with clinical oncologists, people who treat cancer. And we work with them to survey the literature, analyze clinical trials, and prepare guidance documents in the form of either systematic reviews or clinical guidelines that basically help them guide therapy.

And so what we do is we apply the practice of evidence-based medicine. So we look at a clinical trial. We weigh the evidence. We survey the doctors that we're working with to see the degree of consensus. And then weighing a combination of the level of evidence and the degree of consensus, they'll make either a strong or a weak or not so strong recommendation. And so we're very, very familiar, my team and I, in weighing evidence and analyzing it.

And so what I'd like to do today is I'd like to take you through the evidence that these vaccines are safe because our public health officials have been claiming that they're safe. And also, interestingly enough,

[00:05:00]

I know Shawn's on this call. I've taken a deep dive into some of the regulatory issues that explain some of the safety data that we've seen in the COVID-19 crisis, the COVID-19 moment. And so I'd like to have a conversation about the connection between those two things.

And at the very end, what I'd like to do is bring people's attention to the fact that Health Canada is proposing further amendments to the Food and Drug Regulations in order to expand the capacity to push through drugs like novel technologies, like the COVID-19 vaccines, via a back door that they created in 2019. And so what I'd like to do is just show you what a change in regulation means in terms of side effects. And then, maybe, loop back and talk about how the proposed extension to the regulations or the further proposed amendments, what that may mean for Canadians.

So with that very long-winded introduction, I'm just going to jump right into it. I'm going to call this regulatory responsibility.

I am not a lawyer like Shawn who is familiar with regulatory stuff. But we do consider regulations and the burden of proof when we're weighing evidence to prepare a guideline. And so I have a working knowledge of that area.

But one of the things that I'd like to emphasize right away is that our current system is based on testing to prove something. So in this context, when we're looking at the COVID-19 vaccines or perhaps the changes in the upcoming regulation, what we need to know is understand historically, especially as it relates to vaccines, what the standard for testing is. And so the standard for testing at the very top is anywhere between one to ten years. We surveyed the literature. And we basically noted that each step can vary in terms of its time. But in general, there's a sequence of steps that are always done in order to ensure safety. And so I'm just going to walk you through those right now.

The first one is in vitro and animal model studies. So that's called preclinical, so before clinic. Before it gets into people in the clinic, you do extensive animal testing. And some of

these tests can take up to three years. And generally speaking, you want to demonstrate safety in things that aren't human so that when you do proceed to humans in clinical trials, you know that there's a degree of safety. And that you know what to expect and what not to expect to some degree that you can then design your studies in order to be able to monitor potential safety issues. And so you test safety in cells, tissues, and animals before you move on to humans. And that has been one of the cornerstones of our clinical development process.

And so, when a regulator, Health Canada, wants to consider approving a drug, the pharmaceutical company or the manufacturer will submit a dossier of clinical trials. And they'll need to prove, generally speaking, that the preclinical data doesn't show any concerning safety issues. And then when they go to clinical trial, the ethics boards will allow them to go to a clinical trial to see— If the preclinical data is sufficiently safe or if there's no safety signals, then they'll allow them to go to a clinical trial. And they'll make sure that that clinical trial is appropriately designed in order to be able to monitor potential safety signals that showed up in the preclinical data.

So the other principle that applies when we're doing clinical research is you start with Phase I studies. And generally speaking, in my particular area, a Phase I study could have up to 20 patients in it. And so you test a new drug in a very, very small group of patients. And then you work your way up. A Phase II study could be 20 patients, could be a little bit more. Especially if it's looking promising, they might add it to about 80 patients.

And then a Phase III trial, depending on what kind of study it is, whether it's treatment or prevention, will have either hundreds or thousands or tens of thousands if you're looking to try a novel technology in humans that are healthy; so, you need to test it in a greater and greater and greater sample, depending on how many people and how healthy they are. Because what you want to do is you want to make sure that there's no risk of drug injury when you're looking at these particular drugs

[00:10:00]

and whenever you're considering the data.

So the principle then is extraordinary caution and careful study over time in order to ensure that when you start to roll something out to the very broad population that all of the possible safety signals have been detected, not only in the short term but over time. And so you can see here that this band, vaccine development, has taken up to about 10 years at times. There have been rare cases where we've seen that time frame compressed to five years. A lot of people would say that that's a great success because they got a helpful vaccine out onto the market earlier. But every time we compress the timeline, we basically **sacrifice or compromise on long-term safety. Because there's no way to figure out the safety of something in great detail and to fully characterize a safety profile if you've only done it in a short time. So that's one of the principles.**

And so when Health Canada looks at a submission or a dossier that's been submitted for review, they basically look to make sure that each and every one of those steps has been carefully checked; that over time, there aren't any safety signals and that all the steps have been carefully done in order to be able to ensure at the end that you can say that something is both safe and effective.

And I was mentioning, too, that you want more study and more time when you're considering using something in a healthy population. And also, you would want to have

more study and more time when you're considering novel technology: novel meaning you don't know very much about it; you haven't used it in very many areas; we don't have very much experience with it. And also, you want to be able to be careful and more cautious when you're using high-risk products, products where there's a known adverse effects profile.

So with that said, there's Shawn. I actually put your picture in there, Shawn. Basically, this is something that he wrote that I read recently. And it's the test that you would need in order to be able to allow for a drug to be authorized in Canada. And so he's, of course, given many presentations on this. And so I don't really want to go into it much further than to say that in order to get authorization to market a drug in Canada, a manufacturer must meet the test that a drug demonstrates both safety and efficacy and that the benefits outweigh the risk. And so just with that in mind, that is our prudent, cautious, regulatory framework, which sets a very high standard and protects people from potential drug harm by having that high standard.

I just want to step into my particular area, which is this hierarchy of evidence. And this is going to make some people's eyes roll back. But it's very important to know that not all science is the same. And I know that through the COVID-19 pandemic and the COVID-19 crisis, you've got a lot of politicians sitting up and saying, "We're following the science. If you don't follow the science, then you're, you know—fill in the blank." But it is really, really important to know that not all science is the same: not all studies are the same, that you have different types of clinical trials and different types of studies. And each study can do different things.

But there's only one study that can ever prove something and that's the gold standard, that's a randomized controlled trial. And it's considered Level 1 Evidence or the highest level of evidence. And so what we want to see and what we look for when we're setting guidelines is Level 1 proof that something is safe and effective.

So what that means for us is that you have an investigational agent that's been compared to a standard of care. The comparator is very important, ideally. And that it shows that it improves outcomes for clinically meaningful benefit. So for instance, if you want to try and save lives, something that makes your skin clear is not going to be a clinically meaningful benefit. Or something that works for a short time, but doesn't work in the long time, that's not going to be a clinically meaningful benefit. So you want to make sure that the study is properly and appropriately designed to show a clear benefit in an area of clinical benefit.

So, with that said, Health Canada, generally, at least in the area that I work in, in cancer,

[00:15:00]

relies very, very heavily on Level 1 Evidence in order to seek approval. There are very few circumstances when they'll give access to a drug or market access to a drug for less evidence. And then there's lots of follow-up that's required in terms of safety monitoring. But generally speaking, Level 1 Evidence is the standard that is used to ensure that any product that enters the Canadian market is both safe and effective and the benefits outweigh the cost. And that is really rooted in the Hippocratic Oath, which is to first do no harm.

And there was a time at which there was considerably more deregulation, where regulations were much more flexible. And basically, a drug called thalidomide was promoted. And that drug basically was intended to help relieve morning sickness for

mothers. And it was considered safe or it was purported to be safe. It was approved and given to a large number of women, so it was widespread use. However, it hadn't been proven safe. So when these babies were born, they had limb malformations. And so that led to considerable regulatory reform in Canada, U.S., and the U.K. and the establishment of the precautionary principle: being careful, overly cautious when it comes to drug approval so that we avoid any undue harm, as in these children who were born with unusable, at times, arms and legs.

So I'm just going to shift gears and talk about biologics. We deal with biologics all the time. And they basically are types of biological products that are used, at least in the area that I work with, to treat cancer, for instance. So they can target a given receptor or a small molecule that acts to shut down a pathway or turn on a pathway, depending on what we want to do in terms of treating cancer.

But one of the things that is very, very clear when the biologics first began to be used, almost two decades ago, was that considerable caution needed to be applied because it is understood that the risks related to these drugs can be serious and life-threatening. So biologics would be classified as high-risk drugs. And therefore, the burden of proof needed to ensure safety is higher than, for instance, a drug that has very few side effects.

So then, an abundance of caution basically characterizes our approach to biologics. And of course, in cancer we have the desire to help people because sometimes they have advanced cancer that might very well progress and result in the death of the person who has it. So then, what we want to do is we definitely want to experiment in considering novel technology or new biologics because they have such promising outcomes. But at the same time, the last thing that we want to do is add to the burden of disease of somebody who already has cancer. And therefore, there's an extraordinary push to make sure that these biologics are safe before use. And I've added a little bit of a note there, including gene therapy.

So gene therapy is one of the highest-risk biologics that there are. And the FDA basically requires that up to 15 years of long-term safety study be used when looking at gene therapy. That was the standard that was set out by the FDA, and it has been set out. And so in cancer treatment, there are a few areas where gene therapy is being developed. However, because it's so risky and because the safety profile can be very diverse, difficult to detect, and that safety issues can happen long term, it hasn't really moved forward in any considerable fashion. And so again, when we're considering the precautionary principle, the area where we should be the most cautious would be if we're using something like gene therapy, which is one of the riskiest or highest-risk biologics,

[00:20:00]

in populations which are otherwise healthy.

So I just want to talk about a loophole that I discovered in reading a number of different papers recently. And this is the one that Shawn has mentioned at different times. But a loophole was created in our regulatory framework where the standard is that you prove safety, efficacy, and that the benefits outweigh the risks. Probably as early as 2016, a powerful advocacy group started championing for changes to our regulatory framework in Canada. And this is a paper by Ruhl. It provides this amazing timeline where there was an Advanced Council for Economic Growth [Advisory Council on Economic Growth] that was founded by our standing government in 2016.

And so the mandate of that economic growth group, think tank, was to basically figure out how you could grow the Canadian economy. Out of that particular think tank came six what we would call economic strategic tables or economic tables. The health and biosciences and economic strategy table is one of them. And the goal of that particular group was to sit down and say, how can we grow the health and biosciences sector in Canada?

So I just want to mention to you, at this point, that this has nothing to do with regulation and clinical treatment. In the sense that it is the pipeline for novel treatments, but the goal here is an industry, for-profit, motivated group that is basically now going to say, well, if we want to attract investments to Canada in the health and biosciences area, if we want international groups, global entities, to invest in Canada in our economy, then we basically need to initiate these conversations. And in the conversations, one of the things that came forward was that Canada has these pesky little barriers to innovation called high standards and high regulatory standards. And then basically, this group put out a report. And the report was designed to basically revamp or create a loophole in our regulatory framework that would allow novel therapies, as yet fully undescribed, not fully characterized, to get through a back door in our regulatory framework.

And so the pathway for creating this loophole was basically introduced through an omnibus Bill C-97 that was pushed through at the 11th hour in December 2020 by our standing government. And basically, the goal of that particular bill was to allow for an exception clause. It's like a loophole, an exception, a back door whereby the minister could designate certain drugs as exceptions to the rule. And that they could go through a different type of pathway. Not that 10-year pathway that is so pesky and a deterrent to innovation in Canada, but a pathway that is allowing them to do a number of changes. I'm just going to say what they are: so adaptive clinical trial design is one of them; rolling reviews, which is taking early looks and considering approvals based on early data; and the last one would be changing the terms and conditions of authorizations. So those are kind of three crazy words.

What happened shortly after the passing of that particular bill is that late in March 2020, the data for the COVID-19 vaccine was ready. And so the minister of health issued an interim order that enabled the COVID-19 vaccines to access this expedited pathway. So there were at least two orders that I identified. The first one was authorizing the change to clinical trials. So that's the adaptive clinical trials.

[00:25:00]

And the second one was allowing them to start with rolling reviews. There were a few others, for instance. But I don't think that they relate so much to the safety issue, so I won't get into those too much. So basically, what that did is it allowed them to fast track this COVID-19 vaccine, clearly because there was a perceived public health emergency, so that they could get this novel technology, this novel therapy, onto the market to, of course, save lives.

So that's the little bit of backdrop behind that.

So this is the Honourable Jean-Yves Duclos. I've just put his brief bio up there. It's nothing too much. But I want to emphasize that Yves Duclos does not have a medical background per se, but that he is an economic expert. And one of the things that we need to consider when we're looking at guidelines is we're always very, very sensitive to what we would call a conflict of interest. And a conflict of interest is when somebody who has something to gain potentially financially, politically, career-wise, influences a guideline or a

recommendation process or participates in the development of something that would then lead to them profiting long term.

So we've already learned that our government had an intention to grow the economy and that that was the impetus for regulatory reform. It wasn't because our regulatory system wasn't doing a good job keeping people safe. It was because it was a corner of the government that basically wanted to grow the economy and wanted to attract investment from global entities. And therefore, at the behest of that group and those people who are going to profit from these regulatory reforms, Mr. Yves Duclos, who's an economic expert, basically allowed the process of regulatory reform to actually begin. And he's the one that issued the interim order that allowed the first product to go through this new framework and access this pathway of expedited review. And this is a little bit of a—

Wayne Lenhardt

Could I just ask you a question, please?

Deanna McLeod

Sure.

Wayne Lenhardt

Was there any mechanism for fast tracking this type of a vaccine prior to Duclos doing this?

Deanna McLeod

That's a really good question. So in my particular area, which is cancer, there is something called an NOC/c, Notice of Compliance with Conditions, which is kind of like this pathway. But it's used very, very exceptionally and only in small groups of people with very rare diseases where there's no other option.

Wayne Lenhardt

Okay, was it ever done in the past, or was it ever used in the past?

Deanna McLeod

So the Notice of Compliance with Conditions has been used for rare diseases in the past. But this particular regulatory loophole, this back door that was created, the COVID-19 vaccines were the very first novel, or what they would call "advanced therapeutic," to move through this system.

Wayne Lenhardt

Yeah, the timeline is fascinating here.

Deanna McLeod

Yeah, it is.

So this is just text from the announcement about this advanced therapeutic pathway that they created. And, you know, small text, and we don't have a lot of time. But I do want to highlight a few things.

So one of the things is they want to ensure high standards of patient safety, product quality, efficacy, and effectiveness. So that's stated in their, uhm, thing. But before the safety bullet, you can see that they want to maintain an appropriate yet flexible, i.e., being able to lower the standard or increase the standard, depending on what they would like to do, regulatory oversight. Or maybe we'll have some oversight, or maybe we won't have some oversight. So the flexibility and oversight are the things that are emphasized here.

And then the second one, which should be very concerning to everybody, is the second bullet point to promote innovation. So that is not a health-related outcome, whenever you're considering that the impetus for this change is because there's a group of people in Canada that basically want to increase their profits and draw business to Canada.

Now, in the actual document, and I don't have that here. One of the things that they say is they want to— This flexible regulation, what they're saying is

[00:30:00]

they want to move beyond. "Beyond" meaning, they want to do away with the gold standard randomized controlled trial. So we need to translate that and say, "We don't want to have to prove that something is safe and effective or that the benefits outweigh the risks when we're seeking authorization of our products. We want to be able to move our products through, and we want you to give us a regulatory nod, even if we haven't proven them to be safe and even though the benefits don't outweigh the risks."

And I want to highlight the last one: Reduce barriers to bringing ATPs to market. So the barrier that they're referring to is they say, "We want to reduce the regulatory standards that we need to bring these advanced therapeutic products to market in Canada." And when they position it as— We want these products to get to patients in need, faster, right, and so, they put themselves in the position of champion and people who are life-saving. However, one of the things that everybody needs to understand is that the difference between early market access and late market access for a pharmaceutical company can sometimes be billions of dollars. So, if you can think about the billions of dollars that were earned by the COVID-19 vaccines by the pharmaceutical companies before they actually even received regulatory approval, will give you some reason why this would be in the interest of pharmaceutical companies.

And I also want to just pause and mention that, you know, when we were thinking about the cancer patient—so even somebody who has a very severe disease—if you push through a novel therapy and it's harmful, then you haven't helped that person at all. What you've done is you've added to the burden of their disease by adding adverse events or injuries to **the burden of the disease. And so that is not helpful at all. The only way that we can actually help somebody is if we prove that what we're giving them is beneficial and that the benefits outweigh the harms. And that even then, if there is a risk-benefit ratio that that is clearly articulated to the person receiving the agent so that they can make an educated and informed choice about whether they feel that it's warranted or not. That's not something that can be imposed by somebody else.**

So just to finish up on this particular slide regarding this advanced therapeutics pathway that they initiated. What they're asking to do is they want to prioritize innovation over safety. So you can see that innovation over safety. And they want the safety standards to be flexible. They don't want to have to always prove safety. They want to kind of, maybe, put something through and then just hope for the best, or something like that. Or, maybe, you

know, try and figure out a way to measure safety after people have been injured or to assess the degree of injury and then make safety calls. So it is really, really important to say that there is absolutely no way that you can be helping people if you're pushing through unsafe products, and especially, because it profits pharma.

So let's take a look at these products that they push through, the first one that they push through in this particular pathway. So again, whenever we're thinking about how rigorously you want to review something, how rigorously you want to study something, the degree of the standard that you want to set in order to put something through, you need to think about the nature of the product.

So I have here that the COVID-19 vaccines are genetic therapy, gene therapy. They're basically things that teach your body: They introduce mRNA, which is basically like an instruction manual. That mRNA gets delivered through these little lipid nanoparticles into your cells. The lipid nanoparticles are designed to go everywhere in your body and to cross protective barriers that your body has there for a reason so that things can't get into there. And then they introduce these instruction packets into your cell. And they teach your cells to produce a known pathogen. A pathogen means something that is known to cause disease, which is the spike protein.

So it basically introduces a pathogenic protein into healthy cells. And when your cells, basically, express this protein, it goes and sits on the outside of the cell. Then your immune system sees that cell and says, "This is a foreign cell. I need to basically attack that cell." So basically, what it does is, it is something that's engineered to cause your body to attack healthy tissue.

[00:35:00]

It would be very hard for me to understand how this could be helpful for anybody who's healthy. However, that is the nature of the product. It's a biologic product that is basically introducing mRNA that causes your body to produce harmful proteins.

It was known before in the early data that, and we also know this for sure now, that even in the very, very early studies that this could cause clotting. And it is very easy to measure clotting or the potential for clotting in the blood before clotting actually happens, called a D-dimer test. We also know that it causes inflammation.

So based on all of these things, what we should have been doing is putting this into extensive years of testing to ensure that we can produce something that is very safe by careful study. So careful study. Then at the end, when it passes the test, then we can call it safe.

However, what they were able to do is they've changed the test for approval for this particular thing, for approving the COVID-19 vaccines. And now, you only have to have sufficient evidence to support the conclusion that the benefits associated with the drug outweigh the risks. So there's a little bit of word gymnastics there, as Shawn has mentioned many times over. That now, you don't actually have to prove safety or efficacy: remember flexible studies, flexible standards. You just have to produce some evidence that would support that conclusion, so the bar has been dramatically lowered. And this means that now, potentially high-risk, unsafe products, under-tested products, are going to be hitting the market and being delivered to people.

The thing is a public health need. And of course, there's no objective criteria to say what a need is. And anybody can generate a need for something, depending on how strong the media campaign is. And, in fact, a normal part of a marketing process is to develop need, to

highlight the need of your particular drug. And that's, you know, in the clause here. So it doesn't actually have an objective standard. It just has a subjective standard of need. And this is straight from Shawn's excellent presentation. I recommend everybody look into his work.

Basically, there was a clause in section 2.1. And I read this, this morning, and I thought was really interesting. It basically prevents the minister from revoking the authorization. So they're going to lower the standard to this potentially high-risk, novel biological therapy. They're going to give it to healthy people because it's a vaccine. That's what that means. And then, they're going to make it so that they can't pull it off the market. And in addition to that, leading up to this particular interim order, they had actually given the vaccine manufacturers indemnity, meaning you can't actually sue them if they were found to be harmful. So I don't understand why somebody who is priding themselves in the ability to brew safe therapies that are going to help people would need to have indemnity. So that would make me think twice right away.

So let's just take a look at the COVID-19 vaccine and the development sequence. So you can see here that whereas the norm would be 10 years at the outset— And we're going to be trying a novel biological therapy, high-risk, with known adverse events, then I would say that the appropriate thing would be 10 years if not following the FDA guidance of 15 years of testing. But what this interim order allowed them to do is go in the back door and do one year of testing. And what that meant was they did minimal preclinical testing, meaning they didn't take very much time to figure out if it was going to be toxic to humans before they threw them in clinical trials and started experimenting on them.

I'm not sure who the ethics review board was that allowed that. But that's what happened. They were able to combine Phase I, II, III trials. So you know, this step here: the Phase I/II was combined. You can see that here. And then basically, the Phase III studies were conducted for about two months or so before they took a sneak peek at the data. Which is what you call a rolling review. You can get an early look at the data, preliminary data. And then they basically were able to make a call as to whether to authorize it, which they did after two months of study in clinical trials, in a randomized context. Then they dismantled the clinical trials.

[00:40:00]

We'll get into that in a little bit. And now they've been allowing these drugs to be used by people without any active monitoring. I'll get into what active monitoring means in a little bit.

But just a couple notes on the preclinical testing and what you'd want to see and what was done. So what you want to see is preclinical testing on two appropriate animals, so two animals that are similar to humans in the main mechanism of action. So that would be here, with the similar ACE2 receptor expression because that's the little receptor that the virus gets through. So here, instead of having two appropriate animals, they use two studies on rats to do a toxicology, meaning, is it toxic to the cells or is it toxic to the rats?

And some would argue that rats were not the appropriate match for humans and, therefore, would not have given a very good assessment of what safety you could expect in humans. And so some would critique that the only preclinical studies that they did was those toxicology studies. And then they did some about effectiveness of the drug.

But in terms of safety, they did the toxicology studies. But they didn't do it in the right model. And they should have done it in two different models. And the other really important test that you want to do before you start experimenting in humans is something called reprotoxicity, meaning they want to figure out if it's going to be toxic to your reproductive cells; teratogenicity, which means, is it going to cause deformities? Genotoxicity: is it going to affect your genome, your DNA? And oncotoxicity: is it going to cause cancer?

And so, of course, when I was looking at the data, I was very cognizant of the fact that they didn't do any oncotoxicity data. So they're using a biologic, which we use all the time to— We know that biologics can either activate or deactivate cancer pathways. But they didn't bother to test whether this agent could activate biological pathways, cancer-causing pathways, before they rolled it out. Before they started testing in humans. And even to this day, I don't think that there's any oncotoxicity studies that they've used. And so we may not know. But the key thing is that the reprotoxicity studies and the teratogenicity studies were ongoing at the time of authorization.

So not only did they—the authorization of clinical trials—they basically allowed them to start testing things on humans before they actually did the proper assessments to make sure that the products were safe. And to my knowledge, at least at the time when they started rolling it out to the general public, they hadn't done the genotoxicity studies or the oncotoxicity studies. So I don't know how carefully they've looked at this issue of whether these vaccines can be causing cancer before they started rolling it out to healthy people. And that is a really big issue.

So let's take a look at the study that they designed. And one of the things that you need to remember is just because you do a randomized controlled trial, doesn't mean it's a good randomized controlled trial. And it is only as good as how it was designed to assess the data. And I just want to highlight a few really key things that are really important.

So we know that COVID-19 is really a disease that affects the elderly and the immunocompromised and maybe people with comorbidities. And they tested this particular drug in people who were healthy. So you cannot get any sense of whether the drug is going to be toxic to a frail elderly person or a person with comorbidities if you're testing it in healthy people. So the only data that they had when they rolled this out was data in healthy people. And so, therefore, they rolled it out to high-risk groups with very, very little data. They had some elderly patients. They had a very small part that had comorbidities. But for the most part, it was untested, completely untested, in high-risk groups based on the Phase III trial that they used.

I'm not going to get into too much more. All that I want to do is I want to say that the only measurement that they used, the ultimate measurement, was basically, did it produce antibodies seven days after the second shot? So that's called a point-in-time analysis. And so the benefits of the vaccine were only ever measured in one point of time. And nobody knows if they were helpful or harmful leading up to that point in time or if they were helpful or harmful after that point in time.

So, to approve a drug based on one time point is outrageous.

[00:45:00]

And in terms of safety, they only actually followed people up for about two months. So the safety data for all the people hadn't been actually even collected and organized by the time they wrote their first report. And based on that preliminary safety data— Remember that I

would have wanted to see 15 years of study for a novel technology like this, and they have two months. Well, let's just say a year, and their randomized controlled trial, which is the only way to prove safety, was ongoing for two months. So this is what this interim order allowed them to do. It allowed them to take a sneak peek at this early data. And then basically say, "The house is burning. We need to approve this drug and get it to people so that we can save lives," all the while pushing through an extremely high-risk biologic. And giving it to healthy people.

Now this is just a little bit of the profile of the people that I would have been looking for. I would have wanted to see extensive testing in these groups. So again, we talked about the fact that they tested the wrong population. But I would have wanted to see testing in people with comorbidities. Because we know that if this particular agent activates pathways for inflammation, then people with comorbidities, which generally have high inflammation backgrounds, might have more side effects than, for instance, other people. So I would have really wanted to see a lot of good, careful study in people with comorbidities.

Teens and children: I would have wanted to make sure that this is not going to cause cancer and that this is not going to cause infertility in this group of people. So I would have wanted to see extensive testing in small groups of people before we rolled it out.

Pregnant women/babies and being developed: Extremely sensitive time of life and any significant changes during that time could cause considerable long-term harm. I would have wanted to see extensive safety testing. They weren't even included in a randomized controlled trial.

The frail elderly: Almost anything that's toxic could kill a frail elderly person. They were not well represented in the trial. And then, these were rolled out en masse indiscriminately in our long-term care facilities as a means of protecting them. So we're giving potentially harmful high-risk agents to frail elderly people.

And then again, the COVID recovered: Because these people's immune systems have already been activated and can identify the pathogen. So it would be reasonable to think that they're going to have a stronger immune response.

Again, we've talked about the preclinical. They didn't do the oncotoxicity, the repotoxicity, the genotoxicity. So how we could ever even conceive of giving these to people of childbearing age or children is beyond imagining. Again, the standard based on the FDA's own guidance is 15 years of testing. We did seven months.

And what I want to talk about now is that, again, we knew that there would be cardiac harm. So we could have been measuring troponin levels to see if there was any type of damage to the heart at a subclinical level. We knew that coagulation was a problem. So we could have been looking at D-dimer levels. We knew that inflammation could have been a problem. So we should have been looking at the C-reactive protein. These are all ways of measuring to make sure that people are not being harmed. But these were not done in the clinical trial. So what that makes me understand is that these people didn't want to find a safety signal.

Again, seven days. So reactogenicity, which is the immediate reaction that you get after a vaccine, and that was the only very careful monitoring that they did. And they only did that for seven days. So why did they only measure it for seven days? Why didn't they measure it beyond seven days?

How do we even know what happened after seven days? How do we know that there's not toxicity that shows up a month later or six months later? But the careful scrutiny only really happened for seven days.

So again, what that tells me is they didn't want to. This is a study that's designed not to find safety issues. They monitored severe and serious symptoms. So if somebody reported something and said, "Hey this happened just after the shot," then they would monitor that. But that's different than actively monitoring them where you solicit things: "Did you have any cardiac problems? Did you have any inflammation process?" et cetera, et cetera. So they weren't actively engaging the patient to find out if there were anything above and beyond just immediate flu-like symptoms.

So again, the moment they approved the vaccine, they basically dismantled the randomized controlled trial. This is a trick that people use in order to be able to, again, hide any type of long-term safety issues,

[00:50:00]

by dismantling the placebo group. Which means that you unblind the trial, and you offer the placebo group the vaccine. You then send everybody over, and I think that it's up almost 89 per cent of the people in this particular trial went over to the vaccine arm and proceeded on. So then basically, what they did is they dismantle; that's like hiding the evidence. There's not going to be any evidence that there's going to be long-term safety issues.

So I mean, I have no idea what's in the mind of these people who designed this trial. But if I were designing a trial where I wanted to hide the bodies, where I wanted to hide safety issues, this is exactly how I would do it. I would make a decision based on early testing, dismantle my clinical trial, and only do the bare minimum of safety testing and reporting in order to be able to move my product through.

So let's take a look at the side effects profile again. So this is seven days after the second dose, and this is the Moderna vaccine. Now the safety profile for the Pfizer vaccine is practically identical, so I didn't bother putting that in here. But I just wanted to show you that these adverse events here—adverse events are the side effects that happen, fever, headache, fatigue, myalgia, arthralgia, nausea and vomiting, and chills—those are the symptoms of COVID.

So the reason why we're giving the vaccine is so that people won't get clinical symptoms related to COVID, so COVID-like symptoms. However, in giving this vaccine, they basically **cause COVID-like symptoms. They cause the very thing that they're trying to avoid from a clinical perspective in more than 75 per cent of the people who received it. And of those people, 55 per cent of them got so sick from receiving this vaccine, this genetic therapy, this biologic, that they couldn't carry about their daily activities. So more than 50 per cent of the people that got this particular drug after the second dose were so sick they couldn't carry out their daily activities. Fifteen percent of them, they were basically lying in bed and unable to move. They were completely prevented from carrying out their activities.**

So you take healthy people, especially people who don't have comorbidities and aren't elderly. You take healthy people who can easily get through COVID, and you cause 55 per cent of them to be so sick that they can't carry out their daily activities and 15 per cent to be so sick that it prevents them from carrying out their daily activities.

So when we're looking at biologics, when we're studying them, we always look for the red. The red here, it's called the Grade 3 toxicity. And if you have a Grade 3 toxicity, you judiciously, you very, very, very carefully only ever give it out to people who it's been proven safe in. And you would only give it to very high-risk groups where the risk-benefit ratio is highest.

However, with a drug that we know is causing the very thing that it's saying that it's being given to prevent and that it's causing a severe manifestation of it in more than 50 per cent of the people, they actually called this safe. And the way that they got away with that is because they didn't call it a clinical outcome. If we were looking at clinical symptoms as a clinical outcome, we would have said, "This is causing COVID-like symptoms. This is causing the very thing that we want to prevent." What they called it was reactogenicity by adding a creative label to it, just saying it's the thing that happens after you get the drug. Everybody said, "Oh, reactogenicity. We don't need to worry about that." But in fact, the reaction to this drug is so severe that I would have written a strong cautious recommendation in a guideline that we would be developing, saying that this should not be given to anybody who's frail or elderly or anybody who is concerned.

So the fact that they started giving this to healthy people, including people of childbearing age and teens and children, is incredible. So just to note, this is what they were doing. So severe adverse event interferes with daily activity, requires medical care and an ER visit or hospitalization. So this is what somebody looks like if they've had a severe reaction. A serious event as described in this particular thing requires inpatient hospitalization, was life-threatening, resulted in death, or persistent disability. So we know that 15 per cent had severe adverse events.

But I want to take a look now to see what the data tells us in terms of immediately after they had severe adverse events.

But whenever you look at everything altogether, the solicited and the unsolicited adverse events, the vaccines were purported to be very beneficial

[00:55:00]

because they said they were 91 per cent effective. That's a relative risk change. It's basically just the difference between two numbers. It's definitely not that meaningful whenever it's a preliminary study that's only two months along and you're only looking at one point in time. But what makes it really not very interesting from a clinical point of view is that the absolute change between the two groups was only about 4 per cent. So even at six months, which is what this data is, only 4 per cent of people even benefited from that vaccine.

But ironically speaking, if you were to consider the side effects profile that we know, the difference between 850 [placebo arm] and 77 [vaccine arm] were the people who didn't get COVID. But everybody in the vaccine arm pretty much got COVID-like symptoms. So you know, it's a little bit of a shifty, tricky little thing that they did there.

But what I'd love to bring your attention to here is treatment-related adverse events. So this is an adverse event. So something bad that happens after you get the vaccine or the placebo. And it could be from the disease or it could be from the drug. It doesn't specify. But well, this one actually is from the treatment.

And what they said is that in the treatment arm, 5,241 people received an adverse event from the vaccine versus 1,311. So basically, they're lowering the chance of getting COVID by 91 per cent. But if you use the same metrics that they use and do the relative risk change, they actually increase the relative risk of treatment-related side effects by 300 per cent. So they're basically taking healthy people, and they're causing them to have an adverse event. Whereas the decrease, the benefit, was 4 per cent, the increase, the risk, is plus 18 per cent. So if we were holding to our traditional means of following this, the risks grossly outweigh the benefits for this particular vaccine. And that's just looking at any old adverse effect.

If we look at severe adverse effects, let's go back. It's a 75 per cent relative risk rate increase and a plus 0.5 per cent absolute risk increase. And severe, remember that's somebody getting so sick that they can't carry out their daily activities.

And serious, I'm just going to tell you again what serious means: inpatient hospitalization, life-threatening episode, results in death, or permanent disability. You have a net increase between the two arms. Now if COVID was so dangerous that it needed to be treated and treated in everybody, then the serious adverse event, serious outcomes, should have been higher in the placebo arm. And we should have seen lower in the vaccine arm. But what this is telling me is that this vaccine is more toxic, or the manner in which we're doing it vaccinating healthy people with this toxic substance, is causing more harm than good.

I just want to be sensitive to time. So I'm just going to move it along a little bit.

They also looked at deaths. So deaths before they dismantled the trial were 15 [vaccine arm] and 14 [placebo arm]. So again, you would have to say that that's comparable. So you could never argue at the time that this was authorized that this was saving lives because it was comparable between the two arms. But what's really concerning is why— I mean, if you have healthy people and you're measuring this six months later, and one arm is getting COVID, which is deadly and they die, I mean that would explain why you have deaths on the placebo arm. But why do you have so many deaths in the vaccine arm in healthy people after six months? That's unusual even in a sample of 40,000.

If we look at deaths after unblinding. So after they invited these placebo group people to come over to the vaccine arm, there were five additional deaths for a total of 20 deaths on the vaccine arm and only 14 in people who'd received the placebo, after six months.

And again, this particular part here, where they talk about the five additional deaths. Instead of making that very obvious and bringing it into the text and reporting on it in their conclusion, which is what they should have done if they wanted to make sure that they were being abundantly cautious and protecting people, they should have basically written that up in the front and included it in their conclusions. But instead, they buried it in the text.

One last thing that I want to highlight is if you look at the deaths, the cause of deaths, you can see that there were those from a cardiovascular nature. There were nine cardiovascular deaths on the vaccine arm and five on the placebo arm. Now you can't conclude anything clinically from that. But what I would have said is we need increased monitoring for cardiac problems moving forward and that this should not go out without more careful study.

[01:00:00]

And yet, what we did was we rolled it out.

So again, if we remember what our test is and what the conclusion of the study is— So I've walked you through the Phase III trial results. So our traditional regulatory system would mean that we'd have to prove safety. So we haven't been able to prove safety because the study actually proved the opposite.

And yet here is the conclusion of the initial paper from the *New England Journal of Medicine* that was used as evidence to support the conclusion that the vaccines were beneficial. It says, the "two-dose regimen of the Pfizer vaccine conferred 95 per cent protection against COVID-19 in persons 16 years and older. Safety over a median of 2 months was similar to that of other viral vaccines." So they didn't make any safety statements. They just sidestepped that all together. They didn't prove safety. In fact, what their study did was disprove safety, but they failed to actually highlight that.

So I just want to talk about something called risk management plan.

Wayne Lenhardt

Could I ask just two quick questions here?

Deanna McLeod

Sure.

Wayne Lenhardt

This data looks very similar to I think what they came up with in the U.S. Were there separate studies done in Canada, unique studies here?

Deanna McLeod

That's a really good question.

So again, remember how we were talking about global pharmaceutical companies. Basically, they have global pharmaceutical companies developing these products. And then, basically, our government wants these global pharmaceutical product companies to invest in Canada. They need that in order to spur on this bioeconomy, this innovation that they want to do here in Canada. And so the whole impetus for changing the regulatory framework was to allow more innovation or more investment or to give more leeway to these large pharmaceutical companies. And interestingly enough, it's those very same large pharmaceutical companies that are asking us to lower standards of regulation that **designed this trial.**

Wayne Lenhardt

Well, that was going to be my next question. I mean, the Canadian government has spent billions and billions of dollars buying these vaccines. And my understanding, I think, is that they're coming from somewhere else. They're not being produced in Canada.

Deanna McLeod

No, this is not helping the economy whatsoever.

Wayne Lenhardt

I'm sorry?

Deanna McLeod

This did nothing for the Canadian economy, except for burden our healthcare system with vaccine injuries, which is probably going to hurt our economy in the end and perhaps destabilize our health system, I would argue.

Wayne Lenhardt

Okay.

Deanna McLeod

So I just want to continue on. And I want to talk about something called a risk management plan.

So again, the normal pathway is that you have a randomized control trial, that it is continued right to it's full— That it's completed. That it's well designed. And it's designed to prove something that's clinically relevant and completed. And then, at that point, they submit their dossier with all their complete safety results, their complete efficacy results. And then the regulatory official starts to evaluate it. And basically it authorizes them or not, based on whether they meet the test that Shawn has described previously.

This alternative pathway, this back door that they've created, this advanced therapeutics pathway, basically says we want flexible regulatory framework, which means, "I want to do away with this standard of needing to prove it. And I want to be able to move forward to market despite whether I've proved it or not. And what I'll do is I'll do extra surveillance. I'll just do extra study for these. And we'll do risk management plans in order to be able to ensure that people are safe."

So what I want to do is I want to look at some of these risk management plans that are available and what they look like when we looked at it with COVID-19.

So now, I've just got my evidence metre here again. This is my Bible. And so what we're going to be doing is we're going to be moving from the realm of what you can prove, which is up here, Level 1 Evidence, and we're going to be moving down to an area here where we can really only make observations and identify associations. We can no longer prove anything.

So I just want to say from a pharmaceutical point of view, if I'm somebody who is a very rich pharmaceutical company and I want to make money, what I want to do is I want to push the burden of proof down the ladder. Because these studies here are very easy to game.

[01:05:00]

When I say game, it's that it's easy to design them in a way that you can actually get them to say what you want them to say. So you can manipulate the people that you allow into your analysis. You can manipulate the way that you monitor it. And then you can manipulate the

way that you sample different people in order to be able to make the results look the way that you want them to look.

And so what they did was they basically said, "You know what, we'll do more of these trials if you allow us to market so we can make lots of money by missing this one. So basically, preliminary data from this one. And then, even though it showed that it was not safe, we'll do lots and lots of studies." So you can see that there's tons of observational trials done on the COVID-19 vaccines. And you know, they'll say, "The effectiveness is this or the safety is this in this population." But interestingly enough, none of those trials can be used as evidence to prove safety. But that's good for the drug manufacturer because they can't be used not to prove that it's not safe.

So what you do is you let them out. And then, now, the burden of proof has shifted from the manufacturer that was needing to prove safety to now the public that needs to prove that it's not safe. So the one making all the money that has the ability to run the design, the trials, is no longer needed to do those safety testing. And the public who has no money and doesn't have the money to run a clinical trial, a randomized clinical trial, to prove that it's harmful, basically, are unable to do so. So it's brilliant from a pharmaceutical point of view if you basically want to make sure that you are never called to order in terms of your safety. But it basically puts the public in a very perilous position.

So this is a crazy-looking graph, but I'm just going to walk you through it. So these are the different types of studies again and their ability to figure out safety. There are the different ways that you can monitor safety after a drug has been out on the market, or just period. So this one is the randomized controlled trial. And so, if you recall, we just looked at the data. And this is data from the Pfizer vaccine here from Thomas. And it basically showed that 70 per cent of the people that get the Pfizer vaccine are going to have some sort of adverse reaction to it. Five percent of those are going to be severe. Remember, severe is like it makes it so you can't carry out your daily activities.

Now there's another way of monitoring something. So this is active monitoring. It's where you're actively looking for the side effects. You're carefully looking at the person. And that's called prospective active monitoring. And when you do that, you find out that 78 per cent of the people actually are getting side effects from this drug.

The next thing is v-safe. So they basically say, we don't want to do this [prospective active monitoring]. And of course, they don't want to do that because that's the best way to find out what the side effects are. "We want to be able to do something else. We want to have a registry where we'll give the person their shot, and then we're going to send them off. And they'll have a phone. And then they can look at their phone, and then they can basically report any type of adverse events that they have." So when you do that, which is active monitoring, you get 71 per cent of side effects. So it's capturing most of them. But you don't really catch many of the severe ones.

If you look at unsolicited, meaning that you just don't even tell somebody—if they just come and prompt you. Like you don't prompt them, they prompt you to say that they've had an adverse event. You only get 30 per cent. And again, that's within a clinical trial. So this is solicited and this is unsolicited.

What we've done in Canada is we launched these vaccines, and then we basically said, "We're going to rely on our passive surveillance system." Passive surveillance system is a system that's available that if you have an adverse reaction, then you've got to remember you had that adverse of reaction. It's got to be so bad that you go see your doctor. Then the

doctor has to spend an hour to fill in a form. And then that form gets screened by who knows how many people in between. And then that adverse event gets deemed as legitimate because it matches what they're expecting, not what's unexpected, potentially. And then, once it's legitimized and it's entered into the system, our Canadian system records .07 per cent adverse reactions. Now, this is the true adverse reaction profile because we did the Phase III trials. And this is what the government is relying on to call these vaccines safe.

Now, it's not that they're safe. It's that the ability to test for the safety is insufficient. So they're insufficiently monitoring safety. And therefore, in the absence of detecting any safety issues,

[01:10:00]

again, they're not having to prove safety. Without any proof otherwise, they're calling it safe. And so our whole presentation of these COVID-19 vaccines have been turned around because they changed the standard. Now they're saying that it's safe, not because it's been tested and proven safe but because there's an absence of safety data that proves that it's not safe.

So this is the v-safe. This is active surveillance. And this was data that the CDC was collecting and kept from the public during the vaccine rollout. And it was made public through an ICAN [Informed Consent Action Network] lawsuit. And they basically created this dashboard, and it basically tells you— So this is data from the people who had the app, and they were actively being monitored. So we know that this is probably going to be the best sense of figuring out how everyday people responded and reacted to this particular vaccine. And we see here that 30 per cent, according to this particular monitoring thing, and again, it's probably not as accurate as the Phase III trials. Thirty percent of people monitored experienced a severe adverse event. A significant proportion missed work and school. And about 8 per cent required medical care following vaccination.

Now, if you're giving it to healthy people who are not going to need medical care from COVID-19 and then you give them the vaccine and they require medical care, it would be hard-pressed to understand how we're benefiting people.

This is the serious adverse event report from VAERS [Vaccine Adverse Events Reporting System]. So VAERS is the system that barely picks up anything. It's called passive surveillance. It's the one that's the least sensitive at picking up safety issues. And this is basically a sum of all of the different adverse events reporting for all the vaccines leading up to the time when we changed our standard and we started pushing through biologics and giving them to healthy people. And what you see here is that you've got a jump **between less than, what, maybe two or three thousand to thirty thousand adverse events reported. And again, this is passive surveillance. So it's under reported by some very significant amount.**

In terms of deaths, basically, we have an incredibly huge jump in vaccine-related deaths with the rollout of this particular vaccine. So again, what we're seeing is these are very strong signals saying that there's something that's not right. However, this is not sufficient evidence to be able to prove or disprove safety. So therefore, this vaccine continues to be distributed.

This is a pharmacovigilance report. Basically, it's a passive surveillance report. This was again something that the FDA received. And it was not made public.

It measures the adverse events, again passive, unprompted. People have to work really hard to get their adverse events reported. So they suspect that they had a vaccine injury, and they report it to the company. And the company basically creates this report. And I just want to highlight the fact that in this report, there were about 1200 deaths. So this is where somebody got the vaccine. And then, they basically said, you know, "This person died right after the vaccine. I suspect that it's the vaccine." And we can make note of this and we can say, "Oh, that's a signal." But it can never be used as proof to take the vaccine off the market because you can't prove anything with this.

So twenty-five thousand people had nervous system. So again, we were looking for inflammation. We were looking for cardiac problems. But neurological problems were a little bit of a surprise. I just want to highlight something, as well, that 71 per cent of all the adverse events were in women. If I were to see that, then I would say that's shocking. And that should be stopped and looked at right away.

Sixty-four percent of the adverse events that were severe and that were reported were in groups that had little risk of any severe COVID-19. So these were people who didn't even need the vaccine, and 64 per cent of the ones were in that group of people. And you know what they said, "Well, we monitored it for seven days and it looked good. It was great." And so what they didn't say and what showed up in this report is that a third of the people who are injured don't fully recover, based on their own data. That's two and a half months after. So again, I would say this is lots of evidence that it's not safe. But again, not enough evidence to prove that it's not safe.

I think I'm a little bit sensitive for time right now. So I'm just going to jump along here.

[01:15:00]

This is about boosters and particularly boosters and teens. So again, the primary series was the first two doses and the third dose is called a booster dose. Again, we're not surprised that the first dose was about 60 per cent of people had adverse effects. We are familiar with our 75 per cent number.

But what I want to show is with every single dose, it's like getting COVID-19 all over again. You get COVID-like symptoms. You can see them here and here. But what's really troublesome is the severity of the symptoms over time when you get boosted. So the first one, in terms of being unable to go to school, there was only a small amount. Then it increased to point where of the teens who are getting their boosters, 20 per cent of them aren't able to go to work or school for the week after they get their vaccines. So again, I'm hard-pressed to understand how this can be actually helping children, teenagers, **specifically, who aren't sick and have no risk from COVID-19. How can making them so sick that they can't go to school be helpful? It's hard to imagine.**

This is a study by Dr. James Thorpe. And he was looking at outcomes in pregnancy, fetal outcomes related to women who have been vaccinated during pregnancy. And he compared them to the adverse events that happen from the influenza or the flu vaccine. So COVID-19 vaccine versus flu vaccine. It's measured by dose, so they controlled for that. And again, so after the COVID-19 vaccine, menstrual abnormalities.

And this is a really weird chart. So what this means is if "1" is your baseline here and if it's to the right of this, it means that the COVID-19 vaccine is causing more harm or there are

more adverse outcomes associated with the COVID-19 vaccine than the flu vaccine. And when I'm analyzing a study like this and we're looking at hazard ratios, reporting ratios—

Go ahead.

Wayne Lenhardt

Deanna, we're starting to run short on time.

Deanna McLeod

Okay, how about I— Do you want me to finish it up?

Wayne Lenhardt

Thank you.

Deanna McLeod

Okay, so I am going to jump to this last section here.

So I think we've gone through enough data now to say that the problem with a risk management strategy—meaning that you move away from the standard of a randomized control trial that's able to prove safety to something less than that—you can't prove that it's not safe, and, therefore, harmful agents can continue on the market like the COVID-19 vaccine unchecked.

And I want to, at this point, raise everybody's attention to the backdoor expansion program that's underway. So right now, in this issue, government issue of the *Gazette*, Part 1, Volume 156, the government is moving to expand the number of agents that can move through this backdoor. So again, we've just walked through what it looked like when the COVID-19 products were put through this particular backdoor system, where they didn't actually have to prove safety and efficacy before they were authorized. And how the risk management plans were not effective in controlling and identifying safety issues that could stop the vaccine from being provided or protect citizens.

They now want to expand that to Class I to IV medical devices. This particular program was designed because they wanted to have a pathway for things that didn't fit the normal pathway. So it's supposed to be an exception rather than a rule. And one of them was to figure out medical devices that have AI interfaces or machine learning.

And so I would imagine, and I can't say for sure, that one of the elements that would fall into this new category of medical devices could be AI-interfaced medical devices that learn and interface with somebody from an implant, for instance. I don't really know, it's not very specific. But the terms are so broad that almost anything can get through the back door in terms of a medical device, including something that has AI learning and potentially a biological-technical interface with it. So again, I would probably say if we had something like that, then we'd want to have an abundance of caution. And we'd want to take time to really learn what that means for humans and how that would interact with that before we would move it forward or allow it to have a fast track through our regulatory system.

The other thing that they want to do is— They have product-specific biologics requirements.

[01:20:00]

And that sounds really crazy, but it means that you have to test each biologic individually. So, for instance, you had to test the Pfizer mRNA vaccine, and then you have to test the Moderna vaccine.

So what they want to do is they want to just do one study: We'll just do the Pfizer study and then anybody who has an mRNA vaccine like that, all that they have to do is show that they're comparable. They don't have to do all their original research, and we'll approve it automatically. So again, I think that that's very concerning because when it comes to gene therapy or biologics, just slight changes in the actual compound can turn on or off different pathways in your body. And/or code for different proteins or sequences. And so, again, I would say an abundance of caution should be applied here rather than removing the product-specific classifications.

They not only want to have human drugs needed for emergencies, but they actually want to expand it into veterinary drugs. Potentially, I have no idea how this would work, but would it be going into our food supply? And would we be getting secondary effects from any of these biological interventions or gene therapy interventions that are in our food supply? I think that that's something that we need to carefully consider and study before we would open this back door process to them.

And again, they were able to push through the COVID-19 products based on an emergency and, you know, a pandemic, an infectious disease, a global health emergency. But now what they want to do is they just want to be able to push it through the back door if it's an emerging infectious disease. And that term is so broad that they can actually make up almost anything. It doesn't even have to be life-threatening in order to be able to access this back door.

And again, they want to not only use it for treatment, but they basically want to use it for prevention and diagnosis. And the key word there is prevention and diagnosis means healthy people. And so again, if we go back to our standards, we want more study for things that are being given to healthy people.

I just want to say that as the closing thing for my particular presentation is that there's a deadline for being able to oppose these regulatory amendments, the extension of the back door. I highly recommend that we shut the door completely, especially when it comes to novel high-risk therapies that are being given to healthy people. And you can do that by commenting up to April 26, 2023, at the *Gazette*. There is a link that I can make available or calling your MP and saying that you absolutely do not agree with this lowering of the gold standard and this new approach to agents and especially the fact that they're trying to push through so many agents through the back door now.

So we're at a very critical point in our healthcare. Basically, what we're doing by authorizing this back door is when we grant expedited approval to novel high-risk therapeutics without proving their safety, we're basically formalizing the practice of human sacrifice. We're basically saying that it's acceptable as a community to sacrifice the people who will be injured by this on the altar of innovation. And I would say that we need to make a firm moral stance that that's not who we are as a community and as a society. And that we need to go back to absolute standards that protect.

And so this last thing is my sister. She was one of the people who was sacrificed on the altar of this innovation. She was a woman who had cared for special needs children. And she died following the vaccine from heart failure. So it reaches us all. And so that's all I have to say.

I'm happy to take some questions now.

Wayne Lenhardt

Thank you for your presentation. Are there any questions from the commissioners for this witness? Ken?

Commissioner Drysdale

Oh, sorry.

Wayne Lenhardt

She's on the other screen, Ken.

Commissioner Drysdale

There we go.

Could I get you to go back to one of the slides you had? It was the one right before the slide that said risk management plan. I want to understand something here.

Deanna McLeod

Which one?

Commissioner Drysdale

Backward still. Keep going.

Deanna McLeod

Let me know, let me know when I arrive here.

Commissioner Drysdale

Keep going. A little more. Keep going. One right before that one. Okay, sorry I lied—

Deanna McLeod

Just let me know which one it is.

Commissioner Drysdale

Keep going. Wait a minute,

[01:25:00]

I think that's it. Well, I'm not sure, but—

I thought I heard you— When you were talking about the testing that they did and you were talking about that they had split approximately 40,000 people into two groups and one was a placebo group, one had received the injection. And then I believe you said— I'm going over what you told me, and then I'm going to ask you a question about it. And then you said that test went on for two months. And then they took the placebo group and gave them the shot, so they eliminated the placebo group.

Deanna McLeod

Yes.

Commissioner Drysdale

And this was for, of course, you're doing this to test the safety of this product. Correct? You're doing this test.

Deanna McLeod

Uh hmmm.

Commissioner Drysdale

And so my question is— If I was evaluating cigarettes in this way, would I have found any of the bad effects that cigarettes have on people in testing it for two months in a group of 40,000 people? So if I would have tested cigarettes for two months, would I have known that they cause cancer, they cause heart disease, they cause whatever the heck else cigarettes cause?

Deanna McLeod

Well

Commissioner Drysdale

So using this protocol, is it theoretically possible you could have approved something like cigarettes to treat it?

Deanna McLeod

Oh, cigarettes would have definitely been approved. I mean, you could probably make a study look like cigarettes are helpful, right? I'm not sure what your endpoint would be. But you certainly wouldn't be able to find the long-term safety studies that we find, the safety issues that we find, right, with cigarettes using this.

In fact, I'm hard-pressed to think of one trial for cancer where they've only studied something for two months. We would have never, ever accepted a trial that had two months of data and then was dismantled. We would have basically said that the outcomes from that trial are no longer valuable and that it would never have received approval, even in people who are, you know, late-stage cancer patients.

So to think that they stopped the trial or dismantled the safety component of the trial—you know, the part that is able to prove that it's not safe—after two months. In my mind, the only thing that is reasonable to think is that it was done on purpose. Because somebody who was passionate about keeping people safe would have never done that.

Commissioner Drysdale

You also showed some charts that showed how many people had severe reactions to the vaccine. And you define the different levels as— If it affected your normal daily routines or if it made it so you couldn't do your normal daily routines, and so that was charts with regard to the effects of the vaccines.

But I'm wondering, are there charts that show that for getting COVID in the first place? In other words, we keep hearing about COVID cases that had no symptoms. We keep hearing about all kinds of things. So are you aware of a chart similar to the one you're showing on the screen right now for people who actually got COVID? What's the percentage of them that have no symptoms? What's the percentage of them that can't go to school? And I'm wondering how they compare.

Deanna McLeod

Yeah, so the way that you would do that is that you would look at— I mean, in a placebo controlled trial where you're looking at the placebo versus the vaccine, what you're really comparing is people who've received immunity from a vaccine to people who may not have had immunity yet. So this is kind of getting complicated. But it's a gamed trial.

So we know that immunity protects people from disease. And so, if you only give immunity to one arm and not to the other, right, then you know that the one that basically doesn't have immunity is likely going to be more sick.

However, interestingly enough, in this trial, we know that more people got COVID. This is the placebo arm right here—dose two, placebo arm. So this is people who got COVID. This is the background amount of people who got COVID. So they didn't get the vaccine. They got a placebo. And they got COVID. And there's more of them that got COVID. So you should say, wow, if there's more COVID, then you should have more adverse events, right? These are the adverse events. So you should have more COVID-like symptoms if you got more COVID.

But if you actually look at it, the total amount of the symptoms that people get if you were healthy and you got COVID was less than 50 per cent,

[01:30:00]

dramatically less. Most of that was mild. Only, what is it? I don't even know what that is. Maybe 12 per cent of them had something that was enough to make them really sick. And then very, very, very few of them were enough to prevent activities. And then you compare that to people who got the vaccine and prevents activities. Severe, right, red to red, this is dramatically higher. Blue to blue, this is dramatically higher. And gray.

It's incredible that we're thinking that we're giving this to protect people from COVID-like symptoms—or COVID symptoms—by giving them more COVID-like symptoms. It's mental gymnastics to think that this is how we arrived at saying that this is safe, when we agree that COVID-like symptoms are bad because that's why we're doing the trial in the first place.

Commissioner Drysdale

Thank you.

Commissioner DiGregorio

Thank you for coming and giving us testimony again. Very, very helpful.

I have a couple of questions about this new framework under the *Food and Drugs Act* that you talked about today and this alternative pathway to approval. And I'm just wondering, so if a drug is approved by the minister to undergo this alternative pathway, which seems to expedite the process, is there a pathway or is there some mechanism built into that pathway to bring the safety considerations back into the normal sort of time frame or pathway under the regular authorization process? Or is it, you just get into this expedited process and once you have the authorization, you're good to go.

Deanna McLeod

I'm going to say a couple of things. One is that the proposed amendments are so confusing and convoluted. I've never read something that lacks such clarity, which makes me suspect that perhaps they don't want it to be clear what it is that they're trying to do.

So in terms of being able to address those details, I think that that should be something where we should be all stopping and asking those important questions. I can't answer them based on the available information. But I do know from my experience in cancer, where we do have similar pathways called NOC/c that are used to get life-saving treatments to people who are dying from cancer who have no other treatments, so serious diseases, no other options, that once the accelerated approval is given— So what they'll do is they'll say, "Okay, your randomized control trial, preliminary data, I'm going to give you access to the market now. But I want you to complete your trial, and I want you to do said types of monitoring studies in order to be able to prove the safety of your drug."

I think the number is only about 50 per cent of the mandates for additional safety monitoring ever get completed. I can count on one hand the times that they've actually pulled a drug from the market once it's on there. And I think that it's almost like saying, it's a ball rolling down a hill and once the ball's halfway down the hill, it's really hard to get it back up to the top. The amount of energy that you need to employ in order to get that ball back up the hill or get the cat back in the bag or to address everything and to get all the doctors, who thought that it's good, to change their mind— It's very hard to go backwards.

And so what tends to happen is that these products stay out there for a very long time. And I'm not saying that there aren't some pharmaceutical companies who are diligent, who do the proper monitoring afterwards. The momentum to have somebody actively monitoring it from the government and to make sure that they're doing the studies and to make sure that they're checking the databases, puts all of that burden of proof on the government and the taxpayer. Whereas it would just have been simpler to say only the things that have been proven safe get out of the bag. And that way, you don't risk anybody from injury, especially with high-risk agents.

So I don't know if that's helpful. But, you know, after being in this business for probably about 10 years or so and watching this in the cancer area, I would probably say that it

should be under extremely exceptional circumstances that we should ever allow backdoor treatment.

Commissioner DiGregorio

Thank you.

Wayne Lenhardt

Okay. Thank you very much, Deanna. And I'll call on Kyle for the next witness.

Deanna McLeod

Okay, thank you very much for having me. Bye now.

[01:35:25]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 4: James Erskine

Full Day 1 Timestamp: 07:19:15–07:36:48

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Kyle Morgan

The next witness is James Erskine. Can I just get you to spell your name, sir?

James Erskine

It's J-A-M-E-S. Last name is E-R-S-K-I-N-E.

Kyle Morgan

And your full name is?

James Erskine

James Matthew Erskine.

Kyle Morgan

And you promise to tell the truth, the whole truth, and nothing but the truth?

James Erskine

So help me God.

Kyle Morgan

Where are you from, sir?

James Erskine

Winnipeg.

Kyle Morgan

You've lived here your whole life?

James Erskine

Yes, sir.

Kyle Morgan

And you have children?

James Erskine

Three.

Kyle Morgan

Can you just tell us a little bit about what you were doing for work during the COVID period? I guess starting in 2020.

James Erskine

Yeah, I was employed as a police officer in Winnipeg, City of Winnipeg. I was employed since 2011, February. So I was working at that as a constable during the first part of COVID.

Kyle Morgan

Okay, and what do you recall about what happened to your employment when COVID started unrolling?

James Erskine

Well, I was, for the most part, going along to get along. But what happened with the police, in general, is that we were given not necessarily a vaccine mandate, but we were told that we would need to provide proof of vaccination or that we would be, essentially, subjected to totally different treatment than the rest of our peers. That treatment being three times a week going for testing on our own time and wearing masks when no one else was wearing masks.

Kyle Morgan

And when did this policy come about, do you recall? Exactly when that might have been?

James Erskine

November 15th, 2021.

Kyle Morgan

Okay, and I understand that you had some difficulty following those requirements. Is that right?

James Erskine

Well, I wouldn't have had difficulty had I decided to do it. But I was not going to be doing it because I believed a) it was a gross miscarriage of our rights and freedoms to have to tell the rest of our peers what exactly was going on with our own personal medical statuses.

And secondly, I believe that what was going on in Canada, especially as a whole, was extremely problematic, coming from a background where I was there in my belief to serve the public, not to contribute to radical measures.

Kyle Morgan

If I can ask you, are you somebody that was vaccinated in general with other vaccines?

James Erskine

Generally, speaking, yes.

Kyle Morgan

So you didn't have a bias against being vaccinated?

James Erskine

Not at all.

Kyle Morgan

Was there something that caused you some concern about the vaccines that were available in Canada at the time?

James Erskine

There was a number of things that caused me concern. The good doctors that we've just been listening to and professionals that we've been listening to have outlined a lot of the things that, whether I was aware of the entirety of them at the very beginning, I certainly became aware of much of those bits of information over the time that COVID was presented to us. But I would say that the biggest thing that stood out to me is the— It had every ring of, for lack of a better term, organized crime. It looked to me like it had all the markers that I would be suspicious of if I was looking at an organization that was obfuscating the truth and trying to come across with an agenda.

Kyle Morgan

Can you just tell us a bit about your salary and the types of benefits you were getting as a police officer?

James Erskine

Certainly. Well, I was a full senior constable. Just prior to all of these things going down in 2021, I had been asked to be a field trainer. I was getting to a point in my career where I was looking towards my promotion if I could get that. I think I had pretty good standing as a cop. I had a very good work ethic, very good reviews, 650 career arrests, somewhere

around there. I was the second in my class in terms of marks. And so, what happened with me is that because I refused to give those things,

[00:05:00]

I was ultimately locked out of my police station that I was working in. I was sent home without pay with—what did they term it?—“non-disciplinary” unpaid leave. I wasn’t allowed access to my holiday time. I wasn’t allowed access to my bank time. I wasn’t allowed access to any of the time that I had rightfully earned. I was just sent home. The paycheque stopped. And a short time later, I quit because I knew that if I quit, they would at least have to, ostensibly, pay out those things.

So what has happened since, is that I’ve lost, well, 11 years of my life, basically. Though I think, I hope, that I did some good in that time. I’ve lost the pension that I would have had after 25 years. Certainly, I got a payout for portions of it but not in the same amount. And what I’ve done with my family is I’ve gone from a career of making roughly \$120,000 a year—I’m just telling you because police salaries are online, you can look them up—and we’re roughly a third of that now.

Kyle Morgan

Did you ever try to work out a compromise or any type of accommodation?

James Erskine

Absolutely.

Kyle Morgan

Tell us a bit about that.

James Erskine

Well, a number of letters were sent, a number of email communications. We had attempted to go through our union to fight the measures that they were taking. Interestingly, our union president was not just figuratively but literally in bed with one of the executives. It was a common law. I don’t mean in a despicable way, so to speak, other than they were common law. So an out-in-the-open relationship. But, in any case, I’m sure that that has potential to play into the desire of a union to fight for its people.

When the union didn’t help us, we also sought measures to go through the Labour Board. The Labour Board shrugged us off. There was a number of— Well, without getting into it, there’s a number of lies in the Labour Board’s response to me. One of the things that I said to them in my complaint was that these measures had been the single cause of why I had quit. And they came back and their response was that there was no evidence to say that that’s why I had quit. And so, if they’re not going to take me at my word about why I’m quitting, we kind of have a problem with a due process when it comes to seeking out reparations for problems.

Kyle Morgan

Were there any other of your co-workers that had a similar experience?

James Erskine

Quite a number. I was actually fortunate in terms of being on a shift where I had a lot of co-workers who were very supportive and who were also going through the same kind of steps that I was going through. So overall, in the police service, I understand that I think about 96 per cent of them were vaccinated. So I was, in a lot of ways, an outsider. But at the same time, my peers weren't the ones who were necessarily looking down on me. It was the organization from the top down.

Kyle Morgan

You had mentioned that the policy had been differential treatment for those that didn't get the vaccine and testing. Is that right?

James Erskine

Yes, testing. And we would have to wear masks everywhere. The way I understood it, reading all of the various health orders, the police had been exempted from some of them in order to carry on police business. That being said, the Chief of Police still has, you know, the authority to give us orders and that kind of thing. And so there was a point in time where, basically, when we were at least in the office, in our cruiser cars, we weren't required to be masked 100 per cent of the time. It was more when we were in public or at the court or at the hospital. And that faded away

[00:10:00]

in the summer to late summer months of 2021. And folks were just going about business as normal in the stations. Except for those who wouldn't declare their status, come November 15th we were required to wear masks, and in a certain sense, identify themselves by doing that.

Kyle Morgan

And you mentioned the testing. Can you tell us a little bit about what was going on with the testing?

James Erskine

Well, the testing was a very interesting thing because it wasn't done by say a nurse or even one of the health administrators for the city or anything like that. It was done at an off-site place. It was done in front of some other city worker, whether it was somebody who was working for transit or somebody who was working for works and ops who had no training in any sort of health. And they would be administering these tests. They would be correcting us, telling us how far up your nose you had to stick this thing. Now, I never went for this because I didn't want to be doing that. But this is all information I would get from co-workers and that kind of thing.

Kyle Morgan

I'd ask you, looking back on everything that's happened, what do you think should have been done differently with the way this COVID was handled in your organization or in society at large? What do you think?

James Erskine

I've thought about that question. You and I had a brief conversation on the phone prior to me coming here. And I knew that might have been one of the questions that I was going to be asked. I think there's a little bit of a hard answer to that question. I look at it like— Again, I look at this like crimes.

This is very akin in my mind to a whole litany of crimes, whether it's an assault or a coercion or an intimidation or anything like that. And I would say, in the truest sense, that the best thing that I can compare what was done to people crime-wise is a sexual assault and an egregious one. And it's because the integrity of a person's body is, I think, paramount to respecting that person. And I'm not saying this to belittle any person who's been a victim of a sexual assault of any sort. But I would see those as being akin. You're introducing something into the body that that person doesn't necessarily want in the body, and you're using coercive means or threats in order to do it. And I think that that's a very, very serious, serious offence.

So asking what should have been done differently the next time is a little bit like asking how the rapist should have acted differently. I would say that the ultimate truth about it is that none of this should have happened the way that it happened.

Kyle Morgan

I think those are all the questions I have. I don't know if the commissioners have anything. I thank you for giving your time.

James Erskine

Thank you for the opportunity.

Kyle Morgan

Sorry. Janice? Go ahead.

Commissioner Kaikkonen

I just want to ask— I know you kind of alluded that you have three children. How did the three children, how were they impacted? Because they would have seen you and your employer at odds over this. I don't know how the mandates came down here in the education system, but possibly they were under the same scrutiny and mandates within the school system. So how did that affect the family as a whole?

James Erskine

Well, there's a whole bunch of different levels to that answer. My children were in a private school. My wife was working at the time and was able to pay for the private school out of her wage. She lost her job soon into the pandemic. So we weren't able to continue paying. So what we decided to do, because more and more measures were coming into the school system, was to homeschool our children.

[00:15:00]

We're very thankful that we made that choice. But it brings a whole lot of different things to a family, especially when you have— I've got a child who's nearly 18 now. He's turning 18.

I've got a child who's 15. And then I've got a younger boy. And part of what it did was change my wife's day-to-day because now she's taking care of three kids. It took my kids away from their friends. It just changed our lives in innumerable, immeasurable ways.

Janice Kaikkonen

Now that you see that the mandates have been lifted to some extent, are you able to converse within the family about these things in a way that makes sense?

James Erskine

We didn't ever pull any punches with our kids about being honest with them about what was going on and why we were making the decisions that we were making. Again, it's hard to tell a 16-year-old or 17-year-old that they've got to come out of school and hang around with their goofy parents for a year or an undetermined amount of time. I mean, that was part of the problem at the time. Looking back, you can say, well, it was a year, it was a year and a half, kind of thing. But we didn't know that going into it. And I didn't know that going into it when I decided to quit, either. All of the mandates were lifted shortly after I quit, but I didn't know that. It had been getting worse and worse and worse.

And so, speaking with our children, I think the saving grace is that we've kind of given them a little bit of a sheltered space where they're not necessarily having to go out in public and be told every seven seconds, you've got to pull your mask up or you've got to wash your hands or you've got to do these kinds of things that are traumatizing to kids. But it's a give and take. You know, it's had negative effects. But we've managed to pull some positives out of it too, I think.

Janice Kaikkonen

Thank you.

James Erskine

Thank you.

Kyle Morgan

Any other questions?

James Erskine

Thank you for the opportunity.

Kyle Morgan

Thank you very much, sir.

[00:17:33]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

April 13, 2023

Day 1

EVIDENCE

Witness 5: Shea Ritchie

Full Day 1 Timestamp: 07:36:48–07:59:02

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Shawn Buckley

So if we can have Shea Ritchie come to the stand. Shea, can you state your full name for the record, spelling your first and last name?

Shea Ritchie

Yes, Shea Ritchie. S-H-E-A R-I-T-C-H-I-E.

Shawn Buckley

And Shea, do you promise to tell the truth, the whole truth, and nothing but the truth today, so help you God?

Shea Ritchie

I do.

Shawn Buckley

Now, my understanding is that you are in the restaurant business.

Shea Ritchie

Yes, that's correct.

Shawn Buckley

And you currently have a restaurant that has been running for ten years?

Shea Ritchie

Yeah, this month is the tenth anniversary.

Shawn Buckley

And before COVID, you had another restaurant that you had been operating for roughly four years.

Shea Ritchie

Yeah, that's correct. It was called Chaise Corydon.

Shawn Buckley

What was the restaurant business like for you before the pandemic policies?

Shea Ritchie

To be honest, we had just opened, well, a relatively new location there. But we had gone through, you know, several months; we had figured things out. We were well into our, I guess, prime. We were fully operational, very busy. It was a great location.

Shawn Buckley

Right, so things are looking positive, and then what happened?

Shea Ritchie

Well, there was the introduction of the original mandates. I'm sure everyone can remember the two weeks to slow the curve. So—

Shawn Buckley

And I'll just interrupt. But they didn't specify that was a biblical two weeks, did they?

Shea Ritchie

Well, we still are in the dark. Yeah, so the original mandates came out. They were telling us to open and close, open and close. And we were fully compliant. To be honest, there really was no incentive not to; there was no one who was going out at that time anyways. So we had been doing our best to follow whatever the rules and give the leadership and the government the benefit of the doubt. And things just kind of spiraled off from there because the government couldn't even keep track of all the rules they were making up, and the enforcement just became a nightmare.

Shawn Buckley

Now, can you give us some details about when you say nightmare because you have some specific examples to share with us of the type of thing that you experienced?

Shea Ritchie

For sure. So the COVID rules and regulations fell under the authority of Manitoba Health; they were the be all, end all. But I guess that they were overwhelmed and understaffed at the time that they were supposed to go in and add all the extra COVID enforcement to their plate. So they had recruited liquor inspectors and other agencies to kind of help out. So we would have police; we would have liquor inspectors; we would have health inspectors

showing up all the time, you know, maybe 20 different people. And they would have different rules. They were contradictory. They were nonsensical: I was even told at one point in time by a health inspector— So this is one of the people who was trained specifically in these types of fields. A health inspector told me that we weren't allowed to use plates and cutlery because there was no possible way to sanitize them. So going through a dishwasher with chemical and heat was not enough to sanitize them for COVID, according to her.

And so I would have to get these rules and updates all the time. And the inspectors would quote rules that didn't exist. I'd have to go and challenge it, and go and say, "Wait a second, this doesn't make sense; like how come we're not allowed to use plates and cutlery?" Right? And then Manitoba Health would respond and send out the retraction: "Okay, disregard what she said; she doesn't know what she's talking about."

So we were going along fine as far as every other business in that regard until we got our first fine in the summer of 2020. And we were given a fine for people sitting too close together. So the specific rule that was given in the health order said that people who are at different, sorry— Tables had to be six feet apart or two metres from other or from different tables. And it's a really, really vaguely worded rule. And what I was told it meant,

[00:05:00]

and which made the most sense, is that if there was a group of people, they had to be separated from a different group of people.

So I got a fine because they found two people sitting close together. Sorry, there was two instances in a 250-seat restaurant where they found two people sitting too close together. They indicated that we were following the 50 per cent capacity rule. So that if you think about it now, we have a patio space that's half empty, and they saw people sitting 60 centimetres apart, which was the actual number. And if you can imagine what 60 centimetres is, it's pretty much enough to put your arm around a person. So the area is half empty. And people are sitting close enough that they can be touching. And I asked the inspector, I said, "Well were those people from the same group?" "Well, I didn't ask." So then I thought, well, this is ridiculous.

Shawn Buckley

Now, at the time, how many people could be in a group?

Shea Ritchie

Oh, man, it changed all the time. I don't know if there was an actual group size. There was no actual limitation on the group at that point. In the health orders— Actually, I do know because I went over this in court. As far as I know, at that current time, there was a capacity limit of 50 people in a different section of the orders, so if you were to have a wedding or other groups. But in our section, restaurants and licensed facilities, there was no specific limitation.

Shawn Buckley

Right, but I meant in a group like, let's say at a table, how many? There was no limit.

Shea Ritchie

There was no limit.

Shawn Buckley

So the health inspector tickets you for some people being within arm's length but never asked if they were part of the same group.

Shea Ritchie

No.

Shawn Buckley

And my understanding is that that ticket didn't go well for you.

Shea Buckley

Well, actually, the news is pretty favourable towards us at the time. So we had complained about the situation, said, "Hey, this is ridiculous; like we're actually trying to do our best here and follow whatever." Like the rules didn't make sense. But we were trying to do our best. And I just said respectfully, "We're being told different things all the time."

The health inspector who issued the ticket to me had previously come to the location and measured out all of the tables and said, "Yeah, yeah, yeah, everything is perfect; all your tables are separated." And our restaurant tables are smaller and we combine them. For instance, we have tables of two. And if it's a group of ten, we'll have five tables that we combine. It's more efficient because you can always break the tables apart. So a group of four is at a table of four, but a table of two isn't at the same group of four. So the rule said different tables had to be separated. But the inspector told us that that meant different groups of people, not tables; pieces of furniture didn't have to social distance.

So what happened then is they approved me to reopen. And now when they came, they said, "Oh, we saw some chairs that were too close." I said, "Well, in the rule, it says tables; it doesn't mention chairs. And you told me it was tables." And he admitted that in court. He acknowledged that he had told me those things. But it didn't matter at that point. And he acknowledged also that they didn't ask if they were from the same group or not. And they just didn't think it mattered. And out of all— I have almost \$60,000 in fines from COVID.

We were only given two court dates for all of our tickets. This one did go to court, and the judge said that we were guilty. And she specifically said it doesn't matter if they're from the same household or not, they weren't allowed to sit within six feet of each other. So a husband and wife weren't allowed to sit at the same table even if they're living together, they drive together. You think it makes sense? But she adamantly said, "The only common-sense way to interpret this rule—" Because I actually quoted case law and said, "Look, if there's a rule here that's ambiguous. And it's clearly ambiguous because the health inspectors are agreeing with me. And the prosecution is saying that we have to separate the furniture." And then the judge said, "Well, it doesn't matter if there's different interpretations because there's only one that makes sense here, and you should never have come to any other conclusion." And she ignored the fact that the health inspectors had actually agreed with my interpretation.

Shawn Buckley

Right. So following that judge's logic, if a breastfeeding mother came in to eat at your restaurant, she would have to be separated by her infant by six feet.

Shea Ritchie

Yeah, very long straw, I guess.

Shawn Buckley

Okay. So you were found guilty of that one. What was the fine?

Shea Ritchie

\$2,542.

Shawn Buckley

\$2,000. I'm sorry?

Shea Ritchie

\$2,542. This was when the rules first came out. And then they eventually changed the fines to \$5000.

Shawn Buckley

And how many tickets in total did you receive?

Shea Ritchie

I think it was 10.

[00:10:00]

So I had two on the lower scale and then eight on the higher scale.

Shawn Buckley

Okay. My understanding is that for eight of them, they haven't even given you a trial date yet.

Shea Ritchie

No, I disputed all of them and they never— In fact, I thought they were just wasting my time. And in January, I got a memo from the government saying that one of the tickets, the second ticket I had been issued—which was about two or three weeks after the original ticket—they were giving me a court date. And so they gave me a court date for February 15th nearly three years after the violation.

Shawn Buckley

Now, as I understand it, that one was a bit of an interesting ticket because it kept getting changed. Can you tell us about that?

Shea Ritchie

Yes. The liquor inspector who issued the ticket— So keep in mind, not a health inspector, so someone totally different who admittedly in documented communication said he didn't even know what the rules were. So he gave me a ticket because he said people weren't socially distanced and because he saw people dancing. Now, at the time, there was no rule about social distancing. And there was a rule that mentioned dancing only to the extent that it said if you have a dance floor, you cannot use your dance floor, right? So the judge said that that's pretty ambiguous. But he agreed that yes, a dance floor is a specific type of thing. And it's kind of like an area where you're inviting strangers to all mix and mingle.

So the inspector who wrote the ticket acknowledged that we did not have a dance floor. But he said that there was four people out of approximately 200 that were dancing amongst themselves. And he said that nobody told them to sit down. And he saw them about 10 minutes later, and they were still dancing. So that was a clear violation. And in court, he said that we had created an impromptu dance floor. So he said you're allowed to have a DJ. You're allowed to have people in groups and people standing up and sitting. But if they are moving to the music, then you've created a violation. And in the cross-examination, I actually had the inspectors, the second one, admit that technically the entire restaurant and kitchen area could be a dance floor if people were dancing on it, according to this interpretation that they were applying.

And keep in mind that wasn't even my first fine, that's not my only fine for dancing. I had a police officer issue us a fine for dancing. And I have asked Manitoba Health, I've asked the Liquor Commission what's the legal definition of dancing after our first ticket so that we could have some clarification on what the hell it meant. And that, amongst other emails, were completely ignored. They were not interested in education; they were not interested in transparency. They would make up their rules; they would enforce them; and they didn't care if it made sense or not. They would just do whatever they wanted.

Shawn Buckley

Now, were there any changes to that ticket that the liquor licence people issued you?

Shea Ritchie

I apologize for not getting back to that. So the ticket didn't make sense. I looked at the rules. I went over them with the inspector who wrote them. He originally in the phone call said, "I can't find the rule that you broke." Because he said that I broke the P210 Health Act. I said, "Well, where in the act does it say anything about this?" So he went over it. He couldn't find anything, so he said he would get back to me.

He did get back to me later saying that he talked to somebody at Manitoba Health who helped him understand the rules better. And on an unrelated website, there was a set of rules, and I broke those rules. So giving him the benefit of the doubt, I said "Okay, well, did you know that these rules or this website existed prior to this ticket being issued?" And he said, "No, I did not." I said, "If you didn't know about this website, how come you're expecting that I would have known about this website?" Right? Assuming that this website, it was even legitimate. I said, "Don't you think it would be more appropriate to issue a

warning in such a situation?" And he said "No, no, no, you clearly deserved a fine." I said, "Okay."

So he put it down in writing. The reason for the ticket, not the original reason, is a new reason now. Because on this website, it says that people have to be seated; they're not allowed to be served while they're standing. And it says that people can't be dancing. So I said, "Okay." I took that email from him. I sent it to Manitoba Health, the authority on the topic. And I asked them to clarify whether or not those were a part of the official rules. Because it wasn't listed in the *Public Health Act*. And the *Public Health Act* did not refer to any other websites or other documents. So Manitoba Health wrote back clearly in writing, "Those are not the official rules."

So, again, I was in the media. People were wanting to know why we were getting all these fines and everything. And I said, "Well, clearly, we did not break any of the rules."

[00:15:00]

I sent that email to the liquor inspector. I said, "Look, great news, now. We've got Manitoba Health officially declaring that those are not the rules. And we didn't break anything in needing a fine." And that is when the liquor inspector decided to change the ticket because it doesn't make sense to give me a ticket for rules that don't exist.

So then he went back to the original rules, and they picked a rule in the official rules. And then that rule that we were now declared to be in violation of was serving people in an area not open to the public. And when I asked them where this took place—because all of the notes said that they saw people in this area, they saw people in that area—all of those areas that were listed were a part of our licensed premises or official service area. So I asked, "Was it in the basement? Was it outside on the roof? Like, where did you see people being served?" And again, in court, they testified that we did not break that rule. But because they use that rule, they said that that rule meant that people had to be six feet apart and they had to be socially distancing. So they still tried to say that the original reason for the ticket applied to the rules that didn't talk about it. And the judge was just as dumbfounded as I was.

Shawn Buckley

Right. So you were found not guilty on that one.

Shea Ritchie

Yeah. That judge actually took a very common-sense approach and declared us not guilty.

I would like to also point out though, the media had been favourable towards us in the first situation. And in this situation, I expected the same because I said, "Look, we've been given a fine for this violation. Manitoba Health has declared that we didn't break the rules." And I said, "Look, in the rules, there's nothing about this, socially distancing and dancing."

So the media, somehow at this point, all changed their narrative on what was happening. And we became the demonized restaurant where we were viciously putting people's safety at risk because we were letting four people dance uninterrupted. And the media left out the important parts that we were not breaking any rules. So in the actual—I think it was CTV did a report. They interviewed one of my neighbours, and the neighbour goes, "Yeah, it's obvious that people have to be seated; you can't have people standing up."

But they didn't even go and look at the rules. So they had another person who's not an authority say that we were breaking the rules. And that was their story about what had happened. Instead of saying, "Shea says this and here's the rules. And there's nothing that we could find. And look, Manitoba Health agrees with Shea." Like you'd think that a more balanced form of journalism would be something like that. It's like getting a speeding ticket: instead of talking to a cop, they talk to a guy on the street. And they're like, yeah, he looked like he was going fast. Right? No training, no background. It's just some hearsay of some random person. It was a very frustrating situation. So we were completely demonized and people were boycotting us. And there was like, "Oh my god, just go online and look up Chaise Corydon."

Shawn Buckley

Now, my understanding is that it's not wise to tick off a bureaucrat. Can you tell me, or tell us, what the liquor licence people eventually did to you?

Shea Ritchie

Well, I was sure that something was coming down the pipeline because the police officer, who gave us a dancing fine for \$5,000 at a later date, said that he was planning on taking our liquor licence. And I asked him, I said, "Okay, well, the rules don't mention anything about dancing, so I'm not sure why you think that we're breaking this rule." There was no rule at that time about dancing. But then the idea that we were going to get our liquor licence pulled was completely new to me because we'd never had a liquor violation. These were public health order violations, and these are being enforced by non-experts. They're not even trained at all in the public health field.

So I had an impression that this might happen. And in 2022, the LGCA [Liquor, Gaming and Cannabis Authority of Manitoba] basically made an application to their board to have my liquor licence pulled and to have my restaurant basically, in all intents and purposes, shut down. And one of the reasons they cited for this reason to pull my licence was because I was a repeat offender. And I'd never had a conviction with a COVID fine or these issues at all. In fact, they were aware that their agents had been changing this ticket and had committed fraud, basically, by changing this ticket retroactively. And knowing that we weren't guilty because Manitoba Health exonerated us, I actually took that issue all the way to the CEO, Ms. Kristiane Dechant of the LGCA. And she said she looked at the documents and she saw no problem. And she didn't think her staff did anything unprofessional or criminal.

[00:20:00]

So later, yeah, they pulled my liquor licence. And now it's funny that that ticket has been officially dropped in court, and they haven't given my liquor licence back. They haven't apologized. And they basically destroyed my livelihood at that entire location, and since, it's closed.

Shawn Buckley

Right. Because my understanding is you, just in that location, it wasn't feasible to continue operating the restaurant without a liquor licence.

Shea Ritchie

No. And it was in severe decline after all the negative media attention of us, being falsely labelled as degenerates or intentional rule breakers.

For the record, we were actually not breaking the rules. We were following the rules even if they didn't make sense. And the thing is that I was a very outspoken person. And I expressed my— I used my freedom of speech right to just say, "Look, some of these rules don't make sense." I actually wrote an article about what the Great Barrington Declaration was about, saying, "Wouldn't it make more sense to have a focused approach instead of just making healthy people locked down? Why don't we take our limited resources and protect the most vulnerable?" So I had been an outspoken person in that regard. I had sent several letters and emails to the enforcement people at LGCA and the Manitoba Health asking them for better clarity. And I had two people, I had a scientist from Manitoba Health and I had an inspector from the LGCA both in recorded conversations tell me that they agreed with me. But they weren't allowed to officially say anything because they would lose their job.

Shawn Buckley

Thank you. And I have no further questions. I'll ask the commissioners if they have a question. No?

I think we'll call one more witness and then we'll take a break. Oh, we should take a break now. So how about we take a 10-minute break then and return at 3.25 pm.

And Shea, on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony.

Shea Ritchie

Thank you.

[00:22:14]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 6: Sharon Vickner

Full Day 1 Timestamp: 08:11:40–08:40:07

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Kyle Morgan

And welcome back. Our next witness is Sharon Vickner. Ms. Vickner, can I just get you to state your full name, and then spell your first and last names?

Sharon Vickner

I am Sharon, S-H-A-R-O-N. Family name, Vickner. V, as in Victor, I-C-K-N-E-R.

Kyle Morgan

And do you promise to tell the whole truth, and nothing but the truth?

Sharon Vickner

The whole truth, and nothing but the truth, so help me God.

Kyle Morgan

Can you tell us where you're from?

Sharon Vickner

Born and raised in Winnipeg.

Kyle Morgan

And what type of trade or profession?

Sharon Vickner

I am an ISA-certified [International Society of Arboriculture] arborist.

Kyle Morgan

Okay. Now I understand you were impacted quite a bit from the COVID-19 response, particularly regarding your employment, and I guess I would say your general well-being. Can you tell us a bit about what happened to your employment in 2020, what was going on at that time?

Sharon Vickner

Well, I did lose my job in November 2020. I can only speculate as to why. I was removed from my position, so I can't make a direct comment on the employer's part other than he said it was a financial concern. But prior to myself losing my job in November 2020, it was in November and it was a Wednesday, and myself and my employer had met up to discuss my success of the 2020 season, which I did phenomenal. And he gave me my new business cards and a gas card for the company vehicle. We went over how we were going to attack the sales of the following year. And that was a Wednesday.

On that Friday, Pallister went on the television and said, "Don't be surprised if we start naming names of those that got tickets during this COVID." The following week, I was told that I was no longer needed, and I lost my job.

Kyle Morgan

I understand you were working in sales at that time, is that right?

Sharon Vickner

Mostly, yes. Absolutely, yes, I was doing the sales for the tree care.

Kyle Morgan

Your employment would involve you attending to your customers and doing estimates, is that right?

Sharon Vickner

Yes, absolutely, and that's where my bulk of my mental health started to decline. The season for me in 2020 started for work in March, as did a lot of the talks about a potential Chinese Wuhan flu, or whatever you want to call it, came about. And so while I was going to visit strangers—for the most part to me, of course—I was consistently from March all the way to November hearing stories, unsolicited stories about the traumas that family members were going through with not being able to visit their family members in a care home or a hospital or travel to go visit a sick relative.

There's one story that really— Actually two stories that really stuck hard in my mind that I haven't really been able to shake, I guess that's PTSD. This one incredible woman went on to tell me, she was 84 years old and she was so happy to see me, and she went on to tell me that she came from a communist country. And she's got adult grandchildren, and her grandchildren are interested in her history. So she was telling her about what communism was about and why they fled from the country, and all the signs. And what she's seeing, what's happening in Canada and the rest of the world right now. And her own daughter told her that if she continued talking to her grandchildren about this stuff that she would never allow her to see her grandchildren again. So we cried together because the grandchildren were a huge part of her life.

And another quick scenario was this other gentleman. He was in his 80s as well. He had a wife that was extremely involved in community and philanthropy. She's been a huge name in the city of Winnipeg, actually, which I will not name, and she had passed away. And at that time, there was only allowed 10 people to attend a funeral. And I cried with him for probably 45 minutes because he loved her so much that he felt that she deserved more respect than 10 people.

[00:05:00]

And he never did have a service for her. So that's just two out of probably a hundred stories that— I should have wrote a book, actually.

Kyle Morgan

So just to summarize, you would visit with your customers, and

Sharon Vickner

Yes.

Kyle Morgan

invariably they would tell you their stories.

Sharon Vickner

Yes, I guess, I don't know, maybe they just see my kind heart, my nature. I never once talked about my personal opinions or what was going on in this world to any of the clients or potential clients. I was there as a professional, not as a person walking down the street sharing an opinion. So yes, I was invited to a yard to do an estimate for tree work.

Kyle Morgan

Would it be fair to say that you got involved in some type of advocacy work involved in the community about some issues you had noticed going on?

Sharon Vickner

Absolutely, I certainly did. Well, everything was starting to ramp up in 2020 where there was masking this, stand on a dot, follow these arrows, don't see this person, go tell on your neighbours. I realized that my friends that I thought were my friends since junior high and elementary school, for that matter, were really not my friends any longer because I didn't stand on any dots or follow any arrow or anything like that. So I was driven internally.

I'm going to say this on record: I was never a girl that was of faith. And good things, I guess, do happen out of these scenarios. The Lord found me, and when that happened, the Lord actually told me that I had a voice and I had a heart in the right place. And I definitely started standing up in an advocacy sense of educating and sharing love and whatever I could do at that time.

Kyle Morgan

Would I be right in saying that you got some tickets? As a result of that?

Sharon Vickner

Yeah, about \$19,000 worth. Yes, that's not what's causing me my mental traumas, though, that's just part and parcel. I knew what I was getting into when I took a microphone or a bullhorn in my hand; I knew the possibilities. I just had hoped that the benefits of building communities within the fringe minority, I thought we could band together and find that unity where we could.

Kyle Morgan

Now you mentioned that you lost your job, was it October 2020?

Sharon Vickner

It was November 2020.

Kyle Morgan

Okay. Was there anything going on in social media at this time, regarding your advocacy?

Sharon Vickner

In what respect?

Kyle Morgan

Well, you had mentioned that you'd been trying to find your voice in the community. So I'm just wondering if there is increased attention on you at all at that time.

Sharon Vickner

Yes and no, actually. For the first while, I didn't even use my name at all. I never really said it. And then when it comes to social media, it just shows you about what's going on with censorship, way back then, and hatred, in the sense that some complete stranger ended up finding me. [Kolbie] something or other. I don't know. I don't know who this guy is. He ended up getting a picture of me with the company's logo on it, and he posted it and said, "Don't hire this girl," and he really slammed my character, really defamation of character in the big scheme of things. So that forced me to—I guess I should have just totally gotten off of Facebook. So forgive me, my friends, I stayed on. But I did change my name because I didn't want any fallout if someone searched me and found that I was standing up for what I believe to be the truth.

Kyle Morgan

Do you recall when that happened on social media? I'm just thinking about the timeline of your job situation.

Sharon Vickner

Right. That happened just prior, actually, I had to rethink that. It was about the very beginning of November when that occurred. Because I ended up telling my employer about it because I wanted him to know where I stood professionally and that this individual had done this to me. And that I had taken my picture off that stated the company I was working

for, and I changed my name so that there wouldn't be any backlash to his business or his potential clients.

[0010:00]

Kyle Morgan

Now, in your mind, why do you think you lost your job? You might have touched on that before, but—

Sharon Vickner

Again, I can only speculate. But it's just— Some say there are no coincidences. And I can't help but think that he was concerned that I may be unprofessional when I go to visit clients while I'm representing his business.

Kyle Morgan

Now I understand, unfortunately, you actually got arrested. Was that May 2021, around that time?

Sharon Vickner

Yes, it was. May 28th, I believe.

Kyle Morgan

Can you describe that experience to us?

Sharon Vickner

Well, thanks to James reminding me of something. I want to say that, firstly, I was not aware that I was on an arrest warrant. One of the others that were on the arrest warrant told me I was. Apparently, everyone else got a phone call to turn themselves in. I didn't do that. I didn't even get the phone call. I didn't even know until one of the fellows mentioned it to me.

And anyway, without going through that whole long process, I did get apprehended or arrested, I guess it's called. I don't know, I've never been arrested before. And it was interesting because when the police had put me in handcuffs and they put me in the car, they weren't wearing masks. I certainly wasn't, of course. And the first thing the police officer said to me, they said, "Do you know how pissed off we are?" And I went, "What do you mean?" Because I'm like a little talking girl, right? I'll tell him anything, right? And I have nothing to hide.

And they said, "Do you know what fentanyl is?" And I said, "I absolutely have heard of it. Yes." And he says, "We're the drug squad, and we're here arresting you." I couldn't believe that. I just point blank told him, "What a waste of taxpayers' money. You're supposed to be taking dangerous drugs off the street, and you're throwing me, a law-abiding citizen, into jail." And then, so when I ended up getting into the— I'll speed this up. I'm sorry, Kyle. I'm a little bit of a talker, and I'm a little nervous.

Kyle Morgan

That's okay, go ahead.

Sharon Vickers

When I did get out of the police car and they put me in the elevator, this is where the psychological whirlwind really began. They put me in this elevator, and there was initially two police officers that were tending to me, the ones in the car. But when I got into the elevator, there were six others and me, and it was like they did that intentionally.

And as soon as I was walking into the elevator, they said, "Now get in here and face the corner and don't say a word." And I'm thinking, oh, knowing me I can't bite my tongue. And I just told them that it was, "How humiliating. This makes absolutely no sense that you're doing this just for a freedom fighter." So anyway, long and the short of all of that, I ended up, of course, going through the scenario that they do: pat you down, la, la, la, la. And it's just full of lies. I guess that's what police officers do, so I'm not here to diss them if that's the proper procedure where they don't really tell you the truth, how long you're going to be there.

Anyway, I ended up getting put into a cell, and it was kind of disgusting, actually. I had to call them and tell them that— You know, you clearly know the character of who you're dealing with, like the floor had grossness all over it. It was a really vile room.

Anyway, I had to use the washroom. And this female cop walks me to the washroom and the toilet is completely up to the top, filled with yuck. And I just said, "Oh, you got to do something about this." And she said, she rolled her eyes and she said, "So you either got to go or you don't. We only clean it once a day." Well, that's a lie, of course.

I know that's not what you wanted to hear, but so I'm sorry. The whole thing is really kind of boggling my mind about being in jail. I haven't really wanted to think about it too much. So I guess what the hardest part on me, where it really started to stir my mental health, was clearly they had direction to cause me distress. And again, I don't know if this is normal, I really have no idea. So if it's normal, I guess it's just not normal for me.

I was in detention or the cell, or whatever you want to call it for, I believe, it was anywhere from 15 to 18 hours. I think it was a total of 18 hours I was in jail. And every five minutes, someone came and banged on the windows, and I'm not talking just a little tap. I know, someone says, "Oh, they're just making sure you're not, you know, dead," or whatever, right? But they knew why I was there. But every five minutes, they were banging on the window. And I'm going to say it, forgive me, women in the room,

[00:15:00]

but the women were the worst. They actually took their keys out and they crash, crash, crash, every five minutes.

And I know that they had to have been directed to do this because there was a billboard, a clipboard on the side of the wall, and I could see them sign it and I could hear them flick the paper. And there was about 45 different officers throughout that whole time, or 45 times they did that anyway so—

Kyle Morgan

You were arrested because you were getting tickets for gathering outside. Is that right?

Sharon Vickner

Yeah.

Kyle Morgan

Outdoor gatherings?

Sharon Vickner

Yeah, I think it was a P210, I think was the bylaw infraction of inciting gatherings.

Kyle Morgan

I think in May 2021, there was a gathering planned for the legislature here in Manitoba? And that's why a warrant was executed to arrest you? Would that be right to say that?

Sharon Vickner

I'm uncertain, exactly, because they never told me any of that. Not only that, they didn't even read me my rights when they put me in the car either. So that's what I had heard, that it was on May, I think it was just before May 15th. Because the last event that I had something to do with, that I was an organizer for, me and my team, was May 15th. And then, yes, I believe the following one was the legislature, and then the very final one on the 28th was the day that they actually detained me.

Kyle Morgan

Now you were released on bail.

Sharon Vickner

Yes.

Kyle Morgan

And I understand there was a particularly onerous condition of your bail?

Sharon Vickner

Yes, that is correct. And that's the one that I'm— Part of me is embarrassed to admit what I went through. But I guess this is what mental health does when you're a positive person and you've never had to deal with things like this and always around people and always have a friendship circle. It's extremely difficult. So on one of my release conditions, I was not allowed to be on public or private property, in private or public gatherings with anyone other than which I reside.

I lived alone. So that meant I couldn't be anywhere, at any time, with anyone, or I'd be criminally charged. I would have been thrown in jail.

So when they gave me that, when I was going to be released, I signed. I wanted to get out of there; I did not want to stay there any longer. So when I went to sign the documents, I wrote "under duress," because I certainly was. And then they called me back in front of the magistrate and said, "Well, you clearly need to call your lawyer." And I said, "What do you mean?" You know? Because you signed "under duress." And I said, "No, actually, I read it and I just don't agree with it. And this is why I'm signing 'under duress.'" I told them all the reasons as to why I signed "under duress." And they kept me there for about another hour after I had done that.

Kyle Morgan

How long was this bail condition in effect?

Sharon Vickner

One week short of a year.

Kyle Morgan

Can you tell us what your experience was during that year? As difficult as it might be.

Sharon Vickner

Well, it just pulled me out of any kind of support system. I wasn't allowed to— Aside from that particular release condition, the others on the arrest warrant, one was my spiritual guide, Pastor Tobias Tisson: I was not allowed to phone him, contact him at all. So I couldn't have any spiritual support from someone that I trusted.

A friend of mine also on there, I hope this is okay that I mention Dr. Gerry Bohemier. He was also on there and a huge support to me as well. And I was not allowed to be in contact with him either, nor was he with me.

My family had written me off because I had ended up in the paper, and they had said that I had dissed the family name. I didn't realize we were that important. So they wrote me off, and they still don't talk to me.

What had ended up happening, where I lost my job, no one was hiring me because of small industry. I guess, I don't know, word gets around, maybe. Or more importantly, my confidence was destroyed. So I went to a very, very dark place, which I had no idea I even had capability to do that. The first time that actually happened, I just wanted to disappear because, honestly, no one would have really known,

[00:20:00]

because I wasn't allowed to be anywhere, anyway.

I overcame that. And then it kind of spiraled more, when more of the— Like harassment in stores, for example. I'm sorry, but I did not wear a mask. I know how to take care of my health; I don't need something like that on me. It's just a suppression mask. But I was attacked verbally over and over again by managers and customers. The hatred in people's eyes, oh, my gosh, the trauma that so many people must be going through. I was taking that on my own self as it's painful to see people treat others like that. But this time, it was being treated to me.

It actually got to the point where, forgive me, Lord, it actually got to the point where I couldn't deal with it anymore because I couldn't handle what was happening to those around me. I took me out of the equation, actually, and I couldn't handle seeing children with masks on their face and little babies, and just all of the above that most of us know exactly what I'm talking about.

I actually thought, what would be the quickest way, what would be the quickest way that I could end my life? And I thought, oh, heroin. I'll just get a needle and I'll shove it in my arm and I'll die instantly. No, I did not look for it; nor did I go any further than that. But the thought entered my mind.

And just knowing that a thought like that entered my mind added to my mental health decline. Because I had no idea. I'm a loving person; I'm a peaceful person. I love life, I love nature. I never in my wildest dreams did I ever think something like that could come. I guess that's the devil for you, right folks?

But hallelujah, I think what really got me out of that is when you truly put your faith in something greater than yourself, you start to feel a hand on your shoulder when there's really no one there.

So I want to get this on record: I am of no harm to myself and I am of healthy, sound mind. I just want to make sure people know that I'm— Don't be concerned. I love life and I'm here for a long time.

Kyle Morgan

I think we're pretty tight for time. I wanted to ask you what you thought could have been done differently regarding the COVID-19 response. I don't know if you have anything quick you want to say.

Sharon Vickner

I do. I know I'm not supposed to have a piece of paper. But there's just one little statement I wanted to— Just one little sentence because I didn't want to forget it. And I think it might touch all of us. It says, "Holiness does not come from being removed from the world but from engaging it in it."

And that is exactly what I think should have been done differently. To protect our health, we need to be part of the world, and if we are removed from it, we're only going to get mentally ill. We're going to separate each other from everything. So what could they have done?

Well, tell us the truth, that would have been really great. And talked about our actual health, about vitamins and supplements. And how about playing outside? Getting sunshine? How about hugging your children? How about going to see your loved ones? All of those things is what they should have done.

They should have left our own health concerns or our own health solutions to ourselves. The government is overreaching. And they should have no say on how we tend to our own personal health.

Kyle Morgan

I don't know if there's any questions from the commissioners, Dr. Bernard Massie.

Commissioner Massie

This is very touching. I'm wondering how you're doing now. Did you gather a group of people around you that really helped you to go through life?

Sharon Vickner

Yes. I found some really incredible solid people that love me unconditionally, and I'm extremely grateful. I'm not, I'm not entirely healthy yet. I don't think any of us are. I think it's going to take a while for all of us, in the sense that there's constant reminders all around us, every single day, of what this plandemic has put upon us.

[00:25:00]

But as for, like I say, again, I am in a place where I do love life. And I know that there is so much more that I have to do.

So I'm not harming myself. I'm not looking to harm myself. But my mental health definitely needs a little bit more love, I guess, in a matter of speaking. A little bit more hugs. Hugs are good. Because my confidence was taken away from me during that whole process. Because that's kind of what they did to us, right? They tore our confidence down, and they forced us to be scared of people. I'm not scared of people, by the way; they're probably more scared of me. But thanks for asking.

Kyle Morgan

Yeah, go ahead Janice.

Commissioner Kaikkonen

I just want to say from my own experience that it's never too late to write that book on those hundreds of testimonies that you heard from people. Can you hear me, okay?

Sharon Vickers

Yeah.

Commissioner Kaikkonen

And also, I was reading Proverbs 29 this morning, and I can tell you there's some interesting scriptures in there that you might actually enjoy.

As far as the question, I'm just wondering. You did feel bullied by those in authority. Do you feel stronger for it, even with all of the mental health issues that followed? But do you feel stronger that you were able to write the words that you're signing "under duress," for example? Did that empower you?

Sharon Vickner

Did it empower me to be able to write those words “under duress”? Oh, absolutely. It actually did. Because I think I would have handled my time in— I would have probably navigated the circumstance after, in my head, differently. Because words are powerful, and we should be very mindful of our words at all times. It does show me that our justice system is broken, and it is not just in any form. Because if the words “under duress”— They shouldn’t have followed through with any of those conditions because they would have been null and void, and they weren’t null and void.

Commissioner Kaikkonen

So it just lets me come to the next conclusion. If the justice system is broke, I guess we have a lot of fixing to do.

Sharon Vickner

I’d have to say it needs to be torn down and put back together. Because we need to even change the word “government.” Because when you take those two words, in Latin, it actually means mind control. And I don’t think any body governing us should have anything to do with controlling what we do, say, speak, or put into our body.

Commissioner Kaikkonen

Thank you.

Kyle Morgan

Any other questions? Okay. Thank you, Ms. Vickner.

Sharon Vickner

Thank you.

Kyle Morgan

Thank you very much.

[00:28:27]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 7: Pierre Attallah

Full Day 1 Timestamp: 08:40:07–08:57:23

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Kyle Morgan

We should go ahead with the next witness. It's Mr. Attallah.

Hello sir, can you state your full name?

Pierre Attallah

Pierre Nicola Attallah.

Kyle Morgan

And can you spell your first and last name?

Pierre Attallah

P-I-E-Double R-E A-T-T-A-L-L-A-H

Kyle Morgan

Do you promise to tell the truth, the whole truth, and nothing but the truth?

Pierre Attallah

I will.

Kyle Morgan

Where are you from, sir?

Pierre Attallah

I was born in England and raised most of my life in Canada, in Winnipeg.

Kyle Morgan

OK. And what's your profession?

Pierre Attallah

I'm an IT specialist. I've got a BSc in computer science from the University of Manitoba.

Kyle Morgan

Okay. I understand you experienced some difficulties as a parent regarding COVID measures that were in place.

Pierre Attallah

I have two kids in school, elementary school at the time. I was actively involved in their school on a regular basis, on a daily basis sometimes. I was volunteering at the school. I was also working as lunch supervisor for an hour a day, which fit nicely with my other work schedule. I was praised by the parents, the students, and the staff.

Kyle Morgan

I understand your sons experienced some difficulty with the rules that were in place at school. Is that right?

Pierre Attallah

Yes, they were forced to wear a mask in school, and they were targeted by the staff because I didn't agree with the mask mandate that the school was putting in place, and I was speaking out against it. I was pointing out that the public health orders did not apply to any public school in Manitoba. Because I questioned the school about it, they said it was because of the public health orders. But when I showed them the public health orders, it clearly stated the opposite. And they insisted on forcing the masks on the kids.

Kyle Morgan

And how did your sons respond to the mask wearing?

Pierre Attallah

Well, my younger son experienced the worst. He was struggling to be heard, so he was constantly speaking louder than he normally would, which resulted in scarring to his vocal cords. And it led to a really hoarse tone of voice for him. He also developed scarring around his ears where the straps were. There was a day where it started to bleed, and he asked to call home, actually, from the school. And the school principal in the St. James-Assiniboia School Division at Valentine's School, she, the principal at the time, denied him the phone call home to talk to me. When he was trying to take his mask off, he was called into the office to be disciplined for that, and when he was in there, he asked to call home and speak to me, and the principal denied that request of him.

Kyle Morgan

Now you mentioned there was some injury to the vocal cords. How do you know there was an injury there?

Pierre Attallah

Well, he was getting speech pathology from the St. James-Assiniboia School Division speech pathologist. And I asked her if the chemicals in the mask were causing damage to his throat, and she corrected me. She said, "No, he's talking louder when he has the mask on, which is straining constantly for eight hours a day, straining his vocal cords." That was coming from the school's speech pathologist. She also, the school speech pathologist, also referred him to an ear, nose, and throat specialist to investigate it. So we went to the ENT specialist, and he confirmed that there was scarring to his vocal cords and damage to his voice.

Kyle Morgan

Now, did this specialist recommend anything?

Pierre Attallah

Well, I asked the specialist if he could get a mask exemption. Because if the speech pathologist is saying that the mask is causing him to talk louder and that's causing the scarring of his vocal cords, he should certainly be able to write an exemption, so that he could go back to speaking normally and have his condition get better. But he denied the request to give a mask exemption. He said that the boy has to talk quieter.

Kyle Morgan

Now your older son, I understand, might have experienced some effects also. Is that right?

Pierre Attallah

Yes. Because I was actively communicating with the principal of the school and the staff to not put the mask on them,

[00:05:00]

they were more actively watching my kids. And at lunchtime, the educational assistant who was in the room with my older son, she would watch him eat with her arms crossed and tell him to put his mask on constantly while he was eating. She would stare at him, cross her arms, tap her foot. And then, it led to him no longer eating because he was hungry. It changed his eating style. It was like a psychological abuse. At the end, when he did put the mask on, she would force him to say thank you.

Kyle Morgan

So did you try to speak to the school staff about these issues?

Pierre Attallah

Yes, when I found out that this was going on, I went to the school with a letter. It was a notice of liability. I also included an affidavit of my son's statement and a letter, again, asking them to stop forcing the masks on the kids. And the principal wouldn't allow me my

parental right to speak with the school staff. *The Public Schools Act* of Manitoba states that a parent has the right to speak to any school staff member in the school. And the principal would not let me show that letter to that EA [educational assistant]. She denied that.

Kyle Morgan

I believe you spoke to the Superintendent of the School Division. Is that right?

Pierre Attallah

I had, yes. I had a meeting later with the Superintendent of the Division, which is the highest paid employee of the Division. And he said that he was launching an external child abuse investigation. And that was a couple years ago, but I have not received any details of that investigation. I filed a FIPPA [*Freedom of Information and Protection of Privacy Act*] request to get more information about it. And the school division denied me, the father, access to any records of the investigation. I then contacted the Ombudsman to make a complaint about my FIPPA request, and the Ombudsman said it would take about a year to get to it. They weren't very interested in pursuing it. So I was experiencing several levels of governmental failure.

Kyle Morgan

Did you reach out to any other government officials at all?

Pierre Attallah

Yes. I wrote a letter to the Minister of Education because by this point, after the school had seen my written material and the notice of liability, they gave me a no trespass order, which prevented me from talking to anybody on the school property or even being able to pick up my son on school property. Which led to more humiliating and inhumane treatment by the school staff. I learned from my FIPPA request that they were told not to speak to me. So when I would show up at the school, if I said hi to a staff member, they would turn around, turn their back to me, and walk away without even saying hello. I wrote to the Minister of Education, and he didn't respond. That was Wayne Ewasko, Minister of Education.

Kyle Morgan

Did it ever cross your mind to take your children out of this school?

Pierre Attallah

Yes, that's an excellent question. My partner, their mother, wanted them in the school and was in favour of everything that was happening. And the school was favouring her testimony over my request.

Kyle Morgan

Now, just to get the timeline here. You said that you issued a notice of liability to the school staff. Do you know when that was?

Pierre Attallah

I gave them a couple, that would have been around December 2020, or 2021.

Kyle Morgan

Okay. And then they gave you a trespassing notice. When was that?

Pierre Attallah

That was shortly after I delivered the paperwork: the notice of liability and the affidavit and all the court documents that I had in the letter.

Kyle Morgan

You mentioned before that you were working as the lunch supervisor, is that right?

Pierre Attallah

Yes.

Kyle Morgan

And that was a paid position?

Pierre Attallah

It was a paid position, yes.

Kyle Morgan

And what happened with that employment?

[00:10:00]

Pierre Attallah

Well, the principal called me and was demanding my vaccination status. And I told her that my vaccination status was protected and private and confidential. At which point she wanted to end the conversation. And I asked her, "You said that you were going to explain testing procedures." But she didn't want to do that. She just had a bit of a chuckle in her voice and said that it was basically over.

Kyle Morgan

Do you have an opinion on vaccines, in general?

Pierre Attallah

Well, my father, back in 1955, he developed a vaccine for hay fever while he was getting his PhD in biochemistry at the University of [inaudible 00:10:54]. Back in 2002, when he was still alive, there was a SARS outbreak. And they talked a lot about all these policies that were implemented in COVID. They were all talked about in 2002. They weren't implemented back then. But I had a conversation with my father at that time. And I see him

as the expert. And I can tell you what he told me. He told me that he studied viruses like this in the past, and they come and they go, and they come quickly. And I said, "Dad, you made a vaccine. Can they make a vaccine for this?" And he said, "Well, it usually comes and goes too quickly. By the time you made a vaccine, it's already gone, so we don't make vaccines for coronaviruses."

Kyle Morgan

But you're somebody that isn't opposed to vaccines to begin with. Is that right?

Pierre Attallah

No, I've had all my vaccines my whole life and my kids prior to, they had received all. I was giving them vaccines as well.

Kyle Morgan

Can you describe any effects that your children might have to this day over the things that have happened?

Pierre Attallah

Yes. I mean, well, when they were not allowed to go to school, there was a major— I think, the age group of six-, seven-, eight-year-old children, as a whole, I mean, for my kids, I noticed it for my kids. But being taken out of the school system, it was very detrimental to their education. There was a major delay to their education as a result of that because it wasn't really possible to do the— The learning at home wasn't working. It was very infrequent, very short intervals of a video with a teacher. It just didn't make any sense.

Kyle Morgan

Looking back at everything that's happened, what do you think would have been better?

Pierre Attallah

Well, one of the things I noticed when the public officials, the politicians were speaking, they would always start their statements with "We believe," "We believe," and "We believe in science." And my dad taught me that there's no belief in science. Science needs to be understood, not believed.

Kyle Morgan

Are there any other effects that you've experienced, did you want to mention? Or I can open it up to the commissioners if they have any questions.

Pierre Attallah

I'll take questions from the commissioners.

Kyle Morgan

Okay. Did anyone have any questions? I think those are all the questions I had for you.

Commissioner Kaikkonen

Did the teachers at any point feel that they were bullying your children?

Pierre Attallah

Well, I can't speak to how they felt about doing it. But the school division seems to be hiring people that don't question that. I think if you're the kind of person that has a conscience, I think they limit it. Those people were pulled out of the system, and all that you are left with is these Marxist people that will do whatever they're told to do. Like in the instance of the EA who was told to target my son, I don't think—I'm not sure what their thought process is, but that's the type of people that they're putting in there.

I can also say that from the school system, I was completely disconnected from my children's education. I wasn't able to see the work they were doing. I wasn't able to speak to their teachers. And it escalated. It escalated. It was almost like gaslighting where they felt that the measures they took weren't strong enough. So after the trespass order came into effect, they said, "Well, now you can't speak to the schoolteachers." Later, it was, "Now you can't even email them." "Stop emailing them." "Don't say hi to them." It was complete escalation to the point where I was completely cut off.

And it affects, still today.

[00:15:00]

These things are still going on. And it affects my children's education and their ability to get the most out of their education. Because if I want to see some of their work that they worked on, it might take me two weeks of communication going through the principal just to get maybe an assignment that they worked on a few weeks ago. I don't agree with a lot of the things the school divisions are doing. They hold back all the student work for the entire year and give you an incomplete assignment bundle in June, on the last day, right before the teacher leaves, so you don't have a chance to ask questions. It's pretty ridiculous what's going on in the school system today. I applaud the people who are homeschooling. And that's my intention, is to move towards homeschooling for me and my kids.

Commissioner Kaikkonen

I was just also wondering about the schoolboard level. Have you checked out the policies? Because they receive public funds, so I'm just wondering how they could say that you're not allowed to have access to the school or to your children's records if they're accepting public funds.

Pierre Attallah

That's a very good question. In the no trespass letters, they do not provide a reason. It's completely arbitrary, which is a violation of the Charter of Rights. However, this school division, the St. James-Assiniboia School Division, their superintendent is the Chair of Mass.mb.ca, which stands for Manitoba Association of School Superintendents. They pledge their allegiance to global corporations, not to Canadians, not to Canadian citizenship. They call it global citizenship. Global citizenship does not include the *Canadian Charter of Rights [and] Freedoms*, Bill of Rights, any of that. It's a complete betrayal of being Canadian.

Commissioner Kaikkonen

Thank you.

Kyle Morgan

I don't know if there's any other questions. Thank you very much, Mr. Attallah, for your testimony.

Pierre Attallah

Thank you for having me.

[00:17:16]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 8: Tobias Tissen

Full Day 1 Timestamp: 08:57:40–09:16:26

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Kyle Morgan

The next witness is Tobias Tissen. Can you spell and state your full name, sir?

Tobias Tissen

My name is Tobias Tissen, T-O-B-I-A-S T-I-S-S-E-N.

Kyle Morgan

Do you promise to tell the truth, the whole truth, and nothing but the truth?

Tobias Tissen

I do.

Kyle Morgan

Can you tell us where you're from, sir?

Tobias Tissen

I currently live in the Steinbach area. And previously, I moved to Canada from Germany, back in 2006.

Kyle Morgan

And what type of work were you doing prior to the COVID outbreak, I guess in early 2020? Do you recall?

Tobias Tissen

Prior to that, I was actually attending to my father who was on home care. He had had heart failure, and he passed away in early of 2020, April. I was on government support to take care of him and that's actually the beginning of when all the lockdowns hit and really, really affected us.

Kyle Morgan

I understand you were preaching at a church congregation during the same time, is that right?

Tobias Tissen

That's right. I was preaching, still preaching, at the Church of God.

Kyle Morgan

Are you a pastor? Would you describe— Sure.

Commissioner Drysdale

You know, our largest viewers are on the internet right now, and with all of the clapping—and I understand the emotion—but with all of the clapping and interruption, it's making that very difficult. We want to really keep this thing going, and some of the witnesses are a little nervous. So I please ask you again to restrain yourselves. At the end, absolutely, give your appreciation of the witnesses. But let's cut that down in between, please. Thank you.

Kyle Morgan

I know a lot of people refer to you as a pastor. Do you consider yourself a pastor?

Tobias Tissen

I don't really consider myself a pastor. Although I do assist, I preach, and I help in the congregation.

Kyle Morgan

Now, what do you recall once the first restrictions were put into effect in 2020? What do you remember from that time?

Tobias Tissen

So it affected us because they started capping off limits of people being able to go to church, and it went down to 50 per cent. And after that, they reduced it to 25 per cent, 10 per cent. And after that, I believe 10 individuals. And I believe, maybe even down to five.

We're a very close-knit congregation of about 160 people, and we really need each other. And there's a reason why church people gather, why they have church multiple times a week. It's because church functions like a family, and the family is there for one another.

Another way it affected us is, like I mentioned already, my father passed in April of 2020. He passed at a young age. I am only 28. I was 25 at the time. He was 48. And we were not

able to have a funeral like we wanted to. It was right at the beginning, but it was already so far locked down that only 10 people were allowed to be inside buildings. And we were forced to pretty much have an outdoor parking lot funeral service.

When it came to the burial, human is human and people flock together. And by the time my father was buried, RCMP showed up and were wondering what was going on. Thankfully, I had friends that handled all that at the time; I didn't speak to the RCMP then. But it shows how inhumane this response was.

Kyle Morgan

I believe the RCMP attended a church service you were at. Or maybe that happened more than once. Is that right?

Tobias Tissen

Definitely more than once.

Kyle Morgan

Can you tell us about that?

Tobias Tissen

I can't recall how many times they were out there monitoring, service after service, counting how many people walked into the building from the road. One instance we had on November 29th of 2020 was—

[00:05:00]

Back at the time, it was illegal to have any indoor gatherings, as well as drive-in church services. And so, we were determined— And let me make this clear, we're not being rebellious for the sake of being rebellious. We're very peaceful, law-abiding citizens. I can speak for our church that we are. And so, we feel an obligation before God to fulfill scripture, and scripture tells us that we should not forsake the assembling of ourselves together. So we were determined to at least have a drive-in service and show the hypocrisy of the government because while we were forbidden to have our parking lot filled, the big-box stores had all their parking lots flooded.

So we were in for a shock that morning, though, because by the time I came to church— well over an hour before it was set to start—there was a tow truck on scene. And there was **police on scene. By the time it was 45 minutes prior to service, an RCMP cruiser had blocked the entrance way to our parking lot. And there was a lot of vehicles. Word had gotten around: people knew there was going to be a church here that was going to be open. And so, people pulled in, and there was no way to get onto the yard. The whole highway ended up being blocked up. And we brought out a pickup truck close to the end of the driveway there, and I delivered a bit of a sermon. We did some singing, peacefully, and we disbanded from there.**

At the same time, though, big-box stores were open; parking lots were filled. Same time, there was a car rally for the farmers of India, and people stayed in their car just like they stayed in their car at our parking lot. Nobody was fined there. Nobody was in trouble. But

the church and myself both received a fine for that instance. The church received a fine of \$5,000, and I received a fine of \$1,296.

Kyle Morgan

I believe you received a number of other tickets on other occasions. Is that right?

Tobias Tissen

Many. Many for simply being there for people. Just like we've heard other witness reports, there was a lot of loneliness, a lot of people having no one. And church was like their avenue of socializing, of getting together with somebody, and exchanging human needs, spiritual needs. And I had to be there.

Being a preacher is not a career. Being a pastor is not a career, although maybe it's viewed as such. But being a preacher is a calling, is something that someone feels responsible before God and that someone would do without pay. Pay is not what makes a pastor; it's their responsibility. I've got to help people's spiritual need.

Kyle Morgan

And I understand you were arrested also. Is that right, sir?

Tobias Tissen

That's right. I was arrested on October 18th of 2021. A warrant has been out prior to that for about six months, and I was literally hunted down. On the night of my arrest, my family and I were having a gathering at a park. My mother, who was living with us, had decided to move to Europe, and so it was her last evening, and we went out to have a little goodbye gathering. And someone saw me at the park, reported it, and as soon as I pulled off the park, there was several police cruisers that went and hauled me off.

Kyle Morgan

And how long were you in jail for?

Tobias Tissen

I was in jail for 45 hours—two nights—and it was a horrible experience. I've never had a run-in with the law before, never been to jail before. And I was placed in a cell facing away from the clock. I had no idea what time it was, basically ever.

[00:10:00]

For one night, I was in custody; the next day, I was moved to remand. And in there, I had to stay. I had half an hour within a 24-hour period to get out of my cell.

Kyle Morgan

And then you would have been released on bail with conditions, is that right?

Tobias Tissen

That's right, I was released on bail. I could have been released sooner, but I didn't agree to the conditions at the time because the conditions prohibited me from going to church. And I could not, I could not in conscience, in good conscience, sign that. And so, the lawyers worked for me to amend those conditions so that I was able to still go to church.

Kyle Morgan

Is it true that your children would have witnessed your arrest? Is that right?

Tobias Tissen

That's correct. My children are still traumatized. I have two boys and a little girl. The oldest is seven, the second is four, the baby is 10 months. My wife was actually just a few weeks pregnant when I was arrested. And my boys witnessed not just the arrest but multiple times of officers coming to our door. Not just one officer, but two, three, sometimes five coming and handing tickets. To this day, like we live in Steinbach, when I talk of going to Winnipeg, they're like, "I wanna stay home." It'll be something that at their young age, they won't ever forget. The night of my arrest, the whole congregation went out to the police station, and they were singing and walking around the building. I have a little picture of my two little boys peering into the station, hoping to catch a glimpse of me. And it's, it's heart wrenching.

Kyle Morgan

We know that there's been a lot of controversy and division in a lot of areas over what's happened. Was there any division in your church or that you experienced?

Tobias Tissen

There was none. We're a family. Everyone had my back. I'm part of the most amazing church. And not just in Steinbach, we're a global church. Worldwide, messages were pouring into my family of support and prayers.

Kyle Morgan

Within the wider community, did you experience a lot of support?

Tobias Tissen

There was a lot of friends, absolutely. But there was also a lot of hate going on. It is something that I feel was part of the government's tactic to put something out there to divide humanity. The saying goes "divide and conquer," and that was their motive.

Kyle Morgan

Do you remember if there was much transmission of COVID in your church congregation, COVID-19?

Tobias Tissen

Probably someone had it. But we're all old enough to know to stay home when we're sick. And when someone felt ill, they stayed home. We had, not that I know of any outbreaks, no COVID deaths, no reactions, and everyone is still there.

Kyle Morgan

Were there any other effects on the people of your church congregation? Did any of the government restrictions affect your congregation in any way?

Tobias Tissen

Absolutely. When the restrictions came in, in the beginning, we were like, "What is this? This is so new." We didn't know exactly what this was, so we stayed home for a bit. And then we went to drive-in. And pretty soon, we found out it's not the same. People were struggling spiritually that needed support and couldn't get the support as freely. So we felt like, rather have the fines, rather have all that, but we've got to be there for each other.

Kyle Morgan

Was there also a school associated to your church? Was that affected in any way?

Tobias Tissen

We have a private school, and every year we have a graduation ceremony, a little bit of a presentation and a school picnic. And of course, those years when those gatherings were limited, we couldn't, which was really sad for the children,

[00:15:00]

really, the whole congregation because it was a fun day for everybody to get together.

Kyle Morgan

I'll ask you one last question that I've asked all the witnesses: What do you think should have been done differently in the government's response to COVID-19? Does anything come to mind?

Tobias Tissen

There should have been more of a feeling out of, "How are people handling this," instead of a crackdown of a "dictative" approach. There should have been a— "How are you treating this?" I mean, if they have the resources to send all those officers to one little church, why not come out and see: "How are you all doing? What are you doing about this? Are you protecting yourself? Are the sick ones staying home?" And allow us to use our common sense.

Kyle Morgan

I think those are all the questions I have. I don't know if the commissioners have any questions for you. Let's go ahead, Dr. Bernard.

Commissioner Massie

Yeah, I'm wondering if the oppression or the restriction that was put on the practice of religion is not triggering some sort of questioning from people that were not particularly inclined to do religious practice, to wonder whether this shouldn't be something they might consider in the future. A sort of, why is it that this was targeted as something that needed to be crushed?

Tobias Tissen

Definitely. Well, there were a number of people that came out to church that normally wouldn't have. And I'm sure the question was raised in many people, how come big-box stores stayed open? How come liquor stores stayed open? But why was the target on the church? And I believe many were awakened.

Kyle Morgan

Any other questions? Go ahead, Janice?

Commissioner Kaikkonen

I actually have a lot of questions, but I don't think we have time. I'm just wondering, when you went to court, did you have an opportunity to ask about the discrepancy between the box stores and the churches being open or closed?

Tobias Tissen

By the time we got to court, they took our rights to use the Charter, based on a previous court ruling that the Justice Centre [JCCF] with several churches challenged the Province. And all of those concerns were raised by those lawyers—I was a part of that lawsuit—and the Chief Justice Joyal found that our Charter of Rights were not violated.

Commissioner Kaikkonen

Thank you.

Kyle Morgan

No more questions? Okay. Thank you very much, Tobias.

Tobias Tissen

Thank you, sir.

[00:18:46]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 9: Michael Welch

Full Day 1 Timestamp: 09:16:32–09:45:44

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Shawn Buckley

So, Michael, can you take the stand? Our next witness is Michael Welch.

Michael, I thank you, you've been waiting patiently all day. I'll ask if you can state your full name for the record, spelling your first and last name, please.

Michael Welch

Michael Welch, M-I-C-H-A-E-L W-E-L-C-H

Shawn Buckley

Michael, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Michael Welch

I do.

Shawn Buckley

Now you have been a radio journalist for 15 years.

Michael Welch

Yes.

Shawn Buckley

And my understanding is that you have your own show, and it's called "The Global Research News Hour."

Michael Welch

Yes. That's correct.

Shawn Buckley

Can you tell us just a little bit about the types of things that that show would typically cover? Let's not go into COVID. But pre-COVID, how would you describe the show and what types of topics would you be covering?

Michael Welch

Well, the show ultimately was kind of a merger: a merger attempt between an academic website, the Centre for Research on Globalization, or globalresearch.ca, and the network. Because my show, or rather, the radio station, which is a campus community radio station, so there's a bit of a difference there from the mainstream media. We tend to feature topics and investigations that tend to elude the mainstream media. We'll get into all sorts of subjects: focusing on a lot of the questions around 9-11, for example; focusing on a lot of the issues surrounding where the terrorists come from; where there's, for example, the claim that Russia had somehow influenced Trump and maybe helped him win the election. I mean, I'm not necessarily saying Trump is good or bad. But there are some questions there that didn't get asked. So all of these sorts of questions, typically following foreign policy or economics, financing. These are subjects that we cover, and we pretty much span the spectrum from the left to the right.

Shawn Buckley

Right. So your show would be covering things that the mainstream media wouldn't be digging into, and pre-COVID could be considered kind of, you're chasing leads that could be going against the mainstream narrative even.

Michael Welch

Pretty much. Yeah. That's what it says right at the outset. We investigate claims that are not addressed in mainstream media.

Shawn Buckley

And pre-COVID, my understanding is this wasn't a local show, and it's still not. But basically, your show is syndicated so that it's carried on a number of different radio stations across Canada and maybe even outside of Canada.

Michael Welch

Initially, it was just the station. But we expanded, okay, and we got other stations across the country. I think at its max, it was maybe 15 across Canada and a few stations in the United States.

Shawn Buckley

Right, so pre-COVID, your show is becoming more popular and more popular and more popular.

Michael Welch

Yes, that's correct. As far as I can say.

Shawn Buckley

Okay. So now, when COVID hit, am I correct? You didn't change your approach. You still would then be looking at issues that the mainstream media was ignoring. But there were questions that needed to be asked and looked into.

Michael Welch

Yes. With regard to COVID, I started publishing that sort of skeptical slant. Okay, let's take another look at, maybe, something like taking a second look at COVID, and I did a series of stories starting in September of 2020.

Shawn Buckley

Okay. Can you share with us some of the guests that you had on your show?

Michael Welch

Sure. I think my first guest, with regard to COVID, you mean?

Shawn Buckley

Yes.

Michael Welch

My first guest was Sucharit Bhakdi who is a very critically acclaimed doctor in Germany. He was, you know, published hundreds of articles. He was on a very prestigious board.

[00:05:00]

But he was saying these things about— At that time, I mean, he couldn't say too much about the vaccine. But even so, what he was saying was that COVID is not as deadly as everybody's being led to believe. And then, there were quotes of the statistics to back him up. I mean, maybe for the very elderly, there's a little bit of a gap there. But you couldn't quite justify, at that time, that this is something that should be, you know, pursued as something and then have all this social distancing and everything else.

And we also had, who else? I had Mark Crispin Miller, who's not a doctor, but he's a media person specializing in propaganda. And I guess you could probably tell a separate story. But he was also saying, "Well, what is this, all this stuff that's coming out? It appears like propaganda." I had Meryl Nass; I had Jane Orient, who was the head of the American Association of Physicians and Surgeons. Peter McCullough came. You know him.

Shawn Buckley

Yeah, and some difficulty arose after Dr. Peter McCullough was on your show. Am I right about that?

Michael Welch

Well, I had decided that I wanted to arrange a debate between the official story of COVID, with expertise in talking about it, and one of these, call them dissident doctors. So we'll put one against the other and see what falls out. But I realized that the person who would be having the more mainstream take, he just said, "Well, I think you should reconsider this Dr. McCullough. I mean, he's being sued in the United States." And then he basically— I was saying a debate. He was thinking, debating Trump, if you know what I mean, somebody who's going to interject. I mean, Peter McCullough is not going to be an unusual figure. He's not Trump-like, exactly. But I had to phone back Peter McCullough, and say, "Gee, sorry, I can't get you on because I can't get a debate."

I tried other people as well. And they were even worse saying, "Well, this guy is just, you know, it's Flat Earth Society." And Peter McCullough, given his credentials, I mean, pre-COVID, before he started giving his own testimony, he would be considered a really serious expert. But as soon as you step out of line in terms of COVID, you're smeared.

Shawn Buckley

Now can I have you clarify so that everyone understands what you mean when you say, "as soon as you step out of line on COVID."

Michael Welch

What I mean is that if you don't repeat the main messages of the World Health Organization, the CDC, and all the governments that are in charge, you're not credible. I imagine that would happen with Sucharit Bhakdi as well. It doesn't matter, apparently. I mean, it's so easy just to lose credibility. All you have to do is go against the mainstream narrative.

Shawn Buckley

And you had your own experience. So is it fair to say that in the 11 years before COVID hit and you're running this show and more and more stations are picking it up that really you had never had a serious listener complaint.

Michael Welch

I've never, I don't know. I mean, I suppose somebody might have complained, and they didn't tell me. But as far as I know, I not only was without complaints, I had a fair number of awards both within the station and nationally for my work. I was well respected as the news director for a few years. I think I was fairly well respected by our audiences.

Shawn Buckley

Right.

[00:10:00]

Now, can you tell us how that changed with you're running COVID shows and you're basically addressing issues like, "Is the vaccine safe and effective?" That's when it really changed for you, isn't it?

Michael Welch

It seems so. I found myself getting a lot of complaints. I don't know how many. But yeah, like staff told me I was getting complaints. I just talked to a colleague once, I just met out in a marketplace or something, and then he was— Good, friendly guy and everything. But he said a lot of his friends are saying that this guy's show is just not— It's pretty bad. Essentially, it seemed as if my show was going from one of the best shows on CKUW to one of the worst.

Shawn Buckley

Okay. And I just want to make sure I understand. So you'd basically had 11 years really of positive comments. You'd won awards; the show was growing.

Michael Welch

Yeah.

Shawn Buckley

And you hadn't changed the type of news reporting you were doing. You were always doing that digging that the mainstream wasn't doing. But now it's on things like the COVID vaccine.

Michael Welch

Yeah. I mean, I can only think, and I don't know if I'm stepping out of line by speculating here. But I think the people who were listening, like everybody, I suppose, they were so terrified by COVID and then seeing all the deaths in Italy and then there's all this monitoring of the hospitals and so many people are dying that they're scared. And then, here comes somebody, the authorities laying down directions: this is the way we move forward. And people say, okay, okay, okay. So when somebody comes out and actually tries to contradict that, I guess, you're going to see them as like the most malevolent form of life ever known, you know?

Shawn Buckley

Right. I'll ask our AV person, David. I've got an exhibit up on the computer. Can you show that? So my understanding is this is a news article from the *Vancouver Sun*, dated March 13th, 2021, and the headline, "COVID-19: Radio station at SFU temporarily suspends program linked to website with pandemic conspiracy theories." This is about your show, right?

Michael Welch

Yes, it is. And just to correct it, it's not the [ranked] *Vancouver Sun*, it's the *Vancouver Province* [sic] [*Vancouver Sun*].

Shawn Buckley

Okay. And then I'm going to scroll down a little bit.

So the first paragraph here, “as health officials battle the spread of pandemic misinformation.” And, so, you’re basically being branded as spreading misinformation for having guests on like Dr. Peter McCullough.

Michael Welch

True. Essentially, yeah, that’s it.

Shawn Buckley

Okay. And so what happened with your show and this radio station?

Michael Welch

Well, like after this came out?

Shawn Buckley

Yes, after this came out.

Michael Welch

Well, like it said, they suspended the show. I had written them a letter to sort of help them with the process and decide, like while they were trying to figure it out, I’d send them the basics: it’s based on solid science; this is what it’s all about. Michel Chossudovsky had put out— There was a bit of a glib about a CBC article that was dissing his thing, and I tried to correct that in case there were any doubts. And the astonishing thing is I hadn’t heard anything back.

Shawn Buckley

So, David, can you pull up the exhibit, computer again? My understanding is this is your letter.

Michael Welch

That’s right.

Shawn Buckley

And we will enter it, it’s already entered as an Exhibit, it’s WI-6. And the news story is **Exhibit WI-6a so that people watching and the commissioners will be able to see it. But I just want to scroll down to something you said that—**

I think it was your third point. Oh, nope, nope, just wait. Yeah, so the first full paragraph on this page if you don’t mind, I’ll read it. Because I think,

[00:15:00]

what it reminded me of is that saying, “First they came for the Jews, and I didn’t stand up. And then they came for the Christians and,” et cetera, “and then when they came for me, there was no one left to help.”

But my understanding is you got no reply from this letter. But I just want to read so that people who can't see it clearly understand one of your points.

And you say:

But ultimately what I would like you to carefully consider that you are being targeted by forces who will take down voices based on smears appearing in the media, such as allegations Global Research is a part of a Kremlin operation (?) And if you do take down Global Research News Hour because of its association with Global Research, who will be next? Will Canadian Dimension Radio or Canadian Foreign Policy Radio, or any other successful media running effective anti-NATO content be next? Consider that the long haul of this enterprise places the station on a track that ultimately requires them to fully conform to the direction of the mainstream in terms of meaningful conversations.

And can you explain for us what you're saying there? What your concern is? Because I think you're saying something very important about censorship and conforming.

Michael Welch

We talk about freedom of speech. To be clear, what we're talking about is to be free to have freedom of dissenting speech: I am free to say something that you don't like; you are free to say something that I don't like. What we're talking about here is efforts to distract from that or to get around that by simply saying, "It's misinformation, it's disinformation and, therefore, we should get rid of it."

There are too many examples of information—I mean, there's stuff that they say is disinformation or misinformation. But it's pretty clear that dissenting views, they should be heard, get out in the open, and then let's debate it out in the open. It's simply not acceptable to have one group of scientists talking about COVID and vaccinate, lockdowns, and social distancing, and all that, and the other people are absent. As we mentioned before, they don't appear. And there are legions of these doctors out there, and I made a point of trying to talk to them to get the other side. We're going down that road of freedom of speech, and we can't let that fable of disinformation—of anything that goes against the government narrative—prevail. It's got to get out in the open. And that's fundamentally what I have to say and what I'm trying to demonstrate as a part of my job in my role as a journalist.

Shawn Buckley

Right. And had you ever experienced this type of thing before where there was pressure on you to conform with a government narrative on any topic in your career as a journalist?

Michael Welch

Like I said at the outset, one of the reasons I came to the radio station in the first place is because this is a place where I can ask these questions, and I'm wide open to go wherever I like, as long as it's carefully measured. So no, I didn't. Now, it's different. And I don't know where this is headed. Hopefully, it can be stopped, perhaps through an inquiry like this one. But I don't know.

Shawn Buckley

And just so that things are clear, this station did drop your show.

Michael Welch

Well, they said it would be withdrawn temporarily, and that was two years ago. So it looks like it was a permanent.

Shawn Buckley

Right. So CJSF in Vancouver has dropped you for two years now.

Michael Welch

Yes.

Shawn Buckley

And some other stations have dropped you, also.

[00:20:00]

Michael Welch

Yes.

Shawn Buckley

And then for the first time, the Board of your local station on this issue, basically, made it clear to you that you have to be careful.

Michael Welch

I heard from, I think, it was the Chair of our Board. I mean, I met her outside, and we were just having a conversation. But then at the same time, the conversation got kind of serious. And she looked me in the eye and said, "We've got to be keeping with the government narrative. All the doctors are saying that, all across the board." And she's trying to say, "So you're going to align with these policies, aren't you?" And I basically said, "No." But I mean, yeah, that's definitely something that's pretty sharp on our mind.

Shawn Buckley

So if there was one thing that you would like to see happen in the area of journalism going forward, what would you like that to be? Where do you think we've gotten off the rails where journalists like you are being basically pressured to follow the government narrative?

Michael Welch

Are you talking just in my journalism or journalism broadly?

Shawn Buckley

However, you'd want to answer that. You're an expert in the field; you've been a journalist for the last 15 years. So I'm really just asking for your insight, whether it's locally or do you think nationally, however you'd like to answer.

Michael Welch

I think that we have to be more open to other ideas, like I have been. I think we have to listen; we have to, in particular, we really, really have to be in touch with community members. Because I am a community broadcaster, and I think that local people should really take precedence, and we should listen to them. Like we've listened to a lot of fine people—I've listened to a lot of fine people today, and I think I have a colleague who's already collecting information for people to interview.

I remember talking to someone who had been vaccine injured. And she said that when she talked to a mainstream media person about— Is she going to get her story published? She ended up, he or she, I guess, ended up saying, "Well I can't because if I do, I'm going to lose my job." I haven't confirmed that. But I'm just reporting what that person says. Me, I don't think we should be fired for trying to do our job and reporting from actual people.

Shawn Buckley

Thank you. I don't have any further questions for you, Mr. Welch. I'll ask if the commissioners do. So the commissioners don't. Mr. Welch, on behalf of the National Citizens Inquiry, I sincerely— Oh, I'm sorry, I misspoke. One of the commissioners does have a question for you.

Commissioner Kaikkonen

Thank you for your testimony. Do you know if the media that condemned you in Vancouver takes funds from the federal government right now as part of the federal government's initiative to prop up media financially?

Michael Welch

Are you talking about the Vancouver *Province* [sic] [*Vancouver Sun*]? 

Commissioner Kaikkonen

Yes.

Michael Welch

Oh, yeah. I haven't really looked into it to tell you the truth. It's quite possible because a lot of them are. But I don't know. I mean, the way it started in my view is that it started with an individual. The whole CJSF saga began with one individual attacking the station and talking to the program director and trying to get her to take that awful "Global Research" show off the air. And I think she even threatened to find a way of condemning him if they don't.

[00:25:00]

And so she went to this reporter, and then the reporter took interest and that's all. But, yeah, to answer you, I honestly can't say.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

But in a way, and sorry, we have another commissioner question. But I just wanted to interject. In a way it's interesting. So here we have one media station, or *The Province* [sic] [*Vancouver Sun*], so a media outlet, basically complaining about another media outlet reporting. Like, when we all think about that, that in itself is interesting. Do you see what I'm saying?

I mean that would be like your radio station, your show, complaining about what some other media outlet is doing in order to create pressure for that other media outlet to drop a story or position. I mean, that's an unusual take in the absence of fraud or corruption, is it not?

Michael Welch

Yeah, I personally wasn't fond of it. I guess it's a bit of a conflict of interest. You know, it's not the way I want to be introduced to the people of Vancouver. But yeah, it's unusual to see radio stations going against each other that way.

Shawn Buckley

And I'm sorry Commissioner Massie, I jumped in.

Commissioner Massie

I was going to ask you: How do you see the future of this type of journalism in Canada or in other countries in the environment we're in right now? Because I'm not seeing a lot of news stations that are able to openly go counter-narrative and make a decent living out of it. Do you see that people will ask for it, eventually, and it will actually come back? Or is it going to be suppressed, like it is right now?

Michael Welch

I hate to be negative. But it doesn't look too good. I know that the campus community radio network, like it's the network of stations that arrange things. And even though we are charged with the responsibility to dig deep and find a different view of things, collectively, we seem to have marched pretty much in line. And so even myself and a few others who are countering the narrative, even in this network, it's more the minority than the majority. I find that things, so far, are not working in our favour. And even in internet media, there's these increasing tentacles of conforming to standard narratives. It's something that I had not thought would be possible five years ago.

Commissioner Massie

Thank you.

Shawn Buckley

Mr. Welch, I think that's it for questions. And again, on behalf of the National Citizens Inquiry, we sincerely thank you for your testimony and sharing with us today.

Michael Welch

Okay. Thank you very much.

[00:29:12]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 10: Michael Vogiatzakis (Part I)

Full Day 1 Timestamp: 09:47:03–10:05:50

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

PART I

[00:00:00]

Wayne Lenhardt

Mike, could you give us your full name and tell us where you live, and then I'll do the oath with you.

Michael Vogiatzakis

Michael Vogiatzakis. I live in St. Andrews, Manitoba.

Wayne Lenhardt

Okay, and you own a funeral home?

Michael Vogiatzakis

I'm general manager of Voyage Funeral Home

Wayne Lenhardt

Okay. And do you promise to tell the truth, the whole truth, and nothing but the truth?

Michael Vogiatzakis

I do.

Wayne Lenhardt

Pick your own starting date, Mike, and tell us what you noticed that was different during the COVID epidemic relating to what you were seeing at your funeral home.

Michael Vogiatzakis

I think it all starts when COVID started and the government put so much fear into us that even myself was afraid and thought I'd never see my family again because I thought I was going to die. I thought, geez, we're the guys who are going to be touching these bodies that are dangerous and that have COVID and the blood is infected. Am I going to see my family again? Every time we went to a care home, we were frightened. We had staff meetings talking about this and offering staff to maybe not come to work if they didn't want because of what we were going to be facing. The fear was so real that it scared us.

I remember my mom— When they said you couldn't go see your parents and you couldn't be with family. My dad had passed away a few years earlier. When I went to my mom's house, I sat across the table from her, and I said, "Mom, don't come near me. I don't want to get you sick. Please, mom, stay on that side of the table." And she goes, "Oh, don't be silly. Give me a hug." I go, "Mom, I can't hug you, stay on that side of the table!"

And then reality kicked in one day when I went into a care home. A friend that I grew up with since I was a little boy, his dad came to the funeral home and said, "Mike, I have stage 4 cancer. I'm going to die. My last wish is for you to come to this care home and take me into your care once I die." He goes, "You promise me you'll do that." I said, "Yes, sir." It was three months into COVID, and I got a call from the care home, and this gentleman passed away. So I made my way up to the care home.

As I was proceeding to take him off the hospital bed, it was just me and a nurse alone in a room. I looked at this nurse, and I said, "Do you mind me asking how this person died? I'm just curious." And she said, "Oh, he died of COVID." I said, "Yeah, but this is a palliative care ward. This is comfort care. Aren't people here just for comfort care? Aren't the people in here, everyone on this floor, don't they have cancer?" And she said, "Yes." And I said, "Can I ask you a question?" I said, "What does the death certificate say?" She says, "It says COVID." And I banged my hand on the table and I said to her, "Listen, I want the truth. This is my friend's dad, and I want to know how he died." She said, "I don't want to lose my job. I don't want to lose my job. He died of cancer." Of course, he died of cancer. And I said to her, "You have five minutes to change this death certificate to the proper cause of death, otherwise, I'm going to turn on my phone. I'm going to go on Facebook live, and I'm going to make a mess out of this." Five minutes later, this nurse came back with a new death certificate that said that this gentleman died of cancer.

My fear of getting sick and dying, instantly, went away. I knew there was something wrong and I knew that I was not in danger. And I was in every COVID room that you could imagine. Double COVID, double mask. You can't do this. You can't do that. That puts a lot of fear into a person. From that day on, I walked into care homes with confidence. At times, I didn't wear a mask because when you're removing somebody from a bed, you don't want things poking in your eyes. You want to be able to see what you're doing. You want to be comfortable with what you're doing. So that day changed my life as a funeral director, and it changed the staff's perspective on things.

During these two years of COVID, I want to go behind closed doors: behind closed doors where families weren't allowed, where I was able to look at your families in the eyes and see the fear that they were going through, the confusion. A lot of these families were lost and they were scared. It puts tears in my eyes when I talk about this because it is real. What the government did is real, and it hurt a lot of families, and it hurt a lot of people. And it killed a lot of people. People died alone, and nobody should ever die alone. Nobody should ever be alone at the end of life. To hold your dad's hand or to say, "I love you" or just for your loved ones to know that you're at the corner of that bed means everything in the

world. But no, they took our rights away as human beings to say goodbye. They took our rights away as parents to be there for our children.

[00:05:00]

They took our right away to go into a hospital and say goodbye.

It reminds me of a story of a lady that was in the hospital, and she could hear her mom calling her clearly. And as her mom was calling her, the hospital called security and escorted this lady out of the hospital. On the two-way radio, she heard that somebody had passed away, and she looked at the security, and said, "Was that my mom's room?" It was her mom's room. They took her right away to say goodbye to her mom on her death bed. And how's that right? How's that right for us as human beings to put up with that? How's that right for a government that we voted in to do this to their people, to straight out lie to us?

I want to just take you behind the scenes. I want to share some stories with you: stories that are going to touch your heart; stories that caused division and hate and anger and split a world in two, instantly, just like that. It breaks your heart to be able to go into these rooms and to see the hurt in people's eyes, to see the fear in their eyes, to know that they're going to die alone.

I'm going to share a story with you about a care home that I went into. As I went into this care home to take this lady into my care, I was about to put her onto our stretcher. In the bed beside her, there was an older gentleman. He looked at me and he said, "Please take me with you, please; they're going to kill me, please take me with you." I looked at him and I didn't know if he was mentally sound or if he was just being delusional. Then he looked at me and he said, "There's a glass of water just over there." He goes, "Pass me that glass of water; I just want a sip of water." And I said, "Sir, I can't give you that water." I didn't know if he had congestive heart failure. I didn't know if something was wrong with him, and I didn't give him that water. I put this lady into my stretcher, and I started to take her out of the room. He looked at me and said, "My kids hate me. My kids haven't been here for me. What did I do wrong? Why are my kids treating me like this?" And I said, "Sir, this is not your kids. It's the regulations that the government's put forth. Your kids can't come and see you because they're not allowed to come and see you." And this gentleman started crying, and my heart was truly broken for him. It reminded me of my dad, laying there helpless, nobody to help him, nobody to talk to.

Our older generation was locked in homemade prisons—homemade prisons, locked in their rooms, three or four people. As funeral directors, when we go to a room and we take somebody from that bed, we clearly see if a person was changed, if a person was taken care of, if there was bed sores. And we saw all of that and more. At times, I had to call people to take the catheter out because that's not my job. What they did to people was disgusting. These older people worked so hard to build this country for us. They left their countries to come to Canada because Canada was a land of opportunity. Canada was a place where you could raise a family. Canada was a place where you could have freedom. Bang. In a fast second, they took the freedom away.

This gentleman, as he was crying, he said to me, "Can you say a prayer for me? Can you please say a prayer for me?" I didn't know this gentleman. It's really not our job to talk to other people in the hospitals. Our job is to go in and take the person out who passed away. I went over to that gentleman. I held his hand and I said a prayer for him. He cried the whole time and he said, "Don't leave me here alone. They're going to kill me."

I had to leave for the funeral home. As I left the room, you walk down this hallway where all these eyes are just staring at you. These poor people who were in hallways in wheelchairs were waiting for their turn. Waiting for their turn to die. These are your parents, your loved ones, that nobody had a chance to see what was going on behind those doors other than funeral directors and doctors.

Let me tell you, the screaming and the noise and the beepers. There's nights I can't sleep at night. There's nights I wonder what's wrong with my head because I hear these noises. And I see these people's eyes, and I see their tears and I feel them. I go home many times and I hug my son, and I say, "Buddy, dad loves you." "Dad, don't hug me. What are you doing? Are you crazy?" But he doesn't know what you've went through that day and the pain that you felt and the pain that you saw in other human beings.

When I got to the funeral home with this lady, it wasn't even an hour later, I got another call from this personal care home. The gentleman that I prayed for, the gentleman that he begged me to take him with me, he passed away. So I took this gentleman into my care next, and my heart was broken. I'm a man, and I cried for this gentleman all the way back to the funeral home.

[00:10:00]

I told his story to his family, and the kids were heartbroken. Is that something you can get over, to hear that? To know that your family member died alone, that there was nobody there to help him, that there was really nobody to care because the care homes and the hospitals were overstaffed? Confusion—

Wayne Lenhardt

Mike, did they change any of the regulations relating to how you ran your funeral home? Did that impact the families?

Michael Vogiatzakis

Absolutely. I mean, everyone has a right to have a funeral service. Everyone has a right to say goodbye. Everyone has a right to have closure and healing in their hearts. And they took that away from us. They took your right away to say goodbye to a loved one. The only thing that gives you closure sometimes is to attend a funeral service, to be comforted with friends, to hear a pastor say those comforting words that you need to hear to heal your broken hearts. They took that away from us in a fast second.

They suggested that we should cremate people, and there should be no viewings. We did the opposite because we stood up for the people of Manitoba and Winnipeg. When somebody said they wanted to see their loved one, we 100 per cent allowed them to see their loved one. And nobody got sick. We embalmed people and we didn't get sick. We had our hands in people's bodies, because that's what happens during embalming a lot of times, and we didn't get sick. We were breathing in the fumes. And a lot of times when you're in these rooms, you don't want to wear masks because you don't want to poke yourself with something.

They changed the way funeral service ran. They changed the way funerals were held. You would go to a church service with a casket where you need six pallbearers. But the limit is five. How do you carry a casket? These poor families had to carry a casket of their moms and dads by themselves, five people. I broke the rules finally and I said, "Enough of this.

Enough of this. We're going to hire your pallbearers at the funeral, and they're going to work for us that day." The inspectors didn't like it, but that's just the way it was. Because families suffered enough, and we weren't going to tolerate this anymore. Somebody had to stand up and make a difference for these families. And that somebody just happened to be me.

We had an outbreak of suicides like we've never seen before. Suicides that would break your heart. The families come in. Not only are they dealing with a suicide, but they're dealing with vaxxed and unvaxxed and all this silly nonsense and tossing people out of the arrangement office because they weren't vaccinated and they didn't have a right to be there. Well, little did they know that their funeral director was unvaccinated too.

It was a game that they were playing with our minds. It was a game that they were winning because of fear. You throw a little fear in the air. You throw a little anger in the air, a little confusion in the air. Bang, you got everyone. Would it happen again? In a fast second, because people are weak and fear overrides everything. All they have to do is tell you you're going to die. Nobody wants to die.

Wayne Lenhardt

Did you see any difference in the mortality statistics, the kinds of deaths you were seeing and numbers?

Michael Vogiatzakis

Sir, I can honestly tell you that our funeral home went out and bought extra equipment. There was so much hype that there was going to be so many deaths. We bought extra stretchers. We bought extra tables. We bought extra shrouds. We did everything we had to do to prepare for this overwhelming amount of death that was going to happen. And I can tell you that never happened. The death rate was exactly the same. As a matter of fact, the death rate was probably lower. But the suicides and the drug overdoses rose that death rate to be even as it was other years.

The one year, our funeral home lost a whole whack of money. When do funeral homes lose money? They don't. You weren't allowed to have services. You weren't allowed to do this. You weren't allowed to do that. Families changed the way they did things.

So many families are in pain right now. So many families are suffering mental illness. When you're suffering mental illness, you can't even get help. I talk to a lot of people. A lot of families call me and say, "Could you talk to my son? He's thinking of committing suicide." I've taken these kids, personally myself, to the hospitals, and they're simply turned away. **No help. And one of them did commit suicide. One of them committed suicide after I did my best to help my friend's son. But there was nothing I could do.**

Wayne Lenhardt

Is that unusual in your business?

Michael Vogiatzakis

Suicides have been here since the beginning of time. But not at this rate. And they continue. Drug overdoses, we've never seen at this rate. I can tell you right now that if you lost a loved one during COVID of a drug overdose or a suicide, there was a six- to eight-week hold

because they're going to do an autopsy. Imagine that: you've lost your loved one; you're suffering this pain; now you've got to wait six to eight more weeks, in your mind, picturing that your loved one is sitting on some cold table somewhere. It was heartbreaking to see for families.

I want to share a story with you about suicide. A heartbreaking story that makes me cry every time I think about it.

[00:15:00]

Christmas will never be the same for me because of this story. There was a gentleman who was non-vaccinated, and he was going through school to be a professional. He wasn't vaccinated; he refused to get vaccinated. And that was his right. It was his right not to get vaccinated. But in turn, he lost all his friends because his friends wouldn't hang out with him anymore because he was going to make his friends sick. He lost his job because he wouldn't get vaccinated. He got behind in his rent, in his apartment. It was close to Christmas when he was at his house, depressed, lonely, and hurt when the phone rang. And how I know this, I read the suicide note.

The phone rang, and it was his parents. He was so happy to see that his parents were going to call him, somebody that loved him, somebody that cared about him. And his parents said, "We have some bad news for you. We don't want to hurt you, but you can't come over for Christmas this year because we don't want you to get us sick and we don't want to die. So it's best if you stay home this Christmas." This man told his father and mother that he loved them unconditionally and he understood. But deep down in his heart, they put a huge sword. You know how they say, "The tongue is sharper than the sword."

After he hung up with the phone, he wrote his suicide note and he took his life. I could tell you a few weeks later, just before Christmas, that family was at the funeral home crying over his casket instead of having him home for Christmas. These words the dad said are stuck in my head forever. "If I can only turn back time. If I can only turn back time." And I said to him, "Sir, you can't. What was said was said and what was done was done. We just need to move on."

Wayne Lenhardt

We talked outside about what you were seeing when you were preparing the bodies. We talked about blood clots that you were seeing. Can you tell us a bit about that and was that unusual?

Michael Vogiatzakis

So blood clots are part of life. When a person dies of a stroke or dies of a heart attack, they had a blood clot. So blood clots have been here forever. Have blood clots been here like the way we're seeing them now? Absolutely not. I have one of my funeral directors here, and mortician, and it would be great to get him to come up here and tell you what he's pulling out of bodies. He's our main mortician. He's the one who does the majority of the embalming for the funeral home, and you should hear his story because it needs to be heard.

Wayne Lenhardt

Well, maybe I'll put it to the commissioners right now. If you have any questions and if you're interested in exploring that phenomenon of the blood clots, we'd be happy to bring Mr. Mike's associate that works with him, who apparently is quite knowledgeable on this.

It's getting late, but is that your wish, Commissioners? Okay. Are there any questions of Mike at the moment, and then I'll let his colleague come up and talk just on the blood clots for three or four minutes. Any questions from Commissioners for this witness?

Okay, thank you very much, Mike.

We'll bring Mike McIver.

[00:18:47]

[Michael Vogiatzakis' testimony (Part II) continues on Winnipeg Day 3, Witness 11, Full Day 3 Timestamp: 08:25:10-08:30:48.]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 1

April 13, 2023

EVIDENCE

Witness 11: Michael MacIver

Full Day 1 Timestamp: 10:06:15–10:16:03

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Wayne Lenhardt

Could you give us your name, spell it for us please, and then I'll do the oath with you.

Michael MacIver

Michael McIver, M-I-C-H-A-E-L M-A-C-I-V-E-R.

Wayne Lenhardt

You live in Winnipeg?

Michael MacIver

I currently live in Winnipeg. Yes.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during this testimony?

Michael MacIver

I do.

Wayne Lenhardt

Could you tell us about your experience with these blood clots that apparently were unusual that you guys were seeing.

Michael MacIver

Well, I've been a funeral director for over 40 years and embalmed thousands of bodies. And basically, there's two types of clots. There's an ante-mortem clot, which is a white fibrous clot that occurs prior to death. And then there's the post-mortem clot, which is a red jelly-like clot. And I've been seeing a high preponderance of these white fibrous clots since the COVID thing.

And at the offset of COVID— I consider myself a critical thinker and try to disseminate the information as I see it. Right at the offset, Teresa Tam was giving me some information that seemed to be conflicting, and then soon after that, the message was politicized. Prime Minister Trudeau was up there. Pallister government was up there. And I become highly suspect of some of the information that was being presented to us, the public at large.

So I started to look in terms of my profession at what I was seeing in the way of COVID. And I was seeing these white fibrous clots. Over the years, I've seen them occasionally. But almost with every single embalming, I would see these large clots. And I brought Mike in and we have video footage of this. I don't want to be disturbing or anything, but part of my job as an embalmer is to facilitate the removal of clots. And usually, that's relatively simple. I use pressure, and it removes the clots and these sorts of things.

But because of the size of these clots, I have to use a new technique of embalming, a restricted style of embalming that expands the vascular system to facilitate the removal of these clots. And I lack the scientific reasoning to explain why this is. But I see a strong correlation from the COVID thing to these clots, and I can't explain why. But I thought it would be an interesting adjunct to a strong testimony that's been presented here today.

And God bless each and every one of you who've suffered through this, and as a funeral director, I've seen many. And as Mike just testified, we've seen people suffering because of the, I would say, the ineptitude of the government. The government was elected. They're an extension of us, the people. They should be operating on our behalf and not be a dictatorship and telling us how things are.

Wayne Lenhardt

I don't want to get too far afield here, but I think it's fair to say then, from what you're saying, is that you've practised for 40 years as a mortician and you have not seen the severity and numbers of these clots.

Michael MacIver

That's correct.

Wayne Lenhardt

Except when COVID hit, is that fair?

Michael MacIver

Shortly thereafter. Especially, I'd seen reports of the various clots in Europe with the AstraZeneca thing, and this and that. And so, I started looking to see if I could physically or visually see clots myself, and sure enough, almost every body I was embalming that was affected with the COVID. And then, shortly after the vaccine implementation is when I'd seen a higher preponderance of the clots.

Wayne Lenhardt

Okay, I think I'm going to ask for any questions from the commissioners now. It's getting late.

Commissioner Drysdale

I just want to be clear about your testimony. Are you saying that you started to see these clots in 2020 before the advent of the vaccines?

Michael MacIver

Well, just prior to 2020, St. Boniface Hospital had a high respiratory— They had a high incidence of flu and they had this unknown thing circulating. It wasn't defined as COVID at that point.

And then a few months later, in around the end of March of 2020, they put down the restrictions and all those sorts of things.

[00:05:00]

And then shortly thereafter, they fast-tracked some of these vaccines. And I think AstraZeneca was one of the first, and there was a lot of, especially in Europe, they seemed to purport that there was a lot of people suffering strokes and heart attacks and all these sorts of things.

It was shortly thereafter where I started seeing more incidents of these clots. All the bodies at the various hospitals—the Health Sciences Centre, St. Boniface, and all the rest of them—they had the bodies clearly marked with a magic marker, COVID+. And, so, of course, I'd be practising aseptic techniques: protecting myself in the eventuality if I got stabbed or something with a needle or these sorts of things. I was very vigilant in observing what was happening with the body. And, of course, you try to minimize your work area to prevent contamination of the area and these sorts of things. And as Mike alluded to earlier, we didn't see the danger.

Initially, there was a large fear factor, you are kind of apprehensive about— Especially since I have suffered 33 heart attacks, I got blood cancer and all these sorts of things and probably have a greater propensity towards catching something if ever. And I didn't catch anything, and I soon thereafter lost my apprehension and trepidation of going into the prep room.

But it was shortly thereafter that I started noticing these clots. And I called Mike in, and he started photographing and videotaping what I was seeing. It's too graphic for the screen here or the public, but, you know, in the future, if something ever does come of it, I just wanted to present this information as an adjunct to what's already been presented here today.

Wayne Lenhardt

Mike, I've just talked to Shawn here and he has three photographs that came out of the Toronto hearings. We'd just like to put this up and ask you whether the ones you were seeing were similar to these.

Michael MacIver

Yeah, that's exactly what I was seeing, and those are what we call ante-mortem clots. Basically, the body— When it suffers a vascular injury, the body goes through hemostasis. It wants to prevent the body from bleeding out. So the liver kicks out an enzyme that reacts as a catalyst to the thrombin that's circulating through your blood. It converts the fibrin, which is a liquid protein, into a string-like protein and that forms a patch to plug up the vascular damage. And sometimes, if too many white blood cells and plasma get built up in there, it starts backing up and forming an extra-large clot. For the number of clots, I can't surmise that everybody that suffered COVID is suffering some form of vascular accident. You know, they talk about maybe some sort of heart damage or these sorts of things. And again, I lack scientific reasoning to explain it.

Wayne Lenhardt

Can you recall even the month that you started seeing these?

Michael MacIver

That would probably be more towards May, June, because we were kind of restricted—

Wayne Lenhardt

Of which year? May, June of which year?

Michael MacIver

We were restricted in what we could do at the funeral home originally. They limited the capacity of the funeral to like five people at one point. And then Mike was getting very frustrated with the rules and regulations and seeing all the heartache and heartbreak out there, where he just said: "Let's just do it," you know, pardon a better term, "the hell with these government officials and their—"

Wayne Lenhardt

I'm going to press you one more time, was it May or June of 2021 or 2022 or '20?

Michael MacIver

Yeah, it would have been in around 2021.

Wayne Lenhardt

Okay.

Michael MacIver

Yeah.

Wayne Lenhardt

Okay, any more questions from the commissioners? Okay, well, thank you very much then.

Michael MacIver

Well, thank you and God bless each and every one of you. Thank you.

[00:09:48]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

April 13, 2023

Day 1

EVIDENCE

Closing Statements: Ches Crosbie and Shawn Buckley

Full Day 1 Timestamp: 10:16:13–10:21:45

Source URL: <https://rumble.com/v2hz2rc-national-citizens-inquiry-winnipeg-day-1.html>

[00:00:00]

Ches Crosbie

Ches Crosbie is my name. I'm the Commission Administrator. I have a Queen's Council. I'm from St. John's, Newfoundland and Labrador.

Commissioners and everyone in the audience and out there, we've heard very compelling testimony today, but you may recall that in the opening remarks of counsel, he talked about hatred. Well, we've certainly heard the theme of hatred throughout the testimony of the folks who testified before this Commission today.

People may wonder why this is an inquiry into the truth because oftentimes we hear of inquiries which are inquiries of truth and reconciliation. But this, I submit, cannot be an inquiry of truth and reconciliation until the perpetrators, the perpetrators of the hatreds and I believe the crimes we've heard about today, come to terms with what they've done. There are apologies. There is true reconciliation. And there is accountability, which may often include—and for many people, those in leadership positions, must include—answering to the criminal law.

Can I have the slide that we made available a little earlier?

In this country, we have something called hate crime. Section 319, sub 2 of the *Criminal Code of Canada* says, "Everyone who, by communicating statements, willfully promotes hatred against an identifiable group, is guilty of an offence." So what is hatred? It's not defined in the code. Rather, it's defined in case law from the Supreme Court of Canada. For example, *Keegstra*, written by Chief Justice Dixon in 1990: "Hatred is an emotion that, if exercised against members of an identifiable group, implies that those individuals are to be despised, scorned, denied respect, and made subject to ill treatment on the basis of group affiliation."

You see before you an editorial or opinion piece that was published in the *Toronto Star* on August 26th. I think it says 2021, and it goes like this: "If an unvaccinated person catches it from someone who is vaccinated, boo hoo, too bad. I have no empathy left for the willfully unvaccinated. Let them die." And it goes on in that vein.

We can get into the reconciliation phase of this Commission if and when the authorities in Toronto, the police and the prosecutors, lay charges for this act of hate speech.

Thank you.

Shawn Buckley

Thank you, Honourable Mr. Crosbie.

We will be adjourning our first day of the Winnipeg hearings of the National Citizens Inquiry. Every time we have a full hearing day at the National Citizens Inquiry, I tell people that your life will never be the same. And I think those of us that have watched this online and have experienced it, personally feel that way. And I just thank all those brave Canadians that have been willing to tell their story.

I have to tell you that as with every set of hearings, we've had a number of witnesses withdraw even just today. It's because of fear of repercussions, some for fear that they will lose their jobs, some for fear that there will be backlash from their friends and family. And so here we are in mid-April 2023, in Canada, where a lot of us still do not feel that it is safe to simply share our story. And that is the ultimate of silencing: when we're not free to even just tell others what our experience has been. So that's why this is so important. We're going to continue tomorrow. We're going to continue marching across the land. And we're going to continue telling our stories.

Thank you.

[00:05:32]

NATIONAL CITIZENS INQUIRY

EVIDENCE WINNIPEG HEARINGS

**Winnipeg, Manitoba, Canada
April 13 to 15, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 2

April 14, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 2 Timestamp: 00:42:50–01:30:20

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

We're very excited that you're participating with us today. We actually are going to have two asks for those of you that are in the audience and those of you who are watching online. We are a band of citizens that just got together with the idea that we needed an independent look at how all levels of government have handled the COVID-19 pandemic because this is the most significant event for most of us alive today in Canada.

We've never gone through an experience that has so shaped our country and so divided us and so shaken us up. And we all know that we're going to be facing the consequences and the changes that it's going to bring forth going forward, for generations. And so we were just passionate about the need for an independent look. But this adventure that we've started, that's growing and growing, is only going to succeed if we can reach all Canadians and, in fact, really the entire world. This needs to be done in every single country: an independent-of-government, citizen-run inquiry into why the decisions were made the way they were and why all the institutions acted the way they did.

Now we're here today. We've run three hearings in Truro, Nova Scotia. We've run three hearings in Toronto. We ran a day of hearings yesterday in Winnipeg. We have had one mainstream media outlet here for maybe 40 minutes in this whole time, and yet on social media, we're starting to have tremendous success. But the reality is the mainstream media is not going to cover us. And there are some clear reasons for that: because if the citizens in Canada get control of their institutions again, get their institutions working for them again, then it is most probable, in my opinion, that the editorial boards of the mainstream media will be facing criminal charges. So why would they cover proceedings such as this?

So how do we get the word out? And this is our call because what we're finding is there are a number of you out there that have a large footprint in social media. Some of you are podcasters, and I'm talking to you all around the world, not just in Canada. We've got to ignite this around the world. If you are a podcaster, start podcasting about the NCI and we'll give you guests, we'll give you our spokesperson, we'll give you witnesses. We'll help you put us out and plug in and tag us. If you've got a Twitter account—or look, we're on every social media—tie into us and push us out on your networks.

Again, this is a citizen initiative and it only works if you the citizens, and not just of Canada but of the world, start participating. Start taking personal responsibility for doing something. Stop watching. Start doing or this fails, and it doesn't fail just for me: it fails for you and it fails for your kids. Time is short for us to get our institutions working for us again and so the time for sitting on the couch, the time for not participating is over. You are here to decide who you're going to be, and it's decision time, and I'm inviting you to make that decision.

We also have a second call out. In Toronto, we had an embalmer who was very nervous about testifying, very nervous about sharing her story about what she was seeing in the bodies after the vaccine was released. But she was brave and did it, and she placed a call out to other embalmers to participate. Yesterday, we had a surprise at the end of the day where it turned out we had an embalmer in the audience and—without us knowing this, just a witness on the stand told us—that embalmer took the stand. We were able to show that embalmer one of the exhibits that Laura Jeffery, the embalmer in Toronto, had shared with us,

[00:05:00]

and he confirmed, "No, I'm seeing this in the persons that I'm embalming also." And so now we have two. Now we're putting a call out for embalmers to contact the NCI because we need your testimony. Can you imagine if we put together a panel of you to have an open discussion amongst yourselves for the public to watch about what you're seeing because your evidence can't be disputed.

You are finding things, at least this is what we're being told now by two embalmers: you are finding physical changes that cannot be discounted in the persons in whom you are embalming. You are finding—I don't even know what to call them because they're not blood clots, they almost look like earthworms to me. And they're making it difficult for you to embalm because they're plugging up the arterial and vascular systems, and you're having to remove them. And this is new. That you've never seen this before, and the public needs your confirmation: You've seen changes in the blood and the blood clot. You have seen changes in the types of death following vaccination, including different changes in pattern for baby deaths. You have seen things that the public, if they become aware of it, will not be able to deny your evidence is crucial. So we're calling on all embalmers to contact the NCI because you have a special type of evidence that we need to get out there.

Now for my opening, I have to just say, because I'm going to be commenting on the legal system, that this is my opinion. And isn't it funny that I have to say that to try and protect myself because we know that when doctors or nurses, any medical professional steps out, they're sanctioned; they basically lose their licence to practise. It's a form of punishment to create censorship and scare the rest of them from actually taking self-responsibility for their actions and speaking out regardless of the costs and acting ethically regardless of the costs. I haven't seen lawyers being disbarred for taking on COVID cases or speaking out, but to borrow the title from Mr. Huxley's book, we truly are in a brave new world today. And so, to try and protect my licence to practise law, I'm just saying this is my personal opinion. I'm hoping that lawyers are still allowed to have personal opinions on the legal system amongst other matters.

Now, there is in my opinion, in my experience, there is—and people in this room will agree with me—a perception that during the COVID crisis, and to today, the court system has failed us. I've heard that time and time again from persons that are concerned about how

governments handled the COVID crisis. There is a perception that the court system failed us and that is my perception also. I have to say that I am personally grieved with how the court system has handled the COVID crisis, and I was called to the bar in February of 1995, so I'm working on my 29th year of practice.

I've tried to focus on constitutional issues. I've done a lot of criminal work, a lot of *Food and Drugs Act* work to try and keep our access to natural remedies available. Probably within the first 10 years of my practice, I had run a thousand trials. I was a high-volume trial lawyer trying to ensure that our rights were protected. That's always been my focus. And so when I give you my opinion of the legal system, I want you to understand that that comes from basically my entire career of practice, working on my 29th year.

The rule of law is simply the principle that the law applies to everyone equally. It's a very simple process or concept.

[00:10:00]

You don't have to think long and hard to understand how that is important to a liberal democracy. If we're not all subject to the same laws, if we're not all treated fairly in that the law applies to us equally, we don't have the rule of law. What we have is tyranny. And it's funny, the word tyranny, it conjures up negative emotions, but if you look at the definition, I mean, it's actually not a scary thing at all except in its application. But tyranny is just absolute discretion.

You could have a tyrant that actually made really wonderful decisions for the populace. We could have Plato's philosopher kings making great decisions for the benefit of the populace. That would be pure tyranny, but our experience wouldn't be negative. But why it's negative is because in all of our recorded history with the very rare exception, as soon as a government or a ruler has absolute discretion over our lives, very bad things happen to the populace. So that's why when I use the word tyranny, we react to it actually emotionally. So you understand that the rule of law is our protection against tyranny. Because if the government or our kings or our rulers or our bureaucrats, if anyone who has been delegated power over us is subject to the same application of the law as we are, then we're protected. Then we don't have tyranny, and that is why the rule of law is so important.

Now what shocked me with this COVID experience and I think what shocked so many people is that we were expecting the court to basically be a mediator between ourselves and the government. I mean, I know I was expecting— Okay, the government's doing things. I'm going to expect that the court is going to be between the government and myself and if we are going to have the rule of law, then both parties have to be treated equally in the courts.

Now we have a fundamental problem in how our court system and how our justice system has been designed. And that is that we have built into it a conflict of interest that is not consistent with the rule of law, and when we get control of our institutions again, we are going to have to get rid of this conflict of interest. So I just want to speak a little bit about how this played out and how unfair it was. And one thing I've seen in trial after trial where I've had clients that said, "You know, I didn't know that was illegal; like, I didn't know that was a problem—" And invariably, the court will say, and I've heard it time and time again: ignorance of the law is no excuse. Early in my career, I would just accept that as a reasonable proposition.

Actually, I agree it is a reasonable proposition. Because if you have laws and somebody could just say, "Well, I didn't know it was there," and that was some reasonable excuse, then basically you don't— The law is invalid, like you basically can't apply it. There's actually a good policy reason for ignorance of the law not being an excuse into whether or not you're culpable. It could speak to what should flow from a penalty.

But why I'm going into this is— You know we have an inner voice? As time went on and I watched how the legal system was applied to government and I watched how courts would allow our police system to get away with breaking the law over and over again,

[00:15:00]

and just who was charged and who wasn't charged, it came to me that whenever I would hear a judge say to one of my clients, "ignorance of the law is no excuse," that inner voice would add "except for the government and the police." This has happened because of a conflict of interest that I'll explain. But what disappointed me about the COVID experience was kind of a complete abandonment of the law by both the police and the government.

Now we all know about our *Charter of Rights and Freedoms*. We all know about our Charter rights, and actually there are some really wonderful rights in that document. You know section 7: Everyone has the right to life, liberty, and the security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice. What a beautiful right. Courts have made it clear: that includes rights that we already had under the common law to autonomy over our own bodies, where, you know, you can refuse a medical treatment. Prior to COVID, that was sacrosanct in our legal system, in our medical system—the right to deny a treatment—and it's guaranteed in our Charter.

We have freedom of conscience, we have freedom of expression, we have freedom of religion, we have the Charter right to freedom to assemble. I mean, it's a fundamental right to be able to protest. It's a fundamental right to be able to go to church and worship. It's a fundamental right to have your own opinion according to the Charter. Now what's interesting is, here we are in Winnipeg, Manitoba, second day of the National Citizen Inquiry hearing in the year 2023. And the year's important because in this time in 2024, will it be legal in Canada to hold proceedings like this? Will it be legal for me to share this opinion in a year? I don't know and if I'm a betting man, I wouldn't know how to bet.

But we have these wonderful Charter rights and then we have section 52 of the *Constitution Act, 1982*, the same British statute that includes our *Charter of Rights and Freedoms*. It sets out that the Charter is the supreme law. I mean, it basically reads: the Constitution of Canada is the supreme law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force and effect. And what that means is, if you have any law— Let's say a mandate saying you can't assemble, you can't have a group of more than 40 people outside, you can't go to church. Well, that law is below our constitutional right to worship. That law is below our constitutional right to assemble.

So one of the things I learned—probably about a year and a half ago—I was involved in an organization that was forming to start looking into crimes that were committed in the COVID pandemic. I got segued into this NCI, I want to call it an "experience." It's really a movement. This is a movement because this is just Canadians getting together. I mean the strength of this is that it doesn't depend on any person or any groups of persons. So when I'm inviting the podcasters of the world to get involved, when I'm inviting every listener to push us out, I don't care if your social network is 10 people, push us out because

that's how we're going to make a difference. And that's what we are. We're a movement of people that are basically demanding to know what happened so that we can collectively decide how we are going to manage our affairs in a peaceful way going forward. That's what this is about. We're not here to grind an axe. We're here to find solutions so that our children's future is protected and that Canada once again becomes a beautiful place to live where we treat each other with respect and kindness. That's why we're here and that's what this movement is about.

[00:20:00]

Now one of the things that grieved me, though, is when I'm talking to police officers—in fact, you know, it might have been Vincent Gircys, who testified in Toronto; he might have even been one of them that told me. In fact, it might have been him who first shared it with me, saying, “You know when I talk to police officers, a lot of them don't understand that actually the Constitution is the supreme law of Canada. They're not familiar with section 52. They actually haven't been trained.” So you, literally, could have police officers that, to their core, want to enforce the law—who are dragging people out of church, who are pulling veterans out of a line and throwing them on the ground and kicking them—who don't actually understand that they are not upholding the law, that the supreme law of Canada is the Constitution. If they had been trained in this, if they had truly understood that for us to continue to be a free nation, free of tyranny with equal application of the law, and that the supreme law was our Charter—were the rights that were being encroached upon by the police— And you know what? It's not an excuse to say you were following orders.

We established that at Nuremberg, and I explained this principle on an earlier opening address. People in authority that want other people to do bad things understand that if they take away your personal responsibility that you can get people to do terrible things. So it was Himmler that was the head of the SS and he was giving a speech to a group of SS that were about to go out and murder a whole bunch of people. It might have been the speech given before the Night of the Long Knives, but it was a speech given before they were basically to go out and murder a list of individuals. And he literally said, “It's not you. It's not your finger on the trigger, it's not you pulling the trigger. It's me.” And he was saying this because he understood if he took the responsibility for what they were doing, they would follow orders.

And so when we had the Nuremberg trials, and I say “we, the civilized world,” “we, the citizens of the world” had to establish the legal principle that it is not an excuse to harm and kill other people that you were following orders. And so, police officers that dragged people from church services, that threw protesters into cars—it's not an excuse that you were following orders. And doctors that are following orders from your colleges, whatever those are. In Alberta, there was a direction that you were not to treat early COVID. It's not an excuse for you legally that you were basically following directions from your college. If we get control of our institutions, there will be inquiries into criminal liability for the actions of a lot of players here. So police officers didn't understand that in enforcing the mandates, they were violating the law.

But let's turn to the courts because we have just experienced the most significant government intrusion into our lives that any of us have experienced—and more significant intrusions than many would have experienced during wartime in Canada. I used to have clients that did pretty terrible things and would be subject to house arrest with conditions that were more favourable than conditions that you and I were subjected to by our government. And we had not committed a crime.

So here we have the biggest government overreach in our history, and we're all expecting, "Well, okay, but surely the courts are going to step in and be that mediator between the government and the citizen—not treat the government with any privilege because we can't have the rule of law if one side is privileged over the other." Because remember, the rule of law is the equal application of the law to everyone including governments. We have court cases where citizens are saying,

[00:25:00]

"Well, the government went too far; the government encroached upon my rights." We don't have the rule of law if the government position is privileged in any way. We have tyranny, by definition.

It is April 2023. I cannot think of a single court decision in Canada that will, if the government does a similar thing— Let's say monkey pox. Remember we heard that one? We're being told that there might be another pandemic. So let's say something else comes along and they do the exact same things: They lock us down. They force us to wear masks. They do everything they can to coerce us into taking a vaccine or some other treatment. I cannot think of a single court case that will act as a brake on government actions going forward. Now there may be one that I'm not aware of. But I can tell you, I ask other lawyers whenever I have a conversation, "Can you think of a single case?" And no one can.

And there have been a few tricks that have been used by the courts to do this, and one of them is mootness.

So here we have this supreme law of Canada, these Charter rights, and people would start court cases saying, "Wait a second, I have the right to assemble. Wait a second, I have the right to get on a plane without a passport." They start these court proceedings and a whole bunch of resources goes into them on both sides. I mean, affidavits are sworn. People go through examinations for discovery. Arguments are made. There's motions, blah, blah, blah. They get all the way down this path and then the mandate is dropped. Then the Crown prosecution service applies to court saying, "Well, throw this out. It's moot because they can get on a plane now. They can get on a train. They can assemble however they want. They can go there right now to the park and assemble." You can't grant them any relief and case after case after case is thrown out, dismissed by the court.

What they've done then is they haven't made a decision that would put a brake on the government going forward. I'm sorry, when I'm locked in my house for not doing anything wrong, I want a court to decide whether that's okay or not. If you're told you can't go on a plane and fly within Canada or a train, it doesn't matter that you can now. You want to know, was that legal? Did that violate our constitution? Because, otherwise, they can do it again. I mean these are the most fundamental decisions that need to be decided by a court and they have not decided them.

Now the few that have allowed— This has proceeded, either the mandate is still there or the court had said, "No, I'm not going to throw this out for mootness." They have agreed, "No, there's been a Charter violation, but the government's action is okay." We've got this silly clause, section 1 of the Charter, which is kind of a safety valve. Section 1 reads, "*The Canadian Charter of Rights and Freedoms* guarantees the rights and freedoms set out in it," and here's the mischief, "subject only to such reasonable limits prescribed by law as can be demonstrably justified in a free and democratic society." What the courts do is basically say, "Well, yeah, there is a Charter breach, but the government was okay, in this instance; it's demonstrably justified in a free and democratic society."

So basically, those decisions tell the government, “Not only is there no brake on you the next time this happens, but you are justified in doing this.” So basically, rubber stamping what the government has done. Now this is part of a systemic problem and that’s indisputable because in all of Canada, I can’t think of a single case. We’re in a situation where we cannot deny to ourselves that the court system is giving deference to the government.

Many of you have heard—and I know there’s going to be a witness today who might speak about it—Ontario Court of Appeal case *CG v. JH*. For anyone watching, the site is 2023 ONCA 77. So there was a family court case.

[00:30:00]

Basically, one parent wanted to get a child vaccinated and the other didn’t. They’re having a fight in court and at the trial level, the family court judge didn’t side with the father who wanted to vaccinate and just said: “Listen, we shouldn’t give deference to government, so I’m not just following the public health authorities.” Well, it goes to the Ontario Court of Appeal and the Ontario Court of Appeal has said “No, courts, you can take judicial notice,” is the term. “You can consider it as fact, without proof, that if Health Canada approves a vaccine that that is prima facie evidence that they have considered it safe and effective. And you can then draw the inference that it’s safe and effective.”

It is clear that the Ontario Court of Appeal had no idea that the legal test for the approval of the COVID-19 vaccines didn’t require proof of safety and efficacy. In fact, the word “safety” and the word “efficacy” isn’t even found in the test, and we had Deanna McLeod speak to us about that yesterday. So the vaccines didn’t have to be proven to be safe and effective and they weren’t. And yet, we have the Ontario Court of Appeal directing lower courts to take judicial notice that if Health Canada has approved a COVID-19 vaccine, it’s been proven safe and effective. But let’s say they had been proven to be safe and effective, the problem is that the court is giving deference to the government line and that is not consistent with the rule of law.

So there are three things inconsistent with a court system that protects its citizens. I’m just going to speak mostly about the third one. Judges funded and appointed by the government are not consistent with the rule of law long term. A professional government prosecution service is not consistent with the rule of law. And if you want to hear an Orwellian term, I can’t think of a better one than Department of Justice. The big problem is, and the elephant in the room is, the conflict of interest caused by the fact that the Attorney General, federally and in every province—that directs our justice system; that sets the priorities for the police; that set the priorities for the prosecution service, which is a government prosecution service—is a member of the Government.

Think about that. We want the courts to not treat the government any differently than us. But the person who sets the priorities for enforcement, the person that sets the priorities for the police, the person that sets the priorities for the prosecution service is the Government. The Attorney General is a member of cabinet. This is a clear conflict of interest that is inconsistent with the rule of laws, and in my experience, the Attorney General is almost a hundred per cent of the time against citizen rights and for Big Government. I told you before, it was probably within the first 10 years of my practice, I’d run over a thousand trials. I have time and time again been in court arguing that there’s been too much government power and that rights have been encroached.

I can tell you that unless it's just so clearly obvious that the prosecutor would be embarrassed not to admit that there was a Charter violation and something should be done, where you just simply can't deny it, a hundred per cent of the time they have argued against rights.

Let me tell you about a case that has haunted me for a long time, just to illustrate why I've refused, although I've been asked several times. I do a lot of circuit courts and courts in small centres in BC, and I've been asked if I would be the prosecutor. I've refused a hundred per cent of the time in my career because of the culture of the service.

But I had a case when marijuana was still illegal,

[00:35:00]

and this would be, probably, a good 15 years ago. We hadn't gotten even to our debate forced upon us by the compassion clubs, which led to legalization. So according to the Federal Department of Justice this was really serious stuff. I forget now whether it was just a neighbour smelling cannabis while they're outside barbecuing. But the police came to believe that that my clients, a young couple—they were probably both around 26, 27— young married couple, no kids, had some personal use cannabis in their house. I know this is a shocking crime.

So the police get a search warrant that they execute in the middle of the night. It was like one or two in the morning. So this couple actually wakes up with the police turning the light on in their bedroom, surrounded by SWAT people with machine guns pointed at them in bed, with the police's faces covered, and everything. They're just shocked because they're being screamed at to not move. And the husband tells the police, "Let me slip out of bed and get some clothes for my wife so that she can dress under the covers because she's naked." But "for officer safety, we can't tolerate that," so they rip the bedsheets off and embarrass the hell out of her. I'm just upset talking about it. I get to watch the Crown counsel explain to the Court why this is okay. And you know what? It's not okay.

Time and time again, just go sit in a court, whenever there's a Charter argument, and you will never see the Crown counsel argue for our rights. That is because the person directing Crown counsel, the person directing the priorities for our justice system is in cabinet of the government. They are not directing the prosecution service—they are not directing the police—to privilege our rights. And slowly and slowly and slowly our rights have been reduced and reduced and reduced. Our Charter came into force in 1982, and with a splash, courts were creating all these rights. We've got this machine: this prosecution service is a machine. I remember on one constitutional case it was me against 12 DOJ lawyers. There's unlimited resources and they just wear you down. But this machine is in there, time after time with all these resources.

You know, for most of my practice in legal aid for a criminal file— So from picking up the file to when you finish the first day of trial, and most of them finished in the first day of trial, you get paid five hundred and forty dollars. It's hardly enough to run your office, but the Department of Justice lawyers are getting their benefits and big salary and yet, ask the police to jump, and you have every expert you want. Legal aid, you have to beg and beg and beg and beg, and you might get an expert in 10 per cent of your cases. It is so unfair by design, by the government that controls the justice system, deliberately allocating resources so that they can slowly and surely grind away our rights. And what happens is, we've now seen the cage door shut. That's what we saw with COVID. It's been a slow and

steady erosion, and now we've seen this cage door shut. And it's because of a conflict of interest.

So I'm going to end there. We're going to have a witness later today who's a retired judge, who is—I don't want to be a spoiler, but the way this person put it kind of just encapsulates how far down we have gone and how much we need to get that institution working for us again.

I wanted to, before we call our first witness, just briefly watch a video of some of news clips that we experienced during COVID. We just thought this would be appropriate to bring us back to the type of experience we had. So, David, if you want to run that video; then, we'll march into our first witness.

[00:40:00] [Video is missing audio from 00:42:50–00:42:58]

[A video of news clips was played announcing emergency measures, including school closures and restrictions on indoor and outdoor public gatherings. Below are transcripts of the audio content.]

[Video clip] Kelvin Goertzen, Minister of Education

Today we are announcing that we will be suspending classes in Manitoba effective Monday March 23rd for a period of three weeks, a week before spring break and a week after the regularly scheduled spring break. We believe that our schools are safe. However, the experience in other provinces and other parts of the world tells us that proactive measures lessen the impact of the spread of COVID-19 and lessens the negative impact on individuals.

[Video clip] Dr. Brent Roussin, Chief Provincial Public Health Officer

I've recommended the closure of all Manitoba schools effective March 23rd. It's hoped that these proactive actions will help limit the impact of COVID-19 on our communities.

[Video clip] Brian Pallister, Premier of Manitoba

Manitobans are stepping up and they are doing what they can to help flatten the curve, and we thank them for that. Manitobans have led the way by listening to the advice of experts, and I commend all Manitobans for recognizing the critical needs for social distancing and for proactive measures to keep themselves and others safe. We are taking further decisive action by declaring a State of Emergency in the province. This will be valid for 30 days and prior to the end of that 30 days, of course, we will evaluate to see if there's a need to continue.

This puts us on an emergency footing and gives us a readiness that we need in these uncertain times. Understand that this is a temporary measure. Understand that we do not enter into this lightly, but this is part of our need to respond to ensure that we can continue to assist Manitobans in doing our part to protect the well-being of all of us here and all Canadians and global citizens. We respect the rights and freedoms of our citizens. We have stood above throughout our history in protecting the rights and freedoms of others.

Recently, of course, we have stood out and up on behalf of the rights of people who we feel have their rights threatened in another Canadian province by legislation that's been put forward there. And so we respect rights. However, we must continue to use every tool we have in our possible availability to flatten the curve here and to protect, do our part to

protect all Manitobans. The measures that we're taking today will enshrine, quite frankly, what has already been happening in Manitoba. We have not had reports of people violating the advice that Dr. Roussin and others have been giving. And so I want to say clearly that my promise and our government's promise to Manitobans is that these measures will end as soon as possible and will only be used if absolutely required.

[Video clip] Heather Stefanson, Minister of Family

Our government is continuing to take unprecedented steps in response, to respond to COVID-19 in every sector across all government departments. Based on the advice of the Chief Provincial Public Health Officer, licensed child care centres are suspending services at the end of the day and for the next three weeks. During this uncertain and challenging time, we need Manitobans to rise to the challenge.

[Video clip] Brian Pallister, Premier of Manitoba

We now have the mandate through law to be able to ensure the 50-person gathering. But I would ensure, I would ask Manitobans to participate. The best defence we have isn't just a government officer going and trying to stop a restaurant from opening. The best defence is if you come across a situation, and I encourage Manitobans, if you come across a situation where people are not observing the social distancing rules, I'd like you to go on the internet and tell everybody not to shop there.

Don't go there. Do the necessary things right now, the short-term pain that we have to, we know we all have to share in to make sure we have a longer-term gain. So we're not making the decision today that it will not change because we have to be nimble. We have to be ready. But we think we're taking the right steps based on science, and Dr. Roussin is the more qualified person to speak to this.

Know the penalties are onerous, and they're there, and they're there for a reason. They're there to deter behaviour that's unsafe, unhealthy, and that, frankly, is not in keeping with Manitobans' reputation as good citizens. So we don't make laws for the majority of people. We make laws as a consequence of the behaviour of some in the minority. And that is not something we've seen yet, but if we see it, we want people to know we're serious about clamping down on it, and that is what these measures are there for.

[Video clip] Dr. Brent Roussin, Chief Provincial Public Health Officer

As you have just heard the province has declared a State of Emergency. Today I am issuing orders under the *Public Health Act* to reinforce

[00:45:00]

the social distancing measures that we have already been applying. The following measures will be in place effective 4 p.m. today and will be in place for a period of 30 days.

We are limiting public gatherings to no more than 50 people at any indoor or outdoor place or premises. This includes places of worship, gatherings, and family events, such as weddings and funerals. This does not apply to a facility where health care or social services are provided. Retail businesses, including grocery stores or food stores, shopping centres, pharmacies, and gas stations can remain open, but must ensure separation of two metres between patrons assembling within the business. Public transportation facilities must also

ensure that people are reasonably able to maintain a separation of one or two metres from each other.

We are limiting hospitality premises where food or alcohol is served, or any theatres offering live performances of music, dance, or other art forms as movie theatres to 50 people or to 50 per cent of the capacity of these premises, whichever is less. These establishments must also be able to ensure social distances of one to two metres between their customers.

I'm ordering the immediate closures of all bingo and gaming events. All wellness centres offering physical activities, gyms, fitness centres, and athletic clubs and training facilities will be closed. We are taking these steps to ensure people make changes to their day-to-day lives, which you have already seen many Manitobans do. This is to strengthen our message regarding the need for social distancing and the need to act now. With these orders in place, Manitobans have a clear message on the roles that they can play to protect themselves, the people around them, and our communities.

Pharmacists are being required to limit the number and quantity of prescription drugs being dispensed. This is being done to ensure continued supply and prevent the stockpiling of prescription medications. Only a one-month supply will be provided at this time. Stay home if you're sick, cancel events, and very important, use reliable sources for your information. The Act makes it an offence to contravene any order, and so it can be fines or even a term of imprisonment under the Act.

[00:47:31]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 1: Patrick Allard

Full Day 2 Timestamp: 01:30:26–01:55:56

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Kyle Morgan

So our next witness is Patrick Allard. Could you state your full name, sir?

Patrick Allard

Patrick Allard, P-A-T-R-I-C-K A-L-L-A-R-D

Kyle Morgan

Do you promise to tell the truth, the whole truth, and nothing but the truth?

Patrick Allard

I do.

Kyle Morgan

How old are you sir?

Patrick Allard

Oh. Nineteen eighty-one: forty-two? Forty-one.

Kyle Morgan

Where are you from?

Patrick Allard

I'm born and raised in Winnipeg. Winnipeg's north end. Been there my whole life.

Kyle Morgan

What kind of trade do you have or what work do you do for a living?

Patrick Allard

I've owned and operated a renovation company, a residential renovation company, for the better part of 20 years.

Kyle Morgan

I understand you got quite involved in the community in Winnipeg during the COVID period, if we can call it that. Can you tell us a little bit about what happened in 2020 when all this started happening?

Patrick Allard

Yes, watching those videos that we just watched with Premier Pallister and Heather Stefanson, who's our premier now, who used to be the health minister, and Bruce, in here. It brings back a lot of memories, probably for everyone watching. You could tell that they had no idea what they were doing. And I knew that when I was watching it, and I thought, somebody has to step in, somebody has to do something. And like a fool, I waited for my government to do what was right. That wasn't happening. We saw these arbitrary closures of businesses. I mentioned I was in renovations. I was deemed essential. I didn't know how insulting that was to be elevated amongst other Manitobans just because of what I chose to do for a living. I didn't realize that the tattoo artist or the hair stylist, they also have mortgages and kids to feed. So how was I any more important than that? So I had to speak up for those who were deemed non-essential, those who were harmed. I decided to be very loud, public, put my renovation company on hold, and use my voice to stick up for the little guy.

I saw a lot of pain, a lot of hurt. I started being vocal on social media for starters in early 2020. I heard stories of people not being able to see their grandparents or their parents in a nursing home. And I didn't just hear stories, but we had a family member of ours—a 95-year-old matriarch of my wife's family—was locked away in a nursing home for three weeks and never recovered from that loneliness. And we had a funeral shortly after that. My family has pictures in their minds as to what their mother looked like, their grandmother, after being alone for three weeks. Mike Vogiatzakis testified about some of these people that he saw as well. So it's not an anomaly. So speaking of the little guy—that I had to help protect and speak up for—was these elderly people who had no one to talk for them.

And then they shut the schools. They put placards on play structures. They were harming children mentally by making them feel that they're going to harm their grandparents, they're going to harm their friends by playing with them. The two segments of our society that we needed to protect are the ones that we did not. We alienated the elderly and locked them away to rot.

[00:05:00]

I keep saying they're our most precious resource because they have stories and a lifetime of things in their minds that you don't get until you get to their age. We pushed them away like they were yesterday's news. And then our children, we were scarring them right from

the beginning, scaring them, and that we're going to have to fix for 10 years or so. Or it could take decades. I saw this very early.

So we organized our very first protest for May 9th, 2020, in front of the legislature. And I thought we were doing a good thing. I thought we were going to attract a lot of positive attention, but it was exactly the opposite. The *Winnipeg Free Press* labelled us as a bunch of right-winged extremists, racist, white, Anglo-Saxon, everything that they could do to try to get us painted in a negative light. And I didn't understand that. I didn't understand, why is this? Why? Hasn't protest always been an encouraged event, no matter what? And now we're being labelled all these names. I didn't quite get it. So that was May 9th of 2020. And that's where the story really begins, I guess.

After being defamed in the paper, people started gravitating towards myself and Dr. Gerry Bohemier, who's going to testify later today, who was part of that as well, took the face of that one. He took the brunt. I didn't like them picking on Dr. Gerry, either. So I became somewhat the face of the opposition in Manitoba against these measures. It started going from there. We started holding rallies and attracting more people. People could see that they're not alone anymore. And we were doing a good thing. That continued on.

There were more press conferences that Pallister went on and threatened on TV saying, "If you break the public health orders, you'll get your name mentioned on TV." Dr. Roussin mentioned about possible jail time. And we continued protesting. I continued awaiting these fines, these tickets. They were not happening. So I thought the government was just bluffing. We continued on.

November 4th of 2020 was when I was first ticketed for breaking the COVID health orders. That was for gathering in a public outdoor place with more than, I think it was five people. And we were more than five people. We were about 30. I got ticketed. And to my understanding, that was the first ticket in Winnipeg. There was another gentleman who was ticketed along with me. I believe the ticket fine was for \$1,200 and \$1,296. And it just continued on from there. November 29th, 2020, I heard that there was a church, Minister Tobias' church, the Church of God, out near Steinbach that was going to hold a service. And because the churches had been locked down or shut down, I decided to go and— If I wasn't going to get answers from the government, let's see if we can get answers from God. And being raised in a Christian home, I decided I'm going to go and maybe this is the time to go back to church. So I went out there.

Growing up, my father always told me that the police are your friend. If you need help, you can go to the police. I showed up there in Steinbach. And on the side of the road, as Minister Tobias testified, there was about 30 police vehicles, probably about 40, 50 police officers, RCMP officers, all in a line with masks on, and preventing these churchgoers from going to church. It was at that moment that I realized the police are not always your friend.

[00:10:00]

The RCMP, at that time, were on the wrong side of the law. And that's really the moment when I realized—I think the gloves are off now.

So I continued being a loud voice, continued protesting. We held many wonderful rallies. We had mental health rallies because as Mike Vogiatzakis has testified yesterday, mental health was on a huge decline. He's seen a high rise in suicides. We heard Ms. Vickner talk yesterday about her thoughts of despair. And we had mental health rallies, just to get people together to hold hands, to sing, to hug, to shake hands, to know you're not alone.

For those efforts, I was ticketed as well and I was dragged through the media. I asked for all of this because I knew the good that was coming out of it was, I believe, worth it. The joy I would give people just to make a post that there's going to be a rally, that they get happy for 20 minutes of their life: I think it was worth it. And from that point on, from the Church of God incident, I believe I received another 14 tickets. Kyle, you might know better. You might have it there. But all for gatherings.

And after about 10 tickets, the promise of Premier Pallister about getting your name mentioned on TV was brought to fruition when the Winnipeg police put out a press release saying that there's been an arrest warrant set out for five Manitobans plus another visiting individual. And out of that, we became the infamous Manitoba Five. Five of us were arrested for breaking COVID health orders—put in jail. The police exercised a warrant. I was put in a cell, just treated like every other criminal, I guess. But my crime, as per the police officer's disclosure, was that Mr. Allard was seen shaking hands and hugging people. This was the extent to my criminality because they didn't have anything else.

To be the police officers to write that, I don't understand how they could even do, how they thought like that. I might be missing parts of the story, but I know you'll refresh my memory. But that led me to having some bail restrictions. And I was, like Sharon talked yesterday, she was not allowed to communicate with certain people. The five of us that were arrested with those warrants, I was named on that as well. Thankfully, I have a family that I could speak to, but some of the other people didn't and were left alone.

One of my bail restrictions was that I do not plan, promote, or incite gatherings that fall contrary to the public health orders. So it kind of put a stifle on my protest planning. So when Dr. Roussin allowed 150 people to be present at a private or a public outdoor location—unless you were at the time vaccinated because there was no limit for vaccinated individuals—and so we were allowed, if we weren't checking vaccine passports, to have a group of 150. So I made a Facebook post asking for 150 people to block the road to the Winnipeg Blue Bomber Stadium. I think it's a dumb move to block any road, but I was angry that the Winnipeg Blue Bombers were hosting a game with 40,000 people—could be 30,000, 40,000 people, vaccinated individuals only—when people like me were not allowed in. So I wanted to put a wrench in their works.

I got a knock on the door,

[00:15:00]

plainclothes police officers. What that means, those are detectives. They announced themselves as the major crimes unit. People who arrest murderers, rapists, drug dealers, all the worst crimes you can imagine in your life, show up at my door, and I'm in a towel. They said I'm under arrest for the Facebook post. And I said, "Well, would you allow me this—" Shawn just talked about a similar story. I asked, "Would you allow me the decency to get dressed?" And they said, "Nope." They shoved me against the wall and my towel dropped down, outside on my front steps. And thankfully, I was wearing some undergarments. But nonetheless, that's quite tough for the neighbours to see. Quite tough for me to have the neighbours see. My daughter sees this. And she's seven now, and that's the first time that I spent the night away from my daughter. She remembers this. Why was Daddy gone that night? Because I spent the night in jail with wet underwear. They were wet because I was in the hot tub. I should clear that up; they didn't let me get dressed. They pulled me away, and I spent the night in jail. And once again, got out on bail restrictions.

I think shortly after, restrictions were removed, and it kind of gave me a little bit of freedom. I was treated a little bit like all the other unvaccinated people. I wasn't discriminated against as much. But then that led me to filing some Charter challenges. We were in court. We had our challenge dismissed because of a previous court ruling in the *Gateway* challenge. We're at the appeal process with that.

Through this all, I also received two mask tickets. One was shopping without a mask. One was going to the law courts without a mask. And I got to say, I brought up my daughter. She was the only kid in her whole school of 600 that never wore a mask. And people asked me, "How did you do that?" And I said, "Well, I went and spoke with the principal. And I kindly mentioned that my daughter does not wear a mask. And we had the conversation respectfully." We have to respect people, even if they disagree with you.

And she was allowed to participate in two years of school with no mask. His deal was that she was going to set her off into the corner and have her own little workstation. And I said, "Well, if you put the other individual that looks a little bit different than the rest of us in that corner, you put the disabled child over there, and you can put the person with dark hair over there, and then you can put my daughter in the fourth corner." And he said, "Well, that doesn't sound appropriate." And I said, "You're right." So she got to spend the two years with all her friends like a normal kid treated like all the others, even though she didn't have a face covering. I understand, listening to Mr. Attallah yesterday, that not all the children had that luxury of being able to do that. And that hurts me.

Sorry if I'm rambling. But I just saw a need to speak up, especially when I knew from very early on that this was a— they say, "trust the science," this was political science. Before it came to Canada, there was COVID deaths in Italy, in nursing homes. I thought, that's very sad that people are dying in the nursing homes. Of course, it is. But this is a fact of life. People do die. What are the numbers? And I started doing some comparisons, and I compared the numbers of deaths in the Italian nursing homes year over year over year, month over month, and it never changed. So I thought, what's going on?

[00:20:00]

I knew that this wasn't an unusually deadly killer, like people bring up the Spanish flu. This was nothing to do with that. So I don't understand the government—what they did, how they jailed me, how they ticketed me, how they treated everyone else for just going shopping without a mask, getting together, going for church. Yeah, I got so many stories to tell, so many things to say, but I don't want to ramble on too much. I kind of want to give you the gist of—

Kyle Morgan

Mr. Allard, I know that you attended a lot of rallies in Winnipeg. There's a lot of different gatherings that were going on. Do you recall your observations about what was taking place at those rallies and the enforcement that was taking place?

Patrick Allard

If you were protesting the COVID orders, you would be ticketed. You would be fined; you could be jailed. But if you were protesting other events, perhaps Black Lives Matter, Every Child Matters, these seem to be accepted. Some members of our legislative assembly here called for our arrest for protesting. Then the very next day, they would participate in a

protest for the Manitoba Hydro Union or the Black Lives Matter rally, and that was okay. The rule of law is supposed to apply to all, I thought.

Kyle Morgan

Were you present at these other gatherings?

Patrick Allard

I was.

Kyle Morgan

So you had firsthand observation, is that right?

Patrick Allard

I was actually identified by police officers and asked me why I was there. I said, "Well, I heard there was a rally and I'm the rally guy." So they pointed me out, and I made a point of this because now I was participating in a rally that was approved, still against the COVID orders. They knew me, and I'd already been ticketed at this point, but they didn't give me a ticket for that one. Only if you protested the COVID orders.

Kyle Morgan

Thinking back about everything that's happened, how do you think society should have responded to this COVID phenomenon?

Patrick Allard

Well, I think we could have taken Dr. Jay Bhattacharya's advice with his Great Barrington Declaration, and instead of locking away and forgetting the elderly and the vulnerable, we should have protected them. We should have allowed the rest of everyone to govern themselves how they see fit: to raise their families the way they want to raise them, to live their life they want to live. The government should be there not to take our rights away but to protect our rights. And they should tell us when there's a danger, tell us what the possible issues could be if we take the danger into our own hands, and that's it. We understand that by going out, we had the potential of being sick or whatever, we took that on ourselves.

But we learned in the *Gateway* challenge that the government themselves had zero evidence: the government admitted this under oath that they had no evidence to suggest there was any outdoor spread. That's how I interpreted it. And yet, they still put a prohibition on outdoor gatherings. We also found out in that same *Gateway* challenge that the PCR test that allowed all of this to happen— Dr. Jared Bullard from Cadham Laboratory, who did the majority of the COVID tests in Manitoba, testified under oath that 56 per cent of the PCR tests were false positives. So if they told you there were 1000 cases, that's only 460. So it was not as severe as they were telling you. They were not following the science themselves. That's what we could have done. We could have followed the science, the real science. But I fear that we've gone down this path, and like Shawn said at the opening, we may go down this path again and there's really nothing that we can do

[00:25:00]

besides just stand up and say no. And without rambling any further, if you have any other questions, Kyle.

Kyle Morgan

I don't think I have any more questions, maybe some of the commissioners do. Okay, thank you very much for your testimony.

Patrick Allard

Thanks a lot.

Kyle Morgan

Thank you.

[00:25:36]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

April 14, 2023

Day 2

EVIDENCE

Witness 2: Jeffrey Tucker

Full Day 2 Timestamp: 01:57:43–02:28:09

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Wayne Lenhardt

I have Mr. Tucker on my screen. Good morning, Jeffrey.

Jeffrey Tucker

Yes, good morning.

Wayne Lenhardt

If you could give us a brief bio for our listeners. I gather you're with the Brownstone Institute. I don't have much more information on you, but apparently—

Jeffrey Tucker

Yeah, that's fine. I'm an economist by training and I've worked at a number of different institutions. I was working at an institution that hosted the Great Barrington Declaration in October of 2020, and then subsequently founded the Brownstone Institute, which specializes in public health and economics. I have several books that I've published and one I've written on the subject of the government response to COVID, which is, in my view, universally negative in every country it was tried, without exception.

Wayne Lenhardt

Some of the people that know you here at the Frontier Institute have said that you're very versatile and that you would be able to, perhaps, give us some idea of what actions we could take as citizens for a phenomenon like this.

So to give you a bit of context to work with, I watched this right from the beginning. And it became obvious to me after Donald Trump was diagnosed with COVID and was cured in a couple of days that early treatment was clearly available, not only available but actually worked. And early treatment was basically prohibited for most of the COVID phenomenon. And I think if it had been allowed, a lot of—for example, Dr. Bhattacharya's testimony yesterday would probably be irrelevant because I think the treatment very clearly worked.

We had Trump. We had Rudy Giuliani, got cured in a day. We had personalities— Joe Rogan got cured in a couple of days and so did Dan Bongino. I mean, this was available, but it was prohibited. And we were told that there was no cure for COVID. All you could do is go off and quarantine for 14 days and take aspirin. So let me throw it to your discretion here. Is there something we could have done in order to lessen or basically eliminate most of COVID?

Jeffrey Tucker

Public health has always said that when a new respiratory pathogen comes along, the most important thing is to find out the ways to make sick people well. And medical science has a long history of dealing with respiratory infections, and this is what medical doctors were saying throughout February of 2020. They were saying, “don’t panic. We know how to fix this. We have plenty of cures. We know that getting out in the sun is very good for you, vitamin D. There are other medications that are available you can use in a combination, whether it’s vitamin supplements or ivermectin can be very good, antibiotics for secondary infections.” A lot of people thought hydroxychloroquine had seen some success with SARS-CoV-1, and subsequent random control trials have confirmed that.

Wayne Lenhardt

Can I stop you for just a moment? I’ve forgotten to swear you in. So will you promise to tell the truth, the whole truth, and nothing but the truth in your testimony today?

Jeffrey Tucker

I do.

Wayne Lenhardt

Thank you.

Jeffrey Tucker

So this is the priority of public health, always in the presence of a new pathogen. And by the way, there’s always a new pathogen. So everything mutates from everything else. And this is the way the microbial kingdom works. It’s just constantly mutating. And a pandemic means that it’s not yet endemic, meaning that it impacts a lot of people at the same time. And then the usual way you get out of a pandemic is through natural exposure and an upgrading of the immune system. That has been going on since the beginning of time, since the beginning of the human experience on earth, we evolved to coexist with pathogens.

So the role of medical doctors in public health has been to focus on making sure that sick people have the means to get well.

[00:05:00]

That was not a consideration. At least, I can only speak for the U.S. case because that’s the one I know the best, but it was not a consideration at all. The NIH and the CDC just completely rejected the idea of early treatment.

And all my research points to one very grim reality: which is that very early on in the pandemic response the sole goal was to protect everybody from the pathogen through lockdowns and restrictions of mass meetings, closing of all indoor and outdoor congregate venues in order that we could wait for the vaccine to come along. The idea of the vaccine was that it would protect you against infection and transmission. And then we'd end the pandemic through this new technology called mRNA platform technology. And that would give the pharmaceutical companies a big boost, and everybody would love them and be grateful.

Well, that was the scenario that was mapped out sometime in February of 2020 by English and American public health officials. None of that scenario turned out to be true at all. First of all, the lockdowns and the banning of meetings, the dividing of the workforce between essential and non-essential, the plexiglass, the masking, none of that actually stopped the pathogen. It probably redirected or delayed maybe, although it's hard to say that there's a whole lot of evidence in that respect either. We don't see any real difference in virus trajectories between areas that were locked down and those that were not.

I mean, we have the case of Sweden, which had never had any lockdowns or school closures. They went through the pandemic like everybody else and they have some of the lowest mortality losses in all of Europe and no deaths among healthy children at all. So the lockdowns didn't really work to protect people from the virus; people were going to get it anyway. And the masks, all the random control trials show no evidence that the masks actually protected against the pathogen.

And the vaccine was— People think it came out fast. It was actually delayed relative to what they believed. I thought it was going to be rolled out by the summer. It kept being delayed and delayed. Some speculation that it was delayed for the U.S. election in November. It came out two weeks later, but once it was deployed, the evidence came in pretty quickly that it would not protect against infection. Whatever protection it did provide was very short term, maybe a couple, three months, and that it certainly didn't stop the transmission of the pathogen, which is to say it had no real contribution to make in the achievement of herd immunity.

So all this entire time, people kept getting sick. Now, remarkably, the people that were advocating for early treatments and had found a nice cocktail of things for people to take who get sick were censored; their voices were censored online by social media companies, and they were dismissed and denounced by major media at the behest of government officials that were running the pandemic response.

So this went on for the better part of two years. Now, in a lot of countries, and I'm speaking about Central America and Eastern Europe and many places around the world, people figured out that a combination of ivermectin and zinc and doxycycline, to prevent against secondary infections, was enormously successful. India had a miraculous experience really with ivermectin, and it was true all-over Central America. Mexico, El Salvador, these are not prescription medications. They were available over the counter and handed out to everybody, and it really helped the population. But in the U.S., and probably true in Canada too, these things were almost impossible to get.

And it was all because we were relying exclusively on the vaccine to solve the problem of the pandemic. The vaccine turned out to have not achieved anything like what they had predicted. And in fact, there's a lot of evidence that the highly vaccinated were also even more, and this is from all over the world, more likely to contract COVID. And sometimes even more likely to have adverse reactions

[00:10:00]

due to immune dependency enhancement. So what that means is that the vaccine rewires the immune system in ways that make it smart only against one variant, but when the variant changes, it increases individual vulnerability to the new variant.

So all of this could have been anticipated. In fact, was anticipated. I'm not a medical doctor or a scientist in this field at all. But I knew all of this from just ninth grade biology class and from reading a first-year medical textbook on virology that I downloaded in the early part of the pandemic. So I could have predicted everything that happened. But for some reason, the officials behind this response did not understand this. And so they began to impose vaccine mandates and threaten people with their jobs.

Our data indicate that millions of people were displaced from their professional positions, either by being outright fired or just being afraid of the vaccine mandates, not wanting the vaccine, being afraid of being fired, getting fed up with being badgered and harassed and criticized and then demonized as being unvaccinated. You remember the U.S. administration said that the pandemic was entirely the fault of the unvaccinated, which is completely false. So lots of people's lives were dramatically disrupted through these vaccine mandates that turned out to have absolutely no public health justification at all.

Wayne Lenhardt

Do you see anything that the average citizen or any groups of citizens could have done in order to derail this process as it was happening?

Jeffrey Tucker

There was a great deal of fear in the air. We all have fantasies of alternative scenarios. What if the artists had stood up and said, "We're not going to be silenced?" What if the dance halls had not closed? What if the churches had stood up and said, "We're going to continue to let people worship God?" What if the small stores had just opened in any case?

The problem with all those scenarios is that while they might have worked on a mass level, we have plenty of evidence of the people who did do that were arrested, like the previous person who testified here, were arrested and harassed by the government. And a lot of people can't afford fines; they don't want legal entanglements. They certainly don't want to go to jail. So many people were just terrified into going along.

You also have the additional problem that mass gatherings now, even protests, are not as easy as they used to be due to facial recognition technology. We saw in the case of January 6, 2001[sic], everybody who was on Capitol Hill that day has been chronicled in a book and many have been jailed. Others have been harassed and forced to testify, and their lives have been ruined solely for speaking out for political reasons. So these days, it becomes much more difficult to protest these kinds of actions due to these new technologies. So I understand why people were afraid to get out and protest: nobody wanted to be demonized, and even private gatherings in those days were extremely difficult.

In western Massachusetts, I can tell you that anybody who held a house party was in danger of being demonized by the local media. What people were doing, and it's not necessarily the police but individuals were doing, was flying drones around the community and discovering houses with lots of cars parked out front in the evening and taking pictures of them and sending them to the local press, which would put these pictures of these

houses on the front page of the newspaper and claiming that super-spreader events were going on. That alerted the local public health authorities, who went in and fined and harassed people there, including chasing down people and their licence plates. So this was a kind of reaction that we never would have expected in any kind of civilized country that calls itself free with rights for the individual. It's almost like all that stuff just got put on the shelf.

Wayne Lenhardt

So what do we do going forward to make sure this doesn't happen again, in your opinion?

Jeffrey Tucker

Well, I think in the first instance we need to find out more truth about why all this happened.

[00:15:00]

And why is it that our representative government suddenly became disabled? I mean, the people we vote into office to protect us and serve our interests were silenced and disempowered. We need to find out exactly why that happened.

A major problem, I'm not sure about that in the Canada case, but in the U.S., a major problem is that a lot of this is clouded under secrecy under the excuse of national security. So it was a national security response. This began on March 13, 2020, where the policy rulemaking power was transferred out of the Centers for Disease Control over to the National Security Council. That meant that everything is locked in secret. So this is a major problem. Just finding out the truth about what went on is extremely difficult.

I've got a whole team of researchers that's dedicated to this on a full-time basis. And we've run into all kinds of stops. I mean, even filing Freedom of Information requests have not been entirely successful due to redactions for national security reasons. So that is a major problem. So finding out the truth is one thing we have to keep at it.

The second thing we really need to do is convince our legislatures and the people who represent us to end the possibility that anything like this could happen again. And the only way to end that, to my mind, is to completely repeal the quarantine power of federal governments because we've seen how they've massively misused this. I mean, quarantines in the past have never been used for healthy populations. You would never use a quarantine for a healthy population. That just never happened at all in human history. And then suddenly, whole populations, hundreds of millions of people, were subject to quarantine rules by governments. So that power needs to go away. Most governments in the world never had that kind of extreme quarantine power until sometime in the 1940s. And the reason they didn't have it was because it was so subject to abuse. So I would like to see that completely gotten rid of.

Another thing that we really need to tackle is the inordinate power of the public health bureaucracies. That really has to come to an end. And the only way I know how to do that is to permit our elected representatives to be able to fire employees when they're up to no good or even just dramatically cut their budgets. I think something needs to happen to prevent that from happening again.

On the problem of censorship, we saw many cases, we have vast amounts of evidence, amounting to tens of thousands of pages of documents, that show that governments were cooperating very closely with social media companies, big tech companies, and media companies generally to censor dissenting voices in ways that are contrary to all conceptions of free speech. So that sort of close, collaborative relationship between Big Tech, Big Media, Big Government, and for that matter, big pharmaceutical companies, really needs to come to an end. We need a clear wall of separation between government, media, tech, and the pharmaceutical companies, or else we're going to face the situation of continuing collaboration and abuse of the population's rights in the future. That's extremely important.

Wayne Lenhardt

Is there anything that we could have done in order to do that while this was happening that you can see?

Jeffrey Tucker

I think we were all very naive in the early days. We didn't really want to believe that companies like Facebook or companies like Microsoft and LinkedIn and so on were cooperating so closely with the federal government. I think we've all been shocked to discover this.

We knew that people were being censored or throttled in their reach or just blocked and banned. We didn't know it was happening at the behest of government agencies. So I don't think there was really anything that we could have done. One thing I think we'll know for next time is just to have less trust in our public health agencies and these big social media platforms and the

[00:20:00]

major media that served as a mouthpiece for government for the better part of two and three years.

So to my mind, citizens need to start looking at alternative media sources and using different kinds of technologies and getting promises from the companies that we're dealing with that they're not going to cooperate with Facebook and Google and Microsoft and the rest of these companies that have showed themselves to be so thoroughly compromised. I think it's extremely important that citizens get control of their privacy again. That could mean turning to completely different forms of communication between ourselves, bolstering our local communities, in-person meetings, and relying less on these centralized sources.

I hope that happens the next time they try to pull something like this because they certainly have lost trust. Every poll in the United States—I'm not sure about Canada—shows that there's a mass loss of trust in media and Big Tech and in public health, generally in government as a result of this experience. I hope that loss of trust translates into something good, which is that we stop relying on these companies and trusting big media as much as we have in the past.

Wayne Lenhardt

Yeah. Okay, I think I'm going to ask if the commissioners have any questions for our guest.

Commissioner Drysdale

Good morning, Mr. Tucker, and thank you for your testimony.

I have a question. You talk quite a bit about, and there's been a lot of news about the cooperation between the big tech companies and the government. You know, I was raised in a time when every town, every city, had its own little newspaper and its own little set of reporters. And I'm wondering, I haven't heard a lot said about what happened to those traditional media sources, those newspapers with those reporters, working at them in every community, who were competing against each other and telling the story and doing investigations. Can you comment a little bit about what happened, or what you believe may have happened in those traditional print media areas?

Jeffrey Tucker

Yeah, everything changed over the last 25 years. Print media began to be replaced by the internet. And then, the industry became entirely reorganized so that even local media was entirely dependent on centralized media sources, to the point that they no longer really had much independence, and that remains true today.

Another problem is that a lot of the reporters— And this became a huge source of frustration for me over the course of three years. A lot of these local reporters know better than to report things that are contrary to what the dominant mainstream media is saying because they don't want to harm their careers. Because every local media essentially wants to be bought out by a more centralized media, and the reporters want to hang on to their jobs and then experience advance.

So these days, we really are having more and more to rely on citizen journalism, which is taking place at places like Substack and Twitter, ever since Elon Musk took over, and other venues. It's really the only place you're going to get kind of independent news because the entire industry has gone through such a dramatic upheaval to the point that local news is not really local news anymore. I mean, I know this myself. I remember one time I got a call from CNN to talk about some economic subject, and I was surprised over the following week that my one clip appeared in thousands of local venues all over the country, all branded by the local station. I mean, it wasn't local news, but it was all branded under the local station. So this is how it works. It's all become industrially centralized and canned, and therefore, easy to control by government.

Commissioner Drysdale

You know, we always talk about, in Canada and the United States, the free market, free market of business, free market of ideas. It sounds to me like you're not describing a free market of information.

[00:25:00]

Jeffrey Tucker

Yeah, not at all anymore. It became very important during the pandemic years especially for centralized government powers to control information flows. And that impacted everything from early treatments to opinions on lockdowns. You know when groups in the U.S. and Canada protested, the media swung into action demonizing them as disease spreaders without any evidence. So you know, controlling the news has become very important to corrupt bureaucracies and governments.

Commissioner Drysdale

You know I'm old enough— Perhaps I shouldn't bring this up, but I'm old enough to remember the Vietnam War and the coverage that the American and Canadian press had of that event. And to my mind, that was not quite comparable; this is an order of magnitude different. But it was something that tugged at the very fibres of the American society. And can you comment a little bit about the difference between the way the press either challenged or did not challenge the government narrative and how they reacted at this time?

Jeffrey Tucker

This time, it was almost a universal agreement that these actions, we should be clear, are without precedent. I mean, in our lifetimes, they're really— In hundreds of years, really, we've never seen anything like this. It was as if rights and liberties that we had won over the course of a thousand years of historical progress suddenly didn't exist. You'd think that it would have been a greater source of controversy, but it was just the opposite. I mean, the media was acting as if this is just the way you do pandemics. I can promise you: this is not the way you do pandemics.

The actions of governments all over the world, which basically are copying the China model, had no historical precedent whatsoever and should have been enormously controversial. But instead, the media just completely fell into line. And now, you see what's going on: They just basically stopped talking about it. Media these days will report on things like ill health, or the loss of education on the part of students, or growing amounts of teen and young adult mental disorders and problems, and the rise of depression and drug abuse, and all these things that are a fallout from the lockdown years. And yet, never mention that it has anything to do with the public health response. So the censorship, some of it self-censorship, is still going on.

Commissioner Drysdale

In Canada, and I believe the United States is the same, we have legislation, and in Canada it's called the *Anti-Combines Legislation* [sic]. I believe that's not quite the real name, but the intent is to prevent monopolies from removing our free market. The reason I say that is because when I listen to what you say, and you being an economist, I listen to what you say and I believe what you're describing is a monopolization of these venues, and that is supposed to be illegal in Canada and the United States.

Jeffrey Tucker

Well, when the monopolization benefits a very powerful people, apparently there's nobody left to object to it, which is why I think the ultimate solution to this is a kind of decentralization citizen journalism. I mean, it's a very painful process. People have to wean themselves from their attachments to national media, you know, turn off those notifications, delete those apps. It's the only way we're going to get from here to the truth. I don't think the antitrust authorities in any country are interested in busting up big media at this point because it's serving their interest too much, sadly.

Commissioner Drysdale

Is there not precedent, particularly in the United States, for antitrust laws to be applied to large industries?

Jeffrey Tucker

Yeah, there is. But not usually when those large industries became monopolized with the cheers of themselves. And so we've seen over the pandemic period that these monopolies have served very powerful interests. So they don't have any interest in busting them up, unfortunately. There's plenty of antitrust to do these days. But it's not likely to happen. And in fact, I'm not even sure how it really would happen. I think the most important thing we could do right now is to unplug national security from its controls over our big media venues. And we're nowhere near being done with that, unfortunately.

[00:30:00]

Commissioner Drysdale

Thank you very much, sir.

Wayne Lenhardt

Are there any other questions from the Commissioners? No. Okay, well, thank you very much for your interesting presentation.

Jeffrey Tucker

It's my pleasure. Thank you so much for having me.

[00:30:26]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 3: Diedrich Wall

Full Day 2 Timestamp: 03:01:37–03:40:21

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

So now, if that's it for questions, I would like to call our next witness, Mr. Rick Wall, who is attending virtually. And Rick, can you hear me?

Diedrich Wall

Yes, sir.

Shawn Buckley

Okay, so first of all, I'll ask if you can state your full name for the record, spelling your first and last name.

Diedrich Wall

Yes, sir, my full name is Diedrich Wall, D-I-E-D-R-I-C-H, last name is W-A-L-L. Most people call me Rick, but that is my full name.

Shawn Buckley

And we'll call you Rick, because that's what you're comfortable with, and I'll ask you if you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Diedrich Wall

I do.

Shawn Buckley

Now, Rick, you're almost being provocative today because you have a Canadian flag behind you. And I never thought I would, as a Canadian, where my inside voice will say, "Oh, boy, that's kind of an act of rebellion, a Canadian flag."

But you have some interesting involvement in what I'll call the Trucker Movement. So let me just introduce you, and then I'll ask you to explain your story and what happened. But my understanding is that you are the owner of a trucking company in southern Manitoba. And your company does a lot of cross-border shipping since 2009, but you've been running the company for 11 years now.

Diedrich Wall

Correct.

Shawn Buckley

And that you became very involved in the trucking protests. Am I correct about that?

Diedrich Wall

Yes, sir.

Shawn Buckley

And in January 2021, you started getting involved in anti-mask rallies in Winkler.

Diedrich Wall

Yes, sir, correct.

Shawn Buckley

And then for the first couple of months of 2022, you became involved in the Freedom Convoy?

Diedrich Wall

Right.

Shawn Buckley

But you were actually involved in what might be the very first cross-border blockade on January 17, 2022. You were one of the organizers of the first blockade. We'll talk about that later, but I'm just introducing you right now.

Diedrich Wall

Correct.

Shawn Buckley

Okay. But before we get to the trucking part of this, I want you to share with us something that happened with you in an outdoor church. Because my understanding is in May of 2021, you got involved in an outdoor church. So can you share with us your experience there and what happened?

Diedrich Wall

Certainly can. I'd just like to take a quick opportunity to say thank you to the entire team at the NCI. I feel extremely humbled that I was asked to present or to share my story here today. And just thank God for all of you people on the Commission that you guys are donating your time in doing this. I think it's an extremely important part of Canadian history, so I commend each and every one of you for doing that.

Again, I'm a God-fearing father of three, and the last couple of years have been rather interesting to say the least. But yes, my journey in the freedom fight, well, I guess I became quite leery early on when the pandemic first started. There wasn't much scientific proof or anything at that point on which way was maybe the right or the wrong approach on this whole thing. But my critical thinking got the best of me early on.

Early in 2021, a good friend of mine organized the first freedom drive within the Winkler, Manitoba area. And I started helping and participating shortly thereafter. And then in early May of 2021, at this point, churches and everything were locked down. And of course, we as Canadians, or I guess like-minded people such as myself, felt extremely violated that our constitutional rights to worship freely were now officially stripped from us.

And so, we thought it'd be a good idea to organize outdoor church worship services. You know, "what's the harm in that" was our thought process during that time. But this was, of course, when the implementation of the outdoor gathering size had decreased to five, I believe it was. Outrageous to think that, that you're only allowed to gather with five people outdoors. But, yes, it was during that time.

So we organized— The first one was on May 5th, correctly. It was just at a public park. We made sure we stayed off— Like there's a big stage in the city of Winkler where we conducted this. But we stayed off public property, except for the fact of the actual grounds that we were at.

[00:05:00]

We stayed off the stage. We just kind of set up our own little setup and had somebody come out to bring a message, sang some praise and worship songs.

All the meanwhile, we had our Chief of Police not in uniform, off duty, with his personal vehicle. He parked close to the stage and monitored basically our every move and counted how many people attended and therefore got in trouble for it sometime later.

Shawn Buckley

So can I ask how many people would have come out to this event?

Diedrich Wall

If my memory is correct, I would say between 70 and 100 people. We did this two consecutive Sundays in a row. So both times, I think, it was probably pretty average between 50 and 100 people, or somewhere in there.

Shawn Buckley

Okay, and I just want to make sure that I understand. So you've got 70 to 100 people in an outside park, am I right about that?

Diedrich Wall

Correct.

Shawn Buckley

And they're singing hymns,

Diedrich Wall

Hmm, hmm.

Shawn Buckley

and they're listening to somebody give a message.

Diedrich Wall

Correct.

Shawn Buckley

So basically, they're listening to preaching.

Diedrich Wall

Yes.

Shawn Buckley

And the Chief of Police who's known, because this is a small town, is there in his private car photographing who's there.

Diedrich Wall

I understand your question. Oh, so you're asking whether he was in his private car taking photographs? Is that your question?

Shawn Buckley

Yes. Yes.

Diedrich Wall

Yes. In fact, that was the reason why he was there. He documented the event. Therefore, I guess, justifying them later on, fining all three of the organizers for these two events. We were all ticketed for each event. Ticket amounts were— They were for not complying with public health orders and they were for \$1,296 each. I received two of them.

Shawn Buckley

Right, so for your participation outside, singing hymns and listening to a sermon, basically over \$1,000 in fines.

Diedrich Wall

Correct.

Shawn Buckley

And this is in the town of Winkler, Manitoba.

Diedrich Wall

Yeah, it's actually a small city. It's considered a city, but yeah, in the city of Winkler.

Yeah, it was very saddening to witness this time, especially when it came to church-related things. I mean, you think we live in a country where we should have the right to worship.

And it was hard to put it into meaning, what those times are like. And again, when you guys play these clips in between of our public health officers and Premier announcing these measures— Those raw feelings come back. And yeah, it's still hard to believe that we went through that time.

Shawn Buckley

So can I ask you how it affected both you and your family not to be able to attend church? Because my understanding is because of the fines, you guys only did the outdoor church twice.

Diedrich Wall

Correct. Yeah, they made it pretty clear that any time going forward we were going to organize anything like this, that more tickets could be issued. So, and again, memory doesn't serve me well enough to know exactly if that was one of the only reasons why we stopped. Because at this point, I myself was in the same shoes as Patrick that just testified.

You know, you get to a point where you see how unlawful, within the sense of law, all of this was at this point. And where do you finally draw that line and say, you know, it doesn't really matter how many fines I'm going to get. I'm going to do what I'm convicted to do: what I feel God's leading me to do and what I know is true to do.

So I mean, again, I don't recall exactly what the reasons were why we quit doing the outdoor worship services. But at this point, we continued on and had consistent outdoor rallies in the city of Winkler, kind of like they did in the city of Winnipeg as well.

And that was ongoing. And again, even at those rallies, we had consistent police presence again, documenting, and so forth. But as far as tickets go, those are the only two tickets that I received throughout the entire duration of the last couple of years.

Shawn Buckley

I know that we've been asking witnesses what could have been done differently, and it seems to me clear that for protesting, the freedom protesters just had to get the Black Lives Matter people there and they would have been okay. But we live and learn.

Now you got involved in what I'll call the Emerson, Manitoba—the first protest on January 17th, 2022.

[00:10:00]

Can you tell us about how that came about and what that looked like?

Diedrich Wall

Yes, certainly. Shawn, you're breaking up a bit there, so I hope—

Shawn Buckley

And you were too, but you're better now. Are we okay on your end?

Diedrich Wall

There we go. Okay, you're just breaking up there a bit.

But yes, so basically, I run a trucking company, cross-border trucking company. So for our company, it's extremely important that we can cross the border. That is [inaudible:

00:10:32]

And me and my wife talked about it many times and prayed about the whole situation. If the time would come— I'm sorry, I seem to be breaking up here.

Shawn Buckley

We can hear you fine here.

Diedrich Wall

Okay, awesome. So we basically said, too, when the time would come for the truckers to take a stand, we were not going to take a back seat. And again, there was talk about the vaccine mandates being imposed on the truck driver, which again we have to remember: The truck drivers were the heroes throughout the entire duration from when COVID started up to this point. You know, willing to go where nobody else was going to go. And so, they basically went from hero to zero pretty quickly.

And now, when they had basically imposed the mandates, I think, on most industries at this point, it was time to [inaudible: 00:11:27] truck drivers as well, for those that had chosen for whatever reason, some very obvious reasons at this point, to not get the vaccination.

And again, we told ourselves that if that point came, we were going to take a stand. And when it was announced that on January 15th, '21, Canada would start to implement drivers needing to be vaccinated or have a negative PCR test upon arrival or, otherwise, would need to quarantine for 14 days, and also, could likely be ticketed.

With that said, within literally a couple of days, and a bunch of help from a whole lot of people, we were first. We called it a slow-roll protest at the Emerson— That's the Manitoba-U.S. border on highway 75, just south of Winnipeg, and that was on January 17th. We arrived there at 3:45 a.m., if I remember correctly, or maybe it was 4:45 a.m. But it was very strategically planned: we know how busy that port is when it comes to truck traffic, and Monday mornings are always the busiest.

So we did that very strategically, and of course, our plan was to basically abide by all traffic laws. We had no intentions of blocking the road. We just basically wanted to slow traffic down and come out with our flags and signs, and basically, show our dislike with the decision the government had made for truckers at this point. And so, that's what we did. We basically showed up there and we started— When I say “slow-roll” for those of you that don't know what that is, it's just literally going basically as slow as a big rig is going to go, low-gear idle. You're walking faster than that. So that's what we did there on January 17th.

Shawn Buckley

So basically, you backed up the traffic probably for miles. Can you still hear me?

Diedrich Wall

Oh, now I can hear you, Shawn.

Shawn Buckley

Okay, so I asked, did you back up the traffic for miles?

Diedrich Wall

Yes, certainly did. It was very effective. We had a lot of support out there from our supporters. And it was pretty interesting to see how many truck drivers that were basically caught in a slow-roll taking up a lot of their day were very supportive as well. Of course, there was some that were very upset, rightfully so. They didn't understand what was going on there. But, yes, we definitely accomplished what we set out to do.

And I mean, the event caught media attention globally after the first couple of days. And it was the start of the trucking movement. While I have to state that the Freedom Convoy to Ottawa, this was already in full stages of planning. I had no participation in planning for the Freedom Convoy to Ottawa.

But we just saw it was important to do this protest at the border on January 17th, literally, two days after they imposed this mandate for the truckers on the Canadian side. We thought it was strategically important to do it at that time.

Shawn Buckley

Now, you didn't plan the Ottawa trucking protest,

[00:15:00]

but you did have your trucks participate. Can you tell us about the participation of the trucks from your company?

Diedrich Wall

Yeah, for sure. So yeah, we were very much involved, not in an organizing aspect of it. But again, I go back to what I stated earlier that me and my wife prayed about it and thought about it long and hard and our involvement, our company's involvement, because we all saw what happened to a lot of people that participated. And I'll get into that a little bit later

and to what our involvements ended up costing us. But in that sense, we were content with the fact that we could literally lose everything.

It was a pivoting moment in the whole movement, I feel, but we just felt totally at peace with it because I go back to stating what I said earlier. You know, it felt like a true conviction that this is what we needed to do. And no matter what the outcome would be at the end of the day, we would still feel good about that decision because we followed the path of what's true and right instead of just sitting back and—

Shawn Buckley

I'll just interrupt you, but if you can, because we've got some time constraints, if you can tell us about your participation, what your company did.

Diedrich Wall

Absolutely. So we had nine trucks in total from our company that participated in the Freedom Convoy going to Ottawa. Only four of them went all the way to Ottawa. Five of our trucks went slightly, just a little ways into Ontario—Kenora, Ontario. It was a stopping point there, turned around and came back and started organizing for the next protest in Manitoba. Four of our trucks carried on to Ottawa and stayed there for the entire duration.

Shawn Buckley

Then my understanding is one of your trucks in Ottawa got towed at the end when the government marched in.

Diedrich Wall

Yes. I have to make a correction on that. The truck didn't in fact get towed, but basically what the enforcement group— I don't know what group confiscated these trucks, but basically what they did— The trucks they could drive out, they drove out, and the ones they couldn't drive, they towed out. Our driver's truck, they were able to get into it. Our driver still to this day doesn't know how they started it because he had both sets of keys with him, and he was not present when his truck was taken. I must also state that it was an owner-operator truck. The driver owned his own truck but leased on to our company, and yes, it got confiscated and was impounded.

Shawn Buckley

And there was a \$1,300 fine, I think.

Diedrich Wall

Correct. Yeah, that wasn't the exact amount but, yeah, within the realm of \$1,300. After a week of confiscation, we were able to get it out. But the interesting part was, it didn't just sit in the compound and we could just pay our fine and get it out.

This was a truck and trailer. They physically ripped the licence plates off of both power and trailer unit. And of course, I mean that's a registration to travel up and down the road, so we had to get permits just to get the truck back home. I thought that was a rather interesting—something that I don't think would have been necessary, but, yeah, it was just very unique.

And then, also, our permits to operate within the province of Ontario was pulled for an entire month.

Shawn Buckley

Well, maybe those people that took the plates off were some of these good Canadian ambassadors.

Diedrich Wall

That could likely be.

Shawn Buckley

Yeah.

Diedrich Wall

I thought it was interesting.

Shawn Buckley

Now you talked about a Manitoba protest. And this is an important topic because we're in Manitoba today, and people from Manitoba know about the Manitoba protest and it did get some media coverage in the nation. But a lot of Canadians actually don't know what happened in Manitoba with your protest and definitely internationally. Like internationally, everyone knew about the Ottawa one. And I think it's important for you to share in some detail what happened here in Winnipeg, Manitoba.

Diedrich Wall

Yeah, certainly. So like I stated earlier, obviously my heart was set to go to Ottawa as well. I really wanted to go, but after doing some more thinking about it, we thought it was important to organize something in Manitoba because a lot of people couldn't go to Ottawa. It just wasn't feasible for whatever reason.

So we decided to stay back and organize another slow-roll, actually right back at Emerson. And again, this was strategically organized for the date of January 29th. This was when the Ottawa convoy was to be expected to arrive in Ottawa. So we thought it would just be uniform. Again, we're all in the same fight to do it on the same day to get back to the border at Emerson.

And this time, we were there for a longer duration. We were there from January 29th to,

[00:20:00]

I believe it was, February 2nd. So we were there for quite a few days. Same thing again, you know, just a slow-roll. We didn't block the road, but again, it was much more effective even this time than it was the first time. We definitely had our voices heard, we feel. So I'll just carry on here with how we ended up at the legislature building, if that's alright?

Shawn Buckley

Yes, please do.

Diedrich Wall

We were at the border slow-rolling until February 2nd. I believe it was on February 1st, I had somebody reach out to me from another group of organizers within the city of Winnipeg. They were saying that they were planning a protest there and they would love for the truckers to join them. So we did some thinking about that and thought it would be a good strategic move if we go to our local legislature building within the city of Winnipeg. And of course, it would be smaller scale, but, in a sense, the same thing as to what was happening in Ottawa.

So we took that opportunity to refocus our efforts and took a day off. But then on January 4th [sic], once again early in the morning, I believe it was at 3.30 a.m. or something like that, we arrived in front of the legislature building and set up the trucks. And the trucks that we had there currently, four of them, I think we came there with big rigs, and then the rest of it kind of just formed on Broadway and Memorial. The rest of it formed kind of like Ottawa, smaller scale. People started setting up, you know. We had people with food trailers come out, all kinds of things like that.

Shawn Buckley

Can I just stop you? It wasn't just your trucks that were there. There were other truckers, there were like 40 or 50 trucks.

Diedrich Wall

Yes, sir, I think at the height of it, there was around 50 trucks and then, of course, a lot of other participants. There was one Saturday where a whole bunch of farmers came out and brought their tractors out; I mean, the boulevards were lined with the farm equipment, farm tractors. And yes, a lot of big trucks and a lot of local supporters came out throughout the duration of the protest there. It was an amazing expression of, not expression but it was just the whole event was just—I can hardly put it into words, you kind of had to be there. It was very interesting from an organizer perspective. It was a very unique and interesting experience. I can only speak on behalf of myself who went through it. I was one of the organizers there throughout the entire time.

So the continuation of the negotiations with the Winnipeg Police, they were awesome. I can't give them enough credit: they were very respectful to us, but they had a job to do. There were daily negotiations as to things we could and could not do. But I mean their strategy was to eventually get us to leave, which that ultimately did happen after a couple of weeks.

Shawn Buckley

Now was the protest peaceful?

Diedrich Wall

Yeah, 100 per cent. The only un-peaceful event at the legislature protest was what we believe was an Antifa supporter. It was somebody that did not support the movement, that basically came through the crowd with an automobile and struck several supporters that

were there at the event. That was a pretty scary moment that happened early on in the protest. That individual was arrested, I believe, if I remember correctly. I didn't follow the story too much afterwards.

But that was the only un-peaceful thing that I would have recalled. It was just like Ottawa, just a smaller version, all the stories you hear: People coming to support. Farmers coming out bringing fuel for the big trucks. Huge groups cooking food every single day for everybody. No, there was just more unity there than anything else.

Shawn Buckley

So it was really the community coming together in a joint protest to seek change.

Diedrich Wall

Absolutely. I'd like to also add, just to answer your question more thoroughly whether it was a peaceful protest. And someone might be able to correct me and remember this better that was at the event— The Chief of Police, after everything was said and done, deemed this to be one of the most peaceful protests in the history of Winnipeg. So we took some credit for that. And there too, we tried to do our utmost throughout these negotiations daily with the Winnipeg police to meet with what their ask was of us, at the same time, trying to hold the line and keep reminding them as to why we were there as well.

Shawn Buckley

Now, my understanding is the purpose of being down there was you guys were requesting a dialogue with the provincial government and Premier Stefanson. Am I correct about that?

Diedrich Wall

A hundred percent. That was our ask. We merely wanted a conversation with the Premier's Office, and we were denied that right the entire time.

[00:25:00]

And what was kind of painful about that, I'll make it really quick. I believe it was a week, or maybe two weeks, after we left the site that our protest ended, the Ukraine thing started. And of course, I respect everybody. I mean, I respect the Ukrainian people. They definitely had the right to do— Well, they gathered at the legislature building, basically.

And Heather Stefanson had no problem coming out addressing her concerns and her support for these people, which I think is awesome. That's great that she did that.

But we just thought as organizers for our event— We're Canadians. We're pleading for you to have a conversation with us. And our ask isn't anything complicated, right? We're asking to simply have our constitutional rights and freedoms back.

But yet, she had no problem addressing them when she denied our rights and ignored us the entire time we were there. I thought that was a pretty sad example of a public servant that's supposed— That's there for all Canadians, not just for a select few.

Shawn Buckley

Now, we've heard the same from some people that were at the Ottawa protest. We had Tom Marazzo indicate that at no time did any member of the federal government actually speak with them.

But at the end of the day— And I just thank you on behalf of Canadians and actually the entire world because you truckers woke us up. And at the end of the day, there were some changes made because of the actions of truckers like you. And I know you've thought about that, but it just seems to me that you guys exposed some things. Can you share with us what you think was accomplished?

Diedrich Wall

Absolutely. So the question was asked many times by a lot of people: What do you guys feel that you accomplished? What was your wins? For me it was pretty simple, as most will remember. During the protest time, different provinces started to announce that they were going to start lifting restrictions, including Manitoba. Before we left, they announced that they were going to lift the mask mandates, which we thought was huge. I mean, no credit to self or any of the organizers. I think most of us were all fairly like-minded: it was all a group effort. But the group effort, we believe, was a huge contributing factor to them announcing these mandates being lifted.

I strongly feel the mandates would have been in place for much longer had we not protested. Some of the biggest wins that I would take away from it: First of all, the corruption right down to the core from our local municipalities right up to the federal government that was exposed. I think many people did not realize how deep it went. I know for myself I didn't.

It was amazing, again, going back to Ottawa where the *Emergencies Act* was invoked, I believe for the very first time, for breaking up a group of peaceful protesters. I thought that was the definition of insanity in a so-called free country that we live in. So huge wins I would say was basically exposing the corruption.

And another one, just the unity that the government had worked so hard to try to break apart within Canadians for a couple years. We saw clearly that Canadians, when it just came human to human, we respect and love each other. We love our country, and there was such a massive movement of support for the trucking protests.

I thought that that was a huge win, just showing the world that no, Canadians don't hate each other. It doesn't matter which side of the aisle you're on, especially when it comes to the vaccine. I mean, that's been a disturbing conversation to me for the entire time. **Respect each other for who you are as individuals, not for medical decisions you make, which the government wanted us to do.**

So it was a sense of unity and bringing people back together. Again, those are a couple of the big wins. Again, like I said, we saw mandates started to lift and so we thought we accomplished much. And to this day, I mean, had it not been for the entire process of what the truckers did, I think we would live in some very different times.

Shawn Buckley

I think most people would agree with the statement, and I've heard people internationally say it to me, that watching the Canadian trucker movement actually was the first glimmer

of hope because we can't think of any other example where a group of people actually stood up to say no. And the fact that you guys accomplished something shows that actually the only way for us to get our rights back is for groups of people to stand up and say no.

Before I hand you over for commissioner questions—

[00:30:00]

But I just wanted it to be clear. You guys didn't end the protest in Winnipeg just because you decided to go home. It was made very clear to you guys, by the police, that they were going to move in and basically do what was happening in Ottawa.

Diedrich Wall

Yes, correct. So just trying to rethink here now what the date was. The date lapsed my memory. But yeah, there came a day where, again, this was just one of our morning sessions with Winkler police, just a typical negotiation session. And they did come in with a document basically stating that we had a day, I think it was February 22nd if I remember correctly, but that we basically had a day to get everything off the premises and have everything cleaned up or trucks were going to start to be towed. Same thing as was happening in Ottawa.

They stated the fact, as well, that the *Emergencies Act* was still in effect and that they would use it if needed. So yeah, we were definitely forced off the property; again, we all left willingly. There was no hesitation from anybody; as we stated earlier, it stayed peaceful from beginning to end.

Shawn Buckley

Thank you. And I'm just going to ask the commissioners if they have any questions for you, Mr. Wall. And they do have questions.

Commissioner Drysdale

Thank you for coming out this morning, Mr. Wall. There's a few things you said that I was curious about. I've heard testimony over the last number of days from folks like yourself who were facing making a decision, and they weighed whether or not they would speak up or whether or not they would take an action, perhaps make an arrest or break up a protest. And they weighed that against the loss of their income and their pensions. I think, Mr. Erskine, I believe it was, a police officer who had made that statement. And what you said, and I wrote it down, was that you and your wife discussed whether or not you were going to protest and you realized that you could lose everything.

Can you tell me what you meant by that? Is that what you really believed? Why did you believe that? And how did you come up with the decision that you were going to move ahead anyway?

Diedrich Wall

I think that's a great question and thank you for asking it. Basically, when I say that we could lose everything, I guess I was pertaining that we basically were putting our entire company on the line. And we employ about 40 people, so that's a pretty substantial number, and of course, we'd be putting all those jobs in jeopardy as well.

But at the same time, we felt content with the decision, to the fact that— Like I said, I felt truly convicted. I felt a conviction from God, I'm a God-fearing man, that this was something that we needed to do. And the Bible teaches us that he will provide regardless, and so we felt we were going to be okay, whatever that okay looked like. If everything you know— Let's say, for example, that our participation would strip our rights to our registrations, licences, and so forth to be a trucking company, which it did within the province of Ontario. And I mean, there was many threats throughout the duration of the Ottawa convoy or Ottawa protest. So that concern was very real at that point already, and we knew going into it that there was a real risk of that happening.

Commissioner Drysdale

So I just want to be clear I understood what you were saying. So you were fully aware that you weren't just risking your own income, your wife's income, your family support, but there were 40 people working for you, which would have translated potentially into hundreds of people that would be affected by that decision. But you still felt the conviction to go ahead with this.

Diedrich Wall

Yes, sir, yep that's 100 per cent correct. And it wasn't without much consideration and then talking to our office staff. I mean, I can't think of one that wasn't supporting what we were doing.

And again, I felt it was a very bold move for a business owner. You didn't see many businesses, especially larger businesses— I shouldn't say you didn't see many, you saw lots of smaller businesses participate, but I mean it was a pretty bold stand to take. But again, my convictions were very bold, and there wasn't much question about it. And again, it was with the support of our office staff, which I am extremely grateful for to this day.

Commissioner Drysdale

My last question has got to do with your community in Winkler.

[00:35:00]

Winkler is a rural city in Manitoba; it's quite a close-knit community and it has a reputation for a faith-based life.

My question to you is— When you took the initial actions where you had the services, if you will, in the city park, how is that portrayed in the local media and how did that affect your relationship within the community of Winkler following that?

Diedrich Wall

That's a great question. So basically, our local media wasn't really much different than the mainstream media when any of these events were covered. So there wasn't much, and to this day, there isn't great support. I mean, some of the stuff that's happening to this day, they're starting to cover it a little more accurately, I feel, but there was no real support from the local media.

As far as support from the local community, it was absolutely huge. And you're absolutely right, I think Winkler's considered the Bible Belt of Manitoba, if not for Canada. And I truly

feel that these last couple years have really brought that out into light because the community like you said, it's very tightly knit. And yes, there's those that don't agree, which God bless them for it. We live in a country where we should be allowed to disagree with each other respectfully. But yeah, like I said, very well received by the community. There was never a sense of feeling that we really should stop doing this because the community just isn't supporting it and really rather have us not do it. So yeah, it was very empowering to continue ploughing forward.

Commissioner Drysdale

Thank you, sir.

Diedrich Wall

Thank you.

Shawn Buckley

And there's more questions.

Diedrich Wall

Thank you.

Commissioner Kaikkonen

Good morning. I just have a quick question about the service in the park, and I'm just wondering if you saw the Chief of Police at other points come out in his own vehicle, his own personal vehicle without a uniform, when you were doing the slow-rolls or any other moment in time? Or whether you felt that at this time, it was maybe your faith that was being targeted?

Diedrich Wall

That's a great question. I think with all due respect, I actually know this Chief of Police personally, and I'll be honest, I would consider him a friend. What he did the last couple years, I don't think was a nice thing to do to a friend quite honestly, but I do understand he has a role and a position, public servant duties that he needs to uphold as well. You know what? With all due respect, I don't think it was an attack on religion.

The Winkler police, they were very much monitoring all the different rallies. Like, we have so many different rallies within the city of Winkler and area. They were constantly monitoring us regardless of— And I mean, most of the other ones were just protesting against all the other mandates. So yeah, it was pretty consistent monitoring, regardless.

Commissioner Kaikkonen

Thank you.

Diedrich Wall

Thank you.

Shawn Buckley

Rick, it looks like the commissioners have no further questions. On behalf of the National Citizens Inquiry, I want to sincerely thank you for sharing your testimony with us.

Diedrich Wall

Thank you all so much and God bless each one.

[00:38:44]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Moderator Statement: Shawn Buckley

Full Day 2 Timestamp: 02:43:54–03:01:33

Source URL: <https://rumble.com/v2l6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

So welcome back to the National Citizens Inquiry in Winnipeg. We thought that after this break we would start with another video clip. So just to kind of bring us back and remind us of what we've experienced. So I'll just ask David if he would switch us to the clip.

[A video of news clips was played informing the public of emergency measures, including restrictions on public gatherings, closing of non-essential businesses, school closures, the community ambassador program, masking restrictions, vaccine mandates, and vaccine side effects. Below are transcripts of the audio content.]

[Video clip] Dr. Brent Roussin, Manitoba Chief Provincial Public Health Officer

Effective April 1st, all non-critical businesses will close. We know that in effect currently, public gatherings are limited to no more than 10 people at any indoor or outdoor place or premises. This includes places of worship, gatherings, and family events, such as weddings and funerals. Effective April 1st, all restaurants and commercial facilities that serve food are prohibited from serving food to customers in their premises. Bars will be closed. Personal service businesses such as hair salons and massage therapy offices will be closed.

[Video clip] Kelvin Goertzen, Minister of Education

Today following the advice of Manitoba's chief provincial public health officer, we are announcing that Manitoba's K-12 schools will have their in-school classes suspended indefinitely for this school year.

[Video clip] Brian Pallister, Premier of Manitoba

Stay home. Stay home and stay safe. This is not the time for large family gatherings. Don't risk making this weekend's Easter dinner a celebration with fewer people around the kitchen table next year. Do not do that.

[Video clip] Brian Bowman, Mayor of Winnipeg

Starting Saturday, we'll be initiating a community service ambassador program that will get ambassadors out in the community to look for, to help educate, and create awareness to those who are not respecting the public health directions. This includes closed city areas like athletic fields, skate parks, play structures, and picnic shelters. We'll be utilizing our bylaw enforcement officers to start warning and ticketing those who will be making use of the closed city facilities with penalties of up to \$1,000 and the potential of up to six months imprisonment.

[Video clip] Brian Pallister, Premier of Manitoba

We must do everything we can to continue flattening the COVID curve. We must stick to the fundamentals that have allowed us to be where we are today. And that is why we are extending the state of emergency for an additional 30 days. What we are doing is working. And we must continue to do everything we can to continue flattening the COVID curve.

[Video clip] Dr. Brent Roussin, Manitoba Chief Provincial Public Health Officer

The Prairie Mountain Health region is being elevated to the restricted level or orange in our pandemic response system immediately. Group size will be reduced to 10 individuals both indoor and outdoor. Masks will be made mandatory for indoor public places as well as any public gatherings. The entire province of Manitoba is moving to critical or red on the pandemic response system.

[Video clip] Brian Pallister, Premier of Manitoba

I'm feeling so sad at the loss of so many Manitobans, I can't begin to describe to you.

[Video clip] Dr. Brent Roussin, Manitoba Chief Provincial Public Health Officer

This sacrifice over this time will save lives.

[Video clip] Brian Pallister, Premier of Manitoba

Manitobans have a chance to point fingers and blame people like Dr. Roussin or me and that is unproductive behaviour. Everybody's afraid, everybody's stressed and the way to deal with this is not to panic. It's to have a plan and follow it and that's what we're outlining today.

[Video Clip] Actor in Santa Claus costume

I know some of you are worried about me, but I am well. In fact, I'm feeling great. Mrs. Claus and I have been self isolating. In fact, we've been doing it for years. Many, many, many years. Ho ho ho ho ho ho. But even with my Christmas magic, which keeps me strong and healthy, I am always careful when I visit all my little friends. I have custom-made masks designed by the elves that fit my beard. And of course, I always clean my hands well. Ho ho ho ho. I will certainly be visiting you all on Christmas Eve. Ho ho ho ho.

[Video Clip] Dr. Theresa Tam, Chief Public Health Officer of Canada

Wonderful! It's been a very tough year for kids, but they've all been doing their best to keep up with staying safe: washing their hands, wearing their masks, and keeping a safe distance.

[Video Clip] Actor in Santa Claus costume

Dr. Tam, between you and me, the good list is a long one this year.

[Video clip] Dr. Brent Roussin, Manitoba Chief Provincial Public Health Officer

Pandemics all have an end and this one is no different. We have a tool now to manage this pandemic quicker and that is a vaccine, which we should all be optimistic about.

[Video clip] Dr. Joss Reimer, Medical Lead and Official Spokesperson, Vaccine Implementation Taskforce, Government of Manitoba.

Despite the findings that there was no increased risk of blood clots overall related to AstraZeneca in Europe, a rare but very serious side effect has been seen primarily in young women in Europe. So out of an abundance of caution, Manitoba will be recommending that these vaccines only be used in people who are 55 and older at this time. I do want to say that this is a pause,

[00:05:00]

while we wait for more information to better understand what we are seeing in Europe. Typically, the symptoms happen four to twenty days after immunization and the symptoms can mirror the symptoms of a stroke or a heart attack.

[Video Clip] Dr. Brent Roussin, Manitoba Chief Provincial Public Health Officer

Even though our mask mandate is for indoor public places, even if you're gathering outdoors, I recommend wearing a mask if you're gathering with people outside of your household. If we are going to see a steep increase in cases like we've seen in other jurisdictions, then we're going to fall behind on that approach. That's why it's imperative to be cautious. We should be optimistic. We see spring, we see summer, we have vaccines, we have effective and safe vaccines, so there are reasons to be optimistic. But for the next many weeks, next couple months, we need to still be cautious as we roll out more and more vaccines.

[Video clip] Unidentified speaker from an unidentified media station

How the University will check for proof of vaccination or accommodate 6,000 foreign students without Manitoba health cards are also works in progress. Other schools are also developing policies. The University of Winnipeg, Canadian Mennonite University, and Red River College have all signalled there will be a vaccine mandate. University College of the North in The Pas is also instituting one. Brandon University said it will strongly encourage but not require vaccinations before the fall term begins but will examine a potential vaccine mandate in the near future. Assiniboine Community College in Brandon says its policy generally will require all students, staff, and visitors to campus to be vaccinated.

This afternoon the Louis Riel School Division said it would mandate vaccinations for all its employees returning to work in the fall. Now Winnipeg School Division, Manitoba's largest, hopes that the government will mandate vaccines in schools.

Shawn Buckley

I think that everyone watching this, both in person and online, are troubled by these reminders, and I don't want to apologize that we put these clips together to remind us. I have to say that I have strong emotions when I see things like that Santa Claus clip.

There was a witness in Toronto, Rodney Palmer, who also brought our attention back to the CBC piece where if Uncle Bob is talking about the conspiracy theory about COVID being in the lab, how do you basically defuse Uncle Bob? The fact that we are targeting specific messages at our children to create fear and to create compliance is one of the most alarming things I've ever experienced in my life. And what is going to happen going forward with this generation of children that have literally been indoctrinated?

The other thing that I think most of us have found disturbing with the two sets of clips is the government basically calling for ambassadors. It's almost like we're in, you know, East Germany while the wall was still up, and Stasi, the secret service. And when the wall fell and people were able to look at their files, what shocked them the most was how many of their close friends and family members had been snitching on them. And this is a core feature of police states.

And so for all of you good ambassadors out there in Manitoba and other provinces, the good ambassadors, the good Canadian ambassadors, who turned in their neighbours and their friends and people they don't know, please understand that we cannot have a police state without your participation. Police states depend on good ambassadors like you. You are the police state. You are the reason we lost our freedoms. Not you alone, but you were an important contributor. And going forward, I wish three things, really two things for you: I wish that you will never, ever be treated as you treated us. And I also wish for you that you will for your entire life be treated with respect and kindness. So I would like to call our next witness.

[00:10:00]

Oh, I'm sorry, one of the commissioners has a comment.

Commissioner Drysdale

You know, over the past number of days in Truro and in Toronto, and now all day yesterday and today, we've been listening to all kinds of Canadians giving us their testimony about what's going on and how this affected their lives.

You just showed our group videos of the premier of the province, the chief medical officer, and others. And my question is, why are they not here? What efforts has the National Citizens Inquiry made to have these people appear before us? So just like ordinary Canadians or all those Canadians who've taken time from their jobs and they've come here to testify, what efforts have we made, has the NCI committee made, to invite or ask these people who planned this, who executed this, to come before us and answer to the Canadian people?

Shawn Buckley

Commissioner, I can tell you that for the Province of Manitoba—and I can provide you with the names for other provinces—we sent summonses, as were permitted by the rules at the direction of the Commission Administrator, the Honourable Ches Crosbie. We sent summonses both by registered mail and emails to Dr. Brent Roussin, Chief Provincial Public

Health Office, Audrey Gordon, Minister of Health, Premier Heather Stefanson, former Minister of Health, Cameron Friesen, former Minister of Health, and we received no reply. I'm not going to read for the record, but I can provide to the commissioners right now two documents that set out to date, basically, what summonses have been issued.

Commissioner Drysdale

And can you describe how they were invited? And what I mean by that is, you know, these are busy people, we're told, and what kind of options were they given in order to testify before our committee?

Shawn Buckley

That's a good question. I can advise the court, or I'm sorry, the Commission, and anyone can go online and look at our rules. Our summons, our draft summons, is Appendix C. And one of the things that we were told before we finalized our rules is that we're likely to get responses from public health officers or ministers of health or other people that we send summons to, if they reply at all, that perhaps they're just simply not available on the date for which we issue a summons.

Because in all fairness, apparently a lot of them do have very busy schedules, and it's a legitimate concern to just give them notice of a date that we're requesting they attend. So the summonses are all drafted to make it clear that the NCI hearings are being held over several months. And that they can attend virtually so that if they're not available on the date for which the summons is requesting them to attend, they can contact the Commission Administrator and have a different date chosen. And the summons also indicates that the Commission has the opportunity to schedule a special appearance for them and that if that would be necessary, we could do so.

So we have taken every effort in drafting the rules and the summons to make it as easy as possible so that none of these people that were making decisions can, with any credibility, say that we did not give them ample opportunity to attend at the NCI. And of course, we want them to attend. We want them to explain why they made the decisions they did. We want them to explain what evidence they relied on. And you know, basically what they felt they were facing at the time.

So we truly feel it's a loss—not just to Canadians but to the international community watching these proceedings—not to have these people, choosing not to attend with us. Because this is something that we're supposed to be doing jointly.

[00:15:00]

We're not here to grind an axe. We actually want this to be a healing exercise where we understand each other. And we can't understand anyone if they won't come and tell their story and won't share it in this format where people are treated with respect, where the proceedings are managed, and where the evidence is given under oath. So that's the best I can say, Commissioner.

Commissioner Drysdale

Were they also given the option of attending virtually or in any of the nine cities that the Commission will be holding hearings in Canada?

Shawn Buckley

Yes, yes, the summons form, which we have only varied on one occasion, makes it very clear that they can attend virtually. And when I say it's only been varied on one occasion, is in Saskatoon, we're hoping to have Stephen Kirsch attend virtually as a witness. And he had asked one of the people connected with the Ontario College of Physicians and Surgeons, Nancy Whitmore, to engage him in a debate. And so we've issued a summons to her requesting that she would attend virtually on that date to be able to have a safe forum for which to debate with Mr. Kirsch. But aside from that, we've never deviated from the standard form summons, which makes it very clear people can attend virtually.

Commissioner Drysdale

Will these subpoenas be included in the information or the archives for the commissioners and for the Canadian public?

Shawn Buckley

Yes. So there should already be, and I apologize, I didn't check personally— But my understanding is that on the NCI website, we are listing, and actually having copies of the summonses that have been issued listed, so that Canadians and, again, people internationally can understand that the NCI is taking efforts to invite those officials that were making the decisions both federally and in each province to attend so that this can be as comprehensive of an inquiry as possible. And we're not sure what else to do. So I feel like I need to apologize to the Commissioners that we have not been successful to date in encouraging any of these people to attend.

Commissioner Drysdale

Thank you, Mr. Buckley.

Shawn Buckley

And I'll just hand out— Because it should be four copies. If each of you just takes two pages, you'll have a list of them to date.

[00:17:39]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 4: Natalie Kim Björklund Gordon

Full Day 2 Timestamp: 03:40:44–05:03:40

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Kyle Morgan

Good day, Ms. Björklund Gordon. Could you state your full name for the record and also spell your first and last names?

Natalie Kim Björklund Gordon

Natalie K. Björklund Gordon. N-A-T-A-L-I-E, K for Kim. Björklund B-J-Ö with an umlaut, R-K-L-U-N-D, Gordon, G-O-R-D-O-N.

Kyle Morgan

Do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Natalie Kim Björklund Gordon

I do.

Kyle Morgan

I have a copy of your CV here. I understand that you have degrees in science, a PhD from the Department of Biochemistry and Medical Genetics from the University of Manitoba, is that right?

Natalie Kim Björklund Gordon

The biochemistry degree that I did was in microbiology and chemistry at University of Manitoba and my PhD was in the Department of Human Genetics.

Kyle Morgan

I understand that, would it be fair to say, you have an expertise in epidemiology as well as public health and biostatistical analysis?

Natalie Kim Björklund Gordon

Yes, my work involved about three-quarters of the same type of coursework that is done for those training in public health. There's a lot of overlap between human genetics and public health.

And I also did my education on a part-time basis because I had small children, so I took a lot of courses on a slower basis, and I accepted positions, contract positions and short-term and long-term administrative assistant positions, teaching, and additional private work for physicians as part of paying for my education. So I prepared grants in ethics, and I did statistical analysis for physicians. And I also tutored medical students, and as part of my PhD program, I taught medical students genetics and statistics.

Kyle Morgan

Great. So we have your CV. It's Exhibit WI-1 for the record. I don't know if the commissioners have seen it. If we can add that to the record. Oh, can you swear, Miss Björklund Gordon that the CV is a true copy?

Natalie Kim Björklund Gordon

Yes, I swear that that is a true copy of my CV.

Kyle Morgan

OK. Now I understand that you have prepared a slideshow [Exhibit WI-1b].

Natalie Kim Björklund Gordon

Yes. This is to keep me on track, and I'll try not to run over time. I consider this more a personal testimony so if at any point something I've said is not clear or you wish to interrupt to ask for clarification, please do so. This is a less formal presentation.

Kyle Morgan

Very good.

Natalie Kim Björklund Gordon

So can we have the, there we go. Okay

So this is about my concerns as an expert. And we've already gone over my qualifications. I would like to point out that I have 17 peer-reviewed publications. And I published one book in embryology. And I have a second book in preparation. So I'm semi-retired. I'm not part of the academic community anymore, but I am still working as a scientist and producing quality material that is considered part of the scientific literature.

So if you were to summarize what my work has always been about, this very complicated picture, which comes from my book, is a whole bunch of proteins and how they

interconnect with each other and how signals go from the top of the cells down into the nucleus of the cell and result in changes in gene expression.

This interacting biochemical complicated system is present in all the cells of our bodies and work that way. And all of us have genes for each of these proteins, and there are individual variants of the genes within the population that can make them more or less efficient. And that is the main reason why we need to do a lot of epidemiology and statistical analysis. Because studying any one of these proteins is an entire PhD project all by itself. So you can't do this in isolation. You have to be able to examine the literature and see what everyone else is doing and put all the pieces together.

So my awareness of the pandemic began in January of 2020. I was hearing news reports that were concerning to me. When I was in my final year as a biochemistry undergraduate, I did a project in virology.

[00:05:00]

My mentor was working on the mRNA viruses. And so, I had a very intense interest in virology and in pandemics. And I almost considered that as a career choice. I ended up going into human genetics instead for other reasons. But I followed it very, very closely.

And by mid-February 2020, given the reports we were reading, my husband and I became concerned enough that we went into town and stocked up on large amounts of food, plastic sheeting, medical things for isolation, because we were really beginning to think that it was going to be a very serious pandemic.

At the end of February, my husband and I both became ill. And as it happened, we had a friend whose mother-in-law came to visit from China. Before she left China, she was visited by relatives from Wuhan. And the relatives from Wuhan had colds when they arrived. And she felt sick during her trip and initially put it down to jet lag. And eventually, a very nasty flu circulated in our community and my husband and I both became quite ill. I was sick for five days, basically bedridden. My husband was not as sick as that.

But I contacted public health thinking that, quite possibly, we had the Wuhan virus because by my understanding of contact tracing, we had a direct connection with symptomatic people to Wuhan where the pandemic was originating. But we were told we were not eligible for the PCR testing.

And I also found the PCR testing to be puzzling because I've done PCR myself. One of the labs I worked at, we had a full-time technician who did nothing but PCR. And that was his specialty. And he was noted for being able to get consistent, excellent results, which is something that's normally very hard to do. And I couldn't really understand how a PCR test could be being used as a diagnostic test. I figured maybe, well, I've been out of academia in the lab for five years, ten years, whatever it was at that point. And maybe they had some new technology that I wasn't familiar with.

But it was shocking to me that the airports were still open. People were still coming and going at this point. And there was no real contact tracing going on. I couldn't understand why this was happening. It didn't make any sense to me. It contradicted what I understood.

Shortly after we both recovered, my husband developed what we now know to be consistent with COVID toes. His toes looked blue and bruised. And he woke up at 3 o'clock in the morning, got up and collapsed on the floor, and it turned out that he'd had a right

lateral pontine stroke. And he ended up in the hospital. Fortunately, my dog woke me up, my wonderful dog, and we called an ambulance. He was taken in. And my husband's quite a bit older than me, so at the time, he was 78, which would have made him very high risk for this kind of complication from the virus. While we were in there, the staff were wonderful. I stayed with him most of the time that he was in there. It was very patient-centred. I was very happy with the care he got.

I mentioned to the doctors I thought that his stroke was related to the virus because I had been reading already about neurological effects from the virus. But the doctors kind of poo-pooed it. And they said, "It's not COVID. COVID isn't in Manitoba yet. And COVID is a lung disease, not a neurological disease." I didn't argue with them. It wouldn't have affected my husband's care.

The last Thursday that he was in hospital, I was very alarmed by what I was hearing about lockdowns, and I decided I needed to get my husband out of the hospital. And the staff was initially resistant. They wanted to send him off for rehab. They wanted to move him from Dauphin to Neepawa, where I had family to stay with, so he could have a longer recovery. I was becoming very, very frightened about him being locked up in the hospital. And I was beginning to hear stories about the spread of the virus in nursing homes. And I decided I was going to get him out of the hospital, no matter what.

And then the last Thursday, before he was released, which was right before when the lockdown started, I recall sitting in the room with him across from the nursing station and a bunch of men with suits and clipboards came in. And there was a lot of conversation and everything changed in the tone of the hospital. All the staff became frightened, rushed. And they went out of their way to help me get my husband out of the hospital. So an occupational therapist and physiotherapist came in and worked with me for a couple of hours. And the very next morning out we went, and I took him home.

And then the lockdowns happened. And that was an incredibly difficult period for me because my husband was recovering from a stroke, and I had no help of any kind from the government. I couldn't talk to the doctor.

[00:10:00]

There was no physiotherapy. There was no occupational therapy.

Now, a right lateral pontine stroke, patients can make a complete recovery from that particular type of stroke in about six months, but only if they receive intensive therapy. And there was no way to do it.

Now, I spent over \$1,000 purchasing equipment to take him home. And then after we were home, in order to get him the therapy he needed, we spent another \$1,000 buying a specific designed computer game called "Fit Me" that would allow him to do the therapy at home.

My daughter had an undergraduate degree in kinesiology. And she worked with me looking at YouTube videos and so forth so that we could come up with a therapy program for him. And our nurse across the street, who was a very dear friend, violated the rules of the lockdown and came over and helped take his blood pressure, make sure he took his medication.

And during this period, I really wondered. I had resources, education, and funding to take care of my husband in this position. What was happening to all the other people who were

dealing with something like this in the middle of this lockdown? And everything about it felt just wrong, wrong, wrong. And it was initially going to be only 14 days to flatten the curve. That didn't make any sense because what was going to happen when the 14 days were up? How was it going to help? And then it became another week, and then another week, and another week. And the community that I live in is a very small community.

After we retired, we moved into Alonsa, Manitoba. There's about 73 people, if you count the dogs. And it was a very tight-knit community and a farm community. And all of the seniors were basically abandoned. Their families weren't allowed to come and visit them. They didn't know how to use computers. I helped some of them to set up computers so they could maintain contact with their family. But it was a nightmare to see people. They were depressed. They were angry. They were frightened. And they were so isolated. And this was a very tight-knit community, where families were always getting together and everybody looked out for the elders. And all of a sudden, all of that changed.

Kyle Morgan

Miss Björklund Gordon, can I just ask you one point here.

Natalie Kim Björklund Gordon

Sure.

Kyle Morgan

I understand you did have some expertise in virology, or you had studied that.

Natalie Kim Björklund Gordon

Yes.

Kyle Morgan

And I think regarding the COVID-19 respiratory disease you had some understanding of how that disease was spread.

Natalie Kim Björklund Gordon

Yes, that's correct. And I was very disappointed with the government because I had had some very peripheral involvement in setting up the standards for pandemic response that would occur from the SARS-1 virus outbreak. And it seemed like the pandemic response I expected to see from the government didn't happen.

They suddenly went off on a new tack that was completely different from everything I understood that was appropriate. The only country that I knew of that was following what I felt were, based on my training, appropriate pandemic responses at that time was Sweden.

Kyle Morgan

And why do you say that?

Natalie Kim Björklund Gordon

Because they weren't doing proper isolation and contact tracing and they were locking down healthy normal people instead of just the symptomatic. And it felt more like a punishment than a way to stop the virus. And the other thing about it was the intense fear that they were putting into everyone. By this point, it was fairly obvious from the data coming out that this was a nasty bug and it did kill people, but it wasn't really much nastier than the common flu. And you just don't terrorize an entire population with stories of people dropping dead because of a flu. And it didn't make any sense, it just it didn't make sense.

Kyle Morgan

Can I ask you: Do you think it's reasonable to try to tackle a respiratory virus using lockdown—

Natalie Kim Björklund Gordon

No.

Kyle Morgan

restrictions of that nature?

Natalie Kim Björklund Gordon

You cannot eradicate a respiratory virus. At that time, we were told that this was a virus that came out of an animal reservoir. If you have a virus in an animal reservoir that occasionally crosses over to humans, you're not going to be able to eliminate it, ever. It's just something you're going to have to live with. And yet they were approaching this response to this virus as if they could eradicate it in the human population. And that made no sense to me either. Of course, we now know it probably came out of the lab and maybe at that time, they knew it and that's why they did it. I don't know.

Kyle Morgan

Now, I think you said you were familiar with mRNA technology? Is that right?

Natalie Kim Björklund Gordon

Yes.

Kyle Morgan

What were your thoughts about that leading up to what we saw happen with the development of the vaccines?

Natalie Kim Björklund Gordon

I was puzzled by the use of the PCR as a diagnostic technique. I was also puzzled by— I heard that they were doing 44 cycles of PCR, and

[00:15:00]

based on my understanding, that's far too high and you're going to get an enormous number of false positives.

At some point the CDC had also made two different standards for looking at different populations that were being affected by the virus. So they were using 44 cycles for the general population as a diagnostic tool, but in other situations they were using 17 cycles so that they could be very sure that they weren't getting a false positive.

So the way they used the PCR test guaranteed that huge numbers of people were going to be diagnosed as having COVID who didn't have COVID or who had flu or who had something unrelated. That was my opinion.

Kyle Morgan

So okay, regarding the development of the Pfizer vaccine, did you have any thoughts about how that was developed? Given you're familiar—yeah, go ahead with that.

Natalie Kim Björklund Gordon

If I carry on. I chose not to take the mRNA treatment for a very specific reason. The government was telling me things that didn't make any sense to me. For example, they were saying, the Government of Manitoba, I'm referring to now, that the vaccine would not stop transmission, but we all had to have it to stop the pandemic. And that was nonsensical to me.

They said the vaccine stays in your arm. So you're going to inject something into highly vascularized muscle in your arm with connections through the lymph system, but it's going to stay in your arm? And it's not going to stay in your arm.

They said that the mRNA could not be reverse transcribed into DNA because that's not the way cells work. Well, it's nonsense. Most of the time it's DNA, RNA, protein, but particularly when cells are rapidly dividing, you can get the mRNA back into the DNA. So I was concerned about how that was going to work. I was also concerned about the mRNA technology as a whole because we'd been hearing about mRNA technology and the great miracles that it was going to do for at least 15 years before. And to my perspective, it had not lived up to its initial promise.

We heard stories that were discussed in group seminars that there was a young man who had cystic fibrosis and they were going to use mRNA injections in an adenovirus in his particular situation as an experimental treatment to try to cure cystic fibrosis. And everything looked right. All of our knowledge and everything showed us that this would **have been the right thing.**

Now I was not personally involved in this. This is just reports I heard from other scientists who were involved. And this young man accepted the risk. He was informed that it was experimental. He took the drug and he was dead in 24 hours. And they had no idea why he died. And to me, the mRNA technology was a failed technology. And the reason it failed was not because the ideas were wrong, but because we don't understand enough about how cells work to be able to guarantee that the mRNA was going to work the way it worked. And that really bothered me.

And I also wondered, how do they control how much of this spike protein is going to be produced? And this spike is the infective portion of the virus and it's what binds to the

receptors. And if you recall my very complicated diagram, when you have something bind to a receptor up at the surface level, it's going to send massive numbers of biochemical signals all over the place. So why were they using the spike as the thing they were going to inject you with? And why were they using this strange new technology when we already have a whole vaccine technology that we have used successfully? It just didn't make any sense.

And I'm not an anti-vaxxer. As a medical person, I have been vaccinated far more than the average member of the general public. All my children were vaccinated. I had to attend autopsies, so I had extra vaccines that the general public aren't even offered. I had the Shingrix vax. I got the flu vax every year. I am not an anti-vaxxer. I just, everything about this bothered me.

And then I decided, well, maybe I'm crazy. Maybe the government knows what they're doing. So I decided to pull up the Pfizer EUA [Emergency Use Authorization] memorandum on the drug itself and have an actual look at their statistics. And I recall reading it and as I was reading it, I literally felt hairs in the back of my neck start rising. There were so many things that were wrong with this.

There were four cases of Bell's palsy in the case group that weren't in the control group. And Bell's palsy is a neurological condition.

[00:20:00]

And you can't miss that because the person's whole face is like— So that indicated to me that this could mean that this virus was having neurological effects. And if you look at Table 2, page 18 of that, there were 311 cases and 60 placebos that were excluded for protocol deviations.

Now a properly conducted study, those two numbers should be identical. You shouldn't have five times as many people who are excluded for protocol deviations. That's just wrong. And that shows there's something seriously wrong with your study. And they didn't comment on that. And I recall thinking at the time, what was the protocol deviation? Did these people die? Because there was no explanation. And the demographics were wrong. They were doing this on younger people, not older people. They made this dismissive little paragraph about antibody-dependent enhancement and how it wasn't a problem.

Every time that there has been an attempt to have a coronavirus vaccine, it has created this problem of antibody-dependent enhancement. And that means that the second time and the third time that you get the infection, the antibodies interact with the binding protein and cause it to bind more readily. So you end up getting sicker, not better, from being exposed to the vaccine.

And all Pfizer had was this little statement that we did some non-laboratory experiments with no explanation as to what those was. And they had just ruled it out as a possibility.

And I was also disturbed because they were using relative risk, not absolute risk. They didn't actually say what they were using, but it was obvious from the way it was being phrased and what they were doing that they were using a relative risk, not absolute risk. And relative risk, if you pick your population carefully and you have a low infective rate in your population, you can make it look like you've got really, really good efficacy, but it's meaningless because so few people in either side got infected. And these were things that bothered me.

And I decided that the last thing that bothered me the most was they had this one person, a 36-year-old male who had no medical comorbidities and who developed what appeared to be full-blown COVID the next day after having his shot. And the symptoms began on day two and Pfizer attributed it to one of three things: a false negative COVID, an infection process, or an adverse vaccine reaction. To me, that said, their spike protein that they were injecting people with was giving people COVID.

And I noticed as well that in their report, more people in their control group than in their vaccine group were getting it. Now, it was not a statistically significant difference, 409 versus 287, but if I had been in charge, I would have immediately said we need a much bigger group and we need to rule out this as an adverse side effect. And based on that, I decided I was not getting the vax.

And then came the vaccine passports and those were absolutely repugnant to me because they violated everything that I believed was ethical. You just don't do that to people. You just don't say that you get this shot, or else.

I mean, I was banned from attending social events. I couldn't go play curling at the curling centre anymore. I suffered direct discrimination in health and dental care from people. I had a dental hygienist ask me why I wasn't vaccinated. And I was waiting for a referral to an allergist because I've had anaphylactic reactions. So I just said, "I'm still waiting for referral to an allergist." And she said to me, "Well, since this is an innocent and real reason for you not taking the vax, I'll go ahead and do this. But if you were just refusing the vax because you don't want to do this and you don't want to do your responsibility, I wouldn't clean your teeth." So that's the kind of discrimination that was going on.

My eight-year-old grandson, I went to visit him even though it was a violation of the lockdown rules, and he refused to hug me. And he started to run to me, and he stepped back, put his arms behind his back. And I said, "What's wrong? Don't you want to give grandma a hug?" And he says, "Grandma, I can't. My teacher says, if I hug you, you'll die because you're unvaccinated."

What they did to children was such a disgrace. And I found myself suffering depression and anxiety to the point where I even began having fleeting thoughts about killing myself. And at that point I decided, this is really bad. We can't continue down this path. And I went and I adopted this little kitten, and she kind of changed everything because she didn't care who was vaxxed and who wasn't. And I could cuddle her and I could hug her. And I took her to visit my grandson and he was playing with her. And by the end of the time that he was playing with her, he was hugging me again.

[00:25:00]

So the kitten changed everything for us.

Then my daughter decided she had to get vaccinated because she needed to fly for her work. And if she didn't fly, she wouldn't have a job. And she took Moderna vax. I should state that I did not do much investigation into the Moderna vax. I looked mostly at Pfizer. My rationale was that they were both the same basic technology. So what I had learned about the Pfizer vax probably applied to Moderna.

And she had a very severe reaction, and it began eight hours after her shot. And by 12 hours afterward, she began to worry she was actually dying. She had many, many symptoms.

She called— When you went and got vaccinated in Manitoba, you got this information thing and there was a number you were supposed to call if you felt you were having an adverse reaction. And she called them, and she got someone on the other end. And this person said, “You can’t possibly be having a vaccine reaction because I have a list of the things that the vaccine does and that isn’t it. So you must have been exposed to COVID and been incubating COVID before you got the vax and you’re only getting your COVID symptoms now.” And they said, “Do not call an ambulance. Do not go to the hospital because you don’t want to risk the health care workers. Stay home, self-isolate for 14 days.”

I think that she would have died except for the fact that with us being allergic people, we had medications and things in the house so she could treat herself at home. And I wonder how many Canadians died at home because they followed that advice.

This led me to examine the 14-day rule. See, she was told that she didn’t have an adverse reaction, she had COVID. And all across Canada, it was 14 days, zero to 13 days. If you got sick, it wasn’t the vaccine. Twenty-one days in Saskatchewan and BC, I’ll have to point out. And I started trying to investigate this and I found this on the Alberta health page. I couldn’t find any good explanation for the 14-day rule anywhere else, but this was the best I could find.

This came off the Alberta Public Health Services page [Exhibit W1-1a]. And I’ll just go through this in a little more detail. I’ve been accused when I’ve brought this image up of lying and creating it myself. So for that purpose, here’s two links that prove— Joey Smalley was another independent investigator who found the same thing and posted about it. And that’s the link. When people began asking questions about this, Alberta Health Services took it off their website, but they forgot about the Wayback system. So I already had a copy. Joey was able to have a copy. I was able to go get a copy from Wayback.

And if you look at this particular blow-up of the upper left-hand corner of that, you can see that there is a huge surge in the people who got infected with COVID immediately after they got their shots.

And if you go a little further, you can see that a number of people ended up in the hospital after getting their shots during that 14-day period, particularly the older people, the 75, because this has been broken down by age group.

And if you look at who died, it really hit hard in the community 75-plus. So people were getting their shot. They were getting sick. They were ending up in the hospital and they were dying in the hospital, and they were being counted as COVID in the unvaccinated. And I think a lot of these were not COVID in the unvaccinated. I think that they were adverse vaccine reactions. I have to put a caveat in there. I wrote to Alberta Public Health and asked for more details over what period of time did this occur, how many people were involved, what percentage was it, and they never responded to any of my requests.

This really made me think that we shouldn’t be vaccinating the elderly. And I came across this particular paper where Norway investigated a series of deaths in what they called the fragile elderly population. These were 80-plus people who were in long-term nursing care, and they went in and vaccinated everybody and a whole large segment that they vaccinated died. So Norway began recommending not vaccinating fragile elderly people.

Now I tried to do my own little analysis, and this is excess deaths in Manitoba. The blue line represents what was expected and the orange line represents the published data that’s come out of Manitoba. Now these are not COVID deaths. These are excess deaths, the

number of deaths above that that would be expected. And I put in there the various points in time when certain parts of the mandate system came into effect. And my data is incomplete.

[00:30:00]

I wrote to the Government of Manitoba and asked them for more data and they either completely ignored every request I made or one time, I got a phone call back saying that if I put in an access to information formal request in writing, they would provide the data in the anonymized form that would protect privacy, but it would take them two years to do it because they were very busy with COVID, and it would cost me \$10,000.

So basically, they made it impossible for a private citizen like me to look at their data. But you can see spikes in excess deaths that occurred as each of these mandates came in and people went streaming in and began getting shots. So when the youth sport mandate came in, there was a large spike in excess deaths. And again, I think without being able to say for sure that this indicates it was possibly all adverse vaccine reactions that were going on, but there were also things like lockdowns and stuff that were causing excess deaths.

Now this particular picture here is important because 28 days after the first jab and 28 days after the second jab are marked on here. And you can see there's a dip where nothing happens and then there's a little hump and then it kind of calms down. And then there's this great big spike.

And what I think is going on is based again on what happened to my family. One of my family members ended up in the St. Boniface Cardiac Care Unit, 38-year-old female with young children. She developed pericarditis. Her pericarditis occurred more than 28 days after her last jab and therefore was considered unrelated to the COVID jab by the definitions that were being used by public health.

So her cardiologist told her, "Don't get another booster. I'm seeing this, I think it's the jab, but I can't give you an exemption if the government starts mandating boosters because I'm not allowed to. The only ones that are allowed to are certain specific very limited numbers of people." There was only one cardiologist in all of Manitoba who was allowed to give exemptions, and she wouldn't get it anyway because he never gave anybody exemptions. She's still having symptoms to this day.

And then my family got hit again. My son, my eldest son had a benign brain tumour that was about two centimetres. It was discovered when he was 16 and had head injury, and he had another head injury again and it was scanned again. These are familial in my son's father's family, some of his cousins and his father has an identical twin brother who had one of these. They are benign tumours. They don't go anywhere; they just sit there. And all of a sudden, his started growing.

So five months after he had his second Pfizer injection, his tumour had grown from two centimetres to 4.5 centimetres, and he had a seizure and he had to go in and have a craniotomy. They split his head open and cut a chunk of his brain out. He was diagnosed as having an anaplastic oligodendroglioma with an MRI signature of 1p/19q deletion, which is a specific type of brain tumour but only in the very centre portion of the tumour, the rest of the tumour— I've read a lot of pathology reports over the years. My son got copies of the pathology reports for me to read, and I've never seen ones like the ones they had with him. They sent his results off to four different pathologists around the world trying to interpret what was going on, and you could just read from what they were saying that this wasn't a

typical tumour; this wasn't what they were used to seeing and they didn't know why they were seeing it.

He's had seven MRIs since the surgery. They're clean, so far. He just had another one yesterday. We're hoping again that the cancer won't recur and that he'll be okay.

And being a mom that I am, I also went into the literature, and I found a whole lot of scientific support for the idea that the vaccine itself may be causing this to occur. There was a study from Poland that was done by exposing brain cancer cells and normal cells to the spike vaccine. And they noted a whole lot of biochemical changes and alterations that occurred after introducing the spike protein to these cells in an in vivo— But both in the laboratory putting it in cell culture and seeing what happened to their patients.

Then the vaccine passport came along. So six members of my family,

[00:35:00]

five of whom did not want to get the vax, because they wanted to listen to their mom when their mom said, "This isn't safe, don't do it," but they felt that they were being coerced to do it or they would lose their job.

My middle son told me he did a mental calculation and if he refused the vaccine, he would lose his job, his family would lose their home, they would lose everything, but if he took the vax and he was okay, then they'd be fine. But if he took the vax and it killed him, he had a very good insurance policy at his work and he had disability, and so forth. So his family was better off with him taking the chance so that's why he took the vax.

Fortunately, so far, he hasn't shown any bad signs, but that was his rationale. In my family, my three children and their spouses, we had six members who— One refused the vax altogether. The rest, the other five had it, so we had two members affected seriously with health conditions that potentially are life-shortening and one that could have died in the first few hours after the vax.

So my son, he was in an artist's rendition because he's a health care aide. He does patient transport in the hospital, that's the son with the brain tumour. He was out of work for four months after his brain tumour before he could go back to work. And in the early parts of the pandemic, he was the big hero, but as soon as the vaccine passports came out, he was no longer the big hero. And that's an artist's rendition of him and one of his coworkers dressing up to go take care of COVID patients before the vaccine mandates turned the refusers and the anti-vaxxers into criminals.

So my conclusion from all this is that adverse vaccine reactions are very common. They're not rare, and they include this anaphylaxis septic shock in the first few hours afterward. There are vascular effects that appear in the months following the shot. There are potentially neurological and cancer effects, which require more research to understand. And one of the more frightening things to me that I have seen is that the vaccine, when it's injected, accumulates in the testes and the ovaries.

I am very concerned that we're going to find that a large portion of the people who got the vaccine are now infertile. And if that is the case, the way it's going to affect our population with the number of people in our population who have been vaccinated, it's going to make the one child policy in China look like a church picnic. I mean, imagine 70 per cent of Canadians got vaxxed and there isn't going to be any grandchildren or great grandchildren.

And I don't know if that's going to happen and I hope and pray that it is not going to happen, but we don't know, okay.

So I'd just like to very briefly touch on the differences between public health and human genetics. The two of them work hand in hand, but they have very different approaches. Public health is always top down. The officials in public health, the experts decide what is good for us, and they issue orders and then they try to get the public to follow through with them.

In the 20s and 30s, eugenicists within the public health movement decided that 70 per cent of the population of the USA was unfit to reproduce; that's in their literature. And I put this little note about William Randolph Hearst. He was a newspaper person at the time, and he somehow got a hold of their documentation where they were discussing this: "We need to find a way to sterilize 70 per cent of the population of the USA because they're unfit to reproduce." And he wrote this really scathing editorial about them. And they came back at him and said, "Oh, you misunderstood it. You took it out of context. This isn't really what we were planning on doing; this is just speculation." And they didn't use the word conspiracy theory, but that's basically what they said.

And these public health officials that were eugenicists—I'm not saying all public health officials were, I'm saying a portion of them who were eugenicists—they did things like found elected representatives that cooperated with them in trying to bring in laws. They found lawyers that agreed with them.

They had one particular case where both of the lawyers were actually working with the eugenicists trying to bring the law in. But one was pretending to be fighting against the involuntary sterilization of one particular woman, and they ran that course right through to the Supreme Court in the United States. And they eventually won in the Supreme Court to have the right for public health to involuntarily sterilize people that they deemed to be unfit to reproduce because they were morons or epileptics. And moron was a technical term at that time.

And that ended with Nazi Germany because of the reaction of horror to what happened during the Holocaust. And that was also the birth of human genetics.

[00:40:00]

Now, human genetics is a bottom up. It's not a top down; it's bottom up. So the geneticist who is dealing with something, presents to the patient: "This is the problem; this is everything we know. Here are all of your options." You are never supposed to say or do anything to try to influence your patient to choose one option or another. And then, **whatever choice your patient as an individual makes, you never, ever do anything except help them to achieve what their choice is based on their fully informed consent. You don't coerce them; you don't lie to them; you don't give them personal anecdotes about how you feel.**

And these ethical standards, they were codified, beginning when the Nuremberg trials—Afterward, there have been other instances of places and times where disgusting things happen to individuals in the name of improving society, and each time the world has responded with these ethical standards. These are taught in schools. They're designed mainly to prevent abuse of individuals by us experts.

When I come in and say to you, I have a BSc in biochemistry and a PhD in human genetics and I think this is what you should do, I am exerting a great deal of influence on you because I as an expert have power over you. And so, these ethical standards are designed to protect people from abuse by experts.

So it is my opinion that the following of ethical standards were violated during the pandemic: There was no risk–benefit analysis. Everybody got the same treatment. There was violation of the principle of utilitarianism, where you use the minimum amount of treatment that you can to affect what you need to do.

Locking down children who are at very low risk of COVID and vaccinating them is a violation of the principle of utilitarianism, and so is locking down and closing a business or telling people they can't meet in a church.

We were subjected to psychological manipulation, and we now know the military was involved in that. And I'll give you a very specific example of one form of manipulation that I saw.

My daughter and I were having a conversation. It was during one of the breaks in between the lockdowns, and there were lots of conversations going on in the background; it was like a cocktail party. And during the course of our conversation, she said the word "ivermectin" and behind us, the room went absolutely silent, just silent.

And then there was a chorus—"horse paste, horse paste, horse paste, horse paste"—and then all the conversations went back. And that, to me, is an example that people were being literally brainwashed to think if they heard the word "ivermectin," they'd think horse paste. And if they could elicit that kind of reflexive response to a word like ivermectin, what other things were they doing to our heads? We don't even know how much they did. We don't even understand the depth and the length that they went to in their manipulation of us.

But our autonomy as individuals was totally violated. We were told where we were allowed to go, who we were allowed to meet, when we were allowed to meet, how often, and we were told you must take this injection in your body. So our autonomy was violated. Our confidentiality rights were violated.

When that passport came out and the community centre started asking, "show me your proof of your vaccine so you can come into the community centre," well, within 24 hours, everybody in my town knew who was vaxxed and who wasn't. And the pressure was on immediately on us un-vaxxed.

I had a neighbour say on Facebook that he hoped that I would drop dead in a hospital parking lot, not allowed to go in and get medical care and that I should be driven out of town because I had chosen not to be vaccinated.

I had people who I thought were my friends walk up to me, notice who I was, and turn around and walk away. They were either afraid of me or they didn't want to have anything to do with me because I was one of the evil un-vaxxed. And in a normal situation with medical choices, you don't know these things.

So they violated our confidentiality in order to go after us. And they used enticement and coercion and that is an absolute no-no. You can go back to the Nuremberg Code. You must never use enticement, which means things like offering a prize if you accept it, offering money. "Now, if you agree, we will let you go out to a restaurant to eat." That's an

enticement. And they used coercion—no jab, no job. Well, that's about as big a coercion as you can get.

I also want to mention what I saw happening in the Indigenous community. Where I live,

[00:45:00]

the Ebb and Flow Reserve is to the north and the Sandy Bay Reserve is to the south. And there was particular targeting of the Indigenous community by so-called pandemic coordinators. Pandemic coordinators went into each reserve, and they set up clinics. The Indigenous community was given much earlier and much broader access to the vaccine. So it was typically— If you were 40 and up and you could go and get the vaccine, it would be 30 and up if you were Indigenous.

Much more vaccine was delivered to these clinics than they needed. So they always had a great big excess. So every time there was a big clinic, there would be excess vaccine and rather than have the vaccine go to waste, they would say to everybody who was there, "Call your relatives, call your auntie, call, call, call, call. And all the people in the community that you know, your friends and your relatives and things, they can all come in and get vaccinated even if they're not Indigenous and even if they're not yet eligible." And so, in the community that I live in, at least half of my neighbours and friends are Treaty Status. If they're not Treaty Status, they're probably Métis. And if they're not Indigenous or Métis, they probably are married to someone who's Indigenous and Métis.

And by doing that, they were able to very rapidly get this vaccine out into the entire Indigenous community, far ahead of the rest of the population. And they did it by emphasizing special respect for your elders. And they made personal home visits to people who are hesitant.

Some of them came to me and asked me if I thought the vaccine was safe, and I gave them my reasons for thinking that it was not safe. And I always tried to be ethical and say, "You know, this is your choice. This is what I found. This is what the government's saying. You make the decision."

And some of my friends came back to me and said that the vaccine coordinator came to visit them in their home and brought the material with them, to give them the vaccine right on the spot. And told them that I was not the right kind of scientist to understand what was going on and that I was a dangerous anti-vaxxer spreading misinformation and they should not listen to me. And urging them right then and there in their homes to get the vax.

And to me, that violates, again, all kinds of ethical principles. You're slandering and preventing opposite opinion. You're putting pressure on people. When you go into somebody's home and offer them basically, you know, "I'm here. Let's do it now. Why are you listening—" This is coercion.

And I still don't understand why the Indigenous community was so particularly targeted. But given the history of Canada and what they've done to the Indigenous community, I have to wonder, was it necessarily because they had the best interests of the Indigenous community? I don't know.

So I have some specific recommendations that I would like to make that would help prevent this from happening again. Florida's instituting laws like making it illegal to deny

elderly visitors. One of my friends, her mother had a stroke. She ended up in a nursing home. She says that her mother died of loneliness from being locked up for months.

There should be absolute laws that end the ability of public health to shut down businesses for precautionary purposes. I mean, if public health wants to go in and shut down a restaurant because it's full of cockroaches and the patrons are getting listeria, fine. That should go ahead and be allowed. But they should never again be allowed. That power has to be taken away from them. They've proven that they will abuse it.

And I'll also mention at this point that public health is very much a closed shop, and you don't get a job in the government and public health unless you have a mentor or you yourself have also worked in the WHO and the UN.

So the people in public health have a vested interest in what is going on at the level of the UN and the WHO, not just what is going on with the local community and Canadian traditions, laws, and that kind of thing. And we have to strip them of their power. They can never have this again.

We have to have protection for health care professionals and journalists who are acting in good conscience. I had doctors who privately asked me my opinion knowing my expertise. They listened carefully, they would not say anything, and they told me if they said anything, they would have their licences suspended. But they thanked me for speaking out. These people need to be protected. These professional associations should not have the right to take away a licence because somebody says something the government doesn't like.

The fact that I was denied the access to the raw data, that I needed to do an independent analysis is another thing. We have to remove the need for these access to information acts

[00:50:00]

and the huge fees involved. The raw data should be made available to the public. You can anonymize it so you're not going to give away private information of any individual, but that anonymized raw data should be available immediately so that independent experts like me, like Joey Smalley, can pull that data out and look at it. And challenge the government whenever anything like that is going on.

And there should be independent experts that are added to all of these committees and these groups that make the decisions about the safety of the vaccine and whether or not we should go ahead and have these other things.

And there should be absolutely no more support for journalists for Big Pharma. One of the big problems with what we saw was the guy gets on CNN and he talks about how terrible the pandemic is, and on the bottom, it says sponsored by Pfizer. We don't let tobacco companies do that. We shouldn't let Big Pharma do that.

And there should be no removal of liability protections. Everyone who administers these vaccines from the person in the lab who is working to develop the original vaccine, right through to the public health nurse who is injecting it in the arm of the person should be liable, if it can be proven that they did something where they neglected someone or they did something that was unsafe. No liability protection. This vaccine would never have been distributed if every single person in the chain was liable.

There are no excuses. There were pandemic protocols that were set in place, and they had a long and successful history behind them. They were abandoned. The ethical protections of us as individuals were in place. They were all ignored.

Now, Dr. Bret Weinstein had a very interesting podcast, and he said a coup has taken place in western nations. And I think he's right.

Something happened in public health so that they just took over and they brought in rules and regulations, and they violated our rights and the government cooperated. And I don't know what happened and I don't know who the bad guys are. I have my suspicions, but public health is now an oxymoron.

And I'm going to close just with this picture of my family. This was one of the happiest days of my life. My middle son married his beautiful wife who has become a major part of our family. We're standing together. We're all cuddled up. We're smiling. We don't have masks on. It was a wonderful, wonderful event. And I would just like to remind everybody that we were robbed of this. Our weddings, our funerals, they were taken away from us without a good reason. My family is lucky. At least so far no one has died in my family from the vax. Lots of people have lost people to the vax.

We were robbed. And I don't know for sure who it is who is responsible for this robbery but in my opinion, it is a crime against humanity and should be treated as such.

Thank you.

Kyle Morgan

Thank you, Ms. Björklund Gordon. I just had one question. I'll try to keep it brief because I'm sure the commissioners might have some questions. Just about the data from Alberta that you had brought up on the slides.

Natalie Kim Björklund Gordon

Right.

Kyle Morgan

From my understanding, the data that's presented here occurred right when the so-called Delta wave occurred.

Natalie Kim Björklund Gordon

Yes, my daughter had her vax in August, late August, I think it was, and that was when the reaction came, and I began looking and trying to dig this up and finding it. It was on the Alberta website for about a year. You had to scroll way down to find it. And then, when Joey Smalley put his first analysis up and people began asking questions, then it vanished.

Oh, and there's another thing that vanished. Just yesterday, I noticed when I was doing my presentation, I was hoping to be able to refresh my memory on the Medical Association of Canada's [sic] [Canadian Medical Association] ethical standards. In 2018, they were updated, and I read that with great interest. And I went back and looked so I could refresh my memory and make sure I was remembering correctly. And they have also removed their ethical standards from their website.

Kyle Morgan

Okay, what I was getting at there with the data was that there was a notable increase in the cases that were being reported of COVID in the Delta wave,

Natalie Kim Björklund Gordon

Yes.

Kyle Morgan

and that appears to have coincided with when the vaccines were rolled out.

Natalie Kim Björklund Gordon

Yes, I'm not sure because I don't have access to the data,

[00:55:00]

but it seems to me that Delta was generally acknowledged to be far, far worse than the previous one. I wonder if all or some portion of that Delta was, in fact, adverse vaccine reactions, not the virus. I don't have any way to tell, but I think that that is something that really needs to be investigated.

Kyle Morgan

I think those are all the questions I had. I'll turn it over to the commissioners.

Commissioner DiGregorio

Thank you so much for sharing your testimony with us today. I just was hoping you could help me understand a little bit better about this 14-day rule that you described in the Alberta data.

Natalie Kim Björklund Gordon

The explanation of the rule that I have heard from public health is that when you have the vaccine, you don't actually begin producing protective antibodies at a high enough quantity to be considered immune to the virus. And so, for that 14-day period, you are considered to be an unvaccinated person for the purposes of public health. So the zero to 14-day rule means that if someone gets sick and ends up in the hospital, and they have a COVID test, which could be a false positive, they will be counted by public health as being unvaccinated, not vaccinated.

Commissioner DiGregorio

So just to make sure I'm really clear. So when the health authorities were reporting COVID cases in unvaccinated people, it included people who had been vaccinated

Natalie Kim Björklund Gordon

Yes.

Commissioner DiGregorio
in the prior 13 days.

Natalie Kim Björklund Gordon

Yes, that's correct. And in fact, there's a statistician epidemiologist in England who challenged the U.K. data on the basis of that. The U.K. has a commission that's responsible for overseeing and double-checking when a government agency releases data. And he complained to this agency. I'm trying to remember, there's a Canadian group that oversees the government and puts reports out regularly when the government is doing something naughty. In the U.K. they have one specifically for statistics and he complained to them about this, and they examined the zero to 14-day rule and decided that this was causing the data for the U.K. to be totally muddled and useless. And the U.K. health services were ordered to go back and fix it.

And after they went back and fixed it and the data came out, it showed very clearly that the more vaccinated you were, the more likely you were to get COVID or the more likely you were to have a severe reaction to COVID. And I think that probably if it were not for that 14-day rule, zero to 21 days for BC and Alberta, the Canadian data would show the same thing, but that's my opinion, and I don't know.

Commissioner DiGregorio
Thank you.

Natalie Kim Björklund Gordon
Yes.

Commissioner Drysdale

Thank you very much. I have a couple of questions because I've heard quite a bit of testimony about various things that you mentioned. The first thing that I wanted to ask about and be clear in my own mind about is the PCR testing. And I believe you said that you were surprised that that would be used for a diagnostic tool.

Natalie Kim Björklund Gordon
Yeah.

Commissioner Drysdale

Now, you also talked about cycles, and I just want to confirm, one of the previous testimonies was from Dr. Braden. And I asked her this question about cycles and essentially, she explained it to me that if you go from 17 to 44, or sorry, let's make the numbers easy. If you go from 20 cycles to 40 cycles, that's not just a doubling of the material, it's a logarithmic.

Natalie Kim Björklund Gordon
Right.

Commissioner Drysdale

So that if I had one particle when I started, and I went through 44 cycles, I would theoretically have two times 10 to the 44. In other words, two with 44-zeros-behind-it particles after 44 cycles is that correct?

Natalie Kim Björklund Gordon

Yes, that's correct because the DNA is double-stranded. It is opened up in part of the cycle and then each of the double strands gets another strand built on it, and then it's cooled so that the two double strands form. And then it's cycled by heat again, and those two open up and become four, and then four becomes eight, and then eight becomes— And it is an exponential increase. And that's one of the reasons why the more you cycle, the more dangerous it is,

[01:00:00]

because the PCR is not perfect. There are always a certain number of errors that are incorporated, and you can very rapidly end up with a false result because of the errors that not only get incorporated but get magnified with each round of the cycle.

Commissioner Drysdale

I've heard the PCR test referred to as a genetic photocopier. Is that somewhat—

Natalie Kim Björklund Gordon

Yeah. More than a photocopier. I kind of think of it as if your fax machine gets stuck and it keeps sending you the same thing over, and over, and over again. That's kind of what the PCR is.

Commissioner Drysdale

Now, I also heard another testimony— Hopefully I get this terminology right, now. I would like you to explain to me because when I heard previous testimony, I wasn't sure I got it right. You used the term reverse transcription of RNA to DNA.

Natalie Kim Björklund Gordon

Right. Yes.

Commissioner Drysdale

Can you explain that in lay terms for me and why is that such a concern?

Natalie Kim Björklund Gordon

Okay, the normal course, the way it usually works in the cell, is you start out with the DNA, and the DNA is transcribed into messenger RNA. The messenger RNA is then moved outside the nucleus of the cell into the main body of the cell. And when it's out there, it's then used as a code to create a protein. So you have this one-way trip up through the system.

Reverse transcription refers to mRNA that is in the cell body itself that then ends up being pushed back into the nucleus and then incorporated into the DNA, and then the normal repair mechanisms— And there are several different ways it can happen. But the normal response of the cell when hitting this piece of mRNA that's in the wrong place, and isn't properly marked, is to copy it and stick it into the DNA.

And the reason that that is potentially such a problem is, like, if you had this happen in the cells of your testes or your ovaries, you could introduce a mutation that would go down into subsequent generations. And that's the most dangerous thing you can do because you can change the genome of your offspring.

And it can also go into other cells, like, for example, liver cells is where this has been demonstrated to happen from the mRNA. And cells that are rapidly dividing, like in a developing embryo. Every time the cell divides, the nuclear membrane dissolves away to allow the cell division to take place, and during that part of the cell cycle, the cell is vulnerable to accidentally incorporating the mRNA that's present into the DNA.

So under normal conditions of cell division, all of that protein production is first stopped, and then the nucleus is dissolved, and then the DNA is divided. And then the nucleus reforms, and only after the nucleus reforms, the cell continues that process of making proteins.

So the other issue with reverse transcription, and I think this may play a role in causing cancer, is if you have an insertion occur in the wrong part of a gene, you can turn a good gene into a bad gene or you can turn a gene that prevents cancer from functioning. You can cause breaks in the DNA. And if you look at what causes cancer, it's cells that are expressing inappropriate proteins at the wrong time and in the wrong place, and the cells are doing things that are wrong. And when you randomly start inserting bits of DNA into the wrong place, you can cause very serious problems.

So this reverse transcription is potentially quite dangerous. There are viruses that do it deliberately and they have specific enzymes for doing that, but it can happen for other reasons, not just for that reason.

That was one of the reasons I did not understand why they went with an mRNA virus. Why not just take the virus and inactivate it and grind it up and throw little bits in? That's the way we've always done viruses. That works very well, and it is relatively low risk, so why did they do this other thing?

Commissioner Drysdale

So essentially, if I can put it into terms I think I understand: The DNA is like the blueprints for just about everything in your body.

Natalie Kim Björklund Gordon

Right.

Commissioner Drysdale

And this reverse transcription is potentially or has the potential for changing that blueprint or that recipe or that plan. And with that potential change in that recipe or plan, the cells that are being built may be corrupted or they might be something else.

Natalie Kim Björklund Gordon

Yes. That's a very good way to think of it.

[01:05:00]

Normally, our bodies are very good at picking up if one of these things are going on. And the cells will either stop dividing and sit there or they will release signals that indicate that something's gone wrong. And the immune system will come in and destroy that cell or they will begin affecting the cells next to them and those cells being affected will put out distress signals to the immune system to come and clean it up. But sometimes that doesn't happen.

And one of the more frightening aspects of the COVID vaccine is that there appears to be immune suppression. So you get a situation where viruses that were inactive become active. The immune system is not scouting properly, and you have this mRNA ending up in the cells and causing all kinds of problems and the immune system is not responding appropriately.

I've heard tales from pathologists who of course would never say so publicly, but they talk about turbo cancer. And that's a cancer that appears and spreads very rapidly far more and not in a characteristic fashion. And again, I don't know if that's true. I don't have access to the data, but I can understand how a turbo cancer could happen.

Commissioner Drysdale

There are some other terms that are almost ubiquitous, or in other words, they're being talked about all the time. We had a witness yesterday who mentioned it, and I want to make sure that I understand this properly.

Am I right in saying that when the government was telling us that we were going to get 97 per cent efficacy, that they were talking about something called relative efficacy versus absolute efficacy?

Natalie Kim Björklund Gordon

Right.

Commissioner Drysdale

Okay. And from other testimony when I've asked this question, it appears to me that if someone gives you a relative efficacy number, it gives you no idea of what your overall risk to that thing is. And I think, someone compared it to two cars speeding down the highway at 300 kilometres an hour. The relative speed is zero, and their absolute speed is 300 kilometres an hour. So if I was to tell you the relative speed, you'd have no idea whether they were driving safely or not.

Natalie Kim Björklund Gordon

That's correct, but I like to explain it differently. Imagine you have two groups of people, one hundred in one group and one hundred in the other. And one group is your case group, and one group is your control group. And if, just by random chance, three people get sick and two of them happen to be in your case group and one happens to be in your control group, you have a very high relative risk [RR] occurring in your case group because twice

as many people got sick in your case group as in your control group. So you can say that's a very high relative risk.

If you want to talk about absolute risk [AR], you'd have to expose all two hundred people to the virus and see then what your data would be. Now, if you do your relative risk and you know 75 per cent of the population has been exposed in both groups, your relative risk is going to be very similar to your absolute risk.

But in a case like where Pfizer— I mean, they did some of their analyses while we were all under pandemic control conditions. And they did not specify what the infection rate was in the populations that they were looking at. And so, there's absolutely no way to know if this 95 per cent or 97 per cent or whatever it was, was a real value that had any real meaning.

And normally, except if you're dealing with Big Pharma, you will be quoted an absolute risk or you will be quoted a relative risk and they will put that after 97 per cent, RR or AR, and they'll specify what it is that you've got. And they didn't do that. Big Pharma generally doesn't.

Commissioner Drysdale

So if I understand your example where you talked about a hundred people in one group and a hundred people in the next and you got so many sick in one and so many sick in the other— If I was to increase that sample size to 10 million in each group, and I still had your number, I think it was three sick in one and six sick in the other, my relative efficacy in the 10 million sample is the same as the relative efficacy in the 100 sample. But of course, the absolute efficacy has changed significantly because in the first one I had 100 people in the group and one got sick, 100 people in the other group and two got sick, so relative efficacy of 50 per cent.

But if I increase it to 10 million people in each of the groups and have one, again, that's sick in one group and two sick in the other group, it's still a relative efficacy of the same number.

[01:10:00]

Natalie Kim Björklund Gordon

Yeah.

Commissioner Drysdale

And in your opinion, did the general public understand that difference?

Natalie Kim Björklund Gordon

My experience has been that many physicians don't understand that difference. So I would not expect the general public to understand that difference.

Commissioner Drysdale

Okay. You did talk about informed consent.

Natalie Kim Björklund Gordon

Yes.

Commissioner Drysdale

Based on what we just talked about, did folks who were told that it had a 97 per cent or 98 per cent efficacy, were they able to form informed consent on that basis?

Natalie Kim Björklund Gordon

It's my opinion that they were lied to.

Commissioner Drysdale

Let me ask you another question: Did they do testing? You looked at the Pfizer results or the Pfizer testing that was submitted to Health Canada.

Natalie Kim Björklund Gordon

Yes.

Commissioner Drysdale

Did they do testing on pregnant women?

Natalie Kim Björklund Gordon

No.

Commissioner Drysdale

Did they do testing on children?

Natalie Kim Björklund Gordon

As far as I know, no.

Commissioner Drysdale

Did they inject pregnant women in Manitoba with the vaccines?

Natalie Kim Björklund Gordon

Yes, they in fact they made it so mandatory that a friend of mine who refused to take the vax was told by her doctor that he would not attend her delivery. And she and her husband made a decision that they would deliver the baby at home. It was her fourth. It was an uncomplicated pregnancy.

But the labour started four weeks before her due date, so they became concerned that they might be dealing with the preemie, and they decided she should deliver in the hospital. And when she arrived in the ambulance bay in labour, no one from the obstetrics and gynecology department at that hospital where she was at would come downstairs and treat her because they said she was un-vaxxed and they didn't want anything to do with her. So

she sat in the ambulance bay for 30 minutes and finally delivered having a paramedic attend her, while her husband sat outside in the parking lot trying to follow on a cell phone.

The pressure on pregnant women was extreme and totally unethical. They were told they must have this vaccine, "or I will not attend your delivery. You must have this vaccine or else your husband won't be able to be with you when the baby's born."

Commissioner Drysdale

I think I heard you say that there was no fertility testing on this vaccine?

Natalie Kim Björklund Gordon

As far as I know, no one has looked at the fertility in this vaccine. But they did know, well before the vaccine was even released to the public, that the vaccine was accumulating in the ovaries and testes on rat tests that they did in Japan.

As far as I know, there's been no testing done to see if fertility's been affected. I have heard anecdotal reports from people in the in vitro community that they're seeing an increase in infertility in women who previously had successful pregnancies. But that's anecdotal. And again, I have no way of knowing if that is actually factual or not.

Commissioner Drysdale

Prior to the release of the vaccine, and based on your review of the information, was there any carcinogenicity testing? In other words, did they do any testing to see if this may or may not cause cancer?

Natalie Kim Björklund Gordon

No. And one of the things they did is they cut the testing short after two months and declared that it was safe. And cancer takes years to develop. Normally, even turbo cancer takes months to develop. They cut it off at two months. There's absolutely no way that they could have done any kind of, had any ideas about testing. They did some rat work, I think, but rats are very different physiologically from humans and just because you get a result in rats, it doesn't mean that that applies to humans.

And I don't know. I'm not familiar. I could be wrong because I haven't seen everything. There's been a lot of literature. I read somewhere that at one point there was 700 publications a day coming out on this topic. So speaking from what I personally have seen and bearing in mind that there is stuff that I have not seen, I am not aware of any testing that was done on fertility or cancer.

Commissioner Drysdale

We had a previous witness describe to us the initial testing or the testing that was submitted to Health Canada for the Pfizer vaccine. And what that witness described to us was that they had a control group or a placebo group, and they had a second group. And after the close of two months, they took the placebo group and injected them with the vaccine thereby eliminating the placebo group after two months of testing.

Natalie Kim Björklund Gordon

Yes, I understand that's correct.

Commissioner Drysdale

Is that common practice?

Natalie Kim Björklund Gordon

It's common practice for Big Pharma-type people to do stuff like that. It would not be appropriate practice as I understand it. And I don't know how the regulators let that go. As far as I can tell, and I wasn't in the room when this was done, Health Canada did no independent testing of their own. They simply accepted what was being done in the United States as gospel.

[01:15:00]

Commissioner Drysdale

Did I hear you right in the beginning when you were talking about your credentials that you had taught or tutored medical students on medical ethics?

Natalie Kim Björklund Gordon

Yes, in the work I was in, the medical students broken up into small groups for tutorials of about 12 or 15 students. And one of us would each take one of those groups and we would be presenting them with a specific case. And it often included an ethical component that they had to discuss with us. And then they had to understand all of the aspects, medically speaking, as far as how this gene worked and so forth. But they also had to understand the treatment proposals and how those would impact and what kind of ways that they could provide informed consent and treatment.

We do practise the form of ethics in Canada right now, and I'm not talking about MAID. I'm talking about if you have a woman who has a baby, who has a specific defect of some sort, she can go and talk to her doctor and under normal circumstances that I saw when I was involved in human genetics and when I attended clinics, women would be given all the information that we had. There's a 70 per cent probability of this or a 20 per cent probability of that. And then the women would make a choice as to whether to terminate the pregnancy or not.

And some of us, myself included, are very much against termination of pregnancy, but we remained absolutely silent about what our personal opinion was. And sometimes a woman would say, "I'm going to have the baby anyway." And we might think she was crazy, but we never said anything against her, and we would support her through that.

And one of the most valuable lessons that I learned watching that was, you know sometimes a mother would come in and say, "There's something wrong with this baby, I can feel it." And every test we had would show there was nothing wrong with the baby, but she would go on and give birth and there would be something wrong, something desperately wrong.

And other times we would say there's this or that problem with the baby and she would say, "Nope, this baby's fine." And she would go through with the pregnancy anyway. The baby would be born and the baby would be fine.

And to me that illustrates why informed consent is so important because we as experts, we don't always know everything. And sometimes the gut intuition of some farm wife with a Grade 10 education is better than what we experts think.

Anyway, that's why informed consent is so important. You give them all the information and they make the decision as to what the right thing is to do. And that was what was missing during the pandemic.

Commissioner Drysdale

My last question has to do with your family. And I believe you reported out of the six, four had adverse reactions?

Natalie Kim Björklund Gordon

Yes, four had adverse reactions.

Commissioner Drysdale

Were any of those four adverse reactions reported to and included in the CAEFISS [Canadian Adverse Events Following Immunization Surveillance System] system in Canada?

Natalie Kim Björklund Gordon

No, my son's tumour has been dismissed by the neurologist in his care as being irrelevant and not in any way related to the vax.

The family member who developed pericarditis, it was more than 28 days. So it's considered unrelated. My daughter's situation was recorded as COVID in the unvaccinated. One of my relatives had long COVID and repeat multiple COVID infections and in her case, it's been attributed to the virus not the vaccine.

Commissioner Drysdale

Were those decisions to attribute it to the virus done at the upper level of that system or were they triaged by the doctor that you were dealing with or the nurse?

Natalie Kim Björklund Gordon

It was always done by the doctor or the nurse. Part of the problem is that there's tremendous pressure on members of the medical community to not notice these adverse reactions. Doctors who report too many get in trouble. And they don't want to see it. And the other thing is I've talked about the brainwashing and the reflexive reaction out of the medical community.

I think that the medical community has been more heavily brainwashed and targeted and hit with this stuff than the general public. And they don't want to see it. And if you take the

case of the pericarditis in my family, the doctor involved acknowledged that it was probably the vaccine, but there was no way he was going to speak up about it.

Commissioner Drysdale

Thank you very much.

Kyle Morgan

Ms. Björklund Gordon, I just was hoping to adopt your slideshow as an exhibit [Exhibit WI-1b]

[01:20:00]

Natalie Kim Björklund Gordon

Of course.

Kyle Morgan

You swear to the contents of that slideshow? You created those?

Natalie Kim Björklund Gordon

Yes.

Kyle Morgan

They're true to the best of your knowledge?

Natalie Kim Björklund Gordon

They're true to the best of my knowledge, yes.

Kyle Morgan

So help you God?

Natalie Kim Björklund Gordon

So help me God.

Kyle Morgan

I will hand it over to Shawn.

Shawn Buckley

It's unusual for me to step in and ask some questions, but I was just hoping to clarify a couple of things that you'd said. One of the commissioners had asked you about, had the reactions in your own family been reported to CAEFISS and I think you said, "No, with the pericarditis, it was 28 days after." Do you mean after the vaccination?

Natalie Kim Björklund Gordon

It was 28 days after her second jab, and therefore, was classified as unrelated.

Shawn Buckley

Okay, so she would be considered unvaccinated for 14 days after the second jab.

Natalie Kim Björklund Gordon

Well, no, she'd be considered un-vaxxed for 14 days after her first jab. Then between the first jab and the second jab, she would be considered partially vaccinated.

Shawn Buckley

Okay. So my understanding is, in Alberta, people were considered unvaccinated until 14 days after their second jab. Was it different in Manitoba? Since using Alberta statistics and I live in Alberta, so I think in Alberta, they were considering a person unvaccinated until 14 days after their second shot. Would you know?

Natalie Kim Björklund Gordon

I don't know what the Alberta standard was. I know that in Manitoba for a long time they had a classification of partially vaccinated and later, partially vaccinated got rolled into unvaccinated in some jurisdictions. I don't know if Manitoba did that, but the category of partially vaccinated vanished. So you had only vaccinated and unvaccinated, and I don't know where that middle group of partially vaccinated went.

Shawn Buckley

Ok. So in Alberta, you are not sure.

Natalie Kim Björklund Gordon

No, I'm not sure.

Shawn Buckley

What I was wondering is, if it's true that in Alberta, you weren't vaccinated until 14 days after your second vaccination, you'd have a group of people that just had one shot, and whether they had any reaction at any time that would be a vaccine injury after that, they would still be un-vaxxed.

Natalie Kim Björklund Gordon

That would be the case if you're rolling partially vaccinated in with un-vaxxed, yes.

Shawn Buckley

Right. Okay. Thank you very much. And on behalf of the National Citizens Inquiry, we thank you so much for your testimony today.

[01:23:00]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

[00:00:00]

Shawn Buckley

Day two. Our next witness is joining us virtually. Brian Giesbrecht. Brian, can you hear me?

Brian Giesbrecht

Yes, I can hear.

Shawn Buckley

Okay, and we can hear you. I'll ask if you could state your full name, spelling your first and last name for the record.

Brian Giesbrecht

Brian Giesbrecht, B-R-I-A-N, Giesbrecht, G-I-E-S-B-R-E-C-H-T.

Shawn Buckley

And Brian, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Brian Giesbrecht

I do.

Shawn Buckley

Now, my understanding is that you were a provincial court judge in Manitoba for thirty-one years.

Brian Giesbrecht

That's right.

Shawn Buckley

And for 15 of those years, you were the Associate Chief Judge of the Provincial Court in Manitoba.

Brian Giesbrecht

Yes.

Shawn Buckley

And for eight months in 1993, you were actually the Acting Chief Judge.

Brian Giesbrecht

Yes.

Shawn Buckley

You are retired now, and you've been retired for approximately 15 years, but since retiring you have been writing extensively on free speech and Indigenous issues.

Brian Giesbrecht

Yes.

Shawn Buckley

And prior to COVID, you had regular columns in a few newspapers.

Brian Giesbrecht

Yes, I wrote for various publications.

Shawn Buckley

So can you tell us when COVID hit, what happened with your writing?

Brian Giesbrecht

Well, I'm associated with the Frontier Centre for Public Policy and my colleagues and I, fairly early on, began to look particularly at what was happening in Sweden. The approach that they were taking in Sweden seemed to simply make a lot of sense to us. And really what it was, was the traditional pandemic policy that the provinces had followed, in fact, all of the Western world had followed for many decades. So I began writing most of the articles on that. But I began writing articles such as, one was titled "Sweden Is Doing It Right, We're Doing It Wrong," that sort of thing.

And then I teamed up with an emergency planning expert by the name of David Redman; he's known to, I think, a lot of people here. He's done very extensive work in this field and

he's a retired Lieutenant Colonel with the Armed Forces, very experienced in emergency planning. And he had been trying to make some headway in his own province of Alberta, trying to speak to the senior people and basically talking about the emergency plans that had always worked in the past that they'd always used. The lockdown plan is practically the opposite of the normal plan.

So we wrote some articles together and basically what I expected was that there should be some reasonable discussion about which parts of Sweden's approach worked and which didn't. In other words, there would be an objective determination about this. And that's, in fact, what the Swedish architect of the plan, Anders Tegnell, originally said. He said, "Look, this is a good opportunity for everybody because Sweden would be basically like a test tube experiment. We could compare results and we can adjust and say, 'Okay, what's working in Sweden, what is not, and we can transfer that to the other country.'" That didn't happen.

I was very surprised that the reaction was almost uniformly hostile. We had mainstream newspapers, even internationally— *The New York Times* wrote a scathing account about Sweden and how people were just dying like flies. It wasn't true. It's not true. As a matter of fact, Sweden has done at least as well and probably better than most of its European counterparts just by taking its very hands-off approach during the lockdown. They did not close schools. They did not shut down businesses.

Shawn Buckley

And Brian, I'm just going to focus you onto what happened with your writing, as I have to keep witnesses focused today, and so I'm just really curious about what happened to your writing and have you contrast that with, you know, pre-COVID.

Brian Giesbrecht

I get that, Shawn.

[00:05:00]

My point there is that the reaction was hostile. The idea that anybody could take a different view on any lockdown subject seemed to be absolutely discouraged. The mainstream newspapers were particularly harsh on anyone who didn't sort of conform. So that was my experience.

I was writing articles throughout the pandemic and David Redman was making presentations to many people. But people were very divided because there were certainly people interested in what the non-lockdown people were saying, but half of the population at least, seemed to be hostile to any suggestion that things could be done a different way. That was my point there.

Shawn Buckley

Okay, I want to switch gears and actually talk about your experience as a judge because being a judge for a full 31 years itself is quite exceptional. And some of us, we walk into a courtroom and the judge is up there in their robes and it's almost like they're in a different world. And I think the average person does not appreciate that judges are part of our community and that they're also influenced by what the political or social trend is at the time. And I'm wondering if you can speak about that and maybe give us some examples, as

when you were a judge, how you felt pressure on you to go certain ways depending on what was happening in the community at the time.

Brian Giesbrecht

Yeah, I can think back to one time, and this was during the 1980s, when what were called the satanic ritual abuse cases were being heard. And there were a couple of sensational cases where children had been coached, I guess, to come up with these stories about satanic sexual abuse, et cetera. There were actually people who spent years in jail as a result of false claims.

In any event, the pressure on people, not just judges but police officers, social workers, et cetera at the time, was to believe all children. In other words, every claim a child made, no matter how preposterous, must be accepted. Now, of course, that's not reasonable. Children don't always tell the truth, neither do adults, but there was a great deal of pressure at the time. But I don't think that that was anything compared to the pressure judges must have been under when this pandemic struck and I'm here as an armchair quarterback. I will be critical of what the Canadian courts did or didn't do. But I am speaking as a private citizen here.

Shawn Buckley

Can I just back you up because I really do want people to understand that judges do feel pressure about what's going on. So you were talking about this time where there was kind of this hysteria about satanic child abuse and pressure on the authorities. Was there pressure on you as a judge to, basically, kind of believe children when they were witnesses in court because of that social pressure?

Brian Giesbrecht

Yes, exactly, and that was just an example that I can think of. But I don't think it was nearly as strong an influence as what it must have been like to be a judge, or really people in any position of authority, when the pandemic struck. Because, of course, people were taken by surprise and everything was new to people, and in most cases, people had not really undergone anything similar before.

Shawn Buckley

And I'm just going to take you back there—

Brian Giesbrecht

So before I criticize, I want to recognize this fact.

Shawn Buckley

So I just want to take you back there because again, I want to make sure that people understand that point. We were talking on an earlier occasion and you expressed to me that you felt similar pressure when spousal abuse became a big issue, and arguably, in the court system, could be described as a political issue. And I'm wondering if you can describe that period and also whether, as a judge, you felt pressure then to basically find that certain witnesses were credible versus other witnesses.

Brian Giesbrecht

Yes, I think so. At one point, again, fairly early on, spousal abuse began to receive a great deal of attention, and it deserved it

[00:10:00]

because for many years the abuse of a spouse was considered no big deal. Well, the law took a turn; it got a lot of attention, as it should have. But then, as the pendulum very often swings too far, there was definitely pressure on people, on judges, to say, “believe all women,” which is just as silly as the idea that you believe all children. All human beings of every gender and age and ethnic group, et cetera, either tell the truth or don’t tell the truth or think they’re telling the truth when they’re not. So there was a great deal of pressure during that time, and judges were very often under pretty strong criticism if the account of an abused woman was not accepted. So that is another example I would offer of something similar, yes.

Shawn Buckley

And then you were sharing with us already that in your estimation the pressure on judges to basically follow the COVID narrative, and appreciating you’re now an armchair judge, but you’re giving us the impression that you felt that that would have been quite enormous pressure on judges.

Brian Giesbrecht

I think so. I think so. The pandemic was a shocking event for everybody. So I expect that judges were just as affected as everybody else. They had to live through things as well. They had to completely adjust their work routines, et cetera. And I think they probably generally were all from the demographic, say middle-aged, upper-middle-income people who were more likely to be within the group of people who perhaps were most concerned or even afraid of the virus. I think statistically that’s true and that the younger people were less afraid and the older people, particularly in the upper income groups, were much more conscious than the other people.

Shawn Buckley

Now, can I ask you, because as a former judge you would be interested in what the courts were doing with COVID— Can you share with us your thoughts on how the courts handled COVID, just even to focus you more concerning perhaps defending the rights that we had under both common law and under our *Charter of Rights and Freedoms*?

Brian Giesbrecht

Well, like many people, I think I’d say I was surprised and quite disappointed with the response of the courts when people did make challenges to the lockdown rules, particularly the most overreaching of the rules. I think, generally, that the citizen expects the judge to stand between him and government overreach. And I have to say that in Canada, I don’t think generally that did happen.

And again, it’s easy for me to criticize because I’m sure it’s very tough hearing these cases, but the response seemed to be, generally, that well, if the government and their health people make some sort of rule, policy rule, then who are we as judges to question that? And

so often, they simply, almost always, they just deferred to the health authorities. And I think that was wrong.

I was comparing this to the decisions that were coming out of the United States. Now I would expect, in something like this, most of the decisions would uphold the government regulations. That only makes sense. But there, they did have a lively and vigorous testing of the rules, and I think that was very necessary and helpful.

I'll just give one example if I can, or maybe two. That judge that struck down the mandate requirement for masks on airplanes in the United States— Well, the government was going to appeal,

[00:15:00]

but they never did. I think the judge actually got the government off the hook on that one because the mask mandate on planes at that time made no sense and did not cause any problems when it was removed. But the fact is that Americans, for many months, were travelling on airplanes while Canadians still had to wear masks on the planes. And for some people that causes real problems, especially on a long flight.

Vaccine mandates were the other example where American courts had struck down several of the most egregious vaccine mandates months and months before these things were finally put to rest in Canada. And those vaccine mandates caused, especially for people who say had previously been infected and didn't need the vaccine in the first place or whatever, they caused tremendous hardship. People lost their jobs while all of this was going on. Well, I do think that if people had the sense that they could go to court and get a fair hearing and have a chance to have the most egregious government policies removed, they would have done so. But I think the feeling was, at least my impression is, that people felt that there really was no purpose in taking something to court here because nothing would happen.

Shawn Buckley

Sorry to break in, but can I ask you to give us a couple of examples, perhaps from Manitoba, of cases that would have given people in Manitoba the feeling that there was really no point in going to court?

Brian Giesbrecht

Well, I was following the church cases and we had, in Manitoba as you know, some situations, for instance, where the Southern Manitoba churches were even going to the extent of holding church services outdoors or sitting in cars and yet the police were still called. Or even the funerals where people were not able to say goodbye to dying relatives. Well, I think that was government overreach. I don't think that even in Wuhan China the government went that far.

Shawn Buckley

Brian, I'm just going to have to stop you and ask if you can turn off your video because your audio is breaking up, and so I think we need the bandwidth so at least we have your video. We just must have a bad internet connection.

Brian Giesbrecht

I'm sorry. Okay.

Shawn Buckley

Yeah. No. Sorry about that, but it's important that we hear what you say. So you're talking about the lockdown case. Can you tell us what happened in that case and why that might have caused Manitobans to think that the court was not going to stand between the state and themselves?

Brian Giesbrecht

Well, just generally, and I'm not putting myself forward as an expert on any of these cases. But I think, just generally, the people who did bring the case to court thought that they had a very legitimate point and basically being able to attend church, especially if it's done outdoors sitting in your car, that would be reasonable. I think that there are many other examples of overreach by the government. For instance, my personal example is going out for a hike in a park and finding that the outdoor hiking trails were closed.

Shawn Buckley

Brian, I just want to focus you because I'm trying to get you to a place we talked about in an interview. So you were telling me about Justice Joyal in the Manitoba lockdown case and about him privileging the Government's position, and so can you please share that with us?

And then I wanted to take you to that Ontario Court of Appeal case and your thoughts on the judicial system generally.

Brian Giesbrecht

Okay. And I don't want to be critical of Justice Joyal. He's an excellent judge. He's a very excellent judge. But just generally, I think that some of the bylaws, some of the rules that were made in Manitoba were particularly unreasonable. And I think that I'll just say this, that citizens should have the expectation that they could go to court and have a reasonable chance of having the judges, and I'm not critical of any particular judge here,

[00:20:00]

have judges look at that and not simply tell them, "Well, whatever the public health authorities decide is good enough for me." So I think I'll leave the Manitoba one at that. I'm certainly happy to discuss that Ontario case, by all means.

Shawn Buckley

Sure, if you can. So before we leave the Manitoba lockdown case, would I be fair in summarizing that it's the fact that there was deference given to the provincial public health authorities and basically accepting that as true without actually testing it, that was the concern?

Brian Giesbrecht

Yes, I think that's right. I would just say that generally, being too quick to simply accept the decision of the public health officials is not something that the judges should do. And I think

that judges probably are having a lot of discussion about the role they played or didn't play during the pandemic. And I just point out once again: it's easy for me to criticize, I didn't have to do it.

Shawn Buckley

Right. Now, so the Ontario Court of Appeal decision we're referring to as *JN v. CG*. Do you want to share your thoughts on that and then your thoughts on what the ramifications are for the court if this continues?

Brian Giesbrecht

Yeah, as I recall, in that particular case, a mother who had custody of children did not want to have the two children she had custody of vaccinated, and she had definitely done her homework. She was obviously a very capable person and the separated father went to court and wanted to have the children vaccinated. Now, I read the decision of the motions judge and I was totally impressed. I thought that judge really took a lot of time to objectively review the evidence, and the judge came to the decision that the woman, as she had custody after all, should have the right to decide whether those children were vaccinated or not.

But when it was taken up to the Court of Appeal, and not to be too smug here or too quick to judge, but I think that the Court of Appeal basically just said, "Whatever the provincial authorities decide, that should stand." So I would be critical, if I'm right about that, that they gave too much deference to the provincial health authorities. And just because it was under the name of health or emergency, they didn't properly look into the findings that the motions judge made and the evidence that the wife in that case presented. I would be critical of how they decided that case.

Shawn Buckley

Well, you had said something profound to me when we had a conversation. You had said to me if the Ontario Court of Appeal is saying that you can take what the government says at face value, then you don't need courts. And I'm wondering if you, first of all, remember saying that, and if you do, if you can comment on what you mean.

Brian Giesbrecht

Yes, if the court is simply going to accept any decision that is made by a government official, then what is the purpose of the court? The citizen needs the court to stand between himself and the government and relies on the court to protect civil liberties. And if the court is really not doing that, then I do ask that question, "What is the purpose of the court?" And I think on an even larger scale, I think all of us are going to have to ask: Is Canada still the country we thought it was before the pandemic? In other words, our individual liberties, are they valuable? Or have we somehow decided to give them up whenever a virus comes to call?

[00:25:00]

So I think there are some pretty big questions that we all have to ask ourselves. And I do believe that the legal profession and judges are probably asking themselves these questions right now. And they're pretty big questions.

Shawn Buckley

Brian, I know that the social media team at the NCI is going to be very upset with me if I don't ask you to turn your video on, and then I ask you that question again. Because your answer, I think, is of tremendous importance. And I think people should see you when you say it.

So I brought back to you that in an earlier conversation you had shared with me that if the Ontario Court of Appeal—and I think we could say courts generally—are saying that you can take what the government says at face value, then you don't need the courts. And so if, once again, with your video on, can you comment on what you meant by that and what the ramifications for us as a nation are?

Brian Giesbrecht

I wasn't trying to be disrespectful. But I am suggesting that now that this pandemic episode has passed, everybody has to ask themselves some pretty big questions.

I think judges have to ask themselves whether or not they did play the proper role during the pandemic in protecting people's rights. And the country as a whole has to ask itself the question: Are civil liberties and individual rights important to us any longer? Or are we, after this pandemic episode, wanting to live in a different country where we don't have to exercise individual rights, where we rely upon the government to do everything for us?

So I think these are very big questions, and I've been pondering this for some time because it seems to me that Canada is not the country—right now, as we're emerging from this pandemic—is not the country I think it was before the pandemic started. So I do expect that many people, media people too, and our politicians, are going to have to ask themselves some very, very serious questions about the role they've played during this pandemic. And I live in Manitoba, and Manitoba was, I think in many cases, particularly draconian in some of the rules of law, it must be said. And I refer to the cases where people couldn't even attend their funerals for dying family members, et cetera, or even go to church.

Shawn Buckley

Brian, we have to keep the witnesses a little tight today, and I want to give the commissioners an opportunity to ask you any questions if they have any. And there are questions.

Commissioner Kaikkonen

Thank you for your testimony. Have you ever noticed a time when the world came together as it has in the past three years in one mind—all levels of government, the judiciary, the administrators at school board levels, for example—where everybody seemed to be of one mind except for the people, excepting the people who were arguing that our civil liberties were being deprived?

Brian Giesbrecht

No, this was new to me and it was, to be quite honest, a very frightening experience. And I don't know how to explain it, but it does seem that there was some sort of—I don't know if the various leaders all made this at the same time or how it came about. But I have never experienced such a thing and I do not believe it was a healthy experience.

Commissioner Kaikkonen

And my second question is on social media. Somewhere in the middle of the pandemic, there was a photo circulating on social media that had the Supreme Court judges saying they were all vaxxed in unity. And the message to the people was that the judges were vaxxed, why aren't we? So I just wondered— It seemed to me that there was a lot of posturing in that photo circulating, and I'm going to admit that I don't know the authenticity of that photo. But what are your thoughts on the separation of powers? Because we've always had the legislature on one side and the judiciary on the other.

[00:30:00]

And what was that picture circulating around social media doing in terms of promoting the government narrative as opposed to that perceived independence of the judiciary?

Brian Giesbrecht

Well, just generally, I believe from the start that vaccination should be a personal decision. Without going into the vaccine too much, because I'm not a medical doctor or a scientist, but I mean, it was known from the beginning that people who chose to be vaccinated would still be infected and could still spread the disease just like unvaccinated people. So there was never a reason in the first place to somehow demonize unvaccinated people, people who chose for whatever reason they cared not to be vaccinated. And I think the campaign, which was more than just a health campaign, became something quite unhealthy when people were pushed and more than pushed into choosing vaccination. And here in this province, Manitoba, we saw what was almost a demonization of people who were called anti-vaxxers. And this was particularly targeted. It was quite ugly against the people of southern Manitoba and even our main newspapers seemed to—

Shawn Buckley

Brian, can I just—

Brian Giesbrecht

I have to say, the politicians sort of took aim at these people.

Shawn Buckley

David, can I have the mic for a second?

So, Brian, sorry, but I think the Commissioner was asking you really about whether it was appropriate for the Supreme Court of Canada to pose saying that they were vaccinated because then they're basically participating in politics. And traditionally, we've had a separation between the legislative branch of government and the courts that are supposed to be apart. And so, I think the Commissioner was asking you to comment on what seems to be the courts engaging in a political message in support—

Brian Giesbrecht

Yes, and I apologize for not being clear, but I'm agreeing. I'm saying that this campaign, which even included the judges in this vaccination claim, this is not something that should have been done, and it contributes to division. It did not contribute to anything healthy. So I'm agreeing with this person; I'm sorry to make it too long of an answer.

Commissioner Kaikkonen

And I just have one more question. When you think of, and you alluded to this, the newspapers being bought off and independent reporters being dismissed as professors of false information— How do ordinary people influence the judiciary, apart from going to court and having legal precedent set that will go against the populace in the future? How do they influence judges to say that there is a different side to the narrative?

Brian Giesbrecht

Yeah, I don't think that there is any very simple answer. If the courts aren't available to people and if politicians are not willing to listen to the point of view of someone who does not accept the prevailing narrative, then there are very few options. And I think that's what we see. What we've seen, I think, is we've seen basically half the country feeling that they've been not listened to and not treated very well and the other half wanting, at times, even more restrictions.

I'm sorry I don't have a real answer there, but what I'm saying is that it's just a plea for people to try to be more objective and not get caught up in some type of groupthink-type of thing, which I think happened during this pandemic, particularly once we got into the idea that everybody had to be vaccinated. I think that's when things really went off the rails.

Commissioner Kaikkonen

I want to say thank you.

Commissioner DiGregorio

Thank you, Justice Giesbrecht,

[00:35:00]

for giving us your testimony today. We had a witness in Toronto, Mr. Pardy, who talked to us a little bit about— Well, he covered a few things: one being the deference being given by the legislature to the administrative state; paired with the deference that courts have been giving to the administrative state, which I think you've touched on today; and paired with maybe some weaknesses within our Charter that we weren't expecting, having led to the results of where we are today. And when I questioned him on how to address these particular positions, he seemed to think that addressing the legislative deference to the administrative state and even possibly, although not realistically, amending the Charter was a good way of approaching it.

I'm wondering if you have any recommendations on how the courts could look at addressing the significant amount of deference that has arisen.

Brian Giesbrecht

Well, I don't know that I have any recommendations. I'm just suggesting that the judges, in their discussions, should be thinking a great deal about the role that they did play or didn't play during the pandemic: Do they feel that they properly protected civil liberties? Or do they feel that perhaps they gave too much deference to provincial policies, even ones that were quite extreme?

So I'm not sure if I have any suggestions as far as different laws or anything like that is concerned because I don't think that's what is required. I think there needs to be a little more attention given to the individual rights of Canadians. And I really hope, as a Canadian, I hope that we haven't entered a time when we're going to lay down our carefully acquired civil liberties whenever there is any type of a health threat. That's my personal hope.

Commissioner DiGregorio

So you're suggesting really a self-reflection exercise by the courts and the judges?

Brian Giesbrecht

Yes, I am.

Commissioner DiGregorio

Thank you.

Commissioner Drysdale

Good afternoon. I have a couple of questions on some specific things that I believe you said. And the first one is, you were talking about, in a number of instances, how judges feel pressure. You are part of the community; you feel pressure. What do you mean by the judges feel pressure? Maybe that's a silly question, but I want to know. You mean pressure to be fired from their jobs? Do you mean pressure to be ridiculed and oppressed? What were you talking about when you said judges feel pressure, sir?

Brian Giesbrecht

Well, judges are sort of under the public eye every minute of the day. It actually is a very high-pressure job because the judge is absolutely aware that everything he does and says is being very carefully scrutinized. So I think it's fair to say that a judge might feel even more pressure than somebody in a less high-profile type of job. So that's what I meant by judges feeling pressure.

Commissioner Drysdale

I'm actually asking more specifically and I'll let you know why I'm asking.

We had testimony earlier today by a gentleman by the name of Rick Wall. He and his wife own a trucking firm that employs 40 people in Winkler, I believe he said. Now, he, at least in his opinion, recognized that there was something going wrong in this country, and he and his wife sat down and they literally discussed losing everything. But on the principle of what they knew was right, they proceeded with the risk of losing everything, not just for themselves, but for their 40 employees and their families.

So my question is, I can't imagine a pressure stronger than that, sir. And I'm wondering, if I understand what you were saying, you were talking about political pressure on a judge and I'm talking about real pressure. I'm talking about losing everything you own and still doing what you think is right. Can you comment on it from that perspective, sir?

Brian Giesbrecht

Well, I take your point,

[00:40:00]

and I'm certainly not suggesting that the pressure any individual judge would feel when hearing a case involving pandemic restrictions would be anything like that or anything as serious as the knowledge that you're going to lose your life, et cetera. So, no, I wasn't meaning to compare it to any particular person; I'm simply trying to explain why it may be that Canadian judges generally did not play nearly as active a part as their American counterparts did. There was no vigorous testing of the restrictions, et cetera. So I'm not meaning to suggest that the person you're describing was not under much more pressure than any particular judge deciding a case.

Commissioner Drysdale

Would you agree with me that certain vocations within our society are granted certain privileges, and along with those privileges comes special responsibility? And I point out a police officer. A police officer carries a gun, has the ability to take away your freedoms, at least temporarily, so in my mind there's a significant additional responsibility that we have on those people.

Do judges fall in that category of special privileges, special responsibilities, more than the average person like myself for instance?

Brian Giesbrecht

Yeah, I would agree generally that the more power one has, the greater one's responsibility is, if that's what you mean. Yes, I do accept that.

Commissioner Drysdale

One last thing I wanted to ask you about is— I believe you also said in your testimony that people thought there was no point to go to court. And I bring that up because— And I honestly don't recall who told me this, it may have been a judge, that apart from the obvious functions of a court, the court also acts as a pressure relief valve to society. In other words, things are going wrong in society and people feel that they can go to the courts and get relief.

And if the country of Canada and the society that we live in was being affected to its very fibre—and that's what has been testified here today by other witnesses—if our very fabric of our society was under pressure and they could not go to the courts to relieve that pressure or get some kind of remedy, would you say that was dangerous for the safety of our society when they have no way to get justice, no way to get protection from the administration?

Brian Giesbrecht

Yes, I would agree with that. I'd also add that the other function of the court there is to act as a break on some of the excesses of the legislature. And if the lawmakers had the knowledge that a judge would strike down an unnecessary restriction, the legislators probably wouldn't have put in nearly as many restrictions as they did. If I can just give a

personal example: I think I mentioned going for a hike in a public park and finding that all of the trails had been closed, which makes no sense to anyone.

And again, I don't want to be touting the American system, but I think the American legislators were more aware of the fact that if they made ridiculous restrictions, they would not be allowed by a court. And unfortunately, in Canada, I don't think that they felt any pressure from the courts at all. And consequently, some of their—and I would say that the vaccine mandate for flying and taking a train in Canada was an example of a ridiculous requirement that served no purpose and hurt many people—but I think if the legislators knew that such unreasonable restrictions would be struck down, they would not have put them in place in the first place.

Commissioner Drysdale

Thank you. Thank you for your service to your country.

Shawn Buckley

Thank you and there are no further questions. So Justice Giesbrecht, we thank you so much on behalf of the National Citizens Inquiry for giving your important testimony today.

Brian Giesbrecht

Okay, well, I'd like to say you're doing a very useful job, and I wish you the best.

[00:45:25]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 6: Martha Voth

Full Day 2 Timestamp: 06:26:20–06:58:13

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Alexander MacKenzie

Yes, thank you. For the record, my name is Alexander MacKenzie and I'm a practising lawyer in Winnipeg here. Mrs. Voth, would you mind stating your full name to the Commission?

Martha Voth

My name is Martha Voth.

Alexander MacKenzie

Thank you, and do you promise and swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Martha Voth

I do.

Alexander MacKenzie

Thank you. Mrs. Voth, you reside in Niverville?

Martha Voth

Yes.

Alexander MacKenzie

On May the 24th of 2021, you tested positive for COVID. Is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And you also were with your husband, Alvin, and he tested positive as well.

Martha Voth

Yes.

Alexander MacKenzie

You, yourself, had symptoms?

Martha Voth

Not as much by that time. I was on my way, getting better.

Alexander MacKenzie

I see, and how about your husband?

Martha Voth

No, he was not. He was having difficulty breathing, and he had no energy, but he went to get tested so he could go back to work.

Alexander MacKenzie

I see.

Martha Voth

Nothing could keep him down.

Alexander MacKenzie

I see, and what did he do for a living?

Martha Voth

He was a flooring specialist, so he installed flooring for 50 years.

Alexander MacKenzie

And he was very physically active?

Martha Voth

Very, and it's a rigorous job so he had to be physically fit to do it, and he still worked five days a week.

Alexander MacKenzie

And he was 66 years old at that time, is that correct?

Martha Voth

Yes.

Alexander MacKenzie

You say that he was becoming ill. He had symptoms that were flu-like, is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And on May the 26th, 2021, what did you do as a result of that?

Martha Voth

Phoned the Walmart walk-in clinic because we wouldn't have been able to get into the clinic in Niverville without an appointment, but at the walk-in we would. And he simply prescribed a drug, an antibiotic, for him, which he sent to the Niverville pharmacy, was picked up by our daughter, and she dropped it off at our door.

Alexander MacKenzie

I see. The Walmart drop-in was in Steinbach?

Martha Voth

Steinbach, yes.

Alexander MacKenzie

And so you got the prescription and what happened then on May the 27th?

Martha Voth

Well, it seemed that he was getting progressively worse. He couldn't walk very well because of the breathing difficulty. And so, I called the walk-in to ask if we could come in and they said, no, we couldn't because I admitted we had tested positive for COVID. They said we had to go to emergency in Steinbach.

Alexander MacKenzie

And that's the Bethesda Hospital.

Martha Voth

Bethesda Hospital, yes.

Alexander MacKenzie

And Alvin then was speaking and breathing with some difficulty?

Martha Voth

Yes.

Alexander MacKenzie

So you drove him then to Steinbach, to the hospital, and how was he feeling then?

Martha Voth

Well, he opened the window on the drive in, which gave him a lot of fresh air. And by the time we got to emergency, he admitted to me that he was feeling so much better because he had gotten a lot of fresh air. I went in, got a wheelchair so he wouldn't have to walk, and brought him to the registration desk.

We got him registered and we were then put into a plexiglass cubicle where we sat and waited till they admitted him, which was about 15 minutes. And then, when they did admit him, they said I could not stay in the waiting room, I had to go home. And I said, because I'd driven a bit of a distance, I wasn't going to go home; I was going to wait in my car until they released him and I could take him home. So I sat in the car about 45 minutes before they called me and said they were going to admit him and keep him overnight, and that's when I went home.

Alexander MacKenzie

I see, and then you were at home and at around seven o'clock you received a phone call. Is that correct?

Martha Voth

Yes, it was later on in the evening. I would say it was more like 9 or 9:30. They said they had put him on oxygen. His oxygen level was at 58, which is pretty low, but with a mask on the oxygen level did come up. They just wanted to let me know that he was very, very sick, and they were going to send him either to Brandon or fly him to Ontario. And I just said, "No, you're not flying him there and you're not bringing him to Brandon. We want to keep him close to home so that we could—"

[00:05:00]

Alexander MacKenzie

Brandon is about a three-hour drive. Is that correct?

Martha Voth

Yes, yes.

Alexander MacKenzie

And that would have been very hard for you to see him there.

Martha Voth

Right.

Alexander MacKenzie

And of course, Ontario would be an airplane trip.

Martha Voth

Yes, right.

Alexander MacKenzie

So you objected to that.

Martha Voth

Yes.

Alexander MacKenzie

And what were you told?

Martha Voth

They were going to try and get a room somewhere in Winnipeg, but they said all the hospitals were full and didn't actually have room, but they were going to try. And they said they were in contact with HSC.

Alexander MacKenzie

HSC is the Health Sciences Centre—

Martha Voth

Health Sciences Centre, yes.

Alexander MacKenzie

In Winnipeg, which is about a 40-minute or a one-hour drive.

Martha Voth

Yes.

Alexander MacKenzie

And then, was there anything else that occurred that day on May the 27th?

Martha Voth

No.

Alexander MacKenzie

And on May the 28th, can you tell us what happened then?

Martha Voth

My husband called me in the morning, asked me to bring the batteries for his hearing aid and his cell phone charger, and I asked him how his night had gone. He said it was good. He had slept well. And I said, "And how do you feel this morning?" He said, "I feel good" because he was getting the oxygen he needed and he felt good.

Alexander MacKenzie

And how was he getting the oxygen?

Martha Voth

Just with a face mask.

Alexander MacKenzie

I see. Now, you had been asked to bring the cell phone charger and batteries and so what were you doing then? You were preparing to go—

Martha Voth

I was. I was trying to get ready, but I kept getting calls and so was a little slow at getting ready. But then the doctor called and informed me that they were going to ventilate him. I said, "No, no, why are you going to ventilate him? Why are you rushing this?" And he said, "Well, we're not actually rushing it, we would have done it last night because he was dangerously low in his oxygen." I said, "Okay, so wait till later in the day to see how the day goes." Well, no, because they didn't have enough oxygen for him and he needed 60 litres per minute and they just didn't have enough oxygen.

Alexander MacKenzie

Okay, now just stop a moment. He had been getting oxygen?

Martha Voth

Yes.

Alexander MacKenzie

His oxygen levels were up. He had said he was feeling much better.

Martha Voth

Yes.

Alexander MacKenzie

And so they were wanting to ventilate him. What did that have to do with the amount of oxygen?

Martha Voth

If they ventilated him, the oxygen would go directly into the lung and they wouldn't need as much oxygen to keep his levels up.

Alexander MacKenzie

In terms of the ventilation, did you get to speak to him about that, that is to Alvin, your husband?

Martha Voth

Well, after the doctor had explained to me why they had to ventilate him now, instead of waiting, one of the reasons was the anesthesiologists only had eight-hour shifts and were going to go home after their eight-hour shift. And if anything drastic happened and he did need to be ventilated, nobody would be around to do it and then he would die.

Alexander MacKenzie

So then, they were going to take him off the mask, where he seemed to be doing not badly,

Martha Voth

Right.

Alexander MacKenzie

and they were going to ventilate him.

Martha Voth

Yes.

Alexander MacKenzie

And the reason for that was an oxygen shortage, partly?

Martha Voth

Yes.

Alexander MacKenzie

And also, partly because their staff would be gone who could install the ventilator?

Martha Voth

Right.

Alexander MacKenzie

And also, partly, because they'd called an ambulance?

Martha Voth

Right. That was another reason why they had to do it now because the doctor had already called STARS [Shock Trauma Air Rescue Service], which is the emergency medical team that picks people up and flies them to different locations.

Alexander MacKenzie

I see.

Martha Voth

So because he had called them 20 minutes prior to my call, I said, "I can't get there in 20 minutes." And he said, "Well, they'll be here in 10 minutes." And I said, "Well, I'm just not ready to get there; like just hold off." "Well, no, we cannot waste their time because they're flying all over Manitoba, picking people up. So we can't waste their time."

Alexander MacKenzie

And so, again, what is the distance from Niverville, in time, from Niverville to Steinbach?

Martha Voth

Half hour.

Alexander MacKenzie

Half hour?

Martha Voth

Twenty minutes to a half hour.

Alexander MacKenzie

So the STARS was going to be there in 10 minutes and it would have taken you a half an hour?

Martha Voth

At least a half hour to get there, yes.

Alexander MacKenzie

And so what happened next?

Martha Voth

Then my husband called again and again he sounded great. He sounded normal and he asked, "When are you getting here?" And I said, "I can't get there before STARS gets there." And then I asked him, I said, "Are you okay with going on a ventilator?" He said, "I don't know. I have nobody to talk to about this. They just tell me whatever, but I don't know how to gauge whether I should go on it or not."

Alexander MacKenzie

And he very much wanted to be able to speak with you about that? Is that correct?

Martha Voth

Yes. Yes. Yes.

[00:10:00]

Alexander MacKenzie

However, you didn't get there, and he was moved from the Bethesda Hospital to the Health Sciences Centre by STARS?

Martha Voth

Yes.

Alexander MacKenzie

Did you become aware of any conversation that the STARS attendees had? Were you ever told of any conversation that is significant?

Martha Voth

Yes. A doctor called from the hospital in Steinbach and let me know that they had discussed to let me into my husband's room there in Steinbach because I had also had COVID. But then, I talked to him about the ventilator because he had told me he was ventilated and he's on his way to Health Sciences Centre.

And I talked to him about, why did he need to go on it? Why couldn't he just stay on the mask? And then the nurse informed me that the STARS attendees— And my understanding is that STARS has their own doctor that they fly with, that they had questioned the staff in my husband's room asking, "Why are you ventilating him? He seems like he's doing fine. His oxygen level is up with the mask. He got up on his own out of bed and went to the bathroom. He is cooperating. He is not feeling sick, as such. Why are you ventilating him?" I don't know what their answer was.

Alexander MacKenzie

You've never received an answer to that?

Martha Voth

No, just the doctor's reasoning for ventilation.

Alexander MacKenzie

Then, at some point after Alvin had been moved, you got a call from the Health Sciences Centre. Is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And what were you told there about your attendance and so on?

Martha Voth

Well, even though he was close, not in Brandon or Ontario, they still were not going to allow us to go in to see him, but we could set up Zoom calls or video calls with him. And I kind of vetoed that idea because I didn't think there was a point to it. He wasn't responsive anyway. He was in a drug-induced coma. I didn't see the point of it.

Alexander MacKenzie

And that was all on the day that he got moved from Bethesda to the Health Sciences Centre?

Martha Voth

Yes.

Alexander MacKenzie

And then the following day, on May the 29th, you got another call from the Health Sciences Centre, is that correct?

Martha Voth

Yes, it was by the doctor. He informed me of Alvin's condition and just saying that he was very sick and didn't think he'd make it.

Alexander MacKenzie

And was there anything further to your discussion that day that you can recall?

Martha Voth

Well, I asked him to put him on the drug that, and I'm not a medical expert, but that everybody seemed to think was working well, the off-label drug called ivermectin. And he said, "No, we only use scientifically and medically proven drugs that work."

Alexander MacKenzie

I see, okay. And then was there anything else to that conversation?

Martha Voth

No.

Alexander MacKenzie

Okay. Then on May the 30th—again, this is all in 2021—you requested regular video calls. You took them up on their offer. Is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And was that arranged for you and how did that work?

Martha Voth

Yes, they said they would start the next day with the video calls.

Alexander MacKenzie

And during that time too, I understand that you had regular calls and discussions with the medical staff at the Health Sciences Centre as to Alvin's condition.

Martha Voth

Every morning I called to see how the night had gone. Every evening I called to see how the day had gone and about 2 o'clock in the afternoon, the kids and I would do a video call with him being in a comatose state. We would sing, we would talk about our day, and we would pray with him, and generally, it was about an hour-long call.

Alexander MacKenzie

And in those conversations, I understand you had the video calls, but you also had conversations with Health Sciences Centre staff, is that correct?

Martha Voth

Yes. They informed me what they were doing to him and with him every day. One of the nurses in particular was very kind, would speak to him, would turn his face to the sun in the window. And then, they started to tell me that his condition improved when they proned him,

[00:15:00]

and proning means turning him on his stomach, and all the numbers on the machines would be better if they proned him.

Alexander MacKenzie

Okay, and did they tell you any disadvantage to proning?

Martha Voth

No.

Alexander MacKenzie

Okay. And so if he was lying on his back, as I understand what you're telling us, he would have less strong vital signs than when he was lying on his stomach, is that correct?

Martha Voth

That was my understanding because when they did prone him, his stats, his numbers, always were better on the machines.

Alexander MacKenzie

Okay, thank you. And then these calls went on through to June the 7th or June the 8th. Is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And then, on June the 8th, you got a call from the Health Sciences Centre.

Martha Voth

Yes.

Alexander MacKenzie

And what were you told then?

Martha Voth

They said that all the ports and the needles that were in his body, for all the medications and things, were badly infected, and now they were dealing with a new infection in his blood that was causing his organs to shut down, and um. . .

Alexander MacKenzie

And what were they going to do to try to resolve that?

Martha Voth

They were going to try and find new places for all the ports and needles. And they said they would have to work on it all day, and he was in a very bad place.

Alexander MacKenzie

I see. And then on June the 10th, you were called again from the Health Sciences Centre.

Martha Voth

Yes, they wanted us to come in so that we could agree with them to put him in comfort care.

Alexander MacKenzie

And what did you understand that the words "comfort care" meant?

Martha Voth

Kind of in palliative care where they don't actively work anymore to get him better.

Alexander MacKenzie

Okay, thank you. So I understand that on June the 10th then you, two daughters, you have three daughters, two of your daughters and your son attended the Health Sciences Centre, is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And your other daughter attended by video, did she?

Martha Voth

Yes.

Alexander MacKenzie

Were you masked when you attended?

Martha Voth

No.

Alexander MacKenzie

I understand you saw some sign on the door, on the 10th when you attended?

Martha Voth

Yes.

Alexander MacKenzie

And by the door, I mean the door to the room in which Alvin was?

Martha Voth

Yes, it said COVID recovered.

Alexander MacKenzie

COVID recovered?

Martha Voth

Yes.

Alexander MacKenzie

In terms of Alvin's condition, how do you square the sign COVID recovered on the one hand and the fact that he's getting worse on the other hand?

Martha Voth

Well, it was the infection that you can get only in ICUs,

Alexander MacKenzie

It was the infection—

Martha Voth

like a sepsis.

Alexander MacKenzie

It was the infections and sepsis

Martha Voth

Yes.

Alexander MacKenzie

that was the problem for him, not COVID?

Martha Voth

Yes, not COVID.

Alexander MacKenzie

Was Alvin on his back or on his stomach?

Martha Voth

He was on his back, and we were there for a few hours, two or three hours before we actually had the meeting with the doctor and some of the nursing staff, the chaplain.

Alexander MacKenzie

And so you had been in Alvin's room,

Martha Voth

Yes, a couple of hours.

Alexander MacKenzie

and you were sitting with him for a time with your children.

Martha Voth

Yes.

Alexander MacKenzie

And then you went to another room, is that correct?

Martha Voth

Right.

Alexander MacKenzie

And who was in that other room?

Martha Voth

It was the doctor, together with the head nurse and some of the nursing staff and a chaplain.

Alexander MacKenzie

And in those discussions, did the issue of comfort care come up again?

Martha Voth

Yes.

Alexander MacKenzie

And how did that come up?

Martha Voth

He told us how bad the situation was and that his organs were failing and their suggestion was that he should be put in comfort care. And so I said, "It's too bad that you cannot give him that drug, ivermectin." And he said, "No, we don't use that here." And then I said, "Well, could you prone him and would his numbers be better then?" And he said—

Alexander MacKenzie

And so, you asked for him to be proned?

Martha Voth

Yes. Yes, and he said, "Yes, it has improved when we do prone him, but he could have a massive heart attack, and then it'd be over."

[00:20:00]

And I said, "But he has a good, strong heart." And he said, "Yes, he does."

Alexander MacKenzie

So on the one hand, they're saying that he is not going to survive for more than a few hours, yet they are afraid to give him the ivermectin because it might hurt him and they're afraid to prone him because it might hurt him. Is that what I understand from you?

Martha Voth

Yeah.

Alexander MacKenzie

Thank you. It's hard for me to understand that. In any event, they did prone him, did they?

Martha Voth

Yes. We were left alone in that waiting room to discuss whether we wanted him pruned or put on comfort care, and it was a no-brainer. We wanted him pruned because we still believed in a miracle. So we went back to the nurses' station and the same people that were in that waiting room were around the nurses' station, and we told them we had decided we wanted him pruned. And they said, okay, they had to get a few people out there to help with that.

So then I asked the doctor, "You know and I know it's scientifically and medically proven that when a baby is born and doesn't have any human touch that the baby dies." He said, "Yeah, that's true." And I said, "Don't you think that if we spent time in his room touching him, talking to him, and that we were there physically instead of video calls that he would improve"? And he said, "Yes, I believe that." But he said, "I can't make that decision." And he turned his head and looked at the head nurse and said, "Can we make that happen"? And she said, "No, it's not our protocol."

Alexander MacKenzie

And by this time had Alvin been pruned?

Martha Voth

No, that was just before.

Alexander MacKenzie

Just before he was pruned?

Martha Voth

Yes.

Alexander MacKenzie

So you had asked to be able to stay at Alvin's bedside and—

Martha Voth

Well, we just thought we were there, so we thought we may as well just stay

Alexander MacKenzie

Right.

Martha Voth

as long as we possibly could.

Alexander MacKenzie

To talk to him.

Martha Voth

Yeah.

Alexander MacKenzie

To sing to him in person.

Martha Voth

Yes.

Alexander MacKenzie

To hold his hand.

Martha Voth

Yes.

Alexander MacKenzie

To do those things in the hopes that it might revive him.

Martha Voth

Yes.

Alexander MacKenzie

And you were told—

Martha Voth

Well, after they pruned him, then the nurse said, "Well, now you can't be in his room anymore because now his numbers are better."

Alexander MacKenzie

So you could— Just so that I believe I understand every word you say. So long as he was on the edge of death and going to die, you could stay for comfort care?

Martha Voth

Yes.

Alexander MacKenzie

But the moment it looked like he might live, you had to go?

Martha Voth

Yes, and then the nurse did say, “Well, I will allow you to stay one more hour, but then you have to leave.”

Alexander MacKenzie

I believe you recalled to me some specific words that were spoken to you when you asked if staying there might help and the doctor asked the nurse if that would be possible, and the doctor was told— What were those words?

Martha Voth

“No, it’s not our protocol.”

Alexander MacKenzie

And so you left with your children and went home?

Martha Voth

Yes.

Alexander MacKenzie

I understand that on June the 11th, you continued your video calls.

Martha Voth

Yes.

Alexander MacKenzie

And they continued right through to June the 24th.

Martha Voth

Yes.

Alexander MacKenzie

And each day you and some of your family would sing and talk to your husband, Alvin?

Martha Voth

Yes.

Alexander MacKenzie

And that each morning and each evening you would call and get updated information from the Health Sciences Centre.

Martha Voth

Yes.

Alexander MacKenzie

Now, on June the 22nd, you received a call from the Health Sciences Centre.

Martha Voth

From the doctor.

Alexander MacKenzie

And that was doctor—

Martha Voth

Clare Ramsey.

Alexander MacKenzie

Dr. Clare Ramsey. And what were you told?

Martha Voth

She said, “He didn’t have very long, that he was in really, really bad condition. All his organs had shut down by that time because of the massive infection that was running through him.” And I asked her if his condition was strictly due to him being in their ICU, and she said,

[00:25:00]

“Yes, you only get this infection in the ICU,” and that’s what was killing him.

Alexander MacKenzie

Now, on June 25th then, you received yet another call from the hospital. Is that correct?

Martha Voth

Yes, they said he wouldn't make it the day.

Alexander MacKenzie

He would not survive for the day? He would not make it, he would die that day?

Martha Voth

Yes.

Alexander MacKenzie

And you were told you would be allowed to come in again. Is that correct?

Martha Voth

They asked us to come in, yes.

Alexander MacKenzie

And so what did you do?

Martha Voth

The girls and I went in. Our son was doing concrete and he was in the middle of a pour, and it is sensitive work, so he couldn't leave. He was trying to get somebody to do his job, but he couldn't find anybody, so he had to wait until the concrete set. So we went in; the girls and I went in. We got there shortly after lunch.

Alexander MacKenzie

That is, you and your three daughters, yes?

Martha Voth

Yes.

Alexander MacKenzie

And again, your son could not attend, not because he didn't want to, but because he was in the middle of pouring concrete.

Martha Voth

Right. He was trying hard to get there. And we were there all afternoon, and the nurse kept coming in to ask when the son was going to be there because she said he's going to die any minute. But I mean, the machines were still all on him, so—

Alexander MacKenzie

What did she tell you about keeping the machines on?

Martha Voth

She said, "You're not doing him any favours by keeping him on these machines. In fact, it's worse for him to be on all these machines."

Alexander MacKenzie

And you arrived about what time?

Martha Voth

About one o'clock in the afternoon, somewhere in there.

Alexander MacKenzie

And I understand that your son did finally arrive at around seven?

Martha Voth

He finally came at seven, yes.

Alexander MacKenzie

And I understand also that then you and your family were allowed to sit with your husband?

Martha Voth

Yeah, we were there in his room all afternoon and then all evening. And at some point, the kids decided to go get some food.

Alexander MacKenzie

And you had one of your children, you have three daughters,

Martha Voth

Yes.

Alexander MacKenzie

One of your daughter's name is Rebecca, is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And you were about to say that your children decided to get up and go have a bite to eat while you were going to remain with Alvin.

Martha Voth

Yes.

Alexander MacKenzie

And what happened then?

Martha Voth

As they were walking, Rebecca, who is our youngest, she was pregnant. But she started bleeding and she had a miscarriage because of the stress of that day.

Alexander MacKenzie

And I understand that you did stay with your other children. Rebecca went home and that she, nonetheless, stayed for much of the time on the phone and you made a phone connection so that she would be there too.

Martha Voth

Yes.

Alexander MacKenzie

Now, that went on until past midnight on the 25th, is that correct?

Martha Voth

Yes.

Alexander MacKenzie

And then tell us what happened then.

Martha Voth

Well, we went back and forth trying to decide: should we keep the machines on and wait for a miracle or take them off and wait for a miracle? So we went back and forth all that time to try and decide what to do. Because of course you want him to live, right?

Alexander MacKenzie

But you also hoped for a miracle?

Martha Voth

Yes.

Alexander MacKenzie

And so, sometimes different of your family would think, "time to take him off," and other times people would change their minds,

Martha Voth

Yes.

Alexander MacKenzie

and ultimately though, you made a decision.

Martha Voth

We made a decision after midnight to take him off all the machines.

Alexander MacKenzie

And so I'm presuming you called on the medical staff.

Martha Voth

Yes.

Alexander MacKenzie

And just tell us about what happened then.

Martha Voth

Well, they had promised us that when they would take all the machines off, they would take the hose out of his mouth so that he would look normal right at the end. And when they did come in to do that, they said, no, they would leave part of that hose in his mouth because there could still be a particle of COVID in his lung. And then, we would be at risk. My kids and I would be at risk. And if they took it all out and we were in the room, then they would have to fumigate the room and that would take at least half an hour and he would be gone before that time.

Alexander MacKenzie

So they were still worried about COVID and you getting COVID and that was foremost in their mind in terms of—

Martha Voth

So they said, "Well, unless you had the N95 masks," we couldn't stay in there. And we said, "Okay, we'll wear those masks." Well, they didn't fit right; they wouldn't fit right on our faces. And so we said,

[00:30:00]

well, they had promised that we could stay and we were going to stay and they had to take that hose out. So the nurses walked out and discussed it and came back in and said, okay if we took the N95 masks, we could stay in the room, so that's what we did.

Alexander MacKenzie

And then they proceeded to—

Martha Voth

They proceeded to take all the machines off, unplug everything, and whatever air was in his lungs from the ventilator just puffed out in three puffs, and then seven minutes later his heart had stopped.

Alexander MacKenzie

I feel almost foolish asking this question, but I've been asked to ask it. What do you think should have been done differently?

Martha Voth

Well, he did have pneumonia from the COVID and a blood clot. And in my opinion, if they could have just treated that, which they did, and they later on admitted that wasn't even a big deal, the pneumonia or the blood clot. But if they could have just kept him on the mask instead of the ventilator, things in my opinion, would have turned out different.

Alexander MacKenzie

Thank you, Martha. I'm going to just have the commissioners ask you any questions they might wish to ask. It appears that there are no questions. Thank you very, very much.

Martha Voth

Thank you.

[00:31:52]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 7: Sara Martens

Full Day 2 Timestamp: 06:58:27–07:20:21

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Kyle Morgan

The next witness is Sara Martens. She's just making her way through the room. Good day Mrs. Martens, can you state your whole name?

Sara Martens

Sara Martens.

Kyle Morgan

And can you spell your first and last names for the Commission?

Sara Martens

S-A-R-A M-A-R-T-E-N-S

Kyle Morgan

And do you promise to tell the whole truth, so help you God, nothing but the truth?

Sara Martens

I do.

Kyle Morgan

I understand you're from Manitoba, southern Manitoba?

Sara Martens

Yes, Mitchell and Steinbach.

Kyle Morgan

And for your whole life, you've resided in that area?

Sara Martens

Yes, pretty much.

Kyle Morgan

Can you tell us what profession you have, what type of work you do?

Sara Martens

I've worked with Southern Health for 39 years. I'm not a nurse. I am a health care aide. In the last 10-12 years, I've worked only in a clinic, which is a treatment clinic in Steinbach, also under the home care. We treat people with IVs, injections, a lot of wound care, and that kind of stuff.

Kyle Morgan

I understand that an unfortunate accident happened involving your husband.

Sara Martens

Yes.

Kyle Morgan

It would have been I believe October 20th, 2021?

Sara Martens

[Affirmative nodding]

Kyle Morgan

I don't want to skip ahead too much, ultimately his death was ruled to be a COVID death?

Sara Martens

[Affirmative nodding]

Kyle Morgan

Why don't you tell us what happened on October 20th, 2021?

Sara Martens

So October 20th, 4.30 in the morning, he got up to get ready for his job. He had retired from his previous job that he did forever, and this was a casual job. And what it was, is he would drive a half-ton truck with a closed-in trailer, delivering tires all over Manitoba. So that is what he was getting ready for that morning. I woke up and we chatted for about 10-15 minutes, and then he was off to work. Do I just continue?

Kyle Morgan

Sure, yes.

Sara Martens

So then around 8 o'clock, I got a call from an RCMP that he had been in an accident close to the Austin area, Manitoba. And they just told me that— They asked me a bunch of questions about him. Had he been drinking that morning? Some different questions, I answered them.

And then EMS called me shortly thereafter and told me what had happened. And what appeared to have happened is, he was driving and he must have had a blackout. And he just left the main highway into the ditch over another road and back into a ditch. They had had about three to four inches of rain. And I guess he got stuck in that ditch.

And so when they got to him, the truck was still in drive. The accelerator was pressed all the way down. There was a lot of mud and water flying. And he was just sitting at his wheel, holding on. One of the guys had gone to the window, knocked on the window; he had looked at him. I guess it didn't register. He looked straight ahead. Glasses were hanging on his face. His hat was all crooked and he couldn't respond.

And apparently, according to the EMS, he didn't seem to know who he was, where he was going, what he was doing. And so I'm not sure how long they worked with him. But somewhere towards the end, I think he had managed to say his name. And that was it. The EMS informed me, he said, "You probably should just get ready and go to the hospital." But then he said, "No, actually, you can't go there." So he just changed his mind on that because they wouldn't let me in.

Kyle Morgan

Which hospital was that?

Sara Martens

The Health Sciences Centre.

Kyle Morgan

Here in Winnipeg? Okay.

[00:05:00]

Sara Martens

Right. So I kind of sat at home on my couch, and I feel like I was there for two weeks and two days, always sitting by the phone, always waiting what the next call would be, what the next report would be. They had done scans and tests. And what they told me when I called there after a couple of hours was that he had spinal injuries. He had brain bleeds. I believe there was two. He had bruising. He also had a bleed in the abdomen. I think probably that was about it.

Very confused. And I want to say he was confused. They told me that so many times, "He's so confused, he's so confused." And so I did then ask to speak to him, which I did, on Wednesday, the day he had the accident. And I found him to actually be pretty coherent. He said to me, "Did you hear I was in an accident?" And I said, "I did."

He was very concerned that someone else had been hurt. And I said, "No, it was just the truck, just you. It's okay." I said, "How are you doing?" He said, "I'm good. I'm good." And I think he probably had a lot of drugs in him. I'm sure his body was really hurting. But he was very upbeat. We chatted for a while, and Cork is not a phone talker, and I know that.

Kyle Morgan

Just to interrupt you, who's Cork?

Sara Martens

Cork is my husband, that is his nickname. He's had it forever.

Kyle Morgan

Okay.

Sara Martens

Anyway, and I know he doesn't like phone talking, so I thought, I'm not going to bore him; I'm not going to keep him on the phone and blah, blah, blah. And so I just wished him well. I actually prayed with him. Just telling him the things that I did. "We love you. We're here for you." Sorry.

Kyle Morgan

Now I know that a couple days later on Friday, you spoke to him again. Is that right?

Sara Martens

Yeah.

Kyle Morgan

The accident happened on a Wednesday, and on Friday you did speak to him.

Sara Martens

Right. I did. The days in between, like from Wednesday night to Friday, he was on some oxygen, doing good, pretty stable. There was nothing very eventful.

They did tell me, though, either Wednesday night or Thursday, they called me to tell me that he had tested positive for COVID. And I'm like, "Really?" And after that, there was two different nurses that actually said to me, "He tested positive for COVID, but he wouldn't even have known it. It was so mild." So, you know, you go with what they tell you; there's not a whole lot you could do.

We were not allowed to go there, not ever. We were told he was in ER till Saturday. He had to have a room before we could come. But I feel that they misled us. My children say, "No, they lied." They're a little bit more direct than I am. But they really wanted his story out. So I say, thank you for this opportunity.

During this time, they were telling me that a cardiologist was coming in to see him. They're going to fit him for a back brace. There was a few things that they were going to do. And so each time I asked, "Has the cardiologist been there? Has the back brace been measured?" "No, no."

And then, finally, one day, the nurse just said, "We're not doing anything because he has COVID." And they did not one more thing for him, other than give him whatever medication they pumped him full of.

On Friday, I called him. And it was probably noonish. And I talked to him, and he was confused, very confused. He said to me, "Sara, do you know my neighbour?" We have a neighbour lady. Her name is Jan. "She brought me bales for the cattle." And we had a little conversation. I said, "Wow, that's nice of her." And he said, "Yeah, she's so good." And I said, "You're still working and you're in the hospital?" He said, "Oh, yeah." He said, "I'm good."

So there was a lot of confusion there. Because that wasn't true. We didn't have cattle. We did years ago. But none of that was true.

[00:10:00]

So then the funny thing at the end of that conversation, was kind of cute, kind of funny, confusing. I said to him, "Goodbye. I love you." And he said, "Oh, thank you." And then, that was it. And that was strange. And I found it a little bit humorous.

But, you know, you're in a state of such an emotional place. There's a lot of stress. There's a lot of unknown. We couldn't be there. We never could see him. We never could touch him. We could do nothing. We had to trust that what they were doing was the best.

Kyle Morgan

Were you able to speak to a treating doctor? At all?

Sara Martens

And that was the other thing. Every day I asked to speak to a doctor and every day I was promised and every day it didn't happen. On Saturday morning, and twice, two different nurses said, "Well, what do you know?" And I said, "Well, I know what you tell me."

So on Saturday morning, I got a male nurse, and I asked him how the— I did the same, I called every morning, every evening and sometimes there's things in between. So Saturday when I called, this male nurse said, "Well, what do you know?" And I said, "I just know what I know, what you tell me." I was thinking, they're hiding something from me. And I said, "You know, I've asked to speak to a doctor, I've been promised, and I haven't yet heard from a doctor."

So he said to me, "I promise you, I will have a doctor call you." And he did. It didn't take too long, and the doctor called me. He was rude. He was hard. And he told me that they had intubated him last night, the night before, and I felt so deflated. I'm like, what? How? And

why? I spoke to him on Friday. I never heard a wheeziness, a hoarseness, a coughing. I never heard a thing.

And I do work in a clinic where we do see these kinds of things. We have PPE protection, things that we wear when these kind of people come in. And I know kind of, what the obvious you would hear. For them to intubate him so quickly. And I said, "Well, could there have been other contributing factors?" Like, he had a kidney stone problem. He had a stent put in to bypass the stone that was lodged so that he can go to the bathroom. And actually, that Friday they were going to blast the stone and he's had it done a number of times. He had an infection. "No." And I said, "Could any of that have been a part of the blackout?" Because that was my question: Why did he black out?

And that doctor, and that's why I say he's rude, and he was hard and cold. He just says, "No, that was COVID blackout. That's what that was." And so, none of these other things were factors. They were not even considered.

Kyle Morgan

To interrupt you, you're talking about when the accident happened in the car. The doctor was saying that's a COVID blackout, that's what caused the accident?

Sara Martens

Yes, the reason he had the accident was a COVID blackout. And all these other things were irrelevant. I will just say, in all the medical records, that never came up. It was an unknown reason for the blackout. So first, it's one way and then it's another. He said, "I spoke to Cork last night. I explained to him what it would be to be intubated. It would make his breathing easier and so on. And he consented."

How do you ask a confused person to give a consent? And it was definitely not an emergency intubation because he had all this time to sit and talk to him. He could have called me. He had time to call me. And so it was such an incredible shock when I found out that they had intubated him. And you know the sad thing about that is? I'll just back that up for a minute. The doctor assured me "There are no flags here. There are no concerns. He will be on the ventilator three days, maybe five, no concerns."

Well, he never did wake up from that ventilator.

[00:15:00]

He never did, ever. But you know what's so sad and the thing that I have to deal with and my children is— Why did you not let us have a conversation? Why did you decide that you were doing that? And it took away from all of us, any of us, to talk to him one more time. And I believe doctors know how many people actually survive the ventilator.

And you know, honestly, things just went from that point. It just was a big, fast slide. And then he had a hole blown in his lung from the ventilator, and then he had blood clots and they were deliberating whether they should give him blood thinners because he had brain bleeds. But should they do that? And then they decided, well, yeah, it was fair to try. So it was back and forth. They had restrained him because he got up and walked around, and they didn't want that because of his back injuries. So, they restrained him.

In the end, when it all went through WCB—I'm jumping ahead here a little—they threw his case. He didn't qualify because his injuries weren't what took his life. None of this actually mattered. It was COVID.

Kyle Morgan

So you're saying that you tried to make a claim through the Workers Compensation Board?

Sara Martens

Yeah, they actually— They and MPI [Manitoba Public Insurance] contacted me that I could do that; I didn't even know. So I did with WCB. They went through all the paperwork; they said, "Well, he didn't die from his injuries." But yet, in the beginning, everything had to be about his— He couldn't walk around. He couldn't do anything because of his injuries and his brain bleeds, and all of that. And now, none of that played into effect.

Then came the day where— "He was just very sick," so they said, "He was very, very sick." I asked the question, how long they would keep him on a ventilator? And that nurse at that time said, "You know, seeing you asked, I will put you through to a doctor." So a doctor actually called me, and so then that discussion started. And she too said, "It's not good for him to stay on this for so long."

They were really hoping that I would make a decision by that following— This was, I believe, on a Monday, and they wanted me to make that decision by that weekend. "Anything past that weekend," she said, "you are only hurting him. It would not be good for him."

Kyle Morgan

And I understand it was November 5th, 2021?

Sara Martens

He passed away November the 5th.

Kyle Morgan

And the original accident was October 20th?

Sara Martens

Yeah. We were never allowed— They told us that we could come in— If at time of death or the end of life, we would be able to come in. While that was coming closer, we were not allowed to go in. And we never were allowed to go in. We never saw him. We did Zoom calls after he was fully intubated. Then they completely paralyzed him. So there was nothing. The machines kept him alive. That's all it was. And that's how we saw him.

And you know, I feel angry about some of that stuff. And I feel like, those nurses feel so safe and protected with their PPE protection. Well, I have the same. I have the N95. I have all the same. Why could we not go in there? But they told us, "Oh, no, he's shedding. You can't go in there."

Kyle Morgan

I'm mindful of the time, but I wanted to ask you, how do you think things could have been handled differently?

Sara Martens

I think that, and it's been said many times, I think people should have the freedom to have a vax or not. I feel that they should not— They should take care of you whether you're vaxxed or you're not. I think, just like Martha said about people coming in and touching your loved one and talking to them, I think that would have been a big thing. But I think the protocols were what they were.

[00:20:00]

And you know, not to mention the meanness that people— How mean people become. I had a person in the family call me about six months later, and she just tied into me and said, "That death was so useless. If he would have only been vaxxed, he would never have died." And you know, you're already down. I was recovering from a full knee replacement 30 days prior to his accident, and that surgery wasn't that successful because I had to have it redone about four months ago.

And so, you're dealing with all of that. You're dealing with the unknown. What's going to happen to him? Every phone call was a negative one. You dreaded even picking up the phone. There's times I just, I couldn't even phone. And then I did phone, and it was just such a hard time.

And then you have people who are so mean and rude. And where's the freedom? Where's the freedom for us to do what we want to do? You know, it's so ironic: there's lottery tickets if you're vaxxed. There's money given at the place of work if you get vaxxed. It's just so crazy. And you try to maintain relationship with those kinds of mindsets; that's pretty difficult, and it gets pretty ugly out there. And we have felt that, very much so.

Kyle Morgan

Those are all the questions I had to ask you. I don't know if the commissioners had any questions. I want to thank you very much for your testimony. It's very appreciated.

[00:22:01]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 8: Sean Howe

Full Day 2 Timestamp: 07:29:50–07:41:48

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Wayne Lenhardt

Our next witness is Sean Howe. So, Sean, if you could give us your name, spell it out for us, and then you have to do an oath for me.

Sean Howe

Yeah, Sean Howe, S-E-A-N H-O-W-E.

Wayne Lenhardt

And do you promise to tell the truth, the whole truth, and nothing but the truth, during these proceedings?

Sean Howe

I do.

Wayne Lenhardt

You live in Winnipeg or close to it, am I correct?

Sean Howe

Yeah, just outside of the city.

Wayne Lenhardt

I don't know that much turns on it, but let's call it a Canadian railroad, and you have been employed for a number of years with a Canadian railroad, correct?

Sean Howe

Yes, as a conductor first, now a locomotive engineer, going on since 2011.

Wayne Lenhardt

And you have been an engineer running the engines for how long?

Sean Howe

Since 2015.

Wayne Lenhardt

The mandates developed over time. From our discussion, they were talked about in September of 2021, then they were put off until October. And they finally came into effect November the 15th of 2021, is that correct?

Sean Howe

That's correct.

Wayne Lenhardt

And what happened to your employment after that?

Sean Howe

I was placed on unpaid leave of absence with an undetermined end date.

Wayne Lenhardt

And you understood that the mandates were coming, correct?

Sean Howe

They kept on hinting at them and then kept pushing them back. The first one was supposed to take place immediately after the federal election that year.

Wayne Lenhardt

And were these a railway mandate in itself?

Sean Howe

No, it's a federally regulated mandate, so any business or employed federally person would have fallen under the umbrella of these mandates.

Wayne Lenhardt

And railways fall under that requirement because they're federally regulated, correct?

Sean Howe

Correct.

Wayne Lenhardt

You determined that you were not going to take the vaccine, and so you were placed on indefinite leave. What happened to your finances after that?

Sean Howe

Well, it's no secret that railroaders make a lot of money. Basically, it's up to how much you work. But I essentially went from \$160,000 a year to almost a third of that, just because I did find employment thereafter, but like I said, at a fraction. Similarly to what the police officer kind of went through.

Wayne Lenhardt

And at some point, those mandates were rescinded.

Sean Howe

Yeah, in June of 2022.

Wayne Lenhardt

Okay, and that left you on indefinite unpaid leave for how many months?

Sean Howe

Around eight months.

Wayne Lenhardt

Okay, so how did you cope during that time?

Sean Howe

Well, fortunately, I was not affected in a way that the previous two witnesses were. Coming up here and talking about economic losses kind of falls short compared to their stories. But seeing in my wife's behaviours, how worried she became—

Wayne Lenhardt

Did you qualify for any kind of assistance?

Sean Howe

No, no, I never applied. I've never applied for EI in my life; I refuse to do that. But through the channels by which I spoke to other people who were also put off work, I had been made aware that they were being denied their employment insurance claims based— Because their record of employment showed that they were, in fact, "dismissed with cause."

Wayne Lenhardt

But did you ever check your status?

Sean Howe

No, I did not.

Wayne Lenhardt

Okay. But in any event, they did rehire you at some point, correct?

Sean Howe

Yeah, I was graciously invited back to my job.

Wayne Lenhardt

Okay. But that took eight months while you were on unpaid. What losses did you incur in that time?

Sean Howe

We estimated we lost probably around \$80,000.

[00:05:00]

Wayne Lenhardt

That's 80, as in eight-zero. 80,000?

Sean Howe

Yeah, and we have about \$40,000 in new debt.

Wayne Lenhardt

So are you still in the process of paying that off?

Sean Howe

Yep.

Wayne Lenhardt

Okay. How did you survive in the meantime, while you were on eight months of unpaid leave?

Sean Howe

Like I said, a like-minded individual offered employment when he heard about my situation. Prior to the mandates in May of '21, we had sold our house and moved outside the city. And it was basically the equity from that sale that we subsided on, which we had

obviously other plans for, other than just to survive on it. And then racked up the line of credit, credit cards, so on and so forth.

My wife, she has her own small business that she's trying to get going on the side. So that has helped too. But it was looking like I was going to have to go back out west after nearly 20 years of not working on the pipelines or the rigs. I was in the midst of my physical aptitude testing for that. At 40 years old, I was going to go back onto the drilling floor. That was the plan.

Wayne Lenhardt

From our chats you had mentioned that you had been an oil rig worker at one point, and you had also done some construction work. So did you pick up some of that during the eight months?

Sean Howe

Yeah, that's primarily what I did. We worked on some small apartment renovations in an elderly complex, which I didn't have to mask up for, and nobody got sick as a result of it.

Wayne Lenhardt

We chatted about this briefly. Were there similar mandates for all of the Canadian railroads? There aren't a huge number, but—

Sean Howe

So it was a blanket mandate, but I was informed during our time off that exemptions were granted to other railways, some in part and some total in full. Because for one of these railways to lose their unvaccinated employees, it would have meant that life-saving resources would not have gotten to the mostly fully vaccinated northern communities here in Manitoba.

Wayne Lenhardt

Okay. There was an exception of some kind for those?

Sean Howe

After speaking with one of the general managers, yes, that was what I was told.

Wayne Lenhardt

Okay. I think I'm going to turn it over to the commissioners in a minute. But is there anything else you want to add to the hardships that you sustained in that period?

Sean Howe

In terms of hardships, it's mostly economical. But as we all know, economies, economics, it has an impression upon people in a wider variety than just the money in your pocket. It does factor into mental health, into emotional health. It hasn't been easy, but it could have been worse.

Wayne Lenhardt

Okay, do the commissioners have any questions? Yeah, Dr. Massie.

Commissioner Massie

Thank you, Mr. Howe, for your testimony. I was wondering now that you're back on the work, what's the work environment in terms of the relationship with your colleagues or boss?

Sean Howe

For me, it's mostly been positive. There's obviously some individuals who are not happy that we are back. They've made it apparent through some literature or some words they've scribbled here and there. But I've had more positive interactions from people coming up to me and saying that they admire what we did. By taking our stand, that they wish they could have too.

Commissioner Massie

And you also mentioned that there was some exemption for some of the employees. You have any idea of what were the criteria to grant those exceptions?

Sean Howe

There was religious exemptions that in some cases were honoured and some not. Somebody I know personally applied for an exemption based on his Treaty Status and his belief system through that, and this was granted.

[00:10:00]

It was not something that I was willing to consider, personally, because at that point in time, I hadn't quite found my faith. So in all good honesty, I couldn't have put that forward. And I had intentions of joining the Rocco Galati lawsuit, and that was one of the things that you couldn't have done in order to be eligible. You couldn't apply for an exemption.

Commissioner Massie

Thank you.

Commissioner Drysdale

Good afternoon. Were there others that you knew of from your employer that also were sent home without pay?

Sean Howe

Yeah, there's hundreds.

Commissioner Drysdale

Correct me if I'm wrong. Is there a glut of locomotive engineers in the railway industry?

Sean Howe
Is there a lot?

Commissioner Drysdale
Is there an excess? Are there lots and lots and lots of locomotive engineers?

Sean Howe
There's quite a few people qualified, but working engineers, I want to say it's probably around 3,000 to 5,000 across Canada.

Commissioner Drysdale
What my question really is— Are there too many locomotive engineers? What I'm trying to say is, if they put you out of work and sent you home without pay, did that affect the operation of the railway?

Sean Howe
It didn't seem to be the case for us, but for others, perhaps.

Commissioner Drysdale
Thank you.

Wayne Lenhardt
Okay, any other questions? Okay, thank you very much, Sean, and we appreciate your testimony.

Sean Howe
Thank you.

[00:11:58]

Final Review and Approval: Margaret Phillips, August 10, 2023.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 9: Michelle Kucher

Full Day 2 Timestamp: 07:41:55–08:13:46

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

So our next witness is going to be Michelle Kucher, who is going to be attending virtually.

Alexander MacKenzie

Again, for the Commission's records, my name is Alexander MacKenzie. And Michelle—Sandy MacKenzie—we have spoken on the phone.

Michelle Kucher

Correct.

Alexander MacKenzie

You can hear me clearly and I can hear you.

Michelle Kucher

Yes, I can.

Alexander MacKenzie

Michelle, I wonder if you would give your full name to the Commission, and perhaps, spell it.

Michelle Kucher

My full name is Michelle Kucher, K-U-C-H-E-R.

Alexander MacKenzie

Thank you.

Michelle, do you promise that the testimony you are about to give to this Commission shall be the truth, the whole truth, and nothing but the truth, so help you God?

Michelle Kucher

I do.

Alexander MacKenzie

Thank you.

Now, Michelle, you're testifying virtually from somewhere in the United States, is that correct?

Michelle Kucher

Correct.

Alexander MacKenzie

Thank you. And you reside in Matlock, Manitoba.

Michelle Kucher

Yes.

Alexander MacKenzie

And that is a small town on the edge of Lake Winnipeg, about a one-half hour drive from the north end of Winnipeg, is that right?

Michelle Kucher

Approximately, yes.

Alexander MacKenzie

And Michelle, both your father and your mother are now deceased, that is correct?

Michelle Kucher

That's correct.

Alexander MacKenzie

Yeah, your father passed away in 2010.

Michelle Kucher

Yes.

Alexander MacKenzie

And your mother, when did she pass?

Michelle Kucher

My mother passed away January 10th, 2022.

Alexander MacKenzie

You were close to both your mom and your dad?

Michelle Kucher

Yes.

Alexander MacKenzie

And what was your mother's name?

Michelle Kucher

Mildred Kucher.

Alexander MacKenzie

Thank you.

Now, following your dad's death in 2010, your mother lived alone in Garden City. Is that correct?

Michelle Kucher

Yes. Technically, it was the last street of the north end, but it was in the Garden City area.

Alexander MacKenzie

In the Garden City area and that, again, is about a one-half hour drive from Winnipeg.

Michelle Kucher

From Winnipeg Beach? Yeah.

Alexander MacKenzie

Which is very near Matlock, where you lived.

Michelle Kucher

Yes. Where I lived, yes.

Alexander MacKenzie

And what was the condition of your mother's health starting in 2010 through to early 2020?

Michelle Kucher

My mother was a fiercely independent woman. She was extremely active. She belonged to many, many organizations. She managed to stay in her own home, even after my father passed away. She drove her own car until she was 91 years old. She went to—

Alexander MacKenzie

What year would that have been?

Michelle Kucher

When she was 91?

Alexander MacKenzie

Right, that she was 91.

Michelle Kucher

I have to do math.

Alexander MacKenzie

She turned 95, I understand, on October 9th, 2021.

Michelle Kucher

2021, yes, that's correct.

Alexander MacKenzie

So she would have been 91, four years earlier than that.

Michelle Kucher

Correct. Thank you.

Alexander MacKenzie

And that's good enough. Thank you.

Now her health was good then, is that fair to say?

Michelle Kucher

It was good considering she was the age she was. She had, like, cognitively, she was a 100 per cent. She had some issues walking because she had arthritis in her knees. Other than

that, she was very active; she attended two different day programs during the week, so that's three days a week she was out of the house—

Alexander MacKenzie

I'll get to that in a moment, okay?

Michelle Kucher

Okay.

Alexander MacKenzie

Thank you very much.

Now at the beginning of 2020, you were employed in two different jobs. Is that correct?

Michelle Kucher

Yes.

Alexander MacKenzie

And what were those jobs?

Michelle Kucher

I held a full-time position at Selkirk Mental Health Centre in the Acquired Brain Injury Unit, as a psychiatric nursing assistant, and I held a part-time job at Selkirk Regional District Hospital in the day surgery,

[00:05:00]

as a health care aide.

Alexander MacKenzie

Were either you or your mother vaccinated for COVID?

Michelle Kucher

Eventually, yes. Not at the beginning of 2020; COVID hadn't really hit us yet.

Alexander MacKenzie

When would you—

Michelle Kucher

We did get vaccinated. I believe it would have been May of 2020 [sic].

Alexander MacKenzie

And you, personally, didn't like vaccinations, is that correct?

Michelle Kucher

That's correct.

Alexander MacKenzie

But you chose to get a vaccination so that you would fit in with all of the things that were required of you, is that fair to put it?

Michelle Kucher

That's a fair statement, yes.

Alexander MacKenzie

And so in early 2020, you had become concerned about the possibility of your transmitting COVID to your mother who was aging.

Michelle Kucher

Yes.

Alexander MacKenzie

Okay, and how did you deal with that concern, in terms of your employment?

Michelle Kucher

In February of 2020, I moved in with my mother to be her primary caregiver. I would return to her house from work and I would immediately shower and throw my clothes in the washing machine. And I'd always have a change of clothes in the shower in the basement just in case there was any remnants of any kind of virus lingering on my clothing. And then, you know, every night after work, that's what I would do.

Alexander MacKenzie

Right, and again, I'm not sure if it was absolutely clear, but you had been living in Matlock, but you then took up residence in your mother's basement.

Michelle Kucher

Yes. So she had a brief hospital stay and was released from the hospital in January of 2020, and I moved in with her February of 2020, so she could remain in her own home and be safe.

Alexander MacKenzie

And when you say you became her primary caregiver, that's a formal name, is it not?

Michelle Kucher

Yes.

Alexander MacKenzie

Yes. And what did that mean for you and your mother, you living in her basement as her primary caregiver? What other arrangements were you able to make?

Michelle Kucher

Well, we used the Self and Family-Managed Care option of the home care services in Winnipeg. It was through Winnipeg Regional Health Authority. Essentially, I became the manager of my mother's home care and did the payroll, scheduling of employees, hiring, firing, things like that. And I employed two health care aides to take care of my mother while I was at work.

And so my mother was entitled to, and assessed to need, 55 hours of care a week, which is, essentially, the maximum allowable through home care. I managed to get all my shifts to be evening shifts, so the two health care aides that I hired would work during the day and I'd come home from work in the evening— Sorry, I stayed with my mother during the day and the health care aides would work in the evening while I worked, and then I'd wake up the next day and do it all over again.

Alexander MacKenzie

Now, at some point, you did quit your job at the Selkirk Hospital, is that correct?

Michelle Kucher

I took advantage of a leave of absence. As a government employee, I was entitled to take a leave of absence to care for a family member, and so, I took advantage of that opportunity and I stayed home. I stayed with my mom.

Alexander MacKenzie

And you also— You had been working two jobs. You took a leave of absence from the other, as well, is that correct? From the Selkirk Mental Health Centre.

Michelle Kucher

Yes, and the Selkirk Hospital. Yes.

Alexander MacKenzie

From both. And had you ever discussed with your mother the possibility of her living in a care home?

Michelle Kucher

It came up on occasion, especially when she was being assessed by her case managers. She was never, ever deemed unfit or would qualify for a personal care home because she was too high functioning cognitively. Assisted living: She was not interested in that at all

because it would be the same kind of care she would get at home, only in a strange place. And she wanted to die in her own home.

Alexander MacKenzie

And your mother's health at the beginning of 2022 was— How would you say? What was her mental health?

[0010:00]

Michelle Kucher

At the beginning of 2020?

Alexander MacKenzie

2022.

Michelle Kucher

2022 is when she passed.

Alexander MacKenzie

Yes.

Michelle Kucher

Yeah, she had declined drastically as a result of isolation and depression and just really lost her will to live at that point.

Alexander MacKenzie

Now, leading up to that time, while you were living with her in her home, in her basement, can you describe— I believe you have described your mother to me as a social butterfly.

Michelle Kucher

Yes.

Alexander MacKenzie

And could you tell me all about her being a social butterfly?

Michelle Kucher

Well, I mean, all her life she was surrounded by people, but during her last few years of her life, especially after my father died, she really needed to take care of her own mental health. She joined two different seniors' programs and attended seniors group meetings three times a week. Every Friday, she attended a lunch meeting with another program, called Links. She would go for lunch on a weekly basis with ex-coworkers. She was a legal secretary at the Federal Department of Justice and maintained friendships from that time in her life. She would go to church every single Sunday, rain or shine. She would do her own

grocery shopping. She, really, did everything for herself. And for me, it was quite difficult to actually get a date with her because her social calendar was so full. She thrived on being with people and she never missed an opportunity to tell her story.

Alexander MacKenzie

And some of these places that she was going to were the Gwen Sector facility, once a week; Holy Family, twice a week; St. Nicholas Ukrainian Church, once a week; and then these lunches for various people and so on.

Michelle Kucher

Yes.

Alexander MacKenzie

And how about family gatherings, was she interested in those?

Michelle Kucher

Absolutely. My mother's house used to be a hub of activity throughout her life. We would have family dinners where 32 people would be eating at our table. She had ten grandchildren, seven great-grandchildren. They were the light of her life. She always, always welcomed the opportunity to spend time with them: whether it was in Winnipeg, or whether she had to fly to Vancouver or Toronto, or wherever her other grandchildren were at the time.

Alexander MacKenzie

And all this was before there were COVID mandates.

Michelle Kucher

Correct.

Alexander MacKenzie

Did anything change? And tell us about that.

Michelle Kucher

Well, the COVID restrictions— Our TV would bring us daily regulations and daily vaccine availability, and of course, there was the ominous death count that was on TV all the time.

My mother couldn't attend her seniors' programs because one of them was at a personal care home, and personal care homes had sort of gone into lockdown. Gwen Sector had shut down because there were restrictions on gatherings. Restaurants were closed, so going out for lunches was no longer possible. Church services were halted as a result of the inability to have gatherings.

Essentially, everything that meant anything to my mother had been taken away from her. Even having family gatherings, we had to keep our circle small. There was the social distancing regulations that were put in place. And as a result of all those things being taken

from my mother, her cognitive abilities drastically declined, and she became very withdrawn, very depressed, and really felt like she had nothing to look forward to in life.

Alexander MacKenzie

Did any of her friends pass away during those restrictive times?

Michelle Kucher

Absolutely. There was actually several that passed away and funeral services could not happen at the time. Many of her friends were residents of a care home that had a COVID outbreak and many of them died in care.

[00:15:00]

And then, yeah, we could not attend the funerals.

And those types of rituals for a person of my mother's age, who's very old school and quite a devout Catholic, those things were very important to her and her peers.

Alexander MacKenzie

Now, I understand that one of her granddaughters was a ray of light in all of this. How did that work?

Michelle Kucher

Well, when we were doing the Self and Family-Managed Care, one of the health care aides that I hired was my daughter. When the restrictions became very tight, that we had to not have people outside of the household visiting, my daughter decided to move into my mother's house with me. So we made our circle just a little bit bigger. And during that time, she had a baby, her first child, and we brought the baby back to my mother's house. And she was able to be a part of this little girl, sort of, crawling for the first time, walking for the first time. And that was, really, the only ray of sunshine that she had in such a bleak world.

Alexander MacKenzie

Now, I understand that things went on, more or less, in this way until September of 2021.

Michelle Kucher

September?

Alexander MacKenzie

Yeah, I'm sorry, is that— I believe at some point your mother had fallen?

Michelle Kucher

Yes, my mother did fall on September 20th of 2021. She had, for the first time ever, fallen forward and ended up with a bit of a rug burn on her forehead and quite a bruise. Usually, she would fall backwards and she would never hit her head because her back was so rounded, but this time she fell forward and that affected her a little bit.

Alexander MacKenzie

And in terms of her health, generally, then—in terms of respiratory health and fevers and so on—how was she doing?

Michelle Kucher

My mother had been diagnosed with congestive heart failure many years prior to this and she was entering the end stages of congestive heart: So she had a lot of swelling in her legs. She had a lot of breathing issues. She had a lot of fatigue, some confusion at times.

Alexander MacKenzie

And these things were all related, and diagnosed as being related, to congestive heart problems, right?

Michelle Kucher

Correct.

Alexander MacKenzie

So in October, I understand, she was admitted to a hospital, is that correct?

Michelle Kucher

Yes.

Alexander MacKenzie

Which hospital was that?

Michelle Kucher

Seven Oaks.

Alexander MacKenzie

And that was for her congestive heart problem issues?

Michelle Kucher

Correct.

Alexander MacKenzie

And that was made plain to everyone?

Michelle Kucher

Yes.

Alexander MacKenzie

And how old was your mom then?

Michelle Kucher

She had turned 95 years old October 9th, approximately two weeks prior to her going into the hospital.

Alexander MacKenzie

Okay, and did you visit your mom?

Michelle Kucher

Yes.

Alexander MacKenzie

At the hospital?

Michelle Kucher

Yes. We all managed to make sort of a schedule so that she was being visited by different family members and friends on a regular basis.

Alexander MacKenzie

And did she let you know how she felt about these visits?

Michelle Kucher

They were the only thing that really kept her going. Yeah. But because of some restrictions, we could only visit one at a time.

Alexander MacKenzie

And how long did that continue?

Michelle Kucher

Up until towards the end of December 2021. Excuse me—

Alexander MacKenzie

You can take a moment if you wish. Take a moment if you wish.

Michelle Kucher

Sorry about that.

Alexander MacKenzie

No, no, that's all right.

Michelle Kucher

Towards the end of December of 2021, there was a COVID outbreak in Seven Oaks General Hospital,

[00:20:00]

on a different floor than where my mother was situated, and as a result of that, visiting was banned or stopped. The hospital went into a Code Red, I believe it's called.

Alexander MacKenzie

That was a lockdown, basically, then.

Michelle Kucher

Basically, yeah. The only people that could go would be staff and people who were deemed essential care providers.

Alexander MacKenzie

Now, you were your mother's care provider, were you not?

Michelle Kucher

I was her primary care provider, yes.

Alexander MacKenzie

You've used two words here: you use primary care provider for yourself, but the words you used a moment ago is essential care provider. What's the difference?

Michelle Kucher

An essential care provider would be somebody who would be attending the hospital to care for a patient on a regular basis. For example, coming every day to feed them their meals. Basically, taking over a job for the health care aides.

Alexander MacKenzie

I see. So in your capacity as your mother's primary caregiver, you were not qualified, is that right?

Michelle Kucher

That's correct.

Alexander MacKenzie

And so, your visits were cut off.

Michelle Kucher

Yes.

Alexander MacKenzie

Did any other members of your family get to visit?

Michelle Kucher

No. No, the only people that my mother saw after that point would be the staff.

Alexander MacKenzie

Did you have occasion to discuss with any hospital staff your concerns about your mother's isolation?

Michelle Kucher

I did. I had gone to the hospital to visit my mother and was turned away by the screening staff at the door, saying that they're— That's how I found out that they were in a lockdown. They told me to phone the next day and talk to the unit manager to see if I could, possibly, get this designation given to me, to be the essential care provider.

I had phoned the hospital the next day and the nurse at the desk told me— Because I explained to her that my mother was 95, and quite possibly dying, and she was extremely lonely and the loneliness was what was killing her. It would have been hard for anybody in that situation to not have people visiting. And I, sort of, tried to make my case to be declared this essential care provider, and she told me that my mother's loneliness wasn't a reason enough to declare me as an essential care provider.

Alexander MacKenzie

Do you remember her exact words?

Michelle Kucher

Off the top of my head right now, no. I do know that I've said them to you, but I do not recall them exactly.

Alexander MacKenzie

You did say to me that the words spoken to you were, "Your mother's loneliness is not a priority." Is that accurate?

Michelle Kucher

Yes. That's correct.

Alexander MacKenzie

I don't know if you want to answer this question, but how did you feel about that?

Michelle Kucher

I was extremely angry. I sent emails and letters and left messages in a variety of different offices, expressing my disgust, actually, at that comment and just the whole situation in general.

Alexander MacKenzie

You never did see your mother again, prior to her death.

Michelle Kucher

Not alive, no.

Alexander MacKenzie

Now, you mentioned that your mom passed away on January the 10th.

Michelle Kucher

Correct.

Alexander MacKenzie

And so all of this was taking place, roughly, three weeks before her death.

Michelle Kucher

Correct.

Alexander MacKenzie

And when you were barred from going to the hospital, what did you do to try to keep in touch with your mom?

Michelle Kucher

Well, we attempted phone calls. There was a phone in her room and we would try to call, but most of the time the phone was out of her reach. And when it was in her reach, she really couldn't figure out how to use it. Often, we would have to phone the nursing station and say, "Look, I'm trying to call my mom and I don't know if she can reach the phone," and they would tell me that they would put the phone on her bed for her and then we could— Very rarely did we actually get through to my mom.

[00:25:00]

My brother would phone from his house in Toronto and hardly ever got to talk to my mom. It was a horrible, horrible experience. We thought about providing her with a cell phone, but, at that point in my mom's life, I don't know if she would have been able to use it.

Alexander MacKenzie

Now, in terms of your mom's health, what were you led to believe? She'd gone in for the congestive heart problems and what were you led to believe, as all this time was passing?

Michelle Kucher

Well, the goal was always to get her home, to stabilize her and get her home. And she was medically stable and the plan was, of course, like I said, to get her home. What held things up, essentially, was a lack of staffing for home care services.

Alexander MacKenzie

So when she was being cleared to come home, that was at the beginning of January, is that correct?

Michelle Kucher

Yes. Yes, we had been working on her getting home and getting staff in place for quite some time. The Self and Family-Managed Care Program was no longer available to us and she actually did get a discharge date.

Alexander MacKenzie

And what date was that?

Michelle Kucher

January 10th, 2022.

Alexander MacKenzie

So she was going to be discharged on January the 10th, 2022. Did you speak to her that day?

Michelle Kucher

I did speak with her on the phone and I let her know that she was coming home. I made arrangements for Stretcher Services to bring her home because I couldn't do it myself and she would not have been able to get in and out of my vehicle. And we made arrangements: Stretcher Services was to pick her up at 6:30 p.m., January 10th, 2022.

Alexander MacKenzie

But that didn't happen.

Michelle Kucher

No, it did not.

Alexander MacKenzie

What did happen?

Michelle Kucher

At approximately 5:15 to 5:30 p.m., I got a phone call from her doctor telling me that she had been found unresponsive. She was actually sitting on the toilet at the time. They brought her into her bed and there was nothing they could do to— She never did regain consciousness after that and she passed away.

Alexander MacKenzie

On the very day, an hour and a half before you were going to take her home.

Michelle Kucher

Yes.

Alexander MacKenzie

What happened then? You had discussions with the doctor, I believe.

Michelle Kucher

I did. I asked him if I could come and see my mother and he told me that I could.

Alexander MacKenzie

And he made arrangements with the hospital, did he?

Michelle Kucher

Yes.

Alexander MacKenzie

And then you did go to her.

Michelle Kucher

Yes.

Alexander MacKenzie

Yeah.

Michelle Kucher

I went—

Alexander MacKenzie

Sorry, go ahead.

Michelle Kucher

Oh, yes, I went to the hospital and I went in— She was still in the room that she shared with her three other patients, curtains drawn, so she had some privacy. And I was able to sit with my mother, I was able to hold her hand, and I was able to talk to her. After she passed, I was sitting with her dead body. But I could not sit with her live body the day before or the day before that.

Alexander MacKenzie

You know, you've talked about your mother's sense of loneliness. Can you share with us how all of this made you feel?

Michelle Kucher

I mean, we always knew that, like, my mother was going to die, right? Obviously, she was 95 years old; she's in end-stages of congestive heart failure. We never got a chance to say goodbye. We couldn't go see her; we couldn't hug her. There were no more "I love you's" given. She died, alone, you know, possibly neglected because of the chronic short staff-ness, but I can't really comment on that because the nurses and the staff that worked there were really working hard.

I was angry. I was angry and I was sad. She didn't deserve that. We did everything right: we got our vaccinations; we kept our bubble relatively small; we socially isolated; we followed all the rules.

[00:30:00]

And still, the government that she was so obedient to failed her in the end, is the way I feel. I'm angry for her. I'm sad for her. And I think that what happened there was extremely wrong. My mother said to me, about three months into the pandemic, that she would rather die of COVID than die of loneliness, and she did not have that option.

Alexander MacKenzie

Sounds like, ultimately, she exercised that option. In any event, did you ever test positive for COVID?

Michelle Kucher

I did, just last October. I'm vaccinated. I've got two boosters on top of that. I work in a medical facility, so it's somewhat necessary. We have to be vaccinated in order to work under those circumstances. And I had been exposed to one of the patients having COVID.

Alexander MacKenzie

So your positive test was 10 months after her demise.

Michelle Kucher

Yes.

Alexander MacKenzie

Is there anything else that you would like to add, Michelle?

Michelle Kucher

I don't think so.

Alexander MacKenzie

If you will, I'll ask the commissioners if they have any questions that they would like to put to you.

Okay, it appears as though they do not. Thank you very, very much for attending.

Michelle Kucher

Thank you for the opportunity to tell my mother's story.

Alexander MacKenzie

Thank you, Michelle.

[00:31:51]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Shawn Buckley

Charles, can you hear us?

Charles Hooper

Yes, I can. Can you hear me?

Shawn Buckley

Okay, so we've got a good Zoom connection. My name is Shawn Buckley. I'm going to be calling you as a witness today.

So can I ask you, first, to state your full name for the record, spelling your first and last name?

Charles Hooper

Charles Hooper, C-H-A-R-L-E-S H-O-O-P-E-R.

Shawn Buckley

And, Charles, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Charles Hooper

Yes, I do.

Shawn Buckley

I just want to introduce you a little bit [Exhibit WI-9]. Right now, you are president of a consulting company, called Objective Insights. And my understanding is that your company

consults for pharmaceutical and biotech companies, that you basically help companies to make business decisions by doing forecast models that include epidemiology. So for example, if a company was going to introduce a drug for third-line non-Hodgkin's lymphoma, how many people are out there with that and what public policy implications would the company encounter? Your company does things like that. Did I explain that well?

Charles Hooper

Yes, you did. Thanks, Shawn.

Shawn Buckley

So now, you used to work for the pharmaceutical company, Merck, and you were actually there when they came out with ivermectin.

Charles Hooper

Yeah, I was there. I think it was just shortly after ivermectin first launched.

Shawn Buckley

Okay, and then we can't leave out that you worked at NASA as a scientific applications programmer.

Charles Hooper

Yeah.

Shawn Buckley

Okay. Now, you became an expert on ivermectin. I'm just curious if you can explain for us what led you down that path.

Charles Hooper

Well, that's actually a good question. So first of all, I knew a fair amount about ivermectin working at Merck. Merck was actually quite proud of ivermectin when it first came out. And so, when the COVID pandemic hit and I saw ivermectin mentioned, I looked into it a little bit more. I was kind of curious, having a little bit of background, and then that just kind of snowballed. And here we are.

Shawn Buckley

Right, so you just, basically, read every study there was on ivermectin and became an expert. And bearing in mind, you already have expertise in the pharmaceutical field and research.

Charles Hooper

Right.

Shawn Buckley

Now, why should we care about ivermectin?

Charles Hooper

Well, the COVID-19 pandemic led to substantial loss of life, along with large social and economic costs, and ivermectin was presented—and still is available—as a potential drug to treat COVID-19. And I think that it has some legitimate claim to being a good treatment for COVID-19. Therefore, many people who suffered and potentially died, maybe, shouldn't have or wouldn't have if ivermectin was more widely available.

Shawn Buckley

Right. Okay, so can you explain for us, when the pandemic started, obviously there was no vaccine or any other tool available. Can you explain to us the importance of the drugs that are on the market then, at the time, specifically ivermectin, and why it should have been considered.

Charles Hooper

Yeah. So when a pandemic happens, everything happens pretty quickly and drug development is a very slow and lengthy process. So we really have a mismatch of a fast-moving pandemic, a contagious virus, and then a slow-moving pharmaceutical industry and a regulatory environment.

And so, by nature, we really need to look at existing drugs that are either already on the market or are soon to be on the market because anything else would just take so long to be developed that the pandemic might have already run its course. So, we, by nature, have to look at older drugs, and it's actually a very well-known principle that using repurposed medicines,

[00:05:00]

with established safety profiles is a pragmatic public health strategy.

So people looked around at potential therapies that could work and ivermectin showed up as one because of some of the characteristics it has to attack parasites. Those mechanisms also attack viruses.

Shawn Buckley

And that was actually known before the pandemic started, am I correct?

Charles Hooper

The antiviral activity of ivermectin? I believe so, and if it wasn't before, it was definitely early on in the pandemic.

Shawn Buckley

I'm going to ask you, in a bit, on your thoughts as to whether or not you think it is a safe treatment and an effective treatment for COVID. But right away, there was some controversy about ivermectin and can you share with us about that?

Charles Hooper

Yeah, so if you followed the news over the last few years, essentially everything that's been said about ivermectin has been negative if it's been said by the established authorities.

First, we heard that ivermectin was a veterinary parasitic medicine that was intended for horses and cows. And then, second, a number of health and regulatory agencies came out against its use, for example, the Food and Drug Administration in the States. And then even the originator and inventor of ivermectin, Merck and Company, came out against its use. And then, we also heard that the largest study that showed that ivermectin worked was retracted for data fraud. Finally, we were told that the biggest and best study of ivermectin—the TOGETHER Trial—showed that ivermectin didn't work.

And I think there's a need to set the record straight because that's not the whole truth.

Shawn Buckley

Okay, so can you set the record straight for us today?

Charles Hooper

Yeah, I'd be happy to. Okay, so can I give you a little background on ivermectin?

Shawn Buckley

Yeah, do you want a screen share? I think we're set up for that if you need to.

Charles Hooper

Okay. Let's see. Oh, here we go.

Shawn Buckley

Okay, so we're seeing your screen now [presentation exhibit number unavailable]. We're seeing a slide *Ivermectin for COVID-19*.

Charles Hooper

First of all, we mentioned just a minute ago that older drugs are the way to go when a pandemic happens. So the three drugs that I've focused on, other than ivermectin, to treat COVID-19, they were available at day 235, day 661, and day 662. That's Gilead Sciences' Veklury, the generic name is remdesivir; Pfizer's Paxlovid, which is a combination of two older drugs; and then Merck and Company's Lagevrio, which the generic name is molnupiravir.

A little bit of history about ivermectin: It's an important drug and some have actually estimated that its overall public health benefit might be on par with that of penicillin. It was discovered in 1975 through the work of two individuals, William Campbell, at the Merck Institute for Therapeutic Research, and Satoshi Ōmura, at Kitasato University. And this discovery earned them the 2015 Nobel Prize in Physiology or Medicine.

Ivermectin was first used as a veterinary antiparasitic, with human applications coming just a few years after that. And in the developing world, it's proven so effective that it's on

the World Health Organization's list of essential medicines and it has been dosed four billion times

[00:10:00]

in parts of the world where parasites are common, such as Africa, Central and South America. It's been used to treat and prevent river blindness and other diseases. It's been used safely in pregnant women, children, and infants, which is saying a lot.

So my history with Merck goes back 34 years when I was newly hired there and ivermectin was newly launched. And people might say, okay, well, it's an antiparasitic, so why should we use it for COVID-19? Well, it turns out, in the pharmaceutical industry, a lot of drugs have application in multiple therapeutic areas. So just one quick example: The drug amantadine was originally developed to treat influenza, but Parkinson's patients taking amantadine for the flu serendipitously noticed symptomatic relief of their Parkinson's disease. Now, amantadine is regularly taken by Parkinson's patients.

So anyway, with ivermectin, it works through a variety of mechanisms to kill parasites and some of those mechanisms have been found to attack single-strand RNA viruses, such as SARS-CoV-2, which causes COVID-19. So this led scientists to test it in laboratories, in vitro, and they found that it did, in fact, kill 21 different viruses in cell cultures.

Shawn, should I just keep going?

Shawn Buckley

Oh, yeah, please. Please do.

Charles Hooper

Okay. So because ivermectin has been around for decades—it's safe; it's an oral pill; it's cheap; it's off-patent—it would be an ideal therapeutic for COVID-19 if it worked. So the question is, does it work? And here's where things get more interesting.

So Merck came out against the use for ivermectin and said, quote, "It is important to note that, to date, our analysis has identified no meaningful evidence for clinical activity or clinical efficacy in patients with COVID-19 disease."

Now, the FDA was a little bit less circumspect and the FDA tweeted, "You are not a horse. You are not a cow. Seriously, y'all. Stop it." But then the FDA also added a statement pretty much like I just read from Merck. But the FDA went further and the FDA put out a special warning to warn us against using ivermectin for COVID. And it said, quote, "You should not use ivermectin to treat or prevent COVID-19." But this statement went on and it included words and phrases such as "serious harm," "hospitalized," "dangerous," "very dangerous," "seizures," "coma and even death," and "highly toxic" [Exhibit WI-9a].

But this is a drug that is FDA-approved as safe for human use, so why would using this safe drug for a new condition make it dangerous? Well, the FDA didn't say. And in fact, a normal person reading this might think that the FDA was warning against some criminal agent who had laced pills with poison. Then, further, the FDA claimed, with no scientific basis, that ivermectin is not an antiviral, notwithstanding its proven antiviral activity.

So it would be nice to have somebody who's been within these organizations recently and involved in these decisions to explain them. But, absent that, what we can do is we can explore some of the structural reasons for why these organizations might have come out so strongly against ivermectin.

With the FDA, I think it's really two different things: it's the Emergency Use Authorization and then off-label promotion.

[00:15:00]

So the Emergency Use Authorization is a regulatory pathway that the FDA may use to authorize unapproved medical products or unapproved uses of approved medical products in an emergency to treat serious or life-threatening diseases where there are no adequate approved and alternative therapies. This might have given the FDA a reason to want ivermectin out of the picture because if there's no approved alternative therapy, then the FDA could encourage companies, like Gilead and Merck and Pfizer, to keep developing their products. And what this really implies is that the FDA knows how long the drug development process takes and it takes too long, so the FDA, maybe wanting to help during the pandemic, wanted to get these new drugs out there. Also, I think it's possible the FDA wanted to incentivize the drug companies to keep researching these treatments because if the FDA said, "okay, maybe your drug will be approved in 10 years, long after the pandemic's over," then those companies would have very little reason to keep researching their treatments.

The second reason is off-label promotion. So once drugs are marketed, physicians can use them for any condition that they think will help the patient. And such usage is called off-label promotion because it's for a condition that's not specifically on the label of that drug that's been approved by the FDA. While this off-label prescribing is widespread and completely legal, it is illegal for drug companies to promote drugs for off-label conditions in any way, shape, or form. And during a particularly vigorous two-year period, the Justice Department collected over \$6 billion in fines from drug companies in off-label promotion cases. So the FDA takes the position that it doesn't want to encourage off-label promotion, or off-label usage, but it knows it can't stop it.

So if the FDA were to make a statement on the efficacy of ivermectin for COVID-19, it would, pretty much, have to come out neutral or negative because if it promoted a drug for an off-label use, there would be obvious hypocrisy involved.

So Merck faced that same off-label promotion issue. You know, Merck is not going to promote a product and face substantial fines. Merck is too smart for that. Also, ivermectin has long since been generic, so Merck doesn't make much money off it. But Merck was hoping that its new drug, Lagevrio, molnupiravir, was going to be a successful treatment for COVID-19.

Now, sometimes, the sequence of events can prevent or work against the dissemination of balanced information.

Shawn Buckley

Charles, can I just step in and ask you a question? Because you were just offering an explanation, and I appreciate you don't know why the FDA made the statements that it did. But surely, the FDA could have just simply said ivermectin is not approved for treating COVID-19, and so, we don't know whether it would be effective for that. Which is very

different than, basically, making false statements that it's dangerous. Because, surely, it can't be dangerous with 4 billion doses out there and most of them would be non-prescription doses, just over the counter in other countries. So are you being a little gentle with the FDA in what you're suggesting to us?

Charles Hooper

Yeah. I really am curious what went on within the agency, but I don't really know.

[00:20:00]

But I do think that authorities in that position are culpable for what's happened because, essentially, they were spreading misinformation.

Shawn Buckley

Okay, and I'm sorry to interrupt, you were then going to go on about the TOGETHER Trial.

Charles Hooper

Yeah, so with the TOGETHER Trial. Sometimes the sequence of events of how information plays out can work against the dissemination of balanced information. The TOGETHER Trial was supposed to be the best and biggest trial testing ivermectin. But the press release came out at least a couple of weeks before the full study was published. Basically, the main news organizations, or some of the main ones, such as *The New York Times* and the *Wall Street Journal*— The only information they had was from the press release, and so, they basically parroted the conclusions of the study from the press release that said that ivermectin doesn't work.

Most people just stop there. The problem is, for those of us who like to scrutinize the studies, anything that we found was going to be weeks later, and at that point, it would look like old news. The news organizations might be hesitant to publish that because it could make their initial articles look premature or, perhaps, incorrect.

Anyway, after the full TOGETHER Trial was published, a number of researchers have looked into it and they've identified 75 serious problems with this trial. You know, even just a few serious problems would be cause for concern, but there were 75 problems identified. And worse, the trial that we were told proved that ivermectin doesn't work, actually, has results that suggest that it does work.

So in the TOGETHER Trial, the patients who were on ivermectin had a 12 per cent lower risk of death, a 23 per cent lower risk of needing mechanical ventilation, a 17 per cent lower risk of hospitalization, a 10 per cent lower risk of extended ER observation or hospitalization.

And then, using the results of the trial, I was able to calculate the probability of the benefit to patients who are on ivermectin. There were 10 different metrics in the trial and the benefit ranged from 26 per cent to 91 per cent. So 91 per cent was for preventing hospitalization. And for the most serious outcome, death, the probability was 68 per cent that ivermectin was helping these patients.

Now, another trial that got a lot of press was a trial that showed that ivermectin did work. It was a study by Elgazzar et al., but it was withdrawn on charges of plagiarism and faked

data. And so, this one study got a lot of press as if it was one of the only studies, but there's actually been quite a bit of research done on ivermectin for COVID-19.

So there's been 95 clinical trials, 95 studies, that have included 1,023 authors with patients in 27 countries, and the number of patients, if you added it up across all the trials, is 134,554. And if you pool all the results, the results suggest that ivermectin reduces the risk of death by 51 per cent.

So I just want to highlight that. This implies that if everybody had access to ivermectin, the death rate across the world could have been half of what it was and 29 per cent lower risk of mechanical ventilation, 41 per cent lower risk of ICU admissions, 34 per cent lower risk of hospitalization, 78 per cent reduced number of cases, 42 per cent improved recovery, and 45 per cent improved viral clearance.

[00:25:00]

In these results, two of them are significant to P less than 0.01, and the other five of them are significant to P less than 0.0001.

So the other thing that the studies show is the earlier use is better. So, for example, the benefit is 82 per cent if it's given prophylactically, 62 per cent benefit in early use, and 42 per cent benefit in late use. So 45 of these studies were randomized, controlled trials and 80 of the studies were peer-reviewed.

Shawn Buckley

And, Charles, can I just stop you for a second? So you're basically, in that last slide, indicating that the most significant benefit is for early use. And what I find curious about that is, in Canada—I live in a province called Alberta—the College of Physicians and Surgeons in Alberta, concerning the COVID pandemic, basically made it clear to physicians that they would lose their licence to practise if the physicians treated COVID early on. So it was really only possible for doctors who wanted to keep their licence to treat COVID once the patient arrived at the emergency department. But what your analysis is suggesting is that was completely wrong, aside from the fact that it just sounds insane to tell doctors that they can't treat an illness at its early stages. Am I correct that, based on your data, the College of Physicians and Surgeons in Alberta were completely wrong on this?

Charles Hooper

Yeah, I would agree with that. If you look at all the treatments that have any kind of efficacy for ivermectin, and this actually goes more broadly to viral diseases, you want to treat the patient pretty soon after they're infected. And in fact, if you treat them, something like, **eight days after they're infected, the treatments basically have no benefit at all because this is a viral infection. It comes and it goes, and if you don't get it early, you're not going to get it at all.** So it's a pretty established principle that, for a viral infection, you have to treat it pretty early.

Shawn Buckley

Okay.

Charles Hooper

So this just lends empirical evidence to that.

Shawn Buckley

Yeah, and I'm sorry for interrupting, just it was an interesting point you just made.

Charles Hooper

Oh, no, I appreciate your comments and points.

Okay, so we've talked about ivermectin. Now, there are some other drugs that have gotten clearance to be on the market to treat COVID-19, and I mentioned them in an earlier slide. But if you look at their efficacy, it's not as good as ivermectin. In fact, it's typically half or less as good as ivermectin. And further, the safety isn't as good.

So with Paxlovid, 15 per cent of the patients are contraindicated for Paxlovid, which means that they should definitely not get it. Remdesivir is associated with acute kidney failure. And molnupiravir is the most alarming: it's associated with creating dangerous viral variants and it's associated with mutagenicity, carcinogenicity, teratogenicity, and embryotoxicity, which in a little bit more plain English, means that there are risks to human DNA. So these drugs don't work as well, typically, as ivermectin; they're not as safe, and they also aren't as widely available and inexpensive.

Shawn Buckley

And yet they're permitted for treating COVID.

Charles Hooper

Right and they have the backing of the medical establishment behind them.

If you have any other comments or questions?

Shawn Buckley

No. Nope. Carry on. Thank you.

[00:30:00]

Charles Hooper

Okay, so I think to really understand how to interpret the results from clinical trials, we need to talk, for a minute, about the concept of statistical significance. And while it seems like an arcane and unimportant subject, we need to understand it because, essentially, it leads to many false conclusions, especially for ivermectin. What I want to do is show you the results of two clinical trials for ivermectin. Show you the results and then show you what the study authors actually said.

And so, again, statistical significance is a way that researchers try to make sure that the result is real and not due to luck. And so, what they've settled on is a number of 95 per cent. So they want to be 95 per cent sure that the results are real and not due to luck. What they do is if the results are good and the results are statistically significant, they say that the drug works. However, if the results aren't good or the results aren't statistically significant, they say that the drug doesn't work, which isn't true.

So here's one example: This is a study by Ravikirti et al., and as part of the study, they looked at the need for mechanical ventilation. Of the ivermectin patients, only one out of 55 needed mechanical ventilation. For the placebo patients, five out of 57 needed it. So if you just do the simple math, it looks like ivermectin reduced the risk by 80 per cent. But the authors concluded, "This study did not find any benefit with the use of ivermectin in... the use of invasive ventilation in mild and moderate COVID-19." And the reason they said that is because they were only 91.2 per cent sure that there was a benefit. In other words, it didn't match the 95 per cent threshold.

So here's another study: This is by Rajter et al. and this is, again, looking at mechanical ventilation. And so in this case, patients on ivermectin— so 36.1 per cent of them improved and got off mechanical ventilators, whereas only 15.4 per cent of the patients who got placebos got off the mechanical ventilators. So if you look at the results, you'd say that ivermectin benefited the patients by 2.3 times what the placebo response was. But, again, these authors reported no benefit and that's because they were 93 per cent sure that the results were true, but they wanted it to be 95 per cent sure.

Now why is this important and why does it affect ivermectin? Well, when a drug company does a clinical trial, it makes sure that the trial is big enough that it's going to get statistical significance. But with a drug like ivermectin, where there's no real money behind it, it's up to smaller organizations that don't have deep pockets to run the trials, and so, they typically run smaller trials. And so, frequently, you'll get a result like this where the study authors, based on using statistical significance, will say that the drug has no benefit. People who just look at the summary in that write-up of that study will say, "oh, ivermectin didn't benefit patients with mechanical ventilators." But if you look deeper, it actually does.

And so I wanted to just point out how ridiculous this can be. For example, imagine a pharmaceutical company testing drug X and there's two researchers, one researcher at each hospital, and they recruit 1,000 patients for this clinical trial, 500 at each hospital. So each researcher is managing 500 patients. Based on statistical significance, if they combine the results and publish together, they would say the drug works. If they, for whatever reason, maybe they had an argument over whose name should be first on the publication

[00:35:00]

—you know, Jones and Smith or Smith and Jones—and they publish separately, they would conclude that the drug doesn't work. So could it be that the drug works if these two authors get along together and publish together, and it doesn't work if they argue and publish separately? Well, that's ridiculous.

And so what's happened with ivermectin is you've had all these little studies, some of which aren't statistically significant, but together they are. So what I showed a few minutes ago, all those results, when they're pooled, are highly statistically significant.

In conclusion, and then, if you'd like, I can talk about possible solutions to prevent a problem like this in the future.

In conclusion, whenever we have a pandemic, we need to rely on existing medications because new drugs just take too long to develop. And older drugs, such as ivermectin, they're a known quantity: they're safe; they're cheap; the manufacturing is established; and then it's just a question of if they work or not.

And with ivermectin for COVID-19, the clinical evidence is pretty overwhelmingly positive and it's substantially better than for other treatments, and it's safer than other treatments, and it's cheaper than other treatments. And those who dissuaded us from using ivermectin are responsible for some of the problems that this caused.

So I'd be happy to jump into possible solutions. Or I don't know, Shawn, if you have questions.

Shawn Buckley

I do want to actually ask you about that. But just following up on your last point about people being responsible, would it be fair to characterize it— You've made it clear with your presentation that there's 4 billion doses. Am I correct that in many countries, in fact, most countries where ivermectin is taken regularly, you don't need a prescription to get it. It's just over the counter. Is that fair to say?

Charles Hooper

Yeah, I'm not an expert in that, but I believe that's true.

Shawn Buckley

Right and would it also be fair to say, literally, ivermectin is one of the safest drugs on the planet?

Charles Hooper

I think, yeah. Based on what I know, I would characterize it as one of the safest drugs on the planet.

Shawn Buckley

So here we're faced with a pandemic where the media is telling us we're in great danger, and from a safety standpoint, there would have been little downside, even if ivermectin wasn't as effective as the meta-analysis that you've shared shows it is.

Charles Hooper

Right, there was very little downside risk to using ivermectin, and early in the pandemic, there were indicators that it did have efficacy. So the efficacy of ivermectin was pretty well-established— Well, established enough to make decisions around mid- to three-quarters of the way through 2020. So there was no reason after, say, the fall of 2020 to not be using ivermectin.

Shawn Buckley

Now, you had sent me some studies, and I'm not going to go through them, but I'm just going to indicate for the commissioners that we've entered them as exhibits. So you've sent me a study that you are an author in called "Ivermectin and Statistical Significance" [Exhibit WI-9b], and I'll just ask if you would adopt that as true today.

Charles Hooper

Yes. Yes, I would.

Shawn Buckley

And then, we've also entered as an Exhibit WI-9c, where you're one of the authors: "Ivermectin and the TOGETHER Trial." Would you confirm and adopt that that's true today?

Charles Hooper

Yes. Yes, I will.

Shawn Buckley

And then, we've entered as Exhibit WI-9d, an article where you're a co-author, titled "Setting the Record Straight on Ivermectin." And do you adopt that as true today?

Charles Hooper

Yes, I do.

Shawn Buckley

So now, I do want to ask you, and then I'll turn you over to the commissioners for questions, but how could we have done this better?

Charles Hooper

Yeah, that's a really good question and I've got some ideas. We could debate them, probably, for the next year,

[00:40:00]

but let me just list them.

So one would be, allow drug companies to promote off-label uses. What this really means is drug companies have information about their drugs for certain diseases, and right now, regulatory agencies, like the FDA, don't allow them to share that information. So it's really a form of censorship.

The next idea would be to allow drug companies to benefit from finding uses for existing off-patent drugs. So, for example, if Merck really found that ivermectin worked for COVID-19, essentially, it might not make a dime from that investment. But if we change the structure somehow so that Merck did make money, then Merck might have been as interested in ivermectin as it was in its own drug.

Shawn Buckley

So can I just slow you down and spell that out because a lot of people might not understand what you're saying? So when a drug still has an existing patent on it, and Merck holds that patent, Merck can charge a high amount for the drug. And if somebody else wants to make it, Merck has to agree and then, basically, there would be a licence fee paid to Merck. But

when a drug like ivermectin is off-patent, then any generic drug company, or any other drug company, for that matter, can also make it and there's no financial benefit for Merck.

But you're suggesting in a pandemic if somebody like Merck could say, "Hey, wait a second, this data shows that it works for ivermectin," that then if there could be some financial incentive— like a licensing fee or something like that for its use for something like COVID— then that would be incentive for the drug companies to look into that and then, also, for them to share their data?

Charles Hooper

Yes, exactly what you just said. The financial incentive could be a number of different things. It could even be, like, a finder's fee or something that some organization pays to Merck, or whichever company it is. It wouldn't necessarily have to be Merck that would promote these uses for ivermectin.

Shawn Buckley

Right, but some financial incentive because we are dealing with companies that actually have fiduciary obligations to their shareholders, financially.

Charles Hooper

Right. And essentially, the generic market is so competitive, and the products are deemed substitutable that there's no way for a company to say, "Our generic is better," or "we know something about our generic, therefore you should pay us more money." Because as soon as that information is out there, then any customer could just use any generic and say, "Okay, well, this ivermectin is as good as that one, and I know that now it treats COVID-19, so why should I use Merck's?"

Shawn Buckley

Now, I interrupted you. It looked like you had a couple of more suggestions of how we could have done this better.

Charles Hooper

Yeah, so there are government agencies around the world that do a lot of medical-related research and the National Institutes for Health in the United States is one of those. And it has a budget, I think, of \$45 billion a year. So in the beginning of the pandemic, if the NIH just said, "Hey, we're going to find all these old medicines that potentially could be used to treat COVID-19 and we're going to do thorough testing of each one of them," these studies wouldn't just be dribbling in. It would be well-designed studies with plenty of people, statistical significance, and you just do that early on. And that could have had phenomenal health benefits.

So just to keep going down my list. I don't quite know how you do this, but prevent agencies, like the FDA, from attacking older drugs. Or maybe a better way to do it is to allow dissenting opinions. So have, kind of, a red team that's set up to challenge the establishment views.

Another perspective on that is, I think power within these organizations has become too concentrated. Maybe spread it out some, so there isn't so much emphasis on the one organization having the one viewpoint.

[00:45:00]

And kind of along those lines, maybe clean the house within these organizations, that if there are people who are knowingly dissuading us from taking medications that have potential benefit, that's not who we want in charge of our public health organizations.

And then, my last two points are to use statistical significance more wisely.

And then, the very last point is something that has other benefits, also, which is taking the responsibility for efficacy away from regulatory agencies like the FDA. And I'll just try to explain this very briefly. From 1938 until 1962, the FDA only mandated safety testing for drugs. And then, after 1962, the FDA mandated safety and efficacy testing. And it sounds like a wonderful idea, but economists have studied it and it's pretty easy to make the case that things have been worse since 1962.

So if the FDA wasn't concerned about efficacy, but was concerned about safety, then any statements the FDA would have made about ivermectin just would have been about its safety. Which, I think, is pretty clear that ivermectin is a safe drug.

Shawn Buckley

Right, you've put a lot of thought into these and we thank you for that.

I'm going to ask the commissioners if they have any questions for you. And they do.

Commissioner Massie

Well, thank you very much for this very thorough presentation. I have a couple of questions. In fact, the way I look at that is it seems that these small molecule drugs that have been around for a long time, they lose their value after they're off-patent. Doesn't that call for a serious rethinking of the patenting of these molecules? Because why is it that, all of a sudden, a chemical that has been synthesized and proven to be safe and effective in many indications would lose its ability to function in other indications, knowing that it's generally the case that molecules that have been around for a long time have several indications? We know that from the practice. So why don't we come up with a different model? Copyrights, for example, on books or music could last much, much longer than the lifetime of a patent. Isn't that part of the problem we're facing?

Charles Hooper

I completely agree. So when a drug goes off-patent, it basically dies because there's no financial incentive to look for other uses for that drug at that point. The only research that's typically done on drugs at that point is organizations that don't really have a financial incentive. I think your point is actually very important. If we could, somehow, figure out a way to incentivize drug companies or universities or research labs to research new uses for off-patent drugs, I think we would find phenomenal benefit because a lot of these drugs have to be useful for other conditions.

And it could be an issue with patents or it could be just some other kind of reward for finding something that's useful. Or maybe have generics that aren't substitutable, so you could actually say that this generic is different than this generic. We'd have to think about solutions, but the potential benefit is huge.

Commissioner Massie

Another question that I had is, you're in the business of, I would say, advising different drug companies on strategies to develop new drugs or maybe find new markets.

[00:50:00]

I'm a little concerned that the position you're taking right now would probably put your position on this marketplace at some sort of a risk because it clearly goes against the business model of some potential clients. So I'm wondering whether you're concerned about that for your activity.

Charles Hooper

The answer is I'm not very concerned and that's because I'd be very interested in finding new uses for generic drugs, but, also, I'm interested in finding uses for new drugs, and so, that's what I help my clients with. I basically want good medicines to be out there so that people live long and healthy lives. Whether they're a currently generic drug or whether it's some kind of cell therapy that's coming down the road, cutting edge cell therapy, for example.

Commissioner Massie

Thank you very much.

Charles Hooper

You're welcome.

Shawn Buckley

So that's it for questions.

Mr. Hooper, on behalf of the National Citizens Inquiry, we sincerely thank you for attending today and sharing with us your valuable testimony.

Charles Hooper

Thank you for your time and attention.

[00:51:45]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 11: Don Woodstock

Full Day 2 Timestamp: 09:06:00–09:20:05

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

And so our next witness is, if he's here, is going to be Don Woodstock.

Kyle Morgan

Good day, sir. Can you state your full name for the Commission?

Don Woodstock

Don Woodstock.

Kyle Morgan

And can you spell your first and last names.

Don Woodstock

D-O-N W-O-O-D-S-T-O-C-K.

Kyle Morgan

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Don Woodstock

Yes, I do

Kyle Morgan

Where are you from, sir?

Don Woodstock

Jamaican-born, but Canadian citizen since 1995-96.

Kyle Morgan

And I understand you live in Winnipeg right now.

Don Woodstock

Yes, I do.

Kyle Morgan

How long have you been in Winnipeg?

Don Woodstock

Since November 1999.

Kyle Morgan

Can I ask you your profession or line of work?

Don Woodstock

I'm the proud owner of JamRock Security. We're a security company providing some of the top-of-the-line products for home security, burglar alarm, commercial, industrial, residential security.

Kyle Morgan

And how long have you been in that area of work?

Don Woodstock

A little over nine years for myself, personally, but I started in the security business. It was my first job in Canada, in Toronto. I'm still doing it today.

Kyle Morgan

So when I spoke to you before, I was struck with the perspective that you have regarding what happened in our society during the COVID pandemic.

Don Woodstock

Yes.

Kyle Morgan

Can you tell us a little bit about your business, how everything affected your business?

Don Woodstock

Well, we started just before COVID. Just, sort of, sheer trying to diversify to try to get online and promote the business online instead of the door-to-door approach, which we're accustomed to. COVID hit, and we had to be very creative but, more so, push the envelope in terms of getting the business online.

So I had to be vaccinated to get into people's home because this is what I was told I had to do. We gave our customers the option to have a "vaccinated install" done, somebody who is vaccinated, or we have somebody who is not vaccinated, because some of the guys did not want to. Subsequently, all the guys, eventually, had to be vaccinated because nobody would entertain us.

Then we get into the business of self-install. So we would sanitize the product, do a lot of the back-end work to get the product to where it needs to be, and we would ship it to you. You get it and plug it in, and then we end up walking you through the process of installing it. So that was some of the major changes that we had to do.

Kyle Morgan

From talking to you, I understand that your business did relatively well during these years?

Don Woodstock

It's not something I am going to boast about because I've seen some of my clients being devastated by this. It pains my heart. But, yes, we have almost tripled our business because of COVID.

And I say that because when you get a phone call at 10, 11 o'clock at night asking for security because somebody thinks the neighbours are watching them, it speaks to a bigger issue. When they get a phone call that somebody, in an apartment block—eight, nine, ten stories up—saying they need security for their windows and the doors, it speaks to another issue. Who's climbing it, you know, Spider-Man? So it's real.

Kyle Morgan

Yeah. So what you're saying is that before the COVID pandemic era, you noticed a change between the patterns of your customers and their desires of your business during the COVID era.

Don Woodstock

Absolutely. It's night and day. Someone would call because they have a burglary, yes. And someone would call because they have a concern about their general security. But more people were at home, and they were afraid to go from one room to the next without making sure the door in that room was locked or the window was secured, or we had to put sensors.

[00:05:00]

One lady spends, pretty much, almost \$4,000 protecting her home and then turn around and have to sell it and move because there was nothing I could do to keep her mind focused, and just, "It's okay." It doesn't work.

Kyle Morgan

So what do you attribute this change in behaviour of your customers to? Do you have any thoughts about that?

Don Woodstock

Fear. Unnecessary fear being promoted by the propaganda-media frenzy. Neighbours not trusting neighbours anymore. People watching people.

Simplest move people make, they call me and ask me, you know, “Don, should I get a security system to make sure that the neighbour’s dog doesn’t come over my place to poo?”

“And how do you know the neighbour’s dog is pooing on your property?”

“Well, dogs do that, don’t they?”

“Well, have you seen any poop on your property?”

“No, but I want a security system just in case he does.”

Well, how do I secure that? It’s— Yeah.

Kyle Morgan

Okay, do you have any other observations or were there any other effects that your business experienced during these years that you want to tell us about?

Don Woodstock

I had to travel because guys who were not COVID could not do the work outside of Winnipeg. Because my business covers Manitoba and, so, we have clients— Rankin Inlet, Nunavut, all over the place. And I had to line up six feet, social-distancing. I’m vaccinated, yeah? I line up to go in the plane, six feet. I got to the door and I’m sitting shoulder to shoulder, like sardine, you know, with everybody for two hours. And if I need to drink water, I have to pull the mask down and drink and put the mask back on. And right there, tells me this whole thing was a hoax and it was a scam to, kind of, keep us confined.

But more power to the people out there. Power to the people who saw this coming and decided to fight it because, Tiananmen Square, it took one guy to stop it. Nelson Mandela stopped apartheid with his efforts. Gandhi did it. We are the Gandhis.

Kyle Morgan

Now, I understand that you experienced difficulty meeting with certain tradespeople and people you were working with.

Don Woodstock

Yes.

Kyle Morgan

Can you describe to us how you would deal with those issues?

Don Woodstock

Well, we discover, pretty soon, that the small businesses were closing, which was the engine growth of our economy. But the large businesses were open, so we decided to start meeting at Walmart and Shoppers Drug Mart and Home Depots. And it worked because I could go to Home Depot and spend the entire day—meeting my trades and walking up and down the aisle and discussing projects—and nobody said anything to us, so, why not? In fact, I did a petition in the middle of the thing that all churches should go to Walmart and conduct services. Nobody would stop them.

We have to adapt. I think that's one of the things that I, personally, have got from this whole thing is— Government is going to bullshit us as much as they can, but we, the people, have to stand up and realize what the truth is. And once we do, then we adapt and we overthrow them, eventually. We have to adapt to this and rise above it, beyond it, and don't buy into it.

And there was so much anger between people that even when I installed a person's home and keep them safe, they're still worried about their neighbour coming over. Like, your home is secure: if anybody came to the door, the alarm is going to go off, the siren goes off. And it still wasn't enough for some people. They still wanted more security. They still wanted something else, and I couldn't help some folks. Couldn't help some folks.

Kyle Morgan

Looking at what happened in our society, what do you think should have been done differently regarding the response to the COVID pandemic?

[00:10:00]

Don Woodstock

Media. Anything the government tells the media and the media swallows it, we should know, right away, it's a lie. If the media is promoting anything, you know it's supposed to be contrary. We don't have to look far from the last election: everybody thought that Glen Murray was the best thing since sliced bread. Anything people promoting where the media is concerned, and if they're pushing the agenda to say, "This is for you." Whenever governments use those terms, just remember Adolf Hitler. They all say, "This was for you," right? It's never for us, it's for them. To do what? Ultimate power.

So I think we need to find a way to look beyond and don't get to the point where we hate our neighbour, whether they're vaccinated or not vaccinated. The government did a fantastic job of letting us hate our neighbours because this one is vaccinated and this one isn't. And this one is wearing a mask and that one is not wearing a mask.

I see this whole thing as just, man, it's a big boo-boo that went down, and they managed to control it with the media. And for the people who stand up—for the people who are prepared to be the Gandhi and the Mandelas of this world—power to us all, you know.

Kyle Morgan

I think you mentioned something to me about engagement and people shouldn't have kept quiet. Do you recall talking about that?

Don Woodstock

Yes, too many people were prepared to take the income from the government and take the buyout from the government and be silenced by the government because it's an income in the pocket. I'm not a medical professional, in any way, but, you know, the medical doctors have the information, the scientists they have the information, yet still they were prepared to be silenced with it because the government were paying them to be silenced with it. And they should have sensed that something is wrong when things like those happen.

When people ask me whether or not I want to be vaccinated, I said, "no." But to satisfy you, Mr. Client, if I need to come into your home, I'm going to be vaccinated. And what do I do? I've had people call me four or five times and says, "I can't get anybody out to my house. I have two senior people in the home and we are both elderly and sick. We don't want anybody to come into the home without vaccination." The mask thing doesn't work. What do you do?

That motivated me to go, "You know what, I'm going to take this damn, stupid vaccination just to, kind of, get some action going." And my business was riding high, so what do I do? Do I drop it? Walk away from it? Or do I adapt? I chose to adapt. I don't like the fact that I have to take a vaccine to adapt. If I could do otherwise, I would.

Kyle Morgan

I think those are all the questions I had for you, sir. I'm going ask the commissioners if they had any questions. It appears there's no other questions.

Don Woodstock

Good.

Kyle Morgan

I really appreciate your testimony, sir. Thank you, very much.

Don Woodstock

You're welcome. Thanks.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

April 14, 2023

Day 2

EVIDENCE

Witness 12: Dr. Gerald Bohemier

Full Day 2 Timestamp: 09:20:07–09:58:57

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

So I'd like to call Dr. Gerald Bohemier to the stand.

Dr. Bohemier, we'll begin by asking you to state your full name for the record, spelling your first and last name.

Dr. Gerald Bohemier

Gerald Bohemier, G-E-R-A-L-D. Bohemier is spelled B-O-H-E-M-I-E-R. In French it's Bohémier, but we'll go along with the Bohemier or Bohemier.

Shawn Buckley

Okay, well I do want to say it correctly, so I apologize if I'm not. And I'll just call you Gerald because I know you as Gerald. Do you, Gerald, promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Gerald Bohemier

I do, so help me God.

Shawn Buckley

Now, I'm going to state your age, and I do that for a reason because it makes your story more compelling. But you are 72 years old.

Dr. Gerald Bohemier

I'm 73, almost 74 in a few months.

Shawn Buckley

Okay, so much for my notetaking during interviews. So you're 73 years of age, and you are a retired chiropractor.

Dr. Gerald Bohemier

That's correct. I've been retired for about 20 years now.

Shawn Buckley

Even though you're retired as a chiropractor, though, you basically spent your entire life looking into natural health issues.

Dr. Gerald Bohemier

Yes, and I continue to do that. I coach a lot of people. I've been asked by a lot of people to help them understand how they can naturally become healthy again, and many times, try to not have to rely on any kind of pharmaceutical medications. And I've been very proud and happy to have the knowledge and to be able to assist them when I can.

Shawn Buckley

Yes, you basically devoted your entire life to trying to be a healer to people.

Dr. Gerald Bohemier

Well, that's a word that I've never used about myself because the healing comes from the inside of the body.

Shawn Buckley

But you know what I mean.

Dr. Gerald Bohemier

The best thing a doctor can cure is bacon and ham and sausages and things that are dead. The entire healing is an automatic thing you're born with. It's part of being a human being. It's part of God's creation, basically.

Shawn Buckley

When COVID hit, you were working part-time doing some quality assurance work for a natural health product company. Am I right?

Dr. Gerald Bohemier

Yes, as a senior and having had the opportunity to be their spokesman at many health expos in Winnipeg and abroad, I was offered the job when they decided to open up a new plant here in Winnipeg to become their quality assurance supervisor. And to make sure that every product that is sent out to the market follows all of the rules, all the regulations, and that the lab tests show that the product is indeed safe and safely available for the public.

Shawn Buckley

Now, I'm not from Manitoba, but since coming here for the hearings, I have learned a lot about a notorious group called the Manitoba Five. And my understanding is that you are a member of this notorious group.

Dr. Gerald Bohemier

Proudly, a Manitoba Five member, yes.

Shawn Buckley

Can you share with us the journey of how you came to be an esteemed member of this group? My understanding is it basically began in January to February of 2020 as we were learning about this new virus called COVID-19.

Dr. Gerald Bohemier

So yes, I was like everybody else. I was listening attentively to what was going on in the media and my metres of non-truths were just firing on all cylinders. And that's because my whole upbringing and the whole professional training as a chiropractor believed in the terrain theory as opposed to the germ theory.

And therefore, I was never worried about a germ or a virus. I was always worried that if I was going to protect myself or my loved ones, I would train them to understand that the terrain, which is your body's physiology and chemistry, was always up to par

[00:05:00]

so that any bacteria or any microbe that could be coming in that's different, the body is going to be surprised by, but it's not going to have a big effect.

So that was basically how I felt, very strongly about, and how I'd been trained. How I had scientifically read and read and read. If you saw my collection of books that I have, you would see that I felt very strongly about that position. The terrain theory—

Shawn Buckley

Gerald, I'm just going to focus you because I'm wanting you to talk about you going to rallies, what you were protesting there and get into what those experiences were.

Dr. Gerald Bohemier

Right. So the minute I started hearing that there was going to be some rallies organized—and these were rallies that, initially, I had heard from a few of the ladies that were putting them on—I decided that we're going to attend these rallies and we're going to see what's going on here. Because hopefully, they are going to tell the truth about what's going on.

So I attended many, many rallies everywhere from the legislative building, the City Hall, at the Forks, where we have our very infamous— What's the name of that big building there, my mind is slipping up, the Human Rights building. We had rallies at that exact site on numerous occasions. And one of the times—and I'm just going to put this as an aside there because it is on my mind—there was at the Human Rights Museum, if you were not vaccinated you were not allowed in that building. And so, the dichotomy was just so

overwhelming. Then many of the rallies that I attended to and spoke at were out of town, in Steinbach and in Winkler, and elsewhere.

Shawn Buckley

Now, did you notice a police presence at these rallies?

Dr. Gerald Bohemier

I'm sorry, I didn't hear that.

Shawn Buckley

Did you notice a police presence at these rallies?

Dr. Gerald Bohemier

They were always present. They were always, initially, very kind and just observant. And then we started to see that they're taking pictures. And eventually, following these rallies, they started coming to the door and pounding the door. We would not answer them because we did not recognize who was that.

We're seniors. We don't let anybody into our homes, and especially when they have an attitude of pounding on the doors. They were there to deliver tickets, and the tickets were \$1,296. I thought that was pretty weird until somebody pointed out that that's the multiplication of six times six times six times six. And so, I thought, okay, we got some bureaucrats involved here.

There's no doubt that they're out to punish. They're out to punish a dissenting voice that on social media was completely censored. I, and many others that had the same ideas as I did, were censored. So the only place that my voice was heard was outdoors in public, in gatherings called rallies.

Shawn Buckley

So I just want to focus. So you were trying to have a voice online.

Dr. Gerald Bohemier

Yes.

Shawn Buckley

And you were finding that you were censored.

Dr. Gerald Bohemier

That's right.

Shawn Buckley

And your voice was about the government activities. You were basically trying to have a voice about what you thought about lockdowns and masking and mandates and things like that, right?

Dr. Gerald Bohemier

Absolutely, absolutely. They were all ridiculous, in my opinion, and I had to tell the people my story. Then don't forget: there were many, many, doctors worldwide and scientists worldwide that had a voice that was never heard.

Shawn Buckley

Right. But what I want to focus you on and you started to talk about it— Because I'm wanting you to share, basically, your experience with state power. Because you were going to protests to have a voice, to basically say, "Look it, I disagree with this." My understanding is you were always completely peaceful.

Dr. Gerald Bohemier

Yeah.

Shawn Buckley

And the protests were peaceful.

Dr. Gerald Bohemier

Very much so.

Shawn Buckley

But you discovered right away that the police were filming.

Dr. Gerald Bohemier

That's correct.

Shawn Buckley

And then you told us about people coming to your door. But these weren't the police coming to your door, were they?

[00:10:00]

Dr. Gerald Bohemier

No, it was very quick to see that they were tattooed, very large people with attitude. And I'd hear them say, "Come on, Bohemier, come on out here; put your big pants on, we've got something to give you." That kind of stuff. My wife was shaking. She still has PTSD. When somebody knocks at the door, she jumps right away. And this is three years later.

Shawn Buckley

And these people would, literally, be banging on there. Like a pounding on the door.

Dr. Gerald Bohemier

We're talking fists here.

Shawn Buckley

Okay. Because I think the world needs to hear what you're saying. So the state of Manitoba basically hired some Canadian ambassadors that were big.

Dr. Gerald Bohemier

Yeah.

Shawn Buckley

That were tattooed.

Dr. Gerald Bohemier

Yeah.

Shawn Buckley

That were not police officers.

Dr. Gerald Bohemier

No.

Shawn Buckley

And they were coming to your door to give you tickets for your protest.

Dr. Gerald Bohemier

Yes.

Shawn Buckley

And they would pound on your door.

Dr. Gerald Bohemier

That's correct.

Shawn Buckley

And they would yell through the door.

Dr. Gerald Bohemier

Yeah.

Shawn Buckley

Basically, taunting things. Can you repeat what they were saying?

Dr. Gerald Bohemier

Well, like I just said, the worst of the words were, "Come on, Bohemier; put your big boy pants on and come on out here. We've got something to deliver to you." And I did go out initially, the first time, or two times. But after that, they were not going to come to the property anymore. We put up a No Trespassing sign. They were always escorted by a real police officer. We recognized that there was always a cruiser car with a couple officers in there. Just in case that I would take out a baseball bat or something like that. But I'm not that kind of person.

Shawn Buckley

Okay, so there would always be a police car and then another vehicle?

Dr. Gerald Bohemier

Yeah, one or two other vehicles, up to three vehicles that I can remember at one time. Yes.

Shawn Buckley

Okay, and then you basically said that Rose would freak out. So can you explain for us who Rose is and give us more of an understanding there, what you're describing?

Dr. Gerald Bohemier

Rose and I have been together for 23 years. So she is my partner, and she's amazing in this. She has the same drive for natural health and natural health products. And so, we get along just incredibly that way. And she's diminutive; she's not very big and strong. And when these poundings happened, it was very threatening. It was very threatening, especially to her. I wasn't really bothered by that because I knew the door was secure enough that they couldn't pound their way in. And that there were police officers out there and that would never get to that stage.

But, nevertheless, it still left us with this impression that—my goodness, what is going on in this world? This cannot be happening in Canada. This is like thugs at the door here to give me a ticket? Why don't you just mail it to me? That kind of stuff.

Shawn Buckley

How many times would this have happened, where basically these big, tattooed people are showing up and pounding on your door to give you tickets?

Dr. Gerald Bohemier

Well, of the nine tickets that I received, I believe at least seven were delivered to the door. A couple more, the other two, would have been delivered, let's say at the Church of God, at

that one incident that was heard where the police were blockading people entry to that church.

I had shown up in support of that church and eventually stepped out of my car and walked over and stood between the tow truck and the van that they wanted—that the police had ordered towed out of the way on the highway. This van contained children and a family. And I started to yell, “Criminal Code 176, you are causing—” Yeah, what’s the word I used? They were doing a crime. How do you say that?

Shawn Buckley
Committing?

Dr. Gerald Bohemier

You were committing a crime. “You’re committing a crime against *The Criminal Code of Canada*, section 176, where you cannot interfere with a church or a pastor when he’s in the process of wanting to give a sermon or his congregation a service.”

And when I started saying that, some young guy pulled out his cell phone, and sure enough, he was flashing it around, “Yes, Criminal Code 176 does say that.” All of a sudden, the police officers seemed to calm down. And the superior, the superintendent, not the superintendent, but the sergeant

[00:15:00]

from that detachment of the RCMP started to look at his officers. And then he seemed to melt away and tell the tow truck to back off. And we were very happy. At that time, the preacher approached the car that was on the highway, being blocked, and we had a prayer service right there on the car. And the family in the car. And we knew we had had a victory right there.

Shawn Buckley
So getting back to these tickets.

Dr. Gerald Bohemier
Yeah.

Shawn Buckley
So you said there were roughly seven, at least seven times they came to your door.

Dr. Gerald Bohemier
Yeah.

Shawn Buckley
How would that be timed in relation to rallies that you attended?

Dr. Gerald Bohemier

Well, many of them were several days after a rally. Sometimes, I would get a ticket at a rally, like in that case of the Church of God. I was parked on the highway. When they recognized my car—that's easy, the plate number—they had surrounded my car. And they put a ticket in my—I wouldn't open my window to talk to them or anything. So they put the ticket in my windshield wiper. And I flushed it off. So that was a ticket for a previous occasion.

Shortly after that, they were banging on my door to give me one for having attended at that particular outdoor event that was against the rules of the government.

Shawn Buckley

How many thousands of dollars in total have you been ticketed, do you think?

Dr. Gerald Bohemier

The face value is 9 times \$1,296. I believe that's got to be close to \$12,000 plus, somewhere in that vicinity.

Shawn Buckley

Now as I understand it, you've also had the experience of being arrested.

Dr. Gerald Bohemier

Oh, my goodness, yes.

Shawn Buckley

And can you share with us what happened?

Gerald Bohemier

Yes. Unbeknownst to a warrant that had been, as I understand, encouraged by our premier of Manitoba at the time— "That we've got to do something. These clowns are not going to stop just with fines." We seemed to be just thumbing our nose at the fines. And we were, absolutely: got another one, no problem.

I was in the backyard doing gardening with Rose. And at the same time, I had lent my sound equipment—because I'm a musician, I have a very powerful sound equipment—to another group of people in Winkler that wanted to do a rally that day. I was not able to attend, but they had access to my sound equipment. And that gentleman's father was returning the equipment to me at the same time as the police officers arrived. They came into the backyard and said that I was under arrest. And I said, "For what?" "There is a warrant out for your arrest, and we're taking you in." Oh my goodness, and all hell broke loose.

Interestingly enough, the father that was returning the equipment had a phone, and he started filming the whole thing. So the whole thing is videotaped and available on Rebel News. It became quite the public embarrassment to me in public to get arrested. But, nevertheless, I took it with my big boy pants on. And off I went with some resistance, and eventually, they started hurting my shoulders too much. I begged them to not do that because at my age, I don't want to be injured. So they did handcuff me in front, and then I

went into the car. They escorted me downtown, into the elevator upstairs, and into the jail area where they began to process me.

They had told Rose, before leaving— Because she was so worried, “When are you going to come back?” “Oh, it’s a two-hour process. He’s going to be processed and released on a promise to appear. He’ll be back in a couple hours.” This was seven o’clock at night. And so by—

Shawn Buckley

Now did the officer tell you that he could have just given you the promise to appear at your home?

Dr. Gerald Bohemier

No, he never did that, never offered me that as an option, no. And it gets worse. I get processed. I’m still in the processed room. I was interrogated, blah, blah, blah. Three hours later, those officers that brought me in are still there, and I turned to one of them. He was a corporal, interestingly enough. I had learned subsequent to that, that two groups of officers refused to come to my house to arrest me. Why?

[00:20:00]

Because one of the officer’s father, who was significantly injured in a motorcycle accident and had suffered tremendously, was helped by my chiropractic adjustments. His son refused with his team of officers to come and arrest me, who had helped his father so much.

The second set of officers that were told to come and pick me up said, “There’s a conflict of interest. My mother’s his first cousin.” And so, that led only the corporal, so that’s probably one of the superior officers in the thing, to team up with somebody else to come and to arrest me.

So I’m talking to the corporal now, after three hours of being in this jailhouse, still sitting in the interrogation rooms. And I say, “You told my wife it’s going to be two hours, and I’ll be processed and released on a promise to appear.” And he turned all red. He says, “Yeah, that was our intention. But when we got here, we were informed that there was a memo sent out by the Department of Justice to hold us here until we appeared in front of a magistrate and not before. So therefore, you’re going to probably spend the night here, unfortunately.”

I found out recently that there were magistrates available up until 11 o’clock at night in a typical jailhouse like that. And I don’t know if that’s right. But if so, I was lied to that I would get out after a promise to appear. And I was told that the only way we’re getting out is in front of a magistrate, to make a contract with him or her. And that there was none available, and we are going to have to spend the night in jail. So there I was—

Shawn Buckley

So I’m just curious because I’m familiar with the criminal laws. The arresting officer can release you on bail conditions. You were not released by the arresting officer on bail conditions.

Dr. Gerald Bohemier

I was not given that option. No.

Shawn Buckley

Okay, and the officer in charge, which is probably the corporal, can also release you on bail conditions and that didn't happen.

Dr. Gerald Bohemier

That never happened.

Shawn Buckley

You were held, my understanding is, for 16 hours.

Dr. Gerald Bohemier

That's correct, by the time we were finally walking out the door.

Shawn Buckley

So you weren't in the interrogation room that whole time. You were put in a cell, am I correct about that?

Dr. Gerald Bohemier

Yeah, right about the time that he was telling me that you're going to spend the night here, that's when they escorted me to a jail cell. Because they had finished talking to me, asking me all the questions that they would ask, and I was assigned the jail cell.

And the problem is that when I entered there, I was told that there's only one layer of clothes that you can have on. And so by the time I would strip down to one layer of clothes, I would be in my underwear and a t-shirt. And I says, "At my age, I'm going to freeze to death here." And then one young officer said, "Well, put your sweater on and your sweatpants on, and that'll be your one layer of clothes. And then plus that, I'll get a little blanket or something like that when you're in there." And I thanked him for that because how incredibly smart was this young officer to give me that option.

So I stripped down and put on the warmer pants and the sweater. And therefore, I was definitely more comfortable for the rest of the evening. Because I got put into a concrete room, the lights on, with no soundproofing, so it's very noisy. Everything's concrete. I'm given this little flimsy, what they called a wool blanket. It's definitely not the kind of wool blanket that I've ever seen. I'm sitting on this concrete thing, embarrassed to death, not knowing what's going to happen next. I'm 70 years old. I've got an enlarged prostate. I've got to pee every hour. So I knock at the door. And all the way till midnight, the staff would open the door, allow me out, and put me back in, no problem, no questions asked.

Shawn Buckley

You mean allow you out to go to the bathroom?

Dr. Gerald Bohemier

After midnight there is— I'm sorry. I didn't hear you.

Shawn Buckley

I just want to clarify. They would allow you out of the cell so that you could go to the bathroom?

Dr. Gerald Bohemier

That's correct.

Shawn Buckley

Okay.

[00:25:00]

Dr. Gerald Bohemier

At midnight, there was a crew change. There was no way I was sleeping. There was noise, the doors slamming all the time. Everything's steel and concrete, and they're processing people all night long, and bing, bing, bang. I was not aware at the time that there was some of my friends that had been arrested that day either. But anyways, we met the next day.

Somewhere after midnight, it's time to pee again. I get up and knock at the door, and a lady shows up. "Yeah, what do you want?" "I've got to go to the bathroom." "Okay, put on your mask." "No, I don't have a mask, and I don't wear a mask, and I was allowed and processed in this facility with a mask exemption." "Well, we don't care about mask exemptions."

Well, hearing that discussion, the sergeant comes from the desk. He puts his face about 12 inches from mine, and he's turning red, and he's F-bombing me that, "You're going to wear this effing mask because I'm here to protect my staff. And I don't care about your effing medical, whatever it's called, to not wear a mask." And I says, "Well, I'm not going to wear a mask." I was looking at him. He turned so red, I thought he was going to explode. That's how livid he was. He wasn't wearing a mask. Anyways, I just stared him down, and I finally said, "I am not going to wear a mask." And he slammed the door, slid the window off. Basically, tough luck, buddy.

So I turned around very depressed about that and very innervated by the force of his voice and the closeness and the redness in his face. And his eyes were just bleeding. I thought he was going to blow a fuse. And I turned around, and oh my goodness, there's a floor drain in the corner. And so I relieved myself in a floor drain in a corner. How embarrassing is that? But it was a solution, and for the rest of the night, I didn't have to bang on the door and have that kind of treatment by this staff that had replaced the earlier staff, which was very kind, all the way through.

In fact, so kind that one time— Around 11 o'clock, they were ready to go. He knocked at the door, one of the jailers, a very young, obviously a very junior member. He said, "I've got good news for you." "Oh, what?" He says, "I've got news from your son." I said, "My son, he lives in Michigan."

"Yeah, but he went to school with one of the officers that refused to arrest you. And I'm not going to mention the name." But he said, "Your son sends off a message, 'Dad, I'm proud of you. You're my hero.'" And so, it was a moment of joy that this young officer, the jailer, had brought me. It was like a gift. It made me very emotional, and I still am.

And so after midnight, it's just regular freezing to death in there. There's no way to stay warm. The little blanket was used as a pillow because it's all concrete. A big concrete pad, probably the size of this table. And you have to stretch out in there and try to be comfortable. There was no way to sleep. I didn't get any sleep. And the next morning, they finally came around 11 or 12, saying, "You can call a lawyer. Which lawyer do you want to see?" I said, "Rocco Galati." "Okay, we'll get in touch with Rocco Galati, and we'll see if you can have an interview with him." And so they did call, and he was not available. So they came back and said, "No."

Shawn Buckley

Gerry, I'm just going to speed you up a bit because some of that we don't need, but—

Dr. Gerald Bohemier

Okay.

Shawn Buckley

But you were eventually released after 16 hours and put on conditions.

Dr. Gerald Bohemier

Got to see a magistrate, read the riot act, signed the—"Under duress." If you look at my signature on that release order, it's written, "under duress." They did not pick up on that, I guess, because I scribbled it. But you can probably see it. And I was let go.

I asked them, I says, "Can you call my wife and have her pick me up?" "No, we don't do that here,

[00:30:00]

but if you go downstairs, you'll go to the end of the block, and there's police services in there, and you can go in there and have them do that."

Well, I did that, and they wouldn't do it. So here I am, in the middle of, I don't remember the name of the street there, York or whatever. So I turn around, I say, "Okay, well, I'm just going to walk to St. Boniface. There's a couple restaurants that I could use their phones there," because I had no phone, no nothing.

Shawn Buckley

Gerry, I'm just going to focus you because we don't need that much detail. I was just trying to get that you were, basically, prohibited from having contact with people and the effect that was going to have on you under that court order.

Dr. Gerald Bohemier

But there's one interesting part about my walk back home, I have to say it. Because on the opposite side of the street, there was a release of another one of the top five, Miss Vickner. And all of a sudden, we get to Main St. You can imagine, she's walking on one side, I'm walking on the other side. And we say, "Oh, my goodness." And we went and we crossed and we looked and we were so timid. And we hugged. And then, we went each our own way, not to be all of a sudden discovered. Because we were told not to be within 200 metres of each other or any of the five.

But anyways, I got a hug in before I entered St. Boniface. Okay, go ahead.

Shawn Buckley

So how did it make you feel? Because once you were under the court order, it did basically stop your activities.

Dr. Gerald Bohemier

My voice was extinguished for over a year.

Shawn Buckley

Right. So for over a year, you couldn't participate in rallies.

Dr. Gerald Bohemier

None. Under the pressure that I would go to jail until the trial date, which was never revealed to us until many months later. It was almost a year, anyways.

Shawn Buckley

Right. So basically, the force of the state succeeded in silencing your voice.

Dr. Gerald Bohemier

I was depressed. I was sad. I was not permitted to do something that I enjoyed so much, talking to people about alternative health and how to stay well in spite of a so-called "virus" that's going to cause so much havoc. I didn't believe in that theory anyways.

Shawn Buckley

Thank you. I've got no further questions except that I want you to share how you learned about losing your job.

Dr. Gerald Bohemier

The night after the first rally we went to, there was a couple of young individuals that picked the pictures out of the [Winnipeg] Free Press, and on their Facebook, I guess, said, "Hey, we got to find out who these people are. We got to find out who they work for. And we got to get these people fired." And it got to the company that I was working at.

And oh, my God. So they, in a knee-jerk reaction, immediately published a letter to the Free Press and to the government saying that we have no affiliation with Dr. Bohemier. None. So

that night after the rally, when this was all happening— Because the Free Press had published the papers already, published the pictures already. I found out while at home celebrating that we had such a great rally that— You're being fired. You don't have a job anymore. They're saying that they've cut costs. I says, "What?"

No, I know these guys; I've known them for 35 years. They would never fire me without at least calling me and telling me, "Hey, we got a problem. We got a PR problem. We're going to have to let you go. We got to disassociate our company from your activities." That never happened; it still hasn't happened today.

Shawn Buckley

Right. So basically, you were fired because of people's actions and social shaming.

Dr. Gerald Bohemier

And it wasn't a big job. But for a 72-year-old, one day a week, I was in there doing paperwork, making sure that all processes got done properly so that we could certify that the product could be released to the public. So that's what the quality assurance person was entitled to do. The quality assurance person had to have a degree, and I did have a degree. So I fit all the criteria, and, man, it paid really well. A couple hours every Wednesday I'd drive in 75 kilometres from our farm and did all that paperwork for them, and said goodbye, and they gave me a big fat check every month.

Shawn Buckley

Right. Thank you. I have no further questions. The commissioners might have some questions for you.

Dr. Gerald Bohemier

Yes, sir.

Commissioner Drysdale

Good afternoon, Dr. Bohemier.

Dr. Gerald Bohemier

Good afternoon.

Commissioner Drysdale

When at the time that your employer fired you had you been convicted of a crime?

Dr. Gerald Bohemier

No, not at all. Never been convicted of any crime.

[00:35:00]

Commissioner Drysdale

I think somewhere in your presentation you mentioned that you felt you were under pressure. Did you feel like you were under pressure when you made the decision to go to these rallies? Were you apprehensive about doing that?

Dr. Gerald Bohemier

No, on the contrary, going to these rallies was like, oh, my goodness, my voice can be heard here. I really believed that the things that I had to say would help people, would help people lose the fear. I saw the fear campaign, and I needed to go to these rallies. I felt I needed to be there.

Commissioner Drysdale

But did you not understand that there was some potential for retribution or fining in any of these activities that you undertook?

Dr. Gerald Bohemier

Not at the time, not at the first ones. But once the tickets started being delivered, yes. I knew that it was game up. Because I had nine tickets. But we did probably 15, maybe 20 rallies.

Commissioner Drysdale

So there was at some point in time when you did understand that there may be consequences?

Dr. Gerald Bohemier

Yes, at that point, I thumbed my nose up at the consequences. I was going to speak, and people needed to hear that they don't have to be afraid of a virus.

Commissioner Drysdale

The reason I ask you that question is because previous witnesses today said that other people have felt pressure in their positions and that perhaps explained why they didn't serve the Manitobans. I'm particularly talking about the judge who testified today that other judges must have felt pressure. And my point is, you must have felt pressure, too, but you did what you thought was right.

Dr. Gerald Bohemier

I did so. And when I received the notice that I was no longer employed, I was expecting a phone call to tell me what had happened. They never did that. But I retired at that point. I made up my mind, I don't need that job. And therefore, although it was great people to work with and the products that they produced were great, I just quit. And so, basically, that was a relief off of my shoulders. I don't have to worry about Wednesday mornings anymore, going to spend a day at the factory. So no, I just— Get me out at a rally and give me a horn. I felt I was doing something. That was important to me.

Commissioner Drysdale

Thank you, doctor.

Dr. Gerald Bohemier

You're welcome.

Shawn Buckley

Thank you, Dr. Bohemier. On behalf of the National Citizens Inquiry— Oh, I'm sorry, there is another question. I apologize, Commissioner.

Dr. Gerald Bohemier

Oh, sorry.

Commissioner Kaikkonen

I'm just wondering: If you had another opportunity to speak to those ambassadors who came pounding your door, what would be the words that you would tell them?

Dr. Gerald Bohemier

Knowing that they were hired thugs, I would have not spoken to them. I would not have given them five minutes of my time. I would have gone to the police officers. I says, "Get these people off my property." And they would have had to. Because unless they had a court order to be on a property, they would not have been able to be there.

Commissioner Kaikkonen

Thank you.

Dr. Gerald Bohemier

You're welcome.

Shawn Buckley

Sorry to be premature commissioners.

So, Gerald, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing your story today. It was very important to hear your experience.

Dr. Gerald Bohemier

Thank you for the opportunity.

[00:38:52]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 13: Carley Walterson-Dupuis

Full Day 2 Timestamp: 09:59:16–10:08:39

Source URL: <https://rumble.com/v2i6qmk-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Shawn Buckley

Okay, thank you. So we'll proceed. Our next witness is going to be Carley Walterson-Dupuis.

Wayne Lenhardt

Could you give us your full name, and then spell it for me, and then you'll have to give us your oath.

Carley Walterson-Dupuis

My name is Carley Walterson-Dupuis C-A-R-L-E-Y W-A-L-T-E-R-S-O-N hyphen D-U-P-U-I-S.

Wayne Lenhardt

And do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

Carley Walterson-Dupuis

I do.

Wayne Lenhardt

I'll try to help condense this almost two-year saga of yours that you've gone through after your shot. When did you get the Moderna shot?

Carley Walterson-Dupuis

On June 28th of 2021.

Wayne Lenhardt
And why did you get it?

Carley Walterson-Dupuis
I got it because I wasn't going to be allowed into sports facilities for my kids.

Wayne Lenhardt
And right after you got the shot you started having symptoms.

Carley Walterson-Dupuis
Yeah.

Wayne Lenhardt
Is that correct? Can you tell us about that?

Carley Walterson-Dupuis
Yeah. The day of, I felt fine. It was the next day that I started experiencing some stomach problems that lasted about three weeks. From there, I had vertigo for a week, which was new to me. I've never experienced dizziness like that before. Following the vertigo was the really scary part. I experienced heart problems: heart palpitations, loss of breath. I couldn't exercise.

Wayne Lenhardt
And that developed over the course of the first four to five weeks after your shot. Correct?

Carley Walterson-Dupuis
Correct.

Wayne Lenhardt
One of your family members, I believe, took you into urgent care at about the five-week mark. Correct?

Carley Walterson-Dupuis
Correct.

Wayne Lenhardt
And what happened? Why did you go to urgent care and what happened?

Carley Walterson-Dupuis
I was sitting at my desk at home; I was working from home at the time. And I could feel my heart beating out of my chest. It was very, very uncomfortable. I was losing my breath and

felt very scared. So I was talking to my mom, who is a nurse, and she took me into urgent care that day.

Wayne Lenhardt

And what did they do at urgent care?

Carley Walterson-Dupuis

They did an EKG. I got into a room and they had me lay down in a bed. I was hooked up to heart monitors, but everything came back normal. There were no abnormalities that were found on the EKG. The doctors that I spoke to would not consider it being from the vaccine, at all.

Wayne Lenhardt

And they sent your home. Correct?

Carley Walterson-Dupuis

They sent me home because everything looked normal.

Wayne Lenhardt

Okay. So you went back to your family doctor at that point. Correct?

Carley Walterson-Dupuis

I did, yes.

Wayne Lenhardt

What did he say?

Carley Walterson-Dupuis

My family doctor also didn't want to consider this being from the vaccine. But she's known me my entire life. She actually delivered me into the world, so she knows my entire health history, and I've never had a problem before. So she got me in to see a specialist. She recommended me to a cardiologist in the city.

Wayne Lenhardt

And that took you a certain amount of time to make that appointment, and your symptoms continued during that time. Did they?

Carley Walterson-Dupuis

Correct.

Wayne Lenhardt

What were the symptoms?

Carley Walterson-Dupuis

Heart palpitations, loss of breath, and by this point, I was also experiencing chest pain, on and off.

Wayne Lenhardt

You had to rest during the day.

Carley Walterson-Dupuis

I had to rest during the day. Yeah. My workdays, I work at a desk at home all day. But I had to actually go and lay down multiple times in the day to get my heart rate back to normal.

Wayne Lenhardt

Okay. So finally, you got to go in to see that cardiologist. What happened there?

Carley Walterson-Dupuis

He was aggressive, very dismissive, and rude.

Wayne Lenhardt

They did a second EKG?

Carley Walterson-Dupuis

He did a second EKG. Everything looked normal still. But he was aggressive and continued to push me to go and get another shot.

[00:05:00]

Which I refused.

Wayne Lenhardt

Okay. So then you went back to your family doctor, correct?

Carley Walterson-Dupuis

Yes.

Wayne Lenhardt

We're at about the ten-week mark from the time you got your shot. And you're still having problems, correct?

Carley Walterson-Dupuis

Correct.

Wayne Lenhardt

So your family doctor then did what?

Carley Walterson-Dupuis

She recommended me to an allergist just to make sure that this wasn't an allergy-related symptom, which I figured it wasn't. So I spoke to an allergist on the phone. I never saw him in person. He ruled out any of my symptoms being allergy related. He said he had a friend that's a cardiologist in the city, and he recommended me to see him.

Wayne Lenhardt

Okay. So you actually went to a second cardiologist at that point, didn't you?

Carley Walterson-Dupuis

Correct.

Wayne Lenhardt

And what happened then?

Carley Walterson-Dupuis

He was very kind. He made me feel validated. He verbalized to me that this is definitely from the vaccine. He also said that there are numerous other people going through this. It was nice to feel not alone.

Wayne Lenhardt

Is he the one that told you might have an [autonomic] nervous system disorder?

Carley Walterson-Dupuis

Correct. He is the one that diagnosed me with that.

Wayne Lenhardt

Did he prescribe anything for you?

Carley Walterson-Dupuis

I was prescribed beta blockers at that time.

Wayne Lenhardt

We're now at about the thirteen-week point after your shot. You went back to your family doctor at that point, and I'm trying to decipher my notes here. Was there another cardiologist that you went to at this point?

Carley Walterson-Dupuis

That was the only cardiologist. But at that appointment with my doctor, she brought up my medical files, and he wrote— The cardiologist wrote in my medical files that it was from COVID.

Wayne Lenhardt

Okay. So you started to feel somewhat better at this point, is that correct?

Carley Walterson-Dupuis

Yes, things were on and off. It wasn't as persistent as it was in the beginning where it was every day. I would experience on and off symptoms, so I'd have some good days, some bad.

Wayne Lenhardt

Around March of 2022, you started to go to a homeopathic doctor.

Carley Walterson-Dupuis

That's correct.

Wayne Lenhardt

And he prescribed vitamins and a food regimen and that type of thing, correct?

Carley Walterson-Dupuis

Yeah, I looked into alternative methods of healing as the healthcare system was failing me at that point, and I wasn't willing to live the way I was living.

Wayne Lenhardt

And you still have some symptoms today, although things have improved to some extent.

Carley Walterson-Dupuis

Yes. A lot of symptoms have improved. I would say my heart is back to normal at this time; although, we don't know what long-term effects could be. My only ongoing symptom is everyday dizziness. If I turn my head a certain way, I'm dizzy. So it's just something I've had to live with now.

Wayne Lenhardt

How was your health prior to getting the Moderna shot?

Carley Walterson-Dupuis

A hundred per cent.

Wayne Lenhardt

Did you have any ailments of any kind?

Carley Walterson-Dupuis

Never.

Wayne Lenhardt

Okay. At the present time, again, you still have dizziness during the day. Correct?

Carley Walterson-Dupuis

Yes.

Wayne Lenhardt

Is there anything else that I may have missed in your health saga here for those,

Carley Walterson-Dupuis

That sums up it.

Wayne Lenhardt

a year and 10 months, I think it is.

Carley Walterson-Dupuis

Yeah.

Wayne Lenhardt

Okay. I think I'm going to turn you over to the commissioners. Are there any questions that you have for this witness?

Carley Walterson-Dupuis

Thank you.

Wayne Lenhardt

Okay. Thank you very much for your testimony. Appreciate you coming.

[00:09:23]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 2

April 14, 2023

EVIDENCE

Witness 14: Shelley Overwater

Full Day 2 Timestamp: 10:09:024–10:50:39

Source URL: <https://rumble.com/v2i6gm-national-citizens-inquiry-winnipeg-day-2.html>

[00:00:00]

Alexander MacKenzie

Again, for the record, my name is Alexander MacKenzie. Shelley, would you give your full name to the Commission and spell it, please?

Shelley Overwater

Hi, I'm Shelley L. Overwater. It's S-H-E-L-L-E-Y. And then Overwater, just like it sounds.

Alexander MacKenzie

And, Shelley, do you swear that the evidence you will give to this Commission will be the truth, the whole truth, and nothing but the truth?

Shelley Overwater

Yes, I do.

Alexander MacKenzie

Thank you. Shelley, you reside in Morden, Manitoba. Is that correct?

Shelley Overwater

Yes, I do.

Alexander MacKenzie

And that is quite close to where your parents live.

Shelley Overwater

Yes. They lived about a block and a half from me, originally. Now my mom lives just down the street.

Alexander MacKenzie

Right. Your father is now deceased.

Shelley Overwater

Yes, he is.

Alexander MacKenzie

And you, you are a practising lawyer, yourself.

Shelley Overwater

Yes, I am.

Alexander MacKenzie

Getting your call in 2011.

Shelley Overwater

Yes, I did.

Alexander MacKenzie

And you practise now in Winkler

Shelley Overwater

Yes, I do.

Alexander MacKenzie

with one associate lawyer you met while practising at a firm that had a branch office in Morden and Winkler, but they are now closed.

Shelley Overwater

Well, the Winkler office is closed. They still have the other branches.

Alexander MacKenzie

Right. Thank you. And you yourself received vaccine in July of 2021?

Shelley Overwater

I think that was the second one, I believe. Me, my husband, my daughter, and my mom all got two each because we thought we were going to get to go to the U.S. for July long

weekend. And they weren't mandatory at that point. We didn't even think; we trusted that vaccines were safe, so we went and got them.

Alexander MacKenzie

And you had some special concerns about your daughter, Katie, is that right?

Shelley Overwater

Well, we found out after the second shot, which was, by the way, Moderna— Katie has epilepsy. My daughter has had epilepsy her whole life, pretty much. Anyways, that night she broke out in such a terrible fever, high fever, that of course she seized through. When I talked to the pharmacist who hadn't mentioned anything about it causing fever, I said, "You should let people with seizure disorders or epilepsy know that these shots could do this." So she said, "Oh, yes. I'll make sure of that." And then she phoned Manitoba Health. Then they phoned my daughter and said that she couldn't have a licence because of the seizures, right? So she basically did nothing except cause Katie some grief.

Alexander MacKenzie

So because she got the shot, she lost her learner's [licence].

Shelley Overwater

Well, she had a learner's at that point. But yeah, she only had it— Because of the epilepsy, she wasn't allowed to drive till she was older anyways. But that probably ensured she won't be driving.

Alexander MacKenzie

Okay. Now, you've been involved yourself in a number of the anti-mandate citizen initiatives that the Commission has heard about. Is that correct?

Shelley Overwater

Yes. That's correct.

Alexander MacKenzie

You were involved in the slow-rolls on Highway 75, and you joined the convoy from Portage to Steinbach, that is the Truckers' Convoy.

Shelley Overwater

Yes. I did.

Alexander MacKenzie

And you have done some pro bono legal work at the Emerson blockade.

Shelley Overwater

Yes. I spoke for them initially to the— The RCMP had special negotiators come out.

Alexander MacKenzie

And you spoke to them on behalf of the Emerson people.

Shelley Overwater

Yes, yes. I did

Alexander MacKenzie

And we may get time for you to discuss any questions the commissioners may have on those things. But we'll move along from them.

Shelley Overwater

No problem.

Alexander MacKenzie

Now, in addition, you represent a number of accused for charges for fines relating to COVID mandate breaches.

Shelley Overwater

Yes, I sure do.

Alexander MacKenzie

Those are both federal and provincial acts.

Shelley Overwater

Yes, they are.

Alexander MacKenzie

You're also representing parties in a number of litigations: some in the Manitoba Provincial Judges Court; one in the Manitoba King's Bench Court; and another one in the Ontario Supreme Court. Is that correct?

Shelley Overwater

Two in Ontario, now.

Alexander MacKenzie

Two in Ontario.

Shelley Overwater

Yes.

Alexander MacKenzie

Things change.

Shelley Overwater

Yeah.

Alexander MacKenzie

Now, COVID mandates have also affected you personally.

[00:05:00]

Is that correct?

Shelley Overwater

Yes.

Alexander MacKenzie

And you want to inform the Commission about several matters. In fact, one relating to your father.

Shelley Overwater

Yes.

Alexander MacKenzie

One relating to your own medical care.

Shelley Overwater

Yes.

Alexander MacKenzie

And one relating to your employment.

Shelley Overwater

Yes.

Alexander MacKenzie

Well, starting with your dad. Your dad's name was Patrick Rice. Is that correct?

Shelley Overwater

That's correct, Patrick Rice, yes.

Alexander MacKenzie

At the beginning of COVID, he was 89 years old, was he?

Shelley Overwater

Well, he was 89 and a half when he died.

Alexander MacKenzie

Okay. And when did he die, Shelley?

Shelley Overwater

He died December 19th, 2020.

Alexander MacKenzie

Can you tell us what his physical condition was?

Shelley Overwater

He was in excellent health. He didn't even need glasses or hearing aids. He had all his teeth. He still drove; he had his downhill ski pass ready to go to La Rivière, to Holiday Mountain, because he still skied. He also was the oldest skydiver in Canada.

Alexander MacKenzie

And that was all at the tender age of 89 years.

Shelley Overwater

Yes.

Alexander MacKenzie

In relation to his health, it was known, was it not, that he had an aneurysm?

Shelley Overwater

Yes, he did. It had been diagnosed probably around 2015 or so, and they had offered him some kind of surgical procedure. But at his age he decided not to bother. But they told him if it ever went, it would be quick. He wouldn't probably have time to get to a hospital, possibly.

Alexander MacKenzie

I see. And then in 2020, your father had a rapid test for COVID, and he had tested positive at a Winkler drive-through COVID testing station. Is that correct?

Shelley Overwater

Yeah, him and my mom went. They were recommended by the family doctor to go check. This would have been about the first of December, maybe. He tested positive; she tested negative.

Alexander MacKenzie

And that was about the beginning of December.

Shelley Overwater

Yes.

Alexander MacKenzie

And so, in obeying the rules, I take it your father quarantined himself.

Shelley Overwater

Yes, they were told to just go home.

Alexander MacKenzie

Did he have any symptoms?

Shelley Overwater

Not that I recall. He seemed fine. He seemed like Pat always seemed.

Alexander MacKenzie

And no coughs, no fevers.

Shelley Overwater

Not that I recall. I mean, he seemed fine. And when he died, it was three weeks after he'd had this test.

Alexander MacKenzie

Okay. So he had the test; he was asymptomatic in terms of anything to do with COVID.

Shelley Overwater

Yes, so was my mom.

Alexander MacKenzie

He had had an aneurysm in the past; it had been diagnosed. And then on December the 19th, can you tell us what happened on that day?

Shelley Overwater

I believe it was about five in the morning. My mom phoned and she said, "Pat fell and he's mumbling." I said, "Mom, call the ambulance." Because she said he was mumbling, but he wasn't speaking. So she called 911. We got ready to rush over there, me, my husband, and my daughter. I could hear the ambulance because I lived so close; I could hear they were lost. So I phoned 911 and said, "You have to go to—" blah, blah, blah.

When we got there, the ambulance was sitting there with the lights off, and there were two Morden police officers standing in the doorway. I jumped out of the car, and they said, "Your dad's gone." I thought they meant they'd taken him away already, but they meant he was deceased. This would have been, well, I guess 20 minutes, half hour after my mom initially called me.

Alexander MacKenzie

So that was about 5:30 in the morning.

Shelley Overwater

I would say, yeah, I believe so.

Alexander MacKenzie

On December 19th.

Shelley Overwater

Yes.

Alexander MacKenzie

And did you then go into the home?

Shelley Overwater

Oh, immediately. My mom was a mess, obviously. She was there with the two paramedics, I believe, and then the two officers were in there. They were asking her questions in her den. I went downstairs. At that point, we went downstairs, and he was still laying there on his back, and there was a little trail of blood to the bathroom door. So it was obvious, he'd gone to the washroom, come out, and something happened. He fell, must have bashed his arm on his way down. Mom heard the crash,

[00:10:00]

came running, and this is when she said he was like, "urrrrrurr." And then he just died; his breath stopped. So he was dead before the ambulance even got anywhere near there; he was gone. So I wiped up the blood because I didn't want my mom to see it. I got a quilt to cover him because he was still just laying.

Anyways, when I come back upstairs, she was on the phone, at some point there, later. And it was the provincial medical examiner she was on the phone with, a woman, telling my mom that it was clearly a COVID-19 death. At this point, no one had seen him: He had not gone to a doctor. He had not had any outside people look at him. The police weren't taking

pictures. Like nobody had seen him, and he died in a few minutes. Oh, and then she told my mom that she must go that very day and get tested for COVID-19. So later that day, we had to—

Alexander MacKenzie

Before you get on to that, if you don't mind.

Shelley Overwater

Oh, not at all, sorry.

Alexander MacKenzie

Thank you. The medical examiner was suggesting to your mother that your father had died of COVID.

Shelley Overwater

Yes. No, she insisted. And she said they wouldn't be doing autopsies because they were afraid of getting COVID.

Alexander MacKenzie

So without any more information than that your father had died, they were absolutely not going to do an autopsy.

Shelley Overwater

No. No, absolutely not.

Alexander MacKenzie

And they were going to say

Shelley Overwater

Died of COVID-19.

Alexander MacKenzie

[from] everything you could tell, that it was a COVID death.

Shelley Overwater

Yes.

Alexander MacKenzie

Despite your father not having had any COVID symptoms.

Shelley Overwater

Not that I was aware of. And he died, like in 20 minutes. You don't die of a lung ailment in 20 minutes.

Alexander MacKenzie

And he had been diagnosed some time before with an aneurysm.

Shelley Overwater

Yes, yes. So I assumed it was that or a heart attack.

Alexander MacKenzie

Are you aware of how your father's death may have been reported in any local newspaper?

Shelley Overwater

Well, it was on the *Pembina Valley Online* because they were reporting the deaths by different regions. They would report Morden deaths, Winkler, and, of course, they showed December 19th, one male, 89, died of COVID-19.

Alexander MacKenzie

So he was reported in the newspaper as being dead from COVID-19.

Shelley Overwater

Well, *Pembina Valley Online* is like an online news service. But yes, that's where I saw it.

So I just thought, well, whatever, right? I phoned the funeral home because he went Saturday morning, the day he died; he went right to the funeral home. And I asked the owner if they had taken pictures. He said, "Absolutely not." They cremated him Monday. So he was in the funeral home, and he was cremated Monday. And the provincial medical examiner's office phoned my mom again during the week and kept telling her it was COVID-19. And at that point, my mom just gave up on arguing because what was she going to do about it exactly, right?

Alexander MacKenzie

Now, in your work as a lawyer on some of these things that we've mentioned, you've had occasion to see an affidavit that was filed. Is that correct?

Shelley Overwater

Yes. We were working on an appeal for some unnamed clients, and some of the evidence in the transcripts was from the church's case, you've heard about. One of them was an affidavit from this Dr. Loeppky.

Alexander MacKenzie

Well, a person by the name of Carla Loeppky.

Shelley Overwater

Yes, yes, I believe she was some kind of doctor.

Alexander MacKenzie

For the record, that is a document that was filed in a provincial court in Winnipeg in pocket number 558-30323, and there are ten provincial court pockets associated with that affidavit.

Shelley Overwater

Yes, sir.

Alexander MacKenzie

What did you see in that affidavit as you were doing your work as a lawyer?

Shelley Overwater

Well, there was 40 pages of CV. But then there was all these COVID-19 deaths in Manitoba, and they were listed individually. So just because I went through them and, of course, I get to December 19th, 2020: Morden, Manitoba, one male, COVID-19. And so I realized that this person had submitted this as affidavit evidence to the court. I mean as a lawyer, you would never—

Alexander MacKenzie

So what you saw in the affidavit was one death in Morden,

[00:15:00]

exactly on the day of your father's death.

Shelley Overwater

An 89-year-old male, which he was the only death in Morden that day.

Alexander MacKenzie

And it was put down as COVID.

Shelley Overwater

Yes, not COVID related. COVID-19, as it was said.

Alexander MacKenzie

I see. And insofar as that might be relied upon for developing statistics,

Shelley Overwater

Yep.

Alexander MacKenzie
what do you think of that?

Shelley Overwater

I think that they were padding, at the very kindest. I'd say they were padding their statistics. But I mean, to me, this was an out-and-out lie. They had no evidence to support that. They didn't even try to get any.

Alexander MacKenzie

In fact, they assiduously avoided getting any.

Shelley Overwater

Yeah, that's how it appeared to me. I mean, obviously, we're supposed to go to court with evidence, right? So you would just expect that. But apparently not.

Alexander MacKenzie

Thank you, Shelley.

Now, quite apart from your dad, is there anything else you'd like to add in relation to your father's situation?

Shelley Overwater

I can't think of anything other than I just couldn't believe they would browbeat my elderly, widowed mother into trying to get her to accept that. I was horrified.

Alexander MacKenzie

Thank you.

Now, quite apart from your dad, you've mentioned that you've had some medical issues yourself.

Shelley Overwater

Yes.

Alexander MacKenzie

And what is that? What sort of medical conditions did you have?

Shelley Overwater

Well, I have a history of high blood pressure where it would shoot up to like 200 over 110. Angina, chest pains. That kind of stuff.

Alexander MacKenzie

Ever given any medicines for them?

Shelley Overwater

Yeah, I've had nitro and whatever over the years. But my heart's fine. So I felt it was stress-related, probably came in around the time I went to law school. But yes, I have a history of it.

Alexander MacKenzie

In early '21, you consulted with a doctor, is that right, a Dr. Mansour?

Shelley Overwater

Yes, he was my family doctor, and I was experiencing these again. He told me that if it happened on the weekend or during the day when he couldn't be available, I should go to emergency at Boundary Trails Hospital, which was our local hospital.

Alexander MacKenzie

In March of 2021, what happened that day?

Shelley Overwater

So that morning, I felt my chest pains were bad. I was having trouble breathing, and I was feeling kind of dizzy. So I drove my truck by myself over to Boundary Trails. And I parked and I walked over to the emerge. door, and I went to enter the Emergency. A uniformed security guard was on the inside door, and he started yelling at me to wait outside.

Alexander MacKenzie

Okay, now, you drove yourself. You were feeling chest pains.

Shelley Overwater

Yes.

Alexander MacKenzie

You drove yourself from your home, which was about three miles, was it, from the hospital?

Shelley Overwater

Yes.

Alexander MacKenzie

You arrived there; I presume you parked your car.

Shelley Overwater

Well, I parked my truck, yes, and I walked—

Alexander MacKenzie

Your truck, pardon me. You walked to the front door of the hospital.

Shelley Overwater
Well, there's two doors.

Alexander MacKenzie
Emergency door.

Shelley Overwater
Yeah, well the far one is Emergency.

Alexander MacKenzie
Okay, thank you. And what was the weather like that day?

Shelley Overwater
Probably between 10 below and zero. It was cold. It was windy. It was gray. You know, it was like one of those prairie fun, late winter mornings.

Alexander MacKenzie
What was the nature of the discussion with the security guard inside the foyer behind the doors? What was the nature of it?

Shelley Overwater
Well, he just yelled at me to wait outside. And so, I believe I yelled back, "But I'm having chest pains." And he said, "Well, you have to wait." He yelled, "You have to wait." And so, I let go of the door because I was shocked. I didn't know they had security guards at the hospital, for one. So I had to stand there outside. And I'm thinking, well, this is great. If I drop dead, now I'm going to have to lay outside too. So I was becoming more stressed, obviously.

Alexander MacKenzie
And how long, again, did you stand outside?

Shelley Overwater
I think about 10 minutes. It wasn't probably that long. But still, it was scary because it's emerge., right? You go there for a reason.

Finally, he gestured I could go in, in between the two doors where he stopped me. First, I just used the hand sanitizer. Then he handed me a mask with a tong, and I had to sit on a chair with these plexiglass things, like a little cubicle.

Alexander MacKenzie
Like a cubicle.

Shelley Overwater

Yeah. I had to sit there until they said I could sort of distantly approach the lady at the desk; she had a big plexiglass, and all that, too.

[00:20:00]

Alexander MacKenzie

So then you went through some sort of reception process, is that correct?

Shelley Overwater

Yep.

Alexander MacKenzie

How did that go?

Shelley Overwater

It was pretty quick. I said I had chest pains, and I had to put my Manitoba Health on the tray so they wouldn't touch it. Then I had to go sit back down for a few minutes. And then these gowned and covered people came out and said, "We'll take you to the trauma room." I said, "Well, I can walk in." So I walked into this— It's kind of like an operating room, a trauma room, and they're behind me. So I walk in, and there's a bed there. So I go over to the bed and I look behind me, and they're all in the doorway, way far, and they started yelling at me questions.

Alexander MacKenzie

So they brought you to the room, had you go in, sit on the bed, stood at the door. How were they dressed?

Shelley Overwater

They were covered head to foot in those paper gowns and booties and masks and some of them had face shields. I think they had gloves and everything, like the whole nine yards, like you were in surgery. I was like, okay. They all stood in the door and then this doctor or these people are yelling, "What's your problem, what are you there for?" And so I said, "I'm having chest pains; I have a history. I have blood pressure. I think I'm having— My blood pressure's really shot up." And then the doctor said, he had a very South African accent, it was very distinguishing, and he said, "Well, those could be symptoms of COVID-19. We need to test you." I was like, "No, I have a history. I don't have COVID-19. I just want someone to check my—" And he said, "Well, no, no, this could be symptoms." So then we yelled back and forth about me being tested, and I refused. I said, "No, I won't be tested; you're not shoving anything up my nose, I don't have any—"

I should mention quickly, I've had pneumonia; I've had two lung infections. I had lung cancer surgery. I know all about lung ailments. And so, I was—

Alexander MacKenzie

Those are not recent though, those were—

Shelley Overwater

Well, those were prior to when I went in the hospital.

Alexander MacKenzie

But those symptoms that you describe—

Shelley Overwater

Well, no, what I'm saying is that I knew I didn't have a lung problem. I knew that. And so, for him to keep insisting I needed a COVID test was ludicrous.

Alexander MacKenzie

Right. But I'm wanting to make it very clear for the Commission that those were not current symptoms.

Shelley Overwater

No, no, not at all.

Alexander MacKenzie

Those were in the past.

Shelley Overwater

I apologize. Yes, they were all in the past. But I did have some understanding of what a lung ailment felt like.

Alexander MacKenzie

Yes, thank you. I understand that.

Shelley Overwater

Or a flu, I guess I could say.

Alexander MacKenzie

So how long did this stand off go on?

Shelley Overwater

Maybe 10 minutes. Then they said, "Okay, we'll be back." And then a girl came with a tray, like they carry the tray with all the stuff. I believe she checked my blood pressure with the stethoscope, maybe my oxygen level. I cannot remember positively right now, but she may have drawn a little blood, I'm not even sure. Then she started asking me about being tested for COVID-19, again.

Alexander MacKenzie

Just to be clear. So they did test your blood pressure; they did test your heartbeat.

Shelley Overwater

Yep, yep.

Alexander MacKenzie

They did do all that. Did they report those results to you right there on the spot?

Shelley Overwater

No.

Alexander MacKenzie

No. Okay, so what happened then?

Shelley Overwater

Then she left the room, and I waited there. Then they came—an attendant of some kind, I can't remember clearly—and said, "Well, we're going to put you in the recovery area, and we'll monitor you for an hour." And I said "Okay." So I followed them there, and they put you on a bed; there's curtains all around you. I think there was maybe three of us. I was struck by how many staff were going around with all their stuff on. I think there was three of us in that place. But so, I just laid there.

Alexander MacKenzie

Were you feeling anxious?

Shelley Overwater

I was scared. I was starting to get worried because not only were they not talking about what was happening to me, but they were getting— He had been really kind of aggressive and ugly about this deal. And I was starting to get nervous: like what are they going to do, hold me down now? I was nervous. So I was trying to force myself to breathe and calm myself because I didn't want them to have any excuse to keep me. Then, finally, the doctor because of his accent—obviously they're covered up right. But he came in and he said, "Well you might as well leave now seeing you refuse to be tested."

Alexander MacKenzie

Did he tell you of the results of the blood pressure test he'd done?

Shelley Overwater

No.

[00:25:00]

Alexander MacKenzie

Did they tell you of the results of the monitoring of your heart or your heartbeat that they'd done?

Shelley Overwater

No.

Alexander MacKenzie

Did they tell you anything about the condition you'd gone in for?

Shelley Overwater

No. They told me that they would have liked to have tested me for surveillance purposes, and seeing I was being stubborn, I might as well leave. And I said, "You got that right." But I was very anxious to get out of there. So I left and went home.

Alexander MacKenzie

And did you ever follow up with your doctor?

Shelley Overwater

Yeah. He checked me over and my blood pressure was high. He said, blah, blah, blah. And I said, "Don't ever send me there again, ever." I said, "You didn't tell me what it was going to be like, and I will not be tested for something I don't even have. So don't ask me." And that was the end of that. I didn't go back to the hospital till I had my knee surgery, as I told you, and that was only because I had to.

Alexander MacKenzie

Thank you, Shelley. Now, is there anything else you'd like to say about your adventure at the hospital?

Shelley Overwater

What can you say? I felt like I had woke up in the middle of George Orwell's *Nineteen Eighty-Four*. Or I was on the Gulag. I was like, this is unbelievable. This is a hospital. I felt like I was—I don't want to admit I've ever been in a cell, but that's what it felt like. It was very scary. And they were very rude, and that doctor, in particular, he was ugly.

Alexander MacKenzie

Okay. Thank you.

Now, as I mentioned earlier, you've also had some experience that's COVID related in a law office in which you worked.

Shelley Overwater

Yes.

Alexander MacKenzie

That was a satellite office of a larger firm, and that satellite office was in both Morden and Winkler. Is that correct?

Shelley Overwater

Yes, that's correct.

Alexander MacKenzie

When COVID started, the firm adopted a number of safety measures. Can you tell me what they were?

Shelley Overwater

Well, we had to— Obviously, the hand sanitizer, the masks, the plexiglass in the reception area. Initially, they wanted to meet the clients between the two doors at a little table that they had to sanitize every 10 minutes, I think. And we had to wipe down parcels and Lysol all the desks between each use.

Alexander MacKenzie

And how many people worked in these offices at those two locations, Morden and Winkler?

Shelley Overwater

I'd say there was roughly two or three lawyers on any given day, and there would have been five or six clerical staff. But we all kind of went around. Like not all the clerical staff. But the lawyers, we circulated to different offices, sometimes, depending what was going on.

Alexander MacKenzie

So how many people all together would circulate through those offices in a week or two weeks?

Shelley Overwater

Oh, I don't know, maybe a dozen or so. Then we got an articling student that ended up being at the Morden office, I should mention.

Alexander MacKenzie

And was anyone ill during that time?

Shelley Overwater

Well, because of my father's death, I had missed the two weeks over Christmas because they said that we had to quarantine.

Alexander MacKenzie

Because he had been a COVID death, or recorded as that.

Shelley Overwater

Well, yeah. And so, the firm— I would have gotten bereavement, anyways, and it was the holidays. We were closed a bunch of days. So yeah, I was off for the two weeks. Then we

had another girl. She had the two-week quarantine because she was sick for a week. And a lawyer who had a cough, and she was off for two weeks because of the mandated quarantine. That was in the entire time I worked there.

Alexander MacKenzie

Then in May of 2021, there were some changes in policy, is that correct? What were those?

Shelley Overwater

Well, at that point the managing partner and the other partner and the manager decided they were going to have to know the vaccination status of all the clerical staff and the articling student. And if they weren't going to discuss it—

Alexander MacKenzie

They had to disclose their vaccination status.

Shelley Overwater

Yeah. It was mandatory, yes.

Alexander MacKenzie

I see, and how did that go down with the staff?

Shelley Overwater

Well, it went down very badly because I sent an email to the lawyers and said, "What about, employment standards and the Charter and all those things?" And then there was one young girl,

[00:30:00]

20-years-old, who was our reception girl. Just a dear little girl who'd worked there two years, and she said, "Well, I refuse to put that in my body, and no one's going to force me, not even for a job." That was the first time I'd ever heard somebody say that. I was quite taken by it because she was such a young, nice girl. And then one of the clerical staff, whom I'm actually friends with and had been there three years, she disclosed that she hadn't been vaccinated. They asked the articling student who they had hired and couldn't say enough nice things about. And she said, "Are you asking me if I have COVID antibodies in my system?" And when they said, "No, we want to know your vaccination status." She said, "Well, I don't know that you have the right to ask me." Well, at that point, all heck broke loose, so to speak.

Alexander MacKenzie

Were there any inter-office communications, like emails. What sort of was the office buzz during that time?

Shelley Overwater

Well, we had a group email deal: so that's where everybody, lawyers and staff, in all the offices— And it started, this daily almost barrage of, "Well, I know someone who's sick with COVID. And can you believe how selfish these people are, these unvaccinated, and the whole common good," and blah, blah, blah. This went on and on. And in the meantime, all the staff from the other offices would drop the files off outside the back door and yell in the office because they couldn't come in because the unvaccinated were there.

And they were allowed to pick on the articling student. Everybody was mocking her and making fun. Then they decided she couldn't do any real law work because she was obviously—

Alexander MacKenzie

So what did they have her do?

Shelley Overwater

They had her do real estate reports. That's all she was allowed to do. She had to sit in the back with the clerical staff and do real estate and probably, every couple of days, she was yelled at by the partners. She wasn't allowed to come to the lawyer meetings.

But from June on, the lawyer meetings became me battling because I couldn't believe they were going to hold someone's career hostage. Because if they fired her in the middle of her articles, it's pretty hard to get a job, right? And she'd been in school for seven full years for this deal. And these other girls— I just could not believe people would take someone's livelihood like that. I was shocked. It had never occurred to me that they would mandate this stuff and force these vaccines. I didn't understand that that could happen.

Alexander MacKenzie

And I understand that at some point in October, there was an ultimatum.

Shelley Overwater

Yeah, well, the managing partner had told me he would let her finish her articles; this would have been, let's say middle of October. So he comes in—this is about the end of October—he comes in to the Morden office, and he asked me and the other lawyer into my office. He sat down and he said, "I just walked by them, and I'd fire them all today if I could." And I went, "Well, that's no surprise," right? Like tell me something, I don't know. He said, "I've made a decision. If they won't get vaccinated by November 19th, they're fired."

Then he started tapping the desk and he goes, "I've decided even the lawyers will have to submit proof." So at that point, I kind of lost my cool and I said, "Well, I gave you my word I was vaccinated because I'm not like you, I keep my word." And he said, "Well you still have to show proof." I said, "I'm not showing you anything." I said, "You can put me down as resigning on November 19th because I will not stay here then. I will go with the people you're firing." So the next day, [he] goes, "Oh, hey, was that serious?" I was kind of shocked at that, and I said, "Yes, I'm very serious." So I sent him my resignation letter and that was that, and off we went.

Alexander MacKenzie

And what did happen to the articles student?

Shelley Overwater

Well, what happened was we found a lawyer, another local lawyer; he just had three years in, and so he was allowed to finish her articles. So she went over there.

Alexander MacKenzie

And what did you do?

Shelley Overwater

Well, I went home in shock because I went, "What am I going to do?" But, anyways, they were leaving the Winkler building they were in. I knew that. They hated Winkler. So I phoned the owner of the Winkler building, and said, "Hey, how about renting to a different lawyer?" So I rented an office for January 1. But I ended up having a knee replacement, so I didn't actually start till later. In the meantime, the articling student finished her articles, and the lawyer said he wouldn't keep her. So she came over, and she said, "Would you consider working with me?" I said, "Right on, partner." So she's my partner in our little firm. We got another office we were able to rent. So we have two, like an office each in Winkler.

[0035:00]

Alexander MacKenzie

Is there anything else that I've missed relating to your employment situation?

Shelley Overwater

Well, I just wanted to say we were law firms, and we were essential workers. And no provincial health people ever walked into any law offices out there. They didn't, and they weren't going to. I understood that we had to do whatever in the hallways or in front of clients that were nervous. I get that. But we never, ever had a policy of asking clients if they were vaccinated or anything. It was just the people that worked there. But we'd all been there the whole time, and it was fine. And I couldn't believe— By then we already knew that people were still getting COVID-19, even with the vaccine. So there was no real reason other than they just got in a mood. I don't even know what to say. I was horrified. Yeah, I couldn't believe it. I mean the Supreme Court has said your livelihood is an integral part of— yada, yada. So you believe that when you're in law school. Apparently, it doesn't apply lately, anyhow.

Alexander MacKenzie

Okay. Thank you very much. Now, just a couple other small things. You and your mother both volunteered at a couple of homes for aging people in Winkler and Steinbach.

Shelley Overwater

Winkler and Morden. There's Tabor Home in Morden and Salem Home in Winkler, and we volunteered at both.

Alexander MacKenzie

Okay, and do you still volunteer there?

Shelley Overwater

No, when the lockdowns hit, of course, we weren't allowed to go there. But during the time, they got rid of a bunch of their staff, of course. And so, when they wanted volunteers to come back, they contacted us. We just said, "No, we can't in good conscience volunteer for a place that would just dump their employees for no good reasons." So we never did go back.

Alexander MacKenzie

So the employees that they, in your words, dumped, were not ones who were infected. They were ones who would not vaccinate. Is that correct?

Shelley Overwater

Right. Some of them were willing to do the testing. I think they wanted three a week, or I can't remember. To me, it was all nonsensical. The one place said, after it was all said and done, that if people gave a letter of apology, they might consider hiring them back. Yeah, go figure.

Alexander MacKenzie

And Shelley, from your work as a lawyer in these matters that I mentioned earlier, have you had occasion to consider any statistics relating to the fines that have been imposed on people in Manitoba? I believe you did have something on that.

Shelley Overwater

Yes, the Manitoba government—between the federal *Quarantine Act* and the provincial *[Public] Health Act*—they fined over \$9 million, as of lately. Now, I'm not saying they've collected; I'm just saying this is what it is. Five million of it is just the federal *Quarantine Act*.

What that was is when the mandate came in in January at the border, the United States border people had discretion. So some unvaccinated people were still allowed to go into the U.S. Well, when they came back, if they presented at the Canadian border, the screening technology was, "Are you vaccinated?" And of course, if you said, "No," you got an \$8,550 ticket. If you didn't answer, you got the \$8,550 ticket and a \$1,453 ticket. So I'm dealing with—I think I've got about 25, 26 of these we're challenging. But none of these people were symptomatic; none of them had priors; some of them got tickets as late as last fall, September of this last year.

Alexander MacKenzie

And what were the mandates when those tickets were being issued?

Shelley Overwater

Well, the border mandate because they were Canadian citizens entering Canada, and they didn't have a vaccine. Or they didn't have the ArriveCAN [app] or the PCR test. So it didn't

matter. Whatever it was, you were getting an \$8,550 ticket. So that's what happened. It didn't matter if it was— All my clients have no priors; they were all working citizens.

Alexander MacKenzie

What sort of jobs do they hold, typically?

Shelley Overwater

You're never going to guess. Most of them are truck drivers. Some of them are farm labourers. And then, interesting, I had a couple of clients that were actually vaccinated and they got tickets because they didn't have the PCR results because they couldn't wait that long for them.

[00:40:00]

So they made the mistake of saying, "But we have this," and they showed the Charter of Rights. And so, they were given \$8,550 tickets each for showing the Charter.

Alexander MacKenzie

And this may be a dangerous and last question from me in any event. But how do you feel about the way these things were handled both provincially and federally?

Shelley Overwater

You don't want to ask, really. No, I'm absolutely appalled. It's like the Canada— I'm old, right? The Canada I grew up in, this is not the Canada I live in today. I didn't buy into this; none of us did. It was like they ripped away the veil and said, "Haha, you think you have freedoms and rights," and all that. "You've got nothing." And I've never been so ashamed of— I mean, I'll tell you, I've been a separatist for a long time, anyways. But I've never been so ashamed of this country as I was when I saw them in Ottawa bludgeoning working people, like normal, everyday taxpayers. I'll never forget it.

Alexander MacKenzie

Thank you. Shelley, I'm going to ask the commissioners if they have any questions for you. No. Thank you. Thank you very much for attending.

Shelley Overwater

Thank you.

[00:00:00]

Ches Crosbie

Commissioners, I have one very simple point to make— If we could have the slide up on the screen, please?

I know it's late in the day. Could we see a little bit further down the text of the article there? What it says is, it declares a legal emergency in Canada. Can we see any more of that image?

So Children's Health Defense has a Canadian Chapter, and if you can adjust that a bit more, you'll see there's a headline there declaring that there's a legal emergency in Canada. This is datelined on March 26th of this year. We can't quite see that, can we? Anyway, it's March 26th in their newsletter.

For those of you who don't know, Mr. Kennedy, it's Bobby Kennedy Jr., is going to announce that he's running for president of the United States next Wednesday. And he's been identified by the U.S. government as one of the great misinformation spreaders about vaccines, so that's going to be an interesting one to watch.

My point here is that the analysis in the article, which unfortunately you can't see— But take my word for it, it's there. I've read many of the cases. And yes, there is, as we've heard today from many sources, a legal emergency in Canada. And it's mainly with the judges and the courts who aren't doing their jobs. Thank you.

NATIONAL CITIZENS INQUIRY

EVIDENCE WINNIPEG HEARINGS

**Winnipeg, Manitoba, Canada
April 13 to 15, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 3

April 15, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 3 Timestamp: 01:04:22–01:41:00

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

Welcome back to the third day of our Winnipeg hearings of the National Citizens Inquiry as we literally march across Canada. We started in Truro, Nova Scotia. We then went to Toronto. We're now in Winnipeg. Next week, we're going to be in Saskatoon. We're then travelling on to Red Deer. On to Vancouver. Back east to Quebec City. And then finishing in Ottawa.

This has become quite an experience. Somebody said to me this morning, before we started, that this is really the first thing that has happened since the Truckers' Convoy, and very excited about it. Everyone that finds out about this participates, watches. They're finding themselves energized. They're finding that actually the action of participating—learning what happened together and hearing our stories—is strengthening us and healing us. And so, as I did yesterday, I encourage every single one of you to participate by sharing us with your social media. It doesn't matter if you have ten followers on Twitter, for example. Share what we're doing because if we all do this together, if we all share what we're doing, we'll make this happen.

This is our ninth full day of hearing. And I mean, when I say full day, if you've sat through any of these, we sit late. Because we want people to be heard. So we fill each day. We have had one mainstream media attendance to give one little report on us. When even this event, **the fact that it's happening, the fact that some citizens have just banded together, came up with this vision of a way to heal the country—of a way to move forward in a positive way—and planned an event that we had no idea how much work and how big it was and how ambitious it was until, white knuckles, we're running our first hearing in Truro. And purely citizen-funded.**

It's interesting. We were out for supper with some people yesterday, and they just assumed we have a couple of big funders. And we don't. Literally, we send out email asks to people that have signed our petition. And we have your email address so we can share with you what's going on.

Please, actually go to our website and sign the petition. It legitimizes what we're doing. And then, when we have a need— So we had a need for people who are willing to reach out to social media influencers. For example, we sent an email out asking, "Is there anyone out there that will participate?" It's a way for us to plug you in.

But the point I'm trying to make is this is pure citizen-run and -funded, and it only works because we're all doing this together. So when I'm asking you, "Will you please push us on your social media networks?" we don't have a budget for advertising. We don't have a budget to hire people to do this stuff. We need you to do it.

But amazingly, this is happening, and it's happening in a wonderful way because you are participating. So again, I'm calling on everyone to go sign our petition. I'm calling on everyone to donate. Every set of hearings costs us between \$30,000 and \$35,000, and we have some nail-biting moments paying the bills. This is happening because, thankfully, you are supporting us, and thankfully, you are buying into what we're doing. But we need your continuing support—literally, city-by-city—to just help make this happen.

Now this morning, I wanted to talk about one of your enemies. And to help you appreciate that this truly is one of your enemies— And many who hear this, especially online, might be surprised when I identify one of your key enemies. But first I need you to appreciate that your Achilles' heel is fear.

For those of you who don't know the story of Achilles in Troy, he was just this mighty warrior that no one could defeat. But while he's at Troy fighting against the Trojans, an arrow strikes him in his Achilles' heel. That's why we call it the Achilles' heel.

[00:05:00]

And so, he wasn't able to fight, and he was killed.

Your weakness—your weakness—is fear.

So for example, if for those of us in the room, if all of a sudden, we heard screaming outside and a grizzly bear burst through these two doors, fur all standing up on end—we know he's angry. Every single one of us—every single one of us in this room—we're going to run to that door. In fact, we're going to be in such fear. Without thinking, before our conscious mind understands that it's a grizzly bear, our body's already in fight or flight mode, and we are not thinking about anything. We're not fighting a grizzly bear. We're not thinking about anything about flight—every single person in this room. In fact, some of us might get trampled and seriously hurt because the rest of us will be so anxious to get out of that door. So literally, out of our minds.

And we all know that this happens. There's example, after example, after example where people are killed when a crowd is fleeing in fear. Because when we're moved into a state of fear, we are out of our thinking mind, and there's nothing we can do about it. We're literally filled with a drug cocktail. And so, you need to understand you do not have a defence against the physical reaction that occurs when you're in fear. You're not without options, but there is nothing you can do to prevent your body from going into fight or flight mode when you're presented with fear. And using the bear example, it might actually be a couple of hours or it might be a couple of days before you're calmed down.

Literally, there's a physical reaction. And you need to understand there's nothing you can do about your physical reaction. But mentally—mentally—if you train yourself to identify

that when you go into fear— And literally, it's like the police and the military, they train through drills. You have to train yourself as soon as you start getting afraid to go, "Just wait a second, I need to be aware. I have to keep connection to that thinking part of my brain, regardless about how I feel." And you can train yourself. There are people that will look at the stampede at the door and go, "There's no point in me trying to get through that door right now. Is there another way out?" Or just wait until there's a space. There's people that can do that, and you need to do that.

I think we all appreciate that for the last three years, we have been in a theatre of fear. And I use the word "theatre" with two meanings. Because we literally have been in an information war. And theatre is a term to describe war. When I say we've been in an information war, we have had witness after witness speak about censorship. We've had journalists speak about it. We have had medical people speak about it; doctors being silenced. We have been in a theatre of war, an information war.

But more importantly, we have been in a theatre, a drama. Shakespeare said, "The whole world is a stage." When this topic to speak about came to me this morning at about quarter to eight, and I wrote down the phrase—"the whole world is a theatre"—it occurred to me that these sayings are actually true. The whole world is a theatre, and we're just players on the stage.

We have been through a military-grade psyops operation that has been theatre. We have been watching the news, and it has been theatre. It has been deliberately designed to put us into a state of fear where literally, when you're watching the news, you will have a physical fight and flight response that you have no control over. And unless you have trained yourself to keep connection to your thinking mind, you are not thinking.

It's funny,

[00:10:00]

I totally bought into the pandemic before it hit the mainstream news. Before I closed my law practice down last August so that I could participate as a volunteer in this National Citizens Inquiry, I did a fair amount of work with clients that make natural health products. And I had a couple of clients tell me they were having supply chain problems sourcing things from China.

So I start looking. Before it hit our mainstream news, I think China had 600 million people locked down because of this coronavirus. And remember, I'm just coming to this fresh. And this was my thought process, right or wrong: My thought process was, "Wait a second, China is a police state." And surely, they depend on their legitimacy and being able to hold on to power with increasing the living standards of their population. Because we've just actually seen a tremendous increase in their prosperity over the last several decades. And I thought, "They're not going to be locking down 600 million people unless this is a real threat."

So I was afraid before you were afraid. We didn't have to go when people were lining up to buy toilet paper; we didn't have to do that: we had already stocked up. And it wasn't until about 10 days in of the TV coverage when all of a sudden, I started hearing the word vaccine. How could that word come up 10 days in? Because I'm in the drug-approval world, and I knew there's no way they were going to come up with a vaccine.

My wife and I had to make a conscious decision to actually turn off the TV. Because when you're in a global pandemic and the world's falling apart, you're actually glued to the TV. You make a point of watching the six o'clock news. And we were watching it for about a month, even after I thought, "we're being gamed here." But we actually found that we were in such a state of fear—all day, every day—because we were watching TV. So we made a decision: we're just not watching TV, and we turned it off. And I think it took about a month before we kind of felt settled down.

And then, just to give you an example of how good the TV media is at ramping you up. I don't know, maybe it's three and a half, four months ago, we're watching Del Bigtree on "The Highwire." He's talking about, I think it was monkey pox. Remember that they were kind of teasing us with the fear that monkey pox might run through. And so just on his show, he was saying, "Here's how the mainstream media is reporting on it." He maybe played about only five, six minutes of clips of media reporting, much like we've done here, showing six, seven minutes of government announcements on COVID. So I'm watching—for a very short period of time—the mainstream media reporting on monkey pox, and I realized I was afraid. I was legitimately afraid while I was watching this. The amount of money and brain power that goes in to determining how to play on our emotions and create fear when we're watching TV is absolutely tremendous.

Even yesterday, we played two sets of clips that we just had our video guy splice together of news reports from Manitoba, except there was that one Christmas one with Santa Claus and Theresa Tam, and I think everyone in the room will agree with me that it was traumatizing. It was traumatizing to watch old footage of the Manitoba leaders basically announcing lockdowns and restrictions and watching Santa Claus and Theresa Tam encourage children to get vaccinated.

So what we experienced was literally surreal but understand—it was theatre.

[00:15:00]

It was deliberately done: the show, the play was deliberately run to put you into a state of fear. And the state of fear that we were in was horrendous.

We've heard in this inquiry about, basically, people in Montreal and old folks' homes literally starving and dying of dehydration because the care workers abandoned them. Can I say that again? In Canada, we experienced old people—that were totally dependent upon us for their care—dying of dehydration and starvation because we were too afraid to care for them. Can you get your head around that, that that is possible? This is how effective the theatre was.

We know it was theatre. We look at our overall death count in 2020 when we had no protection from the vaccine, and our all-cause mortality was really no more significantly different than in a bad influenza season. We did not have to let old people die of dehydration and starvation alone in their rooms, without their diapers changed. In Canada, we didn't have to do that. But the theatre was such a great production that we had no choice because we were all having a physical reaction that disconnected us from our minds.

We had a witness yesterday who runs a security company. It was almost comical because people would be putting these security systems in their homes because they were so afraid of anyone coming to the door and they needed to be secure. It was irrational. His business took off. It was irrational fear.

I forget who—but it might've even been the Honourable Ches Crosbie—had put up a news article with an opinion piece about, “let the unvaccinated people die.” And we all heard about putting unvaccinated people into camps. We all heard, in Canada, about putting unvaccinated people into camps. Were we in Nazi Germany talking about the Jews? Carrying disease and lice? For public health reasons, surely, we need to get them into camps. We were talking about putting unvaccinated Canadians into camps.

The theatre—the theatre—was tremendous, and it was effective.

You've got to think about this as the day goes on and as the weeks go on— What actually happened? And ask yourself, “My God! How can that happen? How can Canadians let old people die of dehydration and starvation? How can Canadians talk about putting other Canadians into camps?”

Because we were afraid, and we're so afraid that the entire nation has post-traumatic stress disorder. Literally. It's why I keep speaking about hatred and our need to forgive each other. Now that we're in a state of post-traumatic stress disorder where it's still difficult for us to empathize with our fellow Canadians, understand that we are more easy to manipulate because we're already on edge. That switch to fight and flight—that fear switch—it's primed. There's a spring on it now. And it's much more easy to be depressed. We are more vulnerable now than we were in the spring of 2020 when this had begun.

And remember when I said earlier—when quoting Shakespeare—that when we hear these historical phrases, they're true. President Roosevelt, one of his fireside chats: “We have nothing to fear but fear itself.” That is not a historical statement. It is true. It literally is a tautology. It's true.

What you have to fear is not COVID.

[00:20:00]

What you have to fear is not monkey pox. What you have to fear is not the Russians. What you have to fear is fear itself. What you have to fear is being put into that fight or flight mode. We don't need to get locked down because we're afraid of climate change. We don't need to fear civil unrest, although it is being fomented because we're put into a state of fear. We don't need to fear another pandemic that people like Bill Gates is telling us—assuring us—is coming.

When the theatre continues—and it's still continuing. But when it continues in full force, and listen carefully, you will go into a physical fight and flight mode. You will. You can't stop it. That's why they do it. But you can train yourself to understand that you're doing it and **keep that thread of conscious thought to your thinking mind.**

You cannot watch the mainstream media. You cannot watch the mainstream media that has put on this theatre. They have, in my opinion, acted criminally. They have been manipulating you. If the media had not put on this theatre—what I call fear porn—this couldn't have happened. Could you imagine if the media had been reporting, “Ah, there's this new virus,” and actually reporting fairly? “Yeah, it might even be worse than one of our bad influenza seasons. We're not sure. We need to be cautious. But let's not be afraid. We've got plans in place. Here's what we're going to do.”

A witness had to back out for personal reasons yesterday. We hope to have him back at a later hearing. But he had been involved in pandemic planning, and he says, “Oh, you know,

what you do with the City of Winnipeg, you just pick a big building; you empty it. Every single COVID patient goes there. You bring your surplus medical people there. And right away— Because you're not sending COVID patients to all the different hospitals, you're sending them to one place. Right away, you'd know, 'Oh, this just affects old people.' Okay. So now we don't have to worry about young people. We're just now able to—"

All that information comes quickly. And he says, "You're not wearing out your mainstream medical system because the doctors and nurses are doing the regular shifts. They're not facing any new threat." So they're not in fear. You can still go for your regular treatments. You're not afraid to go to the emergency ward. And this is just some things. I see people in the audience shaking their heads, like, "Yeah, this makes sense."

Well, what if the mainstream media had said, "Here's our plan; here's how we deal with this." And it wasn't fear, but it was reassuring. Would we have tolerated being locked down? Would it be possible that we would be coerced into taking what truly is an experimental treatment? What if the media had reported fairly?

I mean— "safe and effective; safe and effective; safe and effective." Well, wait a second. The vaccines were exempted from the safe and effective test. In fact, when you read the test that they were approved under, the word "safety" and the word "efficacy" isn't even in there. They didn't have to be proven to be safe and effective. So why would anyone pretend that they were? Why did the media keep telling us this?

The point I'm trying to make is— This could not happen but for the media, but for the theatre. The police state depends on the theatre.

What would have happened in Stalinist Russia if no one watched TV and no one read the newspapers? What would have happened? It would have been different. But none of this could happen without the media. And if we get our institutions back. If initiatives like the National Citizens Inquiry can get Canadians having a dialogue together, to get us working together, to get us peacefully getting our institutions working for us again, I pose the question: Is it possible that a single person

[00:25:00]

on the mainstream media's editorial boards, or a single journalist— Is it possible that a single one will escape jail? It's a good question. If we get our institutions working for us again, is it possible that a single one of them will escape jail?

Now, understand as I say this, because I'm just trying to educate you about the fact that when you're put into the fear mode, you have no choice. Understand, they will play this card again. **We're not done. They want climate lockdowns; they want 15-minute cities; they want us eating bugs; they want us adopting a digital currency, which we'll have to because "our financial system is falling apart and we're all going to starve and die."** It's like collectively, we couldn't come together and figure something out for a while. **We need their solution.**

But understand, more importantly— Remember, I just asked you the rhetorical question that if we get our institutions back, is it possible that a single journalist that was really carrying misinformation when they were saying, "Oh, this person's spreading misinformation. Dr. McCullough is spreading misinformation. Dr. Malone is spreading misinformation. Oh, you know, if Uncle Bob starts talking about that the virus escaped from

a lab, here's how you defuse him"— If a single one of those can escape from jail if we get our institutions back, I'll be surprised.

But understand: They'll be surprised, too. They know. So you're on the editorial board of a mainstream media company, and if we get our institutions back, you know you're going to jail. They can't stop. They've got to continue with the state now. They have a vested interest. They have a vested interest.

You were their enemy before we started waking up. Because you don't carry out a military grade— And there have been actually Canadian news reports about how we've been put through a military grade psyops: This is what this theatre was; this was the full-meal deal. You don't carry that out against a population unless you consider the population to be your enemy. But now that they're understanding that—if we wake up in time and get our institutions back that they're going to jail—we're really their enemy now. You think about that. We're really their enemy now. And you have to defend yourself.

Don't watch. Educate your circle. And then when they make you afraid—and they will—when they make you afraid, understand it is an attack.

I was dialoguing with a potential witness that chose not to speak at the Winnipeg hearings. We may get this witness to speak at another hearing, and a lot of effort went into trying to get this witness to testify. Listen very carefully to what I'm going to say here.

This witness was afraid of testifying because not just of social repercussions, although that was a very real threat to this witness, but economic repercussions and repercussions against family. Some things have already happened for what this witness has already done. And I'm mindful that some people have actually gone into hiding that we used to hear from regularly on these topics. And so, we were having a discussion and the witness almost wanted me to give them reassurance that speaking would be okay. But I had to say, "Actually, you speaking out is very, very dangerous." But listen to what I said next. I said, "In fact, the only thing, the only thing more dangerous than you speaking out, is you not speaking out."

So we're going to start this morning—and I just can't resist—with some more video clips. And then we're going to move into our first witness, Cassie Schroeder.

David, if I can have you just illustrate for us, basically,

[30:00:00]

what I'm talking about with this theatre and what I call fear porn.

[A video of news clips was played outlining vaccine requirements for public employees and proof of vaccination status using a vaccine passport.]

[Video] Brian Pallister, Former Premier of Manitoba

I've said it before, I'm going to say it again, and we'll keep saying until everybody does it: Vaccines are our safest and only way out of this pandemic. Vaccines are our protection against the fourth wave. Vaccines are our protection against future lockdowns. Vaccines are how we get our lives back. Thank you to you for your willingness to do your part. Roll up your sleeve not once but twice and protect yourself and protect your fellow Manitobans.

Protect our businesses too, our small business community. Protect our economy and to protect our communities and our healthcare system as well.

....

Experts are saying that the fourth wave will be an even greater threat in terms of its numbers of cases than the third. This is why today we're announcing that all frontline provincial employees who work with vulnerable populations must be fully immunized by October the 31st or undergo frequent COVID-19 testing. All designated public sector workers will be required to be fully immunized and provide proof of vaccination or undergo frequent COVID-19 testing in order to ensure the safety of their workplace and the people they serve. As an additional protection measure against the rising Delta variant and a possible fourth wave, we are also announcing today that we are requiring mandatory mask use in all indoor public places. In other words, we're strengthening the value of being vaccinated and the utility of the vax pass in our province.

[Video] Dr. Brent Roussin, Chief Provincial Public Health Officer (Manitoba)

Public Health has been advising Manitobans for many months now on the value of being vaccinated. It's the best way to protect yourself, those around you, and our province. So it's in our best interest to keep these COVID numbers down and the best way for that is for us to practice fundamentals, which includes being vaccinated as soon as you're eligible. So those designated employees who are not fully immunized or who cannot provide proof of vaccination must submit to COVID-19 testing regularly. And so, for a full-time employee this could be up to three times per week.

We're recommending that private businesses and organizations follow the Province's lead and consider mandating COVID-19 vaccination for their employees to protect their staff, protect their customers. But I encourage all Manitobans who have not yet done so, book those vaccine appointments. And what we can see in other jurisdictions that this is now a pandemic, largely, of the unvaccinated. And we have to make sure that does not lead to adverse health effects for all Manitobans. We want to protect all Manitobans from the fourth wave.

[Video] Brian Pallister, Former Premier of Manitoba

Our vax card's giving every immunized Manitoban the right to travel safely across Canada, and it will now be your passport to doing even more and that will be announced later this week. To all of those who have done this, who have gone and got vaccinated, remember the influence you have around you. Remember the people that are your friends and your family may not have made that choice, and you have the opportunity to encourage them—to educate, to inform, and to motivate. Doing your part to get vaccinated and to encourage others to do it is how we're going to get through this together.

[Video] Dr. Brent Roussin, Chief Provincial Public Health Officer (Manitoba)

These new public health orders are being implemented that will require Manitobans to wear masks in indoor public places and that will be effective tomorrow, August 28th. This includes schools across the province. And so, in addition the Province has developed new requirements for individuals to be fully immunized to participate in certain events and activities. These requirements will come into effect by public health order on September 3rd, and these would be for all regions. And this includes requirements to be fully vaccinated to attend indoor and outdoor ticketed sporting events and concerts, indoor theatre, dance, symphony events, restaurants both indoor and outdoor dining, nightclubs

and all other licensed premises, casinos, bingo halls, VLT lounges, movie theatres, fitness centres, gyms and indoor sporting and recreational facilities.

This does exclude youth recreational support, organized indoor group recreational classes and activities and indoor recreational businesses. Children 11 and under who have not been immunized will be able to attend events and activities with fully immunized adults. And again, these orders are here to try to reduce the transmission of the virus as well as to reduce the future need for further lockdowns.

[Video] Dr. Theresa Tam and Mrs. Claus

Dr. Theresa Tam

Every child in Canada has definitely earned a place on a nice list, their parents and caregivers, too. It's been a tough season with lots of viruses making people sick.

Mrs. Claus

Thankfully, Santa and I are feeling as healthy as ever.

[0035:00]

We are both up to date with our vaccinations, including COVID boosters and flu shots.

Dr. Theresa Tam

That's so good to hear.

Mrs. Claus

I always tell Santa to make a list and check it twice. One, stay up to date on your vaccinations. Two, wear a mask in crowded, indoor places and make sure it fits nice and snug. Three, wash your hands to the tune of, "Jingle Bells, Jingle Bells, jingle all the way..."

Dr. Theresa Tam

Great advice, great voice, too. Also, you can be sure to stay at home if you're feeling sick. And if you're gathering indoors with other people or elves, open a door or a window for a few minutes at a time to let in some fresh air. The more items you check off the list, the more protected you are.

Mrs. Claus

Yes, you can think of it like decorating a tree. You need tinsel, lights, ornaments, and the star on top. The tree is at its best when all the decorations are up and nicely layered.

Dr. Theresa Tam

Thanks, Mrs. Claus. Happy Holidays, everyone.

Shawn Buckley

If we get our institutions back, I look forward to that last clip, particularly, being played at a couple of the criminal trials.

I will ask if people can just not clap to respect the audience that's online.

[00:36:38]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Winnipeg

Day 3

April 15, 2023

EVIDENCE

Witness 1: Cassandra Schroeder

Full Day 3 Timestamp: 01:41:00–02:01:14

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

I'd like to invite our first witness, Cassandra Schroeder.

Cassandra, can I get you to state your full name for the record, spelling your first and last name?

Cassandra Schroeder

Yeah, my full name is Cassandra Jaden Schroeder. Spelling of the first name is C-A-S-S-A-N-D-R-A and Schroeder is S-C-H-R-O-E-D-E-R.

Shawn Buckley

Do you promise to tell the truth, the whole truth, and nothing but the truth so help you God, today?

Cassandra Schroeder

Yes.

Shawn Buckley

I'll have to just apologize. Earlier, Cassandra showed up, and I was waiting for a lawyer named Cassie Desanda to show up. And I thought Cassandra was the lawyer. So I was walking her through what she needed to do as a lawyer. So I think I probably put her on edge today, and I apologize for that. Now, Cassandra, you have a bachelor in science degree?

Cassandra Schroeder

Yes. I received it at the University of Manitoba.

Shawn Buckley

I don't want to name your employer. But basically right now, you are working, kind of treading water, because you're wanting to do something else once it becomes available?

Cassandra Schroeder

Yes, yeah. So right now, I'm just working in the meantime while I apply to other programs.

Shawn Buckley

Right. And what you're wanting to do is train to be a naturopathic doctor, is my understanding.

Cassandra Schroeder

Yes.

Shawn Buckley

So now, you made a decision not to get vaccinated.

Cassandra Schroeder

Yes.

Shawn Buckley

Can you share with us how you arrived at that decision.

Cassandra Schroeder

So early on in my degree, I was taking a cell bio course. In the course, we were talking about how you could use mRNA at this time. They called it "gene therapy for cancer treatment" in our cancer unit. I just remember hearing about that. Then, when they rolled out the vaccines—that they said they were going to be mRNA—I was like, "Oh, I've heard this before, and it didn't go over well in science, that's why it's not widely used." So immediately, I had some red flags.

Shawn Buckley

Right. And my understanding is also, you have high blood pressure and that that's an issue.

Cassandra Schroeder

Yes.

Shawn Buckley

Did you speak to your doctor about that to see if you could get an exemption?

Cassandra Schroeder

Yes. So early on, I started collecting some research on this. I was very skeptical. I really only became a problem, I guess, when I couldn't partake in society with friends in school. So I started collecting some research, presented it to my doctor, and she did agree. As a healthy young adult, you shouldn't need to get this, and there is research against this, and so, she recommended not to. At this time though, she told me she could not write an exemption because of legal things: she'd lose her licence and wouldn't be able to practise medicine.

Shawn Buckley

Can I just stop you because I want to make sure that the audience understands what you're saying. So your medical doctor agreed that it would not be medically wise for you to get the vaccine?

Cassandra Schroeder

Yes.

Shawn Buckley

But despite that, she said she couldn't write you an exemption letter or she would lose her licence to practise medicine?

Cassandra Schroeder

Correct.

Shawn Buckley

Okay. Now, you had indicated that you started doing research when some restrictions started on you. Can you tell us how this affected your university? What was happening with the COVID mandates?

Cassandra Schroeder

Sure. So in 2020, in the winter term, they moved classes online. That's when they had their first recorded cases here in Winnipeg, and so everything was moved online. That summer, obviously things happened with the pandemic. Nothing crazy.

Then in the fall of 2020, we were told, as university students, that it was going to be mandatory masking, and all classes would be online. That was for fall and winter of 2020 and 2021.

And then in the fall of 2021, they started rolling out the vaccines that spring and they mandated all university students to be vaccinated. At this point, the university had said— So we all registered for classes in June and July. Come end of August, they released a statement saying that you had to be vaccinated. And you'd have to have your first dose by mid-October and your second one by the end of November.

Shawn Buckley

Can I just pause you? So I think, you were going into your third year

Cassandra Schroeder
I'm going into my fourth.

Shawn Buckley
in 2020, right?

Cassandra Schroeder
In 2020, yes. That was my third.

Shawn Buckley
And you had switched majors to microbiology?

Cassandra Schroeder
Yes.

Shawn Buckley
And in microbiology, there's a heavy lab requirement; you've got to be in the lab quite frequently.

Cassandra Schroeder
hmm-hmm.

Shawn Buckley
Okay. Because that played into things also as it went forward, right?

Cassandra Schroeder
For sure. So I originally was on path to do a biology degree. I didn't quite enjoy the courses at the 4000 level, so I switched to microbio. And with the pandemic, a lot of the labs, if they had the opportunity, they were offered online. But not the ones in microbio that I had to take because they were lab techniques

[00:05:00]

that you had to actually practise. And so because of that, I wasn't able to actually participate in them. I actually changed my degree, which kind of changed the trajectory of my future options. Not because I wanted to but because I didn't really have any other choices.

Shawn Buckley
Right. Because my understanding is your plan was, at first, to do a masters in microbiology?

Cassandra Schroeder

Yeah, I was very interested in doing a masters. I did some research work and enjoyed it. Thought that a master's could be an opportunity, but I couldn't because I changed my degree.

Shawn Buckley

Right. Just so that people listening to your testimony understand. So had you been able to participate normally in classes, you would have gotten a four-year degree and been able to go on and do a master's in microbiology.

Cassandra Schroeder

Yes, I would have been able to go down that route. But now I can't. I'd have to go back.

Shawn Buckley

Right. Okay. So you had to kind of come up with a different plan. What did you decide to do? Because I understand that, at one time, you were actually interested in, then, going into become a medical doctor?

Cassandra Schroeder

Yeah. So I was interested in medicine. I ended up applying to the University of Manitoba. But seeing how everything happened in the pandemic, I was just very appalled with medical ethics. I mean, speaking with my own doctor who said, "I advise you not to, but I actually can't help you with anything."

I couldn't believe or even picture myself practising something like that. So I ended up not going forward with that and applied to naturopathic medicine, instead. I got a seat there, but I still can't attend due to restrictions in the province that the school is in.

Shawn Buckley

Okay, so can you share with us more specifically what the restrictions are?

Cassandra Schroeder

Yeah, so I applied to the Canadian College of Naturopathic Medicine in BC and their clinical requirement—not the school's but provincially—is that you have to be vaccinated to be in a medical clinic, practising as a student, whatever the case may be. If you are employed or a student you have to be vaccinated. And I obviously am not. So I cannot go to that program, and I cannot pursue that opportunity right now.

Shawn Buckley

Okay. So that's why you're on hold right now because you still want to become a naturopathic doctor, but the restrictions today, still in April of 2023, are holding you back.

Cassandra Schroeder

Yes.

Shawn Buckley

Okay. Now, I'm curious if you were treated differently at the university because you were unvaccinated?

Cassandra Schroeder

For sure. So I actually didn't disclose my status to friends or my colleagues. I had told my boss at the time because I was also employed on campus— That was my only opportunity to be on campus was through work. And so, I had been upfront with my boss, but I hadn't disclosed this to anyone else. I didn't think it was information that anyone, quite frankly, needs to know. But I had a couple friends who I did tell, and they ostracized me. They treated me differently.

Going out to social settings was very different. I had people almost treat me as if I was ill, even though I wasn't. And they all knew I was there, and they were all friends with me before the pandemic. So yeah, that really changed my friend groups, which I think was very difficult. As a young adult, you predominantly look for advice and hang out with peers your age, and to lose all of my friends was very, very hard.

Shawn Buckley

Right. And were there any comments by professors or anything like that, that you experienced?

Cassandra Schroeder

Yeah. So in the classes, even though I was taking them online, there were some professors who would still make comments belittling those who were unvaccinated. "I can't believe there's anti-vaxxers." Things like that. "I can't believe that people wouldn't get vaccinated. It's so crazy, make sure you get boosted." It was just crazy. Because I'm taking science courses, but that, quite frankly, has nothing to do with science, has nothing to do with the courses I was taking. It was just kind of a jab at those who chose not to get vaccinated.

Shawn Buckley

Now, you told us that you were employed at the university. And my understanding is that in the winter of 2022, you got tested to see whether you caught COVID or not.

Cassandra Schroeder

Yeah. So my thought process was, how do I end up keeping my classes so I can pursue my degree? How do I make sure I can still work so I can pay for all of this? So I asked my doctor if I could get an antibody test done, which, interestingly enough, you cannot get one if you're vaccinated. So I went to my doctor; she agreed. I got the lab work done. It came back positive. So I said, "Hey, can you write me an exemption so that I can go to these classes?" And she said, "The best I can do is write you a letter saying you can cross the border and go to the States, and you can try to use that to get into classes."

So I emailed what the university had set up as their COVID committee, saying, "Hey, can I provide an antibody test and a letter from my doctor that'll allow me to be on campus so I can continue working and going to classes?" And they told me, no, according to their research, the best bet, even if you had recovered from the disease,

[00:10:00]

was to still get vaccinated. I asked them if they could provide the research that they used to say this, and they just stopped communications with me. Which is very frustrating because at this point, I don't know what they're making their rules on. And there's nothing I can do to fight this, which was very disappointing and discouraging.

Shawn Buckley

Just so that everyone understands. When you say you had an antibody test and it showed you had the antibodies, that means that you had caught COVID, you had overcome COVID, and you had natural immunity now.

Cassandra Schroeder

Yes.

Shawn Buckley

Having successfully fought COVID.

Cassandra Schroeder

Yeah. On the actual antibody test when it comes back, it says. "This test cannot differentiate between naturally induced antibodies or vaccine induced antibodies."

Shawn Buckley

Now, who was this COVID committee that was kind of controlling your life and stopped responding?

Cassandra Schroeder

They never released who it was. I asked a couple people, like who is making up this body? It wasn't voted in; the university never disclosed who made up the committee. They just made the committee themselves, and that was it.

Shawn Buckley

So there's basically this secret committee whose membership won't be shared with the students, who are basically making decisions that significantly affect people like you, and you don't even know who it is.

Cassandra Schroeder

Yeah. I also asked them, too, if people who disclose their vaccine status to the committee—I said, "Who will be able to see this on the university side?" and they didn't provide an answer. So who knows who's seeing that on the other side. They didn't really provide any information.

Shawn Buckley

Right. So they're not going to let you attend in person, even though you have natural immunity. So what did you do?

Cassandra Schroeder

So at this point, the university had offered testing in the fall semester. You could get tested. You could go on campus. Every two days you had to go back and get tested again. They asked you questions like, "Who are you on campus for?" "Who can we send this information to?" Things like that when you go to get tested. So before, that was an option. Come the winter, they took that option away, and you could no longer test, and they kicked me out of all of my classes. I was in some in-person and online options. They still took me out of all my classes.

Shawn Buckley

So they took you off of the online classes?

Cassandra Schroeder

Yes.

Shawn Buckley

I'm just trying to get my head around this. So they kick you out of the in-person classes because you're not vaccinated, although you have natural immunity. But you can't even attend online classes when you're unvaccinated?

Cassandra Schroeder

Correct. After that I did re-register in courses because I just needed to finish the degree. At this point, I was very discouraged and I just wanted to get out of that situation. It wasn't doing anything good for me, and I just needed to finish my degree. So I ended up registering for some online options after that. That's where I switched from focusing on microbio to just finishing my degree as a general science degree.

Shawn Buckley

Right, okay. Now, you actually were living at home at the time, right?

Cassandra Schroeder

Yes.

Shawn Buckley

Can you tell us what happened concerning vaccination with your family and maybe the dynamics that were occurring in that process as COVID went on?

Cassandra Schroeder

Sure. So right off the beginning because I was skeptical— My mom's a nurse, and so she also knows kind of the science background, stuff like that. And she actually got very sick at

the beginning of COVID with COVID. And she called some people, and they said, "We still recommend you get vaccinated." So she did, and then everyone else in my family did as well.

Shawn Buckley

I'll just stop you. So you live with both your mother and your father and then you had two siblings.

Cassandra Schroeder

Yeah, and they were at home at this time.

Shawn Buckley

Right, okay.

Cassandra Schroeder

So I was the only one that chose not to get vaccinated and received a lot of pressure. And I know that they come with good intentions as any mother does, and you know, family. It was just a lot of pressure, you know. [They] mentioned so many times, it was like, "It was your fault. You won't be able to hang out with your friends." "You're going to miss out on all these opportunities." Stuff like that.

And honestly, it just confused me because I was like, "It's not my fault that I'm choosing not to get vaccinated. I just don't think that's the best health for me. But the repercussions that I'm going to suffer, the loss of friendships, the loss of future opportunity, that's not my choice, that's not me doing that." So it was just really hard because it felt like it was me who was sabotaging my own life, which was very difficult. It was lots of tears. Thankfully, I had a really good support group that I found later on that really helped get me through all of it. But it was very, very difficult.

Shawn Buckley

Now, eventually, the kind of dynamics or feeling in your family changed about your vaccination status.

Cassandra Schroeder

Yeah.

Shawn Buckley

Do you want to tell us about that and how they currently feel?

Cassandra Schroeder

Sure. So thankfully my boyfriend also knows

[00:15:00]

a lot of science and sat down and had a really good conversation with my mom and really just opened her eyes to everything. And she was so supportive after that, which I'm so thankful for. But now, also, it's the reality of like, we know people who are vaccine-injured: people who have died from getting the vaccine; people who have brain fog, chronic fatigue, debilitating illness. And it'll change their life forever. And being awake to that reality and seeing that is very, very hard.

There's a lot of stress now. Like, what happens to my parents? What happens to one of my siblings? How do you help people through that? What happens if everyone around you dies? I actually had my first ever panic attack realizing that could be a reality, that I could lose everyone around me. And it was very, very difficult.

Shawn Buckley

And is it's fair to say that, actually, your family that's vaccinated, they're stressed now that they have been vaccinated?

Cassandra Schroeder

Oh, for sure, for sure, absolutely.

Shawn Buckley

Right, so they've come to realize they're at risk now.

Cassandra Schroeder

For sure, yeah.

Shawn Buckley

Okay. Now, you were talking about you came across a group that helped you get through this. Can you just share with us about that?

Cassandra Schroeder

Yeah, so Students Against Mandates is the group. It's founded by Leigh Vossen, who's fantastic. She's been a great support. It's just a bunch of students and young adults, even parents, who are just very, very concerned about what was going on. What options did students have? And really, just give a voice to those who are young and going through this. Because up until this point, I didn't know anyone who was on my side, who viewed things the way I saw it. So it was very, very isolating. So to have a group of people who could support you and talk to you about all this was just amazing, and that really did give me hope. It really was just phenomenal.

Shawn Buckley

Right, so I imagine that you would probably recommend, if anyone finds themselves in fear and isolated, to find like-minded people.

Cassandra Schroeder

Absolutely. Share your story. Find people who support you.

Shawn Buckley

Now, going forward, is there anything that you think we should have done differently?

Cassandra Schroeder

Oh, man, I think the biggest thing is that medicine, bodily autonomy, all that needs to be protected to the utmost priority. It's not a group collective. Each person is an individual going through individual situations, and you cannot make a group decision on what people should do. And that should never be pressured.

Shawn Buckley

Right, okay. I'm finished asking the questions, but I'll ask if the commissioners have any questions.

Cassandra Schroeder

Sure.

Commissioner Drysdale

Good morning.

Cassandra Schroeder

Good morning.

Commissioner Drysdale

You had mentioned that you had signed up for university, and I assume you paid your tuition before you started?

Cassandra Schroeder

Yes.

Commissioner Drysdale

Did they refund you the money when they kicked you out of the classes?

Cassandra Schroeder

So at that point I hadn't paid for my tuition. The way the university works is, it's two weeks. They kicked me out of the classes before they started.

In the fall, I'm assuming the reason that they couldn't kick us out of our classes is because we had already paid for our tuition when their mandate had happened. Because they'd actually told us you had to be fully vaccinated by a date in November. But because, I think, we'd already paid, people were already taking the course, and they couldn't have done anything. They didn't have much power. So that's why, I think, they heavily implemented it in January, and then they just kicked people out before tuition had been paid.

Commissioner Drysdale

Hmm. Thank you.

Cassandra Schroeder

Yes.

Commissioner Massie

Thank you very much for your testimony. I'm a little confused about your situation right now.

Cassandra Schroeder

Sure.

Commissioner Massie

Did you mention that the vax mandate is still in action and prevents you to do some of the courses you'd like to do? Or did I miss that?

Cassandra Schroeder

Yes, so I applied to BC, and in BC, they still have the provincial rules, the laws that say that you have to be vaccinated to participate in clinical. So in naturopathic medicine, the first year you already are in clinics, and you need to be vaccinated for that. So the school does not have the mandate, but the Province is mandating it in clinics. So yes, that is why I cannot go to classes.

Commissioner Massie

And are you aware of any prospect that this law at the level of the province will change anytime soon?

Cassandra Schroeder

No. That's why I'm looking at American opportunities, hopefully. But I have no idea where I'm going to go with all that. We'll see where opportunities present themselves.

Commissioner Massie

Did you explore other provinces?

Cassandra Schroeder

Yes, they have a school in Toronto. Last minute, I was told I could go and attend that school. It was about a week before it would have started, and it was not feasible for me to up and move to Toronto. In the future, I may look at that avenue, but I'm not sure if I want to partake in that right now.

Commissioner Massie

Thank you.

Cassandra Schroeder

Thank you.

Shawn Buckley

Well, Cassandra, those are our questions. On behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing your story this morning.

Cassandra Schroeder

Thank you so much.

[00:20:14]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 2: Steven Setka

Full Day 3 Timestamp: 02:01:14–02:20:19

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

Our next witness is Mr. Steven Setka. Good morning, Steven.

Steven Setka

Good morning.

Shawn Buckley

So I'll start by just asking you to state your full name, spelling your first and last name for the record.

Steven Setka

Steven Christopher Setka. S-T-E-V-E-N, I go by Steve, though. Last name Setka, S-E-T-K-A.

Shawn Buckley

Steve, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Steven Setka

Yes.

Shawn Buckley

Now, my understanding is that you have a business; you are a freight broker in the Winnipeg area.

Steven Setka
That's correct.

Shawn Buckley
And you've been doing that for five and a half years?

Steven Setka
Yes.

Shawn Buckley
So you kind of started just shortly before the pandemic and then, you're still working through that today.

Steven Setka
That's right, we've been doing our business— It's more or less a family business and I won't mention too much about the business, just the fact that it's in the freight and transportation industry. I myself am a sales manager for our company, selling freight services, small parcel services, transportation services for international and domestic shipping.

We started a couple years before the pandemic, and as anyone would know, a new business more or less struggles somewhat out of the gate, so we struggled for sure, for a while. The pandemic actually was a little bit of a supercharger for our business, fortunately. I would never choose to go through a supercharger event like a pandemic in order for the benefits of my business because I was deeply affected by a lot of other aspects of the pandemic. But, yes, that was the career path that I've chosen for the past five years.

Shawn Buckley
Now, you mentioned it as a family business and I want you to talk about your family. But my understanding is that, prior to COVID, you had a sizable extended family in the Winnipeg area and that you were really tied into that. So my understanding is you've got aunts and uncles and cousins and that pre-COVID, I mean, this was a tight-knit family that you were an integral part of.

Steven Setka
Absolutely. I would say we're a pretty tight family. There's a member of my family here today, which is awesome. I really appreciate that. I would say the size of our family, it's medium to large and it is spread across Canada. There was more members of our extended family in Winnipeg up until a couple of years ago, since a few of them have moved away to other areas of the country. My immediate family: there's my mother, father, and my sister and I. Then there's cousins and aunts and uncles, and a few of those families we're very close with. And there were some consequences for my decisions throughout the pandemic that affected those family relationships negatively.

Shawn Buckley

Before you go into that, though, just explain to us how regular your family would meet and for what types of things. Just so that people understand what was normal before things changed.

Steven Setka

It was pretty regular, for sure. There's a cousin I have that I'm very close with that I would spend a good amount of time with. We grew up together. We spent a lot of time together. We had a lot of common interests. Family gatherings would occur, I think, the same as any regular family: maybe every couple of weeks, maybe once a month, maybe once every couple months depending on the season. Summertime, there was definitely a lot more going on. And there would be somewhere between 10 and 20 family members at these events that we would have: barbecues, indoor gatherings, birthdays, Christmas, Easter celebrations, a variety of different things. We all got along really well for the most part. There was some chaos, as there is in any family, for sure, but for the majority of the time it was wonderful. We had a great time.

Shawn Buckley

And you were involved with some sports with some family members.

Steven Setka

Exactly, yes. So growing up, we played hockey. I played rugby with family members. And we were just an athletic family, our extended family. My family, specifically my sister and I, excelled at sports and other members of our family around the city were the same. That was my passion and that's where I really enjoyed spending my time, with family and friends, and that's my community.

Shawn Buckley

And pre-COVID there would be regular phone calls and family group chats and texting and things like that on a pretty regular basis, am I right about that?

Steven Setka

Absolutely, yes. No more, no less than any other family, but we were close. And we appreciated each other's company. I was raised by the phrase that blood is thicker than water and family is very, very important. You can't pick your siblings, you can't pick your family, you can't pick your parents, so you might as well make the best of it.

[00:05:00]

Shawn Buckley

Okay. And we appreciate your enthusiasm. So tell us, as the COVID experience started, what happened and what changed?

Steven Setka

I would say that I was questioning the pandemic. Not necessarily from the start. I started to question it a few months in, before vaccines even came out, before lockdowns and severe

mask mandates and all those different types of things. I have a pretty healthy belief in my immune system, my physical health. That's very important to me: physical, mental, and spiritual health. Therefore, I looked at it from a different lens, right from the get-go, more or less. But I was scared, and I had fear from the get-go. For the most part, my immediate family was very on board. They feel more or less the same way.

Other members of our extended family probably didn't really feel that way. They went right into the so-called fear-porn response, I would say, and watched too much television. That affected the relationship that we had. I was not overly outspoken in the family, but I was most definitely comfortable telling them what I felt in a polite and respectable manner, what I thought. And they didn't really like that a whole lot.

Shawn Buckley

And then was there also some disapproval that you would be going out when, perhaps, the government did not want you going out?

Steven Setka

I was a rule breaker. I'll leave it at that.

Shawn Buckley

Okay, but how did that affect family dynamics?

Steven Setka

Again, the immediate family, there wasn't any issues necessarily, per se, but if we're going to jump ahead and talk about the whole vaccination process and my decision not to get vaccinated, there were a fair-few members of our family that didn't approve of that. Just the fact that I didn't do it and that I was still attempting to participate in everyday life as I normally would. Of course, I wasn't able to for a variety of reasons. As most people that do know me, they would understand that I'm quite a gregarious and outgoing individual. I have a lot of energy. I need social engagement in my life. And being locked down and being isolated in a house or home on my own or with a partner, at the time, was very, very difficult. So it wasn't received very well in my communities, in both family and friends.

Shawn Buckley

Right. And then you told us you chose not to get vaccinated. What types of things happened within the family and your access to the family with that decision?

Steven Setka

There's a few households that I was not able to attend. I have not been back there since. I won't go too much into depth on that, but the relationships of being around those family members has definitely changed. And I would say that it's uprooted some deeper hurt that has been long-standing, maybe, within the family. Our family, I believe, like others, struggles with issues and challenges and relationships. Especially the larger that they get, the more difficulty you can experience. COVID, the pandemic, the vaccines, the lockdowns—our difference in views definitely affected that negatively.

Shawn Buckley

So my understanding is you're not invited to birthday parties and there's some of your nieces and nephews you're no longer allowed to see, right?

Steven Setka

More or less. I would say it's more— Currently, it's just the association, the discussions, the participation in family has been very limited and minimal. I would say our immediate family has been ostracized and excluded from events. Specifically, I'll tell a really quick story.

Members of my immediate family that were vaccinated are and have been invited to events.

And then the ones that aren't, aren't invited to anything anymore, and that's really been the case for a couple of years now. I don't know if that has to do with the vaccination status or with the fact that there's other things going on. To be honest, it doesn't bother me as much any longer. It did affect me really negatively and my mindset for a long period of time, though.

Shawn Buckley

Now, I want to segue to church because you had an experience with church. My understanding is that you were going to Oasis Church when the pandemic hit. Can you share with us what happened there?

Steven Setka

For sure. This is something that I have a friend that I discuss with regularly. Because I was in a Zoom group or more of like a family-care group with this individual. A couple of years ago,

[00:10:00]

Oasis Church was concerned about the pandemic and vaccination requirements, and whatnot. And I brought it up with the leadership of the church that I was concerned about that, the fact that they were going to separate individuals, bring in a vaccination pass or something of the like. And I had met with the leadership of the church to express my concerns, to no avail. Whenever it was that the vaccine pass came around—that would have been 2021, end of summerish, going into the winter—it got really severe and really heated. Oasis Church brought in a vaccination pass, and they had it right around Christmas time. And I made the decision to go— They had a section for undeclared individuals for Christmas Eve. I decided to go to that.

Shawn Buckley

I just want to stop you. So this is Christmas Eve service which, in a Christian church, is one of the two major celebrations.

Steven Setka

Absolutely. Christmas Eve's a big deal. It's a wonderful opportunity to spend time with your family. I decided to go on my own, in the section of the church that was declared for individuals who did not want to declare their status. And I'm walking in and I go into the church and I go into the theatre, which was separate from the main congregation, for the

regular vaccinated service, I guess you could say, on Christmas Eve. I was the only one in that separate theatre at the church. And I was shocked that there was, first off, no one else there. But it didn't surprise me that nobody else showed up: if they didn't want to declare, they just wouldn't go. I just put myself on the line, and that was more or less the straw that broke the camel's back for me when it came to not attending that church anymore because of that decision that they had made. Which brings me to changing churches and going somewhere else now.

Shawn Buckley

Right, so basically, they were accommodating people that were undeclared, but they were in a different theatre. And I guess, the idea would be, you'd watch it on a screen?

Steven Setka

Right. Absolutely.

Shawn Buckley

But when you show up, you are the only one in that room.

Steven Setka

Exactly. There would have been—I would put my number on it at, maybe, 1,000 people at the service in the main area. And then myself as the one individual who went undeclared.

Shawn Buckley

Were there other things about being unvaccinated, other restrictions that affected you?

Steven Setka

Absolutely. There were work repercussions in terms of events and networking and social engagements. That was severe. I also love to travel. I have family all over the country. I enjoy travel for business, family, and leisure. I have not been able to do that for a long period of time. I can now, of course. But I was not able to attend work conventions in the United States, work conventions in Canada. My business partner and I actually drove to Toronto right near the end of the flight mandate—it was about eight to ten months ago—which is a long drive, especially in the wintertime, to get to another city in order to attend a mandatory work event. So we were not able to fly there. Instead, we had to drive 24 hours and take time away from the day-to-day operation of our business in order to do that. And that was very difficult and very challenging.

Shawn Buckley

How has this affected you mentally?

Steven Setka

Tremendously, I would say. As I stated, a very outgoing and gregarious individual, I felt feelings of sadness, loneliness, anger, depression, anxiety, a variety of different things. I would say I utilized my family and my friends as an outlet to talk about them. Was it sufficient? I have beautiful people in my life and I was very happy to have those people

there. And those support groups, the aforementioned ones that Cassie said about S.A.M. [Students Against Mandates] and other groups that I affiliated with. But the readjustment of my social scene and social circle was extremely difficult. And it's ongoing. When you lose friends, when you lose opportunities, miss out on a variety of things and aren't able to do anything for fun, per se, for eight months, that takes a toll on your mental health.

Shawn Buckley

Especially, for a large period of that time, you were living by yourself, weren't you?

Steven Setka

Correct.

Shawn Buckley

So you know, lockdown for you meant just being isolated.

Steven Setka

Exactly. I was living with a partner for a period of that time, but, more or less, probably half of the pandemic I was living on my own.

Shawn Buckley

Now, do you have any ideas how we could have done this better?

Steven Setka

Depends how much time we have to talk about it.

Shawn Buckley

Yeah.

[00:15:00]

Steven Setka

I have a belief that, in this world, we live with a lot of risk every single day. I would have liked to see the government, or those-that-be, allow us to choose which risk we wanted to take in our life and the ability to have autonomy in our own decision-making. If you wanted to get vaccinated or stay at home or wear a mask, or whatnot, that's great. But if you are willing to take the risks associated with daily living, along with going out when there's flu season, sickness going around, that would have been how I would like to see the response.

Now, that response was done in other areas of the world—Florida, probably, being the one that we're most familiar with. Bodily autonomy, personal autonomy, and individual responsibility. That's just what I believe in and how it should have been done better.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions for you.

Commissioner Kaikkonen

Good morning. I'm glad you decided to find another church, but I'm just wondering how the new church did things differently with regard to the mandates and lockdowns.

Steven Setka

So I'll share that I'm a member at Springs Church, and there's other people around here that I see that are there as well, too. I felt more at home there. A little short anecdote about the reason why I ended up there is because of this experience at the previous church, the vax pass, and then being accepted elsewhere. Also, members of the community that I was becoming involved with were there. And I never really knew much about it, but it felt more like home. I went to the church, to Springs Church, for that reason.

I stayed because of the pastor, Leon Fontaine. God bless his heart, is no longer with us. And I'm continuing at that church, and I will be for a long period of time because of the communities and the associations that I've built there. Springs definitely pushed the envelope. They allowed people individual autonomy and responsibility. They were in the news and in the media more than, definitely, many others. They stood up for the Charter freedom that we have to practise our religion or our faith, and I appreciated that because that's exactly how I felt in regard to the human rights we all have as citizens of the world.

Commissioner Kaikkonen

Thank you.

Commissioner Massie

I'm most tempted to ask you a question about what you experienced in the church. I guess you must have had conversations with people over there. I'm wondering whether the question about, what would have Jesus done under those circumstances with the unvaxxed? Was that ever raised?

Steven Setka

I believe so. I have these conversations with my father regularly. He reads the Bible on the daily. We are very biblically focused, and we have a lot of faith, and I don't necessarily know, I don't think there's any—I don't know if in the Bible there's anything to do with vaccination specifically. But Springs teaches us this little acronym that many people are familiar with, and I believe this is what Jesus would have done. He would have loved and accepted and forgiven people for the decisions that they made. Love people for where they're at, accept people for the decisions that they have made, and forgive those who have potentially wronged you. And that's just the spirit that I live by.

Shawn Buckley

Thank you. There being no further questions, Steven, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing your experience with us.

Steven Setka

Thank you for having me.

[00:19:05]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 3: Steven Kiedyk

Full Day 3 Timestamp: 02:20:56–02:33:36

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

And our next witness is going to be a Mr. Steven Kiedyk.

Wayne Lenhardt

Good morning, Steven. Could you give us your name and then spell it for us. And then you're going to have to swear an oath for me.

Steven Kiedyk

My name is Steven Kiedyk, S-T-E-V-E-N K-I-E-D-Y-K.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony here today?

Steven Kiedyk

I do. I will.

Wayne Lenhardt

Your testimony today is going to relate to your injuries that you've suffered from the vaccine. So let's start with a bit of background. Your profession is that of a land surveyor in Manitoba, correct?

Steven Kiedyk

Yes.

Wayne Lenhardt

And when did you first start doing land surveying?

Steven Kiedyk

2007, I believe.

Wayne Lenhardt

So by October 2020, you were still doing that and you were doing it for the Manitoba government, correct?

Steven Kiedyk

I was, yes.

Wayne Lenhardt

That job terminated in April of 2021 for no COVID reasons, am I right?

Steven Kiedyk

That is correct, yes.

Wayne Lenhardt

As a restructuring of the government. You continue to do surveying and went back to your original company in June of 2021. Am I correct?

Steven Kiedyk

Correct.

Wayne Lenhardt

Tell me why and when you were convinced to get one shot of the Pfizer vaccine.

Steven Kiedyk

Well, it took me a while to actually finally convince myself to go in and get a shot. I finally got it in July of 2021. Up to that point, I was pretty adamant on not wanting to get it, only because I believed I should have the right to choose on whether I should get it or not. Secondly, because I wasn't really a part of the demographic that was at risk for the disease. So therefore, I just didn't want to put myself through that risk. But eventually, after months of being essentially cast out of society and being told that I was a horrible person for not joining the vaccination campaign, I finally decided in July. I just woke up one morning and decided to get my one shot to regain my presence in society, I guess.

Wayne Lenhardt

At that point, you are pretty healthy. I understand that you did a marathon in July of 2019.

Steven Kiedyk

Yes, I'm a fairly avid gym-goer. I go to the gym, roughly about five days a week. I ran. Like I said, I did my first marathon in 2019. I actually did really, really well and tried to continue on going down that path of being as healthy as possible. Because I'm only getting older, so I may as well try to stay healthier.

Wayne Lenhardt

And did you have any ailments of any kind?

Steven Kiedyk

Up to that point, no. I was fairly healthy. I was a fairly healthy 35-year-old, just trying to learn how to run.

Wayne Lenhardt

So in July you had your one shot of Pfizer.

Steven Kiedyk

Yes.

Wayne Lenhardt

And when did you have your first health concern?

Steven Kiedyk

So it was only the one vaccination that I had, so I was still kind of locked out of most of society. I wasn't able to go to the gym and I wasn't able to do much physical activity. But it wasn't until October. I got together with some friends and we decided to play some basketball, where just playing a regular game of pickup with some friends,

[00:05:00]

I ended up losing consciousness and collapsing on the floor. Just playing regular basketball. It was really alarming because it had never actually happened to me before under strain, losing consciousness and blacking out and getting all tingly. So that was kind of alarming. But now I realize that it has not stopped, actually. I'm finding myself losing consciousness on overexertion, actually a lot of times. My body goes tingly, I lose vision. I have to take a knee or I have to take a second to regain my composure.

Wayne Lenhardt

And how often does this happen?

Steven Kiedyk

Well, in the beginning, it could happen almost three times a day, depending on what I was doing that day. Now, I'm a little bit better at regulating how much stress and how much strain I can put on my body so that it doesn't happen. But it does happen still quite regularly if I over-strenuate myself, I guess.

Wayne Lenhardt

Has this interfered with your surveying job in any way?

Steven Kiedyk

Indirectly, yes. I'm not as good at my job as I was before. I'm finding myself taking a few more breaks during my work. When I'm doing my physical activity during my work, I'm not getting as much work done as I did before. Again, because of breaks, because of having to catch my breath, because of having to make sure I don't collapse and lose consciousness.

Wayne Lenhardt

Yes. We talked earlier about your work and how you, as you put it, you do a certain number of bars per day.

Steven Kiedyk

Yes.

Wayne Lenhardt

Could you explain what that means for the commissioners?

Steven Kiedyk

Sure. For an example, let's say I was on a regular day, I would be able to place about 12 bars. These are iron bars about three feet long, about one inch by one inch. I'd use a sledgehammer and I would be pounding those into the ground on property corners.

Wayne Lenhardt

Okay, so let me take an example so this is understandable. If you're surveying, let's say, a lot out in the field somewhere, you will want to locate the corners of that lot.

Steven Kiedyk

Yes.

Wayne Lenhardt

And when you do, you will put an iron bar at each corner of the lot.

Steven Kiedyk

Exactly, yes.

Wayne Lenhardt

And it's about two and a half feet long and it's about an inch by an inch in outer dimension.

Steven Kiedyk

Yes. In outer diameter, I guess.

Wayne Lenhardt

So what you'll do is, you'll put that bar and then you'll get your sledgehammer out, and you'll drive that bar into the ground.

Steven Kiedyk

Yes.

Wayne Lenhardt

Okay and then that becomes the precise location of the corners of the lot.

Steven Kiedyk

Exactly.

Wayne Lenhardt

Previously, we had said that you could do something like 12 bars a day. And you're now only able to do, sometimes, three bars, sometimes five a day.

Steven Kiedyk

Yeah, depending, again, on how tough the ground is and how much strain I'm actually having to put onto that. I am actually doing much less than what I was doing before because, again, I'm not able to just continuously work like I did before. I'm finding I'm having to take a lot more breaks and catch my breath.

Wayne Lenhardt

Have these sessions of blackouts, let's call them that, have they gotten worse or better? Or have they stayed the same roughly since October 2021?

Steven Kiedyk

You know, I'd like to be hopeful and say they've been getting better. But I think it's just I'm better at regulating exactly how much strain I can put. Maybe they've gotten slightly better. But for the most part, they're very evident and they are very continuous in my daily life.

Wayne Lenhardt

Okay. Have you gone to a doctor to have him or her look at this?

Steven Kiedyk

That's the one thing I have not done. Mostly because of the whole scenario that has gone on during the pandemic. I've lost a lot of faith in the medical industry; I mean, I didn't really want to. But I just really don't know who to trust and if I'm just going to be cast aside and now your problems are unimportant.

[00:10:00]

I know my body. I know what I know. For the last 37 years I've been living with this body.

Wayne Lenhardt

So is it fair to say, then, that you're able to manage it to some extent so that you can still work?

Steven Kiedyk

Yes.

Wayne Lenhardt

But has it gotten better or worse or stayed the same?

Steven Kiedyk

I definitely wouldn't say it's gotten— It hasn't gotten better enough, to say that it's very noticeable.

Wayne Lenhardt

You have learned how to manage it to some extent?

Steven Kiedyk

Yes, and that's probably about the way I could say it's gotten better.

Wayne Lenhardt

Okay. I think, at this point, I'll ask the commissioners if they have any questions they would like to dig into. Yes, Dr. Massie.

Commissioner Massie

Did you try to report your side effect to the authority?

Steven Kiedyk

I did. I signed a form, one of the forms that was circulating on the internet, but that was about as far as I went. Again, mostly because of the medical industry: I was hearing a lot of people complaining about side effects that were going unheard, so I just didn't really know the right person to give my complaints to that would actually get traction. I'm under the impression that it just wouldn't get much traction—hence why I actually even signed up for this, so that my story could get heard.

Commissioner Massie

And my other question is, has your partially vaccinated status affected your ability to work or your social life?

Steven Kiedyk

Yeah, it definitely has affected it, two ways. One way it's affected it is because the people who are on the vaccine campaign give me flack for not getting my second one. And then,

also the fact that I got my first one. Like I said, it impacts my life, every day. It's very strenuous on my life.

Commissioner Massie

Can you also specify the delay between the vaccination you had and the first onset of symptoms that you have noticed.

Steven Kiedyk

Yeah, it was the first week in July when I got the vaccination. And it was about the second week in October when I actually realized I had that first symptoms and I noticed that I couldn't exercise like I used to.

Commissioner Massie

Thank you.

Wayne Lenhardt

Any other questions? No. Okay, on behalf of the National Citizens Inquiry, thank you for your testimony.

Steven Kiedyk

Thank you.

[00:13:18]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 4: Devon Sexstone

Full Day 3 Timestamp: 02:33:36–02:47:34

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Wayne Lenhardt

The next witness is going to be Devon Sextone.

Okay, could you give us your full name, Devon, and then spell it for us, and then I'll make you swear an oath.

Devon Sexstone

It's Devon Sextone, D-E-V-O-N S-E-X-S-T-O-N-E.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

Devon Sexstone

I do.

Wayne Lenhardt

Okay, to start with a little context, could you tell us what your career and work history has been since about 2005? Just quickly.

Devon Sexstone

So I've been an army reservist for about 16 years; I'm now a veteran. I have operated equipment and trucks, both militarily and in the civilian world.

When COVID hit, I had just become a unit manager managing a freight terminal for an expedited LTL and courier company, one of the largest in Canada. And I lost both that job and I've been kicked out of the military due to the vaccine mandates.

Wayne Lenhardt

Okay. So let's pick up the timeline: March of 2020, then. This is when there was evolving COVID policy happening. You started to have some fears. Then March of 2021, you're off on parental leave for a bit of time. This is why you were working for Purolator. And then in October of 2021, the vaccine mandates came in. What happened, at that point, in your work place?

Devon Sexstone

So March of 2020, three months into being a manager, COVID, as far as I can recall, landed on the shores of Canada. There was constant, ever-evolving policies coming from head office. The executive branch, in my opinion, did not do a good job of allaying people's fears. A lot of people were understandably concerned, but we were told that we were essential services and we were to continue working.

Throughout the next year and a half or so, there was a lot of high stress. Our industry exploded in terms of busyness and it was uncontrollable growth, coupled with mask mandates and constantly changing policies.

When I returned from parental leave after the birth of our fourth child, in October of 2021, I was told that there would be an impending vaccine mandate. I believe the initial date that they had stated was November or December of 2021. They kept pushing it back because there was a lot of pushback. I was told that if I didn't disclose my status—I believe in November of 2021—that I would be disciplined. I actually ended up disclosing it under duress because, at that point, I wanted my children to have presents under the Christmas tree. Because financially, we were still recovering from me being off on parental leave.

At the same time in November of 2021, the armed forces had told me that if I was to refuse the vaccine that I was no longer allowed to train and parade with them. I was made to read through the entire COVID policy from the Chief of Defence staff and discovered that I had missed a date for voluntary release and was told that, basically, I would be forced out—5F released. I told them that I was going to grieve that because I was not aware of it.

So at the same time, I had the stress of losing my civilian job, which provided for us because my wife was at home with our four young children, who were four or five years old and younger at the time, and my part-time job, which we used to help sustain us.

During the time period between October and December of 2021, there was a lot of confusion going on amongst the head of Purolator, the executive staff. There was questions about the legality, both for myself and others. The only responses I got were either no response whatsoever, or I was told that that was a good question, and that was the end of the email.

At one point, one of the individuals responsible for the vaccine mandate at the executive level was asked,

[00:05:00]

essentially, what was going to allow them to legally do this. And his response was that the government was going to be helping them out. So I took that to mean that this was not legal and that, basically, it was a political thing.

Fast forward to January of 2022: myself and 1,032 other individuals were placed on unpaid leave and our ROEs [record of employment] were coded, I believe it was code M—which was suspension or temporary dismissal—and as a result, I was ineligible to collect EI benefits, even though I had been paying into them. So at that point, I had lost my military career. I was no longer allowed to parade. That release finally happened in June of 2022.

So basically, the stress from that was absolutely crushing because had my wife been working and not lost her job, that would have been a different story. But when you are the sole breadwinner for your wife and four young children— To be honest, I felt like an abject failure as a man for quite a long time. Yeah.

Wayne Lenhardt

Okay, to quickly summarize: In January of 2022, the mandate came in to disclose your status or tell them that you're not vaxxed. And if you weren't vaccinated, you would be put on unpaid leave, which happened.

Devon Sexstone

Correct.

Wayne Lenhardt

And so, at this point, you are still basically suspended, unpaid leave with Purolator.

Devon Sexstone

That's correct, yeah, from Purolator.

Wayne Lenhardt

But you did get a different job, so you've been driving truck since.

Devon Sexstone

Yep.

If I may, though, delve into some of the impact that I saw happen to some of my employees that I managed. One of our clerical workers, her husband suffered Bell's palsy as a vaccine injury. She was terrified to get the shots as well, but basically, disclosed to me that she felt **she had no choice because financially, it would ruin them. Two of my drivers that drove for me told me that after their second dose of the vaccines, they had horrendous headaches every single day that they had never had previous.**

After the 1,032 of us were placed on unpaid leave, 215 of us launched a lawsuit. Several of the individuals from that lawsuit lost their apartments. They were in places like Toronto where the rent is extremely high. They were living in their vehicles. The impact of this policy was attempted starvation. To say to someone that you can't work somewhere is one thing. But to say to someone you can't work somewhere and then, basically, pull out any social safety net is a different thing entirely.

Wayne Lenhardt

I think we should note that you have had other vaccines in the past, so it's not as if you are anti-vaccine.

Devon Sexstone

Yes, I deployed to Afghanistan in 2011. I believe I received five or six different inoculations in a very short window. I had no concerns about it at all. I had no adverse reactions whatsoever. I probably have more vaccines than most people sitting in this room. So I'm not an anti-vaxxer.

My reason for suspicion with the vaccine was my mom was a nurse and she told me about a lot of what she knew. The longer things went on, the more it became quite clear to me that it was politically motivated. People that were asking legitimate questions as to the safety and efficacy of the vaccine were told that they were conspiracy theorists. Our own Prime Minister stood on TV and called them misogynists and racists. It was apparent to me that—From my experience in the military, the government will do what it needs to stay in power and to protect its liability. They often don't, unfortunately, do what is right.

There were a lot of veterans that were prescribed Mefloquine, which is an antimalarial drug. And it came out years later that that drug was causing severe psychological effects on those that were prescribed it. And they knew for decades that it was doing that. So I had an underlying suspicion of the government telling me that a drug was safe.

Wayne Lenhardt

In terms of your employment at the moment, are you making similar money to what you made with Purolator before? And could you compare your wages and your benefits now to what you had with Purolator?

Devon Sexstone

I am making similar, but I'm working 12 to 14 hours a day, instead of eight to 10. I had a pension plan with Purolator that was very good. I had a lot of upward mobility.

[00:10:00]

I had hoped to move into more of network planning and logistics and load planning across the entire network, or at least the Western Canada portion. Where I am now, I'm very grateful for the job. The employers treat me very well, but I'm making \$10 an hour less than I was working at Purolator. So it was a substantial pay cut.

Wayne Lenhardt

And was there any benefits from the military prior to you being released from the military back in June of 2022?

Devon Sexstone

No. Thankfully, there had been rumour that my pension would be taken away from that. Thankfully, that didn't materialize. I still have my pension.

Wayne Lenhardt

Okay, so you're managing to support your wife and your four children and yourself at the moment.

Devon Sexstone

Correct.

Wayne Lenhardt

I think, at this point, I'll ask the commissioners if they have any questions.

Dr. Massie?

Commissioner Massie

Thank you very much for your testimony. If I am not mistaken, I was reading this morning that Purolator has dropped this vaccine mandate. Are you aware of that?

Devon Sexstone

I've heard rumour of it, but I have not been contacted by HR to inform me that that's changed. So until that happens— Maybe that is the case, but no one's contacted me to inform me.

Commissioner Massie

Would that be something you would consider?

Devon Sexstone

It's hard to say. To go back after what's approaching a year and a half, to a company that violated every aspect of my employment contract and treated people like absolute garbage—it would be a pretty hard sell. I'm not saying it would be a no-go, but I don't know. By their fruit shall you know them, right?

Commissioner Massie

Thank you.

Wayne Lenhardt

Any other questions from the commissioners?

Okay, on behalf of the Citizens Inquiry, thank you for your testimony.

Sorry, one more question.

Commissioner Kaikkonen

I'm sorry, I'm always slow to put my hand up.

I'm just wondering about the safety net the government provides when you lose employment. I'm thinking of government-contracted employees who can collect EI in the non-contracted periods of the year.

How did you feel when you could not collect EI, even though you had contributed to the system, if you will, since 2005? I believe that's the year.

Devon Sexstone

Yes, since I was 16. It might sound a bit extreme, but I would almost liken it to attempted murder. I mean, you've taken away my ability to provide for my family. It's one thing to do that to me as an individual. Part of the struggle was everyone, it seemed, had vaccine mandates. I have my Class One, which is kind of a ticket to a lot of employment. But a lot of companies would not even entertain employing you if you were unvaccinated.

I mean, even then, you go to an interview— And I had a few interviews that I'm sure the reason that they booted me out the door was because when they asked, "Well, what's going on with Purolator?" "Well, I was unvaccinated." It was immediately a black mark.

So yeah, to pay into something and then be denied it— I mean, it was in keeping with everything they did. Everything Purolator did violated the employment contracts and employment rights of their employees. And they were directed to do that by the government, based off their own admissions.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Any other questions?

Thank you, again, for your testimony.

[00:13:58]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 5: Leigh Vossen

Full Day 3 Timestamp: 02:47:50–03:17:55

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kassy Baker

Good morning. Ms. Vossen, can you please state your full name for the record and then spell your full name, as well, please?

Leigh Vossen

Yeah, my name is Leigh Elizabeth Granelli Vossen and that's L-E-I-G-H, V as in Victor, O-S-S-E-N.

Kassy Baker

Very good. Now, Miss Vossen, do you swear to tell the truth, the whole truth, and nothing but the truth today?

Leigh Vossen

I do.

Kassy Baker

Very good. Now, I believe we've actually had some reference to you already this morning, as Ms. Schroeder mentioned you during her testimony. I understand that you're here today because you're one of the founders of a non-profit organization called Students Against Mandates, or S.A.M. for short. We're going to get into the circumstances that led to the formation of that group. But just to give us a bit of background, can you please explain to us your qualifications and your education and your employment as of the pandemic, at the start.

Leigh Vossen

Yeah. So when the pandemic started, I was working as an in-house graphic designer, and at the time as well, my friend and I were actually planning on opening a small business. So we

just finished doing a business plan and we were looking at spaces to lease. The two weeks to slow the curve hit and I said, "Let's take a pause on this," and it ended up being a little bit longer than two weeks to slow the curve. So that small business was put on hold, but that's where I was at, at the beginning.

Kassy Baker

And you were continuing to work throughout the pandemic, at that point. Your current employment was still continuing at that point, is that correct?

Leigh Vossen

That's right. It was moved to all online, so I was able to work from my apartment. By December of 2020, I decided to leave my position there and go back to school, to take business administration, accounting. I felt that it would be good to make use of the pandemic and that education could be put towards opening my small business.

Kassy Baker

Very good. Where did you enroll for these classes?

Leigh Vossen

It's at Red River College, here in Winnipeg.

Kassy Baker

And just to confirm, that was in December of 2020 that you enrolled in those classes. Is that right?

Leigh Vossen

It started in January of 2021. So my last day at my graphic design job was in December, and then January is when I started business administration.

Kassy Baker

Very good. And at that time, how were classes being conducted?

Leigh Vossen

So they were all on Zoom.

Kassy Baker

All of them, 100 per cent of your classes.

Leigh Vossen

All of them, yeah. And there was no mention of mandates. No mention of vaccine passports. Hadn't heard of them at the time.

Kassy Baker

Very good. So I understand that you were able to complete your first and second term, in fact, of your business administration program.

Leigh Vossen

And third term.

Kassy Baker

And your third term, as well, all via Zoom, is that correct?

Leigh Vossen

That's correct.

Kassy Baker

Now, how long was your program? How many semesters in total?

Leigh Vossen

It would have been four terms. I had one term left.

Kassy Baker

All right. So at what point were you preparing to start your fourth and final semester?

Leigh Vossen

I remember that the mandates hit in August of 2021 and I was still in my second term. The mandates actually didn't affect me because I was online and it wasn't moved to in-person. But any staff or student who needed to be on campus—say, nursing or there's a lot of construction programs at Red River. It's a very hands-on college, so there's a lot of programs that required students to be in-person. At that time, it didn't affect me.

It wasn't until the end of my third term, going into my fourth term, I was notified that my classes would all be moved to in-person and that I would need to submit proof of vaccination. I contacted my school and said, "You'll need to provide an alternative." And I guess I can just say, they provided one online class per course. But for some reason, a number of students'—including mine, another unvaccinated student, I don't know about the rest of them—but our registration portals were frozen until all of those classes were filled. So I don't know why that happened, but I was unable to register for any online classes. They were taken up, and I decided to drop out because I didn't want to support the college.

Sorry, I'm going ahead. I'll let you ask questions.

Kassy Baker

That's okay, I understand. I'm just going to circle back a little bit here and just try and get a little more detail about some of what you've told us here.

So you've advised that you were told in August of 2021 by your school that a mandate would be coming into effect shortly. What, specifically, were the terms of that mandate? You have said that only those that were required to attend classes on campus,

[00:05:00]

at first, were required to be vaccinated and that this did not affect you as an online learner. Is that right?

Leigh Vossen

Yeah, that's right.

Kassy Baker

At what point did the mandate, then, affect you? And what did the mandate require?

Leigh Vossen

Yeah. So again, it was at the end of my fourth term—I can't remember the exact date of when that was. Or sorry, the end of my third term going into my fourth term, that's when I was informed. I received an email saying business administration classes were going to return to campus, and in order to step foot on campus, you need to provide proof of vaccination.

Kassy Baker

And so, this policy was only coming into effect on your fourth and final semester, in fact.

Leigh Vossen

Yes, so the mandate was still in place, but then they were moving my program to in-person. The mandate actually started during, maybe, halfway through my third term. So I felt like I'd be able to get through my whole program without having to go through this.

Kassy Baker

Right. Now, you did say that you expressed some concern regarding the mandate to your administration. Can you just describe, generally, how you communicated those concerns?

Leigh Vossen

Absolutely. So I remember I was driving with my family to Toronto, sitting in the backseat of the car, and I received an email from the President of the College announcing the implementation of vaccine mandates and passports for all staff and students who wanted to step foot on campus. And again, didn't affect me, but I felt so strongly against this—and I guess, throughout the whole pandemic, I'd felt that a lot of the treatment towards the unvaccinated was very unjust—and I decided to do something.

So I wrote an email to the President expressing my concern. I said, "On behalf of a huge group of concerned students—" It was just me but—I just explained I'd like to see the data. I followed that up by posting that email into an anti-mandate group on Facebook that I

joined the day before. There was about 5,000 people in that group. I said, "Could you guys send this and bombard the President of my college?" which a lot of them did.

A few days later, the College announced— I should add, they had said no exemptions were allowed for students who are unvaccinated to step foot on campus. They said, "Actually, we will allow exemptions for unvaccinated students." And then I messaged the President and said, "Would I be able to meet with you in person to discuss the data?" I mean, it's a very nerve-wracking thing to do. I'm not comfortable with that, but I felt like we needed to push back on this. And he ignored a number of emails and voicemail messages and then, eventually, they said something along the lines of, "We're against discrimination and segregation of any kind, but these are our policies, and that's the end of the discussion."

Kassy Baker

Now, you said that the school did, at some point, advise that there would be exemptions made. Were there any conditions that you had to meet in order to qualify for an exemption?

Leigh Vossen

Those weren't stated. And once I started my organization, Students Against Mandates, I started receiving messages from people saying, "My religious and my medical exemptions are all being denied." You're hard-pressed to find a student who got an approved exemption. I think it was just sort of a, "Look we're offering this; it needs to be approved," and none of the exemptions really met the criteria. I think there's a couple of students, but very few.

Kassy Baker

So did you ever receive any direct communication from the administration, specifically with regard to your attempted communications?

Leigh Vossen

I got one email saying, "We'll respond to you tomorrow," and then they didn't. So then I kept emailing them and leaving them voicemail messages. And then I did get that email, that one email, saying, "This is the end of the discussion," essentially. "This is our policy. We stand firm by it. We'll not be meeting with you."

Kassy Baker

Very good. Now, I understand that it's, perhaps, been implied to this point but has not been **directly stated that you either were not vaccinated or were not willing to disclose your vaccination status. Is that correct?**

Leigh Vossen

Yeah, I'm unvaccinated.

Kassy Baker

Okay. Prior to COVID, had you ever experienced any hesitation with regards to obtaining vaccinations?

Leigh Vossen

No, not at all.

Kassy Baker

So this was, essentially, a first instance of concern for you. Is that right?

Leigh Vossen

That's correct.

Kassy Baker

And what, specifically, was concerning for you?

Leigh Vossen

Well, I don't know why this is for me, but I never felt any fear when I heard about the pandemic. I just listened to what our politicians, our leaders were saying, and I started to notice that they were not uniting the country; they were dividing. And to me, that didn't make sense and I felt like there might have been an ulterior motive.

And then as things proceeded— My sister, actually, has a degree in microbio and immunology and she was saying, "You know, these headlines don't make sense; this is not what a virologist would say."

[00:10:00]

And I'd have a lot of really great conversations with her. In addition, my family, I would say they really push critical thinking and listening to both sides of the conversation. So I was always willing to listen to people who had a different viewpoint.

I am very against groupthink and cancel culture. I've been cancelled for my view on cancel culture before. So yeah, I didn't like what I was seeing and I didn't see what the leaders of the country were doing as true leadership.

So as I said, I didn't have really an issue with the vaccine, necessarily, at the beginning. I just thought, well, there's no longitudinal studies. We don't know what this will do and they're not being honest about that. They're saying it's safe and effective and they have no way of knowing that without longitudinal studies, so I chose to hold back.

Kassy Baker

Right. Now, you've advised that you created an account, I believe it started on Instagram, is that right, for Students Against Mandates?

Leigh Vossen

That's correct.

Kassy Baker

Can you tell us about the early days of the creation of that account?

Leigh Vossen

Yeah. I feel being ignored by the President pushed me to create this Instagram account to share the policies that Red River College was implementing. It started focusing with Red River College. I have the graphic design background, so I felt this is something that I could do.

And then, to my surprise— I have to say I was very isolated prior to the pandemic. All of my friends, all of my social circles, did not agree with my viewpoint. I hadn't really told most of my friends. But my family, half of them are vaccinated. I have five siblings, half of them are vaccinated, but they all supported us making our own decision.

So I made this Instagram not expecting much back. I remember I was surprised when I got 25 followers, that there were 25 like-minded people at Red River who agreed with me. But then I just started getting hundreds, now thousands, of messages over the past three years. But hundreds of stories from students, staff, administration, professors, doctors, lawyers. There's underground networks of paramedics and lawyers in Winnipeg.

It opened my eyes to just how many people there were being affected by this, and the degree to which they were being impacted. And it just kept me going and pushing back and speaking up.

Kassy Baker

Can you describe some of the more memorable messages that you received from some other students who are similarly impacted by vaccines or vaccine mandates?

Leigh Vossen

Absolutely. So at the start, a lot of the messages from students, sort of surrounded, feeling isolated, scared that they couldn't speak up. Essentially, there was a lot of messages saying, "Thank you for making this platform because I felt alone and it's been impacting my mental health."

I started saying to anybody who is in Winnipeg, "I will meet up with you. I'll have coffee if it's legal to go to a coffee shop right now. Or you know, we can go for a walk." So I was starting to do that multiple times a week and then it started to get to be a lot. So I started hosting potlucks at my house to get these people to meet each other and form a community. I felt like, if you have people behind you, you're going to be more likely to speak up. And I know I have my family behind me, but these people didn't have anyone. So I started doing that.

But one student I met up with for coffee, she's from China: she's a resident student. She said, "If I don't get vaccinated, I'm going to go back to China, and if I don't get my Canadian passport before then, I'm not going to be able to come back." And she said, "We wouldn't be able to have this conversation in a coffee shop where I'm from, so I'd really like to stay here."

And then I had a message— It really shocked me at the time because I was anonymous up until the Freedom Convoy. On S.A.M., a former teacher that I had had before the pandemic, one that I'd see every day, in person, she messaged me and said, "Can you help me? I got one dose of the vaccine. I'm terribly injured. I can't—" Essentially, like, all the symptoms of Parkinson's: like shaking; couldn't walk well; sleeping most of the day. She said, "I'm having difficulty picking up a cup of coffee." And I ended up saying, "It's me. I'm a former student of

yours.” And she was going to testify, I believe, but she’s not well, so she wasn’t able to follow through with that. So that was pretty hard.

I had a professor—actually, this is about three weeks ago—message me. She said she just wants to share her story with me, that she held out as long as she could. She didn’t want to get the vaccine. She loved her job and she’d worked there her whole career. And they said she’d lose her job if she didn’t get vaccinated. And she said, “If I didn’t, I would lose my house; I wouldn’t be able to pay for my mortgage payments. So I went and got vaccinated, but I was bawling hysterically when I went into the clinic saying, ‘I do not want to do this,’ and no one said anything. They looked sheepish and uncomfortable, but they vaccinated me.”

[00:15:00]

And about two weeks later, they dropped the mandate and she said, “I was raped when I was younger and this is akin to that. But I can’t get the substance out of my body and I’m afraid of what’s going to happen to me.” And she said, “I’m crying right now writing this email to you.”

So a lot of messages like that. It’s been pretty hard, sometimes, to see all this. And I realize I’m very lucky because my situation is a unique one where I was never at risk of, like, not being able to put food in front of my family or a place to sleep. I always knew I’d have a family who’d be able to support me. But a lot of these people are not able to speak up and they don’t have the ability to. But I do. And the fact that this is rare—for you to be able to speak up—is very upsetting.

I also had an administrator from a university contact me and say that the university decided to give students an extra week—sort of like an extra study week or reading week off. And they said the real reason they’re doing that, it’s known internally, is that the suicide rate for students is going up, so they’re giving them a mental health week. And that was due to lockdowns and whatnot.

Kassy Baker

If I can just interrupt you for a moment here.

Leigh Vossen

Yeah, of course.

Kassy Baker

Sorry, you’ve referred several times to students or a professor. Were these all students and professors from your school, Red River College, or were they from—?

Leigh Vossen

All across Canada. The majority of the ones I’ve told you are ones that I’ve met with in person that are from Winnipeg. There’s one story—the one where she emailed me—that was from Alberta.

Kassy Baker

Okay and how many messages did you receive from students and professors, do you think?

Leigh Vossen

At this point, I've received thousands. I've had to bring on more people to help me answer the messages and I can't answer all of them. But I've received hundreds of stories where they're explaining their story and a lot of them are just— They need someone to talk to.

Like, I had one girl say, "Every time I come downstairs, my family pretends I don't exist, and I'll say, 'Hi. Hi, guys. Morning,' and they don't look at me. They look through me and they keep talking to each other." So she had to move out. So she's someone I've met up with in person and talked to because people are being abused.

Kassy Baker

Now, what was the response from the public, generally, to your creation of this group?

Leigh Vossen

I mean, from the freedom community? Very good.

From non-freedom community members? Not so great. I had an article written about me. I received death threats. I was called an alt-right extremist leader of a pro-convoy youth group, which, I guess, fair. It brought members of my family into it, saying, "Look, her mom supports her." I was called a nazi. People said they were going to push me off the top of a building and my family members off the top of a building.

Yeah, I don't advise people to read the comment section. I read that about two or three times over and I'd just be shaking, reading it. It's very weird seeing your name written over and over again. There were hundreds of comments between Reddit, Twitter, Facebook. Former friends commenting, saying, "I used to be friends with her and I distanced myself as soon as I realized what her views were."

And all of my friends prior to pandemic stopped being friends with me; they cut me out. So not good on that side.

Kassy Baker

Right. So if I can just bring us back to the start of your fourth semester.

Leigh Vossen

Absolutely.

Kassy Baker

Again, I think you've touched on this already, but you advise that classes moved back to being in-person and I believe you reached out to the administration and encouraged them to offer some online courses. But I believe you've testified already that you and a number of other unvaccinated students were unable to register for any of the online sections. Is that right?

Leigh Vossen

That's correct. And I reached out and said, "For some reason, my registration portal is grey. I can't click on any of the buttons to register." And they said, "It seems like a number of students are having this issue. We'll contact you when it's fixed." And four hours later, I got an email saying, "Should be good to go." And I go on and all of the online options were gone.

I don't know all of the students that this affected. It could have been vaccinated, unvaccinated, I don't know. But it's very hard to meet people over Zoom. I had met one girl who was unvaccinated and she had the same problem, but I don't know about the rest.

Kassy Baker

To your knowledge, were the online sections reserved for unvaccinated students? Or could anyone register?

Leigh Vossen

Anybody could. They just said, we will provide one per class. You got to make sure you get it in time, basically.

Kassy Baker

Okay, and I understand that you're unable to complete, of course, your fourth semester because of this. What is the current status of your education or completion of that degree? Have you been able to go back and complete it or where do things stand now?

[00:20:00]

Leigh Vossen

No, and I have no intention of doing so because I felt, like, I couldn't give another penny to an academic institution that discriminated against me and segregated me from my classmates. So although I do have to forfeit the money that I put into it, the time and effort, I have no interest in finishing that. It would have been great to have that diploma, but as I said, I'm lucky I did have education beforehand that I can use to get a job. I completed a graphic design program. I didn't need it, but it would have been nice to have gotten.

Kassy Baker

So when it became apparent that you wouldn't be able to complete your degree, did you set about trying to find new employment?

Leigh Vossen

Yes, and I applied to many different places, about seven places. At the time, it was, like, different serving jobs. I just thought, in the meantime, until I can find something else. I was also doing a bit of freelance graphic design, thankfully, I had that. But every place that I applied to, they either start the interview with, "Are you vaccinated?" and I'd say, "No." They'd say, "Are you planning to?" and then I'd say, "No." And it'd either be a really uncomfortable interview, or at the end of the conversation, then they'd ask me.

I had one interview where it seemed to go really well and they're saying, "We're so excited! This is going to be great! What's your schedule like?" and I said, "Completely open. I can

take as many shifts, as few shifts; I can work at any location.” They’re, like, “Great,” and then they said, “Are you vaccinated?” and I said, “No.” And then, the next day, they said, “Our schedules don’t line up, so this is not going to work out.”

Kassy Baker

I understand that you are employed now, is that correct?

Leigh Vossen

I am, yeah. A family member of mine recommended that I apply to where they work and I was able to get employment as a marketing specialist.

Kassy Baker

Very good. Did you experience any other negative impact of your involvement with Students Against Mandates or your general position and outspokenness about the vaccine mandates, generally?

Leigh Vossen

Honestly, I would say, overall, creating S.A.M. is the thing that helped me through the pandemic. I don’t know where I would be if I hadn’t. But there were definitely negative things that came with it, in terms of losing all of my friends, having my friends or people attack me. I was harassed by a doctor for a while, calling me transphobic for posting Jordan Peterson posts.

A lot of not great things happened. But I have such a good support system that, you know, you take it in stride and it didn’t seem so bad.

I’d say the worst thing was losing my friends, losing my ability to get my diploma, and the article— Especially in terms of how it impacted one of my siblings because she’s a part of S.A.M. too. I know it caused her extreme stress. It did for me, as well. It made going to work very uncomfortable, but, nonetheless, it is what it is.

Kassy Baker

Did you ever fear for your physical safety at any point through this experience?

Leigh Vossen

I didn’t initially when I saw the death threats because I just thought people on Twitter are rude. But then someone broke into my house shortly after that article came out. They had actually posted where you could find my house address in the article. I was home alone and I heard someone come into my house. Just the way that I am, I paused the Matt Walsh episode I was watching. And I then figured maybe it’s just my cats making a huge amount of noise and I went upstairs. And later, I came downstairs and the door was open, the mat was flipped over, drawers were open, and the door that I had locked was unlocked. So I ran out of the house; I called the police, and they said, “Has anyone said they want to hurt you?” And I was, like, “Well, actually, yeah. People have threatened my life.” So then, I was not able to sleep there for four days comfortably. I was too scared to go back home.

Kassy Baker

How do you feel that this situation could have been better addressed by, for instance, your administration at the school?

Leigh Vossen

I don't think mandates should have been in place at all. I don't think you can segregate people. I don't think you can coerce people into taking an experimental, novel injection.

I think we need to look at this on the individual perspective, rather than a utilitarian, collectivist perspective. We heard a lot during the pandemic that, you know, "Do this for the greater good; do this for the collective." But that comes with harm to the individual, and at the end of the day, it's the individual that makes up the collective. So if you're harming the individuals that leads nowhere good.

[00:25:00]

We've seen in history that that's not the way to do it. And how can you really quantify it being a worthwhile sacrifice for the collective. I just disagree with that, fundamentally, and mandates should never have been implemented in the first place.

Kassy Baker

Thank you. That concludes my questions, subject to any questions that the commissioners may have.

Commissioner Massie

Well, thank you very much for your testimony.

I heard you say that one of the responses you got from university is that— In their corporate HR environment where DIE, diversity, inclusion, and equity, is such a high, important aspect of the way they want to manage people, discrimination in their view is kind of a cardinal sin. And it's probably true, also, in other corporations where DIE is so important to push as a way to manage the human resources.

So what's the, sort of, moral standard that justifies the kind of discrimination you've been through with the vaccine mandate, as well as other people that have been submitted to that? What's the justification one can propose or one can oppose to this notion that discrimination is bad except in this case?

Leigh Vossen

Yeah, it's so funny. It was so hypocritical to start the full paragraph saying, "We're against all these things, but we're doing it anyways and we're not talking to you about it anymore." Their justification— I mean, they didn't say this, but I'm assuming they're suggesting to protect the vaccinated students and for the health of the students and staff. But again when you ask for data supporting these mandates—

I would understand implementing measures to protect students and staff. Maybe there's a pandemic and you say, "We're going to give everybody the opportunity to do online classes if you want to." Give them that option, but— Oh, I've lost my train of thought. Yeah, they refuse to even discuss the data.

And actually, this is interesting: a lot of students screenshotted their responses from their universities all across the country, asking their university, "What data do you have supporting your measures?" And a lot of the responses are the exact same thing: other universities are doing it; we're not discussing this; this is the end of the communication we're having with you. No university that I can find has presented data to support it.

And that's the same thing, as I said, I just got that diversity, inclusion, equity response; it looked like a copy and paste response. And then, "We're not talking to you. We don't want to talk to you. You're not going to hear from us again." So they can't justify it. They can't justify their discrimination.

Commissioner Massie

Thank you.

Kassy Baker

Are there any further questions? Okay.

Commissioner Kaikkonen

Thank you for your testimony. It sounds more like the pedagogy of the oppressed is at Red River College, but I know it's consistent with other universities and colleges across the country. Red River College in about, I'm going to say, 15 years ago, was well known for PLAR, for Prior Learning and Assessment Recognition.

Given all the experience that you have, do you think the President of Red River College, who is not a doctor—I'm going to assume he's not a doctor; maybe I'm wrong there, but I'm going to assume that he or she is not a doctor—would be willing to take all that experience, the professional experience and knowledge that you have, and finish your fourth semester under the PLAR criteria? Do you think that's possible? I'd hate to see you lose your education.

Leigh Vossen

Yeah, I doubt it. I don't think they're going to be making any allowances for me or helping me. They haven't at this point. So there's no reason for me to believe that they would do that now.

I should add, you were saying— This is for just Red River. It started with Red River and we've expanded. I have a huge team working with me and hundreds of members. This organization serves all of Canada, so we have people on the leadership team who live in BC and Ontario. It's a Canada-wide non-profit.

Commissioner Kaikkonen

Thank you for taking up the torch.

Leigh Vossen

Thank you.

Kassy Baker

Thank you very much for your testimony on behalf of the National Citizens Inquiry.

Leigh Vossen

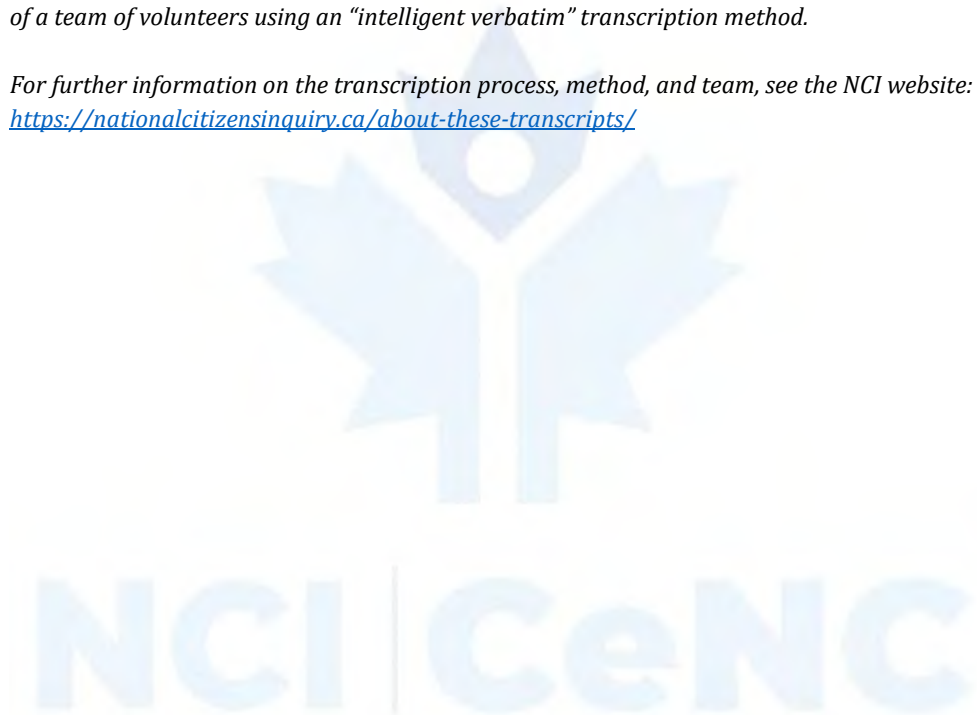

Thank you for having me.

[00:30:05]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 6: Brandon Pringle

Full Day 3 Timestamp: 03:32:55–03:56:45

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00] [Video is missing audio from 03:32:55–03:33:02]

Brandon Pringle

My last name is Pringle, P-R-I-N-G-L-E.

Kyle Morgan

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Brandon Pringle

So help me God.

Kyle Morgan

Very good, sir. I understand you're appearing from Alberta today. Is that right?

Brandon Pringle

Yes.

Kyle Morgan

That's where you reside.

Brandon Pringle

Yes.

Kyle Morgan

Is that in the Penhold area?

Brandon Pringle

Yes, it is.

Kyle Morgan

For about 25 years, you've been in that area?

Brandon Pringle

Yeah. In Alberta, we've been here for about 25 years, yeah.

Kyle Morgan

Okay. I understand you've got two children. Is that right?

Brandon Pringle

Yes. Yes.

Kyle Morgan

You've got some grandchildren?

Brandon Pringle

Yes.

Kyle Morgan

How many?

Brandon Pringle

One.

Kyle Morgan

One grandchild.

Brandon Pringle

We should have three.

Kyle Morgan

Now, before we go down that line of questioning, I just want to ask you where you've been working throughout the time of the COVID period.

Brandon Pringle

I'd been working at a large grocery chain, which I won't say. We had to wear masks. It was very scary all the time when you have doctors going on social media saying people that don't get a vax should be punched in the face. Two doctors in Alberta both publicly stated

that you should lose your job if you won't get vaxxed. It was really fun going to work wondering if you were going to be forced to lose your job.

Kyle Morgan

So I'm right in saying you were, what we referred to as, on the front line. You were an essential worker, right, working at a grocery store.

Brandon Pringle

Yes, sir, and I had to wear a mask every day. I've dealt with migraines for years. Of course, when your oxygen is low, you end up having way more migraines than usual because you're oxygen deprived.

When I asked for an exemption from my doctor, he said, "Well, we in the clinic have decided, as a clinic, that we're not going to be giving out any exemptions." So you know, it wasn't like the science says this or this or that; it was just we, as a clinic, because of basically publicity, we're not giving out any exemptions.

Kyle Morgan

Now, can you just describe what your family relationships were like prior to the onset of COVID there in 2020? Just tell us a little bit about your family.

Brandon Pringle

Very close. We talked to them on a regular basis. We would have family events on a regular basis. We're very connected to our church, as well. We all went to the same church, so we got to see each other every Sunday, as well as opportunities during the week. And Karrina's mom is very infirm. She has very tough arthritis, so she's basically homebound. So she depends on us to be her connection to people.

Kyle Morgan

And who's Karrina?

Brandon Pringle

Yeah, that's my wife.

Kyle Morgan

Okay. Now, you have a daughter, is that right?

Brandon Pringle

Yes.

Kyle Morgan

Do you have a son and a daughter?

Brandon Pringle

Yes, our daughter's 29 and our son is 27.

Kyle Morgan

Can you just describe what happened when the pandemic started, the restrictions were implemented. Do you recall having a conversation with your family around that time? With your daughter, in particular?

Brandon Pringle

Yes, we did. Yes, we did. Right at the beginning. We gave them our faith reasons why we would not be going along with this tyrannical mandates that violate a number of our personal beliefs and freedoms. And we just agreed to disagree. We didn't realize how bad it was going to get. I should have had a warning when they left and said, "Well, the reason why that this is going on so long is because of these un-vaxxed people that won't follow the mandates."

Kyle Morgan

And who said that, just to be clear for the record?

[00:05:00]

Brandon Pringle

That was my son-in-law.

Kyle Morgan

Okay. Now, I understand you do have one grandchild.

Brandon Pringle

Yes.

Kyle Morgan

And what's his name?

Brandon Pringle

His name is Lewis.

Kyle Morgan

And when was he born?

Brandon Pringle

He was born in October of 2020. Sorry, I apologize, September of 2020. Good thing my wife is here to help remember things right.

Kyle Morgan

Okay. Now, if I'm not mistaken, there was a period of time when you weren't able to see your grandson. Is that right?

Brandon Pringle

That's right. We didn't see him for about six months, including his first Christmas.

Kyle Morgan

Do you have any idea why that was the case?

Brandon Pringle

Oh, yeah, it was the mandates and they were absolutely following the mandates. Well, they said they were, of course, they weren't. But it was always a control thing, so you're breaking the law. I mean, never mind the government was violating the Charter and breaking the law themselves. But, you know, it's just what they want.

Kyle Morgan

So that would have been from September/October 2020, until March or April 2021?

Brandon Pringle

That's correct.

Kyle Morgan

Okay. Now, am I right in stating that your children would have been vaccinated? I guess, your daughter—

Brandon Pringle

Our daughter did and our son-in-law did, right off the bat. Our son, on the other hand, almost, actually, got into a fight with security at the mall because they were trying to force him to wear a mask and he refused. And he went on like that for two years. But finally, the bullying and the propaganda and the social outcast wore him down, and so, he finally got vaxxed.

Kyle Morgan

I understand your daughter was pregnant. Do you know the timeline, there, that your daughter was pregnant? Can you tell us about that?

Brandon Pringle

She got pregnant, roughly, about nine months after her first pregnancy. We got a call about two months after— Roughly a year later, we got the call. So perfectly healthy delivery. Everything was perfect.

Kyle Morgan

To be clear, that's your first grandson. Healthy delivery?

Brandon Pringle

Okay, so, I apologize; I'm being corrected here. Everything was not just perfect for her first pregnancy. But Lewis, her son, our grandson, is in perfect health.

But a year later, after a perfect, for all intents and purposes a textbook outcome, we get a call at two in the morning and rush to the hospital and find out that our daughter had lost our grand baby.

Kyle Morgan

Do you know how far along your daughter had been in her pregnancy at that time?

Brandon Pringle

Roughly two months.

Kyle Morgan

I'm just curious about the relationship with your daughter. You spoke about the conversation you had in your family at the start of the pandemic or when the restrictions were starting to be implemented. Just describe the relationship with your daughter and how that progressed.

Brandon Pringle

I had about 30 pages of emails back and forth with her because I wanted her to be able to see facts. So I just simply asked her questions: Why are you trusting what the government is telling you? What is the science that they have to back up what they're saying? Why do you think Bill Gates—who has been very well documented not caring that much about humanity—why is he someone that you trust over me, who would take a bullet for you? Because I just wanted them to answer the questions and have an opportunity to think.

They wouldn't answer any of the questions, and at the end of the day, it was left at,

[00:10:00]

"Well, we're not going to have a relationship with you if this is a topic of conversation." So I basically was like, well, if I want to ever see my kids, then I have to pretend that the emperor has clothes and remark about how amazing and beautiful the clothes are.

Kyle Morgan

Now, did you have a lot of contact with your daughter while she was pregnant?

Brandon Pringle

No.

Kyle Morgan

Leading up to the unfortunate loss of the baby.

Brandon Pringle

No, we didn't even know she was pregnant; they didn't tell us.

Kyle Morgan

So you get this call— Go ahead.

Brandon Pringle

Yeah, we just get woke up at two in the morning, rushed to the hospital. And oh, that was a treat, let me tell you. We get to the hospital. They're all acting like it's Ebola.

So it turns out that our son-in-law, who's vaxxed, has COVID. Gee, that's never happened before. And he is eight days into the quarantine, so he's not allowed in the hospital—our grandson and him are not allowed in the hospital. So I tried to go into the hospital. The hospital will not allow my wife and I to come in. So I went in, and my daughter came out of the washroom, and we hugged and we cried. A girl needs her mom, and so, because only one of us was allowed, I went out in the parking lot and sat in the car while my wife went in to comfort her alone.

Kyle Morgan

I know that neither you or myself are medical experts, but do you have any belief of what resulted in the loss of your grandchild?

Brandon Pringle

No question. After the first two months of lockdown, we knew this was absolute garbage, and so, my wife and I drove across Canada. And you should have seen the fear in people. It was just terror. But we were just asking people questions, you know: Do you know anybody that has this? You know, plant a seed of doubt and plant a seed of truth. People would open up when you told them where you stood, but they wouldn't even talk to you.

And so, I had gone on to the Stats Canada website and it showed how many miscarriages, it showed. We know that what was on the Stats Canada website was a fraction of, actually, what was happening. Many doctors have come out since and said, "We're pressured not to input." I mean, the news reported there were 13 stillbirths in a weekend in Vancouver.

Kyle Morgan

Do you know which vaccine your daughter received?

Brandon Pringle

No, we don't because that's verboten. We weren't allowed to talk about any of it. We told them about infertility. We told them it was not safe. We knew it wasn't safe. They didn't listen to us.

Kyle Morgan

Now, since this incident, how's the relationship been with your daughter?

Brandon Pringle

It's fake. I mean, we still love each other and we hug each other and we smile and just ignore the ginormous elephant. I mean, I attempted at one time to engage my son-in-law in a conversation regarding the Freedom Convoy. He thought that Trudeau was totally justified in implementing the *War Measures Act*—which was not even implemented during 9/11—to deal with the few people playing hockey, drinking coffee, and eating Timbits. He absolutely could not be reasoned with.

[00:15:00]

Kyle Morgan

So would I be right in saying you've never been able to suggest to your daughter what seems to have happened with her child.

Brandon Pringle

Yeah, no, I wouldn't dare. I wouldn't dare. I would probably be risking ever talking to them again if I did that.

Kyle Morgan

I understand there might have been some other effects you experienced in your community, maybe with the restrictions and gathering. Do you want to tell us about that?

Brandon Pringle

Yeah, just so I don't forget: our daughter-in-law lost her baby a week ago.

Kyle Morgan

Would that be your son's partner?

Brandon Pringle

Yes.

Kyle Morgan

Do you know if she had been vaccinated?

Brandon Pringle

Oh, yeah, they got the Novavax. We warned them as well. So did her parents.

Kyle Morgan

I don't know if there's more you want to tell us about that. How's the relationship with that side of the family?

Brandon Pringle

That side is very good. They're willing to talk about it. We try to keep it to a minimum because I don't want them to feel bullied. They're not fully awake yet. They're seeing some things, but I probably won't ever try to help them make the connection about the loss. I think that, hopefully, what will happen is in five years from now, or something, that God will speak to them, and it won't be a soul-crushing thing that they can't get over. They'll realize that they were lied to and manipulated and a lot of it wasn't their fault.

Kyle Morgan

Were there any other effects you experienced in your community related to the restrictions?

Brandon Pringle

I'll just make a quick list here. So Karrina's mom can't go anywhere. She was in an elderly facility and they were treating it like Ebola, so we couldn't visit and couldn't visit and couldn't visit and couldn't visit. And then they changed the rules, so they allowed four people. The four main people, I couldn't be on that list, even though I'm somebody that is kind of the more available person that would actually do small things for her around the place. And so we had to be very creative about how we, once or twice, would get in to visit, to get around the COVID police, I guess you'd call them.

My wife went to the grocery store one day and she wasn't wearing a mask because she's done the research. If you go on the NIH website, you can see 37 studies of how masks don't work and 23 on how they're harmful. That's right on the government website, so we've been sharing this information. And so, this woman in the store was so angry that my wife wasn't wearing a mask that she rammed her with her cart.

I almost never go and get gas from Petro-Canada now because driving all the way across Canada, Petro-Canada—you got gas, but they wouldn't allow you to use their washroom.

[00:20:00]

I don't know if anybody's driven across Canada and had to go to the washroom. I mean, it's just—

What else can I add here? Our church has had a huge split. You know, I find it amazing that people would talk about how loving and kind it is to go get vaccinated and wear your mask—because you're being so loving and kind, you're sharing the love of Jesus when you do that. And then have no problems with hollering stuff that's going on in your personal life across a crowded coffee shop because you're one of these un-vaxxed lepers that should be publicly humiliated.

Our daughter was very dizzy, couldn't walk. She had to take, I think it was a total of three weeks off work in the following two months after getting vaxxed. She couldn't drive, even, couldn't focus. She goes to the hospital and goes to the doctor. Do you think anybody asks the question, "Hey, have you been vaxxed?" I mean, normally, when you go to the doctor, they ask you, "Has anything unusual been going on?" That's the first question.

No, nobody's ever going to ask the question, "Have you been vaxxed?" because that might mean we have to admit that it's traumatizing people. So we're supposed to treat you for a

poison that you know we're just supposed to believe, magically, wave our magic wand and figure out what poison you have in your body. It's unbelievable.

You know, the difference between God and the doctor is God doesn't think He's a doctor.

Kyle Morgan

I don't think I have any other questions for you, sir. I want to thank you for being patient because I know you've been waiting to testify. So I just thank you for that and I'll ask the commissioners if they have any questions for you.

Commissioner Massie

I'm curious about the vax injury that your daughter suffered. Was that reported to the authority?

Brandon Pringle

No.

Commissioner Massie

Did your daughter acknowledge that she was probably vax injured?

Brandon Pringle

No, not at all. We gave them some natural products that are known by a number of doctors to help mitigate the damage and they refuse to take it. They're in absolute, 100 per cent total denial.

Before I leave—I know you might have more questions—I just want to say thank you so much for taking this time to fight for us.

Commissioner Massie

Thank you.

Kyle Morgan

No other questions? Okay.

I want to thank you, sir, for testifying on behalf of the National Citizens Inquiry. Thank you, sir.

Brandon Pringle

Thank you very much. Have a great day. Thank you.

[00:23:45]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 7: Richard Abbott

Full Day 3 Timestamp: 03:56:50–05:06:57

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness today is Mr. Rick Abbott. Mr. Abbott, can you state your full name for the record, spelling your first and last name, please.

Richard Abbott

You bet. It's Richard Abbott, A-B-B-O-T-T.

Shawn Buckley,

And, Mr. Abbott, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Richard Abbott

I do.

Shawn Buckley

Now, I just I want to introduce some of your police service to the commissioners. My understanding is that you were a police officer for a full 25 years [Exhibit WI-3e]?

Richard Abbott

That's correct.

Shawn Buckley,

And you had quite an accelerated career path. So in your first year, you were the class president; you were the valedictorian; and you were the winner of the Officer Safety Award?

Richard Abbott
That's right.

Shawn Buckley
You started in patrol services, which is the normal route. But very quickly you were moved on to a beat team.

Richard Abbott
That's right.

Shawn Buckley
And because of that, you got to know the drug world very, very well.

Richard Abbott
Very well.

Shawn Buckley
And then in year six of your career, you joined the tactical team.

Richard Abbott
That's right.

Shawn Buckley
And my understanding is that's very early in a career for a police officer to be joining the tactical team.

Richard Abbott
At that time, especially, in that era, yes, it was.

Shawn Buckley
Right. Okay, and then you were for eight years, a police sniper. Following that, you taught gunfighting.

Richard Abbott
That's right. When I left tactical section after just about eight years, I moved to our Officer Safety Unit, teaching the patrol carbine program.

Shawn Buckley
Right, and then you were promoted to sergeant. And so, you were sent back to the street to manage a beat team and a patrol team?

Richard Abbott
That's right.

Shawn Buckley
And then they took you back to the SWAT team, basically, in charge of the Sniper Unit.

Richard Abbott
Yeah, I was their training sergeant. That's right.

Shawn Buckley
And then, while you were still in tactical, acting as a staff sergeant, you were promoted to commander for the West Edmonton Division.

Richard Abbott
That's correct: promoted out of Tactical Section, as their acting staff sergeant, back into Patrol Services.

Shawn Buckley
Right, but as a commander.

Richard Abbott
That's right.

Shawn Buckley
So is it fair to say that in your 25 years as a police officer that you were trained quite extensively how to make very rational decisions with an aim to making volatile and violent situations safe?

Richard Abbott
Most of my career revolved around either responding to or commanding, using what we call risk-effective decision-making.

Shawn Buckley
Okay, now you're here to first of all, talk to us about the culture in the Edmonton Police Department when COVID arrived. And so, can you start sharing with us some of the things that occurred in the Edmonton Police Office concerning COVID and the approach taken?

Richard Abbott
I'll talk specifically today about two policies of the Edmonton Police Service that I think will show that, objectively, it crossed from worried about the membership's health and directly into coercing, bullying, and demeaning the membership who had decided not to take the COVID drugs.

The first one occurred in the fall of 2020. It was a disclosure that was forced upon the membership. So the service had said—and I'm paraphrasing—that they needed to know the vaccination status of the membership so that they can make good health decisions for both the police service and the community at hand.

This quickly became clear to me to be a lie. Let's say there's 2,500 combined membership of sworn and non-sworn members of the Edmonton Police Service: there was a handful of the membership who had held off on disclosing their vaccination status. I was one of them.

And to be clear, I was vaccinated and my chain of command knew that I was vaccinated. I'm not here to talk about the reasons why I was coerced into taking the drugs. I'm here to talk about objective reasons of how the policies were not about health.

Shawn Buckley

Right. Just so that I understand. So literally, there's roughly 2,500 people that we're talking about, and only a handful would not have filled in this questionnaire. So I mean, you're like 99.9 per cent plus, and they're saying, well, they need that last handful to fill them in so they can make proper health decisions.

Richard Abbott

Yes, and it gets worse. I had been respectfully speaking through my chain of command.

[00:05:00]

That means up through and including one of the deputy chiefs. I wanted to keep lines of communication open with them, saying, I think if they're not making a legal mistake here, I knew they were making an ethical or a moral mistake.

And I had openly told my deputy chief, "I'm going to fill out your form, but I'm purposely dragging my feet here to keep lines of communication open." And we spoke just like this. I said, "Don't fire me!" I was joking with them. "I'm going to fill out your paper." But when push came to shove, I got a phone call from the President of the Edmonton Police Association.

This might be a good time for me to fill in some three-lettered acronyms that police use. It can be painful.

So there's the Edmonton Police Service, which is the organization itself. There's the Edmonton Police Association, which acts as a union. So although police can't legally unionize, it does act as a union—also called the EPA. And then there's the Edmonton Police Commission. So the Commission is considered the buffer between the politicians of City Council and the police service itself. Across the nation, sometimes they're called the Police Services Board. In Alberta, it's called the Police Commission.

So I got a phone call from the union president telling me, "Rick, they're going to fire you if you don't fill out this form." And I told him, "I told you I'm going fill it out. I'll go fill it out now." So after I filled it out, it came down to one last member of the Edmonton Police Service.

So of those approximately 2,500 people, one patrol constable, who I've gained permission to use his name today: he was a 25-year-combined member of both the Police Service and

of the Canadian Armed Forces, named Constable Rob Kitchen. He was on a *Mental Health Complaint Act* [sic]—on duty as a patrol constable—when he was called in and told that if he didn't fill out the form, there'd be ramifications. He said, "I told you, I'm not telling you my status," and he was suspended without pay at that moment. I use the term tongue-in-cheek, but it's not funny: he was fired on the spot for not filling out a form.

So this is my first example where I think it clearly crosses from, this is not about health, this was about coercion. And they were firing Constable Kitchen to show the rest of the membership that if you defy any of these mandates, there will be serious loss for you and your family.

Shawn Buckley

And I just want to make sure that everyone hearing your testimony understands that when you have 2,500 members and only a couple have not filled in a health questionnaire, that statistically speaking, I mean, you've got the information you need to make any health decisions. That basically what you're saying is there was really no need for them to have 100 per cent compliance.

Richard Abbott

And objectively, since I had shown my hand culturally, saying, "I'm vaccinated." If there was one person left who hadn't filled out that form, you could take a scientific, wild guess as to whether or not that person was vaccinated. You could, basically, still make your decisions on how to make your health choices, as they said this was done for. They were lying. This was about coercion.

Shawn Buckley

Right, okay. Now, there was another incident you wanted to tell us about.

Richard Abbott

The second policy issue I can talk to you about is what I defined as the segregation incident.

So as a commander of a shift, essentially, in one of the divisions in Edmonton, I'd be responsible for a chain of command of, at any one time, four sergeants and their patrol squads, plus some detectives that would be in the area. At any one shift, I'd be working for between 50 and 60 people. This was in the fall, again, of 2020 [sic], where the policies of the police service said that if you chose not to take the COVID drugs, you could go every three-ish days, on your own dime and on your own time, to go get a rapid test to show **whether or not you were sick with COVID.**

So under my command—because nobody could truly disclose who is who; there was supposed to be privacy around that—there was at least, say, on a shift, three or four people who I knew hadn't taken the drugs.

[00:10:00]

Either a) because they confided in me because they trusted me. Or it came later to my knowledge because those who chose not to take the drugs were not allowed to use the lunchroom in the division. They weren't allowed to use the gym and they weren't allowed to work overtime, at that point.

So the issue over not using the lunchroom, really, was even unknown to me until one of my constables came to me and said, "Listen, you know that they're calling the superintendent's boardroom upstairs, now, the 'shame room.'" And I hadn't heard this: the shame room. "No, what's the 'shame room?'" "Well, the unvaccinated aren't allowed to eat with the rest of their squads."

Now, you have to remember what's going on during the shift. We could have a vaccinated and an unvaccinated police member sharing a squad car, responding to the stabbings, to the family fights, to everything you can imagine a patrol service member goes through on a daily basis: sharing the steering wheel; sharing the tight space; I say, kickin' and a'gougin' in the mud and the blood and the beer, arresting people. Policing can be a messy job. Nobody wants to see it. They were allowed to do that messy job with their squad mate in the car.

Shawn Buckley

Right. So they'd be using the same computer keyboard; they could be using the same microphone. One would be driving at one time, one would be driving— Basically, they're touching all the same surfaces.

Richard Abbott

And responding to these crowds of people, all day long, together. But when they came back to the division, they weren't allowed to break bread together. So the boardroom became known as the "shame room" because there were some—a few—members of the service that were sympathetic to their squad mates who decided not to take the COVID drugs and they'd go eat with them in the "shame room."

So okay, I had had enough—that was one of the straws that broke this camel's back—and I wasn't going to allow that under my command. I wasn't going to push that policy. And I knew, based on my experience already with the vaccine disclosure forms, that the police service wasn't listening to me anymore. They were going down this road irrationally.

And I went out of the chain of command, which is not my normal course of duties, and I wrote a letter to the then-Minister of Justice in Alberta, Kaycee Madu. I wrote him a letter directly, telling the story of segregation inside the police service buildings and outlined, as I just said to you, how irrational it was and clearly, this is not about health. This is about bullying; this is about coercion. The Honourable Madu sent that directly to the Director of Law Enforcement, where that complaint should have been directed, and had it investigated by the Edmonton Police Commission.

Shawn Buckley

So can I just stop you there. So this is an October 26th, 2021, letter.

David, can you pull up the computer screen I have for exhibits?

And I'll just tell you, Mr. Abbott, that we've entered this is an Exhibit WI-3b. But I just wanted to read and have you comment. Basically, I'm going to start at the paragraph near the top of the page, "The unvaccinated." And so, this is your letter. But I just want to read you a couple of paragraphs and have you comment on it.

So you write:

The unvaccinated are expected to respond to calls for service, sharing the same police car, hold the same radio mic, use the same mobile workstation, share the same washrooms, showers, locker rooms, parade room, computers, and even use Category I and II uses of force alongside their brothers and sisters in patrol. But the unvaccinated who submit to rapid testing are not allowed to use the lunchroom or the gymnasium.

Tonight, I witnessed unvaccinated members segregated from their work mates to eat and it was disgusting. Not just disgusting because I'm ashamed of the poison work environment our EOT has created, but equally disgusting because the segregation plans are working on our people. The members of the squads that exclude their friends are doing so mostly out of fear of the tyranny from our EOT and chief.

[00:15:00]

My subjective analysis is that most of our patrol members are pro-choice. They admit to me that they're afraid of becoming the next Constable Robert Kitchen.

And I'm just going to skip down and read another paragraph, but I'll just scroll down so it's up on the screen. It's the one that begins with, "We are told."

So you write:

We are told the reasons for segregating the unvaccinated from the lunchrooms and gyms, because this is where 'science' reports that COVID is spread, yet no one can cite any studies. This argument falls flat on its face with even the slightest amount of reason and common sense applied. Those who are taking rapid tests are the only persons in the building known to be COVID-free.

And I'm just wondering if you can comment for us on those paragraphs.

Richard Abbott

I'll give you some more insight into risk-effective decision-making. And I wish that the Edmonton Police Service could have taught this to the nation, although commanders across the nation use this same matrix that I'm going to quickly teach you right now.

It's an acronym: NRA. It does not refer to the Second Amendment Rights group in the United States. It stands for whether or not the decisions we make are necessary, risk-effective, and acceptable. So we do this every day. And I tried to get my command structure to use that NRA risk-effective decision-making matrix against this very decision of not allowing our people to eat in the lunchrooms.

Is it necessary to do this to our membership? There is no data to prove that, so it would stop at the N. We wouldn't go on to the R, in this. Is it risk-effective? Well, it doesn't pass the R test, either, of whether this is risk-effective or not because those who are testing are the only ones that we could say are safe from COVID. The others are not. So there's no risk-effective decision to be made there. But more important to this Tribunal—and I think the

legally-trained will understand this very well—is the A stands for acceptable. Is what we're doing to the people I worked for that night going to be acceptable to the courts tomorrow? Is it going to be acceptable to the courts in 10 years? What about in 30 years?

So to quote another Edmonton Police Service member here, that I want to give credit to—just recently in Edmonton, we made apologies for raids that were made in gay bathhouses in the 1980s. It was wrong. And we're apologizing for that, today. Had we used the NRA matrix in those situations, we would have avoided the embarrassment and the wrongdoings that were done 30 years ago. If we were to apply that acronym here today, we all know that this is not going to bode well for our institutions: tomorrow, 10 years, or in 30 years. It was wrong yesterday. It's going to be wrong in 30 years.

Shawn Buckley

Now, my understanding is that not only were unvaccinated officers prevented from going to the gym and the lunchroom, but they were also prevented from overtime shifts.

Richard Abbott

Yeah, for a short time. Yes, they were. I can't speak to the timelines.

Shawn Buckley

Okay. Now, there was something else that happened with you concerning the—I'll call them blockades or the Trucker Movement. I'm just wondering if you can share with us what your experience was and how you came to do your kind of own investigation there.

Richard Abbott

Yeah, you bet. I had been questioning what was going on in both Ottawa and in Coutts and Milk River in Alberta. Normally from media, we could get different perspectives and interpret from that what was going on. But from what I was watching in the mainstream media versus in any of the independent media sources I was watching, they were so diabolically opposed that I had decided that someone's not telling the truth. The mainstream media was going off on racists, misogynistic, terrorist-types blockading the border in Coutts and protesting in Ottawa.

[00:20:00]

It's a small community, this policing service, and I wanted to speak to someone in Ottawa who was witnessing it. And so, my number somehow found its way to a Canadian hero named Constable Danny Bulford. He shared a similar career path as I did, as a sniper with the RCMP's Emergency Response Teams, and then became involved in assisting with the protests in Ottawa.

Mr. Bulford phoned me. And I'd never met him before, but I'd seen enough of him on TV and we spoke the same languages that I wanted to ask him what's going on. And he told me not to believe him. He said, "Go see for yourself." He said, "Either come to Ottawa or go—" And he hadn't been to Milk River. He said, "It'll be the same crowd. Go see for yourself who's telling the truth." So I decided to travel to Milk River.

And within a day, I did just that. And when I landed in Milk River, it didn't take me long—

Shawn Buckley

And I'll just stop you. Did you travel with anyone else?

Richard Abbott

I have to be careful with

Shawn Buckley

You don't need to name names.

Richard Abbott

names, but I had travelled with another police officer who had been vocally critical of the mandates across the nation, as well. And this is a good point to make: I'm not alone in this. There's cops like me across the nation who've spoken out, but we'll quickly learn here why they're keeping their heads down.

Shawn Buckley

Now, were you on duty that day that you went to Milk River?

Richard Abbott

No, I was on a day off.

Shawn Buckley

And were you in uniform?

Richard Abbott

No, sir. I was in civilian attire.

Shawn Buckley

Okay, so you're just taking your own time to find out for yourself. Not as a representative of the Edmonton police force. But you just want to see for yourself what types of people are participating because the media is telling you one thing—basically, that they're dangerous. What do you recall the media saying?

Richard Abbott

I took it that it was, essentially, a terroristic activity that had taken over our border.

Shawn Buckley

Okay.

Richard Abbott

So prior to going, I did study Edmonton Police Service policy to ensure that I wouldn't break any policy. And at the time, I thought I had maintained, still, the civil right to travel

within my province and I thought I still had freedom of association. And I wasn't going to violate any of our social media policies. I just wanted to go see for myself who is telling the truth. And if I had a chance, my second goal was to encourage attendees and police, both to be peaceful.

So when I got down to Milk River, it didn't take me long to determine who was lying. And excuse me for using such extremist language, but there was no happy medium between whether or not we had terrorists at the border or whether it was the equivalent of a Canada Day celebration. But what I saw in Milk River was one of the funnest Canada Day parties I've been to. It was, truly, horsey rides, jumpy castles, barbecues, and teeth. When I say teeth, it's because people were smiling. It was teeth everywhere. It's remarkable to me to this day.

Shawn Buckley

Now, can I stop you because you've kind of described, you know, the media was referring to these people as terrorists. Do you recall also, perhaps, our Prime Minister calling them things like racists and misogynists?

Richard Abbott

I do.

Shawn Buckley

Okay. So you're going down to see these racists and misogynists and terrorists and what you see is, basically, the best Canada Day celebration you had ever seen?

Richard Abbott

I saw Canadians there. And if I can brag, I think I'm a good read of people. I've spent my career reading people and I believe I'm good at it: this was Canada there. It wasn't the latte/lunch crowd, necessarily. It wasn't just one demographic. It was every Canadian from every walk of life, and if I had to generalize and use a biased opinion of who was there based on my experiences, I would have actually called these farmers.

I come from a rural upbringing in Saskatchewan and I know a farmer when I see him. And although there was nurses, there was doctors there, there were plumbers, there were electricians, it was farmers and farm families that were generally protesting in Milk River.

[00:25:00]

Which I had now analyzed enough to see as a lawful protest.

Shawn Buckley

And I'll just stop you there. So it was a lawful protest because, actually, it was the RCMP that was blockading the road, just to prevent these people from going to Coutts.

Richard Abbott

That's correct.

Shawn Buckley

So they weren't responsible for actually breaking any law. So what they were doing there was a 100 per cent legal, as was your understanding.

Richard Abbott

Other than parking in ditches, which would violate the *Traffic Safety Act*.

Shawn Buckley

Oh, okay.

Richard Abbott

There was no criminality there. This is important for me to paint a picture of the type of people who were protesting in Milk River, too, because I respect them so much for it. Where I'm from, when we go to a Canada Day celebration, we'll imbibe and we'll do it respectfully. We'll put a drink in a coffee cup. I know that there was alcohol in Milk River, but I never saw one open drink and I watch for these things.

Shawn Buckley

Can I just give the people listening to you a little more perspective when you say you're analyzing things. You were a police officer, at that point, for 25 years, and over half of that time in a tactical unit. That's correct?

Richard Abbott

That's correct.

Shawn Buckley

And even a regular police officer, it's life and death being able to evaluate people, to determine whether or not they are a threat, either to the officer or to other people.

Richard Abbott

I'm always looking for bad guys. I cleared this room before I came into it.

Shawn Buckley

But the point I'm trying to make is that you are trained, specifically, to identify threats and evaluate people because the members of you and your team and innocent bystanders, and even the bad guys, depend on you being able to make accurate assessments.

Richard Abbott

That's correct.

Shawn Buckley

So you're not just somebody who, you know, works selling shoes, who have gone down to evaluate these people. You are trained in making this evaluation. And did you see any dangerous people?

Richard Abbott

None.

Shawn Buckley

So and I'm sorry to interrupt you, but I just thought it was important for people to understand: you're a professional at making a threat assessment.

Richard Abbott

That's right.

Shawn Buckley

Okay. So I'll let you carry on, to see what you saw. And I also want you to share with us how the police that were at Milk River would have been experiencing what was happening.

Richard Abbott

Sure, and it is important to understand that I saw this as a lawful protest because the RCMP were blocking the highway at Milk River, which is maybe 30 kilometers north of the border at Coutts. And my take is nuanced. I understand why the RCMP had done that. This was to minimize the number of people that could get to that unlawful protest down at Coutts.

The police members who were in Milk River I met with— I say this tongue-in-cheek, but it's true: this is the easiest overtime police can make. This is the easiest money police make is when they get paid overtime to go watch over you, and you, and you on the Commission. There's no police work to be done. It's minimal, other than dealing with what we'd expect good people to do, like parking in ditches and make noise. It was easy work for the RCMP, and they admitted to me as much.

Shawn Buckley

How were the people who were at Milk River, at this lawful protest, how were they treating the police that were there?

Richard Abbott

As good Canadians treat the police. I've always had good experiences as a police officer. Even though the news, as we've heard today, dwells on the negative, that has never been my experience with Canadians. Canadians are very respectful of our police agencies and are very supportive. They were exactly the same in Milk River and in Coutts, which we'll get to shortly.

Shawn Buckley

Do you mind— David, can you pull up the computer?

You provided me some photos that were taken at Milk River, and so I just want people seeing your testimony to understand what you're watching. So these are the types of people that our Prime Minister would describe as terrorists and misogynists.

So this is one such person at Milk River [Exhibit WI-3d]?

Richard Abbott

One of a thousand I met that day.

Shawn Buckley

And this is what you mean when, basically, you say smiling, lots of teeth.

Richard Abbott

Teeth everywhere.

Shawn Buckley

Okay, so this is representative of the type of interaction you were having?

Richard Abbott

That's right.

Shawn Buckley

And I'm just going to go to another photograph. This is also representative of the type of interaction you were having [Exhibit WI-3c]?

Richard Abbott

I believe he's a vet, if I remember correctly.

Shawn Buckley

Okay, so a war vet, and then I just need to move to another program. Sorry.

[00:30:00]

I just want to show four photographs from Milk River. So this is another one [Exhibit WI-3h].

Richard Abbott

Yep, another one of a thousand.

Shawn Buckley

And then, finally, another one [Exhibit WI-3i]. So these are photos you sent me and these are just the typical kind of farmer Canadians, as you described them, that you encountered

at Milk River. So what was then your impression of the media reporting, now that you'd taken Danny Bulford's advice and you'd gone to see for yourself?

Richard Abbott

Yeah, it didn't take me long to see who was not telling the truth. Independent media were recognizing the horsey rides, the bouncy castles, and the barbecues. I decided, with what I'd seen in Milk River, that the media was lying.

Shawn Buckley

Okay. Now, something else happened at Milk River. Can you tell us about that? You were approached by a Calgary police officer.

Richard Abbott

Another brave Canadian police officer, Brian Denison, and he had left the Calgary Police Service because of the mandates. He asked me if I'd speak to the crowd. He said the crowd was itching to hear from a current police officer as to what we were thinking. There was, at least, 100 people gathered near an impromptu stage they had erected—maybe 200 people—and he asked if I'd give words to the crowd.

And since I had already determined that those folks were lawfully placed, legally there protesting, I wanted to encourage them to be peaceful because I also understand that things can go wrong quickly in crowds like this. With the lies that the mainstream media was producing over this time period, I also saw it as a powder keg and saw that they were being divisive. And so, I wanted to encourage this crowd to be peaceful.

Shawn Buckley

Okay, and what happened?

Richard Abbott

I told them that. I essentially told the crowd that as long as they're peaceful, they're lawfully placed. My understanding is that the *Charter of Rights and Freedoms*, at this time, still stood. I'm not a constitutional lawyer, but I knew at the time that none of the courts across Canada had gone through what's called an Oakes Test— And sir, you'll be able to explain this better than a cop. But essentially, because no courts had said that Canadians' *Charter of Rights and Freedoms* should be suspended, that these folks' Charter rights stood and that means that they could lawfully protest. And I encouraged them to do just that, but peacefully.

Shawn Buckley

And then did anything happen with your talk?

Richard Abbott

Well, within the next days, someone had obviously videotaped me giving this speech and they posted it on, I think, their Facebook page [Exhibit WI-3j]. This went back to my executive officer team in Edmonton who, within 10 days, suspended me without pay for violating Edmonton Police Service social media policy. And you need to know that I've

never had a Facebook page, even under a pseudonym. I've never been involved in social media and that I've been accused of discreditable conduct for what I did in Milk River.

Shawn Buckley

And if I understand the policy, basically, it was alleged you violated their policy because it was said you posted it online and yet, you did not post it online.

Richard Abbott

I had not.

Shawn Buckley

Okay, but you are suspended without pay. Now, you weren't finished there. You're at Milk River and you travel somewhere else. Can you tell us about that?

Richard Abbott

I did continue to the border at Coutts. I'd seen enough in Milk River; now I'm really interested as to what's going on at the border. So I did, and when I got there, I was met by RCMP on the perimeter who guided me into where the blockades had happened.

And this was a different crowd. There was very few people there—maybe 50 people—and again, the RCMP freely were letting people come and go from where the protesters had set up a blockade. And I found out that, only in the respectful, peaceful, Canadian way, they had effectively blocked the border at Coutts, but they did, of course, leave a safety lane open for ambulances to come and go through the border.

[00:35:00]

Shawn Buckley

Okay. So unlike Milk River, this isn't a legal blockade. So they are protesting, but by blockading. They're leaving an emergency lane so that, you know, if there's an emergency, the emergency vehicles can get through.

Richard Abbott

That's right.

Shawn Buckley

Okay, and how would you describe this group? This is a smaller group. How would you describe them? What do you think their backgrounds were and who are these people?

Richard Abbott

I would generalize, again, as calling them Christian farmers. I felt most of the folks were God-fearing, rural farmer-types. Of course, there was trucks there that they'd used to blockade, but I had also noticed that at least one of them was a cattle truck. So I would describe them as the same group that was up in Milk River, but it wasn't a party. This was serious. And they knew that they'd unlawfully blockaded a Canadian border.

Shawn Buckley

Right. So you met with the leaders while you were there.

Richard Abbott

I did, and their counsel.

Shawn Buckley

Okay, so can you tell us about that experience?

Richard Abbott

You bet. So I was asked, again, in Coutts to speak publicly to the crowd of folks that were there: to encourage them to be peaceful. And I said, "I can't speak to a public group here because you're blocking your border." And I said though that I would speak to the de facto leaders who were there with their counsel present. Their lawyer was there. And I told them that this was illegal. I told them that they were going to get arrested and this is how they do it safely and peacefully.

I encouraged them. I said, "if this doesn't go peacefully, you will have lost your message to Canadians." And they completely understood that. So I went through the actual arrest process with them on how to make it easy for the police to make the arrests. And these leaders understood exactly what I was saying. They thanked me for it and their lawyer thanked me for putting it into common language, from a police officer's perspective, on how to make this safe.

Shawn Buckley

So I just want to understand. What's happening is they understand they're going to be arrested.

Richard Abbott

That's right.

Shawn Buckley

So what was your understanding, in speaking with them, as to why they were choosing to be there, knowing they were going to be arrested?

Richard Abbott

They were bringing to light what Canadians hadn't heard until the protests in Ottawa and the blockades in Coutts. They wanted to have their Charter freedoms lifted. They wanted to be able to travel, was the biggest version here. They told me that they wanted choice. They didn't want to be coerced into taking any experimental drug for any reason.

So they were bringing to light the Charter violations being acted upon them. They knew it was a heavy-handed way of doing it, but nobody was listening to them prior to this. I believe our democracy is based on that. Someone said that you and I have a moral responsibility to protest against immoral laws and that's exactly what these folks were

doing. They saw a moral necessity for them to speak out against immoral laws by a tyrannical leadership.

Shawn Buckley

And would you describe the people that you saw there and interacted with as peaceful?

Richard Abbott

Horribly so. These were my relatives. They were our aunt and uncle. It's your cousins. It was us. I saw zero bad guys in this small group of people that were blocking the border. I feel like they were forced into this protest.

Shawn Buckley

So you basically saw a group of Christian farmers who felt forced to take a stand, to have a voice, who understood that they were going to be arrested for just trying to have their voice heard.

Richard Abbott

That's right.

Shawn Buckley

And you were doing the service of explaining to them how to be arrested peacefully.

Richard Abbott

That's correct.

Shawn Buckley

And they actually thanked you for that advice.

Richard Abbott

As did their counsel.

I should get this in now. I know it's impossible to measure,

[00:40:00]

but after the time that I spent down there, and any Canadians who took the time to watch how the surrender went down at Coutts— I'm not taking credit, but I know I had a small piece. But those small pieces add up. I had a small effect on what a wonderful ending it was to that blockade there: a completely peaceful surrender where we saw the protesters hugging the RCMP who had been set up on the border during their blockade.

Shawn Buckley

Can you describe that more for us, just so that the people watching your testimony understand exactly what you're talking about?

Richard Abbott

And I can't speak to what initially led up to it, but it was within two days after my visit to Milk River and Coutts—I think it was after the *War Measures Act* was called by the federal government—that the surrender happened. And the protesters in Coutts, there's a video of them lining up with another line of RCMP, like you'd see at your kid's sports event where the hockey teams would shake hands after. They'd all queued up to hug each other, to thank each other for ending the blockade.

Shawn Buckley

Right, and then they were all peacefully arrested.

Richard Abbott

I can't speak to the arrests that day. I don't know that part of the story, who was charged.

Shawn Buckley

Now, you attending at the Coutts rally, later created some difficulties for your employment.

Richard Abbott

Yes, like I said, I went back that very same day. I went home and went back to work. And within my first few days of returning to work, I was put on what's called administrative leave, which is, in English, suspended with pay.

And then, within a few days of that, there was an article on a mainstream media source that showed me down in Milk River speaking. Again, the service insinuated that I did that public announcement or speech in Coutts. I did not. And when that mainstream media article hit, I was suspended without pay. And the reason given by the police service was that my conduct was discreditable and I had violated our social media policy.

Shawn Buckley

Now, I just wanted to contrast this because you would agree that both at Milk River and Coutts, I mean, this is a protest that's taking place.

Richard Abbott

That's right.

Shawn Buckley

And you know, not far distant in time from that, there was a Black Lives Matter riot in Edmonton.

Richard Abbott

Within the same year. That's right.

Shawn Buckley

Right. And are you aware of any arrests from that riot?

Richard Abbott

I was not directly involved in any of the arrests from any criminal activity, but there was, yes, charges laid.

Shawn Buckley

I'm sorry. Okay.

Richard Abbott

There were charges laid.

Shawn Buckley

And there was property damage in that protest, am I correct?

Richard Abbott

I believe so, yes.

Shawn Buckley

You were given some other photographs and I just want to pull that up. So can you describe for the audience what this is a photo of?

Richard Abbott

This is a still pulled from Global News in Edmonton showing protesters of the Black Lives Matter [Exhibit WI-3]. This is a Marxist group, for the record. This is, politically, an open Marxist organization, protesting against police and recommending the defunding of police. And those are Edmonton police officers taking a knee, ostensibly, agreeing with the Marxists chanting in front of them.

Shawn Buckley

Okay and I'm just going to show another photograph [Exhibit WI-3a]. Can you describe what this photograph is?

Richard Abbott

Again, those are Edmonton Police Service officers taking a knee to,

[00:45:00]

ostensibly, in support of the Marxist Black Lives Matter protesters.

Shawn Buckley

Okay and I'm going to show you one last photograph [Exhibit WI-3f]. And you have deliberately hidden the identities of these officers, but can you tell us what this is a photograph of?

Richard Abbott

Those are Edmonton police officers posing with, apparently in support of, an Antifa member. So these folks call themselves anti-fascists. I don't think the irony of that name is lost on anybody on this Commission, but apparently, standing in support with an Antifa member.

Shawn Buckley

Now, with regards to the police officers that knelt to Black Lives Matter and with regards to these officers posing with an Antifa member, are you aware of whether there was an investigation into those officers as to whether or not they compromised the Edmonton Police Service?

Richard Abbott

I can't speak to whether or not an investigation was done, but I can say that there were no *Police Act* charges against any members of the Edmonton Police Service in support of the Marxist group or the terrorist group, Antifa.

Shawn Buckley

Okay, so you lost your job for what you just described occurred in Milk River and Coutts. That's correct?

Richard Abbott

That's right.

Shawn Buckley

But the officers that, you know, bent their knee in front of the media, in front of Black Lives Matter protests and the officers that deliberately took a photo-op with Antifa— There was no disciplinary action against them.

Richard Abbott

None to my knowledge.

Shawn Buckley

Do you have an explanation for that?

Richard Abbott

This is about policy and politics. Of course, they rhyme for a reason. I'm speaking to this panel today because I can objectively speak to the policies of the Edmonton Police Service: They were not about health. They were about politics. And it hurt our membership and it has hurt Canadians.

It's hurt me and my family, personally, obviously; I had to take an early retirement. So my travel to Milk River and Coutts on a day off, to encourage peace, well, after pension adjustments and loss of wages over the next 10 years—I tried to stay in shape; I think I had another 10 years left in me—will cost my family millions. But I'm not the only one.

We're losing police officers at a rate that nobody wants to talk about. Constable Robert Kitchen being fired for holding his ground on who he thought he should disclose his personal health choices to, will have a far-ranging effect on our communities and our nation, if we can't expect our police officers to speak up. So it's not just the individual. It will affect our communities and it is going to affect the nation, in terms of this piece.

Just this week in Alberta, our premier has promised 50 new policing positions to each Calgary and to Edmonton. I've been speaking with my old co-workers at the Edmonton Police Service, and they're the first to say, "That's nice. Where are we going to get people who want to fill those positions?" With what I've been going through— And I'm not alone on this: we have officers like me across the nation, maybe, with not as big a mouth as me because they know, now, that you will be fired if you speak out politically against the orthodoxy of the day. So the question is, where are we going to find those 50 people to fill those positions?

I can speak to where there's three of them who've spent a career at perfecting our craft. It takes a lifetime to get good at these jobs. And they're pushing us out of those positions because we don't take a knee to the orthodoxy of the day.

Shawn Buckley

Mr. Abbott, I think our bigger danger is the type of person that will fill police positions, understanding that they're guided by politics and they find that acceptable.

[00:50:00]

I think that that's a much larger danger to Canada than those spots being vacant.

Richard Abbott

I use the word "cull." They're culling us from the police agencies across the nation. I can't speak for all of them, but we know each other. We speak from coast to coast, and they're in each one of your communities, but they're being pushed out of your police agencies.

Shawn Buckley

Can you elaborate a little more? Because it sounds like what you're saying is that the officers that do not want policing to be politicized, and want to honour our *Charter of Rights and Freedoms* and want even to be able to exercise their own rights and freedoms are being pushed from the police service in favour of a different personality type.

Richard Abbott

This is how dangerous it gets. So I'm the prime example. I made a six-figure-a-year job and there's police officers in each one of your cities across the nation who are up against *Police Services Act* charges just like me. I can't mention their names because they're trying to keep their heads down, and I don't blame them for that. But they were there trying to fight. So I can't go into details with those people because it endangers them and their families so much to speak out.

A lot of them are just trying to put their head down, so they don't lose their livings over having had a political opinion. Mine is egregious: I was on a day off, in civilian clothes. I never mentioned my company when I was a police officer; I purposely kept the agents that

I worked for, to indemnify them. But now this is public information. I'm one of a few Canadian police officers across the nation who've paid the ultimate price for this and now the rest are, rightfully, running scared.

Shawn Buckley

Right. Mr. Abbott, I don't have any further questions for you, but I expect the commissioners will.

Commissioner Kaikkonen

Thank you for your testimony.

You said when it comes to immoral laws, we all have a responsibility and a necessity to speak out against tyrannical laws. So taking that thought just a little further, the underlying premise of our institutions in Canada is to protect against any law that degrades humans and to recognize that any law that degrades humans is, essentially, an unjust law. I recognize that these were policies within the institution, not necessarily laws, but they still dictated a policy advocating, in your words, segregation.

So my question is, how do we reconcile this with other laws in the broader Canadian community? And I know you've alluded to the Charter, which actually demands accommodation and inclusivity of both citizens and minority voices. And the second part of that is: In your opinion, is there a way to change the institutional mindset within policing, and other authorities like policing, so our country doesn't break down into lawlessness, even when we are witnessing the infiltration of politics within these institutions?

Richard Abbott

Yeah, I can answer both of those. This is officially into opinion evidence now, which I think is allowed here.

The first one is— And I'll have to, partly, respectfully disagree with one of your earlier guests who said that in looking at how Jesus would respond to this— Although, for our brothers and our sisters who are going to come to us now, it's hard for people to say they were wrong over these policies. We need to be there with open arms for those people when they figure it out because they are figuring it out now quickly.

Where I disagree with your earlier guest is we need some of these leaders who, to this day continue to push these policies, to be held to account. The door is quickly closing, if I can paint a picture. We're here to still speak to you, but the door is closing. And if we don't hold **those men who held high places—to put some more Canadiana into this, from the Rush song *Closer to the Heart*—**

[00:55:00]

they need to act like they're in high places. And if they don't, we need to hold them to account. So that means litigation.

The second part of your question— The first part was about how do we get through it and the second half, excuse me, again, was?

Commissioner Kaikkonen

Just the institutional mindset: how do we prevent lawlessness from becoming the norm?

Richard Abbott

Bold leadership. Leadership matters. We need bold leadership in these institutions. So not just leadership: We need bold leadership. Leadership matters. It's a trickle-down effect. I saw some horrible behaviours come out of some of the people that I worked for in the police service. When we have weak leadership espousing violating human rights by segregating them in lunchrooms, it justifies poor behaviour amongst the employees.

I had one of the sergeants that I worked for say out loud that they didn't think any of the Edmonton Police Service members who refused to take the drugs, [they] should not be given access to health care. So these are police officers that are going to overdoses every day— they're truly heroes on the streets.

So the squads that I worked for, I could easily say they'd save one fentanyl death per shift. They'd save that person, and they would rush them to the hospital to get care that they dearly needed, and we dearly believe they need. And then, out of the other side of their mouth, say an employee who doesn't take the COVID drugs, we shouldn't let them get access to health care. That's from weak leadership.

We need bold leadership in all of our institutions and that starts with the truth. Just tell the truth. And I can speak specifically to police agencies: use what you've been trained to use in risk-effective decision-making and decide whether or not what we do in the future is necessary, risk-effective, and acceptable. Will it be acceptable to the courts in 30 years? I think you'll see changes in how we respond to these.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

And there's more questions.

Commissioner Massie

Well, thank you very much for your testimony. I have a question, which is about when police officers are called to intervene in any situation, I guess that there is a risk there that people they will interact with are not vaccinated and they don't know, right?

Richard Abbott

That's right—every day, all day.

Commissioner Massie

So was there something put in place by the police department, in order to protect policemen from these dangerous, unvaxxed people?

Richard Abbott

I laugh because it's laughable today. We'd cry, if we couldn't laugh. No. The masking mandates were the same across the nation, which we all know, when we were doing it, was not true. And most people complied with what we knew to be not true.

There's a certain segment of the people that I work for, though, the frontline officers in the police service—and I can't get anybody in trouble with this today—they knew it was a lie. But they'd still go to your family fights; they'd still go to the robberies; they'd still go to the stabbings. And the smart ones never wore a mask because they knew it was a lie. They were no different than the politicians who put on a mask every time a camera came around. "Oh, we better put on our mask. Here comes the superintendent." And then they go to your stabbing without it.

I don't know if that answers your question. There was nothing— You know the same stories as I do. These people were brave. They were going, even at the beginning when we thought that there could be an actual illness. Of course, we quickly learned, within months, that nobody was dying from COVID and then it became easier. But there were no measures to stop that. The essential workers went to work every day.

Commissioner Massie

So I hear you talking about bold leadership in order to get out of this difficult situation we're in. It seems to me that what bold leadership does well is establish trust:

[01:00:00]

between people, with one another, and with the institution. How can we build trust in a culture of lies? What you described, it seems to me, that police officers have licence to lie.

Richard Abbott

Thank you for the nice segue into what the bold leadership can do. So I was a middle manager. I understand that you can do nothing right. People are going to disagree with you whether it was the right decision or not. So when I say bold leadership, I mean what we need is for our leaders, at every level, to just simply abide by codified Canadian values.

So when we're responding to these high-risk incidents in policing— I spoke about our decision-making processes. When I'm scared, when people are going to get hurt, and when we're under time constraints, we abide by what we called standard operating procedures. So I don't know what to do during a car chase, where it's horribly dangerous, I'm under serious time constraints, and I'm scared. All I do is abide by my standard operating procedures, my SOPs.

We have the SOPs written for Canadian politicians. We have Canadian codified SOPs written for the leaders of our institution. It's called the *Charter of Rights and Freedoms*. So when you're scared, when you think people are going to get hurt, and when you're under time constraints, just point at the Charter and say, here are codified Canadian values that are my standard operating procedures. Until those are lifted, our bold leadership just has to point at those and say, this is what Canadians are going to do next time.

Commissioner Massie

Thank you.

Commissioner Drysdale

Just so that we both know that you are going into the opinion area of this testimony, which is acceptable. I've got a question and I'm going to refer to a couple of witnesses that we've had prior to you on here.

A day ago, I think it was a day ago, we had a retired judge on the stand, and he talked about—I don't want to put words in his mouth, but as I heard his words, he was talking about a failure of the judicial system, in his opinion. Or at least, he was disappointed with the way the judicial system has acted. And I asked him a question about why that would be and he said to me that the judges felt they were under pressure. And one of the things I asked him was describe that to me: What does that mean? Does that mean, if they rule a different way, they're going to get fired, or so on and so forth. And my understanding of his answer was, no, they wouldn't get fired, it was more of a peer pressure, if I understood that correctly. And I'm prepared to be corrected on that.

We talked to doctors previously and they've sworn an oath, like a judge does and like a police officer does. And the doctors were afraid: they were afraid of losing their licence, but they weren't afraid of proceeding with a procedure or administering a drug they knew nothing about, or they knew that it hadn't been tested.

And I can go through the list of all of those people—teachers, doctors, ministers. We've had ministers on here saying the same things, police officers.

Police officers— Sorry, but they require special attention. Police officers are probably some of the bravest, gutsiest people I've met in my life, you know. Somebody's in terrible distress, someone's in a terrible accident, someone's gone crazy, and you have to walk in there. You're just an ordinary person. Courage is what defines the police, or what has defined the police, in Canada.

And yet, listening to all of these people—the doctors, the lawyers, the judges, the police and people carry guns—the most compelling testimony that I heard here today was a truck driver who said he had 40 employees, and he and his wife sat down one night and decided they have to speak up, even though they might lose everything, and they went into it knowing that.

And so, my question after all of that preamble: my question to you is, we talk about trust in our institutions, we talk about leadership in our institutions.

[01:05:00]

How can we ever ask Canadians to trust all of those people when it went so wrong? How is it the police took orders that they knew or ought to have known were illegal? How did they beat people in Ottawa? How did they kick veterans? How did they trample them with horses?

I'm sorry, that's a heck of a lot to ask you to comment on. But when I see what were heroes—and are heroes, in this instance, but they're not over here, they're hiding—and I see a truck driver risking his family, his business, and one person said 40 other people and his employees. So probably 100 people he put on the line. Can you help me out with understanding that?

Richard Abbott

In a word, no. I debate the same things as you and I get asked this all the time. And I try to juxtapose the police officers who run towards the gunfire with the political courageousness.

And I've used this example before: Mr. Dennis Prager, an American conservative Jewish radio host, he speaks about how things go wrong in a society and he, specifically, was speaking about the Holocaust. And he said that you get three things added together will end in bad things happening.

Propaganda. So my answer, first, to you is that police officers are no different than the truck driver. They are propagandized exactly the same way, and we heard this morning that we've had a war of propaganda on us. And they put their pants on one leg at a time just like you.

The second part of when things go wrong is when there's something to gain. And in these cases, I think it's not so much gain to the population, but it's keeping your job is something to gain by not saying anything.

And then, Mr. Prager says the third thing that happens is a paucity of people courageous enough to speak out—and I didn't know what paucity meant. Paucity means hardly anybody will speak out about this. But what I have seen is that sprinkling of courageousness goes across every vocation. It actually isn't concentrated anywhere.

So if I can leave you with any good news, is I think that paucity of courage is sprinkled throughout Canada and it's contagious. So we have a few rare doctors, we have a few rare cops, we have a few rare nurses. We have a few in every vocation who's spoken out against this.

The other truth is—I'm going to agree with you—is that the blue-collar folks, the folks that work with their hands who are the backbone of this nation, I would say that we've seen more of them, maybe.

But anyway, there is courageousness sprinkled out through society. The good news is maybe there's a concentration of courageousness amongst the working class, amongst the trades, who are the backbone of this society, and I think that's what gives us hope. Don't go looking for the police to do it. Don't go looking for the doctors to do it. It falls on every one of us, is my answer.

Commissioner Drysdale

And I understand and I agree with your statements. One of my other questions to you is—and I think you've, perhaps, answered it—about propaganda, you know. And the question is, do we have a free-market media or news group in this country anymore? And what did they contribute to the damage that's been done to our society?

Richard Abbott

I won't mince words here, again. The mainstream media is lying to you about what's going on in our nation. And I know it sounds extreme to put it in those terms. That's my personality. There is no halfway with this. They are lying to you about what's going on, on a myriad of topics, not just COVID.

Commissioner Drysdale

Thank you very much. And thank you for your service.

Richard Abbott

Thank you.

Shawn Buckley

There being no further questions, Mr. Abbott, I sincerely thank you for your testimony, on behalf of the National Citizens Inquiry.

Richard Abbott

Thank you, folks.

[01:10:07]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 8: Robert Holloway

Full Day 3 Timestamp: 05:49:08–06:52:07

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kassy Baker

Good afternoon, Mr. Holloway, can you please state and spell your name for the record?

Robert Holloway

Good afternoon, my name is Robert Ivan Holloway, H-O-L-L-O-W-A-Y.

Kassy Baker

Very good, and do you promise to tell the truth, the whole truth, and nothing but the truth?

Robert Holloway

I do.

Kassy Baker

Very good. Now, Mr. Holloway, I understand you're here to tell us about your experiences and observations regarding censorship. And also some of your observations regarding your interaction with the Freedom Convoy movement here locally in Winnipeg. Just to provide some context to that, can you please describe to me your current profession and age? Could you just give a little bit of background about yourself?

Robert Holloway

Sure. I'm 45 years old. I'm married. I have two children. I have a daughter, age nine, and a son, aged 11. I'm a lawyer by profession. I have two university degrees. I have an advanced degree in economics and a minor in philosophy from the University of Manitoba in 1999. I have a law degree from the University of Manitoba, 2002. I received my call to the bar to practise law in Manitoba in 2003. I've been practising ever since. I specialize in construction and commercial litigation. Currently, I am the managing partner of Holloway

Thliveris Commercial and Construction Lawyers. I live just outside of Winnipeg, and I practise downtown in Winnipeg.

Kassy Baker

Very good. I think that we will start with some of your observations regarding the early days of the pandemic and your investigations into the dangers of the virus itself. And I'll let you take the lead from here.

Robert Holloway

Sure. So I'll just preface by saying that I don't have any particular expertise in the medicine or the science behind COVID or the vaccines. I'm a layperson in that regard. But I'm going to talk a little bit about what I learned with respect to the science and at what juncture because I believe it's material to understanding some things with respect to what I observed with the legacy media, and other observations.

So if we go back to March of 2020, this is the point in time in which COVID-19 has been declared to be in North America and its governments have expressed a concern. Our provincial public health authority is advising people to stay at home as much as possible, to work at home. I'm a practising lawyer at the time; the courts were shut down. We weren't having in-person meetings. We weren't having any trials. We weren't having any motions. Nothing was happening at the courthouse.

So there was a period of time starting about mid-March 2020 where most of us were at home. And I took the opportunity in this extraordinary set of circumstances to do some of my own research into what this COVID-19 was all about. And I did what most normal people do who are lay people like myself: I went online and I started researching whatever I could find. And at that point in time, the whole pandemic wasn't politicized, or at least, it wasn't politicized the way it has become. It wasn't a polarized issue and you could find a lot of information.

It was new in North America, but COVID-19 was not really new in other parts of the world such as Europe and, of course, China. And there was very good information from China and from Europe that you could drill down to—right to peer-reviewed studies from reputable universities and reputable journals.

[00:05:00]

I found a lot of interesting things, but I don't remember all the things that I uncovered in doing the research. But what jumped out at me, that I recall today, is that very early on, it **was clear, based upon the information coming out of Europe and China, the demographics of those who were affected by this virus. And it was clear that it was individuals who had two or more serious underlying health conditions combined with those that were at a certain age threshold. And what was notable to me is that children under the age of 18 had basically zero risk.**

So very early on with this information, which I felt was quite reliable given the various sources that I found, the whole idea of the virus was not something that I was afraid of. I was not personally afraid. I was not even personally afraid for my elderly parents who are in their 80s and late 70s, who are in good health. I was not afraid for my wife. I was not afraid for my children. I was basically not afraid. I parked that information, went on with my life as we all did or tried to do at that point in time.

But the interesting thing is that, of course, COVID and issues relating to COVID were a daily news item. And the way the legacy media, or at least, the legacy media that I was attuning into, was not being candid and forthright about the demographics of who was being affected by this virus. And I thought that was unusual. I thought that was strange. And it was only—and it's a rough order magnitude here—but it was only about six months after I had done this kind of personal research on my own that the mainstream media, the legacy media, started to talk about the demographics of who this was being affected by.

And I thought, you know, I'm just a lay person. I just went online and spent some time and found this information six months ago. Why is it only being publicly talked about now? I thought it was strange. I don't remember all the times in which I had done research and had found information in which there was a delay before it became information that was being publicly broadcast. But it happened many times. That's a particular one I remembered very specifically, but it happened multiple times.

So fast forward: I'm living life. I'm trying to do my best to be a father and a husband and a practising lawyer, and so on. The vaccines are starting to roll out. We're now in about spring of 2021, spring, early summer. And I'm becoming eligible based upon my age to receive a dosage of vaccine. And while I'm a bit skeptical, based upon some of my previous experiences with the delay of information coming out, at the same time, I didn't have a lot of source information other than what I received from mainstream media about these vaccines. And the messaging that was coming out was, "don't just do this for yourself, do it for your community, do it for elderly people, do it for people that are immunocompromised."

And so, I did it. I took the first dosage of the vaccine. I gave public health the benefit of the doubt based upon whatever information that I had, which was really all publicly available legacy mainstream media information.

[00:10:00]

And likewise, roughly six months later, I took my second dosage. And all the while, I maintained relationships with friends and others who made the decision to not get vaccinated. And I have to confess, at the time, I thought it was odd that they weren't getting vaccinated. I didn't understand why they weren't getting vaccinated. I didn't understand what the rationale was for them not getting vaccinated. But at the same time, I believed that people ought to have a free choice with respect to these matters.

Fast forward to the late fall, winter of 2021. The public health authority in Manitoba was now recommending and had vaccine dosages available for children aged five to twelve. At that point in time, my children were aged eight and nine. So they were right within that bracket. And my wife, who I have the utmost respect for and who is a wonderful mother and a wonderful person, stated to me, "I'm going to take the children to get vaccinated." And I said, "Well, you know, don't you think we should do some due diligence on this?" And her response was, "What due diligence are you going to do? Public health authorities have told us that we should get our children vaccinated."

And I would have said, I believe I did say, "Well, you know, you can't just simply take face value what public health authorities say. We know—and we've known since the beginning of this pandemic—that children in our children's age bracket who are healthy children have almost zero risk of serious adverse outcomes, including death from COVID. So I think we should spend some time looking into this. My own sister—who has a different mother than myself, was quite a bit older than I—her mother was prescribed thalidomide in 1960.

Her mother made the decision not to take it. It's probably one of the best decisions her mother made, as we all know. So public health authorities and professionals of all stripes don't always get things right. We're making decisions for our children. We need to spend some time."

So this was the conversation, in essence, that I was having with my wife. And she said, "Okay, well, when are you going to do this due diligence?" I said, "You know, look, it's just a really busy stretch right now. I'm going to do it as soon as I can." And every day from that point onwards, the friction between her and I increased. And to the point where she was calling me up in the middle of the day at work and demanding that we get the children vaccinated, or I do my due diligence right here, right now, and let her know ASAP.

[00:15:00]

To say that it was causing friction between my wife and I is an understatement. Finally, after about, I don't know, five days, six days of this, I'm like, "Okay, I'm just going to stay at work until whatever time takes me at night. And I'm going to do whatever due diligence I can do."

So like I did at the beginning of the pandemic, like lots of people do when they want to find things out, I go online. And I wind up at the Center for Disease Control in the United States website and Health Canada website and I look at the sections on vaccinating children. And I read them: every single word, top to bottom. I click on every single link. I try to drill down to supporting evidence, journal studies, so on, which I could at the beginning of the pandemic: I could drill right down to very legitimate medical and scientific information. And I couldn't.

And it was interesting. I'll start with the CDC. The CDC was making a pitch that you should get your children vaccinated because your children are at risk from severe outcome and/or death as a result of COVID. And Health Canada website was saying, they weren't so much pushing that; what they were pushing is—which I think is more honest—they were saying, "do it to protect the elderly and the vulnerable." And both websites had statistics; they had numbers. I was able to use some of them to run my own analysis.

And a couple things struck me. One is that there was a disconnect between what the CDC was saying and what Health Canada was saying on this very point. Another thing that struck me is that the arguments that both of them were putting forward just didn't seem very compelling. If that was the best arguments that they could make, it just didn't even seem that obvious, based upon their own arguments, that there was a good reason to vaccinate children. But at the same time, the website seemed to indicate that there was no significant likelihood of an adverse effect from the vaccine. The Health Canada website, **speaking of vaccinating children for the sake of protecting those that are immunocompromised and elderly, I thought was immoral.**

But at the end of the day, I had a situation to face, which I don't know where it was going to lead within my family. I very much valued the relationship with my wife and having a strong family unit. And based upon not having any information that I could find to indicate that there was a significant risk of taking the vaccine, I agreed to have the children vaccinated. My wife immediately took them down and had them vaccinated.

By happenstance, about a week later, I was having a lunch with a lawyer from the Justice Centre for Constitutional Freedoms. For anyone that's not aware of the Justice Centre for

Constitutional Freedoms, they are very active in COVID-related litigation. And the topic came up of vaccination and children.

[00:20:00]

And this lawyer started telling me some things about the vaccines as they related to children. And to say that it was contrary to what I had read in the CDC and Health Canada websites is an understatement. It was like two different planets. And I have respect for this lawyer, I have respect for the organisation. I know that they had experts who were highly educated and knowledgeable that they were getting their information from. But I was contrasting this with all the publicly available information that I could find at that time, and they just weren't adding up. And I said, "Look, I'm sorry, but can you send me these studies? Can you send me these expert reports? Because I don't know who to believe anymore." And she did.

And I read them once again, from top to bottom. And we're talking, you know, many of these were peer-reviewed medical journal articles. Some were from more obscure sources, but some were from very well-recognized sources. And what I learned was really jaw-dropping. I'm not a medical doctor and I'm not a scientist, but I am university-educated. I do deal with experts in my profession, a lot. I am, I think, basically capable of reading these things and understanding them. And I know enough to know that any given study can say one thing and be contradicted by another study the next day. But what really jumped out at me is that there was a lot of consistency amongst this material, none of which was public information.

And in this time of confusion, I sent one of these studies—it was a peer-reviewed study with respect to children and vaccination—to a medical doctor I know that for this person's protection, I will not identify. And I said in the email, "Is this study intellectually defensible or is this just whacko stuff?" That's the words I used, literally, I'm quoting. And the doctor replied, "It's very intellectually defensible. There is a fierce debate within the medical community about vaccinating children from COVID-19." And this medical doctor also sent me an article from the *British Medical Journal*, which this doctor indicated was more widely circulated amongst the profession than the peer-reviewed study that I had been reading. But, basically, the *British Medical Journal* article, which was January 13, 2021—about five months before vaccine rollout for children—was saying the same thing as what I had reviewed.

And I stopped. There's a fierce debate within the medical community

[00:25:00]

as to whether children should get vaccinated?

Kassy Baker

Can you describe some of the revelations that you learned through these peer-reviewed studies and how that differed from the research that you had done from the publicly available information from the CDC and Health Canada?

Robert Holloway

Sure, sure, let me just finish this thought though, I will do that. There was nothing on the CDC website or Health Canada website to inform parents that there was any debate within the medical community. Not a fierce debate. No debate. This was consensus.

The information, to answer your question: What I garnered from both the *British Medical Journal* and the peer-reviewed study, as well as other information, was that first of all, the risk to healthy children aged five to twelve from COVID-19 was negligible. However, because the standard for approving vaccines requires at least five years of clinical trials, as I understand it—not being an expert, but as I understand it—and because of the nature of COVID-19 and the urgency to get out a vaccine, these clinical trials had been truncated. And so, there wasn't the benefit of the full five years to ascertain what, if any, significant adverse effects were related to these vaccines.

The licensing bodies provided what I understand to be an emergency authorized use permit for these vaccines. And the consequence of all that is, once again, as I understand it— First of all, I never understood any of this stuff before I got vaccinated that this was an emergency authorized use and that the typical standard is five years because some of these side effects don't appear until many years later. I had no idea: this is something I was learning and questioning my own decision-making process with respect to myself getting vaccinated, but I digress.

The result, when you put all these things together is that because there hasn't been a significant amount of time to do the clinical trials that would normally be done for these vaccines, the risk profile to the vaccine was unknown, which made it not a negligible risk. You put all that stuff together: you have the risk to children aged five to twelve from COVID as being negligible versus the risk of taking the vaccine as being not negligible. It doesn't make any sense. The only possible justification could be that you're doing this to protect the elderly and the immunocompromised, which, in my humble opinion, is completely immoral.

Kassy Baker

This doctor that you spoke with, did she ever come forward publicly with her own thoughts which she had discussed with you?

Robert Holloway

Not that I'm aware of. I did ask this doctor if there was any kind of gag order that was being placed on this doctor by the College of Physicians and Surgeons in Manitoba.

[00:30:00]

And this doctor advised me that in effect there was. And this doctor provided a screenshot of what I believe to be a directive from the College of Physicians and Surgeons of Manitoba, which directed physicians to not depart from the narrative that's being put forward by public health authorities in Manitoba. And part of the rationale for this is to make sure there is a consistent message to the public. So I understand—and this is all hearsay of course—but I understand that this has resulted in a chilling effect within the medical profession, at least in Manitoba, with respect to discussing issues surrounding COVID and vaccination.

I want to add one thing here before I move on. My children are fully vaccinated with all other vaccines recommended by our pediatrician. My wife and I believe in science. As a regular matter of course, we follow the advice of our physicians. There's no ideological position that I come from here. It's maybe cold comfort, but I am thankful, based upon what I did learn after my children got the first dosage of the COVID-19 vaccine and I began sharing this information with my wife, that we decided to not get our children vaccinated with a second dose.

So in December of 2021, Omicron variant becomes an issue. And it's obvious that this variant is spreading rapidly and it's obvious, I think to most people, that it's spreading amongst both vaccinated and unvaccinated. And at this time, I'm now devouring every bit of information I can get from what I believe are reliable sources. And once again, being a lay person but not a completely uneducated lay person, it became clear to me that the mandates were completely disconnected with what the science was saying about the virus and the efficacy of these vaccines. And the fact that the public health authorities were now trying to basically pull a fast one over me with respect to my decision-making for my children's best interest really caused me to mobilize and do something. And one of the things that I became a part of was the Freedom Convoy protests here in Winnipeg.

[00:35:00]

On January 29, I believe, 2022, a rally was organized in the Flying J truck stop west of Winnipeg and I believe in other locations around the province all to converge on the city of Winnipeg. And I called up a buddy of mine and I said, "Hey, let's go, let's join this." I've never been involved in a protest in my life, but this was different. So we jumped in my truck and we grabbed a Canadian flag and we joined I don't know how many—but I'm thinking order of magnitude a thousand other vehicles with Canadian flags. And we're going around the Perimeter. We get to the east Perimeter, the Highway 1 overpass, and from every direction from looking north, looking south, looking east were vehicles basically almost as far as you could see with Canadian flags. It was an absolutely remarkable, organic event, and whether you agreed with it or you didn't agree with it, something very significant was happening. And I participated in this. We went around the Perimeter, we went down Portage, we went past the legislature, we went up to city hall. And as I'm driving, my buddy with me is monitoring what's being reported on this in the mainstream legacy media—and there's nothing. Nothing.

Fast forward about a week or so, the Freedom Convoy protests become stationary in downtown Winnipeg outside the legislative building. So on Broadway and Memorial. And the whole area becomes basically occupied by semi-trucks, by tractors, by mobile homes. I believe we had some Atco trailers, we had a stage, and at various times anywhere between, you know, a 100-odd people and probably 500, I don't know, a 1,000 maybe at certain higher times. And I reached out to the organizers and I identified who I was. I said, you know, "I'm a lawyer, I want to help, and I want to speak."

And on February 5th, which is a Saturday, I spoke at the protest. And I spoke largely about my experiences with the science and my children. And I was candid: "Look, I'm double vaccinated, but here I am." And so, that began an association between me and the organizers of the Freedom Convoy protests in Winnipeg. And I supplied legal advice, I supplied other advice, strategic advice,

[00:40:00]

whatever assistance, within reason, I could provide. I was on the phone or in-person meeting sometimes on an hourly basis, definitely on a daily basis.

Probably consistent with others that have testified here—though I haven't seen a lot of the testimony, but I've seen some of it—almost everything that was eventually reported in legacy media that I saw with respect to the Freedom Convoy protests in Winnipeg was wrong. There were people from all walks of life: There were probably as many women as there were men, if not more women than there were men. There was every different background and a variety of ages. The atmosphere was positive. The people were peaceful in nature and were really trying hard, in my observation, to ensure that there were no bad apples that were going to wreck this event, this protest. There was certainly nothing that I was ever made aware of—and I'm sure I would have been made aware of it given my assistance that I was providing—with respect to hate symbols or anything like that. That never, never occurred, at least, not in Winnipeg.

The atmosphere in the city was extremely polarized. There were people that either supported what this movement was doing or people that detested it completely. And there was almost no one that I saw that was really on the fence on that.

Fast forward to February 14, 2021 [sic]: The federal government invokes the *Emergencies Act*. And it was obvious that the focus of the emergency, or the idea behind the focus of the *Emergencies Act*, was to disperse the protests in Ottawa and perhaps some of the ones that were affecting the border crossings. But the wording of the actual invocation of the Act, as I understood it, applied across Canada, including to the protests in Winnipeg. And don't quote me on the exact wording, but I understood at the time to be to the effect of anyone that participates and provides material assistance to the Freedom Convoy protests could be liable to have their bank assets frozen, property seized, amongst potentially other consequences, I don't know, possibly ranging to arrest, fines.

That day, I went to my bank and I withdrew thousands of dollars in cash. And I hid it. And it's still hidden. It's not at my house, too. We, as a protest, i.e., the organizers and myself—And I should be clear that I am part of a group of lawyers that were assisting the protest here in Winnipeg. I wasn't doing this by myself.

[00:45:00]

There were others that were involved. I won't name names, but there were a group of us that were involved in assisting. But on that day, February 14, 2021 [sic], it became clear to all of us that we were either going to have to shut this whole thing down, or in effect, we were going to have to basically communicate and organize in a clandestine fashion.

And so, we did. We had to stop using cell phones. We had to conduct communications of a sensitive nature, literally, in dark corners of parkades where we were confident that there weren't security cameras and anyone that was close enough to observe, listen. There was a huge police presence, so we had little doubt with the police presence, combined with the invocation of the *Emergencies Act*, that cell phone communications were being intercepted, although I don't have any direct evidence to that effect. But we assumed that was the case.

The whole environment was surreal. Let me rewind this for a second. I'm participating in this in good faith with the best information that I can find for the protection of my children, and the Government of Canada has now made me a criminal? For protesting—to protect and to look out for the interests of my children on a good faith basis—peacefully? Is this really happening in this country?

I was born in this country. I was raised in this country. I've worked all my adult life, aside from the time I was in school. I've never broken the law. I pay my taxes. But for the first time in my life this country, that I thought was my country, was against me. Utterly against me. I felt stateless and I still feel stateless. And until there is some serious reckoning by those who were responsible for managing the governmental response to this pandemic in a forthright, honest manner, I don't foresee my feelings changing.

Kassy Baker

Thank you, Mr. Holloway. Are there any questions from the Commissioners?

Commissioner DiGregorio

Thank you, Mr. Holloway for your testimony today.

I have a few questions about particularly your experience that happened once the *Emergencies Act* was enacted. And you mentioned that you actually went and withdrew cash from your bank account, presumably because you were fearful that the measures would be taken against you personally. And I was wondering if you could comment on whether you felt that you would be targeted for providing legal services to members of the Convoy or whether you felt that it was more related to your participation as a protester.

Robert Holloway

Honestly, I thought anything was possible. I felt that I was living in a bizarro world where anything was possible, including repercussions from my governing body, repercussions from the public, the government.

[00:50:00]

I was aware of all of those possibilities, and quite frankly, I was prepared to accept that risk.

Commissioner DiGregorio

And I'm also wondering, you spoke a little bit about some of the clandestine organizing that was undertaken once you were concerned about surveillance and whatnot. Did you feel that there was a risk that your solicitor-client privileged communications could be intercepted or were the target of interception by the government?

Robert Holloway

Yeah, once again, I considered all reasonable/borderline unreasonable possibilities to be risks. I don't have any evidence that my communications were intercepted or solicitor-client privilege was breached. But we also took steps primarily based upon my initiative but also based upon advice that I was receiving from an individual who has experience in basically clandestine-type operations that you can't communicate with your cell phone. And you have to be careful where you're communicating because there are line-of-sight devices that can intercept verbal communication.

Commissioner DiGregorio

Thank you.

Commissioner Massie

I have a question about— You mentioned that you really value your relationship with your wife, but at one point, because you were raising some issues about what the public authority was saying that it created some tension that eventually seems to have improved. That's my understanding. Because you decided jointly not to get the second dose after you provided the information.

Now, my question is— After you decided to become more involved in the Freedom Movement, did you get support from your wife or was that creating some tension?

Robert Holloway

My wife is very supportive. My wife is not as, shall I say, maybe active in investigating these types of things that I am. My wife, in fairness to her, but like a lot of people, I believe, was afraid.

And under ordinary circumstances, if I were to say, "Let's do some due diligence before we engage in a medical procedure for our children," I don't think her reaction would have been what it was. But she was really afraid. And things definitely improved once I agreed to getting the children vaccinated for the first dose. She did move in terms of her viewpoints once I provided her with information that I received through my physician source as well as from the Justice Centre for Constitutional Freedoms. To answer your question, I'm sorry, it's maybe a bit roundabout. But, yeah, she did support me in my involvement with the Freedom Convoy protest.

Commissioner Massie

I have another question about the censorship. It does have consequences, but in your experience, what would you say was the most damning consequences of censorship in what you've been through during this COVID crisis?

Robert Holloway

When I use the concept censorship, with respect to this pandemic and the governmental response, I think it's important to be clear that at least I'm not thinking of just government censorship. It was a chilling environment across the board,

[00:55:00]

whether it was in legacy media, whether it was in public health authority messaging, **whether it was, I believe, in the judiciary. I'm sure that there was active censorship, but there was also a lot of self-censorship.**

One of our biggest failures as a society in dealing with this pandemic, in my view, is that what we needed to do to have the best chance of successfully, or at least optimally, dealing with it was to have open conversations. But that wasn't happening. It wasn't happening across the board. Not only was it not happening in legacy media where the same individuals were being interviewed again and again and the same messaging was happening, and the same individuals from public health were speaking and the same messaging was happening.

If we recall, the opposition parties of all the provincial legislatures and the federal House of Commons were barely doing anything. The judiciary was making decisions that were consistently supporting the government mandates and regulations. And to speak to your neighbours, sometimes your friends, was a perilous activity because of the polarity, the emotion.

A lot of the public health authority response to the pandemic was to be characterized by the war metaphor: this is a war against this virus; we are going to eradicate it. And there's also another saying in war: loose lips sink ships. But you know what? In war, the enemy has ears and a brain. When you're fighting a virus that has neither ears nor brain, surely, we can have conversations so that the best information—the brightest individuals, the ones that have the knowledge, the background, the experience—they may be right, they may be wrong, but they should all be heard. Because we are all better off for it: me, the public, deciding what's good for my family, what's good for me, what's good for my community. Without having open dialogue, without being able to know what is being discussed, cripples our ability to make those decisions and our societal ability to function properly and to deal with pandemics in a rational fashion, in my humble opinion.

Commissioner Massie

Thank you.

Kassy Baker

Are there any further questions from the commission?

Commissioner Kaikkonen

Good afternoon. I'm just wondering— You said earlier in your testimony that the courts were closed. Do you have any information on how the courts being closed impacted those who were either going because they felt they were innocent and unfairly charged with whatever? Or the impact of the passage of time, and they weren't getting their case heard, their voices weren't able to speak, they weren't able to get justice. Do you have any ideas, since you kind of crossed the lines with the people who were involved in organizing protests, of the impact of those people when the courts were closed?

Robert Holloway

I don't. Many matters that would involve criminal charges against protesters and protest organizers,

[01:00:00]

criminal lawyers would handle that. I'm not a criminal lawyer, and so I haven't been involved in that aspect of things. So I can't comment on that.

I can comment on the civil side because that's the type of lawyer I am. I'm basically a civil litigator. I can comment that, certainly, in Ontario, where I do quite a bit of litigation, that the backlog for many basic types of civil matters are unbelievably long. Sometimes you're looking 12 months to have a motion heard. It could be years before you have a trial that's set down. So I can comment a little bit about on the civil side that it definitely caused backlogs. I think in Manitoba, we're getting back to a fairly good schedule in terms of civil

matters. But in Ontario, in my experience, it's still pretty delayed, all as a result of pandemic-related measures.

Commissioner Kaikkonen

And my second question is, it's kind of a line we use in education, some of the critics of the education system: that it looks like education remains, but it's no longer education. Given that you looked at the CDC results and Health Canada results, and there's all these discrepancies, could we actually extend that to health care: that it looks like health care, but maybe it's no longer health care, in your opinion?

Robert Holloway

Well, my understanding of the legal requirement to administer a medical procedure by a health care practitioner on a patient is that informed consent is required. And without being informed, there can't be consent. And if there's a medical procedure that's performed without consent, that can be tantamount to assault.

Commissioner Kaikkonen

Thank you.

Kassy Baker

Are there any further questions from the commission? On behalf of the National Citizens Inquiry, we'd like to thank you for your testimony, Mr. Holloway.

Robert Holloway

Thank you.

[01:02:59]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 9: Jessica Kraft

Full Day 3 Timestamp: 06:52:25–07:13:00

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kassy Baker

Good afternoon, Ms. Kraft. Can you please state and spell your full name for the record?

Jessica Kraft

I can. Good afternoon. My name is Jessica Kraft. J-E-S-S-I-C-A, last name K-R-A-F-T.

Kassy Baker

Do you swear to tell the truth, the whole truth, and nothing but the truth?

Jessica Kraft

I do.

Kassy Baker

Ms. Kraft, I understand that you're here today because you were terminated as a result of your employer's vaccine mandate.

Jessica Kraft

That's correct.

Kassy Baker

Very shortly I'll ask you to explain the circumstances leading up to your termination. But first, can you please just describe a little bit about yourself, your age, your education, and your position with your employer at the start of the pandemic.

Jessica Kraft

I'm 31, I'm a mom of two. I started at Canadian Blood Services in 2013. I was trained on the job. It was a mix of classroom training and on-the-job training for about six weeks. I really enjoyed the job as well.

Kassy Baker

Can you tell us what your position with the Canadian Blood Services was?

Jessica Kraft

Yes, I was a donor care associate. I was the person to insert the needle into your arm if you needed to donate. I also did some screening procedures as well.

Kassy Baker

When did you say you were hired for this position?

Jessica Kraft

October 13, 2013.

Kassy Baker

And I understand that before the pandemic actually started, you went on maternity leave, is that correct?

Jessica Kraft

Yes, I had my second daughter December 2019, and right after that is when things in the world started to change.

Kassy Baker

All right, so how long was your maternity leave?

Jessica Kraft

I was on leave until March of 2021.

Kassy Baker

So you did return to work in March of 2021, is that right?

Jessica Kraft

Yes, I did.

Kassy Baker

At that point, what safety protocols were then in place to help you continue to do your job?

Jessica Kraft

Well, at the point of my return, we were mask mandated; all of the staff and donors were expected to wear masks within the facility to donate blood. There was also social distancing protocols, certain wellness checkpoints. Donors had to be sure they were in good health before coming in to donate.

Kassy Baker

What other changes did you observe from your work, starting from before the pandemic to your return in the spring of 2021?

Jessica Kraft

Well, when I first started at Canadian Blood Services, it was a really fun place to work. I felt really supported. We had a really good team.

I guess the biggest changes that I saw prior to me coming back—and I wasn't there, but I had heard from other people—is the changing in management. Also, the change in labelling Canadian Blood Services as a biologics manufacturing company rather than a not-for-profit organization.

Kassy Baker

Okay, and what about the donors? Did you notice any differences in the types of people who were donating blood or the frequency? Or what can you speak to there?

Jessica Kraft

Well, I would say that there was a push for first time donors. But the donating community is pretty reliable, happy. But some of the changes within the clinic for the donors, specifically, was that they weren't allowed to bring in family members or friends or their children. They weren't allowed to eat or drink after their donation, which is pretty crucial to recovering properly. So they wouldn't be allowed to sit with anyone. It was kind of a very rigid and sterile environment.

Kassy Baker

Did you observe any adverse effects from not being able to give them some juice or some cookies, which I understand is typical after donating blood?

Jessica Kraft

Definitely, yes. There was an increase in donor reactions.

Kassy Baker

And what does that mean?

Jessica Kraft

Well, if somebody doesn't eat or drink before donating blood, sometimes they can feel faint or pass out.

Kassy Baker

In terms of inserting the IVs, did you have any difficulties? Were there increased safety precautions taken regarding the handling of blood? What can you tell us about that?

Jessica Kraft

There really wasn't anything different about my specific job and the way we collected blood.

[00:05:00]

Kassy Baker

I understand that sometime in 2021, your employer announced that a vaccine mandate would be implemented within the organization. When was that?

Jessica Kraft

The official notice came September 1st of 2021, although throughout the summer there was definitely a lot of talk about it. When I had returned from maternity leave it didn't take long for me to be asked, even in front of colleagues, in front of donors, "So when are you getting your shot?"

Kassy Baker

And what specifically were the requirements of the mandate? What did your employer's mandate require you to do to comply with the mandate?

Jessica Kraft

So I was required to first attest my vaccine status, my personal health information. After that, we were supposed to be a fully vaccinated workforce by the late fall. They never gave us specific dates at that time. It was kind of like, "We want you to attest your status and we'll go from there."

Kassy Baker

Did the mandate allow for any exemptions or exceptions to being fully vaccinated?

Jessica Kraft

It did. There was an option for a medical or religious exemption. When I had spoken to my doctor in regard to that, my doctor really didn't want to go through with that. She said that even if she were to assign an exemption for me, it would have to be cleared by other doctors in order for it to be deemed eligible.

Kassy Baker

So was your understanding that if you applied or asked for an exemption it would not be granted?

Jessica Kraft
Correct.

Kassy Baker
What was your response to the announcement of this policy?

Jessica Kraft
I knew it was coming, but it really devastated me because firstly, I enjoyed what I did there, politics aside of course. I was pretty devastated to know that I would ultimately be faced with this hard decision.

Kassy Baker
So specifically, what part of the mandate did you object to?

Jessica Kraft
Well, I guess I objected to all of it, all of it.

Kassy Baker
Did you object to the information requirements? Did you object to being vaccinated? What were your objections?

Jessica Kraft
Basically, my standpoint was that according to *The Personal Health Information Act*, I wasn't required to attest my personal health information to my employer. After they had asked me to, and deemed me not vaccinated because I didn't attest, they then wanted me to rapid test for the last few weeks of my employment, which I also declined.

Kassy Baker
And why did you decline to participate in the rapid testing?

Jessica Kraft
Well, I didn't think it was a good precedent to set against somebody— It wasn't private; none of it was private. They wanted me to speak to somebody I'd never spoken to at work to get rapid test kits from. It just all didn't seem very private at all.

Kassy Baker
Now obviously you're in a position where you're collecting and handling blood and interacting with donors. At any point in your previous employment with the employer had you been required to obtain a specific vaccine?

Jessica Kraft
No, we were never mandated to get any other vaccines before. They had wanted us to get Hep A, Hep B vaccines. It was never enforced, never had to prove it.

Kassy Baker

So there was no requirement to be vaccinated for hepatitis at all; it was merely encouraged, is that right?

Jessica Kraft

Right.

Kassy Baker

Okay. Have you generally received other vaccines? I understand that your employer wasn't requiring you to get them, but have you generally obtained vaccines?

Jessica Kraft

I would say up until COVID, I didn't really have vaccines on my radar at all. I wasn't opposed to them. I didn't really think about it too much.

Kassy Baker

Did you receive all of your childhood vaccines?

Jessica Kraft

I believe I did, yes.

Kassy Baker

Okay, you're up to date as far as you know on your other vaccines as an adult.

Jessica Kraft

As far as I know.

Kassy Baker

You've mentioned that you're a mother. Have you chosen to vaccinate your children at that point?

Jessica Kraft

At that point, yes.

[00:10:00]

Kassy Baker

So you've mentioned that you did initially try to speak with your doctor about the possibility of obtaining an exemption. Can you go into a little bit more detail about the conversation that you had with your doctor and your understanding as to whether or not you actually would be eligible to even ask for an exemption?

Jessica Kraft

Yes. Well, I had gone in to see her for just a normal checkup. I had mentioned to her that these mandates were coming forward for health care workers. And she really, I don't know, it seemed to be dodgy, the entire thing.

She just kind of dodged my questions and concerns, really rushed me along. I told her that I had an opportunity to get a medical exemption and if I could have one for my specific condition— She checked my heart and told me that I didn't have the condition I had been diagnosed with my whole life. So I thought it was kind of really strange that she would say that.

Kassy Baker

Sorry, just to clarify, you did have a pre-existing condition, is that right?

Jessica Kraft

Yes, I have a functional heart murmur.

Kassy Baker

Okay, and you spoke about this murmur with your doctor, and she was still unwilling to consider writing you a letter of exemption, is that right?

Jessica Kraft

That's correct. She made it seem like, even if she did, that there would be plenty of other doctors after her to sign off on this exemption, that it wouldn't be deemed—

Kassy Baker

That it wouldn't be accepted by your employer, correct?

Jessica Kraft

Correct.

Kassy Baker

Did you express or discuss your concerns about the mandates with your employers or any direct supervisors?

Jessica Kraft

Yes, I did. I tried my best to submit any questions I had to my immediate supervisor, my management, doctors within the organization I worked for. I tried everyone I could.

Kassy Baker

And what was your employer's response?

Jessica Kraft

Basically silence, to be honest with you. I got a lot of blanket statements, seemed like the emails were just copy and pasted, you know, it wasn't really heartfelt. There was no personality in their responses at all or any concrete information to solidify that what they were doing was right.

Kassy Baker

Now, I think you've mentioned that when you returned to work, your co-workers asked in front of donors or other staff members whether or not you intended to be vaccinated. Did you indicate at that point that you did not?

Jessica Kraft

No, I kind of changed the subject. It was a really awkward moment for me because in my private life, I perhaps was outspoken about this vaccine shot. But at work, I tried to keep it as professional as possible. It really caught me off guard that I was asked this in front of colleagues and donors.

Kassy Baker

Did this issue affect your relationship with your co-workers and your employers?

Jessica Kraft

I believe it did.

Kassy Baker

In what ways?

Jessica Kraft

I just didn't know who I could trust completely.

Kassy Baker

Now I understand at some point you received a notice of termination. Can you describe the circumstances that led up to receiving that notice?

Jessica Kraft

Yes. October 15th, two days after— Or sorry, I should back up a little bit. It was Thanksgiving weekend, and I got a phone call from my manager, and she told me that I wouldn't be allowed to come into work on the following Monday.

The following Monday was Thanksgiving Monday. She told me that because I did not attest my status and I did not comply with the rapid testing that I would not be welcome on the premises after October 11th.

That phone call was really hard to get. I asked for that confirmation in an email. She declined that offer. She did not want to send it to me in writing. I cleared it with my union, and they told me to not go into work. I was on unpaid leave of absence where they had told

me they would send me an education package of some kind to better inform me on these decisions of the policy and whatnot. I never received that.

Then, I think it was a couple days before my termination, I submitted a notice of liability form to my employer and went to work to go and get my belongings from my locker.

[00:15:00]

And everyone was so shocked that I was there; it was kind of alarming. It was like, "Whoa, it's okay, I'm just here to get my stuff." In a way, it was kind of like I was being pushed out and not welcome. It wasn't feeling very welcome.

Kassy Baker

And you've mentioned that you raised this issue with your union. Were you able to lodge a complaint through your union regarding this matter?

Jessica Kraft

Yes, after I was terminated, I requested to file a grievance. I was an arbitration case, hopefully. Actually, as of yesterday—

Kassy Baker

Okay, the matter was supposed to go to arbitration as far as you were aware?

Jessica Kraft

Correct, yes.

Kassy Baker

And what is the current status of your complaint?

Jessica Kraft

Yesterday, I was told that I will not be going to arbitration. I will receive no severance pay. I wasn't eligible to collect EI and I won't be reinstated either. I won't get my job back, and the mandates are still in effect.

Kassy Baker

Have you looked for other employment since your termination?

Jessica Kraft

No. On and off I have, nothing serious. I found this silver lining out of all of it, to be able to be home with my two children. I'm very grateful for that.

Kassy Baker

Subject to any question that the commissioners have, that concludes my questions.

Commissioner Kaikkonen

Thank you for your testimony. A couple of questions. So in terms of being a phlebotomist, did Canadian Blood Services train you in that position?

Jessica Kraft

Yes, they did.

Commissioner Kaikkonen

And did you sign your paperwork when you came in that you would agree to Code of Conduct, et cetera, that most employees would sign at Canadian Blood Services?

Jessica Kraft

Yes.

Commissioner Kaikkonen

And did they change that when you went back from maternity leave? Did they actually change the terms of your employment?

Jessica Kraft

No.

Commissioner Kaikkonen

Did the union address that?

Jessica Kraft

No.

Commissioner Kaikkonen

And do you know if the mandates coming down were from the Province to Canadian Blood Services regionally, like in Winnipeg? Or did they come from head office in Ottawa?

Jessica Kraft

It was head office in Ottawa.

Commissioner Kaikkonen

And did head office, the human resources person there, did they clarify any of this in writing—the changes that they were making to your employment contract that, I guess, wasn't in there in the first place?

Jessica Kraft

No.

Commissioner Kaikkonen

And in terms of, you said that it had become a manufacturing plant—as opposed to a non-profit, that balance that we have at Canadian Blood Services—so is it still monitored by FDA and Health Canada? Or is it just strictly as a blood manufacturing facility monitored by Health Canada only?

Jessica Kraft

To my knowledge, it is only Health Canada.

Commissioner Kaikkonen

Okay. And you mentioned about the sterilization, the idea that everything had become sterile as an environment and donors were no longer allowed to have their cookies and their drinks. I'm just wondering, is it a bigger picture? Were you feeling that before you went in, from the community level just what was happening in mandates and Winnipeg? As opposed to, just when you walked into work, the former fun place, that it had just become so sterile that it just didn't seem appealing anymore?

Jessica Kraft

I think the changes began in the community well before I went back to work. I think I was aware of these changes coming down and happening within the clinic for quite some time. Nonetheless, it was still pretty unfortunate to see the donating community dwindle and also, to be not as satisfied with their donation experience, not as comfortable.

Commissioner Kaikkonen

And when donors had to sit alone and they didn't have anybody— Like they should have volunteers, somebody who would be watching them for that 15-minute period to make sure there's no incidents. Were there incident reports filed on donors when they had reactions where they fainted? Or any of those things that happen sometimes?

Jessica Kraft

Typically, if it was a severe reaction, it would have to be documented, yes.

Commissioner Kaikkonen

Thank you.

Jessica Kraft

You're welcome.

I would just like to say one more thing before we wrap up. I would like to say that throughout all of this, like I had mentioned before, the benefits of all of this is that I was able to stay home with my children. But I know that many Canadians can't say the same. I know that a lot of Canadians were met with the decision of making this choice or losing their job, their livelihood, their homes. So I'm here for that reason today.

Kassy Baker

Well, on behalf of the National Citizens Inquiry, we would like to thank you for being here today.

Jessica Kraft

Thank you so much.

[00:20:35]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 10: David Leis

Full Day 3 Timestamp: 07:13:00–08:13:07

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Shawn Buckley

And our next witness is a Mr. David Leis. David, can I get you to state your full name for the record, spelling your first and last name?

David Leis

Yes, my name is David Leis. My name is spelled D-A-V-I-D and my last name is L-E-I-S.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

David Leis

So help me God.

Shawn Buckley

Now my understanding is that you trained in public policy and administration at Waterloo, Toronto, and Ryerson universities.

David Leis

And at Queens.

Shawn Buckley

And at Queen's. You have a master's degree in public policy from Queen's.

David Leis

Yes.

Shawn Buckley

And you have extensive work experience in public policy, including working in many senior roles in government, locally and provincially, in post-secondary institutions, including universities and polytechnique. You have served as the mayor of Woolwich and as a councillor with the Regional Municipality of Waterloo.

David Leis

Yes.

Shawn Buckley

And you have served in policy roles for cabinet committees at the Province of Ontario, as well. You are Chief Executive Officer of the Greater Kitchener–Waterloo Chamber of Commerce.

David Leis

Yes.

Shawn Buckley

You are presently Vice-President at Frontier Centre for Public Policy.

David Leis

Correct.

Shawn Buckley

And the Frontier Centre was founded in 1999 as a non-partisan public policy think tank.

David Leis

Yes.

Shawn Buckley

And basically the mission is to advocate for better public policy.

David Leis

Correct.

Shawn Buckley

Now, I went through all of that just to point out that you've basically spent your life becoming an expert in public policy.

David Leis

Correct.

Shawn Buckley

You've been invited here today to comment on the public policy concerning how governments conducted themselves concerning COVID-19. Can you please share your thoughts with us on that?

David Leis

Yes, good afternoon, everyone. It's an honour to be here.

My points are several. But in essence, never in the history of, certainly in my lifetime, nor I believe, sadly, in the lifetime of recent memory, has there been such a policy disaster. And that policy disaster is very much articulated in many forms, both in terms of policy itself and associated principles of good practice of what makes for good public policy. But I would say also in terms of failure of critical institutions. Canadians were relying on institutions on the assumption that they would serve us. And sadly, they did not. And I could give you a 360 review.

But I also have the point that as a student of public policy, I'm also a student of philosophy and history. And sadly, we can see in history that this is an assault on our Canadian rights and freedoms. I cannot, respectfully, think of a right and freedom that was not violated. And finally— I'm deeply concerned.

Shawn Buckley

If you need to take a moment, you can. Understand, I think, and everyone in the audience appreciates that some of the witnesses are emotional, including myself when I give my opening addresses. So Mr. Leis, please feel free to take time to collect your thoughts.

David Leis

Thank you so much for your kindness.

I'm deeply concerned about the future of our society in the context of an assault on our civic society. I do not say this lightly. Because I am sure,

[00:05:00]

like everyone, we're guided by particular values and principles. In my case, and certainly many of my colleagues at the Frontier Centre for Public Policy, those principles relate to principles of classical liberalism, principles that have an extraordinary history, over thousands of years. An extraordinary history, particularly in the last thousand years, that relate to principles on the assumption that we are born free. We are born free and that we have governments, the king, the queen, or whatever form of government is not above the law but rather serves the people. And there are very clear sets of principles that have been violated within those principles, and I could go through them extensively. But I am very concerned about our society, given the impacts on all individuals and the layers within that society. I apologize—

Shawn Buckley

No, I mean, I think several people in your position— And I was speaking with another member of the Frontier Society yesterday who shared the concern that literally liberal Western democracy is at a crossroads.

David Leis

Indeed it is.

Shawn Buckley

And depending on how this generation responds and how quickly, it might be the end of this experience or experiment in Western liberalism. And my understanding is that's why you're finding this emotional: because you are concerned about where this is going.

David Leis

Indeed I am. I have served my country in many different capacities. And it is atrocious what has happened. From the very beginning, there were numerous signs that would have tweaked in any rational decision-maker. Massive red flags. And I realize this is like peeling the perennial onion where we did not know all the information at the beginning. And that is part of being human. But it was also by design.

And in my opinion, it is indeed a travesty what has happened. And the signs were numerous. I am a student of statistics, and I know enough sense to also consult with a myriad of people. And from the beginning, it was very clear that the statistics of mortality did not make this the Spanish flu. It was obvious. And I have dared so many officials to debate this publicly, any time, any place. The mortality rate was not there. We knew that the persons that were vulnerable were persons classically of an older profile of multiple health challenges, and they needed to be protected.

But to lock down a society is outrageous. The costs are profound. If we look at the myriad of analyses—economic, social, psychological, education, on every age category, and not the least of which is on health—we know a lockdown measure was never, ever envisioned. And we didn't follow the plan.

[00:10:00]

As a former mayor, I am trained in emergency management. I have gone through tough situations. And as a matter of course, we would always follow the emergency plan—Standard Operating Procedure. Part of that methodology, to be clear, is that in any emergency, it is the head elected official that takes charge and brings together an integrative team across all disciplines, all areas—fire, police, every department, including private actors—and brings them around a table like this and does the analysis. What is the situation? What are the risks? What are the options that we can undertake to not only deal with the disaster but to also mitigate it in such a way that minimizes the impacts on the rest of the community, the province, or the country?

It is a huge head-scratcher that those plans were developed and never followed. And from fairly early on in the pandemic, a colleague of ours—Lieutenant Colonel David Redmond, who has done so many emergency plans his head spins—he did the pandemic plans for a number of jurisdictions, including, I believe, the armed forces and the Province of Alberta. And they never followed those plans. These are huge red flags that needs to be looked into

in terms of judgment or competency. I'm not quite certain. Or whether it was just hiding behind the good name of a doctor to avoid political responsibility out of fear.

I know what it's like to be elected. I know what it's like to come in a room with a lot of people who are very upset and very concerned about their safety. And we just followed the core narrative that I believe was largely spilling out of the United States and facilitated elsewhere.

But we didn't do our job. I feel that decision-makers didn't do their job to do that kind of incisive policy analysis. And I get at the very beginning that there's known unknowns. But we knew that the People's Republic of China was not following World Health protocol. They signed that agreement. They did not share the information in a timely manner. And that raised red flags. They locked down Wuhan. But they continued international flights. They were facilitating the spread of this virus, and you could tell it from the very beginning. And that's from a layperson's point of view, so I want to be careful about that. But the reality is that there were signs from the very beginning that we were not following best practices on policy, and we were going to hurt a lot of people. And that's outrageous. And it's immoral.

Shawn Buckley

How do you feel about federally, and in the Province of Manitoba—not just the governing parties but the opposition and other parties that were in Parliament and the legislature—concerning whether or not they listened to the populace? I guess the frustration is, and I'll just rephrase my question.

It seems that every party fell in lockstep. So it seems like every institution fell in lockstep. Was there a College of Physicians and Surgeons in any province that acted differently than the others? Was there a political party in any province or federally that acted differently than the others? And you study this type of thing. So I'd like your comments on that. And if, as best you can, you could offer an explanation for how is it that that everyone is doing the same thing and yet nobody's following the plan.

David Leis

Well, sadly, we were shocked that we heard crickets on so many fronts.

[00:15:00]

There were persons behind the scenes who clearly were concerned, asking what we thought were the logical questions and doing, I think, a fair amount of due diligence behind the scenes.

But peculiar things were going on that I think need to be kept in perspective. One of which is the media chorus was uniformly a message of fear and hysteria. And these are very disturbing for any elected official, then, because they do not want to be seen as being offside. They don't want to be seen as caring when, in fact, seeking the truth is actually caring. This is the supreme irony of this. It was so easy, I think, for any decision-making elected official, let alone a professional body, to go along with these narratives because they were placed in such an emotional, psychological quadrant. And this is dangerous. Because it disables the ability of a population to take a deep breath and say, look, we make decisions based on rational thinking, not just emotion. I can talk endlessly about what I think, around what was orchestrated there.

Shawn Buckley

If you don't mind if I kind of take you in a different direction. It's just that you have some experience and so your thoughts would be helpful.

It is not unfair to say that the public narrative that we were being fed was completely false and very destructive. Let's just say, hypothetically, we accept that as a proposition. And let's say I'm a premier of a province and I understand that the mainstream media narrative is incorrect. And it's going to be tremendously damaging in my province if I follow it. And you're sharing with us, though, that they don't want to be offside. I think a lot of us had wondered this.

How does a politician resist such a sustained and consistent media narrative that was terrorizing the community? Does the premier basically send in the police to be looking for evidence of fraud or misleading? What can a premier do? Maybe we'll have some premiers watching. I'm just trying to figure out, what on earth could an elected official that truly wanted to do the right thing but understands that the media machine can just annihilate him or her— How would they stop this in the future?

David Leis

Well, I can speak in a number of respects. One is I know what I did. When I went through crises, I would work to communicate the information that we had. And I would communicate with confidence, not fear but confidence, that we had a powerful team and we were going to get through this. We would share information with panels of experts on toxicology. I'm thinking, in this case, of a particular water crisis that we worked at. The onus was on us to intelligently share with people, as citizens, the information that we had and the associated risks so that they could have a fairly transparent picture of what we knew.

Shawn Buckley

Okay. So almost like daily briefings, like that fellow in New York was doing, except telling the truth and having experts telling the truth.

David Leis

I think that's an advisable thing to do. To tell the truth.

Shawn Buckley

Okay. And I'm just asking for ideas because, perhaps, some politicians or future politicians will be watching this and any suggestions that you would have could be helpful.

David Leis

I know it was a different time. But in my own experience working with the media, I was so fortunate that, by and whole, I had very good media relationships. But one of the things is I had a profound respect for their work and that they had a profound sense of desire to serve the community: to look into "the story behind the story" and to share information,

[00:20:00]

all within the bounds of their professional standards.

And I'm not suggesting that there aren't journalists today. Because there are. But I think what we have is a long train wreck that has happened over years in the making. This didn't just happen overnight where our journalistic media mainstream outlets are not so much about journalism, they are about pushing a narrative. I think most Canadians would be shocked to know that 2,000 media outlets in Canada are systematically funded by the federal government— 2,000. So this local daily here in Winnipeg, as an example, has almost half its budget from the federal government. Now, you tell me how they carry out their ethical journalistic standards. I'm not saying that they can't do something, like reporting a tragic car crash. But their ability to contradict their funders' priorities— Because they do have it in an agreement. They carry their journalistic practice now through the lens of their funder. They have to.

Shawn Buckley

A conflict of interest. Are you aware— I have heard, anecdotally, that because the federal government just doles out so much cash to clubs and community organizations and the like that during COVID, there would be conditions on the funding that they would support and push the vaccine mandate. Are you familiar with that?

David Leis

I'm familiar with that. I would love to get my hands on a signed agreement. But I can tell you this: There are a proliferation of interests involved in this saga. And each one of them needs to be looked at carefully. But when Pharma is your main sponsor of so many things, one has to keep your head up and your eyes open and say, "What is going on here?"

So I see these institutions, and I've had enormous respect for them. There's a lot of very good people. But within that context, I think we underestimate that one of the principles of classical liberalism is the belief that we have a limited state for a reason.

Now I am not a socialist for many reasons. But a limited state is very important because you need to keep room for the majority of your society, which are working people who do not work in Ottawa for the federal government or otherwise. I'm not saying that those aren't important jobs. But the size of our state has mushroomed dramatically the last 30 years. And its tentacles are everywhere. When you are funding the media. When you are funding various institutions, including professional colleges. When you are even funding supposedly independent think tanks. And by the way, Frontier does not accept any government funding. And it does so for a reason. Because if you go along with the size of that state, you put yourself in jeopardy, sooner or later. Because depending on who is the king, or the queen, they may or may not understand governance. And I can tell you that time and time again it appears that, in our country, our leadership does not get governance.

Shawn Buckley

I'm wondering, just staying on classic liberal principles, if you can comment on the importance to societies, like Canada, of actually having freedom of expression and freedom of belief and freedom of conscience. Because those seem to be things that are becoming— Well, I mean, people wanting to be witnesses at this Commission backed down because they're concerned that there's going to be repercussions.

I'm just wondering if you can comment on how those things are vital to a liberal democracy.

David Leis

They are foundational. When we put into perspective the value of freedom of speech, it is one of the cornerstones of our rights and freedoms because it allows us to debate, respectfully, to get to a truth.

[00:25:00]

Any student of history knows this to be true.

And as we look at this, it is also foundational for our livelihood. Freedom of speech is the cornerstone for innovation, for our economic standard of living to move forward and our quality of life. If you look at the last 4,000 years, our standard of living would be, basically, a flat line. It's only in the last 250 years that we have a standard of living that has increased exponentially— That we have a microphone before me on this table and that we can be in such a lovely room. This is very recent. And therefore, if we do not have freedom of speech but rather censorship and the imposition of the state that suggests that what is black is white and what is green is red, and what are facts are not facts. But the narrative is more important because winning is more important. And the ends justify the means. And that science does not matter. Then we have lost it all. It means that we cannot innovate. It means we don't have a future.

So we have to get a hold of this, now. We have a window, I believe, and I hope I am wrong. We need to wake up people from coast to coast of the significance of what has occurred. Because there are lessons learned in life and such is this time. To be able to look to each other with compassion, in the tradition of civil society, where there is a tolerance for diversity of opinion and intellectual thought. And it has nothing to do with your race or your gender or whatever. It has everything to do with a belief that we came to this place in time through a long history of hard-fought fighting and civil war where many have died, let alone served to protect those rights and freedoms in many world wars. And I am so sad that it seems like quote, "educated people," in my peer group of leadership, that have utterly forgotten this or do not have the courage to sustain it, to serve the people.

Shawn Buckley

Mr. Leis, I've been trying to think how do we— And obviously, the Commission's mandate is to come up with recommendations on how to change things. And one common theme that we've seen with witness after witness, and I think Dr. Bhattacharya was saying, is that you can't ever get a single public health official or even a private spokesperson. We had one person pointing out two people that get paid money to be the go-to experts for the media. One I think at the University of Calgary. But these people will never debate. And we had that radio journalist, I think, on Day 1, indicating that he tried to get a debate with Dr. McCullough and another. They'll never come to debate. It seems to me that one change going forward would be that public officials or anyone that is willing to privately comment in the media, plus our politicians, would have to be required by law to reasonably engage in debate and explanations so that things cannot be done without reasons being given anymore.

I'm just wondering if you could comment on that. And then if you had any other ideas— assuming we could get our institutions back—on how to prevent this.

David Leis

Well, debate is so essential. Intellectual friction, we call it at Frontier. Because it is remarkable what we can learn from our intellectual opponents or persons that, frankly, don't agree with us.

What I have noticed is that as our society has tilted more and more towards— I would refer to them as authoritarian impulse.

[00:30:00]

We have lost or, frankly, don't teach enough about basic points of logic. There's some 26 logical fallacies, and one of which is the most important one, which is never attack your opponent personally— Ad hominem attack. And yet, this is the common theme that has gone on through this crisis. This is a huge flag that debate is being diminished. Because instead of discussing the issues or the concerns, the thoughtful questions that so many citizens have brought forward, it is endless attacks of being a white racist or a person of whatever privilege. When in fact, what is going on is not serving people.

What is going on is policymaking decision that protects privilege of the few. That protects power and money. And this is atrocious. And so therefore, debate is critical. We should be seeking that, requesting that, as a matter of course. And I would say that one of the institutions that I am deeply disturbed by, and I frankly believe is in crisis, is the law profession.

In a high-functioning healthy society, one of the most important responsibilities of the state is to undertake its judicial function, to ensure the rule of law is being respected: There are no arbitrary arrests on someone's property or in their garden. There is trial by jury. We're all equal before the law, and the state is not privileged before the law. The law is above the state.

And just to be clear, our tradition of freedom is dependent on the concept of the common law. The common law, beginning with the Magna Carta and the meadow in Runnymede, before an atrocious King John I and in that meadow, they agreed to basic things that are now in jeopardy. And as I recall, Chapter 18, by John Locke in his *Second Treatise of Government*, is essentially the point that with the end of law, specifically common law, comes tyranny. And that is what we face clearly in the eye today. And 2023 is the prospect of tyranny. And I do not use that word lightly. But this is the ugly reality that we face. So if we look at a 360-degree view of this crisis, it is one of policy disaster. But it is one where civil society has been assaulted.

Shawn Buckley

Well, it's curious that you cite John Locke and his principle that if the rule of law ends that we end up in tyranny. Because tyranny is simply unfettered discretion.

David Leis

Correct.

Shawn Buckley

And we've experienced, basically, unfettered discretion in our public health officials and absolute deference of those decisions by our politicians. So it seems to me that we've just

experienced the exact problem that John Locke described in the *Second Treatise of Government*.

David Leis

Indeed. And when we look at the courts then, the place for prominent public debate, then, is the judge who realizes that the responsibility is not to the state, not to the public health official but to the truth. This is where debate happens in a high-functioning society. Among other quarters, it's part of the culture. It's part of the ethos. It's in the media. It's in the universities, who were, many, on leave. Absent. Silent. What is the point of tenure, a job for life, if you can't speak up with confidence? I doubt if anyone here has tenure.

[00:35:00]

And yet they're speaking up. But this has always been the lesson of history. I have studied thousands of years of history. It's always been the few who have stood up with courage and said, "No more."

Shawn Buckley

That's well said. I'm wondering if the commissioners have any questions for Mr. Leis.

Commissioner Kaikkonen

Thank you for your testimony. We've heard testimony from people who have earned despair, anger, cynicism with regard to government. We've heard testimony over the last few days and from Truro and Toronto about the political world bouncing from one negative and inhumane aspect to another, with less and less making sense. It used to be, not that long ago, that we could somehow interpret our world based on motivations of self-interest and greed, or something to that effect. At least it was a behavioural starting point by which we could then make our world, or model our world, and think about what we might change.

But post-pandemic, there is a form of irrational nihilism that makes little or no sense either from the point of view of rationality or the point of view of sensibility and feeling. And in fact, our freedoms and lives are now being circumscribed by all levels of government. Therefore, it shouldn't come as a surprise from an intellectual sense or maybe even a spiritual sense that there are many feeling lost in how our institutions are acting in that one-mind context that Shawn just alluded to.

But what steps can citizens, like the citizens here in this room or who are watching online, what steps can we take as just citizens to change what is happening in our institutions?

David Leis

Thank you for your question. It's a very wise and insightful one. I think that there's many things citizens can do. One of which is to speak up within your family context, within your community, to be involved, particularly, at the local level. I think that participating in the local democratic process is vital. I ran years ago when I was 19 years old. It was a natural part of my family culture. And I would encourage people, no matter what their age, to get engaged because there has been a vacuum of people engaged in the civic process. And that has, I believe, given a vacuum for other nefarious interests, quite frankly, who do not subscribe to these basic assumptions around freedom and what it makes for a fair and democratic society: They believe that in many ways their cause is beyond question. And

they believe the ends justify the means. I have, unfortunately, studied for years the world of the Frankfurt School. I know all their sorry stories, their tactics, and their strategies. And they have methodically done the long march through our institutions. And this is apparent.

We need to wake up to this reality and call it out. And citizens, I encourage you to read. Not dive into the mindless world of Netflix, as much as we enjoy entertainment, as well. But it behooves us to be informed about this history. And there's many resources I can recommend and also through the Frontier Centre. I encourage you to look at it. And do not be dissuaded by what people call you names. If they do so, then this is shame on them. And take heart and courage because this is the reality that we face: Frankly, an ideological, destructive, toxic opponent within our own communities who do not care about you. They only care about their twisted, idealistic, nihilistic view of the universe. And that kind of utopianism has done, throughout history, enormous damage.

This is the story of totalitarianism, whether it has been China—and I've seen the monuments to over a hundred million people—and I have been to the places in the former Soviet Union in Russia. And Nazism. The Nazis were socialists. And this is almost like a perverse hybrid that we have today. It's a toxic mishmash of a state that is out of control with crony capitalists,

[00:40:00]

with people who don't seem to be grounded in basic things of freedom and respect for each other.

I was always excited about our society because I felt that wow, we live in a society where we as individuals respect each other. Because you're precious. Each individual is precious. And that we can cooperate, we can work together in freedom. That's the brilliance of it. We can innovate. We can start up a business. We can set up a church. We can set up a mosque. But we can be together, though, as shoulder to shoulder as Canadians.

Commissioner Kaikkonen

Thank you very much.

Commissioner Massie

Thank you very much for your presentation. I was wondering, when you see that there's many countries in the western hemisphere that have adopted more or less the same thing as Canada and many other countries, there's a few states, if you want, that stand out. There's a few states in the United States. But I'm thinking about Sweden that has been **demonized by the mainstream media, initially, but now seems to get some sort of more positive coverage.**

Based on your analysis of the way they managed the pandemic, what is it that makes them different? Is it the culture? Is it the institutions that somewhat were strong enough to resist to the temptation of moving in the same direction as everybody else? What is your take on Sweden?

David Leis

Okay, it's a very interesting question. Thank you. So Sweden is a very interesting case study for many, many reasons. We were very intrigued by Sweden from the get-go, based on the

approach that was taken by their public health officials. It was interesting because in many respects they would say they were following best practices. But Sweden was doing something in addition to that. They have an extensive culture and set of plans that relate to emergency management. And they followed those plans. This is not known by many people.

So this should inform any thoughtful decision-maker. Because what is interesting is the results of Sweden are stunning. They, in retrospect, did it right. And I was shocked when I read *The New York Times* last week that there was actually an article commending it. I'm just—anyways. So this is a situation that we can learn from Sweden.

What's also fascinating is that there's an associate of Frontier. His name is Dr. Martin Kulldorff. He's one of the three authors of the Great Barrington Declaration. And he said something very interesting to me the other day. Because I asked him this similar question about Sweden. And he said, unequivocally, the quote "consensus"—and I hate words such as consensus—but the consensus that Sweden did it right.

But what's also fascinating is he said something to me in the same conversation. He said, "During a dark time in the world, there was a select group of people in a country called Canada who got into their trucks and drove across a country and they woke up the world." And that's what he said. I said, "so Martin, are you saying—" Like, he is the preeminent public health official and biostatistician, I believe, in the world. And I said, "Martin, are you saying that the truckers made a difference and gave you hope?" And he said, "That's exactly what I'm saying." So take heart. By the way, he's a Swede.

Commissioner Massie

Thank you.

Commissioner Drysdale

Good afternoon. I have a couple of questions. First, I just wanted a bit of a clarification. I often find that details get lost when we use a blanket statement. And one blanket statement—and I know why we talk that way—is that our institutions have failed us. Well, our institutions in Canada don't just include government institutions, they include our private institutions. So I'd like to talk to you just a bit about those institutions and ask you some very pointed questions.

[00:45:00]

Did our police services fail us?

David Leis

I think it depends which one and what analysis I could look at there. I mean I've been certainly involved in police services. I don't pretend to be able to give a generalization. But generally, they went along with it. They're in a bit of a box when it comes to accountability and under the acts. But I think the type of testimony you heard today was astounding. And even within those units—because the police are essentially paramilitary—there needs to be strong leadership and debate. There needs to be debate. And if there isn't, that's bad leadership.

Commissioner Drysdale

You mentioned that it's a paramilitary outfit. And I don't want to dwell too much longer on the police because I'm going to get a hook come around me and pull me off the chair.

But you know, we heard testimony in Toronto by a fellow by the name of Vincent Gircys who was with the OPP. And he said, and I asked him a few questions. He said that when he went to the Ottawa protests, he immediately recognized—very, very, similar to Mr. Abbott realized when he went to Milk River—that this was a peaceful group.

And so, I said to him, "How is it possible, then, that the police who attacked that group, didn't also recognize that?" And I believe that was a failure. We don't want robots, even in a paramilitary outfit.

David Leis

Yes. That's right.

Commissioner Drysdale

So my next question is, did our health system fail us?

We heard testimony of health officials that were lying to us. We heard testimony yesterday of people who feel that they lost their loved ones because they wouldn't get treatment in the hospital. Because they were—a term that we all, perhaps, biblically understand—as "lepers," we were treated. So did our medical system overall— Not individuals. There are individuals. There are heroes. There always are. But overall, did our medical system serve Canadians?

David Leis

I would say generally not. I think despite having extraordinary people in the system, the system itself is not able to serve Canadians. And I want to be clear, the system itself—and Frontier has done extraordinary work on this over the years with many different international partners—ranks at near the bottom of OECD countries. And number two, it consistently ranks as the most expensive or second most expensive in the world with some of the lowest performing outcomes. Our model should be France and Germany and Sweden, not Canada.

Canada, unfortunately, has an extraordinarily Soviet-style healthcare system that has at any one time, five to six million people on waiting lists. Many in chronic pain. It does not serve Canadians well. But it's not for not trying. And no amount of money—and I'm sorry to tell you this—no amount of money will change that.

Commissioner Drysdale

And my next one is—and I think you've already answered this—did our judicial system fail us? Has it failed us? Or is it continuing to fail us?

David Leis

It's continuing to fail us because so many decisions, certainly, that I've read, and others have read, that the fact pattern is obvious: that judges have forgotten their job. It is not to genuflect to the state. It is to do their job to seek the truth and to seek the common law.

Commissioner Drysdale

Did our educational system fail us? Did they protect our children? And by protection, I don't mean putting a mask on them. I mean serving the function of creating people that could be informed citizens.

David Leis

Generally not, because we have, again, a public monopoly directed by state actors and that has been largely infested now with ideologues that are seeking not a high-performing education system based on the fundamentals. And I can give a long list on Frontier evidence of what that is. But it is a system that's characterized by wokeism, if you will, an ideology that is seeking this endless parade of statements around tolerance when in fact it is intolerant.

Commissioner Drysdale

Do you believe that our religious institutions led us spiritually through this in general terms? There were always stars.

David Leis

Well, these are far-reaching questions, and I don't want to pretend to be an oracle. What I'm suggesting is that it depends on the specific case. And I'm part of that failure.

[00:50:00]

I was part of a church community that had enormous fear, and quite frankly, was in a context where there was not a willingness. A church is voluntary. That's part of the genius of civil society institutions. They're voluntary. They come together, and in our case, we had many people that were older who said, "I don't want to take a risk."

I am so sad that the powers that be—combined with the media—did a horrible number on the psychological well-being when their emphasis, time and time again, was fear. Why in heaven's name—any logical analysis—why would you feature on case count on a daily basis, is beyond me. It means absolutely nothing. And yet they did. Everybody knows this. But of course, the media are in a vortex where they want clicks and people that viewed.

But there was something else going on. And this is something that people should never forget. And you need to be informed about this. I have seen this unfold; there's a long history of this. And this is the control of much of our social media by nefarious state actors. The Twitter files show that. If you don't know that, please read just a part of the Twitter files. And if you want me to do a day lecture, I will. But this is the reality.

Commissioner Drysdale

There seems to be an ever-increasing marriage between corporations and government. Not for the benefit of the people. Historically, I'm aware of what happens when that has occurred in the past. And I wonder if you could comment a little bit about what you have seen or what your concerns are when the government and the corporate world become so large, so octopus-like that there's no escape from them. Which is, I believe, where they are now.

David Leis

Okay, so this is a profound question. When the state gets so large, it suffocates everything with its agenda and in a way that is very harmful to society. It nurtures a particular ecosystem within society. Namely, large corporations love large government because they're able to manipulate them. They're able to squeeze out their competition through regulatory frameworks. This is well known. I did it myself when I was a senior person in a corporation. I was always trying to squeeze out my opponent. But it does not mean that we shouldn't have fair laws and regulation that allows people to compete, including the little guy. So what they did during COVID-19 is a case study of stupidity. We could go to Walmart. We could go to the liquor store. But we can't go to church? We can't go to the local store? On what rational basis do you do that? There is none.

And more to the point, the attack on small business is an attack on democracy, in the sense that if you look at history, again, you look back to ancient Greece. The ancient minos was a cornerstone to Athenian democracy because the minos, the middle class, if you will, in some measure, had a small plot of land. They were able to farm. They were able to do their thing.

And now, and now our governments— It's almost like there's a systematic policy to get rid of the middle class, the people who are not poor and dependent on the state. And conversely— The super-rich who have their own agenda at the top echelons of power. It's like there's no middle. That's what they're doing. And I don't know if it's fully intentional, some would argue, or unintentional because of stupidity or incompetence, pardon my language.

Why is that important? For democracy to succeed, we need people who have the ability to earn a living, to be able to create a life, to create a family, to be able to participate in civic affairs. And that takes years of apprenticeship. It doesn't happen overnight.

[00:55:00]

But these things have been dissolving around us for years. And we need to grab a hold of it now before it's done. That's my point.

Commissioner Drysdale

Yes. One of the things that is continuing to go along. I saw a news article just yesterday where, I think, it's Shaw and Global – is that Rogers?—are joining together in a monopoly, another monopoly. How is it that we have anti-combines laws in this country, but they seem to only apply to small companies?

And I'll give you an example. I'm familiar with a company who was trying to buy a grain terminal in a particular rural town. And they owned one already, but the other one had gone out of business some years before. So they decided they would buy that grain terminal. And the combines legislation—federal government—prevented them from doing it. So how is it that the federal government isn't preventing this union that was just announced in the press a day or so ago?

David Leis

Well, I could certainly talk about some of the analysis I've read. I just think that it's, for me, hard to square the circle how fewer providers, particularly in that market of telecommunications, serves anyone better. And I think part of the challenge that we face is

frankly one of culture. I think that in Canada— And culture is very important. It's the behaviours that we undertake every day and how we treat each other. There's wonderful strengths about Canadian culture, one of which is there's a lot of nice Canadians. The truly nice. I think people can realize that.

But it's nice to the point where, what would it take for us to wake up and realize that we're being abused? What would it take in our Canadian culture to wake up and realize that your rights and freedoms that you thoroughly take for granted are being trampled and usurped away by you? And I use the word usurp because usurp is one that John Locke used in his books, dozens and dozens of times. This is where the government, the state, along with their friends, are taking our rights and freedoms away. And this is wrong. This is the definition of tyranny.

Commissioner Drysdale

This will be my last question. Sorry for taking advantage of my opportunity here to talk to you.

Can you comment at all on the current rewrite of the *Canadian Broadcasting Act* and how that might affect some of our ability to counter the mainstream media narrative?

David Leis

Yes, I can. In particular, Bill C-11, as a case in point, is very disturbing. It is not, in my belief and so many others, about protecting and advancing Canadian content. It is positioning the chess piece for censorship. This is very disturbing. And so when it goes back to citizen action, you need to understand that this particular government is not about free speech.

And it also behooves each one of us to understand that your social media is still problematic. Part of the problem for democracy is, who controls information? And this has been the test of history. And this has always been the case. So when you look at any type of search with Microsoft to Google, all these have algorithms that— You can see that there's problems when it comes to the free flow of information. And this is part of the reason why so many Canadians are still, in many respects, asleep about this issue.

Commissioner Drysdale

Thank you, sir.

Shawn Buckley

Mr. Leis, it looks like there are no further questions. On behalf of the citizens inquiry, we sincerely thank you for your testimony.

Shawn Buckley

And Commissioners, I would suggest that we take a 10-minute afternoon break.

[01:00:07]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 11: Michael Vogiatzakis (Part II)

Full Day 3 Timestamp: 08:25:10–08:30:48.

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[Michael Vogiatzakis' testimony (Part I) can be found on Winnipeg Day 1, Witness 10, Full Day 1 Timestamp: 09:47:03–10:05:50]

Part II

[00:00:00]

Shawn Buckley

Welcome back to the third day of the National Citizens Inquiry in Winnipeg. Commissioners, we've called back Mike as a witness.

Mike, can you quickly just state your full name for the record again?

Michael Vogiatzakis

Michael Vogiatzakis.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Michael Vogiatzakis

I do.

Shawn Buckley

And I've invited you back today to share one story that you hadn't been able to tell the other day. So can you just share that with us?

Michael Vogiatzakis

I was going to share a story the other day about a funeral service of a very young boy who was six years old. The restrictions that— They were 10 people. And as hard as it is as a human being, as a father, and just as a funeral director to do a young service, it made it harder when you'd have to turn people down at the door. And that day I was standing at the door, being a bodyguard for the government, trying to follow the restrictions and tell people that they couldn't come in.

And then a gentleman came to the door and said, "I want to come in and see my nephew." And I said, "Sir, unfortunately, we're at 10 people, I can't let you in." And oddly enough, that day, the police were sitting across the street where they sat quite often. And they were sitting across the street to see if we were following the numbers that the restrictions allowed and possibly fine us if we went over that. And I looked at this gentleman and I said, "Sir, I'm full, I just can't let you in." I said, "The police are across the street and I risk a chance of getting a \$5,000 fine." And this gentleman looked at me and he said, "What kind of man are you? What kind of man are you to turn me away from seeing that little six-year-old boy and saying my goodbyes?"

And I looked behind me where there was a mirror. And I looked directly in that mirror and I asked myself that question, "What kind of man am I to turn people away and take away their last right of seeing a young little boy and saying goodbye?" I said to him, "Sir, come on in." Not only did I do that, but I went out to the parking lot and invited the rest of the people in, the family members that were sitting in a parking lot. I said, "You can all come in. You can all come in and say your goodbyes, it's your right to do that. I'm not going to stop you from doing that." And they all came in.

Couple minutes later, just like I suspected, the authorities walked up to me, to the door, and said, "Well, you're probably going to reach a \$50,000 fine. That's how many people you overdid." And I looked at him and I said, "Sir, can I ask you a question?" And he said, "What's that?" I said, "Do you have children?" He says, "What does this have to do with it? You broke the law. We have a limit and you've passed it." I said, "Do you have children?" And he said, "Yes, I do." I said, "I have a little six-year-old lying in the chapel and the family needs to see him. They need to say goodbye." And I said, "Why don't we turn things around here?" I said, "If this was your little six-year-old that passed away, one of your family members, would you want me as a funeral director to stand here and say, 'Sir, you can't come in?'" And he looked at me dead in the eyes and said the F-word and walked away.

And that day I didn't get a ticket. And that day I didn't get harassed any further. But what I did do is allow a family to have closure, allow a family to see a little child, a little angel that left this world. And no family deserves to lose a child, never mind being told that you can't come to a funeral service. And it breaks my heart, earlier when I was listening to testimony about church.

As a funeral director, I could tell you right now to your face that when you lose a loved one, you need God in your life. That's when people are searching the most. That's when they need a pastor. That's when they need their family, their church family, to have a little bit of hope, to have some faith to be led into that direction, to ask questions, why? Why did this little one leave this world? Why do people leave this world? It's a pastor like Pastor Tobias and other pastors that deserve to have their church open. It's our rights as human beings.

Even Jesus wept at a grave. Jesus wept at a grave. We have a right to weep at a grave. We have a right to say goodbye. We have a right to go to church. It's our right to go to church and say, listen to the word because that word sometimes brings us peace. And if they would

have kept these churches open, I could assure you there would have been less suicides. I could assure you there would have been less drug overdoses. But instead, they opened up the liquor commissions and they encouraged people to buy more drugs. And they encouraged these kids to stay downstairs in their basements and play video games.

Trust me, I've talked to many of them where they've told me, "My kid is stuck in the basement, stuck in the world of the internet and playing games and smoking pot all day long." Is that what the government wants? For our future, for our kids? When I looked in the mirror that day and I asked myself, who am I? I encourage you today and as the days go on to look in the mirror and ask yourselves who you are

[00:05:00]

and what you're going to stand up for.

What I'm standing up is for the future generation, my kids, your kids, your grandkids, and the future. If we don't grab a hold of the future now, there's not going to be a future. Stand up for what's right. Stand up for what's in your heart. Life on earth is short and if we get prosecuted on earth, we have another life to live.

Shawn Buckley

Mike, I thank you so much for sharing that.

[00:05:38]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 12: Kyra Pituley

Full Day 3 Timestamp: 08:31:05–08:51:52

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kassy Baker

Hello, Kyra. Can you, please, state your name and spell it for the record?

Kyra Pituley

My name is Kyra Pituley. K-Y-R-A, last name P-I-T-U-L-E-Y.

Kassy Baker

Now, Kyra, do you promise and swear to tell the truth, the whole truth, and nothing but the truth?

Kyra Pituley

I do, yes.

Kassy Baker

Okay. Now, I understand you're here today to tell us about your experience as an unvaccinated student during the pandemic and also to tell us a little bit about your **personal experience with the Freedom Convoy in Ottawa. Is that right?**

Kyra Pituley

Yes.

Kassy Baker

Very good. Let's start with a little bit of your background. How old are you?

Kyra Pituley
I'm 15 years old.

Kassy Baker
And where are you from?

Kyra Pituley
I'm from Manitoba and live outside of the city.

Kassy Baker
What grade are you currently in?

Kyra Pituley
I'm currently in grade 9.

Kassy Baker
Now, when the pandemic started in 2020, what grade were you in?

Kyra Pituley
I was in grade 6.

Kassy Baker
And how long had you been going to the school that you were then attending?

Kyra Pituley
Since before kindergarten.

Kassy Baker
Okay. Now, what was school like in 2020? Can you give us a bit of a description?

Kyra Pituley
Before March, it was normal, I guess. I got to see all my friends and hang out with friends outside of school and sports. And just live a life as a 12-year-old.

Kassy Baker
And what about after March 2020?

Kyra Pituley
That's when the schools shut down and we were online until June of that year. I didn't get to see any of my friends for that entire duration that we were online. I didn't even leave my house, I guess. Just very, like, distanced from other people.

Kassy Baker

And what about your education? What was it like learning online?

Kyra Pituley

In the first year we didn't have to do school; it was an option. I did do school for the rest of that year, but I know most people didn't.

Kassy Baker

Were you able to get answers to all of your questions, as I am sure all students have at some point while they're going to school?

Kyra Pituley

Most of them, yes.

Kassy Baker

Very good. Before the pandemic and actually, during the pandemic— I understand that you are very active in sports, is that correct?

Kyra Pituley

Yes.

Kassy Baker

What sports do you play?

Kyra Pituley

I play hockey, ringette, and volleyball.

Kassy Baker

Were there any COVID precautions brought in that allowed you to continue playing those sports throughout the pandemic?

Kyra Pituley

Um, not as much to allow me to play but to restrict me from being able to play on my teams.

Kassy Baker

Sure. So of course, the vaccinations didn't come out until 2021. So through 2020 were you able to participate in sports relatively normally, or were there any differences from before the pandemic?

Kyra Pituley

In 2020, there was regular season started for hockey and ringette in September. And by the end of November, beginning of December, it was shut down for everyone. No one was able to play.

Kassy Baker

And then, sports activities resumed sometime in the spring of 2021, is that right?

Kyra Pituley

Yeah.

Kassy Baker

Now, if I understand properly, and you can correct me if I'm wrong: your age group would have been eligible for vaccination in the fall of 2021. Is that correct?

Kyra Pituley

Yes.

Kassy Baker

Okay. Now, did you choose to become vaccinated at that time?

Kyra Pituley

No, I did not.

Kassy Baker

And how did you come to that decision? Was it a family decision? Was it your decision? What led to that decision?

Kyra Pituley

It was more of a family decision. My parents had done some research about it and we didn't really know much about it. And it was also kind of a personal choice as well. I didn't want to get it because of things that we've researched about and just information that we found out.

Kassy Baker

Information such as what?

Kyra Pituley

Like, you didn't really know the effects of it, and it did come out so quickly that no one was really sure what was in it.

Kassy Baker

Now, up until that point, as far as you're aware, were you up to date with your vaccinations? Had you received other vaccinations throughout your childhood and adolescence?

Kyra Pituley

I was up to date on everything else besides the COVID vaccine.

[00:05:00]

Kassy Baker

Had you ever had a negative reaction to a vaccination?

Kyra Pituley

When I was younger—I believe I was around one and a half—I had received the flu shot. And I had a severe allergic reaction to it, which doctors later found out that it was the H1N1 strand that I had reacted to.

Kassy Baker

And so, when you had a severe reaction, as you've described it, were you required to go to the hospital because of it?

Kyra Pituley

Yes.

Kassy Baker

And what were your symptoms? What were the reactions?

Kyra Pituley

I don't remember at all, so I'm just going off of what I've been told. I had stopped breathing. I'm not sure for how long, but the paramedics came to the house and then I was brought to the hospital.

Kassy Baker

So it was quite a serious reaction?

Kyra Pituley

Yeah.

Kassy Baker

From what you've been told. Very good. But as you've advised, other than that, you've stayed away from, I think you said it was an H1N1 vaccination at the time?

Kyra Pituley

The strand in the flu shot, yeah.

Kassy Baker

That's right. All right. So aside from that, you were still up to date with your other vaccinations.

Kyra Pituley

Yeah.

Kassy Baker

Okay. How did the vaccine mandate affect your participation in sports?

Kyra Pituley

I was kicked off of both of my teams—volleyball and hockey, or ringette. Sorry, I was playing ringette that one year. In 2021, I had started ringette and I was playing normally up until— I think it was around December that I had been fully kicked off of my team.

In September, that's when the season started. And in October, the restrictions were put out that parents weren't allowed to be in the facilities— Or anyone over 18 weren't allowed to be in the facilities without showing proof of vaccination. And I was taking my younger siblings in and out of practices and myself as well because my parents weren't allowed to come to the arenas. And up until there was an age restriction put out to get the vaccine, I wasn't able to bring anyone to their practices anymore.

Kassy Baker

Was there any way that you did not require to be vaccinated? For instance, could you have been tested and continued to play on these teams?

Kyra Pituley

There was the option to test. You weren't allowed to test from at home. You would have had to go into your local pharmacy, and we had chosen not to because you would have had to test two or three times a week and the tests, I believe, were \$40 each.

Kassy Baker

So the cost of continual testing made that prohibitive for you to continue participating, is that right?

Kyra Pituley

Yeah.

Kassy Baker

Okay. Throughout this time that you were not allowed to participate in the extracurricular sports, were you allowed to participate in gym class in your school?

Kyra Pituley

No. I was allowed to participate in gym, I guess. I mean, everyone had to wear a mask, regardless of your vaccination status. But as soon as the bell rang for lunch, you had to show proof of vaccination to be in the gym area. And myself and not very many others had to sit outside of the gym, alone, basically, because we weren't allowed to attend the activities in the gym because we didn't show proof of vaccination.

Kassy Baker

So, just to clarify— Over the lunch hour, they would have activities in the gym that students who were vaccinated could participate in, is that right?

Kyra Pituley

Yes.

Kassy Baker

But because you were unvaccinated, you were required to sit in the hall or outside of the gymnasium.

Kyra Pituley

Yep.

Kassy Baker

So if you were in the gym for a class, that was acceptable. But for lunch that was not acceptable, is that right?

Kyra Pituley

Yes.

Kassy Baker

Okay. I understand that you were in two separate ringette leagues at the same time and can you tell us a little bit about how rules varied from one league to the other?

Kyra Pituley

In one league, there was a requirement that you had to either show proof of negative test or proof of vaccination. And the other league, it was more strict that you had to provide those requirements. It was more, I guess, more strict. The one league was more laid back. Like, later on in the season is when they started to require it more. So in October, that is when the one league got really strict on the vaccinations and showing the negative tests. And I hadn't provided the proof of vaccination or negative test.

[00:10:00]

And we had played this one team in a tournament, in one league, that I was allowed to play in. And a week later we played the same team, but in a different league, and I had been

kicked out of the arena because I didn't show the proof of vaccination or proof of negative test.

Kassy Baker

So just to clarify, one week you were able to play a particular team in one rink, and one week later you were unable to play the exact same team because it was in a different rink, is that right?

Kyra Pituley

Yes.

Kassy Baker

Okay. Can you tell us about the last game of ringette that you played that year?

Kyra Pituley

The last game I had played, or was supposed to play, I had went into the rink. My team had said that I wasn't going to be able to play after a certain period of time, but the exact date wasn't given. So I went to this game not knowing if I was able to play but came prepared to play. And when I got into the rink, one of my teammates had actually went out to the coach and, I guess, ratted me out that I was there. And the coach came into the dressing room and asked me to leave, that I wasn't able to play.

Kassy Baker

And was this in front of your other teammates?

Kyra Pituley

It was in front of the entire team and both of the coaches that we had.

Kassy Baker

Okay. And how did that experience make you feel?

Kyra Pituley

It upset me a lot. As soon as she asked me to leave, it was just very straightforward. There was no, like, forgiveness of anything. There was nothing. I had called my dad to come pick me up because— If anything happened, he would come pick me up if I had to get picked up or whatever. And he had pulled my coaches aside to talk to them. I'm not really sure what happened in that conversation because I had to step away, because I couldn't even handle standing next to them.

Kassy Baker

Okay, because you were upset. Is that right?

Kyra Pituley

I was very upset, yes.

Kassy Baker

Okay. Were there any other activities, that were not related to school or sports, that you were unable to participate in?

Kyra Pituley

I wasn't able to go out with my friends. There was a group of us going to an event around Halloween-time. And I wasn't allowed to participate because at that time, anyone over the age of 13 had to show proof of vaccination and I didn't have that.

Kassy Baker

Were there any other students who were, similarly to yourself, not vaccinated that when you were excluded from these events or when you were unable to attend the gymnasium at school, you were able to socialize with during those times?

Kyra Pituley

During COVID, we were grouped into cohorts. So there was two classes per cohort. And in my cohort, there was myself and, I believe, two others who weren't vaccinated. I'm not sure about the other classes because we weren't allowed to mix groups, so we had to stay in our own cohorts.

Kassy Baker

So you would sit outside with these two or three, in total, other students that also weren't allowed in the gymnasium, is that right?

Kyra Pituley

Yes.

Kassy Baker

All right. Now, I understand that, in January of 2022, you actually participated in the Trucker Convoy in Ottawa. Can you tell us a little bit about how you became involved with that?

Kyra Pituley

One night, we were sitting on the couch—me, my dad, and my stepmom—and we had heard about this convoy. And we dug into it a little bit more and found out what was happening and later on in that week that it was coming through Winnipeg. And we didn't have a truck because my dad is a truck driver and he was driving his truck, so we couldn't use his. So we found a truck of our friend's that we were allowed to drive and we joined the convoy in Headingley, I believe, on the 25th of January.

Kassy Baker

And when you say “we,” who are you referring to?

Kyra Pituley

Me and my stepmom, Steph.

Kassy Baker

And when did you arrive in Ottawa?

Kyra Pituley

We got to Ottawa Saturday, the 29th of January.

Kassy Baker

And what was your impression of the convoy when you arrived?

Kyra Pituley

Well, when we arrived in Ottawa, all of the trucks were, I guess, pointed towards one certain street. I don’t remember the name of that street, but along the river behind Parliament. All of the trucks were just at a standstill there. And we were sitting there for around, I want to say, half an hour, 40 minutes. And we had been travelling with another truck that we met, there was two people in it. And Steph went over to them and asked— We were going to go find a way up to downtown from Parliament and we asked them if they’re coming or not.

[00:15:00]

My mom handed me her phone and she said, “Get me here.” And there’s a lot of one-way streets in downtown Ottawa that we had to find our way through, and we ended up being two blocks from Parliament, on Metcalfe and Albert.

Kassy Baker

And did you attend Parliament after that?

Kyra Pituley

Yes. The first or second night, we went up to Parliament Hill just to see what was happening up there, and it was a really cool experience to be a part of.

Kassy Baker

And why was it a cool experience? What was happening that you thought was interesting or exciting or made you glad to be participating?

Kyra Pituley

Over the past, I guess, two years at that point that COVID had affected the entire world, I felt a sense of normalcy to be around people again who weren’t wearing masks and people

who, like, were just good spirit. We could go up and talk to anyone, and they would hold a conversation. You can go over to talk to the truck drivers and, just, everyone was so friendly.

Kassy Baker

And while you were on Parliament Hill or participating in the activities that were taking place there, what impression did you have of those that were participating? Was it positive? Was it negative? What did you see?

Kyra Pituley

I saw a very positive, like, attitude from everyone. I felt no one had any bad intentions to do anything that was not in a good way, I guess. Like, no one had the intention of doing anything bad.

Kassy Baker

Did you ever witness any instances of the participants acting cruelly towards any other individuals or acting illegally?

Kyra Pituley

In the very beginning, like, the first two weeks that we were there, it was all a very positive experience. There was no one, like, any sort of bad actions towards anyone.

Kassy Baker

And how long were you in Ottawa all together?

Kyra Pituley

Twenty-two days.

Kassy Baker

So what caused you to leave Ottawa?

Kyra Pituley

The Friday, I believe it was the 18th, there was more outside law enforcement that was brought in to downtown Ottawa who were trying to push the people out of the streets with force. Like, there was police officers holding batons and they had shields, and it was not a very good feeling to see that happening.

Kassy Baker

Did you see it, personally, happen? Were you there as that was happening?

Kyra Pituley

Personally, no, I was not. My brother, my dad, and Steph were all up there, though.

Kassy Baker

And when did you return to Manitoba?

Kyra Pituley

We got back in Manitoba, or we got back home February 21st.

Kassy Baker

Is there anything else that you would like to mention about that experience that I haven't asked you about?

Kyra Pituley

I don't think so.

Kassy Baker

Well, that concludes my questions. Are there any questions from the commissioners?

Commissioner Kaikkonen

Thank you for your testimony. You mentioned that some of the students didn't do their online education. When they went back to school post-COVID, did you notice a difference in grade standards, grade outcomes, the students' knowledge? You finished your online, but some of them didn't.

Kyra Pituley

I had moved schools at the end of grade 6. So at grade 7, I had actually moved out to Manitoba with my dad and I was attending a new school. So I wasn't really with the people who I had done online the previous year.

Commissioner Kaikkonen

Thank you.

Kyra Pituley

Can I add one more comment?

Kassy Baker

Sure can.

Kyra Pituley

When I was in Ottawa, I was doing online school from the day after I left to around the middle point that I was in Ottawa. And my teachers were very good with sending me work up until a certain point. And I don't know if this had anything to do with me being in Ottawa, but if parents would take their kids on a vacation, let's say, to Disneyland, they would be getting their work and they would be communicating with teachers very well.

And at one point, my teachers had actually stopped sending me work and stopped communicating. So I was reaching out to them about getting work and it came to the point where my parents were emailing and calling the school about getting me more work because they had just stopped sending me it altogether.

[00:20:00]

And the administration of my school had suggested that I be enrolled in Homeschool Manitoba because I was gone. And because I wasn't attending school for two weeks that I had to enroll in Homeschool Manitoba.

Kassy Baker

And when you returned, were you able to continue on with your school?

Kyra Pituley

When I returned to school, yes, I was able to. I had a bit to catch up on because I wasn't sent it, but I still continued as normal.

Kassy Baker

Very good. Are there any further questions from the commissioners? Very good. On behalf of the National Citizens Inquiry, we thank you for your testimony.

[00:20:47]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 13: Michelle Malkoske

Full Day 3 Timestamp: 08:51:58–09:08:02

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kyle Morgan

Our next witness is Michelle Malkoske. Can I get you to spell your full name and state your full name also?

Michelle Malkoske

Hi, my name is Michelle, M—oh man, I'm going to cry already—M-I-C-H-E-L-L-E. And my last name is Malkoske, M-A-L-K-O-S-K-E.

Kyle Morgan

And Ms. Malkoske, do you promise to tell the truth, the whole truth, and nothing but the truth?

Michelle Malkoske

So help me God.

Kyle Morgan

Thank you. Where are you from?

Michelle Malkoske

I was born and raised here in Manitoba.

Kyle Morgan

In Winnipeg?

Michelle Malkoske

Yes.

Kyle Morgan

I understand you've been a nurse for about eight years, is that right?

Michelle Malkoske

Yes. Yes, I've been a nurse for eight years. I did my training in Brandon and then one of my first jobs was here in WRHA [Winnipeg Regional Health Authority] community nursing.

Kyle Morgan

And can you tell us what professional body oversees you as a nurse, if you can recall what it's named.

Michelle Malkoske

Yeah, so I am governed by the College of Licensed Practical Nurses of Manitoba. And then we also have the Manitoba Nurses Union.

Kyle Morgan

Okay. So I gather, from what you just told us, you were working for the WRHA in 2020. Is that right?

Michelle Malkoske

Correct. Yes.

Kyle Morgan

And I understand you were doing homecare?

Michelle Malkoske

Yes.

Kyle Morgan

And you were doing that casually. Is that right?

Michelle Malkoske

Yes, I did not hold a position at the time. I was just casual, so I could pick up as I would like, as I was also homeschooling my kids.

Kyle Morgan

Can you tell us how many hours you would work every two weeks?

Michelle Malkoske

Yeah, I would usually work two to three shifts in a pay period. Yeah.

Kyle Morgan

Okay. Now, I gather that towards the end of 2021, like many others, there were some vaccine mandates that came in that affected your employment. Can you tell us about that?

Michelle Malkoske

Yes, they had led up to this a few times. They had sent out memos saying that we're going to require to know if you're vaccinated or not or if you would submit to testing. And then I believe it was— Sorry, I have it written down, October 20th of 2021. I spoke with manager and he said, "Well, you need to fill out this form." And I said, "Okay, I will fill out this form to the best of my ability and I will submit it because I would like to continue to work."

So I filled out the form and I sent it in, and he says, "Oh, you need to check a box." I'm like, "Well, but I filled out the form the best I could, as you asked, and I'm submitting it to you this way." He said, "Well, let me get back to you then." And so, he got back to me and said, "Well, this is to confirm that all of your future shifts that you have signed up for—" oh, man, "all your future shifts are cancelled," they're just gone, "due to your decision to not disclose your vaccination status as per WRHA policy. This is, of course, something if you would like to change, you are welcome to sign up for shifts at any time as needed by both you and your employer."

So from that point on, I missed six months of work, which is about \$15,000 working part-time. Magically, in April, it was okay for me to return to work, and I was allowed to sign up for shifts again with no other questions.

Kyle Morgan

That would have been April 2022. Is that right?

Michelle Malkoske

Correct.

Kyle Morgan

Now, who informed you? Do you recall who it was that informed you, regarding your placement on leave or inability to get shifts?

Michelle Malkoske

It was just my manager that was above me.

Kyle Morgan

Okay. Did you ever make any other inquiries or ask any other questions?

Michelle Malkoske

I submitted them a notice of liability. They just said, "Okay," and I said, "Okay, well, I guess this is where we're at." They told me that I did have the option to test if I wanted to, and I declined and said, "I'll just wait it out." And it only took six months of waiting.

Kyle Morgan

Did you contact the professional college that you were a part of?

Michelle Malkoske

I did not contact the college, but they definitely were in contact with all of us. They had messaged us saying, "If you have made the personal choice not to be vaccinated for COVID, please continue to respect your clients' rights to safe and ethical care,

[00:05:00]

and to make choices that do not deprive them of access of competent nursing service." Yeah.

Kyle Morgan

So you would have lost your income during that time. Now, I understand you have children, is that right?

Michelle Malkoske

Yes, I have three children. I have a 15-year-old stepchild who, as we heard from Kyra, they had a rough time. And then I also have two smaller children that I was homeschooling at the time, as well.

Kyle Morgan

And are you married at the moment?

Michelle Malkoske

Yes.

Kyle Morgan

And can you tell us a bit about what happened with your husband's work situation, also?

Michelle Malkoske

Yes, he also was put on a leave of sorts as the facility where they get windows from was shut down in Toronto. So he had no income either, so we were without income for approximately three months. It was unfortunate. I know it was a decision that we did not take lightly, as I could go to work if I did agree to be tested. I would use other terms, but that's probably not appropriate. But I did not agree to be tested, so we wanted to stand our ground. During that time, we took the kids to rallies and stuff because I thought it was important for them to also understand the gravity of what was happening around them and to them and to us.

Kyle Morgan

Now, I gather your husband was a window installer. Is that right?

Michelle Malkoske

Yes. Sorry, he was actually the salesman who sells the windows; he didn't install them. Yeah.

Kyle Morgan

But he would attend customers' houses to do estimates, is that right?

Michelle Malkoske

Yes, so in his attendance to people's homes, people would ask him prior to entering their home for his vaccination card. Just to give a quote on windows.

Kyle Morgan

So it would be fair to say he wasn't able to do those estimates and lost income.

Michelle Malkoske

Correct.

Kyle Morgan

Can you tell us a bit about the effect on your family? I guess you were homeschooling at the time?

Michelle Malkoske

Yes, I was homeschooling my two younger children. That was a decision that I have always wanted to do. So for them it was not as bad. The 15-year-old had a much harder time because he couldn't go out and see his friends and all of the social things that come with being a teenager. For the two younger ones, the sports that they were in, they were allowed to go. However, I had to sit outside the emergency exit door to be able to watch them because I was not allowed in the facility.

Kyle Morgan

I understand there were some impacts on your wider family and some of those relationships. Can you tell us about those, too?

Michelle Malkoske

Yeah, I was quite outspoken about my views, personally. As a nurse, I also need to keep my professional guidelines, professional and ethical values, I suppose. So I did speak out to my family about how I felt.

I have nurses within the family who— They told me I should lose my licence and that I should not be practising as a nurse, which is awful to hear from your own family. Ah, it's crazy, just crazy. But yes, so there's some family that we do not speak to anymore and they

do not want to speak to us. It's unfortunate, but they are entitled to their own decisions and their own values and ideals as well.

Kyle Morgan

Do you know if there were other nurses, similar to you, who experienced the same thing as you? Or are you aware of other nurses in the same position as you?

Michelle Malkoske

Yes, I am, actually. I was very blessed to be with quite a few nurses who shared the same values and ideas as myself. I am so grateful to have those people to lean on. When we would show up at work, we knew who we could trust; we knew who we could talk to; we knew who we could confide in and that was such a blessing to have. As we went through this pandemic, you could walk into someone's home and they would point-blank ask you,

[00:10:00]

"How many shots have you had?" And I'm like, "I'm just here to help you. It doesn't matter. You didn't care about anything else like that, six months beforehand. I can provide you service or I can leave, but I will not answer that question for you." That was definitely something tough to have to go through. I know I wasn't the only one.

A lot of the nurses would wear their "I am COVID-vaccinated" sticker, and to a lot of clients, they would see that as a sign that that nurse was okay. If you didn't have the sticker on your badge— I personally was questioned: "Well where's your vaccination sticker? I don't see it on your badge." It just blew my mind, but there was definitely a few other nurses in my office and also in my group that also have stories to share, I'm sure, and they'll come out as we go on with this.

Kyle Morgan

Do you know of any others that made the same decision as you?

Michelle Malkoske

I believe there was at least two others, maybe three, I think, that made the same decision as me to not test and to just not go to work and to sacrifice that because of their beliefs. I know that there's some that did not have that option. There was probably many who did not have that option and had to go in and test every two to three days. And I couldn't imagine having to choose that. That would be tough.

Kyle Morgan

Do you know if the staffing levels were affected by your loss for six months not working?

Michelle Malkoske

In my office specifically, I know it was tough for them. I know they lost a few. I got page-outs all the time about overtime and shifts that were available and I would respond back, "I'm available to work." And they're like, "Did you change your mind or are you going to sign a sheet?" And I said, "No." They're like, "Well, then, you can't." I'm like, "Well, I guess

it's not that important for people's care because I'm a very competent nurse and I'm willing to provide care."

Kyle Morgan

Do you have any thoughts about how this could have been handled differently?

Michelle Malkoske

That's a tough one. I have many thoughts on how it could have been handled differently. That would take a very long time to talk about. I just feel there could have been a better way. I feel like people tried to do the best with what they knew at the time. It may not be what I think was ideal.

I feel the discrimination, if you want to call it that, against people who refuse to just even show vaccination, whether they were or not is unnecessary and that it never should have come to that. If you need help and you need health care and you need service, you should be entitled to that, regardless of whether you're going to show a paper or not show a paper or wear a mask or not wear a mask. You deserve care. That's part of my creed as a nurse. Part of our thing is to provide the right person, the right medication at the right time, the right way, and also allow them the right to refuse.

Kyle Morgan

How is the work environment now?

Michelle Malkoske

Now, it's like it never happened, and in my opinion, I go to work and I love my job still. I have to show up, I have to wear a mask, but it's still a great job that I love. I've never been questioned about this, ever again. Nobody's ever come hounded at my door about it, ever again.

The only problem I'm having now is if I do go to apply for another job at other companies, there is a mandate, still, for a lot of companies that you need to provide a COVID vaccination and that's quite frustrating. So I'm grateful to have had this job and to not have been let go and that I was put on leave. Yeah, I'm very grateful for what I have right now, and I just hope that it can change in the future. And I guess, we'll see.

Kyle Morgan

You mentioned, is it other private companies that still have policies that require vaccinations?

Michelle Malkoske

Yeah, a lot of companies are able to make their own policies and procedures on how they want that to go. I was trying to look up the WRHA policy about it, but I couldn't find it.

[00:15:00]

I believe the last that I was aware of was that you needed to provide proof of vaccination as a new hire at the WRHA, but I am not 100 per cent certain on that. But I know one company that I did apply for in the last few weeks, they requested my vaccination papers for that.

Kyle Morgan

I don't believe I have any other questions. I'll ask the commissioners if they have any questions. Yes.

Commissioner Kaikkonen

You mentioned that you had two to three shifts per pay period. Can you tell me what the average age of your clients would be?

Michelle Malkoske

Most people that I see are between the ages of 50 and 80.

Commissioner Kaikkonen

Thank you.

Kyle Morgan

Any other questions? I want to thank you, Michelle, for your testimony, on behalf of the National Citizens Inquiry. Thank you very much.

Michelle Malkoske

Thank you.

[00:16:02]

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 14: Todd McDougall

Full Day 3 Timestamp: 09:08:01–09:33:28

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Kyle Morgan

I think our next witness is Todd McDougall, that's Todd, there he is.

Todd McDougall

How do I look on my own camera there? I'm usually moonlighting here, you know. Activist, journalist.

Kyle Morgan

Can you state your whole name, sir, and spell your name also?

Todd McDougall

Todd McDougall, T-O-D-D, last name, M-C, capital D, O-U-G-A-L-L.

Kyle Morgan

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Todd McDougall

Yes, I do. Yeah.

Kyle Morgan

Are you born and raised in Winnipeg? Is that right?

Todd McDougall

Yes.

Kyle Morgan

And I understand you worked a number of years in child care, is that right?

Todd McDougall

Yes, 13 years in child care, working for the same centre, as well.

Kyle Morgan

When did that employment begin there?

Todd McDougall

I got hired in, I think it was the spring of 2008.

Kyle Morgan

So then 13 years would have been to 2021.

Todd McDougall

Yeah.

Kyle Morgan

Now I understand the mandates that were in effect also had some impact on you and just tell us what happened with your employment and how your job ended.

Todd McDougall

Yeah. So it's actually kind of interesting with the combination of lots of things. I also had a son that was born literally the day the global pandemic was announced. So I was in the hospital listening to the nurses, discussing how they felt about the beginnings of the ongoing situation. We were also moving out of an apartment at the time. So there's a lot going on.

April of 2020, my daycare was shut down. Although I was still going to work because my director had made it available to take the opportunity to use the option of having no children around, to be able to do all kinds of things to the Centre that we otherwise would normally not be able to do. All kinds of cleaning, organizing. Lots of different stuff. I wasn't necessarily out of work for April because I was still going, so I could keep money coming in. **And helping out with my centre and actually helping out with my community. One of the things I loved so much about my position in the childcare centre that I worked for was that in any one given day, I was assisting not just a school age and preschool centre, but I was also assisting the ongoing of two schools, French immersion and English, a church, and a community club.**

Throughout April and into May of 2020, I assisted all of those facilities because nobody was around. I was doing groundskeeping for the community club, for the church, for the daycare. Pretty much doing anything I could to keep busy, to keep active, to keep money coming in and to assist my community as well.

Then that summer, some children started filtering back into the daycare when we reopened. It was not very many at all. Of course, lots of parents were still working from home. So that summer was pretty, kind of, boring. There was small groups of children. I was helping a few of them with their online learning, which was kind of interesting as well. Kind of business as usual, just with a really small crowd.

Then school started up again, sort of in a normal fashion, September of 2020. And things were still relatively okay. I wasn't dealing with a whole bunch of nonsense that made me feel uncomfortable about my job and how I was treating children and how I was being treated by my employer and my fellow employees as well, too. That all took a sharp change—actually, I guess just inside, I think that school year.

That first school year in 2020, September 2020 started off relatively normal. But then as you got into October, they were really getting harsh on the cohorts and the distancing. And then, let's say for my childcare, we couldn't go back to the schoolyard anymore. And then I was getting told to, "Okay, you're playing out in the schoolyard with the children from our centre, but some other children from the neighborhood came in and wanted to go play with our children. You shouldn't let that happen." And of course, I went, "Never for a day. Like are you joking with me right now?" I would laugh in someone's face that said that to me. Like, "Ha, ha, ha. No, I'm not doing that."

Then the masks came in.

[00:05:00]

And that was difficult. Like myself, I found out very quickly that even if I wasn't working in a very physical capacity, having the mask on for 20-25 minutes, half an hour of extended period of time, was certainly changing the way that I operated. Right? This isn't normal. It was affecting me. Then that took a step up to, you know, "Don't be lazy with it." I had my director and my other employees bugging me, "Why is it below your nose?" Then it was, "Wear it outside." And then, so quickly before we even got into November of 2020, it was basically, "Have it on all the time." As soon as you hit our front steps to the moment where you're allowed to walk off site on your own or into some back room or into the washroom on your own, you're going to have it on all day. Inside. Outside. With one kid. With five kids. It doesn't matter. And I took extreme exception to this. Not only just because of how it felt for myself but, of course, largely for children.

Like many others had said here, by this point in time, by September, by October of 2020, we had gone through the beginning of "A Pandemic," right? And whoever had heard of a pandemic, when in history— Like when there was the black plague or the Spanish flu, did it go away and come back again? But it was all still a pandemic? No, a pandemic is— This is **affecting the world or whatever area for this amount of time until it is not. That is "A Pandemic."** And this was like— Okay, so we had three months of shutdowns and lockdowns and this and that. Then we had a fairly normal summer.

Then we started school again in September. And then it's cold and flu season. So of course, you know, a lot of people in this room spent the last three cold and flu seasons going, "Oh, it's COVID season again." So there was the fears of— Ah, this is going to be a pandemic that is allowed to "come back." And so sure enough, it did. And I'm watching what that was doing to children. Again, seeing this period of time elapse where nothing was happening with children at all. Now they are back at school. They had already started school without all having to be in masks and done it for about a month or so. Now this is creeping into again November 2020.

Kyle Morgan

Now am I right that you started attending some rallies about this time?

Todd McDougall

Yeah, yeah. But anyway, so I wanted to say, it wasn't just me. It was largely what it was doing to the children. I could see very easily how many children, especially of younger ages, that was having a very tough time doing this. I was watching, and this was a big kicker for me: I was watching autistic children. Especially one specific, who I had been doing work with for years.

Let's go back to just the previous school year, before COVID, before the schools got shut down. We were championing—his workers inside the school and us, the childcare workers, as well too—championing the success that had happened with this child. He was right there involved with his peers. He was socializing. He was able to do the majority of what his peer group was doing. I was astounded that as we were watching him regress to not just back to where he was several years prior but even worse. He was far more aggressive and violent towards staff that he was very, very familiar with, in a way that we had never seen before. I couldn't believe it that my staff, including people—I was never trained. No, I got lots of training and did lots of course and seminar work, but I never went to school for child care. I did not do the full three years at Red River College. So I was working with employees that had been doing it for the majority of their adult life. So they're 20 to 30 years older than I, including my director. Of course, the other thing that I couldn't help to throw into that is, you know, much better pay grade.

They had no idea. I was the one that had to sit there and listen to them have round-table discussions about "Why is?" I'll say the name of the autistic child, Toby. "Why is Toby running after us? Why is he hitting us? Why is he beating us? What's going on?" And I went, "Do you know autism? You guys, but this is your job. Have you forgotten what you've gone to courses and done seminar work for?" They're all staring—What is he about to say? "He can't see your face! There's a problem, he can't facially recognize what's going on. He can't read emotions anymore. He's autistic, this is extremely paramount to how he socializes!" They were like, "Oh my god, you're right! And we can't do anything about it!" I was like, "So you're going to let it get worse?"

Yeah, well, Larry, my director said, "Brent Roussin said."

[00:10:00]

I phoned Manitoba Child Daycare head office. I was put on speakerphone in a boardroom, as they all apparently, I could visualize this, stood around a table and they said, "We've never heard this before." This was a year in. This was just before I left my job. I called Manitoba Child Daycare head office and said everything I'm saying now. They said, "Could you stop for a moment? We're going to have to put you on speakerphone. No one's ever called us yet about this." In a province of over a million people with a daycare on almost every frigging street corner and growing? Really? My god. Yeah. Shocking.

That's why I started attending the rallies. Prior to that, I was kind of well—I run a media organization called Winnipeg Alternative Media. And for over a decade, in many different capacities, we have attempted to keep free speech and freedom of information alive by doing practically the exact opposite of what the mainstream media does—which is don't

censor or edit anything and let what we film speak for itself. And that's what I was doing for almost a calendar year, I would say: From the first rally that was held here in Manitoba, May 9th of 2020, up until I think the first one that I finally decided I am not just attending to film. I am here for every other reason as well now, too. Which was early January 2021 in Steinbach.

And immediately I got the repercussions that, of course, I was well aware was going to be coming my way. You know, you attended a rally—you were in a group size larger than public health order—so you have to self-isolate for two weeks. So all of that kind of amounts to why me and child care just wasn't going to work anymore. I could not stand to see what was happening to children, both whether we're talking about autistic and special needs or not. I could not stand the fact that I could not work my job properly anymore. We had gone through January and February, and I had made up every excuse imaginable to not actually do my job and not spend time with the children. Because I couldn't in good conscience anymore, and was doing small repairs and handyman work around the facility for a matter of months, at that point in time. All those options had ran out. I was done. I knew that this wasn't going to get any better anytime soon.

My director— And nobody had any answers for me and frankly, of course, were considering me to be a goofball. You know, like, "What is wrong with you? This is your job to keep the children safe. How can you have these questions?" And I remember one of my last things I told my director was like, "By the way, isn't it funny, I haven't been wearing a mask outside for two months and a parent hasn't said a damn thing." I found that was kind of fun. And the kids didn't rat on me either.

But so, it all just kind of came down. I remember the last phone conversation. This is really sad. After 13 years and being a very, very integral part of that community, once again working hand-in-hand with a church, two schools, a community club, and a school age and a preschool daycare— My last kick at the can there was I had a phone conversation with my director and said— Because I always admitted, I never tried to hide anything. I always said you know, "I don't want to wear the mask and I'm not going to be, and there's going to be lots of times where I'm not going to be when you're not looking at me." I still never got fired because I was one of the longest-standing employees at the time.

I know from firsthand accounts that the majority of the children and the families of that Centre loved me and considered to be one of my favourites. I was a, you know, young male staff. I ran around with the kids. I played rough-and-tumble; I let little boys fall off; I let little boys get in play fights. And then I would, you know, us and dad would high-five afterwards. So I knew how valuable I was and how my director was just hoping that something would change so that she could keep me on. And not go through all this struggle that I was kind of putting down to her.

But our last conversation was on the phone where I once again had to tell her, "Look, I attended a rally again just yesterday, so I guess I'm not coming to work this week." And she went, "No, no, you have to self-isolate, again." And I went, "Yeah, but there's no end in sight here. And so, what happens if I'm going to be attending a rally like every weekend?" "Well, I guess you're not coming back to work for quite some time." "I guess I'm not coming back to work at all." That's how that ended.

I then was not allowed even in the facility to go get my pair of work shoes. About a week later, I decided to go back. I tried calling my director on her personal line. And I called the daycare line several times. Emailed. Then I got there, knocked on the door several times.

Did their little buzzer thing that has a camera and everything, and it's got a full microphone system, as well.

[00:15:00]

Of course, I use that a million times a day. You can talk to people; you can say, "Oh, hello," whatever. Nope, nothing at all. One employee opened the door about this much, tossed my shoes on the outside and closed the door. That's 13 years, right there; that was my last final moment on the property.

Kyle Morgan

So now I understand you work at a seed plant. Is that right?

Todd McDougall

Yeah.

Kyle Morgan

So you had to change your whole line of work.

Todd McDougall

Yeah, 13 years doing— And I did try some of the schooling. Like I was doing a little bit, kind of, touch-and-go with Red River. Yeah, so 13 years of that, being a large portion of my life, that took up a lot of like extracurricular, as well. I did lots and lots of extra work there. When there were special events happening at the community club, I was a volunteer, like, it was being as much as I possibly, possibly could. I liked being a part of that community. After 13 years, I was now training new employees that I knew as like six- and seven-year-olds. I knew a lot of these families about as well as I know some of my own family, extended family members, like it was very tightly knit. And you know, it's the kind of thing that I've been so all over the place and so busy the last couple years of my life, sometimes I don't even think about it until a moment like now where— It was kind of shocking to see that my director and other employees and some of the other individuals there, could just let that happen with— It was kind of shocking to see sort of nobody kind of fight for me in a sense or anything like that.

And to lose that, that sense of belonging in a community that I had put so much work into was extremely debilitating. And then to compound that with having to go—okay, well, I need to still figure out a way to, you know, just to maintain, to bring money in and to move forward. So yeah, luckily enough, I had a friend who I'm sure most individuals would know, I'm sure is in the room right now, that being Patrick Allard. Who was like, "Well, you don't really got the skills for the kind of work I do, but I'll give you a shot." And I think I picked up a few things along the way, so that's nice. I could possibly do a few extra repairs around my own house now, so thank you, Pat. But that even had its problems because then me and him both got arrested.

Kyle Morgan

Yes, that's what I wanted to talk to you about that. So I understand you picked up about 10 or 11 tickets for mostly gathering outside in Manitoba. In addition to a mass ticket.

Todd McDougall

Yes. Hugs and handshakes, specifically.

Kyle Morgan

And like others that have testified, you were also arrested in May of 2021. And to be clear, that was as a result of *The Provincial Offences Act* in Manitoba. They issued a warrant to prevent the continuation of an offence, which in this case was gathering outside. Hugging and shaking hands with others.

Todd McDougall

Yeah. Yeah. And, you know, my— Especially after the daycare was, sort of, out of the way. Then, of course, I could throw myself into the mix even a little bit more. And of course, as all these things are transpiring, it's even more fuel to the fire to need to be more involved, right? So then it wasn't just—hey, I'm here already doing the media thing and maybe I'll get up on stage and speak a little bit. Because, of course, my first couple of times finally getting in front of the camera and up on the stage, I was talking about what I was seeing in child care.

But then after that point, it was more like—no, I want to be directly involved. I want to organize. I want to throw into the mix whatever I can using Winnipeg alternative media as a platform and as a mouthpiece. And then going back and using some of the knowledge that I had gained from activism that I had been involved in a decade ago. And I hadn't really been involved in protests or rallies for quite a few years leading up to the beginning of the COVID rallies. But I had organized and been a part of other different rallies from years before. And so, I was now able to bring some of that to the table and was more than happy to do so.

Kyle Morgan

I understand you were in jail for about 24 hours.

Todd McDougall

Yeah, on two separate occasions. Yeah, I was arrested for a breach as well.

Kyle Morgan

Now, on the first arrest, you are released with a condition to follow all public health orders, is that right?

Todd McDougall

Yeah

Kyle Morgan

And that would include the use of masks?

Todd McDougall

Right.

Kyle Morgan

And so, tell us about your next arrest, which happened only a week later. Is that right?

Todd McDougall

Well, see now, there is already a punchline right there, right? Because follow all public health orders, to me, because of doing the research that was— Oh, what was it again? Oh, yeah, on the Province's website, saying that involved in public health order was the option to be mask-exempt,

[00:20:00]

and to not have to require specific detailed personal information. You do not need to have a doctor's note. You didn't have to have your doctor on the phone for somebody, that it really should be able to just be left up with— If I'm going to go shopping here and you're— I get the whole thing of, like, this is a private, whatever; the answer is no, you still have to leave. Okay, fine, I'll leave.

But this was a Shoppers Drug Mart, so not a little ma and pa store. Like it's a large company, and I had already had my arrangement with the owner. Anyway, so follow public health order means that I should be allowed to be mask exempt. And if someone's okay with me shopping there because I'm mask exempt, then there should be no problems. Or if they say, "No, you're not allowed to be a mask exempt at this store, this location, then leave." And then you do leave. Then again, should still be end of issue. But not this time around. I'm thinking because I was in the news a whole lot that week.

But yeah, so this was my local Shoppers Drug Mart. I had even worked there a few years prior, so I knew the owner. I knew the manager. And I had already dealt with them because of me shopping there throughout the pandemic, up to that point already, and having the issues with other employees and such. And I had to call this man and say, like, "Look, do you know what the public health order states?" And he said, "Yeah." So I said, "You are aware that myself and others are allowed to claim a mask exemption, not show proof?" Yada, yada, and all that. "And this kind of discourse is allowed." And he went, "Yes, I'm aware." So I said, "Okay, well your employees aren't aware. So that would be a training issue, and that would be on your part." And he goes, "Oh yes. You're right. I will have to have a talk with my employees and make sure that they are not yelling or harassing individuals such as yourself that claim this." So I said, "Okay, great, well if that's going to be the case that means I can keep shopping there? Because you are the closest one to me." I had a newborn at the time, so Shoppers Drug Mart is a pretty key place to go for a lot of your infant needs. I said this to him, so I was, like, "You know, we're spending a lot of money there or I could be spending it elsewhere." "Oh, no, please keep shopping here."

Fast forward to, this is a year later. I've been arrested. I've been in the media. I don't think they actually printed my bail conditions, but it's almost as if they did, I guess. Because for some weird reason, that day, I walk in to get registered mail. Registered mail. So whatever was at the post office there that day, I couldn't get from anywhere else. That was my post office. Registered mail. I go there. I'm thinking, this is the location; I have an arrangement with the manager. I wasn't even thinking about my bail conditions really. Funny looking back on that in retrospect, but good story now.

And so, I go in, and as soon as I get up to the post office, there's nobody around in sight. Just the lady, who I knew from working with her three years prior, staring at me, pointing to her face. And I went, "Come on. I've been doing this with you guys for a year. Go ahead, call up Harvey," the name of the manager. "Go ahead, call him up. I'm allowed to be here. You have my registered mail. Give it to me, and I'll be gone, two seconds." She calls up Harvey. Harvey turns the corner, takes one look at me and berates me. Yells, swears, "You get the 'F' out of here!" Like very, very aggressive. And of course, I apologize. I go, "Harvey, whoa. We've had a normal conversation about this before, calm down. But okay, I'll leave." As I'm getting into a vehicle and getting ready to leave, I turn around at the front door and there's the owner, Tracy, looking at me as if she is my mother.

And I go, oh, no. Because she's standing at the front door right now, this is not going to go well. So yes, sure enough, six hours later, I'd just finished eating dinner. Knock at my door, and it's the Winnipeg Police. And I say, I'm holding a little card and I go— They— "You're going to get arrested for a breach." And I go, "But it says follow all public health orders. And I have a little card right here with the Province of Manitoba logo on it from excerpt, from the website." Showed them this right. And, of course, the female officer lowers her head and goes, "Tell it to a judge." I'm sure we all kind of encountered stuff like that over the last few years. Lot of that has been spoken about here at this table.

Kyle Morgan

Yeah. Mr. McDougall, I'm mindful of the time So you did spend 24 hours again in jail on that occasion, is that right?

Todd McDougall

Yes. Yes. Solitary confinement. Only able to use the washroom maybe once or twice if I knock loud, long enough.

Kyle Morgan

I don't have any further questions for you, sir. I'm going to turn it over to the commissioners to see if they have any questions. Doesn't appear so.

So I thank you very much, sir, for your testimony. We appreciate it on behalf of the National Citizens Inquiry, thank you, sir.

Todd McDougall

Thank you. I'll also mention I know a lot about censorship, too.

[00:25:27]

Final Review and Approval: Margaret Phillips, August 10, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Winnipeg, MB

Day 3

April 15, 2023

EVIDENCE

Witness 15: Michel Gagnon

Full Day 3 Timestamp: 09:34:00–09:44:57

Source URL: <https://rumble.com/v2idi8y-national-citizens-inquiry-winnipeg-day-3.html>

[00:00:00]

Wayne Lenhardt

Okay, Mr. Gagnon, could you give us your full name and spell it for us, and then I'll give you an oath to start.

Michel Gagnon

Okay, my legal name is Michel Gagnon, M-I-C-H-E-L G-A-G-N-O-N. But I go under the name Mike.

Wayne Lenhardt

Mr. Gagnon, do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony today?

Michel Gagnon

I do.

Wayne Lenhardt

Okay, due to the time constraints I'll lead you a little bit more than I normally would. You're presently 52 years old, correct?

Michel Gagnon

Yes

Wayne Lenhardt

And you have spent a total of 33 years in the air force?

Michel Gagnon
That's right.

Wayne Lenhardt
But you got out in April of 2022.

Michel Gagnon
That's correct.

Wayne Lenhardt
Okay. Could you tell us quickly what happened that made you leave the air force?

Michel Gagnon
Yeah, so my story is very similar to all the military members that got out. I didn't want to get vaccinated. It was very obvious early on in the pandemic, especially when they came out with a mask, the whole thing was complete B.S. to me. Because the mask— I was a general safety officer for a couple of years; I had to take a course on masks. One of the comparisons that I like to— One doctor that is very vocal against the mandate, he likes to say that the mask, even an N95 against COVID-19, is basically like trying to sift sand through a chain-link fence. It does not work. And I knew that from the beginning, and that's why for me, the minute they started making the mask mandatory, I knew that this whole rhetoric was not about science. It was all a political game or whatever, so to speak.

Wayne Lenhardt
Were there already concerns about things like myocarditis at that point?

Michel Gagnon
Not on my side per se. I had a medical condition that they denied me of. However, they weren't going to approve it, anyway. They approved a bunch of people in Ottawa, but they didn't approve anybody else in Canada.

Wayne Lenhardt
Okay, so there was a procedure to ask you, essentially, or require you to comply with the mandates. And could you tell us what that was quickly and what the end result was?

Michel Gagnon
Yeah, so as part of getting out—because I didn't want to follow the mandate or I didn't want to take the vaccine—they basically started giving you remedial measures, which is kind of like disciplinary measures. You start with one, which is a bit of a warning. Second time was a— I don't know if it was a second or third time, but I think I got three of them where you ended up with a recorded warning. And then after that, you go on into, like, career implications where they're actually going to kick you out. Because you were, in accordance with the military, disobeying a lawful order in their mindset.

Wayne Lenhardt

So it was some kind of disciplinary process.

Michel Gagnon

Exactly.

Wayne Lenhardt

Okay, and so prior to having a disciplinary process be a mark on your record, which was exemplary at that point—

Michel Gagnon

Yes.

Wayne Lenhardt

You decided just to retire.

Michel Gagnon

Yeah, because at the end of my career, I switched to a part-time military, so a reserve class. And I had the options of just giving a 30-days notice. I basically did that before they started the proceeding of pushing me out and giving me a 5F release, which is a dishonourable discharge.

Wayne Lenhardt

And you're currently, basically, living on your pension, is that correct?

Michel Gagnon

That's correct.

Wayne Lenhardt

Was the mandate from the military or from the federal government or a combination? Did you ever get anything in writing, and if so, who did you get it from?

Michel Gagnon

So from the Chief of Defence Staff, we had what they call an order that came out, and basically, they stated that the vaccine is mandatory. And right away in that same order, if you were not willing to follow or give your status of your vaccination, you were going to get disciplinary— All the steps for disciplinary action were all laid out in there. And eventually, you will get kicked out of the military for refusing a lawful order.

Wayne Lenhardt

Were there any injuries that were noted at that time from military personnel that had gotten the vaccine? Were injuries happening at that point?

Michel Gagnon

So from what I've been told, we had no— Like we had COVID cases, but COVID cases based on the flawed test, obviously. So it's hard to say we had real COVID cases. But the military is usually a healthy entity

[00:05:00]

because you have to be physically fit and all that stuff. So the chance of you being in severe complication of COVID-19 was already pretty low because everybody is pretty healthy. And normally, if you have comorbidities, you don't stay in the military. You're getting kicked out because you're not fit for duties. So nobody, really, we might have had a few cases. I've never heard of any complication in the military. Doesn't mean it didn't happen. It's like the flu, right? You can be sick pretty bad from the flu. So I've never heard of any bad complicated case from COVID-19.

However, the minute the vaccine rolled out, there's been a lot of vaccine injuries. So it was, like, astonishing to me that we were still going with the vaccine mandate.

Wayne Lenhardt

Okay, and if there are injuries with the military, especially someone that's been in it as a career like you've been, the military basically has an investment probably well into seven figures into your training that they would lose.

Michel Gagnon

Yeah, so in 2007, I kind of switched trades. Just that training I did in 2006, 2007, basically to qualify a person like me to fly an airplane, it cost the military approximately 2 million dollars.

Wayne Lenhardt

Okay, is there anything you feel that the military or the government should have done differently in your case?

Michel Gagnon

Everything has been done as directed by their superiors to a T. They don't follow— They don't care what the population thinks.

Wayne Lenhardt

Okay, do you feel that this type of thing is going to harm the military in the longer term?

Michel Gagnon

Absolutely. It's already hurting. Right now, what I know of is there's quite a few flying squadrons that their pilots, not just the pilot, entire air crews are failing their medical because they're failing their EKGs. Because one of the first things that the vaccine does, it makes your body produce these spike proteins that are supposed to be the bad part of the virus. But they give you something that is making your body create the thing that is bad from the virus.

So what's happening right now, pilots are failing their EKGs—and air crews, not just the pilots—and because of that, well, you can't fly. So there's squadrons out there, from what I've been told, and this is hearsay, but there's only like two pilots serviceable in an entire squadron. And they're flying these guys all the time because everybody else is unserviceable right now.

Wayne Lenhardt

Is there anything else that you want to tell us relating to this issue with the military?

Michel Gagnon

Well, the thing with the military, they're— Here's the scoop with the military, and I think it's the same with the RCMP: You only promote yes-men. You don't promote critical thinking people. That's the way it works in the military: if you don't agree with your boss, you're never going to get promoted. So that's what's happening at the higher echelon. They will follow your government.

You got to remember the military, unlike the RCMP—which the RCMP fails at this mandate. The RCMP is supposed to be responsible to the public and they're supposed to keep the government in check. Well, guess what? They did the complete opposite during the pandemic because they didn't follow the Constitution. And that's what they're supposed to do.

The military does not have that mandate. They're supposed to defend the sovereignty as directed by their government, which the government—obviously, they wanted to impose that mandate.

But it didn't just happen in Canada: that happened throughout the world, synchronized with all the UN countries. So a lot of people think that the problem is just here in this country. This is the exact same thing in all the UN countries. So there's a pattern here. So we always think right now that it comes from Canada and we did this, we did that. Well, it's the same thing in Australia, New Zealand, U.K., like you name it, all the UN countries were directed to do it this way.

Wayne Lenhardt

Okay, I'm going to ask the commissioners at this point if they have any questions to ask you.

Any questions? Last? Okay, thank you very much.

Michel Gagnon

I'd like to make a quick statement just before we finish, it'll take a minute.

So I'd like you guys to actually go on YouTube and search Dr. Fauci predicting the pandemic. If you guys think the pandemic was something that was released by accident or whatever, it was actually planned. Dr. Fauci, on the 12th of January 2017, predicted that Trump will be hit with a pandemic at the end of his presidency. And the minute that Trump went over to the WEF and the UN, just prior to the pandemic, and said that he will not participate or the country will not participate to the world order, he came back home. And that's when the pandemic was released.

I have friends in the military everywhere; I've been in it for 33 years. We have an intelligence section or trade. I know a lot of people in that trade, and they told me straight up— And this is what you got to remember: The pandemic was created for you to get the vaccine, it was not the other way around. You didn't get the vaccine to try to avoid the pandemic. The pandemic was created for you to get the vaccine.

Wayne Lenhardt

Okay, if there's no more questions from the commissioners, I want to thank you for your testimony today, on behalf of the National Citizens Inquiry. Thank you so much.

[00:10:57]

[00:00:00]

Ches Crosbie

Thank you, Shawn, and thank you, Commissioners.

The proceedings today, as in the other days, have been very, at times, very wrenching and heart-wrenching. Shawn opened his remarks today, Mr. Buckley, with some remarks about courage, and that's certainly a theme that we've heard coming from witnesses who have testified here. Some at a comparatively young adult age, very young. And other people from various walks of life, including the police, who lived up to the principle that standing up for your own beliefs and what is right, even though it may feel lonely at the time, can have outsized effects. I think that's a theme we've heard during the day's testimony, and, in fact, the last three days. That standing out from the crowd can often prevent very worst things, bad things, from happening.

We had the good fortune finally to be noticed by CBC, the mainstream press, in the last couple of days. I just want to mention that because it probably took a degree of courage on the part of the reporter who did the story, filed the story. It was on television news, and there's an article on the CBC website. The gentleman's name is Josh Crabb. He's at Winnipeg, CBC, and he deserves some appreciation for the fact that a) he reported on the proceedings that we were engaged in, and b) in my reading, he gave a reasonably fair and balanced account of what was going on here. The article is called "Citizen-led inquiry into Canada's pandemic response makes stop in Winnipeg," and it's date lined April 13th. So again, the reporter was Josh Crabb.

If I could have that image up on the screen. I often think of the truth in this way. It's a great metaphor. The truth is dammed up behind this dam. The dam in the image here is called the media, so one of those cracks happens to have occurred now in the CBC wall against the truth. There will be other cracks. Dams, at some point, develop too many cracks, and the cracks get bigger, water starts to run through, and eventually, that dam will collapse. These proceedings that all of you, and all of you out there who are watching, and the Commissioners, everyone who's testified, everyone in the audience, these proceedings that you're supporting and are engaged in, and people have supported through their donations

and their testimony, and all their hard work, and all the volunteers involved in this—these proceedings will eventually end with that wall collapsing. That wall will collapse.

The next image here, if I might ask for it, was also a theme we heard come out in the evidence today. This, of course, is the well-known president, assassinated president of the United States of America, John Fitzgerald Kennedy: “A nation that is afraid to let its people judge the truth and falsehood in an open market is a nation that is afraid of its people.” That’s still where we are in this nation, Canada, because no government, no authority wants to inquire into its handling or mishandling of the last three years’ response to COVID-19. So we’re doing it. Governments fear the people, but the people have found a way to inquire into and establish the truth regardless.

The last image, please, and I’ll let that speak for itself.

Thank you, Commissioners.

NATIONAL CITIZENS INQUIRY

EVIDENCE SASKATOON HEARINGS

**Saskatoon, Saskatchewan, Canada
April 20 to 22, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 1 Timestamp: 01:44:03–02:08:36

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Shawn Buckley

I'd like to welcome you to the National Citizens Inquiry as we begin our first of three days of live testimony in Saskatoon, Saskatchewan. Commissioners, for the record, my name is Buckley, initial S. I'm attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie.

Before I start, sometimes I do a call out. We are moving to Red Deer next week. If there are any lawyers out there that want to volunteer, we could use your assistance. We also are in desperate needs of bilingual counsel in Montreal coming up in a couple of weeks, and we could use some help in Vancouver for the next couple of weeks. So, if there's any lawyers out there that want to participate in this experience, please give me a shout.

Now, I always like to start by explaining to those that are participating what the National Citizens Inquiry is. And I have to admit, I'm having a little more trouble defining it. I'm quite pleased about this. There was a time where one could accurately describe the National Citizens Inquiry as a group of citizens that got together with this vision of appointing independent commissioners and marching them across this land to discover what we just experienced— What is the truth? And more importantly, to give ordinary Canadians a voice again: an opportunity to tell their stories safely, to begin a dialogue.

And there is still that group, that's still part of what the National Citizens Inquiry is. I mean, it's a volunteer organization, so people come and go. It's not the same people that started it, by and large. And we start other volunteers on. And once we started this, we needed way more social media people and video clippers. We still need a lot of video clippers. And so, we set them up and get them volunteering on their way. And sometimes they go in directions we don't expect. But that's just a drop in the bucket to what's happening.

What we're experiencing and what we're watching is that since this inquiry began, since it started marching across this country, individuals, families, groups—both formal and informal—have started to do what we've asked them to do. And that is to take personal responsibility for their actions and personal responsibility for the state of this nation. If you go online, you can't miss it. People are clipping the testimonies and putting them out.

They're creating indexes of the witnesses and linking in a way that just makes our website look lame. And so if there's any volunteers out there that want to help us clean things up, we'd certainly appreciate that.

I saw a photo yesterday of somebody had written in chalk at a bus stop, nationalcitizensinquiry.ca. My understanding is, yesterday, the group Posties for Freedom had a call out asking people to go to City Hall in Hamilton with signs that could be read by traffic, announcing the National Citizens Inquiry.

This is going on and on and on. We just find out about it by just seeing what's happening online. Sometimes people will let us know, and we'll tag them to promote what they're doing. Sometimes they don't. The beautiful thing is they don't have to let us know at all because it's not about this little band that is putting on these hearings. It's about all of us making a decision to take personal responsibility for the state of this nation.

So we find ourselves in a situation where the National Citizens Inquiry cannot be explained by the small group that puts on these hearings. And I think it would be more appropriate to describe the National Citizens Inquiry as those persons of all nations. And I say all nations deliberately because what we are doing here is trending internationally. Because people have a thirst for the truth, wherever they are. People across the world find the idea of standing up for freedom—

[00:05:00]

of actually taking personal responsibility, of being given the freedom to do that again because there's a movement—they're finding that quite attractive.

I would define the National Citizens Inquiry now as persons across the world who remember, and I'm using the word "remember" deliberately—who remember that they have a voice. We've all been put under a spell, a siren song that has put us asleep. We need to remember that we have a voice. The National Citizens Inquiry is those people that have decided that they need to stand up for what they believe in. The National Citizens Inquiry is those people who know, know to their core— You know, we know some things deeply. It belongs to those people who know to their core that they must stand up for freedom now regardless of the cost.

I have to say that I am honoured to be part of what is now something very different than it was when it began. I am, for the first time in a long time, optimistic. Optimistic. I have no illusion that our near- and medium-term future is going to be anything but very difficult. But I'm optimistic that when we get through that—because people are starting to take personal responsibility, because the spell is being dissipated—that we actually have a future. So, I'm honoured to be standing with you here today.

Now Commissioners, I need to report the theme of the week. And I'm grieved to say that, at least my experience this week at the NCI, the theme would be sadness. I've reported to you both in Toronto and Winnipeg that when an inquiry date draws near, we have witnesses drop out. They back out because they are afraid. They are either afraid of economic consequences—that they would lose their job—or there would be other repercussions. They have dropped out because of the social pressure. This last week, we've had witnesses drop out for a third reason. And that is simply, they're too ill. They're too ill to testify.

We were approached in Winnipeg by a gentleman whose wife had just gotten out of ICU, and she has a very important story to tell. We were wanting to have this witness testify

from her hospital room because she was then in a recovery ward. But we could not make those arrangements because the report back is that— She took a turn for the worse— Excuse me, I'll collect myself.

There's a witness that might not be able to testify at these proceedings because of health concerns. I'm sorry that I'm getting emotional, but we've been watching witnesses take the stand, especially vaccine-injured witnesses with just heart-wrenching stories. And it's just very difficult not to empathize and be affected by what's going on. I promise everyone that if you watch a day of hearings of the National Citizens Inquiry, you are not going to be the same.

We realize we're going to have to do something else, because we have so few slots for people that have these important stories, especially on injuries. I don't know if we're just going to have to have you guys video them and send us Rumble links or something. But I think just for, both in Canada and around the world, there are people that are not going to be around to tell their stories. And we need to get their stories. So I'm not sure what that looks like for us going forward because we probably don't have the technical capabilities unless people approach us to give us some assistance.

But there are people suffering.

[00:10:00]

And we have to stop denying what's going on, and many people watching this will understand that they're afraid, still, to have conversations about what's really going on. Even though it's becoming hard to deny.

It was about, I think, two and a half, three months ago I was on the website Zero Hedge. And I came across an editorial where the gentleman was basically saying, "We have to wake up." He said, "Look it, why doesn't everyone reading this article just ask themselves, how many people do they personally know who either died or were injured from COVID? And then ask themselves, how many people do they personally know who died or were injured from the vaccines?" And he did it in the article.

Now when I do that in my circle, I don't know of a single person who has died from COVID. I can think of some people that were injured from COVID. The examples in my circle were basically that loss of smell and taste. But my understanding is it's now fully resolved in those people, but they were injured for a period of time and understandably alarmed. And I know people that tell me they were terribly sick.

When we move to the issue of, do I know people who have died and are injured from the vaccine? Yes. There's been death in my circle, absolutely. And actually, it's overwhelming. We have witness after witness who are terribly injured, and they go to the hospital and they're told, "Oh, it's not vaccine injury, and you need to see a psychiatrist or you're anxious" and all of this. But I'm sorry. I know a young man who is, I think, 17 with myocarditis. I'm 57. I've never run across that pre-vaccine. All these athletes dropping dead while they're there and all these young people dying. I live in the province of Alberta. Our leading cause of death, I think, last year, was unexplained illness. They didn't even have that as a death code until a couple of years ago. And now it's the leading cause of death and you're telling us it's not the vaccine?

So, in my circle— Just to show how bad it is, if you were to draw a line 100 yards from my house, draw a circle 100 yards from my house—and I don't know all of my neighbours—I

can think of three vaccine-injured persons in that circle. Now, when my wife and I were driving up here, we had learned in connection to a friend of ours that this friend is now suffering with an illness. And I'm not going to say what it is, but it's a regular COVID-vaccine adverse reaction and one that I would personally be very concerned about. And my wife was actually crying. She was crying in the truck as we were driving up. But she was crying for two reasons. And it's the second reason that I want to talk about. She was crying because she, first of all, was sad that a friend is suffering. But the second reason was she felt shame that she didn't say anything when we were in the midst of this. "Don't do it, don't take it!"

And the reality is, if we were to back up a year or even a little longer, whether you were vaccinated or unvaccinated, there were a large group of people that had come to the conclusion—often through personal experience of being vaccinated—that this vaccine was bad news, and this vaccine was dangerous. And most of us didn't warn. Oh, we'd casually suggest, you might want to rethink this and that. But we weren't screaming from the house tops. Most of us weren't making much noise at all. And we can say to ourselves, "Well, it wasn't a safe environment." And it wasn't a safe environment. If you were a doctor, you're going to get your licence pulled. If you're a nurse, you're going to get your licence pulled. If you're at work, you might lose your job. You're certainly going to lose friends and family,

[00:15:00]

and people are going to call you a tinfoil hat conspiracy theorist.

And now I think if you are not called a conspiracy theorist for what you are saying, then there's something personally wrong with you, and you need to examine yourself. Because that term was invented to basically turn people's minds off. Because as herd animals, there's nothing more scary to us than being excluded from the herd. And so if they can create a term like conspiracy theorist or anti-vax, then you are subconsciously afraid to even go into that camp. And you will literally close your mind to people that you would identify with those views. You will close your mind because it's a protection mechanism. And the joke is on you because their mind isn't closed. You've closed your mind. The state has manipulated you into not considering other people's opinions. You actually close your mind. That term closed mind: it literally means it is closed. And so, the joke's on you because you don't get to hear another opinion. It's still up to you whether you're going to change your mind. But understand that the minute you—"Oh, this is an anti-vaxxer; this is a conspiracy theorist"—you have been manipulated. The second you feel that, understand that the joke's on you.

But it was an unsafe environment. I've heard people say they were worried about the army going door to door and dragging people out of their homes and jabbing them. And there was talk about putting unvaccinated people into camps. In Canada. There was talk about putting unvaccinated people into concentration camps. So yes, people were afraid to speak out. And it's clearly still unsafe to speak because we have witnesses backing out, in April of 2023, from testifying at this inquiry because they are afraid.

But I need you to understand that you need to take personal responsibility now, despite our failures in the past. Because now there are mothers today—today—taking their children to be vaccinated in Canada. That's happening. And it's happening because you're not screaming loud enough. You're not screaming at all. You're not speaking. You're still cowed. You're staying silent. There are vaccine-injured persons that could be directed to resources that can assist them, mitigate what they're suffering from. And we're not telling them about it because we can't have the conversation yet. And so, the reality is, and you're

not going to like this, but people are going to suffer and die unless you start taking personal responsibility and start shouting. So stop being afraid. And stop being intimidated. Or you are complicit going forward in injuries and death that happen, when we all know that this needs to be stopped.

Remember, I spoke—I believe it was in Toronto—about how the police state relies upon you for their participation. It can't happen. The lockdowns can't happen unless you stay in your house, unless you're cowed and stay in your house. And I'm not saying if— You know, if we're having a pandemic hit us and we're not sure what's happening and the government is actually being truthful with us and saying this or that might help, my gosh, we'll all act responsibly.

But it wasn't that long where it had to be clear to anyone with two firing neurons that there's something wrong. One day we're wearing masks; we're locked down; this is all afraid. And then the government just says, "Oh, it's lifted." And now, a second later, we're safe. And, "Oh, we don't need these restrictions. We don't need to show our police state identity papers to access a service."

But it's your compliance. It's you cowering in your home. It's employers requiring passports for your customers to come into businesses. Are you kidding me? You actually did that? You participated? You actually acted as the state. You were the police officer forcing citizens to participate in a police state ritual. Shame on you. And the employees that did it. The employers couldn't do it if the employees would say, "No, I'm not doing that." We just have to stop complying. That's the problem. You need to understand that, as mad as you are of what you experienced: It happened because of you. Because you let it happen. And you need to stop complying regardless of the cost. And you've been complying because you've worried about the cost.

Now, I want to get personal.

[00:20:00]

I want you to think about something I'm going to say, because for almost everyone who hears this, you're going to go, "Yeah, I felt that." And I'm going to suggest to you that sometime in your life, you felt that you were here for something important. You felt there was something bigger going on, that you were actually here to do something very important for everyone else. And then as your life went on, and you got busy with going to school and work and supporting the family, and you know, the real issue is how do you make the boat payments and stuff like that. We're all distracted with the bread and circuses. You might have found yourself even thinking back to how you felt you were here for something important, going, "Well, that must have been my imagination. Because clearly the way my life is manifesting, I'm not here to do something important."

I want to share with you something that's been kept secret from you. That feeling you had that you were here for something important is true. It's true. You are here to do something very important. And right now, you get to decide: Do our children, do our grandchildren? Their fate's in your hand. It literally is in your hand, the fate of your children and grandchildren now are in your hand. It's decision time. Are they going to be free? Or are they going to be slaves?

And there's only one way to decide. You have to decide. You don't get a choice. You can't sit on the fence because sitting on the fence is a decision for the police state. And you don't get

to decide by making a conscious decision, “Oh, no, my kids are going to be free.” If you think that’s going to make them free, you’re still under the spell.

And when I talk about the spell, we hopefully will have a witness come and testify here, during these proceedings in Saskatoon, whose mother had gone to Shoppers Drug Mart to get vaccinated. And there’s a whole line of people behind her mother. And after her mother was vaccinated, for that 15-minute waiting period, is just standing there. And the line is still proceeding, getting their shots. And she dies. A news report I read even reports that she was dead before she hit the floor. She just dies. You know what’s shocking about that? Is that line of people waiting to get the shot stayed in the line and kept getting the shot. Did you hear that? They just witnessed somebody fall to the floor; likely, the person died before they hit the floor. And they stay in line and continue getting the shot. That’s a spell. Now that spell is being dissipated.

That’s what not taking action does: People stay asleep. They stay under the spell. And if you continue to do nothing, you are actively doing exactly what the police state wants you to do. But you want to know what the opposite of doing nothing is? Because doing nothing is your decision to work for the police state. That’s your decision. There’s no “on the fence” here. You’re for the police state 100 per cent or you’re against it 100 per cent. What’s the opposite of doing nothing? Doing everything.

And so you get to decide what type of a country we have, what type of a future our children have. And your choice is to do it all, to give everything. And so I’m inviting every Canadian, every person in the world to stop being afraid, to wake up, and to stand for freedom regardless of the cost.

Freedom is not free. But it’s worth the price.

[00:24:33]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 1: Dr. Francis Christian (Parts I and II)

Full Day 1 Timestamp: 02:08:36–03:09:51/05:48:40–06:26:09

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

PART I

[00:00:00]

Shawn Buckley

Now, I'd like us to segue into our first witness who we're very, very pleased to have with us this morning, Dr. Francis Christian. Dr. Christian, thank you for joining us this morning.

Dr. Francis Christian

Thank you very much.

Shawn Buckley

Dr. Christian, I'd like to ask you, first of all, if you would state your full name for the record and spell your first and last name for the record.

Dr. Francis Christian

Yes. My first name is Francis, F-R-A-N-C-I-S, and my surname is Christian, C-H-R-I-S-T-I-A-N.

Shawn Buckley

Now, Dr. Christian, you have been a surgeon for over 30 years?

Dr. Francis Christian

I have. Twenty-five years, actually.

Shawn Buckley

Okay, I'm sorry. And you actually were Professor of Surgery at the University of Saskatchewan.

Dr. Francis Christian

Yes, I was Clinical Professor of Surgery in the University of Saskatchewan. That's right.

Shawn Buckley

And although you were a professor of surgery—so you're teaching other doctors how to become surgeons—you continued to be a surgeon yourself at the same time.

Dr. Francis Christian

Correct. If I may, I can just tell you very briefly what I was doing in the University of Saskatchewan.

Shawn Buckley

Yes, please do.

Dr. Francis Christian

Yes. So my roles there could be thought of in three parts. The first was as a surgeon, like you said. I did general surgery, trauma surgery, cancer surgery, that sort of thing, thyroid surgery. I have a fellowship of the Royal College of Surgeons of Edinburgh and a fellowship of the Royal College of Surgeons of Canada.

The other parts of my role: As Clinical Professor of Surgery, I was very involved in data analysis and evidence-based medicine analysis. I taught medical students and residents how to critically read journal articles, how to make sense of the data. I gave many presentations. I regularly published peer-reviewed articles.

I was also director of the quality and patient safety department in the Department of Surgery. And in that role, I introduced the department to the National Surgical Quality Improvement Program, which is a very data-intensive program. I also, with the Computer Science Department in the university, developed an app for iPhone and Android, which is still being used, I believe, throughout Saskatchewan for improving quality by recording morbidity and mortality.

In addition, the third part of my role as Clinical Professor of Surgery was in ethics and in the humanities. I was director of the Surgical Humanities Department, which I founded, and was the founding editor of *The Journal of the Surgical Humanities*, which has a worldwide circulation. I had the privilege of being the lead author of the Canadian Association of General Surgeons' position statement on professionalism.

Shawn Buckley

So you come here today speaking about how colleges have treated doctors and how doctors have acted with quite the experience and authority behind you. I will just advise the commissioners that we have Dr. Christian's CV entered as Exhibit SA-3.

Dr. Christian, can you tell us, as this COVID pandemic started to come across or be imposed on us or experienced, what your initial thoughts were? And then if your initial thoughts changed? So I'm just kind of asking you to share your first part of your journey with us.

Dr. Francis Christian

When the whole thing started in 2020, I initially thought I should give the government a bit of a rope. It was supposed to be a new virus and let's see what they come up with. But towards the end of April, the beginning of May, I started seeing signs of what I had learned in my studies, historical studies, of what happened in the Soviet Union.

You see, when I was a teenager, I read a very influential book. It's called *Tortured for Christ* and it's by Richard Wurmbrand. And essentially, he talked about how the Soviet Union,

[00:05:00]

with its tyranny, was able to exert this control over millions of people, including this pastor Wurmbrand. And I decided at that time that I would make the study of the Soviet Union a part of my life journey.

I saw certain things which were very reminiscent to what was happening in the Soviet Union 50, 60, 70, 80 years ago. And that is censorship, the media becoming an arm of the government instead of holding government to account. I saw prominent scientists being censored, deplatformed. Words like "disinformation" crept in and that was straight out of the Soviet playbook. In fact, it was the Soviet Union that invented that word. "Disinformation" was actually a Stalinist term.

So I saw that. I saw some of the scientists that I had known about before COVID as prominent scientists—people like Paul Marik, whose work in the ICU was known to me even before COVID—were being censored. Pierre Kory was being censored. His *Point of Care Ultrasound* book is still being read by people in our hospitals here.

So then I decided to look at the data and none of it made any sense at all. And I tried to influence my colleagues. You see, as a surgeon you work with anesthesiologists and anesthesiologists often also work in the ICU. So I would engage them in conversation. I would ask them about the data, query them about the data, and then try and steer them in the way of the data. And I wasn't making much headway.

And then in the spring of 2021 the government rolled out the COVID injection to our children. And that was being done in what I would call "warp speed." And I decided that I couldn't stay silent anymore because children don't have voices and we have to be their voice. So I had a press conference in which I asked for something which shouldn't really be controversial. And that is informed consent. I pointed out what informed consent in the COVID-era looks like and what informed consent for the injection should look like.

And I had this press conference, which was actually well-attended by the local press. And one week later, I was called into a meeting and fired from my contract. And that is more or less my story.

Shawn Buckley

I'll just stop you there. My understanding is there were five doctors that participated in that press conference.

Dr. Francis Christian

No, there was me. I think you're talking about a video—

Shawn Buckley

Oh, yeah. I'm talking about the video. I am. So please tell us about that.

Dr. Francis Christian

Yeah, so the press conference was just me and another doctor who I hope will be here or is here: a good friend of mine, Dr. Chong Wong, who's a family doctor. And he also spoke at the press conference.

Shawn Buckley

What was the response to that? Well, first of all, tell us about the video and the response to the video.

Dr. Francis Christian

Well, the video itself was about a week before the press conference and that wasn't a factor in my firing—not according to that meeting and not according to what they've produced afterwards. Essentially, that was a video with five other physicians as well; that was just talking about the science around the COVID pandemic.

Shawn Buckley

Right. And to be more specific, it would be talking about the science that was not being reported by the mainstream media.

Dr. Francis Christian

That as well, yes.

Shawn Buckley

Right. So the purpose of the video was to get truthful scientific information to the public?

Dr. Francis Christian

Absolutely.

Shawn Buckley

I understand you ended up writing a letter after the video and— David, can you pull that up on the screen? I want to read, basically, your last two paragraphs from your letter. Just so that people watching understand the types of things that you were saying.

This is a June 12th, 2021, letter. It will be posted as Exhibit SA-3a on our website. Dr. Christian, you write:

[00:10:00]

"For many months during this pandemic, I have tried to influence the system from within and have not made any public statements. My decision to make the video that has generated so much interest is a direct result of the vaccine being rolled out at 'warp speed' to our kids. Not even a semblance of full and accurate informed consent is being made available to parents or children— and kids are being induced and incentivized to get the 'shot' in schools even without parental knowledge or consent.

Any attempt to silent physicians is destined to fail. The Nuremberg Code specifically makes the acquiring of informed consent an absolute requirement in the care of our patients. The Declaration of Canadian Physicians for Science and Truth, which I signed, together with my Ontario physician colleagues and concerned members of the public, is already at 16,000-plus signatures. As the Declaration points out, any attempt to stifle physicians and their pursuit of the solemn duty and obligation of informed consent may itself constitute a crime against humanity."

Can you just explain for us that last paragraph?

Dr. Francis Christian

Yes, the Nuremberg trials were essentially held after the Second World War in order to make sure that such a thing never happens again. And the doctors' trial was kind of a subset of the Nuremberg trials. And after that there was the Nuremberg Code that was published, which made sure that no experiment can be done on anybody without proper informed consent.

At the time of this letter, at the time of this press conference that I had, and even to this day, I believe it is still an experiment: a massive experiment on a large scale, on a population which hasn't been given the information for informed consent. You can only give informed consent if you have the information for informed consent. And so I pointed out that that Nuremberg Code was being violated. And therefore that violation could constitute a crime against humanity.

Shawn Buckley

My understanding is that the lessons from the Nuremberg Code and basically the need for informed consent, which requires both an understanding of the benefits and the risks, has been incorporated into codes of conduct for physicians and for pharmacists and for nurses in Canada.

Dr. Francis Christian

Yes, I think you're absolutely right. The Nuremberg Code has informed several other codes and several other statements of professionalism and ethical behavior for physicians, nurses, pharmacists, and so on. Yes.

Shawn Buckley

Now, you were telling us earlier that after the press conference, you were basically fired. Can you share with us a little more about that? Are you meaning you actually were fired as a surgeon? Were you fired from all of your responsibilities?

Dr. Francis Christian

Yes, I was fired from my contract. And because I was fired from my contract, I essentially lost my directorships as well.

I really don't know how they thought that firing me from the Director of the Surgical Humanities was going to serve the public. Because the reason I founded that department is so that the medical students, residents, surgeons, nurses can be brought into contact—can engage—with the humanities, with art and literature, poetry, drama and so on. Because my contention was, you can't really be a good surgeon or a good doctor of the human being without knowing the human story. So firing me from that position: I have absolutely no idea how that served the pandemic management purpose.

But I have to say, that particular meeting was very much— People have asked me, "Were you shocked? Surprised?" And I wasn't, because I had studied the Soviet Union.

[00:15:00]

I was very disturbed. And there were many tribunals that were set up in the Soviet Union for the show trials. And in my presentation, I'm going to talk a little bit about that too. So I was not shocked, but I was very disturbed.

Shawn Buckley

Yes, and actually I'll invite you to go into your presentation [Exhibit SA-3c]. You've prepared some themes that you wanted to share with us and I invite you to do that now.

Dr. Francis Christian

I'll go into my presentation straight away. I think I would prefer just to go through the presentation and then I could answer questions from the commissioners after that, and from you, Mr. Buckley.

I want to thank you for giving me this opportunity to give my expert witness testimony for an event which I think will be a major historical event in the life of our nation. Because when this time is written about and spoken about, there will be a record.

The scope of my testimony is essentially going to be about our children and the COVID-19 vaccine, the suppression of early effective treatment, and how are vaccine injuries reported in Canada.

Now, before I go into that, I just want to make some preliminary remarks on the use and abuse of data by our health authorities and our governments. "Data, give me data" is actually from Sherlock Holmes and it was told to Watson. In the age of COVID it should be, "Data, give me *transparent* data." And data should not be used to frighten the people; the truth always comes out. Data should not be used to manipulate the population; the population pays the salary of public health officials, physicians, and politicians. And finally, data should not be used to obscure the real data; there will be a price to pay. And there's one more point: data should be transparent and consistent and verifiable.

Very quickly I'm going to go through some of the manipulation and obscuring of data that took place. This is Alberta data: diagnosis of COVID after the first dose. And for three weeks at least after the first dose in Saskatchewan, this group of people would be called

unvaccinated. And if you look at that graph, the peak of cases is at 10 days after the first dose. In Saskatchewan and most provinces, they would be unvaccinated.

Again, what about hospitalizations after the first dose?

Shawn Buckley

I'll just stop you, so that people understand. When you say unvaccinated, you mean for the public statistics.

Dr. Francis Christian

Yes.

Shawn Buckley

So when they're reporting on TV, "Oh, we had 20 million COVID cases this week, run and hide, and get vaccinated—" that 20 million could be all vaccinated people because their definition of vaccinated is basically 14 days after. Now in Alberta, my understanding is you were unvaccinated for statistics purposes until 14 days after your second dose, and there could be a long wait. Was that the same with Saskatchewan?

Dr. Francis Christian

I believe it's similar in Saskatchewan, yes.

Shawn Buckley

Okay, and I'm sorry for interrupting. I just thought that was important for people.

Dr. Francis Christian

And this is— Once again it's Alberta data, because we don't have Saskatchewan data released yet. And shouldn't the public, here too, know this really important group of data? I think so. So here again, hospitalizations after the first dose: it peaks at five to 15 days after the first dose. And in Saskatchewan, such a person would be called unvaccinated.

What about deaths after the first dose? These are Alberta statistics again. In Saskatchewan, we don't have this data. Notice that death peaks at 12 days after the first dose of the vaccine. In Saskatchewan, again, unvaccinated.

I'm just going to run through data, which I believe was manipulated and was given to us in a way that was meant to deceive us. And this is lifted right out of the annual Saskatchewan Health Authority report, page 15.

[00:20:00]

And this tells us about COVID-19 and ICU beds. And if you look at that circle there, it looks at ICU bed discharges and visits before the pandemic. And then, if you look at ICU bed discharges and visits during the pandemic, it is actually less, significantly less. So you remember they were trying to scare us by saying, "Our ICUs are being overcrowded and you have to get vaccinated, otherwise our ICUs will be overwhelmed." Now, there may be

some other explanation for it, but on the face of it, the numbers do not lie. The ICU utilization before the pandemic was actually more than during the pandemic.

Now, what about throughout Canada? Many members of the public do not understand the ICU bed is not a physical bed. An ICU bed is nursing, physician and other staff required to staff a bed. And during the pandemic, was the real ICU bed shortage a shortage of staff with burnout, sick leave and so on? And were patients admitted to the ICU with COVID or because of COVID? And there's a big difference there. And how many co-morbidities did the average ICU patient have?

What about ICU bed usage in Canada before and after the pandemic? And this is CIHI data, Canadian Institute of Health, and essentially it tells the same story. On the left of your screen is ICU bed admissions before the pandemic. On the right of the screen is during the pandemic. And in fact, ICU bed admissions during the pandemic was less than before the pandemic.

Okay, with that introduction about the data, I'm going to get into the meat of my presentation. And the first subject I'm going to speak about is our children and the COVID-19 injection or vaccine.

I want to remind the public that Pfizer has a criminal history. This is in fact from the Department of Justice United States website. And it talks about how the Justice Department announced the largest healthcare fraud settlement in its history. Fraud settlement, \$2.3 billion for fraudulent marketing.

Exhibit 2: "Pfizer to pay \$325 million in Neurontin settlement," "defrauded insurers and other healthcare benefit providers by marketing Neurontin" in a fraudulent way. "Pfizer Admits Bribery in Eight Countries." "For three years, Pfizer Italy employees provided free cell phones, photocopiers, printers, televisions to doctors, arranged for vacations (such as 'weekend in Gallipoli,' 'weekend with companion' and 'weekend in Rome') and even made direct cash payments (under the guise of lecture fees and honoraria) in return for promises by doctors to recommend or prescribe Pfizer products." It happened in Italy, Bulgaria, China, Croatia, Czech Republic, Russia, Serbia, Kazakhstan, and I'm sure in many other countries, too.

Now, by summer of 2021, and actually much before that, it was obvious that there was more than a 1,000-fold mortality risk difference between children and the elderly. What that means is that if you're very young, you had more than a 1,000-fold less risk of dying than if you were very old. And there was the study from England that showed "SARS-CoV-2 is very rarely fatal, even with underlying morbidities," among children. In Germany, with 80 million people, this November 2021 study showed that there was not a single COVID death in children. And my contention still is that this should be, have been, in every informed consent discussion.

So what is the risk of COVID for children? In fact, there's a statistically zero risk of dying of COVID—less than the annual flu. There's 10 times less risk of dying of COVID for a healthy child than of a car accident.

[00:25:00]

Now teachers kept saying, "Oh, we are scared that they will infect us." In fact, there were studies in multiple countries, including this one from Scotland, that showed that teachers

are safer than the general public. And so healthy children do not need/did not need the mRNA injection, which has never been used clinically in humans before.

So for a zero-risk-of-dying children's disease, what are the risks of the mRNA injection? You see, myocarditis is only one of the many vaccine harms that the data is showing. There's also paralysis, transverse myelitis, Bell's Palsy, strokes, pulmonary embolism, and a whole lot of other adverse events.

On the left, you see this very, very sad and tragic case of Maddie de Garay, a child who had paralysis waist down, being tube fed after Pfizer mRNA injection. And this girl is actually in Pfizer's own data, but Pfizer is refusing to acknowledge it.

Now the captured media says that these adverse events are rare, or very rare. What is rare? One in 10,000, one in 5,000, one in 250? Remember the COVID-19 virus poses no risk of dying of COVID for your healthy child. "Rare" is only up to the point it affects your own child. And I defy any decent human being to watch that video in that link I've put up there, and not cry with this father, Ernest Ramirez, who lost his 16-year-old son from myocarditis from the vaccine.

What is the mortality after myocarditis? We've been bombarded by the media with stories about "mild myocarditis." In fact, we know the mortality long-term. From studies in Germany, which showed that the 6.5-year mortality was 20 per cent, 20 per cent are dead after 6.5 years. The Korean study showed that 25.5 per cent with myocarditis are dead in 10 years. There's no such thing as mild myocarditis.

How many myocarditis present to hospital? In various studies, there's one in 2,500, one in 6,000. And in the Thailand study, where they actually looked for myocarditis, it was one in 250. But many myocarditis cases will not present to hospital but will still have damaged heart muscle. So what is the observed mortality of myocarditis? We know it's 20 per cent at 6.5 years and 25.5 per cent at 10 years. What don't we know about the other medium- and long-term effects of the mRNA injection?

So what should informed consent for children look like? The risk of your child dying of COVID is almost zero. The vaccine has a new gene technology that has never been used clinically before. The vaccine was approved using emergency-use or interim-use authorization. It is experimental. Its medium- and long-term effects are unknown. To qualify for emergency-use authorization, there must be an emergency. There is no emergency in healthy children. Children are of no danger to adults. There are thousands of deaths associated with the vaccine. Myocarditis is a serious condition and can be caused by the vaccine. Its real incidence is unknown. It could be 1 in 5,000 or 1 in 250 or even commoner. Myocarditis can be fatal. Many other serious vaccine adverse events are happening. And the risk of the vaccine for a healthy child is likely more than the risk of COVID. That, in my view, should be the minimum information for informed consent and this has not changed since my press conference in June 2021.

But there is a farce that is underway—of informed consent in Canadian children. This is thanks to the good folk at SASK ALLIANCE, and I've put the link there for those who want to go to their website. And these are documents through freedom of information requests.

[00:30:00]

On the left you see consent for COVID-19 vaccine for children. And I want you to concentrate on this, "It is recommended that parents/guardians discuss consent for

immunization with their children. Efforts are first made to get parent/guardian consent for immunizations. However, children 13-years-old and older who are able to understand the benefits and possible reactions”—reactions, what does that mean? Does it mean death? Does it mean adverse events?—“for each vaccine and the risk of not getting immunized, can legally consent to receive or refuse immunization in Saskatchewan.”

So this is a farce. Because if you've seen my previous slide, which 13-year-old can understand all the things that needs to be understood? I haven't met a 13-year-old who can understand even half of what is required to be understood for informed consent.

As part of the informed consent process in Saskatchewan, they were directed to the vaccine information sheet. As far as I could find out, this was the vaccine information sheet. And what they say here is, “People who are vaccinated may experience mild to moderate side effects.” I don't know if you can call death a mild to moderate side effect, or paralysis a mild to moderate side effect, or myocarditis. “They are minimal for most people and should go away in a few days.”

Death doesn't go away. And apparently this mantra: vaccines are safe and effective. But as we know, these are all the things that should be there in informed consent, but wasn't. And that hasn't changed.

So my question for parents is: Should you trust your children to a company with a criminal history? That illustration on the right is from the great work of the British illustrator and cartoonist, Bob Moran. I've put his website in the link there. It shows a plucky little fellow hiding behind his mother who is standing up bravely to the COVID criminal enterprise. But I want to tell the commissioners, Mr. Buckley, the public: My efforts, our efforts, our campaign to inform and educate parents and keep our children safe has worked. Much more work remains to be done but we are winning. Millions of mothers all over the world have not believed the narrative of the COVID criminal enterprise and have heroically kept their children safe.

My question for the Government of Canada, the provincial governments, their agencies and their operatives, and for corrupt legacy media: Why do you want so desperately to inject our children with a dangerous vaccine that they do not need?

And now I'll go into the second part of my testimony, which is the suppression of early effective treatment of COVID-19. And ivermectin, mind you, is only one of several different medications, drugs, and supplements that have been shown to be effective. But I'm taking this example anyway. So I'll try and tell you what happened, why it happened, and why it must never happen again.

On the right, bottom, you see the discoverer of the group of materials that later became ivermectin, the avermectin, Satoshi Omura. He won the Nobel Prize in 2015. It was commercialized as ivermectin in 1981 and since 1987, it has been used in billions of patients around the world to combat parasitic diseases. And 100 million doses of ivermectin are administered every year. It's a very safe drug and it's safer than Tylenol. It's actually in the WHO's “essential medicines” list. Ivermectin before the pandemic, the patent had long expired. It cost less than 10 cents in most countries to produce and sell. And even at that time it was being approved for uses that were off-label.

Now, off-label means that the physician, using his or her own judgment and the sacrosanct patient-doctor relationship, is able to prescribe a drug for off-label use.

[00:35:00]

And a study showed that 20 per cent of all prescriptions in the U.S. are off-label; fifty per cent of all pediatric prescriptions in Europe are off-label.

The antiviral effect of ivermectin had already been shown for a range of viruses, including the dengue virus, the HIV virus, the encephalitis virus, and a range of RNA viruses. If you look at these studies: This one shows that ivermectin is a specific inhibitor of the replication of HIV and dengue virus, 2012 May. It shows, again in 2012, that ivermectin is an inhibitor of viral activity, new prospects for an old drug. And this is actually a very good article which is titled, "Ivermectin: enigmatic and multifaceted 'wonder' drug continues to surprise and exceed expectations." Again, before the pandemic. During the pandemic, the antiviral activity of ivermectin was actually noted against the COVID-19 virus in April, 2020.

And what about ivermectin in clinical trials? Many of you will know this website. It's from the FLCCC [Front Line COVID-19 Critical Care Alliance] website and it shows that ivermectin for COVID-19 has massive beneficial effects in COVID-19 for prophylaxis, for early and late treatment: 82 per cent, 62 per cent, 42 per cent and so on. So during the pandemic, we had no effective, approved treatment for at-home outpatient treatment. Ivermectin is one of the safest drugs known to mankind. It had already shown antiviral activity, including against the COVID-19 virus. It was showing remarkable efficacy to save lives in real-world clinical trials. Even if some studies did not show benefit, it was a safe drug to use. It was the logical drug to use for early, effective treatment.

But what actually happened is that the pharmaceutical companies started a campaign against ivermectin. The media came down on ivermectin like a ton of bricks. They were writing articles that were supposed to be done by "fact checkers." But in fact, the "fact checkers" were not doctors at all; they were mostly young people with basic undergrad degrees. And Matt Taibbi of the Twitter Files fame actually wrote an article on this, "Why Has 'Ivermectin' Become a Dirty Word?"

What happened in Canada with ivermectin? Doctors were suspended for using ivermectin. Ivermectin became scarce, probably because imports were stopped. Pharmacists refused to dispense ivermectin, even with a doctor's prescription. And pharmacists reported doctors and are reporting doctors for prescribing ivermectin. And the captured Canadian media campaigns vigorously against ivermectin.

Shawn Buckley

Doctor, can I just stop you there? Has it ever happened before where pharmacists were refusing to fulfill prescriptions written by medical doctors and reporting medical doctors to their colleges?

Dr. Francis Christian

Never. The pharmacist will sometimes call me, or call a doctor, and say, "I want some clarification and is this what you had in mind?" And that's the extent of the query that the pharmacist does to the physician.

Shawn Buckley

Okay, so this was an extreme change in behaviour.

Dr. Francis Christian

This was unprecedented. Absolutely.

Shawn Buckley

Thank you.

Dr. Francis Christian

Meanwhile, the FDA [Food and Drug Administration] put out this completely ridiculous, cartoonish thing: “You are not a horse. You are not a cow. Seriously, y’all. Stop it.” As if they didn’t know that it was being used all over the world in human beings. And meanwhile, *The Hollywood Reporter* is slamming Joe Rogan: “Joe Rogan Says He Tested Positive with COVID-19, Takes Unproven Horse Dewormer.” And there was only one contrary article in *The Wall Street Journal*: “Why Is the FDA Attacking a Safe, Effective Drug?” After all, it is a safe drug. Let’s say there was no overwhelming proof it works, why not try it?

Why the war against ivermectin? And to answer that, ask yourself the following questions: If there is a safe, early, effective treatment, why a vaccine? If there is safe, early, effective treatment,

[00:40:00]

why emergency- or interim-use authorization for a vaccine? And if there is safe, early, effective treatment, why the lockdowns, the masks, the school closures, the business closures? And if there is a low-cost, safe, early, effective treatment, where are the billions to be made by Big Pharma?

So follow the money. COVID vaccine profits minted nine new pharma-billionaires. And Pfizer’s 2022 revenue from the vaccines was a record \$100 billion. The money that can be made from ivermectin? Zero.

Now, this is a very disturbing article that came out in *The British Medical Journal* last year. It looked at what percentage of the regulatory agencies in various countries—in other words, the agencies that approve drugs and vaccines—are actually financed by the industry itself. You heard that right. What percentage of the regulatory agencies, like Health Canada, are financed by the industry they’re meant to regulate?

And this is the table from that article. Canada is right on the right side, and Australia, Europe, UK, Japan, USA. You’ll notice that Health Canada’s budget for approval and so on is massive per Canadian, compared to other countries. But more than half of its budget comes from the industry itself. Conflicts of interest, they’re not made available to the public. And the regulator routinely receives patient-level data sets? No, in Canada. In other words, Health Canada simply believes whatever the vaccine company or the drug manufacturer tells them. And not surprisingly, 83 per cent of the new drugs are approved.

This is truly disturbing and bizarre. The industry—that is, Big Pharma—that the regulator, Health Canada, is meant to regulate, gives money to the regulatory agency, Health Canada. As Shakespeare would say: Not a rose, but a bribe by any other name smells just as sweet to Big Pharma. And if you want to know the Canadian implications of this, you can go to that article, which I have in my slide.

Follow the money. On the right you see this very ethical, very intelligent woman who is a physician and former editor-in-chief of *The New England Journal of Medicine*, one of the premier journals in medicine. When she retired in 2000, she wrote a book: *The Truth About the Drug Companies: How They Deceive Us and What to Do About It*. And I quote from the book. “Now primarily a marketing machine to sell drugs of dubious benefit, big Pharma uses its wealth and power to co-opt every institution that might stand in its way, including the U.S. Congress, the FDA, academic medical centers, and the medical profession itself.” And also from the book: “It is simply no longer possible to believe much of the clinical research that is published, or to rely on the judgment of trusted physicians or authoritative medical guidelines. I take no pleasure in this conclusion, which I’ve reached slowly and reluctantly over my two decades as an editor of the *New England Journal of Medicine*.” – Marcia Angell.

Now, it turns out that the present editor of *The New England Journal of Medicine* is also in the advisory body of the FDA approving the vaccines.

And finally, the last part of my presentation is the COVID vaccine-injured Canadian. I want to start with the COVID vaccine-injured American. They have a simple web-based form. I quote from the VAERS [Vaccine Adverse Event Reporting System] website: “VAERS accepts reports from anyone. Patients, parents, caregivers and health providers are encouraged to report adverse events after vaccination.” Now remember: this is a simple web-based form.

Now, what about the COVID-vaccine-injured Canadian? Unlike an American, a Canadian citizen cannot directly report a vaccine injury to Health Canada, or even to the provincial public health agency. Don’t take my word for it. This is from Health Canada itself, and it says, “Should you experience an adverse event, please talk to your doctor.”

[00:45:00]

Okay, so step one is find a doctor. Not always easy for a Canadian.

Step two, get the doctor to believe you. Again, in the COVID-era, we know that most doctors don’t believe patients. And you have to get the doctor to accept your injury’s related to the vaccine and agree to file a report.

Okay, let’s say you find such an ethical, compassionate doctor; believes you, accepts the vaccine injury, wants to file a report. He’s confronted with a complex, nine-page PDF form, which he has to download from Public Health Agency of Canada. And the user guide to complete the form runs to 40 pages on how to complete the form.

Okay, so the compassionate, ethical doctor is found; he believes you or she believes you, **fills out the nine-page PDF form with 40 pages of instructions. Then the doctor must send the form to the provincial health agency. And in Saskatchewan—this is again from the Health Canada website; you’ll notice that the address to send it to is given there—the Saskatchewan Ministry of Health, Population Health Branch. But there’s no fax number and no email address. You have to send it by snail mail.**

Okay, step five. Compassionate, ethical doctor found, believes you, fills out nine-page PDF form with 40 pages of instructions. Doctor must send form to provincial health agency. The public health official must then approve the vaccine injury. This step is a mystery to me and to almost everybody. If not approved, the vaccine injury report is stopped cold. Remember, this public health official, who has to approve it, has not even seen the patient.

Shawn Buckley

And would that person be a medical doctor?

Dr. Francis Christian

You know, I don't know. I believe it is, but it's a mystery.

Compassionate medical doctor found, believes you, fills out a nine-page PDF form with 40 pages of instructions. Then the doctor must send the form to the provincial health agency; then the Public Health official must approve the vaccine injury. This step is a mystery. If not approved, the vaccine injury report is stopped cold in its tracks. And then, if the provincial Public Health official approves, the vaccine injury report is sent to Public Health Canada and entered.

What are the conclusions? The Canadian vaccine injury reporting system is convoluted and broken. There are major roadblocks and impediments to reporting at every step. It appears to be designed to actively discourage reporting. It is failing the citizens of Canada. There is an urgent need for an independent, accessible, robust, and patient-centered vaccine injury reporting system.

And I'll conclude my testimony with a few important observations. What is an expert and what is a consensus? The progress of science depends on debate, comparison, dissent, and the pursuit of truth. There are always experts on both sides of a debate. An opinion, even a majority opinion, cannot be called a consensus. There is no consensus in the COVID-19 pandemic. And you see— Can I run this two-minute video?

Shawn Buckley

You can.

Dr. Francis Christian

The experts were very wrong.

[Video] Bill Gates

During 2021, we should be able to manufacture a lot of vaccines and that vaccine, a key goal is to stop the transmission; to get the immunity levels up so that you get almost no infection going on whatsoever.

Everyone who takes the vaccine is not just protecting themselves, but reducing their transmission to other people and allowing society to get back to normal.

[Video] Rochelle Walensky, CDC

We can, kind of, almost see the end. We're vaccinating so very fast. Our data from the CDC today suggests, you know, that vaccinated people do not carry the virus, don't get sick.

[Video] Rachel Maddow, MSNBC

Now we know that the vaccines work well enough that the virus stops with every vaccinated person. A vaccinated person gets exposed to the virus, the virus does not infect them. The virus cannot then use that person to go anywhere else. It cannot use a vaccinated person as a host to go get more people. That means the vaccines will get us to the end of this.

[Video] Dr. Monica Gandhi

Essentially, vaccines block you from getting and giving the virus.

[Video] Joe Biden

Fully vaccinated people are at a very, very low risk of getting COVID-19.

[00:50:00]

Therefore, if you've been fully vaccinated, you no longer need to wear a mask.

[Video] Dr. Anthony Fauci, NIAID

When people are vaccinated, they can feel safe that they are not going to get infected.

We have all the vaccines we need. We just need our people to take it. A, for their own protection, for the protection of their family, but also to break the chain of transmission. You want to be a dead end to the virus, so when the virus gets to you, you stop it. You don't allow it to use you as the stepping stone to the next person.

I think, given the country as a whole, the fact that we have now about 50 per cent of adults fully vaccinated, and about 62 per cent of adults having received at least one dose, as a nation, I feel fairly certain you're not going to see the kind of surges we've seen in the past.

[Video] Joe Biden

If you're vaccinated, you're not going to be hospitalized, you're not going to be in an ICU unit, and you're not going to die. You're okay. You're not going to get COVID if you have these vaccinations.

Dr. Francis Christian

So the experts, as you saw, were very wrong. And the other experts, it turns out, were correct. "Vaccines for all" was not the way out of the pandemic. This was the days of Delta. And it also showed that the vaccine viral load was actually the same. The COVID-19 viral load was the same in the vaxxed and the unvaxxed. And it showed that countries that were highly vaxxed (100 per cent vaccination, 99 per cent) were also getting the highest counts of new COVID cases.

And what is "misinformation" and "disinformation" in science? Both terms were used extensively in government propaganda in the Soviet Russia and in Nazi Germany. It cannot be that "I don't agree with you" equals misinformation or disinformation. If you don't agree with me, debate, discuss, and disprove me. That is the way of science.

On the right of your screen there is a virologist, viral immunologist, anti-virus vaccine developer and Canadian hero, Dr. Byram Bridle. And this is what he said in his recent Substack: "Over the past three years, not one person who has accused me of disseminating mis- or disinformation relating to COVID-19 has ever offered me the courtesy of a conversation prior to doing so. Not one."

The other thing that was said was that everything was for the common good. Individual and societal evils, which are bad, cannot justify the greater good. And they are fundamentally opposed ideas. But individuals and people, even churches, can be deluded and scared and traumatized into believing that the harm they do is for the greater or the common good. This is the playbook of totalitarian regimes. By repeating the harms, loss of our freedoms and liberties, the common good delusion is normalized and the people become desensitized to harm and evil.

Like in this case: Who doesn't remember the media headlines? "I have no empathy left for the willfully unvaccinated. Let them die." "Unvaccinated patients do not deserve ICU beds." And as a physician and a surgeon, should I be asking the question "What about the willfully obese or the willful smoker? Or do patients with alcoholic cirrhosis deserve ICU beds?" Of course, they do! We don't pass moral judgments in medicine. But government-led propaganda works. "Us and them."

I put this up because the guy on the left was supposed to be supporting the common good by saying that one of the fittest people ever to walk the planet, Novak Djokovic, is a threat to health services. I think that's enough said about that particular— Anyway.

Now I want to talk about Trofim Lysenko of the Soviet Union, who was a geneticist, who Stalin elevated to the head of the science academies. He disagreed with what he called the "bourgeois ideas of the West." And especially also the bourgeois ideas of the Austrian monk, Gregor Mendel. You must remember the Soviet Union was militantly atheistic. And it turned out that Lysenko had a particular view of science.

[00:55:00]

A view where he said that math has no place in biology. And he put the famous geneticist and his mentor, Vavilov, on the right, in prison, where he died.

You can actually look this up, even in Wikipedia. Lysenkoism is, "Only my view of science is the truth. Everything else is conspiracy, false, misinformation." Scientists and physicians were persecuted if they strayed from the official narrative. And in time, this came to include all of science except nuclear physics and space. More than 3,000 scientists were deported to the Gulag, imprisoned, or executed.

Now in the COVID-era, the academy, the university, has played lip service to academic freedom but has implemented academic tyranny. The official COVID narrative, which I call "COVIDism," which has become like a religion, and deeply flawed people like Fauci are the religion's high priests.

Shawn Buckley

And doctor, I'm just going to ask how much time you have left, just because we also want to allow for some commissioner questions.

Dr. Francis Christian

I think it'll be only another two or three minutes.

Shawn Buckley

Okay.

Dr. Francis Christian

This religion has prayers, chants and slogans like, "Vaccines are safe and effective." When faced with evidence to the contrary, they follow it up by persecution. And the free exchange of scientific ideas has been abandoned.

With the licensing bodies, they've become the top police of COVID Lysenkoism. The COVID narrative is the religion, COVIDism. The religion of COVIDism threatens to excommunicate you, i.e., take your licence, unless you recant. And the data and evidence do not count at all. And the persecution is pursued with religious fervor, ostensibly for the common good.

This is my last slide and I want to end this testimony by asking Trudeau, Wuhan, and Fauci, and Pfizer three questions. The preamble to the questions is the lab leak theory, which was once considered a racist conspiracy and which is now considered the most likely explanation.

Question one: What really happened in Winnipeg, Canada's taxpayer-funded Level 4 infectious diseases lab? You will recall that just before the COVID pandemic, two Chinese army scientists, what were they doing in our Level 4 infectious diseases lab? Anyway, they were marched out by the RCMP and deported. We don't know what they were doing. Why is Trudeau hiding the truth from Canadians and going to extraordinary lengths to do so? Was gain-of-function research being done in Winnipeg and then exported to Wuhan?

Thank you very much.

Shawn Buckley

Now, Doctor, I'm going to open you up to commissioner questions. But because we have a virtual witness scheduled in about five minutes, I'm going to ask—if there are further questions—if we could adjourn you and have you come back after the next virtual witness.

Dr. Francis Christian

Absolutely. The PDF of this should be in your record if you want it. So anybody will be able to download it and go to the links. Thank you.

Shawn Buckley

Thank you. So I'll ask the commissioners if they have any questions. And, doctor, if you can still sit down, there may be some commissioner questions.

Commissioner Kaikkonen

I want to thank you for your presentation. I too have read the book *Tortured for Christ* and found the content very insightful.

My question has to do with the Tri-Council Research Ethics Certificate Program. It addresses research ethics and informed consent requirements for minors under the age of 18 and for those persons who are unable to make informed decisions for themselves. And as you suggest in your letters, students were being induced and incentivized to get the shot in schools even without parental knowledge or consent. So my question is this: How do we reconcile that the adults in positions of authority—and I'm referring specifically to school boards, administrators, and teachers—who are taught research ethics as part of their academic credentialing, how they just complied without question, essentially doing what they were told to do to the point of putting our children at risk?

Dr. Francis Christian

That's a very good question. And I'm afraid it doesn't have an easy answer, but I can tell you what is egregiously wrong in the system.

[01:00:00]

And what is egregiously wrong is the school, the authorities in school, the government, even the school boards, take the place of parents. That is a trend that's been happening for several decades actually. It's not a new thing. The state would like to own your children if they could. And this is just another manifestation of that very disturbing trend. I think we need to take education back. We need to make it very clear to government that these are our children, not yours.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

And I think we would need to adjourn. Commissioners, will there be further questions for this witness? So there will be for the witness.

Dr. Christian, if we can have you just basically stand down—

Dr. Francis Christian

Thank you very much.

Shawn Buckley

And we're going to be calling Mr. Steve Kirsch and then we'll have you back for further questions.

[01:01:15]

PART II

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. We are going to commence this afternoon with finishing questions that the panel has for Dr. Francis Christian. And there are questions.

Commissioner Massie

Thank you, Dr. Christian, for your very interesting presentation this morning. I had a couple of questions. The first one is about all of the obstacles for reporting adverse effects following vaccination. We've seen in the States that this system has been put in place—if I'm not mistaken in the early '90s or something like that—when they wanted to make that a practice to report. It's been working for quite some time. I was not aware of the system in

Canada, that it was something that different. So there's been a number of people that have done some analysis, or attempted to analyze, the so-called under-reporting factor that we see in the VAERS data. Some people say it's 100-fold; some people say it's 30-fold, depending on how you do the numbers.

Based on the additional obstacles that seem to exist in Canada, what would you estimate the under-reporting factor to be in Canada?

Dr. Francis Christian

Is my mic on?

Thank you, Commissioner, for that question. I think it's a very important question for Canadians. That study you were referring to is the study that showed that, on a conservative scale, the under-reporting in the VAERS system—the Vaccine Adverse Event Reporting System—in the United States, is that it reports anything from one to 10 per cent of actual injuries. Okay.

Now, when coming to Canada, I think the problem is that about 99.9999 per cent of Canadians don't actually know how a vaccine injury is reported in Canada. As I pointed out in my testimony, the system is convoluted and broken. It's designed, I think, to discourage people from reporting anything at all. Now, is there a way to actually make sure that we can get robust reporting systems in place? I think, yes. But as you know, in Canada, health is a provincial subject. And provinces have to come together and all the premiers and the health ministers have to come together and say: "Our vaccine injury reporting system is lousy. It's not serving Canadians. We need a better system. It has to happen."

If the OpenVAERS system—where any U.S. citizen can actually go to the website, fill in a simple web-based form and report a vaccine injury—if that itself is showing about 90 per cent under-reporting, I would think that our under-reporting is of the order of, what, 99 per cent? Because if you look at the number of deaths associated with a vaccine in the Canadian system, it's something like 460. That's just not possible. Just look at the data around the world and it just doesn't match the data. But we know now why Health Canada has not recorded the deaths: because it's so difficult to record anything. You know, I pointed out in my testimony how difficult it is. And that hasn't changed.

Commissioner Massie

My other question has to do with the so-called, I would say, balance of benefit and risk. And it seems to me that during the COVID crisis, with respect to any potential early treatment, the benefit-to-risk ratio has been tilted towards risk, not benefit. And for the vaccine, it's been tilted the other way around. So are we facing a clear case of double standards here?

Dr. Francis Christian

Very much so, Commissioner. The fact is: the ivermectin example that I ran through in my testimony

[00:05:00]

is just one of several medications, some that are over the counter, that have been shown to have had remarkable efficacy in COVID-19.

I'll give an example. A meta-analysis—where we put all the studies together and we used statistical methods to actually arrive at a valid statistical conclusion—of vitamin D showed that if your vitamin D levels were normal, you had something like 70 to 80 per cent less risk of landing up in the ICU. And that's been repeated in studies all over the world. So all the Canadian government had to do, if they really had our health at heart, was to send vitamin D by mail to every household. And they could have made a huge difference in the pandemic. We know that Canadians, especially in winter, have vitamin D levels that are sub-optimal or deficient in up to 70 per cent of the population. So there are several drugs and combinations of drugs that have been shown in study after study to be useful, which have not been actually taken up.

So to come back to your question: The risk-benefit scales have been tilted so much in favour of benefit and they have been ignored. But I pointed out that that's because there's no money to be made in hydroxychloroquine, ivermectin, vitamin D, and some of these other medications. But there are billions and billions and billions of dollars to be made with the vaccine.

So can greed explain all this? I think it can. Corporations have no morals. I looked at the history of that banana company, I think it's called Chiquita Bananas, in South America. In order to increase the corporate profits, they have engineered coups, massacred tens of thousands of people, all just to generate billions of dollars. So billions of dollars were at stake and all these other medications—vitamin D, hydroxychloroquine, ivermectin—would have made them nothing at all.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Good afternoon, Doctor. Thank you for coming back and facing our barrage of questions. I believe that when you first introduced yourself, you had said that you were involved with ethics in medicine. And my question to you is: Is this concept of informed consent something brand new?

Dr. Francis Christian

No, Commissioner, it's not brand new. It's as old as medicine itself.

Commissioner Drysdale

Okay, and who is responsible to obtain informed consent from a patient?

Dr. Francis Christian

The health practitioner who is administering the intervention or treatment, in this case the vaccine, is responsible for getting informed consent.

Commissioner Drysdale

Do you believe it's acceptable for a health practitioner to follow blindly the orders of the health department? In other words, "I was only following orders"—Is that an excuse for not following this age-old concept of consent?

Dr. Francis Christian

That has never been an excuse. It wasn't an excuse that was accepted at Nuremberg. "Just following orders" has never been an excuse. In medicine, we have to put the patient first. Not an order, but the patient in front of you. "First do no harm" starts with the patient in front of you, or the person in front of you to whom you are going to administer this intervention, the vaccine.

That is an overriding ethic, overriding principle of medical ethics, that should override everything else: putting the patient first.

Commissioner Drysdale

I think you talked about the doctor-patient relationship, or a doctor-patient privilege relationship. Based on what you had testified, did we as a society, did the medical profession allow a third party to get in between them and their patient?

[00:10:00]

Dr. Francis Christian

Yes, very much so. But I have to tell you, Commissioner, that that trend in medicine is not new. The individual judgment of the doctor vis-a-vis his or her patient was always paramount in medicine for hundreds of years. And that's because it was understood that the human body has so many variations in physiology and pathology in the way it reacts to disease, that you cannot generalize in any one particular patient. So the individual doctor-patient relationship was paramount.

But about 20, 25 years ago—I've been teaching medical students and residents all my career—there came into medicine the so-called "guidelines culture." In other words, guidelines would be put forward which are essentially algorithmic guidelines, which work perhaps in a computer but cannot work in a human being with so many variables. The algorithmic guideline culture came into medicine and medical teaching about 20, 25 years ago. So the guideline, in essence, was going in-between the physician and the patient. And who actually made those guidelines? Almost all of them are by industry-funded physicians.

If you didn't know the guidelines, you would fail your exam of course, as a medical student or resident. But the guidelines became like a god. And that came between common sense, ethical medical care. This guideline became a god. I think that explains a lot of things in the COVID debacle as well.

Commissioner Drysdale

So unlike society in general, which was embracing diversity, are you telling me the medical profession was embracing artificial uniformity?

Dr. Francis Christian

Yes.

Commissioner Drysdale

Can I ask you another question? Is there a surplus of surgeons with 25 years of experience in Saskatchewan?

Dr. Francis Christian

I don't think so, and I would say not in most parts of Canada, either.

Commissioner Drysdale

Perhaps this isn't a fair question to ask you, but do you think your removal as an experienced surgeon with 25 years of experience in Saskatchewan hurt the medical community or patient care?

Dr. Francis Christian

Most definitely, Commissioner.

Commissioner Drysdale

Are you aware that we had doctors testify to this Commission that the CAEFISS [Canadian Adverse Events Following Immunization Surveillance System] was not only difficult to report to, but that they had been punished? And one doctor who had reported 10 cases—of which 8 the health officer declined—and he was let go from his position for reporting too many reports to the CAEFISS system?

Dr. Francis Christian

I know the doctor who you refer to and I think it's unconscionable what happened to him.

I think some of the mistakes or the egregious violation of medical ethics that have been committed—I'm not saying this lightly—but some of them must go into the area of criminal liability. If in fact colleges have forbidden doctors from giving medical exemptions and then somebody with a genuine reason for a medical exemption gets the vaccine and dies or gets a serious injury, there has to be liability for that. It's not enough to say that this was just a mistake or they were doing this in error. I mean, even a common-sense analysis of some of the egregious violations of medical ethics should show the public that, in fact, the liability exists for harm to the public from the vaccine.

Commissioner Drysdale

We also had previous medical experts that testify to us that a number of the reported vaccine adverse effects

[00:15:00]

were very similar to the way that COVID-19 affected the body as well, so that it was impossible or very, very difficult to distinguish between the two. Have you heard that or have you got any opinion on that?

Dr. Francis Christian

Yes and no, because there are some vaccine-specific side effects which we know does not occur with the natural infection. And we know for example— Mr. Kirsch pointed out the fact that myocarditis after the infection is actually very uncommon but after the vaccine is exceedingly common.

We know of a big Israeli study that looked at hundreds of thousands of patients and showed that in the unvaccinated, the myocarditis rate was in fact no different from previous years. In other words, there was a steady baseline. But in the vaccinated, we know that myocarditis, and especially in young people, is a specific vaccine-related risk.

There are some other things, like Bell's palsy—that Justin Bieber got and so on—and we know that it was probably the vaccine. But we also know that the vaccine seems to be doing harm in different organ systems.

I'm not saying this is designed to cause harm—I think that question was asked of Steve Kirsch—but if somebody were designing something to cause harm and kill people, this was a genius tool. Because it's so difficult to actually say that this is completely the vaccine's fault unless you do an autopsy. And that's why I think Mr. Kirsch was saying very little is being done in terms of autopsy. It affects so many different body systems that it is actually sometimes very difficult to pin down that this is the vaccine.

Commissioner Drysdale

We heard previous testimony that the process from start to finish—and to my mind finish is putting it in somebody's arm—had serious problems, which may account for some of the variability of the reports. For instance, there were reports of concerns with regard to the technology itself. There were concerns with regard to the manufacturing quality control of the vaccines. And thirdly, there was concern voiced with regard to the actual implementation or putting needles in arms where they were not aspirating.

My question is: Is it possible that a lot of the variation of these reported effects are as variable as they are because there's so many variable issues with regard to manufacturing, actual injection, and the technology itself?

Dr. Francis Christian

Yes, I think that's very possible. Dr. Peter McCullough pointed out the fact that the storage of these vaccine batches needs a particular cold chain where it has to be maintained at anything from minus 30 to minus 10. And if it's not, the lipid nanoparticle, the mRNA and so on, can deteriorate. And therefore, a large proportion of those who are being vaxxed are actually getting duds. And therefore, they are all right. But 15 per cent or so are actually being injected with the real thing and are getting problems.

Commissioner Drysdale

One of the witnesses talked about ivermectin and they talked about the number of clinical studies that were done—peer-reviewed studies, independent studies. Despite that, it was still discouraged, shall we say, by the government. My question is: How many independent, peer-reviewed studies were carried out on any of the vaccines prior to them being injected into people?

Dr. Francis Christian

As far as I know, Commissioner, none. In most of the regulatory agencies, including in Canada, patient-level data was not requested or required.

[00:20:00]

In other words, the regulatory bodies gave approval based on Pfizer's own telling of the results. In other words, let's say you're the Health Canada person—the chair of the vaccine approval committee. Pfizer comes up to you with a list of things that their own trials have shown and you look at that and you have to give approval. But if you ask them, "Can you show me the actual data from individual patients," they don't have to show that to Health Canada. They have to show it to the U.S. FDA, though.

You probably know of the fact that there was a FOIA request, a Freedom of Information request, from the FDA for patient-level data: in other words, individual cases, the actual health records. And the FDA said, "Oh, you know, we can't give it to you because, if we give it to you, at 500 pages every month, it'll take 72 years." And then a judge said "No, you have to do it in two years." And that's actually been very good, because it's giving us good data from Pfizer's own studies that these vaccines were not working and they were actually killing people. But that's not required in the Health Canada system.

Commissioner Drysdale

Were there any studies of these vaccines on pregnant women before they were given to pregnant women?

Dr. Francis Christian

None at all.

Commissioner Drysdale

Were there any specific studies done on children before they were given to children?

Dr. Francis Christian

There were Pfizer-related trials. Those trials were a farce because when we looked at the patient-level data, it showed that those children who were vaccinated actually got more sick. They got more sick and they had more hospitalizations, and Pfizer's own data showed that the myocarditis rate with the vaccine was much higher.

So yes, there were trials—very small ones—of children, but they showed that the vaccine was completely useless and dangerous for kids.

Commissioner Drysdale

Why did they call ivermectin horse paste?

Dr. Francis Christian

Because I think they thought that we were stupid.

Commissioner Drysdale

Well, my next question on that is, isn't penicillin given to horses as well?

Dr. Francis Christian

Commissioner, that's a very good question. Because penicillin, when it first was discovered by Sir Alexander Fleming in England, started being used without randomized controlled trials. So the first randomized controlled trials in medicine were actually done in the 1950s. It was in connection with smoking and lung cancer and they showed there was a clear risk and a clear connection. But penicillin literally saved hundreds of thousands of lives on the battlefield in World War II, before there were randomized controlled trials.

Now in the case of ivermectin, not only were there randomized controlled trials that showed huge benefit, there was also observational studies that showed benefit; there were prevention studies that showed benefit; there were some studies that did not show benefit. But the point I was making in my testimony, Commissioner, is that this is a completely safe drug. Absolutely safe. In medicine, we speak of therapeutic range—in other words, the difference in dosage between the minimum effective dose and the maximum dose which causes toxic reactions. And the therapeutic range in ivermectin is very wide. It's safer than Tylenol. So why not use it? And that is the crucial point. Even if it didn't show efficacy in some studies, the majority of studies showed massive efficacy and it should have been used.

Commissioner Drysdale

Thank you, sir. Thank you.

Commissioner DiGregorio

Thank you so much for your testimony today. I was hoping you could help me understand a little bit more about the adverse event reporting system. You talked about the different layers you have to get through: finding a doctor, having the doctor navigate a nine-page report, and then having it approved by a public health official before it gets submitted to the system. I'm just wondering, are doctors in Canada required to report adverse events from vaccines?

[00:25:00]

Dr. Francis Christian

There is an ethical and moral requirement to do so. But as far as I know, I don't believe that there is a legal requirement to do so. In the steps that you just mentioned, I think you just omitted one step. And that is the doctor has to believe you and has actually to accept that this is vaccine-related. A lot of patients, a lot of our Canadian public, are stumbling at that step. Even if they find a doctor, the doctor is telling them, "Oh, this is a coincidence." In nine out of ten cases.

Commissioner DiGregorio

That actually was going to be one of my next questions, was whether doctors are trained to recognize the potential adverse effects of vaccines.

Dr. Francis Christian

The answer is no. The fact is—and this may surprise the Canadian public and people listening to this—I don't think physicians have been trained to recognize vaccine injuries

for any vaccine. So this ignoring of vaccine-related injuries, as I think Steve Kirsch pointed out, is not a new thing in COVID.

You know, I used to consider myself a pro-vaccine physician. But after this debacle I started questioning everything. The evidence for many childhood vaccines is not what they were telling us. The fact is, with childhood vaccines, with COVID, I feel confident that— I mean, in medical school, that training is not given. There is no vaccine injury segment where we teach medical students, residents, how to recognize vaccine injuries. And to answer your question: No, I don't think physicians are trained to recognize vaccine injuries.

Commissioner DiGregorio

You mentioned that once you have a doctor who does believe that there's a vaccine injury, they have to navigate this nine-page form that, I think you said, comes with a 40-page user guide.

Dr. Francis Christian

Absolutely.

Commissioner DiGregorio

Is knowing how to complete that form part of training that doctors have?

Dr. Francis Christian

Commissioner, as far as I know, that form was completely new to most Canadian physicians. That form has to be found on Public Health Canada's website and downloaded. And then there's the 40-page instructions on how to fill that form. How many physicians have the time to do that? And then, after filling that form, as I pointed out, they have to send it to the provincial public health agency in Saskatchewan. There's no fax number, not even an email address. You have to send it by ordinary mail. When that vaccine injury report is received by a provincial health agency, there is a public health officer, presumably, that looks at it. And then decides whether to approve it or not without seeing the patient. This is the broken system we have.

Commissioner DiGregorio

And my final question actually relates to that review by the public official. Are there any public or known guidelines as to when or how such a report would be accepted into the system?

Dr. Francis Christian

I would be surprised if they don't have their own guideline protocols, which inform them whether to approve or not to approve. I think this is part of the guidelines problem. It's an algorithmic approach. And the main thing is: They haven't seen the patient and they get to approve it or not approve it.

Commissioner DiGregorio

Thank you.

Commissioner Massie

To come back to my double standard idea, it seems to me that we've heard from other people at previous hearings that if a healthcare worker didn't want to get vaccinated, they were sentenced to some sort of special training session that would educate them about vaccine hesitancy and so on. So it seems that there are some resources to train the health care worker about the issue of the benefit of the vaccine. But do we have similar training about potential adverse events?

Dr. Francis Christian

The answer is, as far as I know, no.

[00:30:00]

Commissioner Drysdale

Sorry, as I was listening to you answering questions, I thought of something else. I was a professional engineer for over 40 years— 43 years, I believe. And new products were coming out for us all the time. I'll never forget, as a young engineer, I was going to use a certain product. And my boss came to me and lectured me about how I had to be satisfied in and of myself, apart from the literature, that this product was safe and effective.

My question to you is: What responsibility do individual health practitioners—not just doctors, but nurses or pharmacists who are administering these shots—what personal responsibility or professional responsibility did they have to confirm whether or not the shiny brochures they received from the suppliers actually were true and that this thing was safe and effective?

Dr. Francis Christian

That's a very good question, Commissioner. Let me answer it in two parts. Doctors are trained to look at data, to look at studies, and to look at the statistics to see whether they make sense. The training though— I had actually a lot of experience in data analysis because I was the director of Quality and Patient Safety. And the National Surgical Quality Improvement Program that I introduced was very data-intensive.

It's very interesting to me that many of the egregious violations of medicine, medical ethics, and so on, have been unearthed to the public by people like you, who have training in data: economists, for example, and people like Steve Kirsch, who have a much superior statistical understanding of how to interpret studies than doctors do.

So for example, the famous Ferguson model. There was a guy in England called Ferguson. I have absolutely no idea how he keeps his job. Because in pandemic after pandemic he has been wildly wrong and he still keeps his job. And he made a completely ridiculous, nonsensical, comical prediction about the COVID pandemic. My son, who's an economist and has been trained in econometrics, was looking at that and said, "You know, Dad, even in undergrad economics, we know that this model is all nonsense. Why don't these guys actually do proper models?" So the guys who are trained in statistics, data management and so on, including financial guys, are able to see through the data better than physicians.

I think public health people think they're the only people who can interpret data and that's not true. I can interpret data because I'm a physician trained in statistics and data analysis.

So can people who can look at the data dispassionately, like you. That's the first part of my answer.

And the second part would be to recall to the public the fact that when the data is analyzed and is clear, authorities have not accepted the data. So there's abundant evidence, as Steve Kirsch pointed out, that the vaccine does not prevent transmission and does not prevent infection. Now, public health officials in Canada and other Western countries have ignored that data and have created their own set of rules. Our Prime Minister does that all the time; he creates his own set of "truths."

And that, I think, is a societal problem: the ability to define truth for yourself instead of looking for a transcendent source of truth, which most people call God or divine truth, which used to inform medical ethics for generations. All the medical ethical codes—the code of Hippocrates, he called on the Greek gods. And even the modified Hippocratic Oath in the Christian era said that "I will never think of myself as God."

[00:35:00]

And then the Arabic al-Wallahi oath has the looking to Allah as the source of all moral and medical knowledge and wisdom. And then you have Maimonides in the Jewish tradition, who was a rabbi as well as a physician. And then Thomas Sydenham, who actually said, "*Primum non nocere*" in the 17th century. In all this there was a looking for transcendent truth that lies beyond yourself.

In the modern era, the universities have been captured by the postmodern construct of localized version of truth. And that's why they say, "Okay, that's your truth. This is my truth. So okay, vaccines don't stop infection. That is your truth, but my truth says that it does." The data doesn't really matter. That's part of the problem in society, I think. With the public, too: they're able to construct their own truth.

I was mentioning to one of the commissioners at lunch today that the public keeps talking about doctors and says, "Where is your Hippocratic Oath?" What the public doesn't know is that only a minority of medical schools now take the Hippocratic Oath. In the U.S., it's only 40 per cent that take the Hippocratic Oath. Some medical schools, including prominent medical schools in the United States, ask medical students to write their own oaths. That is part of that postmodern construct, "This is my truth" sort of thing.

Shawn Buckley

Thank you, Dr. Christian.

Dr. Francis Christian

Thank you.

Shawn Buckley

On behalf of the National Citizens Inquiry, I'd like to sincerely thank you for attending today and sharing with us.

Dr. Francis Christian

Thank you.

[00:37:29]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 2: Stephen Kirsch

Full Day 1 Timestamp: 03:09:52–05:04:52

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Shawn Buckley

Mr. Kirsch, can you hear us? And I'll ask our AV guy if he can— Oh, you're muted on your end. So, there we go.

Stephen Kirsch

I'm now unmuted.

Shawn Buckley

Well, thank you for joining us today. I'd like to start by asking if you could state your full name for the record, spelling your first and last names.

Stephen Kirsch

Yes, Stephen T. Kirsch, K-I-R-S-C-H.

Shawn Buckley

I'll ask if you promise to tell the truth, the whole truth, and nothing but the truth today.

Stephen Kirsch

I do.

Shawn Buckley

Now, I understand you have a presentation for us, but I'm hoping to just ask you a couple of questions. First about, basically, your bets and then move over to Nancy Whitmore. But just to introduce you to the people that are participating with us today: My understanding is that—and it's not just my understanding—you have quite an impressive career in the tech

industry, being credited as one of the people inventing the optical mouse, and that you've started several tech companies that can be quite properly described as important.

Stephen Kirsch
That is true.

Shawn Buckley

We've had at this Inquiry expert after expert that have had the experience of being labelled by the mainstream media as misinformation spreaders. My understanding is that you also have found yourself in that role. I almost want to say to you, you're in good company and welcome to the NCI. But I wanted you to share with us: How was it that you, because you're in the tech industry, how did you become interested in COVID issues and become passionate about them?

Stephen Kirsch

After I was vaccinated, I started hearing from friends who were either injured or dead. I didn't hear from the friends who were dead obviously, but I heard about friends who had died. And I started looking into the data and the data was very consistent, showing that this was the most dangerous vaccine of all time.

So I ended up quitting my job and pursuing this full time. I actually thought it would only take a couple of weeks to show people that the data was inconsistent with what the government was saying. But apparently that didn't sway people, so it ended up being a more difficult task than I had anticipated.

Shawn Buckley

You've taken actually some unusual approaches to try and make the point that the current government narrative isn't correct. And one of the things that I saw that you've done, and it's on your Substack, is that you've put out a number of million-dollar bets. And my understanding is anyone in the world can come to you, put a million dollars on the table for any one of those bets, and literally bet that you're wrong.

Stephen Kirsch

Yes, I did that for a period of time. I now have one bet remaining. Nobody took me up on the bets, so I revoked them. But there's still one bet on the table, which is whether the vaccines have killed more people than they've saved. And there was only one person in the world that took me up on that but he was only willing to bet half a million dollars. It was an indication to me that only one person in the entire world was willing to risk significant money, believing that the vaccines have saved more people than they've killed. Only one person.

Shawn Buckley

I just want to share with the people participating what some of the other bets are, so that they understand you. Somebody could have come to you with a million dollars, and if they proved you wrong on these points, you would have given them a million dollars. And you've already indicated about the vaccines, but you also had a bet that masks don't work.

Stephen Kirsch
That's true. Yeah.

And these are bets, just to be clear. Mike Lindell, who was just awarded \$5 million— The person who proved Mike Lindell wrong was awarded \$5 million. Lindell was an open challenge. This is an actual bet. So the person has to put up a million dollars. I put up a million dollars and then we go through a process to determine who the winner is. So that's different. So the other party has to take some risk. The point is that nobody was willing to risk their million dollars to bet me that I'm wrong about masks.

Shawn Buckley

And one of your bets was that censorship cost lives.

Stephen Kirsch
Yes.

[00:05:00]

Shawn Buckley

Okay. Then one of them was that you had done a presentation on Fox News on August 10th, 2022. You basically say, "Listen, prove my major points wrong." But one of them had to do with Wayne Root's wedding. And I'm wondering if you can share for us what that bet was about. What is the story about Wayne Root's wedding?

Stephen Kirsch

Yeah, he had a couple hundred people at his wedding. About half of them were vaxxed and half of them were unvaxxed and then he tracked what happened after the wedding. And all of the serious adverse events happened in the people who were vaccinated. None of them happened in the people who were unvaccinated, or maybe there was one death. But it was quite dramatic: I think the deaths were maybe seven or eight in one group, and maybe one in the other group.

There was no randomization, of course. But it was a random selection of guests, essentially. He didn't know who was vaccinated and who was unvaccinated. And then he was just tracking what happened to the guests at his wedding, and he noticed that there were somewhere around twenty or so guests who had very serious adverse events, and they were all in the vaccine group, and there were seven deaths in that group.

Shawn Buckley

Now, I just want to switch gears to Nancy Whitmore. My understanding is that she's the CEO of the College of Physicians and Surgeons of Ontario, and that you ended up sending her a letter back on March 14th. Can you just share with us a little bit of the history of what was going on there?

Stephen Kirsch

Sure. They had met with some so-called misinformation experts and wrote a big piece on their website about how misinformation is so dangerous. And so, I offered to her that what they were doing wasn't working, because more and more people are vaccine hesitant. And the definition of insanity, of course, is doing the same thing over and over again and expecting a different result. And that if she really wanted to stop the misinformation, then the best thing that she could do was to engage the so-called misinformation spreaders and answer their questions, and that we would gladly answer her questions as well. And we could hopefully resolve the differences of opinion as to what the data says if we could both have a dialogue and point out the flaws in each other's arguments.

Shawn Buckley

We've entered that letter that you wrote. For anyone following us, we've entered it as Exhibit SA-4.

Mr. Kirsch, we've already informed you: We had sent out a summons to Miss Nancy Whitmore inviting her to attend today so that she could have a debate in this fair and controlled environment. I regret to inform you that we did not receive a response from Miss Nancy Whitmore, and that summons will be entered as Exhibit SA-4a.

Has anyone on the other side—any physician or journalist or politician, anyone basically shouting the mainstream narrative—been willing to debate you at any time?

Stephen Kirsch

No. And it's not just me that they won't debate, it's really anyone who's counter-narrative. I have yet to see anyone who has said anything in any point that's counter-narrative, including the lab leak origin and so forth, that has been debated by people on the other side. None of this, what the press calls "conspiracy theories"—None of the people on the other side promoting, we'll call it the "mainstream narrative," have been willing to engage at all with anyone who is counter-narrative. It's not just me that they won't debate. It's anybody who disagrees with them who has expertise in the field. They will not debate you. They will not discuss it. They will not publicly discuss it.

They will try to censor you and defame you on a one-sided basis, but they will never, ever engage. We've never seen that happen.

Shawn Buckley

Thank you. I think that point that you just made is extremely important.

[00:10:00]

Now, my understanding is that you have a presentation [Exhibit SA-4c]. You've put some thoughts together that you would like to share with us, and I'd like to invite you at this time to share your presentation. And you should have share-screen capability.

Stephen Kirsch

I do. In fact, let me see here. Hopefully you can see the slides.

Shawn Buckley

We can. We have a slide up that says: "Why is everyone so afraid to talk about the elephant in the room?" We have you up in the top right-hand corner, so we can see you also.

Stephen Kirsch

Awesome, great. So, apparently this is happening to elephants everywhere in the world, where the elephant is sitting on the psychiatrist couch thing, "I stand in the middle of the room and point out the unvaxxed aren't dying and yet nobody notices me." This is what I'm referring to about the elephant in the room; people just don't want to hear about it.

So, my background, former high-tech serial entrepreneur. I'm 66 years old, I was featured on "60 Minutes." And yet today, I'm the top hit in Google when you type in "misinformation superspreader."

I've been doubly vaxxed. I was a believer until my friends were killed and injured by the COVID vaccines, as we said earlier. I was validated by all the reliable data that I looked at and nobody would explain to me how I got it wrong. So I became a full-time journalist. I've written over 1,200 articles on my Substack: [Steve Kirsch.substack.com](https://stevekirsch.substack.com).

You know, the big learning here is that once you're willing to question your beliefs, everything else makes sense. But if you're not willing to challenge or question your beliefs then you'll never figure this out. Some of the beliefs that need to be challenged are: Is it possible we were lied to? Could the "cure" be far worse than the disease? And could the "good guys" actually be causing harm?

What's interesting of course is that nobody in the world wants to answer any of our questions. Even after I offered to pay them generously for their time. So, I'm now at three times your normal consulting rate. I'll probably bump that to 10 times your normal consulting rate, just to show people that it doesn't matter how much we pay, no one will answer any of our questions. And in return, we'll answer a comparable number of questions from their side for free.

And what's interesting is we invite them to speak at our conferences, but they won't let us speak at their conferences. They won't even take any questions. At the last conference at Georgia State University, they even hired police to escort us off campus, even though we were registered attendees. And then, instead of engaging with us in a discussion after the conference, they snuck out the back door so they could avoid confrontation. This is how it works.

I think the single biggest issue is data transparency. We have a very large clinical trial going on in the world with 13 billion doses, and all the governments worldwide are hiding the key data. And I'll get to that in a second. But the magic trick is that they undercount the unvaccinated to make the vaccines look effective. And Norman Fenton and his colleagues caught them doing this in the U.K., published the evidence, and the U.K. regulator agreed with Norman Fenton, and said that the data that they had in the U.K was not fit for purpose. In other words, it could not be used to determine whether the vaccines were safe or not. It's very important.

Of course, the number one most important data is the death-vax records of the deceased. So, when you die, they need to publish when you were last vaccinated. No government in the entire world does this. No state government in the United States does this. These public records are being kept hidden from view so that nobody will know the truth. No

government in the world—and I've asked a few. I haven't asked them all obviously, but I've asked a few. And they stop talking to me. When I point out that there is no privacy violation and I'm willing to pay the expense to produce this data, they stop talking to me.

And what's interesting also is that no medical authority in the world is calling for these records to be released. These are ground zero records showing whether the vaccine would be safe and effective or not,

[00:15:00]

and there is not a single medical authority in the entire world asking for their release.

There are also no autopsies to assess causality. There are very few. They're being done in Germany and Japan. And of course, they all make devastating assessments. Ryan Cole in the U.S. has done over 20 autopsies, investigations, and in 100 per cent, the vaccine is implicated in the death. But CDC isn't calling for this. And you'd wonder: Doesn't anyone want to know the truth? And the reason of course why is that if you want to know the truth, you must be willing to accept the result. And that's why nobody looks.

Now, I personally released the data from Medicare to the public just to prove it can be done. And what it shows of course is: The vaccines are killing people. That line that's in red, that line should be going in the other direction in this particular graph. And nobody has been able to show that this data from Medicare shows that the vaccines are safe and effective. I publicized the data; anyone can download it; and no one has been able to show that it shows the opposite of what I claim it shows.

The way science works today is that half a million people can die from COVID and we call it an emergency, if it indeed was that. But when half a million or more people die from the vaccine, we want to mandate it so that everybody gets it. Which is interesting because if one person dies from eye drops in the United States, they recall the eye drops. And when we have an early treatment protocol for COVID, which results in zero hospitalizations and deaths, the CDC [Centers for Disease Control and Prevention] ignores it.

Here are a bunch of mistakes that people have made— And I'll make the slide deck available for people to look at this in detail. But basically, vaccines did the opposite. They increased death, they increased hospitalization, and they increased the infection rate.

And that's just for starters. Masking didn't work, in fact was detrimental to health in a number of factors. And we can go on and on and on. Lockdowns actually increased the number of people who died from COVID. And all of these things that they did were counter-productive, and they wouldn't take anybody who had dissenting views and listen to them.

So the solutions: to mandate data transparency for public health data, and hold these public health officials accountable in public forums, which we've never ever been able to do. And they should, of course, start listening to the people who they've been censoring and ignore the people that they have been listening to.

Here's some of the scientific peer-reviewed literature—in other words, these are papers in the scientific peer-reviewed literature. And it says, "An abundance of studies has shown that mRNA vaccines are neither safe nor effective, but outright dangerous." And this is a really interesting observation: "Never in vaccine history have we seen 1,011 case studies showing shocking effects of a vaccine." Never in our history. That's an objective fact and nobody disputes that.

The Skidmore paper showed that up to 278,000 people, according to the survey that he did, were killed by the vaccines in 2021 in the U.S. And it's interesting that he was supposedly debunked by Susan Oliver and her dog. And what's interesting is that Susan said, "Well, you know, this was not true, and this was not true, and this was not true." But Susan never then said, "Well, here's the corrected number when you make those corrections."

So the whole point is about trying to take down any information that would be counter-narrative, rather than trying to say, "Oh, there was a slight flaw in this because the ratio, the number of people who were vaccinated versus unvaccinated was a little bit disproportionate. So, let's adjust it by a few per cent, and here's the correct answer." Instead, what they did is they— And by the way, Denis Rancourt and colleagues found the exact same 0.1 deaths per dose rate as Skidmore, and he used a completely different method. But Skidmore's paper was retracted by the editor after basically looking for reasons to retract it.

[00:20:00]

There's something called the COPE [Committee on Publication Ethics] Guidelines, which specify the reason for retraction that the journal adheres to. And none of these COPE Guidelines were satisfied. And so there were dozens and dozens of complaints filed with the publishers, Springer Nature. Springer Nature publishes 3,000 journals. All of those complaints to the ethics email were ignored. All requests for an interview of the editor or of the ethics committee were ignored as well.

Shawn Buckley

Can I just ask, because this isn't the only case where somebody publishing against the counter-narrative is taken down: Are you aware of publications which basically support the public narrative that have been taken down?

Stephen Kirsch

Yes, there was a Surgisphere paper showing that hydroxychloroquine doesn't work. And it was taken down because it was fraudulent data. So that's the only paper that I'm aware of.

Shawn Buckley

And that's a different kettle of fish—actual fraud.

Stephen Kirsch

It is because it was a totally fraudulent study to try to disprove that hydroxychloroquine worked.

Shawn Buckley

And that would have been published in a peer-reviewed journal.

Stephen Kirsch

Yes, it was published in the Lancet, a very famous peer-reviewed paper.

Shawn Buckley

Right, and so the peer reviewers hadn't picked up that it was a fraud.

Stephen Kirsch

Yes, that they fabricated the data.

Shawn Buckley

Okay, sorry for interrupting.

Stephen Kirsch

No problem. So basically, these papers that tell you the truth are— One of the reasons that they said it was retracted is because they didn't get approval from the IRB, which is the Institutional Review Board. Skidmore in fact did get approval from the IRB and the approval was that, "We've looked at all your questions and they don't violate— They're all exempt." And so he got a ruling from the IRB saying he's clear to do the paper.

So he wrote in the paper that the IRB approved it. But the journal said, "Well, but the IRB said it was exempt, so they in fact didn't approve it." But they did, even if they approved it as being exempt. These are things that you could clearly see; they were on a fishing expedition. Skidmore has never had a paper retracted in his career, and he's written over 70 papers. And now, all of a sudden, the journal finds five things worthy of retraction in this one paper. Isn't that amazing?

It's interesting that a disproportionate number of COVID papers retracted after the vaccine rollout were counter-narrative, and you wonder if this is how science works. Thirty-two per cent of the papers gave no reason for retraction. In the retraction of the McCullough and Rose paper after it was published, Elsevier said they are not willing to publish the paper and claim that that was their prerogative and not a breach of contract. Here's the letter. It says "I'm afraid the journal is not willing to publish the paper," after they published the paper.

So, the point is that the journals can go in and retract your paper for any reason if they don't like it. This is not how science is supposed to work, they're supposed to follow the COPE Guidelines. Now, there are papers that are published in the peer-reviewed literature that show that the differences between the COVID death rates for the vaxxed versus the unvaxxed—which is supposed to be the big benefit of the vax—is not statistically significant. So, we have no paper showing a statistically significant difference in the vaxxed versus the unvaxxed death rate. The closest one would be this paper. And if you do the p-value calculation here, you find that it's not statistically significant. And so the point is that there's no proof that the vaccine works.

In fact, in Pfizer's own phase 3 trial, it shows that people were 31.2 per cent more likely to die if they took the vaccine than if they took the placebo. It's even more stunning when you realize that there were very healthy people who died at a five times lower rate than they should normally die in that study. So they picked very, very healthy people in that Pfizer trial and they died at a much lower rate. Yet, there was still a 31 per cent differential: they were killing effectively young people at a 31 per cent higher rate in the group that got the vaccine.

[00:25:00]

What is interesting is that Pfizer basically said, “Of the 21 patients who died, we didn’t think anyone died from the vaccine.” But they provided no proof of that. There was no histopathology that was done. And the histopathology is actually required in order to prove whether there was a link between the vaccine and death. So they basically said, “We’re not going to look. Just trust us, we’re not going to look. We don’t really want to know definitively whether there is a link, but just trust us. There’s no link. The vaccine didn’t kill these people.”

And that’s essentially the problem here, that it’s all based on trust. The CDC and the FDA are trusting what Pfizer says. Pfizer isn’t doing the work to prove their statements, then this goes down to doctors believing that the FDA has said, “We approve it and we’ve looked at the data.” No, they never looked at any of those 21 deaths. And all of my requests to Pfizer to look at that data have been ignored. Why would they do that if it’s safe and effective?

The Israeli Ministry of Health did a study and they published it behind a firewall, so nobody would see it. But this is the Israeli government data showing the days till death after you got the shot. This is showing 196 days. And you can see here it peaks at around four months or so post-vax for shot number two. It should be a horizontal line. There shouldn’t be any difference at all, the days after you got the shot should be completely random. But here it shows that it’s clearly peaking and that’s very problematic. And because it peaks four months later, people don’t associate the death— They just say, “Well, he died months after the shot, but it was four months after the shot.” People don’t associate these deaths with the vaccine.

Dr. Aseem Malhotra’s father died six months after he got the shot, but Aseem was astute enough to realize there was a connection there. The Israeli Ministry of Health also published this in their paper, which shows a huge spike exactly three days after you got the shot in young people. Now that is not random, that is causality. That is not just coincidence. There is no way you can get a coincidence like that.

In Canada, Ontario announced that deaths from COVID were up 39 per cent and hospitalizations were up 31 per cent. And this is “from COVID” after the vaccines rolled out. Now they told us in Canada that the vaccines are safe and effective. And yet why are deaths up 39 per cent in the year after everybody got vaccinated? And why are hospitalizations from COVID? Deaths from COVID and hospitalizations from COVID. I mean, this is stunning.

Shawn Buckley

Just so that everyone understands: In 2022, deaths in Ontario from COVID were 39 per cent higher than the year before, in 2021. Is that what you’re telling us?

Stephen Kirsch

Correct.

Shawn Buckley

But even aside from the vaccine, wouldn’t more people have natural immunity in 2022 than they would have in 2021? Because people are catching COVID and, aside from the vaccine, are getting natural immunity?

Stephen Kirsch

Correct. The deaths should be down. And the variants are also less severe. Omicron was less severe than Delta and the earlier variants. So we have a less severe COVID and we have a lot of natural immunity and yet people are dying at a higher rate. And then someone pointed out, "Oh, well, there were lockdowns in 2021." Well, the lockdowns in Ontario ended mid-year, and then they locked down again in early 2022. And lockdowns in fact have been shown to increase. Every place where there were lockdowns, they increased the number of COVID deaths. And that's pretty clear.

[00:30:00]

There's a Hopkins paper that was published, a paper from Johns Hopkins; three economists at Johns Hopkins, very well-done paper. So, there's no explanation for this. I contacted Nancy Whitmore at the, at that Ontario—

Shawn Buckley

College of Physicians and Surgeons of Ontario.

Stephen Kirsch

Yeah, "the College," as they say. And Nancy Whitmore just ignored me. I said, "Look, if there's an explanation, let's hear it." They basically don't want to say anything. David Fisman, who is also in Ontario, would not say anything either. I emailed him, he didn't respond to my email. Nobody wants to explain this.

So a huge increase in Canada: nobody, no authority, will explain this increase and agree to be challenged with their explanation. It's just, like, well, it happened; you should ignore it. This is completely counter-narrative. And every single authority in Canada is ducking questions about this. Nobody wants to explain it. And what's even more troubling is that the press in Canada is not asking about it either. They're not asking these questions.

Shawn Buckley

Well, I think it's worse than that. I mean, the experience that we've heard from other witnesses is that the press actively participates in character assassination if you step out. And you don't even have to be a Canadian expert. We had Dr. Bhattacharya on here explaining how the CBC basically went after him after he was one of the authors of the Great Barrington Declaration.

And just so you know, because you're in the United States, there's still a culture of fear here. **We're having— This is a citizen-run inquiry. And one of the features is, we don't just have experts like you on, we allow ordinary Canadians to come and tell their stories. But we've had a large number of witnesses back out at the end because they're still afraid of repercussions, both economically at their work and social, like family and friends. So, we're still in a culture of fear.**

And I'm wondering if you have any thoughts on whether it's fear that is preventing people from speaking. Or are there other factors?

Stephen Kirsch

Well, yeah. The fear is definitely preventing people from speaking out. There are some doctors who believe the authorities. They're trained to believe authority and trust authority. These doctors will look at what's going on and they'll say, "Oh well, I just got unlucky." And so there are some doctors who still believe that the vaccines are safe and effective and just ignore the evidence in plain sight.

There are other doctors who realize that if they speak out, they will have their licence revoked. They will no longer be able to practice medicine, or they will have their hospital privileges revoked, or they will be fired from their job. The first duty of these people is to provide for their family. And so, that's what they do. They keep their mouth shut and they follow orders, so they're not fired.

An example of a doctor in Canada, in Ontario, for example would be Ira Bernstein. And look at what happened to Dr. Bernstein. None of his patients died but the authorities are in the process of revoking his license to practice medicine. After complimenting him for being an exemplary doctor before the pandemic happened, now all of a sudden, he's an evil guy because he saved lives. And so they're going after him and it's all out of public view.

Shawn Buckley

In the province that I live in, Alberta, the College of Physicians and Surgeons, as I understand it, basically directed physicians that they were not to be treating Albertans who presented with early COVID. Rather, they were to wait until people presented seriously at the emergency ward.

Have you heard similar things in other jurisdictions? That's something that I have trouble getting my head around. A college basically directing doctors not to treat patients early.

Stephen Kirsch

I haven't heard about that in other places in Canada, but I haven't tracked that at all. I know there are places in the world where physicians are directed to do that.

[00:35:00]

In fact, our own CDC is, I think, guilty in that respect in telling people that none of these early treatments work. And so physicians interpret that as, "Well, I better not do it otherwise, I'm going to get in trouble."

Shawn Buckley

Back to fear. Sorry for interrupting, I'll let you carry on.

Stephen Kirsch

Yeah, no problem. It's interesting that Ontario also published that there are zero COVID deaths in people under 30 in Ontario. So why do they recommend a vaccine? I mean, you can see here: If you're 40 and under, in fact if you're 50 and under and you're unvaccinated, basically you're not dying. You know, it's pretty darn close to zero. And it's actually zero for age 30 and under here. So, why are they even recommending the vaccine? They're not even talking about the risk. It doesn't make sense.

This is a paper which people find really, really troubling if you think the vaccine is safe and effective, which is: the more doses of the COVID vaccine that you get, the more likely you are to become infected with COVID. This is a study done at the Cleveland Clinic, which is according to Newsweek the number two hospital in the entire world.

So the number two most-respected hospital in the entire world did a retrospective study to look at the COVID rates for their staff—51,000 employees, various locations. And what they found is a pretty linear relationship with the number of vaccine doses you have and your risk of infection. The more doses of the vaccine, the more likely you are to be infected. And the error bars pretty much do not overlap, which means these results are statistically significant: the more doses, the more likely you are to be infected.

Now, there's nobody that's been able to dispute the study. In fact, one prominent debunker said, "Well, I didn't like the fact that this axis here was linear." That's preposterous. You didn't like the fact that the axis was linear? And this is one of his primary critiques of this study. He also said he didn't like the way study was done. Well, you know, I'm sorry, but the study shows what the study shows. And the most important thing is that there isn't a study anywhere showing that the opposite is true. Because doctors always like to say, "Well, for every study, there's always a study showing the opposite thing." There is not a study anywhere showing the opposite is true.

Shawn Buckley

I'm sorry. An interesting thing that's jumping out at me is basically, this chart shows negative efficacy. If a marker for efficacy was that it prevented you from getting COVID, which is what the public was led to believe, this is showing that even for one dose— I appreciate your point, for each additional dose it gets worse. But as time goes on in this chart it seems that you'd have negative efficacy if you're more likely to catch COVID than not. But it seems that it gets worse as time goes on in this chart. Am I interpreting that chart correctly?

Stephen Kirsch

The x-axis is time, so it's just showing you the cumulative incidence. So if you divide that then you get a rate. It's not showing you the rate; it's showing you the cumulative incidence over time, which you'd expect to go more and more over time that more and more people get because it's a constant rate. So the rate would be the slope of the line.

Shawn Buckley

Okay.

Stephen Kirsch

Okay? And what's interesting is that the paper itself pointed out, "Hey, we're not the only guys to see this." There were two other studies that were done completely independently that showed exactly the same thing: that people who were vaxxed more were more likely to get COVID. So they said, "Hey, don't blame us. We're not the only study showing this." This is indeed very troubling for the narrative.

And the beauty of this particular study is that everybody started at exactly the same point in time.

[00:40:00]

So everybody was exposed to the exact same variants within their communities and you can see the extraordinary difference. Why this study is so interesting is because it looked at people with various doses over the same time period. And it was done in a hospital setting that's very controlled.

The exact same paper showed natural immunity works: that the more recently you were infected with the COVID virus the less likely you are to get COVID. This is someone who's recently infected with the Omicron variant. This is someone who's not infected at all. So, this is not looking at vaccines; this is looking at natural immunity, showing that if you got COVID, the more recently you got COVID the less likely you are to get COVID again. This is showing natural immunity does work, just like medicine has said for years. But the vaccine is doing the opposite. Natural infection is good, is what this paper said. COVID vaccination is effectively bad.

Now we have some V-safe data, which is self-reported data. Ten million Americans agreed to report their status. When they got the shots, they were given a card to register for V-safe. And 7.7 per cent ended up with severe adverse events. That is not safe—7.7 per cent that had to be hospitalized or see the doctor after getting their vaccine is not a safe vaccine. You can't spin it any other way.

And here's a study, the source is *The New York Times*, showing the more you vax the more people die from COVID. Not more people die, more people die from COVID, which is what we said before. Also, if you look at population studies—and this is CDC data—these are squared values, 0.24 here and 0.29. These are very high numbers for correlation. The more you vax the more people die from all causes.

And the latest U.K. data shows that the vaccine increases the risk of death for all age groups. So we're not just talking about dying from COVID. This is dying from COVID. This is dying from all causes, showing higher mortality if you are vaccinated. The regions with higher vaccination rates have higher all-cause mortality. And the latest U.K. data shows that the vaccine increases risk of death for all age groups. So this is all-cause mortality. And it also shows negative vaccine efficacy for all age groups, which means you're more likely to catch COVID and die.

The Israeli Ministry of Health found the same pattern. The vaccine is more likely to kill you as time goes on. This is days post-vaccination and this is the number of death cases. Look how it climbs. It's supposed to be a flat line across here. The vaccine isn't supposed to make any difference at all in the number of deaths but instead it climbs just 30 days after you get the vaccine. That's what it's supposed to protect you from: dying from COVID. And look at the death rate: it's three times, 60 versus 20 here. I mean, truly stunning. This is from Israeli Ministry of Health data.

And of course, in our own VAERS [Vaccine Adverse Event Reporting] System the blue lines here are all non-COVID vaccine deaths. So every vaccine combined each year, and then red is total reports of death from all vaccines. Okay, so they match up. Every single year they match up until the COVID vaccines roll out, where the COVID vaccines are completely off the charts versus the non-COVID vaccine. So it's not an over-reporting; it's not that suddenly in 2021 people realize there's a VAERS system and started reporting things. Because the bars only go up for the COVID vaccines and no other vaccine.

There is one of three things going on here. There's either massive fraud and gaming by anti-vaxxers reporting deaths that don't exist— But all of those deaths are reviewed by health and human services. And so maybe sometimes one or two gets through, but there's no way that you can have massive gaming. So, number one isn't even a possibility.

[00:45:00]

The second is massive over-reporting. But there's no evidence of that anywhere. We've done surveys of healthcare workers all over the place and nobody says we're reporting for the COVID vaccines more than any other vaccines. It's interesting that happens: all of a sudden, for just the COVID vaccines worldwide, in every adverse event tracking system in the entire world. So could it be there's massive over-reporting? I don't think so. It's not supported by the evidence.

So that just leaves one possibility, which is the deadliest vaccine in human history. And that's the only thing that there's evidence for. And I've confirmed that using surveys that were done by third-party pollsters. And it says that the vaccine is as dangerous as COVID and sometimes more so.

And the mainstream media is not doing any of these surveys to find out, just to validate whether the government's telling the truth. There isn't any mainstream media survey that's been done to look at this data. In fact, there was a Rasmussen study, Rasmussen polls. They said, "This is the most important poll we've ever done." And it showed that the vax deaths were equal to the COVID deaths. And that was amongst Democrats and Republicans and independents. So, you can't say that this is just a right versus left, a liberal versus conservative. It's not. Everybody polled is finding that the vax deaths in people that they know are equal to the COVID deaths, relatively close. So the cure is worse than the disease or at least comparable to the disease.

And what's stunning is that of course the U.K. government claimed that only nine people died from COVID vaccines in 2021 in the U.K. Interesting to see how they undercount that. And of course, even the mice are not fooled. You know, the mice where they do the testing, they're not fooled. Here's the discussion between two rodents: "Are you getting your kids COVID vaxxed?" The other rodent says, "No, I'll wait for the human trials to finish first."

So, someone is clearly lying to you. It's all a matter of what you trust, who you trust. Do you trust the data or you trust the government experts?

And of course, the way you figure this out is that the side that wants to resolve the differences in the civil discussion is almost always— I've not seen a counterexample of this so I can't say definitively never. There's always a counterexample. But in general, the side that wants to resolve the differences in a civil discussion, the people who want debates, they're the people who are telling you the truth. And the people who are running from these debates? They're the people who don't like being challenged.

For some questions, it doesn't matter who you ask. Are the COVID vaccines safe and effective? If they are then the vaccine mandates are pointless and if they're not vaccine mandates are pointless. So who cares? Did my booster protect me from getting COVID? If it did, great, no need for additional boosters. And if not then there's no need for additional boosters anyway. But the question people should be asking is: Why isn't the vax-death data available? This is ground zero data. Why isn't it publicly available from any government anywhere in the world? If they really wanted to reduce vaccine hesitancy, they would show

this data. The governments would be tripping over themselves to make this data public, the vax-death records public. For each person who dies, show us the vaccine dates.

It's interesting that there's a VSD [Vaccine Safety Datalink] database, which is very definitive. But the CDC stopped Professor Brian Hooker and others from looking at the VSD data. Why would they do that? Why would they hide the truth? And if it works so well, how come the drug companies aren't urging— Have you ever heard of Pfizer, Moderna, any other drug company urging the government to make this vax-death data public?

If the vaccine manufacturers really want to reduce vaccine hesitancy because they're going to sell more product, it is in their interest to make this data public. And there has not been a single call from any manufacturer to make the public health data public. To me, that's stunning.

I offered to bet anyone a million bucks that the vaccines have killed more than they've saved. There's only one guy who took me up on it but he was only willing to risk \$500,000. He wouldn't go for the whole million dollars.

And it's interesting that they're so confident that this vaccine works that they are willing to risk your life on it,

[00:50:00]

but they're not willing to risk their money. Like, Pfizer could easily bet me a million bucks. They won't because they'll lose. The point is that they're risking your life, but they're not going to risk their money or their reputation.

Shaw Buckley

Can I just jump in there? Because I would think that if Pfizer took you up and proved you wrong publicly, that would just be a public relations coup in reducing vaccine hesitancy?

Stephen Kirsch

Absolutely.

Shaw Buckley

So it seems that the point you were making, that Pfizer could easily take you up on that bet, is quite a significant point. So, please carry on.

Stephen Kirsch

Yeah. What's interesting also is that nobody can name a single real-world vaccine success story where COVID rates went down at a nursing home or a funeral home after the vax roll-out. I still can't find that success example. And I've talked to other doctors in these Twitter spaces, chat rooms, and I say, "Where's your success story?" And they're unable. All of these people are unable to name a single real world success story. "Hey, at UCSF [University of California San Francisco] the numbers are this." Or, "Hey, at Stanford the number—" Nobody can name a single vaccine success story. That is stunning.

They say it's "10 times reductions in deaths," but they can't point to a single place that that's happening. It's interesting because it's supposed to be happening all over. I shouldn't

be able to find any counterexamples. But all I can find is counterexamples and I can't find anything that supports the narrative. That's really stunning. I mean, that question alone is something that you should be asking your doctor. It's an easy question: If this thing really works, where's the nursing home? Where's the geriatric practice? Where's the funeral home where they can say, "my death rates plummeted after the vaccines rolled out." Show me the funeral home where business went down after the COVID vaccines rolled out. I mean, we cannot find it.

Shawn Buckley

And you're talking about basically, a sample size that is staggering in the measures of billions of doses worldwide.

Stephen Kirsch

Right. They should be able to find these success examples everywhere. And nobody can name one in the entire world. It's really stunning. I mean, it should be impossible for me to find a counterexample because the vaccines are so effective in preventing death. It should be impossible. And yet I can find hundreds of these and not a single counterexample.

You know, it's weird that we can have this public health emergency when no one's dying from Omicron. I've been to the hospital wards in my local community. They're empty. But how can perinatal deaths climb 20 times after the vaccines rolled out? How can Deborah Conrad's caseload before she was fired go up 20 times right after the vaccines rolled out? And here's the kicker: If it's really so safe, why do they need liability protection? Now that they know it's so safe, why not just drop the liability protection? But they don't.

Bleeding in early pregnancy: seven-sigma increase. Gee, if it wasn't the vaccine, what caused this?

The vaccine groups in the phase three trials for all the vaccines, for all three vaccines, all had higher morbidity than the placebo groups. This was highly statistically significant for all vaccines. And yet they're not pointing that out to anyone, that there's higher morbidity. So clearly from the data we have, there's higher mortality, higher morbidity. Why are you taking this intervention? It makes no sense.

Here Vinay Prasad is talking about a Swiss study, 777 Swiss healthcare workers were looked at after they got the shot. And 2.8 per cent had significantly higher troponin levels, which are an indicator of serious heart damage, just three days after the booster shot. Now how can that possibly be safe?

I found out that the Chief Medical Officer at UCSF was issuing a gag order,

[00:55:00]

telling all staff not to talk about the vaccines in the context of any injury. So if somebody was injured, "Do not ask about when they got their COVID vaccine." We haven't had a case where a single prominent individual has switched sides from being anti-vax to pro-vax. It's all going the wrong way.

It's all from people like Aseem Malhotra, who is very famous in the U.K., a medical doctor. And he was promoting, he was pushing the vaccines, signing people up on TV, convincing people to take the vaccines. His dad died six months after he got the shot. And Aseem

started looking at the science and he said, “Whoa, I was fooled.” And so now he’s a prominent anti-vaxxer because he was forced to look at the data after his dad died. And he said, “I can’t think of any drug, anything we have ever used in medicine that has efficacy that is this poor.”

Zoo animals are now dying of unusual causes after the vax rolled out. If this thing is so effective— Nobody is getting it. Even Paul Offit’s not getting the booster and he went on record as not getting the booster. And he’s strongly pro-vax. So why should you get it? If it’s so safe, why did the FDA try to keep the safety data secret for 75 years? John McCain, before he died, said that “excessive secrecy from a government agency feeds conspiracy theories and reduces the public confidence in the government.” This is exactly what is going on here. There are 770 safety signals that have triggered in the VAERS system and the CDC knows it. And they didn’t tell the public about any of those safety signals when they triggered.

We talked about debates. None of the government authorities anywhere in the world, including in Canada, will debate. Three top scientists in Canada—here in this slide—challenged the Canadian authorities to a debate on the science and nobody showed up on the other side. They said, “It’s the three of us against everyone you want to bring to the table.” And they couldn’t bring a single person to the table in Canada. Now that is stunning to me. I can’t name a debate that’s happened ever in Canada, or anywhere else in the world.

Here’s a 123 per cent increase in all-cause mortality in the Philippines on September 30th 2021. Now it wasn’t COVID because there were only 127 COVID deaths that day. So what causes this huge peak?

In Germany, right after they rolled the shots out, these causes of deaths from certain ICD-10 codes—sudden cardiac death, cardiac arrest, sudden death—they skyrocketed. There’s no way that happens by chance. Now, if it wasn’t the vaccine, what caused the rise? You know, you can’t explain this one. This happens all of a sudden. They say that a lot of these things are happening because, “Oh, people aren’t getting their medical care during lockdown. That’s why the death rates are higher.”

Well, Martin Neil, and Norman Fenton actually looked at all of the excuses for what could have caused the death rate. Excess deaths worldwide: What could be causing this? So they looked at all these factors and they found that none of them had a positive correlation with what was going on. The only thing that was positively correlated was the vaccine. Now, nobody’s been able to dispute this study, which is interesting. They all say, “Well, it’s something else, it’s something else.” But they can’t dispute this Devil’s Advocate study where they looked at all these reasons. They showed that they don’t correlate at all.

It’s interesting that for the first time in history, it’s necessary to censor doctors with opposing views. And Peter Marks, who’s the FDA [Food and Drug Administration] director, he’s in charge of CBER [Center for Biologics Evaluation and Research] at the FDA, which is basically vaccines. And he says, “I’m past trying to argue with people who think the vaccines are not safe.” But he’s not argued with any of the misinformation spreaders, not a single one. He’s past that already even though he’s never done it.

And of course, the White House now has a censorship list for the first time in history. And of course, I’m a little upset I’m not on it. But why do they need to have high-tech companies censor doctors for them for the first time in U.S. history?

[01:00:00]

And I offered a million bucks to anybody, any member of the CDC or FDA outside committee members, to answer some questions. So they just show up. This was not a bet. This was, "Hey, here's a million bucks, just to show up and answer some questions." Nobody would do it.

The CDC ignored all the early treatments. I'm going to skip over this. The rhetoric doesn't match the reality. We're seeing so many black swans, athletes dying and so forth in the VAERS system, over 650,000 excess deaths and nobody wants to talk about it. The CDC ignored over 770 safety signals in VAERS. They didn't talk about it. We only found out about it after we issued a FOIA.

I have a friend in Silicon Valley; she's a neurologist, she works at a big practice. They had no VAERS reports in the last 11 years. This year they need to file a thousand. So this is not an over-reporting. This is an actual, "We've never seen anything like this in our practice in the last 11 years because we've only been in practice for 11 years."

Nobody wants to debunk Ed Dowd's book. I know of a large geriatric practice that went from 11 deaths a year to 21 deaths a year in 2022 and they have an 85 per cent COVID vaccine rate. Come on. Why didn't the deaths go down? This is very similar to what has happened in Ontario. And it's a geriatric practice so the numbers are higher.

Doug Brignole offered his life as the test case. He got the vax, died a week after he got the vax, and nobody's talking about it. Huge rise in dementia deaths in Australia between June and July of 2021. Cannot be explained any other way. It coincided with the vax rollout of the elderly.

Pfizer did a clinical trial of pregnant women. It ended July 15th of 2022. It's almost a year ago. Nobody wants to know. What happened? Nobody wants to know. The press doesn't want to know. Nobody's asking them what happened in the trial. How did it go? Isn't that amazing? They do the trial and they keep it secret. And why was enrollment limited to 24 to 34 weeks gestation? The CDC says it's safe for anyone to get the vaccine. We already know it's safe. The CDC has said it's safe. Why did they make the restriction that it was only 24 to 34 weeks to enroll in the trial? Very strange. And yet, they're not telling us what happened in the trial. There is data in the trial. They're not saying a word.

How does this inspire public confidence? Why isn't the CDC asking them what happened? Why isn't the press? I mean, it's unbelievable that nobody wants to know. We still don't know what evidence was used by the CDC to recommend the vaccine was safe for pregnant women. They clearly don't want to know what was in the Pfizer study.

And of course, there's a four times greater risk of cardiac deaths—or four times as many cardiac deaths—in the Pfizer phase three trial. And of course, they never showed us the data on that. It's interesting: there were five times as many exclusions in the treatment group as in the placebo group on a double-blind randomized trial. That's impossible. That is statistically impossible. That is never going to happen. That means there's fraud in the trial, and nobody investigates.

Nobody investigates what happened to the allegations of fraud by Brook Jackson and Maddie de Garay. Maddie was 12 years old when she got the Pfizer shot. She's now paraplegic and she has to eat from a feeding tube probably for the rest of her life. Nobody ever called her. Her experience is not unique. I talked to Janet Woodcock. She promised me that the FDA would investigate. The FDA never called, the CDC never called, and Pfizer never called. Nobody wants to know the truth about these vaccines. And there's nothing

more clear than what happened to Maddie, who's a 12-year-old whose life was destroyed by this vaccine—no question about it. Six times as many Southwest Airline pilots are dying per year now than they used to be dying.

It's interesting that no doctor or nurse in Scotland has ever died from COVID in the past three years. Zero COVID deaths. All the deaths in healthcare? Those are from other causes, not from COVID.

[01:05:00]

The number of COVID deaths of doctors or nurses, non-retired, ages 20 to 64, is zero in Scotland. And this is an emergency?

I was wondering why the FAA [Federal Aviation Administration] hasn't been investigating any of these pilot injuries and deaths from the COVID vaccine. And so, I talked to Bradley Mims and I asked him directly on the phone, "How come you guys aren't investigating these pilot deaths and injuries?" And he said, "No comment." He said I had to talk to the press office. So I contacted the press office, and the press office said, "Well, we don't see any evidence." Yes, because you're not looking. I mean, that's how it goes.

The ACIP [Advisory Committee on Immunization Practices] chair—ACIP is the outside committee for the CDC that approves the vaccine. So she's like the final straw in getting approval. And I have asked her, "Hey, do you want to see the Israeli vaccine data, which shows that the vaccines are super dangerous?" And she refused to answer the question. So yes, no questions. It's a really easy question. Like, "Do you want to see the Israeli Ministry of Health vaccine data?" I have access to the video. I can give her a private showing. She called the cops on me. She didn't want to answer the question. And the cops couldn't arrest me because I didn't violate the law. I just went to her door and knocked on the door and asked, "Hey, do you want to see the data?" She called the cops on me. That's how bad it is. These people run from wanting to see any data.

A real scientist? A real scientist would not call the cops. A real scientist would say, "Yeah, I want to see the data." But these people aren't scientists. I don't know what they are, I don't even know if they qualify as human beings—if you don't want to see the safety data on this stuff.

So many people dying suddenly. These fibrous clots: they're only happening in vaccinated people. And Chris Martenson did a brilliant video. He says in this slide, "The failure to study these clots with all due rigor is inexcusable and inexplicable, assuming public health is the goal." And that really says it all, doesn't it? Because everybody's seen these fibrous clots and nobody wants to look at it. Isn't that interesting?

There's only one pathologist in America doing autopsies. And he's doing the proper test to assess whether the COVID vaccine caused the death and he's getting 100 per cent hit rate. Nobody else in America is doing these tests to figure out whether the vaccine caused the death. This is the definitive test. You have to use these specialized tests in order to find out whether the vaccine caused the death or not. If you're not doing these tests, you don't know. Basically, the only way you find out is, after the person dies you autopsy them. You can't do it while the person is alive. You autopsy them and then you find out the truth. Nobody wants to find out the truth.

The CDC is not even telling any pathologist to check for a vaccine-caused death. Fifteen-year-olds are now dying from heart attacks on a regular basis. I talked to a funeral director

in Texas who told me that she's never in 50 years seen a 15-year-old die from a heart attack. In December 2022, she had one death a week for three weeks straight of 15-year-olds from heart attacks. Explain that.

Here's Google searches. Google searches for myocarditis started immediately after the vaccine rollouts for adolescents. And yet the doctors say the rates for myocarditis from COVID are much greater from the virus versus the vaccine. And yet all of the interest spikes right after the vaccines rolled out.

It's being recommended for kids. But kids have one in a million chance of dying—a healthy kid less than one in a million chance of dying from COVID. So the vaccine has to kill fewer than one kid per 10 million. And to prove that would require a trial of 30 million kids. That trial has never been done. Why are they recommending this? In fact, in Canada, over 96 dead children and counting post-vax, when you'd normally see nine a year from flu. Why are the health authorities not talking about this and why did they stop reporting these deaths?

This is from Dr. William Makis. This list has been silenced. It's really tragic.

[01:10:00]

We have names of the people who died unexpectedly. No investigation.

It's very hard to find the name of one healthy child under 12 who died from COVID in the U.S. We've looked at the death records in many states, and we can't find a kid under 12 who died from COVID. Zero.

And nobody's questioning of course the science behind the six-foot rule. If masks work then why is it that every single randomized trial has failed to show any effect? And the Cochrane report says, "little to no difference." I offered people \$10,000 to remove their mask for the duration of the flight. No takers—but they remove their mask happily when they're served food or a drink. What's interesting is that they can all get infected through their eyes and nobody covers their eyes. You can just as well get infected with COVID through your eyes as through your mask. Why are you wearing your mask and not covering your eyes? It makes no sense. And of course, face masks at best are designed to protect the wearer, not as source control.

So these mandates are nonsense because the mandates are about protecting the public. You have to wear this face mask with no portal because you want to protect the public. But: "There are currently no established methods for measuring outward leakage from a barrier face covering, medical mask, or respirator. Nothing in this standard addresses or implies a quantitative assessment of outward leakage." These things are not designed for outward leakage—hello? And yet we are being mandated to wear masks because of outward leakage, even though there are no established ways of measuring outward leakage. Isn't that interesting? I guess that's how science works.

Why didn't the CDC warn parents that of course masks create dangerous levels of CO2 for kids? We have a number of studies that show that, including one that was done just recently—a systematic review and meta-analysis. And my favourite of course is the one with the two Marines testing masks with bear spray. And nobody has been able to refute this video. It's on YouTube. It's a classic video.

And if the bivalent booster is so beneficial, why isn't Paul Offit getting it? He explained that we should not be trying to prevent all symptomatic infections. That's not what we should be focused on.

And we have Professor Marty Makary testifying in Congress that the greatest spreader of COVID misinformation is the U.S. government. Isn't that stunning? And the reason of course, people don't trust the CDC. I did a survey, 90 per cent don't trust them at all. And the CDC has one overriding goal. The official answer is it's to protect the health of America, but Americans don't believe that. They think it's to protect the drug companies and vaccinate everybody.

Critical thinking still seems to have disappeared. And it's interesting that Vinay Prasad and Jeffrey Flier, who is the former dean of Harvard Medical School, says the scientists who express different views on COVID-19 should be heard and not demonized. Which I agree with. But it appears that nobody in mainstream science agrees with this; they all think that people who have different views on COVID-19 should be censored. It's quite astonishing. So they disagree with the former dean of the Harvard Medical School. And I don't know how we're ever going to resolve this because the pro-vax authorities all refuse to engage in a civil dialogue.

Here's an example: a Paris group of experts, leading scientists, invited most of the leading scientific proponents of the COVID market origin hypothesis to participate in a respectful public debate. All have refused. So you can't even get a debate on the origin. You're never going to get a debate on any of this other stuff. People are going to start to point fingers. The German Minister of Health, Karl Lauterbach, said, "It wasn't my fault. I didn't approve the vaccine." So he's already starting the finger pointing.

And nobody wants to answer any of my questions here. Pfizer and the CDC haven't responded to any of my questions. I don't know what they're afraid of; why don't they just publish the answers? Basically, they lied about everything. All their advice made no difference and made things worse. Virtually all made things worse. Vaccines were a disaster, masks were a disaster, social distancing a disaster,

[01:15:00]

lockdowns made things worse, mandates killed people. We're looking at just tragic numbers of people dying from these interventions.

And the one thing that did work really, really well was the thing that they ignored completely, which is early treatments. And early treatments have basically— If you got on the right treatment protocol you had virtually zero chance of hospitalization and death. **And all those treatments were ignored.**

Solutions: Stop the shots. Stop hiding the data. Hold public health officials accountable—I don't know how you can do that because no public health official wants to be held accountable. Listen to those who've been censored. And each and every public health official has the power to change everything, because they can release the record level vax-death data in their region. And why would they not want to do this? Why would they not want to show the public the truth?

I asked the U.K. to release it and they said it would violate the privacy of dead people. In other words, in the U.K. they think— Death records are public, or they used to be public. In a lot of states death records used to be public. You used to go into Ohio and be able to get

the death records. So all we're saying is, "Let's just add the date when these people are vaccinated." So in the U.K. I asked them, "Why don't you just release this data for the dead people?" And they said, "Well, it'd be violating the privacy of dead people to let us know when they were vaccinated." I don't know of a single dead person who, especially if they died from the vax, would object to having this information disclosed.

But we should do a study where we ask dead people, "Hey, do you mind having your vaccine information disclosed?" But second best would be to ask people who are still alive, "After you're dead, is okay for us to disclose your date of vaccination?" Which, of course, nobody has done. So anyway, these people stopped responding to me.

The FDA head Robert Califf, has said that "misinformation is the leading cause of death." Interesting.

Shawn Buckley

Mr. Kirsch, I'm just wondering how much longer you have.

Stephen Kirsch

Yes, we're done.

Shawn Buckley

Okay, perfect.

Stephen Kirsch

There's an easy way to fix this problem of course, which is that all he has to do is stop talking. And that's what I'm going to do at this point. And I'll leave you with this final slide, which is, "Anyone not publicly calling for data transparency is not your friend."

Shawn Buckley

Well, actually I'm hoping you stick around and allow the commissioners to ask you some questions. You've just given us some tremendous information. I believe the commissioners have questions for you.

Commissioner Massie

Well, thank you so much, Mr. Kirsch, for this incredible tour de force in terms of doing an overview. You've covered so many grounds there. I will try to focus my question to a couple of issues that you probably are aware of, but you didn't detail. The first one has to do with the narrative when the vaccine was initially rolled out. It was basically to reach this elusive herd immunity. And when you look at the data from government from all over the world, it seems that it was working so well. And then when the Delta wave hit, what we've heard is that, "Well, what the vaccine can no longer do is to protect against transmission."

My question to you is: Do we have credible data that it ever worked? Because this whole notion that the vaccine was designed to a strain that was different now, Delta, maybe didn't work because it was Delta and not the original strain. Do we know of any data showing that it ever protected against transmission? And why is it that we are seeing that the statistics were showing spectacular results against transmission?

Stephen Kirsch

Yeah. I've seen some data that might lead you to believe that the vaccines were working and that infections were going down. And there are certain studies. But based on what we've seen today and the careful studies that were done like the Cleveland Clinic studies, I think it's pretty doubtful that they ever worked. See, what the Cleveland Clinic studies showed is that natural immunity has always worked. Because you could see it in those curves. That natural immunity—

[01:20:00]

That the more recently you got the infection, the more protected you are. And it's clearly the case, and it's not clear whether it's the time element or it's the variant. Because it's a little hard to tell, right? Because the more recent variants of course are going to be closer in time and they're going to protect you more.

Is it a time difference or is it variants? It's probably both. But the vaccines were showing just the opposite. So one can infer from that—now that we have this clear data from the Cleveland Clinic study—that it was just a mirage that we were seeing. And we were probably undercounting the unvaccinated and that these studies were not done carefully.

Because the size in the Pfizer trial—there are 22,000 people per arm in the Pfizer trial—and there was only one person who they claimed was saved from a COVID death in that trial. And I know I'm kind of switching here between deaths and infections, but this story starts to get into opinion. I haven't researched this extensively, but I would say that it probably was never the case that these things worked. Because if they did work, we'd be seeing it now too. Because these new vaccines are specifically designed for the Omicron variant, these booster shots. And we're not seeing the reduction, right? We're seeing that the more shots you get, the worse it is. So I'd say that if there is a protective effect, that it is overwhelmed by the non-protective effect of more vaccines making more vulnerable because they pressure the immune system.

Commissioner Massie

My other question has to do with the COVID management in Sweden. We could probably agree that, by and large, what they've done seems to have worked much better than in many other Western countries. However, they were pretty—I would say—proactive in vaccinating a large fragment of the population. So I'm wondering whether you have any insight from talking to people that are more knowledgeable about the situation in Sweden: What was the mindset or culture in the health authority that would make them believe that vaccines would be the way out, given all of the other measure that they had implemented so successfully?

Stephen Kirsch

Well, it's like most health authorities throughout the world: that they take their direction from the WHO, from the CDC, from the FDA, from the EMA [European Medicines Agency]. So the authorities are looking to other authorities to figure out where they should stand so they all look unified. Because it would be really embarrassing if the WHO said, "these vaccines are dangerous" and the CDC is saying, "everybody should get vaccinated."

All these health authorities tend to be aligned with each other. And so, I think that in Sweden, they were basically looking at that and saying "Well, these guys must know what they're doing, so let's go vaccinate everybody." Sweden has had better outcomes. And I

think it's probably more from natural immunity, that people were exposed because they didn't lockdown and people had natural immunity. So it wasn't the vaccine that actually caused the lower death rate in Sweden; I think it was more that they kept it open. People got naturally exposed to the virus early on and that was the cause of their success rather than anything else.

Commissioner Massie

Okay. One last question—a very general question. You, from your personal journey, only realized there was something fishy with the vaccine because you experienced it yourself. And I see a lot of other people that have been through a similar experience, that initially trusted the government and trusted the institution and said, “Okay, that’s what it takes to get out of this COVID crisis, I’ll go and do it.” And now you realize after digging in the data that there’s been a lot of, say, misinformation.

[01:25:00]

I don't want to qualify who's doing it. When you look back at how we came to this sort of roll down very quickly across the world—with the lockdown and vaccine and so on—it cannot really happen unless the culture is already there to accept it.

So my question is: Now that we can gather data on the COVID crisis on many fronts—lockdowns, vaccines, and all of the early treatments, you name it—that is showing more and more with hard evidence that the government has been somewhat misleading the population, the greater question is: On how many other very important issues is the government misleading the population?

Isn't that going to open that kind of investigation from critical thinkers?

Stephen Kirsch

Yes, it should. It absolutely should, right? Because once the public has realized that they've been totally misled on these COVID vaccines, and it's done the opposite in all the directions, in infections, hospitalizations, and death. And that instead of saving hundreds of thousands of people, it's actually been killing hundreds of thousands of people.

Once that trust has been broken, then we start to ask the questions, “Well, what else have they been misleading me on? And then it opens up: well, how safe are these other vaccines? For example, Andrew Wakefield has said that there's a connection between vaccines and autism. And I'll tell you, I've talked to a lot of parents of autistic kids. And it only happened after, right after—in some cases in the parking lot after they got their shot. And so, this stuff is being ignored. It's being swept under— These people who are bringing these accusations are being discredited, which then of course dissuades other scientists from bringing the same accusations because they look at what happened to Andrew Wakefield. That's why it was so important for them to make him the scapegoat and to show people, “Hey, if you go against the authorities, here's what we're going to do to you.”

And yet there was this Simpsonwood meeting, which I've written about in my Substack, where they tried to cover up the safety signals or the signals of harm. And they kept saying, “We can't make the signal go away. We can't make the signal go away.” It's just stunning the amount of corruption that is at the CDC, for example, to this day.

And this corruption exists not only on the association between vaccines and autism.

It also extends to fluoridation of drinking water. The CDC has hailed that as a fantastic accomplishment. But the fluoridation of drinking water in America has been a disaster. It lowers IQ points and it really doesn't do anything for cavities. And in fact, I was at this event for Bobby Kennedy. I ran into someone who said, "We got rid of fluoridation of drinking water in our community. And the cavities went down and the IQ went up and it did exactly what the science says it would."

So I think this is going to open minds. And people are going to now be able to question, and be willing to question, other things where we've been very seriously misled. Things that we were all told to believe in, we're going to find that we were misled.

Commissioner Massie

Thank you very much.

Shawn Buckley

And there are more questions.

Commissioner Drysdale

Good afternoon. Thank you for your testimony. I just want to get a few points right in my own head about what you were talking about. I believe you said that in the United States, the public health officials did not want to disclose the vaccine status of deceased people because it violated their privacy. I want to ask you to comment on the fact that when I would go to a restaurant, or a tire-changing place,

[01:30:00]

they would ask me my vaccine status and I would have to report that. Was that the same experience in the United States?

Stephen Kirsch

Yes, it was the same experience in other countries as well where in order to enter an establishment, you're asked to essentially disclose your vaccination status by showing us your vaccination card because you wanted the services. You were not required to do so; it's voluntary. If you wanted to eat at our establishment, you'd have to show the vaccine card to get in. And there were certain states that required it. I remember when I went to Hawaii: they required me to show my vaccine card in order to enter Hawaii and they also required it to enter into a restaurant.

Now, the email that I showed you—that was actually the U.K. Health Authority, who said basically, "This would be a privacy violation because it would be disclosing private health information. And we're not allowed to do that." And I said, "No, no." On the death record, the 60-year-old died. The laws are going to be different in different places. But basically, in the U.K. they could have anonymized these records to say somebody between the ages of 60 and 65 who was vaccinated on these dates. And they could go and they could anonymize the dates. They could go and do a plus-one/minus-one on the dates, so that nobody's record would actually match up. And nobody could say, "you're making my data public," because the data wouldn't match up. But they were uninterested in doing that.

And I also talked to Norman Fenton in the U.K., who's talked to the regulator, and he got a similar response. They basically don't want to make the data public. They want to take the data and they want to massage it and present it in a way that's favourable to their narrative, so that they control the presentation. It's like you have this massive database of information and they don't want to show it to you. What they want to do is, they want to have this little telescope where you can look at one little piece, and they carefully control what you look at rather than showing you the whole database.

And there was no interest in saying, "Yes. We can't do it right now because of this particular rule but we want to go to bat for this because we think public health data should be made public." There was no interest at all. You know, if you're truly interested in public health, you want to make the public health data as publicly accessible as you possibly can, so that everybody can look at it and make their own conclusions from the objective data. That's how it should work. Instead, they're saying, "We're going to interpret it, and we're going to let you look at it through the lens that we control. And even if we make a mistake on it, you just have to trust us." And that's exactly what happened in the U.K. with this data, where they messed up and they undercounted the unvaccinated. And they misled people into thinking the vaccines are effective. That should just not be done.

To answer your question about the privacy concerns, that was a U.K. statement saying, "We can't do it because of privacy issues."

But again, I think if you asked people, "After you die, do you mind if we publish the vaccine data?" Why not just have people in the U.K. sign a statement that, if they want to keep their vaccine information private after they die, then all they have to do is register with the U.K. government saying, "I don't want my vaccination records released after I die." It would be very simple to do. And nobody would be able to have their privacy violated after they die to know when they were vaccinated. There's no interest in doing that.

Commissioner Drysdale

Yes. I wonder how voluntary it was. We had—maybe you want to comment on this—we've had numerous witnesses come forward to us who were fired from their jobs if they didn't disclose, who were kicked out of school, who couldn't go to church.

[01:35:00]

And I question how voluntary their surrendering of that private medical information was. In Canada, in any case.

Stephen Kirsch

Yeah, exactly.

Commissioner Drysdale

We have heard testimony through the last number of days concerning the financing of various public health agencies—the Canadian one, the American one—and we've also heard testimony of how senior officials from all of those health agencies shortly thereafter became employees of the drug companies that they were regulating. Can you make a comment as to what effect you believe that may have had on those agencies being able to carry out their job in protecting the public?

Stephen Kirsch

Yeah, I mean, it's clearly a conflict of interest that is only disclosed of course after they join the drug companies—and who knows what happened before that. Scott Gottlieb is a pretty good example here. He's appointed the head of the FDA and then he leaves there and goes to Pfizer.

And it's a little bit hard to say, "What are you going to do in the future?" And to say, "Well, that's a conflict." Maybe it should be that if you serve the public, that you can't go and work for a drug company for some period of time. Or be paid or be compensated by a drug— But any kind of thing that you do they'll figure out a way around it. Five years or 10 years you can't work for a drug company, then the drug company will say, "Hey, in 10 years, we're going to guarantee you a payment." And they sign a secret agreement. So I think it's difficult to control.

I think you need to just be really careful about hiring people and really understand where their hearts are. One way to find out of course is to look at their behavior prior to when you hire them. You know: What did they do during this pandemic? Were they people who were speaking out and saying, "This is wrong?" Were they saying, "We need to make this public health data public?" Were they champions for the public, or were they just going along with the narrative? I think the most important thing when you're appointing these people is to look for these potential conflicts but also really to look at their past behavior and what side of the narrative that they were on. Are they looking for truth? Are they proponents of truth? Are they proponents of transparency? And before they get the job, what are they going to promise to do in that job? Are they going to promise to make the health data more transparent or less transparent? Are they going to make the processes more transparent or less transparent? It's like medical journals. When they retract a paper and I ask them, "Hey, can we see the correspondence for how you retracted this paper?" They say, "we're not obligated to give that to you and it's a secret."

So people who are put into a job should say, "Hey look: when I go into this job, I'm going to create more transparency here and more accountability." It's all about what your promise is going into it. It's like being elected to a public office. What am I going to do? What have I promised to do, right? Accepting a job in a public health agency should be the same way: "I promise to clean up this agency, I promise to make it more transparent," and so forth.

Commissioner Drysdale

Thank you.

Shawn Buckley

There's another question.

Commissioner Kaikkonen

We've all heard the analogy of—they first came for us and then they came for them and then there was no one left but me. I'd like to turn that around on the question of silence. First, in Canada, we saw the citizens silenced. And now the regulatory bodies are being silent or silenced. And I'm not going to suggest that the Ontario College of Surgeons and Physicians is being silenced, either by dictate or voluntarily, but I'm just wondering: If we wait long enough, will we eventually understand who is pulling the strings because of who is no longer left to be silenced?

Stephen Kirsch

"If we wait long enough." Well, nobody knows the answer to that.

[01:40:00]

You know, there are speculations that there are people pulling the strings and manipulating this. I haven't seen any hard evidence of that. I haven't seen any memos. I haven't seen any smoking guns that indicate this. I think what we have is kind of a perfect storm. We had some research that was done and that research then kind of went awry and kind of escaped or was let out of a lab. Whether it's deliberately or not, there are different points of view on that.

Then of course, I think that most people involved in this, who are just believers of the narrative, believers in vaccines, believers in Tony Fauci when he said vaccines are the way out, even though they weren't. And we have a lot of people who basically were trying to do the right thing and are believing that they are doing the right thing. And they believe that people like me are evil and destructive and are causing people to die. So these are not evil people, they just have different points of view.

And is there a guy at the top who's pulling the strings and making things worse? Well, certainly, Bill Gates has been funding lots of activities that have made things worse for people like me. But is he doing that because he's an evil person and he wants to see people die? Or is he doing it because he believes that vaccines are safe and effective and people like me are bad? I actually—I may be an exception here—but I believe that Bill Gates honestly believes that these vaccines are safe and effective and that he's completely fooled. And he's not looking at the data like he should be.

Therefore, I don't think that the people at the top are these evil people that want to kill people. Because if they were, then this is not the way to do it. This COVID vaccine is not the way to kill people in large numbers. It's a way to kill one out of a thousand people who take the vaccine, but it's not a way to kill people in large numbers. It's a way to create a lot of chronic disease and so forth, but it's not the best way.

And if you were really an evil person pulling the strings on all of this, this is probably not your main plan of attack here, to construct this. It'd be pretty diabolical if you did it. It'd be pretty clever if you did it. But I don't think people are that smart that they could figure all this stuff out. I think this was kind of an accident and one thing led to another. I haven't seen any evidence yet that this thing is— There's some pretty suspicious stuff here. But it's more people wanting to make a buck than people wanting to actually have evil intentions and wanting to kill massive numbers of people.

Commissioner Kaikkonen

And my second question is: We heard testimony from an embalmer that middle-aged women are dying at an increased level, which appears to be consistent with the retracted findings from Skidmore, who says that 51 per cent of the participants are women with a main age of 47. This is a demographic that has not been identified at any point that I can remember throughout COVID, throughout the last three years.

I'm just wondering if you have any insights into why we haven't heard about this in the public's mainstream media or from the health authorities?

Stephen Kirsch

Specifically, the women, I don't know. But it's all lumped into— They don't want to hear about any deaths at all, right? The COVID vaccine has to be safe and effective because the press has promoted it to the public as being safe and effective. And it would be a huge embarrassment to the press to have to admit they were wrong. I think that that has everything to do with it.

The other part of course is that a lot of these media organizations are funded by drug companies and they would lose—or they're worried about losing—ad revenue. So the management is saying, "Let's not run that story."

[01:45:00]

And I know a number of people in media who have left because of that.

But basically, I think that this is not about specifically covering up any particular age group, or male or female. I think it's all about making sure nobody figures out that these vaccines were not as safe and effective as we said. In fact, they're downright dangerous.

The press will do anything it can to make sure that they don't erode the public's trust in the media by telling the truth.

Commissioner Kaikkonen

Thank you.

Shawn Buckley

And there is one more question.

Commissioner DiGregorio

First of all, I'd like to thank you again for appearing and giving us your testimony today. You've spoken quite extensively today about data transparency issues and it's clear based on your presentation that you have spent a considerable amount of time gathering data from all over the world.

I'm just wondering if you can comment a little bit about the access to Canadian health and vaccination data, and perhaps how easy it is and how it may compare to other jurisdictions, and whether there are others who are doing it better?

Stephen Kirsch

Yeah, so the access to health information varies in different places all over the world. I think the U.K. has one of the best systems because of that; people have focused on that. And then they did an analysis showing that the health data from the U.K. was unreliable. And if the health data from the U.K. is unreliable— The U.K. health data is sort of like the gold standard because they're actually giving us vaccination status information. Unlike in the United States of America where we don't have anywhere close to the level of data that we have in the U.K.

I've talked to the CDC. The CDC says, "We don't get the vaccination records from the states."

And I said, “Really, why not?” They said, “Well, there’s no law that compels them to give us the vaccination records.” So I asked the people at the CDC, “Why haven’t you asked them? You could ask them nicely. You could ask Governor Newsom in California to pass a law or to just hand over the records so that you can do your analysis.” And they basically had never asked. They don’t want to know.

Now in Canada, you can go to the Ontario— and I’ve spent the most time looking at the Ontario data. And they’ve done a really, really good job of tracking all these statistics. But as to whether or not you believe them is another story. They certainly don’t publish the death vax records. The most important thing are those records and they don’t publish them. So the health authorities should be asked that question as to why they don’t. But when I ask, I’ve never gotten a response from any of these people challenging their narrative that’s ended up working out. The health authorities in the U.K. or in New Zealand will actually respond to emails, which is good; it’s a first step. And in certain states, they’ll respond to emails. But then when you press them for the details, they stop talking to you.

I haven’t done the pursuit of this to any great extent in Canada. But I’d be surprised if I found an advocate in Canada. In the U.S., there’s only one guy—one health official in the United States of America—that is willing to sort of bend over backwards and try to get the data. And he’s working on that; he hasn’t produced it yet. But it’s very, very rare. I think there are somewhere around 3,000 county health authorities in the U.S. and only one guy.

In Canada, it would be probably by province. And so your chance of finding someone who actually wants to help you and wants to make this data transparent is pretty minimal. I do appreciate all the work, especially in Ontario. They’ve got a great dashboard.

[01:50:00]

They have great visualizations. They’re showing you the data. It’s just that it’s a little bit hard to believe that data is accurate in terms of their counts. I think that, just like the U.K., they’re undercounting the unvaccinated. Which then makes their data suspect.

Because how could it be? I looked at their infection data, and it shows that the unvaccinated are being infected at a higher rate. Well, that differs from the Cleveland Clinic Study. And so when they’re not counting the infections correctly, it’s probably the case that they’re not counting the hospitalizations and death correctly and attributing them to the vaxxed versus the unvaxxed.

That’s why the national polls that people do are extremely interesting. Because if what they’re saying is true, it should show up in the polls as well. And the fact that the polls don’t validate what’s been going on is troubling.

But the other thing that I love about Ontario, for example, is they were honest. They did say that these deaths in 2022— The all-cause deaths, which is the most important thing— Because you can miscategorise people as vaccinated or unvaccinated, but you shouldn’t be able to monkey with the all-cause deaths. So, I was actually pleasantly surprised when I saw what appears to be a very honest number from Ontario Public Health showing the 39 per cent increase in COVID deaths.

Now that was stunning because usually, they try to figure out a way to hide it to depress the deaths. And in this case, you have some honest data—that looks very honest, that is at odds with the other data. So, what you look for is disparities in the data set that you’ve created. So: “Gosh, guys, if you’re right about the total number of deaths in 2022 versus

2021, then how can you explain all this other data that you show us that claim that the elderly in Ontario are almost 100 per cent vaccinated.” Right?

All the elderly groups—60 and up—almost 100 per cent have at least one shot or two shots. A lot of them are also triple-vaxxed. And those are the people who are dying. And when you have a 39 per cent increase in 2022, those numbers just don’t add up. And that shows that there’s this discrepancy. This doesn’t make sense. And the fact that they’re not willing to talk about it, that none of the public health officials are willing to talk about it, that’s what really makes it interesting.

So I absolutely commend Ontario Public Health for pointing out those numbers. Because usually, when something is bad they’ll cover it up. But they actually put it in their report: very clear, that 39 per cent increase in COVID deaths. So those are the things that you can look at and say, “Okay, now that’s inconsistent and let’s go from there. Let’s have an open discussion.”

But the fact that they won’t have an open discussion is very troubling.

Commissioner DiGregorio

Thank you.

Shawn Buckley

Thank you. I think that’s it for questions. Mr. Kirsch, on behalf of the National Citizens Inquiry, we sincerely thank you for testifying today.

Stephen Kirsch

My pleasure. Thank you very much. Thanks for the opportunity to let people know about this information. I always encourage people to— Please don’t trust me, go and get the evidence yourself. All I’m trying to do here is just highlight the data that’s out there and how that data is inconsistent with what you’re being told. And I’m encouraging people to suspend your beliefs and what you believed in before and just match up the data and see which hypothesis it matches better. Does the data match the safe and effective hypothesis? Or do the data and arguments match the hypothesis that this is not as safe and effective as they said?

Shawn Buckley

Thank you again.

[01:55:00]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 3: Angela Taylor

Full Day 1 Timestamp: 06:26:21–06:59:04

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Dellene Church

Good afternoon. My name is Dellene Church, and I'm a lawyer practicing in a small town in Saskatchewan called Davidson. Good afternoon, Angela.

Angela Taylor

Good afternoon.

Dellene Church

Can you please state your name and spell your first and last name for the record.

Angela Taylor

Angela Taylor, A-N-G-E-L-A T-A-Y-L-O-R.

Dellene Church

Thank you. Angela Taylor, in your testimony here this afternoon, do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Angela Taylor

I do.

Dellene Church

Thank you. Angela, you are an LPN who was working at a seniors' home at the start of the pandemic. And at the time the vaccinations began being given in the seniors' home you were working in you were witness to the effects that those vaccinations had on the senior patients you were caring for. Can you tell the commissioners what you noticed in these seniors after receiving their COVID vaccinations?

Angela Taylor

Okay. Can I read from my sheet? Okay.

First of all, I just want to thank you for doing this Inquiry and giving us a voice to tell our stories. I feel privileged to be chosen to be one of the people included in this Inquiry. I just wish I didn't have so much knowledge and experience from our government's mishandling of COVID. I have been a nurse in a long-term care home facility for over seven years and have been working for the Prince Albert Parkland Health Region for almost 20 years.

I saw firsthand how the lockdowns affected the mental health of my residents. So many of them gave up wanting to live. They weren't able to see their family members or friends for so long. They gave up. Then came the good old vaccine. Twenty-nine out of the 30 residents received them. Within 24 hours many of the residents had side effects such as increased heart rates and pulses—not just a little high, but life-threatening high.

We had to call some of the family members to come, which they hadn't been able to see since we were locked down, because we didn't know if they were going to make it. One of our residents, who was the best-functioning resident there prior to the vaccine, went downhill to the point where she could not walk, talk, feed herself, or even hold a cup. She ended up in a Broda chair, not able to enjoy life, and passed shortly.

The next thing I noticed is that the disease processes sped up, like, three-fold, and they have never rebounded. So, the three-fold that I'm talking about is: If they had dementia before they were admitted into the long-term care it sped up so fast that they didn't know anything anymore. Or if they had Parkinson's, it totally crippled them. Or if they had Huntington's, it went faster and faster. Or cancer—it sped up the cancer rate as well.

I must add that I never wanted these. I was not in favour of them and I did not administer these vaccine injections. I did not want that blood on my hands. After working three or four of the vaccines—I don't know how my shifts always landed on the boosters—I finally went to my boss and said, "I do not want to work up to two weeks after their vaccines, because I don't want to phone family members. I don't want that on my hands." It was terrible. I can't even explain what I saw.

Dellene Church

Angela, can you tell us a bit about then what transpired as far as your job requirements that it became mandatory for you to be vaccinated?

Angela Taylor

It was after the first month that the residents were vaxxed, we were told that we were having to start to get vaxxed as employees of SHA [Saskatchewan Health Authority]. And after what I saw, I knew for a fact that I didn't want this vax.

I'm not pro-vax. I'm not an anti-vaxxer, I mean: I've had all my vaccines, even ones that I needed to get to be a nurse. And when I went traveling, I've had to get vaccines. Like, I'm not saying that I don't agree in vaccines. But I started researching. And I'm guessing you guys have been told that, when you get medication, you usually have a little pamphlet in there. The vaccines didn't have a pamphlet. And we kept being told it was for our health and for our residents and whatever. And I researched myself and I didn't like what I was seeing. And I didn't want the mRNA vaccine and I didn't want aborted fetuses. And I have really lots of allergies.

[00:05:00]

And I was concerned for my health because I have lots of allergies. I tried to get my doctor to give me a medical exemption for my allergies because I can't even take lots of antibiotics. I couldn't get an exemption because Dr. Shahab, the Chief Medical Officer, said that they weren't allowed to give out exemptions. So then I tried a religious exemption. And SHA wouldn't accept my religious exemption either.

I ended up getting the Johnson & Johnson vaccine on March the 23rd because the due date was December 1st. And I only had, like, a week left before I either had to change careers or whatever, kind of thing. So I ended up going in and getting my vaccine. And yeah, it wasn't a good thing.

Dellene Church

So after taking your vaccine, you had some serious health concerns. Can you tell us about that?

Angela Taylor

Yeah. About three weeks after I had my vaccine, one night I had heart attack symptoms. And I took myself to the hospital and I kept saying "I just received my vax three weeks ago. I've got high allergies." To this day, which is just about two years now, I've got this electrical current that goes from the top of my heart up into my neck and down my arm. Since this all took place, I can't sleep on my left side.

I have had so many tests. So many times, going to the hospital to see doctors that don't even— They just want to COVID swab me just to make sure I don't have COVID; they don't want anything to do with the adverse reactions or anything like that. I've tried. I've gone to a cardiologist. I've been sent to him, but he wrote me off at the end of December because he told me it wasn't my heart. But nobody can come up with a diagnosis.

My health and overall, it's not good. I can sleep 24 hours a day. I am lethargic, which means I just don't have the energy. Yeah. I was not like this two years ago before I had my vaccine. I used to work crazy shifts. I live a block from the nursing home and I would get called and I would be doing 12-hour shifts and then be on call all night and then doing another 12-hour shift. Being on call all night, do another 12-hour shift. I did those countless times. I used to be able to do more than I can do now.

Dellene Church

And are your symptoms still being investigated by anyone?

Angela Taylor

No. They basically wrote me off. At the beginning they told me to see a massage therapist and chiropractor, because they figured it must be some kind of a muscle or whatever. I did that for two, three months and then I went back. My nurse practitioner retired and I saw my new nurse practitioner. And she called the cardiologist on call in P.A. [Prince Albert], and I went directly there to do a stress test, an ECG, and blood work and all that.

And I actually had a friend who is an emergency doctor in Prince Albert. And I asked him if he would kindly put myself at ease and do a D-dimer test. And that's when they found out

that I actually had above D-dimer. I had a blood clot somewhere. My friend was, like, "Angie I don't know what I can do because I shouldn't send you home, but the CT machine is down. I know you're on an aspirin a day. I should give you Tinzaparin, which is a blood thinner. I don't feel good about letting you go home, because if you die it's kind of on me." I said to him, "I'll be back here at 7 in the morning." Because he knew I lived 45 minutes out of town from Prince Albert and he just didn't feel good about that. But when I had the CT scan, they only did my heart and my lungs. They didn't do my limbs. And I had been telling the doctors that I had, like, a charley horse in my arm. And eventually, after a couple months of aspirin a day my charley horse disappeared, which I'm guessing was a blood clot.

Dellene Church

Did any of the doctors you saw mention COVID? Ask you if you'd had the vaccine, how far ahead you'd had it?

Angela Taylor

They wanted me to get my second and third shot because the Johnson & Johnson was a one-shot. And I said "No, absolutely not." I said "I know I've got an injury from the vaccine that nobody will even touch me on."

[00:10:00]

They just wanted to give me another COVID shot because it was a Johnson & Johnson, it wasn't Pfizer or Moderna. And they wanted to give me a COVID swab because I probably had COVID that I didn't know about.

Dellene Church

So there was no connection made by any healthcare that possibly this was a vaccine injury?

Angela Taylor

No.

Dellene Church

Or that if you considered it to be one, what you could do about that?

Angela Taylor

No.

Dellene Church

Okay. So you also had some effects in your family from COVID restrictions and mandates. Your husband, children, parents, and your mother-in-law were all affected. Can you briefly tell us about that?

Angela Taylor

Yeah. At our school—it's a public school in Kinistino—I have to sign a form saying that they can get their picture taken. But when the health vaccines rolled out in our school systems,

they did not need parents' signature anymore. And with the peer pressure and all that we pulled our two kids out of public school and we home schooled our 16-year-old and 14-year-old now. They had to quit playing sports because they weren't allowed to.

And then my 22-year-old daughter was going to university in Regina. She was in her third year of social work and she had to drop out because she didn't like online learning. And then because of the vaccine mandates, she couldn't go to school.

My son got married. He's 26 and he could only have 30 people at his wedding.

My mother-in-law— I just want to read this because I don't want to mess this up:

"My mother-in-law got COVID and, to make a long story short, she passed away after getting pneumonia. But the doctors and the nurses wanted to vax her right up until her death. Plus, they treated us like second-class citizens for not having been vaxxed or not having the boosters. It was awful.

We were in the city visiting her and they told us that, 'we may have to put her on a ventilator in a while,' but it wasn't urgent. They suggested that we go somewhere and discuss this as a family, and they assured us that they would let us know before they did anything. We returned from lunch to find her in an induced coma and already ventilated and she never regained consciousness again. They did this while we were gone and her own kids never got a chance to say goodbye to her. Her last words to the nurse were, 'Tell my family I love them.'

They were flippantly passed by the uncaring nurses that told us that they would call before they hooked her up, and then they made her do it alone when we were there at the restaurant less than 10 minutes away. The nurse on the phone had our numbers, and—"

I've told my husband to request her medical records because I'm pretty sure that they did a whole lot of things that they shouldn't have done. Because, for one, she was unvaxxed and she never did want to be vaxxed. So I'm pretty sure they gave her Remdesivir and a bunch of other things. And they had her prone. And everything that I read that you're not supposed to do, they did.

Dellene Church

Okay. And your parents: They also suffered vaccine injuries?

Angela Taylor

Yes, my parents are elderly and they have a winter home in Yuma. They couldn't get across the border so they decided to get vaxxed so they could go to their winter home. My dad has a lot of health things that go wrong with him because of his back and his neck. But when he's over in Yuma, he doesn't need a walker at all. He's really good over there.

Anyways, my dad had a stroke a few months after they were down in Arizona. And then my mom: she started doctoring and ended up in the emergency room down there. To this date, she can't find a doctor to listen to her. It happened a few months after her Pfizer vaccine—her second one so she could go to the States. Her hands are contractured and she can't hold cups or bake or any of that stuff. And she can't cut her food. When she comes to our restaurant, I have to cut her food for her sometimes because she just can't do the motion.

She's 73 years old and she was in perfect health. It was my dad that had the health problems, that's why they were going to the States. And she can't find any doctors to admit that it's a vaccine injury either.

Dellene Church

Okay. And your husband did not vaccinate and lost his job.

Angela Taylor

Well, he didn't lose his job. He was working for a farming dealership for 19 years.

[00:15:00]

He was on the set-up and work crew, kind of thing. He couldn't go to Manitoba, and he couldn't eat in restaurants, and he couldn't go in to set up at the shows and stuff. The first show he went to they made him swab so he could enter the building to set up. But the second show he went to they wouldn't allow that. You either had to be vaxxed or you couldn't go in.

And he was to the point where he was just kind of emotionally spent. He just didn't enjoy his job anymore. And then with him and I talking about how everything was so wrong because of my nurse and my HIPAA— I know that unless you are my patient and you have AIDS or HEP or something, and you're, like, having a baby or something that it's going to affect me, I don't get to know your health information.

And I said, "I don't need to go to Tim Hortons and tell them I'm vaxxed or not vaxxed to get a donut." That's so illegal. So my husband and I discussed it and we prayed about it and we actually opened up a restaurant in Kinisto for the unvaxxed, because it was illegal. And thanks to Tony Wells— We went to Tisdale, to one of her Action4Canada things to find out what our legal rights were as a business owner. Because we're not businesspeople, I'm a nurse and he worked for a farming dealership because he loves the farm life.

Dellene Church

And one other point I think you should talk about is your experience visiting the Regina legislature and how you were received there.

Angela Taylor

Yeah, thanks to Nadine Wilson, the MLA—she's not my MLA, but she listened to me—she let us go to the Legislative Building. I believe it was the second week of December or something like that. And she told us after the fact— They did their legislative thing. She said in her 21 or 22 years of being an MLA, she has never seen where the person we wanted to see refused to see us.

Everett Hindley, Minister of Rural and Remote Health— If you go back and you watch that, you'll be so appalled. I came out of there wanting to run for an MLA because it was worse than watching kindergarten kids. He kept telling Nadine Wilson to go do another election to see if she could win a seat. It was childish. There were so many of us there. There was eight to ten or twelve of us there, and he didn't care about our vaccine injuries or how it affected us.

There was a lady that I met there and her and her son just about died six days apart. Yeah, the testimonies that we shared amongst ourselves: it was amazing that we're alive. And I said to my husband, "if I die from a heart attack, I want you to pay for an autopsy." Because I know it's the vax. And I have four kids and a grandchild and I know that it's my health.

Dellene Church

And did the Minister ever speak to you?

Angela Taylor

He gave us 15 minutes of his time because he had another commitment. And he was just doing it for the politics. He really didn't give a crap about any of us.

Dellene Church

So no guidance as to what you could do about—?

Angela Taylor

No guidance. He's never phoned any of us. He has all of our statements. He's got our phone numbers. Yeah, he doesn't care.

Dellene Church

Okay. What do you think our government could have done differently to have avoided the negatives that you've seen?

Angela Taylor

We need a whole new government. Everybody's there for themselves and their money and their own gain. They don't care about the little old people. They don't care about any of us. The lockdowns hurt so many people. My mother-in-law said that she would never, ever live through another lockdown because her kids were too scared to come to see her.

It should be: if you want to be vaxxed, go ahead. Go crazy. But it shouldn't be mandatory.

I wrote many letters advocating for my residents, to SHA, to Scott Moe, to Justin Trudeau. I never heard back from anybody. And it was illegal, what we did to those old people. We had to wear masks and we weren't allowed to touch them unless we were changing their diapers.

[00:20:00]

That's not quality of life, especially when you don't have a great end of life. It's so heartbreaking.

Dellene Church

Do the commissioners have any questions?

Commissioner Massie

Thank you very much for your testimony. I can see you have a lot of notes that you've taken. Would you agree to make that available for the Commission?

Angela Taylor

Yes.

Commissioner Massie

Thank you.

Commissioner Drysdale

Thank you for your courage and your service. I have a question about your vaccine. Your employer brought in a vaccine mandate as I understand it. And you got one injection.

Angela Taylor

Yes, I got the Johnson & Johnson, which is only a one-dose vaccine. And it was supposed to be no mRNA and no aborted fetuses.

Commissioner Drysdale

But were you able to keep your job when you only had one vaccination?

Angela Taylor

Yes, I had to prove that it was a one-dose.

Commissioner Drysdale

Okay. I understand.

I have a couple of questions, along with what was going on in the personal care home that you worked in. We've heard testimony from a number of other people who worked in those homes. Can you tell us a little bit about what the residents' life was like during that time with lockdowns, with no visitation, with staffing, et cetera?

Angela Taylor

It was devastating. They lost the will to live. Like, it was tough. When you go to a nursing home, you have to give up so much of yourself. And they had given up so much. And now they're locked in this home that they can't have their loved ones or grand babies or great-grand babies come to see them. They don't understand FaceTime because that's not the era they lived in.

One gentleman, he was a war vet. And he thought we were trying to kill him because we had to wear masks and we were giving him pills and he didn't have to wear a mask. So he was scared. He didn't even have the strength to get out of his wheelchair, but yet at night he would barricade his door with a dresser because he was scared we were trying to kill him, because he couldn't see our faces. When I had to give him his medication, I had to take my mask off prior to getting to him. And I had to get down on my knees and I had to say what

each pill was for him to trust me. Because he actually thought that I was going to try to kill him.

We had one resident that actually needed a psych consult because she was trying to commit— Like, she wasn't trying to commit suicide; she said she had no reason to live. And we were scared that she would hoard her pills because she was on lots of narcotics for pain. So we had to get her husband to come in to see her. And it's funny because once they saw their family, they spruced right up.

But we had to get that. And then, since we're in a small facility, it's not easy to get psych consults. Then we had to do FaceTime psych consults because the doctors couldn't see patients. I have in my notes that you will read that after the third or fourth vaccine, after I said I would no longer work these shifts anymore up to two weeks, it was also because after that, they didn't want us to submit anything about adverse reactions to the higher-ups. And I said, "Well, I'm charting it in their nursing notes because this is illegal. Because I am seeing heart rates of over 200 beats a minute, and I'm seeing blood pressures like I've never seen before on people that don't have blood pressure issues." You know, I've worked in the long-term care for seven years and I have never seen two strokes in 24 hours. And a few days later those two strokes had both died in 24 hours. I have never seen that in my seven years at that place.

Commissioner Drysdale

What were the staffing levels at your facility like prior to the COVID-19? Did you have shortages of staff? Did you have excess staff? Did you have exactly the right amount of staff prior to the COVID-19?

Angela Taylor

We are always short-staffed so it doesn't really matter—pre-COVID, during COVID, after COVID. But the thing is, people abused the whole sick pay. Because— I'm unionized, so I could say, "I was in contact with somebody, so I might get COVID." And I'd get 12 days paid COVID and I couldn't show up for work.

[00:25:00]

So it was crazy.

And then when we were in contact with somebody, they were down to two nurses so they had to get people from all walks of the SHA to come in and fill those positions. Which was funny, because we couldn't go work in any other facility because we couldn't bring bad germs back into our facility. But then people that were working in emerge., or in Estevan, or Saskatoon: they could come work in our facility because we didn't have the manpower, because we had to stay home for two weeks to make sure we didn't get COVID.

Commissioner Drysdale

What you've described through your testimony is horrific. You're talking about reactions—or alleged reactions—after vaccines. You're talking about people being locked up in their rooms. You're talking about people not having sufficient staff. You're talking about all kinds of things.

In your experience, in that facility, was there any additional government monitoring? Did they come directly to see what was going on in the facility at any time?

Angela Taylor

No. I asked Scott Moe and a few of the MLAs around our area to come and talk to our residents, to listen to what they needed to say. Because that was one of the things that they kept saying to me is, "Nobody asked me what I wanted." They said, "If I wanted to be locked down, I would have did it in my children's homes." Or they said that they would rather die than be locked away in a nursing home where they couldn't even see their family members. We had a husband and wife that could see each other outside of a window. They weren't allowed to touch, kiss, nothing. And yeah. It was illegal, because nobody should be telling them what they can and cannot do as a spouse.

Commissioner Drysdale

My last question is: How did the people administering the vaccinations to the residents ensure that there was informed consent?

Angela Taylor

Their families.

Commissioner Drysdale

And their families were informed of things that you've been hearing about potentials for adverse reactions and the risks and all so that they could actually form informed consent?

Angela Taylor

The first few vaccines everybody was just gung-ho because they thought that they could come in to see their loved ones. But that's not what was going to happen. It was never going to be opened. We just got rid of our masks two weeks ago. Yeah.

It was, say my grandparent left me in charge of their written or their verbal consent. I would say "Oh definitely, vaccinate them." Some of them don't even have contact with their loved ones and they were saying, "Vaccinate them."

And now— Well, there's not very many left from the start of this. But what I noticed also because I worked the first so many, by the second or third time, I said, "Oh, so-and-so will be next in 10 minutes, and so-and-so will be next 10 minutes after that." And they laughed at me. And I said, "No, I have figured this out." And sure enough, I would be running for the blood pressure machines, and I would be running for everything because just as it happened prior, it happened again.

Because it didn't go by alphabetical order, I'd figured that much out. But finally, I had enough and I said to my co-workers— Because we're the only nurses there; I'm the in-charge nurse, I look after 30 residents— I went and I got four charts out and I said, "Look. A-B-C-D: first vaccine. A-B-C-D: second vaccine." It always was the same people in the same sequence. It was crazy. And finally, I said to one family member after the third one: "Are you actually going to vaccinate them again for the next booster? Because look what has happened to them every time." I said, "you got to reconsider this."

Commissioner Drysdale

How many medical doctors were present during the vaccinations of these residents?

Angela Taylor

None. We have a doctor that comes out, maybe, Mondays and Fridays if we're lucky. And he doesn't really like elderly people, so it's not a big concern for him. But we've never had a doctor there. And when we have the adverse reactions, we never send them to a hospital. We just monitor them because it's end of life care.

[00:30:00]

Commissioner Drysdale

So, there were never reports to the CAEFISS [Canadian Adverse Events Following Immunization] System?

Angela Taylor

Well, we would report it to the doctor and he would come and look at them on Monday or Friday. But for myself I did the complete charting in the nurses' notes, plus I did it for the higher-ups, to be sent the reactions. But, like I said, after so many they quit taking any of the—

They didn't care that this was really happening, I don't think. That's my opinion, because I was just— That's when I said, "Do not schedule me for any shifts up to two weeks after." One time I went in as a care aide because all the staff got sick as well, because they were vaccinated the day before. So I went in to work as a care aide, and there was only two care aides and a nurse. And the nurse started getting sick and the other care aide that I was working with had to go home because she got sick.

I saw so many health issues from my colleagues as well and they won't put the thoughts together. Like, there's a cold and I've worked in that facility for the two years and I never did fit an N95 mask. So I was using the nice blue little medical masks. And I went into 13 rooms one time. We had 13 people that had COVID and I never got COVID. The whole time I have worked there, I've never had COVID. And I was wearing my little flimsy mask with my medical gloves and my medical PPE. I was the only nurse, so I had to go in and out of each of those rooms to give their medications and to do any dressings or to do anything, and I never got COVID. I washed my hands with hot water and soap. I did everything I was supposed to do. Everybody that I work with has basically got COVID a couple times.

Commissioner Drysdale

Were there ever any overall staff meetings where you discussed what was going on, and what the reactions you were seeing were, and what the care level was for the residents?

Angela Taylor

No. Because a lot of the people that I work with don't want to admit that the vaccines are wrong.

Commissioner Drysdale

Thank you very much.

Dellene Church

On behalf of National Citizens Inquiry, I'd like to thank you very much for your testimony here today, Angela.

Angela Taylor

Okay, thank you.

[00:32:43]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 4: Ann McCormack

Full Day 1 Timestamp: 06:59:05–07:28:25

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness today is Ann McCormack. Ann, can you please state your full name for the record, spelling your first and last name.

Ann McCormack

My name is Ann McCormack, A-N-N M-C-C-O-R-M-A-C-K.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Ann McCormack

I do.

Shawn Buckley

Now, my understanding is you have a Bachelor's in Pharmacy and Pharmaceutical Science from the University of Alberta.

Ann McCormack

That's correct.

Shawn Buckley

And you practised as a pharmacist for seven years.

Ann McCormack
About seven years, yes.

Shawn Buckley
And then, for family reasons, you let your licence lapse.

Ann McCormack
Right.

Shawn Buckley
But you went back as a pharmacy assistant, unregulated, in May of 2020.

Can I ask you what happened to the previous employee?

Ann McCormack
Oh, sure. I had heard about this job. I was home on the farm and the lady that I had replaced was so afraid of catching COVID that she couldn't come to work anymore. She quit.

Shawn Buckley
Okay. And now, my understanding is that the pharmacy that you were working at was not selected initially to receive the vaccine. Can you explain to us, kind of what happened, and what happened with the pharmacy across the street?

Ann McCormack
Sure, I'll try to. I think it's a large picture where a competition atmosphere was set up so that the vaccines were promoted. But I think it started very early at a federal level, where the federal Conservatives under O'Toole sort of accused the federal Liberals under Trudeau of not being able to obtain any vaccines. And then the trickle down was that, when these doses were finally procured, provinces would then distribute them.

And so early doses of vaccine of all the brands were initially given to drugstores that could handle a high volume based on the previous year's flu vaccines that they were distributing and injecting into people. We were a smaller drugstore and the drugstore across the street had a larger volume. They had a larger square footage, more staff.

And so there became— The managers almost sort of had their nose out of joint that the government actually selected one business over another. As a patient, if you chose to get the vaccine, you couldn't necessarily just go to your regular druggist—especially if you had a date to get across the border, for instance, to Yuma. It really set up a competition and it took the individual's choice of who they went to for their health, I suppose you'd say. It took that choice away from the individual to some degree.

Shawn Buckley
Now, this is a smaller town, am I correct?

Ann McCormack

About 1,400 people. In Alberta too, by the way.

Shawn Buckley

Yes, so I presume that—I imagine it's the same in the city, but more so in a rural environment—the pharmacist gets to know the patient and is familiar with the patient's medical history.

Ann McCormack

Oh, absolutely. That's the best part. I left being a pharmacist for lots of reasons but the only thing that I really, really miss is seeing the same people every day, doing their blood pressure. You know, we call them the senators. All the old gentlemen would go and get their blood pressures done then they'd go for coffee and compare their numbers, right? It's a social thing. It's a wonderful, wonderful set-up. It is a really loving environment. Yes.

Shawn Buckley

Right. But the thing is, with this policy where people have to go to a different pharmacy, they would be going to a pharmacist that does not know their medical history and record. So that pharmacist wouldn't know if there's something contraindicated with taking the vaccine or whether there should be a specific concern.

Ann McCormack

That's true to some degree. To some degree, they're obligated to do some history on that person but you are sort of walking in cold, for sure. I mean, it is much nicer to know a medical history on somebody, yes.

Shawn Buckley

Now, was the incentive structure different for the COVID vaccines than other vaccines?

Ann McCormack

Speaking to Alberta again, I don't know what you'd call it, a traditional vaccine like Measles-Mumps-Rubella or a TWINRIX vaccine for travel,

[00:05:00]

the drug store would bill the provincial insurance company \$13 per dose. That's your dispensing fee. And so for COVID, we billed Alberta Blue Cross \$25 per dose. Nearly double.

Shawn Buckley

Now you were wanting to say some things about informed consent. So I'm hoping— And please take your time with this because as a pharmacist you actually would be the person, back when you were licensed, actually dispensing drugs. So pharmacists are highly trained in what informed consent is. And I think you were here earlier today when Dr. Christian was speaking about the Nuremberg Code and informed consent.

Can you explain to us what basically are the elements of informed consent and why they're important?

Ann McCormack

Well, I'll go back to what Dr. Christian said: It is the absolute bedrock of patient care. It ought to be the bedrock of banking, of every single way we serve one another as humans.

Informed consent in Alberta is: First of all, you must have the capacity to understand the information before you consent. If you are given every reason in the world to do something, to buy something, to inject something, to ingest something, and you still choose not to, that is your prerogative. That is your choice. However, first of all in Alberta, you must be able to have the capacity to form consent and then you may give your consent.

It's a little bit different in Saskatchewan, in that there is a duty to ensure that the information is understood, and also that a signature is not the same thing as informed understanding and consent.

Shawn Buckley

Right. Now, I don't know, what is the legal drinking age in Saskatchewan? Is it 18?

Ann McCormack

Is it 19 in Saskatchewan maybe?

We live near Lloydminster, so we're a border city that straddles Alberta and Saskatchewan. And many of the health mandates that came up, like the legal age to go into a liquor store or whatever, would be dictated by Saskatchewan. However, lottery and that kind of thing, the VLT that you'd play while you're drinking, was dictated by Alberta. So it was crazy, really.

Shawn Buckley

But it's around 18 or 19.

Ann McCormack

Eighteen or nineteen, whatever, yeah.

Shawn Buckley

Okay. It's just, we had some evidence earlier today about: How does a 13-year-old be able to consent? That it's just not possible. So that would speak to the capacity issue that you've raised.

Ann McCormack

Yes. Even the language that is used to explain side effects to a person, it's just being a nice person. It's just being a decent individual, a moral individual, regardless of whether you've taken an oath or not. Explain things in a way that people can understand and try and ensure that it is understood.

Shawn Buckley

Commissioners, I'll just let you know that Ms. McCormack has provided me with a screenshot of the Saskatchewan requirements. But I'm going to ask David if he can pull up my screen, which is the Alberta College of Pharmacy Requirements. And can you speak to us about a sentence there: "Generally, for a patient's consent to medical treatment to be acceptable—" And then there's three concepts.

Can you speak to those and explain those to us?

Ann McCormack

Well, it has to be voluntary. You know that saying about, "No jab, no job?" I mean, that is coercion. If you threaten someone's income or their ability to put food on the table for their children because you haven't taken an injection that either you're not aware of, or not sure of, or have a question about, that is coercion. That is not freely given informed consent.

We've talked a little bit about the capacity to form consent and that the patient must be properly informed. I don't know that even a lot of the health professionals have been properly informed. The way medications are promoted—and doctors are sometimes educated and pharmacists certainly are educated—is through drug reps.

A drug rep usually has a Bachelor of Commerce degree. They don't have medical training.

[00:10:00]

Our conferences and learning opportunities are often sponsored by the drug companies. Wings of hospitals in different countries are sponsored by drug companies.

Shawn Buckley

And as far as informed consent, my understanding is that a person has to understand both the risks—

Ann McCormack

Oh, the risks and the benefits, right.

Shawn Buckley

And the benefits. And then the ingredients.

Ann McCormack

Well, yes, the ingredients. I don't know that you need to learn how to spell "thimerosal" or some of the ingredients that are in a drug. But certainly, at the bare minimum, you must be able to—in some informal way in your mind at least—balance the risk-benefit ratio and make a decision for your very own body. Or that of your child. Or that even of your unborn child.

Shawn Buckley

Now you had some conversations with the pharmacist that was at your pharmacy because eventually, your pharmacy did get the COVID-19 vaccines.

Ann McCormack

Yes. I will say I wasn't employed at that pharmacy much after the first vaccine doses came in. But I would ask questions, "Well, what about informed consent?" Because keep in mind, I had let my licence go many years before and came back to work because I wanted to. And there would be questions— I would say, "Well, what about informed consent?" And from educated—to my mind, very good-hearted people—the answer was things like, "Well, that's the way we do things now." And you could knock me over with a feather. When I asked about things like blood clots for instance— Because it was in the popular press, people wanted to know; they were worried and they wanted to know the answer. "Well, what about blood clots? What do you tell them?" "Well, you can treat blood clots."

That was literally the answer: "You can treat them."

Shawn Buckley

What would the pharmacist do if asked about the long-term safety data by a patient?

Ann McCormack

That's another one that was brushed off. It was to the effect of, "Well, that is how we do things now." One of the pharmacists—again, licensed, experienced, you know, upstanding person in the community—would say, "Well, first of all, there are no long-term safety data. But am I worried about it? No." So you're inserting an opinion in that conversation which, to my mind, ought to be strictly the facts.

Your opinion— I don't know, you guys are the lawyers. If you try to influence somebody with your opinion on a health decision, I think you've overstepped the line as a professional.

Shawn Buckley

I appreciate that you weren't licensed at the time so that you did not give any injections. If you had been licensed, how do you think you would have dealt with this?

Ann McCormack

I would have quit. There is absolutely nothing— I can't think of a situation where I would have prepared a patient and given an injection, firstly, that I had concerns about. If I had concerns about something, I would have sought answers to satisfy my curiosity. And I couldn't have done it. I couldn't have done it.

Shawn Buckley

Now, as things went on—and you already told us that you weren't employed there for much longer after—can you explain for us what happened?

Ann McCormack

Yes. In 2012, we lost our toddler son in an accident on our farm. And so, I just felt when I was wearing masks, because they were mandated, I couldn't breathe. I got grief feelings: you know, a bit anxious and like I couldn't breathe. I did try wearing masks at work but I eventually just couldn't. And my doctor actually wrote me an exemption.

So, I tootled along. By then everybody's putting Plexiglass up and putting alcohol on ballpoint pens to keep the germs off everything. You know, all these crazy things.

Anyway, my husband is 60 years old. And about six months before I lost my job, our 14-year-old son took his own life the weekend before school started. So, we have lost two children and there was absolutely no way that I could wear a mask.

[00:15:00]

You know, just the feeling of claustrophobia and whatever. And I say that as if I'm putting a label of mental illness on myself. I don't think that that is, I think that that's a very normal reaction given our circumstances. I suspect that it would be mentally ill not to react to the deaths of your two sons and to be able to wear a mask and all this confining stuff.

Anyway, my husband is 60 years old. One day when I was not wearing a mask at the store, I went to help a customer who was his high school bus driver from 45 years ago. Who said, "Get your mask on," or whatever. And I said, 'Well, I can go back here or find somebody else to serve you.' Jason Kenney, our premier in Alberta at the time, instituted a "snitch line" so you could phone and report people. And so she used Jason Kenney's snitch line to report me for not wearing a mask.

The health inspector contacted the pharmacy. On April 29, 2021, within 20 minutes—despite coming in early to cover the pharmacy so that my superior could have a private doctor's appointment for 20 minutes and then come back to the drug store—that was the end of my job. I had to go home.

Shawn Buckley

When we were in Winnipeg last week and playing government clips, when they were talking about snitch lines, they used a much more police-state term. They used the term "ambassador," that you would be an ambassador. I think at the NCI we're going to adopt that: "the ambassador." It just kind of has an Orwellian ring to it.

So you lost your job. My understanding is that you filed a complaint with the Alberta Human Rights Commission.

Ann McCormack

Yes. I did it on my own and then I thought, "This is ridiculous. That's not going to get anywhere." For one thing, if you live in a town the size of ours— I knew who had made the complaint against me and I phoned her and asked her why on earth she did that. She said, "Well, I'm sorry, but—" I mean, I don't even know if she's alive anymore. She's got to be close to 90, or over 90.

And then I thought, well, I am going to fight this. This is wrong on so many levels. This makes no sense. And then I did get a lawyer, withdrew my complaint, and he submitted a complaint to the Alberta Human Rights Commission. And I'd also tried to reason with the College of Pharmacy. I said, 'I'm not even a regulated member. Why did I lose my job?' And of course, what they did was put pressure on all pharmacists so that even unregulated cashiers, everybody, would be wearing masks. I don't know what would have happened to my immediate superior if I hadn't worn a mask. So yes, that's been before the Alberta Human Rights Commission. It will be two years in just a few days.

We had a conciliation meeting to try and work things out—which was not successful at all—in which my lawyer had presence of mind to ask before the Zoom meeting started, because the other party was a little bit late joining, if there was a bias against people like me. “People like me.” And this young fellow from the Human Rights Commission who was sort of mediating this negotiation, or was supposed to be, he admitted. He laughed, he said, “Yeah, well, I guess I have to admit that, yes, we do have a bias against you.”

Shawn Buckley

Interesting. Now, my understanding is you filed almost two years ago and the importance of that is: You haven’t had a decision yet, number one. And two, your two-year limitation to start court proceedings is just about to run out.

Ann McCormack

Yes, it is. And my lawyer has written two letters to the Human Rights Commission. I think it’s probably about the same across the country but this is of course to the Alberta Human Rights Commission. One last October 28th, saying, you know, “I’m seeing other cases go by.” He’s got five of us within the province of Alberta who have expert testimony and legal representation. “Why aren’t my cases being looked at? Why are tribunals not looking at my people, my specific people, at the Alberta Human Rights Commission?”

He just wrote another letter just a few days ago, six months later [Exhibit SA-6b].

Shawn Buckley

I think that was April 14th. Your lawyer is James Kitchen?

Ann McCormack

Yes.

Shawn Buckley

And he’s coming tomorrow to speak. And we’ll file—in fact, we’ve already filed—those letters that he wrote.

[00:20:00]

Just to substantiate, what you’re saying is that they’ve basically been dragging it out for no reason.

Ann McCormack

Yeah. Well, I think the reason is in fact that it times me out, so that they’ve taken my choice to go through the courts away from me. You can’t do it at the same time. If I failed at the Tribunal then maybe I would go through the court proceeding, which would be more expensive and I don’t know if it would be successful or not.

And it doesn’t matter. To me, the fact is that they’ve taken away my chance to advocate for myself, to make my case. It’s so true that justice delayed truly is justice denied.

Shawn Buckley

Right. I have no further questions for you. I'll ask if the commissioners have any questions.

Commissioner Kaikkonen

Thank you for your testimony. I'm just wondering if there was a formal public tendering process for the government choosing which pharmacies would meet the qualifications for giving vaccines to customers.

Ann McCormack

Oh, my! Well, I'm not an expert on that. However, in such an unusual situation to my mind in this country, politicians started naming Shoppers Drug Mart. "Go to Shoppers Drug Mart to get your—" It should be a private business. Why not Guardian Drugs? Why not Apple? And I guess I have seen some coincidences, where Shoppers Drug Mart was bought out by Superstore in about 2013. Owned by Westons. Westons and Trudeaus are pretty good friends. I don't know if that has anything to do with it. I don't know. I haven't read any contracts.

Commissioner Kaikkonen

And also, we heard earlier—I believe from Dr. Christian—that there is an assumption that 13-year-olds are able to understand the benefits and possible reactions to the vax. But presumably the adults dictating that children receive the vax would understand the risks. Did you hear or know of any health professionals that chose not to vax a young person on the basis that that youth might not have the capacity to give consent?

Ann McCormack

I did not witness that, no. However, as a mom of a 14-year-old son who took his own life, I would say that young people probably don't have the greatest judgment. This was absolutely shocking to us. We'd been at home, of course, without school, for months. My son said that this had been the best summer of his life. Okay, the cops are going to get me because we live on a farm and we were not too concerned about all these restrictions. He went boating with his cousins. He could sleep in. You know, he read books, went exploring all over our farm for acres and acres for hours every day, you know, rode his horse, had the dog. I mean, he didn't have to go to school, so he was having a great summer. So, there's an example of a 14-year-old who made a decision that he couldn't undo. And I would suspect that there are lots of teenagers that may make a decision to take a vaccination that you can't undo.

Commissioner Kaikkonen

I'd like to thank you for your testimony and I'm sincerely sorry for your loss. Thank you.

Ann McCormack

Thank you.

Shawn Buckley

And there's still more questions.

Commissioner Drysdale

Thank you for your testimony. Did you witness any of the vaccine injections that were going on in either your drugstore or any other drugstore in your community—like, first-hand witness them?

Ann McCormack

The needle going in the arm? No, I didn't. We have an injection room for privacy for people.

Commissioner Drysdale

Okay. You mentioned that when you questioned the pharmacist about long-term effects, he didn't seem to be concerned with that. Did the pharmacist and then the people around you understand the unique nature of the mRNA vaccines? In other words, this wasn't like a measles vaccine. This was something different. Did they know that?

Ann McCormack

I think so. I think it was in the press. And as I say, I think the political football that it became, like, "We've got to get it! We've got to get it!" Do you remember the competition? It was sort of watching this race to get this vax. There was even different language about it, to get the vaccine out there. Like it was an accelerated pace to get that technology developed, get it into needles, get it into your arm, right? It was a real race.

[00:25:00]

It was a sensationalized thing.

Yeah, so people did know that. As I say, if COVID sprang up in March of 2020— March 17th I think, was sort of the lockdowns in Alberta. School was done for the rest of the year, et cetera. If it was a new disease, surely, surely people must know that if the vaccine was a new technology and only around for six months; there could not possibly be any long-term safety data on it. And if you had that question and you asked it, surely it should have been answered honestly, that we just don't know.

Commissioner Drysdale

I just want to confirm what I thought I heard you say. Did you say that normally the pharmacy would get paid about \$13 per dose for an ordinary vaccine, but that they were paid \$25 a dose for the COVID-19 vaccine—that's almost double?

Ann McCormack

That's correct and that's Alberta. A pharmacist, like maybe Krista Moe— I believe Premier Scott Moe's wife is a pharmacist and they own a drugstore about an hour and a half from Saskatoon, licensed in Saskatchewan, could give you a better answer about Saskatchewan information.

Commissioner Drysdale

Well, Alberta's information is fine. I just want to make sure I understand this. Does that include the cost of the vaccine? In other words—

Ann McCormack

Oh, oh, oh. I'm sorry to interrupt you. Yes, that's a very good question. Sorry. And I believe the other commissioner was maybe trying to get at that.

The expenses around delivering the vaccine for the individual drugstores in Alberta would be the storage requirements in a fridge and whatever personal protective equipment you had to wear—gloves, a mask, whatever. So, I won't say that the vaccines were provided to the drugstores free, because they were provided from the federal government bought with tax dollars, right? So of course, they're not free. But the individual drugstores did not buy them themselves. They had to go to the expense of purchasing gloves and masks but they didn't buy the vaccines.

Commissioner Drysdale

I understand. So, the increased cost may have been somewhat related to them having to buy PPE that they didn't necessarily need to use for, like, a TWINRIX vax.

Ann McCormack

Well, maybe. I think most pharmacists would likely use gloves anyways. Maybe not a mask in the before-times, I guess you'd say, or before COVID. They may or may not wear a mask in close contact with people. I think it was for the extra counselling, maybe, that it took for mRNA injections, to talk to people about them. Probably took more time with this new technology.

Commissioner Drysdale

Extra counselling?

Ann McCormack

Well, pharmacists are required to counsel and make sure there is informed consent and answer questions around it.

In Alberta, I believe the pharmacists were also encouraged to consult their patient lists—so the database that you'd have per patient, which is confidential. And to my mind, that was not breached; I'm not saying that at all. But they were encouraged to contact people that would normally come to their drugstore and make appointments to give the mRNA injections. I don't think that's ever happened—not to my knowledge—in any other situation before.

Commissioner Drysdale

Lust so I'm clear, the pharmacists were cold-calling potential clients and they were using their patient list to do that?

Ann McCormack

Yes. And I believe they were encouraged to do that by the Alberta government.

Commissioner Drysdale

Hmm. Thank you very much.

Shawn Buckley

There being no further questions, Ann, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying today.

Ann McCormack

Thank you all. Thank you.

[00:29:20]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 5: Randolph Schiller

Full Day 1 Timestamp: 07:29:15–07:56:08

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Wayne Lenhardt

Could you give us your full name sir, and spell it for us. And then I'll do the oath with you.

Randolph Schiller

I go by the name of Randy Schiller, but my legal name is Randolph Schiller. R-A-N-D-O-L-P-H S-C-H-I-L-L-E-R.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony?

Randolph Schiller

So help me God, I do.

Wayne Lenhardt

You live in the Weyburn area, is that correct?

Randolph Schiller

That is correct.

Wayne Lenhardt

Okay. Your saga began in what year?

Randolph Schiller

In 2020.

Wayne Lenhardt

Okay. At that point, COVID had come along. The vaccine was being used. You got suspicious. Could you tell us about that?

Randolph Schiller

Yeah. Right from day one in January 2020, when I was watching the news videos from China. When you're seeing some of the people fall dead over in the street, disinfecting the streets, building a hospital in seven days—which to me looked more like prison cells—I questioned the narrative coming out of China. To me, the validity of the virus was not there.

Wayne Lenhardt

So did you get the vaccination?

Randolph Schiller

No.

Wayne Lenhardt

Have you ever gotten it?

Randolph Schiller

No.

Wayne Lenhardt

So what happened next? Did you suffer any financial consequences relating to COVID?

Randolph Schiller

Yes. My employer, Canada Post, had masking mandates. I sought a mask exemption. I eventually got one. Immediately, I was put on short-term disability, which went to long-term disability. And then when Mr. Trudeau removed the masking mandates I could not work, because I was not vaccinated, for about three to four weeks.

Wayne Lenhardt

So at some point, you thought about doing freedom of information requests.

Randolph Schiller

Yes.

Wayne Lenhardt

And when did you do that and to whom?

Randolph Schiller

I first started off with the Holy Family School Board in Weyburn. That would have been in December 2021.

Wayne Lenhardt

Did you have children at that school?

Randolph Schiller

No. No, sir.

Wayne Lenhardt

Okay. I believe you told me that you'd been on the board of that school?

Randolph Schiller

Yes. Previously, back around 2010, I was a trustee for the Holy Family School Division.

Wayne Lenhardt

Okay. So, the Holy Family School Board in Weyburn. And who else did you make requests of?

Randolph Schiller

At the same time, I'd mirrored my FOIA request to the Holy Family—to the Ministry of Education and to the Ministry of Health.

Wayne Lenhardt

Okay. Do you remember generally what it was you asked for?

Randolph Schiller

Yes. I wanted communication between Holy Family School Board and the Ministry of Education. Also, the same thing between Holy Family School Board and the Ministry of Health, or the SHA [Saskatchewan Health Authority].

Wayne Lenhardt

Okay. And so what happened next?

Randolph Schiller

Immediately they took my request. A couple weeks later, I added another FOIA request to the Holy Family School Board. Shortly thereafter, I got a letter in the mail stating that the Holy Family was going with the Saskatchewan School Board Association: they were going to petition the [Saskatchewan Information and] Privacy Commissioner and disregard my request for vexatious statements.

Wayne Lenhardt

Okay. And so that sort of a refusal proceeded through its channels, and then what happened?

Randolph Schiller

I eventually won that case with the Privacy Commissioner. I was lucky enough to have a gentleman sitting with me while I recorded the conversation, proving that I did not utter any vexatious comments.

Wayne Lenhardt

Okay. Now, I gather there's a difference between asking for material from the Ministry of Health. And there is another agency that you can go through as well. So did you get what you wanted from the Ministry of Health and did you have to go elsewhere?

Randolph Schiller

The Ministry of Health came back with those records saying they did not communicate with Holy Family School Division. But I also changed my wording with the Holy Family to go through SHA. SHA did have communication with Holy Family and some of the requests, mostly through the channel of the Weyburn Public Health.

Wayne Lenhardt

Okay. Did you get what you wanted as far as the public health records went?

[00:05:00]

Or was there some other avenue you had to go through?

Randolph Schiller

No, I didn't get everything that I wanted from the health records, that channel. If you're regarding the freedom of information for the Holy Family.

Wayne Lenhardt

Okay. We talked about Panorama records—

Randolph Schiller

Oh, the Panorama record. Okay. I wasn't sure what you were getting at there. Sorry about that.

Late in the fall of 2021, because of the vaccination passports that were coming out, I wanted to block my eHealth records. During my blockage of my eHealth records, I found out that there's also an entity through Public Health called Panorama records. That is controlled by Public Health and it holds all your vaccination status and all those other records. During that time with the Panorama records, I asked for what was on my file. What I did find was some questionable entries regarding COVID. And I challenged the SHA. But in my opinion, those records were fraudulent.

Wayne Lenhardt

Okay. So in other words, you did get some records. You had to fight a bit. Have you gotten all of the records now that you've requested?

Randolph Schiller

No.

Wayne Lenhardt

Okay. And there's still some sort of a dispute going on at the moment. What's happening there?

Randolph Schiller

Well, between the Ministry of Education and the Holy Family, right now I have a request for review with the Privacy Commissioner because the Ministry of Education withheld or redacted much of the records that I sought.

Wayne Lenhardt

Okay.

Randolph Schiller

So I'm asking for a review to have everything unredacted.

Wayne Lenhardt

And you've provided us with all of the FOIP responses that you've gotten to date, which isn't all of it, and they're on this thumb drive.

Randolph Schiller

That is correct.

Wayne Lenhardt

Which is going to be submitted to the Commission to go into their records.

Okay. You haven't done any kind of an analysis of all this documentation, like we've heard from witnesses this morning. But could you give us your general overall view of what you've gotten so far and what you're still hoping to get?

Randolph Schiller

Well, number one is transparency and informed consent. That's always been my goal. That the government is not very transparent in providing records, just from my personal situation.

Wayne Lenhardt

Were the records that you got consistent with what the mandates were at the time?

Randolph Schiller

Could you rephrase that, please?

Wayne Lenhardt

Well, I think you were concerned— For example, we had a discussion previously about masking and whatnot. Did Public Health or the SHA or someone actually mandate the mask? Or was there just a suggestion? And did some other body go ahead and go a little further than, perhaps, the requirements indicated?

Randolph Schiller

I want to say yes, that the Holy Family School Board went above and beyond what I believe was required from the Ministry of Health.

Wayne Lenhardt

Okay. So, let me put it this way then. If you were in charge and you had seen these documents, would you have done the same restrictions and mandates as occurred? Or would you have done things differently?

Randolph Schiller

No, I would not have done all those restrictions. If I was on the Holy Family School Board, I definitely would have not implemented the policies that they did. But my understanding, all school boards were following those directions from the Ministry of Health and the SHA.

Wayne Lenhardt

Did you feel there was any necessity to do what was done that caused you financial harm?

Randolph Schiller

No.

Wayne Lenhardt

Okay. Is there anything else that you would have done differently?

Randolph Schiller

For me, no.

Wayne Lenhardt

At this point, I think I'm going to ask the commissioners if they would like more information.

Randolph Schiller

Would you mind if I give some of my back story? Because I've done 26 FOIPs. So, I was hoping to talk on a few critical ones, if you guys wouldn't mind.

Commissioner Kaikkonen

Go ahead.

Randolph Schiller

I want to enter in the record, as well,

[00:10:00]

I suffer from bad sinuses. Immediately, if I wear a mask, within three minutes my sinuses congest. This has been a chronic problem for ages, and it's been documented in my medical history.

So I started to seek for a mask exemption back when the directives were first coming out with my employer, Canada Post. And the first doctor I went to was in the Weyburn Health Centre, Dr. Erfani. Hopefully I can mention his name; it's too late now. But I asked him for a mask exemption, and this was his quote: My personal health did not matter. It was for the benefit of the public good. I thought that was a pretty profound statement.

During this time, there's a lot of doctors that weren't seeing new patients, so it took me a couple months to get to a second doctor to ask for a mask exemption. His reply—and I'm going to paraphrase—was, "I can give you an exemption for valid medical reasons but if I do, I can no longer practise medicine in Saskatchewan." I thought that was the nature of healthcare in Saskatchewan.

Back when Premier Moe implemented all the mandates in March, I immediately questioned what was happening. During that time, I sent my MLA and the Premier and also the Minister of Health 45 questions that I thought were questions that the media should have been asking but none did. I did not receive a response from any of those three. And at the time I considered my MLA, Dustin Duncan, a friend. I just thought his silence was very profound.

I sent questions to each one of those, three times. None would respond. I sent those same questions to the various departments of the SHA, Saskatchewan Health Authority. They didn't answer my questions either. So needless to say, that was the reason I started to create the FOIPs. I needed to start someplace so that was where I started, with the Holy Family.

But also, I want to discuss: At the same time I was dealing with the Holy Family issues for the disregard, I had sent out three other Freedom of Information requests. One was to the Premier's office, another was to the Ministry of Health, another one was to the Ministry of **Education. I asked if they conducted a cost-benefit analysis before implementing COVID pandemic mandates.**

Within a week, I had a call from the Premier's office. I had a 45-minute conversation with the woman on the other end, and she was seeking clarity to what I was seeking. After 45 minutes, she agreed she understood what I was asking for. Within a week of that phone call, I got an estimate in the mail. On that estimate—it was nearly \$389,000 to provide the records, is what they had estimated. I looked at the estimate closely—\$389,000. I looked at the estimate carefully. The records that they were going to provide at that cost were not the records I asked for. So I pressed them further, and they come back with "no records exist."

The Ministry of Health and the Ministry of Education did the same thing: No records existed. They did not conduct a cost-benefit analysis before implementing their mandates.

I just want to mention, too: It was clear my FOIP requests were going to be a battle, sending lots of reminder emails, because not one of the government institutions were following the 30-day regulations. I should also note that my requests were developed on my personal time and I bore the brunt of these costs. Meanwhile, our government institutions were using employees' time and taxpayer dollars to delay any responses for my questions.

When I was going over the Holy Family records, this is what I found interesting as well. The school boards and schools were agents of the SHA.

[00:15:00]

They were purposely sharing misinformation and promoting fear, from the documents that I was reading. During this time when I was reviewing those records, I was also reading clinical studies from the pharmaceutical companies, and I was going through the SHA website. And what I found was profound. The SHA website was saying that everything was—the vaccines were safe, especially for pregnant women. But the clinical studies weren't saying that.

What was interesting is that I found a site called BASE Learning for COVID-19 Immunization. On this website, it was an online course. And at the end of it you were legally able to give someone—well, I'm just going to say, "the jab" for COVID-19. What I found profound about it: the SHA website, like I said, everything was safe. This course laid out a few of the adverse events that could come from the COVID-19 mRNA drug. But they were still not as close to what the clinical studies were showing.

I just want to add again that the Ministry of Education is still withholding my information, and I've got a review for request within the Privacy Commissioner to have all that material unredacted.

Now back to mid to late June of 2022, after a six-month battle with the Ministry of Health, I finally received records where I asked the question: Could you please provide—I'm going to paraphrase here—all the adverse events for the year 2021 from the COVID vaccine? I asked a similar question to SHA. And I need to read this just so I don't get it wrong: "The SHA is not refusing to provide this information. We are not holders of this information." Which I thought was a profound statement. The SHA is our health authority and they were not documenting the adverse events occurring from the COVID drugs or immunization.

But anyways, back to the Ministry of Health. In late June, I finally received my adverse events records, HE 123-22G. After a quick read, I knew that the document was damaging. It was 122 pages and it involved over 1,200 Saskatchewan people. I immediately sent this information off to SASK ALLIANCE because they had a team of well-known doctors, lab technicians, nurses, and university professors that could actually look at the data too, and hopefully interpret it the same as I did. About three weeks after they were given this material, it was released to the media, and they found the same thing that I found. Out of over 1,200 individuals, 7 people had died in Saskatchewan; 300 people had a severe adverse event and were told to get a second shot. The report didn't tell the entire story.

I'll go on to a different point here, to save some time. That media release for those adverse events, for HE 123-22G, came at the same time as the Carol Pearce tragedy here in Saskatoon. Because of that information, along with the tragedy, it garnered international

attention. But right after that CKOM published an article that stated: according to the Ministry of Health, there was no adverse deaths from the vaccines, the COVID vaccines. I knew that to be a blatant lie. So I contacted CKOM. I provided them with my original FOIP along with the document that I got from the Ministry of Health. And I proved to them that there were seven deaths already in the year 2021. Sarah Mills from CKOM gave me a brush off. This is what she said:

[00:20:00]

“Thank you for the information. If you have autopsy results, we would certainly welcome them. Sarah.” CKOM did alter their original article, but it did not go far enough to absolve the lies that came out of the Ministry of Health.

During this same time, I had sent off a Freedom of Information request to the SHA. This is where I asked for records of accuracy concerning PCR testing. This was a long battle. Every month I had to send every other government entity reminders that I was waiting for the material.

I also, at the same time, sent in a FOIP regarding chain of custody for DNA after a PCR testing. Because I was hearing rumours and reading material online that showed that DNA was being sold to other companies after they were tested for COVID. Unfortunately, because of my busy schedule, I let that one lapse. I wish I hadn't.

But finally, in the fall of 2022, the SHA finally provided the records for the PCR Freedom of Information request.

This is the response that I got for the PCR accuracy portion: “The information you are requesting above had not been provided as the SHA is not obligated to create a record in order to respond to access of information request. As you are requesting information, rather than records, this portion of your request has been denied as previous record was not created for a business purpose.”

I thought that was a pretty convoluted statement. I pressured them more on that, and they've come back to me: “no records exist.” SHA's “gold standard” has no records to prove the validity of their testing. I've also sent to the Privacy Commissioner a request for review for that one, because I've been looking for more records for that one as well.

To date, I've done 26 Freedom of Information requests. I've also helped write some for other individuals. Incidentally, one is a federal doctor. Some have been nurses; some have been teachers. And at the moment, I have won three decisions with the Office of the Privacy Commissioner. I've got two filings under review with the Privacy Commissioner with two more being sent out this next weekend. And I'll be drafting two more as well to the Privacy Commissioner regarding my Freedom of Information request, just because the government and our local authorities are not providing the material.

Thank you.

Wayne Lenhardt

Okay, are there any questions from the commissioners?

Commissioner Kaikkonen

Can you clarify that in Saskatchewan there is a response time, a legislative response time, for those requests to be returned to you with information?

Randolph Schiller

Thirty days. There is a flow chart that they go by, but it should be 30 days.

Commissioner Kaikkonen

But it is 30 days. Okay, thank you.

And then I just wanted to ask about— You made a comment, and I hope I got this right, that Holy Family School Board went above and beyond what was required by the Saskatchewan Health Authority. Can you provide us with an example?

And also, from all of your research, who do you think was responsible for going over and above the provincial mandates? Would that be the Minister of Education, the school board, the superintendents and director, or the school board trustees, or the principals—the administrators? I know the list is long, but I'm just wondering, is there anybody that you have been able to find that would be responsible for making those decisions that go above and beyond the provincial mandates?

Randolph Schiller

That I have not found out. But I can only say that, to me, would be the Director of Education. But it also falls down to the trustees. They are the ones that are directing.

Commissioner Kaikkonen

And you were a trustee, previously?

Randolph Schiller

No, I'm not a trustee currently.

Commissioner Kaikkonen

No, but previously? Did I get that right?

Randolph Schiller

Yeah, previously. Yep.

Commissioner Kaikkonen

So, when you were a trustee, have you ever seen an example of when the school board would make a decision that would go above and beyond some provincial-legislated matter?

Randolph Schiller

During my term, no.

Commissioner Kaikkonen

Thank you very much.

Wayne Lenhardt

Go ahead.

[00:25:00]

Commissioner DiGregorio

Thank you so much for coming today and sharing this with us. I'm hoping you can help me understand a little bit better about the process, particularly when you get a response to one of your Freedom of Information requests and you think that it either doesn't have sufficient records or, I think you mentioned, that sometimes they came back redacted.

What's the process you go through then to try and appeal that?

Randolph Schiller

Well, it depends on what you're looking for. If I see a person's name that's redacted, I'm fine with that. Or their physical address where they reside, I have no problem with that. Or their personal health information, I have no problem with that. That should be redacted. But when they withhold pages, that's where I have a problem.

Commissioner DiGregorio

Okay and so do you make an application, I think you said, to the Privacy Commissioner? How does that work?

Randolph Schiller

Yes, it depends on the battle that you want to fight. If you want to continue the battle, you go to the Privacy Commissioner to have a request for review. What I do is I lay out my arguments, why I want those records. Then you wait for the Privacy Commissioner to make their decision, and then they'll get back to you. And also, if you disagree with the Privacy Commissioner, you can actually take them to court. But that process I hopefully don't have to do. Hopefully, I continue to win.

Commissioner DiGregorio

Okay. And do you get a hearing from the Privacy Commissioner or just written submissions?

Randolph Schiller

No, it's all written.

Commissioner DiGregorio

Okay, thank you.

Wayne Lenhardt

Okay. And anything else from the commissioners? Okay, on behalf of the National Citizens Inquiry, thank you very much for your testimony today.

Randolph Schiller

Thank you very much for allowing me your time.

[0026:53]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 6: Mark Friesen

Full Day 1 Timestamp: 07:56:15–08:38:40

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Dellene Church

Our next witness will be Mark Friesen. Good afternoon, Mark.

Mark Friesen

Good afternoon.

Dellene Church

Can I get you to state your name and spell your first and last name for the record?

Mark Friesen

Mark Friesen, M-A-R-K F-R-I-E-S-E-N.

Dellene Church

Thank you. Mark Friesen, in your testimony here today, do you swear to tell the truth, the whole truth, and nothing but the truth so help you God?

Mark Friesen

I do.

Dellene Church

Thank you. Now Mark, from the start of the pandemic, you were active in protesting government mask and vaccine mandates and restrictions. As a result of that, you received several fines. You later contracted COVID and were hospitalized in Saskatchewan and eventually transferred out of province to a hospital in Ontario. You have serious concerns over the medical treatment you received in Saskatchewan and the reason behind your transfer out of province.

Can you tell us about your experiences with that hospitalization?

Mark Friesen

Yeah, so my story really starts in June of 2020 when we first started protesting what we knew was coming and that was mandates and restrictions and limitations on our Charter rights and freedoms. We initiated protests well in advance of Saskatchewan implementing those mandates and restrictions, in June of 2020. Because we knew that they were coming. There was indications from other parts of the world that showed that rights and freedoms that generally are taken for granted were being trampled on in other countries. We saw that that was probably going to come here as well, and to our province as well.

So, we initiated the protests. I sort of came to the forefront of this movement in Saskatchewan as an organizer, a promoter of these events across the province. I think I was viewed as quite a thorn in the side to our government. My whole life, I have defended the *Charter of Rights and Freedoms* and inalienable rights that I consider to be God-given. And that's how I approached this situation that was coming and being imposed upon us. That these rights that are enshrined in our *Charter of Rights and Freedoms* should be inalienable and should be recognized as such, because that's how I recognized them. And there's a lot of people in this province that also recognized their rights as inalienable. Unfortunately, our government didn't see that, as our rights being inalienable. And there's a reason for that.

In our system for 150-plus years, the supremacy and sovereignty is given to Parliament and to the provincial governments. Nowhere in our Constitution does it mention "we the people," or does it talk about inalienable God-given rights. And there's a reason they're able to subvert what we've taken for granted for so many years of our lives. Because again, that supremacy and that sovereignty rests in Parliament and to the provincial governments. So while we were gathering and while I was promoting these events and hoping for mass numbers to show up in protest and in opposition of what the government was doing in regard to our rights and freedoms, it was important for us to exercise those rights and those freedoms—like gathering, for example.

There was a mandate and a restriction put forward and a limitation to our Charter right to gather.

[00:05:00]

There was a limitation put on that in Saskatchewan, where we couldn't gather with more than 30 people. It was later reduced that we couldn't gather with more than 10 people outside. There's actually admitted by a prosecutor in this province— When they dismissed three people's tickets, the prosecutor admitted to them that the province doesn't have any evidence to back up that limitation or that mandate. Now very clearly written— In section 1 of the *Charter of Rights and Freedoms*, it states very clearly that any government that wishes to limit our rights and freedoms must justify, demonstrably justify, those limitations. And to my knowledge, there isn't one government in this country that has demonstrably justified those limitations.

So I thought it was important that we continue with this protest movement, this freedom movement, to exercise our inalienable rights. And in that, because I was seen as one of the mouthpieces in this province and one that has a shark-infested mouth, the focus was put on me—myself and other organizers in the province. In Regina, I got 11 tickets, each worth

\$2,800. Because I was simply exercising my right under the Charter to gather and to associate and to express myself freely.

Dellene Church

And Mark, have those tickets been dealt with at this point or still in the courts?

Mark Friesen

Yeah, so they're still within the court process; they're under appeal. In a lot of cases, these tickets were increased from what was identified on the ticket. Most of them were worth \$2,800. But there's been judges that have increased the fines to all of these tickets. In most cases, they were increased to five, six. There was a prosecutor that requested \$14,000 for one of these tickets when I was simply exercising my right, clearly guaranteed, quote-unquote, under the *Charter of Rights and Freedoms*.

Dellene Church

Okay. So Mark, after this process where you've been very involved and public, you contract COVID.

Mark Friesen

Yes. So, I ran in the federal election under the banner of the PPC [People's Party of Canada] in September—third week of September 2021. After, we had an election evening here in Saskatoon with the federal party and with Maxime Bernier. At that event it was interesting because while the venue was filling up, we noticed that there was no air circulation in the venue. We thought that was a little bit strange, so we went and discussed this with the manager who was on that shift. And she had said, "Sorry, there's nothing we can do about this. There's no maintenance on staff. We can't turn the air on." I found that a little strange. And then as it turned out, a number of people got sick that evening, myself included.

So my story is a little interesting because after that evening, I did feel a little punky. But I really didn't have any symptoms. So I sort of dismissed a lot of what I was going through. I just chalked it up as, I just got off a campaign; I'm exhausted; I'm just going to sleep this week and get caught up on some rest. At the same time, my wife was showing symptoms. So she got quite sick, a lot sicker than I did. And then I woke up the morning of the seventh day after the election,

[00:10:00]

and I walked from my bedroom to the bathroom. It's about 10 feet. And I just about hit the floor. I couldn't breathe. So at that point, I basically told myself I'm going to be fine; everything's going to be no problem. I went downstairs. I got in my cave, and that's where I spent the remainder of the day. Now, at that time, we still had some ivermectin and some HCQ, which I tried to give myself, obviously too late. And then by 8 o'clock in the evening, I literally crawled upstairs, struggling to breathe, informed my wife that, "I can't breathe, I got to call an ambulance." So that's what I did.

The ambulance showed up, took my oxygen. It was at 70, which is quite low. And off to the hospital I went. When I got to the hospital, I don't remember too much of the first three days I was there; I was doing a lot of sleeping. But I was really struggling to breathe. I remember the doctor coming in every day and asking me when I would give them

permission to put me on a ventilator. And I kept telling him to get stuffed, “I’m not going on your ventilator because that seems to me to be a death sentence.” So I refused that for the first three days. Then I woke up on the fourth day. I had two prongs on my nose, a mask on my face trying to drive some oxygen into my system.

The doctor came in on that fourth morning, about 11 o’clock, and asked me what we’re doing. And I said, “Well, I’m either going to suffocate in this bed or I’m going to die on your ventilator. Those are my choices.” So off to the ventilator I went. Immediately, after being put into a coma, my heart rate went to 260 beats per minute. They had to shut my heart off. It took them three times to get it going again. They just about lost me right off the hop.

Initially, those first three days that I spent, there was no treatment given. And I was aware at that time that ivermectin and HCQ were early effective treatments for this disease, this virus.

Dellene Church

So Mark, are you saying in the first three days before you were put on the ventilator, you were receiving no medical intervention? You were just in a hospital situation?

Mark Friesen

I was basically left there to suffocate. I found out later that while I was in the coma, they did start some antibiotic treatment for my lung infection. They also discovered on my lungs three orange-sized blood clots.

And the evidence behind what the world has gone through seems to suggest that this virus was manufactured and released on the masses. Somebody needs to be held accountable for that.

As I went through this first seven or eight days of being in a coma and just about dying and discovering these blood clots—

[00:15:00]

It was around the eighth day. My wife would get notified by health care staff as to my condition, regular sort of daily updates. But on this occasion, she was contacted by a doctor, the doctor who was in charge of my care. And the doctor was very truthful with my wife. And he said to my wife that somebody way above his pay grade “has decided to put your husband on a transfer list to Ontario.” And in his words, “Your husband is in no condition to transfer across the hall, never mind in a plane at 30,000 feet.” So my wife then asked him, “Doctor, why would they do this?”

I get a little emotional at this point, trying to understand what my wife is going through at that moment. Because she’s also very sick and wondering if this is the treatment she’s going to receive.

Dellene Church

And were they asking for her consent to this transfer?

Mark Friesen

No. He simply stated, "This has nothing to do with his health," and in his opinion, "everything to do with his politics." So my wife took that to mean that the Government of Saskatchewan is trying to kill her husband. How else is she supposed to take that? When the doctor says, "This has nothing to do with his health. Transferring him is the last thing they should be doing."

Dellene Church

So despite all of that, your transfer goes ahead.

Mark Friesen

Yeah, my transfer does go ahead. I survived the flight, obviously, through the grace of God. Got to Mount Sinai Hospital. I was put under the care of a world-renowned lung doctor who immediately put me on the strongest antibiotic they have, called meropenem. I had my advocate with me, a gentleman by the name of Sean Taylor, who was an emergency nurse in the B.C. healthcare system, who was fired because he was telling too much truth through his political campaign. So they fired him; so he had some time on his hands. And luckily for me, he was in my corner. His mouth is just as shark-infested as mine. I had the right guy with me. He ensured that all the care that I should have been receiving was happening. And it was. I have to hand it to the doctors and the health care staff at Mount Sinai Hospital in Toronto. As Sean puts it, the attitude was 180 degrees different than it was in Saskatoon.

Dellene Church

Was there any comments made at that hospital as to why you weren't receiving that treatment right away in Saskatchewan?

Mark Friesen

Not that I'm aware of. I don't know if those discussions had happened; I would have to check with Sean. I don't know, I can only assume, and I'm only left to assume. But that was basically the starting point to my recovery. I ended up being in a coma for five weeks. At the end of my time in Toronto, they struggled to wake me up because I kept fighting with the ventilator. And I wouldn't agree with my breathing. So they tried five times to wake me up,

[00:20:00]

and it wasn't working. And then the fifth time, it finally worked to the point where they were able to transfer me back to Saskatoon. And I also want to say this, that the health care staff at St. Paul's Hospital, once I arrived and was awake and conscious and remembered things, they were fantastic. They were phenomenal. There was no judgment. Because I was obviously unvaxxed: I decided that I wasn't going to take this experiment because there wasn't enough research to back up taking this experiment. And I'm quite happy that I made that decision, even though I went through this experience. I don't think the vax would have prevented this from happening in any way.

Dellene Church

And so when you were in the Ontario hospital, did you have family members that were vaccinated that could come and see you?

Mark Friesen

Yeah. My daughter actually was able to fly out and spend a couple of days with me.

Dellene Church

But your wife was unable because she was unvaccinated.

Mark Friesen

That's right. That's correct. Yeah.

Dellene Church

Okay.

Mark Friesen

Yep. And Sean Taylor was also unvaxxed as well. But he managed to talk his way in. So I'm pretty thankful that he did.

Dellene Church

And are you still suffering consequences from being ill?

Mark Friesen

Yeah. So the recovery process has been long. The initial recovery process coming out of a five-week coma is extensive. I couldn't walk. I could barely talk. In fact, there was probably about 10 days where my wife was doing some reality therapy with me because I was on some pretty heavy drugs, ketamine and fentanyl and a number of others. So it takes a little while for you to break away from fantasy land into reality. And my wife did a phenomenal job of easing me out of that state and into the state of reality.

Now of course, I spent another month in the hospital. I was released on December 9th. The doctor had said I was probably going to be in there 'til well after the New Year's. But I told him, "You want to bet? I'm getting out of here as soon as I can." So I worked as hard as I could to start walking, so I could function properly at home while still under some care from my wife. I still have issues stemming from this. Significant scar tissue of my lungs. I feel like I'm somewhere at around 65 to 70 per cent of my normal lung capacity. I can't do things that I used to be able to do simply because I don't have breath. I don't have lung capacity. The blood clots that were on my lungs left serious scar tissue and fibrosis. And **that's something that doctors are telling me I'll never get back.**

Dellene Church

And what do you feel could have or should have been done differently in your treatment to lessen the seriousness of your illness?

Mark Friesen

Well again, as I said, I was well aware, and I think I even asked the hospital staff the first three days I was in a hospital, "Why aren't you giving me ivermectin or HCQ? It seems to be effective and early treatment, so we can avoid some of these consequences." Of course,

their position was the same as what the Government told them. The Government said, "We're not going to be issuing any of that horse medicine." So I really believe that there's thousands, if not more, Canadians around this country that died because the governments across this country decided not to use early effective treatment like ivermectin and HCQ.

Dellene Church

And also, your transfer at the time most definitely would have exacerbated your illness.

Mark Friesen

Yeah, 100 per cent. Absolutely. Yeah, for sure. It probably extended my coma time, I'm assuming. I'm not a doctor, so I don't know.

[00:25:00]

But it seems all of the things that should have been done and the treatment I should have been given was not given. And mistakes were made. I can't say if it was on purpose. But it seems to me it was when the doctor says, "This is above my pay grade," and somebody above his pay grade has made this decision to stick me on a transfer flight to Ontario. When it was not in my best interest medically.

Dellene Church

Okay, I think we'll turn it to the commissioners to see if they have any questions.

Mark Friesen

Sure.

Commissioner Massie

Thank you very much for your testimony. I have a couple of questions. First is, you said that while you were at home and you started to feel the symptoms of what was likely COVID, you started to self-medicate. Did you have any specific information about the kind of amount or dosage of these molecules you should have taken?

Mark Friesen

No. And that's an interesting question because we had ivermectin in pill form, and we had HCQ. The ivermectin in pill form was 12 milligrams, which— I took one, which was woefully inadequate for the size of the human being I am. Only because I didn't know. I was unaware of dosage and what I should have been taking to effectively treat my symptoms. It was far too late in the process. And I have to take responsibility in that for the first seven days that I wasn't feeling quite right, I sort of dismissed it as just being tired and exhausted coming off a campaign. So, I really— I dismissed a lot of what I was feeling, even though I'm watching my wife with her symptoms. She self-medicated as well and ended up not having to go to the hospital.

Commissioner Massie

So did she use a different regimen in her case or you don't know?

Mark Friesen

She's quite a bit smaller than me. So, I think she just used the ivermectin in the pill form and the HCQ and rode it out by herself. And it worked for her.

Commissioner Massie

So, from what you understood from the conversation—I know that some of it was probably after the fact or with your wife—what was the medical reason that was provided for your transfer to Toronto? Was it because they thought that your condition was beyond what they were able to manage and you would get more specialized or more expert care over there?

Mark Friesen

No. Again, the doctor had said that this decision had nothing to do with my health and that I shouldn't, in his opinion, probably shouldn't be transferred. So this decision was, again, above his pay grade. Somebody at SHA had made the decision to put me on this transfer list, and according to the doctor, who was in charge of my care, didn't believe that it was in my best interest to transfer. So it doesn't sound like it was a decision with my health in mind or my best interest in mind. It didn't seem that way.

Commissioner Massie

So from what you understood, in Toronto you receive antibiotic treatment because one of your conditions had to do with the bacterial infection. Was this antibiotic also available back in the hospital you were in in Saskatoon?

Mark Friesen

It would have been. I assume it would have been available to the doctors. I mean, if it's available in Toronto, it should be available at RUH [Royal University Hospital] in Saskatoon. I'm not sure why I wasn't put on that. There was some doctors in charge of my care, I'm sure, that could have prescribed meropenem. And there's another one that I ended up—when I got home, I had a PICC [Peripherally Inserted Central Catheter] line—that I would give to myself called ertapenem. And that was just one step lower than the meropenem but still a very strong antibiotic, just to kill that infection that I had in my lungs. So it seems to me that they probably could have initiated that treatment here in Saskatoon, but for whatever reason, they didn't.

Commissioner Massie

Are you aware of any other combinational drug that you would have received with the antibiotic in Toronto?

Mark Friesen

Blood thinner, that I remember,

[00:30:00]

being told that I was on some blood thinners to help with the clotting issues from the spike protein and whatever that did to my system. Other than that, I can't recall any other medications that I was on. There probably are some, but I don't recall what they are.

Commissioner Massie

And was the blood thinner medication provided also back in Saskatoon before you moved to Toronto, or is it only in Toronto that they started the blood thinner?

Mark Friesen

I don't know, actually I don't know the answer to that. I would have to look at my medical records to see if they did initiate blood clot medicine. I'm not sure.

Commissioner Massie

You also mentioned—if I'm coming back before you got COVID—that you think it happened during this meeting inside where there was a lot of people and the ventilation was not properly functioning. Are you aware of the number of other people that would have got the infection in addition to yourself and your wife? Or was it just a few people, just only you?

Mark Friesen

Yeah, from what I understand, there was at least upwards of 20 people that had gotten sick from that evening. Again, I think we can attribute that to the lack of air circulation in that environment. It definitely was not an environment conducive to healthy existence. And again, I'm not sure why they didn't have air circulation on. It's very curious.

Commissioner Massie

Thank you.

Mark Friesen

Yep.

Commissioner Kaikkonen

I'm from Ontario. And I often wondered when I heard that we were flying patients in from other provinces, what we were doing with the patients that were in our over-capacity hospitals in our own area?

But I'd like to take you back to the Charter for a minute. The Charter writes— In the preamble of the Charter, we know that we're under "the supremacy of God" in this country and "the rule of law." So, to me, the freedom in society means being subject to laws enacted in a legislature that applied to everyone equally, including the premise that persons are **free from both government and private restrictions.**

So, do you believe the government and the judiciary acted, or are acting, under that premise that they too are subject to the same laws as the citizenry, particularly when you think of the increase in the fines that was suggested by the prosecutor?

Mark Friesen

It seems to me that they're not being held to account. As I said, under Section 1, it's very clear that they have to demonstrably justify any limitations to our Charter rights. To my awareness, there isn't one government that's actually done that: demonstrably justified the limitations of the Charter in this country. I've yet to hear of any government that's provided

evidence that backs up what they did to us, in limiting these Charter rights. I mean, it's gotten so bad even in Saskatchewan, that the Court of King's Bench made a ruling, because it was an emergency that they don't have to live up to demonstrably justifying these limitations. It just seems to me and it sort of proves to me that the supremacy and sovereignty lie within Parliament and the provincial government. What is our Charter for, if it doesn't represent these rights that I consider to be inalienable?

Commissioner Kaikkonen

So in terms of our democracy, do you think we're moving towards an oligarchy where we're ruled by the few, when you think of how you just explain sovereignty and supremacy?

Mark Friesen

Yeah. This leads us into authoritarianism, totalitarianism, where the government reigns supreme. Again, nowhere in our Constitution, nowhere in our Charter does it refer to that act being derived by the will of the people. Nowhere in it does it represent "the people." It only refers to the Parliament and the provincial governments that they have the supremacy and the sovereignty to limit our inalienable rights. Rights that I consider to be God-given inalienable rights.

[00:35:00]

Nowhere in our Charter, nowhere in our Constitution, does it recognize the will of the people. And so this is why they're able to do what they're doing. I think this pushes us in the direction of fundamental change in this country and recognize that it seems to me our Charter rights and freedoms aren't worth the paper they're written on.

Commissioner Kaikkonen

I'm going to read something that's a little bit long, so I'm going to try to make it brief. George Bernard Shaw, in his 1905 play, *Major Barbara*, made a statement, and he was referring to the intellectual oligarchy that acts against the common people.

And one of the lines in that play is, "I now want to give the common man weapons against the intellectual man. I want to aim them against the lawyer, the doctor, the priest, the literary man, the professor, the artist, and the politicians, who once in authority is the most dangerous, disastrous, and tyrannical of all fools, rascals, and impostors."

So when we think of this statement through the lens of the last three years and what you have had to deal with, do you believe the interests of the common people were protected or that the populace had the tools to legitimately present a dissenting voice, and maybe the freedom as well?

Mark Friesen

No. This has been a concern for the three years that I've been active: there is a large number of Canadian citizens across this country that had zero representation. They had nobody in provincial parliaments or legislatures, in the federal parliament, representing us, representing our freedoms. We are a very large segment of the population that has gone unrepresented because there was never an entity elected in this country, provincially or federally, that stood for the people. Not one. And that's an incredibly sad state of affairs

when you have a very large segment of our population that has no representation. There's something wrong, I think, when all of these people— And the convoy showed how many people there are that felt this way. And what the convoy represented that if they're not represented, then we have to represent ourselves. And we're going to gather and we're going to express our opposition to their decisions peacefully, publicly. And that is our right.

But as we saw with the convoy apparently, it's not our right. Apparently, a peaceful protest can be bludgeoned with horses and soldiers and beatings. That's hard to swallow when so many of us have relatives that gave the ultimate sacrifice for our freedoms. And to have them trampled like they have been over the last three years is disgusting.

Commissioner Kaikkonen

You've given a number of recommendations throughout your testimony. Is there anything specific that you haven't said that you would like to say in terms of changing the climate or the mindset of governments and the judiciary specifically?

Mark Friesen

So I believe there is a mechanism for change in this country, and it's called the Amending Formula. We have to take advantage of what former premier from Newfoundland—I forget his name off the top, Peckford, thank you—created in '82.

[00:40:00]

When they created the *Charter of Rights and Freedoms*, there was also an Amending Formula that was created. I think we have to take advantage of that Formula. I think we have to move forward to amend our Constitution, to amend the preamble of the Constitution, to include, "derived by the will of the people."

I think our Constitution has to recognize the people. I think what we've seen in the last three years has proven to so many of us that our inalienable rights can be abridged at any time the government decides they need to do that. We need a rock-solid Constitution that recognizes the people and our inalienable rights.

So, there's a document that's created by a fellow by the name of Brenton Froelich, and it's called the True North Declaration. And I encourage people to read it. It is, I believe, the mechanism to move forward, to amend our Constitution, to reflect the will of the people, and then also to amend and to repeal section 1 and section 33 of our *Charter of Rights and Freedoms*, which gives the supremacy to Parliament and the provincial governments to do exactly what they've done to us over the last three years. We need to repeal that legislation, so our inalienable rights are just that. So we never have to go through this again.

Commissioner Kaikkonen

Thank you very much.

Mark Friesen

You're welcome.

Dellene Church

On behalf of the National Citizens Inquiry, I'd like to thank you very much for your testimony here today, Mark.

Mark Friesen

My pleasure.

[00:42:25]

EVIDENCE

Witness 7: Joseph Bourgault

Full Day 1 Timestamp: 9:02:45–10:10:00

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness is Joseph Bourgault. Joseph, let's start. Can you please state your full name for the record, spelling your first and last name?

Joseph Bourgault

Joseph Bourgault, Joseph J-O-S-E-P-H, Bourgault B-O-U-R-G-A-U-L-T.

Shawn Buckley

And Joseph, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Joseph Bourgault

I do.

Shawn Buckley

Now, you have a presentation for us. But before we get to that, my understanding is that you had a serious health crisis some time back caused by mercury poisoning.

Joseph Bourgault

That is correct.

Shawn Buckley

And because of that, you were literally disabled for approximately eight years.

Joseph Bourgault

I was disabled for, probably— '92, '93. For sure two years, I was mostly bedridden.

Shawn Buckley

And this experience led you to learn how to heal yourself because you had not been able to find the answers in the medical community.

Joseph Bourgault

Correct.

Shawn Buckley

And you literally became passionate about learning about the body and health.

Joseph Bourgault

Correct.

Shawn Buckley

This has now become a lifetime passion for you.

Joseph Bourgault

One of my hobbies.

Shawn Buckley

Okay. You're going to speak in your presentation about your business experience. But one thing I wanted to emphasize is that, my understanding is you have learned through that experience about how to get people to work together.

Joseph Bourgault

That is correct. I've been in management since I was 20 years old and executive leadership positions since 1986.

Shawn Buckley

I just bring that up because, although you're not speaking about it today— Except that I'm going to ask you a couple of questions. You went to Ottawa. You arrived there on January 29th, as the Trucker Convoy was just really arriving and getting organized, and you left on February 16th, two days after the *Emergencies Act* was invoked. For that time, you worked with the truckers to basically ensure that they worked as a team and that the protest remained lawful. So that's why I was bringing up that you basically had gained this experience and you just used that to assist the truckers.

Joseph Bourgault

That is correct.

Shawn Buckley

I did want to ask you if you could comment on whether the trucker protest was peaceful and lawful.

Joseph Bourgault

Well, I'm not sure I'm the right guy to ask that. You might ask the 10 lawyers that were there supervising it, Shawn. But everything— You know, I've been involved in legal matters in our business—

Shawn Buckley

I'll just stop you, Joe. I'm really not asking for legal opinions. Just, you were there; you lived it. I'm asking you. The government and media told us they're misogynists and racist and it's all violence and we're seeing pictures of a Nazi flag and I'm just— You were there. What really was it like? Not a legal opinion.

Joseph Bourgault

As a citizen, it was 100 per cent a legal, peaceful protest. I heard nothing from anyone, including the lawyers. As a matter of fact, there were two rulings by Ontario court judges that said they could continue with the protest as long as they maintained a legal, peaceful protest. And there were two decisions. One related to the horns: A judge had ruled that the horns had to stop. So there's legal precedent that it was a legal, peaceful protest.

Everything I observed—and I was in many of the meetings as an advisor, basically, to the truckers—there was never any discussion that was illegal or unreasonable. The people that were there leading, trying to organize a legal, peaceful protest: they're the most intelligent, rational, reasonable, people. At least those that were in the meetings. Those that were more, let's say, unable to work as a team, to maintain a legal, peaceful protest, we encouraged them not to be in the meetings.

Shawn Buckley

Thank you for sharing that. I just thought it was important for people to appreciate that you had basically contributed in a very meaningful way for really the entire protest, and that you were involved.

I know that's not why you're here to speak today. You're here to give us a presentation and I'll just ask you to begin with that.

Joseph Bourgault

Okay. Thank you, Shawn. So first,

[00:05:00]

I would like to start by thanking all the leaders, organizers, and volunteers for the National Citizens Inquiry. I think it's essential that we get to the truth of the matter of the many governments—all the provincial, territorial, and federal governments that have been involved, and the medical agencies involved—in the handling of the, I'll say, "man-made" COVID-19 crisis situation over the last three years. From the get-go—when I heard this was being organized, I had met with Preston Manning at our Calgary offices at Canadians for

Truth—I'm 100 per cent supportive of what you folks are doing. This is fantastic. It's in the Canadian tradition here. I see the National Citizens Inquiry as a 2.0 to the Ottawa Trucker Freedom Convoy. We're all citizens that deeply value the principles of freedom and truth and justice. And so I'm very grateful to all of you for what you're doing here.

Introducing myself, I think it's really important for me to say this: I'm a father of two adult children and I'm also a father-in-law. I'm a grandfather of three, born and raised in St. Bruce, Saskatchewan. I'm president and CEO of F.P. Bourgault Tillage Tools. I'm president and co-founder of Canadians for Truth, Freedom and Justice.

I want to give you very briefly a bit about my background, because I have a lot of decades of experience in research, in discerning truth. I started working with my father. I was 13. I worked with my dad for 20 years. My dad was a brilliant mechanic and really a self-taught technician or engineer, who invented the Bourgault multi-purpose cultivator. And I was working with dad through that time. I recall working with dad. Dad would always tell us that— I have three other siblings—at least he told me that if you want to solve a problem, you have to get at the truth of the matter. And I feel like I had the greatest parents in the world. They were both always honest with us, loving, kind, respectful parents. So I deeply admired and valued my parents, as well as my siblings.

I took two years of university in commerce. And with that, I set up all the accounting systems in F.P. Bourgault Industries, which was founded in 1973, and set up all the accounting systems. I could see Dad needed help in other areas, so I ended up working in service and dealing with the problems that we were having with the earliest models of our equipment. There was a lot of demand for them, but they weren't without challenges. So I ended up working quite a bit in problem solving, and so I ended up inventing—using my creative skills and my problem-solving skills to invent solutions and to develop new products.

My first invention was in 1979. I became the facilities manager and one of the project leaders, the main project leader, for cultivator research in 1980. I designed and developed the Bourgault Fibro Series cultivators in sizes from 24 to 60 feet. And then in '84, '85, a really major invention was the Bourgault Floating Hitch cultivator, which really helped facilitate air-seeding. My father was the co-inventor. He assisted me with it. In 1985, I was appointed to my first executive leadership position. Dad asked me to become the general manager of one of the Bourgault divisions, the Bourgault cultivator division. I was 29 at the time.

Shawn Buckley

And Joseph, I am going to try and kind of speed you up. Just because I want you to spend time on the things that you would say would be a little more important.

Joseph Bourgault

A hundred per cent. So that speaks to my executive leadership skill. I have been in executive leader positions since then. In 1991, we founded another division of the cultivator division, and that is F.P. Bourgault Tillage Tools, and I was president and CEO of that company. In 2011, jumping ahead 30 years—

[00:10:00]

In 2011, I was nominated and awarded the Saskatchewan Order of Merit. That's what the S.O.M. behind my name stands for—I use it on occasion, I'll kid about it sometimes, "South of Melfort." For job creation and improving the quality of lives of Canadians. So that speaks to my management executive leadership.

A 2.0 in my life was, in 1984, I had developed serious chronic fatigue, and over an eight-year period, that continued to worsen. My health continued to worsen. I worked with it until 1991. In '91, I had to take a leave of absence for my health because I was so ill. But in that eight-year period, I spent those eight years in the conventional medical care system in Canada and in North America. For example, I was three times to the Mayo Clinic over a five-year period. Each time you go to the Mayo Clinic, you go through three days of testing. In those eight years, I never found any clues. Doctors could give me no clues or answers as to what was causing my health problems. So in '92, I knew that I was dying, and I made a conscious decision. I remember that moment where I was going to apply my research skills to try to figure out what was causing what had become severe chronic fatigue, severe chronic headaches, and with that, severe chronic depression.

By the grace of God, I say, I was searching. And in a health food store, I picked up an *Alive* magazine that had an article about a lady who had recovered from mercury poisoning after having her amalgam dental fillings removed. The light went on at the end of the tunnel. For the first time in eight years, I saw light at the end of the tunnel. And I continued researching mercury poisoning, and I had all the symptoms of it. I found a doctor who I felt was the world's leading researcher, Dr. Hal Huggins in Colorado Springs. I went to his clinic in '93, July, August of '93. He safely removed and replaced all of my amalgams, and I began to recover immediately.

One of the significant events in my recovery was: in '92, my wife, children, and I, from my research, began eating 100 per cent organic food diet, and we saw dramatic improvements in everyone's health. Mine, in '92. I didn't have the amalgams out, so I continued to struggle, but I noticed my capacity to think and reason dramatically improved. It took me eight years or seven years to regain my excellent health, but I continued to study natural health and healing, and that's what led me to understanding how to treat viral infections.

In '95, my wife and I had opened a health food store in St. Brieux, which I was a participant in for 20 years. And we shared what we were learning with people to empower people, and one of the things that we became good at was treating viral infections. Dr. David Williams, who I consider one of the world's leading researchers, had in his research found two herbal products—ImmunoPhase and BronchoPhase—which were used to prevent and treat the H1N1 virus. The H1N1 virus was actually deadlier in my mind than the COVID-19, because it would kill young healthy people. They would have cytokine storms in their lungs. And within a matter of days, their lungs would fill with fluid and it would kill them. Healthy people. That was not the case for COVID.

So we had that in our health food store, and we helped people recover from H1N1 and from other influenzas. These were great products.

In 2020, when COVID-19 hit, I knew that we had products available that may work to prevent and treat COVID-19. And then again, in April, another world's leading research doctor, Dr. Joseph Mercola, published information on quercetin. What he had published was that quercetin acted similar to hydroxychloroquine,

[00:15:00]

as an ionophore to shuttle zinc into our cells. And it's the zinc that actually inhibits our polymerase enzyme, which a virus requires in order to be able to replicate.

When that came out—because I'm not a doctor and I've never pretended to be one—I began to share that information. We published a brochure with a protocol, because even though anybody can take these products, you have to know how to take them. For example, zinc: If you take zinc, and I ran into cases where people were taking very high levels of zinc, that can actually depress your immune system and cause other problems. So I knew the RDA on zinc. And I published a protocol that I knew would be safe and began sharing that. As well, Dr. Mercola published a lot of articles on vitamin D3. And vitamin D3 also acted to prevent and treat COVID. It coats our ACE2 receptors, preventing these spike proteins from being able to dock on our cells, on our ACE2 receptors. So I was publishing that information about vitamin D.

So I understood therapeutics and how to prevent and treat. And over the course of the last three years, anyone who asked me for information, I would share information on nutrition, how they could prevent and treat COVID-19. I assisted over two dozen people to recover from COVID-19, including people who were in hospital who called me.

You can see on that slide, the herbal and nutritional supplements that I recommended to people: ImmunoPhase and BronchoPhase, quercetin with zinc, vitamin D—and there are many other excellent supplements, too numerous to mention here. The drug therapeutics I was following as well, because I felt I knew right away that doctors should be allowed to prescribe hydroxychloroquine, ivermectin, azithromycin. And you can go to that website, www.c19early.com, where it has over 2,600 studies and the majority of them are peer-reviewed studies that show the therapeutics that work.

So when COVID emerged in January 2020, I knew that we had solutions, and I was also following the science. I was following the Government of Canada COVID-19 Daily Update Website Statistics, because we had to deal with some panic situation. We knew that the mainstream media was panicking Canadians, the opposite of what you should do. From 30-plus years of executive leadership experience, what you've got to be doing in a crisis situation is you have to remain calm and cool and then focus on the pursuit of truth to understand the root causes of the problem. You don't panic people, that's like yelling "fire" in a crowded theatre.

And that's what the government was doing to Canadians: they were yelling "fire" in a crowded theatre. It just irked me to no end what was going on, and it was affecting our manufacturing company. We have 80 employees and there was a panic going on in early April. What we began to do, late March, was providing a daily update newsletter to all of our employees telling the truth: the good, the bad, and the ugly. Because that's what you do in a crisis situation. We started providing statistics, plus what they could do to prevent and treat COVID-19, and within a matter of a couple weeks, everybody settled down.

The other thing that was happening: By March/April 2020, Laura Ingram, a lawyer and journalist with Fox News, was interviewing many people who had COVID-19 in the US. And hydroxychloroquine at that time was the drug being used with azithromycin. The way, again, hydroxychloroquine works is as an ionophore that shuttles zinc into the cell, and it's the zinc that shuts down viral replication. Azithromycin, the doctors were prescribing in cases like Mark Friesen, where they had a lung bacterial infection. And they had excellent results.

[00:20:00]

The peer-reviewed science that was coming out— Dr. Didier Raoult, is a great example. He's a top-rated European virologist from Marseille, France. He had conducted numerous peer-reviewed studies. I was following him, and his largest one was with 1,061 people, and he had a 98.6 per cent recovery with it. Another doctor in the United States, Dr. Vladimir Zelenko, another honest, what I call "honest truth-seeking doctor" from Monroe, New York: he conducted a trial with 1,000 people, and he had similar results. As I recall, all 1,000 had recovered.

We could see that there was a suppression of the therapeutics. The mainstream media was suppressing the truth about therapeutics. And you could tell already by then, in March/April, there was a centrally controlled narrative. That's all. I didn't have any factual evidence until Rodney Palmer, at a recent National Citizens Inquiry hearing in Toronto, explained what was going on behind the scenes. But it was evident: The mainstream media was instructed to suppress all information about the therapeutics.

With that in mind, by the fall of 2020, a group of friends of mine and like-minded Saskatchewan citizens were fed up with what we're seeing. Because we could see that they were going to kill people, that thousands of people could die if the therapeutics were not released. So we gathered. In November of 2020, we founded and incorporated Canadians for Truth, Freedom and Justice as a non-profit organization to gather truth and share that information with Canadians—to empower and enable Canadians to take preventative therapeutics from the brochure that we had published, how to take quercetin, zinc, and vitamin D.

Dr. Peter McCullough, who needs no introduction, I watched many hours of video with him. And I recall one of his statements that if therapeutics had been allowed, if doctors had been allowed to prescribe therapeutics, over 85 per cent of the people who died with COVID-19 would be alive today. So in Canada, we had, I believe, just under 50,000 people that died with COVID-19. Over 47,000 of those people would be alive today—

Shawn Buckley

I'll just interject. You're meaning alive if the doctors had been able to use early treatment.

Joseph Bourgault

Correct.

Shawn Buckley

Not to wait until they're so sick they're attending at the Emergency Department. I don't know if you're aware, but apparently in the province—I'm from Alberta—the College of Physicians and Surgeons literally directed doctors not to give early treatment for COVID, but rather only treat them when they arrived in emergency wards. And I assume that you would frown on that as a very reckless policy.

Joseph Bourgault

Yeah. I would like to know who is behind making those decisions. I believe they came right from the top. And when I say the top, people outside of this country who were controlling the COVID-19 narrative. I believe the World Health Organization was involved in that. I had seen evidence of Bill Gates funding studies to discredit hydroxychloroquine by giving crazy

amounts so that it would not work. So there were people behind the scenes who were suppressing the truth.

Shawn Buckley

I didn't mean to get you off on a segue.

Joseph Bourgault

So there were doctors in the country, Canadian doctors: Dr. Francis Christian, Dr. Daniel Nagase, Dr. Charles Hoffe, Dr. Mark Trozzi, Dr. Byram Bridle, Dr. Patrick Phillips, and many others who risked their careers. And many lost their careers doing the right thing, speaking out publicly to protect the health of Canadians. Like me, they were just incensed that the truth was being suppressed. And so all Canadians: These people are heroes. They're Canadian heroes.

As I see it, and many of us, I think: We're living in a twilight zone.

[00:25:00]

I grew up, and many of us here grew up, in an era where honesty and integrity mattered. And that if somebody ever lied to us—a friend or anybody that was a perpetual liar—those people were marginalized immediately. Because people who are liars are a risk to society. So I would ask Canadians: How many lies do our governments have to tell us before we stop voting to elect these people?

To me, the therapeutics was the elephant in the room. Again, with what Dr. Peter McCullough said: If doctors could have prescribed therapeutics, 85 per cent of the people who died with COVID-19 would have been alive today. I talked to doctors who attended our meetings of Canadians for Truth. They were frustrated to no end. They knew these medications worked, yet they couldn't prescribe them because they would have had their licenses revoked.

So over 40,000 Canadians would still be alive today. Our hospitals would not have been any busier than normal, and normal, life-saving hospital visits could have taken place. Face masks that did not work would have been completely unnecessary. Lockdowns that did not work would have been completely unnecessary. There would have been no excuses for the reckless spending of 500 billion Canadian tax dollars. There would have been no need for an emergency use authorization for an experimental gene therapy injection. There would have been no experimental injections. That alone would have saved, for sure, thousands of injuries, and we don't know how many deaths would have been prevented. We would not have created all the trauma, division among families, bankruptcies, mental health problems, the suicides that occurred, the deaths due from lack of medical care.

What's happened here has fuelled— For me, I have zero trust in any of these politicians. If they speak truth, fine, but I know that many of them are not truth-tellers.

As I see it, there was massive, gross incompetence, if not criminal negligence, murder, and genocide taking place. Everybody in Canada understands that we cannot just go out and kill someone without going to jail for life for doing so. According to the rule of law, if someone kills someone, unless it's in self-defence, in order to get rid of somebody— If somebody is killed, an investigation is conducted. Factual evidence is gathered and if the factual evidence proves beyond a reasonable doubt—

Shawn Buckley

Joseph, I know you've prepared some slides on criminal liability but we've got a couple of lawyers coming. And I think your point is that you think there should be criminal liability for what happened.

Joseph Bourgault

The point is: Canadians have to understand that, because there are people in positions of authority, if it was not gross incompetence, there was criminal negligence. And the factual evidence, to me, that we have gathered shows there was criminal negligence. So I guess I hope that in light of what happened with the therapeutics, Canadians will see that there was an orchestrated effort to suppress that. Whoever was suppressing that, to me, there should be criminal liability.

Shawn Buckley

Okay. Just so that people listening understand: The point you're making, and I think you've made it very clear, is we had early treatment available and somebody was making policy decisions not to use those early treatments. Flowing from that, there has been a large number of deaths. I think your slide was estimating 40,000 Canadian deaths. When you nod your head, we're being recorded.

Joseph Bourgault

Yes.

Shawn Buckley

Yeah. Then, if I recall your slide correctly, also we wouldn't have needed the lockdowns and the vaccine and all the things that flowed from that. Your point is: There has been so much harm—

[00:30:00]

Joseph Bourgault

Correct.

Shawn Buckley

—caused, flowing from this decision, that someone should be held criminally liable for that. Just so that we understand what you're suggesting.

Joseph Bourgault

So you'll see there's three parts to my presentation. And what I want to demonstrate is that in all three parts, there was lying and deception taking place.

The next one here is the truth in science. You can see, if you could show the video here, I think this guy wearing a face mask definitely proves that you would have never stopped a virus that's 0.1 micron from getting past that mask. So that's the physiological aspect of it. As an employer, as president and CEO of my company, I have a responsibility to make sure that all of my employees are kept in a safe work environment. One of our first mottos—

When you walk into our manufacturing facilities at Bourgault Tillage Tools, our motto is: Safety, Quality, Productivity, in that order.

Know your facts. In Saskatchewan, Canada, we have occupational health and safety laws. So for carbon dioxide levels, under OH&S regulations, normal atmospheric carbon dioxide is 400 parts per million. Carbon dioxide in a work environment cannot exceed a thousand parts per million. Over that is considered unsafe. Over 5,000 parts per million is considered hazardous. These are the Occupational Health and Safety Regulations that we have to follow. The CO2 levels, if they rise over 40,000 parts per million, it's considered immediately dangerous to life and health.

We hired an Occupational Health and Safety expert that is a CSA [Canadian Standards Association] certified trainer to train doctors, nurses, firefighters with respirators and face masks and how to use them. He came in and he measured, behind four different masks and a respirator, the level of oxygen and carbon dioxide. With oxygen, the normal atmospheric oxygen is about 21 per cent, 20.9 per cent at sea level. In our Saskatchewan Occupational Health and Safety Regulations, the minimum oxygen that any of our employees can be exposed to is 19.5 per cent. Below that is immediately dangerous to life and health. And yet we measured the level of oxygen behind these four different masks, averaging between 17 and 17.5 per cent.

Shawn Buckley

Joseph, can I have you back up a slide?

Joseph Bourgault

Yep.

Shawn Buckley

So when it shows there: carbon dioxide levels cannot exceed 1,000 ppm [parts per million] in the workplace, am I correct that if it was measuring at that, you would have to clear out the building?

Joseph Bourgault

No, you would have to take corrective measures.

Shawn Buckley

At what point do you have to vacate a building?

Joseph Bourgault

Well, for sure, 40,000 parts per million would be dangerous. You hear of people going into caves and dying of suffocation in caves because carbon dioxide is heavier than oxygen. I'll make that point about how dangerous high carbon dioxide is with low oxygen.

Shawn Buckley

Right, but you're basically describing that you had an expert come and measure the carbon dioxide in masks. And just unequivocally, they were at dangerous levels. And these are the types of masks the government was mandating that we would wear.

Joseph Bourgault

The government really didn't have any specific mandates, they just wanted people to virtue-signal that they were putting a mask on. But the four different ones— We had an N95, we had a respirator— With a respirator, you can exhaust the carbon dioxide, and it still restricts oxygen but it's much safer. Carbon dioxide is one and a half times heavier than oxygen. When you fill your lungs with carbon dioxide with a mask on, you can't get oxygen. And that's where it can kill you. So we measured.

[00:35:00]

Within two minutes of putting a mask on, you are breathing carbon dioxide between 25 and 43,000 parts per million. The 43 would occur if you would talk, if someone would just talk behind the mask. If someone had exerted themselves behind a mask, it would go way higher. And then with the oxygen, we measured between 17—it went as low as 16, but the average would have been—I took a high average of 17.4, which is dangerous.

Shawn Buckley

When someone was exerting themselves. So what do you think based on what you saw? Because I saw children running around in play yards or school grounds with masks on, so they would be exerting themselves.

Joseph Bourgault

Correct. It was very dangerous and I'm aware of cases. We had one case in our company where someone collapsed with a mask on. There's evidence that it wasn't only the mask. He had exerted himself and there were other factors involved in his case. His heart stopped, and our first responders in our company revived him, and he ended up three weeks in a coma in hospital. And he survived it. We can't discern factually accurately how much of a role the mask played in that because he had other co-factors. He was a young person, though, so they're dangerous. And I was aware of other cases. A woman who was standing in a line at a Walmart with a mask on. She fainted, fell backwards, hit her head on a cart, and then on the floor. She suffers brain damage. She's from Alberta. I've spoken with her.

In Saskatchewan, we have what's called workers' rights. This is posted all over our facilities. You have a right to know about workplace hazards. You have the right to participate in a safety program. You have the right to refuse work if it's not safe and you have the right for protection against discrimination. So we live this stuff. Our company is certified under SASM [Safety Association of Saskatchewan Manufacturers]. We have a bronze certification. We're a company of 80 people. We have a full-time person that's been working at this. We hired him full time in 2016. We take safety seriously. So when the government is telling me I got to put my workers in an unsafe work environment, I'm pissed.

I let the government know about this. They have this information. I feel our federal governments and provincial governments forcing Canadians to wear face masks, they violated the truth in science governing human respiratory health and safety. They risked

the life of every Canadian citizen. Many were injured due to fainting, hitting their heads, and that sort of thing. They violated their own regulations, which we support a hundred per cent, because they're based in science. They violated the Charter of Rights and Freedoms and they impaired every child's ability to learn while wearing face masks. There's a lot of lying going on here. A lot of lying and deception. Ignoring the truth in science. Ignoring the laws that govern our existence here.

One of the things that we're doing at Canadians for Truth, we published brochures on this. We have a brochure that we are handing out to people with what's in this presentation, so that people could see. We still see people wearing face masks! Like, alone in a vehicle. You know, we have to educate our citizens, because the truth matters. It can kill you! You pass out in driving a vehicle, a semi, you could kill a lot of people. It's literally insane that our governments are going along, are not educating our citizens.

So at Canadians for Truth Media, because our media is not doing this, this is what we're doing. We're creating educational and entertaining programs to inform Canadians and to teach critical thinking skills: how to discern truth on important issues such as face masks and therapeutics because this can save lives. We need an educated, enlightened population. And we need Canadians to understand their legal rights. So we're bringing lawyers in as well in our shows, to help educate Canadians.

[00:40:00]

We need Canadians to vote to elect honest truth-seeking, moral, ethical, and highly competent politicians who would be willing to take an oath to always seek truth, to uphold the rule of law, to serve the Canadian people who elected to serve them.

In this next, the third part, I'm going to overlap a little wee bit here with my good friend Dr. Francis Christian to support what he did and to reinforce. We had submitted a document to the provincial government on May 31st at Canadians for Truth. This was before Dr. Francis Christian had gone public. He was discerning the statistics as well. He went public on June 17th; I believe that's the first that I was aware when Dr. Christian had gone public. The group of us in Canadians for Truth, we went to the Government of Canada website.

Statistics Canada generally does a very good job of providing statistics and so they have that daily COVID-19 update website. It was with 100 per cent disbelief and alarm when the federal and provincial chief medical officers, in early 2021, began promoting experimental gene therapy injections for Canadian children under 19 years of age. The infection death rate statistics were near zero out of 265,000 cases and there were many more. There's a peer-reviewed study that shows over 90 per cent of Canadians had COVID-19. The vast majority were asymptomatic. Eleven kids, had they given them therapeutics, those kids would likely be alive—or at least 85 per cent of them according to Dr. Peter McCullough.

Even if this experimental injection worked, the idea of giving it to our kids was insanity, pure insanity. We worked long, hard days—21 straight days—to produce a report. The title of it is "Risk Analysis: Assessing the Risks and Harms of the Covid-19 mRNA Injections VERSUS Using Zero Risk Therapeutic Drugs and Natural Supplements: Making Informed Decisions Based on the Facts." We were expressing our serious concerns with experimental COVID-19 mRNA injections that were developed at light speed and never tested on animals. Now they were going to be using our children as guinea pigs. We knew that these injections were going to kill, seriously injure, and potentially sterilize because that's one of the side effects. The mRNA goes to the prostate and to the ovaries and the immune system will attack and destroy those body parts. They were going to potentially sterilize our

Saskatchewan Canadian children. We wanted to warn Premier Scott Moe. We sent that report to Premier Scott Moe and all of the Saskatchewan Party MLAs. So they were warned.

That's why I wanted to do this part of the presentation, Dr. Christian. I felt that they needed to be warned. The survival statistics showed: for kids that were infected, 11 out of 265,011 died with COVID. That was 1:23,000—99.956 per cent who were diagnosed with COVID had a full recovery, and that's without therapeutics. The statistics also showed that the previous three years, 2.5 times more children died from influenza than they were dying from COVID.

Shawn Buckley

Can I just stop you there so that people understand what you're saying? When you're talking about influenza, you're just talking about the regular seasonal flu that comes through. If we were to back up for the three years before COVID hit, we had actually 2.5 more children dying from the average flu than from COVID.

Now, am I right—and I'm just guessing here—that for the year where they're attributing deaths to COVID for children, there were no influenza deaths? So actually, there would be fewer children's deaths if we would just call COVID a flu season.

[00:45:00]

Because every year we lose children to the flu season. So for the COVID year, even though we're getting all panicked about it in the media, there were fewer child deaths that year.

Joseph Bourgault

Yeah. Very good point, Shawn.

Shawn Buckley

Okay. When you're talking about influenza, I just wanted the people listening to understand what you're saying.

Joseph Bourgault

There are a group of Canadian doctors—and I won't, well, is it safe to say? There are a group of Canadian doctors and nurses that worked hard to warn parents, to tell parents to make an informed consent decision. At Canadians for Truth, we worked with these doctors and nurses to publish. They created a website we helped fund and these brochures, "COVID Kid Facts," you could go to that website. I think the website is down, but if anybody wanted to read, they had put together very good information to warn parents to make an informed consent decision before injecting their children.

This is stuff that's coming out now. The American Heart Association published a study that 98 per cent of all cases of myocarditis among children are due to the mRNA COVID-19 injection. Dr. Michael Yeadon—that quote that's on the bottom there—said "children are 50 times more likely to die from the COVID-19 vaccine than from the virus." This is Dr. Michael Yeadon, who was a former vice-president of Pfizer, that has stood up loudly against this.

Had the therapeutics been there, we would have saved the children who died. And parents would have had nothing to worry about had they used therapeutics like quercetin, zinc,

vitamin D, at whatever their body weight levels, to prevent and treat COVID. What you see here is one of the protocols that we had published on our website. And we posted this also on Facebook at Canadians for Truth to warn Canadians and to help keep people out of hospitals.

As a Canadian citizen, it's completely unconscionable— I don't know how Canadians can remain silent while they're killing our children. All I can do is encourage as we've been doing, encouraging people to share the truth. Because we can't force people to wake up, but we need to keep sharing the truth as you folks are doing here.

Dr. William Makis, an honest, truth-seeking Canadian doctor from Alberta, has done more to track deaths and injuries from the experimental injections that have been killing and injuring our kids than any of the governments. And the numbers are pretty alarming, the number of kids that have died. Way more, no comparison.

So again, our governments ignored the statistical, factual evidence on their own website. Our governments ignored the death and injury statistics from VAERS [Vaccine Adverse Event Reporting System] in the United States. They could have looked over the border. All the information was there. This is, again, criminal, as I see it.

On a final note, I want to say we have much more work to do. But I remain optimistic that with God's help and guidance as Canadian citizens, if we work together and pursue the truth and continue to do as all the truth-seeking Canadians have been doing, to organize and stand up with the science. Do it in a respectful way as much as possible, because obviously our challenge is to awaken the Canadians that are still asleep.

As I see it, one of the ways that we're going to win this is if Canadians that are educated to understand what has taken place here over the last three and a half years vote to elect the most honest, truth-seeking people.

[00:50:00]

I'd also encourage people that are honest truth-seekers to get into office at every level: federal, provincial, municipal. Run for office, those who have been standing up. One of the ways that we're going to regain control over our country is if we can get principled leaders back in positions of authority in our country. I ran for the leadership of the Conservative Party in March, April of 2022, because I'm fed up with electing politicians who value power over the principles.

Any good leader understands that number one, we have to do God's will. And God's will is for us to love, to be respectful, kind, to help one another, to pursue truth, to solve problems. **When we seek the truth, the truth sets us free. And to recognize that every Canadian has a God-given free will, and we can't force anything on Canadians. We can only pray and do the best we can to educate people with the truth. And also, to stand up for justice and freedom. When I ran for the leadership of the Conservative Party, I told the truth like I'm doing here, and I thought, if they throw me out of the race, that's fine, I have done God's will. That's what God wants us to do, is to do His will by being loving, kind, respectful, and always telling the truth, as respectfully as we can. And if we do that, I believe that, as Canadians, we will succeed in defeating the dark agenda that has been taking place the last three and a half years. If we continue to work together.**

With God's help and guidance, we will not fail. So God bless Canada, and we will stand on guard for thee.

Shawn Buckley

Joseph, before I hand you over to the commissioners, there's actually one thing that I've just been waiting and waiting to ask you. You were talking about how, as an employer—and you guys have some significant-sized companies—you have provincial legal obligations to make sure that you're ensuring your workplace is safe. Under the Criminal Code Section 217.1, an employer can also be criminally liable for criminal negligence if how the direct work is done causes a harm or death. Did you guys have any discussions about whether or not to impose a vaccine mandate and what types of things kind of came into play as an employer when you guys were being faced with that?

Joseph Bourgault

I won't speak for my brothers, who also own manufacturing companies in St. Brieux. Between my brothers' companies and mine, we employ approximately 800 people in St. Brieux. But I know my brothers are truth-seekers like myself. My understanding was in our company—and I believe Jerry and Claude handled it the same way in their companies—we respect freedom of choice. And we did not want to discriminate against anyone, whichever way they wanted to go. We respected everybody's freedom of choice. There were no mandates in our community for anybody to take any experimental injections.

Shawn Buckley

Okay. So you're an example of a workplace, collectively, as a family, that didn't impose mandates, that just honoured people's right to decide how they were going to treat their bodies.

Joseph Bourgault

Correct.

Shawn Buckley

And compared to other companies, what types of outcomes did your companies experience?

Joseph Bourgault

To my awareness, I am not aware of anybody dying of COVID. We were aware, we were keeping track of people at one time that were injured or died from taking the injection. It was creating a bit of division in our companies. But I've learned from experience. If you handle things in a principled way, you have to respect one of the principles: God gave everybody free will. It's not for me to tell you, or anybody, what they should do. If they're open— We shared with people the statistics that showed all the people in our company under 70, and most everybody is under 70, were at zero risk from COVID-19 plus the therapeutic information.

Shawn Buckley

I'm just going to focus you because we're running late. We've got a couple of other witnesses, but were you aware of any other companies that had worse outcomes?

[00:55:00]

I have the impression your companies actually had really good outcomes through this experience.

Joseph Bourgault

Yeah, we did. I'm aware of companies that were forcing their employees to take injections. And they lost many good employees as a result because those people refused to take it.

Shawn Buckley

Okay. I'm going to hand you over to the commissioners to see if they have any questions.

Commissioner Massie

Well, thank you very much, Mr. Bourgault, for this very interesting presentation. You mentioned some of the natural products that play a role in preventing COVID. Quercetin was one of them. You mentioned the work that was published by Dr. McCullough. Are you aware of the study that was done in Montreal by Michel Chrétien?

Joseph Bourgault

No.

Commissioner Massie

This was in the mainstream media in Quebec.

Joseph Bourgault

And this is on quercetin?

Commissioner Massie

Yeah. He was all excited about it. He's a real scientist and he was very excited. I've seen it for maybe two to three weeks and then it vanished completely from the horizon. Again, to me, that's an example of— I will speak about what's going on in Canada. I'm very happy to learn about what you've done. But we have a team of people also in Quebec that has done similar work and, I think that as I go across Canada, people are not very aware because of the language barrier, which is unfortunate.

Another example of a clinical trial very successfully done in Montreal in the Institut de Cardiologie by Dr. Tardif on colchicine. This was actually praised by Dr. McCullough as one of the very promising treatments for some indications in Covid. Have you heard of that?

Joseph Bourgault

No, I have not. I'm sorry. I do believe that if we would have wanted to save tens of thousands of Canadians, it would have had to have been the doctors given the authority to prescribe these, whether it was ivermectin or hydroxychloroquine with azithromycin. Natural supplements play a really critical role. Millions of Canadians are aware of this as well. I would be one of probably millions that are aware of this.

Commissioner Massie

I thought your studies—the work you’ve done on masks and potential side effects for health—are very interesting. Because this is something people have hypothesized, that wearing this device could actually lead to all kinds of issues with the build-up of CO₂, for example, which is really bad for your health.

When you started those studies, were you aware of the science that would actually support that kind of warning about wearing the mask?

Joseph Bourgault

We knew the Occupational Health and Safety signs, that we could not put an employee in an environment where the level of carbon dioxide would be above 1,000 parts per million. And we knew that we couldn’t put an employee in it. That’s all in our Occupational Health and Safety Regulations. So we understood that. What I didn’t know, so I hired a guy, an expert with a CO₂ oxygen monitor, to come and measure. And we recorded this. This is all on video. We are actually planning on launching a lawsuit on it.

Commissioner Massie

So to the best of your knowledge, the health authorities, whether in Saskatchewan or in Canada, are not aware of this potential health hazard?

Joseph Bourgault

Well, just a short story. In our company, the way people were wearing masks, we told them that if you are alone in your office or six feet away from others in workstations in the manufacturing facilities, that you wouldn’t have to wear a mask. Somebody possibly reported—it doesn’t matter—somebody possibly reported us. So three government officials came in unannounced and met with myself and our general manager and our human resources manager and I explained this to them. And they made a lot of notes because they didn’t know any of this.

Commissioner Massie

Is it acknowledged today with the new data that is coming from the work you’ve done or other people,

[01:00:00]

that wearing masks on a constant basis could actually be a serious health hazard? Is it acknowledged by health authorities?

Joseph Bourgault

I would gladly work with any government official on this information to get it out. No government agencies have reached out to us to get this information out there.

Commissioner Massie

Thank you.

Commissioner Kaikkonen

You mentioned that it makes no rational or logical sense to be experimenting with our children. When we think of universities and colleges and the K-12 system, and now our pre-school, where all those educators who have the credentials behind their name were responsible or facilitators of their programs, what would you say to them now, knowing what they have done to our children and understanding what masking is doing?

Joseph Bourgault

Well, what I would love to see happen in our country is that we return to teaching the basics of reading, writing, arithmetic, teach computers, accounting. But critical thinking skills, what I observed here in our country, I believe that what we saw: 70 to 80 per cent of Canadians, including professionals, have no critical thinking skills. To discern the truth is easy. You set the goal of truth. You keep an open mind. You listen to what anybody with any expertise has to say. You do your research and gather the facts as you would in a criminal trial. You gather the factual evidence and, based on the facts, using deductive reasoning and logic, you can discern the truth. That's so simple. Why are we not teaching our children and university students how to solve problems?

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

Good afternoon, Mr. Bourgault. You talked extensively about the government and what they've done. But I would like you to comment briefly about the role of the media in this, the role of the colleges of physicians and surgeons. The government couldn't impose this on their own without assistance, so can you talk a little bit about the role of the media and the colleges?

Joseph Bourgault

Well, agreed. Obviously, government, like a premier— Unless you're a doctor or you've had life experience like myself, your government officials are going to have some difficulty in discerning truth on medical issues. So they rely on doctors and scientists for this information. But surely in Saskatchewan, in a province with 1.2 million people, or in Canada, there would be medical— And we have them, medical professionals like Dr. Francis Christian. There are many of them that were speaking up and they were silenced. To me, silencing the honest, truth-seeking doctors in our country: to me, that's criminal, what they did. Because those doctors, around the world, could have saved millions of lives. **But in Canada, they could have saved over 40,000 lives.**

The media— I can't encourage people enough to listen to Rodney Palmer on his presentation of what was taking place behind the scenes. Obviously, the Liberal-NDP government, using hundreds of millions of dollars to buy our media, to shut down journalism— In the words of Rodney Palmer, truth-seeking journalism had gone out the window. It became a propaganda arm of our governments with this narrative. And so there's criminal activity in the media.

I believe there's criminal activity in our medical agencies. I believe they're controlled. Health Canada, I believe, is controlled. The pharmaceutical industry is there, and I think the World Health Organization. Dr. Astrid Stuckelberger, a World Health Organization scientist,

explains really well what's going on at the World Health Organization and how it has been corrupted by Bill Gates and his organization, GAVI. So there's corruption right from the top.

Commissioner Drysdale

One last question, sir.

[01:05:00]

Considering your extensive background in industry, I'm sure you're somewhat aware of the anti-combine laws in Canada. And could you comment on how the current state of the media, the fact that we have so many mergers—and they just announced a big merger in Canada with the media organizations—how would this be allowed to have happened in Canada, considering the anti-combine laws that you were subject to? And do you think what has happened is a benefit or a negative to Canadians?

Joseph Bourgault

Thank you for that question. Diversity to me is nature. God is diversity and I never had trouble with competition in our industry. It's essential to have competition. I don't see anything that's going to correct this monopolization, this centralization that is taking place in our society. And at CanadiansForTruth.ca I really encourage people to go there and read the principles that we espouse. The foundation of a just society and an enlightened society, I believe, flows from these basic principles. Recognizing God as our creator and all the principles and laws that He created to govern our existence. And so I think we need that type of political leadership, principled leaders that are not going to put up with bullshit and corruption. We need incorruptible people in positions of leadership in our country.

Shawn Buckley

Joseph, we've got a couple of more witnesses and we're going to be sitting past six and you kind of segued off the question. Sorry about that.

No further questions. Joseph, on behalf of the National Citizens Inquiry, we sincerely thank you for attending and giving us this testimony today.

Joseph Bourgault

Right. Thank you.

[01:07:15]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Moderator Statement: Shawn Buckley

Full Day 1 Timestamp: 08:53:55–09:02:45

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. It was brought to my attention that this morning when I did a call out for lawyers—because we are short of lawyers—I had said we need some bilingual lawyers for Montreal. And my mistake was we definitely need bilingual lawyers, but our hearings are going to be in Quebec City. So, we are looking for a team of bilingual lawyers that can assist us, basically doing what Dellene and I and Wayne are doing here today, but in Montreal with largely French speaking witnesses. And then we're also short of counsel for Vancouver, which starts in two weeks. So if there are any lawyers that want to assist us with that, please contact us immediately. And I think we're, you know, a couple short in Red Deer too, but what the heck.

So we're going to start with a video presentation just to bring us back, to remind us, some of what we'd experienced before. So, I'll just ask David if you can run that for us.

[Video] Teresa Tam, Chief Public Health Officer of Canada

I think the public has to know this is one of the worst-case scenarios in terms of an infectious disease outbreak and that their cooperation is sought. If there are people who are non-compliant, there are definitely laws and public health powers that can quarantine people in mandatory settings. It's potential, you could track people, put bracelets on their arms, have police and other setups to ensure quarantine is undertaken. It's better to be pre-emptive and precautionary and take the heat of people thinking you might be over reactionary, get ahead of the curve and then think about whether you've overreacted later. But it's such a serious situation that, I think, decisive early action is the key.

[Video] Saqib Sahab, Saskatchewan Chief Medical Health Officer

Whenever an election is called, whenever. If after the election is called, there's evidence of increasing transmission, rapidly increasing transmission—like Italy—I think serious consideration will have to be given to what steps can be taken to minimize further transmission. So yes, you can put very restrictive measures in place, either locally or more broadly, depending on what's happening at any time. We have announced something that we were expecting for a while now: that we have our first confirmed case of COVID-19 in Saskatchewan. It was a person who had traveled from Egypt. Egypt is one of the several

countries listed on the WHO website that is showing COVID transmission. The individual is comfortable isolating at home, like the majority of cases in Canada. Public health is diligently following up with the individual, their movements while in Canada and in Saskatchewan, to see if there's any contacts that need to be informed to self-monitor themselves. We were expecting to see a case at some point. We will expect to see more cases in the future, primarily linked to travel. Anyone, irrespective of travel, if they have a cough or fever, stay home. Anyone who is outside, practice good social distancing. Avoid shaking hands, cough in your sleeve, wash your hands frequently, or use a hand sanitizer. And at the first sign of fever or cough, self-isolate, and don't go to school, university, or work.

[Video] Saskatchewan Premier Scott Moe

So today the government of Saskatchewan is announcing a number of aggressive new measures to prevent the spread of COVID-19 in our province. The Chief Medical Health Officer of Saskatchewan has made the following order pursuant to section 45 of the Public Health Act and it will be effective Monday March the 16th. The Chief Medical Health Officer orders that no public gathering of over 250 people in any one room should take place. The Chief Medical Health Officer's orders that no events with over 50 people with speakers or attendees who have traveled internationally in the last 14 days should take place.

So effective immediately, international travel, including travel to the United States of America for government employees on government business, has been prohibited. The Chief Medical Health Officer strongly recommends that all employers and individuals across the province follow these practices. This will help us limit the spread of COVID-19 in Saskatchewan. It will help to protect residents from exposure to the virus and it will reduce the impact of COVID-19 on our health care system, essentially flattening the curve.

[00:05:00]

Most important is the responsibility that we all have to ensure that we do what we can to reduce the risk to ourselves, reduce the risk to our families, and reduce the risk to our communities. And the best way that we can do this is to practice social distancing, to wash our hands and wash our hands often, to avoid close personal contact like handshakes or hugs and to self-isolate if we feel any of the symptoms, any symptoms of illness.

[Video] Saskatchewan Premier Scott Moe

Today, the government of Saskatchewan has declared a provincial state of emergency giving the government broad powers to address the COVID-19 pandemic. The declaration of a provincial state of emergency provides our government with powers that include the ability to limit travel to or from a community or a region of the province. The decision to declare this provincial state of emergency comes following confirmation from the Chief Medical Officer that Saskatchewan has eight new presumptive cases of COVID-19 and this decision comes on Dr. Shahab's advice.

Public gatherings larger than 50 people are prohibited. All restaurants, bars, and event venues must limit their seating to 50 per cent of their capacity or up to a maximum of 50 people, whichever is less. And I would also note that this is phase one with regards to bars and restaurants and we may implement phase two in the coming days, which would be closing them completely. All gyms, fitness centers, casinos, bingo halls are all ordered to close until further notice. And all government of Saskatchewan ministries, agencies, and crown corporations will implement a phased-in work-from-home policy that will become effective on Monday, March the 23rd. The Saskatchewan Health Authority will be discontinuing all non-urgent elective surgeries and procedures and diagnostics as of March

23rd. Parents with children in daycare should also be preparing for the potential for further restrictions in the days ahead.

And I want to conclude by saying this to the people of this great province. We will get through this, and we will get through this together. But we all have a responsibility. And we all have to take that personal responsibility seriously. And I would say that most of us are doing that. But I have heard some anecdotal reports of people that have returned home from abroad and who are out in the community the very next day. And we just simply can't do that. We need to self-isolate. And I know you may say that you're feeling just fine but you might be endangering the health and the lives of others. Your neighbor possibly, or even an elderly family member.

And I know this is completely counterintuitive, especially here in our province. In times of crisis, we are a community, and we pull together as one. We've shown that so many times. But today, pulling together means we need to stay apart. Helping each other out during this pandemic, it means listening to Dr. Shahab and his advice that he provides, as well as his counterparts, public health officials from across Canada. And this means each and every one of us should adhere to the advice that they provide us. It's important for us to understand that these measures will not completely prevent the spread of COVID-19. But they will flatten the curve. We will get through this. And we will get through this together.

[Video] Teresa Tam, Chief Public Health Officer of Canada

I think the public has to know this is one of the worst-case scenarios in terms of. . .

Shawn Buckley

Sorry, that video just loops.

[00:08:50]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 1

April 20, 2023

EVIDENCE

Witness 8: Bryan Baraniski

Full Day 1 Timestamp: 10:10:45–10:34:11

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Wayne Lenhardt

I think this is going to be an interesting sequel, which wasn't really planned. But we may be able to call this Exhibit 1 or a supplement to Mr. Bourgault's presentation.

Bryan, could you give us your full name and then spell it for us, and then I'll swear your oath.

Bryan Baraniski

Bryan Baraniski. B-R-Y-A-N, Baraniski, B-A-R-A-N-I-S-K-I.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth so help you God?

Bryan Baraniski

I do.

Wayne Lenhardt

You own a hotel that includes a bar and the usual accoutrements in Tobin Lake. Is that correct?

Bryan Baraniski

Yes, I do. We have a resort there. It's the hotel with a restaurant, a bar, conference facilities, cabins, campground. We do guided fishing.

Wayne Lenhardt

And it runs year-round, correct?

Bryan Baraniski

Three hundred sixty-five days a year, yeah.

Wayne Lenhardt

Okay. At a certain point, you contracted COVID, correct?

Bryan Baraniski

I did on March the 6th, 2021.

Wayne Lenhardt

Okay. Could you tell us about that?

Bryan Baraniski

Well, I went to work in the morning. I show up to the hotel usually at 8 o'clock in the morning. And I showed up and went to my office. I wasn't feeling good when I woke up. I decided, well, I'm just going to hide out in my office for the day, so I don't give anybody the flu, or whatever I think I have. As the day progressed, I was getting a little bit worse. I had the shakes a little bit, so I decided, well, I better go home. So I went home. I have a house four blocks away from there and drove home. Went in my house and decided I'll just lay down and maybe it'll get better.

My son shows up at about six o'clock, and he hears that I'm not at work, so he comes to check on me. He comes to the door and I answer the door. He goes, "Dad, your lips are blue." I said, "Oh, okay." I said, "Well, I'm trying to sleep this off, get better in the morning." So he takes off. In the meantime, he had phoned my ex-wife, which is his mother, and tells her the situation. Well, he comes back, and he says, "Dad, I'm taking you to the hospital." I said, "No, no I don't think so." I said, "I'm going to sleep this off." And he goes, "No, get in the truck or I'm going to throw you in the truck." And of course, me and him are always confrontational, but I was too weak and stuff to argue with him. So I jumped in the truck and, okay, I'm going to the hospital.

I get to the hospital, and they admit me. They do some tests on me and they tell me I've got pneumonia. After the doctor had told me that, another nurse comes in. She takes a swab and sticks it up my nose, and it's painful as hell, and she runs out of my room. I'm sitting there, and I end up spending the night. The next morning, I was having a little tough time breathing; it was getting a little worse. And then the doctor comes in and says, "You have COVID." Okay, that's new. They were monitoring me fairly close. Then about noon or so, my breathing was getting a little tough—shorter, shorter breaths. And the doctor says, "We got to load you up and take you to Saskatoon."

Wayne Lenhardt

Your oxygen levels were a bit down, were they?

Bryan Baraniski

Yeah, I was short of breath and it was tougher to breathe. Yeah. I knew I had something, maybe it was pneumonia. I've never had pneumonia before, so I didn't know what it entailed. So yeah, so the ambulance shows up, and they're concerned whether I have enough oxygen to make it to the city or not because it's a three-hour drive. So they put an extra tank in just to make sure I'm going to make it there.

They loaded me up and hit the sirens and away we went, flying. It was fast. I was looking out the back window, and we were passing the vehicles and siren on pretty much all the way there. Get into Saskatoon University Hospital. They admit me. About half an hour in the waiting room—or not in the waiting room, just waiting to get a bed, I guess. Then, finally, they admit me into a room and they're monitoring me. My breathing is getting worse; they got me on a mask. The next day, I was getting worse and worse and worse. The next day, I'm off to ICU,

[00:05:00]

into the ward they had for all the COVID patients. I think there was 10 rooms, all separately isolated and behind glass. So, on oxygen, of course. It was getting worse and worse; pretty soon I was on 90 per cent required oxygen. So the doc goes, "We're going to have to put you on the ventilator if it gets any worse than this." And, of course, they put a tube down my nose, a feeding tube. And yeah, like I don't know if you've seen the picture. It was on CBC News, anyway, because I was the anti-lockdown guy. So they had to beat me up.

So then that night or the second day in, the doc comes in. He says, "You better get a hold of your family and tell them to prepare for the worst." Because as I'm there for my two days, I see them taking body bags out as people dying, right? That are dying of COVID. So, I'm down to short breaths—"aha-aha-aha-aha"—like that's how I'm breathing all day long because I've got no lung capacity. So then, when the doc tells that, I figure, "Well, I'm not going to call my kids and worry them." I'll just start writing letters, right? So I figured this is it for me, right? You know, he's telling me to prepare for the worst. I know what that meant. And so I'm writing letters to people that I figure should hear from me.

The third day in, I was still holding at 90 per cent. Then I woke up one morning, and I had the feeding tube out of my nose. I figured, "Oh Jesus, now they're going to fight to put that back in." It was painful as hell. And the doc goes, "Oh, no, maybe not." He says, "You're down to 85 per cent oxygen." He says, "Maybe we don't have to put that back in." So they monitored me for a few more days and I hovered around that 85 per cent, not over 90. So I wasn't on the ventilator.

The staff treated me really good. One nurse brought me chicken noodle soup because I said, "Hey, if I'm going to die, can I die with chicken noodle soup in me because I don't get none in here, right?" So, she went home and made homemade chicken noodle soup and brought it to me. She said she wasn't supposed to do that, but she brought it to me anyways, which I was thankful for.

Finally, I get out of ICU 10 days later, and they put me in recovery. I'm down to 65 per cent required oxygen, and it won't get any better, and it's staying the same. They tried to get me down to 55, and I struggled to breathe, and they put me back up. So I had several doctors that would come throughout the time I was there, probably three or four different doctors. And one doc says, "You know, you could be here for a couple of months. We've seen it where it takes a while to get you to recover, to get your lung capacity back." And I figured geez, I'm not sticking around here for a couple months.

In the meantime, the CBC had done a story on me while I was in ICU, with the tubes and everything in me. They posted it on social media and on the CBC News. And, of course, all the people beat me up there. They were on social media. They were commenting about how bad of a guy I was and wasn't following the rules, and I was the anti-lockdown guy. Then, Joseph Bourgault, the previous guy that was just on here, he seen me on CBC News. He phoned up the hotel my son was running at that time. In the meantime, they had shut my hotel down; they had shut it down for two weeks. Kicked everybody out of the rooms. Told everybody that they had to leave. My son wasn't even allowed to go there. I was peeved off because it was on autopilot. It was on autopilot for three days in the entire hotel—12,600 square feet. Mechanical systems running, everything. Nobody's allowed in that hotel for three days. Not my son. He's told to be isolated.

I was furious—wild at the government. I couldn't believe that they're handling it like this. This thing could blow up; there could be a water leak. But nobody was allowed in the hotel for three days because we had a COVID outbreak, they said, at the hotel. So that was fine. I was arguing with my son to get back there. And of course, his mom, my ex-wife, was saying, "No. Listen to public health. Don't get in any more trouble. Your dad's in enough trouble already." Right? So that's how that went down. We ended up opening up two weeks later. We had to get an independent cleaner to come clean the entire hotel because they wouldn't let any of our staff do it because they might have COVID.

So anyway, I'm back in the hospital trying to recover here. My ex-wife, of course,

[00:10:00]

she's bringing me grapes and chocolate bars and stuff up to the ward, not allowed to see me because I'm isolated. This is probably day 20-some that I'm already there, and she's brought grapes and stuff several times. In the meantime, Joseph had called me, and said, "Hey, I seen you on CBC News." Of course, he got the number from my son because I have my cell phone right by my bedside. He said, "I like the fight in you." He introduced himself. We had a lot in common. I used to farm, and he had Bourgault Industries. We actually owned some of his cultivators and so had a good introduction there for about half an hour.

Then Joseph says to me, "You go get some quercetin and some zinc, and you're going to walk out of that hospital in five days." And I figured, "Oh, well, I'm going to try that for sure." He said, "I run a health food store, and I've helped lots of people with COVID. And they've all recovered with quercetin and zinc." So, I phoned up one of my wait staff. I have 25 employees in the summer but about 12 to 13 in the winter. One of my waitresses in the city that I'm fairly good friends with, I phoned her up said, "Go down to the health food store, get some quercetin and some zinc. Bring it up to this ward, up here at the University Hospital, and I'll e-transfer you whatever it is." So she did that. I e-transferred the amount.

So the next day, I still hadn't got my stuff. So I said to the nurse, "I'm supposed to get a package delivered up here." And she goes, "Yeah, it was delivered up here. But I showed it to the doctor and the doctor says you can't have it." I said, "Oh, okay." She said, "No, it's not prescribed by us, by the doctor, and whatever's prescribed by him that's all you can have. You can't bring any other medicine in from outside." So I figured, okay, I got to think this one out. So I phoned up my ex-wife and said, "Go down to this health food store, go buy some quercetin and zinc." I said, "Open up the bottle, throw the pills in the bottom of the grapes and bring it up here." So she does that, does what I tell her and brings it up there.

Of course, she told me not to mention her name. She goes, "I'll get in trouble. Don't mention my name." Yeah, okay well, I'm not going to mention her name, but you guys all figured out who she is already.

So then the nurse sees grapes and chocolate bars and brings it through. That was on a Tuesday. So Tuesday, Joe said to take it during your supper and dinner meals. This was Tuesday afternoon when I got this package. I took a quercetin and zinc at supper that night, and then the next morning for breakfast, I took two more. I figured another zinc, another quercetin and— Heck, I'm just about dead, anyway. What the heck are you losing doing three? He said it was maybe hard on the liver and stuff. But I figured that's the least of my worries and so I took it three times. I took it at breakfast the next day, lunch, and supper. By supper, I had improved quite a bit. The doctor noticed. He says, "Yeah, your oxygen requirement is down a bit. You're down to—" I think, it was 45 or 50 per cent. Of course, I never said nothing to him.

The next morning, on Thursday morning, took the same routine, three more times during that day. By supper or just after supper, when the doctor comes through, he goes, "You've improved quite a bit." He said, "If you carry this on, you get under 30 per cent, we can ship you back to Nipawin." He says, "You can go to the hospital there."

So the next day I was down to less than 30 per cent. So then the doctor goes, "Yeah, we can transfer you over to Nipawin." He said, "I'll line up an ambulance." And the ambulance was like 1500 bucks or something like that. I said "Well, can I just catch a ride with my ex-wife? She has a house back in Tobin. She's going back Friday nights, anyway, because she has a business in Saskatoon. She comes up Monday morning, comes back Friday night." So anyway, after being convincing to the doctor, he said, "Oh, okay. We'll just give you an extra oxygen tank to take with you. But she's got to take you straight to Nipawin." And I said "Yep, fair enough."

So anyway, as I'm getting my clothes on and signing out the release forms and everything, as you're getting out of the hospital, I said, "Doc, I got to tell you something." I said—this is tough here but—I said, "You've got to give this quercetin and zinc to everybody that comes in here." I said, "Because I smuggled it in here." So he looks at me, and he goes,

[00:15:00]

"How do you spell it?" I said, "quercetin," and I spelled it. So he goes and researches it, and he says, "Well, we can't. It's in Health Canada trials, and we're not allowed to prescribe it yet." And I said, "Let me guess. It's going to be in Health Canada trials till everybody gets a vaccine, right?" And he smiled and walked away. And then, I went to Nipawin.

So I get to Nipawin. I'm in the hospital for three days there and, finally, they release me. They get the oxygen set up in my house. So I got oxygen. They give me five tanks of oxygen—these little portable ones that I can move around. So three days, I get checked out of Nipawin hospital. I head back to my place. Of course, I got to get back to work. The first thing I do as soon as I get home, I grab an oxygen tank and head down to the hotel, right? Dragging this oxygen tank, away I go. A few hours later, it's all used up. So I got to go back and get another one. And next thing you know, my five tanks are used up. Over each day, I was reducing it a bit, anyway, but I didn't have enough to get through for the remainder.

But my mom, who's in her 80s, she's in a senior's home. So I sent my son. I said, "Brady, take these five empty oxygen tanks, go to see Grandma, and bring her full ones back here." So he took the five empty ones there to her place and brought the five full ones back.

Because I was only getting oxygen— Once a month is when the person showed up there, right? So used up a few of those tanks and then, pretty soon, about five days after being out of the hospital, I was off oxygen. I was back to normal. And I have not been sick since.

Wayne Lenhardt

So I'm going to move you along a little bit. I think you're sitting here hale and healthy at the moment. So I think you obviously recovered. What was it, 30 days you went through this ordeal?

Bryan Baraniski

Yeah, I was admitted in the hospital March 6th, and I got released from Nipawin April 3rd.

Wayne Lenhardt

Okay. Tell me about the financial consequences of what you were doing on COVID.

Bryan Baraniski

Part of the reason CBC was beating me up is because I got two \$14,000 fines. And then we got five \$2,800 fines, some of my staff members got for failing to wear a mask.

Wayne Lenhardt

And they shut you down for a certain period, right?

Bryan Baraniski

Two weeks. Probably lost \$50,000, we figured.

Wayne Lenhardt

And how many staff did you have that you had to send home?

Bryan Baraniski

Thirteen staff all got sent home.

Wayne Lenhardt

Okay.

Bryan Baraniski

So one of the staff, she had an exemption for a mask, which was fine. The public health supervisor, who had been to the hotel several times had said that she was okay, at first. And then, finally, he came out there. He goes, "No. We're not accepting these exemptions anymore." He said, "You have to fire her or else make her wear a mask." I said, "No, I'm not." I said, "You can go tell her that." So he went up to her, he says, "You either put a mask on or you have to go home or I'm going to give you a \$2,800 fine." She goes, "Fine, I'll go home then." So she went home.

Some of the fines they give me— Of course, the supervisor from public health, he'd phone me up pretty much every second day, right? He always had a complaint, like what we were doing. We had our feet stuck in where we were anti-lockdowns for sure, right? Wherever there was a loophole, we'd try and figure out how to work around it. One of the times, I'll give you an example, is that they lowered it to 10 people, private party, right? That's all you could have at a household. So we had the bar that was closed, locked up, but we'd have 10 people in there every night because people wanted to come there. And we carried on like normal, except the doors were locked.

One time the RCMP showed up. Of course, we were getting complaints and they're at the door, and "No, you can't come in. Sorry, we already got our 10 people in here." So of course, away they went. We wouldn't let them in. There was nothing they could do about it. We had the doors locked, and we weren't open to the public. It was a private party, right? So that's some of the things how we carried through.

What else did we have going on? When they give us the \$14,000 fines, the one was failing to keep track of all the customers who was there. We had a book. We had a desk at the front of the restaurant that you signed in. So anyway, they had come there one time, and they give us the fine because three of the names were unreadable.

[00:20:00]

And then some of them were a little bit vulgar, like, there was Daffy Duck, Phil McCrotch. And then, they'd write a number—seven, six, eight f-you, writing stuff like that down. Some of the people just were not following the rules. I couldn't have an extra staff to monitor sitting at the table. So of course, they come in there, and we got a \$14,000 fine for that.

The other fine we got was failing to ask for a vaccine passport. So that was controversial, too. Because I was working the morning in the restaurant, and then there was a public health girl, which I knew that she worked for public health. She was sitting at one of the tables and I'd taken her order and everything. Sorry, I hadn't taken her order yet. I brought her water and everything. Then my son Brady showed up, and I said, "Table two." I said, "I haven't taken her order or anything yet, you can go grab it." So he goes over there with a mask and everything. He puts a mask on because I say, "Hey, that's a public health girl over there. Make sure you get your mask on right." So we're trying to hide it, right?

He goes over there, mask on and everything. Then he gets fined for failing to ask for a vaccine passport. And of course, Brady goes, "Well, I didn't know if my dad asked for it. I just assumed that he asked for it." And no, it didn't matter. So we got nailed a \$14,000 fine because she never got asked for the vaccine passport. So you've kind of set us up there, we thought. It was kind of dirty. So of course, same thing: Three cop cars show up, and the public health people, and they get out. You'd swear to God it was the biggest drug bust that ever happened. And they come out and give us a \$14,000 fine, right? Middle of the afternoon. Cause a big scene, so all the customers can see it.

So we fought them all. Of course, we lost. The judge, he wasn't on my side, for sure, I didn't think. He just thought that the government had the right to invoke those policies. And I didn't follow them and that's just too bad, right? He did reduce the fine down to \$12,000. So we got two of those fines. Then I got a \$2,800 fine. My son got a \$2,800 fine. Three of the staff got \$2,800 fines. The RCMP officer that gave those tickets out also stated to the three girls, "You put your mask on and the next time we come in here, and you have your mask on, we'll just get rid of those three tickets." Of course, went to court, and we tell that story,

and the judge goes, “The RCMP don’t have the authority to release your tickets on a public health order.” So, they all got nailed \$2800 too.

Wayne Lenhardt

Okay, due to the late hour, I’m going to ask the commissioners if they have any questions. I think that’s a no. So on behalf of the National Citizens Inquiry, thank you so much for giving us your evidence.

Bryan Baraniski

Thanks.

[00:23:26]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 20, 2023

Day 1

EVIDENCE

Witness 9: Cindy Stevenson

Full Day 1 Timestamp: 10:34:50–10:56:48

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Dellene Church

Our next witness is Cindy Stevenson. Cindy, can you state your name for the record and spell your first and last name?

Okay, you need to unmute. Not yet, no. Can you see your mute button? Just make sure that's off.

Cindy Stevenson

How about now?

Dellene Church

There you go.

Cindy Stevenson

Okay, I just had my headphones on. I'm sorry about that. My name is Cindy Stevenson, C-I-N-D-Y S-T-E-V-E-N-S-O-N.

Dellene Church

Thank you. Cindy Stevenson, do you swear to tell the truth, the whole truth, and nothing but the truth, so help you God?

Cindy Stevenson

I do.

Dellene Church

Thank you. Cindy, you refused a COVID vaccination and as a result, you were fired from your job of nine years with CN Rail.

Cindy Stevenson

That is correct.

Dellene Church

Can you tell us about that experience, how that came about for you?

Cindy Stevenson

Well, I could see kind of what was coming with all the talk about vaccinations and all the political push for, certainly, passports and mandates. And I had sent an email request to my union looking for representation, because I did not consent to the trials, the medical trials and the therapeutic of what they were calling a COVID vaccine. I had stated that there was so much risk. I put on there the VAERS [Vaccine Adverse Event Reporting System] reporting, which had indicated that there were more than all the vaccines combined in 30 years of adverse events. There was risks that I did not want to take. And also, that I was COVID-recovered: I had just had COVID in August of 2021 and they were demanding that I get a vaccine prior to October 29th or I would not be working after that.

The union responded to that email with a positive message, saying that they understood and that the information in the email would be forwarded to the national and the local chairperson of my union. I never heard anything from the union again until November 10th of 2021. I was held out of service on November 15th, 2021.

Dellene Church

Okay. And through your union, was there contact yourself with your employer, or contact with the employer through the union as well?

Cindy Stevenson

I had contacted the employer multiple times. Stated that I was COVID recovered, that there were higher instances of injury for people who had recovered from COVID, especially such a close proximity to having the virus. And then obviously them demanding that I get a vaccine right away, that it exacerbates and causes extreme inflammatory results. I had done quite a bit of research. I sent a lot of information to the union and my employer in regards to vaccine injuries, risks. Natural immunity was very, very widely acceptable and it was also acknowledged in the National Institutes of Health. There was an article January 26th of 2021 stating that natural immunity was long-lasting with COVID-recovered people.

Everything that I had sent in, all the concerns I had with the risks, with it being stated as a **medical trial, it was in trial phases, nobody responded with anything. Except for the union stated to get vaccinated to avoid consequences.**

[00:05:00]

And also, the employer said that I was privileged to continue working if I was vaccinated. Natural immunity and positive proof of natural immunity being positive is not acceptable.

Dellene Church

Did they offer you any options for testing in order to continue your work?

Cindy Stevenson

No.

Dellene Church

So after you had tried all of these options and avenues, what happened then for you to be let go? How did that proceed?

Cindy Stevenson

My last shift was November 14th, and the next day people who refused to either give out their personal medical information and/or that refused were just held out of service. And there was really nothing that we could do. The union did respond to me November the 10th. A representative asking me four questions, which were quite odd: If I informed the company that I had COVID; did I get a PCR test, which I did not. And just, you know, asking what the company said about my COVID. But nothing to do with any of the concerns that I had forwarded, multiple concerns. I did end up putting in a complaint with the CIRB, the Canada Industrial Relations Board. November 28th, 2021, it was submitted. I prepared it myself, which is not really recommended. They did close the complaint down. It's a Section 37 complaint in regards to unfair treatment and discriminatory treatment or arbitrary treatment by a union. They had stated that there just wasn't enough evidence there to go forward.

Since then, I filed a human rights complaint with the Canadian Human Rights Commission, which was never addressed. I did ask for multiple — I sent emails and I called trying to get an update. They have not responded. I did apply for Service Canada Employment Insurance in November 2021, which was declined. And the reason being was due to my misconduct. So I was left without a whole lot of options. I did retain a lawyer to prepare a reconsideration for a Canada Industrial Relations Board [CIRB] review, which— They're not really wanting to give any updates, so I can't update where that is. That was filed on September 29th, 2022, so I'm still waiting on that. I've had multiple emails sent to members of Parliament, my Member of Parliament, MLA, in regards to other issues with the natural immunity.

I did get my job back June 20th, 2022. There was a motion brought forward by a couple of gentlemen in Toronto. A lawyer had brought forward a challenge to the ministerial order. That was June 14th, I believe. The government suspended the mandates and we were called back to work. Three days later I got a call from CN stating that we were good to come back to work. And I had 72 hours' notice to give them my return-to-work plans, which I did. At that point, I had contacted my union and asked what the protocol was going to be, if we were going to be held out again, or what was going to happen. And there was no positive response, just non-answers.

I did give them my return-to-work plan. I did go back to work on June 20th. Only later, the 28th— I got a letter from CN dated the 28th of June stating that they could reinstate the vaccine mandate if the government said that health and if the science said so, which— There was no response from the union.

[00:10:00]

I did go back to work. I managed to kind of pick myself up and return to work. No response for any of the questions that I had forwarded by email to the union. They basically just told me to leave it alone. That my CIRB filing was frivolous, the one that I put in in November.

There was no support from the union whatsoever. And it became quite difficult to continue working because of the stories of coworkers who were vaccine-injured. It started to kind of get quite resentful, and being in a safety critical position that I worked, I just— I was really not doing very well in that situation simply because— With the natural immunity, it finally being recognized and it's on the mainstream news, nobody acknowledged anything that they had done.

I couldn't continue working and I did resign March 3rd of this year, unfortunately. I just couldn't keep working with the situation that happened, and in a company where I thought that if you bring safety concerns forward with mounds of evidence, they ignored. I just couldn't risk and keep working there. And just knowing that at any time they could just say, "Well, we're going to do this again," it just got to be too much.

Dellene Church

And so, what were the economic losses you suffered over this time?

Cindy Stevenson

I was out of work for seven months. I've spent quite a bit of money on my lawyer, which is worth every penny. I didn't ask for any remuneration. I would have liked my seven months of pay back because I feel that I was wrongly disciplined. The union, in our little handbook, states that: "Employees have the right to be informed of known or foreseeable hazards in the workplace, and be provided with information, instruction, training and supervision necessary to protect their health and safety." It also states that I have the right to participate: "Employees have the right and the responsibility to participate in identifying and correcting job-related health and safety concerns." And also, that I have the right to refuse to perform in an activity that "constitutes a danger to the employee or to other employees." They did not live up to that expectation. I really had no recourse there, but I would have liked my seven months back.

With all the information that came out— Obviously, we were held out of service or terminated, some of us. People need to have the ability to be able to make an informed decision and not be forced into any sort of dangerous or hazardous work. I would ask for that as well, and to have my disciplinary record removed for obviously being held out of service for being non-compliant to a vaccine policy.

Yeah, it's monetarily — I think more so, it was just emotionally damaging. Because every avenue that is available to people to keep them safe at work, to be able to participate in safety discussions, that needs to be addressed. Every avenue—political leaders or members of Parliament or the Premier's office; I tried to reach out to institutions, Service Canada, the Canadian Industrial Relations Board—they all just ignored everything that happened.

Dellene Church

You also mentioned in your questionnaire the effect not only on yourself, but on your family and especially your children, for having trust in our country and government and health system. Can you talk a little bit about that?

Cindy Stevenson

Well, all young adults,

[00:15:00]

my children, four of them. And this lack of trust, there is no trust and there is no recovery for my entire family, just seeing what happened to me. They all worked through everything. We've remained kind of not affected by the pandemic, thankfully; we're a very close family. But every institution, everything that we believed in—the healthcare system, the political system, all of the systems set in place for Canadians—never in a million years would you ever dream that you would be discriminated against because you didn't want to participate in a medical trial, and/or possibly being put in harm's way.

We're all changed. Every single one of us and there is— At this point, for myself, I don't even know if having justice for all the wrongs that have been committed will— It won't change me, anyway. My kids, definitely. They're younger, they're more affected because of their young age. But yeah, the lack of trust is— It's not healthy.

Dellene Church

Is there anything else you'd like to add today?

Cindy Stevenson

Well, I did want to add in that I did ask for — I had my natural antibody test done at a Saskatchewan private business. When I went back to work, the media was hyping up all of the boosters, and you got to get your shots, and they were thinking about mandating shots. I ended up contacting the place where I got my natural immunity test the first time in August 2021, and looking to get another test just to see if it still registered the natural immunity. I did email. And I got a response back that they were no longer able to perform those tests. The Saskatchewan Health Authority had told them they weren't allowed.

So I did contact an MLA, Nadine Wilson. She seems to be the only person in Saskatchewan that is speaking out against the narrative. And I did let her know what is going on. Because when I asked, even just to get my natural immunity test back in August 2021, I called my healthcare provider and was told that, if the test was ordered by that healthcare provider, that they would be called immediately and reprimanded. And then I called another, just a random health clinic, just to see if I could get this test done, because I could see that they were going to start mandating these vaccines. And really, I did not want to be having to put myself in any harm's way. And they told me the same thing: they could not order that test.

So, there is something very nefarious going on. The letter that I received back from the Saskatchewan Health was just to get vaccinated and they need the resources and they can't be offering these tests. But why I paid for that test, and the only way that I was led to the facility that offered it, was through the first healthcare provider that I had contacted. They said the only place that will do it is this location. And I have all that in writing as well.

I did actually send information as well to the Premier's office in regards to why naturally immune people have to be subject to this vaccine. When you have measles or you have the flu, you don't go get a shot afterward. But nobody listened. I emailed the Saskatchewan Health Authority. They never responded. My MLA— Even when there were questions of when they were trying to mask the kids and have vaccine clinics in the schools, there were documents that were on the SHA website. There was an article actually from March, 2021, which alluded to all the trials for the kids. They weren't going to be doing anything at this point just because they were trials and they didn't know.

[00:20:00]

And that article, I sent it to my MLA and he did not respond. I sent it to my MP. But that article went missing off the SHA website. Now I did copy it and I did give that to Nadine Wilson, MLA in Saskatchewan, as well. Because whatever is going on, they are trying to just lure people or lead people into— The only thing to do is just get a vaccine and that's it.

Dellene Church

Okay, I think we'll turn it over to the commissioners if they have any questions for you.

Commissioner Kaikkonen

Thank you. I just wanted to ask: Do you know if CN is still receiving funding from government?

Cindy Stevenson

I don't know if they're receiving anything from the government in regards to incentives. I do know that our union, it was part of the— They're actually on a website, it's called Faster Together and it is a program, a website where there's participants, a lot of unions, where they promote vaccines. I did ask my union representative if they were receiving any monetary incentive. The answer I got back was not that he was aware of.

Commissioner Kaikkonen

Okay, so my second question, if they did receive or if they are receiving from the public purse, is simply: Do you believe that CN was neutral in their decision-making regarding the government mandates at any point?

Cindy Stevenson

No.

Commissioner Kaikkonen

Thank you.

Dellene Church

Okay, thank you very much for your testimony today.

Cindy Stevenson

Thank you.

[00:21:57]

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

April 20, 2023

Day 1

EVIDENCE

Witness 10: Marjaleena Repo

Full Day 1 Timestamp: 10:56:49–11:28:38

Source URL: <https://rumble.com/v2je0zu-national-citizens-inquiry-saskatoon-day-1.html>

[00:00:00]

Dellene Church

Next witness today is Marjaleena Repo. Marjaleena, can you please state your name and spell your first and last name for the record?

Marjaleena Repo

My name is Marjaleena Repo, and it's M-A-R-J-A-L-E-E-N-A. And last name is Repo, R-E-P-O, Repo.

Dellene Church

Thank you. Marjaleena Repo, in your testimony here today, do you swear to tell the truth, the whole truth, and nothing but the truth so help you God?

Marjaleena Repo

I do.

Dellene Church

Thank you. Marjaleena, you found out very early in the pandemic that wearing a mask posed a serious risk to your health.

Marjaleena Repo

Excuse me, I can barely hear you. If you could be a little bit louder.

Dellene Church

Okay. Marjaleena, you found out early on in the pandemic that wearing a mask posed a serious risk to your health and you were given a medical exemption by your doctor.

Marjaleena Repo

Actually, yes, that happened. I first became aware that there was a plan by the City [of Saskatoon] to introduce masking, particularly in buses. Of course, I was very concerned about that. I travel on buses. And when I found out that they were going to do that, I knew that I was going to be involved personally because of my health issues.

So I protested to the City. I made a presentation to the City in a hurry, where I documented what I knew already about the health hazards of masks. I wasn't presenting anything about the effectiveness of masks or anything like that, but the health hazards that are already known. Because I know that I was going to be hit with it in a big way. And that presentation I did it in good faith, and I appealed to them to pay attention to all the populations that would be affected by these masks. People with bronchial problems, what I have. COPD [chronic obstructive pulmonary disease] of course. People who had difficulties hearing. Anybody who was deaf would be incapacitated.

And I especially spoke about children. How children's lives would be affected in a long-term way. And damage their capacities to learn and to relate and so on—all the things that happened. So I presented that in good faith. And I didn't get even one question, and they passed the masking order unanimously.

While doing that presentation, preparing for it, I found out that they had no information. They had no data. They had nothing that would justify doing something so drastic. They had no idea of a precautionary principle. Nobody who had prepared that material, the go-ahead, had any knowledge. They didn't introduce it as an issue—no consideration—and suddenly we were in a situation. And I was in a situation that I had to think twice before I go on a bus, what to do. I couldn't wear a mask for long, any kind of length really. I knew that.

And so my protest hadn't worked and I decided, okay, well, I have to cope with this. Try to do the best of it. Try to avoid hospitals. Try to avoid any situation where they make me wear a mask. And try not to go on the bus. At that time, it was September 1st, I could still bicycle, so I could get around. And I could go to a neighbourhood store that didn't have any masks. So I thought I have a certain freedoms left.

And then, you know, the one thing that I couldn't do— My partner and I had to go shopping once in a while. And of course, I couldn't go into a big store. He hated to go in it and he hated shopping too. But I had to send him in. I would sit in the car, and the weather was cold; it was winter, getting to be winter. And he would go in and hate every moment of it. Because he would be told, "Move this way!" "You're walking the wrong way!" "Where's your mask?" "Your mask is not done right!" And that was done by customers and staff.

So consequently, our shopping trips were quite short. I couldn't really do anything. So my life shrank, just about overnight. But I thought, okay, this is going to war. And I'm some kind of a soldier—reluctant, but I'm going to kind of hang out.

[00:05:00]

But I couldn't do it very long because I started to suffer from serious pain towards the end of October. And I thought, this is not good because I might have to go to a doctor. And I was in severe pain. I had leg pains, I had back pains. I couldn't even sit I was in so much pain.

So I went back to visit my clinic that I had been a member there since the early 80s. A very nice, lovely clinic—the Saskatoon Community Clinic—that I had really liked and supported.

And I made an appointment to go and see a doctor there. I had just gotten a new doctor I was told, because my previous one had retired.

And when I came to the clinic, I didn't recognize anything. It was like an alien world because it was just masks with people. Masked people, masked patients, masked staff. I could barely hear anybody. I still have big difficulty hearing. I have a hearing aid—a top-notch hearing aid—but I can't hear people behind masks. That becomes immediately a communication problem because I have to repeat myself. I keep asking them, "What did you say? Can you say it again? I can't hear you!"

And so that became the whole clinic experience. I mean, it was absolutely disastrous for me. I cannot possibly cope with these people because I was harassed there. You know, my mask wasn't right on. I was leaking air. I was actually hanging onto air every second.

And finally, in my doctor's office, just before she came, I was given a blood pressure measurement by a very anxious nurse who was correcting me and pulling me and telling me to put the mask on. And my blood pressure was 208. It went up very quickly, it didn't come down for a long time. And when my doctor came in, she saw that. And she heard I was sweating, I was puffing, I thought I was going to fall. And she said at one point, "You're in stroke territory." And this is what I felt: I could easily die on the spot. It became that kind of experience for me.

And the new doctor that I had was conscientious and compassionate, and she confessed that she couldn't stand the masks herself. And she tried to help me get out of the place by giving me her shawl so I can kind of just hide behind it so nobody would attack me, I think. And she said, "The next time when you come, just come straight to my office and sit there."

Of course, the next time I couldn't really come. But she did send me for tests. So now I had to go to three hospitals to get tests. And they were both—all—nightmares in terms of getting in and being treated like a human being. Because already the corruption had set in. And the thing that they should have gone by, which is "first, do no harm," had evaporated. There was no sign of it. So everywhere I felt I was being harmed personally. I was attacked personally. I became an enemy in no time.

Even having the test was so stressful that I stressed about it the day before. I stressed during it happening and I was stressed the following day. You know, I'd been captured by the enemy aliens. And I couldn't shake them because I needed those services.

So anyway, I did get my tests done. And on October 23rd I got the results. I went to City Hospital to see the breast cancer doctor.

And he came to his office and he sounded sad, but he had his mask on. And I asked him, "Whatever you're going to say to me, I want you to take the mask off because I cannot hear you." And he did take it off. And he was momentarily a human being because he also felt sad for me.

[00:10:00]

And he told me that my breast tumor had spread to my bones, and I was not operable. I had stage four. And he comforted me. He touched me. He hugged me. He probably had to worry about somebody walking in and seeing him without the mask. And he invited me to come back any time to talk. So he had what was left of the humanity. He still had it.

And I walked out of the City Hospital and I didn't know what to do. Where should I go and cry? I thought, I can't go on a bus, so I'm going to go to the nearby coffee shop. City Perks, it's a nice place. I could go there and get a cup of coffee. I could have a scone and I would go in a corner and I would cry.

I went in. And the two women who were working there— It was very early in the morning. I was the first customer. And before they said, "good morning," "hello," or something to that effect, they said, one of them, "Where's your mask?"

I said, "Well actually, I can't wear a mask."

"Well, here we have to mask. Didn't you see the notice outside?"

And I said "I actually didn't."

And she said, "Well, if you can't wear a mask, then you at least have to sign this. You have to sign your name and the address."

And I said, "Well, that's not mandated yet. That's been talked about. It's not happening."

She said, "Well, these are our rules. This is a private business. And these are our rules."

And that was the end of that, except I left very distraught. Maybe I had hoped that I would tell them my story and then cry some more and they would comfort me. They would be human beings.

I left and wrote a post on my Facebook, telling about my experience. I didn't mention why I had gone there and why I wanted to cry. But I just told about the treatment and said that I felt I was bullied. And I would never go to such a place. And that was on the 23rd of October 2020.

The next day, I woke up, I had hundreds of hostile messages on my Facebook. I was totally flooded. There were people that hated me so much they wanted me to go into a— They wanted me to get COVID and die. They wanted me to go to a hospital where they wouldn't treat me. They just wished that I would disappear. And, you know, incredible phenomenon.

It turned out that there was a radio station in the city that had discovered my posting and considered it an attack on the little café. But more than that, an attack on public health measures and therefore I had to be punished. And this radio station—which I've never heard of called Bull 92.9—had decided to mobilize these people to go after me with incredible insults.

It took me a while to even be able to cope. I couldn't talk to my family about what had happened to me health-wise because I had to basically fend off hostile elements. Names of people I've never heard of, they were not anybody I ever knew anything about.

And with this event—having a terminal prognosis, devastating prognosis—then being attacked at the same time by fellow citizens.

[00:15:00]

I mean, they're supposed to be fellow human beings. They didn't know me and they had decided to undergo a full attack on my person, personhood. I had to worry about whether

they would come to my house. I mean, would they come and throw stones through my window? What else would they do?

The next part of that is that I had decided I have to do something about it. I found out what this man had written in his Facebook, on his program. He mentioned my name; he had my posting there. He wrote, "She has also been a regular on the radio page of this station before we banned her for spamming misinformation and causing a general ruckus."

So what he was doing there, he was describing somebody else. He put my name on it and attached this description. Then sent it off to his fanbase, who then decided that they had to do something. They were also told that there was going to be a protest—also anti-vaxxers and anti-maskers would be surrounding the café—and therefore everybody has to get busy to do something. And everybody got busy to do something which was directed at my person.

The only thing I could do with that—after recovering from it—was to say, "I have to get a lawyer to do something about this. I will get a lawyer."

And I found a lawyer. I said, "You have to clear my name. I don't know how long I'll live. I have been smeared. My name has been scandalized. I want that cleared."

And he took that on. I wanted him to write a tough letter and demand that Pat Dubois—was the name of the fellow, and he is part of the broadcasting family—that he would be made accountable for his actions. The lawyer wasn't very confident that we could get anything. I was very convinced that we would win this case and we went ahead—at least the first letter, which produced results. He agreed to take off the description, but he did not give an apology. I wanted a full apology. I wanted that done so that he would have maybe paid some compensation also for what he had done to me.

At that point—just when I thought that we were now moving to the next phase, which is making more demands—my lawyer quit on me without talking to me. And he said "I don't want to continue. And I don't think you're going to get anyway anything." He basically withdrew without consulting me, saying "You wouldn't be able to prove anyway that you weren't that woman who caused the ruckus." So he basically ceased to be a professional lawyer right in front of me.

So that case— The reason why I have been bringing it up is because it's been festering me ever since. I've had so many other things to deal with and confront with and take on that it's festered. But I've finally decided to find out if I can still put in a complaint about him. I did find out just yesterday: I can. Because you can go after with a complaint about the lawyer as long as they practice. So that's in the works, so that I at least get some satisfaction along the lines that I have planned to do. Some satisfaction.

Anyway, that was a little bit long story, but I needed to have it out because it has been like the poison in my system. It was created by the same mentality that the clinic had and the hospitals had: that you are an alien, you don't belong to humanity, you can be abused, you can be controlled, you can be not listened to, not respected, et cetera. It has been the full story.

The next serious humiliation that I had, after I had received my medical exemption—

[00:20:00]

I received that from the same doctor that had been very good with me. At the end of November, I got a medical exemption and I started to use it wherever I could. And it was never—about 95 per cent, 99 per cent time it wasn't accepted—but I carried it with me on buses particularly, because I went back on bus travel.

And I had it, and sometimes the driver would ask for it or say, "Why don't you have a mask?" And I would say, "I have a medical condition, I can't." And they would accept it. It was uncomfortable, because there could anytime be a driver who would be gruff, who would insult you, and you never knew what you would get. Maybe a customer would come to you and say, "Put the mask on," or throw a mask at you. So it was ongoing. And I knew that I wasn't alone. Because luckily, I connected with protests in the city and I would go there. And at least we could commiserate and exchange experiences and horror stories. And they were all horror—similar things.

Dellene Church

And it affected every area of your life.

Marjaleena Repo

Pardon me?

Dellene Church

It affected every area of your life. That exemption did not protect you.

Marjaleena Repo

It didn't! It was, it was like nothing. I still have it somewhere here too. I also carried with me what the public health regulations said: that if you have a particular medical condition and you are signed in by your health professional, you don't have to wear a mask. Basically, it was there. I had both that and all of it was swept aside by people who became the judges and juries of my existence.

After my prognosis, I had to actually attend the Cancer Center here in the city. That was a nightmare of the nightmares. Because I have to now deal with masked and gowned and gloved people, who basically only wanted to know where my mask is. Or why. Mask was the only topic! I didn't get a kind word there; I, in fact, got threats. Threats like when I was measured for radiation treatment and the technician that measured me, when I said to him "I can't"—I was telling them—All the professionals, I was telling them "I can't breathe. It makes me feel panicky. I think I might faint if my blood pressure goes up." And I said "I can't wear a mask to this!" He said, "Then you're not going to get radiation."

And he meant it! It was it was that kind of control. It's life and death, you know? It could be trivial, and it could be life and death. That all had to do with the mask becoming the king. And no basis for it. Absolutely no basis for making it that, and no—

Dellene Church

Marjaleena, we're running close to the end of our time, so I'd like to ask the commissioners if they have any questions for you.

Commissioner Kaikkonen

Thank you for your testimony. When you said you the people around you only wanted to know where your mask is, do you ever remember society—a place in society—where our greeting to one another would have been honed in to just one simple question, “Where is your mask?” Do you ever remember a time where society would be that abusive to one another?

Marjaleena Repo

I had a hard time hearing you. I mean, it's very blurry. Can somebody repeat that? I'd like to hear it.

Commissioner Kaikkonen

I don't know if I could repeat it all. You made a comment, “only want to know where my mask is.” That other people who were speaking to you would normally greet you and say “How are you?” or “Good morning,” or something to that effect prior to COVID.

What happened to our society? Or maybe that's not the right question. Have you ever seen a part of society where the only thing that mattered to people around you was: Where is your mask?

[00:25:00]

Marjaleena Repo

I didn't quite completely hear you. I wish I could. But that's almost like an example of my experience when people had masks. You don't have a mask, but you're at a distance there and the sound distorts.

But getting back, just the essence of my story is the dehumanization— Medicine disappeared as a human practice. And it did it so quickly. And then the masking just became a method to punish you in every which way. It was just incredibly fast! And my head was constantly, “How can this be? How can it happen? Who are these people? What happened to them? Did they all get processed somewhere that they came out this way, that they can't— They don't hang on to their humanity?”

And I'm talking now about health professionals. They absconded. I didn't see any resistance. They didn't have kindness. You're in a cancer clinic and you feel abused by everybody. Because they didn't want to know of you. They didn't want to know you! They wanted to know your mask. They wanted to make personal contact with your mask. And that was the horror of it.

It's kind of a whole, total distortion very quickly of the whole society. And I don't see how it can get back, how these people can get back to that. How can they find their previous selves—if they had them—and become human beings again and treat others with essential respect? And this is what I've lost systematically, a sense of feeling that I'm respected. I'm respected. Because any time, I can be questioned by total strangers.

And then the nameless strangers, you know, hundreds. There was maybe 300 abusive emails orchestrated by a disc jockey who had nothing better to do. And he actually praised the event, what they had done: “We kicked ass.” Well, the only ass that they kicked was me. And he got away with it because my lawyer gave up on his own profession. Everything is,

like, giving up on humanity and knowledge that we've accumulated over a hundred years and become totally primitive people. You know, with the mask, that is exactly being at the receiving—at that end. It's like you're back into a primitive society.

We still are there, and it might be around the corner. It's not going away because the same people who are in power, they haven't been pushed away yet. And they pine for this power. Actually, during that period, anybody— Powerless people become powerful. Because they can exercise power over me, just like the bus driver did that banned me from a bus. I was actually banned from a City of Saskatoon bus that wouldn't open the door. Just waved a mask in front of me and took off and left me.

And I complained about it to the Human Rights Commission because it was rank discrimination. And the Human Rights Commission basically didn't want to touch it. And complained to the Ombudsman—complained about the Human Rights Commission to the Ombudsman—and the Ombudsman said “Well, they have their own rules.” So these institutions, one afternoon, collapsed internally and became enemies too.

So that has been our collective experience. And I think that I've lived it. I've lived it with others and for others.

Commissioner Kaikkonen

Thank you for your testimony. And do know that, after today, I'm quite sure there's a lot of people in Canada praying for your healing.

Commissioner Massie

Thank you very much for your very touching testimony. I was wondering:

[00:30:00]

How is your health right now?

Marjaleena Repo

How is what?

Commissioner Massie

Your health.

Marjaleena Repo

It's not very good. The only thing I'm getting right now, I've been getting one pill a day, chemotherapy. So I'm hoping to continue. I'm hoping that I can last. And I hope that I can live long enough— I've lost three years now. All the different things that I had wanted to be and do, I can't get them back. But I'm hoping that other people can make the changes that I would have wanted to make. I wasn't able to because we have an immense thing to deal with. My prognosis health-wise is still the same. I'm inoperable. I rely on the pill and I'm just hoping I last.

Commissioner Massie

Thank you very much. Take care.

Marjaleena Repo

Okay.

Dellene Church

Marjaleena, I'd like to thank you very much for your courage through the last three years as well as your testimony here today.

Marjaleena Repo

You're welcome.

[00:31:49]

[00:00:00]

Shawn Buckley

That's the last witness that we have scheduled today. And I think that everyone that just listened to Marjaleena will understand why we're doing this. If there's any doubt in anyone's mind that we need to hear stories, I think that that's put to rest. And Marjaleena, I thank you for your bravery. And I thank you for sharing with us. And I think that every Canadian that sees your testimony will share with me the shame that we feel.

So we're adjourned.

NATIONAL CITIZENS INQUIRY

EVIDENCE SASKATOON HEARINGS

**Saskatoon, Saskatchewan, Canada
April 20 to 22, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

Welcome to the second of three days of the National Citizen Inquiry hearings in Saskatoon. I have been asked to remind people to go to our website, nationalcitizenshearing.ca, and to sign the petition, and also to donate. Every time we do one of these sets of hearings in a city, it costs us about \$35,000, and we hope to recover our costs as we go along.

Commissioners, this morning I am attending as agent for the Inquiry Administrator, the Honourable Ches Crosbie.

I wanted to speak a little bit about masks, because that seemed to be a theme yesterday from various witnesses. It got snuck in one way or another. As I was thinking about masks, I was asking myself the question: Surely our governments knew? Surely the health authorities knew that masking was not a good idea? The CAPR's meta-study has come out. We had Steve Kirsch yesterday at one of his slides indicating the media and the public health authorities were relying on this Bangladeshi study, which apparently anyone reading it can understand that it's not there. We had Joe Bourgault here yesterday who, just as a businessman with employees, they brought in an expert to actually measure CO2 levels and oxygen levels within masks and were able to determine very quickly that they were not dangerous. So when I am a little along in my presentation this morning, I want you to keep that question in the back of your mind: Did they know?

I didn't have time to research, but I think one of the main advisers to Trump has admitted on TV that no, they just kind of made it up: "Well, let's do something, let's mask." And we've heard about all of this harm, about kids, literally their IQs being stunted because they are wired, hardwired; their brains learn how to speak and to learn emotion and appropriate behaviour by seeing our faces. So, an immeasurable amount of harm has been done. And the question I want you to keep in the back of your mind is: Did they know?

Now, I spoke last week in one of my openings about fear and how it is the main weapon used against us because we are so afraid of being shamed. We are herd animals. We are community people. We need to be part of the tribe. And we are so afraid of being shamed that our greatest fear is being excluded. In fact, police states have learned that, rather than

just torture and torture and torture people, just put them in isolated confinement for a long period of time and they'll break.

Now the enemy uses this fear that we have of being shamed by the herd and being excluded. It's the primary weapon. And the war is for your mind. This is where the war is being fought. And your enemy wants your mind closed so that you don't think. The enemy will give you messages, will give you a belief, and then will use this tactic of fear against you to close your mind. Understand, what I'm saying is: You will be given messages. You will be given beliefs. Then once you've accepted them, once they've been hammered in—although it's going to be constant repetition, I mean, read Hitler's *Mein Kampf*: repetition, just keep repeating the lie over and over and over and over again, and it becomes truth. Once you've accepted the message, then the next tactic—and it's playing on your fear of being shamed, it plays on your fear of being excluded from the tribe—is what I call “labels of shame.” And labels of shame are terms that are deliberately made up so that we will close our mind if somebody presents to us a message that is different than that that we've been force-fed. Labels of shame would include “conspiracy theorist.” What do you do if you're having a conversation with somebody, “Oh yeah, well, then there's this ‘conspiracy theorist—’?”

[00:05:00]

All of a sudden you don't even want to go there because if you do, that label will be attached to you. And now you will be an object of derision and shame: “climate denier,” “anti-vaxxer,” “disinformation.”

Wasn't Dr. Francis Christian refreshing yesterday? I found it interesting, I didn't know that the words “disinformation” and “misinformation”—that those words were first used in the Soviet Union as labels of shame. But understand that these terms are actually weapons that close your mind. Because if I have accepted the mainstream narrative that the vaccine is safe and effective, and then I've come to believe that if I personally go against that narrative I will be labeled as an anti-vaxxer—and I understand that that is a term of derision—now my fear of being excluded from the tribe is going to kick in. I'm actually going to have an emotional reaction to that type of information and I will close my mind as a defence mechanism. And I will close my mind because the last thing I want is to be shamed. The last thing I want is to be excluded from the tribe. So I hope you can see how effective these labels are. You're fed a belief and then you're placed in this context where, if you challenge that belief, if you even entertain ideas that go against that belief, you will be labelled with a derisive label and you will no longer be part of the herd or the tribe.

Now the danger about that is it means that we're only allowed to have one belief, and that's a belief that's given to us. It's not a belief that we've arrived at with our own thinking and without critical thought. So we've got to defuse those terms. We've got to start calling them out. **I think we need to be proud of them. We need to call ourselves “anti-vaxxers” and “conspiracy theorists” and “disinformation spreaders” and “climate deniers” even if those labels actually don't even apply to us. But we have to take the power away from them.**

And as soon as somebody starts doing that, I think we have to start explaining to them, “Do you understand that actually is a weapon being used against you? It means your mind is captured because when you use that label, it means that you are looking at any other counter-argument or information basically with disdain and with derision. And because you have that view, you can't even consider it. So your mind is closed. It's not about changing your mind. I mean, if you're so right, why are you threatened by information?” I think we need to be explaining to people that these weapons exist. Because if they can't see the weapon, they can't defend against the weapon.

When you hear a journalist use terms like “misinformation” or “anti-vaxx” or “climate denier” or “conspiracy theorists,” in that context it’s being used as a weapon. When you hear your family members or friends using that term, I hope that you can appreciate that they are a victim. So the weapon has been used against them and the weapon’s been effective, but that’s not a person to get angry about. That’s a person to have this conversation, about how they actually have a closed mind.

We have probably had the biggest fraud in history perpetrated on us. I mean, anyone watching these proceedings, it’s like: We have had these vaccines mandated. I mean, this can’t be a surprise to anyone. There were vaccine mandates. We all experienced it. For the first time, we’ve been basically told we can’t work, we can’t fly, we can’t travel, we can’t go to a hockey game unless we take a treatment, which by all definition is experimental. And we’re learning just how misguided that was—and that’s being a very generous term. I think that historians will look at what has happened in the last couple of years and describe this as the biggest fraud perpetrated in human history connected to a vaccine.

[00:10:00]

And a lot of people listening to these words will go, “Yeah, I agree with that.”

Now, pay attention then to what happened yesterday. I was fascinated how witness after witness who would agree with me, “That vaccine was bad news and we’ve been gamed.” Witness after witness said the magic words: “I’m not an anti-vaxxer,” “I’m not an anti-vaxxer,” “I’m not an anti-vaxxer.” We heard that time and time and time again by a various number of witnesses that were outraged about what the government did. And yet here they are at the National Citizens Inquiry almost instinctively saying, “I’m not an anti-vaxxer.” And you know why they’re saying that? Because they don’t want that label on them. So even in the context of these proceedings, witnesses that are saying things that definitely go against the government narrative are saying, “I’m not an anti-vaxxer,” “I’m not an anti-vaxxer,” “I’m not an anti-vaxxer.” They’re saying this because their minds are captured on that point.

I can almost guarantee you that every single witness that said that has not looked into the science behind the vaccines to determine for themselves whether any given one is safe or effective. I can almost guarantee that. But they don’t want to be shamed. And instinctively, like robots, they do that. Do you see how scary it is in a context like this? Like, literally, this is an inquiry into what happened, into what likely is the biggest fraud in history connected to a vaccine. And we have witnesses instinctively saying while they’re testifying, “I’m not an anti-vaxxer. I’m not an anti-vaxxer. I’m not an anti-vaxxer.” It’s evidence to us of just how deep this conditioning goes.

As I say, the only way to break the power of these labels is to embrace them proudly and to let people know. Let’s stop being ashamed. Somebody wants to throw any label at us, let’s stop being ashamed. Because that’s where the power is. If you understand it’s just a weapon, the label is actually a weapon, and if you allow yourself to be shamed then the weapon has power over you: once you realize that, it stops. And these labels are dehumanizing. “Climate denier?” What the heck? You mean we can’t have an honest discussion about that? “Anti-vaxxer?” Like, really? If there’s strong science on anything, and Steve Kirsch made this point, then you’d think we’d want to actually look at the science and we could just shame anyone that disagreed with objective truth, couldn’t we? And wouldn’t that be what happens? Human beings are not stupid. We have the ability of critical thought. We have just had weapons used against us so that our minds are closed and that we don’t think critically. But these terms are dehumanizing and they’re meant to be.

And our actions have been dehumanizing. You know, our last witness, Marjaleena Repo, really struck me yesterday. If you haven't seen her evidence, you must see it. She was an elderly lady who could not wear a mask. She had COPD [chronic obstructive pulmonary disease]. When she was on the stand at the beginning you could hear her breathing. And I see some people nodding in the crowd, "Yeah, I know, I heard her breathing problems." She's got a letter from her doctor. There's no question that this old lady cannot wear masks. She can't. Medical reasons. Full stop. She shared with us how she went to her oncologist and got the news that she had stage four breast cancer. So basically, a death sentence. She's shocked. She's grieving. She's anxious. She decides to go to a café to just kind of get some comfort. And they ask her to wear a mask. And she says, "No, I'm medically exempt." And then they want her to sign her name and write down her address. Just like it was the East German Stasi: "What's your name? What's your address?"

[00:15:00]

And she quite rightly said, "Well, actually, that's not a requirement." And they have this little confrontation and she leaves. She posts on Facebook what happened. Remember, what was it—the next morning when she saw? Like a hundred people led by this radio newsperson had shamed her publicly. This little old lady, who had just learned that she had stage four breast cancer, who was just looking for a place where she could settle down, who can't wear a mask for medical reasons, was being publicly shamed by what I describe as mob violence. This public shaming, where we shame others online: that is mob violence. And let's call it for what it is: It's evil and it's wrong. I'll explain that a little further.

Do you remember how she said she got no kindness at the cancer clinic because she wouldn't wear a mask? It's almost like she was a leper. She's basically repeating things we've heard throughout these proceedings from patients and medical people that testified. She was banned by the bus driver. That's her way of getting around! Listen to a couple of things I wrote down that she said— I'm not a transcriber, I might have gotten this wrong but the meaning is going to shine through. Just listen: "Masking became a method to punish you in every such way." This is her experience. "Masking became a method to punish you in every such way." She said, "The horror of it, the horror of it, this total distortion, and very quickly—" She couldn't believe how we just turned as a society on her. And she described it as dehumanizing.

The treatment that she received can only be described as utterly shameful. I was ashamed listening. I was ashamed as a Canadian to hear how she had been treated. And she said, "I didn't see any resistance." I think that's the biggest thing of all. I think that's more shaming than anything else. We had a witness in Winnipeg [sic] [Toronto] that had a mental disability and a physical disability—and told the police before she was violently taken down at Walmart and handcuffed and dragged out in front of a whole line of people. But what shocked her most was nobody helped. Nobody said anything. There was no resistance.

The questions we need to ask ourselves today is: How do we get there? How do we as a society get to the point where we're bullying old ladies who can't wear a mask? And there's no resistance. How do we get to the place where we're going to wrestle a disabled person to the ground in front of a crowd and there's no resistance? Nobody says anything. And that was over a mask too. It can't be fear. It can't be fear from the virus that you have to wear a mask to protect yourselves. Because if people were really afraid that they were going to get to COVID if they didn't wear a mask, then they wouldn't have even gone to restaurants. Because sure, you had to wear it going in, but as soon as you sat down at your

table you could take your mask off. And yeah, you're six feet away from the next table, but give me a break: If you were afraid that you were going to catch the COVID virus and get hurt or die because somebody wasn't wearing a mask, you would not go to a restaurant. And my favourite is the fact that the people that buy the mainstream narrative don't see the problem with this one: One day we're wearing a mask. One day we're wearing a mask, we're shaming old ladies in cafés, we're wrestling disabled people to the ground in Walmart. And the next day the government says, "You don't have to wear a mask."

[00:20:00]

And all of a sudden, we're all okay! We're 100 per cent okay. We can not wear a mask. We can smile at each other. Everyone's in a better mood. And that's not possible. That the government can all of a sudden understand that a virus is no longer going to go near somebody because they've taken a mask off. Was there some agreement with COVID-19 that was binding that was signed with the government?

It's not fear, it's compliance. It's compliance. Because the government then just says all of a sudden, "You have to wear a mask again," and then we're shaming old ladies again, and we're wrestling disabled ladies to the ground in Walmart. This is cult-like behavior. Listen to that. This is cult-like behavior. This became an excuse for Canadians to become vicious. And we were vicious. And we were encouraged to be vicious.

We had one witness, the pharmacist, telling us how in Saskatchewan they set up a snitch line. We watched some video clips in Winnipeg and it wasn't called a snitch line. It's like, "Be an ambassador. Be an ambassador." If that isn't a scary term. George Orwell would be very proud of that term, "ambassador." Now understand that when this is compliance, and understand how we were led to be in bad behavior: as I asked earlier understand, ask the question, "Didn't the government know that masks would make no difference?" Because if you conclude that the government knew, or should have known, that masks truly were a farce, and yet led us into these acts of violence and viciousness as a society, then some much more troubling questions come up in your mind.

The question I have for all of us who shamed people online, who were unkind to old ladies who weren't wearing masks, who stood and watched a disabled person get wrestled to the ground by the police—and I could go on and on—my question is: "Is this what we really are?" Because the problem is, we can say, "That's not who we are." We can say, "No, we're Canadians and we're kind to each other and we respect." But I have a saying: You don't look at what somebody's saying. If you want to know who a person is, who they truly are, you look at what they do. It's our actions that tell us who we have chosen to be. It's our actions. And I am ashamed of our actions. Masks are absolutely dehumanizing and the way we've treated each other is shameful. And understand that masks, like the passports: they're a **sign of obedience.**

If you conclude, "Wait a second, the government should have known. Why are we having to do this?" And I've spoken about the passports being a police state ritual; I might go back to that tomorrow, I haven't decided. But understand that the masks are a visual sign of your obedience to the state. Putting on a mask before you go into a store or a restaurant has become a new police state ritual.

Back to, "the government knew the masks didn't work." I wear a cloth mask that some lady was just selling online, that there's no way it's sealed against my face. And there was no specific requirement. If this was real, then we would have had to wear real masks. People actually would have been wearing respirators and the whole like. So, I'm hoping we can

accept that you're not really being honest with yourself if you truly believe that this worked.

But let's say the government knew this didn't work.

[00:25:00]

What happened subconsciously to a person who— Before, we were free. So before the mask mandate, you could do anything. You could go to the grocery store. You could go to kid's hockey game. You could do anything. Essential service, non-essential. You didn't have to put on a mask, you're absolutely free. Nobody was going to kick you out of the store. Police weren't going to come and wrestle you to the ground. You weren't going to be treated with unkindness. But as soon as there's this mask requirement now you actually have to go through the ritual of putting the mask on. And if you believe it doesn't work and is a farce, understand this is now just a total ritual of submission. And subconsciously the message is that, "You have to go through this action."

You used to be free to go to the grocery store but now you're not free to go to the grocery store. You are granted the privilege "if" you do what the police state is asking you to do and put on a mask. We need to start understanding that there's a real programming-in-our-mind problem. There's a real subconscious thing that occurs when we participate in things like masking. Let's say we were in a situation where we truly were in a scary, dangerous pandemic and masks could be helpful. There's still a cost. There's still a cost to the government saying, "You must wear them," instead of saying, "Here's the danger, you choose." Right? Because a lot of people—if we were being fed truthful information, we would choose to do things. Most of us probably would. Not all. The government makes it mandatory to force compliance. We're told. But understand, it also conditions us to be sheep. Because it tells us we're not free to do something we were free to do before unless we go through this ritual. So there's more going on here.

I've already said those that were attacking Marjaleena Repo are themselves victims. It means that they have accepted the conditioning, they've accepted the fear. And they're actually enforcing the ritual. So many people would not have worn masks but for it was the social pressure. It was the businesses, it was the citizens, it really wasn't the police. So we embraced this unaware.

I think that the second commandment is our only way back as a nation. And for those of you who don't know what the second commandment is, it's just when Jesus said that we are to treat every other person like ourselves. So basically, we're supposed to treat people the way we want to be treated. That's the second commandment.

I don't want to live in East Germany when it was under communist rule and their secret police, the Stasi, had every neighbour and family member snitching on everyone else. And I don't want to live in the Canada of 2020. I don't want to live in the Canada of 2021. And I don't want to live in the Canada of 2022. I don't want to ever live there again: Where we have governments telling Canadians to be good ambassadors. Where we have Canadians basically enforcing police state rituals. Where we have Canadians not treating others like they themselves would want to be treated. And I think our moral compass, our basically societal norms of right and wrong have been broken.

I was very interested when Dr. Francis Christian was on the stand yesterday, and he was talking about post-modernism. Where something might be true to you, but now we're in this milieu where, "Yeah, well, that's your truth, but I have my own truth." So there's really

no anchor of truth. There's no moral standard. And that has been deliberately imposed upon us through the education system, through the media. It's been deliberate. And it's been imposed on us to separate us, and to divide us, and to conquer us.

[00:30:00]

Because we have a civilization that was based on Christian principles, and you can't deny it. For those of you who are lawyers, one of our great jurists was Lord Denning. And he had great influence in our civil law, and our civil law dictates our responsibilities to each other. "Hey, you can't trespass on my property," for example. There was this one famous case where he just asked the question, "Who then is my neighbour?" Because we were entering an industrial age and we could now be affected by things more broadly than when we were just in an agrarian society. And he asked, "Who then is my neighbour?" That was the touchstone. The second commandment was the touchstone for determining what our civil obligations to each other are. So we had a society, and we still have a legal system, based on the second commandment, that we are to treat others as we would like to be treated ourselves. But that is being undermined, and this culture is being undermined.

I think our only way back is to understand that there are moral truths. And that the second commandment is a moral truth. It is true. You can't say it's not your truth. I'm telling you: "It is true that you are to treat others like you would like to be treated." And that needs to become the bedrock of the new Canada. If we all believe that we have to treat others like we want to be treated then there will be no bullying of old women online. And there won't be unkindness in cancer clinics. And there won't be this viciousness and this dehumanization of others. And so we have to get back to our anchor, our moral compass.

So that's how I wanted to open today. It's important because, what we're seeing here is, we're seeing witness after witness after witness affected. Experts concerned about how we basically haven't followed the law and how all our institutions have changed. And lay witness after lay witness basically testifying about the effects of this. And the problem is that we have gone into this postmodernism, this moral relevance. And we no longer hold it as a core value that we need to treat others like we'd want to treat ourselves. And if we did hold onto that, we would treat each other with kindness and respect. And none of this could happen. I think that we need to understand and start thinking at a philosophical level.

[00:33:08]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 1: James Kitchen

Full Day 2 Timestamp: 01:37:38–02:55:50

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Shawn Buckley

Our first witness will probably help us with that. David, do we have James Kitchen yet? So, James, can you hear me?

James Kitchen

I can.

Shawn Buckley

Okay, so first of all I'll ask if you would state your full name for the record, spelling your first and last name.

James Kitchen

Sure. James Kitchen. That's J-A-M-E-S. Kitchen is K-I-T-C-H-E-N.

Shawn Buckley

And James, do you promise to tell the truth, the whole truth, and nothing but the truth today?

James Kitchen

I certainly do.

Shawn Buckley

Now, for those of you who don't know you, you are a lawyer. You practice in the area of Charter rights, you practice administrative law, you practice criminal law, and you've been involved in many constitutional challenges at the Justice Center concerning COVID issues.

James Kitchen
That's right.

Shawn Buckley
You're here to speak to us about a number of things, and I'm just going to let you launch in.

James Kitchen
That's great, thank you.

Hello everyone. I appreciate this opportunity to do this. I hope that I'll have a lot of information that's maybe not quite been heard the way I'm going to say it—from a person who's in my situation, because most lawyers are quite scared to speak as candidly as I have and as you've just heard.

What I want to cover today briefly is my analysis on why the courts failed to uphold and protect your rights. Not so much how—we know that, I think—but why. And then I also want to talk briefly about what I call the regulatory capture of the health professional regulatory boards, but really all professional regulatory boards.

So let's launch in. Why did the courts do what they did?

First you need to understand at a basic level that our system is set up intentionally to divide power, not to have it coalesced around one person or one small body. Inevitably, we know from history, as soon as you do that you get tyranny. You no longer have freedom, you don't have respect for individual rights, you don't have the rule of law. You have arbitrary despotism.

We have generally the legislative, executive, and the judicial. The courts, our judiciary, are the third branch of government; that's by design. These three powers are separated.

Usually, the executive is limited by what the legislative will allow them to do. Of course, if they step out of bounds, the people can say, "This is wrong, this is not lawful. Courts, please tell them it's not lawful and protect our rights." For a long time, that functioned pretty well in Canada compared to the rest of the world historically.

But what you had in March 2020 is of course: the legislative and the judicial shut down. So you have all the power that are normally spread across these three coalesced into one: the executive. So you have all these cabinet orders, and of course they delegate a lot of their authority to the health ministers and the regional health authority leaders like Deena Hinshaw, et cetera, all across the country.

Now you have health ministers and the small groups of people in their office and the Deena Hinshaws of the country running around basically ruling as petty tyrants. And you don't really have any accountability and oversight. So whether these people had good intentions to begin with or not—of course that may be doubted—naturally, power corrupts. So what happens is you have these people going around and they're just tyrannizing everybody who doesn't agree with them.

Okay, so the judicial branch is supposed to do something about that.

Well, first of all, they shut down for the first two or three months. I don't know how many people remember that but that was immediately concerning for me and, as cynical as I tend to be, really quite shocking. They literally shut down, were no longer ruling on cases. But when they fired back up around June of 2020, it quickly became obvious that they did not see their role as holding government accountable and upholding rights. They saw their role as enabling government to continue to act in this arbitrary, repressive way because: "for the greater good," "we're all in this together," et cetera, et cetera.

So why?

Well, the first thing I want to try to explain to you to help regular Canadians understand—I've been doing this for years all through COVID and even before: you have to understand who judges are and how they get to their position. They're just regular people, insofar as lawyers are regular people, if you can believe that. We tend to be mostly regular people. Judges are just promoted lawyers. They're regular people who care about their professional reputations, their social reputations, and their physical safety.

What I observed— At least for me in the cases that I had in front of the judges that I was in front of,

[00:05:00]

and also, my colleagues and what they told me about the judges that they were in front of, I saw these very human realities really coming through. I saw judges who were scared, who were afraid. For their personal safety. And, I perceived at least, for their reputation, professionally and socially as well. There's obviously some speculation on my part there, but that I think played a role.

But specifically, the personal fear, the personal safety issues, perhaps surprised me a little bit because I would have thought and hoped that, as a judge in this country, you would recognize that there might be some sacrifice and some risk. There might actually be some difficult things you have to do to uphold this duty that you have. You're not merely enjoying a job that you can't be fired from, and that you're going to earn north of \$300,000 at every year no matter what. You do actually have a duty to serve the country. And that may actually involve occasionally some risk and some sacrifice on your part to do that.

It really seems like judges in our country do not have that perspective. They do not see themselves in that role. I think that played in, because I saw judges really quite concerned about their own personal safety. Just the fear and the way that they looked at me, and the comments that they made, and the comments they made to my colleagues in court. And just the way they wore their masks and the way they got really upset if anybody in the courtroom didn't.

If anybody even knows about me, I've of course never worn a mask and never will. I decided in July 2020 I'd rather give up my law licence than wear a mask. I deliberated about that decision. That took a lot of consideration. My wife and I sat down and thought about that beforehand, so I wouldn't just succumb later on.

And I was challenged every time I went into court, which wasn't very often. Physically, I got challenged. I was publicly challenged at the Coates trial. I was challenged at a trial for some pastors in Edmonton that were charged \$80,000 for not letting a health inspector in. "Why aren't you wearing a mask?" I'm sure you've heard this over and over again: It was almost as if the judges didn't know about the law, or weren't aware of the human rights

protections, or couldn't fathom that somebody's not wearing a mask because of their religious beliefs, which is my reason.

There seemed to be a real, real reluctance, a real hesitancy to respect that. I don't think it was just rooted in the normal typical political reasons for not liking it, but actual personal fear. Of course, that raises the question: Why are the judges so afraid personally? Well, obviously, a lot of them are older. You can understand that. No matter what you believe about this, they are the more at-risk population. So there is that factor. We have to keep that in mind.

I think it also goes to show that judges are generally consumers of mainstream information, which is part of the reason why they seem to be so impervious to inconvenient or minority facts and information and opinions and perspectives. Because they have been inoculated by mainstream information, because these are the worlds they live in. Do judges get up and read the *Western Standard* in the morning? No. Unfortunately, I'd be very surprised if any of them did. They probably get up and read CBC, and that's just part of the problem.

That goes into my second point about who the courts are and why they did what they did. You have to understand: There's a lack of a conversation in this nation, I think, about this issue. You have to understand that judges are appointed. Why are they appointed and who are they appointed by? Well, they're appointed by politicians, and it's a political process. Do judges have to meet a test for merit? Well, of course they do. And certainly, from my perspective, most judges I get in front of—they're pretty competent. They might have prejudices and biases and political views and ideologies, but they're pretty competent. I don't usually encounter incompetent judges.

So it's not that people are being appointed to the bench merely because of their political views. But there are lots of meritorious lawyers you can pick from to go on the bench, to go on the courts. Who are you going to pick as a politician? Well inevitably, whether you mean to or not, you're going to lean towards the judges who you know or you suspect share your political views and ideologies. I don't just mean donating to the political party. Obviously, we've heard about the judges that have donated tens of thousands of dollars to the Liberal party. That's a very partisan allegiance. I'm talking about a deeper, more philosophical ideological allegiance.

If you're a lawyer who has supported the People's Party or maybe the Conservative Party or whatever—

[00:10:00]

pick your alternative freedom, right-leaning party—you support that party probably because you hold conservative views about individual liberty, limited government, that market forces are good, socialism and Marxism are bad. These are your underlying political views.

You don't need to talk to me very long to understand that I'm a libertarian and that I think government is bad and individual rights are good and that human flourishing only happens in a context of maximum human individual rights and freedoms. So if you put me on the bench, do you think I'm going to walk around and throw around section 1 justifying what the government's going to do? Obviously not. You don't need to be a brain surgeon to figure that out. Is Trudeau ever going to appoint me to the bench? Well, of course not. Maxime Bernier might consider me, but Trudeau's not. Right? Of course not. It's not so much about

whether or not I'm a partisan Conservative and I'm at Poilievre's rallies. It's about the ideology.

You have to understand that most lawyers in this country—for a couple of decades now, and I'm a younger one but from what I've seen from older people—it's been now 10, 15, 20, 25 years that the legal profession as a whole in Canada has shifted to the left. People who view the world the way I do and the way Mr. Buckley does and the way some of the other lawyers you've heard from do, we're in a very small minority.

That plays out in a number of different ways. But one of them is that we are the pool of people that judges are chosen from. If a lot of judges, generally, are more left-wing than the general population of the country that they're representing then they're going to rule in a way that the rest of the country sometimes finds confusing. That's what we get.

Obviously, we've had conservative governments. But even they are limited in who they can choose to put on the bench, because most lawyers tend to lean left. And by "left," I just mean that they tend to take a lower view of individual rights and freedoms. They take a higher view of government intervention. They take a lower view of market forces. They generally don't believe that people are really good at governing themselves. They generally believe that government intervention is required, it's good, that government is benevolent. They believe in the rights of the collective and that individual rights are just sort of a nuisance that we tolerate when we can.

That's just their worldview. That's their ideology. So of course, they're going to impose that. They're invited to through section 1 of the Charter. Section 1 of the Charter takes rights away from the people, gives them to the judiciary, and says: "You can remake the country in your image and we trust you to do a good job of it."

This was the Charter's self-destruct button and it only took 40 years for it to be pushed. This is part of the reason why you have constitutions that don't have those self-destruct buttons that are still sort of hanging on for dear life, as in our southern neighbours, who for a quarter-millennia have had a pretty decently free society, historically speaking. Whereas, after 40 years, our major constitutional instrument for defending rights and freedoms has already been essentially destroyed. "Freedom of expression," 2(b) is maybe the last part of the Charter that has any meaning beyond words on a page. And that's because of the fact that we've given all this authority to mould the Charter over to these promoted lawyers.

So you have to understand the role of ideology in judges and the fact that a lot of them subscribe to a general left-wing ideology. It's been going that way for many decades now. If you were to go back to the '50s, '60s, '70s, '80s, you could find rulings from justices like Iacobucci and Major and go back to *Boucher v. the King*, which is a famous pre-Charter case, **and you can see all these wonderful ideas about individualism and freedom and the rule of law and rights and limited government.**

But that has died out and been replaced by the new decisions that we've had from the new Supreme Court justices and appellate court justices that have used section 1 to strike down our rights. And that's what happened over the course of COVID. And we know that. We know it was section 1. But why?

The last reason I'm going to point you to as to maybe why this happened: Knowing that judges are just regular people, they tend to have left-wing views and they are politically appointed partly because of their political views, what I saw is the role of chief justices.

Now we're getting into the inner workings of how the court works. What is the role of the Chief Justice? Well, oftentimes it can be their role—if they decide to exercise it a lot—to appoint which judges are going to sit on cases.

And this is typically a good thing, right? You need some sort of guidance in this at times. Ideally, you're going to have judges with appropriate experience sitting on cases that are complex and involve that kind of experience.

[00:15:00]

What I saw is that the chief justices tended to directly intervene a lot, and in two ways.

One, they tended to take a lot of the COVID cases themselves. I saw this in BC with Justice Hinkson. I saw this in Manitoba with the primary Justice Center-led COVID-challenging case over there. I saw it when I was involved in the injunction about the international bridge between Windsor and Detroit. That was heard before the Chief Justice of the Ontario Superior Court. It was surprising to me the amount that chief justices involved themselves in these cases, took them themselves "I'm going to take this case." And of course, you look at all those chief justices' decisions and they're all pro-government. They're all against the people. They're all against the rights. They're all upholding the COVID narrative and the government's efforts to supposedly stop COVID. Universally.

But what I also saw almost across the board: the judges I saw that were sitting on COVID cases were recently-appointed Trudeau appointees. There's a couple of problems there. And it's not so much that they're Trudeau appointees per se, it's that there was a really strong trend. It's not like all the judges on our bench are recent Trudeau appointees. Obviously, there are lots of judges that were appointed by the Harper government. And we can go back into the Liberal governments from before that way back into the '90s and '80s, because some of our judges have been there for 20, 30 years. They were appointed when they were in their forties or fifties and they're still there, which is not necessarily a bad thing.

But that's just it. In my experience, between my cases and all the cases that I saw my colleagues do, we weren't getting the 70-year-old guys—well, men and women—that have been on the bench for 25 years and have sat on a whole bunch of Charter cases, and have kind of had mixed rulings, and were appointed before Trudeau's time. But those judges exist. We never encountered them. We never saw them. And it's hard to believe that that's mere coincidence or just merely numbers. It's hard to believe that a judge with the kind of experience to handle— That a really complex Charter case on COVID is actually being heard by a judge who's been on the bench for less than two years and has never heard that kind of case.

That's concerning. Why is that? Why is that judge being selected, presumably by the chief justice to sit on this case? It's definitely not the best-qualified judge to hear this case. These cases are obviously hugely important. Why are we constantly encountering the same type of judge over and over? How come we're never getting before a judge who might actually rule in our favour because he actually does hold different underlying ideological views about the rules of government and how far section 1 should be used or abused?

And that, I think, contributes to the "why."

Why do we see so, so, so few decisions from our courts that in any way challenge the narrative or uphold the rule of law or the rights of individuals when it comes to the vaccine

mandates, when it comes to masks, when it comes to the general COVID restrictions, when it comes to all the tickets that people have gotten under these unconstitutional laws? And all these challenges based on section 2, which is free speech, freedom of religion; section 7, the right to life, liberty, security of the person; section 8, privacy.

Why are all these failing? I think part of it is because the judges who might actually take a different view of the law were either passively or directly prevented from sitting on any of these cases. There are a few judges left in the country I've read decisions from and I've thought to myself, "I'd like to see what he or she would have had to say about this if they had been the judge at first instance."

It's difficult because we don't talk about this. Lawyers are terrified to talk about this. I'll give you an example—and this, I'm going to talk about in my second part.

I criticized the courts in Alberta. They had a vaccine mandate for the courthouse. Lawyers and members of the public could not access certain parts of the courthouse if they were unvaccinated. People who were vaccinated had to demonstrate proof to access those areas, which is a problem as well: not just prohibiting the people who can't. This is injustice. It's tyranny. It's oppression. It's completely unbecoming of the court, who is supposed to think independently for itself.

I mean, if our courts are not thinking independently for themselves, if they're simply parroting what the government is saying, we obviously have a problem. They're obviously not functioning as the independent third branch of government. They're not doing their job.

So I criticized the courts publicly. I did it in an academic way.

[00:20:00]

I did it strongly, of course. As anybody who knows the way I speak, I speak strongly. But I was not vulgar, I was not demeaning, I was not insulting, I did not swear. I was academic—strong but academic—about my criticism.

Sure enough, a lawyer who works at a bank in Ontario complained to the Law Society of Alberta, saying I was being uncivil and not upholding the respect for the administration of justice in the country.

Well, the Law Society, instead of doing its job to dismiss that complaint, decided to investigate the complaint and demand that I defend it and give a response to it, and that I had to meet with somebody, et cetera. This went on for over a year and I had to go through this process. It took me several hours of my time. And now, ultimately, that complaint has been dismissed, which I find interesting. I actually am surprised; I didn't expect it to be. I can only speculate as to why, but I suspect that if I was a complete nobody, a complete no-name lawyer, it might have gone differently.

So you can see from that example right there why this conversation is not happening. Because who's going to start it? It's going to have to be the lawyers. Are they really going to take that risk? I had to talk to my wife before I posted that. "Wife, I do this, the Law Society may take my licence. We're not going to be eating as well." Wife said, "That's okay. Go ahead. Your integrity matters more."

There are not a lot of people in that position—who are willing and able to make that sacrifice. Here's the problem: You shouldn't have to. You should be able to have this

conversation and criticize the courts and criticize these things without putting your licence on the line. I'm putting my licence on the line today to be here to speak with you. I know that. And I'm prepared to do that. But I shouldn't have to. And the reason that I am is the reason why this conversation isn't happening as much. And it's part of the reason how we got here in the first place. If we'd had this candid conversation for the last 20 years about who our judges are and what they believe and why they're ruling this way, we might not have been so ready to fall the way we did over the last three years.

And again, I point you to our neighbours to the south. When they are talking about who they're going to put on the bench, they have an open, rancorous conversation or debate—whatever you want to call it—about who that person is and why they're being appointed and whether or not they're good to be appointed there. Because they know: Americans, at least, more so than Canadians, understand that a lot of their rights and freedoms depend on the philosophical and political views of those nine promoted lawyers who sit in Washington. That's why they want Kavanaugh and not a judge who can't even tell you the definition of a woman. Because they know that one is going to do a whole lot better at upholding their rights and freedoms in the long run—the rights and freedoms of themselves and their children—than the judge who can't even define for you what a woman is.

We lack that conversation in Canada, which is part of the reason why we have got into this mess. I spent a lot of time on that. I'm going to spend a little bit less time on my next point because I want to leave a little bit of time for questions.

So, the courts are part of the reason all this tyranny and this abandonment of the rule of law happened. One of the other reasons—not the only, but one of them—is what I call the regulatory capture of professional regulatory colleges. The Law Society would fall into that category.

Now, just briefly, the whole idea of— You probably have not given any thought to these bodies prior to COVID. “Why do I care what the College of Pharmacy is or what it does?” “Why do I care what the College of Physicians and Surgeons is or what it does?” Well, you should care because it has a direct role in your life, and you've probably painfully experienced that over the last three years.

The idea of these colleges is that we want— At least as Canadians, we like all this over-regulation, so we want the professionals to be regulated to protect the public interest so they don't hurt us. Meanwhile ignoring that the market would probably do a better job of that, but that's a debate for another day. We say, “Okay, well, if we have direct government control, that might be bad. That might be too much power and control for governments. They might wield that power over professionals and then control them and then they can use that to control society more.” It's probably not a good idea to have direct government control of professionals, especially health professionals. And that's part of the reason why the bill in BC is such a bad idea.

So the idea is self-government. We delegate the power to regulate and control professionals to protect the public interest to the professionals themselves. And they will have legislative authority and they will have a body to do that and the professionals can elect people to these bodies to do that, so there will be some democracy behind it all.

And the idea is for independence from the government, right? Again, division of power, separation. We don't want to coalesce all the power over everything into one body, we'd get tyranny.

[00:25:00]

These colleges are supposed to stand up to government when government goes too far, and say: “No, we have clients and patients to protect. You’re going too far. You shouldn’t be doing this. We’re the experts in this area, you’re not. And let us tell you, this is a bad idea.” Again, it could be law, it could be the pharmacist, it could be the physicians, it could be the accountants, whatever it is. They’re supposed to actually resist government or criticize government or engage in a dialogue with government to protect the people that they serve. Their job is to protect the public interest.

Of course, what that means has been lost in all of this. The colleges have interpreted this to mean “protect our agenda and protect the government.” But it was supposed to be “protect the people.” Right? Professionals are supposed to serve as a bulwark, to stand between the people that they serve and the government.

Instead, what happened is they did the opposite. And that enabled the government to continue to do what it did. It enabled the media to sway the masses to the government’s perspective, because the people weren’t hearing from the experts who were dissenting. Because there were plenty who were dissenting. There were plenty more who would have dissented but they were scared of censorship and discipline by the regulatory colleges.

So they didn’t speak up. And then the few who did speak up were in fact disciplined. And I’m sure you’ve heard some of these. I’ll just give you some examples that I went through:

Some of you may be aware of the mask case I have in Alberta, with the chiropractor there versus the College of Chiropractors of Alberta. He went through a lot. They tried to take his licence on an emergency basis, saying he was a harm to patients. They failed because I intervened. And then he went on this two-year long proceeding.

I called four expert witnesses about how masks don’t work and they’re harmful and they’re dangerous. And this body called the Discipline Tribunal—they have two public members and two chiropractors so that’s an interesting thing right there, the fact that it’s made-up half with members of the public, which can be a problem because it’s hard to grasp all the issues for public members. Unfortunately, a lot of the public members that get into those positions are the types that like to police and control the professionals and tend to have a view that the professionals that are there must be bad, must be doing something bad to the public.

Sure enough, the Tribunal ignored all the evidence, ignored my experts, gave a huge wrong decision about how everything the College did was good. And none of the evidence that Dr. Wall brought in—from Dr. Byron Bridle, for example, or Chris Schaefer, the occupational health and safety expert in Alberta—none of this evidence was any good or reliable. These people are wrong. Interesting, though, they didn’t even cite to the record to support their decision in the end. And they decided against him. And he now faces discipline, and all these other things that I’m going to be going through with him.

That’s just one example of how this works. Were there lots of chiropractors in Alberta who didn’t want to wear a mask or who in fact didn’t just didn’t get caught? Sure there was, but they didn’t want to go through what Dr. Wall went through. So they complied. They submitted. They bowed down. They covered their face, because they were scared of one of their patients snitching on them to the College. Because the College now has just become this bulldog for AHS, Alberta Health Services, instead of independently standing up for its

members and saying, "Masks don't work, they're harmful, we know that, we're not going to comply with this."

If you're a chiropractic patient you know that most chiropractic patients are the types of people that would have been upset about this whole thing—wouldn't have worn a mask, would have seen through the narrative, and would have wanted their chiropractors to stand up for them. They would have wanted the Chiropractic College to stand up for them. It didn't.

I had some other cases of course, with physicians. The CPSA [College of Physicians & Surgeons of Alberta] went after a doctor because she was prescribing ivermectin. She literally saved three people's lives just in the weeks leading up to this new prohibition—with ivermectin. Because we all know it works. So, what's the College of Physicians and Surgeons of Alberta doing getting in there, aligning themselves with the likes of all these pharmaceutical companies who contributed to the loss of millions of lives over the last three years? Why are they coming in and implicitly supporting that position by professionally disciplining a doctor who's prescribing ivermectin?

Maybe they disagree with the doctor. But should not the doctor have some clinical licence and some discretion to prescribe things? Most of you would say, "Yes, of course." But no, the College comes in and says, "We're going to discipline you if you don't stop prescribing ivermectin."

[00:30:00]

I had to defend on that.

I had another doctor who could not take the shot because of her religious beliefs. Sure, AHS went after her and didn't want to employ her anymore. That's one thing—that's an employment issue. Then the College went after her and made it a matter of professional discipline that she didn't take the shot. Even though her reason for not taking the shot is a protected ground in human rights legislation, and the human rights legislation is supposed to be above all other legislation, as our courts have been saying for the last 20 or 30 years. I had to defend her.

I had to defend multiple nurses in BC and Alberta who, because they said online somewhere, "Masks don't work and you shouldn't wear them and please don't take the shot, it's dangerous," these Colleges wanted to take these nurses' licences. And I had to defend them.

And I'm sure you're aware of all the medical doctors across the country. There's a whole bunch in British Columbia, Alberta, and Ontario that have either lost their licences or are facing that because they stood up to the narrative, because they actually challenged it. They actually did their job as professionals to give you the truth and defend you.

Yet what has happened? The regulatory colleges, who are supposed to lay off that and actually let professionals have their professional and clinical judgments, went after them and censored them and scared them by threatening to take away their licences, and then actually taking away their licences. Which means now they don't have a livelihood, which means: How can they continue to do what they do?

Same thing here. How can I continue to serve you and serve the nation and the work that I do if my licence is taken? I'm not allowed to do it anymore first of all; so now you've lost me

from doing that. And you're probably not going to be able to hear much from me anymore because I'm going to have to go off and find a job to feed my family and I'm not going to have time to do this.

This is how it works in a practical way: If the government can control the professions, if the professionals are no longer independent, you've removed one of the few major bulwarks against tyranny. Right? The courts are one. Professionals and their regulatory bodies are one. And there are few others. And if you systematically remove all these, tyranny is the result. The abandonment of the rule of law is the result. And that's what we've got for the last three years.

I wasn't surprised, but I really wish these bodies had functioned the way they're supposed to, because, had they done that, it would have looked a lot different. And I encourage all of you to care a whole lot more about how these regulatory colleges work. They have public members on them that get appointed by government and they have professionals that are elected by the professionals to them. Increasingly now, what governments want to do is decrease the amounts of professionals that are elected by themselves into it and increase the number of public members appointed by the government.

That sounds good in theory, because "public members, public representation." Yeah, okay. But who's being appointed? Again, it's like the judge scenario: The people being appointed by the government are those personally and politically connected to the government, which means: they get in there, they're going to do what the government wants.

So it's not necessarily good to have more public representation on these professional bodies. What you actually want is almost entirely professional representation because at least then there's more hope that those professionals are actually—because there are some other professionals that support them and elected them—going to do their job to hold government accountable and stand up to them.

Before I finish, I'll just give you one example of that. That's what's going on now with the Law Society in Ontario. You may or may not have heard: Years ago, before COVID, we had this whole thing over there with the critical race theory ideology. Lawyers had to sign up to some Marxist ideology in order to continue to practice law and to do things in their firms and all this stuff. They had to sign this "statement of principles," and these "principles" were basically Marxist principles about race.

What happened is, this lawyer said, "No, we're not doing this." And my friend Lisa Bilty got together with a bunch of lawyers and they ran—I think it was 2018 or '19, around there. A bunch of them got elected to the Law Society as benchers and they were able to put a stop to some of that.

Now we're having another election again for the benchers in Ontario. And that's the main issue. Is the Law Society going to continue to be this woke arm of enforcement for government ideology or is it going to actually do its job to simply regulate lawyers in a limited way? That election is going to matter for the rights of Ontarians, let me tell you. Because the direct result of that is that lawyers like me, who actually defend the rights of the minorities who oppose the government tyranny, are on the chopping block if these bodies get too much power.

The Law Society of Alberta is having an election later this year. And the public should actually care and get involved and be aware of who is running. What may happen if we get a Law Society of Alberta that's completely woke,

[00:35:00]

and completely censorious, and has gone way beyond its mandate and simply politically punishes all the people who criticize it or oppose it like I do? People's rights are going to suffer. And the public needs to start caring about this stuff and paying attention so we can somehow try to prevent COVID from happening again.

So that's everything I had to say in my initial presentation. That leaves a few minutes for questions, I hope. And I'm ready to answer those.

Shawn Buckley

James, before I turn you over to the commissioners, you've spoken about section 1. And I think you referred to it as the self-destruct button for the Charter. I'm wondering if you can also speak about the doctrine of mootness and how that has been used to affect COVID cases.

James Kitchen

Sure. The idea behind mootness is that the courts will say: "We don't want to waste our time on academic debates. There has to be a real practical issue. We don't want to just rule to make the law better. That's a waste of our resources." The problem with mootness is that judges have been overusing and abusing this to help government, and government knows this.

Everybody knows that the law moves pretty slow. If government puts in law A, it's going to take the lawyers two months at least to get together and mount a challenge to it and file it. At least—maybe more like four months. Then they've got to get to a hearing, which takes more months. So maybe within eight months we've filed our challenge and we're getting a hearing.

Well maybe six months after the law was in place, the government just yanks it out and says, "We're not doing that any more." Which, I guess is good, but the damage is done. What are you supposed to do about that? You've lost your job. You couldn't get your passport. You've been dragged out of Walmart. You were denied medical procedures. And now it's too late. The damage is done.

So, what happens now? The government says, "Well, it's moot now. The law's not in place anymore. It's a waste of time to go back and evaluate whether it's good or not—because what's the result? The law's not there; you can't strike it down even if you find that it's unconstitutional."

And the courts say "That's a really good point. You guys are fine. We're not going to rule on that. It's moot. It's academic. There's no practical value to the country if we actually rule on whether or not that law is unlawful."

I've seen that used over and over and over and over and over again through Justice Centre cases, through some private cases. I've had it come up a little bit in my cases, but I've seen it a lot in my colleagues' cases. It's a misuse or abuse of the law in my opinion. Of course, courts would disagree. They would say, "This is exactly what the law should be." What I would say is it shouldn't be, because the reality is you're giving government a free pass. They know darn well now that you can put a law in place and keep it in just long enough until finally there's a hearing on the challenge that the lawyers were able to get together.

And now they will yank it. But the damage has been done. And the government can keep putting in unconstitutional laws, yank them, then just put it another one.

This is part of this is a problem. It's not hard to figure out. You put in a law. You yank it before the hearing, then the judge says it's moot, and you just put it back in again. And then what? The same thing. The lawyers have to get together and get a hearing. The courts are enabling this. And I'd like to think that they know better because I don't think they're that stupid. This is yet another way that government is getting a free pass being able to do whatever it wants, which is not the rule of law. That is arbitrary rule. That is tyranny.

The whole idea of the Canadian justice system is to have the rule of law, have government actually follow the law, and have the courts hold them accountable. Well, that's not going to happen if every time the government passes a law, then yanks it just before a hearing, they are able to get away with it because the courts say it's moot. That's been a big problem all through COVID. It was a problem before, but it's been a big problem all through COVID.

Shawn Buckley

Thank you, James, and I will turn you over to the commissioners for questions.

Commissioner DiGregorio

Thank you so much for your testimony today. I have a few questions.

You spoke a little bit earlier in your presentation about the process of appointing judges and how there is a political element to it. I'm just wondering if you have any views or recommendations on how Canada could improve upon that process.

James Kitchen

One: You could actually have some judges elected. That's pretty radical but that does happen in some of the lower court levels in the U.S. They have a mixed system where most are appointed, but some are elected. I don't think that's a bad idea to introduce some of that.

Our country is very fractured. Albertans think very differently than the people who live in the GTA, generally, or in Ottawa.

[00:40:00]

I think a lot of Albertans or Saskatchewanians or Manitobans or British Columbians don't realize that the judges at the superior level—not at the provincial level, but the main level of court with inherent jurisdiction, I think it's called the King's Bench in Saskatchewan; it's called the King's Bench in Alberta—these judges rule on provincial cases all the time. But they are federally appointed. Every King's Bench judge in Saskatchewan is appointed by Trudeau in Ottawa, not appointed by the Premier of Saskatchewan. Provincial courts level are—so that's good—but not that level. It's the same with the Court of Appeal. Who promotes those judges to the Court of Appeal? Trudeau.

In Alberta, we had a judge come in brand new. She ruled in some COVID cases, ruled in favour of the government, and then she was promoted to the Court of Appeal. You can guess why. And Trudeau was the one who did that appointment.

So the judges who sit in the most important levels of court in each province are federally appointed. Maybe that should be changed. I suggest it should be. It should actually be the provincial government that appoints those judges who are in those courts in the province, who have jurisdiction over the province. And that way, at least hopefully, you have judges that reflect better the views and values of the people in those provinces, which helps protect those provinces from the tyranny of the federal government in Ottawa. So that's one recommendation.

My third recommendation is—obviously I don't have high hopes of this happening—but it would be nice to open up the conversation both at the cultural and at the political level, of: "let's talk about how judges are appointed and why they are appointed, and let's start being honest with ourselves."

Yes, there's a merit-based test and everybody we're talking about in Parliament about whom we're going to select has passed that merit-based test. What's the remaining selection criteria? Look, it's the judge's political views. It's: "We like this judge because we think they're going to bring the country in a better direction." Liberals think the country goes in a better direction when the government has more control. Conservatives think the country goes in a better direction when the individuals have more rights and freedoms.

Let's actually be honest and have that conversation and admit that. They do a little bit in the States. Obviously, there's still this charade that the judges just rule about law and they don't impart their political views on the cases, when we know that's all hogwash. In fact, it's a good thing it is because we want judges who say, "This is the Constitution, these are the rights, I'm going to uphold them, I'm not scared of the government." At least, if you're a guy like me, you want that. Let's be honest about it at the political level and have that conversation. I'd like to see that happen.

Right now, it's really oblique and it's really vague, what's really happening, and nobody's having an honest conversation about who's actually being appointed and why. I think we should just have that and be honest with ourselves and say, "If the judges are going to be appointed, not elected then let's talk about why." It's a merit-based test, but it clearly can't be only a merit-based test. Let's be honest, and let's have that part of our conversation when we decide if we're going to elect Trudeau or we're going to elect Poilievre.

We know Poilievre is going to put freedom-minded judges on the bench. We know Trudeau is going to put socialist judges on the bench. And maybe you want socialist judges. So you can vote for Trudeau, and that's part of your reasoning. Maybe you don't, so that's part of your reasoning. There were millions of Americans that held their noses and voted for Trump because they wanted Kavanaugh and Gorsuch on their bench to protect the rights of their children. We don't have that conversation in Canada at the political level or the cultural level, and I would like to see that change so we can be honest with ourselves.

Commissioner DiGregorio

So is one of the ways that that could be done through hearings for judicial appointments prior to judicial appointments?

James Kitchen

Yeah. They should be much more public than they are right now. Members of the public should be able to come in and in some limited way, even be able to ask questions, I think.

I think you can look at the American system of how they do it. Ask: How can we do this and maybe do it even better to have this be as transparent a process as possible?

Maybe not at the King's Bench level per se, but especially at the appellate level and at the Supreme Court of Canada level. These are the judges who are remaking the country in their own image and deciding how you and your children are going to live. So the public should have some input and there should be some grilling from the public about who these people are.

Why should judges from the King's Bench be appointed by Trudeau to the Court of Appeal without the public having any say in it and being told? "Hey, notice to the public: we're going to have a public hearing on whether John Smith is going to be promoted to the Court of Appeal. Come have your input. Come have your say." That should happen.

Commissioner DiGregorio

Thank you. My next question has to do with your discussion about the chief justices of the court and the discretion that they have to appoint particular judges to cases. And I'm just wondering if you have any thoughts or recommendations on how any perceived problems with that process could be addressed.

[00:45:00]

Whether there's something that could be done in the court rules themselves that talk about how cases are assigned, or if you have any thoughts whatsoever on that.

James Kitchen

That's really tough because the court does need to be independent in order to do its job. So, you don't want too much interference with that. At the end of the day, you do somewhat just have to rely on these judges really caring, actually perceiving what's good for the nation and caring about that enough to let things unfold. Or, maybe to say: "Look, I'm going to make sure that there's a balance of my lefty colleague here and my righty colleague here, and I'm going to give one case to him and one case to her and let them shake it out and then I'll let the Court of Appeal deal with it."

That's how it should happen. And it's difficult to say we can fix that by having more oversight or control, because that right there is going to challenge the independence of the courts, and we don't want that. We want the courts to be independent. The trouble was the lack of ideological independence over the last two or three years.

I think the way you really fix that is you start to have a more transparent process about who is being appointed to the bench. And hopefully, through that, you get a more balanced representation of the people of the country on the bench. We always talk about diversity of judges representing the country, but we only talk about it in this woke, superficial way of skin color and what genitals you have. That's ridiculous. Is that going to reflect the visual diversity of the country? Sure. Is it going to reflect the political or philosophical diversity of the country? No, it's not likely to.

The way you fix that ultimate downstream problem of the chief justices is at the source—by having a judiciary that actually philosophically represents the country. So you actually have judges who think the way I do alongside the Marxist judges who think government is great, and let's just rubber stamp everything so they can get on with making the world a

better place. And in that way, you actually have that philosophical debate amongst the court itself. And the public is watching that, and aware of that, and gets to have a say in each election on who they're going to elect and then whom that elected person is going to ultimately appoint to the Supreme Court of Canada, and how they're going to decide that.

Abortion is a perfect example in the States. We've got enough conservative judges, now the states have the say over abortion instead of the federal government. That process should be happening here, and it's not. I don't think the way to fix that is to come in and try to exert too much influence over the chief justices.

Commissioner DiGregorio

Thank you. I'm hearing you say that the way of dealing with it is right up front through the appointment process.

In terms of where the courts are at today: We had a witness in our last set of hearings in Winnipeg who was a former justice who, when I questioned him about what the courts could do to address the state of where they are and the decisions that they've made throughout COVID, he thought that a self-reflection exercise should be conducted within the courts themselves. I'm just wondering if you had any thoughts on that.

James Kitchen

I think that would be better than nothing. But I think that has its limitations. I don't know if the courts are even capable of that at this point. The number of small-c conservative judges, I would guess, are outnumbered 8 to 1. And their voices are not tolerated. The left-wing ideologies are not tolerant of different viewpoints. The right-wing ideologies are. They don't mind that. They disagree vehemently, but they tolerate the disagreement.

So, yeah—I guess I agree. I just struggle with whether or not that's going to actually help. I unfortunately take a fairly pessimistic view on this. I say, if this problem is going to be fixed at all, it's going to take a long time and a lot of hard work. It's going to take a lot of young people who actually believe in rights and freedoms to say, "I'm going to be a lawyer and I'm going to get involved in this system and maybe even someday I'll be a judge." And it's going to take a lot more lawyers to be more brave if they actually feel this way, and to speak up. And it's going to take years and years of systemic reform.

For years we have been putting left-wing judges on the bench. And that's culminating now, where we are. The law is dramatically different from what it was in the '80s and '90s when we actually had a free society and the Charter was working and we had judges upholding the rule of law.

It took 20, 25 years to get here. It's going to take probably just as long to get out. We're not going to fix it overnight, but we have to start having the conversations at the cultural and political level.

[00:50:00]

And hopefully then downstream we can start systemically fixing the problems on the bench by having more transparency, having people with varying viewpoints that are getting on the bench to reflect the views of Canadians. Not everybody in Canada is a socialist who thinks government is great; some people actually do believe rights and freedoms are good.

Let's reflect that instead of calling these people bad names and stacking the court with people that will keep shutting those people up.

I don't know if that self-reflection is going to be nearly enough. I guess it's a good start.

Commissioner DiGregorio

Thank you. I just have one more question, because I think the other commissioners have some as well. So, I'll restrict myself to one last question which has to do with the Charter itself.

We had a witness in Toronto, a law professor, who spoke to the need to amend the Charter.

I think for some of the similar reasons that you were talking about, describing section 1 as a self-destruct button. I'm wondering what your thoughts are on whether or not Canada needs to amend the Charter.

James Kitchen

Well, absolutely. It's useless for its original purpose, which was to be a shield for the people against the government. It's been rendered useless. I think we'd probably be in a better spot if we got rid of it. There were a very few people who said in the '70s and early '80s, "The Charter will take away freedoms in the long run. It won't increase them."

If you go back to Supreme Court decisions prior to the Charter, they were strong on free speech and freedom of religion and all kinds of other areas when it comes to individual rights and freedoms. We didn't need the Charter. It only looked like it helped in the very beginning because of who the judges were that were interpreting it and applying it.

So, get rid of it! Amend it? Sure. Obviously, you want to get rid of section 1 and probably section 33, the notwithstanding clause. Chuck those two out. Maybe you'd have a workable document because now what you've done is you've taken away the discretion from the judiciary to remake the country in their own image. And now if there's a rights violation, the law is struck down or the government action is struck down. Period. Absolute rights.

That's what the American system is. Look how much better it is. Look how much longer it's lasted. There is no, "The government can do whatever it wants if the judge agrees with it" in the Constitution of the United States of America. It is "Government shall not do this." If the courts find a rights violation? That's it. Done.

It's not that, in Canada, the courts don't find rights violations. They do all the time. It's just part of the process. We find the rights violation and then we justify it in other sections. **Get rid of section 1. It renders the whole Charter useless to the people.**

Forty years is not a long time in the history of law. The fact that our Constitution has been rendered useless in 40 years is really quite pathetic. That should be obvious. I guess it's not obvious to the public but to legal scholars, it's obvious that that was a poor document if it only took 40 years for it to self-destruct.

Amend it, maybe—but I would say, "chuck the whole thing." The country was in better shape as far as rights and freedoms before it was instituted. Whatever you do—amend it, replace it, chuck it—the problem is giving all this power to the judges to remake the nation in their image. And then the governments appoint the judges so the governments can do it through the courts. And the whole system at a philosophical fundamental level is wrong,

and it's taken 40 years for that to be revealed. It needs to be fixed, whether it's through amendment or complete abandonment.

Commissioner DiGregorio

Thank you.

Commissioner Kaikkonen

Good morning, James. Thank you for your testimony.

I was thinking as you first started speaking about when Jesus came to a city and he wanted to bring peace, but their eyes were hid and he wept. And I thought: "Wow, is that where we are in our country?" But then I listened to you say, "We need a conversation." And that's what we're doing here. We're starting the conversation. We're bringing forward a conversation. We're looking at ways that we can contribute and offer hope again in this country.

I do have a couple of questions. We've seen a number of losses recently in the courts, for example, *Servatius* in B.C. As these cases are not being appealed, don't these rulings have a potential to be cited or even become precedent-setting in future litigation? And how do we counter that?

I believe in that particular case, that was a parent who brought forward her concerns. She didn't go through the administrative process, exhausting all the appeal processes through the administrative part of it. But then she loses in court. She has a good heart. She has her own motivations. So she walks away. And that precedent is set. And there is no one else that can step in and appeal in that particular case.

I'm just wondering what those lasting precedents are going to do in this country if we can't change the conversation?

[00:55:00]

James Kitchen

Well, they're very dangerous. It's always a conversation that I and my colleagues have, "How do we avoid setting more bad precedents?" There's almost a hesitation to litigate in this area because we don't want to just keep giving the courts cases that they can rule on to set bad precedents to support a further abandonment of rights down the road.

It's sort of a catch-22 because if you don't litigate, then you don't have the possibility of setting the good precedent, and if you litigate, you have the possibility of setting the bad one. What do you do?

The lower court decisions—non-appellate levels, first instance trial-level court decisions—their precedential value is limited because it doesn't bind even the same court. It doesn't have a lot of impact outside of the province that it's in, so its damage is limited insofar as that precedent is not in any way binding or even necessarily influential.

If you get to the court of appeal level, now you're making binding law. The Court of King's Bench in Saskatchewan has to follow what the Court of Appeal in Saskatchewan says. So if you appeal, you're potentially creating a worse precedent if the Court of Appeal is going to

uphold it. There's no easy way to fix this. All we can do is keep trying. As it takes years for these to go through the courts, a lot of these cases are at the appellate level now or on their way to the appellate level.

The courts of appeal in this country could turn this around if they wanted to. The courts of appeal in B.C. and Saskatchewan and Alberta and Ontario, and eventually the Supreme Court of Canada, could turn this around. I'm not really hopeful, even if the courts of appeal may do a good job somewhere. Of course, in our [Supreme] Court in Ottawa, there are only two people who really uphold the *Charter of Rights and Freedoms*: Justices Brown and Côté. I haven't seen from the other seven of them that they really have any kind of acceptable regard for what those rights actually mean and for the role that section 1 should play, if any.

So I'm not excited about what's going to happen when these COVID cases get to the Supreme Court of Canada, assuming at least some of them do. That's just how it works in the law. You have to take the risk of setting bad precedents in order to go after the law or the government action that is wrong.

I don't have a good answer for how we avoid the bad precedents. I just know that if we continue to set them as we have for the last two and a half, three years, the long-term bad consequence of that is that it's a big neon sign for the government, saying, "Yep, you can do whatever you want" five years from now, because you're going to be able to rely on all this COVID case law about how government can get away with anything under section 1.

That's why I say the problem is to deal with the law itself, to remove section 1 of the Charter altogether. That's the only way you can, in a wholesale manner, get rid of the precedents—to actually change the Constitution.

Commissioner Kaikkonen

And my second question is: Yesterday we heard testimony that those fined under COVID mandates were seeing their fines increased by the prosecutor when they got to court.

I'm just wondering what it will take to restore justice in this nation so that administrators apart from judges are not permitted to go above the law, as in this case—threatening to increase fines beyond the scope of the fine the police gave and what is considered acceptable by the legislature.

James Kitchen

It's my view that too many laws are a bad thing. Discretion is generally actually a good thing.

All these systems and all these laws and our Constitution and our whole societal structure are only as good as the people who live in the society and who fill these roles. It's only good insofar as there are enough individuals who are moral and ethical and actually understand to some degree what is good and right for people, for humanity, for society.

If people honestly believe that Marxism is the path to better human flourishing, it's going to impact their morals and ethics, and their morals and ethics are going to be corrupted by that corrupt ideology. But if they actually believe that individual rights and freedoms and the ability for people to live according to their own view of what's best, with as few

restrictions as possible, is the path to human flourishing, are they going to have the types of morals and ethics that are going to guide them to use their discretion in a good way?

So ultimately you fix that, I think, at the cultural and societal level. Not by just having more laws. This goes back fundamentally, philosophically, to the last 300 years. You can only have a society that is self-governed through limited government and limited laws and a lot of freedom in an open market if the people are generally somewhat moral and so therefore can actually govern themselves.

[01:00:00]

That's what the French philosopher and observer Alexis de Tocqueville observed in America. This American way of living free is only possible because the Americans are generally a fairly moral people and can actually engage in self-government.

That's who Canadians are going to have to be. And they're going to have to come to terms with the fact that historically, whether you like it or not, the most moral and therefore the most free societies have been informed by Judeo-Christian values and morals and beliefs. All the other tyrannical societies in history generally didn't have those views and values. And generally, the people could not govern themselves without chaos and violence, and so needed a strong arm of some sort of state or emperor or ruler over them in order to keep the chaos from destroying everything.

We have to go back to the philosophy of how to live in a society that is self-governing and is moral and is free. And recognize that, yes: If the people, each individual who's fulfilling these roles and exercising their discretion, don't have some sort of morality, if they don't have some sort of view that the world is a better place when people are free, then they're going to abuse their discretion. They're going to become corrupt in the way that they do things. And you're going to have less freedom—less equality, by the way, as well—and you're going to have abuse of power. You're going to have corruption.

Dissidents and minorities, like those who didn't want to take the shot or didn't want to wear the mask, didn't want to comply with everything, are going to suffer as second-class citizens. Because, inevitably, without morality what you're going to have is just mob rule, implemented through all these people exercising their discretion in a way that upholds that mob rule.

That's what we've seen, I don't think you can fix that through just putting in a better rule or a better law. You have to fix that at the human level. That is the only way to ultimately fix it.

Commissioner Kaikkonen

Thank you very much.

Commissioner Drysdale

Thank you very much. I've got some fairly basic questions, I think, and then I have some questions that will probably get us both in trouble.

The first one is: Are judges subject to the rulings of the Law Society, considering they are lawyers or promoted lawyers? They're not?

James Kitchen

They're not.

There is a body—I think it's called the Judicial Council—across the country that's made up of the chief justices and the associate chief justices. This body self-regulates judges. For example—if I'm getting my story right and so take this with a grain of salt—I seem to recall, when Trump was elected there was a judge— I forget where it was, I think somewhere out east. And as sort of a joke—he was an older guy, he thought he could still joke—he walked into the court one morning with some sort of Trump hat, MAGA hat, whatever. And everybody had their hair on fire about this.

Who is the body that deals with that? Well, it's the Judicial Council that deals with that.

So again, you have a problem. If all the chief justices and associate chief justices who are politically appointed to those positions hold a particular view about what it means for judges to be professional, or acceptable in their conduct, those are the ones enforcing it. Obviously, judges are going to self-censor and they're going to be scared to speak out. And they're going to be scared to act or do in a certain way because they don't want to be sanctioned by the Judicial Council, which can sanction them just by telling them to smarten up.

Or this Council can actually recommend to the government to have this judge removed. That's extraordinarily rare in Canada, but that's actually the process for how a judge would get removed. The Judicial Council would recommend that Judge X is "out to lunch" and he needs to be removed by the government from his post. He's no longer fit to actually be a judge.

So that there's sort of an internal regulation amongst judges through this Judicial Council, and that right there is somewhat influenced by the government of the day, because the people who sit on that are appointed to their positions.

Commissioner Drysdale

Has the Judicial Council to your knowledge made similar types of restrictions on judges that you experienced with the Law Society yourself concerning the COVID narrative?

James Kitchen

Good question. I'd like to know that. I'm not aware of that. That's a really good question. I wish I knew. My guess is no, but I just don't know.

Commissioner Drysdale

We've heard a great deal of testimony in the last several weeks from people who talked about what Dr. Christian said was the fundamental basis of modern medicine, and that was informed consent.

We've had testimony that people who were given the shot—

[01:05:00]

and there's been a great deal of testimony on this from people who actually experienced this—were really told nothing before they got their shot. For instance, pregnant women weren't told that it wasn't tested on pregnant women.

I can go on about that, but again, I'm short for time here. My question comes down to this: Are you aware of any college of physicians and surgeons in Canada bringing a doctor or some other practitioner to task for not having fulfilled this most fundamental precept of medicine? And that is, allowing people to make an informed consent when so many have testified that they were not.

James Kitchen

No. I'd be shocked if a college of physicians and surgeons did that.

I currently have open a complaint from a member of the public against Dr. Deena Hinshaw—as a doctor, not as the Chief Medical Officer of Health, but as a doctor, because she is a regulated member of the College of Physicians & Surgeons of Alberta. A member of the public has complained about her partly along that basis: that she was recommending these shots for his children, his teenagers, and that recommendation was so unsupported scientifically that it does stray into unprofessional conduct. That complaint is before the College of Physicians & Surgeons of Alberta, so they're going to have to make a decision about that, that I will publicize.

I fully expect the College of Physicians & Surgeons to completely exonerate Deena Hinshaw and say that she did everything right, and that they're proud of her, and that there's no professional misconduct.

If they were acting independently, they would actually make a decision to have— Right now it's at the preliminary stages, because the complaint's already been dismissed and I've appealed the dismissal of it. So, we're not even getting into the actual hearing of it. But if this body was doing its job and saying, "We need to investigate this. We need to see the evidence. We need to have the scientists and the experts come forward. We need to have a full public hearing on this, we need to figure this out—" Me and my client both fully expect the College to not do that. We expect them to protect Dr. Deena Hinshaw. We expect them to protect any doctor who was complained about for not properly giving informed consent to the people that they administered the shot to, or recommended that the shot be administered to.

No, I expect the College to do the opposite: to continue to toe the party line, and to protect the COVID narrative and protect the government and protect the doctors that did that, and to continue to use all their enforcement efforts to censor the doctors who disagree with them and disagree with the government, disagree with the COVID narrative.

Again, that's the problem. These colleges are doing the opposite of what they should be doing.

Commissioner Drysdale

So that talks about one of the most fundamental beliefs held in our medical system.

I want to now ask you: Is it not a fundamental belief of our justice system that every party standing before the court is of equal stature and the law will be applied evenly regardless of who you are, whether you're Ken Drysdale or whether you're the Government of Canada?

James Kitchen

That's the ideal. We're not living up to it. It's the ideal that we have informed consent. We're not living up to it. It's the ideal that we accommodate Christians because religious beliefs are protected in the Human Rights Act, as much as we accommodate transgender people or black people, or whatever, but we're not.

We're not living up to those ideals. The laws are only as good as the people who choose to enforce them and live by them and try to implement them. It doesn't matter. The ideals are not being met because the people just don't care anymore to meet them.

Imagine how morally bankrupt you have to be as a person to say, "I'm going to fire you because you won't inject yourself with this experimental injection. The Government's mad at me and telling me I have to do this." You're clearly a coward. You clearly have no moral compass anymore.

We have hundreds of thousands of Canadians who are completely morally bankrupt. That's what they've done over the last three years: they've shouted at people who won't wear masks, and they've fired people who won't take a shot, and they've refused discrimination to religious people because they can't stand them. They've said: "You're not equal because you won't agree with our science, and you won't agree with the government, and you won't agree with the narrative, so you're not equal to us."

That's what the ideology of Marxism teaches. It actually teaches inequality in the name of equality.

So here we are. We're not living up to our ideals as a nation at all. I think it just goes to show that we've been a lot more like the whitewashed tombs that Jesus talked about when he was talking to the Pharisees. We've put on this show that we are nice and compassionate and caring and meanwhile, deep down, we're not. And when the crap hits the fan, like with COVID, it all comes out.

[01:10:00]

We're exposed for the morally bankrupt, cruel, vicious people that we really are. We need to admit that and come to terms with that if we're ever going to get out of this and address our moral failings as a people.

I don't care how many laws you have or how good they are on paper. They're useless without some sort of cultural morality about what is good and evil, and what is bad and what is right, and individual rights and how they should actually be respected.

Commissioner Drysdale

You talked about the issue of mootness, but you didn't mention anything about the practicality of that. What I'm talking about is, I believe Brian Peckford launched some kind of challenge against what he said were Charter infringements and the government declared it moot.

What kind of consequences financially does that have for a plaintiff when the government declares something moot? And does that have a chilling effect on someone else who might want to bring a case forward?

James Kitchen

Well, it does, because it takes a lot of money. Somebody has to pay for this, or somebody has to take a huge cut in the income that they're earning as a lawyer in order to run these cases. They take hundreds of thousands of dollars, at least at market value, to bring these cases to the courts. Then all that money is down the drain because the court just said, "It's moot, we're not going to rule on it." So there's one financial consequence.

Part of the problem, and part of the reason that the Justice Center existed, part of the reason Liberty Coalition Canada exists—which is the organization I work with now—is because we recognize that ultimately, none of these cases about civil liberties are ever likely to come to the court because they cost a lot of money to bring. And who is going to come up with that kind of money? Even if they have it, are they willing to spend it on something like that?

The only way you can challenge the government in a lot of ways through these civil liberties challenges, these Charter challenges, is to crowd-fund and pull the funds, and to take the best cases, and to pay the lawyers a reasonable rate to run the cases all the way, and to finally get a ruling from the courts. Because the courts don't just roll around finding Charter cases—they're not supposed to, anyway. They have to be brought to them.

It takes a lot of resources to bring them. When the courts just dismiss them as moot: yeah, it's a waste of a lot of resources. You drain the resources for those challenges to continue to happen. There's only so many resources. Then there's the chilling effect: Why should I even bother challenging the law? The court has got the government's back, they're just going to rule it's moot or they're just going to justify it under section 1. Why should I even bother?

So yeah, there is that there is that chilling effect.

Then you have the reality that the court, if it wants to, can award costs against the applicants and say: "Look, you never should have brought this challenge. This law has already been taken out. It's moot. You should have withdrawn your challenge as soon as that happened. We shouldn't be here today. The government had to spend resources to defend your action. I'm going to award some costs against you. You're going to have to pay some of the government's costs." Sometimes that does and sometimes it does not happen in those types of cases. It's up to the court whether or not to award those costs.

So yeah, there's lots of costs and lots of chilling effects that result from the courts just constantly saying "it's moot" or "it's justified under section 1." Eventually the people just say, "We don't have any more money, we've spent it all and we've just given up because it's not worth it to continue to spend this and not get anywhere."

Commissioner Drysdale

You talked about, at the beginning of the pandemic, how the courts shut down. And we've heard from other witnesses recognizing the three different branches of government: the legislature, the administration and the judiciary.

I want to ask you about the fourth level of government, and that is the media. The media plays an incredibly important role in our democracy as the interface between all those three levels of government and the people. Their role is to report to the people what's going on, so the people can make an informed decision.

Can you comment on that aspect of what went on in the pandemic: the media's role in this whole thing?

James Kitchen

Well, only briefly. I litigate publicly, I do a lot of media work, so I'm familiar with the media. I see it as a tool to educate the public and hold the courts accountable and hold government accountable. And I use it to the best of my ability. Obviously, you don't see me on the CBC every day. You're going to see me on the *Western Standard* and *The Epoch Times*, et cetera.

So I guess I would just say two things. Obviously, the media is corrupt and biased: pro-COVID narrative, propping up the government.

[01:15:00]

Part of that is completely explained by the fact that a lot of these mainstream media outlets receive money from the government. It's obvious why that's a bad idea. You're an idiot about human nature if you can't see why that's a bad idea. That never should have been allowed. If there had been any litigation against that, the courts should have done their job to say, "No. That's an infringement of freedom of the press, freedom of expression." Because obviously the press is not going to be independent if it's receiving money from the government that it's trying to criticize.

So obviously, the media—terrible through the whole thing, and it's contributed dramatically to the whole thing.

But I guess again, I would go back to saying to the people. Stop being so gullible. Stop only watching mainstream sources. Seek out alternative news sources. Stop watching and listening to CBC or Global or CTV or whatever. Start reading the *Western Standard*. And don't just read, by the way, your favourite alternative news outlet. Read five of them. Get the different perspectives.

People don't realize how much power they do actually still have in the quasi-democracy that Canada still is. You know? Withdraw your market support for these mainstream organizations. Stop bemoaning the fact that the mainstream media is lying about everything, and make sure that you never participate in that by never consuming mainstream media and telling everybody else, "Hey, you probably should not consume mainstream media. Let's go consume a truthful alternative media. Let's consume different ones and compare them to see which one is the most truthful."

So part of it's the media's fault, part of it's the people's fault too, I think as well.

And I've heard repeatedly from people throughout the COVID thing that they've begun to wake up and realize when they started to consume some more alternative media sources. It sounds ridiculous to me, because I've never been roped in by mainstream media sources, because I've just always been that kind of guy. But for some people that's a big deal.

I had a number of people that came to me in 2020 when I was the crazy conspiracy theorist that they thought was awful, and said "Oh geez, you're right! One of the ways I realized that you were right is because of the BLM protests. I started to pay attention to what was going on there and the mainstream media's narrative about it, and the inconsistencies. Then I started watching some alternative news and getting some actual truth, and now I've changed my views on the whole thing."

I have heard that over and over and over again. So it can happen and it can be really good when it happens and that's what has to happen. People have to unplug from the CBC, Global News, whatever: stop caring about what they say or don't say and just start consuming alternative media or even producing the media themselves. We've seen a proliferation of alternative media sources over the last two or three years. That's a good thing. That's a source of hope right there that, because of the technology we have now, we can have these small independent journalists who can go out and give people the actual truth.

Commissioner Drysdale
Thank you very much.

Shawn Buckley

James, that's it for questions. On behalf of the National Citizens Inquiry. We sincerely thank you for participating today.

James Kitchen
Thank you. It's my honour.

[01:18:12]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witnesses 2 and 3: Suzanne and Barry Thesen

Full Day 2 Timestamp: 02:56:15–03:32:57

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

[00:00:00]

Louis Browne

Good morning, members of the Commission, ladies and gentlemen, and Mr. and Mrs. Thesen. My name is Louis Browne. I am a partner with the law firm Willows, Wellsch Orr & Brundige LLP in Regina, and I'm delighted to be one of the volunteer lawyers working with the Commission here in Saskatchewan. Mr. Thesen, Mrs. Thesen, good morning. I'm going to start with you, Mrs. Thesen. Can you please state your name and spell your last name for the Inquiry, please?

Suzanne Thesen

My name is Suzanne Thesen, S-U-Z-A-N-N-E, Thesen, T-H-E-S-E-N.

Louis Browne

Thank you, Mrs. Thesen. And would you prefer to swear an oath or solemnly affirm?

Suzanne Thesen

It makes no difference.

Louis Browne

Okay. Do you swear that the testimony you are about to give in this National Citizens Inquiry will be the truth, the whole truth, and nothing but the truth?

Suzanne Thesen

Yes.

Louis Browne

Thank you. And Mr. Thesen, can you please state your name and spell your last name for us?

Barry Thesen

Barry Thesen, B-A-R-R-Y, Thesen is T-H-E-S-E-N.

Louis Browne

Thank you. And Mr. Thesen, would you prefer to swear an oath or solemnly affirm?

Barry Thesen

Don't matter.

Louis Browne

Mr. Thesen, do you swear that the testimony you are about to give in this National Citizens Inquiry will be the truth, the whole truth, and nothing but the truth?

Barry Thesen

Yes.

Louis Browne

Thank you.

Mrs. Thesen, I wanted to start with you— Just because it is perhaps a little bit unusual, certainly in a court proceeding, to have two people testifying at the same time. Can you just please tell us, what is your relationship with Mr. Thesen?

Suzanne Thesen

Barry Thesen is my husband. That's it.

Louis Browne

Sure. And how long have you both been married?

Suzanne Thesen

Oh, we've been married about—how many years, Barry? Forty-some years.

Louis Browne

Okay. And then so briefly, we're going to get into it in details, but just in kind of 30 to 45 seconds: Why are you testifying with your husband here today?

Suzanne Thesen

Well, I'm here to help Barry. It's very difficult for both of us to be here. Barry was quite severely injured. And it's left him—it's very difficult for him to express himself and say what he wants to say. He can't find his words, things like that.

The reason we decided to come was because for every one of us that testifies, there's probably thousands that have a story to tell. I do have notes here and I am going to try to help Barry with his testimony.

Louis Browne

Sure. Thanks very much. We're going to get to the incident which brings you here today.

But I just want to have a reference point because we don't know Mr. Thesen.

Can you just give us again a 30 to 60 second description of your husband in terms of energy, activities, and overall health before May of 2021?

Suzanne Thesen

Okay. I'll let Barry say a little bit about himself. What do you want to say, Barry?

Barry Thesen

I'm just a retired farmer and also a fuel and fertilizer company, agency I owned and sold. And that's what we did before we retired.

Louis Browne

Mr. or Mrs. Thesen, can you just tell us a little bit about how Mr. Thesen was before May of 2021, just in terms of his overall energy, activities, and health?

Suzanne Thesen

Barry was— Actually, he's being quite modest here. He was a large farm owner and he ran an Imperial Oil agency, which is a fairly large business. And he was involved in various committees and he was very active in the community. We had recently retired and so we were spending more time travelling.

[00:05:00]

We were spending more time with our grandchildren, and he was active and well.

Louis Browne

Excellent. Thank you.

I'd like to go through your evidence in time frames, okay? We're going to talk about certain time frames, what happened during those time frames, and we'll move on to the next time frame. Okay?

So, we've now covered before May of 2021. Can you tell us what happened in May of 2021, please?

Suzanne Thesen

In May '21, Barry had his first Moderna shot. And he didn't have a serious reaction, he had a few. And he's going to tell you what kind, okay?

Barry Thesen

We were uptown in Melfort and took the shot. And it made me feel not very good for about two hours or three hours. It wasn't real bad: I had a sore arm. Everything outside of that wasn't much problem.

Louis Browne

Okay, great. And then let's carry forward then to what happened next that's relevant for the Inquiry. Can you tell us the date, do you remember the date that that first vaccine occurred?

Suzanne Thesen

I'll help him with that a little bit. He has a difficult time with events and time and remembering things.

First of all, maybe I can say that he was hesitant on getting this shot. The reason he finally decided was because he was trying to convince me to get the shot so we could continue our travels like we had planned. And also, his father was in a nursing home and in order to visit his dad, he had to get a shot. When I chose not to have my shot, that meant that I couldn't see him unless it was through a window. And after that, when he wasn't well, it was not at all. And I'll probably live with this for the rest of my life, but I was not able to be with him when he passed away, which was of course during COVID times.

Barry, he went for his second Moderna shot.

Louis Browne

Hold on a second. When did the first shot occur, please?

Suzanne Thesen

Pardon me?

Louis Browne

When did the first shot occur?

Suzanne Thesen

The first shot was in May, 2021.

Louis Browne

Do you remember the date?

Suzanne Thesen

Yes, I do. I think it was May 5th. And the second shot was in Melfort on May 10th.

Louis Browne

The second shot was on May 10th.

Suzanne Thesen

Yes, 2021, again.

Louis Browne

Okay, so when was the first shot? Sorry, when was the second?

Suzanne Thesen

It was May—

Louis Browne

Just take your time, Mrs. Thesen, just take your time.

Suzanne Thesen

Oh, sorry. May 10th, 2021, was in the mall.

Louis Browne

And what was that? What happened on that date? Was that the first or the second shot?

Suzanne Thesen

That's the first shot.

Louis Browne

Okay, so what we have then is the first shot happening on May 10th, 2021. Is that correct?

Suzanne Thesen

Yes.

Louis Browne

And where did that shot occur?

Suzanne Thesen

That was in Melfort and it was Moderna.

Louis Browne

And that's in which province? Which province are we talking about?

Suzanne Thesen

That's the first shot, yes.

Louis Browne

Which province did that occur in?

Suzanne Thesen

Which mall?

Louis Browne

It was in Melfort? What is the province that Melfort is located in? I just can't lead you, so just please tell us what province that's located in.

Suzanne Thesen

Oh, the province? It happened in Arborfield, Saskatchewan.

Louis Browne

Saskatchewan, okay. Thank you. So, please carry on. What happened after that? We can carry on to the second shot now.

Suzanne Thesen

His second shot was on July 13th, 2021 at 11 o'clock.

Louis Browne

Where did that occur?

Suzanne Thesen

That happened in Nipawin—again, Saskatchewan.

Louis Browne

Okay, thank you. And then, so what happened? Tell us what happened?

Suzanne Thesen

Well, Nipawin is about a half hour away from us. And the pharmacist did have him sign a consent and I have it here. I went and got it. And nowhere on the consent, first of all, does it say anything about side effects or injuries, possible injuries.

[00:10:00]

It's very basic. They did make him wait also 15 minutes and he started feeling unwell once he went back to his truck.

Should I let Barry say a little bit? I'll fill in if he has trouble, okay?

Louis Browne

Can we just understand, Mrs. Thesen? Were you with him in the truck?

Suzanne Thesen

No. I'm a substitute teacher so I was subbing that day, so I didn't see him 'til a little bit later on but— Should I let Barry say?

Louis Browne

Sure.

Suzanne Thesen

Barry, can you say how you felt?

Barry Thesen

I didn't feel too bad to start with. And it was probably maybe a half hour later, I started feeling really quite sick. And I just didn't know how to deal with it. I should drive home or what? And then I kind of backed off and just sat around for a while. And then, I went home, feeling a little better. By the time I got to home, I was really in bad shape. I shouldn't have been driving. When I got home, I got in the house. And I barely got up the stairs into the house. [To Suzanne] What happened then?

Suzanne Thesen

This is what Barry told me earlier and I wrote it down. He says he thought he was going to pass out when he was in his truck, so he had to wait in his truck for a little bit until he felt more stable. He was very dizzy, and he felt like vomiting. So after waiting in his truck for a little bit, he got home and by the time he was home, he was shaking uncontrollably. He said it was almost like convulsions. It was just, like, all over the place. He was sweating, almost like dripping wet, and yet he was very, very cold. He could barely make it up the stairs, and he went straight to bed.

And then, when I got home, I couldn't wake him up. I was quite worried about him. Off and on during the night, it was like he was laying still— Shaking a little bit but all of a sudden, again, he would start shaking uncontrollably with his arms flinging all over. It was like convulsing.

Louis Browne

And did you suggest anything to him at that point?

Suzanne Thesen

Pardon me?

Louis Browne

Did you suggest anything to him at that point?

Suzanne Thesen

I did not. I tried to wake him up, and then I thought, well, maybe he'll feel better in the morning. Then I fell asleep for a while, and then I'd wake up when he was shaking all over the place. Barry didn't get up 'til about 9 o'clock in the morning. So he slept a long time. When he got up, I had been up for a while. When he got up, it was shocking. His right side of his mouth was drooped. His body and shoulders were drooped. His eyes were wrong. They weren't right. They were unmoving. His arms just hung to his side. He was shuffling his feet, and he was walking very, very slowly, almost as if he was in a fog.

Barry told me—I asked him, how are you feeling? He said he felt weak and he felt like he had been beat up, like a car had run over him. He was extremely disoriented, couldn't speak. If he tried to say a sentence, it was wrong. It wasn't the proper words or the proper structure. He was finding it really, really difficult to process things. For example, I would give him a dish and I'd say, "Can you go put this in the fridge?" He would take it—and it was almost zombie-like. He would take it

[00:15:00]

and turn around in the opposite direction that he was supposed to go to, and start walking towards, let's say, the stairs. And then he would just stop, and he didn't know what he was supposed to do, where he was.

So simple things, like, for example, he'd say, "I'm going to bed." I would watch him head to the wrong room. He would go in the opposite room. And he'd look around in the room and he didn't know that. And then finally, he'd turn around and look again around, and finally, he'd find his way. I was just observing him.

That night and for the following few weeks—because this went on for quite a few weeks—Barry remembers practically nothing of those two weeks. When I went to bed he said, "Are you coming to bed?" I said, "Yes." He says, "Well, do you sleep here?" I said, "Yes." "Oh, well, that's nice. Okay." It's just that he did not know what was going on.

When he woke up, I said, "We should go to the hospital." I felt like it was probably a stroke or something. And he said, "No."

[To Barry] Do you want to say why you didn't want to go to the hospital?

Barry Thesen

I don't think I can say.

Suzanne Thesen

[To Barry] No, you can't? Okay.

Barry said he didn't want to go to the hospital because he was scared that he was going to be stuck there and I wouldn't be able to visit and he was going to die alone. My sister's a nurse and she came over and she says, "I'm not a doctor, but I think he had a stroke. You should go to the hospital." Barry again insisted, "No, I've had enough."

My opinion, I guess, was that the damage had been done and I was also afraid of him going in there and never getting out.

[To Barry] Do you have anything to add to that? [Nothing to add].

Can we skip to what he's left with now?

Louis Browne

I just wanted to ask you, Ms. Thesen— so we're in the very brief aftermath of the second shot. Right after the shot, you've described a number of your observations of your husband. But can you just identify: What was his appearance like? What was his face colour like at that point? Was it normal?

Suzanne Thesen

His face?

Louis Browne

Face color, like the color of his skin.

Suzanne Thesen

He was, like, ash white, ashy gray-white.

Louis Browne

Okay, sure. Thank you.

In and around that time, was there any interactions with your family physician? With Barry's family physician?

Suzanne Thesen

No.

Louis Browne

Okay. Why don't we go then to how we're doing today? How are we doing recently, lately?

Suzanne Thesen

Cognitively, and Barry can help me with that— I'll get him to talk. Cognitively, he says his brain is like it's in a fog all the time. And he finds it difficult to express himself, to make decisions. He can't say what he wants. And the weird thing is, he now has, like, visions, and he'll explain that to you a little bit.

Barry Thesen

It's just like the birds came into your house and they're flying around in there and it's not really— It's like a shadow of a bird. And it drives you crazy, I guess. Makes you just wonder what's going on. It kind of comes and goes, you know, it isn't constant.

[00:20:00]

Like the last couple of weeks, I've been feeling quite well, I thought. And before that it seemed like all it is, is like animals or birds or whatever. And they kind of flutter around and, I don't know. It's weird. But I also read where it's a problem.

[To Suzanne] How did that go?

Suzanne Thesen

Well, just recently, I saw that—because I thought it was so strange—it's one of the things that other people have also been experiencing. I don't know for sure, but another thing that Barry keeps commenting on is, like, there's people in our house. And then when we— Barry likes to set the table before we're going to eat. And almost every time, even yet today, he'll say, "How many people are here?" And I'll say, "Just you and I." "Oh, I thought there was more people." I said, "No, there's just you and I." And he keeps thinking that either his grandson's downstairs or he says he hears voices; he thinks people are here.

Another thing that is happening to him—now Barry will confirm that; he says that it hasn't happened in the last couple of weeks—for example, I will send him off to the neighboring town, which is, like, seven kilometers away to his daughter's place. And I'll say, "She's waiting for you for supper. I'm going to be away." And he will go towards that town and, all of a sudden, he will have to pull over and stop because he doesn't remember where he's going. He doesn't remember why he's going. He explained it as a total blank. He just goes totally blank. Then he, after sitting for a little while, sometimes it'll come back. But even then, he's very disoriented. He gets into that town and he doesn't remember where the house is.

Louis Browne

Mrs. Thesen, can you or Barry tell us: How's Barry's strength doing these days? How is his walking, his legs?

Suzanne Thesen

His walking now?

Louis Browne

And his strength, his overall physical strength.

Suzanne Thesen

He's extremely weak. His knees— He'll talk to you about the pain he has, like a constant pain. But his knees, he has to be very, very careful. When he goes up the stairs, quite often even holding on to the railing isn't good enough. He'll use his hands and put them on the steps in front of him one at a time. When he goes down the stairs, he goes one foot at a time, like a two-year-old where you go one foot, two feet at the same step, and then keep going that way. He's lost a lot of his strength, he's lost his appetite, he's lost weight, he has a very, very hard time with dates, events. For example, if he knows he has an appointment, I'll write it down on a calendar, and he has it on his phone. But every day he has me check to make sure, like, "When is my appointment?" I said, "Well it's still five days away." The next day he'll ask me the same thing, "When is your appointment?" and then I'll repeat that.

Barry also does that with other things. There's certain things that really bother him and he doesn't remember, so it has to be checked every day.

[00:25:00]

He wants to use the car to go uptown. He will say, "Are my plates good?" "Yes." "Okay. Is my licence good?" "Yes." "Well, how do you know?" "Because we checked the day before, right?" Then he will go to the car and get the registration and he'll bring it in. It's very difficult for him to process the expiry date, so he'll say, "Can you help me with this? What does it say? How long?" And I'll say, "You're good for six months." "Okay." Then the next day it's the same thing.

TV, he struggles with the remote, trying to find channels. I often go and set it up for him, ask him what he feels like watching. Paying bills: he has to depend on me for a lot now. So I pay the bills, I do the banking, even business, and his credit cards and debit cards are extremely confusing for him. He'll say, "I'm going to go get some money. Which card do I use?" I say, "If you're using the ATM, you'll just use your debit." "Which one?" "This one." So he'll go and use that card and then he'll come back and he'll say that it didn't work. I'll say, "Which card did you use?"

Sometimes he'll say he used the black card—the MasterCard—or sometimes he'll say, "I use this number." "Oh, that's for the other card." He still has a business card and he has a personal card and we have MasterCards. And for him that's a lot.

[To Barry] "Do you want to say anything, Barry? Are you okay?"

Barry Thesen

That's enough.

Suzanne Thesen

That's enough? I know.

Louis Browne

And Mr. and Mrs. Thesen, you're both doing very well. And we're coming to the end here. I just want to confirm something before I invite the commissioners to ask questions. Mrs. Thesen, everything we've discussed today occurred in the province of Saskatchewan, Canada. Is that correct?

Suzanne Thesen

That is correct. Both shots were in Saskatchewan and we live in Saskatchewan and have for a long time.

Louis Browne

Thank you. At this time, I do have maybe one or two more questions, but they're conclusion questions. I'll just invite the Commission if they have any questions.

Suzanne Thesen

We did end up going to the doctor. Do you want to know how it was recorded, his injuries?

Louis Browne

Are we talking about the VAERS [Vaccine Adverse Events Reporting] System?

Suzanne Thesen

Both. We went to the doctor first. There is one doctor that Barry trusts; his name is Dr. Fowler and he lives in Carrot River. Due to lockdowns we had to do a phone interview. And I asked Dr. Fowler—we had him on a speaker phone and so we did it together—to file the injury report. Dr. Fowler was extremely hesitant. He says, “You do realize that you’re the first person that has ever had an injury that I know of.” And I’ll say, “It doesn’t matter. I want this recorded. I want it sent away to—” Then he would say, “These forms are really long and difficult. It will take us a really long time. Are you sure you want to proceed?” I would say, “Yes.” He says, “It does appear like your husband suffered a stroke but maybe it was a coincidence, maybe it had nothing to do with it.” I said, “Please, we’re asking you to report the injury.” He did go ahead and he did finish recording it and we’re hoping he sent it away.

[00:30:00]

He did follow up and he wanted us to go see a neurologist. When the appointment came, when it came time for Barry to go see the neurologist, Barry refused. He said no.

Louis Browne

And we can maybe just pause there for a second. Why don’t we invite the commissioners to ask some questions, and then we’ll just carry on? I don’t know if the Commission has any questions, but if not, then I’ll wrap up. We’re good. You’ve answered all their questions. So my second last question for you is: In summary, in just 60 seconds or so, what would you like this Inquiry and Canadians at large to take away from your evidence today?

Suzanne Thesen

First of all, I don’t think Barry would have taken the vax, or the shot—I guess I would call it—if they would have properly warned him that there was going to be some possible side effects.

Barry’s always been fairly trusting of the institutions, and doctors, and the government. I just know he just thought it was just harmless, “We’ve always taken vaccines.” And another thing is the coercion that went on to get these shots. Barry probably wouldn’t have gotten that shot if he knew he could have travelled without the shot. And also, if you could go and visit people in the nursing home without the shot.

Louis Browne

We may have covered it and there may not be anything more to say, but I want to make sure that you feel you’ve had your day in court, so to speak. My last question for you: Is there anything else you’d like to share with us today?

Suzanne Thesen

We just feel this injury was totally unnecessary. It was preventable. This injury has changed our life forever. It's stolen our dreams and retirement plans. It's stolen everything from us. Barry is the real hero here—to be here today. This is difficult for him, to say how it's affected him and how it's damaged him. The world needs to know what it's done to people.

This has nothing to do with our injury, but I do have one thing as a teacher. Can I say something?

Louis Browne

It's your evidence.

Suzanne Thesen

I'm still substitute teaching, and I was on a leave for a few months. I was teaching in the Grade one and two classrooms, and what I saw was horrific. If you can imagine: In the middle of winter, when kids go outside to play and they have runny noses, and they come back and their masks are frozen on their face. In the classroom, they're wearing those wet masks. And if ever somebody came in the classroom, they were told to put their masks on. Put them up. Put them up. Another thing that's damaging, that not that many people talk about is: everywhere you go, they have these sanitizers. When you first get into the door, kids had to go and line up and get their temperature taken. They had to also squirt stuff, this sanitizer, on their hands. Kids' hands would get raw and they thought it was fun.

And then they would go in the classroom and there was one in the classroom.

[00:35:00]

Now I would discourage them. I would say, "No, you can't." But they only had to use them before they ate, after they ate, before they went outside, after they went outside, before they went home, after they came in the school. It was on and on. Then parents would also buy them sanitizers that they would put on their desk and use, like, 10, 15, 20 times a day. Then they would eat their sandwich.

Kids would come in an hour late and then they would say, "I'm late because I just had my shot." It was beyond difficult. I had to turn around and just get hold myself a little bit. I just kept thinking, what if that child gets injured like my husband? What if?

That's all I want to say.

Louis Browne

Thank you, Mrs. Thesen. I just want to make sure if Mr. Thesen has any concluding thoughts. If not, that's totally fine.

Barry Thesen

No, everything's good.

Louis Browne

Mr. and Mrs. Thesen, thank you very much for giving us your evidence today.

Suzanne Thesen
Thank you.

[00:36:41]

Final Review and Approval: Jodi Bruhn, August 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Saskatoon, SK

Day 2

April 21, 2023

EVIDENCE

Witness 4: Dr. Luz Maria Gutschi (Parts I and II)

Full Day 2 Timestamp: 03:33:20–03:46:30/03:55:08–05:04:01

Source URL: <https://rumble.com/v2jlxvm-national-citizens-inquiry-saskatoon-day-2.html>

PART I

[00:00:00]

Shawn Buckley

I'd like to begin by asking you to state your full name for the record, spelling your first and last name.

Dr. Luz Maria Gutschi

My full name is Luz Maria Gutschi: L-U-Z M-A-R-I-A G-U-T-S-C-H-I.

Shawn Buckley

And do you promise to tell the truth, the whole truth, and nothing but the truth so help you God?

Dr. Luz Maria Gutschi

I do.

Shawn Buckley

Just by way of introduction, my understanding is you're an expert pharmacotherapeutic specialist. And you're going to have to explain for us what that is.

Dr. Luz Maria Gutschi

I'm a pharmacist by training and have some extra training in what we call pharmacotherapy, which is therapy using drugs, as well as drug assessment skills, which includes looking at the data and assessing the drug for safety and efficacy and for application to individual patient care.

Shawn Buckley

Okay. And as far as the drug assessment thing, you've done reports for the Canadian Pharmacists Association and for various regulatory agencies.

Dr. Luz Maria Gutschi

Correct. I've written a few chapters for the Canadian Pharmacists Association on vitamins and minerals, and on lifestyle management. And I provided expert scientific advice to the Patented Medicine Prices Review Board [PMRB], which is a quasi-judicial board that regulates the prices of pharmaceuticals and vaccines in Canada.

Shawn Buckley

And then you've also been a clinical pharmacist for the Canadian Forces Health Services Centre.

Dr. Luz Maria Gutschi

Yes, I ran an [inaudible] clinic. In addition, I have practiced in intensive care units for 10 years, and have developed an expertise in antimicrobial management, including what we call antimicrobial stewardship and infectious diseases.

So quite a variety of experiences that I've had in my career.

Shawn Buckley

Right. Now we've entered—you sent me a CV that we've entered as Exhibit SA-2a, which also includes that you've got a doctorate in pharmacy.

Dr. Luz Maria Gutschi

Yes.

Shawn Buckley

And assuming I haven't changed your CV, you adopt it as true?

Dr. Luz Maria Gutschi

Yes, that's true.

Shawn Buckley

Okay. Now, you've got a presentation for us today [Exhibit SA-2]. We've invited you to speak about the manufacture of the mRNA vaccines. And I'm going to ask if you can proceed with that.

Dr. Luz Maria Gutschi

Yes, thank you. And I will try to do it as a—

First of all, before I start, I would also like to thank the Thesens for their testimony. It was very emotional for me as well, as I've had some—I understand that I've seen these—I'd

just like to say, “thank you” for their testimony. It was very emotional. And I think this is a great thing that we get to hear what happens with vaccine injury, among other things.

What I’m going to talk about is fairly technical, which I apologize for. However, I feel it is necessary for people to understand how these products were regulated from a regulatory perspective, and what the implications are for the future. Most of this was independent, as I basically stopped working a few months before the pandemic was announced.

Because of my infectious disease training, I was very interested in a pandemic and was following all along. And when I heard about the vaccine, I started doing what I would normally do in order to assess a drug.

One of the first things I do is I go to the European Medicine Agency [EMA], which is not typical of most people. Because in my previous experience, I had found that their reports were very complete, with lots of information that usually assisted me in my analysis.

For background, all regulators work from a Common Technical Document that’s called the eCTD, which is: the same information, the same basic information, is shared among all the regulators in the Western world—

[00:05:00]

the EMA, which covers all the European Union, except for Switzerland and the UK, and then Canada, the FDA [Food and Drug Administration], and Japan and Singapore as well.

In this case, this product was reviewed as a rolling review assessment, which means they started assessing each piece of information as it came in, as it became available. What is normally done is the manufacturers would make an entire submission, bring it in, and the regulators would look at it. It does not change safety, efficacy, and quality requirements—that’s what we were told. I would say technically, that is true—the requirements were not changed—but there are implications for a rolling review, in my view, for assessment of the drug.

The pivotal trial, the trial that showed that we had 95 per cent vaccine efficacy, was published in November 2020. And shortly thereafter the vaccine was approved under Conditional Marketing Authority. That’s what they call it in the EU. It is an EUA [Emergency Use Authorization] in the US, an Interim Order in Canada. The Public Assessment Report that I used for this assessment went on the web on 2020. And actually, it was corrected in February, but I think I read it in January 2021.

I expected what is known as “regulatory flags,” which are specific obligations. These are obligations placed on the manufacturer in order to get full authorization that they had to meet. Canada has something similar, and so did the FDA. I expected that with regards to safety and efficacy and clinical data from the clinical trials in humans.

What I did not expect is that I saw four specific obligations out of the six that were manufacturing-based. And I read this and thought, “My goodness, how could they let this go on and actually give this to people?” I was really quite impressed. But I thought in my innocence that it would just take a little bit of time, and they would fix some of these manufacturing defects. So I told my family, “We’re going to wait until they fix these things,” because that’s likely, “and then we’ll reassess at that point.”

In addition, there's a leak of confidential documents to the dark web in January 2021. I found out about it in September. And it supplemented quite a bit all the information that was on the European Public Assessment Report [ePAR].

First, I'd like to talk about the steps in manufacturing this product. It is very complex with lots and lots of parts to it, or components, and each of those components have to be of very high quality. There are a varied number of manufacturers, number of suppliers, ultra-cold storage, and rapid transportation between sites. They'll have, like, 108 hours by the time they made the mRNA, and had to run over and put them in the lipid nanoparticles.

There are advantages to an mRNA vaccine, especially for a pandemic. Number one: it's fast. You can make a sample for 20 or 30,000 doses in 10 days from start to finish, and regular vaccines will take months. And the other advantage is that it is cell-free. We are not using cells, which are bound to be complications—such as putting it on chick embryos or other cells like insect cells or tobacco that we use, whatever.

The steps are: You make it in a production bioreactor, which actually does include E. coli. You digest out the DNA so that you can extract the mRNA, and then you have a lot of purification steps. You put it into the LNPs [lipid nanoparticles], which then require a bunch of purification steps. And then you bring filler finish, which is actually quite a big step. Manufacturers usually subcontract that out, and that is the steps for quality control, dilution, sterile filtration, capping it, labelling it. Then they put it in the deep freeze and sent it out as required.

Oh, dear, I'm stuck. Shawn, I'm—

Shawn Buckley

You're having some technical difficulties, are you?

Dr. Luz Maria Gutschi

Yes, I am.

Shawn Buckley

And you see, usually we have these at the beginning of the day. So it's nice to shake this up.

[00:10:00]

Dr. Luz Maria Gutschi

Lovely, I might have to go to my other computer if that's all right? Or I'm just going to have to— It's not working.

Shawn Buckley

If you need a couple of minutes, we actually have a video that we skipped over that takes about 6, 7 minutes that we could segue to, and then have you pick it up from there?

Dr. Luz Maria Gutschi

Fine. Let's hope I can get it to work. Thank you very much.

Shawn Buckley

Well, thank you, Maria.

So just to announce: We watched a video yesterday and what we've done is we've just had one of our video people put together clips for Saskatchewan. Because sometimes it's good to remember, even though it wasn't that long ago, just some of the things that we've experienced. So, okay— And our video lady is just looking for that, so just be patient and we'll just wait for Maria to get back on track.

[Video] Scott Moe

So effective immediately, public gatherings are now limited to no more than 25 people.

Night clubs, bars and lounges must be closed. Effective on Monday, restaurants are required to close except for takeout and delivery services. Personal services, such as hair salons, are also ordered to close.

Dental, optometrist, chiropractic, podiatry clinics are also ordered to close except when offering non-elective procedures. Daycare facilities are limited to eight children unless they are able to...

Shawn Buckley

We have Maria logged in, so it might flip back or forth a little bit. We can give you a few minutes, Maria.

David, I think we might just take a break and we'll come back in about five, six minutes.

[00:13:10]

PART II

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. We're sorry that we had to take a break, but when you're doing things online with virtual witnesses and the like, invariably you have some technical difficulties.

I'm pleased to have Maria Gutschi back on the line, and hopefully Maria, we're good to go. I'll just ask you if you can continue with your testimony.

Dr. Luz Maria Gutschi

Thank you very much. Can everyone see the screen in here?

Shawn Buckley

We can. We've got a slide "Regulatory review: Vaccine or gene therapy?"

Dr. Luz Maria Gutschi

Yes. So I talked about all the steps in manufacturing and the complexity of it.

One of the questions many people have is: Is it vaccine or is it gene therapy? And by definition, with the FDA and as well as the EMA, it is objectively a genetic therapy. Because it includes ribosomal nucleic acid, which is a nucleic acid or genetic therapy, and it acts inside the cell by translating those nucleic acids into a protein—in this case the spike protein. So objectively, it is defined as human gene therapy product. It does not necessarily affect our genetic makeup, but under regulatory, it is being classified as a vaccine for evaluation purposes.

We did a deep dive, some of my collaborators and I, to look at how the process occurred. In the early 2000, for example, the EMA and even the FDA had looked at mRNA- and DNA-type products and had classified them as gene therapy products, and they were being assessed as that.

Somewhere between 2004 and 2008 though, these products then became classified as vaccines such that, in 2012 in the EMA, the mRNA products were going to be evaluated as if they were a vaccine. Similarly, the FDA specifically said that guidance for gene therapy products do not apply to vaccines for infectious disease.

What we call in regulatory affairs the indication: What is the use of this product? If it is used to prevent an infectious disease, then it went down the vaccine regulatory pathway. And both the EMA and the FDA also specifically excluded them from long-term studies for genetic therapies. Because I could see a potential possibility where you would assess it as a vaccine for efficacy or under the clinical trials—you know, works as a vaccine; you do the clinical trials as a vaccine trial—but then assess its adverse events as gene therapy products. But these were specifically excluded.

Regulatory guidelines that are used in Canada, the EMA, and the FDA, was the WHO [World Health Organization] 2005 guidelines, who actually give nucleic acid vaccines the status as a vaccine. It delineates the controls, Good Manufacturing Practices for purity and quality, and supporting studies for a new formulation, which is the case for these mRNA products.

It's interesting that Moderna, even in its Security and Exchange Commission filings as late as June 2020, will admit that mRNA is considered a gene therapy but it is not assessed as such. And the BioNTech founder, Ugur Sahin, in 2014 wrote in a very seminal paper that they were uncertain where it would be classified. Because it would be classified either as gene therapy, somatic cell therapy, or biologic—and biologic includes vaccines.

So the issue with this mRNA product is that we really have two separate products. We had one product that was made in a different manufacturing process for the clinical trials, that pivotal November 2020 paper, and then we have the product that was used and rolled out commercially. While they were in the clinical trials that manufacturing process was not amenable to making millions of doses. It was an engineering issue that had to be resolved to scale up to make a large amount.

What they did—

[00:05:00]

On the left-hand side is this two-step reaction that you make. Now comes the technical part: You have to make a DNA, right? And from the DNA you make the mRNA, and the DNA is a

template in a line, and on the left-hand side is a two-step process. And on the right-hand side, the commercial product was a one-step process. And so it wasn't as accurate, and it had more contaminants.

And then came the purification steps. With the purification, they used something called magnetic beads to take the beads out that would suck the mRNA out, and then it would be denatured, and then the beads would get demagnetized, and you'd have nice little mRNA. With the commercial product, they had to scale it up and use a lot of filtration steps. And as a result, there were a bunch of unforeseen circumstances.

Overall, what the regulators were worried about—and these came very loud and clear in the documents, in the ePAR as well as the confidential documents—was the quality and purity of the mRNA; the different manufacturing process on scale-up; contamination; what was being produced by the mRNA, the spike protein; what they call characterization; and potency or pharmacology.

First, let me look at mRNA because it's absolutely, I find, critical for people to understand. Number one, the mRNA in these products—both in the clinical trials and here, are biosynthetic and modified. I think people think it's just simple mRNA from the virus, for example. Nothing could be further from the truth. They have been modified a great deal. I call it a biosynthetic, sometimes I call it a bioplastic mRNA.

On the left-hand side, this is how Moderna actually explains mRNA. It's a string of code basically, that goes through— The yellow thing is the ribosome, which is a little kind of a factory, and the little string coming out is the amino acids. Those get folded up into the spike protein. At the beginning, you have a 5' cap, which is kind of the beginning of a sentence, or the start. It's a capitalized word. You have what's known as untranslated regions. They're just regulatory functions. Then you have that section, a coding section.

For coding, you have something called codons, or three nucleic acids make one protein. It's a triplet to make a protein. At the end, you've got a stop codon that tells it to stop making the protein. Then you have a long poly(A) tail, which sometimes wraps it out and keeps that ribosome steady so that it can continue to make the protein.

What they've done with the mRNA is that these individual codons: they've substituted another nucleic acid. You end up with the same protein. You end up with the same amino acids in the same sequence so that you really have no change. That's called a synonymous mutation, so that there's no change in the end product.

However, there are potential issues regarding how it's translated and other issues with the mRNA. Why do we actually do it? Why did BioNTech and Moderna do it? That's because the virus— **If we put the virus mRNA into the lipid nanoparticles particles and they go into the cell, the cell realizes it is foreign mRNA and will mount a response to get rid of the viral mRNA, just like when you would get infected. So it gets destroyed before it can be made into the protein.**

In addition, you actually facilitate the translation into protein and you make more protein than you normally would. It's also important to realize that we have human elements in this modified mRNA at the 5' end and at the 3' end. They are proprietary, or there's a patent for those. We think they come from the hemoglobin. The particular amino acid that they substituted was something called N1-methyl-pseudouridine. It is found in humans but in very, very small amounts. The organism that has the most N1-methyl-pseudouridine I found is a group of bacteria called archaeobacteria,

[00:10:00]

which are ancient. These are bacteria that are found in the bottom of the Mariana Trench near those sea trenches growing at near-boiling water temperatures and at pHs of 1. They can tolerate a lot. So this nucleic acid is extremely stable.

What happened with the roll-up and the commercial or the scale-up is that you had a lot of truncated and fragmented mRNA. You need a full intact mRNA with the 5' cap and the poly(A) tail to make the protein. What we found was up to 50 per cent— They were running 55 to 60 per cent intact mRNA and the rest was truncated and fragmented. You could see these little bumps. Not only that, but the bumps were at specific times—or specific lengths, I should say. That usually meant there was a problem with the actual process, the IV transcription. As the mRNA was made, it would stop and wouldn't continue on, so you had that fragment length.

So they had a big meeting with Pfizer and said, "What's going on here? Can you please discuss this and tell us what the impact on safety and efficacy will be?" Pfizer said, "We really don't think it's going to be a problem. The bumps are the same. We just have more of them and it's unlikely to impact safety because they would be degraded and not translated since they don't have all the elements that are required for that to occur."

In the end, though, what the EMA was very concerned about is that we did not have the same product for the commercial batches as we did in the clinical trials. Normally under regulatory affairs, what most regulators would do with this amount is that we would ask for another clinical trial to ensure that we got the same safety and efficacy as we did in the original clinical trial that was published in November 2020. They had a big meeting. This slide is from a meeting they had with all the regulators, including Health Canada, the FDA. And said, "This is our concern: What are we going to do with it?"

I don't know what the outcome was. All I know is, as of December 2020, these amounts of impurities were accepted, and it was still given its conditional marketing approval despite these problems.

Back to the mRNA that are biosynthetic and modified. These issues with this modified biosynthetic mRNA was a potential problem that was recognized even by the founder of BioNTech: that with prolonged treatment, you might have adverse events within the cell. You could have toxicities or immune pathology because, even though they are less immunogenic than viral mRNA, they may have some actions that we don't know about. Especially in this little area here: We don't know how it's going to be metabolites and risks with metabolites, how it's going to be broken down, and potential unwanted cross-effects. These things needed to be assessed. Again, I reiterate, it has non-natural nucleosides as well as human.
