Yes, of course. I'm not going to show my slides just yet. I'm going to say a few words first. I'm going to tell you that if we'd done nothing—that is, if the government hadn't reacted at all; if there had been no talk of a pandemic; if there had been absolutely no reaction, either in institutions or hospitals or in terms of government action—there wouldn't have been any excess mortality anywhere. If we had done what we normally do, there would have been seasonal mortality as we're used to seeing for over a hundred years of taking detailed measures. Nothing would have happened. That's the conclusion I draw after three years of detailed study of mortality statistics, all causes combined.

Chantale Collard

Basically, you're going to talk about excess mortality in connection with the measures. So there have been excess deaths.

Dr. Denis Rancourt

Yes, of course.

Chantale Collard

But it was not due to COVID, but instead due to the measures, as I understand it.

Dr. Denis Rancourt

So what I'm doing is studying all-cause mortality statistics. This means that we count the dead, we count the presence of a person who dies, we know their age, we know the place where they died and we know the date on which they died. And we compile these statistics on the scale of a nation or a province or a region or a city, and so on. And it's this type of data that I analyze across several countries and around the world. We collect all the data we can, wherever we can, and analyze it. And on the basis of this analysis, which I've been doing in detail for a long time—and I can't explain it all to you because there are too many of them, and they're scientific reports of a hundred pages with lots of graphs, and so on—I've come to the following conclusion: The data prove that it couldn't have been mortality due to a transmissible respiratory disease.

[00:05:00]

It's inconsistent with a viral respiratory disease because a viral respiratory disease—and this includes what's known as COVID—when tested clinically, kills people with a risk that increases exponentially with age, with a doubling time of ten years. This is well known, as detailed studies show.

I'm not saying it's not true. I'm saying that if we accept that the virus kills in this way, well, the excess mortality that we measure in detail and quantify, for example in the United States, is not correlated with age at all. So if I show you—and I'm going to show you later—

the excess mortality in the United States, for example, by state; and I plot this mortality as a function of the number of people over 80 or the number of people over 65 or the median age of the state's population, there is no correlation. Which is strictly impossible if this excess mortality were due to a respiratory viral disease, period—and above all, COVID, where clinical studies have shown that the risk of death is exponential with age. So we can demonstrate that mortality is not due to the transmission of a viral respiratory disease. No doubt about it. And I'm going to show you other types of data which establish this, which are really striking: maps on a European scale, and so on. That's the first point.

Second point: The excess mortality we see, which occurs suddenly in mortality peaks following certain events, is directly associated and synchronous with measures taken by the government. So for example, at the very start of the pandemic, as soon as the pandemic was declared, there was a demonstrable spike in mortality as a result of treatment protocols in hospitals in the early months of the pandemic.

Chantale Collard

You are talking about March–April 2020. To situate us in time.

Dr. Denis Rancourt

Yes. So the pandemic was declared on March 11, 2020, and immediately from then on—I'll show you some graphs—there was a very large excess mortality in certain hotspots. And this is further proof that it wasn't a virus. It only happens in certain hotspots and is synchronous across the world wherever it occurs, which is strictly impossible for a virus that is spreading. It's strictly impossible. I also do modeling research. Epidemiological theory shows that the time between the "seed," as we call it, the first cases, and the rise in mortality, is a time that depends very much on the circumstances in the country, the cultural and institutional structure, and so on. It can't be synchronous everywhere in the world; it's strictly impossible if we accept what we know about the epidemiology of respiratory viral diseases. So there's plenty of evidence that excess mortality is associated with things we can see directly. I'm going to show you some very striking examples.

And finally, my other important conclusion is that vaccine deployment directly caused immediate excess mortality. As soon as you deploy a dose of vaccine, there's an excess mortality that can be measured and quantified. So we are, I think, the first research group to quantify this on the basis of all-cause mortality. And I'm going to tell you the result of this quantification; I'm going to show you the mortality risk per injection. And this risk increases exponentially with age. We're the first to demonstrate this, and I'll show you that we've proved it for several countries. And this means that we absolutely should not have given priority to vaccinating the oldest people. It's the opposite of what should be done. **The basic presupposition of those who want to inject us is that the risk of side effects doesn't depend on age, it's simply a risk, whereas we've shown that the risk of mortality increases exponentially with age.**

[00:10:00]

It's very, very significant, and rises to very high values per injection when it comes to the elderly.

So now that I've told you my conclusions after three years of research, I'm going to show you some graphs that illustrate these points. I've prepared some slides that we can put on the screen now. So there you have it. This is to show that my detailed scientific expertise is

in several fields that are relevant to the COVID study. For example, I'm an expert in environmental nanoparticles, nanoparticle synthesis, nanoparticle properties and nanoparticle characterization. This is very relevant because we say that viruses are nanoparticles, and these nanoparticles are the basis of vaccines. I'm an expert in molecular science, molecular reactions, theoretical and experimental molecular dynamics. I'm an expert in statistical analysis, error propagation, advanced Bayes-type statistical analysis. These are fields in which I have published scientific papers.

I'm an expert in theoretical modelling. I've modelled environmental phenomena and I'm now modelling epidemiology to show how classical epidemiology, as it's promoted, can't explain the phenomena we observe. So I'm an expert in modelling and I'm an expert in scientific measurement methods. So I've written articles to develop and advance techniques such as diffraction, different kinds of spectroscopy, magnetic measurements, measurements of all kinds, calorimetric, et cetera, and microscopy methods. And in my laboratory, I had an electron microscope, I had a nuclear spectrometer, I had these instruments; and I was the head of a laboratory that used these instruments to do detailed research on environmental substances, et cetera.

So all that to say that I have a lot of expertise that is directly relevant to these issues. I have a group; I work in collaboration with people I really like, including Christian Linard who joined us recently, and then there's Marine Baudin, Joseph Hickey, Jeremy Mercier, John Johnson, who is a professor at Harvard University with whom we recently wrote an article comparing the effect of lockdowns in the United States. So those are my collaborators. The articles I base my work on are on my website, denisrancourt.ca. There are more than 30 articles in this field; they're big reports and you can find them all. The vast majority of these articles have been translated into French. The translation is on the article page of my website, where you can find a link. I've prepared a book of evidence that's almost 900 pages long, containing 20 of the articles most relevant to the conclusions I'm drawing today, which I'm making available to you as evidence [Exhibit QU-1].

Chantale Collard

Also available on the web.

Dr. Denis Rancourt

I've also made this book of evidence available on the web, yes, but I want it to be tabled before this Commission too. So those are the conclusions I've already described. I'm sorry, the slides are in English. The fact that there was no pandemic, et cetera, I've already explained.

Here, I'll show you what all-cause mortality data can look like. Here we see mortality by month in the United States from the year 2000 until recently, and we can follow the seasonal variations of this mortality. We can see that there's a dip in February, and that's simply because there are 28 days in February. There are fewer days, so there's less mortality. You can spot the Februarys here. This is to show you what it looks like when we do mortality by month for an entire nation like the United States. And you can see that the last group, in this sort of mauve, is mortality during the COVID period.

[00:15:00]

So from the moment a pandemic was declared, mortality was much higher in the United States. And the mortality has a structure—has peaks—that is completely unusual.

Normally, you can't have peaks of mortality in the summer in a country in the northern hemisphere, but there were in the United States during the COVID period. We've explained and shown that this is only true in poor states, where there are lots of poor people, where people were killed in the summer, and we try to explain this in our articles. But that's to show how mortality appears. And the black dots are the sum of all mortality over a period such as the COVID period versus the period just before that, but of the same duration, versus the period just before that of the same duration. So we can see the black spots: it's the total mortality for a period that would be equivalent to the COVID period. We can see that there's a big jump in mortality in the United States when we enter the COVID period. This is a very precise quantification of total mortality over the COVID period.

Chantale Collard

Professor Rancourt, I know you're going to give us a very elaborate answer, but in general, the arguments one might say we hear are: "The population is aging, maybe that's why it happened." I hope you'll respond to that.

Dr. Denis Rancourt

There isn't a sudden spike in the number of elderly people who will die during the COVID period. There isn't a bulge in the elderly population that, as time progresses, reaches the age at which they're going to die, and then die suddenly. So the effect of age, for example, the aging of the population, will cause a gradual increase in this integral, this total mortality. But when there are sudden jumps, it can't be, for example, the baby boomers or things like that. It has to be a sudden event that happens in the population when you do this kind of study.

Now, this is just to give you a sense of what all-cause mortality looks like. This is the same mortality for the United States, but seen by week and where the same integral is used. Here, the black dots have the same meaning, but here, we see in greater detail the mortality per week and we see the peaks I was talking about, which are very abnormal, and which I'll describe in a few moments. And you should also know that this relatively gigantic mortality in the United States corresponds to 1.3 million deaths that would not have occurred had we not done everything we did during the COVID period: in the United States, 1.3 million more deaths!

Well, in Canada, there was almost none. The excess mortality during the COVID period in Canada is so small that it's almost impossible to measure. We've quantified it and I'll show you in a moment: it's very small, and much smaller in proportion to the population. It's not because there are fewer people. And so we would have to conclude that the virus refused to cross the border between the United States and Canada, which is completely absurd if we want to believe that it's due to a virus.

This is further proof that it's not a respiratory disease: because the border is several thousand kilometers long, with constant economic exchanges. It's strictly impossible for there to have been a virus in the United States that killed 1.3 million people and virtually nothing in Canada. It's strictly impossible in the context of respiratory viral disease theories.

So for the United States, there was this excess mortality, and it can be calculated on the scale of the 50 states of the United States. This is a graph of excess mortality in y for the entire COVID period as a function of the percentage of the U.S. population living in poverty. And here, we see that there's a correlation: in science, we say that it's a very strong

correlation. There's a coefficient called "the Pearson correlation coefficient," which has a value of +0.86. A strong correlation like that is unheard of.

[00:20:00]

And it's not just a correlation, it's a proportionality. That is, those who are used to looking at graphs like this will notice that it passes through the origin, meaning that in a state where nobody lived in poverty, nobody would have died due to the measures that were involved. And so this is another demonstration that it can't be a respiratory viral disease. Respiratory viruses don't attack poor people. They attack people who are old, vulnerable and have comorbidities, and that's how they cause death. They don't choose to kill people who are poor.

Chantale Collard

By the way, I'm sure you'll be talking about the African continent, if we are considering poor people.

Dr. Denis Rancourt

That would be another topic, but not right now. So poverty has a very strong correlation in the United States with this excess death, as well as the number of people who are "disabled," who are not functional due to severe mental illness. In the United States, there are 13 million people suffering from severe mental illness to the point where they can't function in society on their own, and who have to be cared for by various institutions, and who are heavily medicated. So we have a correlation graph with the number of people per state in this condition, and there's a very strong correlation there too. So the correlations we find between excess mortality and societal factors are: poverty, the number of people in this type of extreme misery—mental illness, et cetera—and average family income. If you make more than a \$130,000 a year per family in the United States, you don't die from COVID, period, according to the statistics we've studied.

So I'm not showing all these graphs but I just wanted to show this one, which speaks directly about poverty. So in the United States, there are a lot of people living in poverty and misery, I would say, caused by a medical system that gives psychiatric drugs to a lot of people on a large scale. There are many, many people who are in this misery, who are in very poor health, and that's why there's a very high mortality rate in the United States and almost none in Canada. This is the excess mortality for the ten most populous states in the U.S. by age group. So you see, age groups 0- to 24-years, 25- to 44-years, and so on.

And here we show the excess mortality expressed as a percentage of what the mortality would normally be. This is the period before we started vaccinating, so, this is the COVID period but before the vaccine was deployed. We can see that, even in that period, excess deaths by age group were of the order of 20, 30, 40 per cent in excess of normal mortality in those ten states, to give an example. And then, in the period when we started vaccinating, the same graph looks like this: we see that for the youngest, it goes up to 60 per cent for the 25- to 44-age group. So we see a change in the structure by age group when we start vaccinating people in the United States. It's very measurable.

Chantale Collard

So this is the first dose.

Dr. Denis Rancourt

Here, we're including mortality over the entire period from vaccine deployment to the final days of this study. So we were still vaccinating. This is the result.

But what's surprising is that we've just explained the United States, but now we're going to look at Canada. And what we see in Canada is the light blue curve. The light blue curve shows all-cause mortality per week in Canada from around 2010 to the present, essentially. You can see that there's virtually no change.

[00:25:00]

We're entering the COVID period and there's not really a big change. And what I've highlighted in red, and this will surprise you, is what the Canadian government is telling us, what Theresa Tam wrote in a scientific article: she said that if the government hadn't done everything they did—the vaccines, the masks, the distancing, the lockdowns—then there would have been about a million more deaths in Canada. This graph shows the absurdity told to us by Theresa Tam and her co-authors. They claim that if nothing had been done, the mortality rate would have been this high. And the mortality you see on the screen, because the scale starts at zero in y , is an absurd mortality. There hasn't been a world war, there hasn't been an earthquake on a time scale that could be normalized, there hasn't been any known phenomenon in history since these data were first measured that could produce such a high mortality.

Chantale Collard

Purely hypothetical.

Dr. Denis Rancourt

And Theresa Tam claims that, because of these measures, this great mortality we would have had is down to the level that is exactly what it would have been had we done nothing. In other words, they didn't bring it down to half, they didn't bring it down by 90 per cent to get to ten per cent. No, they lowered it to a level as if there hadn't been a particularly virulent pathogen. We're in this absurd situation. It's what they're telling us, what they want us to believe. And for a scientist like me, it is the realm of the absurd.

Here I'm taking the data for Canada and putting it on a scale where we look at it in a little more detail. And now, I'm doing this integral for a year-cycle; so I'm going from one summer to another to capture the mortality that tends to be higher in winter, to show the extent of the small increase that is nevertheless seen in integrated mortality for Canada when we get into the COVID period, and in the cycle after that too. So there is a small increase that we can quantify. On a larger scale, we can still see this small increase. And in Canada, we can also compare all-cause mortality with vaccine deployment. So in Canada, we can see that there's a peak at a time in the seasonal mortality cycle when there shouldn't be a peak, which coincides with the start of deployment of the first doses. And then, when the third dose takes place, that is, when there's an acceleration in the cumulative number of administered doses, we see a peak in the winter of 2022 that's much greater than all the other peaks on this graph. So we're really seeing correlations in Canada of vaccination affecting mortality. We've analyzed this in more detail, but it's just to give you an idea of what we're doing.

This is an enlargement of what we've just seen: the correlation between mortality and vaccine deployment. The peak I've marked as C is a very strong peak in Ontario, especially

for people aged between 50 and 65, and it's exactly when vaccines were deployed in this age group. The peak referred to as *D* is a very thin peak due to a heat wave that took place in British Columbia at exactly that time. It's well known that heat waves cause very thin peaks that last little more than a week. So we can analyze each of these mortality peaks. But the peak I'd like to illustrate in greater detail now, and you'll be really struck by the result, is the peak I call *Peak A*: because the arrow pointing upwards, that's the date on which the pandemic was announced, and immediately afterwards, there was this huge rise in mortality. So I want to analyze it and show you what this peak looks like. And I'm going to show you that there was such a peak, which was very, very strong in certain states of the United States, especially in New York.

[00:30:00]

So here we see this very, very strong peak. Here I have all-cause mortality per week for the states of Connecticut, Maryland, Massachusetts, New Jersey, and New York all combined. And you can see that seasonal mortality, when normalized by population, is always about the same, but this peak is very different from state to state. There were 30 states in the United States that didn't have this peak. So it's a virus that was attacking just some states, and very strongly.

The same peak occurred at the same time on the other side of the world, in Europe. And so here we see the same peak taking place in Lombardy in Italy, similar places in Spain, and so on. There's also one in France. There are hotspots like this, where very thin peaks in mortality occur immediately after the pandemic is announced. And so when I wrote my first article about this peak, in June 2020, I said: "This is not a viral respiratory disease pandemic. It's not possible for something like this to be caused by a virus. It must be caused by what you're doing in the big hospitals in those jurisdictions." And so, we're going to look at what's happening on maps, what's happened in Europe with this peak, and you're going to be amazed.

So I've got a map here, just to remind you where the European countries are. I've also marked in blue certain borders that I want you to look at—because these are borders that the virus has absolutely refused to cross. So from Portugal to Spain, it was impossible for the virus to cross; from Spain to the south of France, it was impossible; Germany was protected in its entirety and the virus didn't penetrate Germany at all; the north of Italy was hit hard but it didn't spread further north, and so on. Just like that, there were hot spots. In Sweden, there was a hot spot in Stockholm that never spread. So they killed a lot of people during the first two months of the declared pandemic, which didn't spread. So that's to show you where to look on the maps I'm going to show you.

So here it is. This is the first map: excess mortality in Europe for January 2020. And you see, **the map is white because there's virtually no excess mortality, everything's normal.** Everything is normal this January 2020 compared to all other Januarys in the past. If we extrapolate the historical trend, it's the same mortality we've always seen. And now I'm going to February: same thing, no excess mortality for February 2020 in Europe. And here's the mortality for March, the month in which the pandemic was announced. As you can see, the boundaries I pointed out have been respected. The mortality supposedly due to the virus has not crossed into Germany. Germany is a jurisdiction with a very low mortality rate, and you can see that the borders have not been crossed. And if I go another month, to April, we're still in that early mortality peak and it's still pretty much the same places; and the borders are respected, the virus isn't crossing. And then, in May, it's over. It's a very thin peak that ends in May and in June, there's none.

So this famous peak in the first few months of the pandemic did occur in Quebec, the province with the strongest early peak, and it occurred in hot spots. We were able to go to the regional level in France and identified counties where there were large hospitals where people died. So this mortality cannot be due to a virus. We think it's due to what was done in the hospitals. Mechanical respirators in hospitals were very important because in Lombardy, Italy, they invented a way of putting two patients on one respirator machine. They were very proud of this: "We're going to save everyone; we're putting them all on respirators." This partly explains the very high mortality rate in Italy at the time.

[00:35:00]

I'm going to shock some people in the audience a little. But hydroxychloroquine, HCQ, is a very interesting molecule with beneficial effects but with a therapeutic window that is very well defined and relatively narrow. And when you go beyond a certain dose, it becomes lethal. And at the start of the pandemic—because a lot of researchers like Didier Raoult said, "Look, it's useful"—well, people who didn't know how to use it in hospitals in the territories used it a lot, but in a less supervised way, I think, than what happened in Marseille. There is a correlation between a peak in the use of hydroxychloroquine and this high mortality. And this peak can be seen in European countries where there are these mortality hotspots.

Chantale Collard

The places related to hydroxychloroquine are where the protocol had not been followed.

Dr. Denis Rancourt

Exactly, it happened where a protocol had been invented which was way too high by dosage and it certainly poisoned a lot of people. So there's this correlation. A German researcher, Dr. Claus Köhnlein, was one of the first to suggest that: "Look, in Germany, we didn't do that and there were no deaths. Wherever two grams or more has been used, there have been many deaths." He had suggested this, and so we went into the statistics to see if there were any peaks in the prescription of these molecules. In fact, we're in the process of identifying many molecules used in aggressive treatments at the start—because everyone was in a panic and so on—which are correlated with this high mortality.

And the final theme of my presentation is the high toxicity of vaccines in terms of actual mortality. So I'm going to talk about that. I'll start by saying that there can be no doubt that vaccines are killers. Vaccines can kill people, can cause death. There are many lines of evidence. There are very detailed autopsy studies that demonstrate this and I quote from those studies. There are adverse event monitoring systems that show spikes in adverse events, including death, at the very beginning immediately after vaccination, and then up to two months later. The statistics show this very clearly and we've written an article on the subject. There is a study that was done in the United States by Mark Skidmore which showed that, on the basis of scientific survey questions in the United States, he had calculated 300,000 deaths due to the vaccine in the United States. We quantified the figure using our own methods and came up with the same figure. So that would mean that in the United States, there were 1.3 million excess deaths; and in that figure, there are more than 300,000 people whose deaths were caused by vaccines.

So that is one line of evidence. There are plenty of articles on pathologies that are induced by vaccines and there are more than 1,250 articles in scientific journals that speak about the damage that can be caused by vaccines. So I think, when you look at all of this, you have

to conclude that it's possible that the vaccine could kill people. Our task is to quantify that. How often does it kill people? And so that's the autopsy studies. Now, we're going to see if we can use mortality to quantify the risk of dying from the vaccine.

So the first article we wrote was on India because in India, it's very difficult to get good data on all-cause mortality. Some researchers had published data but hadn't noticed that there was a peak—but a huge one!—of mortality in India which, coincidentally, was exactly when they deployed the vaccine in India. All right? So in India, we were able to quantify that the vaccine definitely killed 3.7 million people. There was no excess mortality in India until they deployed the vaccine. There was no COVID in India; the data are clear, there was no excess mortality. And in India, they had what they called a “vaccine festival”.

[00:40:00]

The Prime Minister said, “Go vaccinate the most vulnerable people.” They made a list of 12 comorbidities and said, “Go get these people and vaccinate them.” Essentially, they encouraged people to vaccinate the oldest, most vulnerable people; and in a very short space of time, they killed 3.7 million people in India with their vaccine. We wrote a whole article about it.

Here, the graph shows Australia. We chose to study Australia because it's another country where nothing happened in terms of excess mortality until the vaccine was deployed. They don't say that in the media. There is no excess mortality in Australia except when the vaccine is deployed. And so, we enlarge this for Australia and you see the seasonal mortality and you see the deployment of the vaccine: you see that we're entering a higher degree of mortality. You can see that there's a peak. You'll notice that in Australia, because they're in the southern hemisphere, seasonal peaks in mortality occur during our summer, which is their winter. So it's reversed. And then, during their summer, which is our winter, there's a peak in mortality right in the middle, which you see here, which is very large, coinciding with the third dose of the vaccine, deployed very rapidly at that time. Without any doubt. Here, I have a graph showing the deployment of the vaccine, the number of doses administered per week, in black, compared with the peak in mortality at a place which holds the historical record for mortality in Australia, but where there has never been an excess of mortality or a peak in mortality—never in history.

And in Australia, people don't die from a heat wave; it's not due to a heat wave. I've traced all the heat waves in Australia and I've found that the most intense one caused a very small peak because in Australia, they're used to being hot. So this spike is definitely due to the vaccine and it's happening in every state in Australia. We can go through the states here: Victoria, New South Wales, Queensland, et cetera. So we have very clear data where we have mortality. There was no excess mortality until we deployed. When we deploy, we have a new scale of high mortality; and when we bring in yet another dose, we have a spike on top of that. So we can use this data to quantify how many people died per dose of vaccine administered. That's what we're going to do.

And so this is to show that it's not just in Australia. This is Mississippi in the United States. You'll notice that in Mississippi, there's a huge peak in mortality—again in the middle of summer, that is, our summer, when there shouldn't be any mortality in the seasonal cycle. Well, there is a huge peak, and it coincides with an acceleration in vaccination. But it's not just any acceleration: it's what was called in the United States “the vaccine equity campaign.” So “vaccine equity” was a vaccination campaign paid for by very influential financiers who spent tens and tens of thousands to hire lots of people to go and vaccinate vulnerable people who hadn't yet been vaccinated. They caused this spike in mortality, but

only in the poor states of the USA. People died in this vaccine equity campaign in states where there was a lot of fragility and a lot of poverty. So we spotted this peak, which coincided with an acceleration in vaccination due to the vaccine equity campaign in all the poor states of the United States. And that's a phenomenon that has to be attributed to the vaccine.

And here again, we can quantify what this represents in terms of mortality. The mortality that took place in the poor states of the United States at that time has an equivalent risk to the mortality that took place in India, which killed 3.7 million people. This is the same risk of mortality in the poor states of the USA as in India. Here we see Michigan, a state in the north of the United States. In Michigan, there is an excess peak that occurs at the beginning, when the first doses of vaccine are deployed—a completely abnormal peak that is very similar to the same peak that occurred in Ontario.

[00:45:00]

So this is to show another example where the deployment caused sudden large mortality in an unexpected place.

So to sum up the question of vaccines, we—and we were the first to do so—wanted to quantify the risk of mortality due to the vaccine by age of the person receiving the vaccine. But to do this, we need to find data in the jurisdiction in question where they give us mortality by age group as a function of time, and also, vaccination for that same age group as a function of time. And when we find jurisdictions where we can find these data, we can make the calculation shown here.

So Israel and Australia have very good data, and that enabled us to make this graph. So this graph represents the risk of mortality per injection. It's what we call the "vaccine dose fatality rate" as a percentage, as a function of a person's age. We can see that there's an exponential rise for older people, and we can see that the mortality risk reaches almost one per cent on this graph. This means that one dose in a hundred will kill a person of that age when injected—one dose in a hundred! That's enormous. So we were able to prove this for the first time. We're the first to have done this quantification.

Here, I'm showing on an enlarged scale what's happening to young people. We can see that young people have also been killed by vaccines, the younger age groups, and that this mortality risk is higher than the exponential curve deduced for other ages. So young people have a mortality rate that is independent of age and higher than the exponential trend found for other ages. For those who are more used to looking at this type of graph, I've put the same data in semi-log and you can really see the exponential trend, the straight line. We can see, for young people, that we're deviating significantly and that we're remaining constant in the mortality risk. So there they are, the young people affected by the vaccine: that's where we see them.

Finally, this is just to show what the data in Israel typically looks like. In black is the deployment of any given vaccine dose and in purple is all-cause mortality. We can see that when the vaccine is initiated, there is a mortality peak that is larger than the vaccination peak. When another vaccine is introduced, there's another mortality peak and so on. But as the doses progress, mortality per injection is higher. And so there are a lot of curves like this for different age groups in Israel. That is the 80-year-olds and over, 70- to 79-year-olds. It's just to show the shape of the type of data we're analyzing. In the end, this enabled us to produce a summary graph showing the risk of death by injection as a function of age, but for the different doses received. So we can see that the first doses are not as lethal as the

next ones and those after. Doses three and four are particularly lethal; and we can see that for the elderly, the higher the dose, the greater the risk.

Chantale Collard

And here, you have effectively stopped at four doses but there are others who have gone up to six or seven.

Dr. Denis Rancourt

At the time we wrote this article, that's the data we had.

Chantale Collard

It can be inferred that—

Dr. Denis Rancourt

Ah yes, our studies continue in all directions. Many countries are now being studied. I will conclude with this last slide. To date, India, Australia, Canada, Chile, Germany, Israel, New Zealand, and the United States have been studied in detail. Many of these results have not yet been published but we are just about to publish them. The average risk of death following vaccination in Western countries, all ages combined, ranges from 0.05 per cent to—in the case of advanced doses—as much as three per cent for the most elderly.

[00:50:00]

That's the kind of mortality risk you find. And when you use average values for all ages, you can calculate how many people would have died from the vaccine. So on a global scale, it's 13 million people. In India, as we've demonstrated in detail, it's 3.7 million people. In the United States, we've calculated—and we're quite confident of this calculation—that 330,000 people would have died as a result of the vaccine. In Canada, we're currently estimating and we're in the process of refining our error calculation, et cetera. It's more difficult in Canada because there's less mortality, but we think that around 30,000 people have died from the vaccine. These are mostly very old people. We have the excuse of not thinking about the vaccine because we expect them to be frail and elderly. So it's easy, perhaps, not to talk about it. These are deaths that are less visible, but which are nonetheless due to the fact that these people were vaccinated. And so vaccine-induced mortality is much higher than governments are prepared to admit.

Well, that concludes my presentation.

Chantale Collard

Professor Rancourt, I may have one last question. In fact, you have autopsy results. But on the other hand, we can see that the capacity to have autopsies conducted was rather hindered; people weren't able to go that far. So what can we infer from the autopsy results?

Dr. Denis Rancourt

I'm not a pathologist; I'm not the person who does autopsies. I'm in contact with the researchers who do the autopsies. I talk to them and I look at their results and I ask for their help in interpreting what they see under the microscope and the tests they do, et

cetera. But I know that, yes, we didn't do as many autopsies as we should have; we should have done a lot more. But there are dozens and dozens of papers reporting very detailed autopsies which conclude that death was due to the vaccine—and more and more are coming out. So it's typically family members looking for someone to do the autopsy. There's a great German doctor who's done several for family members and these data are starting to come in. Every month, there are new articles reporting autopsies.

Chantale Collard

They'll keep coming out. And at the very beginning you answered the question we're asking here for the benefit of the National Citizens Inquiry: So what could have been done differently? You answered, "We shouldn't have done anything."

Dr. Denis Rancourt

Exactly. What we had to do differently was to do nothing. If we hadn't invented this pandemic— I mean, sure, there are always pathogens present; sure, there's a whole ecology of pathogens; sure, people get sick and get better all the time, that's not the question. The question is: Has there been excess mortality due to a particularly virulent pathogen? And my answer is: absolutely not.

And one thing I haven't said is that in the United States, where there have been so many deaths, the CDC admits that, of the deaths they attribute to COVID, more than half of these people also had bacterial pneumonia, which is noted on the death certificate, in a country where they stopped prescribing antibiotics, okay? You need to know that in Western countries, antibiotic prescriptions dropped by 50 per cent during the COVID period and it's stayed that way. I would argue that this is certainly not an accident. There have been suggestions from agencies to stop prescribing antibiotics; and so the poor people who have died in the United States are also the same populations who are normally prescribed a lot of antibiotics because they have a high susceptibility to suffering from bacterial lung infections. And so this same population that— Normally, when you look at a map of the antibiotic prescriptions in the United States, it's red in the poor southern states. Well, we stopped prescribing antibiotics to these same people. They had bacterial pneumonia, and it's largely this population in the United States that has died.

[00:55:00]

So in terms of mechanisms, we've been able to identify this in our articles.

Chantale Collard

Professor Rancourt, I will let the commissioners ask you questions, if they have any.

Commissioner Massie

Thank you very much, Professor Rancourt, for your brilliant presentation, which is rather frighteningly dense. Fortunately, I had read a little of it beforehand, which helps, but I still have several questions. I'll start with the last one so as not to forget it. When you extrapolate the deaths due to vaccination in Canada, you're estimating, on the basis of averages that have yet to be refined, around 30,000. I note that in the United States, you estimated around 330,000?

Dr. Denis Rancourt

Yes, our estimate for the United States is more refined and better. So from one country to another, the error in this estimate may be greater or lesser. For India, we're absolutely certain of 3.7 million. In Australia and Israel, we know in such detail that we can talk as a function of age and of dose. So there's a great deal of certainty there. But what's astonishing is that, when you go from one country to another—and now we've done a lot of countries, I'd say over 50—you always find the same risk per injection, more or less; we're always in the same range. And when you take particular peaks, if you don't just take the vaccination period, but if you take peaks and associate that with doses given at the time, you still get the same mortality risk. Do you see what I mean?

Commissioner Massie

Yes.

Dr. Denis Rancourt

So we're very confident that's a robust number.

Commissioner Massie

My question was that you had presented earlier that the excess mortality, all causes combined before vaccination— Well, when we looked at the measures that had been deployed before vaccination, what we observed in the United States compared to Canada was that the difference was not proportional to the population. And here, you put forward the idea that, in fact, the population or the proportion of poor and vulnerable people in the United States being much greater, it's probably these target populations that have suffered more. And I thought I understood from your presentation that the more vulnerable people are also going to be the same people who are going to suffer more from vaccine injuries in any case—are likely to die from vaccination. And here, the ratio seems in any case to be within the margin of about one in ten, which corresponds to the proportion.

Dr. Denis Rancourt

Yes. I'd say, at this stage, looking at the data and all that: I gave 30,000 to give an idea for Canada. But in our final analysis, there's going to be a margin of error, and it's going to fall, I'd say, between 10,000 and 35,000. It's going to be in that range. So there's a lot of uncertainty about the estimate for Canada because we're still in the early stages of analyzing the data, but it was to give an idea for the Canadian audience.

But, you see, when we went looking for the vulnerable in the United States with the vaccine equity campaign, the injection mortality rate was as high as in India. So we were in the one per cent range in those age groups, which aren't even the oldest. But when we look at Australia and Israel for all ages, we find exactly the same figure—0.05 per cent—and our first estimate for Canada is still in the same ballpark. So I tend to use that figure to make this calculation, and that's the figure I used for the United States, so I used the same proportion.

Commissioner Massie

My other question is that an all-cause analysis requires fairly precise figures on fairly large populations if we want to arrive at estimates. For example, in the case of vaccine-related deaths, there was at one point an episode in Quebec when the government wanted to

launch vaccination campaigns in senior citizens' residences in a rather, I'd say, sustained manner. And there were even articles about it in *La Presse*.

[01:00:00]

I saw a scientific article published almost a year later that recounted this episode and mentioned that they had slowed the pace a little because they found it was particularly aggressive. Can we do any studies on this, given the population and the event or incidence that happened?

Dr. Denis Rancourt

With the methods I use, all-cause mortality, I can't quantify these things, but these are cases of specific institutions and we can get precise figures. And there are European countries that have noticed the same thing and have issued warnings not to vaccinate the elderly without a thorough clinical analysis. So they went too far at first in several countries, but we can see from what they said publicly that they then made adjustments. Some countries have noticed that the risk increases exponentially with age. They've noticed it; they've seen the consequences of vaccination in the elderly, there's no doubt about it; we can see it in these governments' communications.

Commissioner Massie

Finally, my other question concerns certain environmental factors. I'm sure that your studies have tried to make other correlations apart from those you've shown—and in particular, when we look at the period in which we deploy, for example, the second or third or fourth dose. Given that we know from studies carried out by people involved in vaccination that it is contraindicated to administer a vaccine to a person who is infected or who has just been infected, so as not to cause overstimulation, when we see the increases in toxicity as a function of dose, isn't there a part of this that could be explained by the fact that we know that the Omicron wave was particularly abundant, according to the studies we've seen? Wouldn't vaccinating a third or fourth dose at that point increase the problem?

Dr. Denis Rancourt

Here, we cross into the realm of immunology theory. So I've made a conscious effort to avoid venturing into that territory. I've always adhered to all-cause mortality data, to the mathematical correlations I can establish, and to a calculation of error in making this statistical analysis. And I've refused to go into that territory, to talk about the mechanisms, what could cause it. But, for example, when I find that more advanced doses are more lethal, we have to be careful because often, it's in jurisdictions where advanced doses have been more directed at the elderly. So when we don't distinguish by age group, we can, in the all-ages data, be wrong in a certain sense. It may appear that the dose is more lethal, but in fact, this is because more vulnerable people have been vaccinated.

And so when the data allow it, I can discern things. When I can't, I have to admit that it's a possibility. But I understand your question and to answer it, I'd need to have data on the level of infection of people who are injected, and I'd have to believe that these data are reliable. And so, as I'm not ready to have data by age groups at the level of the jurisdictions I'm interested in, and as I have absolutely no confidence in the assessments as to whether the person is infected or not, because we're in the dark—are we talking about symptoms, which symptom, et cetera? Are we talking about PCR tests? That doesn't mean anything. So my approach was: "I don't want to know anything about all that."

I mean, when they announced the pandemic, you'd see people lying dead in China, then you'd see people falling down, and they'd say the same thing: "The hospitals are full." But personally, the first thing I did was to go outside, then I looked to see if there were any dead people in the street and I didn't see any. Okay? And in other words, what I did was I immediately went and looked for all-cause mortality data to see if there was any increased mortality. And there wasn't!

[01:05:00]

There were just hot spots with peaks, like in Quebec, New York, London, Paris, and northern Italy. That's what there was, but there was nothing elsewhere. In a study we did with John Johnson of Harvard, we compared states in the U.S. that were next to each other, that shared a border, that were very similar. One state did a lockdown and the other didn't, and we found 12 pairs of states that we could compare directly like that. And we systematically found that the state that imposed a lockdown had a much higher all-cause mortality than the other.

And so all this to say that there was no excess mortality where we didn't attack people and we didn't kill people in hospital at the beginning and we didn't do the lockdowns later. There weren't any. That was the response I got to the suggestion that people were going to die everywhere, et cetera.

All-cause mortality is very powerful. I can look at mortality in Chile and tell you what day there was an earthquake. I can tell you what day there was a heat wave in northern latitude countries. I can tell you about the aging of the population, I can tell you about the wars that have happened. Do you know, I studied all-cause mortality in detail, and I looked for the pandemics that were announced by the CDC to see if I could find the number of deaths they said had occurred: Will I see them in all-cause mortality? I couldn't find them.

None of the modern pandemics since World War II has produced a signal that can be detected in all-cause mortality. I'm not talking about COVID; I'm talking about the pandemics that have been announced since the Second World War. There haven't been any. As far as I'm concerned, there's no excess mortality. So what are we talking about? Why are we making such a fuss and showing people how to blow their noses and telling them to wear masks and do tests, when on the scale of a country like the United States and in all the countries we can study, these pandemics have not caused excess mortality. What are we talking about? While on the other hand there are real phenomena that cause mortality: war in particular. You can see the Dust Bowl in the United States in the 1930s, economic crashes: you immediately see the mortality. There are major social phenomena and structural changes that cause mortality. And I say that what happened during COVID was exactly this kind of attack on the population, as if there had been a meltdown in the economy. The population was affected in the same way; and in the United States, that's what caused the deaths.

Commissioner Massie

I'd like to ask you, given the power of this approach: How many people are there who have the capacity to carry out analyses like you do and like Pierre Chaillot does, who recognize that it should be a practice that should be widespread in all governments so that we can precisely understand the phenomena we face? Is there a desire to move towards this kind of analysis or do we prefer, for the time being, not to practise it?

Dr. Denis Rancourt

Statistics Canada does analyses of mortality, birth rates and all that sort of thing. There are many experts who do this. There is no lack of technical knowledge to do so. What's lacking is the motivation to really be honest and report what we see, what the data want to tell us. Mortality is very simple to understand. Once you get used to it and you can spot the kind of things that can cause mortality, you get used to it very quickly.

But you know, since I started working in all-cause mortality, my biggest job and my biggest frustration has been trying to get my scientific colleagues to understand that we have to look at all-cause mortality and stop talking in circles about all kinds of things and start by seeing if people are dying. Who's dying, where are they dying, and why are they dying? And let's leave aside all the theories and all that.

Personally, I get frustrated with my colleagues because I'm in several discussion groups with researchers and I've had all the trouble in the world getting them to understand. It took me three years, and now they're starting to understand. They say, "Okay, so we're going to analyze all-cause mortality; Denis, could you do it?"

[01:10:00]

Well, that's where we're at. But, you know, the education system is very faulty. We train very specialized people and we don't place any importance on clear, robust, direct thinking.

So the scientific researcher wants to apply his theories and his way of seeing things to his field but doesn't ask himself the question: What would be the best way to tackle this problem? Which expert should be called in? What do I need to learn to understand this phenomenon? They don't ask themselves that question. Instead, they ask themselves: How am I going to apply the theory I've learned to say something about this phenomenon? And that's a big problem in our society. There's a shortage of thinkers.

Commissioner Massie

I will ask my colleagues: Ken, you have any questions you want to ask? Anyone else? Okay. I have more, but we will move on.

Chantale Collard

Professor Denis Rancourt, thank you. Your testimony is truly invaluable. You're talking about major issues; you're talking about all-cause mortality as much as post-vaccination mortality. And let's hope that your research will be widely disseminated. Thank you.

Dr. Denis Rancourt

Thank you.

[01:11:37]

Final Review and Approval: Erin Thiessen, October 31, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members

of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 11, 2023

Day 1

EVIDENCE

(Translated from the French)

Witness 10: Christian Leray

Full Day 1 Timestamp: 11:11:33–12:00:55

Source URL: <https://rumble.com/v2sjzn2-quebec-jour-1-commission-dengute-nationale-citoyenne-franais.html>

[00:00:00]

Jean Dury

So good evening, Monsieur Leray.

Christian Leray

Good evening.

Jean Dury

We'll start, if you don't mind, by swearing you in. Do you solemnly swear to tell the truth, the whole truth, and nothing but the truth. Say, "I swear."

Christian Leray

I swear.

Jean Dury

Thank you. So without further ado, for the benefit of this commission, could you tell us a little about your curriculum vitae?

Christian Leray

Yes, I'm a graduate of a business school in France. The accent gives me away, I'm of French origin. I arrived in Canada and Quebec in 2000. I was an exchange student finishing with a Master's degree in Communications at UQAM [Université du Québec à Montréal]. So there you have it: I'm a double graduate, in fact, in management and communications.

To sum up quickly, I could say that I wrote a book on content analysis—so media analysis so to speak, in 2008, which was published by PUQ, the Presses de l'Université du Québec. Because I was also working at the Laboratoire d'analyse de presse de l'UQAM [l'Université

du Québec a Montréal] at the same time, which I directed for a few years. This makes me a media analysis specialist in a way.

And I also contributed to the book, *Crise Sanitaire et régime sanitariste*, which was published in 2022, I believe, and was a bit of an assessment of COVID in Quebec; what had happened. I wrote a chapter on the vaccine passport. And since 2009, I've been self-employed, which allows me to be independent. I'd like to make it clear right away that I have no conflicts of interest and that I can speak freely.

Jean Dury

So without further ado, let's address the three parts that are going to be interesting this evening. We'll start with the authorities' lack of transparency. What do you have to say on this subject?

Christian Leray

So if you like, I've even got a PowerPoint I could share. Otherwise, I can get straight to it. First of all, there's definitely a huge transparency problem in Quebec. I'm really interested in Quebec.

By the way, I forgot to mention that I'm a member of Réinfo Covid Québec, which has now become Réinfo Québec. It's a collective that was created in July 2021; and for this collective, I did a lot of work on data in Quebec. In fact, I was behind the dashboard we published every week, which included data published by health authorities.

As a first assessment, we can mention that there is an incredible lack of transparency on the part of the authorities. We can take several examples: the first, for example, is data as a function of comorbidities. So what are comorbidities? They are the serious illnesses that people can have, for example: cancers, heart problems, diabetes, and so on.

So the INSPQ [Institut national de santé publique du Québec] put together a very interesting table up to May 2022, I believe, showing deaths according to comorbidity and also age. What this table showed was that people with at least two comorbidities accounted for 92 per cent of COVID deaths. It also showed that if we added people with just one comorbidity, the figure rose to over 97 per cent. So in fact, we could see that COVID was not a dangerous disease for the vast majority of the population. Only those at risk—that is, those with comorbidities—were really at risk of death.

There was another factor we knew about and that was age. We could really see that the people at risk were those over 70, not to mention 80 and 90. So in fact, this was a very specific category of the population, one that could have been protected. This completely contradicted the idea that the virus was a new plague and that, in the end, everyone had to be confined.

[00:05:00]

So this data was really disturbing. And the INSPQ stopped publishing it as of May 2022 because it was becoming untenable.

Other data were also gradually withdrawn: I'm thinking, for example, of data on cases and hospitalizations according to vaccination status. So in fact, from July 2021, Santé Québec [Quebec Health] wanted to show that vaccination was working. To do this, they started

publishing data on people who had a positive PCR test and were hospitalized for COVID according to vaccination status. So on the one hand, we had the people who were vaccinated—and we could see the number of people who had a positive PCR test or who were hospitalized—versus the unvaccinated, about whom we saw the same information. As I'll show in the next section, this data became disturbing and was simply withdrawn as of July 2022.

Even more important than cases and hospitalizations, of course, are deaths by vaccination status. And this is even worse because it has simply never been shared. This data has never been made public by the authorities. Why? We have to ask ourselves why—because if the vaccine is effective, why not put up a comparison showing people's deaths according to whether they've had one dose, two doses, or no dose at all? So there's no way of knowing; it's hidden from the public.

And finally, the last and perhaps most important point is the data on all-cause mortality according to vaccination status. These data should obviously be made available, as we discussed earlier. Monsieur Rancourt and Monsieur Chaillot talked about it. I made an Access to Information request to obtain these data and Santé Québec replied that it didn't exist. I'll quote you pretty much what they told me, in fact. It's quite extraordinary. They told us that, "The Ministry of Health and Social Services cannot provide you with data on deaths from all causes, because to do so would require the production of a document as well as work such as data extraction, compilation, and comparison." So if the Ministry has to carry out extraction, compilation, and so on to answer this question, that means they're saying they don't have the data. It seems absolutely unimaginable, in fact; because right now, even the Institut de la statistique du Québec acknowledges that there is an unexplained 10 per cent rise in mortality. And this data should be watched as carefully as milk on a stove, it's obvious.

So it seems pretty obvious to me that it does exist. It exists in other countries, as Monsieur Chaillot said, notably in England, it exists in Scotland, and so it certainly exists here. So I've come to the conclusion that the truth is being hidden from us and that there's a very clear desire on the part of the authorities to hide the data. We have to ask why. How come they're hiding all this from us? The explanation—we'll get to that later—I imagine is that it has to be hidden because the vaccines aren't producing the expected results.

Jean Dury

So let's move on to the second part: you talk about data manipulation.

Christian Leray

Exactly. So first of all, we've seen that the authorities are hiding as much as possible. That is already an admission that there's a very big problem. But what's more, for everything that's actually been made public, we realize that there have been manipulations to the data. So we can make a list of many examples.

[00:10:00]

We can start with PCR tests, for example. As we learned from Monsieur Chaillot, who spoke at length about this subject, PCR tests can, after all, almost create a pandemic if they're adjusted too tightly. So how does a PCR test work? It's based on a number of cycles, and I'll make it very short: the higher the number of cycles, the more acute the test. The problem is that if you do too many cycles, you'll end up with a test that's so intense that it may declare

people as being positive when they aren't necessarily so. In fact, this was the title of an article in *The New York Times* as early as, I think, August 2020, which said, "Your PCR test is positive; maybe you're not." And the reason would be that the number of cycles is too high. And this number of cycles should be known, in fact. Yet it's not known; it seems to be hidden.

I made an Access to Information request to obtain this information. I finally got it after two or three tries because when you make an Access to Information request, you have to be very specific. They do everything they can to skirt around the issue, to avoid answering the question; and then every time you make a request, it's going to take you at least 20 days before you get an answer. So you make the request, 20–30 days go by, and then they tell you it's not a good question, it's not clear enough. It can take up to three months to get an answer. So I sense a clear willingness to conceal information.

Finally, I learned that in Quebec, these PCR tests are set at between 40 and 45 cycles. So you need to know that, generally speaking, we estimate that a normal rate of cycles for the PCR test is roughly between 28 and 32 cycles. If we exceed 32 cycles, we run the risk of having a test that's too acute, which will declare people with bits of dead virus as being positive. In any case, this can create a feeling of panic because more people will be declared positive than is actually the case. And this may also partly explain why so many people are asymptomatic: quite simply because our tests are far too sensitive. So already we can see here that there's a huge problem of transparency and obvious manipulation because: Why test between 40 and 45 cycles when the scientific literature talks about 28 to 32? It's quite problematic.

There's also everything to do with COVID hospitalizations. So we heard a lot, especially during the first wave, about hospitals being overwhelmed. But here too, I think there was some manipulation. Why? In France, the ATIH [Technical Agency for Information on Hospital Care], a public institute, published a figure that made a big impact: namely, that the hospital occupancy rate for people suffering from COVID was two per cent. So it caused quite a stir. We thought, "What's going on, how can this be?" And I wanted to verify what was going on in Quebec.

So I searched for the data. It wasn't easy but I finally found the hospitalization data. On the INSPQ site, you can find data on people hospitalized with COVID. So on the Santé Québec site, we have the overall hospitalization rates; and by doing the ratio, I came up with a total of 2.1 per cent, meaning that in 2020, the percentage of people hospitalized for COVID was 2.1 per cent of total hospitalizations. This means that 97.9 per cent of hospitalizations were for other causes. So in fact, people hospitalized for COVID never really jeopardized the healthcare system, especially when we consider that hospitals were transformed at the same time: special units were set up for COVID and many operations were postponed. In fact, hospital activity plummeted in 2020.

If I could share my screen, I could show you all the data. It speaks for itself.

[00:15:00]

And we can see that, in the end, maybe there were a few hospitals that were indeed overwhelmed at certain times. But you have to realize that the heaviest traffic, let's call it, in hospitals because of COVID was I think on April 16, 2020, and we reached five per cent. So in fact, there hasn't really been a hospital crisis. The data show that there weren't really any overcrowded emergencies or departments and, by 2021, it was 2.3 per cent. So here again, we see that there was some fabrication; there was a narrative to make us panic, to

tell us that this was a catastrophe and to encourage us to isolate ourselves and then to accept the health measures we were ordered to follow. There were other manipulations too and one that particularly strikes me as extremely serious.

Commissioner Massie

Christian, can you share your presentation? It would be easier to follow your numbers. Is that possible?

Christian Leray

Yes. No problem. Can you see that?

Commissioner Massie

Yes, that's good.

Christian Leray

If I can show you here, it was the INSPQ table on comorbidities. So we found that 92 per cent of people who died from COVID had, in fact, at least two comorbidities; the INSPQ talks about pre-existing conditions. And if we add the people who had one pre-existing condition, we arrive at 97.3 per cent. So this table showed that the general population had virtually nothing to fear from COVID, despite what we were led to believe.

If I go a little further, here, this was my Access to Information request, which showed that in Quebec, PCR test cycles were between 40 and 45. Here is the famous graph showing the drop in hospital activity in 2020, when hospitals were supposedly overwhelmed. This is due to the fact that hospitals actually delayed operations and transformed the units into COVID units, which were probably not as full as we were led to believe. These are the raw figures. Here we see the total number of operations in 2020 and 2021. In fact, we see that the COVID proportion is very low and cannot have had seriously jeopardized hospital activity. But that's what we were led to believe.

This brings me to my next point, which seems to me to be a very important one, which is that there is some doubt as to how vaccinated people were classified for the 14 days following their vaccination. Because during the 14 days following vaccination—especially the first dose, because for subsequent doses, it was 7 days—during the 14 days following the first dose, they were considered not yet protected. So in fact, they were considered unvaccinated. However, what the data show, and this is a table taken from Ontario Public Health, is that people who receive a dose of vaccine—here it's the first dose, I believe—tend to manifest the symptoms of COVID during the 14 days that follow, essentially. We can see that here, up to 12 days, we still have a lot of cases and then it drops off quickly. So vaccines tend to create COVID cases.

Incidentally, in one of her recent lectures, Naomi Wolf said that this was the third-most common side effect of vaccination. This is absolutely incredible. She based this statement on data from the Pfizer files. So what it looks like, in fact, is that people develop COVID within 14 days of being vaccinated. The question is knowing how they're classified because if they're classified as unvaccinated because they're still considered unprotected, then the weight of those numbers falls into the unvaccinated category. And we've made requests for Access to Information and haven't had a clear answer.

[00:20:00]

So there's a major uncertainty hanging over whether people who have been vaccinated for less than 14 days, and who tend to develop COVID, have been classified with the unvaccinated, which could explain the famous epidemic of unvaccinated people. As you'll recall, the epidemic of the unvaccinated in 2021 may in fact have been an epidemic of the vaccinated. In fact, Patrick Provost and I talked about this, and we wrote an article about it that was published in *Libre Média*. So if this turns out to be true, it would be an absolutely gigantic manipulation because it would really mean that the unvaccinated were blamed for the contaminations and the hospital occupancy, whereas it was, in fact, the vaccination that caused it— So a way of hiding the data that is absolutely—I do not think this can even be put into words.

There were also other methods of manipulation. I've written articles about this on the Réinfo Québec website. So a fairly classic method was to present the raw data of the day. For instance, every day on Santé Québec's dashboard, they presented the data: the numbers of cases and people hospitalized. But it's important to know that this data was polished over the following days, even weeks or months. When you look at the data, Santé Québec very quickly modifies it all.

And what's important to know is that, generally speaking, this is to the advantage of the vaccinated. Let's take an example: at the beginning the dashboard showed 100 vaccinated in hospital versus 120 unvaccinated in hospital. But if we revisit the site a week later, we'll perhaps see 90 unvaccinated versus 110 vaccinated, and the more time passes, the more it increases, in fact.

Sometimes it's the other way around. Sometimes, it's the [un]vaccinated who are increasing, but overall, and in a fairly major way as we refine the data, I'd say it's more the vaccinated. It depends on your point of view, of course, but let's just say that they look much better on the day it's posted—on the day itself—rather than in reality, in the actual facts. Yet we only see the actual facts a week or a month later and that's too late because we've moved on to another day and it's been forgotten; it's been erased.

And so this too is an absolutely unacceptable way of presenting things, and that's why, in our dashboard—we'll come to that later—we did what the English did: we presented an overview that didn't take into account that day's data. We let ten days go by, and once the ten days had passed, we went back over the previous four weeks. So that gave us a more dependable idea of things because if you look at the current day's data, it's raw and it favours the vaccinated, and so it gives the impression that we actually have an epidemic of unvaccinated people.

Then there were other manipulations. I'll be brief about these. For example, we had an absolutely incredible testimonial from the field: a person told us that his 95-year-old father had died. He was in a CHSLD, a retirement home, and the doctor classified him as a "COVID death" and unvaccinated. So why COVID? Primarily, because he had had a positive PCR test two days before. So we pretty much know the value of the PCR tests today but that was reason enough to classify him as COVID. And he was 95 years old; he was at the end of his life and his son who testified told us that it was probably his time, unfortunately; he was at the end of his life. And if he had COVID, he actually didn't die of COVID: he died with COVID. But he was classified as a COVID death.

Beyond all that, he had been vaccinated. In fact, he'd received two doses. Yet the doctor classified him as unvaccinated. Why? According to our witness, it was because he had received his two doses more than six months earlier. Now that's extraordinary.

[00:25:00]

This means that six months after having multiple doses, the authorities may— Is it the whole of Santé Québec, or just individual doctors? We don't know. But in any case, after six months—and we know that in France, it's like that. In France, there actually was a directive that said that after six months, you were considered unvaccinated. Your vaccination health pass no longer worked. So that's what this doctor applied. He considered that after six months, you were no longer vaccinated, and so the effect fell into the unvaccinated category. And how many cases were there like that? I believe there have been many and a thorough investigation could reveal this.

Then there was survivor bias. I think it's also been touched on by other speakers before me, so I don't want to go over it again, but it's a way of calculating statistics that ultimately overexposes the unvaccinated, giving the impression that they're more affected than the vaccinated, when that's not the case. Fenton spoke of survivor bias using a placebo as an example. Both groups had received a placebo, in fact. The victim or survivor group was over-represented, even though it was a placebo, so you're at 50/50.

I also wanted to come back to transmission, which was quite interesting. So this employed a slightly different manipulation: it's about the establishment of the vaccine passport, which was based on the idea that it would protect us from the transmission of viruses, given the understanding that the vaccinated were no longer transmitting the virus while the unvaccinated were. This justified the vaccine passport, so that the unvaccinated could no longer go spread the virus in restaurants, bars, and so on.

Except that what Madame Small from Pfizer informed us—in fact, we already knew about this earlier, but she made it official, so to speak—was that Pfizer's initial trial never demonstrated that the vaccines prevented transmission. All it could show was that they prevented infection. But then again, as Pierre Chaillot has shown, it involved 170 people: 162 unvaccinated people infected, 8 vaccinated people infected, out of a total of 40,000 people. And based on these 170 people, they were able to say that they had 95 per cent efficacy against infection. This is absolutely incredible, but in any case, the trial could not demonstrate that it prevented transmission. That's what Madame Small belatedly said at the end of 2022.

So the question is, what did the authorities know about transmission before the introduction of the vaccine passport? Well in fact, as it turns out, they knew virtually **nothing because there were two, quote-unquote, "studies" that came out. I did some research on this. There's a study that was done in Israel. As you know, Israel was the "Pfizer nation." That's where there was an agreement between Israel and Pfizer for Israel to get more vaccines more quickly. In exchange, they would transmit all their data to the company. So they were able to do an initial study on transmission, but it was Pfizer's study, so there was already a conflict of interest from the beginning. Then there were other problems that I've listed in other articles as well. So it wasn't very solid, let's say.**

And the second study—on which Monsieur Macron particularly relied—claiming that vaccines reduce the risk of transmission by a factor of 12, is in fact a model from the Pasteur Institute. The two studies, Pasteur and Israeli, came out in June, and they are modelling studies. There are many limitations to this, because everything depends on what

you input into the model. For example, if the model uses a 90 per cent vaccine effectiveness, well, you're bound to get a model that tells you that it will reduce transmission, that's certain. And in fact, that's pretty much all the authorities had.

But what do we realize, in fact, as early as July? It's that there are outbreaks in places where there were only vaccinated people.

[00:30:00]

The British aircraft carrier, *Queen Elizabeth*, for example: all were vaccinated and there was an outbreak. There were other cases in hospitals where virtually all the patients were vaccinated, and then studies started coming out. At the end of July, I think it was *The Washington Post* that published a study quoting the CDC to the effect that vaccines no longer prevent transmission—well, we've never really known that they did. On July 31 or 30, 2021, *Le Monde* published an article citing an Israeli study already showing that vaccines were only 39 per cent effective. At that point, the mandates hadn't yet been put in place; and all the studies that would follow would only reinforce this, showing that vaccine efficacy declines over time and so on.

And despite all this, they would succeed in imposing a mandate as discriminatory and undemocratic as the vaccine passport. It succeeded despite the obvious evidence; the manipulations are gigantic. That's what I wanted to show you: we realize that the authorities manipulate the data to their advantage and that we can't trust the data, but it was enough to make us panic and to succeed in applying the lockdown measures, the masking, the vaccine passport, et cetera.

Jean Dury

And finally, you talk about the negative effects of the mandates.

Christian Leray

That's right. So after presenting my many situations—in other words, showing that the authorities hide what bothers them, and of the little that they do reveal, they manipulate the data—what's quite extraordinary is that, in spite of all this, their own data shows a negative efficacy.

I've been very interested in vaccination, of course. Now, we already know that lockdowns are probably negatively effective. There was the "Mr. Vaccine" from Israel, Monsieur Cohen, who admitted this on the French TV channel CNEWS. We now know that masks are ineffective, and even that they have negative effects when we consider the psychological damage to children as well as the chemicals in the masks. But I'm really going to come back to the vaccines.

So the first thing that's interesting to see is that in Quebec in 2022, despite an 85 per cent vaccination uptake, we had more deaths than in 2021. This is absolutely incredible. I'll show you right now. This is data taken from the INSPQ website: you can really see that hospitalizations are higher in 2022; they're exploding.

And for deaths, at the bottom, it's the same thing; and in fact, it is certainly higher than in 2020. That's because in 2020, as Monsieur Chaillot said and as previous speakers have said, there was particularly—excuse me, but the way they counted in 2020 was absolutely absurd—In particular, there was the Arruda directive in Quebec, which stated that people

who had COVID in a building—so it could be, for example, someone without a test who had a runny nose or a sore throat or whatever—and if there was one person in a building who had such a symptom, it was said to be COVID. Then, all the people in that building who died were classified as COVID.

So as a result, the number of COVID deaths exploded. And Monsieur Arruda, who was Director of Public Health at the time, admitted on several occasions that many people who were classified as COVID had never actually been tested. They were classified, no doubt hastily, as COVID. Not to mention the problems that arose with the abandonment of the elderly. There were doctors who testified that many elderly people had died of thirst or starvation.

[00:35:00]

Anyhow, in short, all this is to say: that when it comes to COVID deaths in 2020, there's most certainly been a lot of exaggeration; and that we're seeing an astonishing rise in 2022 compared to 2021, even though we have a population that's 85 per cent vaccinated. So it's quite astonishing, let's put it that way.

So the next important point to note is that we used Santé Québec data. As I said earlier, to prove that vaccination was effective, Santé Québec shared data on cases and hospitalizations, and we used these data. So what was it actually? It was an Excel table showing, for each day, how many hospitalized people were unvaccinated, vaccinated "one dose," vaccinated "two doses," "three doses." So for example, on May 3, 2022, we could have five unvaccinated, three "one-dose," four "two-dose," and so on.

And ultimately, with some very simple Excel calculations, we arrived at the following table which, in fact, showed that people who had received three doses were largely over-represented in hospitals, since at the time they actually represented around 50 per cent of the population—51.2 per cent—but accounted for 70 per cent of COVID hospitalizations. So there was a negative differential of minus 18.8 per cent, which is absolutely absurd. If vaccines work, we absolutely shouldn't have that. When you see that, you're just speechless.

I'd like to remind you that this is Santé Québec data; nothing was made up. It was published every week on our site because we did what we called a counter-dashboard. And the fact checkers, the media, were perfectly aware of it, and I can tell you that they followed us closely. We had a few instances where they, quote-unquote, "came down hard on us." We were "debunked" by Radio-Canada. At one point, they did a 20-minute report on "The Multiple Faces of Réinfo Covid." Thus, they claimed to be tracking us closely, and I can tell you that if we had been wrong, we'd have known about it straight away. I don't think it would have taken long, a few hours at most, before we'd have had articles saying that we were talking nonsense. So I think these data are very reliable and, in fact, show the ineffectiveness, at least of the third dose, which has very deleterious effects.

So that was for the mandates. It was so bad here in July 2022 that the authorities had no choice but to withdraw them. At first, it was very good for them because I think, since there was this way of actually classifying the vaccinated during the first 14 days as -unvaccinated, it created an epidemic of the unvaccinated, so it was fantastic. They could show the data. It was magnificent. It was wonderful for them. But as time went on, there were in fact fewer and fewer people receiving a first dose. Therefore, fewer and fewer unvaccinated people developed COVID symptoms, and so, little by little, the reservoir dried up and the reality

became more and more obvious. And that's what led to this result. And there was no other choice: they had to be withdrawn.

So we've seen hospitalizations, but now we know that there was also a piece of data that was never shared: deaths. Why aren't we sharing data on deaths? We tell ourselves that the explanation is no doubt because we shouldn't show them because the results aren't very favorable. And that's effectively what we got, since we applied for Access to Information. It was complicated; we had to do three of them because each time, they gave incomplete data, so we had to specify exactly what we wanted.

[00:40:00]

And we obtained a document showing the number of people who had died from COVID according to vaccination status. And what did it show? It showed that 95 per cent of people who die of COVID are, in fact, vaccinated.

It's absolutely outrageous. We mustn't forget that nearly 85 per cent of the population is vaccinated, so this is gigantic. In fact, it is a ten-point difference. This is rather extraordinary for a vaccine that is supposed to protect against disease. This is based on Santé Québec's own data, which is known to be manipulated. The data is not very good. It's understandable why they hide it. It's even quite catastrophic. So that's the current situation in Quebec. And then what do we notice? We notice that there is an unexplained increase in the number of deaths. The ISQ, the Institut de la statistique du Québec, recognized that there has been an unexplained 18 per cent rise in mortality among young people.

You can see it here, in fact: so, this is taken from the ISQ website. We can see that from mid-2022, there's actually an upward trend towards midsummer. And this trend of increasing mortality continues on, which is not normal if we look at the summers of 2021 and 2020, when there was no excess mortality. Here, we can see that there is excess mortality; it's well explained. But when we see this table here, we get a rough idea; and in fact, at least we have a hypothesis, so to speak. And the way to verify this hypothesis would be to have deaths from all causes according to vaccination status but, as I told you, Santé Québec tells us it doesn't have this data, so we can't verify it.

That's more or less the situation in Quebec today. So we can see that based on public health's own data, vaccines seem to have negative effectiveness. There is an unexplained rise in mortality. Could the vaccines be part of the explanation for this unexplained rise? In any case, the authorities are making no connection whatsoever. They're certain that the vaccines are safe and effective, and that's where we're at today.

Jean Dury

Thank you very much, Monsieur Leray. Do we have any questions for you?

Commissioner Massie

I understand it's getting late now. We've all had a very long day. I'll limit myself to just one question for Monsieur Leray. You've done a colossal job compiling all these data and I would be interested to have you comment on the evolution of your mindset regarding data collection and the questions you had when seeing those discrepancies from your observations that seemed to materialize every time you did a study. Has this led you personally to take a firmer stance regarding what seems to be a fabricated narrative that, in any case, does not seem to want to be dismantled by government authorities? So what is

the evolution of your approach and where are you now after all the analysis you've been doing for at least the past two years?

Christian Leray

Clearly, this can only reinforce the idea that there's a problem with vaccines. Moreover, that was the idea behind one of my articles for *Libre Média*, where I said the vaccines are not the solution.

[00:45:00]

All this happened step by step: first we had the INSPQ table on comorbidities, then we had the data on hospitalizations, then we had the data on deaths according to vaccination status. It's clear that at each stage, the idea that vaccination has a negative effect is only reinforced. What's shocking is that this is something we're even questioning. As I say, everything we do is public, it's detailed on our website. In our articles, I do explain the methodology; and we know perfectly well that all the media and fact-checkers are watching us and they have nothing to say. So it's an admission that what we're saying is true, that we're not too far off the mark, and that they're extremely embarrassed. We find ourselves asking, if the public knew all this, what would they think and how would they react? It's unbelievable.

So in fact, in the end, the authorities and the media—I call them subsidized media because they receive subsidies, which obviously doesn't make them free; they're not independent—but they're stuck in their discourse of safe and effective vaccines and they can't go back. I mean, it would be extraordinary; they're capable of anything, but it would nevertheless be quite extraordinary to suddenly be able to tell us, "Oh, you told us that vaccines were ineffective and that we shouldn't be vaccinated." So they're forced to continue with this discourse that vaccines are safe and effective. And that's worrisome for the future because the future is more or less what other speakers before me have been talking about. What has happened, in fact, is social engineering. We succeeded in scaring people, making them conform, locking them up, and injecting them with a product that was still being tested. It was a great success, and this success has been analyzed by the people who organized it all, and it's still going on.

So now we're going to have the sequel, perhaps with global warming. They're talking about "15-minute cities," where we'll have to accept cameras in the streets for these "15-minute cities," where we'll be filmed all the time because we won't be able to take our cars anymore because they pollute and because they heat up the planet. We're approaching a world of Chinese-style control; that's what I fear. And the media, who have committed themselves, are somehow trapped in the chain of events. Occasionally, they'll publish a few articles by a few researchers warning, "Hey, you know what, we've gone too far with artificial intelligence, and we need to reflect." But maybe that should have been done earlier. Now, we're well on the way, and it's high time to reach out to the public and make them aware of what has happened, what is happening, and where we are going. It's very, very important.

Commissioner Massie

Thank you. I'll ask my colleagues. Do you have any questions to ask Monsieur Leray? Okay then, thank you very much. I'll let you and the host finish here.

Jean Dury

So we'd like to thank you very much, Monsieur Leray, for steering us on in this matter.

Christian Leray

Thank you very much.

Jean Dury

Thank you. Good evening.

Christian Leray

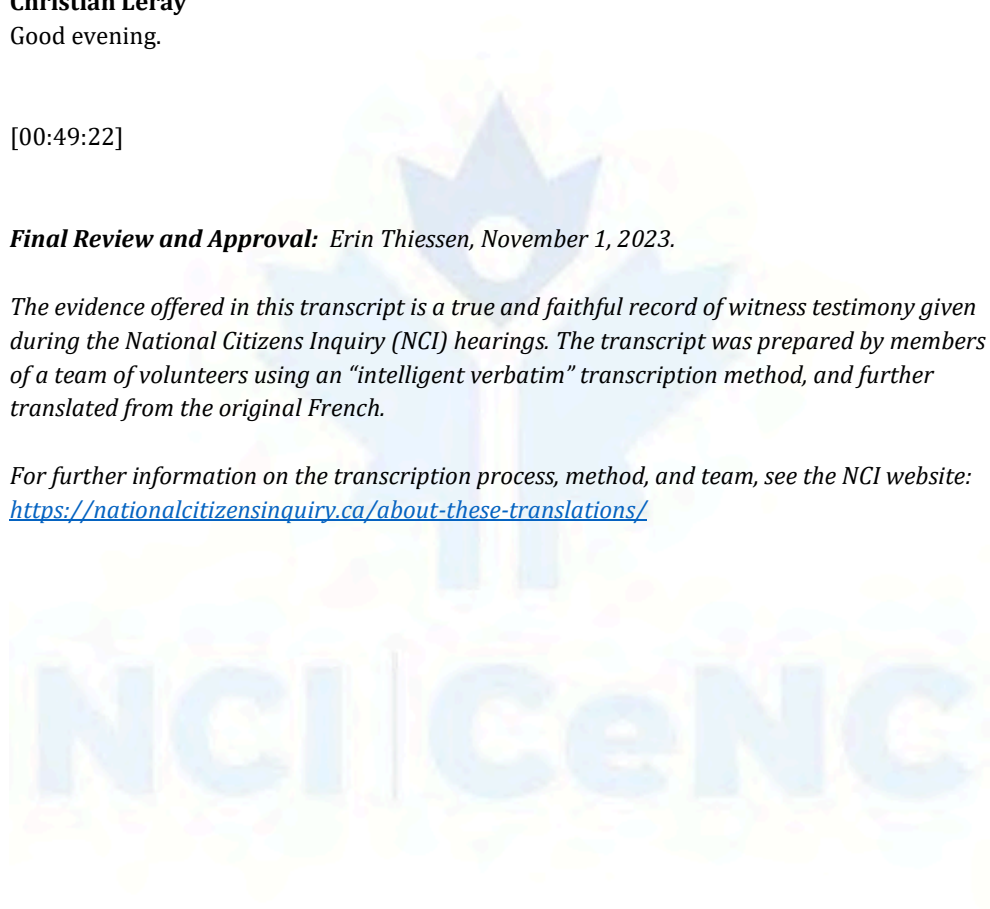

Good evening.

[00:49:22]

Philippe Meloni

Thank you, everyone, for surviving all this information and emotion for so long. It's been a long day, and tomorrow is likely to be just as long. Rest up, and we'll be back in the morning.

Thank you all very much and have a good evening.

[00:01:29]

Final Review and Approval: Erin Thiessen, November 7, 2023.

NATIONAL CITIZENS INQUIRY

EVIDENCE QUEBEC HEARINGS

**Quebec City, Quebec, Canada
May 11 to 13, 2023**

ABOUT THESE TRANSLATIONS

The evidence offered in these translated transcripts is a true and faithful record of witness testimony given during the Quebec City hearings of the National Citizens Inquiry (NCI). Hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From July to November 2023, a team of volunteers assessed the French AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcriptions.

The testimonies in Quebec City were presented primarily in French. To provide greater public access, a small and dedicated team translated the transcripts into English, employing human resources with the aid of digital translation tools.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the translated transcripts would be as clear, accurate, and accessible as possible.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 2

EVIDENCE

(Translated from the French)

Opening Statement: Philippe Meloni

Full Day 2 Timestamp: 00:00:00–00:04:45

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Philippe Meloni

Good morning, everyone. We're back for the second day of the National Citizens Inquiry. For those of you who were here yesterday, you know it's going to be a long day. I hope you had your cereal this morning because it's going to be intense. For those of you who weren't attending yesterday, you will see and hear some science, figures, and data, but you will also experience some very, very strong emotions. Many of you ended up with wet handkerchiefs yesterday and I'm guessing it'll be the same today.

I'm not going to talk for too long this morning. The first thing I'd like to say is that we are here at something that was undertaken by citizens—and so, it has been accomplished through the efforts of citizens at every level, from funding it to the actual work of putting it together.

So we have a first request: We need bilingual people. And I don't just mean the people in the room: I mean the people who are listening to us live and the people who are listening to the recorded version. We need people who are good at social media and who are bilingual. If that's you and you'd like to be part of this great adventure, please go to the Inquiry's website—nationalcitizensinquiry.ca—and sign up as a volunteer, specifying your skills: media and bilingual.

There is also the financial aspect. Those who are here can see the amount of equipment we have here and the quality of the place we're in. It's not free, and not a cent of it comes from the government or from taxes: it is all from citizens who help out, each in their own way. To put it into perspective, we estimate that these three days will cost around \$35,000. You might say, "Compared to the same thing done by the government, that's almost [like the amount given for] a tip," but it's still a lot of money.

So if you have the means, there are various ways to donate. On the website, when you register on Eventbrite, you'll also be given the opportunity to donate some money according to your own means. For all three days, we've also had paintings donated for a silent auction. And we have clothing you can purchase in the next room. So at the end of the

three days, we will take those who have donated the most. Anyway, we also take cash and cheques. Unfortunately, money is the lifeblood of the battle and we need it to carry on. So if you are able, please give a little.

I won't talk much longer. I'll hand it over to Samuel Bachand, who will begin Carole Avoine's testimony. This first testimony will show you that not everyone has emerged unscathed from this pandemic. And as I said yesterday, I've heard a lot of people say, "It's over. Get over it. Move on." I don't think those who have paid a high price in this pandemic will ever be able to think like that. Those who were here yesterday heard from people who will pay for the rest of their lives. We could give them all the money in the world. We have a young woman who can no longer hold her child in her arms, who can no longer touch her husband because she's in so much pain. I can't imagine any amount of money that could compensate for that. When we talk in law about irreparable damage, I think there's a lot of that. Today we're going to talk about it again. So I'll let you hear what people have really experienced.

Good day to you all.

[00:04:45]

Final Review and Approval: Erin Thiessen, November 14, 2023.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 1: Carole Avoine

Full Day 2 Timestamp: 00:04:52–00:22:00

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html?mref=1sktjm&mc=2l88w>

[00:00:00]

Samuel Bachand

Hello, Samuel Bachand. I am acting as counsel for the Commission. Madame Avoine, if you could just say your name and spell it for us first, please.

Carole Avoine

My name is Carole Avoine, C-A-R-O-L-E A-V-O-I-N-E.

Samuel Bachand

I will swear you in. Do you take an oath to tell this Commission only the truth?

Carole Avoine

Yes.

Samuel Bachand

So you're here to tell us about your experience with the AstraZeneca vaccination.

Carole Avoine

Yes.

Samuel Bachand

And its consequences with respect to your diagnosis of Bell's palsy. So I would ask you to relate all of this to us in chronological order, quite calmly; and then, if necessary, I will stop you to ask for clarification.

Carole Avoine

Perfect. On April 22, 2021, I received a dose of AstraZeneca. On the twentieth day after my vaccine, I started feeling a pull in my ear. I felt it start to tug in my mouth. In any case, I went to bed since it was late at night. I went to bed thinking it was stress because I had just started a new job. I wasn't sure: "I'm going to go to sleep, maybe it will pass." The next morning when I woke up, half of my face was paralyzed. I went to the hospital. I saw an emergency doctor who confirmed that I had Bell's palsy. She pointed out to me that I had the same paralysis as Jean Chrétien and that, basically, I could cope. I could nevertheless have a good life because he had had a good career despite his condition. When I asked her for a note for my work because I had just started a new job, she told me she couldn't do anything for me because it was a possibility that I would stay like this my whole life. And then, that was that. And she told me that she was referring me to an ENT [ear, nose, and throat physician] and that I was to wait for news from the ENT.

Samuel Bachand

When was the intensity of the paralysis described or diagnosed, under what circumstances?

Carole Avoine

At that time, my paralysis was not yet at its "top" level. It was when I went to see the ENT a few days later, she was the one who told me that I had a grade six.

Samuel Bachand

What does that mean?

Carole Avoine

Well, with Bell's palsy, you've got seven grades, I was a grade six. Grade seven is when your face sags. Fortunately, I didn't have a sagging face. That's the only criteria I didn't get for Bell's palsy. To confirm my grade six paralysis, I had to have an electromyogram, for which the doctor puts little needles in your face and administers electric shocks to see if a current runs through your face, through your nerves. And I had nothing going on. Nothing was moving. It was then that they told me my recovery would be long and that I would be left with sequelae.

Samuel Bachand

I want to come back to your first consultation with the emergency doctor. Can you just elaborate a bit on what she told you about the permanence or impermanence of the problem?

Carole Avoine

She basically didn't tell me anything about it. I asked her if there was a link to the vaccine that I had received. I took out my paper to show her that I had received a dose of vaccine.

Samuel Bachand

Which vaccine?

Carole Avoine

AstraZeneca.

Samuel Bachand

Against?

Carole Avoine

COVID. All she did was wave her hand, "No, that's not it, there's no connection to that." And she never took my paper, she never wrote in my medical file. And she sent me home.

Samuel Bachand

Did you ask her, or did she otherwise tell you why she felt there was no connection between your paralysis and the vaccine you received? We're looking at you receiving it approximately two weeks prior?

Carole Avoine

Twenty days. No, no. No reason. When I met the ENT again, I again asked if there was a link, a possible link. She replied that all flu shots can cause Bell's palsy but that wasn't the case for me, for no other reason than that.

[00:05:00]

Samuel Bachand

Did you check with the ENT to find out why she felt there was no link between your AstraZeneca COVID vaccine and your paralysis?

Carole Avoine

Yes, I asked her but I never got an answer, other than her saying that in my case, it wasn't that. So basically, the only answer she gave me was that I was better off with this than with COVID.

Samuel Bachand

Can you describe any other symptoms that you have endured or experienced as a result of your COVID vaccination?

Carole Avoine

I lost hearing in my left ear. It took seven months before I managed to close my left eye. Of course everything else, with my mouth and all that. When you have paralysis, you have no more strength in the corner of your mouth. That was definitely part of my symptoms.

Samuel Bachand

From the preliminary documents that I received from you, it seems there were also apparent impacts, or in any case, somewhat unexpected endocrinal or hormonal phenomena, if you could tell us about them?

Carole Avoine

Yes. I had my dose in April—on April 22. Then in June, I had my period for two weeks despite the fact that I had been postmenopausal for seven years. I had no periods for seven years, then I had two weeks with heavy bleeding.

Samuel Bachand

Where there any medication changes, related to your hormonal status at that time?

Carole Avoine

The only medicine I took was hormones for the hot flashes, so that's the only medicine I took. I didn't take any other medicine.

Samuel Bachand

Okay, so how long have you been taking it?

Carole Avoine

Since 2015.

Samuel Bachand

Okay, in April, May, June, what modification did you make to your intake of this medication?

Carole Avoine

I had no changes. The only change I had in my medication intake was the AstraZeneca vaccine.

Samuel Bachand

Have you expressed the desire—and if so, how—to file a claim with the compensation plan for vaccinated persons in Quebec, the public plan?

Carole Avoine

I tried to file a claim myself.

Samuel Bachand

How?

Carole Avoine

By the internet. But it was impossible to do so because it took a signature from a doctor who linked the vaccine to my paralysis.

Samuel Bachand

When you saw that, did you go back to see a doctor to ask for such a document or such a declaration?

Carole Avoine

I met another ENT. He also told me that he wouldn't fill in the forms, that he didn't make declarations, that, basically, there was no connection.

Samuel Bachand

Did he give you a reason other than that for not filing a return?

Carole Avoine

No.

Samuel Bachand

Okay.

Carole Avoine

After my first appointment with the ENT, when I saw that no one wanted to report my side effect, I went online and filled in a statement myself, submitting directly to AstraZeneca. They sent a form to my ENT but I don't know if she filled out the form and then returned it because it needs my vaccine batch. But I had nothing in my file that said I had had a vaccine, which meant that she didn't have the information for it.

Samuel Bachand

Give us a bit more background on this voluntary statement you made to AstraZeneca. How was it done in practice?

Carole Avoine

Well, I went online and said I had Bell's palsy after I got a shot. And then they sent the form directly on the internet.

Samuel Bachand

On the internet, where was it on the internet? The internet is vast.

Carole Avoine

Well, it was on the AstraZeneca site.

Samuel Bachand

So what did it look like, in terms of the form, other than what you told us?

Carole Avoine

I couldn't tell you; I haven't seen the form. The only thing I know is that my doctor received the form.

Samuel Bachand

How do you know?

Carole Avoine

She was the one who told me about it because she had an obligation to fill it out since it came from AstraZeneca. Then she told me that she had received the form because it needed my vaccine batch. Since it wasn't in my file, she didn't know anything about my vaccine. So she wanted to have my sheet which described my vaccine.

Samuel Bachand

Are we talking about the first ENT in the timeline?

Carole Avoine

Yes. Basically, I saw just one. I saw the other ENT only once because I needed a follow-up for a neurologist, since today with my sequelae, I have lots of spasms that cause speech problems. So basically, the only treatment I can receive is Botox injections that I may have to receive until the end of my days.

[00:10:00]

Samuel Bachand

What kind of access to your medical records have you requested from the various specialists mentioned?

Carole Avoine

Currently, I have not yet requested my medical records. This is my next step because I want to have my side effects acknowledged.

Samuel Bachand

If the commissioners have any other questions, I invite them to ask.

Commissioner Massie

Good morning, Madame Avoine.

Carole Avoine

Hello.

Commissioner Massie

I have a question concerning the difficulties you encountered in having your adverse effects recognized. What do you think the possibility is of meeting enough doctors until you find one who might be more receptive? Is it difficult to get these appointments?

Carole Avoine

It's super difficult. To date, I have one doctor who offered me his help, and this just happened very recently. I've been looking for a doctor who is willing to help me for two years.

Commissioner Massie

And for the escalation of your adverse effects, you absolutely need to have a doctor's signature. And here, you have indeed succeeded in taking this step.

Carole Avoine

Yes.

Commissioner Massie

What follow-up are you expecting? Are you waiting for recognition by the health authorities or is it not necessarily automatic?

Carole Avoine

I would appreciate recognition because I am one of those who have succeeded, according to Mr. Dubé. When it happened, the lottery of the 400-some thousand who were entitled to a dose of AstraZeneca, which was available in April—there were 400-some thousand doses. According to the government, I won the lottery because I managed to get an appointment for that dose.

Commissioner Massie

Following this unfortunate incident, did you immediately make the decision that there's no question of you taking other doses?

Carole Avoine

Well, at the time, I was asking myself that question. I asked my ENT if it was safe to take the second dose. What she told me was that basically the second dose would be safer because I wouldn't be getting the same vaccine. I would get Pfizer which, according to her, would be safer. Following my first appointment with the emergency doctor, I filed a complaint with the CIUSSS [Centre intégré universitaire de santé et de services sociaux/integrated university health and social services centre] of the hospital that I went to, because I didn't exactly understand the service that I had gotten. And then I received a Letter of Finding about my complaint from the CIUSSS, and the person who wrote to me referred me to public health for my second dose.

So from there, I was like, "As for my second dose, Public Health doesn't have any of my medical records." As I had no answers to my questions, I made the decision that I wanted

no more doses. I was done. I didn't wait for the doctor's approval. I told myself, no, I was not taking the next dose.

Commissioner Massie

Do you know of other people around you who have had the same type of side effects as yours?

Carole Avoine

No. Yes, I know one, excuse me. I know one at my work who had it, but she recovered. She wasn't left with sequelae.

Commissioner Massie

And so, what is the current prognosis for your recovery from your sequelae?

[00:15:00]

Carole Avoine

Today, I received confirmation that I would have to live with a grade three, that I had no possibility of it improving. It's been two years today that I've been paralyzed. Yeah, it's been confirmed that I would have to live with a grade three. A grade three means that I have to tape my eye shut to sleep every night—because when I close my eye, I get so many cramps that it becomes difficult the next day. The only way I'm able to drink is from a bottle. A glass is also very difficult. Often, I will have to drink with a straw. When I go outside, if it is sunny, my eye waters all the time. Every time I eat, my eye waters all the time. It's all part of my sequelae, which I have to learn to live with. Eating at a restaurant is over. I can no longer go to a restaurant because, when I eat—since I have no more strength on that side—I either drool or my food can come out of my mouth. So that's it.

Commissioner Massie

I'm also curious to know, did the dysregulation of your cycle finally recover?

Carole Avoine

Yes.

Commissioner Massie

So it was a relatively short episode?

Carole Avoine

Two weeks, yes.

Commissioner Massie

Very well. You have any questions?

Commissioner Massie
Thank you very much.

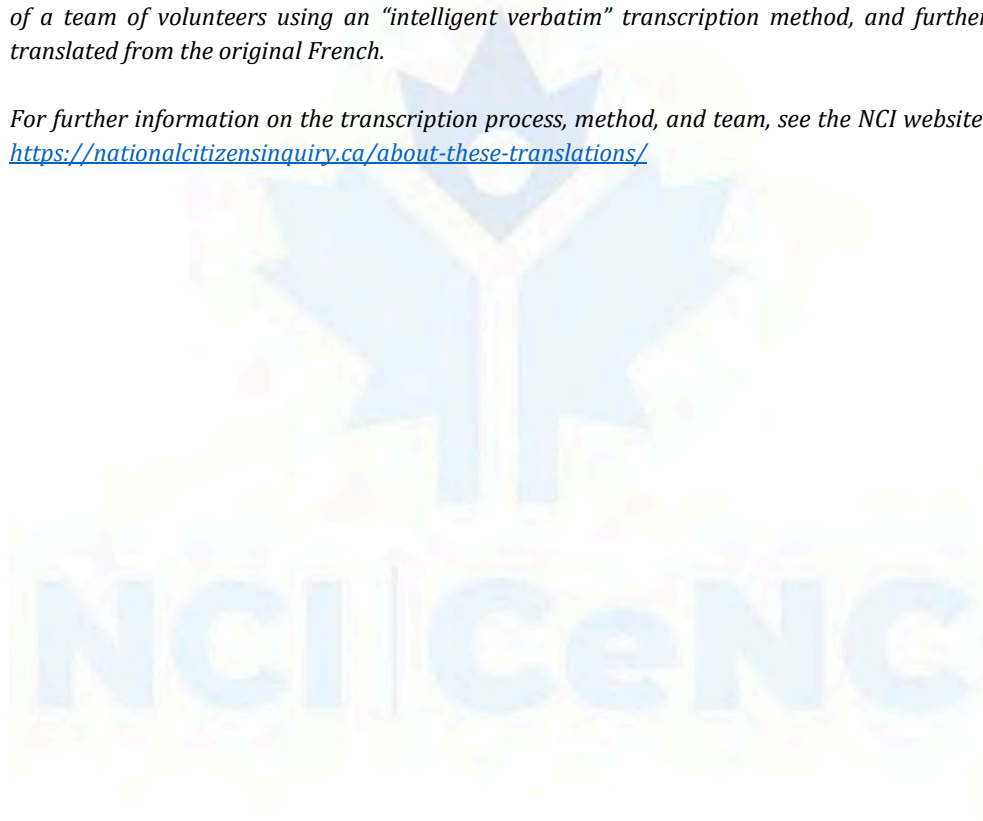

Carole Avoine
Thank you.

[00:21:48]

Final Review and Approval: Erin Thiessen, November 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 2: H       Banoun

Full Day 2 Timestamp: 00:32:27  01:25:45

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

So hello again. We  ve solved the little technical problem with the PowerPoint and now we  ll continue with our next witness, Madame H       Banoun. Madame H       Banoun, can you hear us?

H       Banoun

Yes.

Konstantinos Merakos

Perfect. We have the PowerPoint here on the screen for people to see. I  m going to be the one manually changing the pages, so just let me know when; we  re going to be working as a team on your PowerPoint.

I  m going to start by swearing you in. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Say "yes" or "I do."

H       Banoun

Yes, I swear, with the comment that when it comes to science, there  s no such thing as truth. I can give the state of science that seems correct to me today. All this can change.

Konstantinos Merakos

Fine, but the answer is yes?

H       Banoun

Yes, of course.

Konstantinos Merakos

Excellent. So I'm going to ask you for your full name and to spell your last name, please.

Hélène Banoun

My family name is Banoun, B-A-N-O-U-N.

Konstantinos Merakos

And your complete name is. . .

Hélène Banoun

My first name is Hélène, H-É-L-È-N-E.

Konstantinos Merakos

Perfect. And where are you currently located?

Hélène Banoun

I'm in Marseille, in the south of France.

Konstantinos Merakos

Perfect, and are you alone in the room or with someone else?

Hélène Banoun

No, I'm alone in the room.

Konstantinos Merakos

Excellent. So Madame Banoun, I have your CV in front of me. I'd like to start by talking a little about your expertise. We'll start with this. Tell us a little about yourself.

Hélène Banoun

I'm a pharmacist-biologist. I was a researcher at Inserm, the French National Institute for Health and Medical Research, a very long time ago. I worked in anti-cancer molecular pharmacology and I started working intensively in virology a few years ago, and particularly since the pandemic. I've published bibliographical reviews in international journals, in particular a review on the evolution of the virus, and various scientific articles in international peer-reviewed journals. So I think I have some expertise as an independent scientist. That's what I can say.

Konstantinos Merakos

Excellent.

Hélène Banoun

I should add that I have been a member of the French Independent Scientific Council since its creation in April 2021.

Konstantinos Merakos

Excellent. So where do you currently work?

Hélène Banoun

I work from home since I'm retired. I'm an independent researcher, a volunteer.

Konstantinos Merakos

And in your CV, could we talk about at least one or two themes, namely the work in progress, an independent analysis in English?

Hélène Banoun

I work with Dr. Maria Gutschi, who presented her work to the National Citizens Inquiry in English a few days ago. There's also Dr. David Wiseman, David Asher. So we're working on the analysis of the European Medicines Agency's report on vaccines and on pre-clinical trials of RNA vaccines, among other things. I work in collaboration with these people. By the way, I'd like to thank Dr Maria Gutschi and David Wiseman for some of the things I'm going to say in my presentation.

Konstantinos Merakos

Excellent.

Hélène Banoun

I've also worked with Professor Patrick Provost at Laval University, and together we published an article on the necessary observation period for adverse effects of RNA vaccines.

Konstantinos Merakos

Perfect. Thank you very much. So without further ado, let's start with your PowerPoint. Is that okay with you?

Hélène Banoun

I'm not going to repeat what I've said about myself, so we'll move on to the second slide. I'm going to talk about the problem of regulating these RNA vaccines. Are they gene therapies or are they vaccines—or both, if possible? I'm just going to give a quick introduction to help you understand the problem, that is, the way these vaccines work. So on the first slide, I'll quickly remind you what a virus is. So it's a complete parasite made up of nucleic acid. You can see in the center of the diagram: everything in orange is nucleic acid. In this case, for coronaviruses, it's RNA. Then, in green, you have an envelope to which surface proteins are attached, including the famous spike protein, which is an antigen of the virus and which is very abundant, and which will therefore be recognized by the attacked organism, by the person who is ill, as an antigen.

[00:05:00]

This person will produce antibodies against these antigens and some of these antibodies are capable of neutralizing the virus. That's why vaccine manufacturers have chosen the spike as the antigen for the vaccine.

On the next slide, I'm going to say a few words about the immune system. The immune system is divided into several branches. There is innate immunity, which is non-specific and has no memory of pathogens, and adaptive immunity, which is pathogen-specific and retains a memory via cells. This adaptive immunity is divided into two branches: cellular immunity, whose effectors are cells, in particular T-lymphocytes; and humoral immunity, whose effectors are antibody molecules produced by B-lymphocytes.

So I've got a little diagram here, where, on the bottom right, you can see the virus with these little spikes on the surface in red and the antibodies in pink-white that bind to them. But what needs to be explained is that all these systems cooperate with each other and cannot act alone. For example, the macrophages you see at the top right, the kind of purple cell, play a role in innate immunity, but also in adaptive immunity through cooperation with lymphocytes. In fact, we'll see that with conventional vaccines, and especially with RNA vaccines, we focus solely on antibodies and one virus antigen. That's a pretty limited mode of action.

On the next slide, we can see the different types of classic and new vaccines that we're accustomed to using. So historically, we've gone from live attenuated vaccines to RNA vaccines. In other words, the first vaccines were made with live attenuated viruses—in other words, empirically, as was the case for smallpox. They were attenuated using very empirical, very crude methods. Then we developed more refined methods. These were the first viruses.

We've also tried to make chemically inactivated viruses. We've tried to make particles that look like viruses. We've used virus vectors, such as DNA vaccines from AstraZeneca and Janssen. Historically, we have also used antigens. We chose an antigen, a part of the virus, and we made recombinant proteins, meaning that we synthesized, either chemically or by biological recombination, proteins that serve as antigens.

And then more recently of course we have DNA vaccines, in which the vaccinated individual synthesizes the antigen, and then, finally, the famous mRNA vaccines, in which the vaccinated individual is injected with part of the virus's genetic code and is expected to produce the antigen himself. And so we focus on a specific antigen and antibodies.

Regarding the next slide, I'd just like to make a brief comment about this WHO [World Health Organization] diagram, which tells us that only antibodies are represented: since the beginning of the history of vaccinology and immunology, only antibodies have been taken into account in the immune response. We see on this diagram that viruses are depicted and then these small kind of Y-shaped molecules are the antibodies that are supposed to bind to the virus and neutralize it. And particularly for coronaviruses, which are respiratory viruses with a nasal entry point, innate immunity is essential: the innate immunity found in the nose has little to do with antibodies, in fact. And so with this idea of focusing on the antibody response, we forget about the T-cell response, cellular immunity, and innate immunity. And that's a problem for vaccines.

So on the next slide, let me remind you of the same thing. In actuality, we've forgotten that the organism reacts to a living, whole pathogen, introduced via a natural pathway: in this

case, the upper respiratory tract in the case of a coronavirus. And here, with mRNA vaccines, we're going to inject only a genetic code into the muscle. So it has very little to do with the attack of a real, natural, living pathogen.

[00:10:00]

For the next slide, I'd like to say a few words about the phenomenon of the facilitation of viral infections by antibodies, known in English as "antibody-dependent enhancement." This phenomenon contradicts the protective role of antibodies asserted by classical immunology, since immunology tells us that antibodies are there to protect us. But in fact, this phenomenon of facilitating viral infections has again recently been discussed in relation to the clinical aspect of COVID-19. Actually, in some cases, antibodies are harmful and, in fact, antibody levels are correlated with disease severity. So it's not necessarily a causal relationship, but it can't be easily ruled out.

Incidentally, I published a theoretical article on this subject in relation to the theory of evolution. You'll find the reference at the top of the slide. So antibody-dependent reinforcement of infection is the accepted mechanism to explain severe reinfections due to dengue virus—among others, because it happens with other viruses—and also the higher occurrence of severe dengue in vaccinated people. Vaccine antibodies are capable of aggravating an infection that subsequently occurs with a dengue virus similar to the one with which we vaccinated. And so this antibody effect seems to contradict the immunological theory. This is another criticism that can be levelled at these vaccines, which focus on the production of antibodies: more and more antibodies to fight the disease, when in fact they can sometimes work against a patient.

On the next slide, I'm going to quickly remind you of the principle behind the design and synthesis of these messenger RNA vaccines. So they comprise synthetic messenger RNA molecules which direct the production of the antigen that will provoke an immune response. You're injected with part of the genetic code of an antigen that you'll manufacture, and against which you'll produce an immune response in the form of antibodies. Now, I'm not going to go into detail about how this is done because it's very complicated. RNA is transcribed in vitro from a DNA matrix. This may explain the recent discovery that there is contaminating DNA in vaccine vials that shouldn't be there. There are also a number of stages in the manufacture of these messenger RNAs that are poorly handled because they are completely new; and above all, there have been many subcontractors in the manufacturing process to produce billions of doses, so we can expect problems with this manufacturing process. All this was detailed by Maria Gutschi in a previous presentation to the National Citizens Inquiry.

For the next slide, I've put together a diagram showing the theoretical mode of action of messenger RNA vaccines. Now, I'm not going to go into detail because it's very complicated, but I will remind you that the designers of these vaccines are only interested in the fate of these products in specialized immune cells, which are known as antigen-presenting cells, APC cells. But we now know that RNA circulates throughout the body and can be translated into this famous spike protein by numerous cell types. And we also know that this spike is toxic, not to mention the toxicity of nanoparticles, because messenger RNA is wrapped in nanoparticles that serve to protect it and act as vectors to deliver it to the site of action. So there you have it. The official site of action is immune cells but in reality, this RNA goes everywhere and is possibly translated into spike by different cell types in virtually every organ.

So on the next slide I've just taken a screenshot from Professor Frajese, who spoke at the International COVID Summit in Brussels last week, where he reminds us that these vaccines are, in fact, prodrugs; in other words, they are pharmacologically inactive in themselves. This is important to understand from a legal and scientific point of view, and even for politicians. They are pharmacologically inactive and must undergo metabolic transformation by the body to achieve their supposed activity. And so if you like, it's difficult to subject them to the regulation of conventional vaccines or conventional drugs; it's something completely new.

On the next slide, the same Professor Frajese reminded us that we don't know how this product works. We don't know where it is biodistributed or how it is excreted. And he also reminded us that we don't know on what scientific research the authorization of these RNA vaccines for pregnant women is based.

[00:15:00]

So how are they supposed to work officially? On the next slide, I've taken a diagram from the Finnish Health Institute because I thought it was very educational, where they show the official mode of action of RNA vaccines, according to the official narrative. So the messenger RNA contains the genetic instruction to make the spike; it penetrates the muscle; the muscle cell produces this spike, which is recognized as foreign by the body, which protects itself against it by making antibodies. That's the official mode of action, but it's not so simple because on the next slide you'll see that, in fact, this messenger RNA contains the modified code of the virus' spike protein, which is itself modified.

So all this is not natural RNA and it's not the spike of the virus which circulated around the world. And let me remind you that almost all the pathogenic effects of the COVID-19 virus, SARS-CoV-2, are due to this toxicity of the spike, the surface protein. And moreover, the vaccine spike is apparently more toxic than the viral spike, precisely because it has been modified to be more stable.

On the next slide, we see that lipid nanoparticles, or LNPs, which act as vectors and protection for messenger RNA, penetrate the whole body and many cell types. And these nanoparticles are also toxic. This seems to be becoming clearer now. So we now know that the modified RNA of the vaccine and the modified spike of the vaccine produced by the vaccinated individual can persist for months in the body. I've also published—you'll find the reference on the bottom left—a summary of the bibliography on what was known before and since the anti-COVID RNA vaccines were marketed regarding the biodistribution and, possibly, excretion. But that's another matter, and we won't go into it here.

On the next slide, we see that transfected cells—meaning those in which the RNA has penetrated and been translated into spike proteins—well, these cells will express the protein on their surface. They will induce the synthesis of anti-spike protein antibodies. But they can also be destroyed because they will be recognized as foreign by the immune system, since they carry a foreign protein on their surface. This can explain the undesirable side effects as cells necessary to the proper functioning of the human body are destroyed.

And so on the next slide, we come to the heart of the matter. According to this principle of action, RNA vaccines are gene therapy products. In fact, according to the FDA [Food and Drug Administration]: "Gene therapy products are any products whose effects are mediated by," here I summarize, "the translation of genetic material," which happens—a

transfer—“and which are administered in the form of nucleic acids,” which happens. So this corresponds exactly to the mode of action of gene therapy products.

The next slide shows the European Medicines Agency’s definition of gene therapy products. A gene therapy product “contains an active substance consisting of a nucleic acid, with a view,” in particular here, “to adding a genetic sequence,” which is exactly the case. “Its effect, whether therapeutic or prophylactic,” which is the case here, “is directly linked to the sequence of this nucleic acid” that is injected. This is exactly the case here. But what you need to know is that the European Medicines Agency was already telling us in 2009 that gene therapy medicinal products do not include vaccines against infectious diseases. So through a simple regulation, we decided that these products, which were objectively gene therapy products, would be excluded from the regulation of vaccines against infectious diseases. We’ll look at the chronology of this exclusion in a moment.

I’ll perhaps move on quickly over the next slides on vaccine clinical trials, because I don’t want to take up too much time, so as to allow questions to be asked. It was just to remind you, chronologically speaking, that the sequence of the first official SARS-CoV-2 virus was officially published in January 2020 and that the complete genome was officially published on January 11, 2020. Despite this, it’s worth noting that the first vaccine candidate entered human clinical trials with unprecedented speed on March 16.

[00:20:00]

On the next slide, we’ll look specifically at the Pfizer clinical trial. Development began on January 10, 2020, the day before the virus genome was fully published. And from what I’ve been able to understand by researching official documents, phase I on humans began before the phase on animals. Since the rat studies were approved on December 17, 2020, they would have started in June 2020, and they would have started after phase I on humans. So all these stories coincided, which explains why these products couldn’t undergo the usual testing. In particular—again, from what I understand because maybe I’m wrong; it’s not very clear in the documents—it seems that phases I, II and III were conducted simultaneously. And I will remind you that phase I is used to decide the optimal dose. In phase I, there were three dose levels, but if phase I is carried out at the same time as phase II and phase III, they won’t be able to choose the optimal dose for phase III, which is the pre-commercialization phase. And this seems to have been what happened.

The next slide on the continuation of the Pfizer trial, is just to point out that a whistleblower, Brook Jackson, had published an article in *The British Medical Journal* which reported integrity problems in the clinical trial data. So we need to look at this clinical trial with circumspection. There may have been problems. I wouldn’t say fraud, but integrity problems.

Concerning the Moderna trial and again the chronology of this trial: Moderna officially began work on the vaccine on January 13, 2020. I remind you that the genome was published on January 11. But in fact, we later learned from a journal—you have the reference below—that Moderna had started trials as early as 2019, so before the official start of the pandemic. And in fact, these data were so encouraging that the CEO had announced in 2019 that the company would double its vaccine development program in 2020.

The next slide shows the continuation of the Moderna trial. Likewise, here we can say that the preclinical studies on non-human primates were conducted in collaboration with the American Institute of Health, and they published about monkeys in July 2020, while the

phase III on humans began on July 27, 2020. In other words, phases I and II—if they took place because I haven't found a reference to phase II—well, they began at the same time as, or perhaps even before, the animal studies. So there really is a problem with the clinical trials.

So for the next slide, I'm going to talk about the history of gene therapy regulation in relation to vaccine regulation. In 2005, the WHO granted nucleic acid-based vaccines—which, I remind you, is the case for RNA vaccines—the status of vaccines. They are vaccines. In 2007, the European Medicines Agency defined nucleic acids for prophylactic use—and vaccines fall within this framework—as GTPs, in other words, gene therapy products. Similarly, in 2007, the FDA defined DNA plasmid-based vaccines as gene therapy products. So at that time, there was no talk of RNA vaccines because they weren't yet a reality. We hadn't even imagined making them yet. And in 2008, the European Medicines Agency confirmed that DNA vaccines were subject to the regulations governing gene therapy products.

On the next slide: What happens in September 2009? Well, the European Medicines Agency decides that vaccines against infectious diseases cannot be classified as gene therapy products. Suddenly, they're no longer subject to regulations, and the same thing was decided by the FDA in 2013. The regulation of gene therapy products does not apply to infectious disease vaccines.

And we'll see on the next slide: what happened between 2008 and 2009? Since up until 2008, nucleic acid-based vaccines, including RNA vaccines, had to comply with these regulations? Well, in 2009-2010, we had the H1N1 flu pandemic and Dr. Anthony Fauci was looking for solutions for a universal flu vaccine.

[00:25:00]

And in November 2010, talk began of a DNA vaccine, but not yet of an RNA vaccine. And in 2011, two European companies, CureVac and Sanofi, began collaborating with DARPA, the U.S. Army Research Agency, to develop RNA vaccines. And in 2013, DARPA awarded Moderna a grant of up to \$25 million to develop a messenger RNA vaccine-based therapy against infectious diseases. So there seems to be a temporal concordance between this regulatory change and the decision by U.S. medical authorities to focus everything on RNA vaccine research against infectious diseases, but most specifically against influenza.

So just to let you know that all the references for everything I'm telling you here are in a preprint that I've uploaded to Qeios [since published and available as Exhibit QU-11 in the French and QU-11a in English]. It's really a preprint because I've modified it a lot. I'm going to modify it again in order to resubmit it to other journals because it's been rejected due to it being a very sensitive subject. I've been told that the regulation of RNAs is an important subject. All the people who criticized me told me it's very delicate. So in this preprint, I remind you of something very important: that RNA vaccines should follow the regulations for gene therapy products because objectively, they are gene therapy products. But what's important to note is that an RNA molecule, virtually the same molecule that targets tumors—that is, one used to combat cancer—is considered a gene therapy product. But as a vaccine against an infectious disease, it is no longer considered a gene therapy. And this exclusion is scientifically unjustified.

So on the next slide, I confirm the bizarre nature of this exclusion by the fact that Moderna and Pfizer expected their product to be subject to the regulation of gene therapy products. This came out in a press release from 2020, you have the references here for Moderna, and

from 2014 for Pfizer. So according to the CEO of BioNTech, who worked with Pfizer, they really expected messenger RNAs against infectious diseases to be considered gene therapy products. So even the manufacturers expected it. That's why they've produced trials that correspond in part to those for gene therapy products.

On the next slide, we see that whether RNA vaccines are considered vaccines or gene therapy products, they must in either case comply with the rules applicable to human medicinal products according to the European Medicines Agency. And so, as I said, if it's a cancer therapy or a vaccine, they won't undergo the same controls.

Now, it's worth noting that the European Medicines Agency requires additional studies for vaccines that use new formulations—and we'll see that not all these studies have been carried out. Vaccines in general have long been exempted from pharmacokinetic controls without any real scientific justification. Why exempt products that are administered to the entire human population, as opposed to drugs that are only administered to a few patients? But it should be noted that, as RNA vaccines represent a new class of drugs, they should rightly be subject to more controls than conventional vaccines because they are based on new technologies.

In fact, the European Medicines Agency wrote, before the arrival of RNA vaccines of course: "Vaccines are in most cases administered to a large number of healthy individuals. A robust non-clinical safety evaluation is required." So there you have it. It's a real problem, as the European Medicines Agency itself acknowledges.

On the next slide, we can see which regulations apply to these RNA vaccines. They are obviously subject to the control of new vaccines by regulatory agencies. So like all vaccines, like all human products, we have to demonstrate the purity and quality of the raw material. For this, I must refer you to the presentation by Maria Gutschi, who is currently analyzing the European Medicines Agency's report on product purity and quality. In the case of a new formulation, which is the case here, with both a new excipient and a new product, pharmacokinetic studies—meaning biodistribution in the body—are normally required for new vaccines.

[00:30:00]

We can see that they've only been partially done. Toxicological study of the new additive must also be carried out. These studies have been very incomplete. And so above all, I'm going to emphasize pharmacokinetics. In other words, this concerns vaccine absorption, distribution and biotransformation in the body, and possible excretion. And this must be studied for new vaccines.

On the next slide regarding product quality, please refer to Maria Gutschi's presentation. In fact, as I told you, when RNA vaccines came onto the market, there were no specific regulations for RNA vaccines because it was a new product. So in fact, what we can gather from the pre-clinical trial reports is that the regulatory agencies, particularly those of the European Union, adapted the regulations. They asked for specific controls—which were inspired, in fact, by the controls for gene therapy products—to be applied to these RNA products.

And so one control for gene therapy products requires genetic identity: that is, the exact nucleotide sequence of the product. This has not been provided. There is a requirement to study the interaction of the nucleic acid with the vector. This was not provided. In fact, stability studies were underway when the vaccine was approved. There is a very technical

condition that must be demonstrated: the presence or absence of CpG dinucleotides. This has not been provided. This is always the requirement for gene therapy products, I remind you—to which RNA vaccines are not officially subject, even though they are, in fact, gene therapy products. For these gene therapy products, research and quantification of product-related impurities is required. So it's very technical: sequences that have been deleted, rearranged, hybridized, oxidized, or depolymerized. This was not provided in the preclinical trials. The presence of antibiotic resistance genes found on the RNA vaccines must also be justified. This hasn't been done either.

For the next slide, I'd like to talk about another point that has come to our attention very recently. Independent researchers, several independent teams, have found the promoter of the SV40 oncogenic virus in the DNA matrix used to synthesize RNA. And this promoter is known to amplify translation into proteins and to facilitate integration into the genome. This is a worrying problem, since DNA contaminants have also been found in vaccine vials. So these vials contain this promoter, which could facilitate the integration of DNA and/or RNA into the genome.

On the next slide, I'd like to remind you of the controls that were thus avoided for these RNA vaccines, as they were not subject to the same controls as gene therapy products. So for example, the route of administration. We have to study the route of administration, study the worst-case scenario. For example, we know that for these vaccines, there was no requirement to aspirate once the needle was inserted into the muscle. Aspiration before injection ensures that the needle is not in a capillary, a blood vessel. If you don't do this, it's possible that you're injecting into a blood vessel. And for gene therapy products, study is required to verify what happens when the most unfavourable route is used, and this has not been done.

What hasn't been done either is biodistribution [study]. We'll talk about that on the next slide. Biodistribution in the human body is very important, as you'll see. The characterization of the presumed mode of action has not been given. In fact, the European Medicines Agency has pointed this out: The mode of action has not been described. As I said earlier, it was difficult to determine the optimal dose, since phase I was conducted at the same time as phase II and III. In terms of potential toxicity targets, it was not specifically determined as to where it could be toxic in the body. Research was not conducted regarding integration in the genome. The European Medicines Agency requires that this be looked into for gene therapy products, even when such integration is unlikely, which is the case for RNA vaccines, but it must still be investigated. Transmission in the germ line has not been researched either, even though there are signals in the gonads, both the ovaries and the testes. It is known that the vaccine goes there, but it has not been investigated.

[00:35:00]

There is also a need to carry out sperm fractionation studies and integration analyses. This has not been done. There is also a need to investigate the toxicity of structurally modified proteins; that is, it is possible that the vaccine may cause a vaccinated individual to synthesize proteins other than those investigated. This has not been researched. For gene therapy products, it is also required to study toxicity on embryo-fetal reproduction and therefore go as far as human trials. There should also be study into repeated toxicity, since vaccine manufacturers initially thought there would only be two doses, but in the end, they went as far as five/six successive doses for certain populations, and the toxicity of five or six doses has not been studied.

On the next slide, I focus on the biodistribution and excretion of messenger RNA and the RNA product, in other words, the spike. As I showed you earlier, I have published a review of the literature. We now know that RNA and the spike are found throughout the body, in all organs, and persist for at least several weeks. For gene therapy products, regulatory agencies require study of this biodistribution, especially if the synthesized protein, the spike, is excreted into the bloodstream, which is indeed the case here. I've provided two references here, but there are others that show that spike is indeed found in the blood.

Regulatory agencies also demand that the duration and expression of the spike be determined by PCR. This has not been done. They also require identification of the target organ and confirmation that the product actually reaches the target organ or tissue. This hasn't been done either. They also ask for the study of excretion into the environment in animal models, and also, eventually, for excretion studies for humans. This has not been done. For gene therapy products, they also ask for excretion via semen. This has not been studied.

The next slide presents the continuation of biodistribution problems: the FDA specifically requests that aberrant localization in non-target tissues and cells be studied for gene therapy products. They ask for a determination of exactly how many copies of the vector are present in the cells. This has not been done. They ask for study into the potential horizontal transmission from the patient to family members. This request is made exclusively for viral vectors, but as we are dealing with RNA—which is not a viral vector—and spikes which are known to be distributed throughout the body, these excretion studies should also have been carried out. The FDA also asks for a study of transplacental passage and in breast milk, as well as toxicological study based on the duration of persistence of the product in the animal model. This has not been done.

So just a word—I think I'll speed things up a little because, on the next slide, I'm going to take too much time. Recently, there was an article published on the problem of nanoparticle regulations as well. They are asking for toxicity and biodistribution studies on the complete particle injected: in other words, the lipid nanoparticle with the vaccine RNA inside. This has not been done. It's been done with related products or separate ingredients but it hasn't been done on animals. The actual biodistribution of the vaccine as injected into humans has not been studied.

Next slide: so if messenger RNAs had been classified as gene therapy products, they would have had to undergo all these controls, and then the ambiguity would have been removed. The biodistribution study should have been carried out on the actual particle injected, and not on products of that particle or similar products.

On the next slide, I'd like to emphasize two points. Since we now know from preclinical studies carried out before these RNA vaccines that when lipid nanoparticles equivalent to those in RNA vaccines reach the liver—which is the case and has been verified for COVID RNA vaccines—well, they are able to pass the placental barrier and be delivered to the fetus, and express the gene encoded by the RNA.

[00:40:00]

If a woman is vaccinated while she is pregnant, it is possible that the vaccine passes the transplacental barrier. This should have been studied if the vaccine had been classified as a gene therapy product. Moreover, in a declassified FDA document on adverse reactions, it talks about exposure of babies through breastfeeding and of fetuses through the transplacental route. The FDA does not deny this but confirms that it is possible.

In the next slide, we're going to talk specifically about the passage of RNA vaccine into breast milk, which should have been studied if these vaccines had been classified as gene therapy products, which was not done. There are now four independent studies showing that it is possible that the vaccine RNA in a woman injected while breast-feeding her baby can pass into breast milk for at least the first week following injection. This has been proven.

And in fact, on the next slide, in the adverse reactions reported in the first two months after the vaccines were marketed, adverse reactions were noted in breast-fed babies within seven days of vaccination, which corresponds exactly to what was found in the passage of the vaccine into the milk. Moreover, in a response to a citizen's petition, the FDA does not question the detection of RNA in milk. It acknowledges the absence of functional studies demonstrating whether the vaccine RNA detected is translationally active, which should have been studied. And so it would have been very prudent to require RNA excretion studies in milk before commercial release and, above all, before approval was given to inject it into breast-feeding women.

On the next slide, I'd like to remind you that genotoxicity and immune suppression studies are necessary for gene therapy products. But either they haven't been carried out for immune suppression, immunotolerance, or they have been only partially carried out for genotoxicity since they were only done in vitro—that is, on cultured cells. And, in fact, they were carried out with messenger RNAs coding for proteins other than the spike, meaning not actually with the vaccine products. There are no studies of carcinogenicity, mutational insertion, or tumorigenicity in vivo, which are required for gene therapy products. And there are no studies on immunotolerance and immunosuppression, which have now been proven, as I've put here, by two publications that appeared after commercial release.

And on the next slide, I show you that the FDA requires long-term follow-up for gene therapy products, long-term follow-up of adverse effects over five to fifteen years, and this long-term follow-up does not apply to vaccines. So RNA vaccines escape this long-term monitoring because they are not considered gene therapy products. For gene therapy products in particular, they require long-term monitoring of cancers, new neurological diseases, autoimmune diseases, new hematological diseases, and infections. It should be noted that all these diseases are reported after RNA vaccines in peer-reviewed scientific publications. So this should have been studied before commercial release.

And finally, the next slide: RNA vaccines have escaped all these checks on gene therapy products, which are, however, essential for a new formulation and a new principle of action. So why did the European Medicines Agency give emergency approval when specific obligations in the requirements were not met? Why didn't the FDA actually evaluate these vaccines, unlike the European Medicines Agency? We know that in 2021, senior FDA officials resigned because they felt excluded from key vaccine decisions. All the references for this are in the preprint I pointed out. And according to documents leaked from the European Medicines Agency, it was learned that in late 2020, U.S. and E.U. government officials pressured European authorities to quickly approve the vaccine, despite safety concerns.

And so in conclusion, on the next slide, I'd like to ask that in future, we consider whether or not all messenger RNA products should be subject to the same regulations and controls, whether or not they are considered vaccines against infectious diseases.

[00:45:00]

There is no justification for subjecting therapeutic RNAs to strict controls when they are intended for patients who ultimately represent a small proportion of the world's population—because people with genetic defects or cancers are numerous, obviously too numerous, but they represent a small proportion of the population—whereas RNA vaccines are intended for the vast majority of the world's population, and a healthy one at that. Why exclude them from such regulation? That's the question I'm asking; and I think everyone should understand that it's very important, even though it's a rather onerous subject.

That's it, I'm done. Thank you for your attention. I hope I haven't taken too long.

Konstantinos Merakos

Yes, excellent. Thank you, Madame Banoun; thank you very much. We'll now go to our commissioners for questions. Please, go ahead.

Commissioner Massie

Hello, Madame Banoun, and thank you very much for this very exhaustive overview of the historical development of these products, which were made available to the public very quickly. My first question concerns your analysis, which to me looks like a literature review or a review of available government documents. And you have the expertise as a researcher that enables you to do this kind of reading and ask the related questions, and then try to find the documents that will make it possible to document the whole narrative you've presented to us.

My question for you is this: You know the research community—you have other colleagues in France and abroad. How many researchers would have this kind of expertise and could have done an analysis somewhat similar to the one you've presented to us? Does what you've done require such unique expertise that only a few people in the field can do it?

Hélène Banoun

No, I don't think so because I haven't been an expert in vaccines or regulations for very long. I looked into the problem because I thought it was important. In fact, I've already submitted my preprint twice to international journals. It was probably rejected because there were some inaccuracies as I'm not an expert. So what I'm giving you here is the result of the corrections I made following the comments of the experts who judged me. They're anonymous experts, but I'm guessing they must be part of official regulatory bodies. So I've been working on it; it just takes a lot of time and precision, but it's not that complicated. You need to attend to it, but I think this problem can't elude scientists, especially those who are regulatory experts. Besides, all those who criticized my preprint said that I was right to pose this problem, that it was a real problem: this problem of contradictory regulation between vaccines and gene therapy products. So I think it's within the grasp of a lot of people.

Commissioner Massie

My next question concerns the quality of these products. We've had other experts come and testify before the Commission, and they've raised a whole series of problems similar to those you mentioned in terms of product quality. Maria Gutschi was here and other experts also made presentations. And when we analyze all the questions raised about product

quality—and above all, the fact that when we go into clinical trials, certainly in phase II, we should have products of absolutely impeccable quality, so that the conclusions we draw about product efficacy, and eventually safety, cannot be called into question given the heterogeneity of product quality. This poses a problem for the conclusions of clinical trials.

And here's the question: Given that we've rushed through a lot of stages—in both evaluation and production, in manufacturing—based on the analyses you've carried out, do you think that we currently have technologies that are sufficiently robust to ensure the large-scale commercial production of these products to the right manufacturing standards? To ensure that the product, once marketed, will really have all the attributes we're looking for from the regulatory bodies?

[00:50:00]

Hélène Banoun

So there are two ways of answering. There's the way Maria Gutschi answered your question, by analyzing the reports of the European Medicines Agency, which itself specifies that there is product heterogeneity. And then there's the clinical result we've been observing, since a study recently appeared—I believe from Denmark—which points out something we've been noticing for a long time but which hadn't been officially published in a peer-reviewed journal: that is, there's great heterogeneity in batch toxicity. Since some batches are highly toxic, they have led to many reports of adverse events; and for some other batches, there are very few. So in fact, what was noted in the analysis of product quality, namely product heterogeneity, is found in the clinical effects. In other words, we find heterogeneity in batch toxicity. Therefore, it seems that the manufacturing process is poorly controlled.

Commissioner Massie

And from your experience examining other biological products—for example, therapeutic antibodies that are widely used in cancer therapy—do the technologies that lead to the production of these commercial products have the same kind of problems—in terms of the heterogeneity or quality—as the products that are available on the market?

Hélène Banoun

Well, I can't answer that because I haven't studied these products. I don't know if Maria Gutschi has. Well, I'm sorry, but I can't give you an answer.

Commissioner Massie

Okay, thank you. Do my colleagues have any questions for Madame Banoun? Do you have any questions? No?

Konstantinos Merakos

Madame Banoun, the National Citizens Inquiry would like to thank you most sincerely for your valuable information, and for your very educational PowerPoint. So we thank you very much and wish you, since you're in France, a good afternoon or good evening.

Hélène Banoun

Well, thank you for inviting me. And I'd just like to add a few words. I think it's very important to tackle this problem of regulation and to try to make it understood to lawyers and politicians because it's the politicians who ultimately decide on official regulations. I think it's very important to make everyone—scientists, lawyers, and politicians—understand that messenger RNAs are gene therapy products and must undergo all the controls required for gene therapy products. This is important for the future because there is now talk of generalizing this technology to other vaccines. This is already underway, with plans to build factories.

So where are we going with this technology? This is very important and we must quickly address the problem. The time to do it is now. Thank you very much.

Konstantinos Merakos

Excellent. Thank you once again.

[00:53:18]

Final Review and Approval: Erin Thiessen, November 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-translations/>

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 3: Christine Cotton

Full Day 2 Timestamp: 01:26:04–02:12:40

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Chantale Collard

Yes, so hello. I'm going to lower the microphone a little. So, Chantale Collard. I'm acting as a lawyer for the National Citizens Inquiry today. I'm going to look at the camera. So good morning, Madame Cotton. Can you hear me?

Christine Cotton

Hello Chantal.

Chantale Collard

Yes, hello. So first of all, on behalf of the Inquiry, I'd like to thank you for agreeing to testify today. It is very important to us.

Christine Cotton

Thank you.

Chantale Collard

So let's proceed with the identification, if you don't mind. Simply give us your first and last name.

Christine Cotton

Christine Cotton.

Chantale Collard

Perfect. I'll also swear you in for formality's sake. Do you solemnly declare to tell the truth, just the truth? Say "I do."

Christine Cotton

I do.

Chantale Collard

That's perfect. So, Christine Cotton, I'm going to introduce you very briefly—but of course you'll then be able to add to it everything you've done as well as your work. So you're a biostatistician with 23 years' experience in the pharmaceutical industry. You were CEO of your own company for 22 years in a clinical research organization [CRO]: a subcontractor in charge of monitoring, data management, statistics. Your customers have included AstraZeneca, Pfizer, Sanofi, App Science, Bayer, Aventis, and many others, as well as various hospitals, to name but a few.

And you have experience with all types of trials in a variety of therapeutic fields: oncology, central nervous system, gastrointestinal system, autoimmune diseases, osteoarticular system, odontology, pneumology, ophthalmology, nutrition. You have a really wide range of skills. Notably you've also done phase I, II, III, and IV clinical trials and observational studies. Is that a good summary? But I can see that you really have a very specialized field.

Christine Cotton

Yes, I've worked in a huge number of pathologies, including viral diseases, hepatitis C. I worked in tuberculosis, in renal transplantation—well, when you're a subcontractor, you have a lot of clients—so in diabetes. So I've effectively participated in nearly 500 clinical trials.

And what you need to know is that it's not at all a doctor's job to carry out a statistical analysis of a clinical trial; it's a biostatistician's job. And I've been doing it for a very long time.

Chantale Collard

So Christine Cotton, we're very curious to hear the results of your research and clinical trials, particularly the poor efficacy assessment. I don't know if you have a PowerPoint with you.

Christine Cotton

Maybe I can share my screen.

Chantale Collard

Yes, please do.

Christine Cotton

So here we are. I don't know if you can see it clearly?

Chantale Collard

Yes.

Christine Cotton

So I examined all the documents from the Pfizer clinical trial. A clinical trial involves dozens, if not hundreds of people. I've drawn up a small document. In summary, there are those who recruit the participants. Then of course there's the sponsor: the one who launches the study. We have the data management team, which creates the system for recording the data. There's the statistics team. We have the monitoring team, which views the sites that recruit patients in order to verify their documents. There's the pharmacovigilance team of course. We may have laboratory services to analyze a whole range of parameters. We have the quality assurance team, which makes sure that all these people are working correctly.

So the statistician comes in at the beginning, since he writes the methodology for a clinical trial.

[00:05:00]

He guarantees the validity of a clinical trial. And he intervenes at the end when we have all the data, and sometimes during intermediate analyses, since he's the one who plans and validates the trial—there is often a group of us, depending on the importance of the trial—and ensures that accurate results are delivered. Because in this business we can't afford to make mistakes.

So he delivers the results and a medical writer writes up the clinical reports. So obviously, as a biostatistician, I know how to read all the clinical reports, since I was the one who wrote them—or at least half of each report—in collaboration with the doctor who wrote them.

So what we know about COVID clinical trials—that's COVID clinical trials in general: we know that it usually takes around 15 years from molecule discovery and so on to obtaining marketing authorization. These trials benefited from what is known as accelerated development, meaning that each phase began before the previous one was completed. So obviously we didn't have all the results each time. A phase would begin without having the results [from the previous phase].

So the Pfizer clinical trial—since that's the one I've been looking at in great detail—basically should have lasted about two years. A certain number of visits were planned at which the participants—those who had been recruited, who had volunteered, and who signed an informed consent form—would go to the site that recruited them to undergo a series of tests. Obviously, if they had COVID before visiting the site, they would come forward to say they have such-and-such symptoms. In that case, they would be given an appointment for a PCR test.

What we've known since December 2020 is that pregnant or breast-feeding women are never included in clinical trials, as they are part of the protected population. We also know that immunocompromised patients were not included; patients with comorbidities—diabetes, pulmonary pathologies, et cetera—were not included; and patients with autoimmune diseases or inflammatory problems were not included. In other words, the most fragile patients.

We also know that interaction with other vaccines has not been studied. Neither has transmission been studied. While there's been a lot of fuss about this uninvestigated transmission, it is quite usual. The main problem with the Pfizer clinical trial is not at all

that transmission wasn't studied— that was playing to the crowd. Symptomatic cases were not studied.

So what did they do? Since the study lasted two years, they proceeded with interim analyses in order to provide results before the end of the trial. So at each interim analysis, each time they provided results on a population—whether adults over 16, teenagers 12-15, the 5-11-year-olds, babies, and so on—we systematically had a maximum of three months' follow-up for the participants. So in other words, we count COVID cases over these three months; and therefore we also examine tolerance over these three months. So it's a short period of time and obviously we can't draw any conclusions about medium- or long-term tolerance when our hindsight each time is of three months max, or even less than two months 50 per cent [of the time].

Chantale Collard

That's very quick.

Christine Cotton

Yes. On this basis, we can't say that it's safe. I mean, when we say "It's safe," yes, it's safe according to the results over the examined period. So, as you can see, it changes quite a few things.

So what is very, very important? This famous efficacy criterion. We've been told, "We have 95 per cent efficacy. That's fantastic," and so on. So in fact, when we look at this efficacy criterion, the famous 95 per cent is an efficacy calculated on mild or moderate COVID cases confirmed by PCR. And how you eventually know if you're a COVID case is whether you have a certain number of symptoms: fever, aches and pains, diarrhea, vomiting, and so on. Yet the vaccine induces these symptoms. So there are a certain number of symptoms that the patient will eventually have; and instead of going for a COVID test because it may potentially be COVID, we record it as a reaction to the vaccine.

[00:10:00]

So what we know from the documents made public by court decisions. Thanks to Aaron Siri in the United States, we can retrieve the database—that is, the tables, what's called SAS, that is, the software on which the statistical analyses are carried out and which was used to analyze this trial— We know, in fact, that there were fewer PCR tests done for the vaccine [group] than for the placebo. So we realize that if we don't do PCR tests, there's no risk of being a PCR-confirmed COVID case, since we didn't do the test. And we also know— If you don't understand, if you have any questions, please interrupt me because I'm running on!

Chantale Collard

In fact, you are comparing what is typically done in clinical trials with what has happened since 2020. We can really see that there's a difference with the protocol.

Christine Cotton

Exactly. In other words, clinical trials involve methods, regulations, and a heap of rules to be followed, which have been in place for years and are known as good clinical practice. And if my trial doesn't respect good clinical practice in the choice of its efficacy criteria, in the analyses carried out—it's worthless.

Chantale Collard

There we have it.

Christine Cotton

There you are. So that's why you have to understand what clinical trials usually look like in order to know whether this one is valid or not. You have to know all these good practices, for which there are hundreds of documents governing all the tasks of all the people that I mentioned earlier. And if the tasks are poorly performed, then I have deviations from good clinical practice. So I have some that are very serious and others that are less serious.

What we also know from this trial is that participants were allowed to take antipyretics.

That's for fever. It's going to suppress certain symptoms. And we see that many more participants took these antipyretics in the vaccine group. So if I suppress symptoms, I'm not likely to do PCR tests, so that's called a methodological bias: a statistical bias that prevents me from correctly assessing my efficacy.

So in fact, what we know for sure is that this choice of efficacy criterion only measures part of the disease. To really measure the disease in its entirety, there they should have used a criterion which they did in fact measure, that is, the antinucleocapsid serology. This tells us who and how many had COVID during the trial. And when we calculate efficacy on this basis, we no longer have 95 per cent; we have around 55 per cent.

Chantale Collard

There was no measure of antibodies if I understand correctly, Madame Cotton?

Christine Cotton

Well, that's another matter. We'll get around to antibodies. This is really about who's had COVID and who hasn't. And we're no longer talking about mild to moderate COVID confirmed by PCR test. Now it's: Who has had COVID?

So the goal is really to prevent you from catching COVID! It's not to prevent catching mild or moderate COVID confirmed by a PCR test. So the choice of efficacy criterion is clearly wrong. Do you understand the problem? So this 95 per cent efficacy measures an efficacy that doesn't exist in reality, and which never existed!

Chantale Collard

Based on erroneous results and based on an erroneous method.

Christine Cotton

Precisely.

Chantale Collard

But later, it was said that 95 per cent had dropped to 85, then 70, and then more frequent downgrades.

Christine Cotton

Yes. Because we've seen that in real life, people catch COVID. In real life, it's not just mild or moderate. What was also very important at each interim analysis was that they never demonstrated an effect on severe cases. There was never any statistically demonstrated efficacy on severe cases in any of the reports that led to authorization: none. In adults, there is no efficacy on severe cases. For example, you see this table. We're told, "Oh well, there had been one severe case for the vaccine and three for the placebo, so efficacy is 66 per cent." But statistics is more than that. Statistics means looking at the validity of my results. And as it turns out, I've found no difference between the vaccine and the placebo groups in terms of efficacy on severe cases. Therefore, there was no proven efficacy, neither in 12-15-year-olds—since there were zero severe cases—nor in 5-11-year-olds, nor in babies aged 6 months to 4 years.

[00:15:00]

There has never been any proven efficacy in severe cases.

Chantale Collard

Incredible.

Christine Cotton

Then we have an imbalance in recruitment among centres. We have five centres that have recruited almost 10,000 patients among them. So when we have that, what do we normally do? We do a centre-by-centre analysis. So why wasn't this done? Anti-nucleocapsid serology with its 55 per cent efficacy rate was never included in the report. Why? It was never submitted. In other words, it's a criterion for which we've never had the results.

So when they did the analysis at six months, we had a little more hindsight on the tolerance. And now we had a table. So this is a publication they released, not after three months' follow-up, but after six months. And after six months, we had the deaths from COVID, for example. And there was one COVID death for the vaccine and two in the placebo. So we have no proven efficacy on COVID mortality.

Chantale Collard

None.

Christine Cotton

In addition, more people died in the vaccine group than with the placebo. So where is my actual effectiveness for mortality? It hasn't been proven in the studies.

Chantale Collard

There's a negative efficacy, you could say.

Christine Cotton

Not really.

Chantale Collard

There are more deaths following the vaccines.

Christine Cotton

Yes, that's it. There is no proven efficacy for mortality.

Now the real scam, so to speak, of the Pfizer clinical trial are levels of this famous neutralizing antibody. Here, on the left, are the results on monkeys. And here, at the bottom, you can see the time showing the antibodies being measured on day 21, day 28—so after the doses [were administered]—and day 56, that is, at two months. And here, you can see that the antibodies start to drop.

Now, this graph on the right is the result in the 18-55 age group. And there, we see that on day 28—so one month after the second dose—it's a little higher than at two months after the second dose. And yet, it's pretty convenient that we don't have a measurement of the levels. And why don't we have this measurement? Because we did an intermediate analysis at three months. Can you see the trick? And who authorized an interim analysis at three months? The FDA [Food and Drug Administration], in writing specific guidelines for COVID vaccines, authorized an analysis at three months. That's why there was no six-month measurement. And when they released the report regarding boosters, here are the six-month level measurements! Can you see them? It's the red arrow.

Chantale Collard

Absolutely. There's a big difference.

Christine Cotton

So if we'd had this first analysis at six months, would a health agency have given an authorization based on this drop in antibodies? I don't think so.

Chantale Collard

And why did they?

Christine Cotton

They gave it because at the time, this red arrow showing the neutralizing antibodies, which are supposed to represent immunity against the disease: well, we didn't have this result because we did an analysis after three months, not six! And the laboratory didn't schedule any visits between two months after the second dose and six months after the second dose. Why didn't they schedule any visits? In other words, you don't measure what you don't want to show.

Chantale Collard

There you are.

Christine Cotton

So how did they know it was going to drop? They knew it from the publication on the monkeys because we could already see it there. And they knew it because in the documents

submitted by the agencies in France—the ANSM [National Agency for the Safety of Medicines and Health Products], et cetera, or the HAS, Haute Autorité de Santé [National Authority for Health]—they already told us in December 2020 that a booster was being investigated. Ah, how convenient!

Therefore, not measuring the antibodies is how they hid the fact that they were decreasing. That way they received an authorization with a completely bogus efficacy since it doesn't measure the disease in its entirety. So they didn't measure the antibodies but they knew very well that they were going to decrease, so they prepared a booster. Then six months later—on December 22, 2021—they said, “Aw, that's too bad, we just noticed that the antibodies are decreasing. It's annoying, but we're going to need a booster.”

Chantale Collard

Another booster.

Christine Cotton

So we needed a booster. After that, we needed a fourth dose, then a fifth— But this is inevitable since it only lasts three months. But we've known from the beginning that it lasts three months.

[00:20:00]

So let me summarize. Efficacy being 95 per cent: false. No proven efficacy in severe cases with each authorization. Antibody levels: they didn't measure them because they knew they were decreasing and that's why they were studying a booster. So protection and efficacy are zero! In terms of methodology: zero. So it's worthless.

If I move on to tolerance— When I read the reports, I don't have any major problems regarding tolerance. However, in the adult clinical trials, I know about the well-known Augusto German Roux, who contacted me from Argentina. He took part in the clinical trial and almost died. So he sent me all the letters he'd sent to all the health agencies to point out that he'd almost died and that it wasn't in the clinical report; that it wasn't reported as a serious life-threatening adverse event. It's not there. So that means that the tolerance is incorrect. As for teenagers: I'm thinking of the well-known Maddie de Garay case in the United States where the mother moved heaven and earth to have her daughter treated, but to no avail. So if these serious effects had been reported, it would have been much less safe than it was made out to be. So obviously, the tolerance is incorrect.

And then there are the risks. So what are the risks? Well obviously, it's having adverse reactions, but it's also all the unknowns. So as we saw at the start— Use in pregnant women since December 2020: unknown; it was not measured in clinical trials. Immunocompromised patients: unknown. For fragile patients with diabetes, chronic illnesses or cardiovascular problems: unknown. Use in people with autoimmune diseases with inflammatory problems: unknown. Interactions with other vaccines: unknown. How could we offer a flu vaccine on the same day if we didn't have any studies at the time of authorization? And we say, “Oh sure, we can do that.” We don't have any studies that say it's safe! So obviously, long-term tolerance is indeed: unknown.

Chantale Collard

But pregnant women, Madame Cotton, I don't understand. I'm sure you'll tell me. Usually, they can't take any medication at all. It's always pregnant women who are prevented from taking even a simple aspirin or Tylenol, sometimes even food. How did we get pregnant women to take this injection when we know the risks?

Christine Cotton

Pregnant women have been classified as an at-risk population.

Chantale Collard

At risk of contracting the virus, and not at risk of vaccine side effects.

Christine Cotton

Exactly. So they classified them as at-risk and proceeded to vaccinate them without any clinical trial results. There was one clinical trial on pregnant women but it was stopped. Three hundred or so women were recruited out of the four thousand planned, and we never saw the results.

What's more, the laboratory isn't hiding anything from us—or nothing much—since in the results for the 12- to 15-year-olds, there's even a chapter written in plain English with links and everything you need. I retrieved everything. It's available; anyone could retrieve them. Every time there's an authorization, it's put online. It's not hidden. And in this report, there's a chapter called "Unknown Benefits and Risks." And in it they tell us point-blank that the unknowns for teenagers are the same as for people over 16: duration of protection, unknown; efficacy in certain populations at high risk of COVID, unknown; efficacy in those who have already had COVID, unknown—since in the clinical trial, these are people who have never had the disease; effect of illness on future vaccine efficacy, unknown; efficacy on asymptomatic infections, unknown; efficacy on the long-term effects of COVID, unknown; efficacy on mortality, unknown; efficacy on transmission, unknown.

They're not hiding anything; it's all there in black and white! So when health agencies see this, they should normally be alerted to exercise a little caution. So no, obviously it doesn't bother anyone that there are all these unknowns at the moment when authorizations are given. Then of course, because there are so many unknowns, they say, "Oh well, we'll study the occurrence of myocarditis and pericarditis. We'll study pregnant women. We'll do real-world studies or more clinical trials."

[00:25:00]

There you go. But in the meantime, authorizations are granted. So there was indeed a trial on immunocompromised patients and one on pregnant women. There you go.

And what has been known since October 2020— Since we had a presentation by Steve Anderson, who's not just anyone, as he's one of the people in charge of biostatistics [at the FDA] and also in charge of adverse reactions in this situation—what was known? Well, that possible events following vaccination had to be monitored. These could include Guillain-Barré, disseminated encephalomyelitis, transverse myelitis, convulsions, cardiac arrest, anaphylaxis, myocarditis and pericarditis, autoimmune diseases, death, pregnancy and birth problems, thrombocytopenia, et cetera. And something very important that we've known all along: what they call "vaccine enhanced disease." So instead of preventing us

from catching the disease, the antibodies we create aggravate it or cause us to catch it. This has been known since October 2020. It's online! If you click, there it is: it's not hidden.

In fact, the real problem is that with a file like this, the health agencies should theoretically have countered with: "You must add three months of follow-up; the data is insufficient," and then not rushed to give authorization. So why did the health agencies rush to give this authorization?

And then the last point concerns the quality of the data, following these notably good clinical practices. And we know from Brook Jackson in the United States that there have been problems at certain sites, that patients were not properly monitored. We know this with Augusto Roux in Argentina because that was tragic. So we have doubts about the data's quality. When you have doubts about the quality of the data, how can you not have doubts about the quality of the results? So clearly, this clinical trial is the worst I've seen in my career. Therefore, the efficacy is false.

Immunogenicity and antibodies [measurements] are incomplete. The tolerance is false, so the benefit-risk ratio is obviously false. And the FDA tells us that they audited the centres, but due to complications during the pandemic, they say they didn't in fact check the integrity of the data. So this clinical trial is a sham in every aspect.

Chantale Collard

A monumental fraud.

Christine Cotton

You bet! Frankly, at this stage, it's unprecedented. And it was done with the agencies' blessing.

Chantale Collard

There you are.

Christine Cotton

So the question is: Why? I can't answer that question.

Chantale Collard

I think people will draw their own conclusions from your presentation—which is crystal clear—and from your support[ing information]. It leaves me speechless to see that it was all false. We suspected it, but now you've proven it.

Christine Cotton

That is, it's all there in writing. But in order to reveal it, you need to know something about clinical trial methodology.

Chantale Collard

And you know what you're talking about, so there may be questions from the commissioners to complete your testimony.

Christine Cotton

Of course.

Commissioner Massie

Thank you, Madame Cotton, for that very enlightening presentation. You mentioned that in order to recognize the shortcomings that may have been present in this case, we need to have knowledge—among other things—of good clinical practices to understand whether we are really in a position to generate data on which we can draw reliable conclusions. Unless I'm mistaken, I assume that people who work in regulatory agencies—whether it's the EMA [European Medicines Agency], the FDA or Health Canada—in principle should have this kind of knowledge of good clinical practice.

Christine Cotton

Absolutely. So I've been involved in several FDA filings for laboratory projects of varying sizes and in those cases, we have [to answer] questions.

[00:30:00]

They ask us to explain why, and how we were able to prove this. So obviously, they [ask] about good clinical practice. I'm all the more familiar with it as I used to be my company's quality assurance manager. So we have standard operating procedures that we have to follow; we have standardized methods. So obviously all these people are perfectly familiar with them.

So have these files been reviewed by biostatisticians? Because when I talk to you about statistical bias, you have to know a little bit about statistics. But even so, I think an experienced examiner has to see that there are biases. If I don't dose and I do fewer [PCR tests] for the vaccinated [group] than for the placebo [group], obviously that's a bias because if people weren't tested, I can't know whether or not they have COVID. So I mean, you don't even have to be a biostatistician to figure that out. So it's incomprehensible. I mean, when I read all that, it's incomprehensible that the health agencies have accepted this file as it stands.

Commissioner Massie

My next question is a little technical: it's about PCR tests—because this was one of the key elements in the so-called claim for vaccine efficacy. Do we have any details in these files on the number of cycles used for the PCR tests?

Christine Cotton

I didn't find anything. So personally, it doesn't bother me too much because there's no reason in biostatistics for it to create a bias since there's no reason for me to have, for example, more false positives for the placebo [group] than for the vaccine [group]. So that's why I don't really bother mentioning the PCR test result in this analysis in terms of methodological bias since there's no reason to. If, for example, I have 10 per cent false positives or false negatives depending on the test or the number of cycles used, there's no reason for the methods to be different, or for there to be a difference between my groups. So it's not a bias for me. Do you understand?

Commissioner Massie

Yes, I understand. My next question concerns the evaluation of the populations: where we measured the number of weak symptoms in the placebo group and in the vaccine group. When I do the rough calculations, I think the challenge we're facing is: Will we have a chance of having enough events to be statistically significant? Roughly speaking, out of 40,000, with the number we have here, that's about one case of infection in four hundred. The first question is: Is one case of infection in four hundred—in a population in the midst of a pandemic—a good indication that we're in an important phase in terms of infecting people?

Christine Cotton

I was thinking about this when I looked at the calculation of the number of subjects. They had predicted that 1.3 per cent of people on placebo would contract COVID, which—in the middle of a global pandemic with lockdowns everywhere—is very few. I said to myself, “Well, for something so infectious, in the midst of a pandemic, if we calculate the number of subjects and see that only 1.3 percent of those receiving placebos—that is, salt water injections—will [contract COVID], in the end, this COVID isn't so infectious after all.” Well then.

Commissioner Massie

And so the next question is: With the numbers we had available to assess this relative effectiveness, is it actually statistically convincing, let's say?

Christine Cotton

Yes—because it's a calculation. In any clinical trial, there is an assumption of efficacy, or in this case, percentages of sick people in each group. That's how we calculated that 44,000 subjects were needed for the trial. So that's not the problem. But this is calculated on mild or moderate, PCR-confirmed COVID cases. However, if we had said, “We want to use severe cases as an efficacy criterion,” we would have needed many more patients in the trial, since they are rare. As you can see, I have zero teenagers [in the placebo group] and zero [in the vaccine group]. So I'm not likely to show a difference between the placebo [group] and the vaccine [group] because I don't have any cases.

[00:35:00]

So this is an unproven efficacy due to a lack of cases. I believe the choice was discussed well beforehand at meetings—WHO [World Health Organization], agencies, et cetera. And so they said that for severe cases, which would have been much more relevant—since it's the severe cases that lead to hospitalizations and deaths, and that's what we wanted to avoid—well, we would have needed far too many patients. So that's why they chose this one, which is totally unrepresentative of reality. They could have chosen to use antinucleocapsid serology, but that wouldn't have suited them because 55 per cent efficacy—as opposed to 95 per cent efficacy—is harder to sell.

Commissioner Massie

My next question concerns the deployment of the vaccine. In the early months that followed, there was a certain amount of data to which we didn't have immediate access, but to which we ended up gaining access a little later through requests for Access to Information. And initially and for a very long time, the idea was hammered home that

vaccination was actually significantly reducing the number of cases. It was even better than what was observed in clinical trials. So everyone had to be vaccinated if we were to emerge from this pandemic. Then suddenly, the Delta variant arrived and the vaccine no longer seemed to have the capacity to reduce infection and transmission.

Is there anything fundamentally different between the Delta variant and the other variants on which the vaccine had been tested? Or is it simply because the greater number of cases made it more difficult to demonstrate this in the figures we were accumulating as we went along?

Christine Cotton

So I don't agree that we didn't have access to the documents. I retrieved the documents as early as December 2020. In April 2021, I gave my first broadcast on the results of the four vaccines that had been released up to that point: Janssen, AstraZeneca, Moderna, and Pfizer. We had access to the clinical reports. I retrieved them all.

Commissioner Massie

What I mean is the documents that followed the rollout of the vaccines that Pfizer and the FDA didn't want to be made public for 75 years.

Christine Cotton

Yes, that is, they didn't want to make internal documents public. But the clinical reports were available. All the deliberations were available on the FDA's YouTube channel. You could have eight hours of deliberations with all the presentations from the CDC and Pfizer staff in particular. So we had everything. It's just that people don't know it exists and obviously, very few know how to read clinical trial reports. But I had already collected everything, so I already knew that there was no known efficacy for severe cases and that there were lots of populations that hadn't been analyzed. As early as April 2021, I did a broadcast to warn people that if they were immunocompromised, there were no results proving that it was effective.

So the second point is about the results we were getting, which kept being released: the efficacy of this and of that, and so many percentages. Well, these are real-world studies based on retrospective databases. In other words, we take databases and analyze cases on the basis of that. In my 23 years in the pharmaceutical industry, I've never carried out analyses on retrospective databases. Because in terms of the validity of the conclusions and the proof of the conclusions, it's at the lowest level. In other words, the conclusions drawn from them should be taken with great caution because, in terms of method, they're not worth much. So they could always bring up whatever they wanted because it was worthless, really.

Commissioner Massie

But when the health authorities tell us, for example, that this vaccine can no longer prevent transmission, it is implicitly suggesting that it did at the beginning.

Christine Cotton

They had drawn conclusions from a real-world study which tended to prove that it slowed down transmission. But then, we don't give marketing authorizations on the basis of real-world studies. We give authorizations on the basis of clinical trials.

[00:40:00]

That shows the point. In other words, that in terms of methodology, I can't give authorization based on a real-world study method. Why? Because it's not valid, or it's much less valid. And my conclusions are to be taken with much more caution than a clinical trial, which is randomized, where we've selected people who meet inclusion criteria, et cetera, who are followed in a certain way, all in the same manner. So otherwise, if real-world studies were all that it took to bring a product to market, we'd have stopped doing clinical trials a long time ago. See what I mean? I'll prove whatever you want with a real-world study. You choose your database well; you choose the methods that suit you; and then you prove whatever you want. Some people have managed to prove that Nutella reduces hypertension or the like. So from here on—

Commissioner Massie

Isn't one of the problems with the clinical trial that the inspections we should normally have had from the regulatory bodies were insufficient to ensure good clinical practices? Is this unusual? Or is this how it's usually done, or did we do less than usual?

Christine Cotton

So if you look at the number of audits carried out by the FDA, it has actually dropped. But it was a rather special period. So the real problem is, when they tell us they're going to audit: What does auditing mean? It means checking all the patients' source files. So I take out the medical file and I check what had been reported in the database— via a system called eCRF, "e" for "electronic", CRF, "case report form." I check that the data that is in there is indeed what is in my source file. It's the integrity, the validity of the data. Has it been entered correctly? Does it match? That is, I have to take data at random; I have to validate all the circuits and PCR tests and how soon they are sent out. All this is recorded in a centre that recruits patients. It's all part of good clinical practice. Did the people who called in saying, "I'm ill, I have such-and-such a symptom" get a call back from the centre staff? There are logs, tracking systems. Everything is recorded.

So that's why, when I wrote a report on this trial in January 2022, I asked for a full audit of all the centres' documents. So now we know who wasn't called back when they should have been tested on account of being ill. From this we know everything. And the FDA tells us, "Oh yes, but the integrity of the data has not been verified." If the integrity of the data hasn't been verified, then I don't know if my data is reliable and therefore, all the more so, my results.

Commissioner Massie

We had another witness who mentioned that during the clinical trial, a certain number of people had been excluded from the compilation and that this number of people was much higher in the vaccine side than in the placebo side. Have you seen any data to that effect, and how would you explain it?

Christine Cotton

So I think it's a question of defining the populations. That is, when we define the analysis populations, when we write the protocol—which was my job—we define the analysis populations and we exclude a certain number of people that we've defined as unable to fit into these populations. But that's a complicated subject to talk about because the reasons for exclusion are defined beforehand. And when we exclude patients, we're supposed to do so blindly; this is known as blind review. So to say there are more exclusions in the vaccine group, okay. But I don't have this blind review document, so I don't know how it was done. So I didn't talk about it because I don't think it's the main issue. There are so many other problems. So when we say, "We're excluding so-and-so, so-and-so, so-and-so," we're not supposed to know who got the vaccine or who got the placebo. And we do that before we do the analysis.

[00:45:00]

It's a document that's drawn up beforehand and then, when we do the analysis, we know what the product is because it's blinded. And we mustn't forget that in the Pfizer clinical trial, the only one who knows what the patient has received is the one who prepares the product and injects it. He's the only one who knows; the others don't. So, *a priori*, when we hold this data review meeting where we say, "So-and-so, so-and-so, so-and-so, and such-and-such number have deviations, and so we will exclude them from the analysis population," we're not supposed to know whether they had taken the vaccine or the placebo.

Commissioner Massie

Okay, thank you. You have any questions? Are you okay?

Chantale Collard

Madame Christine Cotton, listen: thank you for your truly enlightening testimony, in terms of both methodology and analysis of clinical trials. In any case, I've personally learned a great deal, even if I already knew a bit about it. So listen, thank you and I invite you to spread your message far and wide.

Christine Cotton

Oh well, I made quite a bit of noise with it, didn't I? I did go to the Parliamentary Office.

Chantale Collard

Keep making noise.

Christine Cotton

I'm not finished.

Chantale Collard

Thank you very much.

Christine Cotton

Thank you.

[00:46:36]

Final Review and Approval: Erin Thiessen, November 12, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 4: Lynette Tremblay

Full Day 2 Timestamp: 02:13:05–02:34:34

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Samuel Bachand

Good day. Samuel Bachand. I will be acting as the attorney for the Commission for the purpose of your testimony. Madame Lynette Tremblay, could you please spell your name in full?

Lynette Tremblay

My first name, L-Y-N-E-T-T-E, Tremblay, T-R-E-M-B-L-A-Y.

Samuel Bachand

I'll swear you in. Madame Tremblay, do you swear to tell the Commission nothing but the truth?

Lynette Tremblay

I vow to tell only the truth. Moreover, I can add right from the start that I've already been part of two documentaries in Quebec, *COVIDENCES* and *CHSLD: je me souviens*, in which I talk about the same subject: the death of my father, then my reaction toward the way governments treat seniors, which I find absolutely, unbelievably awful.

Samuel Bachand

So the skeptics will be able to compare testimonials.

Lynette Tremblay

They'll even be able to see photos because I could have brought photos, but they're already available in the two documentaries.

Samuel Bachand

Very well. So I don't need to tell you to speak slowly to help the translation.

Lynette Tremblay

Yes.

Samuel Bachand

You're here to tell us about the circumstances surrounding your father's last days in CHSLD [a nursing home or long-term care home]. So what I suggest you do, as we did on the phone in preparation, is tell us all about it: date by date or period by period, chronologically, very calmly. And then where I need further clarification, I'll interrupt you.

Lynette Tremblay

Excellent. So listen, it was at the beginning of the pandemic in 2020 and my father was in a CHSLD. In this CHSLD in Montreal, there were no cases of COVID. It had even been mentioned in the media. And then overnight, I think it was in March, the COVID alert was triggered. And then I was informed by the director of the centre—

Samuel Bachand

Who triggered the COVID alert?

Lynette Tremblay

The government.

Samuel Bachand

What COVID alert?

Lynette Tremblay

They were saying, "We can't see our elderly anymore, it's dangerous." I didn't see my father for two months.

Samuel Bachand

Just a moment. When you say, "The government says 'you can't see them,'" how were you given this message? What form did it take? Did you receive a written document? Did you watch a press briefing, et cetera?

Lynette Tremblay

For me, it was because I used to visit my father regularly and then I was denied access. There was an employee I paid to accompany my father, to take him out. He was no longer allowed entrance. And then, from one day to the next, I was told that "from now on, starting Monday, Public Health is going to be in charge. They're going to go into the CHSLDs," and they were going to test people.

Samuel Bachand

To the best of your recollection, approximately what date is this?

Lynette Tremblay

March 2020.

Samuel Bachand

Okay. When you say: "I was denied access," who was denying you access? On what terms? In what way?

Lynette Tremblay

Well, on the phone, because I called often. I remember coming back from vacation and wanting to go see my father, but it was on the exact day I got back that the measures were implemented and access was denied. They were doing Zoom, WhatsApp, so we could see our parents and talk to them, and then we were forbidden access.

Samuel Bachand

Who were you talking to on the phone when you got the message that you were barred from the CHSLD?

Lynette Tremblay

Well as I said, it was in March, maybe the end of March. The director of the centre herself said to me, "Listen, Public Health will be coming tomorrow." But I said, "There are no cases; why are they going there?" Then she said, "Well, that's it; they're coming to check." And then she said, "Tonight, I'm doing rounds." I thought it was weird that she was working on a Sunday night. She said to me, "I think your father has a fever." I said, "Oh really!" Then she said, "I'm going to test him for COVID." But I said, "No one had anything last week." It was a centre that had apparently been completely free of infection.

[00:05:00]

So she said to me, "Well, I'm going to test him; he has a fever." I didn't say much, but the next day, she told me, "Ah, your father's been tested, and he's got COVID but he's asymptomatic." I thought, "That's impossible!" Look, this is a virus that's supposed to kill, that suffocates you, that knocks you off your feet, that makes you contagious. How can you be asymptomatic?

Samuel Bachand

Okay. Was it the director who told you, in the first conversation you mentioned, not the second, that you couldn't access the facility, or was it someone else?

Lynette Tremblay

Well it was the centre's rules. I can't say exactly.

Samuel Bachand

Who told you? I'm trying to find out who told you that you couldn't go. You told me approximately when.

Lynette Tremblay

There was a ban that applied to all CHSLDs in Quebec starting on a set date.

Samuel Bachand

Who at your father's CHSLD told you about the ban? Who told you, "You can't come to visit"?

Lynette Tremblay

It could have been the administration or the person who answered the phone. It could have been reception because everyone had the same message.

Samuel Bachand

So it wasn't the director in the first conversation. It was another employee you can't identify.

Lynette Tremblay

I can't say exactly. Except that, when we got there, there was a policeman. And I'm telling you, even if we had tried to get through, it would have been impossible.

Samuel Bachand

I understand.

Lynette Tremblay

So that was my experience. She told me, "We've done COVID tests, and your father is positive but asymptomatic." And then I called every day, and I realized that every day, there was a different doctor on my father's floor and on every floor. Every day, they changed doctors with the result that none of them knew the patients.

Samuel Bachand

How exactly do you know that?

Lynette Tremblay

Because I phoned every day and asked, "It's a new doctor! Why isn't the regular doctor answering?"

Samuel Bachand

When you called every day to find out who the doctor was, did you talk to a nurse? To an attendant? Who were you talking to?

Lynette Tremblay

No, I talked to the doctor! Because I demanded to speak to the doctor.

Samuel Bachand

All right.

Lynette Tremblay

And then, I didn't believe it. I even asked the doctor, "Are you going to give me the proof of the positive test; I want to see it." He never gave it to me but he said, "Ask the nurse, ask someone else," and then that person over there— It was like something out of *Asterix*.

Samuel Bachand

The house that drives you mad in *Asterix*.

Lynette Tremblay

Yes, *The Twelve Tasks [of Asterix]*. So everyone passed the buck. I never got the test. And then they told me that patients who are COVID positive are going to be put in the cafeteria. I found that absolutely absurd.

Samuel Bachand

Was it still a doctor who was telling you that?

Lynette Tremblay

Yes, was the doctor. He said to me, "Public Health is in charge of all that." Then I was told, "The patients will go to the cafeteria for two weeks and then we'll check on their condition." I called every day. I'd say, "Is my dad okay?" He'd say, "Yes, he's fine, he's eating well, he's asymptomatic." And I'd say to myself, "So he's not . . ." Then what I realized was that because it was new—there was no vaccine yet and the tests were new—they were practising on the seniors. Because he told me that he kept testing them until the test was positive.

Samuel Bachand

A doctor told you he was testing patients.

Lynette Tremblay

Yes, he said, "We tested several times." Also I was friends with people there, we knew each other, and the daughter of another patient told me, "My father had some kind of pneumonia and then they tested him three times until the test came back positive."

Samuel Bachand

Over what period did they test it three times?

Lynette Tremblay

Oh, they were testing either the same day or within a few days—very, very quickly.

Samuel Bachand

Okay. Have you heard from other people, for example medical staff, that it's common practice to test as often as necessary over a short period of time until a positive test is obtained?

Lynette Tremblay

I know that some people have been tested three times before testing positive. I've been told that. But listen, it's been a while.

Samuel Bachand

I know, I'm trying to . . .

Lynette Tremblay

I can't say who or when.

Samuel Bachand

You're sure.

Lynette Tremblay

That's what was needed. When a patient tested COVID positive, all treatments were halted. In my father's case, he had a large bed sore and needed to sleep on an elderly care air mattress. The sore had been caused by neglect because they left him lying down too long.

[00:10:00]

So when treatments were halted, they said they didn't have that bed. The patients weren't even given vitamins C or D. When I demanded they at least give my dad vitamins C and D, the doctor said, "Oh, that doesn't work, it's not necessary." I said, "Well, I want you to give him some and I'm going to come and check. If you don't, I'm going to take it to him. Then I want you to give it to him." And that's what I did. I brought in a little box of vitamins which they never gave him. They put the box aside and gave it back to me after my father died. The box was intact.

In the end, the patients apparently didn't stay down there for two weeks. I think it was because the system did not work. I was told, "We're moving them back up to the bedrooms; your father is okay." And then, I wanted to see him, I wanted to see him. He said to me, "He's fine, he's fine."

I'll just take a look at my notes, in case I've missed anything.

And then, at some point, a new doctor phoned me. He said, "Ah, your father's a bit weak, maybe you could come and see him." So I rushed off to see my father and went to his room. There was a woman lying in his room and it was all converted and identified by the lady's name. We paid for this room; it was ours; it was like his home. And I arrived and saw a

woman lying in the bed. Then I said, "It's not an air bed, it's all decorated, it has photos." It was clear that this woman had been there for a while. Then she said, "No, your father's not here; he's in that room." Then I went to see him but I said, "What kind of room is this? It's a hard bed, it's empty, there's no name with his picture! Where are his clothes, his TV, his personal belongings? Where are his things?"

They didn't answer me. When I went in, I can't even tell you the protocols I had to go through! We had to enter through new access corridors and dress up in face shields and a mask. I thought, "Is this theater, vaudeville, or what?" It was incredible to me. I thought, "They can't be serious, they're trying to scare everyone!" I was outraged by the circus. What's more, they'd brought the military into the centres. I said, "What on earth are you doing, bringing in the military? People are already scared! They're going to see the military come in. What you're doing is appalling!"

Samuel Bachand

Who summoned the military—or the possible presence of the military?

Lynette Tremblay

Ah, it wasn't just possible, it was credible: the military was there. The military was there apparently because the employees were so scared of COVID. They [the employees] were paid—I think they got the CSP [Canadian Emergency Benefit] which paid more than their salary—and they all left.

Samuel Bachand

Okay. Did you see the military with your own eyes?

Lynette Tremblay

Yes, I saw them. Fortunately, they weren't dressed in military garb. Then I realized they were there to help.

Samuel Bachand

How did you determine that they were military personnel?

Lynette Tremblay

I asked them.

Samuel Bachand

Okay, then what kind of response did you get to the best of your recollection?

Lynette Tremblay

They were all nice.

Samuel Bachand

What words did they use? Did they say, "I'm Sergeant what's-his-name"?

Lynette Tremblay

No, I didn't go into detail about that. All I cared about was seeing my father. I didn't ask any questions.

Samuel Bachand

But you're certain that these people told you they were members of the Canadian Armed Forces.

Lynette Tremblay

Yes.

Samuel Bachand

On what date did your father die?

Lynette Tremblay

May 5, 2020.

Samuel Bachand

What was the cause of death?

Lynette Tremblay

Well, that's just it! Because, when I went in on May 4, 2020—the day I realized they had changed his room—I realized he was being given some kind of solution; apparently, they were giving additional medications to patients who tested positive for COVID. And so I took some photos, then I said to my dad, "Dad," and it seemed that he heard me. I thought, "He's completely drugged." I still didn't know what was wrong with him.

So that's how it all happened from my perspective: the room; how he was treated; how he looked; his hair was all dirty! It was as if they'd abandoned him. When I saw the director I said, "How can people be treated this way? My father's hair is all greasy and dirty! I don't even know whether you are changing his—" It's unbelievable!

[00:15:00]

When I returned the next day, they told me, "You can't stay longer than five minutes." I replied, "Listen, I haven't seen my father in two months; I'm going to spend as much time as I want with him." Then one of the nurses freaked out at the doctor when she saw I was taking photos. She shouted, "She's taking photos! She's taking photos!" And I'm thinking, "What on earth is this charade?" So what? I was taking photos. Next he said, "You have to leave right now." So I left.

The next morning, I came back and the director took me into her office with some employees I didn't know. She said to me, "You know, you had no right to go in there yesterday. Your father's not in mortal danger." I said, "Why did you move my father to another room? Why did you do this, and what's wrong with his arm? What did you do to him?" No answer. She said, "Oh, he's not dying, he's not in danger of dying. You have to leave." And then in the evening, at four o'clock, he died.

Samuel Bachand

During the period you've described, about how many doctors in total had you spoken to regarding your father's case?

Lynette Tremblay

For two weeks, let's say, there was a doctor every day.

Samuel Bachand

Okay. Before this COVID situation, what was the physician turnover like?

Lynette Tremblay

It was the same doctor every week. And he would visit patients who needed to see him and treat those who needed it.

Samuel Bachand

Before COVID, how frequently would you call and talk to the doctor? Once a week?

Lynette Tremblay

My father had no issues. He didn't suffer from anything. I used to go in person because it wasn't far from my house. I preferred meeting face-to-face.

Samuel Bachand

I understand. At this point, I'll leave it to the commissioners to complete this interview, if needed.

Commissioner Massie

Thank you very much for your testimony. I have a question about your father's health. How long had your father been in the CHSLD?

Lynette Tremblay

I think it had been two or three years.

Commissioner Massie

And you mentioned earlier in your testimony that he had bed sores, perhaps because he had difficulty getting around.

Lynette Tremblay

A person who's been lying in bed for a long time will develop bed sores. And they hadn't healed properly. When he went to the hospital because of this, she said, "Ah, he's going to die from that bed sore." I said, "What do you mean, a bed sore? You don't die from that!" She said, "Yes, you can die." But I said, "Bed sores are caused by mistreatment." At the hospital they agreed with me. It is necessary to use special dressings. After that was done, all went well. They put in drains but my father wasn't supposed to have any pressure on

the sore, so they prescribed an air bed. It's like water; it doesn't put pressure on the wound. And it healed very, very, very well.

Commissioner Massie

Was your father mobile? Could he get up, move around, or was he always bedridden?

Lynette Tremblay

At first he could. When he went in there, he was moving just fine. And then—you know, I don't wish to make an issue of it—they had given him a tranquilizer that I had cancelled. I ordered them to stop giving it to him because he didn't need it. But it caused him to lose mobility: his legs had gone limp. It was a very powerful drug that put him in hospital. The doctor thought he was going to die from it.

Commissioner Massie

Concerning your first visit in two months [of being denied entry], when you noticed that your father wasn't in his old room: Did you ever get any satisfactory explanation?

Lynette Tremblay

None at all. When I asked, "What is he doing there? Why did they change it?" None! It seems to me that my father was chosen, selected. In any case, I'll let you draw your own conclusions. Apparently, they put him there because they thought they'd only call me when he died. In my opinion, I wasn't supposed to see him like that, in another room and all that.

[00:20:00]

Commissioner Massie

And I'm curious: When you mentioned the day you went to the CHSLD to see your father and the director told you that your father was doing quite well, that it wasn't necessary for him to stay in that room for very long—what was it in her judgment, based on the doctors' examinations, that would allow her to tell you that?

Lynette Tremblay

When I went there, it was because the doctor for that day had said to me: "Ah, I think you should come see your father," except that I don't think the management had been informed.

Commissioner Massie

Okay.

Lynette Tremblay

And the next day, when I wanted to go back, it was the management who took me to their office to tell me, "You shouldn't have gone there; you shouldn't have seen your father; your father is in good health." Then the next day, when I saw him dead, well, I saw that they had rushed to wash his hair; it was clean. I know they declared him a COVID death. I'm sure my father didn't have COVID. We did not have the right to request an autopsy because when

someone died of COVID, autopsies weren't allowed. And that's that. It's unfortunate but he died in an atrocious way.

Commissioner Massie

Thank you.

Samuel Bachand

Thank you for your testimony.

Lynette Tremblay

Thank you.

Samuel Bachand

You are free to go.

[00:21:29]

Day 2

EVIDENCE

(Translated from the French)

Witness 5: Marylaine Bélair

Full Day 2 Timestamp: 02:35:19–02:54:19

Source URL: <https://rumble.com/v2v90b6-quebecIII-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

So hello again everyone. It's my turn to share another difficult testimony. Up until now, I know that the lawyers have had some very, very difficult testimonies on their plates during preparation period. When we talk about preparation, we mean calming the witnesses down, reassuring them, and helping them to organize their ideas a little. But what you will see here is all of their own free will; it's their own emotions. And sometimes we too have our own emotions and we need to remain strong during this process. So I'd like to thank our team here and all the witnesses of yesterday, today and tomorrow.

So without further ado, we'll continue with another difficult testimony—with Madame Marylaine Bélair. Hello Madame Marylaine.

Marylaine Bélair

Hello.

Konstantinos Merakos

So I'll start with your oath. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Say: "Yes, I solemnly affirm" or "I swear."

Marylaine Bélair

Yes, I swear.

Konstantinos Merakos

Excellent. Can you say your full name and spell your surname?

Marylaine Bélair
Marylaine Bélair, B-É-L-A-I-R.

Konstantinos Merakos

Excellent, thank you. So for our viewers, Madame Bélair is here with us in person in front of me. So Madame Bélair, take your time with your testimony. We're going to start from the date when the chaos started for you: March 2020. Does it make sense to start with that date?

Marylaine Bélair
Yes.

Konstantinos Merakos
Excellent. Go ahead.

Marylaine Bélair

Actually, I want to testify on the impact of government measures on my life. In March 2020, more and more measures were being introduced every day. On March 13, schools were closed. At the time, my husband had been studying with the APCHQ [Association provinciale des constructeurs d'habitation du Québec] to get his RBQ [Régie du bâtiment du Québec - for construction management] licences. So his studies were stopped. He had the choice of taking the CERB [Canada Emergency Response Benefit] because at that time, the government was offering students the choice of being paid or of finding a job and going to work.

My husband thought, "We're in a crisis in Quebec; I can't just stay home and get paid for doing nothing." So there was a call from the government for security guards to enforce the measures in public places. My husband got a job on March 29, 2020, as a security guard at Walmart. At that time, one of the measures in place at Walmart was to let in only one person per family; you couldn't bring in more than one person. It was his job to enforce those measures.

Konstantinos Merakos

Perfect. So because of lockdown, measures, and mandates, your husband was forced to find this type of work.

Marylaine Bélair
Yes.

Konstantinos Merakos

So the next date that's important to your story is April 4, 2020: What happened on April 4, 2020?

Marylaine Bélair

Well, my husband was on duty as a security guard at the Walmart in Fleurimont. While my husband was making the rounds inside the Walmart, a customer arrived with his girlfriend and wanted to get in and, well, he was prevented from doing so by the other security guard on site—it was a woman—so he got into an altercation with her. Finally, he withdrew with his girlfriend to the parking lot. My husband rejoined his colleague outside the store and she explained the situation to him. Then the customer returned in his car to the front of the Walmart. My husband was there and, being a man, he didn't want the woman to be annoyed by this customer again. So he got into an altercation with the customer. They ended it a little further down the Walmart parking lot. And the customer got into his car—he was still in his car, in fact—and drove straight into my husband. My husband got onto the car to protect himself. After that, the customer maneuvered to get him off, so my husband fell directly on his head. He was taken away in an ambulance with a skull fracture and internal bleeding.

I was called and I went to the hospital. As soon as I entered the hospital, they looked at me and said, "Madame, you need to leave. You have no business here." I said, "My husband just arrived by ambulance." She said, "Yes, but that doesn't matter. You must leave." A nurse who heard me, and knew what had just happened, took me to the sixth floor. And I didn't understand because my husband worked in a parking lot.

[00:05:00]

I was like, "Okay, it can't be that bad an accident. He must have been in his car." Then the nurse started explaining to me what really happened, and that my husband was in emergency surgery at that point. And then she looked at me and said, "But you can't stay in the hospital." I said, "What do I do?" She says, "You can wait in the parking lot; we'll call you with an update on the surgery." So I spent six hours in the parking lot with my parents-in-law waiting for a call that came around eleven o'clock in the evening.

Konstantinos Merakos

In the hospital parking lot, excuse me.

Marylaine Bélair

In the hospital parking lot, yes, waiting for a call. The surgeon told me that the operation had gone well. He was still in critical condition but I wouldn't be able to see him unless he died.

Konstantinos Merakos

Before we talk about the hospital, I just want to make it clear to the viewers and to the audience that the situation that happened at Walmart was because of—what? Explain a little about what was going on at Walmart that evoked such emotional reactions from customers towards your husband, who was there as a security guard.

Marylaine Bélair

Well, it was dissatisfaction and misunderstanding of the measures that the government had put in place. In the early days of COVID, no one understood what was going on and the measures made no sense. Everyone was in a state of panic. So it wasn't easy to keep people calm and enforce the rules.

Konstantinos Merakos

Perfect. So we can say that the person went haywire in this situation because of the measures, because of his anger. He potentially unleashed it on your spouse.

Marylaine Bélair

On my spouse, yes.

Konstantinos Merakos

So coming back to the hospital, were you allowed to be next to his bed or not?

Marylaine Bélair

The next morning, I called to ask for an update and I then spoke to someone else who gave me permission to go and see him that day. He apologized for the call I'd had the day before, and told me: "You can come and see him, but only with your spouse's father." So my mother-in-law wasn't allowed to see her son for a month and a half.

My husband was in a coma for four-and-a-half months. I was often in and out: at times I could go to the hospital at times I wasn't allowed to go there for two weeks. I had to take it day by day. My own children and my spouse's siblings—there are six of them—were only able to see their brother and father once in the hospital. It was very restricted. I wasn't even able to see my parents who lived in another district for the first two months because they were afraid to cross a district, because fines were being imposed.

Also, there was a regime of fear everywhere—even in the hospital. They were still understanding but it quickly became other patients saying, "Why does he have the right to have his family?" It quickly turned into chaos. It wasn't easy.

Konstantinos Merakos

And can you just mention, because you talked about your children, how many children you have, without necessarily mentioning their ages? We'll keep this a little confidential for you. Are they teenagers or are they in elementary school?

Marylaine Bélair

I have five children, and at the time of the accident they were all elementary school age.

Konstantinos Merakos

Excellent. Okay, and these five children weren't allowed to see their father during treatment.

Marylaine Bélair

They were only allowed once.

Konstantinos Merakos

Once. Okay. After the operation, after the treatment, there was palliative care.

Marylaine Bélair

Yes. After four-and-a-half months in a coma it became clear that my husband was dying, so he was transferred to palliative care. Again, once in palliative care, I was told that there was a maximum of two visitors a day. We're talking about someone who's at the end of his life. Two visitors a day, I said, "That's all? I have five children. He's got six brothers and sisters, there's his parents, there's my parents." As I said, the hospital was a little understanding, but it didn't take long for things to get out of hand on the floor. In the end, we had to manage who was allowed to come and see Philippe and who wasn't.

Konstantinos Merakos

Your situation has been publicized. Anyone can do a Google search to see what happened. Did the media have a positive or negative impact on your situation? Tell us a little about the effect of the media, about the pressure in your private life.

Marylaine Bélair

There was a positive effect in the sense that—among other things—that's why the hospital gave us a little more leeway. Because having heard the story, knowing that there were five children behind it who were perhaps about to lose their father, it had a positive effect all the same. I had a lot of help; there was a donation platform.

[00:10:00]

As far as I'm concerned, it's not easy having your story on TV! We agree that it's not something you want in your life, but still something positive came out of it.

Konstantinos Merakos

Like it or not, in spite of the pressure—the fear, as you said earlier—the media in this case created the pressure to act. Do you think that if the media hadn't been there, the situation would have been different?

Marylaine Bélair

Probably, yes.

Konstantinos Merakos

For the worse? Can you say?

Marylaine Bélair

Yes.

Konstantinos Merakos

Okay. So what happened after palliative care?

Marylaine Bélair

After my husband passed away it was time for the funeral. I never thought I'd have to choose who could attend a funeral. Again, you had to make a list of who could and couldn't

attend. Within the funeral complex, we again weren't allowed to hug, weren't allowed to shake hands; we had to wear masks.

Then even during the ceremony, there was the two-meter distance between family bubbles. I was all alone, sitting at the end of the row, really far from the other people around me. At one point, my best friend took my chair and said, "This doesn't make any sense; you come sit next to the rest of us." But it was very cold; it was dehumanizing to live like that! That's the word that comes to mind. It just didn't make sense.

Konstantinos Merakos

Did you, the parents, and the children have a last hug, a last goodbye to their father? Were they able to touch him to say a final goodbye?

Marylaine Bélair

I made arrangements with the hospital. Given the measures and all that, I said, "I'll just take fifteen minutes, I'll bring my five kids all at once."

Konstantinos Merakos

Take your time, no problem.

Marylaine Bélair

So they allowed it. Yes, they were able to say goodbye to their father.

Konstantinos Merakos

Take a minute, there's no problem. Take a Kleenex. We're here for you.

So following this unfortunate death, I imagine it was also financially difficult because now you find yourself a single mother with five children. And I salute the courage of the rest of the family, which I imagine helped you through this difficult situation. Have you received any suggestions—whether from doctors, the government, or whoever—related to bereavement support? What resources are available to you following such a tragedy?

Marylaine Bélair

Well, I really didn't get any help. There wasn't anyone to help me. I had to do the research myself because you're not born with the resources to say, "I'm going to mourn the death of my spouse and the father of my children at 35." So I did a bit of research. Then ironically, I came across the Quebec government's website, which gives a few guidelines for when you're going through a bereavement. And one of the first things is to avoid isolation. Okay, that was pretty ironic.

Konstantinos Merakos

So just a quick note, what were their suggestions—according to the government—in order to recover from a bereavement?

Marylaine Bélair

Firstly, to avoid isolation.

Konstantinos Merakos

Okay.

Marylaine Bélair

Secondly, to meet people who have been through the same thing as you. But you realize that you're in a lockdown and nothing was happening at the time: sports activities, meeting new people. That was the sort of thing I was reading. I was like, "Okay, I'm not entitled to any of that right now." Another was to find professional help—but then realizing that psychologists and other counsellors were already overloaded with all that was going on. So I found my own ways to help myself.

Konstantinos Merakos

Okay. So you tried to get resources and not only were they unavailable, they were contradictory based on the environment you found yourself in.

Marylaine Bélair

Yes.

Konstantinos Merakos

Perfect. I don't want to take more of your time. I know it's a difficult situation to replay because I imagine there's been a lot of media coverage, plus a criminal court case.

Marylaine Bélair

Yes.

Konstantinos Merakos

So I'd like to bring this to a close. In your opinion, as a human being, what could have been done better? What are your recommendations for humanizing what happened? Please give us your suggestions.

Marylaine Bélair

In my opinion, a prime minister's role—whether federal or even provincial—is to serve the people. He's not there to enslave people.

[00:15:00]

As for the vaccine— I didn't take it, but I didn't mind them making it available. But you can't impose a vaccination. Then if you make it available, at the very least you should say: it's experimental. Then when there are side effects, you should mention them, so that people can make the best decision for themselves because it comes down to your personal decision whether you choose to risk taking the vaccine versus risking the virus. That's the first recommendation.

The second concerns the other measures. I think isolating people who were at risk was a good thing to do, but again, with free choice. Some grandparents would rather see their grandchildren and die of the virus than be locked up in a nursing home. So they should recommend these things but let others live their lives. I mean, I could go out; I was ready to live with catching it. If someone was afraid, then it was up to them to isolate themselves. Don't bully others on behalf of someone who's scared or in danger.

Then, my last recommendation is this: I'm a mother of five, I'm a company director. A person experiences crisis situations on many levels. When faced with a crisis situation, you have to weigh the pros and cons in order to see the positive effects of the decision you're about to make, of course, but also to consider the negative effects—and there are always negative effects whether you like it or not. Then when you know what they are, you work with the people who are going to have to live with them.

The government has completely ignored us as a people. And the way I see it, the National Citizens Inquiry is doing is what our authorities should have done. They should have asked themselves more questions, then seen the impact it was having. Even François Legault, when it happened to my husband, said at the press conference, "Oh, it's unfortunate, it shouldn't happen." No alarms were set off—not a single one—about what he was doing to our society.

Konstantinos Merakos

Okay, excellent. And I also want to remind you that—you already disclosed it, but—vaccination status or any other medical procedure is personal, it's confidential. So just a reminder—and to other people too—that you mentioned it here, but you didn't have to.

Marylaine Bélair

No, but I don't mind.

Konstantinos Merakos

Yes, it's your choice. Excellent. So thank you very much. I'll now open the floor to questions from the commissioners.

Commissioner Massie

Thank you, Madame Bélair, for your touching testimony. We appreciate you sharing it with us so that we can understand the reality of this pain. My question is this: Looking back, where are you now? Despite the obstacles, have you managed to find a way to grieve? And if so, was it really that much harder to get through those stages given the circumstances you were in?

Marylaine Bélair

It was extremely complicated. That's when I learned how important mental health management is. Then—as I was saying earlier—I had to find my own ways to keep my mental health as strong as possible, while also supporting my five children. Today, I'm still able to see the positive despite everything. I mean, that's when you discover the strength that's inside you.

Commissioner Massie

Thank you.

Konstantinos Merakos

Will there be any other questions? No? Madame Bélair thank you very much. You're very brave. We thank you. You're a role model for your children. We congratulate you. Thank you for being here today and for your testimony. Thank you very much.

Marylaine Bélair

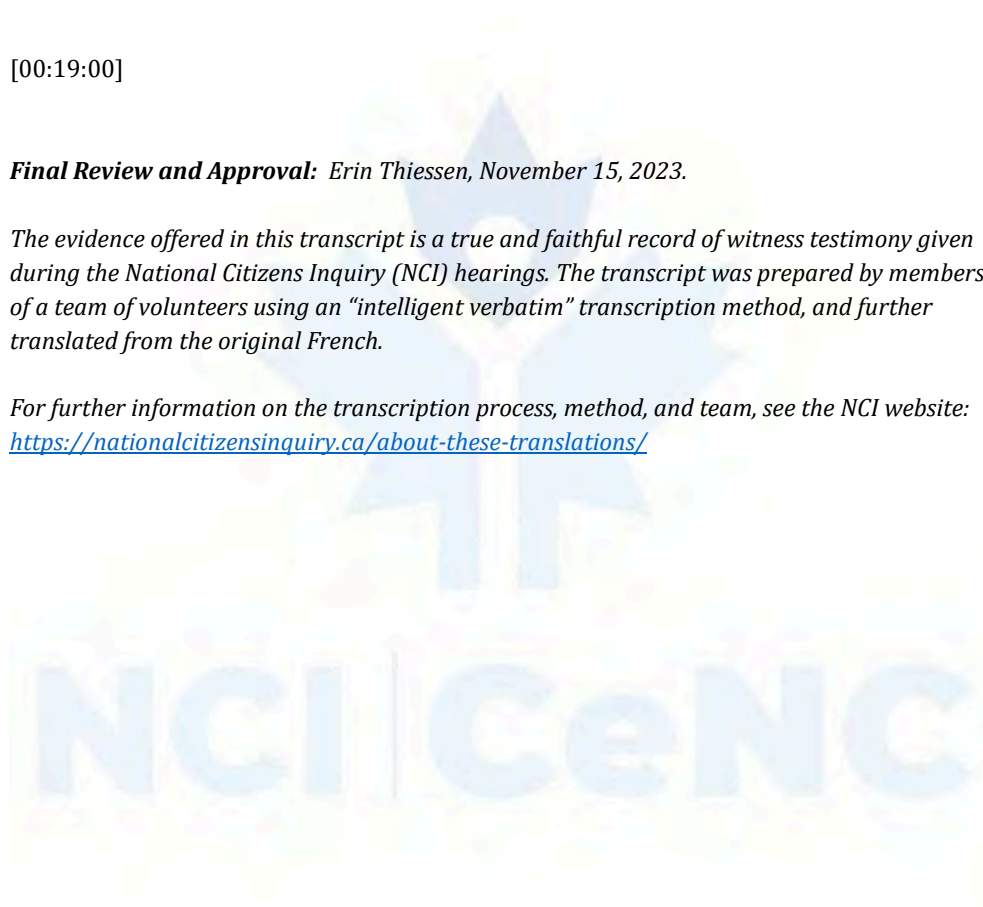

Thank you.

[00:19:00]

Final Review and Approval: Erin Thiessen, November 15, 2023.

Day 2

EVIDENCE

(Translated from the French)

Witness 7: Amélie Paul

Full Day 2 Timestamp: 03:57:00–04:38:35

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Louis Olivier Fontaine

I welcome you all. My name is Louis Olivier Fontaine. I'm a lawyer and I'm acting today as prosecutor for the National Citizens Inquiry. And we are resuming after the lunch break with the testimony of Madame Amélie Paul.

Good day, Madame Amélie Paul.

Amélie Paul

Good day.

Louis Olivier Fontaine

We'll start with your formal identification. So I'll just ask you to state your first and last name, please.

Amélie Paul

Amélie Paul.

Louis Olivier Fontaine

Now I'm going to ask you to take an oath. So I'm going to ask you to solemnly swear that you are going to tell the truth, the whole truth, and nothing but the truth. Say: "I swear."

Amélie Paul

I swear.

Louis Olivier Fontaine

Madame Paul, let me introduce you in a few words. You can tell me if my presentation is adequate. So Madame Paul, you are a singer, actress, producer, content creator—an example of which are the comedy news bulletins, *La vérité brutale*—and you are also co-host of the podcast, *En toute franchise*.

Amélie Paul

That's right.

Louis Olivier Fontaine

Is that right? Thank you. So today, Madame Paul, you've been invited by the Commission to testify about the consequences you personally suffered during the COVID crisis. From reading your file we understand that there are questions that will be addressed in terms of the consequences you've had, and the censorship to which you've been subjected. So that will be the subject of your testimony this afternoon.

I suggest we simply go in chronological order. So I'd like to know: What were you doing before the start of the declared pandemic?

Amélie Paul

I had started a booking company to book cover bands for festivals and corporate events and such. I had spent most of the winter working on that, notably to book my own two bands. So I had a good summer ahead of me just before the lockdown was announced—on March 13, I think. So that's what I was doing.

Louis Olivier Fontaine

Okay. So when this pandemic was declared, what happened to you personally and professionally? In your own words, how did it go?

Amélie Paul

Well at the time I was scared—not about what was declared, not about the virus—but about all my shows. I was afraid. And indeed, everything was cancelled. So of course, it was very insecure as an artist. You find yourself without a contract before you.

But it didn't last long compared to what I saw unfolding before me. I thought the press conferences and all that were like theatre.

In my opinion, I've never bought into it. And that's why—very quickly—I wanted to highlight the absurdity of it all through video clips. It simply came to me. I like editing a lot; I studied communications so it is of course my area of expertise.

Louis Olivier Fontaine

Okay. Yes, let's talk about those video clips. Why did you do that? What did you do?

Amélie Paul

I found what they were telling us in the press conferences interesting: what we had to do to avoid catching COVID. And I had just finished my studies in naturopathy. So I thought it was really odd that it was practically the opposite of stimulating an immune system. So for me, that's when I came up with the idea of doing a video called *Les onze façons d'affaiblir son système immunitaire* [Eleven Ways to Weaken your Immune System], to approach it in a humorous and sarcastic way, pointing out that practically everything they told us to do actually weakened an immune system.

It turned out that I'd done it quite naively—for my own amusement, in fact—but then it went viral and was very successful. So after that, I decided to continue with that view of pointing out the inconsistencies and absurdities that I saw.

[00:05:00]

Louis Olivier Fontaine

Can you give a few more specific examples of what these videos are about?

Amélie Paul

For example, I could talk about masks: how it was good for our health to constantly breathe in the waste we expel, like our CO₂ and so on. I had made a video that asked 80 questions, I think. They were just questions, but it was to get people thinking and to show what was going on. Not just in relation to COVID, but I felt that there were a lot of things going on in society that didn't make sense any more. So I wanted to make people think, but in a humorous way because if you talk about it seriously, people often don't agree.

In Quebec, I think humour really reaches people: it's part of our culture. I'm not a comedian at all but I didn't need to be a great comedian to point out society's inconsistencies. It was just funny!

Louis Olivier Fontaine

All right, thank you. And what happened after that? Did you keep doing that for a while? What happened next?

Amélie Paul

I continued with the comedic videos. At one point I interviewed a biologist and she said, "You're good at this. You should keep doing it." So I continued to interview people who inspired me and those who I found had an important message to bring because I wasn't a specialist in anything in particular. So I wanted to get interesting people to share their message. That's it. So I continued to do comedy, conducting interviews, discovering such little gems on social networks: people I found inspiring and that I wanted to put forward.

Louis Olivier Fontaine

Perfect. So if I'm hearing you correctly, things had been going relatively well for you up to this point. What's the time frame here if you remember?

Amélie Paul

It went well. Right from the start, with the first video I made. Of course I was getting attacks on social networks but it was things like “conspiracy theorist” or “you’re a public menace” or things like that, but it didn’t get to me any more than that. So as with everyone else who was called a conspiracy theorist, it went on like that for about a year. Of course, I had comedic videos that were regularly censored. I thought it was strange when it got to the point where you couldn’t even do comedy anymore. But nothing terrible happened to me, I think, until a CBC article was published on June 2.

Louis Olivier Fontaine

If you don’t mind Madame Paul, before moving on to this other subject, I’d like you to elaborate a little. You say, if I’ve understood correctly, just online attacks by “trolls.” Could you go into a little more detail on that part?

You also mentioned the censorship aspect: that is, videos that have been censored if I’ve understood correctly. I’d like you to go into a little more detail on these two aspects. So firstly, the attacks you mentioned and, secondly, the video takedowns or censorship you mentioned.

Amélie Paul

The videos where I made fun of masks were definitely censored. Some of the interviews I’ve done—I did one with Guylaine Lanctôt so of course that was very controversial—it was censored too. Usually anything that talked about naturopathy or attacked health measures would be an area that shouldn’t be touched. Otherwise, the attacks I received were on social networks. The media hadn’t started talking about me. As long as it stayed on social networks, it didn’t bother me much.

But it was stuff like— I remember I made a video as a joke telling people, “Wear a mask and make a hole in it, then paint your face on it, so it doesn’t show.” A doctor actually attacked me, saying I was a danger for suggesting people do that. But people aren’t so stupid as to do that. Sometimes I couldn’t believe the attacks I was getting. At the same time, I had a naive side in all of this because it was total absurdity to me. It seems that I didn’t realize that for some people it was very serious and they were afraid.

[00:10:00]

In a way, I was ridiculing their fear. I don’t think I was aware of that.

Louis Olivier Fontaine

When you say, “I was attacked by a doctor,” you have to be very specific: How does that actually happen?

Amélie Paul

I think it was on Facebook. It’s been a long time because it’s been three years, but I used to get a lot of comments, especially on Facebook. You don’t see that as much now. But at the time, it was new and people were still afraid; and it wasn’t popular to criticize the measures so I got a lot of criticism. At one point, a woman on Facebook said, “I’m a doctor at such-and-such a place. You’re a public menace telling people to put holes in their masks.” And attacks like that.

Louis Olivier Fontaine

Okay, I understand. And again, when you say, “The videos were censored,” I understand what you’re saying, but in practical terms, who does that?

Amélie Paul

It was mostly YouTube shutting down a video and then saying, “You’re not respecting the community guidelines.” And that’s it. They often don’t really explain. At that point, they’d say, “You’re criticizing the health measures.” It was a little more specific but you were able to assume the reason. But I say “were able” because the more it went on, the more obscure the reasons became for censoring the videos.

Louis Olivier Fontaine

Okay. And when that happened? Did you do anything to appeal that decision?

Amélie Paul

Yes. There’s always a way to appeal but it rarely worked. It worked sometimes. I did appeal and videos came back. You just have to say, “Yes, I’m being funny and I would never criticize health measures!” Then you faked sympathy, and sometimes it worked.

Louis Olivier Fontaine

Okay. Thank you very much, Madame Paul, for those clarifications. So if you don’t mind, we’ll move on. You mentioned an article if I understood correctly. Perhaps I could ask you to elaborate and continue on this subject.

Amélie Paul

Yes. In fact, my first official experience with the media was in January 2021. A journalist from Québecor contacted me that time. I spoke to him, quite naively, and we talked for a long time, like in a kind of pre-interview or whatever. Then finally, he said, “Listen, I’m not putting you in the article I want to publish tomorrow. I’ll get back to you in three days.”

He actually published an article in the *Journal de Montréal*. The next day, I saw: “Des complotistes qui menacent nos”—I don’t remember the title: “*Les complotistes menacent nos structures*” [“Conspiracy theorists menacing our structures”] or something. And three days later he got in touch with me and then he rather implied that if I pushed the health measures on my platforms— Saying, “If you say: ‘We had a good laugh but we still have to respect the health measures, avoid clogging up the hospitals, it’s important.’ If you include this, you’ll have your moment of glory and I will promote your career.” And I went, “Well, that’s because you don’t understand how it works. Firstly, I can’t do that, and secondly, even if I did, nobody would believe me. It’s ridiculous! And even if I did, they wouldn’t listen to Amélie Paul. They don’t care, I’m not a guru. You know, people use their brains.”

In short, I refused and then I got scared. I said, “When’s this article going to be published?” It was either I accept [his demand] or he was going to write the unflattering article he wanted to publish in the first place. He told me it was going to come out on Monday. But in the end, nothing came out.

So there I was, at peace, and then I said to myself, “My God, I’m never going to deal with the media again. I don’t want anything to do with journalists.” Until, it had to be May 2021, Brigitte Noël, after the death of my friend Bernard Lachance—

Louis Olivier Fontaine

Sorry to interrupt you again, Madame Paul. Could you please tell us which media outlet contacted you?

Amélie Paul

At first it was a guy from Québecor.

Louis Olivier Fontaine

Okay, from Québecor. And it’s your decision, but would you like to mention this person’s name?

Amélie Paul

I’d rather not mention it. I don’t know; I’m a little afraid of the potential consequences it might cause.

[00:15:00]

Louis Olivier Fontaine

Yes, you’re ahead of me. So why do you want to avoid it?

Amélie Paul

Yes, that’s right, it’s due to fear. That’s why—although I did talk a little about it—I never took any further action. The media scare me. I’m traumatized, you might say. It’s just my opinion but I know they can go to great lengths to write things that can harm someone.

So there you go.

Louis Olivier Fontaine

Could you give us some examples of things that have been written about you? I know we’ve been going chronologically here. We can either continue chronologically or if there are examples that you’d like to mention now.

Amélie Paul

Well, my friend Bernard Lachance passed away on May 11, 2021. That was exactly two years ago yesterday. Of course, the media made a big deal out of it—because he’s a conspiracy theorist who died of AIDS—to show that he was in the wrong. So it was wonderful for them.

And then a few weeks later, Brigitte Noël from CBC contacted me for an interview and I didn’t even reply. I didn’t even reply to decline because I also know that she has a

reputation of destroying people. Her work isn't very constructive. So out of fear, I just ignored it, very naively thinking, "Maybe she won't talk about it if I don't respond."

And finally, she wrote to me again a few days later and said, "You know, Madame Paul, I'm going to do my story no matter what, even if you don't write me back. But I'll give you another chance. So here are the points I'm going to cover." Then she made a list. And she mentioned private conversations I'd had with my friend in the bullet points. I thought to myself, "It can't be legal to do that, to publish conversations between two friends. She'll never publish that!"

Well, no! Finally, on June 2 an article was published on the CBC website. Then on the CBC news at six o'clock, there was also a little report talking about me in particular. It implied that I was his naturopath. Because I had studied naturopathy, they sort of made the association that I was his naturopath, which wasn't true. He was my friend and he never paid me for consultations or anything. I've hardly done any consulting since I got my diploma. I wasn't really interested in one-on-one consultations. It was more for myself, to cure a health problem I had.

So there you have it. I was in no way Bernard's naturopath. They also implied that I was selling him natural products to cure his AIDS. But Bernard—whether you agree with him or not—was campaigning to say that HIV didn't give you AIDS. And as far as he was concerned, he didn't have HIV. So it makes no sense to say that he was taking natural products to cure HIV.

And he took natural products like me. We took the same thing for daily maintenance because he was a bit like me. We liked to talk about health, naturopathy, and all that. And we had a mutual friend who sold us these products.

Louis Olivier Fontaine

Okay. Once again, let me interrupt you. So you're talking about an article that was written by Madame Noël in June but on a completely different subject. So why do you think they suddenly decided to write about Amélie Paul and one of her friends? Do you have a hypothesis? Why do you think this article was written?

Amélie Paul

Well, as with all the other so-called "conspiracy theorists," to demolish their public reputation. So that we don't have any credibility. So that people don't come and listen to us in our videos, on our platforms, I imagine. I can only assume that's the case.

Louis Olivier Fontaine

And how did it make you feel? How did the publication of this article and this report affect you?

Amélie Paul

I was definitely devastated. Not only was I ashamed because I said to myself, "I'm a disgrace to my whole family, to those around me. I'm hurting my mother," who was fighting cancer and it was very difficult for her at the time.

[00:20:00]

People boycotted my boyfriend's restaurant. So it caused a lot of problems in my circle of friends. But on a personal level, I had become bad company. I felt like I had leprosy. No one could associate with me. It was like a social death sentence if you like. I was blamed for Bernard Lachance's death and even today—two years later—I still get attacks from people who say, "You've got blood on your hands, you're responsible for his death, you belong in prison." It's never really stopped.

Beyond that, from a professional point of view, a few days after this article appeared, my two YouTube channels were shut down. They were my bread-and-butter. Then my music shows—because in the summer of 2021 shows were starting up again. I had a few shows booked. It was starting up again, I was happy; and then in the end, they were cancelled.

From a naturopathic point of view as well, I was really too scared. I was already hardly doing any consulting. At that point, I didn't want to do any more at all. It wasn't worth doing consultations for the small amount money I was making, and then potentially saying the wrong thing and getting sued by the College of Physicians. Because after Bernard's death—this is just me guessing, maybe they were real people, but I found it very suspicious—I received maybe three requests from people who said to me, "I'm HIV-positive. Could you recommend some natural products to stop my tritherapy?" In any case, I thought it wasn't very subtle. I said to myself, "Well, I quit." And I know that many naturopaths and holistic health practitioners have stopped practising because of this witch-hunt.

Louis Olivier Fontaine

So if we're talking about your professional income: For example, we're talking about YouTube channels that were closed that were a source of income for you. We've talked about the shows. We've talked about the naturopathic practice which has been greatly reduced.

Amélie Paul

Stopped outright.

Louis Olivier Fontaine

Stopped, all right. Did your band continue? How did it go?

Amélie Paul

At some point, I'm not sure—two months after this saga, maybe a little before—I was starting to feel better— Because I had disappeared for maybe a month or two. And then I had a show coming up with my band in Repentigny. I was happy. I said, "Here, I'll post this on my social networks. It will be a nice change of scenery and I can't be attacked for having a show."

Louis Olivier Fontaine

Sorry. When was this, if you remember?

Amélie Paul

I think it was maybe the end of July if I remember correctly. Because the other thing had happened on June 2 and then I left it for a while. It was, I'd say, at the end of July that I announced on social networks that I had this show.

And then there are the little soldiers of the celebrity pages, the haters who are on our backs all the time. I don't know if you want examples: Xavier Camus, *Les Illuminés du Québec*, that whole gang. They called the sponsors of the event where I was going to play to scare them, to tell them, "You're hiring a conspiracy theorist." So they had to issue a statement saying, "Calm down. We don't endorse Amélie Paul's comments. She won't be coming here."

So that show was cancelled, and immediately afterwards there was an article about it in *Le Soleil*. And then I guess these people did some research because I hadn't announced it anywhere, but I had a show in Gaspésie opening for Éric Lapointe, which is all the more ironic. Éric Lapointe is no choirboy! But anyway.

[00:25:00]

So there, same thing: the event organizer received calls to say, well, probably the same thing. I can't say exactly what they said. But at least he called me to say, "Amélie, I'm obliged to cancel you. My board of directors is on my back; they're getting calls." So they cancelled that show. And from then on my musicians said, "Listen, we won't play with you anymore because we're risking our careers." So they booted me out of my own band that I had launched: my own company. And after that, well obviously, the other shows planned for that summer were cancelled.

Louis Olivier Fontaine

And—feel free to answer or not to answer—but I understand that many sources of income had disappeared. How are you doing today?

Amélie Paul

Well, people give me donations. I get a bit of advertising revenue from YouTube because I've opened another channel, but it's not the same as before because now there's a lot of shadow banning. I don't have any proof but that's what I think.

Louis Olivier Fontaine

Can you explain to the Commission what this is?

Amélie Paul

Yes. The shadow ban—on Facebook especially, and on YouTube—is when they allow you to exist, if you will, but they're going to promote you to a lesser degree in people's news feeds. You'll have a little less visibility. So I have a bit of income from YouTube and Facebook, but it's mainly public donations that keep me alive. So when I make videos, I ask for donations and people encourage me. So this shows that you have to stay honest and true when your income depends on the people who listen to you.

Louis Olivier Fontaine

So in the chronology, we talked about Madame Noël's article. We've talked about a number of subjects. Are there any other topics further down the chronology that you'd like to mention to the Commission? And in a few minutes, we'll have to give the floor to the commissioners, who may also have some questions for you.

Amélie Paul

Well, I think that about covers it. There's also the music. I don't have concrete proof of this but at the time, when my manager was trying to track my music on the radio—that is, to contact radio stations to try to get them to play my songs. Let's say, of the two big radio stations in Montreal, one said, "We don't play Amélie Paul." For the other, the musical director had agreed to play my song but then he said, "My hands are tied, I'm not allowed to play it." So you could argue: "But it wasn't a good song." But it had reached number one on iTunes Canada, so it must have been not bad.

So basically, it was thanks to people on social networks because I didn't get any support, obviously, from the radio or the mainstream. Of course, nobody wants to play me and nobody's going to talk about me.

Louis Olivier Fontaine

A question we often ask at the end of interviews is: How could things have been done differently to make things go better for you? I know it was difficult for you, but is there a thought or reflection that comes to mind? How could things have been done better?

Amélie Paul

After the Radio-Canada [CBC] article, I tried to contact journalists. And my manager at that time had also tried to reach someone with his contacts who would allow me to give my version because Bernard and I spoke every day. So I knew the truth. I would have told it and there would have been no problem. But nobody ever wanted to interview me or get my side of the story, whereas Bernard's sisters were in the media with Paul Arcand, with Denis Lévesque, but Bernard hadn't spoken to them for six years, I think. So that's where it was suspicious. I mean, they should have given me the right to speak in my own defence, but I was never able to defend myself in that story.

Louis Olivier Fontaine

If you could have had the right to reply, the right to speak, things would have gone better.

Amélie Paul

Well, I think for all the subjects that we deal with, what is missing is the debate in the media. I think that's the key. Both sides should be represented in the media but they are not. Even if someone comes across as a conspiracy nut and has outlandish theories, let him express himself. He'll discredit himself. Lies discredit themselves.

[00:30:00]

Louis Olivier Fontaine

I think that's a very good conclusion to your testimony, Madame Paul. I'll turn the floor over to the commissioners if they have any questions for you.

Commissioner Massie

Thank you very much, Madame Paul, for your testimony. It's touching and disturbing. In a society, we would expect our artists to explore new avenues, be creative, and lead us away from political correctness, let's say. At least, when I was young, that's what was most popular. Well, I admit I haven't kept up with it all that much lately—I've been a bit out of touch—but I did notice that, whether in music or theater or other forms of artistic expression, it seemed pretty restricted.

In your artistic milieu, are there many other artists like you who have taken this risk or had this naiveté — I don't know, you mentioned naiveté — to express themselves because they found this situation absurd?

Amélie Paul

There are very few. At the very beginning of the pandemic, Lucie Laurier spoke out against it. She talked about it but it wasn't far-fetched—what she was saying was very logical—and then she was cancelled immediately. But she was already established and well known so she had a lot to lose. Perhaps she served as an example because after that, very few people spoke out.

Guillaume Lemay Thivierge just said, "No, I'm not vaccinated yet; I'm waiting for a Quebec vaccine." I think it was Medicago at the time. Just because he wanted to wait, he was also mistreated by the media. He lost a big sponsorship.

So I think that all these people served as an example to say, "Don't say anything if you don't want to lose your career and your gains." And artists who were known for speaking out against the government, for being rebels and non-conformists, suddenly became the ultimate conformists. It was pretty special.

Commissioner Massie

Does this suggest, finally, that the artistic community is somewhat limited in its ability to express itself, given the forms of remuneration to which it has access, which perhaps go through government channels or firms that may somewhat control the messages?

Amélie Paul

Well, given that Quebec is a small market, whether in film or music—I'm not certain of what I'm saying—but I think it also works largely through subsidies, even for artists. So yes, it's difficult. I imagine they'd rather keep quiet and not risk losing everything. Or even if it wasn't subsidies, if you no longer have the support of radio stations and the media, it's the end of your career or, at any rate it's more difficult. It's not the end, but it's a lot harder.

Commissioner Massie

To pick up on Mr. Meloni's opening comment this morning, a lot of people are now saying, "Well, it's over, we're moving on." Do you now feel the freedom to express yourself quite well within different art forms? Is it all over?

Amélie Paul

Absolutely not. In any case, from an artistic point of view, there may be an opening. So the organizers, maybe they have an opening and they don't mind, but it's a risk taken at the corporate level. Event sponsors run the risk of being attacked. Nobody wants to take the risk. So I have the impression that it's the code of silence. Everyone knows that everyone else knows, but we just pretend. That's just my impression.

Commissioner Massie

And how long do you think it will last? Will we get out of it soon?

Amélie Paul

I have no idea. Naively, I hope so. I hope the truth will come out, and we'll get through this, and justice will be done, but I have no idea.

Commissioner Massie

And what do you think it would take for the voice of this artistic community to be liberated? What would have to happen in our society?

[00:35:00]

Amélie Paul

Well, since you can't do anything about the media—which is obviously controlled by the government—all the artists would have to get together. But it's like in any milieu—I'm talking about artists here—but in any milieu, if everyone had stuck together, all these stories would have fallen. But there was a division into two camps. So as long as we're not all together, I think that's the problem.

Commissioner Massie

Now the question is: You mentioned that at the beginning, when you observed what was happening with the launch of measures to counter the pandemic, that from your point of view, it didn't seem credible. And you commented that, perhaps, you were a little naive at the time. After three years, have you come out of the age of innocence?

Amélie Paul

I've had some wonderful evolving gifts in three years. Yes. I'm just as naive but deep down, my naivety at the time was that I didn't think what I was doing was serious. I wasn't aware that it wouldn't go down well with society.

Commissioner Massie

Thank you very much.

[Addressing the other commissioners in English] You have any questions? Okay.

Commissioner Drysdale

[In English] Good afternoon. Given the treatment that you got from the social media and the media, have you got any kind of an opinion as to what the recent amendments to the Broadcasting Act through Bill C-11 might have on your future?

Amélie Paul

My opinion on Bill C [11], the consequences it may have for my future as an artist, right? As a content creator on social networks—I think that's it, if I've understood correctly?

I think it's a law that is a bit disguised, and will eventually have even more control over the content of social networks, and then control "disinformation." So when what you say is not in line with the government—that is, not in line with the accepted narrative—I assume it's disinformation. So is this going to open the door to more censorship? That's what I think, but I could be wrong. I don't think it's necessarily for the good of Canadian content creators. Only my naive side would believe that.

Commissioner Drysdale

[In English] The second part to that question might be with regard to new music in Canada. Most of the new music coming out by emerging artists is funded by the government through grants and assistance, and most of the festivals have government funding in them. Can you comment on what kind of an effect that has on artists like yourself, and making a decision whether or not they're going to have protest music? You know, they used to have protest music when I was about your age, and there isn't any of that anymore.

Amélie Paul

So the question was: Given that most artists are funded by government subsidies, what impact will this have on protesting artists? Is that it, if I understood correctly?

Personally, I have no hope of getting a grant anyway, and I wouldn't want one so it doesn't affect me. There are those who make their way on social networks, and you can still denounce things through music. I think that the best way is in fact to denounce through song lyrics. I think it gets across a lot better.

I was going to say, the mistake I made—it's not a mistake—but to denounce through comedic videos or by speaking directly, saying "It's a fraud," doesn't make it through. But on a canvas or through a song, I think it can still make it through. But the idea is to use new media, social networks, and travel your path by yourself. I also think that is the future. We can't go on forever. I don't think subsidies are going to continue. People are awakening and detaching themselves from this falsehood.

[00:40:00]

Artists who didn't do anything during all that time, who didn't even raise maybe a few questions, who didn't denounce anything? I don't know. I can't say. But personally, I don't want subsidies. I'm not in this. I don't want government help. I'd just like, maybe, to have permission to play on the radio or to do shows. At least to be able to play in places where sponsors are not called and harassed. So that's that. That's my situation. As for the others, they just have to be docile and they'll be fine.

Commissioner Drysdale

Thank you.

Louis Olivier Fontaine

So in closing, Madame Paul, it only remains for me to thank you on behalf of the National Citizens Inquiry for your testimony.

Amélie Paul

Thank you.

Louis Olivier Fontaine

I'm aware that coming to talk about your personal experience can generate a lot of stress and anxiety. So I congratulate you on your courage and integrity.

Amélie Paul

Thank you so much for giving me this opportunity.

[00:41:35]

Final Review and Approval: Erin Thiessen, November 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 8: Stéphane Hamel

Full Day 2 Timestamp: 04:39:16–05:21:27

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Chantale Collard

So good morning. For those just joining us, my name is Chantale Collard. I'm a lawyer and I'm acting as prosecutor for the National Citizens Inquiry here in Quebec City.

So Monsieur Hamel.

Stéphane Hamel

Hello.

Chantale Collard

Hello. First of all, thank you very much for agreeing to testify here at the Inquiry.

Stéphane Hamel

Thank you for participating in this exercise: it is overdue.

Chantale Collard

First, we'll proceed with your identification. So simply state your full name.

Stéphane Hamel

My name is Stéphane Hamel.

Chantale Collard

And I'll swear you in. So do you solemnly declare to tell the truth, only the truth? Say: "I do" or "I swear."

Stéphane Hamel

Yes, I swear.

Chantale Collard

Perfect. So Monsieur Stéphane Hamel, I'll let you introduce yourself. But first, I should mention that you've had major political involvement, including being a founding member of the CAQ [Coalition Avenir Québec].

Stéphane Hamel

Yes.

Chantale Collard

So you've had a close relationship with Monsieur Legault and you can tell us all about that. And so the question today is, first of all, your motivation for coming here to testify before the Commission, your primary motivation. And to begin, I'll let you talk briefly about your occupation because you're not just in politics. You also have another career path: you're in business, you've also studied computer science, and so on. So you can tell us about your professional career.

Stéphane Hamel

Yes, but not anymore because it's extremely difficult for me to find work. Usually, I work in very large companies. And since I had my episode with the CAQ—which became very public—I no longer have any possibility of getting contracts because I'm a contract worker and large companies and the government seem to have flagged me. So it's been very, very difficult for me over the last three years.

As for my career path, at heart, I'm mostly a computer scientist. I got my first computer when I was twelve and I was making my own games at the time. I enjoyed making them, not playing with them. So I also trained in computer science and accounting at UQAM [Université du Québec à Montréal].

At the start of my career, I was Operations Manager for a small company in Montreal, and that's where I practised my accounting. I also had my first attempt in business management and all the processes they can have for companies.

Then I designed a computer system for the major oil companies in Canada. So with my father, I started a company called Les logiciels Infosys. And I was the architect and coder, more or less, of this system which is used for the global management of major companies such as Ultramar, Petro Canada, Shell, and many others with whom I worked in the United States, Canada, and many other countries.

I had a few partners when I bought the company and I was defrauded by my co-shareholders. So I spent about seven years fighting with the justice system and I know the justice system from that experience; in my opinion, it is a disaster for ordinary citizens.

Chantale Collard

Monsieur Hamel, thank you for giving us a brief overview of your background; we will yet see a link. Maybe we can't see the link between IT, politics, the pandemic—what we call a

pandemic. So one of the first questions is, of course, your political involvement. So we're talking within the party, so as not to confuse the two: the government and the party are two different entities.

[00:05:00]

Stéphane Hamel

Yes. I was an activist with the CAQ from the very beginning; there weren't many of us.

Chantale Collard

What year?

Stéphane Hamel

It was the end of 2011–2012.

Chantale Collard

More than 10 years.

Stéphane Hamel

So really at the very beginning of the CAQ. I'm a founding member of the CAQ. I took part in the first campaign in Terrebonne with Monsieur Gaétan Barrette, who was my MNA [Member of the (Quebec) National Assembly] at the time, my candidate in the riding of Terrebonne. It was a campaign full of developments. Monsieur Barrette is very talkative.

From then on, I took part in all the CAQ conventions. I've really cut my teeth in politics; and I'm particularly interested in the philosophy of politics, sociology, and all that.

So I did my homework; and my goal was to enter parliament in Quebec one day because in computer systems or government ways of doing things, they spend billions and billions of dollars on systems and nothing ever works. And even today, there's nothing that works, especially in the healthcare system. And we saw the disasters with the Société de l'assurance automobile du Québec [Quebec Automobile Insurance Company]. They don't seem to be able to come up with a system that works, whereas in all my years in the private sector, I've never seen such disasters. Of course, we're no angels: sometimes there may be things that don't work, but I've never seen projects cancelled and restarted *ad vitam æternam* [to life everlasting].

Chantale Collard

All right. So Monsieur Hamel, we're going to start in 2020. There's a link between the pandemic and politics. I'd like you to tell us about that link and how it affected you.

Stéphane Hamel

Starting in 2018, I participated in two campaigns: in Vimont and in Laval-des-Rapides. And at that time, I became president of the Laval-des-Rapides riding [association] for the CAQ. When the pandemic started, we had a lot of Zoom meetings. And what kept bugging me was

that no one was talking about the elephant in the room. In all the meetings, I tried to bring the subject to the table, and it was as if I had eyes looking at me with—!

Chantale Collard

How did you bring up the subject?

Stéphane Hamel

I brought up the subject as: What's the point of all this? What did the CAQ, as a party, do to try and smooth things over? Because what I was seeing at the time was that the government was doing everything it could to stir up fear. I expect politics to bring people together, not try to scare them in ways that I've never seen. So that's what it was all about at the beginning because at the beginning we hadn't even had any discussions yet.

Chantale Collard

Of what point in time are we speaking?

Stéphane Hamel

Really early in the pandemic.

Chantale Collard

So April 2020, around then?

Stéphane Hamel

Late March, early April 2020 when everyone was like deer on the highway facing the high beams. Everyone was wondering what was going on. My first observation was that nobody was talking about it.

Chantale Collard

Very true. By the way, when you broached the subject, what was their reaction? How did they respond? Were the words clear? Or was it something hinted at when you talked to the party?

[00:10:00]

Stéphane Hamel

People on the party executive, in particular, were saying, "We mustn't ask questions because it's absolutely essential that the whole population be on the same wavelength—because it could be dangerous to have people leading others elsewhere." And I could understand at some level saying, "We've got a pandemic, an extremely dangerous virus, so don't disseminate information that could lead people to disregard health measures."

Chantale Collard

Which, at the time, had just been imposed.

Stéphane Hamel

Which had just been imposed. We remember, at the very beginning it was, “Stay at home.” Then there was a crescendo in the measures. That was at the beginning. As time went on—over the next few months—it became increasingly clear that it was people who were already at the end of their lives who were succumbing to COVID. So I asked these questions at meetings. And we were just speaking among ourselves; we were not in the public eye.

Chantale Collard

Yes, that’s right.

Stéphane Hamel

We were speaking among ourselves, the executives and all that. “Aren’t you being a little too alarmist?” And it wasn’t—

Chantale Collard

That was the wrong question.

Stéphane Hamel

These were not questions to ask, even between us. We were not to talk about such things, absolutely not. It was an *omertà* [a code of silence], already at the start.

Chantale Collard

Already at the start? Within the party itself?

Stéphane Hamel

Within the party itself. So for me—someone interested in politics for a long time—I said: “But that’s not democracy. We should debate this.” On the other hand, I can understand that in the beginning, we wanted to be reassuring. But we weren’t reassuring people, we were leading them into fear—increasingly so!

Chantale Collard

At the time, you were wondering about the narrative that the people were led to believe. So it was very well orchestrated. That’s what I understand.

Stéphane Hamel

It was made clear that we were not to discuss government decisions.

Chantale Collard

So it was very clear.

Stéphane Hamel

That’s right. At the time, I was president of Laval-des-Rapides, and Monsieur Legault came up with an initiative which he called: “Je contribue” [“I contribute”].

Chantale Collard

So “Je contribue” was an initiative to get people to donate their time in CHSLDs, RPAs and so on [long-term care and seniors’ residences].

Stéphane Hamel

Yes. And I wanted to give a bit of my professional background at the outset—precisely to put into context the fact that I’m someone who asks a lot of questions due to my work. It’s part of my job to ask questions in order to find solutions and computerize processes. So you need to ask a lot of questions to understand.

At the time, I was also very naive, as Amélie [Paul] would say: I was naive too. I decided to go and work in a CHSLD to lend a hand.

Chantale Collard

What was your main occupation in the CHSLDs?

Stéphane Hamel

I was a service assistant, so a bit of a jack-of-all-trades. We fed the residents, helped them get dressed, emptied the garbage cans: it was really a little bit of everything.

Chantale Collard

But you were in direct contact with the residents?

Stéphane Hamel

I was in direct contact with the residents, yes.

Chantale Collard

So you were able to observe things?

Stéphane Hamel

Yes.

Chantale Collard

Can you tell us about it?

Stéphane Hamel

Yes, absolutely.

[00:15:00]

At the very start, I was greeted with suspicion by the establishment’s management because I was president of the CAQ, the party in power. But that had nothing to do with it. I could see what was going on; we heard, “the lack of staff.” I was naive enough to say, “I’ll go and help.”

Chantale Collard

You wanted to do a good deed?

Stéphane Hamel

Well, not just a good deed.

Chantale Collard

But for the community?

Stéphane Hamel

It was really: "I can't stand seeing people left to fend for themselves like that!"

Chantale Collard

Absolutely.

Stéphane Hamel

I think there are a lot of people who were there, like me, who worked for "Je contribue" for the same reason. They can't stand to see people die like that.

Chantale Collard

Absolutely.

Stéphane Hamel

All alone in their excrement, not being fed. And I was hired at CHSLD St. Jude in Laval.

Chantale Collard

What exactly did you observe at this CHSLD?

Stéphane Hamel

I have a few anecdotes. There's a big corridor on the first floor. There was a lady who was constantly going out because the lady smoked. So the door was right next to her room. Then there was a gentleman in a room just across from her, and the door was right next to him. He wanted to go outside. The gentleman was no longer capable but he was a gentleman with all his faculties. He was a very fine gentleman. I even had conversations with him. He said, "Can you help me? Let's go for a stroll." On top of this, it was a beautiful spring day in May; the first really beautiful, sunny day of 23-24 degrees. The gentleman said to me, "I can't take it anymore, I want to go outside."

Chantale Collard

Ah yes.

Stéphane Hamel

So I went out of my way. I went to see the management. I said, "The gentleman wants to go out, so I'll go with him." This was just as I'd done with the lady going out for a smoke. "I can take them both out at the same time. It's outside: there's no danger. I'll keep them away from each other." I got an answer like, "Yes, maybe" from a nurse. Then he passed it on to management and suddenly they said, "No, we can't do that." I said, "But the lady can already go out!"

Chantale Collard

So you were denied.

Stéphane Hamel

And it stayed that way. When I arrived at the CHSLD the next morning, they'd put bars on the gentleman's door!

Chantale Collard

No.

Stéphane Hamel

To make sure he didn't go outside. His bedroom door! And I found that absolutely terrible.

Another anecdote which took place a few weeks later: there was a gentleman I had become very attached to. He was Monsieur Labbé. We'd had several conversations and he was in his right mind. Then at a certain point, I heard some confusion: a problem had come up, but I was so busy taking care of a number of residents that I didn't see it. It happened around 7:30 in the morning.

Then I let it go. At half past one or one in the afternoon, I went to see the gentleman. I didn't know what had happened. Since the very beginning of the day, the gentleman had needed his diaper changed. And supposedly he had been aggressive in his request, but I know the gentleman and he's not an aggressive man. And at one o'clock, he exploded. And they'd been putting off changing him since early in the morning because they said he was aggressive.

So I talked about it with some of my colleagues who were there as helpers like me. Because I didn't have the skills or the strength to do that job—to change a diaper—one of the others took it upon himself to do it.

[00:20:00]

So all the employees were supposedly forbidden to do so. At that point, I escalated the situation up to management and told them that the gentleman wanted to lodge a complaint. I was immediately, forcibly thrown out.

Chantale Collard

Okay. So basically, you were there as a helper. You wanted to help this person.

Stéphane Hamel

Yes.

Chantale Collard

The complaint process is something to which we are entitled.

Stéphane Hamel

Yes.

Chantale Collard

Was there a link—and you'll get to this—between your ouster from the CAQ and what happened?

Stéphane Hamel

That was my first strike. I've had three strikes with the CAQ.

Chantale Collard

Okay.

Stéphane Hamel

When it happened, I asked for the phone number or e-mail address of the director of the CISSS [Integrated health and social services centres] in Laval and I wrote a complaint for Monsieur Labbé. I sent the complaint directly to him. And then the director of the CISSS called a minister—I don't remember which—and complained that I had made a complaint for the gentleman.

Chantale Collard

So he complained that you had made a complaint.

Stéphane Hamel

So the minister called the CAQ leadership and I then received calls telling me that I had no right to file a complaint on behalf of this gentleman.

Chantale Collard

Did they elaborate on the reasons? Did they send you a letter? What happened next?

Stéphane Hamel

No. Once again, there was no debate.

Chantale Collard

Okay.

Stéphane Hamel

And I was told that I was going too far and that I wasn't in solidarity with the CAQ and the CAQ executive. And I was told very, very clearly that I had to keep quiet.

Chantale Collard

It was clear.

Stéphane Hamel

It was clear.

Chantale Collard

But it wasn't in writing, if I understand correctly?

Stéphane Hamel

No, it was all verbal. I got a lot of phone calls, and the word went around: "What are you doing?" Well, I was naive. I complained, which is the man's right. The gentleman didn't have the capacity to do that. So there you have it.

Chantale Collard

You say this was your first strike. There have been two. Now we'll come to the second strike.

Stéphane Hamel

The second strike was the CAQ blitz in every riding to call its citizens because everyone was still in shock. So they said, "We'll call citizens to see how they're doing," which seemed fine until the directive was to call them, but also to offer them a free membership card for a year. So I said, "No, I won't do that." But it looks like everyone cooperated and did it. And there were even lists of who performed the best and sold the most membership cards.

Chantale Collard

Sold, given.

Stéphane Hamel

So if it would have been a matter of calling citizens to encourage them, "Are you doing well?" and all that. But to be judged by the number of membership cards we sell! Because that's automatically renewable.

Chantale Collard

Absolutely.

Stéphane Hamel

I thought it was utterly unscrupulous. And I said so.

Chantale Collard
You've made it known.

Stéphane Hamel
That was my second strike. They made it clear that they weren't happy with me.

Chantale Collard
Still verbally?

Stéphane Hamel
Verbally, yes.

Chantale Collard
And your third strike?

Stéphane Hamel
The third strike was, I think, at the beginning of July 2021. A lot of water had passed under the bridge by then.

[00:25:00]

So I stayed pretty quiet and observed. I still attended all the meetings and they never ever had any discussions about the pandemic.

Chantale Collard
A taboo subject.

Stéphane Hamel
An absolutely taboo subject until the government began to set its sights on a health passport.

Chantale Collard
We are now in 2021?

Stéphane Hamel
I think these discussions started in April 2021 and intensified until it became almost official in July 2021.

Chantale Collard
Yes, just before the passport.

Stéphane Hamel

And then I made a post on my Facebook, which is private. On which I have, of course, friends who are in the CAQ—I have MNAs; people on the executive committee; all sorts of people—but above all, it's private.

Chantale Collard

It's not accessible to the general public.

Stéphane Hamel

It's not accessible to the general public. So I wrote a note. I can't remember the wording. I think I gave it to you yesterday.

Chantale Collard

You had the letter. I have the letter.

Stéphane Hamel

No, the Facebook post?

Chantale Collard

No, I don't have it. Tell us about it.

Stéphane Hamel

I'll try to paraphrase. I said, "I don't agree with a health passport, and if the government decides to go ahead with it, I'm going to oppose it." It was as simple as that. So it wasn't public; I didn't make a public statement.

Chantale Collard

But you did say it was clear that you were going to oppose it?

Stéphane Hamel

Yes.

Chantale Collard

It was always private, but it became known.

Stéphane Hamel

Yes, because I had a lot of CAQ people on my Facebook, so they all saw it. So that was the third strike and that was the final one. And then I received a letter from the party executive telling me that I didn't support the constitution of the CAQ party and that I wasn't in solidarity with the party. And that for that reason—I'm paraphrasing because I don't have the letter with me—

Chantale Collard

Yes, I have it right in front of me.

Stéphane Hamel

They immediately removed me from my position as president. And the executive voted for that unanimously.

Chantale Collard

By the way, I can [read] this part for everyone's benefit: "However, we have become aware of the publications and comments you have shared on numerous platforms or social networks—" You mentioned Facebook.

Stéphane Hamel

Only on one.

Chantale Collard

"—and we are of the unanimous opinion that you are openly opposed to the principle of the constitution and are in breach of the requirements described above." So as a result, your mandate came to an end, et cetera, et cetera.

Stéphane Hamel

Well, there's a problem with this letter, which is: I opposed the government—I opposed a government decision—

Chantale Collard

Not a party decision.

Stéphane Hamel

—which is not the party. The party and the government are two separate entities. So I wasn't opposing the constitution of the party. I was opposing a directive or decree from the government, which was then formed mainly by CAQ MNAs. But as soon as the government is formed, the notion of party no longer exists: the MNAs are there to represent the public. So they're no longer members of political parties. In all the training we've had as party members, we've always been told to be extremely careful to distinguish between government functions and partisan party functions.

[00:30:00]

And they ignored that, simply because I was criticizing a government directive.

Chantale Collard

Monsieur Hamel, we're running out of time, but first I'd like to know if you'd like us to submit this letter signed by Céline Tessier?

Stéphane Hamel

Yes. It is already very public.

Chantale Collard

Okay, but to the Inquiry?

Stéphane Hamel

Yes, absolutely [no exhibit number available].

Chantale Collard

So listen, I know we could have talked about—you mentioned it briefly—computers and all that, but time's running out.

What I'd really like to ask you is this: Basically, what conclusions can we draw from this, and what could have been done differently in relation to your own situation?

Stéphane Hamel

Well, what could have been done differently is to have what is supposed to happen in any democracy: debate. But obviously, there was no debate; and debate was shunned like the plague. So the obvious conclusion to draw is that we are no longer in a democracy. There is no more democracy. The basis of democracy is freedom of expression and the exchange of ideas. As a group we will find solutions.

What I saw was that it had now become a single party. Even the opposition was no longer opposed. So what else could we do? Calling people conspiracy theorists— If there are people who don't see a conspiracy, I think they're asleep. At first, I thought, "Okay, they want us all to speak with one voice so that people will respect the health measures." But as we eventually realized that it wasn't such a dangerous virus, that the vaccine didn't work— Because even Dr. Fauci in the United States said—just before I opposed it, and this is one of the reasons why I opposed the health passport—that the viral load of an unvaccinated person and a vaccinated person is the same, which makes a health passport obsolete.

So what could we have done differently? I say: nothing, because it was a conspiracy, a plan. But the word conspiracy has been distorted. It's clear now that there was an agenda. What was the agenda? Speculating, well that's where you may become a conspiracy theorist. But those who don't see a conspiracy or an agenda, well—

Chantale Collard

Based on verifiable data.

Stéphane Hamel

Wow! I also see that there's no media here.

Chantale Collard

Mainstream media, you might say.

Stéphane Hamel

Mainstream. And I haven't heard any media coverage of this Inquiry. And we're in Quebec City, where Radio X is supposedly trash radio. Even they didn't talk about it, even in Quebec City!

Chantale Collard

That's right.

Stéphane Hamel

They didn't mention the Inquiry. So what's going on? Why is everyone so quiet? You asked Amélie [Paul] earlier, "Is it going to stop?" No. It's still going on, as you can see. There's no openness on the part of the media or the government to have a debate. We've had three years of extraordinary drama and all of a sudden, nobody's talking about it anymore. The drama is over, the pandemic is over.

Chantale Collard

As if it was nothing; as if nothing had happened.

Stéphane Hamel

And what they want: "Don't talk about it anymore; move on."

Chantale Collard

No. We're going to keep talking about it.

Stéphane Hamel

That's it. What else can we do? In fact, it is what you are doing.

[00:35:00]

Then perhaps, continue to hammer home the message that, "Hang on, we've got things to say!"

Chantale Collard

To pass on the message. Thank you. I'll leave you with the commissioners, who probably have a few questions.

Commissioner Massie

Thank you, Monsieur Hamel, for your testimony. So if I may summarize the core of your testimony, it's that: In your experience with the CAQ, at the beginning you were relatively motivated to participate, to debate, to propose new ways of doing things so that we could improve. You were mainly motivated to improve, for example, the government's IT processes, which is no small task. But to make any kind of change or reform, there has to be discussion. And here, I think you were disappointed—that's what I understood from your message—that there wasn't that kind of openness.

What is surprising, however, is that a party takes power and then falls into a certain unanimity that is perhaps partly dictated by our British parliamentary system where— Well, it's very tight around the Premier and ministers, and even the MNAs don't seem to have much say, if anything. What's surprising though, is that during the pandemic, there wasn't much of an outcry from the opposition, who seemed to be in the same unanimous frame of mind.

What do you think is at the root of this state of affairs among the political and ruling classes? During this pandemic, I'd say there's been a kind of crystallization of a position that we can't seem to get out of. We're still caught up in it. And so from your political experience, how do you try to understand what's going on right now in the political institutions we have in Quebec?

Stéphane Hamel

It's certainly the same thing that happened among MNAs in caucus that I experienced with the executive. I think the watchword was, "We all have to get the same message across." And I think they did the same thing within the other parties. So the government had to be unified and that's what we saw. They were a single party. There no longer was any difference between the parties. They were all saying the same thing. And the Parti Québécois, the Québec solidaire party, and especially the Liberal Party: their opposition consisted of asking for more than the government was doing. So they weren't criticizing the government's decisions but were notably asking for even more restrictions.

So the MNAs and all the party executives saw what happened to me when I opposed. So I was the naive one of the bunch and I served as an example. Just as they did with Amélie [Paul], it was the same thing. So when the artists saw Amélie being treated like that: zip, they shut up. And the same goes for the political class: when they saw my treatment: zip. So they don't need to make many examples. Just a few, and everyone shuts up.

Commissioner Massie

No, but my question, to try and open up a few other avenues: Do you think there's any possibility of a renewal in this mentality that is closed to debate, at least at the level of the political class?

Stéphane Hamel

What's astonishing today—now that the pandemic is over—is that there's no such openness to debate. So yes, we're going to have to make a complete change in the political culture because it has been like this now for quite a few years.

[00:40:00]

And how can we do that when we don't have a voice in the media because the media censors us? Every time we try to talk about those three years, the media won't let us. So how do we get our message across? Because people are also getting a single message from the media: "Everything's fine now; let's stop talking about it and move on."

So that's a good question. I think we need to have a collective debate on the following: Our democracy no longer exists, how can we reinvigorate it? And that's what Amélie Paul and I have been doing for the past eight months. The aim of the podcast we've started—we stream it every week—is to launch this debate. And all the invitations we've sent out to

people have been turned down outright. Nobody wants to come and talk to us—apart from people who are already well known, and who have already spoken out publicly against all this, and tried to find solutions. But we're still under that *omertà* [culture of silence]. So I'd like us to find some solutions but it seems that the agenda isn't finished yet.

Commissioner Massie

Thank you, sir.

Chantale Collard

Stéphane Hamel, thank you so much for your honesty and authenticity. We often don't know what goes on behind the scenes. As the Premier himself said, "It's not health, it's politics," and I think your testimony bears this out.

So thank you very much, and I hope that all this will be widely disseminated.

Stéphane Hamel

Thank you.

Chantale Collard

Thank you.

[00:42:11]

Final Review and Approval: Erin Thiessen, November 8, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)*

Witness 8: Dr. Barry Breger

Full Day 2 Timestamp: 05:21:54–06:24:56

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

So good afternoon. This is Konstantinos Merakos, with the law firm of Bergman and Associates, and I will proceed with the next testimony. Today we have Monsieur Barry Breger on Zoom. Monsieur Breger, can you hear us?

Dr. Barry Breger

Yes, I can hear you.

Konstantinos Merakos

Excellent. So Monsieur Breger, or Breger [pronounced with a French accent], do you have a preference?

Dr. Barry Breger

My name is Breger, but in French we often say Breger [pronounced with a French accent]. But I answer to anything.

Konstantinos Merakos

Perfect, excellent. Then whether you prefer French or English, it's up to you. We are comfortable with either. We have fabulous translators backing us up, so don't hesitate.

Dr. Barry Breger

Very good.

* This witness spoke predominantly in English; the NCI lawyer spoke in French. French passages were translated to produce a document that reads seamlessly in the English – editor.

Konstantinos Merakos

I will begin by swearing you in. So Monsieur Breger, do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Say yes, I solemnly affirm it or I swear it.

Dr. Barry Breger

I swear it.

Konstantinos Merakos

Excellent. Can you please state your full name?

Dr. Barry Breger

Barry Breger.

Konstantinos Merakos

And where are you located right now?

Dr. Barry Breger

I am currently in Morin Heights, in the Laurentians, north of Montreal.

Konstantinos Merakos

Perfect. And are you alone in the room?

Dr. Barry Breger

I am alone in the room.

Konstantinos Merakos

Perfect. So we're going to spend the next 15 minutes together. I would like to start, Monsieur Breger, by talking a little about you. So based on your CV, can you please briefly tell us about your expertise and who you are?

Dr. Barry Breger

Yes. I am a doctor by training and I have worked as a general practitioner for 42 years. I was born in Montreal, raised in English, but appreciating the French-speaking reality in Quebec. I studied at McGill for science and at the l'Université médicale de Grenoble [Université Grenoble Alpes] for medicine. So I live in both languages: in the office and with individual patients, we speak English and French; and at home too we move from one language to another freely. So I prefer to do most of my testimony in English because it is my mother tongue. I feel more comfortable in English, and when I speak to four commissioners, all four understand English well, whereas I don't think that is the case for French.

So I was born in Montreal, as I said, and studied medicine in France, at the Université médicale de Grenoble, after doing an undergraduate degree at McGill University. My

experience: I spent six years in France, came back to do my family practice in Newfoundland and became a certificant to the College of Family [Physicians of Canada]; I did three years of internship and residency in Newfoundland. Subsequently, I worked doing emergency room shifts in locums, replacing other doctors in remote areas in Newfoundland. In the middle of all that, I worked in the Far North, both in northern Manitoba and in northern Ontario, working in nursing stations as a GP obstetrician. In one of the nursing stations, I was the only doctor; there were three-four hours flights from any help, so I was quite isolated.

[00:05:00]

In between, I did a long trip trekking in Nepal and across Asia for six months, and it was a big part of my learning experience, especially for high-altitude medicine. The trekking to Everest Base Camp, which interested me as well—high-altitude medicine. I've been doing complementary medicine since the beginning. I've been interested in nutritional medicine since I was a teenager actually, and continued in that line as I became a doctor.

I did integrative medicine; it's now called nutritional medicine, integrative medicine, functional medicine, or, according to Linus Pauling, two-time Nobel Prize winner, for chemistry and peace: orthomolecular medicine. "Orthomolecular" means, "ortho" is the right molecule, so it is trying to use the right molecule to address whatever the underlying metabolic problem is that leads to the symptoms of a disease. So if you are dehydrated, the right molecule is water, H₂O. It's not beer, it's not wine, and it's not a fizzy drink: it's water. That's a simple example. So orthomolecular medicine treats all diseases that way: we try to use the right molecule to deal with the problem. Of course, you know, if you need to treat the symptoms or you need an antibiotic for a severe infection, you use modern medicine, but otherwise you try to use natural molecules.

My particular interest over the years had become chronic diseases. Modern medicine is actually quite excellent at treating acute diseases, sometimes miraculously so. For chronic diseases, it's not so good. Modern medicine tends to treat chronic diseases symptomatically, with medication. My goal is to treat the underlying problem, using medication only when absolutely necessary. So I became interested because people who came into my office had these problems; they couldn't find another doctor quite often to take care of it, so I did: chronic fatigue syndrome, fibromyalgia, environmental hypersensitivity, both chemical and electromagnetic. Both of those are not, by the way, recognized in my province of Quebec: electromagnetic hypersensitivity and chemical hypersensitivity.

Hypersensitivity is when people develop various debilitating reactions when they are exposed to whatever they are hypersensitive to. So somebody who is chemically hypersensitive will get really sick when they are exposed to perfume, or aftershave, or the smell of soaps, or renovation products, or all sorts of common things that we smell all the time; the smell of a new car, that will make them very sick. And the ones who are really hypersensitive are isolated and lead lives that are very difficult: oftentimes, they can't go outside easily; they have to be careful; people can't come over wearing anything that can have the smell of soap on them. So it's a fragile population, which is the relevance to what we're talking about. My population that I saw was fragile.

Konstantinos Merakos

Right, thank you.

So I will continue the questions in French to help the translators a little. So you have spent 42 years as a doctor. You have experience in emergency, intensive care, hospital care, in several regions in Quebec.

I'll proceed with my second question, Monsieur Breger. As a doctor in the field, what would you say were your experiences and observations as a doctor both at the beginning and during the pandemic?

[00:10:00]

Dr. Barry Breger

Well, at the beginning, I was in a multidisciplinary office working as part of a team. But at the start of the pandemic, I was in a private office, meaning people had to pay to see me. In Quebec, we have the right to do this. In other provinces, to my knowledge, it is not allowed. So people were motivated. I had patients who were—as we called ourselves—awake. They knew what was happening; they saw exactly what was happening.

What struck me the most were things that the two previous witnesses—and I'm sure there have been others—talked about. It was the fear factor—

Ah, I am switching from French to English, I am not even realizing.

Konstantinos Merakos

No problem. Don't worry. It's not a problem.

Dr. Barry Breger

The fear factor. It seemed that everything that was done at the beginning was to increase the fear of the population.

Konstantinos Merakos

To create an overarching fear. I'm just translating. In other words, to frighten the world.

Dr. Barry Breger

Yes, yes. To create fear; the fear factor.

Konstantinos Merakos

Yes. Please continue.

Dr. Barry Breger

And it seemed to be a goal, and it was done by everybody. I had read a book called *La pandémie du mensonge et de la peur* [The Pandemic of Lies and Fear], by Dr. Jean Stevens. And he actually quoted—I think it was the assistant director of the WHO—that their protocol for pandemics is to “keep calm and keep the population calm” because oftentimes fear could cause more collateral damage than the infection, as we're seeing now actually.

So how did it start? Well, the first thing we were told was that it was a novel virus: it wasn't known; this was the first time; and that we didn't have immune function that was adequate to fight this novel virus. First of all, it wasn't a novel virus. It was a coronavirus that we all know and love, and our immune function— Well, I don't think in any of our lifetimes, anything invented by man will get better than our immune function. Our immune function is superb, but we have to support it. So that was the first— Without being insulting, but to me, they were lies.

And then we learned that in 2009, the definition of a pandemic was subtly changed, without any fanfare. Instead of being many, many deaths and disease, we started to define a pandemic according to cases. So cases were put into the definition. Now disease is pretty easy to define: people are sick, they have symptoms. Death is really easy to define: we can recognize death immediately. Cases are more complicated. So then we have to define what a case is. They decided with this so-called novel virus, which it seems more and more likely was a man-made gain of function virus— Well, I'm pretty sure that's what it was. The virus was produced, according to Luc Montagnier, who observed that there were more than a thousand peptides in the proper order that come from the HIV virus; Luc Montagnier won the Nobel Prize for discovering HIV, so he's a pretty credible witness. When interviewed, he said: "Look, I have nothing to lose. I'm an old man." He was well into his 80s. "I have my Nobel Prize. I have no reason to not speak about what I find." And in his laboratory, he discovered that this novel virus had many peptides: a thousand—those were his words—in the same order they were in HIV and also malaria. So in other words, man had altered the structure.

So we had this new virus, and the pandemic definition was changed. And how do you define cases? Well, you define it with the PCR test. The PCR test was invented by Kary Mullis, who won the Nobel Prize for it. And he repeatedly said before his death, during the pandemic—as Luc Montagnier died during the pandemic—that this was not a diagnostic test. It was not developed to be a diagnostic test and it was not a good diagnostic test. But we started to use it as a diagnostic test to such an extent that even one of my patients coming back from outside the country with a positive antibody test—which is a blood test, which is much more reliable—was told that no, she had to get a PCR test. So she had to get the inferior test in order to prove that she was actually resistant to the virus.

[00:15:00]

In any case, so we were using the PCR test, which should not be a diagnostic test. The PCR test multiplies the amount of viral particles so that they become visible. I use the word visible to cover lab tests detection: probably a better word. During the pandemic, I learned that 25 cycles— Because you have to do cycles to get enough of the expansion of the viral particles in order for us to detect it. Usually it's 25 cycles, approximately. Once you get over 35 to 40 cycles, you get a lot of false positives. And in one estimate that I read, there was as much as 90 plus per cent of false positives. So if you did 35 to 40 cycles, you would get many more cases; and there would be more of an argument to declare a pandemic because cases are now part of the declaration of a pandemic.

To what end? One might ask: To what end is this happening? Also, we were using a modelling from out of Oxford University in England to show how serious this pandemic was. They use models now to predict what will happen. And this was from a serially false modeller; the modelling that this person, this university, had used, had been wrong on multiple occasions. But for some reason, the World Health Organization and all the public health bodies signed on for this model. To what end? So here we had a virus that we could not defend ourselves from; we had modelling that was inaccurate; we had a PCR test that

was not accurate also; and we were able to declare a pandemic by this simplified version of a pandemic. So suddenly, it was a big pandemic and tens of millions, if not hundreds of millions, of people would die according to the models.

Along comes the next step. Now, this caused a lot of fear in everybody. And that fear was on the news, on the mainstream media, in social media, repeatedly: how we should be afraid. At the beginning, when we didn't know what was going on, fair enough: we had to be safe. But then we started seeing and people started reporting and the fear factor continued.

Subsequently, or at about the same time, there was a lot of censorship going on and suppression of information. I'm part of a whole network of people, an informal army of people that share information. I'm now part of more formal organizations that share information, but at the time, it was informal. So somebody would come across a video or a blog from Professor Didier Raoult in France—who was the foremost infectious disease person at the time—or other epidemiologists or immunologists or virologists. And we started seeing what was going on and we shared information. Well, we knew that within 24 to 72 hours, it would be removed from the internet, with oftentimes a warning—that Amélie Paul talked about—that said we were going against community standards, whatever that means. I don't know who decided what the community standards were and who enforced. It was called misinformation or disinformation.

Eventually, the people that were spreading the word—renowned doctors and scientists and professors and all sorts of people who I knew before who were credible—were called the Dirty [sic] [Disinformation] Dozen. So that was a nice little catchy phrase: “Don't believe anything the Dirty Dozen says.” For me, the Dirty Dozen were the people to listen to. So we were all waiting for the vaccine because we were told that our own immunity would not be adequate, and we needed the vaccine that would protect us. It was going to be safe; it was going to be effective; and it was going to end the pandemic like that. And it was being developed at “warp speed” according to President Trump. A little Trekkie Star Trek term, another Dirty Dozen Star Trek catchy phrase, so we know that it's coming along fast.

[00:20:00]

And then the vaccine came along: the so-called vaccine. Of course it's not a vaccine, it's gene therapy. It's an experimental technology that had never been used for what it was being used. It had failed all the animal tests; the tests that the companies did were being kept secret. We didn't know what was in the product. At least one of the companies declared that they would keep it secret for 55 years. Now if it was so wonderful and it was so miraculous, why keep it secret? Anybody who starts keeping secrets, I get very suspicious.

Eventually, they had to release the data—and I'm sure there were other people who testified who are much more confident at interpreting the data than I am—that showed that it was not miraculous. We learned that the vaccine was neither safe nor effective; it did not prevent carriage; it did not prevent transmission. It was so safe and effective that after the first two doses, we had to have a third, then we had to have a fourth, then we had to have a fifth, and I think they're up to the sixth dose now. So effective that we need six doses. And we still don't know what's inside of it. On top of it all, in order to release the vaccine in the limited time with the inadequate testing, it had to be given emergency use authorization by the FDA, and everybody followed suit. To get emergency use authorization, one of the criteria is that there's no safe and effective treatment.

Which brings me to the most important point of this particular part of my testimony. There are many safe and effective treatments. There are many protocols that work—and worked

for COVID—that we found out early on. Paul Marik, Pierre Kory, and the [Front Line COVID-19] Critical Care Alliance were publishing them. These are renowned American doctors, published doctors. Paul Marik is probably the top intensive care doctor in the world, and his team. Kory went in front of the Senate Committee and begged them. He said, “The evidence is overwhelming that ivermectin works. Please recognize it as a treatment.” He literally was begging. And it was publicized; I saw it on the internet. Ignored. Not only was it ignored, but anybody who put forth an alternative treatment suffered the same fate as the two previous witnesses. That is, they were shamed, they lost whatever they could lose. So they lose their licence, they lose their hospital privileges, they lose their professorship, they lost their *gagne-pain* [livelihood], their way of making money. And this went on and on and on.

Eventually, it was also greatly encouraged—I wrote down “pushed”—for pregnant women and children; and there were no adequate studies at all for pregnant women. You’ve got to realize that for pregnant women the fetuses are particularly sensitive, especially during the first trimester. There was one study that I tried to find—and I could find it if the inquest requires—that was done on pregnant women and found a 17 per cent miscarriage rate in those who were vaccinated. And that’s bad enough. However, what was not said in the conclusion, when you look at the data, was that of the women who were in the first trimester—the first three months when the fetus is developing into a human being and all the organs are developing—those women had an 80 per cent miscarriage rate. In other words, of the 17 per cent that all the women had of miscarriages, the first trimester represented the great majority. And you’d think that in a proper society—a free and democratic society—they would tell women this; this is their babies. But no, they left it out of even the publication: you had to go searching for it. And then subsequently, we found out that— We now know that it’s dangerous. Children: they were in no danger from the virus; no child died from the virus. And if they did, they were dying from cancer or some other terrible disease; they weren’t dying from the virus. They had very, very mild symptoms.

[00:25:00]

We learned that in Quebec, 70 per cent to 75 per cent of those who died from the virus in the first wave were in CHSLD, which are the long-term care centres for the elderly and infirm in Quebec. The average age of those who died was over 80 years old, somewhere around 85 years old, and they had at least two comorbidities. Comorbidities are two other diseases: diabetes, hypertension, cancer, renal failure, whatever. So these were not healthy people that were dying. We also learned that of those who were dying, in one study, they checked their vitamin D status and the vitamin D levels were really low: alarmingly low. Yet we weren’t told; the word wasn’t given out that everybody should be on a supplement of vitamin D. There were those who treated with vitamin C—IV and orally— successfully, adding zinc, quercetin, and a whole bunch of other things. There were many, many protocols but all those protocols were suppressed. Towards what end? Is it a coincidence that emergency use authorization could not be declared if there was a viable treatment?

That’s it for this section.

Konstantinos Merakos

So thank you Dr. Breger. The translators have informed me that they have to play with several buttons to do the translation. So for the next question— I understand that your mother tongue is English, but would you be comfortable trying to do it in French for the sake of the translators?

Dr. Barry Breger

Do I speak to the translators or do I speak to the commissioners and the population?

Konstantinos Merakos

To everyone, myself as well. But I want you to be comfortable. I understand that the information is important to you but I want you to tell me what makes you comfortable. If you want to stay in English because there are medical terms, I will communicate with the translators and they will do a “one-way” translation.

Dr. Barry Breger

Yes, but when it is broadcast across Canada, to the United States, will there be subtitles? Will there be? You see, what I want is for people—as many people as possible and especially the commissioners—to understand exactly what I mean. I know exactly what I mean. I can easily say it in French but I’m not here to please the translators; I’m here to disseminate information to the general population.

Konstantinos Merakos

Yes, it’s whatever you want; I want you to be comfortable.

Dr. Barry Breger

English.

Konstantinos Merakos

Okay, no problem. It’s just a request that they made to me because I know that they are doing a very, very strong and very, very good job. So I want you to be comfortable because we appreciate your efforts and your information.

Dr. Barry Breger,

Oh, I appreciate them; I’m not mocking them. No, no, I’m very respectful.

Konstantinos Merakos

Perfect, absolutely. So I will continue with my question. The third section relates to your experience in your office. So here I would like you—while respecting your professional secrecy, client confidentiality—to tell us about stories that you have personally dealt with or experienced in the medical field as a doctor, especially during the pandemic. Can you tell us a little about this?

Dr. Barry Breger

Okay, I’m going to speak in generalities. Of course, I’m going to respect people’s confidentiality—that goes without saying of course—but thank you for reminding everybody that that’s what I am doing.

This brings me— What I didn’t discuss was the masks and the mandates. Because people were forced to wear masks when they went out in public. This was apparently for public

health reasons but there were no studies that showed that masks would help prevent transmission of respiratory infections among a healthy population. None. It was quite the opposite. And as time went on, there were other studies that came out; and there were meta-analyses done recently by the Cochrane collaborative, a very well-respected group. Their conclusion was that there is little or no benefit. But we knew that before.

[00:30:00]

Actually, they had even done studies in masking surgeons and unmasking surgeons. And there was no increase in infection in the patients that were operated on by unmasked surgeons. And plus, the masks were not adequate: the holes in the masks were 100 times greater than the size of a virus for the regular paper masks that we were using. People touched their masks; people adjusted their masks. The masks, in my view and my reading, were virtually useless. But people had to wear masks. Now I dealt with a vulnerable population, so I was having patients coming to me saying: "I can't breathe when I have the mask on" and "I started to get pimples all over and then my eyes water." "My daughter put on her mask and two minutes later her eyes started to water." There are chemicals in the masks, there are microplastics in the paper masks; and plus, they don't work. So I would have to issue mask exemptions, which were generally respected actually.

However, you had to be very brave to use a mask exemption to go out without a mask. I personally put on my mask whenever I went anywhere when I was being observed because I didn't want to get into a confrontation. You know, there is some person loading the shelves, working in a store, telling me that I had to wear my mask. Am I going to get into a discussion with them and start to say, "I'm a doctor and I read the studies"? No. I just wanted to be able to buy my stuff and get out of there. But some people couldn't wear their mask: it was really difficult for them. So I issued mask exemptions. Theoretically we did not have to show, in Quebec, the mask exemption; all we had to do was say that we had a mask exemption. But people were talking about how difficult it was to go shopping, to circulate in public without a mask just because of the social separation, of the disapprobation that they had. People frowning, metaphorically, at them or criticizing them or aggressing them.

The other thing was the vaccines of course: the so-called vaccines. Of course we knew the vaccines were experimental and that they had nothing to do with a regular vaccine; the mechanism of action is completely different. We were told that the material would stay in the arm like a regular vaccine and, in fact, when it was examined in the animal model, it was in every tissue that they examined. The messenger RNA got into every tissue in the body that was examined. So it hijacked our own cells to produce the spike protein, which was the toxin—which actually is a toxin. So our own cells were hijacked to produce the toxin. The logic being that our immune system would recognize this toxin, produce antibodies to attack the toxins that our own cells were producing. And where would that end? What was going to happen? Were our own cells going to stop producing it? I never quite understood the logic behind it but we were told by the experts that this was perfect despite the fact that the animal models failed terribly.

In one study all the animals died after getting a messenger RNA vaccine and in other studies they just failed. And of course in the human trials that were eventually released because of freedom of information, it didn't do very well either. So people were forced to take the vaccine. I say forced, well, they weren't forced: they could stay home. Of course they'd lose their job; they'd lose their business; they'd lose their status. So they were forced; they were coerced, which went against the Nuremberg Code. The Nuremberg Code, I think it's the first paragraph—I haven't read the Nuremberg Code but I know this about it—it said that we could not force anybody to undergo an experimental therapy without

free and informed consent. Of course this was a reaction to the Nazis and Dr. Mengele, and every country in the world signed onto the Nuremberg Code. And yet we were now forcing people—coercing people, without free and informed consent—to take an experimental vaccine. Because it was “safe and effective,” we were told.

Konstantinos Merakos

Yes. So I know that, for example in Canada and Quebec, we have Charters of Rights and Freedoms. Because you have just broached the subject of human rights, can you—in your experience, whether in the hospital or in your office—talk a little, give examples of these violations that you have observed in terms of human rights here in Quebec?

Dr. Barry Breger

Yes. In Quebec and everywhere, doctors are supposed to get free and informed consent for any treatment. “Free” means that the person is giving their consent without any force, without any coercion. So they do it freely, not because we’re going to shoot their family members if they don’t follow along or put them in prison; or lose their jobs. It has to be free. “Informed” means they get all the information, otherwise it’s not informed. And I’m sure the inquest has heard countless testimonies of where we were not being informed. There was censorship going on: whenever any information came out that was not following the mainstream narrative, it was censored. So there was no informed consent.

It went against our Constitution, it went against the Quebec Constitution, it went against the American Constitution, and people went along with it. It was absolutely mind-boggling! And the reason they went along with it was because it was “for their own good.” So children were vaccinated by parents because it was a safe and effective vaccine: as young as 12 months. And they were going to protect their grandparents because those kids: if they got sick, they would be asymptomatic because they didn’t get sick very much from COVID; and then they would pass it on to their grandparents, who were fragile; and the kid would be responsible for the death of his grandma or grandpa.

That doesn’t sound informed to me. That was also the myth of asymptomatic transmission, which I haven’t mentioned as well. It was the other thing to put fear. Even if you didn’t have symptoms, you were going to potentially pass on the virus to somebody else. Well, that means we’re all walking time bombs; we’re all a danger to everybody else. I suppose it could happen, you know it does happen, but it’s relatively rare, very rare, just like it is all the time. So yes, I think that *en français, on dit que les droits constitutionnels ont été bafoués* [in French, we say that the constitutional rights were violated].

And on top of it all, our own Collège des Médecins [College of Physicians] told us doctors that it was an ethical obligation to take the jab—to be injected with this experimental vaccine—in order to protect our patients. So we were being unethical if we didn’t take the jab. As a matter of fact, healthcare practitioners would not be able to work if they weren’t jabbed. The deadline was October 15th: we had to all be injected. I was not going to do it; there was no way that I was going to put my life in danger because the Collège des médecins said it was my ethical obligation. They sort of made it up. I mean, there’s no ethical obligation to be treated with an experimental vaccine. I mean, it goes against the Nuremberg Code! So there’s certainly no ethical obligation. And if that’s what’s in the Code of Ethics then they better change the Code of Ethics.

[00:40:00]

In any case, I decided I was going to just stop working for the time that it took for all this to blow over. So what I had to do was cancel three months of appointments. These are people who are waiting to see me: people I'm following; people who are waiting for follow-ups; people who are having their yearly exam, et cetera, et cetera. So I just had to cancel everything. A lot of work for the staff to cancel three months of appointments, to renew all the medications—because who knew how long it was going to take? And for somebody who was making an appointment to get a medication that they needed and their appointment was in two months and I might be off work for a year or two years: I had to write a prescription. So we had to go through all the charts and renew all the medications.

Come along to October 15th, I can't remember whether it was 2021 or 2022—I'm not very good with dates—we were then told: "We're getting a two-week extension; we have another two weeks to vaccinate ourselves." So we get back to the patients, tell them, "Listen, I'm working for two weeks. We can fill up the schedule. I could work extra days, but I'm going to be stopping on November 1st." I remember it was October 15th and November 1st, probably 2021. And then—we'd already cancelled everything. I think 24 hours before November 1st, we were told that, no, that was cancelled. We could continue working even if we were not jabbed. However, there were restrictions: we had to put a plastic barrier between us and the patients; we had to stay six feet apart; and we had to wear masks. All of which were useless in a viral infection. You know there are billions of viruses in the room; they're all over the place. And there was no information given about how to do—except for doctors like me, who gave our patients information.

Now we couldn't get ivermectin. As a matter of fact, I was told that the Order of Pharmacists in Quebec forbade pharmacists from serving ivermectin to patients who had a proper prescription unless that patient said it was for parasites. And it was dissed, everybody was criticized: "It's a horse parasite medication!" No, it's an anti-COVID medication as well. But we couldn't get it. It was impossible to get: stocks were low, they wouldn't release it. So the safe and effective treatment, which did exist, was not released. Hydroxychloroquine: there must have been over a billion doses given over time. It's sold over the counter in all of Africa, India, Indonesia. But it's no good. And even though Dr. Didier Raoult in France showed in the statistics in his hospital that his patients were doing a lot better than the rest of France and than the rest of the Western world, we were told not to give hydroxychloroquine as well. And of course, in Quebec, it's not allowed to give IV vitamin C. Because that is not done in Quebec—that's the reason that we're not allowed to give IV vitamin C. It's given in Ontario, for example, in Alberta, in BC, and in most states in the United States—certainly, many states in the United States. For the last 30, 40 years. It's very safe and very effective for all infectious diseases. But in Quebec, it's not done.

Konstantinos Merakos

So Dr. Breger, I apologize for interrupting you but time is running out. I would like to ask you two questions and after that, we will move on to the conclusion. The first: In your experience, and with your patients, have you understood that—or have people testified to you that—they were forced either indirectly or directly to proceed with this medical procedure?

Dr. Barry Breger

Absolutely, people were forced. There were many ways to force people. First, people were socially isolated because there was so much fear, everyone was afraid that people—

I had a patient who lived in the countryside with her husband, who was vaccinated. There was no way she was going to take the injection. There was a neighbour who called this woman's house after a snowstorm to ask her husband to come help her free her car from the snow. So she said, "Okay I'll tell him and I'll come and help too." She said, "No, no, no, no. You're not coming. You are not vaccinated." So she couldn't even meet other people outside. It was not a question of masking; it was that she wasn't vaccinated. She shouldn't be around anyone. That was the level of fear.

People were losing their jobs even if they worked remotely. I had a patient who worked for the federal government, on Zoom, with her colleagues and with the public, and she was going to lose her job if she didn't get vaccinated.

[00:45:00]

Konstantinos Merakos

Yes. Excellent.

Dr. Barry Breger

Wait. There's just one more thing if I'm not losing track.

Konstantinos Merakos

Yes, go ahead. No problem.

Dr. Barry Breger

No, it will come back to me; I've lost track.

Konstantinos Merakos

Okay, but my second question is related to that because you're talking about employees. So essentially, it's clear that for work there are requirements: for people in the construction field, you need a helmet, you need a coat, et cetera. For your part, can you confirm that this medical product—that is vaccination—was a permanent medical procedure that could not be reversed once it had been carried out? In other words, once it's done, it's not like a coat that, once the job is completed, you can take off and come back home without having gone through this medical procedure.

Dr. Barry Breger

Okay, so you're asking if it's irreversible.

Konstantinos Merakos

Exactly.

Dr. Barry Breger

It is irreversible or it's not irreversible: Who knows? It's experimental. It's experimental. We are guinea pigs, we are rats; they're experimenting on us. We don't know, it's never been studied. So is it irreversible? I certainly hope not. So far it is. People are still getting

sick; there's an excess of deaths around the world. That's measurable. And people can't get it out of their body. But that's probably formally true. But I believe that the default of the body is to heal. So I think that virtually anything is reversible, in my mind, with my type of approach. However, we really don't know.

Konstantinos Merakos

Okay. You confirm that because of the permanence of the medical procedure, in your opinion, there should have been a little more transparency regarding all the questions and all the subjects that you spoke to today?

Dr. Barry Breger

Oh absolutely. People need information and we were hiding the information. It wasn't as if the information wasn't there: we were hiding it. The company wanted to keep its secrets for 55 years; the mainstream media were not talking about it. I've lost complete faith in mainstream media so for the last three years I've not watched television news, I've not bought newspapers. Over the last three weeks, with the National Citizens Inquiry, I've started buying newspapers—the *Journal de Montréal*, a local Quebec “journal” that is read all across the province, the most sold newspaper in the province; and also the *National Post* which I can get in my village—and no mention of the National Citizens Inquiry. It's omertà, just like the previous witness mentioned.

Konstantinos Merakos

So Dr. Breger, thank you. Can you conclude everything for us in one sentence and after that I will pass you on to the commissioners for their questions? In one sentence please, or in two.

Dr. Barry Breger

Okay, I'll do my best.

Konstantinos Merakos

Please go ahead.

Dr. Barry Breger

For me, COVID was the great reveal. So in fact, COVID has brought front and centre the fact that we are not living in a free democracy. Our information is being censored; the information is being suppressed. The people who try to get out there and have a discussion and talk, and put forward another narrative, are being punished. And we are seeing the corruption that exists. We have to start asking ourselves why different levels—whether it be public health, international, national and provincial public health, politicians, the mainstream media—why they are doing what they're doing. There is a reason. It is organized.

Konstantinos Merakos

Excellent. Thank you very much. So now we'll go to the commissioners for their questions. Go ahead.

[00:50:00]

Commissioner Drysdale

Good afternoon doctor. Thank you for your testimony. You know, when we've been going across the country, I keep hearing time and time again about a principle in medicine that's supposed to be sacrosanct, and that is informed consent. How could the public give informed consent for a vaccine which they don't know is experimental, which they've been told it's safe and effective? And they haven't been told that it wasn't tested on pregnant women; it wasn't tested on children; it wasn't all kinds of things. How can you achieve informed consent as a medical practitioner if you're not providing information?

Dr. Barry Breger

Well, it's an interesting question. The answer simply is: you can't, it's impossible. The mystery is how doctors bought into this. Now there is a series of videos on the Children's Health Defense [website], five one-hour videos directed by Vera Sharav, who is a Holocaust survivor. She makes the argument that it's the Nazi playbook from the '30s. Now, this might sound extreme; watch the videos, you'll see it's the same thing. It's being done for our own good. So people do things, they obey because it's for the good, the greater good. And the people who are telling us that are supposedly respected and credible people. But no, there was no way that there could be informed consent. There was no information so it couldn't be informed consent.

And we went against the Hippocratic Oath— which I hadn't mentioned as well. The Hippocratic Oath, which could be summarized, for me, in two major— It's a bit more complicated but these are the two biggest things. Above all, first, do no harm. And number two, the patient comes first. So public health doesn't come first. Our medical boards, which have way too much power, they're now telling doctors how to— It felt to me as if, metaphorically, these institutions have come and sat down between me and my patient and are now directing me. Me—with my 40 years of experience, my curiosity, always reading stuff—they're now telling me; these nebulous figures are now telling me what's the best thing to do. When in fact, that is a sacred place between doctor and patient. It's so sacred that it has to be kept secret. So no, they couldn't get informed consent, impossible.

Commissioner Drysdale

Well, I want to stick to informed consent just a little while. We had a witness—he or she was a doctor, I think a professor and policy analyst—and they said that even if the medical practitioner informs the patient of what the risks are, if the medical practitioner is aware of a third party influencing that decision then they're obligated not to provide the procedure. In other words, if they know there's coercion or they know there's some kind of blackmail that's forcing the patient to do this then that's not informed consent either. Is that concept also familiar to you, sir?

Dr. Barry Breger

In other words, if that person has been threatened by whomever that if they don't do this treatment— No, that's not free. It's free and informed consent; that's not free. It's the "free" part that they're going against there.

Commissioner Drysdale

The other thing that you said in your testimony, you talked about fear. And you said that in the beginning, it seemed that they were creating fear in the population. And we also had testimony from a lady—I believe it was in Red Deer or in Saskatoon. And I thought this was incredible and that maybe you want to comment on this: this lady told the story about how her mother, I think she did it in secret, went to the corner drug store to get the vaccine. And she stood in a long line to get her vaccine, and she sat down and she got the vaccine, and she dropped dead on the spot. And not a single soul in the line moved; they just stood there. Is that something you've seen before? Is that something that might be out of fear? Is there any comment you can make on that?

[00:55:00]

Dr. Barry Breger

Mattias Desmet, a psychologist, talked about this notion of mass hypnosis. We've been [under] some sort of mass hypnosis. You probably have not seen it but there are videos that show the number of sports figures, on the field, who have dropped dead; people giving lectures who have dropped dead; there's "sudden death" pilots who have dropped dead. There is one Canadian doctor, I don't know if he testified, but he has documented 150, or whatever, Canadian doctors who died post-vaccine.

Now the argument is that we don't know it's from the vaccine. So this is a very important point; it's interesting that you bring this up.

We have been as doctors discouraged from reporting—generally speaking, with any vaccine—what we think is a vaccine side effect, whether it be death or disease, but especially in this case, death. So what we should be doing—and what it was initially designed for, the reporting systems—is that we should be reporting any suspicion and we should be encouraged to report any suspicion.

So if this woman dropped dead within ten minutes of receiving the vaccine, it should be reported. Now if she's the only woman out of 1,000,000 that dropped dead immediately after the vaccine, well statistically, probably not due to the vaccine or she had a particular reaction to the vaccine and other people don't have to fear it. But if there are 20 others, and maybe there's 500 who dropped dead within a week, and another 2,000 who dropped dead within two months, then you statistically look at it and say, "Well, the statistics are such that you can calculate there's a 90 per cent chance it's because of the vaccine." But if you discourage from the get-go people from reporting side effects, people from reporting death, then we'll never find out. And then we say, "Well, there's no reports." And that's been what's going on for decades and decades and decades.

And of course the great reveal: COVID. It so happens they overplayed their hand. And sooner or later—what's the expression?—they'll come home to roost because now we're seeing people dropping dead. So no, I've not heard of anybody dropping dead immediately. I've had reports. They're second-hand reports because of course very few of my patients were vaccinated: second-hand reports that they know of somebody. This woman that I was telling you about, one of her neighbours just dropped dead post-vaccine within weeks of the vaccine; and she was perfectly healthy. And of course, the sports figures that dropped dead: well, they were perfectly healthy, people on the soccer field dropping dead.

Commissioner Drysdale

Thank you, sir.

Commissioner Kaikkonen

Thank you, Dr. Breger, for your testimony. I'd like to just go back to censorship for a minute. Disinformation has been described as one of the most pressing and harmful forms of malicious behaviors online. And by their silence, the legacy media has condoned the government narrative. And sadly, this one-mind perspective is not just confined to Canada but it has encroached in all the other countries around the world.

So what recommendations would you make going forward that would encourage free discourse and dissenting voices within the public space? Or more pointedly, what can hardworking Canadians do in their circle of friends to reverse this trend?

Dr. Barry Breger

Woah. That second part of the question is really hard because people are— The hardest person to convince is an ignorant person who thinks they know. So once you're convinced you know, once you're convinced that you know the truth, very hard to change minds. You know, I've not succeeded in my family yet. Not my immediate family: my immediate family understood.

But what we could do? I think the first thing we could do is allow information to flow. We're all thinking human beings. Who has the right to say: "This is misinformation or disinformation—"? Nobody has that right. There are hate laws so if you say: "The Holocaust doesn't exist," that's taken care of by criminal law. If you say: "You should go around and kill everybody who's under five foot eight," there are rules [against] inciting criminality. But in terms of misinformation and disinformation, that was just, you know— That's a Donald Trump presidency: it was sort of made up.

[01:00:00]

So now everybody's taking advantage of it. Then anything you say that doesn't follow the narrative— This is *1984* you know, the book *1984*. This is group speak: you can't think differently; you can't speak differently; you can't have another opinion. Well, read Mattias Desmet, how that happens; it happens when people— I mean, it's way beyond what I have to say but this is something that has been planned for a long time. Doctor David Fleming, I think that's his name [sic] [Dr. David Martin]: he's an expert on patent law. He goes through the patent history that led up to this. The trial runs with H1N1 with declaring a pandemic. I mean, this has been planned for a long time. Judy Mikovits has written two books; one is called *The Plandemic*.

So this is long, long— Somebody was playing the long game. So what we have to do is we have to have our constitutional rights respected. And anybody who was complicit, any politician who was complicit in not allowing freedom of information— Robert F. Kennedy said that the first and most important part of all our freedoms is freedom of information; it's the First Amendment in the States. So if we don't have freedom of information, there's no way anybody is going to change their minds. So I guess the first job to do is go after mainstream media and find out why the heck the journalists are not being journalists. We know why of course: they're being bought. They're being bought. In the States they depend on ads. I saw one video where we saw CNN news, MSNBC news, CBS news, all sponsored by

Pfizer. So you know, that's where you have to follow the money. Age-old truth: follow the money.

Commissioner Kaikonnen

Thank you very much.

Dr. Barry Breger

I don't know if that helps.

Konstantinos Merakos

So Dr. Breger, the National Citizens Inquiry thanks you wholeheartedly for your testimony. We thank you sincerely for your testimony.

Dr. Barry Breger

You're very welcome. And I thank you all, the commissioners, and all of you who have volunteered to help with this Commission. All your hard work—and I'm very pleased to be part of it. I thank you for listening to me.

Konstantinos Merakos

Thank you.

Dr. Barry Breger

Goodbye.

[01:02:53]

Final Review and Approval: Erin Thiessen, November 2, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 9: Évelyne Therrien

Full Day 2 Timestamp: 06:40:54–07:07:30

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Chantale Collard

Hello. Chantale Collard, lawyer and prosecutor at the National Citizens Inquiry. I see you on the screen, but I'm going to look towards the camera. So we have Madame Évelyne Therrien. Hello, Madame Therrien.

Évelyne Therrien

Hello, Madame Collard.

Chantale Collard

Can you hear me well?

Évelyne Therrien

Yes, I hear you well. Do you hear me?

Chantale Collard

Yes, very well, Évelyne Therrien.

Évelyne Therrien

Do you see me well or am I cut off anywhere?

Chantale Collard

No, I see you very well and I think the audience can see you very well too.

Évelyne Therrien

Okay, good.

Chantale Collard

So first of all, we will proceed with your identification. Can you state your first and last names?

Évelyne Therrien

Évelyne Therrien.

Chantale Collard

We're going to take the oath, the solemn declaration. Do you solemnly declare that you are going to tell the truth, the whole truth, nothing but the truth? Say, "I affirm it."

Évelyne Therrien

I affirm it.

Chantale Collard

So Évelyne Therrien, first of all, thank you on behalf of the Commission for coming to testify. I know these are not things that are easy to say but by sharing them, other people will surely recognize themselves in your testimony and will feel less alone. So thank you, Évelyne Therrien.

First of all, can you tell us about your occupation? What are you doing right now?

Évelyne Therrien

As of now, I've been on long-term disability for six years. In March 2020, I was on disability and living in my dad's house. My mother was in intermediate residence because of her Alzheimer's. So that's both my current situation and my situation as it was in 2020.

Chantale Collard

So if I understand correctly, Madame Therrien, you were already on disability. And at that time, did you have a job? And for whom did you work at the time of your disability?

Évelyne Therrien

Before my disability?

Chantale Collard

Yes, we could say around 2020, I imagine that you were on disability from an employer? You worked before? Who was your employer?

Évelyne Therrien

It is TD Bank. And the TD Bank insurer that pays me the disability pension is Manulife.

Chantale Collard

All right. Can you tell us your primary motivation for coming to testify here, at the Citizens Inquiry?

Évelyne Therrien

I would like people who are searching to have access to information about what has really happened since 2020 and the real consequences of what governments have done, so that when people search for it the information is available.

Chantale Collard

Regarding this information, we will talk about your experience. We'll go in chronological order. You are vaccinated. How many doses of COVID vaccine do you have?

Évelyne Therrien

Two doses.

Chantale Collard

You have two doses. Can you tell us about your first injection? What state were you in? And were you open to that first dose? Tell us about the context of the first injection.

Évelyne Therrien

All right. I would like to say one thing first because it is important to me.

Chantale Collard

Yes, go ahead.

[00:05:00]

Évelyne Therrien

I found that in 2019, I was more spiritually and religiously empty. I felt that there was something wrong, that I was vulnerable to falling into fear, panic, manipulation in 2020. So I took the first dose voluntarily on May 4, 2021.

Chantale Collard

Okay.

Évelyne Therrien

For a very long time, I also had a very fragile immune system. So that played into my initial decision too. I had experienced a lot of infections, bronchitis, pneumonia.

Chantale Collard

What we call comorbidities, if you will. You had other previous problems.

Évelyne Therrien

Yes, that's it. The stroke was caused by celiac disease; and if it's not treated for a long time, if it's undiagnosed, well, it causes a great deal of damage to the immune system.

Chantale Collard

All right. There is a question. Before your first injection, at the time when you had said, "Okay, I'm going to do it," were you afraid of the virus?

Évelyne Therrien

I would say that at the beginning of 2020, I was scared. But by 2021, I wasn't as scared anymore. It was more blindness, overconfidence in the government. Because in 2021, little by little, I had started to do my own research. I hadn't done any research in 2020 but I started doing my own research in 2021.

Chantale Collard

When you say you did your own research, did you do your research before or after your first injection?

Évelyne Therrien

A little before my first injection.

Chantale Collard

A little before. You still went to get injected.

Évelyne Therrien

Yes. I hadn't done much research. It was little by little.

Chantale Collard

All right. But not enough to—

Évelyne Therrien

I was less fit and less healthy at that time. I didn't have much time to research either.

Chantale Collard

Did you have any side effects after your first injection?

Évelyne Therrien

No, I did not have any side effects.

Chantale Collard

Okay. And after that, you went on with your daily life. And you had your second injection. Can you tell us about your second injection? How did it go, what state were you in?

Évelyne Therrien

Well, I continued my research between the first and the second injection and I changed my mind. I didn't want to take the second injection anymore. I took it anyway out of desperation because I knew what my dad's reaction was going to be and how he was going to treat me if I didn't take it. Well, I suspected that it was going to be terrible and that probably I was going to be forced to move [out of my house].

Chantale Collard

At that time, were you living with your father, Madame Therrien?

Évelyne Therrien

Yes.

Chantale Collard

All right. So you didn't want to take it because you had learned some information, but you went to take it anyway. What was your main reason?

Évelyne Therrien

There are no good reasons. I think I could have fought it. I think it would have been very, very painful. It would have taken me a long time to move out of the house because I'm slow; I was slower then, I was in worse shape.

Chantale Collard

Can we say that you took it out of social pressure and not because, well, "I am immunosuppressed," or—

Évelyne Therrien

At that point, no. By the second injection, I was no longer worried about the virus or my health— Well, up to a point, but I understood that the injection was not a solution, but the opposite.

Chantale Collard

Okay, but you went anyway. On what date did you receive the second injection?

Évelyne Therrien

July 1, 2021.

Chantale Collard

So as of July 2021, you had received two doses. Following this second dose, did you have any side effects?

Évelyne Therrien

Yes. For three weeks following the first day of the injection, it was: diarrhea, a lot of muscle pain, headaches, very great fatigue, and a lot of sweating, chills, hot/cold.

[00:10:00]

I couldn't sleep much and I couldn't do all my daily activities and my father had to take over the cooking more during that period. I couldn't do my daily chores.

Chantale Collard

How long after the injection did these effects begin?

Évelyne Therrien

It started on the first day.

Chantale Collard

The first day.

Évelyne Therrien

Yes. Then it seemed to calm down; it was better. Then, perhaps one or two weeks later, I experienced an esophagitis—in any case, the doctor calls it esophagitis. It is pain in the throat and the top of the digestive system, which makes it difficult to eat and swallow. So after a few days of that, I went to consult my doctor.

Chantale Collard

Your family doctor?

Évelyne Therrien

It wasn't my family doctor but it was my family doctor's clinic. They gave me antacids for two months and I can't remember if they gave me an antibiotic or not. Anyway, I took the antacids for two months and after that I was able to stop them and never took them again.

Chantale Collard

What I am hearing is that you started having side effects the day after [the injection]; they continued; you went to the medical clinic. Did you ask the attending physician to report these side effects?

Évelyne Therrien

I only did six months later, in the winter of 2022. Because initially, in the summer of 2021, I was convinced that no doctor was going to give credence to it. I knew the context; and also, I have had a long and difficult medical journey. I know doctors. In my twenties and early thirties, it was very, very difficult. So I didn't expect any doctor to take me seriously. And I saw the context of the television news too: even at places like Radio-Canada [the CBC], it was announced that the second dose had more side or unpleasant effects. So I pretty much

thought that nobody cared about me or nobody would care about me. Six months later, I decided it was my duty to try. My family doctor reacted exactly as I expected.

Chantale Collard

What was her reaction?

Évelyne Therrien

That was in the winter of 2022; it was January 2022, I believe. She told me that it was not the doctor but the patient who had to fill out the form. So I looked for the form on the internet. I don't believe it was the correct form because it was just a form for general drug side effects. So I posted this to the Government of Canada, the CAEFISS [Canadian Adverse Event Following Immunization Surveillance System], I think it's called.

She also told me—because I had asked her for an exemption for the third dose—to go and take the third dose and that she had had no unpleasant effects aside from the first day. Then she also told me that there were several other patients of hers who had come to her asking for exemptions—because things had happened to family members due to the injections—but that, no, she wouldn't give an exemption and she couldn't give an exemption.

Chantale Collard

Basically, you wanted an exemption for the third dose.

Évelyne Therrien

Yes.

Chantale Collard

Now, what will also be important to know is— You spoke of your father.

[00:15:00]

At that time, you were at your father's house: between the second [dose] and your request for a waiver of the third dose. What happened? Explain that to us.

Évelyne Therrien

In December 2021, they started pushing the third dose really hard in TV media. I refused to take it. It caused huge conflicts. My father was extremely angry; he called me every name in the book. And he was really extremely angry on a daily basis, and extremely insulting and unpleasant. In December 2021, I considered moving out. But I changed my mind in the end because I saw that it was submitting to the government's strategy of divide and conquer, in order to cause the most possible destruction. But then, in January and February—

Chantale Collard

That was in January 2022.

Évelyne Therrien

Yes, that's it: January–February 2022. I started taking all sorts of actions and made a credit card donation to the Freedom Convoy because I wasn't able to get to the demonstrations. I can't drive such long distances since the stroke.

Chantale Collard

When you donated to the Freedom Convoy, you were still at your father's house?

Évelyne Therrien

Yes. When he found out, he was very angry and he told me to leave his house.

Chantale Collard

He kicked you out.

Évelyne Therrien

Yes, that's it, he kicked me out. So as I am slow because of the stroke, it took me four months in total to move. So I moved in July 2022. It was four months between when he told me to leave and when I was able to move. During that period, there were times when he was rather explosive, when he was quite hateful. I was relieved to finally move.

Chantale Collard

Has your relationship with your father ended since you moved, or have you reconnected?

Évelyne Therrien

It is at the bare minimum. I go to see my mother once a week in a CHSLD and, since he goes to see her every day, of course I see him when I go to see my mother. Apart from that, it is very rare to see him and I've decided that I will never invite him to my house again. In any case, at the very beginning, I had invited him once or twice and I really thought he was too—I don't know what adjective to use. But his personality didn't change with the onset of COVID, he was already like that and it got worse over the years. It causes a lot of problems in general, even outside of the COVID situation, and it continues to this day. I still had conflicts by telephone with him: twice in the winter of 2023. So I will distance myself even more, I will withdraw as mandatory and as executor because I will not be able to work with him—or with my brother. My brother is really similar to my father. Less aggressive but it doesn't work at all, so I'm going to distance myself more.

[00:20:00]

Chantale Collard

Madame Therrien, I see that time is running out. But there is an important message: If your father is listening—currently, your testimony is being broadcast across Canada, around the world—what would you say to him?

Évelyne Therrien

I don't think I would have anything to say to him because I've tried everything and I know he doesn't believe in doing research on the internet.

Chantale Collard

If you spoke to him directly? Talk to him directly.

Évelyne Therrien

[Long silence.]

Chantale Collard

It's not easy.

Évelyne Therrien

What I would say would be really nasty and they would sound like insults even though they are true. I would tell him that I find him cowardly for not even being able to care enough about the side effects of my second dose to realize that there is something wrong; that the reality does not match what the government says; that what happened to me is not what the government says and what the government does. So I find him cowardly, and I find him insensitive, and I find him cruel.

Chantale Collard

Madame Therrien, you talk about yourself, you feel hurt.

Évelyne Therrien

Yes, certainly.

Chantale Collard

You feel rejected.

Évelyne Therrien

However, he didn't behave that way only with me. I found that, during COVID in general, his behaviour has been abominable.

Chantale Collard

It has affected you immensely, that's what I can see from your testimony. It takes a lot of courage to speak here at the Commission today. And as a final word, do you feel that there is a lesson to be learned and whether things could have been done differently?

Évelyne Therrien

One must not sacrifice one's freedom and integrity for an illusion of security.

Chantale Collard

Very good final words: "You should not sacrifice your freedom for an illusion of security."
We will remember these words, Évelyne Therrien. Thank you.

There may be questions from the commissioners, so stay online.

Commissioner Massie

Hello, Madame Therrien. Thank you for your testimony.

Évelyne Therrien

Hello. Thank you.

Commissioner Massie

My question is— I understand that it is a very tense situation, which is caused by your incapacity; you are something of a prisoner of your disability, which makes you less able to go out of your immediate family circle. Do you have people around you who can support you in this difficult tense situation, finding yourself perhaps without the support that you could have had from your father?

Évelyne Therrien

Since my move, I have been involved in support groups and in volunteering. So it allowed me to create some new links and new contacts. I'm in the Solaris groups. I volunteered for Réinfo COVID Québec. And then, what else was there? The Universal Exchange Garden. It allowed me to make a few new connections. I also have an unvaccinated sister who lives in Coaticook. She is very far away but it is at least moral support to know that she is aware. She also has a lot of difficulties.

[00:25:00]

She also has health issues. She has a job but is struggling. She's not someone I can see on a daily basis, but she supported me a lot in the process with my father before my move—cheered me up, encouraged me. I also have a friend who is one of the few friends I have kept over the years. She too was very understanding. She did not want to be vaccinated and she got vaccinated under the threat of losing her job from her employer. She helped me through it all too, and I still see her. My abilities continue to improve over time. This allows me to see more people a little more frequently than before. That helps me too. I managed to see a lot more people in the winter of 2023 than in the fall of 2022. In that respect, it continues to improve. It's not as bad as it could have been or could be.

Commissioner Massie

Thank you very much.

Chantale Collard

Thank you very much, Évelyne Therrien. I know that this testimony was not easy. You have a lot of courage. That's also freedom: it's having courage. Rest assured that your testimony will have echoes, hopefully, throughout the world. Thank you so much.

Évelyne Therrien

It was a pleasure. Thank you very much for the work you do. Thank you.

[00:26:36]

Final Review and Approval: Erin Thiessen, November 8, 2023.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 10: Dr. Sabine Hazan

Full Day 2 Timestamp: 07:08:08–07:50:45

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Louis Olivier Fontaine

Hello everyone. My name is Louis Olivier Fontaine. I'm a lawyer, and today I'm acting as prosecutor for the National Citizens Inquiry Commission, which is currently being held in Quebec City. So this afternoon, we're honoured to have with us Dr. Sabine Hazan, who joins us from California. So Madame Hazan, can you hear me?

Dr. Sabine Hazan

Yes. Yes, can you hear me?

Louis Olivier Fontaine

Yes, very well. Thank you.

Dr. Sabine Hazan

Okay, great.

Louis Olivier Fontaine

So to begin, just as a formality, I'm going to ask you, Dr. Hazan, to state your first and last name please.

Dr. Sabine Hazan

Sabine Hazan.

Louis Olivier Fontaine

Very well. Now I'm going to ask you to take an oath, so another small formality. So if you don't mind, I'm going to ask you to solemnly swear that you are going to tell the truth, the whole truth, and nothing but the truth. Say: "I do."

Dr. Sabine Hazan

I do.

Louis Olivier Fontaine

Good. Now Dr. Hazan, I'm going to make a brief presentation of your professional profile. So you'll let me know if everything is in order—and I apologize in advance if I leave out any details of your very comprehensive CV. So Dr. Hazan, you're a medical doctor specializing in gastroenterology. You're also an expert on the intestinal microbiome. You are president and founder of ProgenaBiome, a genetic sequencing research laboratory.

Dr. Sabine Hazan

Yes.

Louis Olivier Fontaine

You've been conducting clinical trials for pharmaceutical companies for around three decades. And you've also authored several scientific publications, notably in connection with COVID. Is all this true, Dr. Hazan?

Dr. Sabine Hazan

Yes, that's right. That is correct.

Louis Olivier Fontaine

Are there any other qualifications you'd like to add to your CV?

Dr. Sabine Hazan

I have numerous qualifications, but that's fine. It's enough I think.

Louis Olivier Fontaine

All right. So during the short briefing we had today in preparation for your testimony, you mentioned a subject that was important to you. And if I understood correctly, it was about the publication mechanism of scientific research and the difficulties you encounter in publishing these studies.

So if it's all right with you, we could start with that subject. And after that, if you have any other important subjects you'd like to cover— Obviously, you understand that in fact the subject is, let's say, the consequences and management of the COVID-19 crisis in Canada, but also world-wide. So that's it.

If you have any other topics you'd like to raise afterwards, we have about 45 minutes, including any questions our commissioners may have for you. So about 30 minutes to allow time for questions from the commissioners.

Dr. Sabine Hazan

I have to finish in 30 minutes because, unfortunately, I have a very important meeting afterwards. So you only have me for 30 minutes.

Louis Olivier Fontaine

Very well. Then we'll reserve a few minutes for questions from the commissioners, so maybe 20 to 25 minutes for you. Thank you. I'll leave you to elaborate.

Dr. Sabine Hazan

As I've done clinical trials for pharmaceutical companies, I'm in the field so I know how to do things: how to register patients for trials; how to write a protocol; how to submit a protocol to the FDA [Food and Drug Administration]. So when COVID started, I had already developed a laboratory that was starting to look at the microbiome.

In clinical terms, the microbiome means— What do Parkinson's patients have in their microbiome? And the microbiome is the bacteria and viruses in the intestines. So if someone has Parkinson's [disease], which microbes do they have in their intestines that could perhaps predict Parkinson's, and would it be possible to treat Parkinson's by changing the bacteria through knowledge of this bacteria? The same goes for Alzheimer's disease, autism, and so on. So I had written protocols to actually look at the microbiome in the clinical field.

[00:05:00]

When COVID came along, I was obviously involved in clinical trials. I've helped many pharmaceutical companies over the years bring products to market, and I've helped in the research of these pharmaceutical products. That's been my role as a doctor, especially in the last 15 to 16 years. I've done a lot of research for pharmaceutical companies.

There was a bacterium called *Clostridium difficile*, and I brought a lot of patients into this research because in the end, when the patient wasn't doing well, when the medication wasn't working, I did stool transplants. And it was really the stool transplants that somewhat awakened me, that led me to discover the world of the microbiome. And not only me, but a lot of doctors that were doing stool transplants.

When you see a patient with no hair, with the disease alopecia areata, as the cases of Dr. Colleen Kelly at Brown University where suddenly they grew hair, the hair grew— I apologize for my French, it's been a long time since I spoke French; I speak mostly in English— So when you see that the hair has grown, there's something going on when all you've done is manipulate the stool, wouldn't you agree?

And when you see a person with Alzheimer's—in fact I had a case of someone with Alzheimer's. I gave him his wife's stool. He had *C. diff*, and suddenly, he remembered his wife's name. Well.

As a doctor, as a scientist, as a researcher, this raises questions: What's going on in the microbiome? So when COVID arrived, the first thing I did was start looking at and reviewing all the documents, and I came across Dr. Raoult's document. Before COVID arrived in the U.S., I looked at his research—and I speak French—so I looked and said, "Well, this is research that's done quite well." Hydroxychloroquine makes sense; it changes the pH of the cell, so maybe when the virus gets into the cell, it gets killed by the change in pH. Azithromycin, the same thing: maybe the virus gets killed by the azithromycin. And zinc blocked the virus. So the idea started to grow in my head that maybe this was a pathway.

What really impressed me about Dr. Raoult was the fact that he treated all his patients and he survived. He never had COVID, he never went to hospital, yet he was exposed to all his patients. You could see the rows of patients who had COVID!

And you have to remember that in March 2020, we didn't yet have COVID. COVID had just started, so we were getting ready. I started writing the protocols to submit to the FDA in America. So we hadn't really received any patients. It's when the first patients arrived that the doctors became quite frightened. What really gave us the courage as doctors to treat was the efforts of the doctors before us. In Italy, as well as the doctors in France who started to treat, and they themselves survived.

So when I saw Dr. Raoult—who is quite an elderly gentleman—I said, "Well, if he survived, I'll be okay. I'm a little bit younger than him. So fine, I can go and start treating patients." Because when COVID arrived in America, there were no masks; we were hindered. We were told, "Well, you have to go to work and treat the patients." Fear took over. So if there hadn't been doctors before us who had treated patients and were okay, maybe we wouldn't have had the courage to go and see all those patients.

So the first thing I thought was: I'm sure that COVID must appear in the stool. So I said, "Well, I have a microbiome lab that analyzes the microbiome. I have a lab that does studies for pharmaceutical companies. I'm going to write a protocol, and I'm going to add Dr. Raoult's protocol. And I'll add vitamin C and vitamin D" because I'd seen that vitamin C and vitamin D increases the good bacteria in the microbiome.

So that was my protocol. I wrote it, I gave it to the FDA. The FDA said, "Dr. Hazan, you can start treating patients, there's no need for a clinical trial." That was the first letter we received. The second letter, the next day, we get a letter: "I'm sorry, you have to do a full phase I study."

[00:10:00]

So I said, "Well, since these drugs are safe, can we go from phase I to phase II?" Well, the FDA let us go to phase II. We started doing clinical trials. So then there were patients in the phase II clinical trials who were taking hydroxychloroquine, azithromycin, zinc, vitamin C, and vitamin D.

At the same time, I collected stool samples. And at the same time, I analyzed the stools of the first COVID patients I had in California. And I said to my scientist, "We have to find COVID. I'm sure that COVID is in the stool." And that's when we discovered that in the patients who actually had COVID, 100 per cent of the those who had the positive PCR nasal test were found to have the whole genome of the virus in their stool. And we didn't find one copy; we found thousands of copies of the virus in the stools. So when I saw that, I said, "What's the virus doing to the microbiome?"

And when I treated patients, I noticed that there were patients in the same family. And in fact, we published the document about finding COVID in the stool. And I was in communication with the government, the National Institute of Standards, and I told them from the start, “You have to look at the stools because I’m sure you’re going to discover COVID.” And then the government started looking in the sewers to see if the virus had mutated, et cetera.

While they were looking in the sewers, I was looking at the patients. I would say, “Well, what’s the mutation? Is this mutation serious? Is the patient seriously ill?” So I started looking and saying, “Well, some people have COVID in their stools and they’re severely ill. What’s the difference? Does their microbiome protect them or not?”

So what I did was look at the families and I said, “Okay, I’m going to take the families where some have severe COVID and some don’t get COVID. What’s the difference between their stools?” And what I discovered was that some people have a microbiome with bacteria called “bifidobacteria.” These are the bacteria that are in the realm of probiotics, right? We know that probiotics are good for us; it’s a trillion dollar business.

So I said, “Well bifidobacteria must be important because people who are severely affected by COVID don’t have bifidobacteria; and people who are exposed to COVID and haven’t had COVID have a lot of bifidobacteria. So maybe that’s what I should be looking at.”

After that we discovered that vitamin C increases bifidobacteria. And we discovered, in fact, that even ivermectin—which has the same type of secretions [fermentation product] as a bacterium called *Streptomyces*—and with this bacteria being in the same group of bacteria, perhaps it feeds the bifidobacteria while the patients’ oxygen levels are really low. Because one thing I had noticed was: when I was treating patients with hydroxychloroquine or the treatment protocols I was following—because I was blinded, I didn’t know which—there were patients whose oxygen had gone down. So when their oxygen came down, I said: “Well, I’m going to change protocols because I don’t know if they’ve had the hydroxychloroquine. I’m going to give them the ivermectin off-label.”

And that’s when I discovered that when I give them ivermectin while their oxygen is low, two hours later, the oxygen increases. So when I realized that maybe the oxygen was increasing, I said to myself, “Maybe the oxygen is increasing because we’re decreasing the cytokines that are in the lungs with the circulation, and maybe the bifidobacteria are increasing, and taking those cytokines and releasing them into the sewer.”

So that’s how my research got into the microbiome. It was really looking at bifidobacteria.

What we’ve discovered about bifidobacteria is that people with Lyme disease don’t have bifidobacteria. People who have Crohn’s disease and haven’t been treated—they’re naive, it’s their first time having Crohn’s disease—they don’t have bifidobacteria.

[00:15:00]

Even recently, we presented at Digestive Disease Week that people with advanced cancers have no bifidobacteria. Now is it the cancer that has destroyed the bifidobacteria or is it the missing bifidobacteria that causes the cancer? We don’t know; it’s the chicken or the egg. But in the end, when you look at the research, you really have to see all the evidence and look at the research properly.

So bifidobacteria was my domain for looking at the microbiome. And what I discovered was that when we looked at the before and after of patients who had been vaccinated—we had a baseline of microbiomes in the patients, and then we tested one month after vaccination—we found that bifidobacteria levels dropped by 50 per cent in these patients. Not all patients, but it was quite significant. And we continued to monitor four patients and we found that in all four patients, bifidobacteria continued to decline. So we asked ourselves: Is there something in the vaccine that kills bifidobacteria? And maybe if we go down this path of science, wouldn't it be a new opportunity, a new frontier? If we look at bifidobacteria, maybe that's why people who had the vaccine, and developed COVID after the vaccine, actually demolished the bacteria that protected them.

So obviously, it's all a hypothesis. It's my hypothesis; it is science. But that's how I treated everybody and I didn't lose anyone. Nobody that I treated died on my watch, even though they were in my FDA clinical trials. But I monitored them very closely to see if their oxygen went down; and if so, they were off protocol and I treated them off-label, so to speak.

So that's it. In my experience treating patients, I've learned a lot. I learned that a little girl who had been exposed to her parents who had COVID developed Tourette's disease. And we discovered COVID in her stools after six months of Tourette's disease. And when we gave her a little bit of hydroxychloroquine and we gave her ivermectin and vitamin C, her Tourette's symptoms disappeared and she felt better. So there's something there. There's something that I observe in the manipulation of the microbiome. It's evident; it's all research. But we achieved success in that I didn't lose anybody—nobody died from my treatment.

Louis Olivier Fontaine

You say you haven't lost any patients.

Dr. Sabine Hazan

My frustration— I want to say, my frustration is that there was interference in the research. I didn't even want to speak to this committee because nothing is being done! They don't listen to doctors anymore. There is no science anymore! When a hypothesis has been retracted from a journal, there's no more science, okay? We can't even treat patients. We can no longer ask a patient's consent. We can't even tell them, "You have to be careful, there may be problems with this vaccine." No, we can't even tell them that! So where's the science? Where are we with this?

The whole pandemic made me want to retire to Noah's Ark because all I discovered was that there was a lot of corruption. When you see politicians talking about hydroxychloroquine: they have no experience. Or actors talking about ivermectin: they have no experience. They interfered with the research I was doing because when patients came to my clinical trials, they didn't want to go into the clinical trials. So there was interference in the research that was being done.

Louis Olivier Fontaine

All right. I wanted to ask you, Dr. Hazan, how many patients have you treated with these protocols?

Dr. Sabine Hazan

That's difficult. Everyone asks me how many patients. In terms of protocols, I've treated roughly— With hydroxychloroquine, azithromycin—I was blinded—there were about 200 patients. As for prophylaxis, we had about 200 or 300 patients. With the ivermectin, doxycycline, we treated 30 patients. And there were another 1,000 patients that I treated off-label because I wasn't going to let them die. The patients who called me didn't want to enter the FDA protocol. So I said, "Okay, I'll treat them." And then on top of that, I shared my protocol and helped doctors; that's evident. Because we all wanted to help patients.

[00:20:00]

And then the patients saw for themselves. I have complete videos of the patient who couldn't breathe. And then, suddenly, the patient is breathing after we give him the ivermectin: the oxygen was low and the oxygen went up. So something happened, did it not? It's not magic, where suddenly the patient was going to die with an oxygen [saturation level] of 63 [per cent] and then all of a sudden, five days later, he's cured. It's not magic.

Louis Olivier Fontaine

So I am clearly hearing that you have the impression that you have not been heard as a doctor, as a scientist. I'd like to know: You obviously went against what might be called a certain consensus; did this lead to any consequences or reprisals? Could you elaborate on that? For example, how did the media react to your, shall we say, rather unorthodox approach?

Dr. Sabine Hazan

Well, I'm not really in the media. All I've really done in the media are two interviews that went quite viral. There's an interview I did in *The Epoch Times*, and it was on TikTok. And we actually got about 1.4 million views on this TikTok video that wasn't even posted by me; someone else posted it. And then, suddenly, it was completely removed.

I did an interview with a farmer because I discovered that people who work on farms have a pretty superior microbiome. So I made a YouTube video with the farmer. We didn't really talk about medicine or COVID. We just talked about the farm, the fertilizers, the fact that the microbiome is really like the farm, it's like the fertilizers. And this video was retracted. Why? Because in the video, the farmer was married to a woman who was a professor and the woman had had COVID. And he took . . . saliva . . . [inaudible] . . . and he never got COVID. And when we looked at his microbiome and his wife's microbiome, we discovered that he had a microbiome that was quite superior to that of his wife. And that's why he didn't get COVID. In my opinion anyway.

Again, it's science. Science isn't something that— It's not black and white; it's in colour. And there are a lot of interpretations in science, and a lot of bias in science. So it's clearly a vision. If someone else wants to prove something else to me, well, they have to— Science is everything. Prove me right and prove me wrong. That's it.

Louis Olivier Fontaine

And have you experienced any pressure or reprisals among your medical and scientific colleagues? How did it go with your colleagues?

Dr. Sabine Hazan

My colleagues know me. They know that, first of all, it's my money that I spent; it's my savings, okay? I didn't get a grant. So when I did the research to find COVID in the stools, it was my savings. Obviously, at the time, I wanted to develop a lab test to actually help doctors. And we couldn't. We really had a lot of problems developing this test to look at the stools.

Personally, I think that the biggest loss— There were two big losses; there were several big losses. First, the research interference, the interference of politicians, of the media, that destroyed the research. Secondly, we can't publish; it's very difficult to publish. We have a lot of problems with publication. And then thirdly, we had a lot of problems recruiting patients. There was a lot of interference with Facebook, Instagram and at the time, Twitter. When I published something on Twitter before Elon Musk, it was removed.

So a lot of things are removed, a lot of things are retracted. It's like we're following a narrative. And if people don't wake up and see that we're being manipulated— we are being manipulating through our thoughts, we're being manipulated with everything they give us. All the drugs are now all publicized. There's a publication—I should say, an advertisement. You can't turn on the radio without hearing about taking this drug or to taking that drug. There's no longer doctor-patient relationships. It's definitely in the news. There's definitely a direction in medicine that's removing the doctor and directing patients towards the narrative being marketed.

[00:25:00]

And that's what we're seeing. That's what we've seen with COVID and what we'll continue to see in medicine and research. There's no more room for innovation, in my opinion.

Louis Olivier Fontaine

Yes, that's very interesting. Before turning the floor over to the commissioners, who will perhaps have more in-depth questions—we have some commissioners with scientific backgrounds—I'd like to ask you: Is there anything else you'd like to talk about before we turn the floor over to our commissioners?

Dr. Sabine Hazan

I think I've touched on interference. I think I've touched on the fact that, ultimately, there are retractions. In fact, in my view, it's all about interference in medicine and research.

Louis Olivier Fontaine

Thank you very much, Dr. Hazan. I'll turn the floor over to our commissioners, if they have any questions for you.

Commissioner Massie

Good day, Dr. Hazan. Thank you very much for your presentation. I've been following quite a bit of your work. I'm a microbiologist by training and I've really appreciated all the work you've done in the field of microbiota. I had a question for you. You mentioned that, if we have a good microbiome composition, especially with bifidobacteria, we seem to have a much better ability to resist the effects of infection. Have you considered, or are you

currently using, a protocol that would replicate what's been done in the case of fecal transplants with *C. difficile* for the treatment of SARS-CoV-2 infections?

Dr. Sabine Hazan

Yes, that's been my interest. I've written a protocol for long-haulers that I think is going to help, and also for people who have had problems with vaccines. Because, what we discovered with the vaccine problem is that with people who have been vaccinated and have problems, it's as if their microbiome is naked/denuded. They have one phylum—you're a microbiologist, so you know what a phylum is—they have one phylum. How do you survive with a single phylum? How could a phylum of actinobacteria have been completely removed, and then the loss of bacteroides, or the loss of firmicutes?

So that's what I see: I see a lack of microbes. And I think that in medicine, we've always been in a way—I'm always a bit of a rebel because I'm always the kind of person that, if someone tells me to go right, I'll go left, just because that's the way I think as a scientist, don't you agree? A scientist is always someone who doesn't want to follow the given path and will seek a new direction.

The microbiome was a new direction for me because I think what I've seen in 30 years of solely pharmaceutical research is that we haven't cured anything. We've cured nothing! Maybe two diseases. But Crohn's disease isn't cured. Patients have to be given medication every month. Parkinson's disease is not cured. Autism. And Crohn's, Parkinson's, and Alzheimer's are increasing. In 30 years of autism—There was 1 in 2,000 patients with autism in 1982. Now, in 2030, they say there will be 1 child in 16. If we don't stop and look at what's happened, we'll lose medicine; we'll lose science!

What I think is happening is that we're losing our microbes. Now that COVID has opened the door, we're at the point of showing that the problem is a lack of microbes. It wasn't necessarily COVID that was the problem; maybe it was the lack of microbes. And I have a lot of documentation that I need to write up, for that matter. And I have proof for that, which will impress everyone. But the problem is that every time I try to advance my research, I'm stuck fighting, defending something. And I'm used to it. People have always tried to attack me because I go one way and the other. So I'm used to defending myself and going to war with these people. But the problem is that it doesn't help me advance my research.

If I discover something—that there's a lack of bacteria—we have to look at that. And it's evident that, yes, if there's a microbiome that's a super donor, a microbiome that I call the resilient microbiome, then we need to learn about that microbiome, don't we? We can't just say, "Well, let's put everyone in the same box; let's say all humans are the same." We're not the same! And that's that. I survived COVID. How did I survive? Why? What's in my microbiome? How did Dr. Raoult survive?

[00:30:00]

There are people who survived, and there are people who survive COVID. And there are people who survived the vaccine too: who didn't have any problems because it didn't affect them. We have to learn to look at the resilience of these people. We have to learn what this resilience is all about. So we're at the beginning of this science, but I think we need to start looking at the difference between a healthy person and an unhealthy person. And in my opinion, that starts with the microbiome.

Commissioner Massie

Thank you. My next question would be to know: What interaction can the microbiome actually have with the immune system to perhaps provide this resilience or resistance? Not just to COVID, but to many other ailments that basically involve a poorly balanced immune system?

Dr. Sabine Hazan

What we've noticed and what we call an imbalance in the microbiome, gut dysbiosis, is really an imbalance between microbes, correct? So if we look at the microbiome and say, "Well, there's a phylum of good bacteria and a phylum of bad bacteria, yes? And there's an imbalance between the bad and the good; maybe viruses get in because there's an imbalance."

So this is what we call "leaky gut." How does leaky gut happen? Perhaps because there's an imbalance in the microbiome. Maybe the stools themselves—this microbiome of actinobacteria, firmicutes, and all that, very diverse—maybe that's what protects us in the first place, especially when we eat a hamburger that has *E. coli*. Maybe the *E. coli* enters, goes into the colon and suddenly there's a war between the microbes to try to remove it. So the way you get diarrhea and vomiting is really the microbiome working to remove the bad bacteria, in my opinion. And the good bacteria hold out.

But when a person has lost all their good bacteria, it's obvious that they're going to get caught with germs that they can't shake off. Let me put it this way: It's like a city, there's a war going on, there's the enemy on the other side of the fence, and then there are the people on this side. If there's no one to defend the fence, the enemies will get inside. So I believe it's the same thing for the microbiome. The microbiome is really the balance between good bacteria and bad bacteria. According to me, if we alter this balance, the viruses will get in.

So that's the microbiome. That's microbiome-thinking. Except that we've always thought that it's always a single microbe that causes disease. We have strep pneumonia: it causes pneumonia. So we administer an antibiotic and it cures the pneumonia. Clearly, it helps against pneumonia. But now, what does this antibiotic do in the colon? Does this antibiotic kill other bacteria that perhaps help with other things, like digesting milk, digesting B vitamins, helping metabolism, helping immunity?

So we need to start understanding more about the loss of microbes, more than the increase of a microbe. Because it's never a single microbe. In the microbiome, there are trillions and trillions of bacteria and at the end of our lives, when we die, these bacteria take over the colon and decompose us in the soil. So it's clear that it's the bad bacteria that decompose the body. I can see this. Babies are born with a lot of bifidobacteria and elderly people die with no bifidobacteria at all. So maybe the loss of bifidobacteria is doing something, increasing the bad bacteria, and that's what's making people die. We just don't know. We need to start investigating and researching it. So that's it.

Commissioner Massie

Last question: To maintain a healthy microbiota, is a particular diet important? What kind of diet should we try to use? With vitamins and other kinds of fibre—for example, dietary fibre, that nourish the microbiome?

Dr. Sabine Hazan

There are a lot of studies on fibre. One hundred per cent, fibre. The problem with probiotics is that some probiotics aren't real. If you look at the studies, there's a study that showed that 16 of the 17 probiotics that were tested didn't have any bifidobacteria in them. They were actually bacteria, or dead bacteria, or no bacteria.

[00:35:00]

So firstly, there's very little control in the probiotic field, and secondly, if you look at foods like yoghurt— One of the things I did during the pandemic was kill my bifidobacteria as an experiment, just to see. And I discovered that if I drank kefir from California—because I live in Malibu, I bought kefir—I was just drinking kefir to try to increase my bifidobacteria, and in fact, it didn't go up. So when I tested the kefir, I discovered, "Ah, there's no bifidobacteria in this kefir." But it says bifidobacteria on the bottle. So that's what it's all about: doing the research.

You do your research, you think you're on the right track, that you're increasing your microbiome, that you're doing the right things. And then you find out, well, there's no bacteria in this kefir. It's evident that one thing we've proven is vitamin C and vitamin D: we've seen that they increase bifidobacteria. So in my opinion, immunity starts with vitamins.

The fact that people weren't told during the pandemic to make sure they were taking vitamin D was really a crime, in my opinion. Because people were quarantined for a month, two months, three months, and then they were told, "Okay, go outside." But it's obvious that they're deficient in vitamin D because they were in their homes, not exposed to microbes, not exposed to the sun. So there's a lack of vitamin D in these people. So we should have told them right from the start: "You have to take your vitamin D."

So vitamin D increases bifidobacteria, vitamin C increases bifidobacteria. Now, you have to be sure of the quality of these products. Precisely because I was involved in clinical trials and working with patients, when we tested products, I had to make sure that my vitamin D was rigorously made in a clean factory. I even had to know who the manufacturer was. I studied until I found out what the manufacturer was all about: What is their procedure for making vitamins? Even with probiotic companies, I had to investigate with the owner to find out: Did he do the research properly?

That's what research is all about. In the end, you're like a detective; as a scientist you become a detective who examines. So to answer your question: food, yes; if the vitamins are well made and good, yes, that should help; if the food is well made, there's no bacteria in your meat or yoghurt, or the yoghurt has been properly processed, that should help.

But I think the most important thing is to understand that research into the microbiome is really in its infancy. We're trying to understand it all. It's obvious that I did this research quickly because I wanted to see. So I saw the first 20, 30, 40, 50, 60 patients who had severe COVID and I noticed that there were no bifidobacteria. And then I saw the patients who were long-haulers and I saw the patients who had problems with the vaccines. So all this takes time to analyze, to write up. But it gave me a good outlook on the microbiome, the power of the microbiome.

Moreover, why did I see that my role during the "pandemic" was really to be in this research? Because I had a lab that did clinical trials for pharmaceutical companies. And I had a lab that was doing genetic stool analysis and we were starting the research. At the

outset, I had samples from patients before COVID. So it gave me a really good perspective on: What is the microbiome of a healthy child? What's the microbiome of a healthy young teenager? And why did the teenager who got COVID get COVID when he was expected to be like any other healthy person?

So we're at the beginning of this research and we really need to support it. But if we argue as scientists and if we argue as doctors to advance research, to treat our patients, there really is a problem. And I think that the Good Lord, in a way, put me here. Because I think that my whole life, my whole career, has been about arguing, about presenting my point of view.

[00:40:00]

So that's why I'm here today and that's why, even without make-up or anything, I said: "Well, I'm going to show up" because I think what I have to say is more important than what I look like, what's in it for me. I have no interest in this. I want peace, and if I'm told to take a drug, I want the research to be have been done properly. And what I've seen is that the research hasn't been done properly on vaccines. I saw that no microbiome analysis had been done. I saw that no one had done the analyses on the p53 gene to see if this vaccine was a danger to some people. No one has done the analyses. Even the animal research took one week. They gave the vaccine to six monkeys, killed them in a week and then said, "Okay, the vaccine works." But that's not research! Come on! It was necessary for the animal research to be done properly.

Why didn't we do research on animals for an extended time, at the same time as we did the analysis on humans? It was necessary to do all that. So what I saw was research that was poorly done. There was no consent from patients. Patients went to the pharmacy and were vaccinated without knowing whether or not there were risks, without knowing if they were part of a research study. It wasn't even approved for children, and children were already going to the pharmacy. So I believe there was even a certain movement that pushed all these children and pushed the whole world to get vaccinated and to follow like Panurge's sheep. That's it. And now, unfortunately, we're going to start seeing problems, and I hope that scientists and doctors will at least open their eyes to the possibility that there is a problem with this vaccine.

Commissioner Massie

Thank you very much, Dr. Hazan.

Louis Olivier Fontaine

So in closing, Dr. Hazan, it only remains for me, on behalf of the National Citizens Inquiry, to thank you very much for your testimony. You have shed a unique light on a field that is in full development, so your testimony was very much appreciated. Thank you very much and goodbye.

Dr. Sabine Hazan

Thank you. Thank you very much. Good bye.

[00:42:37]

Final Review and Approval: Erin Thiessen, November 12, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 11: Stéphane Blais

Full Day 2 Timestamp: 07:51:36–08:18:20

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Samuel Bachand

Hello, my name is Samuel Bachand. I'm acting as prosecutor for the Inquiry in connection with your testimony, Monsieur Blais. So Monsieur Stéphane Blais, please spell your name in full.

Stéphane Blais

S-T-E-P-H-A-N-E-B-L-A-I-S.

Samuel Bachand

I'll swear you in. Do you swear to tell only the truth to the Inquiry?

Stéphane Blais

I do. I vow to tell the whole truth.

Samuel Bachand

First of all, Monsieur Blais: with your help, I have extracted from the public registers of Canadian jurisprudence on CanLII [Canadian Legal Information Institute] the disciplinary decisions concerning you, which you are about to discuss. I've given you a hard copy of these documents, which are listed jointly as Exhibits QU-3 through QU-3d. Do you have them in front of you?

Stéphane Blais

Yes.

Samuel Bachand

Do you recognize these documents?

Stéphane Blais

I recognize these documents.

Samuel Bachand

Can you tell us what they are?

Stéphane Blais

It's a decision: a disciplinary decision against me, revoking my [chartered accountant] licence for life plus 18 months—because they were afraid I could be reinstated—plus a \$20,000 fine.

Samuel Bachand

Proceed document by document—because there isn't just one decision, is there?

Stéphane Blais

There are so many documents here: "Decision on the respondent's motion to obtain the information necessary to hold an impartial public hearing," as I felt that the committee was biased; then "Decision on guilt," which means expulsion; and then "Decision on sanction," which means that I was guilty. And the penalty was expulsion for life plus eighteen months, plus a \$20,000 fine.

Samuel Bachand

Right. So with that established, you're here to testify about your personal experience with the disciplinary system of the Ordre des comptables [professionnels] agréés [CPA] du Québec [the Quebec CPA Order covering Chartered Professional Accountants], following public statements you had made about COVID governance. Is that correct?

Stéphane Blais

Of course.

Samuel Bachand

Take us to the beginning of all this. Then we'll go chronologically. Then, as you know, if you get lost or if I need clarification, I'll jump in.

Stéphane Blais

Yes, I understood that I wasn't permitted to promote la Fondation pour la défense des droits et libertés du peuple [Foundation for the defence of people's rights and freedoms]; that's what you told me. So here I am: President of the Foundation.

Samuel Bachand

That's not exactly what I told you, but that's okay. It's not about us. Just go ahead.

Stéphane Blais

So what I'm being accused of is having undermined the dignity of the profession of chartered professional accountants—despite the fact, Monsieur Bachand, that in my career and my life, I've never been to a civil, criminal, or disciplinary ethics court. So since this was a health crisis, I'll put it in context for you. I received an email on June 12, 2020: four days after I filed an appeal for judicial review seeking to have Bill 61 declared null and inoperable as well as the decrees that violated our fundamental rights and freedoms guaranteed by the Charter. So to put it in context, four days after filing this appeal for judicial review—which was a bit of a bombshell in legal and political circles, we talked about it—I . . .

Samuel Bachand

So we're saying June 12, 2020?

Stéphane Blais

On June 8, the appeal was filed. On June 12, I received an e-mail from the *syndic* [representative] of the Quebec CPA Order asking me 76 questions, many of which—most of which—related to the content of the appeal for judicial review. So I told him to get lost. I told him that they were a creation of the Quebec government, which was being sued, and that there was no question of them interfering in a public prosecution since they were in a conflict of interest.

Samuel Bachand

Allow me to take you back to the list of 76 questions.

Stéphane Blais

Yes.

Samuel Bachand

Can you tell us a little more about the type of questions that were there, because we don't have the benefit of reading the document here?

Stéphane Blais

Yes, well for example: "Why do you say that what's happening in terms of the health crisis is nothing more than an international coup d'état by a clique of powerful thugs against the peoples of the world?"

Samuel Bachand

That's what you had said, and that's the basis on which they eventually accused you?

[00:05:00]

Stéphane Blais

I've said it before and I stand by it today. And the more that time goes by, the more we are proven right.

Also: “Why do you promote civil disobedience?” Well, my friend, André Pitre, and I met Rocco Galati in Toronto—who’s a constitutional expert by the way—and he explained to us the importance of defying unjust laws. And it was also based on the ideas taught at university, such as those of Henry David Thoreau and Martin Luther King, who is celebrated every third Monday in January.

Samuel Bachand

What other questions were you asked?

Stéphane Blais

Several other questions. Listen, they wanted to know if we were registered with the Registraire des entreprises [REQ –Business Register], who the directors were—the total inquisition.

Samuel Bachand

When you say: “If we were registered with the Registraire des entreprises du Québec,” with the REQ, you say “we.” “We” meaning the Foundation?

Stéphane Blais

The Foundation indeed.

Samuel Bachand

So you were already the head of this organization at the time?

Stéphane Blais

Yes. It was founded on May 7, 2020, and was duly registered.

Samuel Bachand

Okay. Do you remember any other questions you were asked in this list of 76 questions?

Stéphane Blais

No, I don’t remember.

Samuel Bachand

Or any other topics that were brought up?

Stéphane Blais

These were scientific themes. Then during the inquisition that followed, we provided reports from international experts who became the Foundation’s experts. So these were given to the Disciplinary Committee.

Samuel Bachand

Now, as for what you were asked to do in this 76-question letter of inquiry—

Stéphane Blais

I'm sorry?

Samuel Bachand

In the letter from the *syndic* [of the Quebec CPA Order].

Stéphane Blais

Yes.

Samuel Bachand

In the letter of inquiry, sorry— You mentioned scientific aspects that you had raised. Can you tell us which scientific elements were covered at that time? Not what came after; we'll get to that.

Stéphane Blais

Well we were asking questions about excess mortality. We had carried out analyses of what was happening in Sweden—where there were no mandates—versus Quebec: so the mortality rate. We already had statistics. So we brought up statistics; and then we justified the statistics with reports submitted in 2021 by our experts, including Laurent Toubiana, an expert at Inserm [Institut national de la santé et de la recherche médicale] in France, who corroborated our allegations.

Samuel Bachand

Now when you say, "We subsequently filed them," you didn't file them with the disciplinary authorities, did you?

Stéphane Blais

No, of course it was filed in the appeal for judicial review which is currently under deliberation. But it was also submitted to the disciplinary committee to demonstrate and corroborate our positions at the time.

Samuel Bachand

So ultimately it was also filed with the disciplinary tribunal, called the Disciplinary Board or the Disciplinary Committee?

Stéphane Blais

Yes.

Samuel Bachand

Before the ruling on whether or not you were guilty?

Stéphane Blais
Yes.

Samuel Bachand

All right. Now I'll come back to your response: You said you had sent the Order's representative packing.

Stéphane Blais
The *syndic*, yes.

Samuel Bachand

The *syndic*, yes, sorry. Is there anything else about your response you'd like to tell us?

Stéphane Blais

What I told them was that freedom of expression rights were guaranteed by the Charter of Rights and Freedoms. And that if we compare a prior decision—that of René Fortin, CPA, which I texted to you; the guy was banned for four months for watching children being raped on his cell phone—I felt that saying that what was happening with COVID 19 was nothing more than an international coup d'état by a clique of powerful thugs against the peoples of the world was far less offensive to the dignity of the profession than watching children being raped on a cell phone.

Samuel Bachand

Now are you referring to the Fortin decision?

Stéphane Blais
Yes.

Samuel Bachand

Okay. I believe you've taken the trouble to find the reference to this disciplinary decision?

Stéphane Blais

Yes. The decision was November 2019. I texted it to you.

Samuel Bachand

But you're the witness. Can you give me the reference for the benefit of the Inquiry?

Stéphane Blais

Of course. Would you like the decision number?

Samuel Bachand

Absolutely.

Stéphane Blais

My pleasure. So the decision number is 47-1900321. The decision was made on November 11, 2019. The *syndic* was the same one who investigated me: Claude Maurer.

Samuel Bachand

Now, following your reply to the *syndic's* letter, which included many items, what happened?

[00:10:00]

Stéphane Blais

The complaints were subsequently upheld by the Disciplinary Committee. I appeared before the Disciplinary Committee and told them that they were a creation of the Quebec government; and I asked the Chair of the Committee to tell me if she had sworn allegiance to protect the institutions. She refused to do so. I also demanded the immediate withdrawal of the *syndic*, Claude Maurer, because he was restricting my freedom of expression since I had never committed any professional misconduct as an accountant. So he was interfering with an appeal for judicial review, with legal proceedings, and also with my freedom of expression. At the time, I was the leader of a political party called Citoyens au pouvoir du Québec. So it was quite absurd not to be able to criticize the Legault government and then, additionally, to see them interfering in legal proceedings.

Samuel Bachand

You were the leader of a registered party? Provincial?

Stéphane Blais

Yes. Absolutely.

Samuel Bachand

For how long?

Stéphane Blais

I've been leader since January 2018. It is a party that already existed.

Samuel Bachand

What's it called?

Stéphane Blais

Citoyens au pouvoir du Québec.

Samuel Bachand

Very good. Continue your chronology.

Stéphane Blais

So I was brought before the Disciplinary Committee, and I asked the committee chairperson to tell me whether she had sworn allegiance, and she refused to do so. So I simply said that under the International Covenant on Civil and Political Rights, I had the right to be tried before an impartial committee; and I demand to appear before a panel where I would be able to have my say and they would have their say. They refused. So I told them this wasn't Communist China and to go fuck themselves. That sums it up. And after that, I never showed up for any hearings. I let them deliberate and then I got the result we're seeing today. And if I had to do it all over again, I'd do it a hundred times over.

Samuel Bachand

The result we're seeing today is what?

Stéphane Blais

It's a lifetime licence revocation.

Samuel Bachand

And you were the object of a decision *in absentia*.

Stéphane Blais

Yes, absolutely.

Samuel Bachand

Can you tell us about your experience of this process *in absentia*?

Stéphane Blais

Well, you wait for a bailiff to bring you the result of the decision. And after that, you put it in the archives. It's as simple as that. So I have no interest in being part of a professional order—especially accountants who are supposed to understand numbers, analyze the numbers— They were available at the INSPQ [Institut national de santé publique du Québec]: there were several expert reports coming out and yet everyone kept their mouth shut. In fact, I blame the experts in Quebec for not coming to the rescue of Quebecers in that crisis. We had to go abroad to find experts to defend Quebecers. So that says a lot about courage.

Samuel Bachand

Let me take you back to the subject of your testimony. I have reason to believe that in the Disciplinary Committee hearings, you raised constitutional and Charter arguments at the outset. What were they, roughly speaking? What is your understanding of your own arguments?

Stéphane Blais

Yes, it was simply that it infringed on my freedom of expression that is guaranteed by the Charter. And that the "dignity of the profession" was not an argument: it's an undefined

Trojan horse that's a catch-all. When you want to trap someone, you invoke dignity. But what is dignity?

Samuel Bachand

What you're telling me here are arguments that you, or your attorney, brought to the Committee's attention?

Stéphane Blais

That's right. But then I gave up. Because I have bigger fish to fry than a professional order that I no longer want to be part of. So I defended myself on my own and then I gave up. And then I appealed the decision but there were procedural issues and— Well, they weren't the correct procedures. So case closed. My licence was revoked for life plus 18 months.

Samuel Bachand

Let's come back to the decision on guilt before talking about the penalty. Obviously, the commissioners have access to the entire text, but the commissioners have access to a lot of texts. So I'd like you to offer them a summary of this decision and its conclusions. What offence were you charged with exactly? And of what were you found guilty?

Stéphane Blais

Yes, well in fact, it's: an affront to the dignity of the profession and an obstruction to the work of a *syndic*. I can read the conclusion.

[00:15:00]

Consequently, under the first count—Offence to Dignity—the Board: “finds the respondent guilty with regard to the offence based on section 5 of the Code of Ethics of Chartered Professional Accountants and section 59.2 of the Professional Code: “orders the conditional suspension of proceedings with regard to section 59.2 of the Professional Code.” Under the second count—Obstruction of the *Syndic's* Work—it “finds the respondent guilty of the offence based on Section 60 of the Code of Ethics of Chartered Professional Accountants and Section 114 of the Professional Code.”

Samuel Bachand

What conduct was alleged to be obstructive? What had you done that was called obstructive?

Stéphane Blais

Well, I was criticized for not having cooperated in a timely fashion. In fact, the *syndic's* questions were answered some 20 days after I had initially refused to do so—on the recommendation of Monsieur Bertrand, my lawyer at the time. At the committee meeting later, I upset the *syndic* a little by telling him it was a real disgrace to the profession and that he should resign on the spot, and then I gave him 15 minutes to think about resigning. They didn't like that.

Samuel Bachand

Is that why you've been accused—correct me if I'm wrong—of trying to intimidate the *syndic*?

Stéphane Blais

That time, yes, I did intimidate the *syndic*.

Samuel Bachand

All right, then. Now, the sanction decision.

Stéphane Blais

Yes, so it's a lifetime licence revocation plus 18 months. I had trouble understanding—

Samuel Bachand

There's a legal principle behind it.

Stéphane Blais

But, you never know; maybe it'll get reinstated, I don't know. And there's a \$20,000 fine. And a bailiff comes every month or so to bring me my payment notice, which I haven't paid. I don't have any money left; I can't pay it. I won't pay it either.

Samuel Bachand

By way of comparison, in relation to the sanction you've suffered or are subjected to, I think you were speaking earlier about the Fortin affair— Fortin, was it?

Stéphane Blais

Yes.

Samuel Bachand

Right, in which the defendant was sentenced to a suspension of how long?

Stéphane Blais

Four months, for using a cell phone to watch children being raped.

Samuel Bachand

All right. For my part, that concludes your testimony. I'll leave the floor open for any further questions from the commissioners.

Commissioner Massie

Good day, Monsieur Blais.

Stéphane Blais
Hello.

Commissioner Massie

My first question is— Well, I understand from your testimony that your case is still being reviewed. Or is it completely over?

Stéphane Blais
It's over.

Commissioner Massie

And the representations you made concerning the challenge to the law on health measures—is that also settled?

Stéphane Blais

Actually, the judicial review appeals are still alive. We have a judicial review appeal regarding the curfew which is on stand-by; the same goes for the masks. And we have a general appeal covering all measures which is currently under deliberation: it's been four months. So we had the hearing on the government's request to dismiss for theoretical reasons. We had another hearing on March 13 because we found a document that had been hidden from us, by either the lawyers or the government.

Right now, they're still trying to figure out who hid the document from us. It was a directive from the Deputy Minister of Health to the effect that masks were mandatory in the health sector. So as for the argument that it was theoretical, until very recently everyone who went to the hospital had to wear a mask, otherwise they were removed by security guards or police officers. The judge is still deliberating on this point. The three appeals for judicial review are still alive. So there you have it.

Commissioner Massie

Obviously, as it's underway at the moment, we can't—

Stéphane Blais

We won't go into too much detail. I know that Lili Monier is coming to testify and she'll probably talk in a little more detail about the appeal for general judicial review, which is under deliberation.

Commissioner Massie

Are there any cases like this? In Quebec, I don't think there are any others—but in Canada or in other jurisdictions?

Stéphane Blais

I don't know of any appeals for judicial review that cover all of the measures and that are still pending, other than the ones we filed. Other appeals have been filed. For example, the Foundation helped Mr. Rocco Galati via Vaccine Choice Canada but the case was dismissed.

[00:20:00]

So as far as I can tell, only we remain to cover all aspects of the health crisis, both legally and scientifically.

Commissioner Massie

Thank you very much.

Stéphane Blais

It's my pleasure.

Commissioner Massie

Any questions?

Commissioner Kaikkonen

[In English] Thank you for your testimony. I did try to follow as much as I could, so if I missed something, I'm sorry. But you did mention at one point there about the barriers: that the procedures were what held you back as a barrier. Is there something that would help other people as well?

Stéphane Blais

I don't understand— The barrier . . . of what?

Samuel Bachand

The procedural hurdles that have been placed before you.

Stéphane Blais

Ah, the barriers. Okay, sorry. Sorry, okay. I don't understand the sense of your question. Could you repeat please?

Commissioner Kaikkonen

So you'd mentioned that the procedures were one of the barriers. You didn't actually use the word "barriers," but the procedures kind of stopped you because there's so many procedures in going into either a tribunal or the courts.

And I'm just wondering if you have any recommendations?

Stéphane Blais

Well, actually, it always comes to the same point. Okay. So yes, it always comes to the same point: that the narrative for the general public is given by the mainstream media. As long as the mainstream media continues to hammer home the narrative of those who own them, it's going to be very difficult for the people to move forward. So what's really needed is for people to realize that the media are, as Tucker Carlson used to say, the Praetorian Guard of—

Samuel Bachand

With the Commissioner's permission, sorry: I'd just like to refocus the witness and then maybe make sure he answers the question about procedural hurdles, not the question of media.

Stéphane Blais

Okay, well, the court is the court. So we followed the procedures, which are very, very long. If we're talking about my professional order— I hope that the professional orders will regain their power because I'd like to digress here to talk about the Quebec government's interference in the professional orders. This is very important because I forgot to mention that two days after Guy Bertrand's lawsuit was filed, Madame Marie-Josée Corriveau [a lawyer], who was already president of all the disciplinary committees, was made president; and then two days later, there was the *syndic*'s investigation. But you have to understand that from that moment on, there was a witch hunt in Quebec. Daniel Pilon, an accountant, was also disbarred for life. And well, we know what's going on with Gloriane Blais.

Samuel Bachand

So listen, since you mentioned Monsieur Pilon, can you just tell the court a little bit about the accusations against him?

Stéphane Blais

It's the same thing. Once again, it's the fact of being on social networks and speaking out against the government narrative that earned him the same sanction as me. He had his licence revoked for life plus a \$10,000 fine.

Samuel Bachand

Now, to better answer Commissioner Kaikkonen's question, I have a suggestion to make to you: Tell us about the response deadlines imposed on you or given in the *syndic*'s letter asking you 76 questions.

Stéphane Blais

Yes, excellent. On Friday June 12, I received an e-mail at 2 p.m., which I didn't read. At 9 p.m., I opened my e-mails and saw that a second e-mail from the *syndic* had arrived. It was 8 p.m. on a Friday, and he said, "I require answers immediately." So he was in a hurry to get answers. And we knew very well that it had something to do with the lawsuits that had been filed against the Quebec government. So what I said was, "You're interfering, and this is a political request."

Samuel Bachand

Okay, just to make sure that your testimony is extremely clear on the subject: What was the deadline given to you in the letter of the 12th?

Stéphane Blais

It was immediate.

Samuel Bachand

It said immediately? In the letter?

Stéphane Blais

At 2 p.m., he demands an immediate response.

Samuel Bachand

And there are 76 questions.

Stéphane Blais

There are 76 questions. So it was completely ridiculous. I spoke to Monsieur Bertrand. He said, "Well, listen, answer the questions." At the time, I refused to answer the questions. Then, about 20 days later, he convinced me to write to the *syndic* to say that we were going to answer the questions.

[00:25:00]

Samuel Bachand

What happened after you answered?

Stéphane Blais

Well as you know, I replied; they put it in the archives; and following that, I had the Disciplinary Committee which accepted the *syndic's* complaints; and we proceeded.

Samuel Bachand

To be precise, could we say that the Disciplinary Committee was occupied with a complaint from the *syndic*?

Stéphane Blais

Oh yes.

Samuel Bachand

At this stage?

Stéphane Blais

Yes, yes.

Samuel Bachand

Then between the time you first send them packing and the time you responded on the advice of your attorney, what happened during those 20 days?

Stéphane Blais

It depends. Are we talking about the global environment?

Samuel Bachand

No, no. In the disciplinary process?

Stéphane Blais

In the process, I didn't have—

Samuel Bachand

Didn't you get a reminder from the *syndic* or whatever?

Stéphane Blais

No. Not that I can remember. I simply replied with a little “get lost,”— If I recall, it was “go fuck yourself.” So I think he got the message. And Guy Bertrand told me to be gentler and answer the questions, which is what I did later.

Samuel Bachand

Writing is always easier than speaking, isn't it?

Stéphane Blais

Yes, yes. But I'd still like to mention that Marie-Josée Corriveau—lawyer Marie Josée Corriveau—was the subject of a complaint for interference—

Samuel Bachand

Well, listen, I'm going to stop you there. It's off topic. So if the commissioners want even more—

Commissioner Kaikkonen

Thank you.

Stéphane Blais

It's a pleasure, always a pleasure.

Samuel Bachand

On behalf of the Inquiry, I'd like to thank you for your testimony. You are free to go.

Stéphane Blais

Thank you, Samuel. Thank you.

[00:26:44]

Final Review and Approval: Erin Thiessen, November 12, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE

(Translated from the French)

Witness 12: Dr. René Lavigueur

Full Day 2 Timestamp: 08:19:13–09:10:07

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

Good evening. I am Konstantinos Merakos from Bergman & Associates. It's my pleasure to introduce a medical doctor, René Lavigueur, who is with us in person today. Good day, Monsieur Lavigueur. How are you?

Dr. René Lavigueur

Yes, I'm fine. A little nervous.

Konstantinos Merakos

That's normal. You'll be fine. We're here for you. Take your time, I'm not in a hurry and I don't think anyone else here is either. We're here to hear what you have to say. I'm going to start by swearing you in: Do you solemnly affirm or swear to tell the truth, the whole truth, and nothing but the truth? Say "I solemnly affirm" or "I swear."

Dr. René Lavigueur

I affirm.

Konstantinos Merakos

Perfect. Can you spell your full name, please?

Dr. René Lavigueur

René, R-E-N-É, Lavigueur, L-A-V-I-G-U-E-U-R.

Konstantinos Merakos

Thank you. And do you live in Quebec?

Dr. René Lavigueur

Yes.

Konstantinos Merakos

Very good. Thank you. We will start with you simply saying a few words about yourself, your expertise, and your CV. Go ahead.

Dr. René Lavigueur

Well, I've been a practising doctor for over 40 years. I've worked mainly in general practice. Over the last few years, I became interested in philanthropy. I founded a social pediatrics center. I should say, I'm in Gaspésie so I'm in a remote region. And I do general medicine, which involves a lot of office work, a lot of house calls. That's about it.

Konstantinos Merakos

Perfect. And today, are you still practising? Do you have your own office? What do you do for a living?

Dr. René Lavigueur

In fact, I'm part of an FMG—a family medicine group—so I work with several doctors. I should also mention that I have some administrative experience as I was a director of professional services.

Konstantinos Merakos

Okay, that's fine. We're going to proceed with the main topics I have in front of me. The first one is: as a practising physician, you see a lot of things in the field. Can you tell us a little about what you have observed as a family doctor?

Dr. René Lavigueur

Family doctors have certainly been at the heart of it because people consult us, so we really are at the center of the matter. Most people accepted the usual narrative and didn't question us about whether they should be vaccinated. But the few who did ask us, well, that's where we got caught. There is a conflict between our code of ethics . . . Pardon me . . .

Konstantinos Merakos

Take your time. Continue when you're comfortable.

Dr. René Lavigueur

I don't know why this affects me like this, but it does.

Konstantinos Merakos

No, that's okay. Just take your time.

Dr. René Lavigueur

The theme I want to address is the dilemma of a family doctor. On the one hand we have orders from Public Health, on the other we have a code of ethics and the Hippocratic oath. That's our duty to our patients. And the conflict is daily because if we tell our patient the truth about the vaccine in question, then we're in conflict with Public Health. So the doctor has to make a choice: Do I betray my code of ethics—my Hippocratic oath—or do I listen to what Public Health tells me to do? If I listen to my duty as a doctor, I often find myself in conflict with my colleagues. And that's what happened. Because the easiest thing to do is to do what you're told. It's simpler and doesn't lead to conflict.

So in my practice, one thing I do is go to a CHSLD [a nursing home or long-term care facility]. And, in fact, this ties in with some of the things that have been said today.

[00:05:00]

I remember a gentleman from . . . Excuse me . . .

Konstantinos Merakos

No, there's no problem. We can go into the examples when you're ready. That would be perfectly acceptable.

Dr. René Lavigueur

I remember an 84-year-old gentleman who had been a mine foreman. He was at home, he was confused, and a decision was made to send him to the CHSLD. The rule was that when someone arrived at the CHSLD, they were isolated. So a gentleman who had moved from his private home, where he had taken care of all his own affairs, was placed in a room where he was isolated for two weeks: locked in. Someone wearing a mask opened the door half-way to give him his food and then closed it again. The gentleman became very agitated, and I was asked—as his doctor—to give him a drug to calm him down. This is interesting because it shows the dilemma for the doctor: the demand made to give a medication that the patient should never have received! That's all I have to say about that.

Konstantinos Merakos

Okay. Do you have any other examples to share with us? Perhaps about nurses? I'll give you a second.

Dr. René Lavigueur

I have another example of an 82-year-old lady who was mourning the death of her husband, and who went into a private seniors' center and rediscovered her zest for life through contact with several people she knew. Two or three months later, COVID arrived—she had been in a deep depression and so it's clear that contact with others had revived her. She was confined and fell back into a deep depression, from which she has never recovered.

Well, I talked to my colleagues about it because I had spoken out publicly and said that it was a gene therapy. And right away there was a bit of a chill because the young doctors talked amongst themselves and they disagreed with me, stating that, "No, it's a vaccine like any other; it's not a gene therapy." I had also said that side effects had not been reported, and that offended several colleagues. So many doctors have lived with their colleagues—That's the law of clans or groups: you belong to a community, so it's very hard to walk in

the hallways and get— You know, ultimately when you believe in something, you go ahead anyway.

Also, as a doctor, I find it interesting that no one wants to fill out injury compensation reports. I filled out several of them. People knew about me because I spoke out publicly. So a patient from Ottawa came to Montreal and I met him there—I had to go to Montreal anyway—and I filled out an injury form. Then I . . . It will pass . . .

Konstantinos Merakos

Yes, yes. Yes, yes.

Dr. René Lavigueur

I'll get used to it.

Konstantinos Merakos

Yes.

Dr. René Lavigueur

So I filled out three injury compensation forms that nobody wanted to fill out. But it leaves me wondering: why would a doctor be afraid to fill out an injury compensation form? There's no risk there. Instead the fear is so great that they don't want to talk about it. They stay away from anything to do with it. A gentleman had a skin disease and it was clear that it had been caused by vaccines. I filled out the form even though I know the injury compensation program isn't very generous. Another gentleman had very severe strokes. Yes, well— Shall we move on to the second point?

Konstantinos Merakos

Yes, but I have a question about that. Speaking of filling out forms, I'd like to know a little about your observation regarding filling out exemption certificates for vaccination. What happened in that area?

Dr. René Lavigueur

Well, yes. In fact, people ask me for exemptions. Nobody wants to give them. Well, now I'm making a name for myself.

Konstantinos Merakos

Why do you think the others would refuse?

Dr. René Lavigueur

They don't want to touch anything. They know that there are three exemptions defined by the Ministry, by Public Health, and that almost no one fits into these criteria, so they don't want to touch that. That's interesting because it means that the doctor is betraying his profession—because his first duty is to his patient.

[00:10:00]

Konstantinos Merakos

Did you fill out exemption certificates?

Dr. René Lavigueur

Yes.

Konstantinos Merakos

And they were, of course, all justified and meeting the criteria?

Dr. René Lavigueur

Well it's easy to justify. I wrote: "This is an experimental vaccine. By definition, the patient has a choice; and there is no evidence of efficacy. Therefore, I recommend that this vaccine not be given to such-and-such a child or adult." I have never been blamed for exemption certificates.

Konstantinos Merakos

Because they were justified.

Dr. René Lavigueur

I would have liked to have been blamed because then we would at least have been discussing the real issues. I knew that this technology— It was known by the FDA [Food and Drug Administration] in February 2021, and then it was revealed in documents that Pfizer was forced to— But there was an advisory committee to the FDA that detailed that there were 28 classes of side effects that were all already apparent on VAERS: the American vaccine adverse effects reporting system.

So it's easy. Because when you know a person with an autoimmune disease, a chronic illness, someone who's already had cancer: all these people fit into categories where they were eligible for exemptions. It wasn't complicated. It was based on the principle that free and informed consent had to be given and that the person was free to choose the vaccine. So if someone says they don't want to have it and on top of that, they have a chronic illness, I don't see why the doctors would be afraid [to provide them with an exemption]. It was their duty to do so.

Konstantinos Merakos

Perfect. And could we hear you maybe provide an example of a young person or an older person that you treated as a result of a side effect or other problems. What happened after the medical procedure?

Dr. René Lavigueur

Yes. In fact, there are several. I was making house calls, and I arrived to find a person with Bell's palsy. Actually, it was at a foster home where I went to see the residents. However, I saw that the proprietor, who had just returned from hospitalization, had permanent facial paralysis. So I said, "Has this been reported?" "No." So I reported it. Then after that—

Konstantinos Merakos

I beg your pardon. Resulting from what? Had he had the medical procedure, that is to say, the vaccine?

Dr. René Lavigueur

Following a vaccine.

Konstantinos Merakos

Okay. So that's the cause according to you.

Dr. René Lavigueur

Yes, it was three weeks after a Pfizer vaccine. And even if I don't think that the vaccine was responsible, it doesn't matter. You have to understand that I asked my local public health department to investigate because I observed that a vaccine had been administered at a certain time, and then there was an event a few months later. It's not up to me to decide on a causal link, but I know that anything can happen, so I report it.

Konstantinos Merakos

Very good. So you want to do your duty as a doctor. You want to report the facts, to find the cause, to study, to get an answer. What happened? Because you live in a small town and you have statistics with you, can you tell us a little about what happened when you tried to report all the anomalies that occurred? Can you tell us briefly about your experience?

Dr. René Lavigueur

Well, I've done 16 reports. We need the MCI, *manifestations cliniques inhabituelles [la suite d'une immunisation]*/adverse events following immunization]. It's a six-page report, but it doesn't take that long to fill out. So I'd get referrals. For example, a patient would say to me, "My brother had something like this and his doctor doesn't want to report it." I'd say, "Well, he can come and see me, I'll do it." Among the sixteen [reported cases], six died within three months of the vaccine. We're talking about a population of 12,000. Six deaths, all elderly people, including two or three—I think it was three—one month after the vaccine. So I reported all this to Public Health. Among the sixteen, there were other things: menstrual bleeding, that's very common; Bell's palsy.

[00:15:00]

So twice, I called Yv Bonnier-Viger, the director of Santé publique de la Gaspésie [Gaspésie-Iles-de-la-Madeleine Regional Public Health Department], and told him, "Listen, I see that there are deaths in long-term care hospitals." There weren't many in Gaspésie— four or five. "So you should go and see and then try to count the deaths; find out if there are more than before, if there's a difference." Another thing I said to him, "No one is filling in the reports despite the fact that they are obligatory, so Health Canada will receive very few." Then the second time I called him because a report I sent in had been returned to me with the following note: "Your claim is rejected because the event occurred more than 30 days following vaccination."

Consequently, I wrote a letter; and then I phoned my director of public health and told him, "The Dr. Leblanc who wrote this to me is not well informed. I think she considers the

COVID 19 vaccine to be like any other vaccine.” And that’s interesting because, in the grand scheme of things, the great success of this marketing was to say: “a vaccine like any other.” But what’s most astonishing is that this slogan was swallowed whole—believed and accepted—by doctors. But I can’t believe that a doctor—taking even a cursory look at how messenger RNA works—would not say: “No. This is not a vaccine like the others.” And yet even the doctor who analyzes the Public Health reports considers it to be a vaccine like any other and then fits it into her analysis grid. Her analysis grid for vaccines—for measles or anything else—is 30 days and after that the event is irrelevant. So no wonder the statistics we see from Health Canada are excellent regarding reports of side effects but are completely inconsistent with those we see from more credible reporting around the world, in England, the United States, or elsewhere.

Konstantinos Merakos

Perfect. So we’ve talked a little bit about some seniors who have had side effects, who have died from this. On the subject of young people, if I understood correctly during our preparation, you spoke about young people being locked up in a room for 40 days, or at school, having high pressure surrounding vaccination from non-medical people. Parents reported these facts to you, asking for help. Can you tell us a little about what happened with the young people?

Dr. René Lavigueur

Yes. A mother told me about her 14-year-old son who is depressed because he can’t be in his ski club anymore. Other employees—nurses—are really torn because they don’t want to be vaccinated. Another striking example, I think, is a mother who told me, “Well, my 9-year-old child at school had the teacher ask the students who were vaccinated to raise their hands.” She was the only one not vaccinated. It’s easy to imagine the trauma a child goes through.

Konstantinos Merakos

Perfect. I want to talk with you about one last subject. Earlier we discussed the forms and how some doctors were reluctant to fill them out. You’ve travelled all over Quebec to consult with people to see if they’re victims of side effects or not. You said that no other doctor would do what you did. Why is that? Is there fear? Is there pressure? Are there reprisals? Why did you do what you did?

Dr. René Lavigueur

Well, I find it very interesting because it’s a worldwide phenomenon. It sheds light on the psychology of people, the behaviour of colleagues, allegiances. And to what extent doctors believe or don’t believe in their profession, that they are ready to act contrary to articles of their code of ethics without saying anything at all. Later, if I visit the Collège des médecins [College of Physicians], it’s even worse— My explanation is all the pressure doctors have been under. I think a lot of doctors did what Public Health asked them to do, but it was gut-wrenching for them. They knew they were in trouble.

[00:20:00]

And if speech becomes free one day, we’ll find out how many doctors were actually torn.

But most of them live their daily lives, rely on their income, and don't want to have to deal with the College. They're afraid of the College. There's a visceral fear of the College of Physicians of Quebec which is their professional organization. So all these factors lead people to resign: it is the simplest, easiest solution. The entire context certainly provides fertile ground for this, which is that medical practice is very difficult. Statistics show that 50 per cent of doctors are depressed or on the verge of depression. I see this among the young doctors around me. There's a work context of obligations and pressures that makes resignation an easy choice. When up against a conflict like this one—regarding orders—a doctor can decide, “Oh no, no, no. The simplest thing is to obey what Public Health tells me to do, so that's what I'll do.”

Konstantinos Merakos

Okay. Thank you very much. The next topic is one that I think a lot of people will be familiar with. It's about your letter in *La Presse*. You published a letter in *La Presse* which was removed, censored the next day. And *La Presse* even issued an apology—excuse me—a clarification: not an apology to you for removing your medical letter, but an apology for daring to publish your professional medical opinion. So can you tell us a little bit about that?

Dr. René Lavigueur

It's a fantastic episode because it's a letter that I was really careful to ensure was accurate, precise, factual, and scientifically verifiable. But it's also a letter that involved some very sensitive issues. Among other things, in the letter I suggested wording that could be used when seeking free and informed consent. We could say to the person: “Madame, do you agree that your child should receive a vaccine? It's an experimental vaccine. We don't know the short- or long-term side effects. We don't know the risk-benefit ratio for your child. They say it's to protect the elderly. Do you agree to receive the vaccine?” These are very basic, very verifiable things, but I think they were unacceptable in the context of Quebec at that the time. I don't know. So in less than 24 hours, it was removed, with apologies from the chief editor.

Konstantinos Merakos

Excuse me, just to clarify: apologies?

Dr. René Lavigueur

An apology to the public, to readers, from the editor-in-chief, for daring to publish this.

Then there was a letter from Nicholas De Rosa in *Le Soleil de Québec*, with the aim to really tear me down, which called on a Health Canada official as a witness who said: “It's not true that side effects aren't reported. There's a law requiring doctors to do so. There's even a penalty if the reports aren't submitted.” Then a virologist was questioned; there were two university specialists—researchers—who said things that were really— I don't remember. I can't tell you exactly, but if I had them in front of me today, I'd debate them. I know I am right. And what's interesting is that these are people who had conflicts of interest.

Researchers in a university are under influence: 90 per cent of those doing medical research in Quebec are under the influence of pharmaceutical companies because 90 per cent of research is funded by the pharmaceutical industry. In fact, one of the ways of explaining what has happened—which is the primary concern—is the gradual control, year

over year, of medicine in general by the pharmaceutical industry in medical schools. What never ceases to amaze me is how uncritical the young doctors I know and work with are. They take recipes and they apply them. And because that's what they were taught to do at university, they feel good because they think they've done their job as doctors.

Konstantinos Merakos

Yes. What was the reaction of the media or the people around you? Has there been an online smear campaign?

[00:25:00]

How have people on the internet and other media reacted to you?

Dr. René Lavigueur

I confess I didn't even read them. I read them several months later; I didn't want to know anything. I was at a friend's house cutting up firewood when I heard Radio-Canada [CBC] calling me something, and then talking about me. It was pretty violent; it was hurtful. But there you go. I knew that the media were completely— That's it.

Konstantinos Merakos

Before we move on to the next topic, I'd like you to tell us how your professional organization reacted to this letter. Have there been any consequences? Yes, go ahead.

Dr. René Lavigueur

We're talking about the letter here but I've also spoken out in several media platforms. I've been asked to comment on the radio, on social media, and I've given my opinion. I've always agreed to do so. So there were several reports to the College of Physicians of Quebec: "Dr. Lavigueur is telling lies, he's saying things that are contrary to—" So they reported it; it's very easy. You can do it online or you can phone. A few months later, I received a letter from the College of Physicians of Quebec, which basically said: "Dr. Lavigueur, we've looked at all your public statements. We have carefully examined everything you have written and said, and we wish to emphasize that you must respect your code of ethics with regard to the expression of physicians in the media." Period. It was an intimidating letter but it said nothing. There was no mention of anything I had said that was contrary to science. It was simply an intimidating letter: a reminder of my code of ethics. So I continued to say what I had to say.

Konstantinos Merakos

Okay. Were there any threats of you being struck off, dismissed, or losing your qualification?

Dr. René Lavigueur

No. No. No.

Konstantinos Merakos

Anything at all? Do you know of any other doctors who have potentially been threatened with this, or who have lost their licence?

Dr. René Lavigueur

Personally, I don't know of any doctor in Quebec who has had their license revoked for speaking out about the pandemic. I do know of one doctor who was dragged through the mud—I don't know how that's going to be translated into English—in a really shameful way. He was forced to apologize publicly for a question regarding masking. And I think it was a simple matter of making examples of one or two doctors to intimidate the rest of the 20,000 doctors in Quebec.

Konstantinos Merakos

Warnings, basically. There were warnings for you and others but at least, according to you, there were no—

Dr. René Lavigueur

To my knowledge, no one has lost their certification.

Konstantinos Merakos

Okay, excellent. The last topic: I'd like to talk about your intervention with the College of Physicians, if you would talk a little about that.

Dr. René Lavigueur

So we wrote to the College of Physicians of Quebec on two or three occasions. In the last letter, we reminded the president of the College of Physicians of Quebec that every month he swears in doctors to the Hippocratic oath, and that he himself had to respect it. Then we asked for a meeting. There was a lot in the letter. We talked about the scientific side, but above all we talked about the ethical side. Our intervention with the College focused on medical ethics and deontology, and also on the vaccination of children and pregnant women.

We avoided thorny issues such as ivermectin and hydroxychloroquine, even though I think—I've got a lot to say about that right now. But we were diplomatic.

[00:30:00]

But we did mention in the letter that COVID-19 vaccination—with its virtual absence of animal testing—was akin to the thalidomide and diethylstilbestrol events of the 1960s with all the disasters they caused. That's what I wrote in my letter to the College. And I also wrote that there was evidence in animals of the presence of the spike protein in the gonads of rats, and that we should therefore be concerned about the fertility of the children we inject with the vaccine.

We also said that the proof—basically because everything is upside down—the proof of safety belongs to those who promoted the vaccine. It's not up to us to defend ourselves. So normally, we have the right to speak out publicly. But a lot of people were suppressed because they talked about the risk of infertility. I spoke about it publicly. A colleague talked

about it publicly and was severely reprimanded by the College. But in reality, the world is the opposite of common sense. You're entitled to ask all the questions about something experimental that is being given to an entire population, and then there's a duty of transparency.

Konstantinos Merakos

Perfect. So one last question. We've talked about your care and concern for seniors, young people and parents. We've talked about how the media treated you. One last question: Just from asking questions to finally get an answer—if I understand correctly, that's your job—what has been your quality of life after asking questions, after the media, after all this? How is it financially, at home, mental health-wise? Tell us a bit about you personally. What's been going on?

Dr. René Lavigueur

Well, let's just say that I'm a little emotional today, but I think that during this whole adventure, I said to myself: "It's an awakening," because what we're seeing today was present before the pandemic. The mechanisms were in place. The ability of human beings to make each other believe things, to take the easy way out, is human; it's been there since the dawn of time. So I prefer to be in the camp of those who are trying to understand, and then move on to the most difficult camp, which is that of trying to make it all make sense and repairing the broken links. The next step requires a lot of inner work. So all in all, to answer your question, to me it's all positive.

Konstantinos Merakos

Excellent. But you are very strong. So do you have any last words before I hand things over to the commissioners?

Dr. René Lavigueur

I'm fine.

Konstantinos Merakos

All's well? So ladies and gentlemen of the Commission, go ahead.

Commissioner Massie

Hello, Dr Lavigueur. Thank you for your testimony. I'd like to ask you a question. You mentioned—in a somewhat offhand way, I'd say—that all the epithets you've been called didn't affect you too much. But you were undoubtedly aware that they could still affect your willingness to continue to speak out in this way. So how did you cope with that part? Nobody likes to be denigrated and basically called a liar when you put forward facts, when you ask questions, and no one comes to you to start a dialogue, to answer you. How did you keep your motivation?

Dr. René Lavigueur

I don't really know, but I can give you some clues. It's all very interesting. There are two children I take care of, children of Africans who live in the community. I frequently take care of them—12 and 15 years old—and then they heard the criticism of me on television.

The kids, well, they had absorbed the standard narrative. You know, for a child, a teenager, everything that's said on television they get caught up in too; they can't distinguish.

[00:35:00]

Then they look at me, who's very close to them, and they understand— So the lesson I've learned is that, in bringing up children, perhaps the best thing to teach them is critical thinking. So in answer to your question, I think it's great because this adventure teaches us how to prepare for what's to come.

Commissioner Massie

I have another question about what impact you expect to see in the medium term—because in the short term, things remain at a standstill—as a result of all the actions you've taken? In particular, there was the meeting with the College of Physicians; there was a second letter that you submitted to it; ultimately, if I remember correctly, you received a relatively brief response. And after that, you continued to try to put in place actions to advance the cause.

What do you expect in the medium term, let's say, from all these initiatives?

Dr. René Lavigueur

Briefly, the College of Physicians of Quebec is deemed independent and non-political. Quebec's Director of Public Health is the Deputy Minister of Health, so he's politicized. We have institutions, the INESSS, the Institut d'[excellence en santé et services sociaux], that are politicized. So the College's approach is to say, "We are the last bastion of public protection." The College of Physicians boasts, and writes everywhere, and always says that they're there to protect the public. Here was an extraordinary opportunity to do just that. But they became completely obedient: they submitted to the Public Health Department. And that's a major weakness of our College of Physicians of Quebec. I hold them culpable for that. Then I think that the institution itself—I often say "the institution"; I believe in it because you need a college to protect the public—but the administrators of that institution failed in their task. That helped me identify these things.

And I think that the extraordinary and abusive power of the College of Physicians of Quebec is one of the problems identified in this adventure. And I think we can work in the future, in particular by getting the College of Physicians of Quebec to bend on alternative therapies. Abuse of power leads to situations like that. Does that answer your question?

Commissioner Massie

Yes, that answers my question. Thank you so much for your testimony.

Commissioner Drysdale

[In English] Good afternoon. Were you not able to talk to any of your colleagues, other doctors? I mean, it's hard to stand in the storm alone. But if you approached them with 30 other doctors, perhaps the outcome may have been different.

Commissioner Massie

I'll translate for the crowd. So the question my colleague asked was: Given that it's quite difficult to face this, would it be appropriate to join forces with other medical colleagues to give a little more cohesion to his approach?

Dr. René Lavigueur

At the approach of—?

Commissioner Massie

The process of taking on the whole of—

Dr. René Lavigueur

Ah yes, okay. I don't know if I'm going to answer correctly. It wasn't possible to join forces with any of my colleagues because none of them was critical enough about what was going on. I have two or three colleagues with whom I can exchange e-mails quite— Progress is possible, but it can't go too far because they're specialists— So it was impossible. There's a doctor who deals with childbirths and once I asked her, "Can you talk to me? What do you think about this vaccine for children?" She said, "I don't want to hear about that," and afterwards it was really brutal. So I never mentioned it again. But that just goes to show how taboo these subjects can be between doctors.

[00:40:00]

Commissioner Drysdale

[In English] That's shocking. My next question is: the people who run the College of Physicians in Quebec, are they all practising doctors?

Commissioner Massie

So the question is: Are the leaders of the College of Physicians in Quebec still practising physicians, or are they administrators?

Dr. René Lavigueur

As far as I know, they are administrators. But they often have a background as practitioners. The president, Dr. Mauril Gaudreault, is a family doctor who has spent his entire career as a family doctor. It's interesting. At the meeting we had with them, the directors—there were four of them. The president was very uncomfortable and couldn't wait for the meeting to end. He didn't want to hear us. I was accompanied by specialists who know messenger RNA, qualified people. And the directors didn't answer any of our questions, even though we challenged them on the most sensitive subjects. We told them they were in breach of the code of ethics. And we got no comment except that afterwards we heard the president say, "The College of Physicians in Quebec is not a scholarly society." I don't know if that's going to be translated. Is it understood in English? I don't know how you say it: "Société savant." How's that? But it's interesting because it's a College of Physicians in Quebec that advocates for even more measures than the government is asking for, and yet is incapable of justifying these measures scientifically!

Commissioner Drysdale

[In English] My understanding is that the sole purpose of the College of Physicians is to regulate the safe practice of medicine in the province in which it acts. Is that correct?

Dr. René Lavigueur

[In English] Yes.

Commissioner Massie

The question is whether the *raison d'être* of the College of Physicians is really to regulate medical practice to ensure that it's done in the best possible manner.

Dr. René Lavigueur

—in its goal to protect the public. But when the College punishes a family doctor who has been doing his job for 30 years or a specialist who—one time—receives a report that isn't correct and then ignores it, he's going to be punished with a three-month suspension. So the College is like a police force that refuses to go beyond its mandate simply to punish. So if it is true that the College's proper role is to protect the public, it should get involved in public affairs. And here was a golden opportunity to say: "We have a code of ethics, we have an event, we can provide an opinion." What we were asking for was a moratorium on the vaccination of pregnant women and children. It was an extraordinary opportunity for a college to fulfill its function. I think perhaps we're the only ones in Canada to have challenged our College of Physicians; maybe there were others, I don't know. We challenged it on a deontological, scientific, and ethical level. And I wonder why it hasn't been done elsewhere in Canada.

Commissioner Drysdale

[In English] I'm waiting for the translation, sorry. I'm not totally familiar with the College of Physicians. I am with other professional organizations in Canada. So don't they also have a function to educate their membership? Don't they issue practice notes or warnings to the membership?

Commissioner Massie

The question is: besides controlling medical practice, doesn't the College of Physicians also have an important role to play in educating the profession's physicians and bringing them up to date on best practices?

Dr. René Lavigueur

I can't really answer that, I don't know. I think so, but not in an extensive way.

[00:45:00]

Rather, it's our federation of physicians, our professional unions, who ensure the quality of and then education: continuing professional development. The College will punish people who practise outside the norms or who make professional mistakes according to recognized and established standards, but they are not very involved in education as such, as far as I know.

Commissioner Drysdale

[In English] So the College of Physicians does not have an ongoing educational requirement for its membership?

Dr. René Lavigueur

Ah yes, oh yes. Are you translating the question?

Commissioner Massie

The question is whether there is an obligation to have continuing education for the training of doctors.

Dr. René Lavigueur

Yes. There are a certain number of hours per year of continuing medical education that are mandatory over a five-year period; and this is very closely monitored by the College on an annual basis, yes. At the age of 70, I've just received a whole questionnaire on my practice; and then they can go on to examine my practice. So yes, the College has a role to play in monitoring doctors' practice and methods according to standards.

Commissioner Drysdale

[In English] It would just seem to me that if they're taking a role in policing continuing education that— The media and the government presented the pandemic to the world as if it was the most threatening event that had ever happened. And so you would have thought that the College of Physicians would have educated their doctors about the Canadian influenza pandemic plan which they had prepared in advance of the pandemic. So were you made aware of the Canadian influenza pandemic plan by any of the professional organizations?

Dr. René Lavigueur

No.

Commissioner Massie

So the question that was asked was whether the College of Physicians has a function to update physicians' knowledge to ensure better practice. Since the pandemic represented an extraordinary public health event based on plans that existed before the start, which were pandemic preparedness plans, are physicians receiving ongoing training on these pandemic preparedness plans?

Dr. René Lavigueur

In fact, it's not the College that does this. It's the Public Health Department, to answer your question.

Commissioner Drysdale

[In English] Did Public Health do it? Did Public Health provide you with the influenza pandemic plan so you'd know what they wanted you to do?

Commissioner Massie

Did you receive the Public Health preparedness plan? Have physicians had access to this information?

Dr. René Lavigueur

They surely have access. I confess that I haven't seen or read it.

Commissioner Drysdale

[In English] Given the information that we now have around the world, has the College apologized to you yet?

Commissioner Massie

I have to repeat that one. Given all the information available now, has the College of Physicians acknowledged or updated its understanding of the pandemic, and apologized for the vision that was shared at the beginning of the pandemic?

Dr. René Lavigueur

I think that the College of Physicians of Quebec, and not only the College of Physicians, but also the health authorities—the Department of Public Health, the Minister of Health, the politicians, the specialists who influence, the influencers—are hardening their position at the moment and are far from apologizing because the consequences are too great. In fact, we can draw a parallel with the silence after the Second World War, when we weren't supposed to talk about anything that had happened because too many people were complicit. Too many people favoured the measures. Then when they learn that it's being contested—that there are scientific studies showing excess mortality—it bothers them too much.

[00:50:00]

When you've been involved in promoting the vaccination of women and then children, and you see the consequences everywhere, it's too big a step to take. There's going to be a hardening of positions and that's what we're seeing. I don't know if it's going to explode or how it's going to end.

Commissioner Drysdale

[In English] Thank you, sir. Thank you for your testimony and your courage.

Konstantinos Merakos

So Monsieur Lavigueur, thank you very much for your testimony. Yes, thank you, and that's all. Beautiful. They're getting ahead of us, but thank you very much. A nice round of applause. Thank you, Monsieur Lavigueur.

[00:50:54]

[00:00:00]

Chantale Collard

Yes, hello. Chantale Collard, lawyer and prosecutor for today's National Citizens Inquiry. So today we have as a witness François Amalega. First of all, thank you, Monsieur Amalega, for coming to testify here at the National Citizens Inquiry. Your testimony is important. As a matter of formality, we're going to proceed with your identification, so simply state your first and last names.

François Amalega

My surname is Amalega Bitondo, and my first name is François.

Chantale Collard

All right. And now we'll proceed with the swearing-in. So Monsieur Amalega, do you affirm or swear to tell the whole truth, the whole truth, and nothing but the truth? Say "I do" or "I swear."

François Amalega

I do.

Chantale Collard

So Amalega François, maybe there are some of us here who know you, maybe others not so well. In any event, we'd like to know more about you. So perhaps first of all, a brief presentation of your main occupation, your professional career, and then from there, what brought you to where you are now. So regarding your professional career, what is your formal education?

François Amalega

First of all, I'd like to thank you for the honour of being here. It means a lot to me.

I immigrated to Quebec in 2012. Before that, I studied mathematics. I got the equivalent of a bachelor's degree in Mathematics in Cameroon in 2000, and also a secondary school teaching diploma. Then I also got a master's degree in teaching Mathematics in Cameroon, and I emigrated to Quebec after teaching mathematics in high school. So in Quebec, I studied for a master's degree in Mathematics at the Université de Montréal. I obtained a master's degree in Algebra. Then I went on to doctoral studies, where I studied arithmetic geometry. I didn't finish, I didn't submit my thesis, but I completed all the coursework. Then I started working at Collège Jean-de-Brébeuf as a mathematics professor. I taught for five years. After three years, I got tenure and became a permanent math professor at Collège Jean-de-Brébeuf. At the same time, I gave courses at UQAM [Université du Québec à Montréal], specifically at the École de technologie supérieure.

Chantale Collard

At the same time, you were teaching at UQAM, at the university.

François Amalega

Yes, and at HEC [HEC Montréal, the graduate business school of the Université de Montréal], but my permanent position, my job, was as a mathematics professor at Collège Jean-de-Brébeuf.

Chantale Collard

All right. So at Collège Jean-de-Brébeuf, you were there. We'll begin in 2019 or 2020.

François Amalega

Yes.

Chantale Collard

What happened? Basically, you were teaching, and what happened? Now, you're not teaching anymore, if I understand correctly?

François Amalega

Yes, on February 5, 2021, I submitted my resignation in the face of all the pressure I received at my school. What happened was that on March 13, we were in lockdown and were told that there was a very dangerous virus spreading around the world. I believed the story; I believed and trusted the Prime Minister. But since we were in lockdown—because we had been busy at work and suddenly we had nothing to do—I was at home. And they were talking about COVID, so I went all over the internet: YouTube, Google. I typed in "COVID-19" to find out what it was all about. That's how I came across Professor Raoult, who said that with hydroxychloroquine, it was all over. I said to myself, "Okay, that's it, we've panicked for nothing." But I was surprised to realize that he was challenged, insulted in France, and despised by many people. That's when I said to myself, "When I see his CV and I see that he's not being given any consideration, I understand that this is messed up."

And then I started to follow the press conferences with fresh eyes; and you could see that there were contradictions in mandates that changed at every turn. There was a strong contradiction between the certainties that were presented—because they said “we’re building the plane in flight, and we don’t really know what’s happening”—and the simultaneous authority which accompanied the issue of these mandates. Now these are two contradictory attitudes. One cannot be in the process of learning something and at the same time be authoritative in the way one dictates things. So it showed that this uncertainty had a single objective: to create confusion. But the real agenda had been pushed through by the authorities.

But that didn’t fit with my role as a professor. Because when I teach mathematics to students, we have activities before presenting a concept.

[00:05:00]

The aim of these activities is to lead the student to an impasse so that he or she understands the necessity of the new mathematical object about to be introduced. And to do that, students need to reflect and realize they’re stuck. And then you can tell them, “Okay, I’m going to show you this theorem that will solve the problem.” So to do that, you need him to critique you, to challenge you. And when they don’t, you challenge them. So it creates a critical mind, but that’s not what the government was proposing. The government was proposing that we believe, that we submit. And that didn’t work, so I started going to demonstrations, posting photos on my Facebook account, and so on.

Chantale Collard

I don’t mean to interrupt, but when are we?

François Amalega

We’re in the summer of 2020.

Chantale Collard

Okay, it’s not April. In April, you confirmed about the lockdown. It’s a bit later. In other words, in April, you’re in fact still technically working online for the school.

François Amalega

I worked for the school; until February 5, I still worked.

Chantale Collard

February 5, 2021.

François Amalega

In April, we restart the interrupted winter session online. And I already know that the government is talking nonsense, so I post about it. At this point, I’m not yet going to the demonstrations because my Facebook is a bit restricted, but I become more informed and my contacts keep growing. I still post about the virus and all the mandates. It’s clear to me that it’s all nonsense, and I publish along these lines. There are indeed a number of facts that show that everything we’re being told makes no sense. Facts that are easily verifiable.

For example, Ferguson's article that predicted—and scared everyone—ends up being false because the data doesn't work. In midsummer there's, for example, "Lancet-gate," and then a lot of other things that are obvious. But what's happening now is that in the fall I take a photo of myself because it's becoming clear, very clear to me that the people who are supposed to be protecting us are out to destroy us. And for me, civil disobedience becomes evident. There's no possibility of negotiating at this stage. I take a photo of myself and I put it on my Facebook page.

Chantale Collard

And when are we exactly?

François Amalega

We're at the end of September 2020.

Chantale Collard

2020.

François Amalega

So I film myself without a mask in the subway and I write: "Civil disobedience is a duty." That photo gets me called in. I'm called in by the human resources department of Collège Jean-de-Brébeuf, and the director of human resources has a very stern look in her eye, but it's online. And she asks me to remove the photo, to comply, to submit, and I tell her right from the start that it's a waste of time.

Chantale Collard

Your photo was on social networks? Probably Facebook?

François Amalega

Well, at that time, the social network where I was most active was essentially Facebook because, before COVID-19, I really wasn't too much of a social networker. I used it but not very much. But with COVID-19, we were locked down. It was almost the only means of communication, so I became very much a social networker from then on. So I put the photo on Facebook and I called for civil disobedience. In any case, that's what I could do in my own small way. But this photo posed a problem. The school wanted me to remove the photo and I refused, so they backed down. In fact, they backed off and left me alone.

But things continued on because the mandates were absurd. For example, when we were doing exams— Because the studies were online, we had a problem with the way the children were assessed. So when you did a math homework assignment, each child was at home doing the exam. You had no way of monitoring them. So they would do the exam on the sheets, take a photo, and send that to us. So you had no way of knowing whether the photo sent to you by the strongest student might also have been sent to his classmates and girlfriends. There was no way of knowing. So as with all the other colleagues, the idea was to at least have in-person exams.

So we managed to have the exams in person, except that during the in-person exams, the main exam room was a large separate room, but the students had to wait in a small

adjoining room where they were crammed against one another. You'd go there and get them and bring them back to the big room, and it was in the big room that the students were spaced out—such ridiculous things. And then, even among the teaching staff, people would wonder, "Did the virus stop being active in the small room?" Things like that.

Chantale Collard

Okay, among your colleagues, you were all talking about the absurdity of it.

François Amalega

Well, some colleagues didn't have the courage to criticize the government directly, but with little measures like that, even they could see that there was a problem.

[00:10:00]

And I was very vocal among my colleagues, but for them, it was the school management that was confused. But it was François Legault that was the problem, at least at the Quebec level, and they didn't want to go there. There were so many things. I encountered problems. I was suspended for three days because I had my mask under my chin. I didn't want to put it under my nose. I was suspended for three days without pay. The final straw came on January 9: it was the first curfew in Quebec.

Chantale Collard

2020?

François Amalega

2021. So it was the first curfew in Quebec, and we went to defy the curfew at the Mont-Royal metro station. There were only about 20 of us and there were a lot of police and a lot of media. So since there weren't many of us, we were filmed by TV cameras and so on. And then a journalist asked me questions. He asked almost all the demonstrators questions because there weren't many of us. And there were a few seconds of footage of me, and that's when I got the impression that the school authorities had been rapped on the knuckles. This time they summoned me and suspended me for two weeks. They told me, "Now you're not just on Facebook, you're going to the media networks." Because I think it was LCN, TVA, and all that.

Chantale Collard

In the mainstream media.

François Amalega

In the mainstream media. They told me, "No, you've gone too far now." And then I told them that there was no way I was backing down. They realized that—for me—it was clear. I told them I was waiting for them to chase me out because no matter what, there was no way I would back down.

Chantale Collard

You are going to go all the way. You were ready.

François Amalega

At one point, they told me that Brébeuf has resources. Do I need some help?

Chantale Collard

Ah, okay, psychological help.

François Amalega

Yes. I said, “But that’s just what I’m waiting for.” So they decided to have me meet a biology teacher who’s well-known at Brébeuf, who’s a grandfather, in the sense that his students’ students are CEGEP biology teachers. So he was a reference in the matter. When they said I was going to meet a biology teacher, I smiled because I said to myself, “My opposition to health measures doesn’t come from the fact that I’ve mastered biology. That’s not my argument. My argument is the inconsistency of everything we’re saying.”

Chantale Collard

The incoherence.

François Amalega

And what happened was that I had prepared my presentation: I had nine points. And in the first point, I started to talk about mathematics. I talked about the Ferguson paper, which had made predictions about the number of deaths. He had said that in Sweden there would be 100,000 deaths by the first of May if they didn’t comply with health measures; however there weren’t even 10,000 deaths after the first of May.

So when we met that day, there were three of us: the president of the union, who was supposed to be defending me, but who was there to tell me to back down; and the biology professor in question. And the union president asked the biology professor to explain COVID and everything to me so that I’d understand that I was going astray. But the biology teacher said he’d rather I did the talking, so that he could help me.

So I started talking. I had nine points—but when I started the first point, he wanted to stop me to say, “No, these are just little probability problems, François, you’ll have to come back.” I told him: “No, no, no, no, listen, you’re a prof, I’m a prof.” And among the three of us, the president of the union is also a biology prof. I said, “Of the three of us here, the one who knows the most math is me. So you can’t just wave your hand at me and say, ‘It’s a question of probability.’ If I made a mistake in what I said, you have to point it out.” Voices began to rise and the union president calmed us down. Then, he told the biology professor to tell me what he says to his students. And so he presented Raoult; he presented me and everything; but in the end, the report was so— In fact, he had nothing to say.

Chantale Collard

There was nothing he could say.

François Amalega

He had nothing to say and he fled the meeting. He fled because he couldn’t cope. At the end, he said that he told me such and such a thing, to which I replied, “You tell me that, but Didier Raoult tells me this. You’re a CEGEP biology professor; Didier Raoult is a professor of

medicine, director of one of the largest centres in Europe, if not the world. If it's just a matter of faith, who do you want me to believe in?" He himself understood that it wasn't working. And then, well, it ended there; and he left, he disappeared.

But I remained for two weeks. I was surprised that at the end of two weeks, I received my salary because I was getting paid every two weeks. When I spoke to the human resources manager, I said, "But I'm getting my salary. That's rather interesting, because if you suspend me and pay me, I'll carry on." And then they took back the two-week suspension, they took back the salary and everything.

I'll perhaps come back to that in relation to the last question. So they said to me, "Okay, well, at this point, you're going to resume your classes and so on, but we're asking you just to make sure your Facebook is private. We're not prohibiting you from demonstrating and all."

[00:15:00]

Except that I was producing certain publications—videos that I was posting, articles and so on—where some of my Facebook friends were telling me, "François, we can't share," and so I made some of my posts public. This publication was visible. And afterwards, the human resources manager called me back and said, "You've got to make it private, there are things that can be seen." I told her, "No, no, I've made my Facebook private, but there are publications that are public. Those will stay that way." And then she scheduled another meeting. This time it was with the director of Brébeuf himself, asking me to close my account. If I didn't, there would be severe penalties and so on.

Chantale Collard

Did they tell you, Monsieur Amalega, about the penalties? Was it a veiled threat or was it clear?

François Amalega

No. He didn't say exactly what the penalty would be, but after taking a three-day suspension without pay, and a two-week suspension without pay, and a withdrawal from my classes, he said that a heavier penalty was on the way. So from that point on, I had the option of staying and waiting for him to penalize me. But that's a choice I made because I realized that they themselves knew they had no argument, since the first thing they said to me was, "You're entitled to your opinions, but we ask you to keep them to yourself." Opinions are expressed. Something that remains in the mind is not an opinion. You give your opinion.

Now as far as I'm concerned, it was unbelievable when I realized that they knew they were wrong, yet they wanted to keep me quiet. And that's because they wanted to preserve their social status. Because social death is more painful than biological death. When you die physically, you're gone: it's the people who love you who cry over you and you're no longer there. But to die socially is to see yourself and feel sorry for yourself—and that's even more painful. And that's why so many people do everything they can so as not to die socially.

My resignation was intended to send them a message and to tell them that, "I think you're the equivalent of prostitutes if you're genuinely prepared to go against your conscience to protect your gains." And that attitude was the reason for my resignation. I handed in my resignation on that same day. And I told them, "You're the ones who should be encouraging

me to think critically, but you're simply reciting what the government says." And I told them how disappointed I was. I submitted my resignation at that point.

Chantale Collard

Basically, you submitted your resignation but you continued to speak; you continued to demonstrate. What happened? After you resigned, was there no more teaching?

François Amalega

After resigning, there was no more teaching, and then all that remained for me was to demonstrate.

Chantale Collard

Your main occupation.

François Amalega

It was practically my main occupation.

Chantale Collard

Tell us about your main occupation after you resigned. There were demonstrations for a number of reasons, correct? I suppose it was the mandates?

François Amalega

My dream was to see 10,000 people out on the streets at curfew time. Personally, it was something I felt so strongly about defying. Because the problem is, there are people who fill themselves with anger. But when you fill yourself with anger and you show up in front of the police, it's nothing. And they're trained to inflict repression, so when you're violent, you prove them right; you give them the moral high ground. But if during curfew, 10,000 happy, gentle, calm people take to the streets and do no harm, the police have no moral ground; they are confronted. For example, mothers with walkers, people in wheelchairs, who do no violence, take to the streets. But the police are confronted because these gladiators don't have the moral backing to strike people who are acting peacefully. So that's why I, personally, have started going to police stations with other people.

Chantale Collard

For the benefit of the audience: you went to the police yourself. You were going to the police station yourself.

François Amalega

On February 14, 2021—I had chosen this day because it was the day of love—and I went to the nearest police station in my neighborhood. I went to tell the policemen that I was looking for my love who was freedom, who was locked up in the police station. And I told them I wasn't going home—I don't respect curfew—and I made it clear that it was out of the question. They fined me.

Chantale Collard

Okay, so you went deliberately to be fined.

François Amalega

Yes.

Chantale Collard

Have you accumulated many of these fines?

[00:20:00]

François Amalega

I have \$98,329.87 in fines.

Chantale Collard

So close to \$100,000.

François Amalega

My only regret is that I didn't reach the \$100,000. So the objective was that the more people don't comply, the more they're unable to act. And that's what happened because there are examples in Quebec. For example, they imposed masks on us during demonstrations, but when people refused to wear them, the police stopped issuing tickets. Because when 20,000 people march without masks, who are they going to start with? And then the nurses also provided an example. The nurses brought Dubé and Legault to their knees because they refused en masse to be vaccinated, and they understood what a disaster it was going to be.

So with peaceful civil disobedience: as soon as you take away the peaceful character, you give the police the moral backing to act. That's just what they're waiting for. And that makes the others happy. But the problem is, when it's peaceful, they have no moral ground. In other words, they have none when an 80-year-old mother with a walker tells a policeman, "I'm not going home" with a smile on her face. What can this seven-foot man do? If he hits her, then he acts to destroy that, so he is himself defeated. In fact, that's the idea. So I continued to protest. I was issued several tickets for it. I'm currently being prosecuted for that.

Chantale Collard

Basically, Monsieur Amalega, you've participated in many demonstrations. Have they always been peaceful?

François Amalega

Absolutely.

Chantale Collard

And you've always continued your efforts in a peaceful way. On the other hand, you have been penalized and sent to prison. Would you like to tell us about that?

François Amalega

Yes, I've been imprisoned several times. In fact, I've been in prison four times. I can't count the number of times I've spent nights in a cell.

Chantale Collard

That's one single night?

François Amalega

Yes, a single night in a cell. I'm not sure how many; it's several times. I have to stop to figure it out. But prison itself: I've been to prison four times. And I'd like to point out that I did seven days in prison because I refused to wear a mask at the municipal court. That's the only reason. That is, I went to the municipal court for a trial I had and I refused to wear a mask. Since I was being tried for a mask-related offence, it was clear to me that, in order for there to be any chance of a fair trial, the judge had to at least allow me to proceed through my trial without a mask. If it was impossible for me to participate in my trial without a mask, then I was already convicted. And the judge made the mistake of holding me for seven days. And that's it, I was in prison for the seven days of my whole trial because I didn't wear a mask. I spent three months, three weeks in prison.

Chantale Collard

Can we say it was for this offence?

François Amalega

No, because I went to prison four times, the fourth time being three months, three weeks. And that time, it was because I'd been arrested: they'd given me a condition not to be within 300 metres of the Prime Minister.

Chantale Collard

Okay.

François Amalega

But on January 16, 2022, the Prime Minister was supposed to go on "*Tout le monde en parle*," [a Radio-Canada program] and we organized a demonstration around that appearance because he had to pass by that way. And the police arrested me, saying I hadn't respected my condition. They put me in prison and then wanted to release me a few days later with other conditions so that I would have to wait. At that point, I told them I wasn't a criminal. If they think I'm a criminal, they should keep me in prison but if not, release me unconditionally. So that's how I spent all that time in prison, by refusing the conditions. In the end, I was released unconditionally.

Chantale Collard
You were released?

François Amalega
May 9th.

Chantale Collard
May 9, 2022?

François Amalega
Yes, I was arrested on January 16, 2022 and released on May 9, 2022.

Chantale Collard
Released or acquitted?

François Amalega
I had four trials, of which two trials were in prison, both of which I won.

Chantale Collard
So won: we're talking acquittal.

François Amalega
Acquitted, yes. But the verdicts for my other two trials came after my release from prison.

Chantale Collard
What were the verdicts?

François Amalega
This is what demonstrates the political aspect. Because the first two trials, at which I was acquitted, were much more delicate than the other two, which were very easy to prove. Except that when I got out of prison, I had interviews with several influencers where I said that: "I won the trials, I was right." And I think that, to teach me a lesson, they had me lose the other two trials. Because in one of the trials I had four counts against me: I was acquitted for three and convicted for one. And with the other last trial, I was also convicted and sentenced to probation.

Chantale Collard
Okay. Were there any convictions other than probation?

François Amalega
So far, all I've had is probation.

Chantale Collard

Probation for what? Keeping the peace?

François Amalega

I was told: You have to keep the peace; you cannot disturb the public order.

[00:25:00]

Yes, generally, that's the probation they gave me for most of these trials. But I'd still like to say that, when I was in prison, those were times— I didn't always have access to all the privileges of other prisoners. For example, in prison, the quality of the food and all isn't good. For example, there's a canteen you can order from. And I was ordering from the canteen but my orders only started coming through towards the end of my time there. I had the same outfit for maybe 40 days. I had the same clothes on my body, meaning it was the same garment I had on my body, and the conditions were really humiliating.

Chantale Collard

Discriminatory, would you say?

François Amalega

Yes.

Chantale Collard

Compared to other inmates?

François Amalega

For example, one day— Because it happens that prisoners hide drugs, they hide weapons, they hide telephones; there's a lot of trafficking going on in prison. And to catch the prisoners, what they do is sometimes—since there are the cells and there is the common area—they make unannounced raids. So when we're in the communal area, they just turn up and pick out four or five cells and search them. And it's random searches like that, which allow them to find things. And there was a day when they went into the prison—that day, I was watching a chess match; and that's one of the positive things I've learned, my chess level has improved a lot— So that day, I was watching a chess match and they came. They went around and they entered a single cell: one single cell. And just when they were entering the cell, a prisoner there said, "But why are they in the cell of the conspiracy theorist?" Because he knew. So they went into my cell—just my cell—they turned everything upside down. And then they ransacked everything. Just my cell. They didn't ransack any other cell.

Chantale Collard

How did you get through that period? Because it's really difficult: you're in prison, you're already getting unfavorable treatment, but now, on top of that, they're only ransacking your— How did you get through that? It's undoubtedly a struggle.

François Amalega

It's a huge struggle, but the problem is that I knew I had exposed myself to all these attacks. And the problem is that we mustn't give them the chance to think they're winning because in reality, they're not; because in all they are doing, they're exposing themselves. And I'd like to take this opportunity to say that, for example, at the beginning of this month, I received a letter from a bailiff for the \$98,000 I owe—because I've already been sentenced for \$69,121.69—and for that they're proposing that I do 817 hours of community service. And if I don't, they're going to put me in prison.

Chantale Collard

What are you going to do?

François Amalega

As far as I'm concerned, I'm not going to help them sweep their crime under the rug. Because it's important to know that on May 12, 2023—today—the Quebec government is still prosecuting people for non-compliance with health measures, so it's not over yet. Because right now there's a possibility of arrest, and not only that: there are other people who have, for example, made agreements with the government. I'm not condemning them—people live in different situations—but the government is collecting money. In other words, there are people who have decided to pay \$50 every month for this. So that means that COVID-19 isn't finished: because they haven't stepped back from it.

And I can't wait to see the judge who's going to sign my arrest warrant. Because the judge who's going to sign the arrest warrant is definitely condemning himself. I have fully forgiven all the people who, in their confusion, committed acts in 2020 and even in 2021. But the judge who, in 2023, signs my arrest warrant—of course, I will surrender peacefully—but that judge, Quebec should clearly remember that this man has written his name among the greatest criminals of all time. This is not a game, because when he signs my arrest warrant, it's not because I was driving 120 kilometers an hour and hit a pregnant woman. No, no, he's going to sign an arrest warrant because I didn't wear a mask in the demonstrations, because I didn't respect the curfew, and so on. So that means that, in 2023, this judge will be saying that the government was right to do what it did. So it's important to know, and even those who are collecting the \$10 and \$20: they're condemning themselves now because things can't stay the way they are.

[00:30:00]

So by refusing to take a step back and instead continuing to commit their crimes, they are definitely proving that they don't regret what they're doing. So I'm eagerly awaiting my arrest warrant and the first thing I'm going to get is the name of that judge. It's clear that Legault has been condemned, but that judge is also writing his name among the guilty, so it's very important that he knows that. And I think that before he picks up his pencil and signs, he should tremble and step back because it's not just Amalega François he is attacking.

I say this because there is, for example, the trial of Professor Patrick Provost which, for me, is not the trial of Patrick Provost: it's the professor against the science. In other words, someone doesn't even have to say things accurately, but the discussion must take place. Meaning that it's through the confrontation of ideas that the collective intelligence creates something that none of us would have achieved otherwise. That's why whoever signs my arrest warrant will be saying that he approves it.

But I think that if a judge is pressured to sign my arrest warrant—if he thinks there should be a debate on COVID, I'm not even saying if he thinks I'm right, no; if he thinks that, in 2023, we should take a step back and look at what's going on—if a judge is pressured, I think he should resign. So if a judge signs my arrest warrant, he should know that he has no excuse. We're going to forgive him in our hearts but we're going to make sure that he's judged to the full extent of the signature he's provided—because what he's about to do is very serious.

Chantale Collard

Absolutely. Listening to you, there aren't many people like that who follow through to the end. You're a man of principle and you've been called a lot of names, but today you have a chance to answer them, and you've largely answered. But there is one question: what do you say to all those who have called you a conspiracy theorist? What do you say to them today, on May 12, 2023?

François Amalega

I think that if a man refuses to let his wife look at his phone and his wife finds odd pictures of him, finds him acting strangely and such, and then he doesn't want to give his wife any explanation—he instead says she's crazy, he talks nonsense and so on, while his wife pieces together a puzzle, and it shows on her face that she knows something's wrong—I think this is just someone avoiding confrontation because he knows he's in the wrong. That's exactly the situation we're in right now and there are so many factors.

And I say this: COVID-19 is a medical issue, but then there is the “Lancet-gate.” In other words, you see an article appearing in the world's biggest academic journal saying that hydroxychloroquine doesn't cure it, for the purpose of discrediting Raoult and all the people who are with him. But afterwards, we realize that the data are false and it is retracted; and we even realize that the director of human resources is a porn actress. And *The Lancet* writes afterwards that they made a mistake. Meaning: I don't need to be a doctor to see that it's a commissioned article.

I don't need a mistake to see that the article from someone like Ferguson—who encouraged compliance with health measures— was later found to be false. And you find that during the health measures, he committed adultery twice with a married woman, disregarding the health measures. I mean, when you see that, you think, “These people don't believe in it. They're talking nonsense.”

So when we gather all this evidence to say, “Look, your mandates are contradictory, there's no truth, and all that,” and then I'm told that I'm a conspiracy theorist— But as soon as you refuse to have a debate, a discussion, as soon as you create murkiness in a subject, it's clear you favour the other. So among us who contest the measures, some are moderate, others are a little less moderate, others go far. But all this happens because of the lack of transparency. So if someone believes even very serious things, that is much more excusable than the government making things deliberately opaque. So no, I think the word “conspiracy” is just a word created by weak people to discredit solid arguments against them.

Chantale Collard

The argument of the weak: labelling.

François Amalega

Absolutely. It is the argument of the weak. In fact, they're the weak ones. We're much stronger than they are because we're in the truth. Listen, if you do something bad, the look in a five-year-old's eyes will make you tremble because you're wondering, "Did he see what I did?" So that's the situation we're in right now.

[00:35:00]

They can have all the weapons they want but I don't think they have that many. They mostly operate through intimidation. And one of the lessons I've learned from this is that in the fight for justice, you can't be moderate. You can't be moderate because it's with the use of microaggressions that they just keep gaining ground.

Personally, I think that perhaps I ought to have been a lot more vocal from September 2020 onwards because I was only posting on my Facebook and chatting with friends and such. But the issue is that when you don't allow microaggressions and you stop things early on, these people will also have difficulty moving forward. They're nothing but people who work through intimidation, lies, that's all. They don't have any more power than that.

Chantale Collard

Thank you.

François Amalega

Thank you very much.

Chantale Collard

Thank you. Listen, maybe I'm like many others. I listen attentively and your words carry an air of truth and authenticity that we very rarely see in people. Perhaps our commissioners will have a few questions for you.

Commissioner Massie

Thank you, Monsieur Amalega, for your testimony. My question, in fact I only have one, is: Where does your inner strength come from? Does it come from your culture? Does it come from your personal journey? What gives you the courage to express your opinions with such firmness and kindness?

François Amalega

I think there are two main things: there's my faith in God, and there's also the fact that I've been exposed, in a way, to untruths. In fact, I've been convinced that certain things that are officially said are not true. That did predispose me. Personally, I followed things like the Kennedy assassination. When I was growing up, we were told that the ozone layer was going to disappear and that the world was going to burn and all, and September 11th and all that. There were a number of things that made it clear to me that what we were being told wasn't true.

And then, I remember when I was at Brébeuf, I asked a colleague—since I had had discussions with this colleague on a number of subjects—and one day I said to him, “What is the unfinished pyramid doing with the little eye on top of it on the one-dollar bill?” One day, I asked him, “I want you to explain that to me.” I don’t have an explanation but I said to him, “How do you explain that?” So I mean, there is the fact that I’m exposed to these things that have no explanation.

And the biggest problem is telling people there are bad questions. When I go into a class as a prof, I tell my students that there are no bad questions because I hope that when the student leaves the class, he won’t say Monsieur Amalega told him such and such. No. But rather, that he’ll say, “This is true because I can prove it.” So the fact is that I had been exposed and it was clear to me that there were a lot of things being said that weren’t true.

And then, the second thing too: I believe in God. And for me, human authorities are very important: I believe they are appointed by God. They are very important and must be obeyed, but they themselves are answerable. So that means there’s an authority above human authorities; and for me, that’s a very important thing.

Commissioner Massie

Thank you very much.

Chantale Collard

Thank you again on behalf of the Commission. There is one question.

Commissioner DiGregorio

Pardon me, I’m going to ask my question in English; Doctor Massie will translate. You spoke about your time in jail and how you were treated differently from the other inmates. And I’m just wondering if you know what crimes those other inmates would have been in for, what types of crimes?

Commissioner Massie

So the question is, you spent time in prison and, according to your testimony, you were treated differently from the other prisoners who were there.

[00:40:00]

And the question is: What kind of crimes did the other prisoners who were in the same place commit compared to your crime?

François Amalega

So Bordeaux prison, one of the prisons that I was in for three months and three weeks, has two types of prisoners. There are prisoners who received sentences of two years less a day. Generally, it’s theft, things like that, or someone who was perhaps violent towards his wife, arrested, and then sentenced. And there are those who are awaiting trial. So they’ve been deemed dangerous; they can’t release them, they’re waiting.

And there, I met people who had committed murders, who had killed several people. So there are people who have committed murders. I remember once talking to a guy who was

very big, very strong. He was there because he had hit a gentleman who ended up in a coma. So he had hit him; he was very violent and everything. Listen, it's really— There are several people who committed horrible crimes inside. They dealt drugs, they did things. And all these people are there, in prison, and you have to be there with them because you refused to submit to health measures.

I believe that the government and all these people have committed crimes. We all want to turn the page, including me, but the problem is that if the page is turned without having resolved the issue, that means more harm can be done in the future. So we mustn't turn the page without really— That's why I think a commission like this is so important. Crimes must be identified. Things have to be stated clearly.

Commissioner DiGregorio

Thank you. Merci.

Commissioner Kaikkonen

Thank you for your testimony. I'm just wondering if you think there's a spiritual climate change that needs to be addressed in this country?

Commissioner Massie

So the question is, should the spiritual crisis we're currently experiencing in our society be examined, or at any rate, should we try to find solutions to this spiritual crisis?

François Amalega

Honestly, I do. I believe that creating a purely material world in which people have no hope is brutal. And I think this is sustained. It's sustained because—at least when I arrived in Quebec—when I wanted to talk, people told me that we don't discuss politics and religion. But this is quite extreme because politics and religion are the most important subjects in society.

When we don't discuss politics and religion, we can talk about hockey, we can have fun, we can do anything and everything. Yet politics and religion are still the main subjects because, even when someone says that they don't believe in God and they're an atheist, that is a religious subject. I mean, when you exclude all that, it means you're excluding very important subjects: politics, religion. The rest are low-grade subjects. We're just having fun, laughing with each other and all that, but it separates people.

And what really happens is that the government takes God's place. As a result, some people have nothing else because there's nothing beyond the government. So without necessarily having one religion—because I think it would be a bad thing for one religion to dominate; it would be pointless—but I think that driving faith and religion out of the public square is a job that has been and continues to be carried out methodically. And I think it produces people who put all their hope in the material world and in their lives. And I think they'll do anything to keep that, because they've lost all hope. And I think it's something important.

Commissioner Kaikkonen

Thank you, merci.

Chantale Collard

François Amalega, thank you sincerely, from the bottom of my heart. Your testimony has touched many, including myself. We understand that it's a spiritual battle—I wouldn't say that you're fighting but that you are firmly rooted in your values, in your convictions—and the truth will most certainly come out.

[00:45:00]

I won't tell you: "Let's keep going." I'm going to tell you, "Carry on, carry on!" And by all means, you've given us hope today. Thank you.

François Amalega

Thank you very much.

[00:45:50]

Final Review and Approval: Erin Thiessen, November 12, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-translations/>

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE*

Witness 14: Shawn Buckley

Full Day 2 Timestamp: 11:03:24–12:01:45

Source URL: <https://rumble.com/embed/v2ktd8s/>

[00:00:00]

[inaudible to 00:00:18]

Louis Olivier Fontaine

So tonight, we will have a testimony by Mr. Shawn Buckley. So good evening, Mr. Buckley.

Shawn Buckley

Good evening.

Louis Olivier Fontaine

First of all, I will ask you to identify yourself by stating your full name.

Shawn Buckley

Yes, my name is Shawn Patrick Buckley.

Louis Olivier Fontaine

Okay. Now, I will swear you in. So I will ask you to swear to say the truth, the whole truth, and nothing but the truth.

Shawn Buckley

I do.

Louis Olivier Fontaine

Tonight, the object of your testimony will be the changes to the drug approval test for COVID vaccines.

* Because the testimony took place entirely in English, the transcript is drawn from the English language video, which can be heard without a French voice-over – editor.

Maybe first of all, I will ask you to explain how your background is relevant to this testimony, this presentation.

Shawn Buckley

Okay. Before I do that, can I just deal with a bias issue?

Louis Olivier Fontaine

Yes, of course.

Shawn Buckley

Yeah. The Commissioners and some people that will be watching will know that I've been counsel on these matters at some of the hearings, and also that I've been involved in some of the organization of the National Citizens Inquiry.

And so the bias issue is that when you know somebody, and especially if you might have positive feelings or work with them, you're more inclined to find them believable. So it's kind of like a positive bias that we need to guard against. I wanted to get that out in the open, both for the commissioners and anyone watching, to basically be aware that there is that bias. It kind of forces you to take the position where you're not going to find me credible, but you have to apply your critical thought before you accept my testimony.

Now, the one saving grace is that I'm really just talking about: What does the law say? So I'm going to throw some slides up saying, "Well, here's the drug approval test normally and here's the test that was substituted." And this is very easy for anyone to verify.

So my testimony is going to be very technical. And then also, we have entered—as Exhibits QU-2 and QU-2a—a French and English version of a discussion paper that I had written on this subject for a non-profit association called the Natural Health Products Protection Association. And at the end of that discussion paper, there are links that make it very easy for people to follow to the drug regulations, to this interim order that I'm going to discuss.

We wanted to have another lawyer who is a drug approval expert come and testify but they're far and few between, and none of them have actually looked into the interim order that we had contacted. So here I am as the only one I know of in Canada that's looked at this issue. But it's so pressing that we felt the need to put this evidence in front of the commissioners and the public, but have those caveats in place.

To my background: I was called to the bar of British Columbia in February of 1995 and I've been a member in good standing ever since. Very early on, so probably starting about 1995, I started to have clients dealing with *Food and Drugs Act* matters. And probably 40 to 50 per cent of my entire career has involved dealing with the *Food and Drugs Act* and Regulations, largely defending companies and practitioners that practice alternative medicine and, specifically, manufacture or sell natural health products. I think there was about a seven-year period where I defended everyone that had charges in Canada that would fit into that description, so I've got extensive experience. I've been called as an expert in food and drug regulation on the Standing Committee of Health; I've been called as an expert in constitutional law in the Senate, so I've got a lot of experience in the area.

Louis Olivier Fontaine

So how many lawyers would have that kind of experience in Canada, according to you?

Shawn Buckley

Well, as far as defending people, I probably stand alone.

[00:05:00]

With my level of expertise in the *Food and Drugs Act* and Regulations in the area of natural health, I'm probably number one. But generally, if we were to move more into the new drug approval process, I would guess about ten.

Louis Olivier Fontaine

Okay. So the first question I would be asking you would be: What are the normal regulatory requirements for the approval of drugs such as the COVID vaccines?

Shawn Buckley

Well, okay. So now, assuming that nothing happened— Because the approval of the COVID vaccines became a political issue, not a health issue. So if that hadn't happened, we have new drug approval regulations. For a condition like COVID, you would fall under the new drug approval process, and anyone wanting to look at the drug regs you'd look at C.08.001 and just go from there. As long as you're at C.08, you're in the zone.

And they're very simple. What you basically need to approve generally, to get market approval to introduce into the human population a new drug, is you have to prove it's safe. So you have to establish its risk profile. So how safe is this? You've got to completely satisfy the Minister that the drug is safe. And then you have to deal with its benefit profile. Is it effective? Does it work? Because there's no point introducing in the human population a drug that doesn't work for the purpose you're trying to use it for.

And then, although it's not written into the regulations, the third thing that happens—and it happens as a matter of common sense—is: now that we understand the risk profile, and now that we understand the benefits profile, do the benefits outweigh the risk? Because, again, there's no point allowing a drug onto the market if the benefits don't outweigh the risk. Now, one thing that people need to understand: you cannot get to the risk-benefit analysis unless you've established the safety profile and unless you've established whether it works. If you haven't gotten there, you can't do a risk-benefit analysis, and pretending that you can is a fraud. I just point that out because these three things are the minimal requirements for a health decision for drug approval.

So if the purpose is deciding, "Do we allow a drug onto the market or not?" the minimum requirements, if you're actually making a health decision, is establishing whether it's safe, establishing whether it's effective, and then doing that cost-benefit analysis where the benefits outweigh the risk. Anything shy of that and you can't call it a health decision. It's how we know that— it's one of the things we know that tells us this was a political decision to approve the vaccines.

And I'll just go on and explain. Here, I've just set out what the regular process is, but the Trudeau government made a political decision that they wanted all of Canadians to become vaccinated. And I say this with— And I'm going to use this interim order as an example but

I mean, we lived through mandates. So we had the federal government tell us that we couldn't fly or go on a train unless we had a vaccine. They told us that we could not be federal civil servants or contractors for the federal government unless we took the vaccine. They used fiscal and other means to encourage provinces to follow suit and to encourage private industry to follow suit. And we've had public health officers, both provincially and federally, say the mandates were in place to encourage people to get vaccinated. So we know there's a political decision to try and get every Canadian vaccinated. Well, we have a problem with our regular drug test, because if we're going to apply the regular drug tests to the COVID vaccines, they have to be able to pass that test. But if you're making a political decision, then you've got to come up with another test.

So on September 16th, 2021, an interim order was made. Now, our *Food and Drugs Act*, section 31.1 has a provision that allows the Minister of Health, in certain conditions, to exempt a drug or a class of drugs from the application of parts of the Act and Regulations. And so the Minister of Health made an interim order under section 31.1 of the *Food and Drugs Act*,

[00:10:00]

basically setting out that COVID-19 drugs, which includes the vaccines, don't have to go through the regular drug approval process. And it actually then created a different process— so a different set of laws— that applied only to COVID-19 drugs. Now, the Minister of Health can make the order, but it's only good for 30 days unless it's approved by the Governor General in Council. Now for those of us that aren't lawyers, when you read "Governor General in Council," you know that means the federal cabinet. So the Prime Minister and the other ministers: Minister of Health, Minister of Finance. That's for colloquial terms: the Governor General in Council. So the Trudeau government, the Cabinet, made a decision to approve this order and it was approved and it was published in the Gazette, so it's good for a year.

Now, basically, the order tells us that this is a political decision. Because what the test is— And I'm going to put it up on the screen and show you in detail, but it doesn't require proof of safety. In fact, the word "safety" isn't even mentioned in the test. It doesn't even mention safety in the test, which we'll all find interesting from our messaging, right? Because we've been told the vaccines have been proven to be safe and effective. I'll explain that that's political messaging. So there's not a requirement for the drug companies to prove that the vaccine works. In fact, the word "efficacy" or "works," that type of language, isn't in the interim order at all.

A couple of other interesting things happen that tell us this is a political decision to get Canadians vaccinated. The interim order exempts the application of certain parts of the drug regulations. Now, in Canada, you cannot import a drug unless it's been approved of by Health Canada. So if you're making the drug in Canada, you've got to get it approved before you can sell it, but you can't import finished drugs for human consumption unless they've already been granted market approval. Well, this interim order exempted the federal government from this so that the federal government could purchase, import these vaccines, and distribute these vaccines before they're approved.

Understand what happened is: the federal government imports COVID-19 vaccines; the Canadian government distributes them to the provinces; and they're not approved. And this is written into the interim order before anyone has filed a submission to have the vaccines approved. So the federal government, the Cabinet—when they're writing this, they have no idea whether these are safe. They have no idea whether they're effective. They

have no idea whether this is a good idea or a bad idea when they write this law, and they wrote themselves into a conflict of interest. It's a bit of a conflict of interest to import a whole bunch of drugs, distribute them through the provinces, and then wait for yourself to approve them. But if it's a political decision, then this makes perfect sense.

The one that really I find interesting is, in our regular drug approval world—and its regulation C.08.006—the Minister of Health has a really, really important power that should never, ever be taken away. And the problem we face is that the Minister can approve a drug for the market. But what if we learn after it enters the market that it's unsafe? I mean, Vioxx comes up as an example where we learned after the drug was approved that it was causing deaths and it was eventually withdrawn from the market. So this regulation C.08.006 allows the Minister to withdraw from the market a drug that's already approved for several reasons. So for example, let's say subsequent evidence shows it's not safe. What if subsequent evidence shows that it's not effective? What if it comes up that fraud was used to get the drug approval? The Minister can withdraw the market authorization. But curiously—and listen carefully, because you have to ask yourself how this is in the public interest—for COVID-19 vaccines, this interim order, this new way that they're going to be approved, took away from the Minister for a year the power to withdraw the vaccines from the market if subsequent safety concerns arose, or if evidence came to light that they didn't work,

[00:15:00]

or if evidence came to light that the application was based on fraud. Now, that's not a health decision, to remove that power from the market. It tells us that the decision to approve the vaccines was a political decision, not a health decision. Now, if you don't mind, I'll just walk through and actually show people the law because it's quite shocking.

Louis Olivier Fontaine

Go ahead.

Shawn Buckley

David, now if you could throw the slides up [Exhibit QU-2b].

So the first slide, all this is, is every time Health Canada approves a vaccine, they create a webpage for it, where they put the information about the approval and other information. And I've just taken the French and English first page of the Pfizer vaccine to use as an example and I've highlighted the first sentence. Now, I can tell you— I mean, I took these screenshots maybe last week. The date will be on the bottom of there, so it's in this month. But if you had looked last month or a year ago or two years ago— As long as the Pfizer page has been up, it starts with the same sentence. And that sentence is: "All COVID-19 vaccines authorized in Canada are proven safe, effective, and of high quality." And that bold is Health Canada's bold. I put the highlighting on, but they've put this in bold.

Now, I've already told you that these vaccines are approved under a test where you don't prove safety and you don't prove efficacy. So you might wonder why that language is there, but that language is political messaging. And it's essential political messaging. Because if you made the political decision that you are going to try and get every Canadian possible vaccinated, you have to have political messaging that supports the decision. And this is the minimal political messaging that will support Canadians getting vaccinated.

Could you imagine if Health Canada communicated the truth that the vaccines are unsafe? Or what if they said, "We don't know if the vaccines are safe?" That is not messaging that is consistent with getting your population to take the vaccine. What if the messaging had been "Well, the vaccine isn't effective." Or "We don't know that the vaccine is effective." That's not messaging that is consistent with the political decision to have people vaccinated. A lot of us have been confused, within the drug approval world, with messaging like this. And it's just simply a failure to realize that this is political messaging that is absolutely necessary. It's essential for the political goal, which was to have us vaccinated. And I'm not second-guessing the political goal. I'm just pointing out that that's what this messaging supports.

Now, the next photo: I want you to pay close attention to that rabbit. Because when I'm done this presentation, that's going to be your expression. You're going to— Your mouth is going to be open. And if you had paws, they are going to be grabbing the ground in sheer terror.

So this I've already said, I've pulled this out of the discussion paper. But it's just where I point out and I've highlighted what I've already explained to you. But there's maybe a couple of other points I can make before we go on to the actual text of the legislation. So I've said, "Listen, you've got to prove something safe. You've got to prove it's effective and you have to prove the benefits outweigh the risks." But where I could strengthen this is I've put in here the word, "objective." So they've got to objectively be proven to be safe. And we will go into the legislation where this is very clear, and there's got to be objective evidence that they work. And I think I've already explained the cost-benefit. You cannot— You just simply can't do that analysis unless you've proved safety, unless the risk profile is known, unless the benefits profile is known.

So this is the test. We just have the French test— This is straight out of the drug regulations, the French test on the left and the English test on the right. So C.08.002(2): "A new drug submission shall contain sufficient information and material to enable the Minister"—and this is the important part—"to assess the safety and effectiveness of the new drug, including the following—" and then there is a long list. You know, right down to ingredients and brand name and things like this.

Now, I'm going to get to— I've reproduced g) and h), which are two parts.

[00:20:00]

But that red part is really the important part. You have to understand that in the regular drug approval process, you've got to do all these things, but they are to help the Minister assess the safety and effectiveness of the drug. That's what the Minister's looking at: safety and effectiveness. Everything you do in the new drug approval process is to give the Minister sufficient information to enable the Minister to assess safety and efficacy. I put ellipses there because, like I say, there's a), b), c), and a whole list of things, but when we get to g), remember the word "detailed reports." So this is our regular process: "detailed reports of the tests made to establish the safety of the new drug."

So in the regular process, to enable the Minister to assess safety and efficacy, which is what it's all about, you've got to have detailed reports about safety and h) substantial evidence of the clinical effectiveness. So "substantial evidence," and this is, again, to help the Minister assess safety and efficacy. The point I'm trying to make is: in the regular test, it's all about safety, it's all about efficacy, and it's robust evidence. We're talking detailed reports, substantial evidence.

So I've told you, "Okay, but wait a second. This doesn't apply to COVID-19 vaccines. We have a new test." I'm just going to jump it. So back—remember we see this C.08.02? I'm jumping up two slides and I've just moved it to the bottom left, okay? So bottom left, that's what we just looked at. And if we move to the bottom right, we are now looking at the interim order and what it's supposed to focus on. And I put in red what's important here.

So on the left, our regular drug approval test, it's all about "sufficient evidence and information materials to enable the Minister to assess the safety and effectiveness of the new drug." Under the interim order, "contains sufficient information and material to enable the Minister to determine whether to issue an authorization." Do you see the word "safety" or "efficacy" there? So safety and efficacy is the focus under the regular test. But for COVID-19 drugs under this interim order, the focus is just: can we enable the Minister to issue the authorization?

Now remember, this is a political decision. And there's a long list of things to provide here. The only thing in that list concerning safety and efficacy is this o): "the known information in relation to the quality, safety, and effectiveness of the drug." Compare that over to the other side, g) detailed reports, substantial evidence. So instead of detailed reports on safety, instead of substantial evidence of effectiveness, the only requirement is to give the known information in relation to the quality, safety, and effectiveness of the drug.

It gets worse. Because you don't even have to provide the known information. Under the interim order, section 3(2): "If, at the time an application is initially submitted to the Minister, the applicant is unable to provide information or material referred to—" And then there's a list and I've highlighted (o). You basically don't have to. You just have to, in your application, explain to the Minister how you're going to get it to the Minister later on.

It's shocking.

Now, the next slide: this is the test. And I've highlighted the words "must issue," because this is really important. Remember, the focus isn't safety and efficacy, it's whether or not the Minister can grant an authorization. Now 5, it says: "The Minister must issue an authorization" basically, if these a), b), and c) are met. It's not "may." And the Minister's Health Canada. It's not like the Minister of Health sits down and does this, it's the Health Canada bureaucracy that does this.

So Health Canada must issue an authorization if this test is met. Now what's important about this is: Health Canada could believe it's not safe. Health Canada could believe the vaccine doesn't work. Health Canada could believe this is a bad idea, that the benefits do not outweigh the risk. And yet if this test is met, Health Canada has to, by law,

[00:25:00]

issue a market authorization for a COVID-19 vaccine.

Now, the first one, a), just basically refers to—we've already looked at 3, you've got to do this submission. So that doesn't really concern us. The second one is, there's some sections where the Minister can ask for some more information. The real test is c). So c) at the bottom, I'm just going to bounce ahead two slides where that's bigger. But c) begins "the Minister has sufficient evidence to support the conclusion—" That's the test. This is the wording that the COVID-19 vaccines are approved under.

So I'm just going to skip ahead to where I have that bigger. We've got the French wording on the left and the English on the right. I should just say that the French wording in the interim order is different. And it's a little different than that, and if you look at the French discussion paper, it will become apparent. In Canadian law, if you're trying to figure out what the meaning of a law is you look at both the French and the English versions because they're of equal value. And you're supposed to use both to inform yourself of what the meaning is, and that's what courts do. I'm going to show you later on that Health Canada, for the purposes of approving COVID-19 drugs, have full stop used the English wording—so the test as it's set out in English. I'll show you a piece from an affidavit where that is crystal clear. But I just wanted, for the purpose of the presentation, how anyone pulling up the French version will see that it's a little different than the first point I make in English.

This test begins: "the Minister has sufficient evidence to support the conclusion—" And I'll just stop there because this is really clever language. And this is language meant to deceive us and this is language that tells us this is a political, not a health, test. Because if you were— and remember, the Minister is Health Canada— if you were supposed to prove something to the Minister, it would read, "The Minister has sufficient evidence to conclude." So do you understand this? Let's say Pfizer's making an application under this test. If Pfizer has to convince Health Canada of anything, it would read: "The Minister has sufficient evidence to conclude."

I put this on the next slide. You see on the indenting there, the English side is on the right. The wording in the test is, "The Minister has sufficient evidence to support the conclusion." That doesn't mean that Pfizer has to convince Health Canada of anything. If Health Canada had to conclude this, if it was an objective test, it would read where I have that indented below: "the Minister has sufficient evidence to conclude." And this is important. Because if Pfizer has to prove something to Health Canada, if it read, "the Minister has sufficient evidence to conclude," we may still be in an objective test. We may. But what does "sufficient evidence to support the conclusion" mean? I went to a dictionary; I went to a thesaurus. I mean, "conclusion" is synonymous with "argument." Like, I think we're in a pure subjective test here: the Minister has sufficient evidence to support the conclusion, not even their conclusion. So it means Pfizer just has to make the argument for what follows.

Let's go back to the test. So what follows then? "The Minister has sufficient evidence to support the conclusion that the benefits associated with the drug outweigh the risks, having regard to the uncertainties relating to the benefits and risks and the necessity of addressing the urgent public health need related to COVID-19."

Whoa, that's clear, isn't it?

I'm just going to jump ahead. One thing that's really interesting to note there— And like I say, this is the test. Not only does it not require there to be proof that the vaccine is safe, the word "safety" doesn't even appear in the test. The text is there for you to read. The word "safety" doesn't appear at all.

Jump to the next slide. We can say the same with "efficacy." So not only does the test not require proof that the vaccine works,

[00:30:00]

it doesn't even have language. It doesn't have the word "efficacy," or "works," or "effectiveness."

Now, I'll just stay at this slide. It uses risk-benefit language, which is again clever— whoever drafted this spent a lot of time. So it uses risk-benefit language without actually requiring there to be proof that the benefits outweigh the risks. And it's subtle, you have to look at it for a while. And remember I was pointing out, you actually can't do a risk-benefit analysis if you haven't established the risk profile, you haven't proven safety, and you haven't proven efficacy. You haven't set out the benefit profile. It's impossible to do a risk-benefit analysis without establishing the risk profile and the benefit profile, which is what you do in the regular test. But again, it's not that the Minister has to conclude; there just has to be an argument that the benefits outweigh the risk. Now, I'll stop.

In the regular drug approval world, if Health Canada's not sure: "Wait, I don't know if this is safe. I've got evidence suggesting it's safe, but I'm really unsure," it stops there. You're not going to get a drug approved if Health Canada isn't confident, reasonably confident, about what the safety profile is. And the same with efficacy. In the regular drug approval world, if Health Canada finds itself after reviewing an application: "Well wait, there's some evidence that shows it works, but it's really not clear, I'm not sure." If there's any doubt, it stops there. They're not going to let a drug into the human population when they're unsure. And yet here, because this is a political test— Remember I told you the bare minimum for a health test? Understanding safety, understanding efficacy, and then doing a risk-benefit analysis: that's the bare minimum. I mean, I could sit here for two or three hours and explain how that's really even insufficient for good health outcomes, but that's the bare minimum for a health decision.

But this test tells us this isn't about health. So after it tells us, "support the conclusion that the benefits associated with the drug outweigh the risks," listen to this next part: "having regard to the uncertainties relating to the benefits and risks." In the regular world, if there's any uncertainty about benefits and risks, there's no way there's approval. But here, Health Canada is being told. And if Pfizer meets this test, they have to approve. Remember, there's no discretion here—this is mandatory. There has to be an argument that benefits outweigh the risks and, by law, you have to take into account that you might not know the benefits and risks. It's, "having regard to the uncertainties." And then it's kind of like— It's almost an impetus to approve because, by law, they have to take into consideration "the necessity of addressing the urgent public health need related to COVID-19."

Now, how does that end up in a drug approval test? Basically, telling us we have an urgent need. So you mean: we don't look at safety, we don't look at efficacy, we don't actually have to have proof the benefits outweigh the risks, and you're telling us to approve anyway? This is a totally subjective test. It's not objective at all. It can in no way be described as a health test, a test that's supposed to help us health-wise.

And this slide just explains what I just said. It uses risk-benefit analysis without actually requiring proof of benefit and risk. And logically, you can't do that. I mean, I basically call it a fallacious test because it is. The test is logically inconsistent with itself, if you understand drug approval regulation at all. So any lawyer that's a drug approval expert looking at this will go, "Okay, this has nothing to do with health. This is a political test." And I've already told you that the Minister had to approve if unsure.

Now, this slide is important because remember I told you, the French version is a little different than the English version. There was a Federal— There actually were a number of Federal Court decisions. And the Health Canada employee, Celia Lourenco, who was the final approval on every COVID-19 vaccine in Canada, she swore an affidavit that ended up in the Federal Court and filed T-145-22.

[00:35:00]

And in it, she discusses her approval of two of the vaccines. And this is her paragraph for the Pfizer vaccine. But her paragraph for the other vaccine is very similar. And I kind of cut out the first part, where she's given us the dates and stuff like that, and got to the juicy bit and put it in red—just to emphasize that she's clearly telling us she's using this test in the interim order.

“The evidence supports the conclusion”—oh, that’s our wording, isn’t it? —“that the benefits associated”—the test says, “with the drug,” well, they’ve just thrown in the name of the drug. So “the evidence supports the conclusion that the benefits associated with the Pfizer BioNTech COVID-19 vaccine outweigh the risks, having regard to—” Remember, the test is “the uncertainties concerning the benefits and risks,” which she tells us what the uncertainties are now: “having regard to a shorter term (median of 2 months) follow up of safety and efficacy at authorization.” That is a shamelessly small period of time, a median of two months, to assess safety and efficacy. And she carries on, “and the necessity of addressing the urgent public health needs related to COVID-19.”

So her affidavit is the smoking gun that tells the world clearly that Health Canada approved the COVID-19 vaccines using the interim order test. Because, make no mistake, Pfizer and the other companies could have applied under the regular test, but they didn’t.

Now, there was a little bit of a shell game played. Remember in the United States, there was the Comirnaty kind of thing, where they applied under the regular test with a vaccine with that name but then they never made that vaccine available. So if you were getting the Pfizer vaccine in the States it was the one under the emergency order, but you might think that it was the one approved under the regular test.

We did it a little differently. We approved it under this interim order. But the way our law works is, if Cabinet approves an interim order within the 30 days and then it’s gazetted, it only lasts for a year. So before the year ran out, what the Trudeau government did is they actually took the test in the interim order, they took most of the provisions—not all of them—and they moved them into our regular drug regulations. And they tweaked it a little bit, but the slight tweaking of wording really is of no consequence. So now, in our regular drug regulations—that’s C.08.001 and onwards—we have the regular test that applies to every other drug. And then we have this test from this interim order that applies to COVID-19 drugs.

And once these were added into the regular drug regulations, Pfizer and the other companies reapplied for a regular DIN, a regular Drug Identification Number, and it was reported in the media, “Well, they’ve reapplied under the regular drug regulations.” And so **everyone thinks they’ve gone through the regular testing when they just basically relied on having passed the same test that they were applying under before. So our smoke and mirrors on the Canadian public was a little different.**

This last slide is just again emphasizing the one point I made earlier. Because it truly is amazing to think that here the Minister—in our regular drug regulations—has the power, if a safety concern comes up or an efficacy concern comes up, to withdraw a drug from the market. But for a year that power was taken away from the Minister for the purposes of COVID-19 drugs. Now, that power’s back now, that time period has expired. But if this was about health you’d go, “Well, that’s not consistent with health, withdrawing that power.” But if you understand, no, this was a political decision where we wanted Canadians to get the vaccine, and it wasn’t a health decision, then it makes perfect sense.

So that's really all I wanted to say. I didn't need to be long or anything like that. And I think I stuck to what the law said.

[00:40:00]

So people can verify and go and check out that this really is the wording and what I'm saying really is in there.

Louis Olivier Fontaine

So thank you, Mr. Buckley. Maybe the Commissioners have questions for you.

Okay, no questions, so— Oh, sorry.

Commissioner DiGregorio

Thank you, Mr. Buckley, for giving us that presentation.

As a lawyer and as a tax lawyer, I read legislation all the time and so I'm very familiar with the tricks that can be played with words and how important every single piece of word in a legislative test is. You mentioned having to prove something versus just having an argument for something. You discussed having a requirement for the Minister to approve something versus just giving the discretion to the Minister to approve something, and so what you've demonstrated to us here is really quite shocking to me. Sorry, that's not a question, that's just my first comment on what you've said to us.

So, if I can just take you back a little bit to the regular drug test and the three requirements that you talked about—which is, proving safety, proving efficacy, and then doing a risk versus benefits weighing—who is it that those things have to be proven to? I know you said Health Canada, but is there a board established that does that or what does that look like?

Shawn Buckley

I think it depends on the drug and kind of the severity and ranking. Health Canada has a number of drug-approval scientists. For a regular application, it would just go to one of those scientists. I mean, it might be a collaborative effort. The COVID-19 vaccines, my understanding from Cecilia Lourenco's affidavit was, I think there was a team of 23 people—it was 20-something, I think it was 23— that she said her team was. And then they also seem to rely on recommendations outside of Health Canada.

Now, the interesting thing is, it depends— Again, because drug approval has been political for a long time— I don't know if you're aware of a former Health Canada drug approval scientist Shiv Chopra. He and I became friends. He's deceased now, but he wrote a book called *Corrupt to the Core* about Health Canada and he had become a whistleblower and forced the Senate to call himself and three other drug approval scientists to the Senate about, basically, corruption at Health Canada. One of the drug approval scientists, Dr. Margaret Hayden, gave an interview to the CBC after testifying in the Senate. And she said something that should concern all Canadians. She basically said, "Look, after you've been at Health Canada long enough as a drug approval scientist, you basically learn how they're going to get around your decision not to approve a drug."

Understand, this is a drug approval scientist that's hired by Health Canada to basically apply this test about safety and efficacy. And that person concludes the benefits don't

outweigh the risks, this is a bad idea, we shouldn't do this. And then what happens is the management, who invariably are not doctors or scientists, will appoint an outside counsel—so outside of Health Canada—a panel of experts to reassess. And then that panel will approve the drug and you won't know who voted "yes," who voted "no," so there's no liability on this panel. There's no liability on the management, who doesn't make the decision, but based on the panel recommending that Health Canada will approve the drug. And she was saying, after you've been at Health Canada long enough, you know that's how they're going to get around their own people's decision that it's not a good idea to approve a drug. So we've been facing political decisions for a long time. This just went to a different level.

Commissioner DiGregorio

So perhaps that panel isn't necessary when you have an interim order.

I wanted to take you to the language on the website, the Health Canada webpage you showed us, and that particular bolded language about all COVID-19 vaccines are proven to be safe, effective, and of high quality.

[00:45:00]

And how you've shown us that that is inconsistent with even the language under which they've been approved in Canada. Should the website say that they've all been— What is the language, "there's sufficient evidence to support a conclusion that the benefits outweigh the risks," yada yada yada? Would that be a better statement to have on those websites?

Shawn Buckley

It would depend on the purpose of the website. So, if the purpose on the website is to support the political decision to have Canadians vaccinated, I think the language they have there is the minimal political language. If the purpose on the website is to communicate truthfully—basically, what was and what was not proven—then yeah, I agree that they should follow the language in Ms. Lourenco's affidavit.

Commissioner DiGregorio

Yeah, I'm not sure that all of the "safe and effective" messaging that we heard across the country in 2021 would have flown quite as nicely over the tongue if you had to repeat that entire giant test.

Shawn Buckley

Well, that's why I say this is the minimal, what's there is the minimal language for the political goal. Regardless of where you are in the conversation on COVID, who would support all these restrictions—which are premised on the vaccine being safe and effective? I mean, we're not going to accept restrictions on not being able to fly because someone didn't eat cornflakes. Nor would we because someone didn't take a vaccine that Health Canada is saying, "Well, we don't know if it works, and we don't know if it's safe." We wouldn't support any of these restrictions without the messaging.

So that's why, in my opinion, that messaging is the minimal messaging that's necessary to support the political decision.

Commissioner DiGregorio

My final question relates to the power that the Minister of Health has to make these interim orders to exempt drugs from the normal approval process. In your opinion, is there ever a reason that the Minister should have this power, or should the safety and efficacy tests that are in the Act or in the Regulations always need to be met when a new drug is introduced in Canada?

Shawn Buckley

Remember when Bruce Pardy was testifying in Toronto about how we've moved to an administrative state? And this is a relatively new section, so I'm guessing it's maybe been there 20 years. It was used similarly during this swine flu period and the interim order that kind of showed the way for COVID.

But no, in my opinion, if we are going to have a government that's responsible for things, then this should be done in Parliament. And if we really actually did have a crisis and Parliament was informed with the truth, I'm confident that we could handle things like we've handled things in the past. I mean, we've gone through pandemics and we've gone through wars and we didn't have the administrative having these types of powers.

If I can just segue: the Minister of Health now, and this happened in my career, was given the power to exempt any food or drug from any part of the Food and Drug Regulations. But there used to be safeguards. So when the power first came in— And this is administrative state creed. So the power first comes in, and the Minister can only do it if the Minister determines it's safe, and it has to be published in the Canada Gazette so that everyone can see. So let's say you were concerned about some food or some drug you are taking. Is this compliant with the Food and Drug Regulations? You could at least hire a lawyer like myself and I could go through the Gazette and see whether it's been exempted. But then they went further and basically permitted the Minister to exempt any food or drug, and the safety requirement was taken out, and the requirement to publish it was taken out. So now you couldn't even hire me to tell you whether any given food or drug complies with our Food and Drug Regulations.

And especially in the area of food regulations—I mean, it's basically accumulated wisdom. So let's say we want to introduce orange popsicles for the first time. Well, they have to be what we call "ultrasafe." And ultrasafe is just one death per million per year. So if there's 36 million of us, as long as only 36 children die with a certain level of orange dye in our popsicles, then that's ultrasafe and we'll approve it and we'll put that level in our food regulation. So it's kind of accumulated wisdom: we can't increase the amount of that dye or we'll kill 37 kids instead of 36 and that's not permissible.

[00:50:00]

But when you create a situation where you can't even tell if a food or drug complies with this accumulated wisdom, it becomes quite problematic. I have to tell you that, when they took that power away, the publishing requirement, I thought, what are they hiding? So I went back, and just on my own, okay, well, what are they exempting? And they were exempting all this—like, beer and wine and spirits and all of this allowing genetic stuff in, so I just I switched to European or organic beer. Yeah, because you just don't know what's in this stuff anymore.

So it's interesting. From a lawyer that's practised in the area of mostly drugs but also in food, because they interlace, it's troubling when you feel that the law no longer serves the populace—that it's actually become adversarial.

Commissioner DiGregorio

Thank you.

Commissioner Drysdale

You know, you talked about how the regulations were changed and the tests were changed within the regulation, but one thing I don't think you spoke about I'd like you to comment on, is that fundamental definitions and words changed. You said in one of your statements that words are important. And we've heard through days of testimony that the word "vaccine," the meaning was changed; the word, "pandemic," the meaning was changed; the word "biologic," the meaning was changed, because they took a genetic treatment, which was the mRNA biological treatment and said it was a vaccine, so it could skip certain requirements of revision. One of the favorite ones I've heard you say before is how they changed the word "snitch" to "ambassador" and the last one was "safe and effective."

They seem to have changed the fundamental meanings of these fundamental words. How do you account for that? Is that a lead-up to what happened?

Shawn Buckley

Well, I mean, the problem is— I think what we're experiencing truly is what Bruce Parry, or Professor Parry, described as the administrative state. And you can't just have a law that just on its face says something, or people will wake up, right? Which is why I'm suggesting that this political language is necessary. So when the state became adversarial against us, they started just passing, you know, playing these tricks.

Equally disturbing, and I can speak about it in the *Food and Drugs Act* area but it applies everywhere, is we've basically put the administrative bodies in the position where they can destroy any company or any person for perceived administrative wrongs without you ever seeing the inside of a court. So for example, in the *Food and Drugs Act*, they created a new term, "therapeutic product" because the populace wasn't willing to accept these penalties for natural health product manufacturers. But I mean, the Minister can make an order just saying that you're to do this or that and it's literally a million-dollar-a-day fines for violation. And I mean, they could destroy any small business and you never have the right to go to court, and it's never adjudicated.

I know years ago during the Harper administration, when Tony Clement introduced Bill C-51, An Act to amend the Food and Drugs Act, and then Harper introduced Bill C-52, this Consumer Product Safety Act, both of them had basically the same language to introduce all these huge penalties. And it's always in the name of safety. But when you give bureaucrats the ability to destroy businesses and people in the name of safety without there being a neutral arbitrator, there's a problem. And when I say, "safety is used as a weapon," because I'm involved in the natural health community, I campaigned on Bill C-51. And we got that where that has only come back in pieces over the last years, but an election was called and Harper reintroduced Bill C-52 and I wasn't fighting that. I vicariously fought that when the two bills were together and I remember— I don't know if it was Irwin Toy, it was some big manufacturer of children's carriages and toys and all of this called me and said, "Are you going to fight this?" And I was like, "No, I'm the natural health product guy."

[00:55:00]

Why aren't you guys fighting?" And he says, "The industry can't fight this. It's safety. We'd just get slaughtered in the press."

It's another example where it's this kind of, like— People have to understand that whenever the word "safety" is used by the government, they're being duped. I mean, if we were to back up 20 years and say, "What laws did we not have that we have now that we really needed?" Were we less safe 20 years ago? I'd argue we were more safe. And were we less safe 30 years ago? I'd argue we were more safe. And so the law isn't the answer. It's the application of the law. And we cannot be moving ourselves and—well, we're already there. We're in a full-on administrative state, where in pretty well every sector you can be completely destroyed if you tick off a bureaucrat. Yeah, and the rent-seeking is just outrageous, so.

Commissioner Drysdale

Well, that seems to be a trend and just— Because we've had this testimony earlier with regard to the *Broadcasting Act*, they've now given even broader powers to a regulatory agency, the CRTC, which they never had before. So that they now have the ability to crush individual content-makers. And in that instance, it's safety. They don't use the word "safety," they use "disinformation," "misinformation," and "Canadian content."

So is that another example of what we're talking about where, rather than writing a specific law, they're handing it over to a bureaucratic board?

Shawn Buckley

Now, I have to confess that I don't recall if they were changing penalties, but I do know that they were giving the CRTC authority over online content now and that the justification is to protect Canadian content and Canadian values. Obviously, I find that extremely threatening to give the government any more control over speech because, without free speech, you have tyranny. And it's one of the biggest problems. I mean, is an inquiry like this going to be legal in a year? Or are we going to be streaming online things that go against government values? I don't know.

It is funny, I often wonder. Pre-COVID, I used to lecture fairly regularly at health shows. I would just wonder, well, at what point is what I say going to become illegal?

Commissioner Drysdale

Perhaps we'll go back to the way it was in the 1950s when they set up those giant radio transmitters offshore or in Mexico and broadcast in North America.

Shawn Buckley

I'm game.

Commissioner Drysdale

Thank you, sir.

Louis Olivier Fontaine

Okay. So that was a very interesting presentation, Mr. Buckley, so thank you very much for your testimony.

Shawn Buckley

Thank you.

[00:58:39]

Final Review and Approval: Jodi Bruhn, August 20, 2023 (updated to include a missing exhibit number and clarify the testimony's language and URL source on November 25, 2023).

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 12, 2023

Day 2

EVIDENCE*

(Translated from the French)

Closing Statement: Philippe Meloni and Ches Crosbie

Full Day 2 Timestamp: 11:52:27–11:56:45

Source URL: <https://rumble.com/v2v90b6-quebec-jour-2-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Philippe Meloni

Hello everyone. To end the day, I asked Ches, who—along with Shawn, who you just heard—is one of the lawyers without whom all you have seen here today would not have taken place. Unfortunately, he does not speak French, but I thought we could arrange something together. So he prepared a little statement in English and I will repeat it in French at the same time as him—one after the other, of course.

So these are the words of Ches.

Ches Crosbie

Merci mon ami, Philippe. [Thank you, Phillippe, my friend.]

[In English] Philippe invited me to say a few words. I'm the Administrator of the Inquiry. I'm honoured by Philippe to say a few words in summation: a very few. One of the founders of Western philosophy said: the price good men pay for indifference to public affairs is to be ruled by evil men.

No one in this room, nobody watching, no volunteer, no witness in these hearings is indifferent to the events of the last three years. And none of us want to be ruled by evil, although we know that evil abounds.

I'm referring now to the slide that you should see in front of you. The antidote to evil is courage: the courage to speak your truth and to support those who speak their truth. Every National Citizens Inquiry volunteer and every witness has that courage.

A wise English novelist, C.S. Lewis, said: "Since it is so likely that children will meet cruel enemies, let them at least have heard of brave knights and heroic courage."

* Presented by Ches Crosbie in English. Philippe Meloni provided line-by-line translation into French.

You are those knights and heroes. For the future of Quebec and the Canada we love, inspire your children to be like you. And remember, evil knows how to divide and conquer. Courage knows how to unite and build.

Thank you all.

[00:04:18]

Final Review and Approval: Erin Thiessen, November 14, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

EVIDENCE QUEBEC HEARINGS

**Quebec City, Quebec, Canada
May 11 to 13, 2023**

ABOUT THESE TRANSLATIONS

The evidence offered in these translated transcripts is a true and faithful record of witness testimony given during the Quebec City hearings of the National Citizens Inquiry (NCI). Hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From July to November 2023, a team of volunteers assessed the French AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcriptions.

The testimonies in Quebec City were presented primarily in French. To provide greater public access, a small and dedicated team translated the transcripts into English, employing human resources with the aid of digital translation tools.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the translated transcripts would be as clear, accurate, and accessible as possible.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE*

(Translated from the French)

Opening Statement: Shawn Buckley and Philippe Meloni

Full Day 3 Timestamp: 00:00:23–00:15:25

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Shawn Buckley

[In English] Welcome to Day Three of the National Citizens Inquiry in Quebec City. My name is Shawn Buckley. I'm a lawyer that has been volunteering with the National Citizens Inquiry.

I'm from Alberta, and coming from Alberta is important at this time because there's a synergy between Alberta and Quebec. Quebec and Alberta have been the two provinces that have traditionally been most concerned about provincial rights. Flowing from that, Quebec and Alberta have been the two provinces most concerned about freedom generally. And because the cultures of Quebec and Alberta have been freedom-loving cultures, Quebec and Alberta now bear the largest shame for allowing what has happened to happen.

I want to speak about the example—the bad example—we have set for our children. Three years ago, before COVID, our children were witnessing us acting like free citizens. We were free to go where we wanted to go. We were not told by anyone that we had to basically be under house arrest in our own homes. We did not have to show identity papers to be granted privileges from the state. And most importantly of all, our children did not witness us prior to COVID being afraid of our government.

But that all changed because we were not prepared for what we experienced. Our children watched us stand by silently while we were told that we were confined to our homes. Our children watched us stand by silently as our schools and economy were shut down. Our children watched their parents, for the very first time, being afraid of their government. And how is that generation—how are our children—going to stand up against the government and stand for freedom when they face their challenges, when they've seen their parents cower in fear?

[00:05:00]

* Shawn Buckley made his opening statement in English with line-by-line interpretation by a volunteer. For ease of reading, the French interpretation has been omitted. Mr. Meloni spoke in French – editor.

I want to speak about a police state ritual that our children watched us participate in. And what I specifically want to talk about are the vaccine passports. But I'm going to refer to them as what they are: they're identity papers. Before the passports, we were free to go wherever we wanted to go. If you wanted to go to your kid's hockey game, you could go. If you wanted to go to a restaurant, you could go. And we knew we were free to do these things because we did not have to ask permission from our government. We just were free to do them.

But all of a sudden, we found ourselves in a situation where we had to participate in a police state ritual of showing identity papers to do things we were once free to do. I need you to understand that the act of showing identity papers for permission to enter a place or be part of an activity is actually a police state ritual that conditions your mind. When you have to show your identity papers to be able to enter a restaurant, psychologically the message from the police state is that you are not free to enter the restaurant, but you must perform a ritual to be granted permission from your master, the government. Every single time you show your papers, you are subconsciously reinforcing the message that you are no longer free to do something you were free to do before, but you must perform the ritual to be granted permission by your master.

Traditional police states like Nazi Germany or Stalinist Russia: when they set up roadblocks in cities, they really didn't care where you were going because they knew where you lived and they knew where you were going home at night. The real purpose of the roadblock is to reinforce in the citizen that the citizen is a servant to the state which is a master that controls the citizen's movement.

[00:10:00]

And we need to understand that our children have just watched us participate as servants in a police state ritual of providing identity papers to do things we were once free to do. And how do we come back from that? How do we undo the damage that we have done in the minds of our children? How do our children have any chance of being free after the example we've set of cowering before our governments?

And that's the decision that you have today because we're in a situation where you need to make some choices. We are at a crossroads in Canada where if the citizens do not start standing up for freedom, our children will find that they have no freedom. I'm going to urge all of you to basically understand that you can no longer sit on the couch. You can no longer just watch other people stand up and try to protect your freedom. This is the time that you must take personal responsibility.

But I also want you to understand that you no longer need to be afraid because you are no longer alone. We are many and we are beginning to stand together. And so I'm very proud to be in Quebec, which is essential. This nation will not become free again without Quebec demanding freedom. So I'm proud to be here standing with you.

And I'll end by just saying that I'm praying that this generation will undo what it's done and set an example that our children will be proud of going forward.

Philippe Meloni

Hello everybody. After these profound words, I will talk to you about more practical things. As you know, this Commission is financed solely by citizen donations. Among the things we

have set up today is a silent auction. You may have seen it in the room on the other side; we have paintings and we have clothing with the commission logos. Quite simply, it began with the start of these commission hearings in Quebec. If you like an article, you write down your telephone number and the article number that interests you. And this afternoon, at 4 o'clock in the afternoon, we're going to take a little break. And at this time, we're just going to pull out all the ballots and see who won the different prizes. So it will be done at 4 o'clock this afternoon.

I wish you a good day, which will probably be as intense as the previous two.

[00:15:02]

Final Review and Approval: Erin Thiessen, November 13, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 1: Jérémie Miller

Full Day 3 Timestamp: 00:15:59–00:49:45

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

So good morning, everyone, to our third marathon day. I'd like to thank everyone for their patience: the online viewers, the audience, the team, the commissioners, the lawyers and the technicians. So if you'll excuse me, I'm going to present myself for the third time, but it's for new people, new viewers who don't know us.

My name is Konstantinos Merakos. I'm a lawyer in Canada with Bergman & Associates. And just a little bit about us to explain why we're here: In 2020 and 2021 our firm, Bergman & Associates, on behalf of federal public service employees, took the federal government to court for having violated its employees' constitutional rights—rights under the Charter of Rights and Freedoms—and human rights, on grounds of the choice of bodily integrity, medical choice, and the right to privacy.

I'd like to congratulate the Inquiry first, for having offered its professionalism, for having offered a level of transparency and willingness to listen and learn among citizens, and for having an exchange that is respectful and conducted with honour among people. All this is extremely important for a free and democratic society, especially in today's world. I'd also like to congratulate you because there have been many testimonies so far from different people with different experiences, different cultures, and different backgrounds.

Today we have testimony from another unique perspective. I'd like to welcome Jérémie Miller, who is with us in person today. Hello, Jérémie.

Jérémie Miller

Hello.

Konstantinos Merakos

Do you prefer Jérémie or Monsieur Miller?

Jérémie Miller
It doesn't matter.

Konstantinos Merakos

It doesn't matter, okay. We'll say Jérémie, as we would among friends. Okay. I hope it'll be easier for you, for your testimony. I want you to be calm, don't worry. If you need a minute, don't hesitate to ask. I'm going to start by swearing you in. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Say, "I do" or "I solemnly swear."

Jérémie Miller
I solemnly affirm.

Konstantinos Merakos

Excellent. Your name, please, and would you spell it?

Jérémie Miller
Jérémie Miller. J-E-R-E-M-I-E M-I-L-L-E-R.

Konstantinos Merakos

Okay. So Jérémie, let's start at the beginning of the story, around the vaccination. According to you, it was from that day onwards that you started to have questions. So go ahead.

Jérémie Miller

Yes, well, I'd had questions even before the vaccination but when it came time to decide whether I was going to get vaccinated—so we're talking about the end of May, the beginning of June in 2021—my wife and I were talking. And I said to her, "Well, listen, I don't really mind getting vaccinated. I don't see the importance of getting vaccinated, but I don't mind. I just don't think mass vaccination will ultimately have much effect on the continuation of the pandemic."

I was basing my opinion on the statistics available from Israel, which had a much higher vaccination rate at the time. And I won't go into the details, but I told her, "In six months' time, we'll be back to square one even if we have mass vaccinations." And indeed, three, four months later, the Delta variant arrived; about six months later, there was Omicron. Seven months later, in Quebec, we had serial closures around the holiday season in 2021 and even a second curfew.

My decision to take the vaccine was, in fact, because I was strongly against compulsory vaccination. I could see that this was what was coming, and I wanted to be able to speak from a position that would be accepted by the people around me, and not be categorized as a "whacko" who believes that vaccination is dangerous or bad or whatever. And at that time, people weren't listening at all to what I had to say.

[00:05:00]

That was really the only reason I wanted to be vaccinated, so “I’m going to get vaccinated.”
The first dose I got—

Konstantinos Merakos

How did it go after the first dose?

Jérémie Miller

After the first dose—in fact, 24 hours later—I was in the office working quietly when suddenly, I began to have difficulty breathing. I had a pain in my chest. It lasted about two to three hours, so it wasn’t very long. It was long enough to be worrisome, but I didn’t go straight to hospital because eventually it passed on its own.

Konstantinos Merakos

Excuse me, how long after?

Jérémie Miller

Twenty-four hours after the first dose.

Konstantinos Merakos

Twenty-four hours later. Thank you.

Jérémie Miller

And I didn’t think about it again until the next dose—the second dose—which was a month later. And I arrived to get vaccinated and the nurses looked at me, and there were four or five nurses around me saying, “No, you should see a doctor before you have your second dose. With the side effects you had from the first dose, it could actually be quite serious.”

At that point, I made an appointment to see a family doctor. My question at the time was, “What’s the risk of taking the second dose in my situation, given that I had these effects with the first dose?” And we know that it can be up to ten times more serious after the second dose. So I wanted a rough idea: “What are the risks? Have you seen other cases like this? And how should I proceed with this?” The doctor’s response to this question was, “Well, there are more benefits than side effects or problems with vaccination.” And I wasn’t really satisfied with that. I’m a safety officer. I work in risk management. My question was to determine the level of risk, not to determine whether there are more benefits than side effects in the general population; it was in my personal situation.

Then I heard stories of two other contacts—not close friends but contacts—who were also told by their doctor, or by certain doctors, that they should receive the COVID vaccine, even though in one case she’d been told for a decade not to take any more vaccinations because she’d had an autoimmune disease triggered by another vaccination that I can’t recall. Then the second friend: this woman tended to have a lot of thrombosis and a doctor told her to take this vaccine anyway. She took it and of course she suffered from thrombosis as a result.

Konstantinos Merakos

So there were concerns. You went to the doctor looking for an answer because you were open, but you wanted to balance the risks and benefits. And in your opinion, were you satisfied that you'd been given free and informed consent, that you'd been given all the information, and that you could say, "Well, I got the answer I wanted: clear, neat and precise"?

Jérémie Miller

In fact, no. The answer I got was more or less the public health message. It wasn't an informed medical opinion on my situation based on my medical history, which is what I was really trying to get. It was just a very generic message, and I decided not to have the second dose because of that.

Konstantinos Merakos

Allow me to interrupt you. You mentioned history; Do you have a pre-existing history of problems here at this level [gestures targeting the heart and lungs]?

Jérémie Miller

No, actually, it's more the case history of the first dose.

Konstantinos Merakos

Okay, but in general—

Jérémie Miller

In general, no, I didn't have any problems. But I did know that I was in the population most at risk of heart problems following vaccination because I'm a relatively healthy young man. I already had this information before I went for the vaccination, after the effects of the first dose. But I wanted a clearer answer.

Konstantinos Merakos

What do you think were the effects for a young, healthy man? What do you think the risks are? What would your doctor have told you, for example?

Jérémie Miller

Well, I knew there were risks; it wasn't the doctor who told me about them: risks of pericarditis, myocarditis, among other risks for young men. And even my wife met a perfectly healthy young man in his early twenties who, for several months after his vaccination, couldn't even walk a long distance because he had heart problems. So I wasn't prepared to put that on the line.

Konstantinos Merakos

One last question before the next topic: Is this doctor a family doctor you've had for a long time, or is it someone you found because you previously didn't have a family doctor?

Jérémie Miller

It was a family doctor who was replacing my family doctor who was on leave, but even then, I'd only seen my family doctor once.

Konstantinos Merakos

Okay. Even then, there was something missing.

Jérémie Miller

Yes, I didn't have a relationship with that doctor.

Konstantinos Merakos

Okay. So the next step is for you to talk about your social experiences with the health measures in general.

Jérémie Miller

Yes, more broadly. I work in the aviation industry, so from the first days of the state of emergency, I lost my job within the first two weeks.

[00:10:00]

Then for six months, it was impossible to find another job. I was too qualified for unskilled jobs; they knew it was dangerous to hire me because I'd leave if other opportunities opened up in aviation. So I lost my job for six months. I got through it relatively well financially because I didn't have many expenses, but it's clear that my financial situation right now is much worse than it would have been if I'd kept that job and worked those six months. I wouldn't be in the same place at all in my life right now.

Konstantinos Merakos

And Jérémie, do you have a family? Do you have any children?

Jérémie Miller

I have gotten married and had children, but that was later.

Konstantinos Merakos

Okay. Excellent.

Jérémie Miller

As for the vaccine passport, well, I couldn't get one. I'd had only one dose. What I found most damaging wasn't necessarily not being allowed to go to certain places—although to me that seemed unjustified on the part of the government, and very questionable to say the least—but it was above all the message coming from the government, the message we were getting from everyone around us, saying, "It's your fault we're still in a pandemic; it's the fault of the unvaccinated."

In fact, since the first wave, the government has been looking for scapegoats. So at first it was the spring break, which was earlier in Quebec than elsewhere, that made the situation worse in Quebec. Then it was the fault of the “covidiot.” Then after mass vaccination, it was the fault of the unvaccinated.

And when I’d talk about my particular situation, a lot of people would say, “Oh yeah, you’re different,” but I’m no different. People don’t get vaccinated for many reasons. Some of them are really valid. And in implementing these requirements on a large scale, the government completely forgot about this impact: that there were people who had valid reasons, who were just completely forgotten in all of this, and who then suffered the consequences for something that was beyond their control.

Konstantinos Merakos

Some had medical exemptions, religious exemptions.

Jérémie Miller

Personally, I had to be vaccinated because I worked in the aviation industry. I managed to get a vaccination exemption, not for medical reasons because I didn’t have a precise diagnosis—I went to the doctor too late and I would have had to go straight away when I developed symptoms. But I managed to get it for religious reasons.

In fact, it’s a conscientious objection because at the federal level, the religious exemption is also a conscientious exemption. I was against compulsory vaccination; and I submitted this request for exemption, which was accepted because—among other things—the general manager of my company, the owner of the company, and several other people in the company were also against compulsory vaccination and were not vaccinated either. And the airport manager had no interest in playing police officer when it came to vaccinating employees at her airport.

So at that time, we had these exemptions that were authorized quite easily, but I know that’s not the case for everyone. I know I fell in with a company that accepted this kind of thing. It isn’t the case for everyone.

Konstantinos Merakos

Yes, so here we could talk about exemptions based on freedom of religion, for example. So you offer an interesting perspective because in society, there are different cultures and there are different religions. And I imagine that for some people who don’t frequent religious venues, they haven’t had the experience of what happened, whether it be in a church, a mosque, a synagogue. So if you like, can you talk about what happened in the religious sphere?

Jérémie Miller

So in fact, at the religious level it’s an interesting question. Because the right to practice one’s faith is a right that is protected by the Constitution with good reason, because someone who isn’t religious himself doesn’t have many conceptual tools to understand the religious phenomenon. And so there is constitutional protection to ensure that these values, which are central to the lives of believers, are protected from a government that might override certain elements that are important to someone who is religious.

What I found deplorable was that we had a government that is secular—that wants to be secular, that seeks to be secular, to be perceived as secular—that is generally also made up of atheists and agnostics at about probably the same ratio as the general population.

[00:15:00]

They were the ones who assumed the right to decide whether the Church was essential or not, even though they didn't necessarily have the requisite religious knowledge to have an enlightened perspective on the matter. They went so far as to decide where, when, how, why we could practise our faith—and even beyond that, who could practice their faith—at the outset. They did it by limiting the number of people in places of worship, which was problematic enough: in the churches I attended, we were obligated to hold two different services and to split the church in two, which is unheard of in a liberal democratic society. And then, by eventually imposing the vaccine passport, which is absolutely immoral from a theological point of view.

The government has no place deciding who has the right to come to church. And church leaders were put in a position where they were forced to say to believers, to the faithful who had been in their church for decades, “No, you—you don't have the right to come in.” There are many churches that decided to simply close and wait it out. Unfortunately, there are a few churches that decided to implement it. The church I grew up in—it's no longer the church I attend—decided to implement it. It led to a division in the church that is still present.

So the government, by interfering where it had neither the knowledge nor the right from a constitutional point of view, has caused damage that is potentially irreparable. They've inflicted it on families, but they've also inflicted it on religious families—on families of faith—and I find that irresponsible. Irresponsible.

Konstantinos Merakos

Which means that in your opinion, according to the government's statements and actions, there's a division not only in the church or religious center, but in society as a whole. Would you agree that this would constitute a “divide and conquer” in society? What was your understanding of why the government was using such a divisive tactic in society?

Jérémie Miller

I think it's mostly ignorance. I think it's ignorance, among other things you know. Because, well— Between the curfew issue that would not have impacted the homeless in Montreal and the Prime Minister saying, “Ah, there are plenty of resources for all the homeless,” that just demonstrated an ignorance of certain segments of society. It's because they were too small a group—just the executives—to be making all the decisions unilaterally as a crisis unit—even smaller than just the executives. I think that it's the same reason at the religious level too: it was just ignorance of the religious reality. That's how I understand it. I don't think it was deliberate.

Konstantinos Merakos

Okay, excellent. Jérémie, do you have one last thing to add, something you'd like to say to the world here right now, or to our viewers?

Jérémie Miller

Well, there was only one subject I would have liked to cover, but I don't have the time.

Konstantinos Merakos

Go ahead in one sentence.

Jérémie Miller

As a safety officer in an airline company, I work in risk management and emergency measures management. And there are some really basic, conceptual elements that I have some really serious questions about in terms of how the pandemic was managed at the governmental level, mainly in terms of assessing the effects of the health measures and the long-term effects of the measures that were put in place: something that the government to this day systematically refuses to do at all levels of government. They don't want to hold investigations that question their decisions, either at the parliamentary level or even at the civil level—even though that's the basis of risk management: you want to learn from the past to prepare for the future. Governments systematically refuse and that, to me, is incomprehensible.

Konstantinos Merakos

Okay. So last comment: in your opinion, because you work in risk management, could things have been done better over the last three years? Would you agree that the approach could have been more humane?

Jérémie Miller

Well, first I think that the risk analysis of the health measures was botched and not well explained, and secondly that the analysis of long-term effects was not carried out. There was a refusal to do so and that's inexcusable. It's really inexcusable.

Konstantinos Merakos

Okay. Thank you, Jérémie. I'll now open the floor to questions from the commissioners. Go ahead.

Jérémie Miller

[In English] I can take questions in English also.

Commissioner Massie

But we will start in French.

Jérémie Miller

Excellent.

Commissioner Massie

First of all, I'd like to thank you, Monsieur Miller, for your testimony.

[00:20:00]

I have to admit, I was very impressed by the depth of your reflection and the range of elements you covered in terms of the dimensions of the health crisis; it is not just societal, but has a spiritual dimension that you brought into the discussion which is very interesting. In fact, when I closed my eyes, I wondered whether I was dealing with a young man or a very wise, mature man. And I have to admit that when I opened my eyes, I was always surprised, every time, to hear you. It's very refreshing to see young people like you expressing themselves so well and taking a stand.

I'd like to ask you a few questions about the various aspects you've covered. The first is about your approach. You mentioned that you carried out relatively rigorous analyses; and since you're in risk management, I think you have the mental framework to carry out analyses that will lead you to draw certain conclusions. And based on these analyses, you concluded that, in your case, vaccination was not indicated. But you decided to vaccinate anyway. I understand that where you worked, it was strongly recommended even if it wasn't yet compulsory at the time you decided to be vaccinated. Is this the case?

Jérémie Miller

Well, actually, there were a lot of dissenting voices at work even so. But more generally it was within society that made me—

Commissioner Massie

Within society.

Jérémie Miller

Within society in general.

Commissioner Massie

And your position was to say, "I'm not ideologically opposed to vaccination, but in this case, I want to express my opposition. I want to show that I'm not ideologically opposed by getting vaccinated." If I've understood you correctly, that's what you did?

Jérémie Miller

Well in today's world, image is more important than content. It's the reality of the matter and that's very unfortunate. But I knew that image. If I wasn't vaccinated, people would say, "Ah, but that's because you're just thinking about yourself, you just want your own freedoms and you don't want care about the rest of society." There are a lot of people I knew who weren't vaccinated. They were the most supportive people I've known, who gave a lot of their time to society. It wasn't a question of that at all. In fact, I wanted to get that image completely out of the way so I could speak out against compulsory vaccination. Because that's really what I found problematic. I knew it was coming too.

Commissioner Massie

So in the sequence of events, when you go back to get the second dose, what I understand is that you had a conversation with the people who were there to vaccinate; and in the course of that conversation you told them that you had had some adverse effects and that worried

you. What did they say when they advised you: “Well, maybe, in your case, it would be a good idea to seek consultation before getting the vaccine”? From all the testimonies we’ve heard to date in the Inquiry, it’s very rare that people who have been confronted with these situations have had this kind of advice.

Could you tell me a little more about the kind of conversation you had at the time when you were advised to see a doctor?

Jérémie Miller

Yes. In fact, when I went to get my second dose, I just wanted to get it over with and move on. So when the nurse stopped me and said, “Wait, I’m going to see my superiors”—they were other nurses but they were in charge of the vaccination center, which was pretty big—I was more concerned about it because I’d never made the connection to myocarditis or pericarditis either. In fact, the thing that really struck me was that I had a metallic taste in my mouth. I thought it was strange, and so I researched it, but I didn’t find anything about myocarditis or pericarditis. But when she told me, I questioned myself a bit more: “Ah, okay, maybe it’s more serious than I thought.”

And then there were four or five nurses, including those in charge of the vaccination site, who said, “No, that really doesn’t sound good, and we don’t feel comfortable giving it to you before getting a doctor’s opinion.” Because they didn’t want anything to happen at that time and to have to deal with a serious situation. They wanted to make sure they had a doctor’s opinion because they weren’t able to assess the risk at that level.

Commissioner Massie

So what you experienced was a clear indication that this kind of questioning could be done in the vaccination centres, even if many people told us that they were vaccinated without being asked many questions?

[00:25:00]

Jérémie Miller

Well for the first dose, there weren’t many questions; they were very generic. I’m in good health, I’ve never had any problems, so I was cleared to get vaccinated as a matter of course. For the second vaccination you had to go through another nurse who asked you what your side effects were from the first dose, so that’s when it was caught. What I found deplorable was that the nurses seemed much more worried than the doctor. As for the doctor, it seemed to be absolutely nothing because he didn’t examine me for another month.

Commissioner Massie

Finally, my other question concerns what I would call your conscientious objection to compulsory vaccination which, according to your analyses, you found to be unsupported, and also the element of social discrimination that this implies. And you made a comment that I find quite rare in people of your age, which was: “How can a society run by people who, for the most part, are non-believers or agnostics understand what religious practice means for people who practise religion?”

And when you made this comment, I was reminded of a phrase by [Alexis de] Tocqueville who wrote extensively on democracy. He said that in a democracy, firewalls or institutions have to be put in place to protect minorities from the tyranny of the majority. Isn't this what we experienced in this lockdown, particularly in terms of religious practice? As I travelled across Canada, I sensed that in other parts of the country, religious practice was, perhaps, more frequent than in Quebec. In Quebec, it seems to me that religious practice is rather low compared to the rest of Canada.

Jérémie Miller

Well, that's one of the reasons I wanted to talk about it: because in Quebec, there are fewer of us. Well, historically, there are reasons for that too.

And what I deplore is the fact that—if we go back to March 2020—we see that at the start of the crisis, it was as if the government had touched a “panic” button. And all of a sudden, there were no more safeguards. All the institutions that were in place to protect minorities were completely sidelined in favor of a crisis unit run by a tiny group of people with a very, very, very limited perspective that would not allow the justifiable protection of minorities. As we've seen from a number of health measures, this had a disproportionate impact on marginal populations: the poorest, the most religious, and so on.

And for me, that's inexcusable because we have parliamentary institutions for a reason. But it's as if we had a government that—because it was quicker and simpler—just decided to say, “No, we'll put that aside and go ahead pragmatically.” This goes against the very basis of a liberal democracy. I was already of this opinion long before the vaccination campaign, and it's one of the factors that informed my decision in this respect.

Commissioner Massie

My last question concerns the question put to you by Monsieur Konstantinos: What is your position on what happened during the crisis and on what we currently face? And I think that your attitude towards this is relatively Christian or benevolent, in the sense that your main explanation is ignorance, which is a perfectly plausible explanation. But with the accumulation of all the information available, how far can ignorance be pleaded today?

Jérémie Miller

I have already said what I could be confident in saying. And further, in a society where there's no longer any trust in our fellow man, dialogue actually becomes impossible. That's part of our Judeo-Christian heritage. I think you need to have at least an inkling of the good faith of people who are of a contrary opinion in order to be able to work together constructively.

[00:30:00]

And this is another reason that I wanted to speak publicly. Because in my opinion, everything I said during the pandemic privately to the people around me—I think it is important in a democracy that it's said, that it's heard, so that we can work constructively. I don't think it's constructive or useful in the long term to simply repudiate the institutions that are in place. It's important to reaffirm their foundation and solidify the foundations that have been shaken, I believe, by ignorance; some might say by malfeasance but I'd only go so far as to say by ignorance.

Commissioner Massie

Thank you very much for your testimony.

[In English] Any questions, Ken?

Commissioner Drysdale

[In English] Good morning. In your testimony, you talked about government messaging that seemed to target—or not tolerate—the unvaxxed. And my question is: How did the messaging that you heard from Mr. Trudeau and Mr. Legault make you feel?

Jérémie Miller

Okay. In my testimony, I spoke about the messages from the governments. And the question is how I felt about the way Monsieur Trudeau and Monsieur Legault communicated with the public. I felt a lack of respect, a lack of listening, which was surprising at first. But eventually, after two-and-a-half years of this kind of situation, you get used to it. But it showed me that there was no possible way to make a government listen to reason when it had decided to distance itself from its parliamentary base, and that there was really no will to listen to the citizens they were supposed to serve at the grassroots level. And that's certainly deplorable.

Konstantinos Merakos

Jérémie, be a little more specific, especially towards the word that the commissioner used: the word 'tolerate,' especially the phrase that it was used in.

Jérémie Miller

[In English] "Do we tolerate these people?" [In French] That question, yes?

Konstantinos Merakos

Yes, just a clarification on exactly that question.

Jérémie Miller

If a prime minister doesn't even tolerate a significant portion of his population, how can we move forward as a country? Really, my reaction as a citizen was to say, "It's impossible to recover from this. Well, it's possible, but it takes a lot of work at the level—"

It doesn't demonstrate the integrity of our Prime Minister or the ability to listen that's necessary for someone in that position in order to move forward as a society together. The language is "exclusionary" [in English]; I'm not sure of the French word.

Konstantinos Merakos

That's perfect, yes.

Jérémie Miller

And these types of comments destroy our society in my opinion.

Konstantinos Merakos

Excellent. So Commissioners, thank you so much for your questions. Jérémie Miller, once again, thank you sincerely for your testimony today. You're a brilliant young man. Thank you very much and we wish you every success in the future. Once again, thank you, thank you.

Jérémie Miller

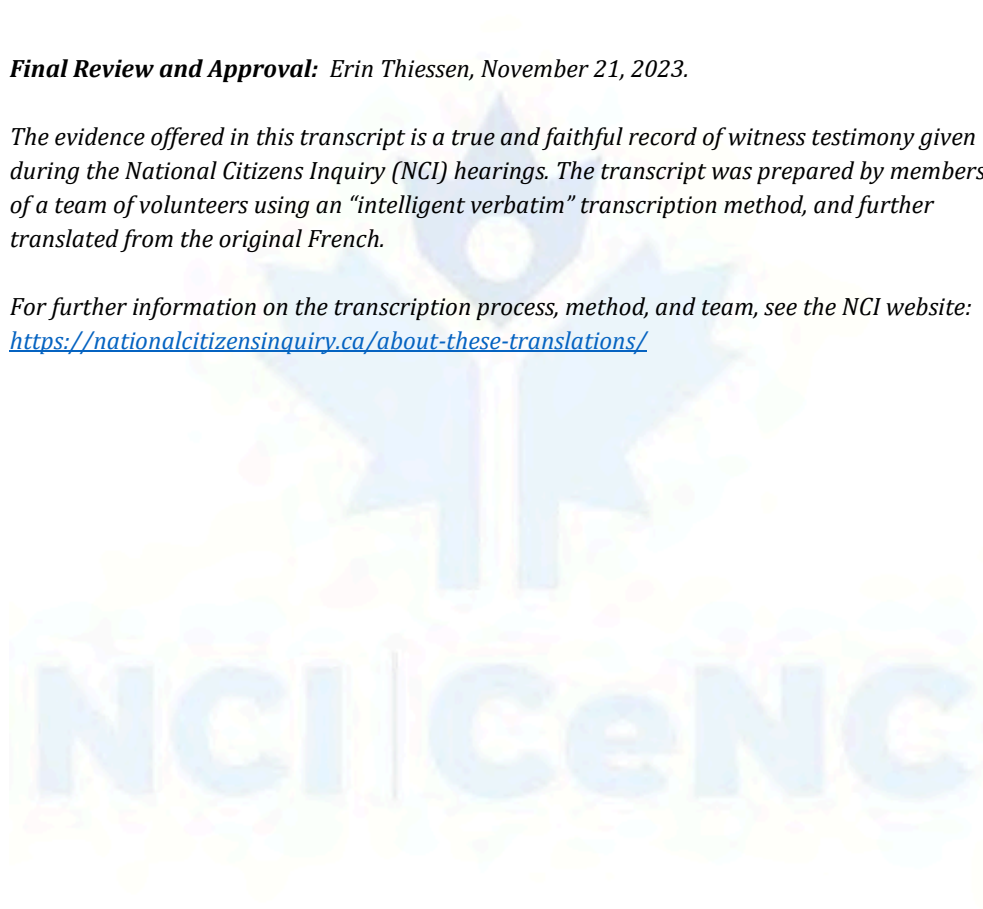

Thank you.

[00:33:46]

Final Review and Approval: Erin Thiessen, November 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 2: Dr. Jérôme Sainton

Full Day 3 Timestamp: 00:49:50–02:05:58

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Chantale Collard

Hello. Chantale Collard, lawyer and attorney for the National Citizens Inquiry today, May 13. I see on the screen Dr. Jérôme Sainton. Hello. Dr. Sainton, can you hear me?

Dr. Jérôme Sainton

Hello.

Chantale Collard

Yes, good morning. First of all, on behalf of the Inquiry, I'd like to thank you for agreeing to testify as an expert witness. I'm going to identify you. All you have to do is state your first and last name.

Dr. Jérôme Sainton

My name: Sainton, S-A-I-N-T-O-N; Jerome, J-É-R-Ô-M-E.

Chantale Collard

Okay. We'll now swear you in. Jérôme Sainton, do you affirm to tell the truth, the whole truth and nothing but the truth? Say, "I do."

Dr. Jérôme Sainton

I do.

Chantale Collard

So thank you. Dr. Jérôme Sainton, I'm going to give a brief description of your background and then you can add to it. Then we'll move on to more technical questions, which you'll be

able to answer. So you're very versatile, Dr. Sainton. You were originally trained as a scientist with a degree in agricultural engineering. You also studied computer science and statistics. You then changed direction to study medicine and at the same time epistemological and ethical philosophy. You are currently a general practitioner with your own practice and patients. You are also a bioethicist working in the field of palliative care and, more generally, on the relationship between ethics and technology.

During the COVID period, you were a doctor in the field during the pandemic. You worked for SOS Médecins [SOS Doctors in France], both in the office and in patients' homes. Can you tell us about that period as a doctor in the field?

Dr. Jérôme Sainton

Well, we were perhaps the doctors closest to the wave that was arriving, and so we were confronting the unknown virus with few—or even no—resources. And I was able to measure the extent to which a certain pattern was repeated: namely, that the serious patients who ended up hospitalized or even in critical care were always rather elderly patients who had stayed home alone with no medical consultation and were always on Doliprane [acetaminophen] and no other treatment. That was kind of the recurring theme.

And what was disturbing quite early on—and this may link in with the previous testimony—was that medicine was governed by press releases. This had already been the case before, but it became much more pronounced and acute. Authorities would say: “You have to do it this way, you have to do it that way.” And medical deliberation, moral deliberation—which had already been cut back to a mere pittance with the modern functioning of medicine—now disappeared completely. That's a brief summary. It would take a very long time to describe, but this is what I can say were my first impressions of the experience.

Chantale Collard

Thank you. You've done a lot of assessments. You say you did the safety assessment of the Comirnaty vaccine. Can you tell us what that involved?

Dr. Jérôme Sainton

So you may be referring to the fact that—

Chantale Collard

How the risk management plan—

Dr. Jérôme Sainton

This may complement the presentation I just gave.

[00:05:00]

Very early on, things were out of balance and disproportionate to what seemed to be good medical and moral sense. This prompted me to do my own research in conjunction with other colleagues. In medicine, we learn to reread scientific and medical literature, to do our own research, and to read and deconstruct articles to understand them, criticize them, summarize and compare them, and to corroborate sources. And so this was a project that I

undertook very early on. And so if you're talking about Comirnaty, you may be referring to one of the research projects I carried out—

Chantale Collard

Yes.

Dr. Jérôme Sainton

—which I recently published in an international peer-reviewed journal [Exhibit QU-4]. It's about the evaluation of the safety of COVID vaccination by Comirnaty—that's Pfizer's vaccine—in pregnant women.

Chantale Collard

Exactly.

Dr. Jérôme Sainton

This is one of the research projects I've done that I can tell you about.

Chantale Collard

Yes, so how does the manufacturer's risk management plan assess vaccine safety?

Dr. Jérôme Sainton

Yes, that is typically one of the questions I've been working on. I'm going to share my screen with you because I have some slides that may help. There, I think you can see it clearly?

Chantale Collard

Yes.

Dr. Jérôme Sainton

Pfizer's risk management plan for assessing the safety of its product in pregnant women has gone through several versions: nine in all. We're currently on the ninth version. The first version that came out with the vaccine said, "The safety profile of this vaccination is not known in pregnant or breast-feeding women." And they specified that there are pregnant women who might want to be vaccinated and they added: "despite the lack of safety data." Elsewhere in the same document, they stated that it was not known whether vaccinating pregnant women with Pfizer's vaccine could have unexpected adverse effects on the embryo and fetus.

So that's the version that came out with the product. Pregnant women were in fact excluded from the pivotal study: the one that gave marketing authorization. This remained the case for quite some time, until early 2022. And I note that in September 2021, there was a statement came out specifying— Here we are at the end of 2021, so almost a year later, we're still in the same vein—Pfizer still said: "The safety profile is not known." And they specified: "Administering Comirnaty to pregnant women should only be considered if the potential benefits outweigh the potential risks to the mother and fetus." That's stating the

obvious but perhaps they saw fit to put it in writing. And by the way—we can talk about this later—it wasn't really possible to know both the potential benefits and the potential risks, but that's a detail.

It's not until February 2022—you'll see later why this is important—that Pfizer began to change the language in its risk management plan. Pfizer said: "The safety profile is not completely known in pregnant or lactating women. However, 'post-marketing' studies are now available." So Pfizer still admitted its lack of knowledge, but this lack was now partial. That's February 2022. This would be the pivotal month when different recommendations around the world started to change noticeably.

I won't go into it in detail—I explained things well in the article I published. But the post-marketing study spoken of here is methodologically rather a poor study. It was extremely limited and also flawed, and had to be corrected three months after publication. Among other things, it had to be corrected for the fact that, at the outset, the study could be used to claim: "There is no risk of miscarriage." That was precisely the point that had to be corrected three months later: to say that they actually knew nothing of the sort.

[00:10:00]

Well, I won't go into statistical detail. Here is shown memo 94—about the risk management plan—and it refers to a very weak study which was not sufficiently reassuring. But Pfizer remained cautious, saying the safety profile was "not completely known." I'll end on this comment. Not only since February 2022, but since the very beginning—we saw the small variation in 2022—the safety profile is "not completely known." There are terms that have always been used and that you'll still find online today. Meaning that the manufacturer's risk management plan today—the first line I've highlighted, page 93—at one point talks about trials and the fact that pregnant women were excluded from the pivotal study. Why? To avoid its use in a vulnerable population. We're reminded of a fact that has always been known, especially in medicine: pregnant women are a vulnerable population. It's a key word to remember.

Chantale Collard

At risk.

Dr. Jérôme Sainton

The MAH [Market Authorization Holder]—some component of the manufacturer—agrees that monitoring the safety of vaccination in pregnant women is critical. It's something that remains [in place] from beginning to end. In the same vein, they tell us, "It is important to obtain long-term follow-up on women who may be pregnant or who are of child-bearing age who come to be vaccinated, so that possible negative consequences on pregnancy can be estimated." These are all terms that are still present in the current risk management plan. And finally, from the outset and to the current date, the manufacturer has said: "We anticipate that use during pregnancy will be submitted to the regulatory authorities. We expect that there is likely to be little intentional vaccination of pregnant women." I think this is important to know because—I could elaborate later if you wish—that's not what happened.

Chantale Collard

Yes, and Dr. Sainton, I'd like to ask you: How has this assessment been integrated by the European and French regulatory agencies?

Dr. Jérôme Sainton

I'll tell you about that in a moment. I'll just mention that Pfizer even planned a clinical trial dedicated to pregnant women. You can see it in version [2.0] of their risk management plan: a study on 4,000 pregnant women in the last trimester of pregnancy. And in February 2022, we learned that since almost all the pregnant women had been vaccinated, the study could not be continued. It ended with results from less than 400 pregnant women and only in the third trimester. And even 4,000 people wasn't going to be a robust enough study to see anything. The strength of a study comes from being able to highlight what's interesting. The pivotal study—the one that provided the authorization—involved 40,000 adults; and even with 40,000 adults, the study wasn't robust enough to show anything interesting. So if ten times the number was insufficient, then starting a study with 4,000 wasn't robust enough. And in the end, they had less than 400 people.

So Pfizer's study of pregnant women—planned from the outset—collapsed. And in any case, it was never of the right size.

To answer your question, how has this risk management plan been integrated by the agencies? Here in Europe, it goes through the European Medicines Agency [EMA]. Well basically, as of the end of December 2020, the European Medicines Agency's online fact sheet read: "Data on the use of Comirnaty during pregnancy are very limited." And that's all they said. They continued by saying: "A decision to vaccinate a pregnant woman should be made in close consultation [with] the healthcare professional after considering the benefits and risks." So it's very cautious.

[00:15:00]

At the end of November 2021, the European Medicines Agency softened its stance and said, "The data are no longer 'very' limited; they are limited." That's the only thing that changes. And from February-March 2022—those pivotal months—that's when the European Medicines Agency said: "Comirnaty can be used during pregnancy." We can see that the European Medicines Agency is much bolder than Pfizer, which remained extremely cautious. As far as the EMA is concerned, from March 2022, it's good to go.

And to answer your question completely: in France we saw a further deterioration in caution. What I'd like to remind you is that whether it's Pfizer or the European Medicines Agency, from February-March 2022 onwards we see a change in narrative. Pfizer remains very cautious. Then, in March 2022, it is the European Medicines Agency that says: "It's all good. Pregnant women can be vaccinated." But in France, our Conseil d'orientation de la stratégie vaccinale [vaccination strategy orientation council] said in April 2021: "All pregnant women must be vaccinated." And then at that point they even said: "Maybe we should wait until the second trimester." I think it's a month later they said: "Even in the first trimester, you're good to go."

And a few months later in France, in July 2021, we had the government's decision in conjunction with what's known as the Haute Autorité de santé [French National Authority for Health]. They decided to make vaccination compulsory for caregivers. And at that time, the Haute Autorité de santé made absolutely no mention of the issue of pregnant women.

And so, implicitly—and this is indeed what happened—pregnant women were obliged to be vaccinated. In this case, it was absolutely compulsory.

Chantale Collard
Obligatory.

Dr. Jérôme Sainton

And that's as early as July 2021. So when you place these dates in relation to what we've seen in risk management by the manufacturer and the European Medicines Agency, there's something shocking; and we really have a progressive deterioration in caution. That's all I can say to answer your question.

Chantale Collard

You've answered the question very well. But do you have any idea what should have been done to properly assess the benefit-risk balance so that this vaccination is only considered when the potential benefits outweigh the potential risks to mother and fetus?

Dr. Jérôme Sainton

Yes, according to the terms in the risk management plan itself. So the answer is yes and no. I also have a few slides related to this question.

Yes and no. In the long term, by definition, no. There's no way of knowing. Firstly, we don't really know if COVID absolutely must be avoided in the long term. But mostly, the new technology—I'd like to remind you that this vaccination isn't just about mRNA. There are many new elements to this vaccination. It's virtually experimental. For one thing, a more conventional product requires at least five years of data, if not ten, to be able to talk about long-term risks. Even more so for this completely new technological configuration. So we can't give a correct assessment of the benefit-risk balance. We just can't.

I can suggest something here. In a pinch, they could have done something to try to properly calibrate a short-term benefit-risk balance. At least, they could have put things in place to know what they were doing in the short term. Let me put it this way. It's a little technical, but I've tried to be clear in this slide, to explain a little how a benefit-risk balance works in medicine and medical research.

I'm simplifying a little— On one side, you have the benefits. What are the benefits? It's the product. It will reduce the risk of a serious event linked to the problem, namely, COVID. In this case, what is the reduction in the risk of a serious event for the mother or child in utero, linked to COVID?

[00:20:00]

And I'm talking about a reduction in absolute risk—it's a little statistician's detail; perhaps we'll have time to talk about it later—and not a reduction in relative risk, which is very sellable, with big figures that say nothing about the real benefit. So absolute risk.

This reduction in true, real, absolute risk is—if you like—one side of the scale: the benefits side (a). And on the other side, the side of risks, is the product—in this case vaccination—which itself may induce a risk of a serious event for the mother or child. Again, it may

induce an absolute risk. We'll call it (b). And then in order to have a favourable benefit-risk balance, the first must be much greater than the second. And I mean far superior. You don't want simply "superior" or "equal," unless you're a utilitarian and you're willing to kill as many people as you save. We need a balance that is substantially in surplus, especially for pregnant women.

I remember a class in which our professor—the chair of pharmacology at the faculty where we were taught medicine—said that he did not even give paracetamol [acetaminophen] to his pregnant wife. So in the case of pregnant women, we normally don't mess around. For pregnant women, the right medication for every illness is childbirth. I'm joking a little, but it's a reminder that for a vulnerable population, Pfizer's terms are fair. We don't treat them the same way we do other populations.

Chantale Collard

Dr. Sainton, I'd like to ask you a quick question. You say that the benefits must far outweigh the risks. We're not talking about 50 per cent plus one here. What percentage are we talking about?

Dr. Jérôme Sainton

Well, that's it. So for our benefits to be well in excess of the risks, we'd first need to have an idea of the benefits. What risks could we reduce? So we first had to properly analyze the risk posed by COVID to pregnant women and small children, and then determine how much that could be reduced by vaccination.

Well, I chose a study; I didn't look for a study that suited me, but I found this one very interesting. This study happened in England, but the official data were based on a study carried out in Scotland, to demonstrate the benefits of vaccination for pregnant women. It was a forward study that followed all pregnant women in Scotland during the ten months of vaccine deployment. They looked at all those who were vaccinated and those who were not. I'll skip the details; everything is explained in detail in my article.

So this study was biased. It was highly questionable and you could reject it. I've explained why but it doesn't matter. I take it with its biases, as less is often more, if you will. Even if it were perfectly accurate—which I don't think it is but I'm really taking the highest possible view of this study—well, at best, it reduced the absolute risk of a serious event linked to COVID in pregnant women and their unborn babies by between 0.01 per cent and 0.001 per cent. So these are really super-low reductions in incidence. Basically, to give you an idea, vaccination may have saved the life of one pregnant woman in those ten months, but this is for an entire country. And even then, we're not sure. I won't go into the statistical details, it doesn't matter. The point is, we're certain about actual things. This study had shown vaccine efficacy, et cetera, but in the end, when you try to see its benefit and measure it, to size it up, it was really very, very, very, very modest. That's the least we can say.

[00:25:00]

With an estimate of risk reduction, we are able to design a trial. It will enable us to establish our short-term benefit-risk balance. I'll skip the calculations; we know how to do them. Mathematically, it's very simple.

We know that to have a 95 per cent chance of detecting an event that occurs at a frequency of 0.01 per cent—Ninety-five per cent is the risk we use in statistical science when we say,

"This is not due to chance. We're measuring something real." It is already very lax. Normally, we have to be more demanding in medicine. But basically, let's accept this. We are very favourable to the vaccine hypothesis. We are not really being very demanding. So to detect a single occurrence of a frequency of the order of 0.01 per cent, we'd need a randomized trial of 60,000 subjects. Well, a trial of 60,000 subjects hasn't been done.

That's what they should have done. And even that wouldn't have been enough because if you detect only one occurrence, that's not enough. You need a few more occurrences to be able to start making statistical tests. So not even 60,000 subjects; you would need more. Yet everything that's been done in randomized trials has been less. I remind you that Pfizer's pivotal study involved 44,000 subjects, and with only that, it was not robust enough to see certain things: the benefit in severe cases; the risk of poor tolerance and of serious adverse effects. Likewise, we were borderline. Our statisticians are obliged to cumulate several studies with Moderna, et cetera, to begin gathering some statistics. So in this case, when Pfizer tells us: "We're going to do a special trial on pregnant women with 4,000 subjects," and at the end they say, "We didn't succeed; we only have 300 pregnant women left"—

Chantale Collard

Very little.

Dr. Jérôme Sainton

That's what we should have done. But to answer your question, even then, we would only have touched on the basis of a short-term benefit-risk balance. Again, that would have given us an idea of the benefit possibly being a little greater than the risk. It would have been modest, but at least we would have had something rigorous. I'm not saying it would have been satisfactory, but at least we would have had something rigorous. So much for answering your question.

Chantale Collard

Dr. Sainton, you've come to talk to us mainly about pregnant women. Have you looked at other specific populations besides pregnant women?

Dr. Jérôme Sainton

Yes, there are two other specific problems with this vaccination, two other specific populations. Pregnant women were a special population that needed to be treated separately and this was not done in practice. There were two other specific populations: children, in which I didn't take much interest; on the other hand, I did take a great deal of interest in the population of COVID convalescents—those who had already had COVID. And today this concerns just about everyone. Well, has it broken through the media filter?

And finally, there was a meta-analysis published in *Lancet*. A meta-analysis is what brings together the analyses of several studies, and in fact allows us to approach a degree of certainty. A few weeks ago, *Lancet* published an article telling us—well, they mainly studied what had happened before the Omicron variant but it gives us a good idea—that convalescence, the fact of having been infected with COVID, protected very well against reinfection. It protected well over time and was at least equivalent to, if not better than, what the vaccine regimen of the time produced. In simple terms, it was two doses before Omicron, three doses after Omicron. I'm simplifying, it's not exactly that. The schedule at the time was two doses.

And so the effectiveness of natural immunity was better. Well, I'm sorry to say, we knew that back in 2021.

[00:30:00]

The first meta-analysis was carried out in 2021 by Mahesh Shenai, with whom I was able to speak, and was published— but not in a journal as prestigious as the *Lancet*. As early as the autumn of 2021, they had shown— Here is a table, but I'm perhaps not going to comment too much, it's a bit technical. But basically, you have this [vertical] line, and what stands out on the right of the line indicates a true difference. Statistically, we can see the difference. In short, natural immunity, compared to vaccination, was always either better or at least equivalent. So this shows that we already knew about the [relationship in 2021].

And here [the second vertical line] is something very interesting. They also looked at whether there was any benefit in vaccinating COVID convalescents. The answer is yes, but with the naked eye, you can't distinguish things; you see, it stands out. You can't see it with the naked eye; you have to actually calculate. This shows that the benefit was in fact weak, modest, an understatement— it was three times nothing.

When we put this in relation to the risks of vaccination, well, obviously, the balance was not *a priori* positive. Addressing vaccine politicians, Shenai and colleagues concluded: "In conclusion, an automatic exemption from vaccination, based on history of infection or serological evidence of immunity, should be urgently considered until the benefit-risk balance is better defined." This call for caution, which seemed to be the most elementary form of rigour, went completely unheeded.

And for the record, I said exactly the same thing myself. And I did a mini-review of the literature at the same time as Shenai and his colleagues—there were dozens of references, which is quite substantial—which I forwarded to the Haute Autorité de santé in France, where I concluded the same: that the most elementary rigour dictated that convalescents should not be systematically vaccinated. It was common sense.

Chantale Collard

That's right.

Dr. Jérôme Sainton

I sent this work to the Haute Autorité de santé: I didn't get a reply. Some colleagues tried again; they asked my permission and I gave it. They took over my work. With a syndicate, they sent this file to each of the Haute Autorité de santé committees in France. There was never any response. Never.

Chantale Collard

No response, never.

Dr. Jérôme Sainton

I sent it in December 2021. I'm still waiting for a reply.

Chantale Collard

You're still waiting for an answer? You still haven't received it?

Dr. Jérôme Sainton

Yes, not even a polite reply. I didn't even get, "We received your mail, it doesn't correspond to our request. Thank you for your participation." No, no, I received nothing.

Chantale Collard

Radio silence.

Dr. Jérôme Sainton

All I got was an acknowledgement of receipt of the registered letter. I don't know if it's like that in Canada, but in France, you can request an acknowledgement of receipt by mail. The post office only replied that receipt acknowledgements had been received, but that's all.

Chantale Collard

Hopefully you'll have an answer very soon, Dr. Sainton. Finally, in conclusion, are you interested in any other aspects of COVID vaccination?

Dr. Jérôme Sainton

Yes, the big project—what I'm presenting to you now—is thousands of hours of work. Something that immediately became apparent as the work progressed was that there were some pretty impressive biases that tended, in all the studies, to systematically overestimate vaccine efficacy. And so this was one of my projects. While the first work I showed you on pregnant women was peer-reviewed and published, this work is more in the pre-publication stage and under review, and I've had excellent feedback on it. It's not published yet; it should be shortly, but the reviewers approve.

[00:35:00]

I'll just give three examples of bias. So what is a bias? In science, a bias is a systematic error. So systematically, we're no longer going to be on target. Systematically, we're going to miss the target. It's not a question of imprecision; you can be very precise. It's like rifle shooting. If you're very precise in all your shots but you're off target, being precise won't help in the slightest. If you have a bias, there's a systematic error, and you don't hit the target. This is more serious than the problem of imprecision. A first problem is a bias that can be called **extra-methodological**—a colleague, Michel Cucchi, on the Independent Scientific Council in France has done a lot of work on this—an example being that all publications over the last three years, with the exception of Mahesh Shenai, have only communicated relative efficacy instead of absolute efficacy.

So it's hard to explain what this means in statistical terms. To imperfectly illustrate the difference between relative and absolute efficacy, relative efficacy is a little like testing the strength of a bicycle helmet at the factory: you measure its strength, but absolute efficacy is a little like its usefulness in the real world. And the problem with the pharmaceutical industry in general—which was already too biased beforehand but was always biased during the COVID crisis—calculates the strength of the helmet at the factory and says, "Oh, everyone must wear it, even those who don't ride a bike." That's the bias from talking only

about relative risk reduction rather than absolute risk reduction. It's about making even non-bikers wear helmets. That's the problem.

And what's rather embarrassing in this story is that ten years ago, the FDA, the Food and Drug Administration, had clearly written in black and white ten points identified for improvement for studies in the general area of evidence-based medicine, particularly when it came to establishing risks and benefits. We're right on topic. The FDA had ten priority points for researchers to consider. The first, which I haven't included here, was to put a cost on things. That goes without saying. The second priority was to stop communicating only relative efficacies but also to communicate absolute efficacies. Because they said—and they wrote it down in black and white—that patients are “unduly influenced” when risk information is presented only in terms of relative efficacy or relative risk.

But in fact, as we can see from the FDA document, it's not just patients, it's prescribers too. Studies have been carried out on doctors showing that if doctors are only given terms of relative efficacy, we tend to prescribe all the time. If reports are substantially adjusted by absolute efficacy, we won't have the same enthusiasm to prescribe. And I get the impression that the [regulators] didn't follow their own recommendations when they did their job. That's the first bias. It's fundamental; it alone can change everything. Now that's a bias; in fact, it's enough all on its own to change everything.

[00:40:00]

The second bias is a multiple bias. There are several types of methodological biases involved. Here, I've expressed vaccine efficacy in terms of relative efficacy; so the y-axis is relative efficacy, and the x-axis is time. Well, look at what vaccine efficacy does, in blue. And in general—if you can see my mouse pointer—it's almost always been identified there, especially at the beginning. It is always identified here. It's very rare that it's been identified before [in pink]. It's almost never identified within two, three, four weeks after the first injection, and never within the first week or two after the second injection. The same goes for after the third, et cetera.

And it's very rare to see efficacy beyond four months—five, six months at most—after injection [in pink]. But more and more studies are showing that, in fact, in the very first weeks after injection, efficacy is not only very mediocre, it's even negative. We now have enough studies to think that this is not just a coincidence. And just after vaccination, we have several studies showing negative vaccine efficacy. This means that vaccinated people are more likely to become infected than non-vaccinated people during, say, the first two weeks after the first injection, for example. This was particularly the case with Omicron.

There's undoubtedly an immune imprinting phenomenon, even if there are other possibilities behind it. Immune imprinting, in fact, means that the vaccine has targeted the peak protein of the Wuhan variant, but Omicron had deviated so much, evaded so much, that the immunity acquired by vaccination of the actual Wuhan variant lost its footing against Omicron, to such an extent that it can even facilitate infection. So there you have it. Here again, we're in an area where it could be that the vaccinated infect more, and therefore transmit more, than the unvaccinated.

In green, I've shown you what the effectiveness of natural immunity would look like. All this is a schematic. I don't claim that the scales are perfect. It's just to give you an idea.

Chantale Collard
It presents the idea well.

Dr. Jérôme Sainton
That's it.

Chantale Collard
So we understand that people who have been vaccinated are more likely to transmit the disease—contrary to what we were told, which is that this was an epidemic of the unvaccinated. You've just demonstrated this, Dr. Sainton.

Dr. Jérôme Sainton
Absolutely. So for many reasons, we can't prove it one way or the other. On the one hand, the question of transmission is very complex—much more complex than just knowing whether you're infected or not, that sort of thing. It's more methodologically complex to set up. The second thing is that I'm speaking in the conditional tense because we have several studies which can be summarized in this diagram; we must remain cautious. But if in fact it were confirmed then we have vaccinated people who, at the start of their vaccination period, served to cause the epidemic's explosion rather than its containment.

Chantale Collard
That's what we're seeing.

Dr. Jérôme Sainton
And when the Delta variant appeared in India, for example, we know that it exploded at the same time as the vaccination campaign was launched. And everyone said, "Oh yes, but that's because those who have been vaccinated have risky behaviours. They've just been vaccinated, so they have risky behaviors." That's not an acceptable justification, especially since there are studies showing that— In fact, it was found when we reworked the raw data from the Pfizer and Moderna double-blind trials. I'd like to know how—in the Pfizer and Moderna trials—risky behavior was observed after the injection but not when the placebo was given. Anyway, no. If ever this were to be confirmed—and there's a growing body of evidence to support this—we may well have had epidemics of the vaccinated. It's entirely possible.

Chantale Collard
Listen, Dr. Jérôme Sainton, thank you very much. There will probably be questions from the commissioners, so please remain at their disposal.

[00:45:00]

Commissioner Massie
Thank you very much, Dr. Sainton, for your overview of an analysis that is quite complex if we want to understand the phenomena. Unfortunately, we can't measure everything. I'd like to come back to the studies from 2021, where there were indications—actually, where we were trying to determine whether there was a benefit to be gained from vaccination,

either for people who were not cured, not convalescing from COVID, or for people who were convalescing. And as you mentioned, these studies—the meta-analyses—showed that the benefits were very slim.

From what you presented in your last diagram, what I think is extremely important is the temporal dimension of those studies. In a meta-analysis, we take data collated in each of the studies. If those analyses were made in the most favourable or the most positive conditions for demonstrating a benefit of vaccination, aren't we precisely in the process of having a very significant methodological bias, which casts many doubts on the conclusions we can draw, from even these meta-analyses?

Dr. Jérôme Sainton

Absolutely. However, this is mitigated by the fact that, fortunately, some studies have gone beyond four or six months. And so these studies, as they appear in the meta-analyses, will be expressed. But as they are few in number, there will be a certain imprecision in the later temporal window. And so in particular, this decline in vaccine efficacy may appear, but with such a problem of precision that we can't allow ourselves to draw a definite conclusion. I don't know if I've answered the question.

Commissioner Massie

Yes, that's a very good answer.

Dr. Jérôme Sainton

Yes, of course, by selecting small windows each time, we bias the measurements. We're more interested in taking photographs that suit the situation rather than tracking them with a time-lapse camera. But this bias is tempered by the fact that, since there have been sufficiently long studies, the data will appear—but with too little precision because there won't be enough studies measuring things over the long term.

Commissioner Massie

Finally, my other question concerns: in so-called real-life analyses of the claimed efficacy of gene injections, when we try to compile the benefit, we're always somewhat confronted with the problem of following up—to say the least—an approximation of the benefits we can measure. We tend rather to rely on indicators such as: "What type of antibodies can I measure?" and "When I take booster doses, will more antibodies give me the benefit I hope to obtain from vaccination?" However, we know that it's not just the quantity of antibodies, but also the quality—the kind of antibodies generated by these booster doses—that can ultimately affect the profile of protection we hope to obtain from vaccination.

And you mentioned that in the Omicron phase—and with all the booster doses that were recommended based on meta-analyses that suggest a benefit of protection—there was this somewhat vague notion of hybrid immunity that I'd never heard of before COVID.

Regarding the type of antibodies, there are studies which show that repeated doses generate antibodies such as the IgG4 type [immunoglobulin type G4], which are not very beneficial and are known to induce what we might call tolerance when we want to, for example, reduce allergic reactions.

[00:50:00]

Doesn't this phenomenon practically nullify the validity of measuring antibodies or antibody types in booster doses? Which gives us the illusion that we could have protection when in fact this protection wouldn't really be based on solid data showing that the antibodies or antibody types, which increase following vaccination, will indeed be beneficial? For the time being at least, this is mainly what is being used as a marker, if you like, for potential vaccine efficacy in booster doses.

So this approach is focused solely on antibodies. We don't look at cellular immunity; there are lots of things we don't measure. To what extent is this also an additional bias in these analyses?

Dr. Jérôme Sainton

Of course. I've only shown you a few biases, and I'm not going to answer your question as an immunologist: I'm not one. Already, IgG4-induced tolerance is one of the possible explanations for the negative vaccine efficacy I've shown you. There isn't only immune imprinting. There are other phenomena. That one is probable. But to answer your question, yes, very little has been done to distinguish between the quantity and quality of antibodies. Very little has been done to correlate antibody measurements with what would be measured in the field. So it's all very well to have antibody figures, but is there a clinical interpretation?

We've talked almost exclusively about antibodies, but immunity isn't just about antibodies: immunity is much broader than that. For acquired immunity alone, it requires consideration of cellular immunity and of passive immunity; in short, it's much broader. And finally, to go even further, you talk about indicators, but perhaps my colleague from the CSI [Conseil Scientifique Indépendant], Pierre Chaillot, told you about this. We've also worked with antibodies to measure vaccine efficacy by measuring indicators of hospitalization, intensive care unit occupancy, beds, and so on.

All this can be summed up by the disease of modelling. Whether it's for public health or even immunology, it's clear that a model is much more comfortable because you have complete control over things. The problem is that the model isn't reality—and the gap between the model and reality is a problem we've known about for years. It's really a phenomenon of our time which could be covered in philosophy more than anything else, in the philosophy of science. But during COVID management, we reached the acme through using only indicators, only modelling, and a decoupling from reality.

Immunity has been reduced to humoral immunity, which has been reduced to antibodies, which has been reduced to titration, and without ever considering what this means in the field. As a small example—and this ties in with COVID convalescents—we have a study which looked at COVID convalescents in whom no antibodies were found. It turns out their cellular immunity was so robust that they were nevertheless very well protected against reinfections of COVID. It's a detail, but shows the problem of decoupling the model from the reality. But of course, it's much easier to manipulate indicators and models. We are in a bit of an omnipotent state: if we're careless or clumsy, we can do as we please. Because a model will output what we put into it, it will show up in the end result: a model that has no connection to reality.

Commissioner Massie

I'd like to come back to the question of mass vaccination at a time in the pandemic when more and more people are likely to have had a first infection. So there's a temporal

deployment that can vary from one place to another, and it's very difficult to make comparisons between different countries or geographical areas if the deployment of vaccines or infections isn't done in the same way. In your opinion, would it have been prudent and rigorous to systematically test people for the presence of a previous infection at the time of vaccination?

[00:55:00]

Dr. Jérôme Sainton

Ah yes. For me, that would have been the most elementary rigour. In fact, when faced with the compulsory COVID vaccination of caregivers, some people would say, "Oh, caregivers, they already have other compulsory vaccinations so why don't they want to?" No, the other vaccinations aren't compulsory. They have to provide proof of immunity and, for example, if someone is already immunized against hepatitis B, we're not going to vaccinate him against hepatitis B. Yes, that would have been the most elementary rigour. It would have been the bare minimum of prudence. Yes.

Commissioner Massie

And I'm perhaps going to take you into another area, which is your philosophical and epistemological training, to ask you to propose an explanation for this apparent confusion— or at least this contradiction—in the case of this disease or new virus that has come upon us. We've essentially set aside all the elementary notions we knew about respiratory viruses; non-pharmacological measures; the fact that we're not treating this new disease because it's new; the fact that we're totally discrediting natural immunity.

It's clear that scientifically—at least from my point of view—it doesn't hold water. And yet this mental framework has been used absolutely systematically throughout our Western democracies, for reasons that I find hard to comprehend. Could you speculate, from your more epistemological or philosophical knowledge, why we've ended up in such a surreal situation?

Dr. Jérôme Sainton

So for me, there are two complementary elements. More or less, there is a decision-making sphere and the sphere of the common citizen to whom this is generally applied. In the first sphere, we've arrived at our current era which is, after all, the culmination of modernity. Modernity was founded on a Copernican revolution in our understanding of science. To put it more simply, before Descartes and Galileo, science meant observing and trying to understand reality. Since the start of modern times, we have had the preconception that reality can be mathematically measured. This is super-important, because from then on—and the fathers of modernity saw this plainly, and Descartes already spoke of this very clearly, as did Bacon—when nature is able to be mathematically measured, you'll be able to assert control. And that's what Descartes famously said: we can "render ourselves masters and possessors of nature."

So we're in a state of mind where the scientific spirit has suddenly been confused with the spirit of power. I'm simplifying; I'm not saying that the spirit of power is only modernity, et cetera. I'm simplifying, but we are, after all, the descendants of this technocratic epic. And we've arrived in the present with such great power—we were talking about the power of models and the ease of relying on models—that it's much easier, much more comfortable, and much less tiring for those in decision-making positions to rely on and favour

techniques of control and power. And as Tolkien said would happen, especially in a fallen world where evil and the love of money exist.

We will depend on models and set up tools of control. In other words, we'll manage the pandemic like a computer program: if you get a virus, you apply your antivirus, and then subscribe to that antivirus software.

[01:00:00]

It's much easier and much less costly intellectually, and it's obviously much more profitable and much easier to make money by following this logic.

Philosophically speaking, it's not neutral. And for the average citizen who's going to follow, he's not unharmed by all this. He's grown up in a technocratic society where there is a cult of science. So yes, on a scientific level I agree that what we've been through is absurd, but it's not at all contradictory because of what we might call the technological morality: "Vaccines are scientific," and "Those who don't vaccinate are anti-science," yada yada. It's not a scientific discourse; it's a religious discourse, where science is not quite deified but where technological power has become sacred.

There's an author in France—I don't know if he's well known on the other side of the Atlantic—named Jacques Ellul. He's been ostracized in France but he's made a good study of the technological system. He says, "It is becoming religious." Technology has captured the sacred and science is like a myth. It's the new discourse. So symbolically, there's an image of science on which our rulers have based themselves, and so on. So they are not relying on science itself, but on the representation of science—a religious representation. And those who don't follow are automatically excommunicated. And it's very difficult to set oneself apart from the common morality. Today's common morality is technocratic. Anyone who doesn't accept the alleged technological efficiency, the alleged rigour, is anathema.

So this all comes together quite easily. The evolution of mindsets, the way in which we have philosophically decided to understand the world and our relationship to the world—a relationship of mastery—means that in the end, things fall into place quite easily. So that we arrive at this aporia, if you like, this scientific contradiction. In other words, in the name of science we do something that is completely aberrant scientifically—and with this contempt for nature, for natural immunity, and other things.

And indeed, masks were glued to everyone as if it were natural to live and confront a virus by masking everyone, all the time, as if we had to live with these prostheses.

So there you have it. There's also a bit of a transhumanist perspective behind it, which is simply an extension of the technocratic epic we've been living through for centuries and which has accelerated in recent decades. I don't know if I've answered your question.

Commissioner Massie

Yes, you've answered my question very, very well. I think my colleague Ken would like to ask you a question too.

Commissioner Drysdale

[In English] Thank you very much for your testimony, Doctor. I have a few questions, and I have to rely on my colleague to translate for me.

Commissioner Massie

Ken has a few questions, then I'll do the translation for him.

Commissioner Drysdale

[In English] Being here in Quebec reminds me of how important communication is.

Commissioner Massie

Being here in Quebec reminds me of the importance of communication. Ken doesn't speak French very well.

Commissioner Drysdale

[In English] And I am a professional engineer, so I have training as you do in mathematics.

Commissioner Massie

As a professional engineer, I also have a background in mathematics.

Commissioner Drysdale

[In English] But I find perspective is very important for people who are not engineers and scientists to understand.

Commissioner Massie

But I think that for people who are not scientists or engineers, it's extremely important to have the right perspective.

Commissioner Drysdale

[In English] So when I listen to your presentation concerning risk and risk-benefit analysis—

Commissioner Massie

So when I listen to your presentation, you make a very pertinent analysis of the risk-benefit ratio—

Commissioner Drysdale

[In English] And I understand what something like 0.01 per cent means.

[01:05:00]

That means one in ten thousand.

Commissioner Massie

And I fully understand the figures presented and their relatively modest significance.

Commissioner Drysdale

[In English] And so, my question, again, with regard to perspective is: When you're thinking about risk to pregnant women—

Commissioner Massie

And my question concerning the outlook for pregnant women and the risks that have been analyzed—

Commissioner Drysdale

[In English] We have heard testimony previously that a person in the childbearing range in Canada had a chance of all mortality—of dying for any reason—of about 1 in 3,000 or 4,000.

Commissioner Massie

We heard from several other witnesses at the Inquiry who told us that the risk of a pregnant woman dying from any [cause] was relatively modest, on the order of about 1 in 3,000 or 4,000.

Commissioner Drysdale

[In English] And that same woman's chance of dying from COVID was 1 in 250,000.

Commissioner Massie

And these women's risk [of dying from COVID] was much lower, on the order of 1 in a 250,000.

Commissioner Drysdale

[In English] And in 2020, the risk of a woman dying just because she was pregnant was about 1 in 16,000, I believe. I'm going by memory.

Commissioner Massie

And to die as a result of pregnancy was about 1 in 16,000.

Commissioner Drysdale

[In English] So would you consider speaking in those types of terms to the public? In other words, a person's risk of dying in a certain age group was, say, 1 in 3,000. A person's risk of dying of COVID was 1 in 250,000. And a person's risk of being pregnant and dying from being pregnant was 1 in 16,000.

Commissioner Massie

So to put things in perspective, can you consider that the relative risks range from 1 in 3,000-4,000, 1 in 16,000, or 1 in 250,000 in the case of [women] who are pregnant and can die from COVID? Does this perspective—

Commissioner Drysdale

[In English] My point being that if we communicate to the public that their chance of dying of COVID is a number—whatever that number is—but they don't understand what the everyday risks of death are to them, then they have no ability to evaluate that risk.

Commissioner Massie

So the question is: To what extent do people have the capacity to assess the real risk if we don't put it in perspective or in relation to other risks?

[In English] So your question is—?

Commissioner Drysdale

[In English] I know your report is being submitted to the scientific societies but it's very important, the information that you're bringing forward. And my question is: Would you consider wording some of your information in that way so that the general public can understand the relative risks?

Commissioner Massie

So the question is: Are you ready to present your analyses in a way so that people can understand what they represent in a more concrete way—for people who don't necessarily have the capacity to assess risks in terms of numbers—because they're not generally accustomed to doing this kind of analysis? That's your question.

Dr. Jérôme Sainton

Yes and no. Yes, because I'm going to give an answer, but the no, I'll explain right away. In the work I did on risk assessment in pregnant women, I didn't assess the risk in pregnant women myself. The core of my work was to evaluate the risk assessment carried out by Pfizer, then by the European Medicines Agency, and then by the French authorities. It's not quite the same thing. But incidentally—and I've included it as an appendix to my article—I've given precisely this perspective you're talking about in order to make a proposal.

So I'm not qualified to give a definitive answer but I'll try anyway. Let me remind you that my work has been a critique, a re-reading of the risk assessment [done] first by the manufacturer itself, then by the European Medicines Agency, and also by our supervisory agencies in France. Having said that, I came across a study in Scotland—the prospective study I mentioned earlier—by Stock and his colleagues.

[01:10:00]

And to answer your question, I'll repeat here what I said earlier. Over the ten months following the roll-out of vaccination in Scotland—when pregnant women started to be vaccinated, they started here and then tracked what happened over the ten months. According to this study, which is open to criticism: roughly speaking, there was one

unvaccinated pregnant woman who lost her life to COVID who might not have lost her life if she'd been vaccinated. Out of the whole population of Scotland. I think this is something that can help put things into perspective: in the ten months following the roll-out of vaccination, particularly among pregnant women in Scotland, at the time when the variants were most dangerous—the first variants, Wuhan, Alpha, Delta—out of all the pregnant women in Scotland who could be followed up—that's just about all of them—there was one unvaccinated woman who died of COVID during her pregnancy. And we can perhaps imagine that she would not have died if she had been vaccinated.

I hope this answers your question. It may give you an idea of the low risk they had to be protected from. It's always difficult to put things into layman's terms—and maybe that's not my particular talent either—but there are still a lot of things in biostatistics that need to be put into perspective, such as the size of groups. At that time, there were pregnant women who had been vaccinated and none of them died from COVID during this study. There was one death, an unvaccinated pregnant woman who died from COVID: that is very, very few. That's one person, and we can't even be certain that vaccination would have saved her. We can suspect it from the study, but it is not certain.

Commissioner Drysdale

[In English] That's true, and we don't know whether or not she died with COVID or because of COVID, because of the testing.

Commissioner Massie

It's true. And what's more, given the nature of the tests that have often been used, we can't even know whether that person who died died with COVID or from COVID.

Dr. Jérôme Sainton

Absolutely. And this study was typical of one of the biases. I didn't have time to show you, but one of the biases that can change everything in a study: it's the classification bias linked to vaccination status. For example, vaccinated women between zero and three weeks after their first dose were considered unvaccinated. So who's to say that the unvaccinated woman who died wasn't a woman who caught COVID two weeks after her first dose? It's entirely possible given the size of the study, which makes for a completely biased methodology. We can't rule it out.

Commissioner Drysdale

[In English] Just my one last point— Sorry that there's a bit of a delay in the translation, so sometimes I have to wait for it. With regard to pregnant women, if I understand this correctly, pregnancy takes nine months: It would be possible then for a woman to get a first jab when she first becomes pregnant, a second jab a month later, and then get a booster before she's completed her pregnancy, is it not?

Commissioner Massie

So if I've understood correctly, since pregnancy lasts nine months, theoretically it's possible for a woman to have her first dose at the beginning, a second dose during pregnancy, and even a booster dose before the end of pregnancy?

Dr. Jérôme Sainton

Exactly.

Commissioner Drysdale

[In English] Did you look at any effects of multiple injections to people, pregnant or not?

Commissioner Massie

Have you looked at the effect of multiple injections, whether pregnant or not?

Dr. Jérôme Sainton

No, that's not one of the things I looked at in detail.

Commissioner Drysdale

Thank you, Doctor.

[01:15:00]

Commissioner Massie

Okay. Any further questions, colleagues? No? Okay.

Chantale Collard

So Dr. Jérôme Sainton, your analyses and research speak volumes. And on behalf of the Inquiry, I'd like to thank you very much for appearing before us. Thank you very much.

Dr. Jérôme Sainton

Thank you. And thank you very much, in fact, for allowing me to integrate my work and contribute my mark to a collective work. As researchers and analysts, we often have our shoulder to the grindstone. It's an expression in France. Thank you for integrating this work and connecting it, making links. Thank you very much.

Chantale Collard

Thank you again. We'll now take a ten-minute break before the next testimony.

[01:16:08]

Final Review and Approval: Erin Thiessen, November 23, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 3: Dr. Michel Chossudovsky

Full Day 3 Timestamp: 02:24:53–03:33:58

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Louis Olivier Fontaine

Hello everyone. My name is Louis Olivier Fontaine. I'm a lawyer and I'm acting today as an attorney for the National Citizens Inquiry. And now for our next witness: we have the privilege of speaking with Professor Michel Chossudovsky. Professor, good morning.

Dr. Michel Chossudovsky

Yes, hello.

Louis Olivier Fontaine

So to begin with a quick formality, I'm going to ask you to identify yourself by stating your first and last names, please.

Dr. Michel Chossudovsky

Michel Chossudovsky.

Louis Olivier Fontaine

Now we're going to take an oath. I'm going to ask you to make a solemn affirmation to tell the truth, the whole truth, and nothing but the truth. Say: "I do."

Dr. Michel Chossudovsky

I do.

Louis Olivier Fontaine

Very well. So I'll start with a short presentation. You can tell me if everything I say is correct. Professor Michel Chossudovsky is an award-winning author of 13 books. He is also Professor Emeritus of Economics at the University of Ottawa. He is founder and director of

the Montreal-based Centre de recherche sur la mondialisation [Centre for Research on Globalization]. He is also editor of *Global Research*. His latest book, available free in PDF format, is titled, *The Worldwide Corona Crisis: Global Coup d'État Against Humanity*. And on the cover, the title continues: *Destroying Civil Society, Engineered Economic Depression*.

So with such a hard-hitting title, Professor, I'm going to ask you to elaborate and explain to us the research that led you to write this book—and to these, as I said, very hard-hitting conclusions. During our preliminary discussion, you proposed to summarize by explaining the four main pillars of the crisis as you see them. So may I suggest that you start your explanations with these four pillars.

Dr. Michel Chossudovsky

I'd like to thank the organizers for this initiative, which is absolutely fundamental. It's also an opportunity to share opinions. I think we need to confront the lies at both the scientific and the political levels. We experience this crisis on an individual level, but we also experience it on a collective and global level because it's a crisis that affects more than 190 countries where measures are being applied simultaneously. And there is a series of lies. I will start with the pandemic.

The PCR [polymerase chain reaction] test was used to measure the incidence of COVID. For the moment, I won't revisit the legitimacy of the PCR test. But I should say that at the starting point, in January 2020—and I've been following this for the last few years—there was a WHO [World Health Organization] initiative supported by the World Economic Forum that was meeting in Davos, also in January. And on January 30, the Director General of the WHO made a historic declaration that we must remember.

[00:05:00]

He declared a global public health emergency of international concern. He gave his press conference: global emergency, 83 cases outside China, which are the COVID-19 cases confirmed by means of PCR.

The PCR is another problem. But 83 cases led to the declaration of a global emergency. This is a lie. This is the beginning of the lie. So here you have the data corresponding, you might say, to this first phase of the pandemic. And a few weeks later, there was a new press conference by the illustrious Director General of the WHO, Dr. Tedros. This was on February 20. What Tedros was saying was that the pandemic was imminent: "The windows are closing." He made a very dramatic speech based on what? On 1,076 positive PCR cases, or positive COVID-19, out of a world population of around 6.4 billion outside China.

Once more, it's an element of falsehood—a conflict of interest—because after his statement, the financial markets collapsed. It's catalogued as the most serious financial crisis in history since 1929. So it's the collapse of the stock markets on a planetary scale based on a fraudulent declaration by the Director General of the World Health Organization, who is also obviously in collusion with Bill Gates and company.

Now just to put it into perspective, it wasn't 1,076 cases: it was 452 cases. Let me explain. If you look at the graph below, you have different categorizations of where these cases are located; and the majority are from people who got sick on the *Diamond Princess* because they were confined to their rooms and then given PCR testing. They were all sick; they were coughing. And anyway, the PCR test doesn't detect the virus. You have to understand that. It's fundamental. The PCR test doesn't detect the virus; it detects genetic sequences.

These genetic sequences can be attributed to other viruses such as other coronaviruses like the common cold, for example, or to seasonal flu. I'll come back to this later, but I should also mention that the PCR test was discontinued by the CDC [Centers for Disease Control] in the U.S. as of December 31, already with warnings saying they [the PCR results] were invalid.

[00:10:00]

Similarly, the WHO didn't withdraw it but said, "If you've applied the PCR test as required with a magnification threshold greater than 35, you must redo the test." And that was a year later, in January 2021. So the two key organizations in this debate were questioning this PCR test. At that time, I was not questioning it because these figures were so ridiculous that we came to the conclusion that there was no pandemic.

I'll proceed to the third [pillar]. So it caused a financial crisis. For those of you who know a bit about economics: when you have foreknowledge of what Tedros is going to say—insider information—when you also have foreknowledge of where you can manipulate information, then you can make billions on the stock market. And that's exactly what happened. I'd now like to turn to the month of March. It was on March 11 that the WHO officially declared the pandemic. Once again, there was a stock market crash—Black Thursday.

There were 44,279 positive cases catalogued as of March 11. These are cumulative cases. In other words, if people are recovering, well, they're no longer active cases, but they represent cumulative cases counting from the start of the crisis in January. And 44,279 cases were catalogued by the WHO to justify draconian measures. In English, this was called lockdown; in French, it's confinement. And this occurred on a planetary scale.

So we have to ask the question: How is it that 190 governments implemented this simultaneously—albeit with intervals—and in such a way as to essentially paralyze their economies? Because when you lock down the workforce and freeze the workplace, what happens? I can ask my first-year students that. With all the workers at home and the workplace frozen, it's obvious: It's a global and social economic crisis that affects the foundations of civil society from one day to the next. And we've experienced it.

And then there's the masking. It's social distancing. We were unable to gather together. We were unable to debate. This decision was based on stupid numbers. These are the numbers. Read carefully what's on the screen now: 125 confirmed cases in Canada on March 9. Is this the basis for declaring a national and global pandemic, accompanied by a campaign of fear and intimidation and draconian measures to paralyze not only the economy, but civil society as a whole?

So as an economist, I'll tell you what my interpretation is because I have several chapters in the book that deal with the economic dimension. But I have to say that I don't know a single one of my colleagues who has examined the issues at stake in this crisis. They said, "Oh no, it was the virus that caused the economic collapse." Frankly, it's very convenient to blame this crisis on the virus, okay? But we must say: the collapse was a product of engineering. And the collapse, the lockdown of the workforce, and the work freeze—we know very well what's going on.

[00:15:00]

First of all, it's bankruptcy processes at the level of production entities, but it's also impoverishment on a planetary scale. I followed this economic and social crisis in several countries. I contacted people in India and China.

In India, lockdown was decreed, while 45 per cent of the urban workforce was made homeless. These were migrant workers from different regions who travel to Delhi, Mumbai, and so on. They were told, "Go back to your villages." They died. There was no transport. Look at the incidences of famine in all parts of the world— not just in the so-called Global South. I tried to document the famines. The data is generally incomplete but what I can say is that this lockdown is an economic and social crisis. And probably the most serious in human history because it was generalized to 190 countries.

It's not necessarily a matter of creditors from the [International] Monetary Fund, for example, interfering and saying, "Ah, you've got to do this, you've got to do that." But look at the economic landscape around you: the fact is that SMEs [small and medium-sized enterprises], restaurants, and stores were going bankrupt, and it's not over. And that's where we come to the next steps. Governments have given handouts, as you say: subsidies for different sectors. This is essentially to silence them and to sustain them during a very complex phase.

But the legitimacy of this pandemic was not even confirmed by the PCR test from the very beginning. So that's 125 cases in Canada on March 9. That's 44,279 cases worldwide for a population outside of China of 6.4 billion. It's the height of ridiculousness.

And then I have to say one thing: the mortality and morbidity figures have been manipulated from the start. This brings me to something that's very important in the Quebec context. This is a directive from the Ministry of Health. Read it carefully. The probable cause of death in Quebec is COVID-19, test or no test; no autopsy allowed. I would like to ask the health workers if this really means anything. This directive was sent out in April 2020 when there were virtually no cases of COVID-19 in Quebec and Canada. Well, if there were any, there was certainly no underlying mortality because— Well, anyway, look at the WHO definition of COVID-19: it's something similar to the seasonal flu—they're the ones who say this—and there can be complications for a certain percentage [of the population], on the order of 10 to 20 per cent.

[00:20:00]

But anyway, they say probable cause of death—you don't die from COVID-19; you die from the vaccine, yes—but probable cause of death is COVID-19, test or no test, no autopsy allowed. That's a tad bit of a governmental diagnosis, François Legault. But for now, I'll proceed to the Canadian press's interpretation.

I believe that this date came just one week after the government directive was issued. And then overnight, at the beginning of April, 44.9 per cent of deaths in Quebec were attributed to COVID-19! The leading cause of death in Quebec: COVID-19! Look at the graph. I think it was *La Presse* that published it. They didn't even ask themselves where this kind of analysis came from. And nobody saw that it was a lie, but it is the pinnacle of lies: 44.9 per cent when in reality, just a few weeks earlier, there were practically no cases. We're not talking here about recorded deaths in Quebec or in Canada.

So that's the beginning of this fundamental crisis affecting us. And I conclude that there has never been a pandemic. And those people who refer to the virus should ask themselves: the PCR test doesn't detect viruses—especially if you do it at a magnification threshold of 35, at

which point you see absolutely nothing—and the results of this PCR test are invalid, and this is recognized at the official level by the WHO and the CDC.

But there's another element. Initially, it was called 2019-nCoV. That's right, the name of the virus was 2019-nCoV which, it turns out, is exactly the same name that was used in the [Event] 201 simulation that was held in October, which included participants from intelligence services, health executives, virologists, et cetera. And they ran a simulation of a pandemic two/three months before the actual event. And by the way, many people were at that Event 201, including the director of China's CDC, George Gao Fu.

Well, firstly, it's called 2019 nCoV—the “n” stands for “new coronavirus”—and later, it was changed to SARS-CoV-2. The name of the virus changed completely. Where did this SARS-CoV-2 come from? Has anyone asked? But I'll tell you— And it invalidates virtually every statement made by the governments from the start.

SARS-CoV-2 is modelled on the SARS virus of 2003.

[00:25:00]

And the Berlin Institute of Virology, which was commissioned by the Gates Foundation, recommended this to the WHO and it was done. The WHO declared, “We haven't isolated the new virus, but we do have a virus that's virtually identical, and we're going to use that as a term of reference.” That's right. And then they took the 2003 SARS-1 virus as a point of reference and inserted it into the PCR test. So when you get a PCR test, although they're genetic sequences, they're genetic sequences that relate to a virus dating back to 2003.

And I wonder why and how they were able to say that the new one was similar to the one from 2003 while at the same time saying: “We've never done an isolation.” You can read all about it in the Drosten Report from the Berlin Institute of Virology. It was very generously paid for by Gates, and then it was integrated. There are patenting issues. I can't say anything precise about it, but it's certain there's fraud behind it, that SARS-CoV-2 is there for a particular reason related to intellectual property, and so on.

Please note that all statements about variants, whether Delta or Omicron, et cetera, are based on PCR test results. And the PCR test can't detect either the virus or the variants, so all these statements—as far as I'm concerned—are totally false. They're part of the fear campaign. So I think first of all, of course, that there's a trajectory, but what's absolutely fundamental is that this PCR test is what we would call a “smoking gun.”

And the number of positive cases is increasing because we've ordered billions of tests from China, and so on. We have all the equipment but, in fact, China is collaborating at the level of the pharmaceutical companies—the Chinese “Big Pharma”—because they are able to produce. Take the case of Canada: we've bought 290 million antigen and home-antigen tests for a population of 38 million. That's about seven antigen tests per person. Inevitably, this leads to an increase in testing, et cetera. I won't go into the details of this but it's important to realize: initially, the statistics were falsified, the fear campaign was pushed, and also this virus is undetectable with a PCR test—impossible. I should mention that the inventor of the test died mysteriously in August 2019 but the causes of his death remain unknown.

But there's a new development. I've already talked about the economic crisis and the third pillar. I won't go into detail but the economic and social consequences are on an

unprecedented scale. It's not strictly a public health crisis and I think doctors should appreciate that. There's a lot at stake.

[00:30:00]

I must say that what concerns me as an economist—and I've been working with doctors for the last 30 or 40 years—is that when someone loses their job, is isolated, or driven to starvation as a result of global lockdown measures, it inevitably has repercussions on mortality and morbidity. That's clear. And therefore, it's not just the virus that causes this or that consequence. It's the fact that, for example, people are isolated; they're wearing masks; they're not allowed to talk to their neighbors. And what does that create? Mortality, morbidity, and mental health [issues].

I've tried to document mental health as well—so drug-related deaths, alcoholism, and so on. We already had these figures in 2020 but they gradually became distorted and we no longer know exactly what's going on. I'd now like to move on to the third stage.

Louis Olivier Fontaine

Professor, allow me to interrupt you. You talk a lot about the economic consequences and I'd like to ask you a question. You certainly have colleagues who are economists: What has been the reaction of your economist colleagues? Because what you're telling us today before the Inquiry is enormous and I'd like to know what they think, according to your knowledge, if you have this knowledge.

Dr. Michel Chossudovsky

I have people in my profession whom I respect enormously. But I haven't seen a single economist who has said that lockdowns—which were presented as a solution to the pandemic; shutting down the world economy isn't a solution— So anyway, I haven't seen a single economist who has really addressed the issue, so far as I know. As such, the profession itself will deal with the crisis in the aftermath. The fact that financial analysts have said, "Ah, it's the virus that caused the stock markets to crash," is nonsense. I know how stock markets work. Firstly, they're manipulated, and the enrichment that was triggered in the wake of this lockdown is documented. It's in the book. But there are studies done by an institute in Washington that have documented the impacts on the concentration of wealth, on the multi-billionaires, et cetera. It's clear that this crisis favours the financial class. There's no doubt about it.

Louis Olivier Fontaine

For people who don't have this knowledge of the markets, of the stock market, could you provide just a few more specifics on how someone with this prior knowledge would achieve the enrichment you're talking about, just to be a little more concrete?

Dr. Michel Chossudovsky

Well okay, without getting into the intricacies of these transactions, let's just say that Bill Gates had prior knowledge of what Tedros was going to say—and I'm sure it's probably him who told [Tedros] what to say—and he has 60 per cent of his assets on the New York Stock Exchange, and the derivatives market is known, so you speculate. But those who make money from speculation are those who have prior knowledge; we use the term

“insider information” or “prior knowledge.” He had prior knowledge of what Tedros was going to say: that’s clear.

That day, he made a fortune. But it’s not just him: it’s the whole apparatus. And so you have institutions like BlackRock, which is dominated by the Rothschilds, the Rockefellers, and so on. Well, they’re involved in these financial operations. In derivatives trading, for example, we talk about “naked short-selling,” okay? It’s a technical term.

[00:35:00]

For those of you who lost money on the stock markets on February 20, you will know. It’s clear. If you had prior knowledge of what Tedros was going to say—which was based on a 1,076-case imbecility: “the windows are closing, we’re very close to disaster,” et cetera—you would have made a fortune!

Louis Olivier Fontaine

This is what is known as short-selling, if I understood correctly?

Dr. Michel Chossudovsky

Yes. There are very sophisticated mechanisms and no regulation. And that was the product of changes made at the end of the Clinton administration in 1999. Major reforms were made to the banking system allowing large financial institutions to integrate speculative operations with commercial operations. In short, there’s a whole debate about this, but I have to say that, for sure, my colleagues haven’t pointed it out. They come up with the imbecility of saying: “Ah, it’s the virus that caused the stock market crash.” That’s a fraudulent statement; it’s propaganda and it’s false. I said that because— Well, maybe I’m wrong too, I don’t know.

Louis Olivier Fontaine

Professor, what do you think would be the likely explanation for your colleagues’ silence, if I were to ask you to speculate on probable causes?

Dr. Michel Chossudovsky

Well, listen, economics is a field with all kinds of contradictions in terms of comprehension. You could say that a market mechanism exists, it certainly does, but so do the actions of the players and that’s how I’ve always analyzed it. For example, people who actively comprehend financial issues are much more likely to say, “No, it was so-and-so who caused the disaster.”

I’ve been studying these financial operations for a number of years: For example how, in Asian countries, the so-called Asian crisis led to the collapse of national currencies— But that’s a bit off topic. What I can say is that the lockdown itself was certainly not a solution to a pandemic that did not exist. But neither was it a solution if you suppose that it [the pandemic] did exist. It became existent with the fear campaign, et cetera. So in a way, in facing a pandemic, it becomes necessary to ensure that the economy is not affected because it is the very foundation of our resources, et cetera.

Right now in Montreal, we can look at the infrastructure situation: the entire urban landscape is being altered, farmers are going bankrupt, and so on. All this started on March

11, 2020. It's a part of our lives and something that preceded the vaccine. I'll try not to be too long, but this is the next stage in this crisis: the vaccine is presented as a solution. It's presented as a solution to a pandemic that never happened.

You may argue with me but, in my view, there are two smoking guns. One is the PCR test that doesn't validate. I'm not questioning the existence of the virus; I'm saying it [the PCR test] doesn't detect the virus: it detects anything at all.

[00:40:00]

And secondly, the vaccine has absolutely nothing to do with the virus. It's mRNA: it's a vaccine that modifies the genetic make-up, which has consequences. I won't go into the medical details but I'd like to point out a number of things on this subject. This is also the second smoking gun.

December 2020 was the launch of the vaccine. The Pfizer company undertook an internal study, a confidential report with a sampling of about forty-something thousand in different countries; and they looked at the period between the middle of December and the end of February. And please note that in most cases, the effects of the vaccine are felt much later, not immediately.

Pfizer's report was confidential. It was shared with government bodies and the FDA [Food and Drug Administration] in the United States. But if you look at this report—and many doctors and medical officials have looked at this report in detail—1,200 adverse effects are categorized therein. There are mortality and morbidity rates associated with the incidence that they collected during a relatively short period—between December 15, let's say, and February 28. That's what they indicate in the report.

And they now have a report that has been made public thanks to a legal procedure in the United States, namely the *Freedom of Information Act*. It has been made public. It's never been mentioned in the media and it seems that many doctors don't know about it. But in short, for me, this report is what you might call "from the horse's mouth," and it provides documentation in a coherent and scientific way. There's subcontracting there but it's the Pfizer report, so they can't say, "Oh no, it's peer-reviewed" or "it's not quite that" or "they're conspirators." No, it's their report.

So here you have the accounting: it's just an extract from a graph. We have it in several of our texts on Global Research and the Centre for Research on Globalization. If you look at this report in detail, you'll come to the conclusion that—based on the numbers between the middle of December 2020 and February 28, 2021, certainly—all the data is there to state this vaccine is dangerous and leads to mortality.

[00:45:00]

And insofar as it's applied on a planetary scale, it is inevitably a crime against humanity. There's no other way to put it.

But I'd like to make the distinction that by February 28, 2021, Pfizer had a document in its possession demonstrating that this vaccine was certainly not a solution against the alleged virus. Rather, through the adverse effects and underlying mortality, it constituted a drug that was dangerous and deadly. I call it the "killer vaccine." It's a killer vaccine, and that is a label based on Pfizer's report. So in early March, Pfizer knew the results of this confidential report and should have said, "We won't go ahead with marketing because our own data tell

us that this is going to have mortality and morbidity consequences.” In other words, up until February 28, it’s involuntary manslaughter. But when this vaccine is imposed on the whole of humanity, it becomes a crime. It’s the transition from manslaughter to murder from a legal standpoint.

Louis Olivier Fontaine

So Professor Chossudovsky, those are your conclusions. That’s your interpretation of this report, if I’ve understood correctly.

Dr. Michel Chossudovsky

Yes. I’m not a medical doctor but I can certainly read; and I’m in contact with a lot of doctors and scientists and we catalog individual cases. We know because we live in communities; we know that so-and-so has been affected. But think about it.

The next step in my reflection is twofold. One is that Pfizer has just released its annual report for 2022 and they made, after paying all the—well, they have to fund all kinds of people—but they made \$100 billion in profit in one year. One hundred billion dollars profit in one year! And then if we look at the consequences of this vaccine, you could say that the killer vaccine allowed them to make an absolutely phenomenal amount of money. First of all, it’s a crime against humanity. It’s profit-driven, so it’s all about making money.

And I have to speak because no government and no media in Canada or elsewhere has had the courage to point out that Pfizer had criminal, not civil, action against them. Lawyers are very aware of what a civil class action is but when it’s criminal, in the U.S., it involves the Department of Justice. And similarly in Canada, it would be His Majesty’s government, so I’m talking about King Charles.

[00:50:00]

So it was a Department of Justice action against Pfizer. And there was also a provisional clause in there. They weren’t put in jail but were told that for four years, “We’ll be watching you.” But in reality, it was Pfizer that was watching the American state entities.

So first, we have a company that is aware of the impact of its vaccine because it conducted this confidential study. The confidential study should be on François Legault’s desk or Trudeau’s desk by now, but in any case, they should know about it. So anyway, and I’ll end on this: When we extrapolate all the individual cases we receive, that we’re aware of—mainly in Quebec, in Canada, but we have friends everywhere—and they tell us, “There’s so-and-so who died unexpectedly.” We’re currently looking at Dr. William Makis’ reports on an almost daily basis as well as those of Dr. McCullough. They report these cases: pilots, health care workers, all sectors of the population, infants. This graph shows the number of vaccine doses over a period ending in September 2021. Now, I’ve extrapolated this graph. By March 2023, 14 billion doses had been administered worldwide for a world population of 8 billion which means an average of 1.75 doses per person.

It’s a question of finding out or analyzing what this implies at a global level [in terms of] the impact on mortality and morbidity. And here—and I’ll end on this point—we now have another trend because of the vast sums of money involved. The distinguished President of the European Commission, Madame von der Leyen, formerly Germany’s Finance Minister, is now negotiating 4.5 billion doses for the European Union! 4.5 billion doses for the

European Union for around 450 million people, so we multiply by ten: that's ten per person. It's never-ending.

And then, of course, there's the debate on the pandemic protocol that will be debated at the WHO in the next few weeks to establish a mandatory vaccine system, and so on. But I'd like to leave the "what's the future" question for later because this crisis isn't over yet.

The fifth pillar is debt. There is excessive debt at all levels of society and on a global scale, and creditors are essentially able to dictate national policy.

[00:55:00]

There's the question of the welfare state, health services, privatization and societal projects, and the move towards a state that would appear to be totalitarian on a national and international scale.

So there you have it. My book is available for free as a PDF. I'm sorry, it's in English. It's been translated into Japanese. The Japanese translated it and released it last April. And I hope to release it in French soon, but I'm having a lot of trouble. I haven't had any offers from publishing houses because they don't like the content. But that's another subject for debate. But I'm offering it as evidence for the Inquiry.

Louis Olivier Fontaine

Thank you very much, Professor. I'd now like to give the floor to the commissioners, who may have some questions for you.

Commissioner Massie

Thank you very much for your testimony. I had a question about the graph you presented, which I had missed: at the start of the pandemic, that COVID was the leading cause of death in Quebec, accounting for 44 per cent of cases. My question for you is this: This graph was based on figures that aggregated mortality on what basis? Daily, monthly, annualized? What do we know?

Dr. Michel Chossudovsky

Look, coming back to the Ministry of Health directive. It's based on lies, okay? Probable cause of death: COVID, no test required, no autopsy allowed. So what is it? They say, "The person died of COVID." Anyway, it's not— A death from COVID: how do you establish that? You have to make a medical diagnosis. You can't just say "probable cause, blah, blah, blah," okay? This directive comes from the Ministry of Health, ask them.

But it's clear that from one day to the next, it can't be 44.9 per cent. In one week, the mortality rate went from zero to 44.9 per cent [COVID deaths]. I didn't invent this, *La Presse* did. Where do these figures come from? They come from a lie told by the Ministry of Health. Now I'm going to tell you that in the United States—because I looked at the United States situation—they say "underlying." I'm going to say this in English because these are medical terms: "the underlying cause of death, COVID-19, more often than not." This is the directive given to doctors and institutions. So these figures are totally invented. They're totally made up. Overnight, 44.9 per cent of [deaths in] the Quebec population dies of COVID?

Well, of course, it's temporal. It's not going to stay like that forever, but at the time they published it— And ask *La Presse*: *La Presse* got the data from the Ministry of Health.

Commissioner Massie

Thank you for your clarification. Any questions, Janice? You can probably translate it yourself since you're completely bilingual.

Dr. Michel Chossudovsky

Okay, it's fine. I'm an Anglophone.

Commissioner Kaikkonen

[In English] Okay, it's a big translation.

[01:00:00]

It's been repeatedly stated during testimony that liberal democracy cannot survive if the law is weaponized against its citizens to persecute citizens with dissenting voices and dissenting views, but what you have described goes a little bit further. It reminds me of the story of *Doctor Faustus*, when those in privileged places of power made a deal with the devil—or could have made a deal with the devil in this case. But in this case, exasperated by corruption, incompetence, and greed. I'd like to believe—and I may be naive in this—that there is a place where this country can come together to restore constitutional foundations under the supremacy of God and rule of law. And you have stated it is not finished, so that's kind of my concerning point. Have you given any thought as to how hard-working citizens in this country can engage in peaceful civil disobedience that can reverse what many see as being destructive for our country going forward?

Dr. Michel Chossudovsky

As I understand it, in the final analysis, this crisis isn't over. And the question is: How do we act to reverse the process? If I have to answer that question, first of all, freedom of expression is absolutely fundamental— freedom of debate, as we're doing here. There are certainly different visions, as we've seen. But I also think that truth is absolutely a fundamental instrument, that is, truth that is corroborated, not opinions about truth.

But I believe that the first step is to understand that some of these decisions are criminal in nature. And it's about civil society retaking possession of state institutions. We see this in various government bodies. I personally believe that demonstrations and protests are not the solution. Because instead of protesting, we should question. That is what matters. And you can have healthcare workers or pensioners in France holding demonstrations, but that doesn't solve the problem.

What we need to do is question the legitimacy of the decision-makers: the legitimacy of those who made these decisions. Madame von der Leyen, for example. It's also our own governments. I gave you the mortality figures that Quebec published, didn't I? It's obvious that this was to create a fear campaign. And so they attributed mortality to COVID-19. We can't even do that kind of tabulation because we're not able to differentiate with PCR testing. We can't; it could be something else.

But right now, we have governments that are waging a campaign of fear. They're forcing us to take the vaccine, so it's not a matter of protesting. It's not a question of constitutional law either. We're beyond that. The vaccine must be stopped immediately. That has to be clear. And it has to be clear based on the data inside this Pfizer document. And we have all the data. In Europe, it's the EMA [European Medicines Agency] and in the United States, it's VAERS [Vaccine Adverse Event Reporting System]. We have a huge number of documents: peer-reviewed studies, specific studies, et cetera, to say this vaccine is dangerous and must be stopped immediately.

[01:05:00]

And it's not a question of saying, "We're going to give people the right to accept it or reject it." And furthermore, we have an economic and social shift that's based on supporting the pharmaceutical industry rather than emphasizing maintenance of services, et cetera. Healthcare is clearly being privatized. The state is so indebted; and it's indebted to creditors; and it's indebted to Pfizer too because they operate together. So I think we necessarily need to target the legitimacy of the decision-makers. And protesting says, "We don't agree with you but we don't question your legitimacy."

So the legitimacy of decision-makers—whether in government, high finance, or the pharmaceutical industry—is what needs to be targeted. And of course, everything behind this project—and here I'm speaking as an economist—is based on the concentration of economic power on an unprecedented scale. There is a concentration of economic power; and this financial and banking power is taking over the real economy. And that means that even big corporations like Air Canada are bankrupt and they will be taken over.

And we're seeing the whole economic landscape now: SMEs being liquidated; a desire to consolidate farmers' land; and there are other agendas in there but I won't go into those complexities. But I think if we formulate it with an understanding of what's at stake in this crisis, then we're able to confront them and to not accept their legitimacy.

We're not going to say, "Monsieur Legault, could you do this and that?" No, we don't accept their legitimacy because they're such liars. Okay, I know this is controversial—but anyway, that's my opinion.

Commissioner Kaikkonen

Thank you very much.

Louis Olivier Fontaine

So Professor Chossudovsky, on behalf of the Inquiry, I'd like to thank you very much for your testimony as an economist. You brought a unique perspective that, to my knowledge, had not been brought to the Inquiry's attention. So we thank you very much and wish you every success in the future. Thank you very much.

Dr. Michel Chossudovsky

Thank you.

[01:09:03]

Final Review and Approval: Erin Thiessen, November 13, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 4: Gary Lalancette

Full Day 3 Timestamp: 03:35:06–03:59:49

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Samuel Bachand

Hello, Monsieur Lalancette, can you hear us?

Gary Lalancette

Fine, and you?

Samuel Bachand

The same. My name is Samuel Bachand. I'm acting as attorney for the Inquiry in connection with your testimony. I would ask you, Gary Lalancette, to spell your name in full.

Gary Lalancette

G-A-R-Y L-A-L-A-N-C-E-T-T-E.

Samuel Bachand

I will now swear you in. Do you swear to tell only the truth to the Inquiry?

Gary Lalancette

I do.

Samuel Bachand

Very good. You are here, Monsieur Lalancette, to tell us about your experience of losing your job and claiming unemployment benefits related to COVID or COVID policies. To facilitate the Inquiry's administration of your case, I would like us to begin by introducing the bundle of documents you intend to present to us. Ladies and Gentlemen of the Inquiry, the witness's bundle is numbered [Exhibit] QU-5. It includes documents QU-5a to QU-5l in

chronological order. So Monsieur Lalancette, I'd like to ask you, do you have access to these documents? I've sent you the bundle.

Gary Lalancette

Yes.

Samuel Bachand

Okay, now open this on your computer and very briefly—because we'll go into detail later—but simply identify the procedural and other documents that appear in this bundle so that the commissioners can make notes and refer to them quickly.

Gary Lalancette

All right. So the QU-5a: that's the vaccination policy that's been established at the company, with all the details.

Next, the QU-5b is my note stating that my employment would be terminated if I didn't comply with this policy.

Next, QU-5c is the reference letter I received from my immediate superior.

Next is the QU-5d: this is the notice that they want everyone to return to working in the office and are extending the vaccination requirement by one month in order for us to provide proof [of vaccination].

Then you have a QU-5e, which is the code for my dismissal.

Then [QU-5]f, which is a screen shot of my employment record showing the reason for dismissal.

Then you have document QU-5g. This is the confirmation of my complaint to the CNESST [Commission des normes, de l'équité, de la santé et de la sécurité du travail – Standards, Equity and Occupational Health and Safety Commission] for dismissal without just cause.

Then document [QU-5]h: this is the document I provided to Employment Insurance showing all my reasons for refusing to comply with this policy, which were supported by sections of the law.

Then [QU-5]i, which is the refusal of my benefits, in other words, the decision of **Employment Insurance to refuse my request.**

Then [QU-5]j shows that I appealed and they still refused to give me benefits.

Then, [QU-5]k is my filing at the hearing: in other words, what was done by my lawyer, which proves that I made an additional appeal.

And [QU-5]l is the document which attests to the notice of hearing for the CNESST, which is coming up on June 19.

Samuel Bachand

Right. I don't want to cut you off. Were you about to say something?

Gary Lalancette

No. That concluded the description of the documents.

[00:05:00]

Samuel Bachand

So just to set the context for the commissioners and to avoid explanations that would interrupt your story, am I right, Monsieur Lalancette, to say that you were fired by your former employer for failing to comply with the mandatory vaccination policy?

Gary Lalancette

That's correct.

Samuel Bachand

You then filed an Employment Insurance claim which was denied. You challenged it administratively without success and are now taking the case to the Federal Court. I checked and it is indeed the Federal Court.

Gary Lalancette

The Federal Court, yes.

Samuel Bachand

In another case you're making a claim related to your dismissal in its own right, so it's not Employment Insurance. You have lodged a complaint with the CNESST, the Standards Commission, for short, and you are awaiting your hearing on this matter before the Tribunal administratif du travail [Labour Administrative Tribunal], a provincial authority.

Gary Lalancette

Correct.

Samuel Bachand

Very well. So now, start from the beginning and tell us what happened to you.

Gary Lalancette

Well, just as a preamble, I'm a career computer scientist. I have about 30 years' experience in IT in several jobs prior to this one. I was in my second-last position for seven-and-a-half years, and left it only because they closed the IT department and repatriated it to Toronto. As I wasn't among those who wanted to move to Toronto, my employment ended right there.

Let's start again with my former employer: February 23, 2018 was the date I got my confirmation of employment as an analyst, and March 12 was my first day of work.

Samuel Bachand

Sorry, I'm going to interrupt you from time to time. Could you tell us very briefly, as to an outside observer, what your tasks were like on a normal day?

Gary Lalancette

Yes, that's what I was just about to describe. At the beginning of my employment, we did office work; and mostly my job was to take remote posts and solve computer problems for the company's internal employees. Sometimes, when it's a hardware problem, we would go to people's offices to remedy it, but most of the time it was done from our workstation in the office using remote access. So under this system, we had an employee regulation that included working two days a week from home. So I was officially telecommuting two days a week for a while.

Samuel Bachand

So this was happening before the declaration of a health state of emergency.

Gary Lalancette

Yes, correct.

Samuel Bachand

Continue.

Gary Lalancette

And indeed, that lasted until the declaration on March 13, 2020. Following the declaration of a health emergency, I worked remotely all the time. In other words, I was working remotely full time. One of my main tasks was to provide technical support to employees, which I did remotely by connecting to their computers. So the operating process wasn't really any different; it was the same thing, except that instead of being in the office, I was at home.

Then on August 19, 2021, my employer adopted a vaccination policy—which is document QU-5a—that required all employees to provide proof of full vaccination—which at that time was two doses—between August 23 and September 30, 2021. Did I get the date right? Yes.

Okay, so between August 23 and September 30, 2021. So I had to show my vaccination status and hand it over to the company so they could record all of that. The only possible exemptions were medical or religious. Testing wasn't a part of that, so it wasn't even possible to take a test to be able to do this. The goal of their policy was to have us return to the office gradually and that's why they asked for this.

[00:10:00]

By then, we knew that the vaccine had already been shown to be not all that effective and also that it didn't prevent spreading or having the disease.

Samuel Bachand

I would simply ask you to continue with the history.

Gary Lalancette

So on the following September 15, I notified my employer that I had no plans to be vaccinated against COVID 19 and that I wasn't invoking any exemptions, either religious or health-related, because they didn't apply to my situation.

I then received a letter from Human Resources on the 21st, which is document QU-5b, stating that if I did not provide proof of vaccination that I was fully vaccinated by September 30, or proof by September 23 of my intention to make an appointment to receive the series of vaccinations, my employment would be terminated as of September 30. On the 23rd, two days later, I replied to the letter by e-mail advising that I stood by my decision, and that I wanted to continue my employment but with the conditions agreed upon in my employment contract. In other words, this was a policy that came into effect after I was hired and I didn't agree to it. I also made it clear that I refused to be vaccinated as it was still an experimental vaccine at that time, and that it contravened my fundamental rights—that is, my free and informed consent before accepting a medical treatment that infringed upon my bodily integrity.

Samuel Bachand

Did you express these arguments to your employer?

Gary Lalancette

Yes, I told my employer.

Samuel Bachand

Continue.

Gary Lalancette

On September 26, I received an e-mail from the head of human resources stating that the vaccination policy was reasonable and necessary to protect the health and safety of employees and that it complied with applicable laws. I question all that but I'm not going to discuss it right now. Seeing that my employment was heading towards an end, on September 28 I asked my immediate superior for a reference letter, which is under Exhibit QU-5c. I'm going to read this one because it'll show you what kind of employee I was with the firm.

Samuel Bachand

Yes, and if I may, this will also allow the Inquiry to bridge the gap with Service Canada's decision on your unemployment insurance claim. Please go ahead.

Gary Lalancette

Correct. So dated September 28, addressed to me, reference letter:

To whom it may concern,

This is to certify that Gary Lalancette has done an excellent job at—my employer—for the entire duration of his employment since March 2018. The main qualities I have noted in Gary are his courtesy, his organizational skills, and his ingenuity in improving some of our processes. During his time with us, Gary has been a pillar of our service center. He has also been in charge of our mobile device fleet and iPhones for the Montreal office and has taken part in a number of deployments and other tasks involving the firm's mobile devices. He is therefore a great asset to any IT department. Please do not hesitate to contact me for any further information. I'll be happy to recommend him to you in person.

And this was from my DTI manager.

Samuel Bachand

Continue.

Gary Lalancette

So you can see from this letter that it wasn't due to my work that they wanted to fire me but it really was about policy. The same day, September 28, as seen in Exhibit QU-5d, the return-to-work plan was postponed to November 1, 2021. So the plan to vaccinate and to provide proof of vaccination was pushed back another month. However, the company did not take the extension into account, and on September 30, they terminated my employment.

Samuel Bachand

When you say return to work, what you mean is the return-to-work deadline that had been postponed or delayed, right?

Gary Lalancette

Correct.

Samuel Bachand

Okay, continue.

Gary Lalancette

So following my dismissal—as anyone would—I tried to limit the damage. I made an application at the employment centre. That happened on October 3, 2021.

[00:15:00]

I filed my application at that time and on October 14, under Exhibit QU-5g, I also filed my complaint with the CNESST, and I received my confirmation notice on that date. On

December 19, as Exhibit QU-5h, you'll find the reasons for my refusal. We could go on at length about that but I'll try to keep it brief.

Samuel Bachand

Okay, just tell us who refused what and why. Because it's central; explain it to us.

Gary Lalancette

Okay, this is my refusal to comply with the company's vaccination policy. The Employment Insurance office asked for justifications for my actions, and in response to that I provided this letter, which I've put under the Exhibit I've just mentioned: 5h. In it, I refer to several articles of law, including under the theme that I have the right to refuse any medical treatment, under the Civil Code articles 3, 4, 10, 11.

Samuel Bachand

Monsieur Lalancette, I'm going to stop you there. We have access to the document, and I would ask you to explain to the Inquiry rather than referring to sections of the law, to tell us perhaps the four or five fundamental rights that you feel are the most important among those that you invoked against Service Canada in this letter dated December 19, 2021, labelled QU-5h.

Gary Lalancette

Yes, that's exactly what I wanted to do. Article 1 [sic] [3] of the Civil Code clearly states that "Every person is the holder of personality rights, such as the right to life, the right to the inviolability and integrity of his person, and the right to the respect of his name, reputation and privacy." So that's a very important point. And the next one, Article 4 [sic] [11]: "No one may be made to undergo care of any nature, whether for examination, specimen-taking, removal of tissue, treatment or any other act, except with his consent. Except as otherwise provided by law, the consent is subject to no other formal requirement and may be withdrawn at any time, even verbally." So I had the right to refuse this one.

Samuel Bachand

So for the other rights invoked, I'll refer the Inquiry to document QU-5h. We don't have much time left, but I want you to be able to explain what happened procedurally, so let's say in about ten minutes, please.

Gary Lalancette

Yes, all right. So as a result, Service Canada denied my application for benefits, which is under QU-5i. I appealed this decision on January 18, 2022.

Samuel Bachand

Let me stop you right there. The Service Canada decision—

Gary Lalancette

Yes, for Employment Insurance.

Samuel Bachand

—which denies you unemployment insurance, to use a good Québécois expression, is based on what grounds? What is the reason for denying you this benefit?

Gary Lalancette

This was refused on the grounds of misconduct because I didn't follow company policy which was, in short, vaccination.

Samuel Bachand

Is any other information provided? Does Service Canada elaborate on the meaning of this reason, which is your, quote, "misconduct"?

Gary Lalancette

That's the only thing. My disobedience of the policy in effect led to my misconduct. So my dismissal was my responsibility and not that of the employer.

Samuel Bachand

Am I right in saying that what you've just mentioned doesn't appear in document QU-5i? Are these things you were told afterwards?

Gary Lalancette

Yes, yes, that's part of the discussions with the employment center, yes. These are discussions I've had.

Samuel Bachand

All right. Continue.

Gary Lalancette

So as I was saying, on January 18, I appealed this decision, which in turn was rejected on February 4, 2022. One of the main reasons for this was that everything to do with constitutional laws and so on is not a part of their mandate. They follow Employment Insurance laws and have no authority or competence to deliberate on this.

Samuel Bachand

Okay, let's stay on that for a moment. I assume you're referring to document QU-5j?

Gary Lalancette

Correct.

Samuel Bachand

Entitled "Objet : demande de révision de décision d'assurance emploi" ["Subject: request for review of Employment Insurance decision"], this appears to be a mechanism for

administrative review of the initial decision denying you the benefit of unemployment insurance.

[00:20:00]

In the context of this administrative review, I'm guessing that you raised constitutional arguments or certain fundamental rights; and then you told us that, well, the tribunal felt it didn't have jurisdiction. Tell us a little about how that happened, how you raised those arguments, and then how the decision came about.

Gary Lalancette

Okay. It was recorded in the document I mentioned, the QU-5h, which I had given to the employment center with all the articles of law that protected my decision. And it was as a result of these documents that they—at the hearing, as soon as I brought up one of these points—said that it wasn't something they had the competence and the possibility to deliberate on.

Samuel Bachand

Help me out here: I don't see any references to your fundamental rights arguments in the QU-5j review decision.

Gary Lalancette

No, they didn't really stipulate that in the decision. They only said that they were keeping the misconduct decision on file. And that's why I'm still appealing, to be able to go to the Federal Court of Appeal to debate these issues.

Samuel Bachand

Okay, help me out once more. You seem to be saying that Service Canada, or the Employment Insurance Review authority, has told you that it has no jurisdiction to rule on constitutional issues. I don't see it here in the file; maybe I'm mistaken. How was this communicated to you?

Gary Lalancette

At the hearing I attended to argue my case.

Samuel Bachand

Okay. Your case under review or initially?

Gary Lalancette

Under review.

Samuel Bachand

All right. Around what date?

Gary Lalancette

I don't have the date in front of me right now.

Samuel Bachand

Okay. We can always refer to your timeline with the notes anyhow.

Gary Lalancette

Yes.

Samuel Bachand

Very well. So you're now before the Federal Court to contest this decision. Now what happened with the CNESST and the TAT [Tribunal administratif du travail - Administrative Tribunal of Labour]?

Gary Lalancette

Okay. For the CNESST, it's the [Exhibit] 5k. This is the notice of hearing I filed. So this is my appeal that I filed with the help of my lawyer, to once again appeal the decision that had been refused twice to that date. Because, as I was saying, they didn't have the expertise for the constitutional debate. So I'm taking it to the federal level to do just that.

On August 23, 2022, the Social Security Tribunal, in other words the CNESST, allowed my appeal in this regard. Basically, that's the essence of this story. Right now, as far as Employment Insurance is concerned, I'm waiting for a date for the next Federal Court hearing. And as for the CNESST, I've submitted it and I've got a hearing date of June 19 coming up for this. So I'm at that stage right now.

Samuel Bachand

Well, thank you for your conciseness. We still have a bit of time. I'll give the floor to commissioners who would like to ask questions. It's all good? There won't be any. So the Inquiry thanks you for your testimony, Monsieur Lalancette. You're free to go.

Gary Lalancette

Thank you very much.

Samuel Bachand

Thank you.

Gary Lalancette

Enjoy the rest of your day.

[00:24:43]

Final Review and Approval: Erin Thiessen, November 15, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 5: Lily Monier

Full Day 3 Timestamp: 04:51:13–05:35:06

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

So good afternoon once again. I hope everyone had a good lunch. We're going to proceed with our next witness. Her name is Lily Monier and she's with us in person today. Hello, Madame Monier. Are you well?

Lily Monier

Yes, yourself?

Konstantinos Merakos

Yes, thank you very much. If there's any point when you're not feeling well, take your time. We're here for you; we want to make your testimony as comfortable as possible for you. So I'm going to start by swearing you in. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Please say "I do" or "I solemnly swear."

Lily Monier

I solemnly swear.

Konstantinos Merakos

Thank you. Could you please spell your full name?

Lily Monier

Lily, L-I-L-Y, Monier, M-O-N-I-E-R.

Konstantinos Merakos

Excellent. So Madame Monier, I'd like to start with you. Tell us about your CV and who you are. And after that, my second question is: Why are you here today? So starting from the beginning, go ahead.

Lily Monier

I have a bachelor's degree in Industrial Relations. I also did my first year of law school, and then I chose to be self-employed and work from home. I transcribed court cases. When people go to court, it's recorded, and when they need an official transcript— So I worked with a stenographer's office. For 26 years I listened to trials. I'm also trained in crisis intervention, particularly with people who are suicidal, and I'm trained in mediation using Nonviolent Communication.

Konstantinos Merakos

Excellent. So we can see that you have an interest in the vulnerable in our society.

Lily Monier

Exactly. I wanted to be a lawyer to defend the poor, the oppressed, the orphans.

Konstantinos Merakos

But you're not at the moment, but maybe one day.

Lily Monier

But I work closely with people who are, and that gives me great joy.

Konstantinos Merakos

Okay, so from your perspective—as you see here, we're trying to get different perspectives from different ages, different regions—and I'm kind of answering my own question: Why are you here today? What's your perspective on what happened during the last few years regarding health measures?

And maybe we could start with your story, which is that at first you went along with the measures that were in place despite having questions, but later you started having doubts.

Lily Monier

In fact, I have a bit of a hypochondriac side, so initially I was a little scared in case there really was a pandemic. I may have been a little scared but I'm also someone who thinks, who questions, who looks at herself. So I faced my fear. I finally said to myself, "Look, if there's a dangerous virus and a major pandemic and if I die, well then I'll die and that's that, and we'll move on to other things." So I sort of made peace with that part of me that was afraid and I observed what was going on.

At one point, I had friends who said to me, "Ah, Lily, the pandemic: there's no pandemic here," and they started telling me things. It made me wonder but I didn't really want to hear it at first. I wasn't sure. I wanted to give it a chance. I watched and waited for

something to happen to confirm or deny the situation. Also, I live in a village of 5,000 inhabitants. If there's a pandemic, we're going to know about it.

For me, a dangerous pandemic means death: lots of people dying, no more room in the cemeteries, the need to make a mass grave. And you take notice. You go to the grocery store, and there—a village of 5,000 people, everyone knows everyone else—you meet someone and the person says, "Did you know that so-and-so is in intensive care or whatnot?"

[00:05:00]

So, I waited to see. What finally happened in June was that—

Konstantinos Merakos

June of what year, please?

Lily Monier

2020.

Konstantinos Merakos

Thank you.

Lily Monier

In June 2020, transcription stopped because the courthouses were closed. I had some time for myself; and in a way, I appreciated having a little more time for myself, to slow down for a while.

Then along came Bill 61. Of course, I have a legal background. I've often read legislation; it interests me. I read Bill 61 and was outraged: outraged that my government—I won't say "my" government, but "the" government—was abusive. For me, it was an attempt to abuse. Well, there were several elements in that bill that I won't mention, but there was the aspect where it [the government] gave itself the right to indefinitely renew the state of health emergency. That was unacceptable to me. For me, that was abusive overreach. People are down, they're vulnerable, and you want to do that? To me, that was a big X. *[She traces an X in the air with her hand.]* That was it, the case was settled.

And then from that point on— Two women from Val-David organized a demonstration two days later because things were moving fast at the start. We had to do something quickly. So we got together in our little village and I gave a speech. There were about 300 people in front of the church, and people were giving each other big hugs because they could no longer bear not being allowed to do it.

Konstantinos Merakos

And did you participate in—

Lily Monier

I gave a speech and hosted the protest. I didn't know I was going to host it. I spontaneously offered to give a speech. Afterwards, I regretted it. I said to myself, "My God, I've got a day-and-a-half to prepare," but I did it and it was a great pleasure. And I quoted Gandhi's phrase: "Civil disobedience is a sacred duty when the state becomes lawless or corrupt." Well, I've become an expert in civil disobedience. I've decided to not obey unjust laws.

And I'd also like to mention Rosa Parks, the black lady who got on the bus. Apparently, she was too tired that evening so she didn't go all the way to the back of the bus. She decided to sit at the front and that was prohibited. And that woman changed the course of events because she chose not to obey that day.

Konstantinos Merakos

So despite the fact that the details are different in each situation, what matters to you is the principle or the idea behind the act. In other words, depending on the situation that arises with the laws that the government decides to pass, you feel that the citizen's role is to ask questions. And one way of asking questions is through, for example, a demonstration or civil disobedience, et cetera. Do you agree?

Lily Monier

Yes. And that's also what I did when they imposed masking. It just didn't work for me. Then Dr. Arruda held a conference, and he said, "Ah well, it's useless in a community setting. People are going to wear it crooked; they're going to play with it; they're not going to use it properly, it's absolutely useless. Wash your hands." Then two weeks later, it was the opposite. I don't like that. It doesn't make me feel respected. I'm an intelligent person. You can't tell me the opposite two weeks later and expect me to trust you.

Since I always see things from a legal point of view: I read the decree, and then I saw the exemption: "Unless they have a medical condition." So I said, "Well it doesn't say 'unless they prove they have a medical condition.'" And I did some research. I went and looked at all kinds of things, and I printed out the decree. I called the owner of the Metro [grocery store] in my village and said, "Monsieur Vincent, I have a medical condition that means I can't wear the mask." I asked, "What are you going to do?" He was in a panic, "Can you put on a veil or a scarf?" I said, "No, nothing."

[00:10:00]

So he says, "What's your medical condition?" I said, "I don't think you've read the decree and that you don't know the law because medical records are confidential. Would you like me to send you the decree?" Then he said, "Yes, I'd like that." I knew he was going to forward it to Metro's legal department because I'd worked in big law firms in Montreal, I knew how these things worked. And that's what he did. And the next day, he called me.

Konstantinos Merakos

Sorry to interrupt, but were you working as a secretary?

Lily Monier

Yes.

Konstantinos Merakos

Thank you.

Lily Monier

He got back to me the next day and said, "Well, you were right." I knew that I was. And then I suggested that, like at Costco, customers with a medical condition had a little something on the basket. And then I said, "Maybe that could make your life easier." Because I'm not a confrontational person. I refuse to allow my fundamental rights to be restricted unless it is justified and justifiable, but all the while I will behave with respect for those around me.

You know, the Metro owner wasn't responsible for what was happening, and I understood his panic regarding the other customers. And that's what was really problematic. What also struck me was that I could go to the Metro without a mask, but the other customers were— Anyway, it was an intense experience. I felt the inner satisfaction of having respected myself. But it took a lot of courage to do that. And afterwards, I took part in a lot of demonstrations.

Konstantinos Merakos

That's the subject I'd like to pursue a little. On the subject of demonstrations, you've been a witness and you've taken part. I'd like to get your perspective on the ground. Was it peaceful? Was it done with love? Was there any violence? I'd like you to relate the facts you observed.

Lily Monier

That's right. I've spoken several times as well, given speeches. And I often talked about the legal aspect and what I knew about it because I have lots of lawyer friends to whom I asked questions. And I took part in many demonstrations which were completely peaceful. I didn't meet a lot of "anti-vaxx" people. I met a lot of pro-choice people. What's important to me is that people should be able to give free and informed consent. And that we should give them the right information, explain the risks involved in experimental injections, and let them decide for themselves.

Konstantinos Merakos

What was the atmosphere like at the demonstrations? The people, the families—were there any families? What were the reactions like? Because earlier you talked about hugs.

Lily Monier

It was wonderful. It's like I have a new family. I have lots of new friends, and they're people with the same values as me. And we got together and it was like a party. Our goal was to be seen and heard in peace and harmony. But they were opportunities to meet each other and to give each other support. And then to see that there were so many of us with the same point of view that something wasn't quite right.

It wasn't the protesters who were the problem. I observed police brutality. I even talked to police officers and told them, "Listen, there is no sense in what you are doing. People are super peaceful. You pick someone up and he's ready to follow you, yet you put their hand up behind their back like this." I say, "If you use more force than necessary—you are

subject to the Criminal Code—don't you think that could be considered assault? And you're going to have an ethics complaint." It hurt me deeply.

Konstantinos Merakos

Yes. Were these questions you asked the police?

Lily Monier

Yes.

Konstantinos Merakos

But one very important subject: Can you tell us about one or two incidents of police brutality that you observed as a witness? You mentioned, for example, people who wanted to follow the policeman but were handcuffed behind the back. Were there any other—

Lily Monier

And, you know, it was quite hard. For two years I— You have to understand that from the moment I got involved, I was incapable of sitting back and doing nothing.

[00:15:00]

I chose to get involved. I started doing Facebook Live videos, explaining, "Okay, here's the decree. Here's how I work within it." I wasn't giving advice because you aren't allowed to if you're not a lawyer. But I was saying what I did when I wanted to go without a mask. Then I'd talk about the demonstrations and about police brutality, and then people would call me. When people saw that there was someone who could be a point of reference, who knew lawyers, who was looking for answers, well listen, for two years it was 24/7.

Konstantinos Merakos

Basically, you were helping people.

Lily Monier

Distress calls . . . It was very difficult: difficult because what should have functioned normally—I'm a person of action, of solutions—and what should have worked, didn't. It was as if the ceiling had become the floor and the floor, the ceiling. The government wasn't respecting its own regulations and was maintaining a state of confusion. That's the feeling I got.

They frightened shopkeepers with fines if they let people in without masks. Yes, but if you had a medical condition, you wouldn't be fined. It was extremely difficult for people to assert their fundamental rights.

Starting on December 20, 2020, the police brutality began. And in La Fontaine Park, there was a woman on that day—I don't remember if it was December 2020—who phoned me following a demonstration where she had been dragged off by the police. A 72-year-old man was dragged off by the police. These people were not resisting. It was like intimidation.

I spoke at a demonstration in Val-David and told people, "If you see someone being arrested and being led away by a policeman, please follow him. Follow him and yell, 'We're with you, and we'll stay with you until it's over.' And take note of the policeman's badge number. Write it down, and then exchange contact details. And when you get home, talk to others and make several police ethics complaints." I said this because I was speaking with a policeman who told me, "You know, one complaint doesn't bother the police officer, but four or five complaints start to become tiring." So I passed this on during a demonstration and I knew that the police were there, listening to me. I was sending a message to the police. I'm a vigilante at heart. It follows me everywhere and stays with me all the time.

Konstantinos Merakos

I have one last question about the demonstrations. Before the police started arresting people, were there any warnings? Were there any warnings to say, "If you don't leave this place, we're going to start arresting you"?

Lily Monier

This happened in Rimouski. They did it in Rimouski. It was like a recording. I was supposed to speak at a demonstration in Rimouski. I think it was in October 2020. And then I sensed that we were heading in that direction. I'm a courageous person in general, okay, but not one to take a beating. It scares the hell out of me. I don't want to go through that.

I was ready to demonstrate. I was ready to talk to the cops. I was ready to do a lot of things. The fact is, I feared for Rimouski. I sensed where it was going and chose not to go after all. And that's what happened, in the sense that the police were there in huge numbers and they did warn the demonstrators. They gave a warning and the people were forced to disperse. But as far as I know they didn't do that again at the other demonstrations I've been to.

Konstantinos Merakos

Yes, there were no warnings at your demonstrations, just immediate arrests.

Lily Monier

Well, there were times when there were arrests. Listen, we were in Montreal and we were demonstrating. There were a lot of us; we took up the whole street. And I managed to get in the middle. I tried to get close to certain influencers who sometimes had bodyguards. I was careful. I'm careful.

[00:20:00]

So it happened that I saw people being taken away by the police to a side street. This was getting serious. If you're going to arrest someone, arrest them there. Why are you taking them off by themselves, what's the deal? Because these people were just walking down the street. I mean, no criminal acts were being committed. Maybe they didn't have a mask, but then issue a ticket—which I consider illegal—but at most, leave it at that.

Konstantinos Merakos

Another important point I'd like to make: we spoke earlier about your interest in helping vulnerable people, or helping the world in general. I know that some people see you as a

mother, as a grandmother; you're very approachable. And I saw that in our brief preparation when we introduced ourselves.

Lily Monier

I'm not a mom.

Konstantinos Merakos

Okay, no, but I mean you are perceived as being approachable. You're—

Lily Monier

Kind.

Konstantinos Merakos

Yes, you're very calm. It's been very easy to communicate with you for this purpose, and I can see you're doing very well here. But then there are some people, for example, for whom what you're doing right now is very difficult.

So some people have called you. While respecting the confidentiality of these people, has there been talk of suicide, depression, or other hard subjects that have been discussed with you during these phone calls?

Lily Monier

A case that particularly touches me . . . I'm telling you, it does me good to cry. I allow myself to cry because it's a release. This man couldn't wear a mask, but it wasn't a physical condition, it was psychological: his father had tried to suffocate him when he was a child. Do you think that a rag on his face—? He wanted to kill himself. He couldn't take it anymore; he wasn't being heard. I suppose that sounds a bit out of proportion, but I think there's an element of post-traumatic stress. It was huge and he couldn't get anyone to listen to him, and then he couldn't get a note from his doctor. There is that too: the doctors followed the narrative. And then there's the Collège des médecins [College of Physicians]—we're not going to put them on trial here, but I can tell you that it wasn't easy. He finally convinced his doctor to give him a note because it didn't make sense for him to continually go through all that. This touched me deeply.

I have a lot of stories, a lot of people who phoned me were about to lose their jobs. This just floored me. A person in a very large law firm in Montreal—impressively large. I won't name them, that's not the point. But it just floors me. It's like: "Hello? What's going on? You're a lawyer." If I am able, I have an obligation as a citizen to know my rights and responsibilities. I can't go before a judge and say, "Oh, Judge, I didn't know about that law." He'll tell me, "No one is supposed to ignore the law." Well, a very large law firm sends messages to its employee: "When you come back, everyone must be vaccinated." The person working from home said, "Hey, I'll be returning soon, and [suddenly] they are demanding vaccination."

Konstantinos Merakos

And in several industries, but we'll come back to that subject.

Lily Monier

I've heard from people from all kinds of industries: unionized and non-unionized. I was referring them [to lawyers]. At one time I arrived with a group of lawyers, of which there weren't many. The group wasn't very big because it's too risky—it's too risky to stand up both as a citizen and as a lawyer, to be crucified in the public square, as a professional.

Konstantinos Merakos

Excuse me for interrupting. When you say, "crucify," with respect to the media and the image that they could— Define this word.

Lily Monier

All the words used: for example, "conspiracy theorist," "covidiot"—

Konstantinos Merakos

Do you have any experiences like that with the media where you have been placed in a negative, derogatory category?

Lily Monier

They didn't dare. On Facebook, I experienced something from a group that attacks influencers, that searches for things in order to attack people who do a bit of what I do.

[00:25:00]

And they searched for a really long time because I'm very careful when I speak, as I'm sure you've realized. Having listened to court proceedings for 26 years, I'm rather conscientious of what I can and can't say. So I was very careful and they could hardly pick up on anything, but they found something in my past and they broadcast it publicly. They didn't dare use the "c" word, which I detest, and the day it happens to me—I'm saying it publicly—I'll sue for defamation and have that word defined, and then they'll have to say how it applies to me.

I haven't taken that action yet. It wouldn't be very difficult for me using a procedural model. It hasn't happened and I hope it doesn't because I wouldn't tolerate it. Some people accept it and then say, "Oh, that's okay with me," but not me. Not me. I don't label others and I don't want it done to me.

Konstantinos Merakos

So we were talking about actions, and we'll move into the next subject with that word. In the beginning, we said that you were reading decrees, consulting lawyers, and taking part in peaceful demonstrations in keeping with democracy, as is your right in a democracy: it's one of the fundamental rights. And after that, you undertook other legal activities since you wanted to get some answers to your questions. So what was one of the questions you posed to the government through the—?

Lily Monier

A legal action in which I am a plaintiff. There are five plaintiffs.

Konstantinos Merakos

And we're about to discuss this. Excuse me for interrupting, but unfortunately, we won't be able to go into details. We'll just stick to the general themes of the conversation. But go ahead, excuse me.

Lily Monier

I have been with the Fondation pour la défense des droits et libertés du peuple [Foundation for the Defence of the Rights and Freedoms of the People] since October 2020. An appeal was filed: an appeal for judicial review. A lawyer had written it, but eventually withdrew from the case for all kinds of reasons. At that point, we had five expert reports from world leaders. A lot of money had been spent: about \$700,000. Then, the lawyer withdrew. I said, "Well, listen, could we represent ourselves?" I suggested we represent ourselves. At the same time, I thought that was very fitting.

What I've been longing to do for the past two years is to help people regain their power. That's what it's all about. And so I became like a spokesperson. Our procedure, our objective, was to say that there wasn't really a pandemic. They exceeded their authority with these measures. We're asking that the decrees be annulled, and that we talk about the Charter of Rights and Freedoms. And we'd like the government to show us that it has met the Oakes test because, while there is a right to infringe fundamental rights in an exceptional situation, a crisis situation, there is also an obligation to show that those four criteria are met. And I'd like to name them, if possible, so that people are aware.

Konstantinos Merakos

In a word, briefly, because the point I want people to understand, is that you have questions for the government. You've taken the legal route. And in essence—confirm to me if this is correct—you've asked a judge: whether a pandemic existed; if so, what are the reasonable limits of invasion on private life; and whether these measures are proportionate to the situation at hand?

Lily Monier

Exactly.

Konstantinos Merakos

I'm summarizing some of the technical elements because it is easy for people to get lost in the details. What are the criteria?

[00:30:00]

Lily Monier

We tell the judge, "As far as we're concerned, there was no pandemic, as is demonstrated by our experts in their report. And if you decide that there was a pandemic, we would at least like to be able to examine the measures in the light of these criteria: Was it reasonable? Was it effective? Was it a minimal impact? Were there alternatives to a curfew?"

Personally, I don't call them measures; I call them outrageous and totally incoherent. You're allowed to walk a dog after eight in the evening but no more than a kilometer. I could name plenty of examples here, but I think people know them. It's probably not necessary.

And I'm very proud. The Attorney General's lawyers filed a motion to dismiss our proceedings, saying the usual thing: that it had become theoretical because there were no more measures. But we countered, and I pleaded on January 4.

Konstantinos Merakos

It's under advisement, so we'll stop here as we are awaiting that decision.

Lily Monier

We're waiting for the decision. That's what "under advisement" means.

Konstantinos Merakos

Exactly.

Lily Monier

I'm very proud. It took a lot of courage. I was a little stressed, but I had great support. It's the most extraordinary thing I've done in my life, honestly, and I'm so very proud. I believe that everyone should use their skills to make a difference in their own way. I have skills in this area, so I put them to good use.

Konstantinos Merakos

Okay. So for you, it was essentially an exercise in democratic citizenship in order to receive answers in a reasonable fashion. And you mentioned earlier that you might want to slow down the machine.

Lily Monier

The bulldozer. It is a big bulldozer. Like in the cartoons, you have to throw wrenches or something into the wheels to slow it down. And me having legal recourse is no fun for them, to have this hanging over their heads. And it sends a message that: "You can't just do anything you want."

Konstantinos Merakos

The government.

Lily Monier

Yes. It's important that I do that, and to disobey. For me, civil disobedience is a relatively easy approach. It doesn't take a formal lesson: you just don't obey.

Konstantinos Merakos

One last question: I'd like to get your perspective because there are words that have been spoken in political speeches by the top ministers from different levels of government. What

is your opinion on these words that have been said? If we're talking about the words, I think you know.

Lily Monier

Yes, well, one thing that really struck me—and I couldn't believe it; I fell out of my chair—was when I heard Monsieur Legault say, "If you have employees who haven't been vaccinated, you can fire them." I thought, "Wow!"

Konstantinos Merakos

Can you tell us exactly if you've heard this on TV or radio?

Lily Monier

I don't know if it was at a press conference or— In any case, I definitely envision a photo of Monsieur Legault and a newspaper article. I think it was at a press conference but I'm not absolutely sure. That really blew me away.

Konstantinos Merakos

But you can confirm that it was negative?

Lily Monier

First of all, he's not a lawyer. If I'm not allowed to practice law illegally, I guess he's not either. And how can he say such a thing? They say that vaccination is not mandatory, but that's contradictory.

And then Monsieur Trudeau— What particularly struck me lately is that he seems to be saying that, well no, he didn't force people to get vaccinated. But there were all the threats. There were job losses. Well now, you didn't force them? That's nonsense. It's all nonsense. It's black and white, white and black. It changes from week to week. I just don't get it.

Konstantinos Merakos

Thank you, Madame Monier. We'll now continue with questions from the commissioners. Commissioners, go ahead.

Commissioner Massie

Hello, Madame Monier. Thank you for your testimony.

[00:35:00]

I see that during this health crisis, you've evolved on a personal level. You've faced up to your fears—which isn't the case for everyone. Because even today there are still people who are somewhat in the grip of fear, which isn't easy to manage because they lose their capacity for discernment at that point. But you've managed to do it, and it's a fine model to follow.

I see that you have basically pursued two paths: civil disobedience—which according to your testimony is based on ethical and moral principles inspired by Gandhi and many

others who have followed this path—and also you said to yourself, “Well, as I have expertise in legal procedures, why don’t I go this route?” And indeed, it’s a big adventure and it requires expertise to bring it to a successful conclusion.

But it may be that civil disobedience or demonstrations have their limits in terms of what they can achieve. The same goes for legal proceedings, which I think we’re approaching rather timidly in Canada, including in Quebec. When I hear about the procedures currently underway in the United States, it is not remotely the same. And I think that in the United States, this approach will probably end up having an impact.

My question is: If they rule against you—we know that it isn’t over yet and it is good to keep up the pressure for as long as possible, that sword of Damocles is good—do you envisage any other way of specifically changing the situation? Because at the political level, politicians who feel they have sufficient support from the population to continue along this path are not going to change; they’re going to continue along the same path. So how do you see this situation evolving? How do you see breaking the deadlock if your legal approach doesn’t produce the desired results?

Lily Monier

I don’t know. Sometimes I come up with other ideas, other plans for action. It’s in my nature. But I think what we’re doing here today is fabulous. And for me, what we’re doing today may not produce results next week, but the results are now. And I believe there’s more than the eye can see. I also believe in energy. Words resonate.

I’d like to thank everyone who has come here and all those who are taking part. I believe deeply in what we’re doing here. I think of the repetitions. You know, I think of the very old movies when I was little in which there was a castle gate and a group of people who got together and took a battering ram to that gate. And then, after 72 or perhaps 36 blows, the door gave way— I believe in that.

I often have ideas for other ways to proceed. I also think about the number of times you try again, when you don’t let go. When your child pulls on your sleeve and won’t let go, at some point you’re going to give in. I think it takes a lot of perseverance.

There are times when I’m disgusted. You know, I said to myself this morning, or yesterday, that if I weren’t involved in concrete action, participating and doing what I’m doing today—I’ve been accompanying Myriam, who will be testifying later, all week—I don’t know what other form it would take, but I need to be involved. And if I weren’t, I think I’d be in a depression with the world being as it is today. I need hope. What gives me hope is concrete action. I have ideas as I go along. Maybe I’ll have some tomorrow. I’ll say, “Ah, I could have answered that.” Right now, I’m waiting for the decision. That will tell me what to do next.

Commissioner Massie

Thank you very much. Do you have any questions here?

[00:40:00]

Lily Monier

I understand English well.

Commissioner Massie

No, it's for the people in the audience.

Commissioner Kaikkonen

Hello. [In English] The Charter of Rights and Freedoms in Canada includes the right of accommodation. And for me, what that means is accommodation for persons considered to be vulnerable within our society. So I'm going to ask you a question.

Commissioner Massie

[In English] Allow me to translate, otherwise I'll have to remember. I'm getting at the lower level of functioning.

What Janice has just said is that the rights of our society include the right to make accommodations in order to take into account the condition of people who are more vulnerable.

Commissioner Kaikkonen

[In English] So what recommendations would you make or suggest as to how we, as a society, can bridge reconciliation and compassion between the needs of people who are without against authorities—for example, the policing, the legislatures, the judges, the public service—who may not, for example, necessarily understand how eight o'clock curfews might impact someone who's already living on the streets?

Commissioner Massie

So the question is, how can we suggest ways of operating that will enable police, judiciary, and institutional authorities to implement or seriously deploy measures that will reconcile the specific needs of vulnerable people, including the homeless, for example? What can we do?

Lily Monier

People who were already suicidal before this crisis and who experienced lockdown—When I spoke to a police officer at one point, I asked, "Are there many more suicides?" He said, "There is no end to them." And listen, I'd like to give you an encouraging answer, but I get the impression that for our government, these people aren't important. I don't know if it's because these people don't contribute. I don't know what we can do about it.

I think we could stop the anxiety-provoking messages because I look on the internet, or even on MétéoMédia [The Weather Channel], when you look for the weather forecast and they announce that the summer is going to be horrible so don't think all is well. It's everywhere. It's in everything. It seems like these continual anxiety-provoking messages are to keep people in fear. I think that would be the first step. I find it criminal to do this because you cannot ignore the impact it's going to have, and it's your responsibility as a manager. You have no right to not know.

Commissioner Kaikkonen

[In English] You answered the question very well. Thank you. Merci.

Commissioner Massie
[In English] Are we okay?

Konstantinos Merakos

So Madame Monier, the Inquiry would like to thank you from the bottom of our hearts for your testimony, and we wish you a pleasant evening. Thank you very much.

Lily Monier

Thank you, and I thank you from the bottom of my heart for what you are doing. Thank you very much.

[00:43:53]

Final Review and Approval: Erin Thiessen, November 18, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 6: Vincent Cantin

Full Day 3 Timestamp: 05:35:58–06:00:25

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Louis Olivier Fontaine

Hello everyone. My name is Louis Olivier Fontaine, lawyer. I'm acting today as prosecutor for the National Citizens Inquiry. We will now hear from Monsieur Vincent Cantin, who will testify about the consequences of the COVID injections he received.

Good morning, Monsieur Cantin.

Vincent Cantin

Hello.

Louis Olivier Fontaine

To begin with, I would ask you to simply state your first and last name, please.

Vincent Cantin

Vincent Cantin.

Louis Olivier Fontaine

Very well. And now I will ask you to solemnly swear to tell the truth. So, do you solemnly swear to tell the truth, the whole truth and nothing but the truth? Say, "I do."

Vincent Cantin

Yes, I do.

Louis Olivier Fontaine

To begin with, I'd like to ask you, Monsieur Cantin, what do you do for a living?

Vincent Cantin

What did I do for a living? I was a senior civil engineering technician for a consulting engineering firm.

Louis Olivier Fontaine

Okay, and can you explain a little more about what you do for a living?

Vincent Cantin

I was a site supervisor, and during the winter, I was a draftsman at the office. That's what I did: roadwork. I was on Henri IV, here [in Quebec City]. That's what I did.

Louis Olivier Fontaine

Okay, so you say what your occupation "was." So I understand there's been a change. What's going on professionally now?

Vincent Cantin

The pension plan has recognized me as disabled.

Louis Olivier Fontaine

Okay, I understand.

Vincent Cantin

So I'm still on workman's compensation but, I mean, I got my answer recently: I have been recognized as disabled.

Louis Olivier Fontaine

All right. To try to explain this situation, we can perhaps proceed chronologically, if you don't mind. So we said that you had consequences following the COVID injections. I'd like you to first explain what led you to receive one of these injections.

Vincent Cantin

Well, it was strongly encouraged to protect the vulnerable, the elderly, and then to protect oneself, supposedly. They called it a civic duty, which I did. My first dose was AstraZeneca, and 20 days later, I went into hospital with a stroke.

Louis Olivier Fontaine

Just before you go on, do you remember roughly what date, what period of time it was at that point?

Vincent Cantin

My first dose was on April 15, 2021.

Louis Olivier Fontaine

April 15, 2021. And tell me, Monsieur Cantin: Before receiving this first AstraZeneca injection, what was your state of health?

Vincent Cantin

I was super healthy: no drugs, no Tylenol, nothing. I was in great shape.

Louis Olivier Fontaine

Okay.

Vincent Cantin

I had a demanding job in the summer working 50 hours a week. I mean, I was working. I was in good shape.

Louis Olivier Fontaine

Okay, so now we're back to April 15, 2021. So what happened after this intervention?

Vincent Cantin

Well, I got vaccinated. Then 20 days later, I started to experience dizziness and numbness, then headaches and nausea. That's why I called my brother to come and take me to the hospital. For me to call someone to come and take me to the hospital, I really have to be feeling bad. It seems like I went in on my own, but I don't remember anything after that. Luckily, I had my stroke in the hospital so they treated me quickly.

Louis Olivier Fontaine

Sorry to interrupt but if I understand correctly, what happened was a stroke, right?

Vincent Cantin

Yes.

Louis Olivier Fontaine

Okay.

Vincent Cantin

A thrombosis of the basilar [artery], or I don't know what— An ischemic stroke.

Louis Olivier Fontaine

Okay. So now you're talking about hospitalization. How long did that last?

Vincent Cantin

Well, all in all, I spent 80 days in hospital and at the rehabilitation centre. But after that, I had several [strokes]: I eventually had five strokes, then five TIAs.

Louis Olivier Fontaine

Can you explain what this is?

Vincent Cantin

Well, TIA stands for “transient ischemic attack.” Basically, it’s a seed in the carburetor. That means it leaves no after-effects, unlike a stroke.

[00:05:00]

A stroke leaves bruises; it leaves marks. They see them when they do scans. It was 80 days before I could return home. Because there were occupational therapists and all these people who came to see me at home, to see if I was capable of not burning myself and living on my own. Luckily— Otherwise, if they had said I couldn’t go home, well, then I wasn’t going home.

But anyway, it’s been two years since then.

Louis Olivier Fontaine

So you say you spent a total of 80 days either in the hospital or in a rehabilitation centre. Which one was it?

Vincent Cantin

It was the IRDPQ [Institut de réadaptation en déficience physique de Québec] here, not far away.

Louis Olivier Fontaine

Okay. So in your file, we see that you received a total of three injections. When did you receive the second and then the third?

Vincent Cantin

The second was at the rehabilitation centre: they vaccinated people at the rehabilitation centre. They told me that in my case—given my state of health—it was preferable not to have COVID, and they strongly advised me to get vaccinated. Then I had my third dose as well; I was back home by then.

Louis Olivier Fontaine

Forgive me for interrupting. We’re talking about the second injection. Was it the same product?

Vincent Cantin

No, it was the Moderna because the other one had been withdrawn. AstraZeneca had been discontinued in Europe and then they discontinued it here. The FDA [Food and Drug Administration] in the United States never accepted this vaccine. As a result, they immediately stopped giving it. In fact, I was one of the first to get it here; and after that, they stopped giving it because it was causing too many cases, I imagine.

Louis Olivier Fontaine

Okay, so at this point, you're on your second dose of the product. In fact, your first dose of the Moderna product, but your second dose of COVID products. You're in a rehabilitation centre and it's strongly suggested that you receive this—

Vincent Cantin

That I receive it. Then they would go out and vaccinate people, just as they did in RPAs [seniors' residences]. I was vaccinated the second time at the rehabilitation centre.

Louis Olivier Fontaine

And at this point, when it was suggested that you take this second injection, what was your state of mind? I understand that you were in a rehabilitation centre but how did you feel about receiving this other injection?

Vincent Cantin

Well, back then, I wasn't like I am today. I could hardly eat on my own, and I couldn't take a shower standing up. I was really— So anyway, I didn't want to. But like I said, the doctors strongly advised me to get vaccinated given my condition because they thought that if I got COVID, it would be dangerous for me.

Louis Olivier Fontaine

So it was the doctors who told you that?

Vincent Cantin

Yes, doctors. There are several of them. Basically, it's the same doctors who are at the hospitals all over Quebec City; they also work at the rehabilitation centres. And that's it.

Louis Olivier Fontaine

Okay. And in your file, you mentioned a third injection. Do you remember when that was?

Vincent Cantin

This was when I was at home; that was my family doctor. He didn't want to see me if I wasn't vaccinated and I couldn't see my mother if I wasn't vaccinated. That's why I got vaccinated.

Louis Olivier Fontaine

So if I understand correctly, the recommendation to receive this third injection was made by your family doctor based on the fact that—?

Vincent Cantin

That in my condition, it was preferable; that if I had COVID, it would be dangerous for my health. Although I got it anyway, after the third dose.

Louis Olivier Fontaine

So once again, if I understand correctly, you were also sick.

Vincent Cantin

I had COVID.

Louis Olivier Fontaine

All right. So, you returned home. What was daily life like when you got back from the rehabilitation centre?

Vincent Cantin

Well, it was difficult. I was ordering myself ready-made meals because I found it hard to cook and on top of that, I no longer have a driver's licence—nor will I ever again. So mobility is tougher. And in winter it's complicated, so I have to walk.

In the end, as I said, I don't have a driver's license, but I can't ride a bike anymore either.

[00:10:00]

Like right now, I can't see you. I have to do this to see you [*turns body to the right side*]. Like here [*turns body to the left side and indicates the whole right half of the audience*], I can't see that whole part of the room. And this is just one of the things I've had, apart from amnesia.

Louis Olivier Fontaine

Okay, yes, that might permit us to move on to this subject. You mentioned some consequences. Would you like to share, for example, if you have been medically diagnosed with anything?

Vincent Cantin

Yes.

Louis Olivier Fontaine

Okay. Would you like to talk about these diagnoses?

Vincent Cantin

Well, I've got them here; I can't remember them all. I have hemianopia: I can't see on one side. My eyes are fine; it's in my brain. Then I have anterograde amnesia: I forget events as they happen but my long-term memory is still there.

Louis Olivier Fontaine

Okay.

Vincent Cantin

So when you're feeling nostalgic, it's not so bad. But when you want to live in the moment, on the other hand, I would have been better off with the other [kind of amnesia]. But that's another story.

Apart from that, well, I have hemiplegia: it's like body-wide paresthesia, from my fingertips to my toes—the entire half of my body. I have dyschromatopsia, that's a kind of acquired colour blindness. For me, the sky is no longer blue, it's gray; I can't see blue in the sky anymore. The colours came back. At first, I spent two months not seeing any colors: it was brown and gray. Now it's coming back a little: like I'm able to distinguish the lines on the ground [here]—they're green—but the sky is permanently grey.

I have high blood pressure, which I never had before. I have visuospatial disorders: I have trouble finding my way around places even when they're places I know. In fact, when they took me home the first time, I went past it three times; I didn't recognize the place. Then, just like when I came here—I came by paratransit—well, I don't recognize the place. And since I won't remember anyone here, I have prosopagnosia: I forget faces; I can't recognize faces. The faces of people I knew before remain, but new faces, well, that's it: I meet someone in the morning and in the afternoon, it's as if I'd never seen them. That's pretty much it. I don't have a driver's licence anymore. I don't work, and that's that.

Louis Olivier Fontaine

How did you get here, Monsieur Cantin?

Vincent Cantin

Pardon?

Louis Olivier Fontaine

What means did you use to get here today?

Vincent Cantin

Paratransit; and that's the Société de transport adapté du Québec [Capital Paratransit Service]. It's a service they offer to people with mobility problems or people who need it. At least I have that, which is always good.

Louis Olivier Fontaine

And you mentioned earlier having a family doctor and you also mentioned [medical] diagnoses. What does your family doctor—or what do the doctors you see or the health personnel you see now—give you as a prognosis? Or what do they tell you about the future?

Vincent Cantin

Well, they don't want to say too much, but for me personally, my prognosis is life-threatening. There aren't many studies here, but I've read studies—maybe I shouldn't have but anyway, it doesn't matter—studies in Switzerland that have followed over time, let's say, 1,500 people who've had strokes like mine. In any case, they're talking about between 6 and 15 years. That's about right.

Louis Olivier Fontaine

Have you sought a doctor's opinion on this—

Vincent Cantin

They don't talk to me about it but they nod yes; you can tell my research was right. In other words, I'm not going to make it to 75 [years old], that's for sure. But anyway, that's it.

Louis Olivier Fontaine

And how did the doctors react when you— In fact, did you talk to them about a possible link between the injections you received and the consequences on your health? Is this something you talked about?

Vincent Cantin

Yes.

Louis Olivier Fontaine

What was their reaction?

Vincent Cantin

Ah, well, nobody wants to wear this one. One of the "gang" told me, "It looks like that."

Louis Olivier Fontaine

A doctor?

Vincent Cantin

Yes.

Louis Olivier Fontaine

Okay, a doctor.

Vincent Cantin

Yes.

Louis Olivier Fontaine

Is it your family doctor?

Vincent Cantin

No. It's a doctor who was at the Hôpital de l'Enfant-Jésus.

Louis Olivier Fontaine
And what did he tell you?

Vincent Cantin
“It looks that way.” Without saying anything, basically.

[00:15:00]

Louis Olivier Fontaine
Do you know if this doctor or another doctor would have reported these vaccination consequences?

Vincent Cantin
No. I think they’re obliged to report adverse events, but the doctors didn’t do it during COVID. They’re obliged to: it’s a legal requirement for adverse events following vaccinations. But they didn’t do it.

Louis Olivier Fontaine
And how do you know they haven’t?

Vincent Cantin
Because I asked them.

Louis Olivier Fontaine
You raised the question?

Vincent Cantin
Yes.

Louis Olivier Fontaine
Okay. Now, I know there’s an injury compensation program in Quebec. Is it a program you’re familiar with?

Vincent Cantin
Yes, yes. I saw it; I’ve applied.

Louis Olivier Fontaine
How did that go?

Vincent Cantin
Well, that’s it, no one wanted to. I asked eight doctors, including my family doctor, the neurologist at Enfant-Jésus [Hospital], all those who have been following me, plus doctors

who make inquiries. And then I found one, but I had to talk to eight others first. Nobody wants to go there. It would have been better if I had been a leper.

This injury program is pan-Canadian but it is managed by the provinces. All across Canada, they study your claim on the spot except in Quebec, where they require a medical representative. Then, of course, the doctors don't want to get involved. Anything to do with COVID and the doctors don't want to have anything to do with it; they'll be punished. It's as simple as that. But in any case, that's it.

Louis Olivier Fontaine

And do you have people around you—either family or friends—who understand what you're going through right now?

Vincent Cantin

Yes, yes, I'm well supported.

Louis Olivier Fontaine

Monsieur Cantin, is there anything we haven't yet discussed that you'd like to share with the Inquiry?

Vincent Cantin

No, I don't think so. It's okay, we've covered everything.

Louis Olivier Fontaine

Okay. So if you don't mind, could we see if the commissioners have any questions for you?

Vincent Cantin

All right.

Commissioner Massie

Thank you, Monsieur Cantin, for your very moving and disturbing testimony. The first thing I'd like to make sure I understand is that, well, you went [to get vaccinated] the first time out of civic duty; we did it to save the vulnerable. And obviously, there may be the fact that you're thinking at your age, "Well, maybe it will be beneficial to me." You end up with quite severe medical consequences. And then you were strongly recommended to take a second dose?

Vincent Cantin

A second, then a third.

Commissioner Massie

How capable were you—I would say, emotionally, psychologically, and physically—of questioning that or resisting that on your own?

Vincent Cantin

I didn't want to have any subsequent doses but it was the doctor. I was at the IRDPQ. I was in bed with an IV. At some point they said that in my case, I'd be better off getting vaccinated. They're more "knowledgeable" than I am on the subject, so I agreed, that's all.

Commissioner Massie

And in these discussions, did they even raise the possibility that if you found yourself in this precarious condition—from a medical point of view—it was probably the consequence of the first vaccination you'd had?

Vincent Cantin

No, nobody said that.

Commissioner Massie

But what were you thinking at the time?

Vincent Cantin

Maybe I misunderstood.

Commissioner Massie

For the first vaccination that led to your rather severe medical conditions, did you make the connection in your mind that it could be due to the vaccination?

Vincent Cantin

It's officially certain. I went back in time to look at the sequence; I asked around. Then one way or another they stopped that vaccine: it was causing thrombosis. Back then, I read the literature on the internet—just about everywhere—that people were having thrombosis in the first few days, in the first month, let's say.

Commissioner Massie

And when you accepted the dose of Moderna, which isn't AstraZeneca—so it's not "adeno" [an adenovirus vaccine]—were you reassured that this time, it wouldn't be too serious because it wasn't AstraZeneca?

Vincent Cantin

Not necessarily, but in my condition, I nodded automatically.

[00:20:00]

It was in the first few months, so I wasn't quite there yet. And then it was recommended by the doctors; there was a whole panoply of them. Three or four of them came to see me and they all advised me to get vaccinated. So that's it.

Commissioner Massie

And did you observe that the adverse effects were more pronounced or less pronounced following this second vaccination, or did you not really see any difference?

Vincent Cantin

I didn't see any difference.

Commissioner Massie

So it's possible that this second vaccination didn't necessarily make things worse.

Vincent Cantin

No, it didn't make things worse.

Commissioner Massie

Okay. But the third vaccination surprises me a bit because it looks like your family doctor indicated that if you were not up to date in your vaccination record for COVID, he'd rather not see you?

Vincent Cantin

Yes, exactly: not see me at his office.

Commissioner Massie

Was this a widespread practice for doctors, or was your doctor an exception?

Vincent Cantin

No idea. I think my doctor is about to stop practising because he's going to be 70. I think he's retiring soon; he was very scared!

Commissioner Massie

He was afraid.

Vincent Cantin

Hey, he practically raised his voice. So, yeah, he recommended it to me. Also, I was often going to see my mother, and well, the RPA [seniors' residence] she was staying at was requesting vaccine passports.

Commissioner Massie

And you were no longer up-to-date with your vaccine passport given the date of the second dose?

Vincent Cantin

Yes, I needed a third.

Commissioner Massie

And following this third dose, did you find that your state of health was stable?

Vincent Cantin

It was stable. Yes, the last two doses didn't make any difference.

Commissioner Massie

It didn't make a difference, okay. Another question, perhaps, which is a little more personal. I noticed during your testimony that you were constantly making, I'd say, comments that show you have a way of handling this particularly difficult situation with a certain philosophy, or a certain serenity.

Vincent Cantin

Ah, thank you.

Commissioner Massie

How do you feel at the moment about the future?

Vincent Cantin

Well, I don't really know what to say, in that there are stages of grief. There are five stages of grief, and I haven't arrived at the first one yet; I haven't accepted it yet. So that's it. Like I often say, "When I sleep, I dream; it's when I get up that the nightmare begins."

Commissioner Massie

So what you're going through is very difficult.

Vincent Cantin

Well, I like to say, "I'm like an old oak tree losing my branches one by one but instead of light, it's darkness that passes through."

Commissioner Massie

Do you have the support of friends and family or professional help to get you through these difficult times?

Vincent Cantin

Not really. Well, I mean, I have an employee assistance program; they've never called me. I put my name on lists to see psychologists—these people, those people, other people. And no, I don't get any help. Then all the doctors who were treating me, well, they let me go. But I'm good; I'll get through it.

Commissioner Massie

Thank you very much for your testimonial.

Vincent Cantin

Okay, thank you.

Louis Olivier Fontaine

Monsieur Cantin, on behalf of the Inquiry, I'd like to thank you very much for taking the time to come and tell your story.

Vincent Cantin

My pleasure.

Louis Olivier Fontaine

I think this is a story that will be heard. And I salute your courage in coming to testify before us, for which I thank you very much.

Vincent Cantin

My pleasure, thank you.

Louis Olivier Fontaine

Good bye.

Vincent Cantin

Many thanks to all of you.

[00:24:27]

Final Review and Approval: Erin Thiessen, November 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 7: Myriam Bohémier

Full Day 3 Timestamp: 06:01:50–07:13:50

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Samuel Bachand

Hello, my name is Samuel Bachand. I'm acting as Inquiry counsel for your testimony, Myriam Bohémier. First, I'd like you to spell your full name.

Myriam Bohémier

Myriam M-Y-R-I-A-M, Bohémier B-O-H-É-M-I-E-R, like Richard.

Samuel Bachand

I'm going to swear you in. Do you swear to tell the Inquiry nothing but the truth?

Myriam Bohémier

I do.

Samuel Bachand

As a first step, Madame Bohémier, I would ask you to provide us with something of an overview of your CV, which will be filed for the Inquiry's benefit at a later date. I don't have the file number yet, but I'll let you know as soon as I have it [no exhibit number available]. Please go ahead.

Myriam Bohémier

I've been a lawyer since 2000, so for 23 years, and an accredited mediator since 2015. My practice has always involved medico-legal issues. I did my internship at the Société d'Assurance Automobile du Québec [Quebec Automobile Insurance Company] in legal damages, so I have 23 years of experience in medical forensics. I also have a great deal of experience in all matters of harassment—both psychological and sexual—and domestic violence; and I've touched in a general way on social and labour law—in fact a lot of things

that concern people in the face of big entities such as governments, institutions, insurers, and government agencies. So this has always been my practice for the past 23 years. Since October 2021, I've been concentrating more on cases involving government measures.

Samuel Bachand

I offer the witness to the court as an expert witness with the qualifications of a jurist.

Myriam Bohémier

Yes.

Samuel Bachand

Myriam Bohémier, I believe you have some opening comments to make.

Myriam Bohémier

Since I'm testifying as a lawyer, my speech is limited to what I can say under the attorney-client privilege. So everything I say here has either been: authorized by my clients or disclosed by them; or the information has become public through judgments; or it concerns me personally in my capacity as a lawyer.

Samuel Bachand

Myriam Bohémier, you've shared with me a rough outline of your presentation, which you have in front of you, as do I. I don't think it's necessary to submit it as an exhibit. However, if the commissioners would like to see it to assess credibility or something of that nature, they can simply glance at it; otherwise, we can just carry on. Is that okay? So first of all, you wanted to talk about constitutional rights in the context of COVID.

Myriam Bohémier

Well actually, I'm going to tell you about my involvement with the measures from October 2021 to the present day. I've been immersed in this subject for a year and a half now, let's put it that way. So my involvement covers a lot of subjects. Firstly, I'm involved in the Foundation's appeal, the power of judicial review concerning the constitutionality of all government measures. I'm also involved in certain tickets, where the right to demonstrate was so restricted that to demonstrate against wearing a mask— There was an obligation to wear a mask in order to demonstrate against wearing a mask.

Samuel Bachand

Let me stop you there for a moment. When you talk about "tickets" you're talking about penal charges or statutory offences which are penal but not criminal.

Myriam Bohémier

Exactly. Contraventions based on the various decrees that have been issued in relation to the *Public Health Act*. So I'm involved in this type of file. I'm involved in labour law—labour law for unionized employees.

[00:05:00]

My role is limited since unionized employees have a union; except that in certain contexts, I act to protect the divergent interests that these employees may have with their unions, as in the case of Professor Patrick Provost. A portion of my work is labour law as related to labour standards—so for people who have lost their jobs for refusing to comply with a vaccination policy, that is, people who had refused to comply with the vaccination policy and then lost their jobs after two years' continuous service. So these people can appeal to the Tribunal administratif du travail [Administrative Labour Tribunal], and I have files of this type. I've defended and advised university professors against their university who, let's say, were censuring them for having sounded the alarm about the COVID-19 vaccination, or rather injection, for children.

I'm also involved in employment insurance [EI]. I have a federal appeal pending. Because you have to understand that people who refused to follow an employer's policy on vaccination lost out—either because they fell into a no-man's land, with an indefinite suspension, where they couldn't even get their vacation or their accumulated days off. You know, they had nothing at all. They were left with nothing but they weren't fired either. Alternatively, people were fired outright. But when these people applied for EI, they were told that they had committed misconduct by refusing to comply with a company policy. EI decided that it wouldn't get into the legality of the policy. They're interested in the reasonableness, but not the legality of vaccination policies. As a result, many people found themselves not only unemployed but without employment insurance.

Samuel Bachand

Okay, in one minute, elaborate a little on the distinction between reasonableness and legality. These are things that are familiar to us as jurists but for others, it may not be so clear.

Myriam Bohémier

Legality means that if you want to challenge the legality of an employer's policy on a constitutional or charter level, the social security court refuses to go there. So we are at the federal appeals court because we have to be, I mean— You know, we could make this caricature: let's say the employer had a policy that said everybody had to come to the office naked. I think it would have been pretty clear that the social security court would not have declared noncompliance with that policy as misconduct. But the mandatory vaccination policy was considered reasonable by the social security court. When I looked into it, I came across only one case that was successful. There are questions of [systemic] delays, but on the fundamental question of refusing the vaccination policy, only one case to my knowledge was successful, and that was last December. But otherwise, it was considered that the pandemic was real.

You know, it's like we don't question the seriousness of the situation or the pandemic as such. So therefore, the vaccination policy becomes completely reasonable in such a serious situation. So that's how I would sum it up.

Next, I've done a lot of disciplinary work, and I still do a lot. These are professionals, members of professional orders who have criticized government measures and who have either been intimidated by the *syndics* [representatives] of their organization, or have been brought before their professional organization for having sounded the alarm on masks or on the COVID-19 injection.

[00:10:00]

There have been police officers and firefighters as well among the people I've advised.

Right now, I'm preparing a criminal law file based on section 9 of the *Food and Drugs Act*, which states that you can't engage in misleading advertising. I consider that what was said regarding the COVID-19 injection was misleading to the public. So I'm working on a file like that.

And the cases that have kept me the busiest were the family law cases in which a parent who wanted a child to receive the COVID-19 injection was required to go to court when the other parent was opposed, and this ended up before the courts. But I'll come back to that in the second part, as I think it's important to outline the legislative history in Quebec because Quebec has its own distinctions. I won't go into all the technical details, but it's something that could eventually be submitted to the Inquiry.

I'll just explain that on March 13, 2020, a health emergency under the *Public Health Act* was declared which gave the government special powers. Under this law, the government could adopt decrees that lasted a maximum of ten days, if I'm not mistaken. And at the end of ten days, the decree either had to be renewed or, at some point, the National Assembly had to make a decision. To avoid going before the National Assembly, the government chose to renew every ten days. It renewed the health emergency and at the same time, it changed the measures more or less regularly every ten days—which made it very, very, very difficult to follow.

Not to mention that in law, we have a code of civil procedure for court proceedings. We have rules of evidence and procedure before the courts as well: the Superior Court, the Court of Quebec, all the various courts, not to mention the administrative tribunals. And on top of that: with the pandemic, they started issuing directives, but directives for each district, each courthouse, each tribunal. It became like *The 12 Tasks of Asterix*—extremely difficult to follow. Then, in addition to the usual procedures, you had to fill out form X, then send it in so many days in advance—because it had to be captured by the digital registry so that it would appear on the roll. And then the roll calls were no longer made the same day and you had to be available the day before. And then the roll call could be made by phone. In any case, it became extremely complex and in a certain sense, very anxiety-provoking.

Samuel Bachand

What you've just described is your personal experience as a practitioner using regulatory tools, guidelines and so on, correct?

Myriam Bohémier

Yes, tools were imposed on us that were outside the usual rules: outside the law and outside the regulations. We started getting directives from chief justices, from every courthouse, and from the Ministry of Justice. You know, it was hard to keep up. It's still going on today. There are forms and then things change.

Samuel Bachand

When you say outside the law and regulations: Does your statement mean to say that the courts' COVID directives were not authorized, not statutorily founded, or simply that they were in addition to—

[00:15:00]

Myriam Bohémier

Ah, they were additional, yes.

Samuel Bachand

All right. My other question. Earlier you mentioned the decrees and, I suppose, the related ministerial orders and the fact that they change very often—on a weekly basis, perhaps?

Myriam Bohémier

Pretty much, yes.

Samuel Bachand

Good. What kind of administrative codification or consolidation was made available to jurists and the general public, so that they would know exactly where they stood?

Myriam Bohémier

Well normally it's published in the official gazette, so I don't know if that's your question.

Samuel Bachand

No, I mean was there ultimately a summary in the same manner as in—?

Myriam Bohémier

No, no, no.

Samuel Bachand

You know, in reality, a municipal by-law—and here I put the question to you—my understanding is that a municipal by-law is often a sedimentation of various amendments. Except that we make available to the public, and to lawyers, what we call an administrative codification or consolidation, which enables people to see where things currently stand. To your knowledge, was the equivalent of this type of tool made available to lawyers or the general public?

Myriam Bohémier

To my knowledge: no. I'd say it's also that we're lawyers here and it's our job. But it was also difficult for us to keep up with the measures, what was going on, and where we were at. It was *The 12 Tasks of Asterix*. It was complex.

Samuel Bachand

You can go back to your outline. I've diverted you from it.

Myriam Bohémier

Yes, it changed frequently. Then what increasingly happened was that when we wanted to challenge certain measures, the government backed down or changed the measure. And then we ended up in a lot of decisions where the courts said, "Well, it has become a theoretical debate because the measure no longer exists."

So the government changed their measures before the hearing—

Samuel Bachand

Let me stop you there. The courts said it had become theoretical, and so what happened with the files?

Myriam Bohémier

They were rejected. The files were rejected.

Samuel Bachand

The challenges to the COVID measures were rejected because, according to the judges in question—

Myriam Bohémier

It had become theoretical. The debate had become theoretical, so—

Samuel Bachand

Because the measure in question has ceased to have effect?

Myriam Bohémier

Yes, and we talked about the Foundation's appeal for judicial review. They spent \$700,000 to travel there, put together this file, obtain expert assessments and all that—only to have the case dismissed because it had become theoretical. I mean, that's an incredible amount of resources invested. And just when the trials are about to take place— And that's been done too with Madame Manole's file, which had the health care workers, the caregivers, and the transportation files because we couldn't travel any more.

To date, there is only the vaccination passport case, and that of the Foundation for which we are awaiting decisions. But only the vaccination passport has escaped the [label of] theoretical debate. The other appeals that were launched to contest the measures and determine whether or not they were constitutional were deemed by the judges to be theoretical. Furthermore, they said that considering the lack of judicial resources, these had to be assigned for purposes other than discussing something that had been terminated.

So if I come back to the chronology, there was the declaration of a health emergency. Then there was an attempt to introduce Bill 61, which caused a great deal of indignation because the government was clearly going too far. But the fact is that it was never actually put into place.

Samuel Bachand

You'll have to tell us something about it because we're not all aware of Bill 61.

Myriam Bohémier

Yes, well I won't go into detail because I don't remember much about it. But what I understood from Bill 61 was that it maintained a state of health emergency for two years, if I am remembering correctly. They could expropriate without compensation—and it was like nothing ever seen before. There was no more need to repeat the decree process; the government was on a roll.

[00:20:00]

[The government] said that it would make things easier—with construction projects, for instance—to get Quebec back on track after being on hold when things stopped, when we went into lockdown. So the intent was to promote the economic situation by depriving, well, you know, by expropriating, and—

Samuel Bachand

Okay, we've got 40 minutes left. I'll let you evaluate where you want to put the emphasis because you have several points.

Myriam Bohémier

Yes, yes. Okay. So in May 2021, we began vaccinating children aged 12 to 17. In Quebec, children aged 14 and over have the right to decide on their own health care. As a result, children at school could be offered vaccination and put under a form of peer pressure to be vaccinated. Then came the introduction of the vaccine passport on September 1, 2021.

Samuel Bachand

Which consisted of?

Myriam Bohémier

Which meant that people needed to be double vaccinated to be able to go to the movies, to go to restaurants, even for children to participate in activities. If teenagers over the age of 12 wanted to play hockey, if they wanted to do all kinds of extracurricular activities, they were forbidden to do so unless they were double vaccinated. Then—and this is an important point I'd like to highlight—on September 7, 2021, an article was published. It wasn't in the usual newspapers but in specialized legal journals. In it, the Chief Justice of the Supreme Court of Canada said that there was a vaccination policy at the Supreme Court of Canada and that all Supreme Court of Canada judges were vaccinated. In the same article, the Chief Justice of the Federal Court of Appeal refused to talk about a vaccination policy at the Federal Court of Appeal, saying it raised a reasonable apprehension of bias. I fully agree with this view.

Samuel Bachand

Myriam Bohémier, which publication was it?

Myriam Bohémier

It's an article that appeared in *LexisNexis* or something, but I would be able to provide it to the court [sic].

Samuel Bachand

What date again?

Myriam Bohémier

That was September 7, 2021—so even before Prime Minister Trudeau was re-elected on September 19 and imposed vaccination on federal workers. So on October 15, 2021, compulsory vaccination was introduced for healthcare workers; and it was the day before, I believe, because Madame Manole had taken steps in a legal action to prevent this compulsory vaccination. So two days before, the government backed down, saying, ah well it's going to cause a break in services. They then pushed it back to November 15. And on November 15, the government again backed down on the vaccination requirement but imposed a testing requirement. What's very important to understand is that these decrees stated that professionals who didn't respect the vaccination requirement, and later the testing requirement, were automatically undermining the dignity of their profession.

So it's like creating a presumption that they've breached their ethical obligations and may therefore have problems with their professional order. It was also indicated that the professional order could, as it were, denounce doctors by reporting matters to the Ministère de la santé des services sociaux [Ministry of Health and Social Services] and the Régie de l'assurance-maladie du Québec [Quebec's Health Insurance] in order to prevent doctors from being able to bill for services. And it's worth noting that even telemedicine doctors were obliged to be vaccinated or later, tested. So it was really a deliberate attack on the incomes and even the rights to practise of healthcare workers and professionals.

[00:25:00]

Then, around the same time, an injunction was issued that workers, federal employees, and government suppliers had to be vaccinated by November 30, 2021. Failing this, they would be suspended without pay. For his part, Monsieur Hans Mercier brought an action to try to have the vaccine passport suspended. This too was rejected.

It's also important to understand that on November 18, 2021, we began vaccinating children aged 5 to 11. And what was said was that we recommended that parents be offered vaccination. It was an offer, but not mandatory; it was not a compulsory vaccination. On the other hand, it did say that doctors could impose contraindications. But it was never said that the contraindications—which I believe were set out by the INSPQ [public health] at the Ministry of Health and Social Services—were really limited to three things. I can't remember the three things off by heart but one of them was allergies.

I had a case of a pregnant woman with a neurological condition whose job required her to get vaccinated. And she produced a medical certificate but that was at the federal level. And Transport Canada wouldn't accept her certificate because it didn't meet one of the three criteria—the three recognized contraindications. So she was suspended without pay while she was pregnant.

Then as of November 30, 2021, the federal government prevented unvaccinated people from travelling by train and by plane. And there was also a ban on unvaccinated caregivers

visiting their loved ones, helping out in healthcare facilities. I believe that was in December 2021.

And on December 30-31, 2021, a new lockdown was introduced saying that the unvaccinated were to blame. This was followed by multiple draconian measures to prevent unvaccinated people from going to the Société des alcools du Québec [liquor store], the SQDC, the Société Québécoise du cannabis [cannabis store]. Nor could they go into big box stores larger than 1,500 square feet. They couldn't go to the garage to change their tires. And they couldn't go to Costco, Bureau en gros [Staples], Canadian Tire—those places were off-limits. And they were threatening to impose a health tax on people who hadn't been vaccinated. And I know from having seen a lot of information circulating that, for example, people who were waiting for a transplant and who had reached the point of receiving a lung, for instance, were refused a transplant if they weren't vaccinated.

Then followed the truckers' convoy and the *Emergencies Act*, where bank accounts were seized without going through a judicial process. And people were jailed too. At that time, I got involved with Réinfo Covid; and several lawyers signed a letter dated February 16, 2022 to the Bâtonnière du Québec [the President of the Bar of Quebec] to say, well listen, as the Quebec Bar, you are responsible for the respect of the rule of law, for the enforcement of the rule of law, and for the protection of the public. So what's going on? What are you doing about it? We never got a reply to our letter; no reply at all.

[00:30:00]

And also in May 2022, we had several lawyers from the CCLC. It's another association of lawyers I'm involved with. We wrote a letter—

Samuel Bachand

An association called CCLC, Canadian Covid Lawyers Coalition, if I'm not mistaken?

Myriam Bohémier

Yes, that's it. Yes, exactly. So it was a former judge who wrote a letter, a complaint against the Chief Justice of the Supreme Court of Canada for his comments on the truckers' convoy, which he had called anarchic, et cetera, et cetera. But there were several cases already before the courts that were likely to go all the way to the Supreme Court of Canada. So this departure from the Chief Justice's duty of discretion—when he spoke of misinformation, anarchy, et cetera—raised a reasonable fear, in our view, among the public of not being judged impartially if ever one of these cases were to end up before the Supreme Court of Canada. And in June 2022, this complaint was ruled inadmissible.

Samuel Bachand

Can you explain to us what the concept of inadmissibility is and what it meant in this context?

Myriam Bohémier

Well, what that meant was that it was considered frivolous, you know: obviously unfounded, that it wasn't even worth the board's consideration.

Samuel Bachand

Were you given the terms of, how shall I put it, the reasons for inadmissibility?

Myriam Bohémier

Yes, we had a letter on the subject. And in short, it was basically that the Chief Justice of the Supreme Court of Canada had greater room to maneuver with regard to his duty of discretion.

Samuel Bachand

All right, then. You're halfway through your time, or a little less. I invite you to perhaps take a quick look at what all you still have to tackle, so as to touch on what's most important to you.

Myriam Bohémier

So my desire to really get involved in children's COVID-19 injection cases began with a judgment handed down on December 23, 2021, which ruled that communication between an unvaccinated father and his child would be cut off. In my opinion, the child was penalized, not the parent. Well, of course the parent was penalized, but I mean we always look at the child as having rights and parents as having obligations towards their children. That's kind of the philosophy when it comes to children's rights. And in this case, I felt that the child had been mistreated. I felt that we were preventing a parent from being who he is with his child. For me, this was important.

And remember that at that time, children had to wear masks to school. There were a lot of measures that seriously affected children. So I decided to get involved—especially as we were making decisions on COVID-19 vaccinations, injections, for children on the basis of protection orders. You have to understand that a protection order is used to deal with emergencies, okay? Let's say you separate and you want to know who's going to get custody, who's going [to get] alimony, quick, quick. You know, the things that need to be settled quickly in order to establish a status quo right at the start. But these are things that can be re-established later when we hear the evidence. Because a protection order is just sworn statements. There is no proof at that point.

But we're talking about an injection here. The injection can't be removed. Once a person has been injected, it's over: it's in their body. So I said for this, we needed decisions on merit. For me, that constitutes consent to care under the Quebec Civil Code. So it requires hearings on the merits. And I've had some success in getting hearings on the merits. But you have to understand that in the middle of a major pandemic health emergency, it was considered a question of urgency. So we had to put together files in a week or ten days: in-depth files on such a complex issue.

[00:35:00]

How did the case law develop? It was to say, "well, look, the court won't go against public health recommendations. If a parent wants to follow what public health recommends, well, that's what will happen." So the notion of the child's best interests was not really taken into account. Nor was the question of free and informed consent. I saw the documents given to parents at school and they didn't really talk about side effects. Well, they were already saying firstly, that COVID is like having a cold. Good grief, even if it's serious, it will pass.

And then they specified the risks of catching COVID-19: the systemic syndrome, the pericardial and myocardial problems were all indicated as possibilities with COVID-19.

But when it came to the side effects of the injection, they talked about possible reactions, mentioning rashes, fever, chills—you know, fairly benign things. And on the consent form, there was a question about existing clotting disorders. But nowhere did it explain why that question was asked. Still, it was important. So I made a first attempt. In the course of a few days, on a Friday, I had to proceed with a case on the merits by the following Friday. And then fortunately I had the cooperation of Dr. Lavigueur to come and attend the hearing. They refused to recognize him as an expert because he hadn't produced an expert report. Okay, I'll try again. I said—

Samuel Bachand

Madame Bohémier, I'm really sorry, but at this rate, you won't make it. So what I'm suggesting—and you're free to accept it or not—is to propose to the commissioners the placement of your summary outline in the file, along with stable hyperlinked references to the judgments you intend to comment on in the next few minutes. May I suggest that you move on to the question of your disciplinary experience and then to the practical recommendations you wish to make to the Inquiry.

Myriam Bohémier

Okay, well, briefly, on the question of vaccinating children, I tried to get a doctor to testify but it didn't work. I tried to get a vaccine expert to testify but it didn't work. I tried to submit medical certificates from a doctor who did not recommend vaccinating children but it didn't work. Invoking the fact that there were hereditary heart problems in the family didn't work. At one point, I said, well, I'm going to contact Dr. Quach, who's the president of the Comité d'immunisation du Québec [Quebec Immunization Committee], to ask her some questions since we could only take into account public health recommendations. Well, the subpoena was quashed on the grounds that this is a case between two parents on a question of parental authority. So it was not relevant. So that's it: the notion of free and informed consent was eliminated and we couldn't allow the parents to hear anything other than what the government was saying.

Samuel Bachand

This is your summary of the relevant case law?

Myriam Bohémier

Yes, effectively it is.

Samuel Bachand

Okay. Continue.

Myriam Bohémier

And here I come to my own situation, which is that during this year, or 2022, I had three requests for investigation by the *syndic's* office.

[00:40:00]

The first was following a video I made with Monsieur Stéphane Blais of the Fondation pour la défense des droits et libertés du peuple [Foundation for the defence of people's rights and freedoms]. I was questioning whether parents have the right to ask questions, to challenge public health recommendations, to disagree. And I had mentioned the name of an article which said that vaccinated people were a few weeks away from acquired immunodeficiency syndrome. I had just mentioned the name of an article. This earned me a request for investigation, and the *syndic* concluded with a simple warning. But he told me that I had no right to talk about science and that he was sure to win if he went before the disciplinary board. Because what I had said was like saying that the earth was flat, that was my—

Samuel Bachand

Is what you've just recounted the content of a written document or the content of a verbal exchange?

Myriam Bohémier

A verbal exchange.

Samuel Bachand

Can you also place it in time?

Myriam Bohémier

I made my video on February 10 and I read the response on February 25. Then, on July 14, 2022, I received a second request for an investigation. This was the result of, let's say, an emotional reaction I had to a judge who refused to recognize Commissioner Massie, present here, as an expert and his expert's report as an expert's report. As far as she was concerned, once the children's pediatrician had said that she recommended vaccination against COVID-19—that she recommended it and declared that there was no contraindication—the case was actually settled.

So I had an emotional reaction, but afterwards— At any rate one thing led to another: I asked for her recusal; I went to appeal; I filed a notice of appeal and a presentation. And the *syndic* criticized me outright for doing my job. I didn't even know what the problem was with my notice of appeal. He kept quoting me in bits and pieces but I asked him— Like, on September 29, 2022, when I spoke to him—I asked, "Listen, without admitting that I committed a fault, how could I change my notice of appeal to satisfy you?" And he never answered me. He referred me to a decision that had nothing to do with my situation.

Samuel Bachand

Do you remember what the decision was?

Myriam Bohémier

I'd rather not name it.

Samuel Bachand

Okay.

Myriam Bohémier

Following this, I have a good friend who's a lawyer and university professor—a full university professor in civil law—and as part of his teaching duties he organizes moot court competitions for his students in appeal courts. So I submitted my presentation to him; I submitted my notice of appeal to him, which I had modified; and he saw no problem.

Samuel Bachand

Listen, I think that for obvious reasons of admissibility and reliability, we should avoid invoking the expertise of a third party who cannot be questioned. Let's continue.

Myriam Bohémier

So anyway, all that to say that I had no intention of violating my code of ethics. And on November 15, the same day I did a video with Maître Fontaine on *Sam en direct*, I was served with a disciplinary complaint. Then on November 18, I received a third request for an investigation into the video I had made with Maître Fontaine.

Samuel Bachand

Excuse me, maybe I just had a moment of distraction, but the *Sam en direct* video, what exactly is that?

Myriam Bohémier

Well actually, Maître Fontaine and I represented a nursing assistant in front of his professional association because he had criticized government measures, and we went to *Sam en direct* to talk about the case and to ask for funding.

[00:45:00]

And on that show, we announced that we were subpoenaing Pfizer and McKinsey. I also announced that I intended to ask the board about their vaccination status. Because, in my experience, there are two camps now: there is no middle road. So I felt that for the sake of impartiality, it was a fair question to ask. And then just before the interview, which was about to begin, we got a warning from the *syndic* that he was keeping an eye on us. In fact, it was the *syndic* against our client, who had complained to our *syndic*. So I didn't—

Samuel Bachand

I just want to come back to this. I'm not sure I'm following you, there are several *syndics*, et cetera. Just—

Myriam Bohémier

Yes. Well, actually our client's *syndic*—representing the Ordre des infirmiers et infirmières auxiliaires du Québec [Order of nurses and nursing assistants]—he followed the video, he saw the video. So he forwarded it to our *syndic* for the Bar, who then warned us about the hearing, which was coming up on November 28. So we were under a lot of pressure.

I should also mention that before I made my presentation to the Court of Appeal for my other case, where I had had a disciplinary complaint, I had also been warned in advance to be careful about what I was going to say in my presentation. It was a lot of pressure to receive when you haven't even done anything and they are telling you, "Hey, I'm watching you because—"

Samuel Bachand

Were those written warnings?

Myriam Bohémier

No, it was verbal. Well, the one for my presentation was verbal, but the one for the nursing assistant's trial was in writing.

Samuel Bachand

In the case with verbal warnings, did you ask for a written version?

Myriam Bohémier

No, I didn't, but it [the warning] wasn't denied because I proceeded with the inquiry request just last week, the week of the 20th, from Tuesday to Friday of last week. And the *syndic* didn't deny it.

Samuel Bachand

All right. You have about five minutes left for everything.

Myriam Bohémier

Yes, okay. Anyway, all that to say that the nursing assistant's case, where we experienced the intimidation, was closed on January 10. On the other hand, I had to appear before my order this past week. I can't comment because it's under deliberation. But the members did have some interesting questions about what was derogatory about requesting a recusal or raising a reasonable apprehension of bias—because this is provided for in our *Code of Civil Procedure*. It's something you can do. It's even a fundamental right under section 23 of the Quebec Charter. So they were wondering where we draw the line between what we can do as lawyers in our job and the point at which it becomes derogatory. So there were some interesting questions, but the answer was rather weak.

Samuel Bachand

Whose answer?

Myriam Bohémier

The *syndic's*.

Samuel Bachand

Right.

Myriam Bohémier

Now for the recommendations. I'm going to dare to address a taboo that bothers a lot of people. I've noticed that I'm naturally disturbing, I have red hair and I have a way of being. I mean, in one case, there was a journalist who attended the hearing; and since she was present at the hearing, I could summon her to testify, which I did.

[00:50:00]

I've sent formal notices to journalists about Patrick Provost's treatment and media coverage. I subpoenaed Pfizer, McKinsey, and they have tried to have the subpoenas quashed: I'm awaiting that judgment. I subpoenaed Dr. Caroline Quach, President of the Quebec Immunization Committee, to answer questions. In short, you could say I've got a lot of nerve. But I see it as part of my job. In front of my own disciplinary board, I asked about their conflict of interest and also their vaccination status. And the answer was: "It's a confidential medical act." I replied, "Can you please write that into your decision as there are an impressive number of people who have lost their jobs because that wasn't accepted." It's such a simple answer. And we're still debating the issue of the vaccination passport in the courts. And yet, before my disciplinary board, it didn't even take two-and-a-quarter minutes to reach that conclusion.

So, I am coming to the practical issues, and I dare to address the following taboo: money. Nobody has the means that the government, Pfizer, McKinsey, whatever, have. I defend people who have no money. And the financing of claims is a major concern. Also, we've had appeals rejected after considerable expense because they became theoretical debates after the measures were changed. We also have many, many appeals—for example, on tickets where the value in dispute is perhaps \$1,500: we can't ask people to pay more than the value of the ticket. So it's complex because I have to eat too. I also have to live. I have to pay my rent. And people who lose their jobs, who don't have any money, finally have their means cut off.

So, how? How are we going to defend these people? It takes funding; it takes money. And, you know, for example: just to give you a written overview of all the measures, given the number of decrees, orders, and case law decisions, I could do that. But then again, I'm a full-time lawyer, one hundred per cent. It would again be pro bono work. And while I'm doing this, I'm not making any money. I'm self-employed. I don't have a job other than being a lawyer. And I'm not retired, I don't have a pension, I don't have anything else. So that's an important question because I want to help these people; and I don't want money to be an obstacle to helping them.

There are also legal notions that take precedence over human rights, such as the concept of the greater good. We have a decision on caregivers where Justice Brossard recognizes that caregivers and those being cared for are in great difficulty, that there is real damage, even potential death—but that the government is presumed to be acting for the greater good. Well, the problem is that the courts take so long to hand down decisions that, in the meantime, the debate has time to become theoretical. And people die and children are vaccinated and suffer side effects. The Court of Appeal has said that child vaccination is a matter of public law.

[00:55:00]

As for a public law debate today: None of them are heard on the merits, and it's 2023. On the other hand, I barely had ten days to prepare a trial on the children's injection issues. Neither works.

There's also the idea of unions. When a union agrees with the employer to apply measures and doesn't want to defend the employees, well then, the employees have no recourse.

There are charters. The notion of discrimination is limited to what is indicated in the charters. So vaccination status is not in the charters. On the other hand, gender identity is. So there's no protection against the discrimination we've experienced in relation to vaccination status. As for the notion of hate propaganda, which is contained in our criminal code, gender identity is there, but not vaccination status. So all the talk—

Samuel Bachand

Why, exactly, are you referring to hate speech?

Myriam Bohémier

Hate propaganda. Well, we've had such unparalleled media beating from—

Samuel Bachand

Okay, I know it's not an easy exercise but can you recollect an example of this kind of talk?

Myriam Bohémier

"Covidiot, ignoramus, selfish, toothless, imbeciles; we should starve them."

Samuel Bachand

Who carried or relayed these words?

Myriam Bohémier

Journalists and columnists.

Samuel Bachand

Okay.

Myriam Bohémier

And, yes, you could say that even our government leaders in their press conferences didn't have very complimentary things to say about the unvaccinated.

Samuel Bachand

It's time to wrap things up, as you're running out of time.

Myriam Bohémier

Yes, and now I have a few fundamental and philosophical points. First is the issue of fear. I'm a lawyer who decided to be on the front lines. This has caused me difficulties, pressures from my professional order. And there are a lot of people and lawyers who don't dare to do what I do. A lot of professionals too. So fear is an issue. It's a very big issue. If we want a

different world, we're going to have to examine that and examine also the judgments that we make about each other. Because we're on the same team here, but some people fight people on the same team. It is not easy. But judgment is what kills. They are only ideas, not reality. They're just projections of one person's own thoughts onto someone else. So indeed, that has to change.

So we have to get out of the victim-persecutor-rescuer space and look at ourselves. Because change has got to come from each and every one of us. Love yourself first of all, as you are, then accept yourself. That way we leave others free to be who they are. Because the fundamental question here is: Why is this still important today? Our right to breathe has been attacked—our right to breathe. To breathe is to live. Our right to decide what happens to our own bodies has been attacked.

Samuel Bachand

Excuse me, how was the right to breathe attacked?

Myriam Bohémier

Through masking.

Samuel Bachand

Ah, right.

Myriam Bohémier

Through masking. They attacked our right to decide for our own bodies regarding the COVID-19 injection by attacking our very survival. You know, we were given the choice between our physical integrity or our survival through our work. We're essentially fighting for humanity—

Samuel Bachand

What you mean is subsistence.

Myriam Bohémier

Subsistence, yes. We're also fighting for our humanity, for life. And what direction can we follow in a world that has lost its bearings? Everyone has to make life choices. Life choices imply solidarity and loyalty to self-love and accepting that others are the way they are, that they have the right to be, without that affecting us in any way because we are in solidarity with that right to be.

[01:00:00]

Samuel Bachand

Thank you for your time. We'll stop now.

Myriam Bohémier

Yes.

Samuel Bachand

So if the Commissioners have any further questions.

Commissioner DiGregorio

Thank you for your testimony. I'll ask my questions in English and Dr. Massie will translate for people.

[In English] Across the country, we have heard other lawyers talk also about how the Charter of Rights has not protected people.

Commissioner Massie

Across the country, we also heard a lot of testimony from other lawyers who mentioned being disappointed that the Charter of Rights didn't seem to have adequately protected people.

Commissioner DiGregorio

[In English] And we've heard suggestions that perhaps the Charter needs to be amended to provide better protections.

Commissioner Massie

Discussions were held to suggest amendments to the Charter of Rights to provide better protection.

Commissioner DiGregorio

[In English] But because amending the Charter is such a difficult thing to do, some of the other suggestions we've had are to change some of the laws.

Commissioner Massie

But since changes to the Charter could be quite complex to achieve in our confederation, people suggested perhaps trying to amend other laws that would be less difficult to change.

Commissioner DiGregorio

[In English] And so I'm interested in your thoughts on which changes might be most effective. For instance, you have spoken today about government measures being removed before you get to court. And then when the court, it comes before the court, the court says it's moot or theoretical.

Commissioner Massie

So for example, what suggestions would you have on more accessible changes, such as the comments about the reasons that are presented and become obsolete when measures are no longer active.

Commissioner DiGregorio
[In English] Your thoughts.

Myriam Bohémier

Well, I think that in this type of case, the government should have to demonstrate the measure first, rather than us having to challenge it. That would reverse the burden of proof on the government to justify its measure before putting it in place.

Samuel Bachand

What does this mean in practice? The Commissioners have been told about the Oakes test before, but in practice, the burden of proof of the state or the public prosecutor does not operate in the same way, as I understand it. So perhaps you'd like to explain to the Commissioner what you mean procedurally.

Myriam Bohémier

Procedurally it would mean that before adopting an infringing measure, human rights must be discussed. Not just any rights. We're talking about physical and psychological integrity, the right to life. These are rights to which you are entitled simply by being born, they are intrinsic human rights. It's written in the Quebec Charter.

Samuel Bachand

The practical side?

Myriam Bohémier

Yes. To infringe these rights, the government would have to justify that the measure it wanted to put in place was justified within the framework of a free and democratic society. And it would have to meet the criteria of proportionality and reasonableness before imposing the measure; and then, I tell you, it would go to court very quickly.

Commissioner DiGregorio

Thank you.

Commissioner Kaikkonen

[In English] The Prime Minister rejected truckers as anarchists while actively supporting Black Lives Matter.

Commissioner Massie

The Prime Minister called the truckers anarchists and protesters on the same level as people who protest in militant groups like Black Lives Matters.

[01:05:00]

Commissioner Kaikkonen

[In English] At the same time, the federal court is posturing, signalling to the populace that they are vaxxed.

Commissioner Massie

At the same time, the— [In English] Can you repeat with me?

Commissioner Kaikkonen

[In English] At the same time, the federal court is posturing, signalling to the populace that they are vaxxed.

Commissioner Massie

At the same time, the government is reporting that there are people who are recognized as vaccinated.

Commissioner Kaikkonen

[In English] The censorship bill C-11 was signed into law by the Governor General in record time.

Commissioner Massie

Bill C-11 came into force in record time and was quickly approved by the Governor [General].

Commissioner Kaikkonen

[In English] The lesser magistrates have climbed on board, deferring their decision-making power to public health.

Commissioner Massie

The judicial authorities quickly delegated their judicial functions to the government health authorities.

Commissioner Kaikkonen

[In English] We've heard testimony that our institutions are weaponizing the law to suit their own ideological agendas.

Commissioner Massie

Across Canada, we've heard testimony that institutions have used the law to implement their ideology.

Commissioner Kaikkonen

[In English] Particularly when they consider their own institutional view as the only acceptable view.

Commissioner Massie

Particularly when these institutions considered their vision or ideology to be the only acceptable one.

Commissioner Kaikkonen

[In English] And that the dissenting views of the citizenry are not accepted.

Commissioner Massie

And that any other vision of the world or other ideologies of citizens were perceived as unacceptable.

Commissioner Kaikkonen

[In English] So given where we are and your own experiences as a lawyer: Are we already living in a police state? And what constructive recourse do hard-working Canadians who love this country need to do to restore their God-given inherent rights and freedoms and, as you suggest, their birthright?

Commissioner Massie

So given the situation we find ourselves in, which is documented by a whole series of court cases that were quickly evaluated, as we've seen, as you've testified: Are we finding ourselves more and more in an authoritarian police state—one that is in fact eroding citizens' rights, fundamental rights, rights that are given at birth? And what can we do to try and re-establish the exercise of these essential rights, the fundamental rights of citizens?

Myriam Bohémier

Yes, in my opinion we are now in a totalitarian state. The last three years have shown that the courts have been powerless to prevent the infringement of people's fundamental rights, whether by delays or by strategy under the *Public Health Act*, where measures are changed a few days before the hearing. So there's no doubt that everything that's in the *Public Health Act*—those measures can't continue. And what's worrying—very worrying—is that the Charter statute is supposed to be higher than the measures and decrees of the *Public Health Act*. But that's not what we've seen in recent years.

So all the tools exist—they are there—but they're illusory. We haven't been able to use them. We've invoked them. We've gone to court to claim them. But there are concepts like judicial notice; it's a concept where it has been said that— Well, it's now judicial knowledge that there's a pandemic.

[01:10:00]

But it's never been proven that there was a pandemic. It was the government and the media that said there was a pandemic. But no demonstration has ever been made in a court of law that there was in fact a pandemic. So this concept: from the moment that everyone believes there has indeed been a pandemic and this premise goes unchallenged, well then, all else follows. The measures become justified, and everything can be explained on that basis. But that's why—particularly in a disciplinary case involving one of my clients—I questioned the notion of a pandemic because there was no excess mortality at that time. But since the COVID-19 injection, yes, now there has been excess mortality.

So in my opinion, you have to dare to question these false premises. And if we don't go that far for fear that the courts won't accept us going that far, or for fear of losing our credibility as a lawyer, well I mean, we won't succeed that's for sure. Because the basic premise isn't true. So you have to challenge it; you have to work through it; and then you have to dare to do it. I haven't seen much of that being done because it was deemed too difficult to question that premise.

Commissioner Kaikkonen

Thank you very much.

Samuel Bachand

Myriam Bohémier, thank you for your testimony on behalf of the Inquiry. You've always been free, but now you are free to go. Thank you.

[01:12:00]

Final Review and Approval: Erin Thiessen, November 21, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-translations/>

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 8: Éloïse Boies

Full Day 3 Timestamp: 07:15:08–07:52:14

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Konstantinos Merakos

Hello again everyone. I am Konstantinos Merakos from the firm Bergman & Associates. So we have our next witness. This next one is about social media. As you know, there has been a lot of debate between citizens and governments about the COVID measures. And these debates, or battles, have taken place not only in the street—through peaceful demonstrations, through courts of law—but also, and I would even say mainly, on the internet and more specifically, social networks.

I have with me on Zoom Madame Éloïse Boies. Madame Éloïse Boies, can you hear us?

Éloïse Boies

Yes.

Konstantinos Merakos

Okay. I'll swear you in, Madame Boies. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Say: "I do" or "I do solemnly swear."

Éloïse Boies

I do.

Konstantinos Merakos

Could you please spell your name?

Éloïse Boies

É-L-O-Ï-S-E B-O-I-E-S.

Konstantinos Merakos

Okay. Thank you. Are you alone in the room?

Éloïse Boies

Yes.

Konstantinos Merakos

Okay. So Madame Boies—or if I have your permission, I'll call you Éloïse. Is that all right?

Éloïse Boies

Yes.

Konstantinos Merakos

Okay. So Madame Éloïse, I'd like to start by talking a little about you, your current career, your work, and so on.

Éloïse Boies

I'll be fairly concise. My career right now is paused because I'm on maternity leave for the whole of 2023. I just had my second baby in January. My career is actually in television. I was an actress before the pandemic, then I became increasingly involved in production as a production coordinator. Then I was production manager for a documentary just before I went on maternity leave. So I won't go into the details of how complicated it can be to work right now in our field, the television industry, which requires a whole lot of— In any case, during the peak of the pandemic, it was really very difficult to work. So that's it, I was an actress for a long time.

And now I've started my YouTube channel—which isn't just on YouTube, but it's simpler to say so. I'm very present on the social network platforms and I've tried to do journalism as professionally as possible. In fact, I don't consider myself a journalist but rather I create entertainment. I get people with expertise to give their opinions, whether they're scientists, lawyers or psychologists. I felt it was important to give a voice to people who weren't being heard in the mass media, to bring nuance back into the public sphere. And since I'd been in the entertainment business for a long time—as an actress and I'm also a singer, so in the communications field—I knew I had the expertise to do it. My partner also works in the same field—he's a director and cameraman—so we started out doing something really professional together and it proved to be successful.

Konstantinos Merakos

Okay. Thank you. You said it was difficult to work in the media industry during the pandemic. Can you share a few details or experiences that explain this difficulty?

Éloïse Boies

Yes. Well in fact, at the peak of the requirements, or mandates as we say in English, the Union des artistes [Artists Union] required three doses of vaccines, even though everywhere else it was two doses for the vaccination passport. In our field, in order to work in front of the camera, you needed three doses. And children—even children who

dubbed or worked on sets—needed two doses. I don't know, as of today, what it is. I just quit, and I don't work anymore, I don't audition anymore. Anyway, I quickly became an outcast. So that's it, I don't work in front of the camera anymore.

And even behind the cameras on set, masks and all that were required. The working conditions were really difficult. My partner experienced this because he continued to work during the pandemic; it was really peculiar. Suppose the actors had to do a scene where they had to get close and it was less than two meters, well there was someone on the set to time them. During the day, they were allowed just 15 minutes. If it was more than 15 minutes, they couldn't do the scene: it was postponed to another day. It was totally crazy. It wasn't about "stopping the spread of a virus" at all. It was just creating endless rules and rules and rules.

[00:05:00]

So working under conditions like that can be extremely anxiety-inducing. And I really had no appetite for it. I was a new mother; I had my daughter in 2020 at the start of the pandemic. So my priorities were my family and continuing to make online content to keep people as informed as possible.

Konstantinos Merakos

Excellent. Before moving on to the theme of the content, you talked about rules, rules, rules. Were there any exemptions to be made in your field, either religious or medical?

Éloïse Boies

No, not to my knowledge, with reservations. But I'm in contact with many people in the industry who don't dare say publicly that they're against the mandates, but who do tell me privately because I'm publicly opposed to what we've been through. At least I have a lot of reservations about what the government has done. Really well-known actors write me to say— I know one actress who got an exemption to return home in order to avoid getting her second dose because she had extremely serious side effects after her first dose. And she's one of the very, very few in the country who managed to get an exemption. In the industry, it's definitely talked about. I don't think it's interesting or relevant to bring it up because it's rumour, but exemptions were exceedingly rare.

Konstantinos Merakos

Yes, and just as an example of practice, I would be bound to ask you if you've applied for exemptions. But since your medical records are private, I'm not going to ask questions like that, just as an example to the world, because you didn't mention your vaccination status. **That's between you and your doctor. So just as an example, to show the world.**

Éloïse Boies

Exactly. But if I may just digress for a moment.

Konstantinos Merakos

Yes, go ahead.

Éloïse Boies

Because of my positions, people assumed my vaccination status, but I never mentioned it publicly. So in making assumptions about me, people also assumed my spouse's vaccination status. Then my spouse found out from people who usually hire him that they hadn't called him for contracts because, "Ah well, you're not vaccinated!" In principle, nobody knows that. Nobody knows that. They surely cannot know for certain: they just assumed. So my husband lost some work because of it and me too—because I publicly asserted my reservations. I've hosted scientists who criticized the injection. So people assume that we're not vaccinated; they stop calling and they don't give us work anymore. And so we're self-employed.

Konstantinos Merakos

Excellent. Thank you for this. Let's go with the content of your videos. Tell us briefly: What was the specific content during the pandemic? If you made any videos, what were they about? What were the themes and topics?

Éloïse Boies

I launched my channel by making two videos that had nothing to do with the pandemic—because I come from the entertainment field and already had expertise therein. I observed the presence of paedophilic themes in Hollywood or that sort of thing, where in entertainment we saw the normalization of the hypersexualization of young people, et cetera. Then I decided to do one on media misinformation, which was my first video that had more to do with the pandemic. I started explaining propaganda techniques, things I knew about because I'd done a lot of research on it before. As I say, I come from a background in entertainment. It's important for me to understand how the means of entertainment are also used to control people to think in a certain way, to create social currents, et cetera, so I made videos on that.

I made a video on censorship because I realized that people around me went about their lives with their little daily routine; people went to work—"commute-work-sleep"—and weren't really aware of the extent of the rampant censorship, the extent to which so-called "dissident" discourse was being stifled. So I made a video giving examples of the extent to which the media reported news in a very biased way, already telling us how to think about it. It was very pragmatic because I try to make all my videos in a very pragmatic way, and so my video on censorship was censored by YouTube. YouTube completely deleted it. And I have several videos that have been deleted—most recently, one of Louis Fouché that I had just put online privately because I wanted to publish it later, and then YouTube deleted that.

Konstantinos Merakos

Yes, excuse me. You're ahead of me. That's exactly the next question. Has the censorship video been censored, as well as other videos you've published? So tell us a bit about that. Which videos have been censored and why?

Éloïse Boies

Okay. Well, the censorship video was the first one. Then I made one that went viral called "Why Refuse Vaccination?" It was online for 16 minutes before it was suddenly deleted by YouTube, creating a wave of frustration.

[00:10:00]

And it went even more viral on Facebook; Facebook didn't delete it. And in my video, I used excerpts from scientists who explained details about vaccination—renowned people like Dr. Zelenko, Dr. Malone, people with international reputations who had the expertise to at least give their opinion—in order to bring a plurality of points of view into the public sphere so we could have a clearer opinion. If you want to receive medical treatment, you should have free and informed information. And that video was censored. And then I've just been through it more recently with Alexandra Henrion Caude, a geneticist I hosted last week. I'd reached 40,000 views after two days on Facebook, when Facebook deleted it saying it could cause physical injury.

So there's been a wave of censorship that is obviously not over yet. Right now, we're well into 2023, and I am still facing a lot of censorship. But basically, it was YouTube and Facebook. That's pretty much where I experienced the most censorship.

Konstantinos Merakos

Okay. And what reasons or justifications did they give you for censoring these videos? What messages did YouTube and Facebook send you after censoring you?

Éloïse Boies

Well, the lamest excuse, if you ask me, is probably algorithms that detect content and keywords. So I don't think there are actually humans who sit down and watch our videos before handling the request. So generally, they say it goes against YouTube Community Guidelines or Facebook Community Guidelines. I even had a comment deleted on a group that I manage. I'd said, "Thank you so much for this." I was replying to someone and said, "Thank you for taking the time to reply to me." It was just like a thank you, yet it was judged as "against." So you can see that algorithms sometimes get a bit mixed up. But if we appeal, it falls through the cracks.

As for Facebook, I usually don't get any feedback. And with YouTube, they usually respond in minutes to say, "We've reviewed your request but unfortunately, we're maintaining our position." And it often comes with sanctions: either they threaten to shut down your channel after three warnings or the algorithms completely stop us from working, which is what happened with my channel. For a year or two, I had no growth at all on YouTube. Now, I'm earning—I don't want to say my income because I'm not really making any money with "Élo veut savoir" ["Élo wants to know"]—but it's still my job and I invest a lot in this project. So it's important for me to reach a lot of people and to have a lot of subscribers. And when there's censorship like that, it also hurts my ability to have what I do be seen by people and perhaps affects my chances to partner with sponsors, that sort of thing. So I can tell from the developments surrounding my project that it's actually enormously detrimental to my career.

Konstantinos Merakos

Excellent. Have you received any personal or hateful attacks from other people on the internet for posting these videos, in your private messages, et cetera?

Éloïse Boies

Yes, all the time, that's for sure. Trolls are everywhere on social networks.

Konstantinos Merakos

And another question, perhaps more important: Have you been discredited or attacked, either by government agents or by the media?

Éloïse Boies

Yes, that's it; that's even more disturbing.

Konstantinos Merakos

Okay. Go on.

Éloïse Boies

Because whether you're on one side or the other, there'll be trolls. At some point, you learn to live with the hatred that's out there. But in fact, the problem arose when I was present in Ottawa during the Freedom Convoy: I went with my phone, I met truckers, I went live. Then it went super-viral because people were hungry for information that was neutral. I was just a normal person interviewing people. My goal wasn't to tell people how to think, as the mainstream media was doing when reporting the news by demonizing the Convoy. So at that time—it was January 2022—I exploded on Facebook.

It also goes back to what I wanted to say earlier. My other video that went viral was "Why Refuse the Vaccine?" When videos go super-viral on the internet, what I've noticed— I had the same thing happen with scientists I interviewed on a talk show I created called "Juste pour savoir" ["Just To Know"]. I had three scientists on: Bernard Massie, who is here today, Patrick Provost, and Christian Linard. They came to explain, to give another point of view, to give nuances contrary to what we always hear in the mass media. That video went extremely viral. I think we were up to half a million views.

[00:15:00]

That's when the media started attacking me regularly. The first time was the vaccine video. *Le Soleil* did an article on me to say that ultimately, it was a pack of lies. "Fact-check": it's become the most-used word in the last three years. But what I do is more or less 'fact-checking' because I give the floor to internationally renowned scientists who have the right to their opinions which are based on facts. And then we have a journalist straight out of journalism school who feels he can tell internationally renowned scientists that they don't know what they're talking about. And I experienced the same thing with my video featuring the scientists I've just named. This time it was more difficult, because Radio-Canada [CBC] actually did a program on *Décodeurs*. Then came an article in which they debunked my video. Excuse the Anglicism but, hey, they "fact-checked" it and "debunked" it.

I was more or less attacked personally. I was just seen as this terrible conspiracy theorist. They didn't use the word "conspiracy theorist" though because I don't think anyone could label me that way when I'm just a host who interviews people. But in the article, they took the statements of the scientists I interviewed, one by one. In fact, I think they were the ones who received the tsunami of criticism. But what happened when Radio-Canada—which in the eyes of the general public is seen as a recognized, credible institution—attacked me, well afterwards, I definitely felt the repercussions in my private life.

Konstantinos Merakos

Thank you. So we are talking about censored videos, about the media trying to discredit you. In your opinion, is this an attack on your freedom of expression?

Éloïse Boies

Yes, it is crystal clear.

Konstantinos Merakos

Tell us about freedom of expression.

Éloïse Boies

You want me to talk about it?

Konstantinos Merakos

Yes, feel free to go ahead.

Éloïse Boies

Well, for me, it's the most important thing. That's why I'm suing Google and YouTube with my lawyer, William Desrochers, who contacted me during the pandemic. Because we were saying to each other, "This is serious, you know. We have a Charter that's supposed to protect our freedom of expression." My comments do not incite hatred nor do they incite anyone to commit a crime. I'm just trying to give a voice to scientists who have something else to say, and I get censored repeatedly. There's something extremely alarming—

Konstantinos Merakos

Excuse me, I'm just going to interrupt just to warn you not to talk about the court case with your lawyer. You can mention the theme, et cetera, but we won't go into detail. Politely, I ask you this.

Éloïse Boies

No problem. Anyway, I can't give you the details; it's not my expertise.

Konstantinos Merakos

Excellent. My apologies. Please continue.

Éloïse Boies

In fact, the point is quite simply that I think many of us felt that our fundamental rights were really being trampled underfoot during the pandemic. We even found a way of ridiculing a word that should never be ridiculed: namely "freedom." And, no, it's not all raving lunatics who say the word "freedom." It's so incredible that we've reached this point as a society. So for me, the battle is here: I'm a mom now, and we're in the process of creating a world. And when we bring children into that world, well, of course we ask ourselves what we're going to leave to that future generation. It involves me in a completely different way in society; to me, this is important.

I'm lucky to have a voice. I already had experience; I wanted to be an entertainer for a long time in my life. I had the opportunity to express myself publicly, to host people, to ask questions. What's more, as I said, I was also lucky enough to have the technical resources around me. A lot of people put their shoulders to the wheel for free, in the shadows, to make sure that our productions were really aesthetic, beautiful, and professional. But just to see the extent to which people didn't want their names mentioned in my projects shows just how much fear there was, as Madame Bohémier referred to earlier: that fear of expressing oneself publicly; that self-censorship; that fear of losing one's job; that fear of being judged; of losing friends. The social climate is really—I never thought I'd go through this in my life. And I intend to continue fighting as peacefully as possible, but as I see it, what we're going through as a society is extremely serious.

Konstantinos Merakos

Thank you. The next topic is more personal in tone, and you're free to answer as you feel comfortable. I'd like to talk a little about your family. You have a husband and a son and daughter? You have a young child?

Éloïse Boies

Two children: one boy, one girl.

[00:20:00]

Konstantinos Merakos

Okay. Congratulations.

Éloïse Boies

Thank you.

Konstantinos Merakos

So I'd like to talk about your family's situation, your family's quality of life. Did you suffer social rejection, ostracism, financial hardship? Tell us a little about what you and your family went through during this very, very difficult period.

Éloïse Boies

Yes, well, we've certainly been through the same thing as everyone else, you know. I'm here to talk about it today, but I have the impression— So many people wrote to me to share what they were going through, and so many of us went through it: it was violent. Let's say for example, Patrick Lagacé's article calling us toothless—that's where the term "toothless" began—making totally meaningless associations, like we were less educated if we opposed vaccination. If we went to Ottawa, we were transphobic, misogynistic—really, just denigrating labels that mean absolutely nothing in this context. It has nothing to do with anything but it's just repeating the rhetoric over and over: denigrating, degrading people who have chosen use their critical spirit to position themselves differently from what those in power want. So yes, we've been through it, and in my partner's case, a lot of friends have stopped talking to us. Some of his friends even took him aside because they were worried about his mental health after seeing the report about me on Radio-Canada—because they thought that he was probably under the influence of a conspiracy theorist—which is extremely hurtful when these are childhood friends you thought you knew well.

And where I personally really experienced— As I said, in February 2022, last year, Radio-Canada wrote the article about me right after—really, immediately after—my videos had gone viral. I had videos in Ottawa that had reached 300,000, 400,000 views. And I also had the video on the scientists, which was rolling at the same time that Radio-Canada ran the program on *Décodeurs*, right afterwards. That's when my daycare called my partner to say that we no longer had a space at that daycare. It's a family daycare. It's extremely difficult to find a daycare centre. And we never found out why; she simply said she didn't like the way I talked to her, even though I'd never had any conflicts with her. So for sure, the timing of events was rather dubious. We'll never know for sure why we lost our daycare centre in February 2022, but it came at a time when I was very publicly exposed, when social pressure was enormous.

As I said, I never talked about my [vaccination] status, but just as a reminder: those who opposed mandatory vaccinations, those who opposed all of that, couldn't go to the SAQ [Société des alcools du Québec – provincial liquor store] anymore. If I wanted to go to my pharmacy, for instance, which was in a Walmart, I had to be escorted by a person to ensure I didn't go anywhere else in the big-box store—because I wasn't allowed to pick up my little prescription [alone]—and then return home. So the social climate made it okay for people to hate us. Monsieur Legault even talked about depriving us of healthcare if we weren't vaccinated, and this was picked up by the media. At the time, Denise Bombardier was repeatedly calling for war against the unvaccinated in the *Journal de Montréal*. I published her articles two or three times; she used that terminology, which is extremely violent, yet can be interpreted more or less positively by the people who receive it. So in my opinion, her freedom of expression should have been stopped right there.

And that's when it became really alarming. The day we lost our daycare centre, we had to downsize. My husband turned down contracts because we were now working full-time with one child. At the time, my channel was doing really well so I was trying to expand. I was also starting an independent media company called Libre Média. So everything was happening at the same time. My partner stayed home more to allow me to continue working. But to this day, I'm still pretty sure that we lost our daycare centre because some people must have reported that I was in Ottawa, and that *Décodeurs* had done a show about me.

Konstantinos Merakos

Thank you. These attacks—or this situation between you and your husband: Did it affect or touch your children's lives or quality of life, whether at school or elsewhere? What was their reaction to what they saw Mom and Dad go through in the media or through friends, in the community, et cetera?

Éloïse Boies

Well, my daughter was born in 2020, so you could say she was protected because she was so young.

[00:25:00]

And I had my son in January. We were lucky enough to have grandparents around. And I make no secret of it, my parents were extremely present in the early years. I don't know how it's possible for those who followed the recommendations to not have their parents' help. That is why it is always said that it takes a village [to raise a child], especially for

young children. I thought it was important for my daughter to see faces; I thought it was important for her language. There are plenty of scientists, plenty of studies around the world, that have come out saying that when children do not see faces, it delays their language. In any case, we know that, but I won't go into that now.

But for me, putting my daughter through that was out of the question, so I made sure she kept seeing people. Of course, we didn't go out in public much. I wasn't really going to the grocery store with her; I didn't want her to see people wearing masks. It was important for me to protect her from that. So I think we did a good job of protecting our children. We succeeded: my daughter is almost three years old, and she speaks extremely well. And I'm very pleased about that because at the daycare centre, there are actually children who speak very, very little. In fact, I think it's my daughter who speaks the best. Even four-year-olds have problems with language delay. So you can see it all around us: where the mask mandates have been applied, well, the kids have paid the price.

Konstantinos Merakos

Okay. Then it's a good thing they were still too young to understand what was going on around you.

Éloïse Boies

Truly.

Konstantinos Merakos

Okay. I'd like to give you a minute to add anything if you want before we go to the commissioners for their questions.

Éloïse Boie

Well, I think we've skimmed through the most important part of what I had to say today. We can go straight to questions if you like.

Konstantinos Merakos

Excellent. So Commissioners, it's your turn. Oh, yes, before I proceed: they told me we need to swear in each individual. So we'll do it again if it hasn't already been done. They gave me the go-ahead, so I'll do it. Do you solemnly swear or affirm to tell the truth, the whole truth, and nothing but the truth? Please say, "I do."

Éloïse Boies

I do.

Konstantinos Merakos

So if it's [already] been done, it's been done now a second time.

Éloïse Boies

We did it.

Konstantinos Merakos

Okay, excellent. They gave me the signal. And when they give me the signal, then I clearly do it. I'd rather be 100 per cent sure than have a little doubt. So thank you very much for the gesture. We'll continue with the commissioners and their questions. So go ahead.

Commissioner Massie

Hello, Éloïse. I'd like to thank you very much for your testimonial. I understand that in your current situation it's not easy to free yourself up for this, so we really appreciate it—especially as your testimony was quite special, as it concerned both your professional and personal life and where the two are a somewhat intertwined. And as circumstances have it, you've been at the forefront of many phenomena, including censorship. It's quite paradoxical to have a video about censorship censored: it's a lesson in absurdity. And I'd like to ask a question about censorship in social media. I'm not young so I don't know much about social media. In fact, I'm a bit confused about it. And I find it hard to understand, let's say, the consistency of censorship assessments where a video is removed, not removed, put back. What's the mechanism whereby, for example, YouTube and Facebook decide that such and such content is okay or not? How does that work? I find it a bit anarchic.

Éloïse Boies

Yes, it is indeed anarchic and it is totally incoherent, as with absolutely all the rules we've had for the last three years. Don't look for coherence, you won't find any.

However, what I do understand is that they respect the WHO [World Health Organization] recommendations. This was stated by the CEO of YouTube, who said at the start of the pandemic: "Anything that doesn't respect WHO recommendations," for example, taking vitamin C, "will be removed," so deleted from YouTube. I included it in my video on censorship, by the way.

[00:30:00]

So unlike Facebook, which adds a banner— You can see it on Spotify too now, where it says "COVID-19: for WHO recommendations," and then there's a hyperlink you can click on— YouTube, on the other hand, removes it altogether; it's a much more aggressive approach. But then what I experienced this week was that Facebook became just as aggressive and decided to delete my video about the vaccine with geneticist Alexandra Henrion Caude. However, it's also hard for me to understand, because Alexandra Henrion Caude has been interviewed on Sud Radio, by André Bercoff, on several occasions. All the interviews are available on YouTube; none are censored. So I can't quite understand it, it's really multifaceted. I can't explain it because I don't even think they'd be able to give us a logical explanation; there isn't one.

Commissioner Massie

My other question has to do with all these stories of denigration and mud-slinging by social media, trolls, and institutions. You mentioned in your testimony that you were quite affected by being very vigorously targeted by Radio-Canada with *Décodeurs*. Does it bother you on an emotional level to be attacked like that, or are you disturbed because an institution like Radio-Canada, which has an aura of respectability, seems to have lost its moral compass?

Éloïse Boies

Yes. Well actually, I don't think I've been personally affected from an emotional point of view. On the contrary, I expected it, I knew it. It happened on February 19; I remember because it was the last day in Ottawa and the trucks were leaving. Then I woke up in the morning and I had lots and lots and lots of messages. Everyone was saying, "Did you see it? Did you see it? *Décodeurs* wrote an article about you." Then I just went, "I knew it was coming." Because I was too successful; it's called character assassination. It was only a matter of time before someone came after me. They had to destroy my credibility to make sure no one was going to take me seriously.

So as you say, Bernard, it's more disturbing to see an institution—that we also pay for, as taxpayers, with our taxes—that hasn't represented us, that hasn't given us a plurality of points of view, even though that was their mandate. And even today, as I said— Well, of course I'm changing, it was Facebook that censored me. But anything that goes against vaccination, no matter how watertight, factual, or evidence-based the argument, if it leads you to doubt about getting that injection, it's considered disinformation and shouldn't be broadcast in the mass media. In my view, that's the big red flag. It's absolutely abnormal. It's like listening to only one person in a conflict. It's totally illogical. Our parents taught us, as brothers and sisters, to at least listen to both points of view before making up our minds about a conflict or taking a stand.

So I can't understand why we're only allowed to hear "Oh, the vaccine, it's wonderful! It's absolutely fantastic!" But we can't hear about all the women who've lost their menstrual cycles. You can't hear all the other arguments that might make you doubt, especially as in my case where I wanted to have a second child. So there you have it. Basically, I think that Radio-Canada, like all journalists in the mainstream media—with few exceptions—have failed us. And I think people just wanted to keep their jobs. I know people who worked for Québecor who managed to write articles that gave the floor to pediatricians who had reservations, "In the case of children, is it okay to wear masks to school?" And then he was told, "You're not writing about the pandemic anymore." So that's how it was during the pandemic.

Commissioner Massie

My last question may be a little more personal, but anyway: How does someone like you find the strength to get through this? Not only are you weathering the storm, but it seems like you are even proactive.

Éloïse Boies

Thank you.

Commissioner Massie

What gives you this energy?

Éloïse Boies

Well, we've already talked about it together, Bernard, but we certainly have a sense of community. It's good to feel that we're not alone. And when I was on the front lines, I was lucky enough to have a lot of people writing me to share their distress—a lot of distress—and to share their appreciation of what I was doing. Because they were telling me that thanks to me, "I feel less crazy because at work, there's no one who thinks like me," and so

on. So it kind of gave me the feeling that someone was needed in the public sphere who was articulate, who had a command of French.

[00:35:00]

It sounds a bit corny but, for me, it's important to do it in a professional manner. It takes someone to do it, and I can see that not that many people have had the courage to go to the battle front because some people are afraid of losing their careers. As I was saying, I'm very close to the cultural milieu. Artists have been criticized for not speaking out but I can understand why they didn't want to, when you see how Guillaume Lemay-Thivierge was treated when he finally spoke publicly. We were getting our heads chopped off.

So to answer your question, Bernard, I think I've always had a very strong sense of injustice or justice; I'm very sensitive to injustice. For me, what we are experiencing is profoundly unjust. So given my personality, I couldn't just sit back knowing that I had the tools to do something in the battle. So I decided to go to the battle front. And also, I enjoy the interviews I do. I enjoy the human contact. It's intellectually stimulating. I was lucky enough to meet Oliver Stone, who invited me to his home in Los Angeles. So there are people who appreciate the work I do and who appreciate the work of searching for the truth.

Commissioner Massie

Thank you so much for your testimonial, Élo.

Éloïse Boies

Thank you.

Commissioner Massie

Questions?

Konstantinos Merakos

Any other questions? No? So Eloïse, by chance, you're my last witness. And we end on a good note, an important note for the future. These days, everything happens on social networks, on social media.

Before I say goodbye to this adventure, I'd like to thank you from the bottom of my heart for your testimony and your courage, on behalf of the National Citizen Inquiry. So thank you very much and good evening to you and your family.

Éloïse Boies

Thank you for doing what you are doing too. Have a nice evening.

[00:37:06]

Final Review and Approval: Erin Thiessen, November 18, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 9: Luc Harvey

Full Day 3 Timestamp: 08:17:55–08:52:07

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Samuel Bachand

Hello, my name is Samuel Bachand. I've been appointed to act as Inquiry counsel for your examination, Monsieur Luc Harvey. Please spell your name in full.

Luc Harvey

Luc L-U-C, Harvey H-A-R-V-E-Y.

Samuel Bachand

I will now swear you in. Monsieur Harvey, do you swear to tell the Inquiry nothing but the truth?

Luc Harvey

As usual, yes.

Samuel Bachand

So Monsieur Harvey, you're here to tell us about your experience and research in a legal case that began before the Court of Quebec in connection with the application of the *Youth Protection Act*. One of the parties called on you at the appeal stage, is this correct?

Luc Harvey

Exactly.

Samuel Bachand

So that you could help him gather evidence—new evidence— in this case, both as a researcher and thanks to your skills and experience as an investigator, correct? For the purposes of the court case?

Luc Harvey

Exactly.

Samuel Bachand

So you're here with us to explain a little bit about your career path, the obstacles you've encountered along the way, and what you've found.

Luc Harvey

Okay. Quite simply, to begin with, when you go before a judge, you have to have evidence. Part of the evidence is often based on documents or reports produced by specialists—or expert witnesses, as they say. The difficulty was that my friend had something like ten days to accumulate or find expert witnesses. In fact, he had found Dr. René Lavigneur, who had been willing to work with him; and two days later, René Lavigneur informed him that he could no longer speak to him and that he would not even be responding to emails. So my friend was left with no one to back him up in court.

This is where I came in. Yes, I'm an investigator for an international organization, but I'm also a former federal MP so I have a pan-Canadian network. I've also worked with international organizations based mainly in Europe and Eastern Europe; I've been working in Eastern Europe, the Middle East, and Africa for almost six years. So I have a relatively interesting and extensive international network.

In this instance, I quickly managed to recruit Monsieur Steven Pelech at the University of British Columbia, who was willing to become an expert witness in the case. He was the first expert witness. The second expert witness who was willing to come on board was Monsieur Eric Flaim from the University of Alberta.

Samuel Bachand

I'm going to stop you there. In fact, I'm going to slow you down a little, asking you for the contribution you envisaged for each of these experts.

Luc Harvey

Pardon?

Samuel Bachand

The contribution you had in mind: What were these experts you're listing going to say, one by one?

Luc Harvey

Well, it was about finding someone who had the capacity to ask, "Was vaccinating a child worthwhile? Were there any real gains?"

Samuel Bachand

Okay.

Luc Harvey

Because there are advantages and there are disadvantages. And what the governments of Quebec and Canada had produced via the INSPQ [Institut national de santé publique du Québec – public health] was too simplistic for making such a decision. So we went looking for international specialists, people who were indisputable in the debate. So Dr. Flaim's and Dr. Pelech's objective was to define: "Was the vaccination of a child valid and safe?" and "Was there a benefit?" That's what's in the document here in front of me; it's over 150 pages long.

Samuel Bachand

Do you perhaps have a reference, a title, anything that could direct the commissioners to these documents or to these experts when they consult the case you've just told us about if necessary?

[00:05:00]

Luc Harvey

Yes, of course. I could give it to you privately but I can't make it public. Given that the child has a disability, there are restrictions on publishing information publicly; it can be given to specialists or commissioners but I won't be able to share it publicly.

Samuel Bachand

I understand. So we'll see to that later. Continue.

Luc Harvey

But I have documents here. I can confirm that they're original and there's no doubt about that.

Samuel Bachand

Okay, continue.

Luc Harvey

The third specialist we've brought on board is Alexandra Henrion-Caude. Madame Caude is a specialist in clinical studies. So Madame Caude pointed out the biases surrounding how the COVID vaccine had been given special authorization for use in the population. There were in fact 15 major biases that would have forced the study to be repeated: just one would have been enough. And the study published by Pfizer alone had 15 of them. In spite of this, the vaccine was authorized for use in the general population. So that's what Madame Henrion-Caude's report says.

Other specialists we went looking for later—who are not a part of the proceedings filed with the Supreme Court—were added: people like Christian Perronne and Astrid Stuckelberger. They were participants in the case filed with the Supreme Court, should it be heard by the Supreme Court.

Samuel Bachand

And what contribution are they expected to make in terms of themes and subjects?

Luc Harvey

So it was a matter of finding the specialists and getting their consent to participate and debate the appropriateness of vaccination at the Supreme Court. And the basis on which the report was submitted to the Supreme Court was very simple: the ability to ask questions, the ability to get answers, the ability to have a debate; in other words, a full and complete defence and a fair and equitable trial.

Samuel Bachand

Very good. So just for future reference, perhaps when you say “to the Supreme Court,” it is that there would have been an application for leave to appeal to the Supreme Court in this case file?

Luc Harvey

Exactly.

Samuel Bachand

Okay. That was ultimately denied?

Luc Harvey

That was eventually denied. The debate was denied.

Samuel Bachand

All right. Could you take a look at the proceedings and give us the number of the case you intervened in, I mean the docket number?

Luc Harvey

I'll give you that at the end, too. I won't make it public for the sake of protecting the identity of the child and the father, but I'll be able to provide it without any problem. I have the document here.

Samuel Bachand

Very good. So at this point, I'll let the commissioners ask any questions they may have.

Luc Harvey

I've got a copy of the document here, so I'll be able to supply it, no problem.

Samuel Bachand

From a distance, I'm guessing it's the Supreme Court decision—

Luc Harvey

Refusal.

Samuel Bachand

—dismissing the application for leave to appeal, correct?

Luc Harvey

The rejection, yes.

Samuel Bachand

Very well. Do the Commissioners have any questions?

Commissioner Massie

Hello, Monsieur Harvey. If you can shed some light on this case: Did you take any previous steps before ending up in the Supreme Court?

Luc Harvey

Yes.

Commissioner Massie

And now that you're basically blocked from filing or arguing your case in the Supreme Court—I don't know the judicial system—are there any other appeals, or is this the end of the road?

Luc Harvey

Well, we reached the end with a question we sent to CIUSSS [Centre intégré universitaire de santé et de services sociaux – Integrated university health and social services centre], which was simple: “Do you still intend to [vaccinate the child]?” Because in the entire proceeding, when we submitted our documents, CIUSSS responded with a two-page document.

[00:10:00]

CIUSSS's two main arguments were that, since the child had already been vaccinated once, the debate was moot, despite the fact that the vaccination had been given during the proceedings. So there was an issue of contempt of court over the child's vaccination; but it was secondary. And the second reason—

Samuel Bachand

When you simply say “there was contempt of court,” was there a request for a declaration of contempt of court?

Luc Harvey

Yes. It was during the proceedings.

Samuel Bachand

Was there already a pronouncement or notice of contempt of court?

Luc Harvey

Yes because when we went to appeal—rather anecdotally—they didn't expect us to have specialists and expert witnesses. So we arrived with our three witnesses: Pelech, Flaim, and Henrion-Caude. And they said, "Oh, listen, can you give us a week to look at all of this and then come back?" We were pleased and said: "Okay, no problem." And two days later, our lawyer told us that they had already vaccinated the child. That was the first vaccination, and that was during the procedure. And after that—

Samuel Bachand

So just to make sure we understand, at that point you had already indicated to your opponent and to the court that you intended to ask for permission to produce new evidence at the appeal stage, right?

Luc Harvey

Yes. Well, yes, that's right. We were arriving for the first time with specialists.

Samuel Bachand

Which once again means that when you introduce new evidence on appeal, you need permission?

Luc Harvey

Yes.

Samuel Bachand

Because normally on appeal, no [new] evidence is presented. We use the evidence that was presented in the first hearing, right?

Luc Harvey

Yes.

Samuel Bachand

So you were taking steps to reopen and improve the evidence.

Luc Harvey

To enhance the evidence.

Samuel Bachand

So when you signalled this intention with the names of experts to back it up, the result was as you've just described?

Luc Harvey

They asked for a seven-day delay to analyze what we had, which we granted: no problem, no stress. And two days later the lawyer—I don't know, he was from the Centre jeunesse

[Youth Centre] or the CIUSSS—informed our lawyer that the child had been vaccinated after all. That had happened during the process. And well, then there were debates and everything. We decided to go to the Supreme Court too to resubmit the file. What was filed with the Supreme Court, here, was our complete file, with the questions I mentioned earlier: the right to debate, right to question, right to answer, and everything. It was denied. So that's it.

Commissioner Massie

So my question is: Is this the end of the line? From this point on, is there no other recourse?

Luc Harvey

They said that since the child had already been vaccinated once, the debate was moot; that's the argument they sent to the Supreme Court. The question we asked the Centre jeunesse and the CIUSSS: "Do you still intend to vaccinate the child?" So they were stuck. If they replied: "No, we have no intention of vaccinating the child," we win without being flashy, but we win all the same and without debate because the child is not vaccinated.

And if they answer "yes," well, we'll be able to go back to the Supreme Court and say that they lied to the Supreme Court by saying that the debate was moot because the child was already vaccinated. So they're in a bit of a catch-22 situation. Whether they answer "yes" or "no," it's pretty much the same thing for us. And so to date, we still haven't had an answer and I don't think we're going to get one either.

Samuel Bachand

I understand that what you're revealing or disclosing to us today, up to a point, has been authorized in full by the party you've been working with, has it not?

Luc Harvey

I don't understand your question.

Samuel Bachand

What you're telling us about the file and the party you helped, did they give you permission to tell us about it?

Luc Harvey

Yes, of course.

Samuel Bachand

Okay, that's good.

Luc Harvey

There's no problem with that, we're working very closely on this. The boy isn't my son but emotionally, he's really special to me. I always want to say his name because to say "the child" or whatever— But I can't. So it's not easy.

[00:15:00]

Listen, I have seven children, so I'm someone who's very open to children and all that. I understand the energy. I understand emotionally what it can mean to be a father in this circumstance. And the other thing is that to put pressure on the father, to take revenge on him—today, he doesn't even have the right to see his son. All his rights have been taken away.

Samuel Bachand

Perhaps you could go back a bit and tell us what happened initially, and then afterwards?

Luc Harvey

Okay. I have to tell you that before we met, I had planned to provide a history, but then we changed things a little bit.

So during the proceedings, they even sent a letter to the Supreme Court saying, "Listen, wait before you make a decision because the father is going to lose his rights over his child." They sent that to the Supreme Court! The institution itself is sending this to the Supreme Court in collaboration with the mother. So you understand the level of malice, the level of sentiment—

Samuel Bachand

I don't think it's necessary to lend intentions.

Luc Harvey

No, but that's the level— To have believed in the government—

Samuel Bachand

Go ahead, be factual. The Commission is capable of noting for itself.

Luc Harvey

Yes. So I'm going to avoid giving opinions. And this withdrawal of his relationship with his son gradually [worsened]. At first he could go out, but not out of the parking lot. Imagine, the child is in a youth center with children much more severely behaviourally challenged than him, so it's very noisy. For him, getting time away from the youth center is a moment of respite. So the child was allowed to walk around the parking lot. He likes to drive around in the car, so the father parked the car, backed up, drove ten meters, parked the car again, backed up, parked the car again, backed up, parked the car again. Imagine a child with the mental age of five or six saying to his father, "Dad, what's going on?" He himself found the situation so crazy that he couldn't understand what his father was doing, continually parking and moving the car.

After that, he was limited to visiting his son only in the Youth Center, under supervision. And now all his visits have been taken away. He cannot see him anymore; they just talk on the phone. That's the situation. Emotionally, imagine that you love your son, you love your daughter, that you're doing everything legally possible. And one of the things my friend is being criticized for is having questioned his son's vaccination against COVID—having

questioned it, raising questions about it, wanting to debate the subject. Emotionally, it's very heavy, even for me, even if it's not my son. And that's terrible. It's terrible that a government would do that to its citizens. I'm sorry, I'm a former politician and I'm ashamed to see what's happened today. I'm ashamed, deeply ashamed and disappointed to watch all these institutions. In the national anthem, where it says, "*protégera nos foyers et nos droits*" ["will protect our homes and our rights"], and in English, "on guard for thee," — Okay, they've taken that away from us.

Samuel Bachand

Do the Commissioners have any further questions?

Commissioner Massie

Well, I'm still a little confused about what comes next. You seem to be at an impasse in terms of the development of legal remedies. But you mentioned that if there was a clear expression from the organization where the child lives not to proceed with further vaccinations, at that point, would that satisfy your friend given the circumstances?

[00:20:00]

Luc Harvey

We would win by default.

Commissioner Massie

But you have reservations about this eventuality? You don't know what's going to happen?

Luc Harvey

We don't have the answer. They could just as well vaccinate him without telling us. We don't know. My friend isn't even allowed to see his son anymore. You have to understand, they have gone too far; they have gone very, very, very far.

Commissioner Massie

And you wonder that if ever there were other vaccines administered—?

Luc Harvey

Other versions or a new wave, or whatever.

Commissioner Massie

The argument that the Supreme Court uses to say that it's moot would be null and void at that point?

Luc Harvey

Listen, even the child's lawyer— Since the child is in the DPJ [Direction de la protection de la jeunesse – Youth Protection], he can't make decisions for himself. He has a lawyer who is paid by the state, who is hyper pro-vaccine. And everyone's holding hands and saying:

“Yahoo, let’s vaccinate!” So that’s what’s been happening all along. They’ve been vaccinating everyone with enthusiasm. So today, we’re waiting to see how they respond. And so after all, we now have other information; we would have another way of going about things. But I have to tell you that the average success rate of anyone who wanted a debate on COVID is an absolutely zero. Despite the fact that we arrive with concrete evidence, no one wants to listen.

And I have a document here that might be of interest. It comes from the Ministère de la Santé et des Services sociaux [Ministry of Health and Social Services]: a letter addressed to Monsieur Mauril Gaudreault, President of the Collège des médecins [College of Physicians]. This was posted on the Ministry of Health website—I have the proof here—on September 17, 2021. The Ministry of Health informs the Collège des médecins that if any person in the health field requests an exemption, it will be thoroughly analyzed to ensure that no one is able to request a, quote, “unnecessary” exemption. So I have this document here with the screenshot. The Collège des médecins has been informed by the Ministry of Health that there will be no exemptions.

Samuel Bachand

Would the Commissioners like the document to be quoted separately?

Commissioner Massie

I think it would be easier to locate that way.

Samuel Bachand

So we’ll assume it’s QU-7: Exhibit QU-7. QU, capitalized, dash 7. We’ll set it aside.

Luc Harvey

So I’ve got that here. And here’s another document I’d like to share with you. This is from my good friend, Daniel Brisson, who works with me on this file: it’s a coroner investigator’s report. It’s an autopsy report where the coroner clearly says, “There is a substance detected in the blood. However, given that the results must be taken with circumspection as there may be an appearance or overestimation of the substance in the case of death, it will therefore not be mentioned in this report.” So a substance has been found; we don’t know which one; we don’t know if that’s what killed him, but we won’t talk about it all the same.

Commissioner Massie

Which case are we talking about here?

Luc Harvey

The deceased is Monsieur Pierre Paquette.

[00:25:00]

Samuel Bachand

The Paquette family gave you permission, is that right?

Luc Harvey

The Paquette family didn't just authorize us, they asked us—in memory of their father, brother, and husband—to file this so that if his death serves any purpose, it will serve the Inquiry or whomever. So an unknown substance appears in his blood, we don't know if it's what killed him or not, but we won't talk about it. Whereas a spectrometer can tell us what a flower from Brazil is made of.

Samuel Bachand

I propose to the Inquiry that this document be quoted separately.

Luc Harvey

[Exhibit] QU-8. Okay, it's done.

Samuel Bachand

In the course of your research, you came across information about a person involved in some of the work of the World Economic Forum, did you not?

Luc Harvey

Yes.

Samuel Bachand

I don't know if it's displayed on the screen or if you have it on your computer?

Luc Harvey

Of course. It's Madame Renée Maria Tremblay, Deputy Executive Legal Officer to the Chief of Justice of Canada, Supreme Court of Canada. I would like you to take note of this and read all the good things that are written about this lady, her influence with the Supreme Court and, above all, the arrogance that these people can indulge in.

Samuel Bachand

Listen, I'd like you to stay on the facts. So you're establishing a link, I believe, between a person and an institution, or two institutions.

Luc Harvey

Let's just say that Madame Tremblay is someone the [World] Economic Forum prides itself on having very close to them. As you'll read the whole thing, I won't comment further. But Madame Tremblay is perhaps just the tip of the iceberg of the meddling that a group like the World Economic Forum does within our institutions.

Our institutions have failed—and I'm speaking as a politician here—our institutions have failed.

Samuel Bachand

Does the Commission wish to mark the document separately? Yes, so it will be [Exhibit] QU-9.

Luc Harvey

Well, I don't mind, but this is on the computer.

Samuel Bachand

We'll print it together. That's not too much to ask. Any further questions?

Commissioner Kaikkonen

Bonjour. [In English] I'm not sure I have a question, I just have an observation, but maybe I can turn it into a question. When we think of the Supreme Court, we think of people with dissenting voices or various voices or diverse perspectives— Kind of like if you put seven people in a room and you have a bowl of jelly beans. As to which colour they're going to go take, some people might take two and some people might take different colours. And I'm sitting here wondering about family law. That's been an increasingly large industry for a long time over the years. I can go back in decades to see where family law has gone to.

But how does anybody get a fair and objective judicial decision if everybody is taking the same colour of jelly bean, or they're coming from the very same one-mind perspective that we've already seen across the world? I just wonder, even if you get into the Supreme Court, how does somebody, getting to that point, going through all the levels of law, finally get a decision that is fair and objective? Maybe that's my question.

Commissioner Massie

I'll try to summarize the question.

[00:30:00]

Janice mentioned that, to take an example, if you had [seven people in a room with a bowl filled with] "jelly beans"—I don't know how to say it in French; we understand each other— in the end, the people in the same room are concentrating on just one colour. No other colours are allowed. This raises the question of whether we won't have unanimity when examining the cases, which will mean that if we don't look at the different perspectives in the end, isn't there a risk that justice won't be exercised as wisely?

And so, I think if we return to the question: Do we have a challenge or an issue in terms of the practice of justice, starting from the level of the lower courts all the way to the Superior Court, if we systematically use the same approach—the same colour—without leaving room for other versions, if I've understood correctly?

Luc Harvey

If I understand the question correctly, as I said at the beginning: yes, I'm a former politician, a former federal MP. I'm an investigator, but I'm also on the UNF [United Nations Foundation], which is a small organization recognized by the United Nations for the protection of human rights. So when the question was filed with the Supreme Court for debate, I, on the other hand, sent a letter to the Supreme Court as UNF's ambassador to

Canada, saying: “What is your view on the loss of rights and freedoms, on COVID, on everything that’s been done, the truckers, the right to demonstrate, all that? What is your point of view on that?”

To my great surprise—because in total, I had sent some twenty letters and only got three replies—the Supreme Court responded by saying: “Please note that all decisions regarding measures and precautions with regard to COVID-19 in Canada are made by the federal and provincial governments. The Supreme Court of Canada can only consider appeals of decisions made by the highest courts of the provinces and territories, as well as by the Federal Court of Appeal and the Court Martial Appeal Court of Canada. To date, the Supreme Court has not rendered any decisions related to COVID or its vaccines.” That suggests that they had not had any questions, so they didn’t have to answer. Here, I have proof that there was a question; and here, they tell me they didn’t have any questions. [The witness shows the two documents that constitute evidence].

If you want, I can enter this as [Exhibit] QU-9.

Samuel Bachand

Well, I just want to make sure, I think we’re at QU-10 at this point, because we started at [Exhibit QU-]07, which was the letter from the CMQ [Collège des médecins du Québec – College of Physicians]; [Exhibit QU-]08 is the coroner’s report; [Exhibit QU-]09 was the excerpt from the WEF [World Economic Forum] website; and [Exhibit] QU-10 happens to be the Supreme Court response dated—?

Luc Harvey

Reply to myself, because it’s sent to Monsieur Luc Harvey, UNF Canada, at my personal address, of course.

Samuel Bachand

Dated—?

Luc Harvey

Dated July 20, 2022. Because there’s something special about the Supreme Court. You can send them questions, but they can accept or reject the question and they don’t even have to justify their answer. And under normal circumstances, we were informed that the Supreme Court’s response takes between four and five months but in the end, it took practically eight months.

Samuel Bachand

We are out of time. So on behalf of the Inquiry, I’d like to thank you for your testimony. You’re free to go.

[00:34:12]

Final Review and Approval: Erin Thiessen, November 24, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 10: Marc-André Paquette

Full Day 3 Timestamp: 08:53:03–09:32:10

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[0:00:00]

Samuel Bachand

Hello. My name is Samuel Bachand. I have been appointed by the Inquiry to act as prosecutor in this examination. Monsieur Marc André Paquette, please spell your name in full.

Marc-André Paquette

Paquette P-A-Q-U-E-T-T-E, Marc-André M-A-R-C A-N-D-R-É.

Samuel Bachand

I'm going to swear you in. Do you swear to tell the Inquiry nothing but the truth?

Marc-André Paquette

Yes.

Samuel Bachand

In a few words, what would you like to talk to the Inquiry about today?

Marc-André Paquette

As a kindergarten teacher and former medical student, I have had many email communications with pediatricians, public health physicians, and others. As such, my email communications reveal several elements that can help us understand what we've experienced.

Samuel Bachand

I would like to ask you in advance: Is there anything in your career path related to this theme that might be of interest?

Marc-André Paquette

Yes, from 1994 to 1999, I studied medicine at the Université de Sherbrooke, after which I obtained my bachelor's degree in elementary and preschool teaching. I've been teaching kindergarten since 2003.

Samuel Bachand

Just to make your testimony clearer—I'm not saying it's not clear, but to make it easier to understand—could you tell us what the main themes or sections of your testimony will be?

Marc-André Paquette

Yes, I'd like to touch on six aspects. Firstly, my e-mail communications with pediatricians, which clearly show at what point pediatricians were silenced or chose to remain publicly silent. Secondly, my e-mail communications with experts in pediatrics and public health—I had contacted 16 experts—show that they had no answers to basic questions about RNA vaccination, nor did they seek or find the answers. These communications also show that they had enough information to raise questions but they choose not to publicly defend the precautionary principle for children.

My third theme is about the APQ's [Association des pédiatres du Québec – Association of Paediatricians of Quebec] notice for the start of the 2021 school year. It's an announcement that was ignored and stifled by public health and the government. I'm the one who made it public and I'll talk about it in my testimony. And despite the fact that I made it public and sent it to 500 candidates in the 2022 provincial election, not one political party mentioned it. Nor did the vast majority of the media deem it necessary to inform the public. This is an important point. For my fourth point, I'd like to talk about how the media silence of pediatricians and other Quebec experts in the media has had a disastrous impact on all childhood environments. This is related to my expertise as a teacher.

As point five, I'd like to touch lightly, but with important references, on how the measures were excessive for children and detrimental to their development. Then I'd also like to present some documents for point six, which will help us better understand how misused data in Quebec created an exaggerated fear in the population; how this allowed the population to accept measures that were excessive and unjustified for the population as a whole, which included children; and how this exaggerated fear allowed the government and public health—this is the important point—to temporarily dismiss the concept of immunity that could be acquired by children and could serve as a shield for the entire population. This opened the door to the mass vaccination of children.

Samuel Bachand

Earlier, we added a voluminous, composite document to the Inquiry's electronic file: [Exhibit] QU-6.

Marc-André Paquette

Yes.

Samuel Bachand

In order to enable the commissioners to refer to it effectively, I'd like you to tell us what the primary structure of this dossier is.

Marc-André Paquette

Certainly. There are two documents, three folders. The first document explains how the folders work. I'm going to talk about the three folders first.

Folder A is my testimony folder. This folder is subdivided into other folders; and each deals with separate aspects and provides references. Each subfolder is independent, so if there's an aspect that's important to you, all the references are there.

Folder B consists of all the documents because, as you'll see, I've collected an enormous amount of paperwork over the last three years.

[00:05:00]

It's all the information that I have collected and referred to.

And folder C contains all my e-mail exchanges because I've had numerous exchanges with the media, with public health doctors, and also with a many other contributors. All my e-mail exchanges are there.

Then my second document is the authorization to use and share these documents if needed, to help understand what we experienced.

Samuel Bachand

Sorry, just a reminder not to speak too fast for the simultaneous translation.

Marc-André Paquette

Of course.

Samuel Bachand

So now that the plan has been announced and the documentation is available, you can go ahead with the first item.

Marc-André Paquette

Perfect. As a kindergarten teacher, I was already extremely worried about the impact of the measures that were being imposed on children at the very beginning of the crisis. I was also worried about possible excesses that we were already seeing. I felt it was important for people to speak out publicly and that's what I did. I wrote an article and then I was lucky. It was the only article that I published in the mainstream media, in *Le Devoir* and *La Tribune*; and I did an interview on Radio-Canada [CBC]. Both the article and the interview were on social distancing and its impact on the development of interpersonal relations in children.

I'm a kindergarten teacher and in my classroom, I work extensively on group cohesiveness by developing the children's interpersonal skills. In my classroom I had 27 images: 27 pictograms of relational gestures. There are many relational gestures, like inviting a friend to play, including a friend—as we saw during the crisis, everything was forbidden—consoling a friend, congratulating a friend, encouraging a friend, helping a friend: these are relational gestures. So I worked extensively on this with my students. When I returned from the first lockdown in May 2020, I went back to my classroom and found that 21 of the

27 relational gestures that I'd been encouraging in my students were now prohibited, impossible, or difficult to work on: 21 out of 27. That was sort of the trigger for me.

Samuel Bachand

Let's slow down.

Marc-André Paquette

Okay. So at the start of the 2020 school year, the mandates weren't in place yet and I went on sick leave. I was incapable of imposing measures on children that I felt were detrimental to their development. Then for the next two years, I opted for an unpaid leave of absence, so I'm on unpaid leave this year in terms of teaching. I chose an unpaid leave so that I could continue to speak freely: that's what I'm doing today. So I really have no conflict of interest. I've sacrificed a lot to be able to keep this freedom of expression.

For you to be able to assess the relevance of my interventions today, you need to know that as early as May 2020, I was contacting all the pediatricians, scientists, and others who were speaking out publicly and whose contact details I found: those who were speaking out publicly to question the public health discourse and the government discourse, the measures imposed, and the consequences of the measures on children.

In my opinion, what was being done to children was unacceptable. I invested energy and time—a lot of it—to encourage others to band together to speak out publicly and better defend children. It's later in my presentation, but it's important for the points you're about to see. In a sense, I have participated in the development of three collectives: the first was a collective of parents, grandparents, and caregivers concerned for the children; the second is the collective for fairer media coverage about the health crisis; and the third is the school staff collective for a return to normalcy in the schools.

This gives you an idea of how the other aspects came about. Can I move on to aspect 1? Okay. Regarding my e-mail exchanges with pediatricians: at the start of the crisis, I was really worried about what was being inflicted on children. As a teacher and a medical student—maybe that's what made me unique—I was aware of what was happening elsewhere in the world and I could see that children weren't vulnerable to COVID. That's why I immediately tried to get in touch with the pediatricians who were sounding the alarm because there were pediatricians sounding the alarm at the start of the crisis.

[00:10:00]

Through my personal e-mail exchanges and my involvement in the three collectives I mentioned earlier, I've had many e-mail exchanges with pediatricians who have spoken out, including the three APQ spokespersons: Dr. Marie Claude Roy, Dr. Jean François Chicoine, and Dr. Marc Lebel.

Samuel Bachand

What is APQ?

Marc-André Paquette

Association des pédiatres du Québec [Association of Pediatricians of Quebec]. It's going to come up a lot. I also had e-mail exchanges with Dr. Annie Janvier, Dr. Gilles Julien, and

several other pediatricians, but especially the pediatricians who really spoke up. I've made my e-mail exchanges public in a compilation document. My compilation document is entitled: *Abandon des pédiatres québécois: protection des enfants à l'égard des effets dévastateurs des mesures sanitaires* [Abandonment by Quebec Pediatricians: Protecting Children from the Devastating Effects of Health Measures]. You'll also find the e-mail exchanges on the USB key I gave you.

Samuel Bachand

Which folder will it be in?

Marc-André Paquette

Well now we're at aspect 1, so in the testimonial "Aspect 1" is where all my elements for this aspect are to be found. In this document, I've placed a chronology of the positions that the pediatricians were defending at the start of the crisis. I've also included the e-mails I exchanged with the pediatricians which show their support for those same positions. My e-mail exchanges make it possible to illustrate—and this is where I felt my participation was important in the Inquiry— My e-mails make it possible to see precisely when pediatricians stopped supporting and publicly defending children.

In the beginning, pediatricians were pleased with the support provided by our first collective of parents, grandparents, and caregivers concerned about children. Our collective supported the position that pediatricians and the APQ, had set out on October 5, 2020. This position was expressed in the letter, *[Deuxième vague:] la rentrée scolaire n'est pas coupable* [[Second wave:] Back-to-school is Not the Culprit], which became the APQ's official position and which was posted on their website. In this letter, the three APQ spokespersons talked about a "generational sacrifice." Our collective supported this letter; we had collected 402 testimonials by then. On November 25 and 26, 2020, we received an e-mail from Dr. Marc Lebel, president of the APQ, and an email from Dr. Annie Janvier, who were really speaking out publicly at the time. We also received an e-mail from Dr. Catherine Dea, a doctor specializing in public health.

The pediatricians were really happy with the actions taken by our collective— You'll see the emails on the USB stick. But the pediatricians' support for our collective fell off abruptly between November 26 and December 9, 2020. At that point, the pediatricians stopped defending the positions they had been defending publicly until then. Let me explain how it happened.

On December 7, we sent our open letter and the 402 testimonials in support of the pediatricians—these were the 402 testimonials from parents, grandparents, and caregivers who were concerned about the children—to 180 members of the media and all the MNAs [Members of the Assemblée nationale]. There was no media coverage at all: absolutely none. But that was to be expected given the single guideline that was imposed rather quickly at the media and political level.

I had already invited pediatricians to sign a second collective statement that I was working on; I was really active. I had worked with others in the previous collective—I wasn't alone—but this collective statement was about fairer media coverage of the health crisis. I had already invited them to sign this statement.

The day we sent out our open letter in support of the pediatricians, the APQ contacted me to ask me to retransmit the open letter about the other collective statement about fairer

media coverage. I did so. They wrote back to me and asked me to pass on the list of signatories that we had and would publish. Once again, I invited all the pediatricians with whom I was in contact to sign the collective statement.

Despite the pediatricians' initial enthusiasm for our approach with the first collective statement and the interest they showed—or seemed to show—in our second collective statement, not a single pediatrician signed this second statement. That's fine. But what's surprising and worrying is the response we received from Dr. Marie Claude Roy, who was a signatory to the pediatricians' position which our collective supported. Despite the fact that the 402 testimonials from concerned parents, grandparents, and caregivers were ignored by the 180 members of the media, Dr. Marie Claude Roy wrote to us, "On the contrary, I consider the media to have shown great objectivity and have made room for all points of view supported by science, whatever those may be."

[00:15:00]

Our collective was in support of pediatricians; we received no media coverage. This response is reminiscent of the June 3, 2020 opinion of the Collège des médecins du Québec [College of Physicians of Quebec]. My compilation document, which I mentioned earlier, clearly shows that pediatricians had abandoned the positions they previously defended. Between November 26 and December 9, 2020, the pediatricians quite clearly chose to remain silent or were forced to remain silent. I continued to write to the group of pediatricians because I wanted to encourage them to keep thinking, even though they were no longer replying to me. But in March, I sent them a paper that must have upset them—it's a French article called "*Impacts traumatiques de la politique sanitaire actuelle sur les enfants: un constat clinique alarmant*" ["The traumatic impact of current health policy on children: alarming clinical findings"]—because three of them wrote back to me, including Dr. Gilles Julien.

Dr. Gilles Julien passed on his reply to me and to the eleven other pediatricians I had contacted, including the three APQ spokespersons. Everything I say is important because you'll see the connection. Dr. Julien ended his e-mail this way: "We have a duty to bear witness and to act together as much as possible." It may be a coincidence but, the very next day, the APQ chose to no longer take a public stand in defence of children. And without fanfare—and this is important—without clearly informing the public of this reversal in the APQ's public position, the APQ discreetly published its new official position on its page: *Pandémie et mesures sanitaires chez les élèves du primaire – Position de l'APQ -2021*[03]11 [Pandemic and Health Measures for Elementary School Children - APQ Position -2021 [03] 11]. The APQ chose to dissociate itself from the parent pressure groups that were denouncing the recent imposition of masks in primary schools.

If you look at my document where I set out all the positions of the pediatricians and see the e-mails, the pediatricians were initially fighting against the imposition of masks on daycare providers. When I spoke with them, they were concerned about the imposition of masks on preschool children; there were no masks for preschoolers, but there were for all the teachers. And at this moment, they disassociated themselves from that. Furthermore, in their letter on the position of pediatricians, the APQ specified that its role was "limited to maintaining the quality of its members' workplace conditions."

I've compiled another document entitled *Censure et autocensure des pédiatres et autres professionnels québécois* [Censorship and Self-censorship among Quebec Pediatricians and other Professionals]. In this document, there are several parts, but among them are my e-mails with Dr. Mathieu Bernier. Dr. Mathieu Bernier was one of the doctors who spoke out

publicly at the start of the crisis, denouncing the measures being applied to children and adolescents. He found himself under investigation by the Collège des médecins [College of Physicians], retracted his statement, and then stopped defending what he had originally defended. My e-mails are on my USB key. Maybe that concludes my aspect 1. How's that?

Samuel Bachand

We have about twelve minutes left. I know your first two points are longer, but just to let you know.

Marc-André Paquette

Okay. As a former medical student and father of three, I had questions about RNA vaccination for children. I wrote down my questions and passed them on to doctors. My questions were basic ones because I'd only been in medicine for five years and it's been 25 years since then. I wrote these questions with my teenagers. I forwarded these questions to 17 Quebec doctors, including 16 experts in pediatrics and public health. Most of these doctors held key [positions] in their institutions. Several of them had already spoken out in the public arena. I don't know if it's important—I know time is limited—but perhaps quickly, I'll name a few: Dr. Mélissa Généreux, specialist in public health and preventive medicine, director of public health in the Estrie region from 2013 to 2020, medical advisor to the public health department [of the CIUSSS] de l'Estrie and to the Institut national de santé publique [du Québec], professor at the Faculty of Medicine—

Samuel Bachand

You're going too fast. I'm sorry, but it's just not possible to translate at that speed.

Marc-André Paquette

Okay. Maybe I'll pass, but they were real experts in pediatrics: people who had spoken publicly or had roles in their institutions.

[00:20:00]

My article, "*Les médecins québécois 'experts' en pédiatrie et en santé publique ne semblent pas avoir de réponse au sujet des injections ARN des enfants*" ["Quebec's 'expert' doctors in pediatrics and public health don't seem to have any answers on the subject of children's RNA injections"], and my compilation document, *Mes questionnements sur les injections ARN* [My Questions About RNA Injections], both explained my approach to these experts. My exchanges clearly show that these experts in pediatrics and public health had no answers to my questions and that they did not seek and/or find answers to even basic questions.

I also have another document, *Vaccination ARN des enfants : les pédiatres québécois ont choisi d'ignorer le principe de précaution* [RNA Vaccination for Children: Quebec Pediatricians Choose to Ignore the Precautionary Principle].

In this document, I provide all the information that I've passed on to pediatricians and public health doctors. This one is for pediatricians and it shows that pediatricians had enough information to have doubts, but they did not defend the precautionary principle. If they were aware of the unanswered concerns—if there was any doubt—they too should have questioned the authorities in order to protect children. In the document I had sent them, there was an open letter—there were three open letters on child vaccination—but

there was one with 1,441 signatories. The pediatricians not only failed to defend the precautionary principle, but worse, one of the three APQ spokespersons, Dr. Jean François Chicoine, appeared on television in the presence of children to promote RNA vaccination of children on November 18, 2021.

On my USB key, I've filed all my communications with pediatricians, but I've also filed my communications with three public health physicians and my open letters to two of them: Dr. Mélissa Généreux and Dr. Yv Bonnier Viger. These two public health physicians ran in the 2022 provincial election under the banner of an opposition party. Despite the responsibilities incumbent on them—in terms of their considerable expertise in public health and also of the role of political representation they wished to exercise—they too did not answer questions. Nor did they seek out or find answers to our questions. They didn't publicly question the government and medical authorities. They didn't choose to assume this responsibility.

As for the principle of informed consent: well, it was completely swept aside during the RNA vaccination. While a vaccine passport was being imposed, fingers were pointed, people were publicly denigrated, and all those who questioned it were socially excluded—even if pediatricians and public health experts had no answers to the questions. And without answers to basic questions, when the experts have no answers, we can't talk about informed consent for the population, especially if the population doesn't know that the experts have no answers.

The public seems to have put their trust in doctors, perhaps believing that they had a responsibility to ensure the benefits and safety of vaccines. But my research shows that those who were questioned did not feel this responsibility. Doctors seem to have placed absolute trust in their institutions: the Collège des Médecins [College of Physicians], the public health department, the pharmaceutical companies, the government. It appears they didn't question themselves; it appears they didn't seek to validate the accuracy and validity of the information they were given; it appears they didn't question the sources of this information, or the presence or absence of conflicts of interest.

Samuel Bachand

Let me briefly interrupt. What you're telling us are opinions. And I understand that it's a summary of the lessons you've learned from your interactions with the medical profession.

Marc-André Paquette

That's why I also linked all the e-mail exchanges in easy-to-see documents, but they really have a lot of information. And I received several responses. But one of the open letters that was forwarded to many people was the open letter sent to Dr. Mélissa Généreux and Dr. Yv Bonnier Viger: *Demande d'intervention au sujet de la vaccination ARN des enfants dans un contexte où le questionnement et les inquiétudes des médecins, des scientifiques et des citoyens semblent interdits, ridiculisés, banalisés et censurés* [Request to intervene on the subject of RNA Vaccination of children in a context where the questioning and concerns of doctors, scientists and citizens seem to be banned, ridiculed, trivialized, and censored]. But Dr. Mélissa Généreux's answer to this question—we don't have much time—but to answer that—

Samuel Bachand

Yes, but even if we don't have much time, if you talk too fast, we're no further ahead. You're caught between a rock and a hard place. Just talk slower.

Marc-André Paquette

Okay. Well, she answered me. It was really a question about vaccination. It was the third open letter. I'd already sent in my questions.

[00:25:00]

I put her in touch with the scientists and doctors from all the exchanges that I submitted to you. These weren't inconsequential; these were issues where there were genuine questions raised by people other than myself. She replied to this last open letter, "On returning to the office this morning, I can confirm that my mandate as a public health physician is in Estrie and that decisions regarding the Quebec immunization program are made at the provincial level. I think you'd get more answers if you were to address the proper authority, such as the Minister of Health, Dr. Luc Boileau, the INSPQ [Quebec Public Health] or the Comité d'immunisation du Québec [Committee on Immunization of Quebec]." So looking through everything I have, you can see that there was never a response. It's not just supposition. There was no response. There was no feedback.

Aspect 3?

Samuel Bachand

We have five minutes.

Marc-André Paquette

Okay. In August 2022, I published an article entitled "*Les pédiatres doivent briser le silence*" ["Pediatricians must break the silence"] on the *Nous Citoyens* platform. Following the publication of the article, a citizen sent me photos of the APQ's notice for the start of the 2021 school year—a notice that had been sent to the government and public health by the APQ on August 9, 2021. The notice didn't seem to have been made public. It didn't appear—and it still doesn't appear—on the APQ website. The only reference to the notice was in an article in *Le Soleil*: "*Les pédiatres du Québec réclament une rentrée 'normale' pour les écoliers*" ["Quebec pediatricians call for 'normal' back-to-school for schoolchildren"] published the following day: August 10, 2021. But one day later, on August 11, there was a new article published in the same newspaper, which presented a totally different position: "*Les pédiatres 'globalement satisfaits' du plan de rentrée scolaire*" ["Pediatricians 'generally satisfied' with back-to-school plan"]. The APQ's opinion on the start of the 2021 school year is extremely important; the two spokespersons—Dr. Marie Claude Roy and Dr. Marc Lebel—signed this opinion. They didn't want primary school children to have masks on their faces, and they questioned the RNA vaccination of primary school children. The opinion was completely ignored, dismissed, and kept under wraps by the government and public health; it was I who made it public.

Samuel Bachand

I think at this point it's worth explaining how it was that you're the one who released the document.

Marc-André Paquette

Okay. I published my article, "*Les pédiatres doivent [briser le silence]*" ["Pediatricians must break the silence"]. A citizen sent me the photos. This citizen had obtained the photos because, following the article—

Samuel Bachand

Photos of what?

Marc-André Paquette

The notice. Following the August 10 article in *Le Soleil* which talked about this notice—it's the only reference we found—he contacted the newspaper because he was in proceedings with his ex-wife and children. He wanted to have the notice, so the journalist or the newspaper sent him the photos of the notice. When he saw my publication, he passed them on to me. With all the actions I had taken since the beginning of COVID, I got myself organized to make it public.

Samuel Bachand

What did you do afterwards to validate, or attempt to validate, the authenticity of this document, which is ultimately an image of a print?

Marc-André Paquette

Yes, well, every time I published something like this, I'd pass it on to the pediatricians involved—so to the two signatories and all the other pediatricians. I no longer get replies from the pediatricians but they never disagreed. This notice was widely circulated. The pediatricians knew about it because I had put them in touch with other people. So if it hadn't been a true announcement, they probably would have said so. Is that okay?

Samuel Bachand

I'm just going to interrupt you for a moment. You have one-and-a-half minutes left on the clock. The witnesses are of course entirely at the Inquiry's disposal. We still have two major topics to discuss.

Marc-André Paquette

Yes, but I think this point is more important than the other two.

Samuel Bachand

Okay.

Would you like to hear the witness for five minutes, let's say, so that he can finish his presentation? [This question is addressed to the commissioners, who give their assent]. Okay, go ahead.

Marc-André Paquette

To make the notice public, I sent it to the media. The mass media didn't publish it. I wrote an article, again on *Nous Citoyens*, which is an alternative platform. Then I was contacted by

Radio X, which is a somewhat alternative radio station; I did an interview. I was contacted by 107.7 FM, which is a more traditional radio station; I did an interview. I did a video testimonial that was seen by just over 10,000 people, but I also sent the notice to the 500 candidates in the Quebec elections—there were five main parties—that’s almost all the candidates; we forwarded it to the candidates whose e-mail or Facebook address we had. Despite the fact that the notice had been kept under wraps for a year, no opposition party, in the middle of an election campaign, felt it important to inform the public.

[00:30:00]

And the content of the notice is quite crucial. For almost a year, the children were masked, and then vaccination began in November 2021. The existence of the notice also shows that contrary to what the media, public health, and the government have always said—that there was a scientific consensus—there wasn’t one, even within the APQ. The three APQ spokespersons had signed the initial position which spoke of a generational sacrifice on October 5, 2020. But when it came to vaccination, Dr. Jean François Chicoine went on television to encourage vaccination, while Dr. Lebel and Dr. Roy signed this notice questioning vaccination.

As far as the scientific community is concerned, this has certainly had an impact. Because if the notice had been made public, more scientists or stakeholders probably would have spoken out publicly or would have had the courage to do so. In the case of Patrick Provost—indeed an expert researcher on RNA who was sanctioned by his university; he’s still an expert researcher on RNA—he expressed reservations about vaccinating primary school children, as did the two pediatricians who spoke on behalf of [the APQ], except that he did so publicly, while they did so discreetly. When scientists, pediatricians, or doctors have questions, it’s important for the public to know so that we are able to give informed consent.

I don’t know whether I can go on to the other two points or whether I’ll drop the other two.

Samuel Bachand

Ah, you have three minutes left. Use them!

Marc-André Paquette

Okay. This notice also shows that a public silencing had been imposed on pediatricians. Nonetheless, a number of pediatricians continued to defend the children in the political arena and in their institutions, as did Dr. Roy and Dr. Lebel in signing this notice. But the media silencing of Quebec pediatricians and experts has had a disastrous impact on childhood environments.

Let me explain. There’s an open letter in which I explain this too. In childhood environments, educators, teachers, and caregivers who wanted to minimize the impact of the measures—who wanted to create a more humane environment for children—had no credibility. They were called out, dismissed, and ignored because they were few in number and because there were no public experts to back them up. On the flipside, managers and public speakers who were afraid of the virus, or afraid of public health measures such as closing classes and schools, had every possible latitude to impose their vision. Some managers and public speakers—probably thinking they were doing the right thing—even went beyond what was required in terms of measures. In this way, unknowingly and

unconsciously, they probably contributed to a vicious circle of fear in the childhood environment, which led to more drastic measures for children. So it had an impact.

Before I quit teaching, I was starting to see it. A letter had been written in the newspaper and I passed it on to the other teachers; I had started to be a little lax with the children. But with 18 or 19 students, you have 30 or so parents in front of you, and you can't afford to deviate when everyone is pointing the finger at those who do. You need experts to back you up and you need a dialogue, and there was none of that. So it was disastrous for the childhood environment. And in my e-mail exchanges, I challenged a lot of people by saying, "You've got to speak up; you have to because, in the childhood environment, there's nothing else we can do."

Is that okay?

Samuel Bachand

You have 30 seconds left.

Marc-André Paquette

Okay. About the impact of the harmful measures imposed on children, I'm just going to make one comment. I hope that my comment will help you to grasp the extent of the mistreatment that we've inflicted upon children. Five years before the crisis, in a time when there was no pandemic, if—and this is five years before the crisis— out of a personal and perhaps irrational fear of viruses, I had decided to impose the same measures on the students in my classroom and my children at home, I'm sure I'd have lost my job and probably the custody of my children. It's not because public health suggested the measures, or that the measures were imposed by the government, or that the media trivialized them that the measures suddenly overnight became less harmful to children's development.

[00:35:00]

The mistreatment inflicted upon youngsters was imposed on us—but as adults, we contributed to it for two whole years by participating in it. And then we made it even worse by agreeing to systematically insert it into our society and into every corner of our children's lives.

Samuel Bachand

We need to close on this.

Marc-André Paquette

That's fine.

Samuel Bachand

Marc André Paquette, thank you for your testimony on behalf of the Inquiry. You're free to go. Ah, there's one question, sorry.

Commissioner Massie

I'd like to ask you two quick questions as I know we're running out of time. First of all, I'd like to thank you for all the massive amount of work you've done documenting and trying to publicize all these exchanges to try and raise people's awareness. You've had some successes and then we've shut off your mic, if you like.

On a personal note, I understand you're no longer an active teacher. What's the reason you're still in this frame of mind of not returning to teaching, given that now, for all intents and purposes, the measures have been eliminated? Do you intend to go back to your milieu and do the job you used to love?

Marc-André Paquette

Yes, I intend to probably go back in August. I didn't return this year because we have to decide beforehand whether or not to take a leave of absence. So I took my unpaid leave last year when I knew there was an election as I was afraid the measures would return. I didn't want to find myself in a position where I'd have to resign. I wanted to keep the option of maybe returning, so because I had the right to a second year without pay, I chose that. I couldn't go back and impose the measures.

So now I'm going to return to teaching but if the measures come back, I'll leave again. During the two years I was without pay, I did other training. I became a carpenter-joiner; I'm an apprentice. That's the way I work now; I'll go back to being a carpenter-joiner. But I love my job as a teacher; otherwise I wouldn't have become involved like this.

Commissioner Massie

My second question is: Do you hope that with all the actions you're taking right now, you'll be able to see an impact, at least in the area where you intend to return next fall? Do you think that the teaching milieu, the parents, and students will be more receptive to the position you've tried to defend?

Marc-André Paquette

I don't think so. I don't have a lot of ties to that community. Some communities were a little more open than others. But I don't think so. Rather, I think they're going to pretend it didn't happen. And I'm going to be the best teacher I can be with my students. But above all, I hope that what we're doing today will have an impact.

Anyway, we haven't had the impact I would have liked to benefit my children, who were unvaccinated, discriminated against, and excluded. It made them grow up. But I hope that we'll have an impact at least for their grandchildren and that the next time—I don't think it'll necessarily be viruses—but the next time there is going to be malfeasance—whether ecological, health, or political—that there will be people able to stop them early on, and that more interveners speak up. We see a lot of people at the Inquiry speaking up. I think the people who are talking today are going to keep on talking every time there's something that's not appropriate for society and for human beings.

Commissioner Massie

Thank you very much, Monsieur Paquette, for your involvement.

Marc-André Paquette

Thank you.

[00:39:07]

Final Review and Approval: Erin Thiessen, November 13, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 11: Dr. Jean St-Arnaud

Full Day 3 Timestamp: 09:33:12–10:04:30

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Chantale Collard

Hello. Chantale Collard: lawyer and attorney for the National Citizens Inquiry today, Saturday, May 13. Today we have with us Dr. Jean St-Arnaud. First of all, Dr. St-Arnaud, I'm going to ask you to identify yourself by your first and last name, if you could spell that too.

Dr. Jean St-Arnaud

Jean St-Arnaud, J-E-A-N S-T-A-R-N-A-U-D.

Chantale Collard

And I'll swear you in. Do you affirm or swear to tell the truth, the whole truth, and nothing but the truth? Say, "I affirm," or "I do."

Dr. Jean St-Arnaud

I affirm.

Chantale Collard

So first of all, thank you very much for agreeing to testify at the Inquiry. We've had the chance to talk together, and I think that what you're going to tell us will benefit us all. First of all, yes, you're an expert, but you're also a father and a grandfather. And of course, you studied medicine in Sherbrooke some years ago. You were a family doctor but you also had a specialty with an obstetrics component. After that, well, there's even a book that was written, I think, jointly with your wife: *Le médecin accoucheur que les femmes ont fait naître* [The obstetrician that women gave birth to]. You're going to tell us all about it. And as I was saying, you're a father of three, grandfather of seven grandchildren, and retired family doctor—but only for the past three years. Is that correct?

Dr. Jean St-Arnaud

Yes.

Chantale Collard

And I know how difficult it is for you to come and testify at the Inquiry. It involves a lot of emotions, one might say. So I'm going to ask you first: What motivated you to come and testify here today, your primary motivation?

Dr. Jean St-Arnaud

Before answering your question, if I may, I'd like to add that social medicine has been a key element in my professional development. During the years when I was doing my residency in family medicine, the Université de Sherbrooke was developing the social medicine approach, and this has been a common thread running through my entire practice. The essential thread was that, for me, the doctor is at the service of the patient and not the other way around.

So I was very reluctant to testify before you because I feel very small, vulnerable, enervated, and often powerless. What motivated me to testify is that I don't think I'm alone in Quebec in experiencing such feelings. My journey began in 2020.

Chantale Collard

I was also going to ask you, Dr. St-Arnaud, about your underlying motivation, which is to ensure that people don't feel alone. That's one of the reasons why you're here before the Inquiry. So tell us about your journey in 2020. When the pandemic broke out in March or April 2020, did you buy into the narrative? Tell us about that. What happened, and how did you get there?

Dr. Jean St-Arnaud

So yes, I did buy into the "scientific consensus" that I now put in quotation marks, and I've been vaccinated three times.

Chantale Collard

So three doses.

Dr. Jean St-Arnaud

Three doses. And then, oh surprise, I got COVID after that.

Chantale Collard

Oh, you did not have it before?

Dr. Jean St-Arnaud

That's it.

Chantale Collard
You had it afterwards.

Dr. Jean St-Arnaud
Fortunately, it was an Omicron episode, and a harmless one that lasted five or six days with few symptoms.

[00:05:00]

Chantale Collard
Didn't you have any symptoms after the first, second, or third?

Dr. Jean St-Arnaud
No, I was spared. I've had no negative or adverse reactions to any of the vaccines I've received.

Chantale Collard
And I want to ask you: Why wasn't there a fourth dose?

Dr. Jean St-Arnaud
Ah well, then there was a major change in my journey. One of my children, my daughter, had made the medically justified choice not to be vaccinated. My wife, Lise, and I were very supportive of our daughter's decision. Except that it was she who questioned us, who led us to change, who shared with us her convictions—and she has some solid ones—that led us to realize that vaccination was not as safe and effective as we'd been told. And that's when Lise and I went to the demonstration in front of the Collège des médecins [College of Physicians] organized by Réinfo Covid at the time.

Chantale Collard
So this was after the discussion you had with your daughter?

Dr. Jean St-Arnaud
Yes.

Chantale Collard
Essentially, you supported her choice not to be vaccinated; and in the end, she supported you in your choice to be vaccinated. But in the end, the roles were reversed, so to speak.

Dr. Jean St-Arnaud
Exactly. I remember my daughter's reaction when I told her I wouldn't be going for the fourth dose: "Yippee!"

Chantale Collard

Ah, okay, that's what we wanted to know; so your daughter's reaction was one of relief.

Dr. Jean St-Arnaud

She was very happy and relieved, yes.

Chantale Collard

Then you understood a little later why she was relieved? You went to a demonstration?

Dr. Jean St-Arnaud

Exactly. So there was a demonstration in front of the Collège des médecins and I had the chance to meet several people: René Lavigueur, Patrick Provost, Bernard Massie. And Lise and I allowed ourselves to be challenged by their message. I learned that René Lavigueur is a competent family doctor, and I learned that Patrick Provost is a recognized, competent scientist. I still don't understand why he's been deemed a conspiracy theorist all of a sudden.

Chantale Collard

Did you know them beforehand?

Dr. Jean St-Arnaud

No, not at all. They were new to me. And then I got a call from René Lavigueur who said, "Jean, would you agree to come and testify with us at the Collège des médecins?" This was following the two letters that had been sent—one in October, I think, and the other in February—asking the Collège des médecins to impose a moratorium, to stop vaccinating pregnant women and children.

Chantale Collard

So you sent this letter following your meeting with Dr. Lavigueur and Patrick Provost. Have you had any feedback on this letter? Did you receive an answer? In what year were the first letters written?

Dr. Jean St-Arnaud

That was last February.

Chantale Collard

That you sent this letter?

Dr. Jean St-Arnaud

No, the first letter was sent in October. I was not a signatory to that first letter.

Chantale Collard

What year, Dr. St-Arnaud? 2021?

Dr. Jean St-Arnaud

I'm having a bit of trouble with dates at my age.

Chantale Collard

Was it during the pandemic?

Dr. Jean St-Arnaud

Oh yes, it's October.

Chantale Collard

Probably 2021 or 2020.

Dr. Jean St-Arnaud

2022. And the second letter, which I co-signed with over a hundred others, led to a meeting with the Collège, which agreed to meet with us.

[00:10:00]

And so the aim of our action at the Collège des médecins was to ask that the precautionary principle be respected, and to call for a halt to the vaccination of pregnant women and children. And as this was an area in which I'd been involved all my professional life, I was interested. So I spontaneously replied to Dr. Lavigneur, "Yes, I'll gladly go along with you."

Chantale Collard

You were going to testify before the Collège des médecins directly?

Dr. Jean St-Arnaud

That's right.

Chantale Collard

Okay.

Dr. Jean St-Arnaud

We were received in a very structured way, with very limited time. And the main thrust of my testimony to the Collège des médecins was to talk about the scientific consensus that had been debunked during my 45 years of practice. I'm not going to talk about the four consensus I told them about. I'm just going to quickly tell you about the one that, for me, was the most important.

When I started work as a young doctor in 1975, there was only one way to give birth. It was called the surgical model: mom on her back on an operating table, legs in stirrups, sterile drapes, all the actors, including dad, who had only recently been admitted to the delivery room—before that, he couldn't go—disguised, excuse me, dressed up as if for surgery.

Chantale Collard

Okay.

Dr. Jean St-Arnaud

After that, I got a lot of requests from moms and dads saying, "Is there any other way to give birth?"

And then I went to train with Murray Enkin at McMaster University and I also went to train with Michel Odent in Pithiviers near Paris, to see how they managed requests for a different model, which we called the birthing room. At that time, the big argument against abandoning the surgical model was: "You're going to have infections; it's going to be dreadful."

Chantale Collard

That was back when?

Dr. Jean St-Arnaud

Yes, in 1975, during the years '75-'80.

Chantale Collard

Okay.

Dr. Jean St-Arnaud

So we developed the concept of the birthing room, and it spread to many hospitals in Quebec. And there were no infections.

Chantale Collard

There were no infections.

Dr. Jean St-Arnaud

The big difference was that, while the medical authorities imposed a particular way of giving birth, which was always the same, we took this power and handed it over to the couples. And in the birthing room, it was the couples who decided how they wanted to give birth.

Chantale Collard

And now I imagine you're going to draw a parallel with the COVID period from what you're saying.

Dr. Jean St-Arnaud

Yes. I think I'll go there straight away, actually, because time's running out.

Chantale Collard

How did the Collège des médecins respond? Because, basically, what you're saying is that there had always been a certain way of giving birth, which no one had questioned. At that time, you asked questions; and in the end, it's just another way of doing things and there are no infections. So it's more or less the same thought process that's been going on here. In the end, maybe science is all about asking questions.

Dr. Jean St-Arnaud

That's right. Of course, faced with the facts that women died in childbirth and that premature babies died or remained disabled for life, certainly the surgical model—the medical model—had its place and so much the better. The problem was that the model was generalized to all women in childbirth, whereas it only applied to, what? Ten, fifteen, twenty per cent of all women giving birth.

Chantale Collard

I'm going to ask you, Dr. St-Arnaud: I understand the framework, time is flying, and so I'd really like us to get to the point. Did you have a response from the Collège des médecins after your testimony? You've talked a bit about the gist of your testimony—but was there any response?

Dr. Jean St-Arnaud

Well, we've had a recent response that isn't an answer.

Chantale Collard

So the response was—?

[00:15:00]

Dr. Jean St-Arnaud

We were told that the Collège des médecins was not a scholarly society and that they deferred to Public Health.

Chantale Collard

Meaning to the INSPQ [Institut national de santé publique du Québec]?

Dr. Jean St-Arnaud

Yes, that's it.

Chantale Collard

So in the end, it took a long time to get an answer, and the answer was no answer. That's where you are now. You personally haven't had any side effects, but do you see people around you who have?

Dr. Jean St-Arnaud

So yes, that's it. I came back from testifying at the Collège des médecins and I met people in my own circles who had.

The first news about this came the day after I returned from the Collège des médecins: it was that four women were suffering from severe menstrual disorders.

Chantale Collard

Did you learn that the next day?

Dr. Jean St-Arnaud

I found out the next day.

A mother told me that her 12-year-old daughter asked her on the way home from school, "Is it true, Mom, that I won't be able to have children later on because of my vaccine?" So here, there are two possible answers. If we believe the narrative, we'll say, "Don't worry, my daughter, there's no problem." But the real answer is that we don't know.

Chantale Collard

Exactly.

Dr. Jean St-Arnaud

And with the information that has been shared with us over the past three days, there are some serious questions to be asked. All the more if some women have experienced menstrual problems because this means that the vaccine is to be found in the ovaries. We also know that it can be found in the testicles. And, as has been shared here in great detail, Pfizer advised against vaccinating pregnant women even before the vaccines were put on the market.

I learned that two people in my circle had experienced shingles after the vaccines.

Chantale Collard

After the vaccines.

Dr. Jean St-Arnaud

Three people reported problems related to blood clots.

And here's one I can't quite grasp: an immunosuppressed person was advised by his cardiologist—because he'd just undergone surgery to change a heart valve—to get vaccinated, which was contradicted by his oncologist because this same person was being treated for two cancers. So the oncologist told him, "It doesn't make sense for you to have a vaccine, you're immunosuppressed. Your body can't make antibodies in response to a vaccine. You're immunosuppressed." And then, a few weeks ago, when I heard the WHO [World Health Organization] is still maintaining that immunosuppressed people are prioritized to receive the vaccine, I started to wonder.

Chantale Collard

You've seen a lot of people with side effects.

Dr. Jean St-Arnaud

That's it.

Chantale Collard

So roughly speaking, what you're telling us here is that the people you're talking about are all ordinary people that you know, people in your circles.

Dr. Jean St-Arnaud

That's right, they're people in my circle.

Chantale Collard

That's a lot of them.

Dr. Jean St-Arnaud

And maybe I can add another one here. Because when I went to get my hair cut on Tuesday to come here and look presentable, my hairdresser told me that she knew three people in Coaticook—the town where I live—who had died after the vaccine. And I'm sure it'll continue like that when I return home.

Chantale Collard

What do you think of the traditional media? You name it, we've heard about it throughout the Inquiry. What do you think of mainstream media?

[00:20:00]

Dr. Jean St-Arnaud

Well, the media aren't present. It's as simple as that. I forgot to say: what really shook me was the lack of acknowledgement from the Collège des médecins. Added to that, the media don't really inform people. And so I lost trust in our journalists—knowing that they can't talk about it because their management forces them not to, knowing that they are sometimes even dismissed if they do.

Chantale Collard

Dr. St-Arnaud, we often think that vaccinated people—at least from what we've heard—see a wall between themselves and the unvaccinated. They don't understand how the reality changes whether people are vaccinated or unvaccinated. What do you think of unvaccinated people? You are triple-vaccinated.

Dr. Jean St-Arnaud

Sorry, I misheard the end of that sentence.

Chantale Collard

You have been vaccinated three times.

Dr. Jean St-Arnaud

Yes.

Chantale Collard

I think you're sensitive— You have your daughter who is unvaccinated: How do you see them? Explain that to us. What were the consequences of your daughter not being vaccinated? Were there any activities she couldn't participate in?

Dr. Jean St-Arnaud

Ah yes, I understand. I'll give you an anecdote.

Chantale Collard

Go on.

Dr. Jean St-Arnaud

At one point, my daughter called me and said, "Dad, would you go with my son"—who is seven—"to the hockey game? I can't go with him because I'm not vaccinated." At my age, 81, I was asked and then I did it—I accompanied my grandson because his unvaccinated mother couldn't.

Chantale Collard

How did you feel?

Dr. Jean St-Arnaud

Angry.

Chantale Collard

Angry.

Dr. Jean St-Arnaud

What's more, in the reactions of the people I mentioned earlier and others, there was so much anger—I'd even say rage—in some people about the situation of the unvaccinated. And what we're learning about the side effects, it's worrying.

Chantale Collard

You have a lot of support. You can feel it, you can see it, and that's why you're here too. You're here before the Inquiry to show your solidarity with everyone. And this kind of split between the unvaccinated [and the vaccinated] should never have happened. And I'd like to ask you: If this could be done all over again, what could have been done differently?

Dr. Jean St-Arnaud

Well, to that question, I'd like to propose a ceasefire.

Chantale Collard

Go on.

Dr. Jean St-Arnaud

Let's bury the hatchet, get out of the trenches that were dug at the dawn of our absolute certainties, and spark a real scientific debate. But after three days here, I find myself saying, "Not just yet. The truth has to come out first." And that's why I'm so grateful for the work our commissioners and all the people here and across Canada who are doing at this Inquiry.

Chantale Collard

And you, Dr. St-Arnaud, how did you manage to get through this period of crisis? What was your best support?

[00:25:00]

Dr. Jean St-Arnaud

There were several. The first was my wife because Lise and I have been through this whole journey together. There are my children; I mentioned Paula earlier. And my grandchildren were also a motivating factor. And maybe I'll venture into the spiritual dimension—even though I know I'm on thin ice.

Chantale Collard

Go on.

Dr. Jean St-Arnaud

Every birth in my life has helped me to understand the Paschal mystery. How many mothers have I tended to who told me: "The pain is so intense that if the baby isn't born, I'm going to die"? And this suffering, this fear of death, gave life.

Chantale Collard

Was it also your faith that sustained you?

Dr. Jean St-Arnaud

The couples who allowed me to accompany them through childbirth revealed to me this central element of my faith.

Chantale Collard

Thank you very much. I think the main point has been made. I know you may have a chart if you need to present it following questions from the commissioners.

Dr. Jean St-Arnaud

Well maybe I can just put it up quickly.

Chantale Collard

You can put it up right now.

Dr. Jean St-Arnaud

I don't even know how to put it up. I have it here on the screen and I'd like it there. I don't know if there's anyone who can help me. Ah, here it is.

Chantale Collard

It's already there.

Dr. Jean St-Arnaud

So if there's anything I'd like to see done differently from what's been done, it's to choose the learning approach over the blame approach. And I've characterized what the blame approach is.

The blame approach assumes that everyone must be perfect. The learning approach assumes that no one is perfect.

In the blame approach: one mistake, one blame. In the learning approach: recognizing the possibility of a mistake.

In the blame approach: blame creates a feeling of guilt. In learning: make it a learning opportunity for yourself and others by checking the facts.

Reaction to blame: attempt to deny or find someone else to blame. Doctors are pretty good at this with nurses. And in the learning approach: find a way to fix the mistake if necessary.

When approaching blame, defence mechanism: discredit the person formulating the blame instead of looking at the content of the blame.

Chantale Collard

"Conspiracy theorist," for example.

Dr. Jean St-Arnaud

Yes, it's a trendy word.

Chantale Collard

Discrediting.

Dr. Jean St-Arnaud

Whereas learning reinforces the feeling of belonging to a group.

Consequences of blaming: injury, isolation, rejection, division, and conflict. Consequences of learning: avoids injury, isolation, rejection, division and conflict.

An eye for an eye, a tooth for a tooth on the blame side. Requires great strength—called humility—on the learning side.

And finally, a quote from one of our favorite poets: “Everybody’s unhappy all the time” in the blame approach. Whereas in the learning approach, you never lose: either you win or you learn.

Chantale Collard

That sums it up very well. It couldn’t have ended better. Are there any questions? No? I think everything’s been said.

[00:30:00]

Dr. St-Arnaud, you have given us food for thought. You came here despite finding it difficult. You weren’t sure, you hesitated, but you did the right thing and I thank you. And I would tell you that, yes, a doctor heals the body, but he also heals the soul. What we call a good doctor does both. And not too long ago, I was in my car and I heard a song that I had never heard before. And I will share part of it with you: “The body is the workshop of soul.” So for the two to be united, you have to take care of both.

Thank you very much, Dr. St-Arnaud.

Dr. Jean St-Arnaud

Thank you for allowing me to speak.

[00:31:18]

Final Review and Approval: Erin Thiessen, November 25, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Witness 12: Dr. Patrick Provost

Full Day 3 Timestamp: 10:06:10–11:23:27

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Louis Olivier Fontaine

Good evening, everyone. My name is Louis Olivier Fontaine, lawyer. I'm acting today as attorney for the National Citizens Inquiry. And to conclude today's testimonies, we have Professor Patrick Provost. Good evening, Professor Patrick Provost.

Dr. Patrick Provost

Good evening.

Louis Olivier Fontaine

To begin, I'm going to ask you to identify yourself by saying your first and last name, please.

Dr. Patrick Provost

Patrick Provost.

Louis Olivier Fontaine

Now for the solemn affirmation. I'm going to ask you to solemnly affirm that you are going to tell the truth, the whole truth, and nothing but the truth. Say, "I do."

Dr. Patrick Provost

I do.

Louis Olivier Fontaine

So Professor Patrick Provost, I'm going to introduce you briefly, and you can tell me if all this is in order. Professor Provost, you are a full professor in the Department of Microbiology-Infectious Diseases and Immunology in the Faculty of Medicine at Université

Laval. You are also an academic researcher at the research centre within CHU [hospital affiliated with university] in Québec, and have been for the past 21 years.

Dr. Patrick Provost

That's correct.

Louis Olivier Fontaine

You run a research laboratory on RNA [ribonucleic acid] and on lipid nanoparticles.

Dr. Patrick Provost

Exactly.

Louis Olivier Fontaine

So Professor Provost, I know you have a presentation that will help you with your testimony. I would ask you to describe any additional personal experience that is relevant to your talk today.

Dr. Patrick Provost

Okay, if I can have the presentation on the screen, please. Thank you. So just to let you know that throughout my research career, I've been able to benefit from financial support from governments—to the tune of about six million dollars in the form of salary awards and grants of all kinds. So maybe this is the best way I become like *The Six Million Dollar Man*.

In terms of scientific contributions throughout my career, I have published a total of 97 scientific articles in 45 different peer-reviewed scientific journals. My articles have been cited more than 15,000 times with an h-index of 45. So 45 of my articles have been cited at least 45 times. I've been invited to six countries to give more than 61 presentations, and I've trained more than 60 people in research. And more specifically, since 2019, I have carried out more than 208 communication activities for the general public. And my research work in 2003, 2014, and 2021 earned the distinction of "Discovery of the Year."

So perhaps I'll present the next five slides, which I've taken from the slide sets of the presentations that I usually give, to give you an idea of why I believe I hold some legitimacy to speak.

This slide shows the nature of my research activities over the last 20 years, which have been aimed at understanding the regulation of messenger RNA function by smaller RNAs called microRNAs. And my first discovery of the year was that of the ribonuclease dicer: an original discovery at the time. In this slide, you can see in the left-hand box a bunch of dark squares: they show that the new RNA type that we discovered is much more abundant than the family of micro RNAs shown in the red box on the right, which earned their discoverer a Nobel Prize.

Next, on this slide I'd like to show you that we've developed a new PCR [polymerase chain reaction] method in the laboratory to quantify and detect these new RNA types, which are the shortest ever discovered.

[00:05:00]

Next to show you is that when we do PCR, we don't consider results where the CT [cycle threshold] is higher than 30 because of a sensitivity limit. Above 30 there is too much risk of false positives, whereas public health has recommended up to 45 cycles to detect whether a COVID-19 test was positive or not.

And finally, this slide summarizes our research activities over the past ten years, which have focused on lipid nanoparticles found naturally in the cow's milk we drink. So our particles look like the image on the top right—this is a cow's milk nanoparticle—and it's schematized on the left. We see the ball, which is the nanoparticle, and in its center is a kind of RNA.

So that's the nature of our research projects in the laboratory. And that's why I put forward the idea that I have a certain legitimacy to express myself publicly.

Louis Olivier Fontaine

Thank you for those explanations, Professor Provost. We'll now move on to another topic. I'd like you to tell us about your personal experience with COVID injections.

Dr. Patrick Provost

On July 5, 2021, I received my first dose of Pfizer-BioNTech's COVID-19 vaccine. And following this injection, I experienced five unusual side effects that I had never experienced before, including a disturbance in my diabetes.

I informed my doctor of these effects but he never agreed to report them to the public health authorities. And that really made me question not only my own situation, but the whole crisis we were going through. Obviously, it also shook my confidence not only in my doctor, but also in the institutions.

Louis Olivier Fontaine

Now as we all know: you've spoken out publicly about the COVID crisis. I'd like you to explain to the Inquiry why you decided to speak out publicly like that.

Dr. Patrick Provost

It was clearly the government's decision in the fall of 2021 to massively vaccinate children aged 5 to 11. I felt that this was going too far and that, in the case of this age group, the risk-benefit balance was not in favour of vaccination. So that's when I took action. I actually participated in a conference of doctors and scientists on December 7, 2021 to speak out about the risks or side effects that may be caused by COVID-19 vaccines in children, and to effectively sound the alarm.

Louis Olivier Fontaine

Have you spoken out in other ways?

Dr. Patrick Provost

Yes. It was my first public appearance—and that first appearance led to a few problems with my institution. At the time, our society was going through a great upheaval; and I took the initiative of sending an e-mail message to a list that I had put together of 1,750 professors at Université Laval. I appealed for reflection and mobilization so that they could speak out publicly; and as an example I presented my participation in the conference of doctors and scientists.

And then, out of all these professors, only one—who doesn't like me, by the way—decided to lodge a complaint with Université Laval.

[00:10:00]

And Université Laval—rather than trying to reconcile us or invite us to a meeting, a discussion, or an exchange—decided to polarize the debate and said, “Okay, we have an accused person and we have an accuser, so we'll have to decide.” Even then I felt that Université Laval was deviating from its mission where, it seems to me, ideas should be debated and not sanctioned.

Louis Olivier Fontaine

Among the other professors—so you mentioned 1,750—what were the other reactions?

Dr. Patrick Provost

I had a few opposing reactions, but I had three or four times as many sympathetic reactions and support for my initiative. So that first complaint led to an investigation process in which Université Laval placed university professors in a position of authority over me. They were able to impose their opinion over mine; and the Université Laval then used this to suspend me without pay for two months.

After this, on July 14, 2022, I was invited to appear on CHOI 98.1 Radio X. And after my talk, in which I criticized some of the health measures on air, one listener of the tens of thousands filed a complaint. And once again, instead of inviting the listener to come and meet me so that we could discuss and explain, Université Laval chose to use a “cut and paste” process leading to another suspension, this time of four months without pay.

Then at the beginning of the year, in January 2023, I received the third complaint that would lead to my dismissal. It concerned an article I had published as a preprint in *Research Square* magazine. The complainant used several labels that I won't mention to denigrate our work, but this time Université Laval decided to reject the complaint. And why? Because the day before, Université Laval had received a letter supporting me, signed by 281 fellow professors at Université Laval. And I'd like to mention that several professors confided in me that they didn't want to sign the letter—which was only addressed to the Rector—for fear of reprisals. So that is simply to illustrate the atmosphere inside the University.

My career as a professor and researcher is now seriously compromised because of all this. At present, my two main suspensions are being contested by the union and myself; and now it's up to an arbitrator to decide whether the University was right to sanction me or not. This is a very lengthy process, with 19 days of hearings scheduled until December 2023 and the arbitrator's decision due in March 2024—some two-and-a-half years after the events. There have been two favourable decisions so far: the arbitrator refused

Université Laval's request for *in camera* proceedings to protect the identity and testimony of its witnesses; and the arbitrator also refused to grant expert status to the four university professors recruited by Université Laval to act as investigators on the inquiry committee. So that is all going on right now, and we'll see what happens.

Louis Olivier Fontaine

Another question I'd like to ask you is: What impact have these processes had on your life, your personal life, your family life?

Dr. Patrick Provost

The impact is major. My life has been turned completely upside down—well, notwithstanding a certain financial insecurity; obviously, anyone who would lose six months' salary is still losing a lot of money—but my whole life has been turned upside down.

[00:15:00]

My research—I no longer have access to my office. I can't get in touch with my students, who have been abandoned for months on end.

Louis Olivier Fontaine

What's stopping you from getting in touch with your students?

Dr. Patrick Provost

Well, because I'm suspended, I'm not allowed to report to my workplace. So if I did show up, I'd be violating the conditions of the suspension, and then I could be subject to other sanctions. So I have to respect the conditions.

Louis Olivier Fontaine

Any other impacts you would like to mention?

Dr. Patrick Provost

On a personal level, it's clear that the whole situation I've been through has led to a reshuffling, so to speak, of my circle of friends. Obviously, I've lost a number of friends. But I've also made a lot of new ones, and I see this as a positive change. You have to find the positive in such an unfortunate situation.

Louis Olivier Fontaine

Now, I'd like you to explain to the Inquiry the accusations made by your employer, Université Laval.

Dr. Patrick Provost

So as you can see on the screen, Université Laval is essentially accusing me of five things: demonstrating a deliberate confirmation bias in the choice of information; presenting biased interpretations or quotations used in a targeted manner; not treating the data with

all the necessary rigour, making a biased or partial collection, a non-objective presentation; delivering polarizing information; lacking responsibility towards the general public and not presenting the full body of scientific knowledge of the time.

So when you look at it from my perspective, all I can say is that it's a little like when children mirror everything. That's exactly what I feel inclined to do: tell them, "Look, all your accusations towards me can also be directed to the government, the professional orders, the professionals themselves, the experts, the journalists, and the media—all of whom have promoted vaccines in a quasi-advertising fashion without mentioning the risks of side-effects, which are furthermore poorly documented and grossly underestimated." But we'll get to this a little later.

So all these criticisms make me think that my academic freedom is in fact constrained by a doctrine. And that goes against Bill 32, which is supposed to protect academic freedom in universities. So if I can follow up on—

Louis Olivier Fontaine

Yes, so explain to us what the concept of academic freedom actually is.

Dr. Patrick Provost

Yes, okay. So you see on the screen: Bill 32 was passed on June 7, 2022. I had taken part in the public consultations on this bill, where I had spoken of my concerns about the influence of private interests on the university's mission. And in this law, article 3 defines the right to academic freedom in the university environment without doctrinal, ideological or moral constraint. And article 6 gives the Minister the power to intervene with an institution that fails to comply with Bill 32. So it's quite worrying to see that as things stand, the Minister has decided not to intervene in my case.

Louis Olivier Fontaine

So no intervention from the Minister?

Dr. Patrick Provost

None at present. She's decided to let the arbitration process run its course; except that in the meantime—for the two-and-a-half years it will have taken—well, the situation hasn't been resolved.

[00:20:00]

Other university professors see the way I'm treated and of course it totally discourages them from speaking out publicly. And so, academic freedom is in serious trouble here in Quebec and is clearly under threat, in my opinion.

Louis Olivier Fontaine

And tell us, Professor Provost, have there been any reactions at the political level, for example?

Dr. Patrick Provost

On the political front, not a single party represented in the National Assembly wanted to speak out. It's like a hot potato. Only Éric Duhaime showed support and put pressure on the Minister of Education to intervene, but she refused. *Québec solidaire* had dissociated itself from me as I was an ex-candidate myself.

So anyway, I'm very disappointed with politicians, who I don't believe really understand the importance of academic freedom for our society.

Louis Olivier Fontaine

And have there been other groups that expressed support for you, for example?

Dr. Patrick Provost

As a matter of fact, yes. La Fédération québécoise des professeures et professeurs d'université, the FQPPU [the Quebec federation of university professors]: it has a committee called COPLA, the Standing Committee on Academic Freedom, which looked into my situation. They analyzed my file; and in December 2022, they came back with the results of their analysis, which you can see here on the screen. You can enlarge the text in the box here.

And so the COPLA committee, which is made up of three jurists—so expert university professors—believes that academic freedom protects the right of any university professor to express ideas. They don't protect only those opinions with which everyone agrees. And so, an institution cannot start imposing sanctions on an academic for comments he or she has expressed if they do not contravene a law applicable in Quebec. As such, they mention that it's not necessary to conform to the consensus to be able to express oneself but rather, that academics have the right and duty to expose the pitfalls and falsehoods of a statement. And it is through refutation that professors involved in teaching and research must combat the statements of other professors according to recognized methods.

So clearly, it's the mission of the universities to let ideas circulate and to allow professors to debate, so as to gain the best possible comprehension of what's at stake in our society. And when we prevent these debates, obviously we no longer have the best picture possible. All we have is a distorted picture, which was distorted through the absence of the censored voices. And that leads us to confront Université Laval with its own contradictions.

So in February 2021, Université Laval adopted an institutional statement on the protection and development of freedom of expression at Université Laval. The text at the top of the red box is an extract I've taken from this statement. So the university talks about its essential role in the development of critical thinking in individuals; that any subject can be tackled; and in the face of controversial subjects, the establishment avoids censorship and encourages people to speak out. And as an institution, Université Laval is committed to: protecting the free flow of ideas—even controversial ones—in compliance with the law, collective agreements, and regulations; and providing an environment conducive to exchange, debate, and dialogue. So I didn't invent this.

And evidently, in my situation, Université Laval is doing just the opposite.

[00:25:00]

Université Laval does not respect Bill 32. It does not respect the collective agreement. It does not promote free speech and the free flow of ideas. It does not encourage discussion or debate. It does not foster the development of critical thinking. In short, it no longer fulfills its public-interest mission.

And of course you might ask yourself why Université Laval is doing this to me. Because we have a government that doesn't enforce Bill 32; the minister doesn't intervene; the media doesn't cover it. So why?

In response, I would put forward three hypotheses. One is that the current government wants to impose its political agenda by censoring academic scientists. So that's one possibility. The other is the influence of private interests. So at Université Laval, we know that pharmaceutical companies contribute to the Foundation and also to the funding of the university through research chairs, for example. And unfortunately—but curiously—the list of private donors to the Fondation de l'Université Laval was deleted from their website in July 2022.

Louis Olivier Fontaine

Excuse me, Professor Provost. What might we find on that list?

Dr. Patrick Provost

Well, you could actually see the identities of the pharmaceutical companies that contributed large sums of money to the Foundation. So the Foundation decided to hide this information to avoid becoming even more embroiled in controversy. And the information is also very difficult to access, even in the annual report. And as a third point, I wonder if there isn't some kind of retaliation behind this. Because in the summer of 2021, I published not one or two, but four opinion letters that were critical of the Université Laval administration because of the influence of private interests it was subject to. And it's quite plausible that they didn't appreciate my opinion letters published in the mainstream media.

Louis Olivier Fontaine

Okay, could you give the Inquiry more details about these opinion pieces?

Dr. Patrick Provost

Yes. By the way, my submission has been filed with the Inquiry—but I can do an overview of the four letters. So the first one is dated May 26, 2021, which I entitled *L'Université Laval et le Port de Québec: l'Absolugate* [Laval University and the Port of Quebec: Absolugate].

Why? Because there was an absolute confidentiality agreement between the two organizations, the very existence of which had to be confidential. And for a public institution, I found that unacceptable.

Then on June 4, I followed up with a letter to the *Journal de Montréal* about private interests and public universities, giving all kinds of examples of how private interests are interfering in our public institutions, including by way of research chairs.

Next, on July 29, *La Presse* finally published the letter I had submitted to them a month earlier, which I had entitled *Institution universitaire à vendre* [University Institution for Sale], in which I deplored the fact that Université Laval was actually selling the names of their buildings. That is why, on the Université Laval campus, there are buildings named in

honour of people, but now there is a Desjardins pavilion, there is a La Laurentienne pavilion. So we can clearly see who the sponsors are.

And then, in *Le Soleil*, I published an article on August 8, 2021 asking the question: Why don't we recruit Professor Alain Deneault to Université Laval? I should just mention that Alain Deneault wrote a book, *Noir Canada*, which was very critical of Canadian mining. And curiously, there's a research chair at the Faculty of Law that's funded by a mining company.

And so we see how private interests can influence the mission and decisions that can be made within a group of professors or within an institution, and thus compromise its mission.

Louis Olivier Fontaine

Okay, so you're not shy about voicing your opinion against your employer.

[00:30:00]

You also chose to write, again in the media, on the famous COVID subject. Could you explain to the Inquiry what you wrote on this subject and how it came about?

Dr. Patrick Provost

First of all, I'd just like to correct the fact that when I express myself publicly, it can be perceived as being against Université Laval: in fact, it's constructive. What I deplore about this situation is that I feel it needs to be corrected so that Université Laval can better fulfill its mission. But I did speak out publicly on COVID-19.

On June 22, I was under my first suspension, so instead of being at the lab, I was at home and started writing. And what I did was simply draw up what I considered to be the true portrait of COVID-19 in Quebec at that time. And what I did was simply an objective analysis of official government data, mainly from the Institut de la statistique du Québec and the INSPQ [Institut national de santé publique du Québec]. And in that article, I raised 17 questions that remain unanswered today. And why? Because the article was censored some 40 hours later and removed from all Québecor platforms. And, well, it can only be found on the Wayback Machine or in *Libre Média*, which agreed to republish my text. This followed a protest by Doctor TikTok and investigative journalist, André Noël, who demanded that my article be withdrawn.

Louis Olivier Fontaine

Sorry, did you say Doctor TikTok? For those who aren't familiar—

Dr. Patrick Provost

Mathieu Nadeau-Vallée. So these two people wanted Québecor to withdraw my article, but instead they were invited to write a review of my article. And two hours later, well, the text was finally withdrawn, so obviously— And in fact I was extremely disappointed, deeply disappointed by this censorship, because when I saw that my article was going to be published in the *Journal de Montréal*, I was hopeful. I said to myself, "This is it, we're finally ready to debate the issue in Quebec." And unfortunately, when I saw the censorship, I said—excuse me, but: "Shit, we've just turned the wrong way. And now we're headed down the road of censorship rather than debate."

And I wrote to the editor in charge of the *Faites la différence* column, the opinion column in the *Journal de Montréal*, Sébastien Ménard, whom I know. And I asked him, “But why did you remove my text?” If you look at the red box, he wrote back to me, “As I wrote on Twitter: ‘after verification, we found that this text contained inaccuracies that could mislead the public.’ I will not argue with you on this matter.” So you can see that my article was withdrawn and I was given no explanation. So what I take from this is that debate is no longer allowed, that critical thinking must be conformed, and I see here the imposition of a single mindset.

Louis Olivier Fontaine

Tell me, Professor Provost, have there been other forms of censorship, other ways of preventing you from writing or expressing yourself that have affected you?

Dr. Patrick Provost

Yes. So you should know that in September 2019, I co-founded the Regroupement Des Universitaires, a coalition aimed to mobilize or inform the public about climate change, the environment, and biodiversity. And I succeeded in setting up a coalition that today includes 630 university graduates, mainly in Quebec. And we had a “*Tribune Des Universitaires*” that consisted of a full-page article every Saturday in *Le Soleil* and other newspapers in the *Coops de l’information* [a regional chain of daily newspapers].

[00:35:00]

And so, after 121 consecutive columns, Valérie Gaudreau, the editor-in-chief of *Le Soleil*, decided to end the column—suspend it actually—for the summer of 2022. But I’m still waiting to hear from her about a possible resumption.

So as you can see, for my initiative that was carried out in good faith, I was once again penalized in the media even though it was in the public interest. And I’d just like to add here that there were five of us coordinating the coalition and the other four left because of my public criticism of the management of the health crisis. And just to illustrate the division this has created, this coalition is currently on life support.

Louis Olivier Fontaine

Okay. Let’s move on to another subject, which is the media’s treatment, you might say, of the Patrick Provost case. How has the media reacted to this whole affair, this whole saga?

Dr. Patrick Provost

So I was the subject of media coverage. And I’d just like to remind you that journalists are bound by the *Guide de déontologie journalistique du Conseil de presse du Québec* [Guide to Ethics of the Press Council of Quebec]. So I’ve put together a few statements for you to read, and I don’t want to go into too much detail. But what I’ve noticed over the past three years is that there have been many departures from good conduct and journalistic ethics, leading to media treatment that isn’t entirely respectful of the people or the information conveyed.

Let me give you a few examples. So first of all, in *Le Soleil* on December 30, 2021, Jean François Cliche reported on our laboratory discovery of a new form of RNA—a glowing article, all in all. It was a “Discovery of the Year” in Quebec City. But six months later, after I

had spoken out critically against COVID-19 vaccines, Monsieur Cliche changed his tune and made certain assertions in his June 26, 2022 article reporting on my eight-week suspension without pay.

I had criticized the lack of an active monitoring system for side effects, which is true because the current system is passive and we can see that there are many problems, whereas Monsieur Cliche said that this was patently false. Then I said that we don't know anything about the long-term side effects of vaccines, whereas Monsieur Cliche said that was not quite true. Monsieur Cliche claimed that messenger RNA didn't persist for long in our bodies, whereas vaccine messenger RNA has been detected several months after injection in human body organs. So what did he mean by "not long"? And furthermore, this makes the possibility of long-term effects highly implausible.

So he's showing a biased reassurance that everything's going to be fine, whereas when there are unknown factors such as these, it requires caution and moderation in what is put forward so as not to close the door on possible major side effects.

Louis Olivier Fontaine

Professor Provost, when you see these answers in the media that you consider to be false information, what do you do?

Dr. Patrick Provost

There's very little we can do. The newspapers and journalists have the last word over us. No matter how much we write, e-mail, call, or demonstrate, they simply have the last word. It's really frustrating. And above all, we can't intervene, we can't correct. A journalist has the last word.

[00:40:00]

And if I decide, for example, to lodge a complaint with the Press Council, the Press Council can simply give a friendly slap on the wrist and say, "Don't do that again." But there is no sanction that can be imposed on a journalist who deviates from the Code of Ethics. So in the end, there's nothing we can do about it except contain our frustration.

Then on February 22, 2023, Monsieur Cliche repeated his disparaging remarks, calling me "Prof. Provost," a bit like Doc Mailloux. He attributed to me "ill-founded remarks" about messenger RNA vaccines, when in fact they were well-founded. He claimed that my methodological basis has convinced essentially no one in the scientific community. So I'd like to know where he gets his information from. Next, he attributed to me a largely erroneous position on messenger RNA vaccines.

I published three scientific articles in *IJVTPR* [*International Journal of Vaccine Theory, Practice, and Research*]*—* we will come to that*—* and instead of criticizing the content of my articles, he criticized the journal. So he had the audacity to call himself a science journalist. And so, anyway*—* He ended by talking about scientific consensus and when I hear people talk about scientific consensus, it makes my skin crawl. You can't reach a scientific consensus when you censor and vilify scientists who express dissenting opinions. You have to invite these people to the table and debate with them on the basis of scientific arguments; and that's how a consensus can emerge, there is no other way.

Then there is Québecor journalist, Dominique Scali, who doesn't actually reproach me with anything in the content, but rather in the titles of her articles—although she may not be the one writing them— Here, for example, where she says that I'm one of the professors feeding the disinformation. Again, "disinformation" here is a media label and is also used for political purposes. And Madame Scali keeps calling me a dubious expert. So if I may use her term, it's rather dubious to use such terminology when it is coming from someone who is much less qualified than I am on the subject. It's pretty frustrating.

Next, I'll conclude my examples with Isabelle Hachey of *La Presse* in an article from June 28, 2022, where she departed from journalistic ethics in several places in her text. So here she says that the effectiveness of Pfizer and Moderna vaccines based on messenger RNA no longer needs to be proven. This is quite astonishing coming from a journalist. So you have to wonder where she gets her sources. Then she says that the arguments I put forward have no scientific value and in fact that the scientific value is low, if not nil. So that's a nice way of saying that I'm talking rubbish. Then she says I've completely gone off the rails. And then she attributes her thoughts to others. So in her own words, she says, "You'll tell me: too bad for this researcher. After all, he is defending not a scientific point of view, but a lie." So she accuses me of telling lies and that I deserve what I get, and then she calls me irresponsible. Well.

So you can see how journalists handle the news. And given that I'm a critic of the health measures, they are much harsher; and they use arguments or terms to denigrate me and in fact disqualify me, to disqualify my remarks, because the people who know me don't recognize me in these articles. And the shame is that, unfortunately, I can't go out and meet the 8.5 million people in Quebec. But clearly, when those who know me read these articles, the treatment I am receiving allows them to see for themselves the bias of the media.

[00:45:00]

The question then arises as to why journalists and commentators deviate from their journalistic code. And the main reason is probably the government funding of the traditional media. Obviously in the crisis we were experiencing, the government wanted to control the message conveyed to the public—and it did so by heavily funding the media with advertising to generate and maintain support for the COVID-19 measures and vaccines. But at the same time, all those who expressed criticism or took a stand against the government's measures or decisions were discredited or censored in the media so as to once again promote a single mindset and avoid any debate. And so, in my opinion, this is not healthy. It's not the sign of a free and democratic society, and it's not the way to reach the best decisions.

Louis Olivier Fontaine

Earlier, Professor Provost, you mentioned the scientific publications you produced during the crisis.

Dr. Patrick Provost

Yes.

Louis Olivier Fontaine

Would you like to briefly present them to the Inquiry?

Dr. Patrick Provost

Yes, certainly. So the first scientific publication was published in August 2022 in the journal *IJVT* [International Journal of Vaccine Theory, Practice, and Research]. In fact, all three publications are in the same journal. This is a journal where you can submit and publish scientific observations and analyses that are critical of the management of COVID-19. In this publication, my co-authors and I presented a conscientious objection to using messenger RNA technology as a preventive treatment for COVID-19. The objection is based on two principles that are flouted by the COVID-19 messenger RNA vaccines, which are not genetic vaccines.

It is a pro-drug since the active ingredient is not in the vaccine. The active ingredient is produced by our body's own cells. And therefore, the dose of active ingredient and the biodistribution of the active ingredient are unknown. Whereas when you take a 325 mg aspirin, you know exactly what you're taking, when you receive a COVID-19 injection, you don't know which cells in your body will express the spike protein, or at what levels. And there can be more than a hundred-fold difference in the expression levels of the protein, which is the antigen that will stimulate the immune response. And there are studies that have correlated that a high level of spike protein is associated with myocarditis. So there are concerns here that justify a conscientious objection.

The second publication is a retrospective study using pharmacy records: patients' pharmacological records. In fact, what's interesting to know is that at the INSPQ, which analyzes side effects following COVID-19 vaccines, they use a window of only six weeks following injection. So if there are symptoms or manifestations that occur beyond this period, they are not considered. I got confirmation of this from a nurse who called me personally about my own side-effects. So in this article, we observed that three-quarters of the complications in patients' pharmacological records occurred beyond the six-week period following their last injection of COVID-19 vaccine. So what this suggests is that vaccine-related adverse events are underestimated by a factor of four. All right?

And finally, I published this article. The message here is that the under-reporting of adverse reactions to COVID-19 vaccines represents the pandemic's blind spot.

[00:50:00]

It was based on the study of two clinical cases in which we were able to list some 40 constraints on the reporting and analysis of adverse effects, and these were of a clinical, systemic, political, and media nature. Obviously, even before COVID-19 we knew that side effects were under-reported by a factor of at least ten. And with the testimonies we heard a little earlier during the Inquiry, we can see that doctors or healthcare personnel are not reporting side effects. And so in my opinion, this factor of ten—which had been estimated before the crisis—is even higher since COVID-19. And combined with the factor of four that I put forward: we can think that the undesirable effects following COVID-19 vaccination are perhaps underestimated by about a hundred times.

And so when the authorities assess the risk-benefit ratio of a vaccine, it is absolutely essential to know not only the benefits but also the risks as accurately as possible—in order to arrive at an assessment that is also as fair as possible. What I'm saying is that the risks associated with vaccination are grossly underestimated, which leads to a significant bias in the risk-benefit assessment. So at present, the authorities may have recommended vaccination or judged this balance to be beneficial and favourable to vaccination, whereas if they had had the real figures, these vaccines probably shouldn't have been authorized.

Now, this slide summarizes the messages of the three publications. So that brings me to a conclusion—I think there are three or four slides left— So the whole saga that I've been living since I went public on December 7, 2021 has enabled me to analyze the pandemic from a rather unique perspective. What I've been able to observe is that differences of opinion are now subject to legal proceedings, even within universities, which is quite incredible. Debates are forbidden. I asked the University to meet with the plaintiffs and they never granted it. So they're really going against their mission. And if we can no longer debate or even express our ideas in our universities, well, where will we be able to do so? So I think that the current fight for academic freedom is crucial because if we lose it, the freedom of an entire population is at stake.

Of course, we can go along with these interpretations depending on our values, our knowledge, and our intentions, good or bad. But what I'm experiencing at the moment leads me to see the situation in the following way: I have the impression that it is private interests that are attacking the last bastion of democracy and public protection, which academics represent. Because, in fact, university professors have that freedom; they have a unique function within society that enables them to express themselves on social issues and raise problems when no one else can do so.

And when this last bulwark falls—as it has in the past in other political regimes in other countries—then it gives free rein to private interests, who will be able to impose their agenda. And we can see that the level of capture and corruption of our institutions is at such a level that it's shaking the foundations of our society and our democratic life. And, well, I don't want to say any more than that because we heard quite a lot during the Inquiry. But I'd like to end with a few recommendations for the Inquiry members.

I think it's very, very important to defend academic freedom.

[00:55:00]

And to do that, we need to ensure the immunity of the professors who exercise this freedom, and not allow for them to have their heads chopped off as soon as they exercise it or speak out. So we need to encourage public speaking. And that's always in the public interest.

We must ensure compliance with the rules of ethics and good conduct in research. At Université Laval, I've been criticized for failing to comply with the policy of responsible conduct in research. But what I've done are public interventions for the general public; that's not research. In short, we have to apply the principles and rules of ethics and deontology in research and clinical practice, and not depart from them because of an emergency. Because these principles and rules were established precisely so that when a situation like this arises, these rules can help us remain respectful and not lose our minds. And that's what we heard earlier at the Inquiry: that emotions make us lose rationality, rational thinking, and then thinking becomes emotional. And that's when we allow ourselves to blow up our reference points, skip over the markers, and impose measures that are no longer in line with the ethical and deontological principles that otherwise have always guided our activities.

Personally, I'd like to be able to analyze the contents of COVID-19 vaccine vials. Okay? We have the expertise to do it. We have protocols already in place in the lab to analyze lipid nanoparticle and RNA content; and we can collaborate with other teams to evaluate other aspects of vaccine content. And above all, when you consider that these vaccines have been

repeatedly administered to billions of people all over the planet, to be at all responsible or accountable, these vials must be analyzed. And this has to be done by independent university scientists, free of any conflict of interest and influence, and also free of any reprisals for what they report from their analyses. I think this is absolutely critical. I appeal to the government to give me the money and the freedom to do this, as well as access to the samples.

Well, I've used the term "whistleblower." It's not a term we usually apply to university professors because they have academic freedom; we don't need whistleblower status. On the other hand, in my situation where my academic freedom is constrained, I claim whistleblower status because that's what I've done. Since December 7, 2021 my public interventions have been aimed at sounding the alarm, at saying, "Just a moment, these injections must be stopped because in my opinion, the risks outweigh the benefits for a larger part of the population." I will continue to maintain this position; and I demand to be able to debate it publicly with the experts, the people in positions of authority and decision-making. And it's thanks to these confrontations that we'll get to the truth, or at least to the best understanding of the situation. And it is essential that public interests be defended.

So if I speak publicly, it's because I truly have the public's best interests at heart. I have four children. I care deeply about their future and want to be able to defend their interests; and to do that, we have to allow public debate. Otherwise, we can't do it. And if we're not allowed to have public debates or speak out, then we're talking about censorship and decisions that aren't necessarily in the public interest. And I'm always going to speak out against that kind of behaviour. So really, I'm here to defend the public interest at the very cost of my career, which I know is currently in jeopardy. But anyway, I think I'll stop here. Thank you.

[01:00:00]

Louis Olivier Fontaine

Thank you, Professor Provost, for that excellent presentation. Now I'll leave the floor to the commissioners if they have any questions for you.

Commissioner Massie

I realize it's getting very late but I can't resist asking Professor Provost a few questions. My first question has to do with the climate we're in. Your description is so detailed, so accurate of all the steps that have been taken. What we're seeing in Quebec is not unique. We've seen the same thing in every other city in Canada. We've seen similar censorship in Europe, in the United States.

And my question is: When you mention, for example, Bill 32—which clearly states what the protection should be for academic freedom—and we see this discrepancy in what's happening in your case and others who are perhaps self-censoring to avoid having the problems you're facing, how can we imagine that the accountability necessary to enforce the law might eventually manifest itself? The institutions don't seem so willing to do it, even the justice system. Do you think it's going to take political reforms with a real willingness to enforce the laws? Because we seem to have the regulations in place.

Dr. Patrick Provost

Well first of all, Bill 32 has no teeth, okay? So Bill 32 is toothless, to use the term. So there's no penalty if an institution doesn't comply with Bill 32. And the fact that Bill 32 doesn't take precedence over a distorted disciplinary process is extremely worrying. I've always seen laws as taking precedence over administrative processes.

And that's when a political decision was made not to intervene with Université Laval. And I know that the Minister herself says that she is in contact with the university rectors, but I tried to contact the Minister to no avail. I went to see my MNA [Member of the National Assembly]. I wanted to meet the Minister of Higher Education but it's impossible. I've never heard back. So how can a minister be in contact with the management of Université Laval but not with me? We have to be able to talk to each other. I get the impression that the Minister of Higher Education doesn't understand the scope of Bill 32 and the importance of academic freedom for society, for our democratic life, and that's really deplorable.

Commissioner Massie

The other question has to do with the hope you had when you published your article in the summer of 2022, which seemed to show a certain openness that closed, I'd say, violently given all the backlash that followed. Today or yesterday—I can't remember, I'm tired—Monsieur Hamel came to testify about his career. I was surprised to learn from him that even radio stations that were more open to criticism of health measures—for example Radio X, where I know you are associated because you do weekly columns—hardly seem to be motivated or interested in talking about the Inquiry, for example. As you have contacts there, what is your assessment of this state of affairs?

Dr. Patrick Provost

It's really disappointing the way the traditional media—even media like Radio X—cover events. I think the National Citizens Inquiry is extremely legitimate and essential. It should have been a government-initiated public inquiry. Unfortunately, in Quebec, there has never been the will to do so and I deeply regret that. The fact that it's a citizens' initiative doesn't disqualify it at all; the Inquiry is highly relevant.

[01:05:00]

And I don't understand why any self-respecting media outlet doesn't cover your work because what we've been through over the past three years is really quite unique. It's going to go down in history. There has not been such a devastating event in our society for a very long time. And so, the fact that we don't even want to do a kind of *post mortem* to review everything that's been done—in order to draw lessons and establish recommendations or change our policies; so that if a similar crisis occurs in the future, we can react in a much more appropriate way—it's very worrying that the media aren't interested in this. And we can see it from the testimonies and from the people who attend the hearings: this crisis has had a major impact on all spheres of activity in our society.

So why aren't mainstream media covering this? For me, it's a mystery; and I'm outraged by it. I am outraged because, as a citizen, I ask to have access to complete information about what is happening in our society. And the work of the Commission is unique in that sense; and it should have filled the room with traditional media. And the fact that we simply want to pass over the Commission and the work of the Commission in silence, well, that says a lot to me. But what it tells me is that, ultimately, the traditional media don't really seek to

know the truth because that's what we are doing here. That's what the Commission's work is for: it serves to [reveal] all the truths that we no longer see in the traditional media.

And in any event, hat's off to the Inquiry's commissioners and organizers because it's really essential. Your mission is essential and I hope that people will take an interest in listening to all the witnesses who have testified before the Inquiry, and that the recommendations you make in your report can be widely disseminated in the media or to the public. Because given the way governments have handled the situation over the past three years, there are clearly many things that need to be changed and improved.

Commissioner Massie

As it's getting late, I'll limit myself to one last question. I think there's a landmark event in your journey during the COVID crisis, which is the famous conference organized by Réinfo Covid on December 7 [2021]. And I realize from your presentation that you had a bit of an obstacle course before that. And I must admit, I was surprised to see your participation in that conference because I anticipated that it might cause problems. I don't think you went in there innocently either but did you expect such a reaction?

Dr. Patrick Provost

Not at all. Maybe I was a bit naive but I never thought it would result in all the consequences that followed. It's all a bit beyond belief. But if you were to ask me if I'd do it again, yes. Yes, I would do it again; and all the months that followed proved me right. Today it's clear that I was right to sound the alarm and I'm going to continue to sound it wherever I can. Even if the decision-makers don't listen, that won't stop me from intervening whenever I see fit. But it's not just a responsibility, it's a duty for someone in my position to intervene publicly when I deem it necessary.

[01:10:00]

And I find odious the fact that I'm being punished for doing so. especially the way it's being done: where I'm being deprived of the chance to debate.

So if I can take advantage of this opportunity, I'd like to call for a public debate in front of the cameras. Bring in the experts, we'll bring in as many from my side: we'll debate and the public will be able to form an opinion. But until that happens, we're going to have this one-track thinking imposed on us, along with a very worrying future for society and for our children.

Louis Olivier Fontaine

Thank you very much, Dr. Provost, for your testimony to the Inquiry.

Commissioner Drysdale

[In English] Dr. Provost, thank you for your testimony. Isn't what you've experienced here at the university really the crescendo of a wave that's been coming for decades? You know, in the social sciences, for years now they've been imposing certain thought processes on students and professors. This has been going on for years at the university, has it not?

Commissioner Massie
Do you want to translate?

Dr. Patrick Provost

Quite simply, is what I'm experiencing right now in fact the result and culmination of a whole succession of changes that have occurred in our university education system over the past few years or decades?

I wasn't necessarily aware of this possibility, because I thought these changes weren't going to affect me. I thought it was restricted to the use of words like "nigger" or words that are very loaded, but I didn't think they would attack hard science and censor scientists and prevent them from making their concerns known to the public. I didn't think it would go that far.

Commissioner Drysdale

[In English] The other item I would like you to comment on is: You were expressing concern and surprise that law 32 had no teeth. What we seem to have heard across the country in testimony is that the Charter of Rights and Freedoms has no teeth, that the Ethics Commissioner has no teeth, that the courts have no teeth. So I guess I'm not giving you a lot of hope here, but do you want to comment on that in comparison to what you're experiencing?

Commissioner Massie
Can you translate the question?

Dr. Patrick Provost

I don't remember the wording.

Commissioner Massie

Okay, well, I'll do it then. Our colleague mentioned that, yes, according to your comment, Bill 32 didn't have any teeth. We also see that the courts don't seem to have many teeth either; the Charter of Rights doesn't seem to have many teeth; and under these conditions, obviously, it presents a rather bleak picture. But he would still like to hear your comment on this situation.

Dr. Patrick Provost

Actually, if I had just one comment to make, well, it would be that toothless people aren't who you think they are. Unfortunately, it does take teeth to assert our rights. And that's why a lion roars: it's to bare its teeth and really claim its rights.

Commissioner Drysdale

[In English] This just seems to be a lesson to us all in that when we think that we're immune because it's not knocking on our door, it's knocking on our neighbor's door, but it will soon be knocking on ours.

Dr. Patrick Provost

The point is, if we don't pay attention to what's going on around us, sooner or later it's going to affect us.

[01:15:00]

So yes. But again, in the current situation most people will only be inclined to act if they're directly affected. And personally, I was motivated by what I experienced after my first injection. I dare not think, for example, that if I hadn't had any side effects, would I still be asleep today? It's possible. So it's hard to blame people who aren't awake yet, but it's up to us to go and find them. But to do that, we have to open up, not resent them, and be positive in our approach, urging them to join us in building a society that's much more cohesive than the prospects we're presented with.

Commissioner Drysdale

[In English] Thank you, Professor.

Dr. Patrick Provost

Thank you.

Louis Olivier Fontaine

Professor Provost, in conclusion: on behalf of the National Citizens Inquiry, I would like to thank you for your testimony. Professor Provost, you belong to a very, very select club of Quebec scientists who have spoken out and demonstrated their integrity. So I recognize you for that and I thank you once again.

Dr. Patrick Provost

Thank you. Thank you to the Inquiry.

[01:17:17]

Final Review and Approval: Erin Thiessen, November 19, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method, and further translated from the original French.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-translations/>

NATIONAL CITIZENS INQUIRY

Quebec, QC

May 13, 2023

Day 3

EVIDENCE

(Translated from the French)

Closing Statement: Dr. Robert Béliveau

Full Day 3 Timestamp: 11:23:40–11:41:41

Source URL: <https://rumble.com/v2vbsoc-quebec-jour-3-commission-denquete-nationale-citoyenne.html>

[00:00:00]

Dr. Robert Béliveau

Why don't you do a little stretching? I was tempted to inundate you with— but it's 8:28 p.m., so— I've called the title of my speech: A Call for Ordinary Heroism. But I think that we have some people here who are already extraordinary heroes. So first of all, I'd like to start by thanking the committee and the commissioners from the bottom of my heart for this initiative, which is absolutely essential to the survival of freedom of thought and freedom of speech too. And also for the inspiration I've found through the contacts and the testimonies, which have all been so very rich.

There was nothing futile; the three days were a great success. For my own part, I'm leaving tired but full of hope that there are still people out there who are caring, honest, generous, intelligent, and committed.

I talk a lot about commitment. We're all interested in what's going on and there are a few who get involved, but rarely are there those who fully commit themselves. So I'd like to invite everyone to embrace heroism: to bring to life the heroes and heroines within us. This is a golden opportunity and we must not miss it.

And I'm going to start with a little quote from Pierre Dac, a French comedian who died quite some time ago. He said: "Predictions are difficult, especially when they concern the future." I thought it was brilliant. And here I am: retired, dreaming of a life of tranquility, calm, and serenity. And now we are plunged into a crisis that is also a gift—a gift for everyone, a gift that we can perhaps pass on to our children and grandchildren—which is to stand up against the ignoble, against things that are unbearable, that are no way to live.

The table that has been set for us over the past three years is something that should outrage us—in fact, more than outrage us. Stéphane Hessel, who said, "Indignez-vous!" ["Time for Outrage!"] when he was 93 years old, long before the COVID crisis, also said, "Engagez-vous!" ["Get Involved!"] And for me, that's what makes all the difference!

And for three days, we were lucky enough to see through a kaleidoscope: lawyers, statisticians, some doctors, a variety of brilliant people. People who have been affected in

one way or another by the crisis and who came to testify courageously, to speak out, to dare to speak out. And it moved me on every level. I shed tears, many tears. If you haven't shed a tear in the past three days, you haven't witnessed the same thing that I have and you're not as sensitive as I am. Maybe I am hypersensitive, I am getting older. I'm an aging being; it seems that as we age, we become different, men and women are more alike. So maybe I'm becoming more feminine, more feminist even.

[00:05:00]

So I'm going to ask you to make a little effort. I'm going to start at the end because I never get to it. And the end— I have picture in my mind that you can't see. It's a picture I took in the neighbourhood I grew up in: in Hochelaga Maisonneuve. I'm from Hochelaga Maisonneuve, and we used to walk down Ontario Street, past a funeral home that's still there today. And funeral homes don't die: people die, but they always have business. And it was called T. Sansregret. As little boys, we thought it was absolutely hilarious. T. Sansregret, you know: "You're going to display your father or your mother and—'you're without regret.'" Then, as I got older, I asked myself: But isn't that exactly how you should die? Without regret? Knowing that I lived my life: I committed myself to it; I gave what I had to give; I took what I had to take; I lived it intensely; I lived it with awareness and with dignity. And I'm leaving a legacy. They won't get much, but they will perhaps receive a little wisdom that I will have bequeathed to them.

Anyway, I hope I won't bequeath to them the world we've been living in for the past three years, which is being established. You can see the threats. You know as well as I do that they don't always come to pass, thank God. I have a few words of advice.

I know that our Premier, Monsieur Legault, is an intellectual so he likes to read. I have a book to recommend to him: Alan Watts' *The Wisdom of Insecurity: A Message for an Age of Anxiety*. He is a man who is relentlessly generating fear and security as a means to an end instead of accepting that in life, there is something called risk. Wall-to-wall security is death: the death of life, of that which is important in life, of what gives value to life—namely the connections. Connections, encounters, trust, awareness, creativity: all of these are suppressed in his fear-generating thought system.

What I also want to leave him with is a little quote because I know he's someone who's very fond of vaccination: "With the vaccine, you still die, but without the vaccine, it would be worse." When I read that, I thought, "That sounds exactly like what's going on." So what are we left with? Fear. And what, do you suppose, is the way out of fear? I feel that if we face our fears, they will no longer be able to direct and control us. I was listening to François Amalega. What makes it that he is not afraid but we are? It's an extremely important question and I think it's food for thought.

And by the way, if you want to think about it a bit more—because I'm going through this very quickly; I won't go through all my seven pages because you'll go to sleep—we'll get together again near here on Sunday, [May] 28. Anyway, on May 28 at the Domaine des Maizerets—somewhere near Quebec City—there will be something going on with the Réinfo Québec group, which used to be called Réinfo Covid, and you're invited to join in. And it will be an opportunity to share, and to be out in nature too. We'll be doing meditative walking, lots of practices that will help us nourish what's been forgotten, which is called the inner life, or living.

And for me, it's something that's absolutely essential. [Blaise] Pascal said, "All human evil comes from a single cause—man's inability to sit still in a room." So maybe that's the first

thing we need to master: to be at ease with ourselves and to know that there's a place of rejuvenation. If we've learned to be at ease with ourselves, to welcome what's going on inside us— And it can sometimes be anger or sometimes all kinds of energies, because we're connected with a complex reality which is not always pleasant, not always easy, and sometimes warlike. We're not the ones who've provoked a warlike state but we have suffered and experienced it; and it affects us and our relationships, as we saw.

[00:10:00]

Everyone was hurt during this episode. Our bonds were damaged. Some of the bonds we had were completely dislocated, if not completely fractured. We'll have to work on convalescing and getting back to— In any case, because everything needs to be revised, there may be relationships we'd do well to keep and there may be others we'd do well to let go. So we have to be very careful not to get hung up on the relationships that can be a source of distress rather than a source of satisfaction and gratification. We need to see what we're paying attention to, who we're paying attention to, and be aware of what we need in the here and now.

I just wanted to share a little: in a crisis, you have to know that there is both danger and opportunity, occasion. And if we're going to live through a crisis, let's live through a fruitful one. We need to determine what is in my interest to change within myself and what is in our interest to change collectively: in our organizations, in our professional orders, and so on. We need to clean house. The healthcare system is completely sick: it's a healthy system of sickness. So we have to change that. And it won't be changed by the people in charge; the people on the outside will change it. Some people have too much interest in keeping things as they are. So the change will come from you; it will come from me; it will come from each and every one of us. And what I've heard over the past three days is a fabulous collective wisdom. And what makes it so wise is that we're able to welcome everyone and let everyone speak.

And my spiritual father, Thich Nhat Hạnh, who died at 95 years of age, used to say the next Buddha will be a collective Buddha. What does that mean? It means we will learn with others. Doctors will learn from their patients, who will sometimes learn from their doctors, but that's rarer. And patients need to be patient with their doctors, but active too to get them to change, to make the type of relationship we have—which is often a complementary relationship, but completely asymmetrical—a little more symmetrical. May patients stop being patients and become architects of their own lives and health, and take back their power; and may doctors let go of some of that power. And so I think it's important to regain a little power when we've been powerless for three years. Power belongs to us, and will always belong to us.

We have to realize that the decisions we make affect us. And it's up to us to make decisions based on what's right for us. Society and the individual make up an environment that can sometimes have extremes. The individual can crush society, as we're seeing at the moment: some individuals are trying to impose their own agenda on society as a whole. Society can also crush the individual. Both are unhealthy. So what we need to do is find the centre again—that's the individual—and take care of him so that he can then take care of the community. It's not one against the other, it's one with the other; and one depends on the other. So I think it's important to recognize this, and to simply participate in it. In fact, be what you need to be in order to live. "Be the change that you wish to see in the world." You want to see honesty and integrity? Be honest. Have integrity. It's already a full-time job.

So it's on ourselves. And I invite everyone to work first and foremost to rediscover that power to achieve something called "celebrating life." So for those who want to know a little more, we're going to give you some meeting places. Personally, I think being together is essential: it's sharing, it's creating bonds, it's breaking the isolation. It's the only way to get through this—and it's not over yet.

[00:15:00]

I'm reminded of Mark Twain's words: "I'm an old man—" Where I'm at— It's: "I am an old man and have known a great many troubles, but most of them never happened." So we have to be careful about our tendency to sometimes demonize the future, to see only the troubles and not the changes, the transitions, or the transformations. There can be difficult moments of transition, moments of turbulence: that's inevitable. But eventually, they may lead to a more satisfying balance, and that's something we can work on.

How will this happen? One day at a time. Well, I'll stop here; it won't take long. You have to be able to commit without locking yourself in; you have to be able to have roots without neglecting your wings. Wings are extremely important. So stay fluid: fluid in both your mind and your habits. Don't cling to your habits. Be open to what life has to offer, and come back to immortal values. [Johann Wolfgang von] Goethe said, "Whatever you can do, or dream you can do, begin it. Boldness has genius, power, and magic in it."

I'd like to invite my other half to come, and then I'd like you to stand up. There's something about standing up! We'll close our eyes and then assume a posture of strength, dignity, and courage. And there are people around you, so take the hand of the person around you. I've got my other half, Chantal, with me. Nineteenth-century poet Alfred de Musset said, "I don't know where my road is going, but I know that I walk better when I hold your hand." . . .

NATIONAL CITIZENS INQUIRY

EVIDENCE OTTAWA HEARINGS

**Ottawa, Ontario, Canada
May 17 to 19, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

Day 1

EVIDENCE

Opening Statement: Shawn Buckley

Full Day 1 Timestamp: 00:13:40–00:40:20

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Welcome to the National Citizens Inquiry as we begin Day 1 of three days of hearing in the nation's capital, Ottawa, Ontario. Commissioners, for the record, my name is Buckley, initial S. I am attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie.

I'd like to begin, for those that are watching online that are not familiar with the NCI, to give a brief description. We are a volunteer-organized and -run group that really just decided that there had to be an independent inquiry into how all levels of government dealt with COVID-19. And so with this ambitious goal of appointing commissioners and marching them across the land, we now find ourselves in our eighth city and our twenty-second day of hearings. I think we've heard over 250 witnesses, both expert and lay witnesses.

And I have to say that we're quite amazed that this has happened; because it's happened only because you have volunteered. You have poured yourselves out in many ways to make this happen. And you've supported us financially. Each set of three-day hearings costs us approximately \$35,000. I'm always instructed, because of the necessity, to encourage you to go to our website, nationalcitizensinquiry.ca. Sign our petition. We want you to sign our petition, so that it's obvious that we have public support for this initiative. And we also want you to donate to help participate in funding these hearings, as we've been marching forward and basically taking action.

I have also been encouraging all of you— We have had literally crickets from the mainstream media. We've had one CBC story. And even media that we would expect to be extremely friendly and covering what is an historic event have been obvious by their absence in most cases. And yet the word is getting out, and it's getting out solely because you have been taking the initiative. You've been sharing our tweets. You've been sharing us on social media. And we're still being, as far as I can tell— Excuse me, I always get a frog in my throat in the morning just before I do my morning opening. And today is no exception, but we'll power through.

We've actually had just an incredible reach on social media. And it's solely because you have been sharing us. We're still being search-banned on Twitter. So most of us, because of the Twitter files, have just assumed that Twitter is not censored; but I don't know about Twitter Canada. So we're still inviting you to tweet Elon Musk and hashtag #NCI and ask why, when searches are done, basically, we're not always showing up. And we ask, every single time you send a tweet on anything connected to COVID or government response to COVID, that you add the hashtag #NCI so that we rise in the algorithms. Together we can get the word out.

And I can share that within my own family, there have been members who, it wouldn't matter who it was—Robert McCullough, whatever, like big names, credible people — there's no way I could get them watching a video or anything like that if I was to send it or share a paper. But there's willingness to watch these proceedings. And there's willingness because witnesses being put under oath, led by lawyers that have volunteered but are professional counsel done in a professional way, before commissioners that are independent and who also question the witnesses, resonate. And it resonates because of what judges refer to as the "ring of truth." If a judge believes a witness, sometimes you'll hear in a decision, "that witness had the ring of truth." And the NCI is about getting to the truth and promoting the truth. So I thank you for participating.

Now, I wanted to talk this morning. I actually wanted to share something with you. I'm not going to share it yet. I'm going to hold you in suspense.

[00:05:00]

But I want to give you a different understanding about something that you've experienced. Everyone hearing this will have experienced what I'm going to refer to. And defining it differently, naming it for what it is, will change you. Because when we understand something differently, our mind actually changes. Our neurons are wired differently. We change our mind. And language, and how we define things, is extremely important.

I don't know if everyone has read George Orwell's book *1984*, which I think was written in '49. It's quite prescient. But if you haven't read it, you should read it. One of the things that comes out in that book, in his uncanny prediction of how we would move into an authoritative state, is the control of language with the Ministry of Truth and what's called "newspeak." Where new terms are used and—listen carefully—old words are erased from the language because we communicate our ideas and we hold our beliefs in language. You think in language. And so, if the government can control our language, they literally can control how we think. And so, for generations going forward that will not have the use of words that we are now banning, they will not be able to think the same way we think. And so, when I define something for you differently today, understand that that's important. **And when you read news stories about universities and other institutions banning words from use, understand what is happening as it's part of this movement to gain control of our minds and how we think. And we need to take that very seriously.**

Now before I continue, I wanted to thank everyone. We had a bit of a scare at the NCI earlier this week. We had one of our team members fall ill and the NCI family became very concerned. This person doesn't know, but— I was getting emails from even the commissioners like, "How is this person doing?" All of this. There was extreme worry. And the NCI is not a religious organization, it's a group of volunteers of different beliefs. But I want to thank the NCI because I asked for a call for prayer to go out, and the NCI allowed that to happen. And people did pray and God responded.

And what touched me is, a lot of you communicated to us. And it was touching actually—I'm choking up, sorry. But it was touching to hear that you were praying and that you were concerned. And it was a beautiful experience. And I'm sharing this because all of us can call to mind times where we've basically experienced love. Because that's what this was. It was a collective expression of love towards one of our team members. And what we experience when we experience love is we have a sense of joy. And you all know what I'm talking about. And we have a sense of peace.

I want you to call that feeling to mind right now. Because we've all had those feelings where we have felt touched, where we have been literally choked up because we've experienced somebody else loving or we've participated in loving someone else. And I want you to understand that that is a state of freedom. That is a state of mental freedom when you're experiencing peace,

[00:10:00]

and when you're experiencing joy. And I want to contrast that to a different state.

And to illustrate part of that, I want to speak about a witness that testified last week in Quebec City: François Amalega. And for those of you who are not familiar with François, he resisted the mandates. All of the mandates—masking, curfew, vaccination—he resisted. Quebec was under a curfew; I think it was an 8 o'clock curfew. That's what the government called it. Remember, language is important. We could use other terms, like "martial law." Because what's the difference if, at a certain time, you have to be in your homes or face the consequences of the state?

So I'm told, on Valentine's Day, when Quebec was under martial law and had a mask mandate, that he went to the police station after the curfew, not wearing a mask: basically, announcing that his love, Freedom, was being held in the jail. And he was clearly making a political protest. So understand, he's attending at the police station after the curfew, not wearing a mask. Now the police at this point have a decision. They have a choice. Because they could have made the choice, they could have said, "Okay, this guy's making a political statement. We're just going to ignore him. We're just going to carry on our business. And sooner or later, he's going to get tired, and he's going to go home." They could have made that choice. But rather they made a choice to exercise power and to arrest him. And I don't know how long through all of his mandate resistance he spent in jail. But my understanding is it was a number of months. And I view him as—and he was—a political prisoner. There's no question he was resisting to make a political statement because he disagreed.

François was a political prisoner. And we have political prosecutions in Canada in 2023. I just expected, growing up, that they would be few and far between. I mean even liberal **Western democracies, which I thought we were, has the odd political criminal proceeding.**

But I hadn't anticipated that I would watch truckers, who were clearly engaging in a constitutional right to protest, being subject to criminal proceedings and civil proceedings, and having bank accounts frozen with the intent of setting an example for the rest of us: so that we will not do what they did and put ourselves on the line and subject ourselves to political prosecutions—basically criminal charges, civil proceedings, and having our bank accounts frozen.

And I have to say that it's really starting to bother me: that we are not supporting the truckers; that we are not creating a political uproar over what's happened. That we are not ensuring that their defences are financed. That we're basically not ensuring that they're

taken care of. I'm mindful of— We had a witness in Red Deer, Regina, who had come from Poland, and she had been at the start of the Solidarity movement. And they were small in numbers. And their leadership was— I keep forgetting the words she used. It wasn't "arrested," it was some other term which basically communicated that the state had separated them from their families. And they were no longer able to be leaders in the movement. And what the remnant did was took care of the families.

And we need to take care of our truckers. I'm having trouble today, so forgive me.

So let's get back to François Amalega

[00:15:00]

because a couple of days ago, he was attacked on the street in Quebec City. And after he was attacked, he started the video on his phone. And the video he took you can see: he was kind of basically attacked a second time. He just made an attempt to catch the people who had attacked him on camera. And what you see is, is you see around five, it looks like males all in black, hooded, wearing masks so you can't see their faces. So you can't tell who the attackers are in any way. Now, this would not be a race attack upon François. We can't speculate about the motivation. My understanding is, he's thinking that this particular attack might be because of his activities in resisting having transvestites attend at schools and do story time. But that's just speculation.

And isn't it curious that he has been a visible, basically freedom fighter, standing up to challenge the government narrative peacefully. He attended as a witness at the NCI in Quebec City last week. And this week there is a rather alarming video of him being physically attacked, in Canada. And if that happened to any of us, we would be afraid. We would truly be afraid to have five or six hooded and masked people physically assault us. And as I was thinking about how I would be afraid, something else happened in Quebec City.

So basically, we got visited by somebody that I knew personally, and that person brought a friend with them. I was having a conversation with them, and they were talking about the very beginning of the pandemic. And they were talking about part of the experience I had forgotten about, where at the very beginning, literally it was changing so fast, you didn't know day to day what was happening. I remember I was living in Alberta and I happened to be in B.C. at the time. And I was wondering: Do I have to get back soon? Are they going to close the border? And they were saying, "Oh yeah, well, the announcement would be at noon every day." That's when you would learn what new restrictions were being imposed because it was just happening so fast. We were just, you know, "What freedom am I losing today?" And that got me kind of back into the experience.

And I want to take you back there because I actually want you to get back into that emotional fear and confusion that we experienced because we did cower in our houses. Do you remember that? Do you remember being told to stay home? And we stayed home. In the audience, I see people nodding their heads. We wore masks when we didn't want to, after we realized that they were of no benefit. We closed down schools, and dramatically, dramatically, affected our children in a negative way — and in ways that, for some of them, they will carry for the rest of their lives as a burden. We participated in police state rituals such as showing identity papers to be granted permission to participate in privileges being granted to us by our master, the state. We were in actual fear of our government. And you remember that. And worst of all—and our true shame—was our children watched this.

Our children watched us react in fear, live in fear, and participate.

[00:20:00]

And we did it because we were afraid. I was afraid. I felt real fear.

You know, at one point I was worried—and this was before Rachel Notley in Alberta was talking about sending people to the doors of the unvaccinated—but I was concerned that the government was going to go door to door. And I see people nodding their heads. They understand. And we felt helpless. We felt like we had completely lost control over our lives. Now, do you feel that again? I want you to feel that again. I want you to feel that darkness again. And the reason why is I want to name it. Because you will call it fear. And I call it the “spirit of slavery,” which is a very different thing. Because that feeling that you felt, that is what slavery feels like.

I’ll say that again: that feeling that you felt is what slavery feels like. Because it is slavery. When you have the experience of slavery, you can’t go against the wishes of your master. Because in your mind you’re enslaved, you’re afraid to go against your master.

So let’s call a spade a spade. Let’s call slavery, “slavery.” And do you understand? Even just me now naming it differently, it should have a different feeling. Because when it’s fear, you feel afraid. When it’s slavery, you feel angry.

Now, you consented and you participated because you were afraid of the cost of freedom. And most of us are still consenting and we’re still participating because we are afraid to pay the price for our freedom. So we cower in obedience, even now. I mean, we don’t have mandates now. We’re not told to wear a mask. We don’t have a curfew. There’s still vaccine mandates. There are still places where you have to wear a mask if you have to go into a hospital or a medical clinic. And why are we allowing that? Why are we allowing that lie to continue? We’re still cowering. We’re not taking care of our people subject to political prosecutions. We are still cowering in fear.

So let’s go back to François Amalega. Because remember, he spent months and months in jail because he refused to cower in fear. I want to read to you something he wrote. And I think I’m going to read it to you twice, because it’s too important not to sink in. He said, “I feel more free within the four walls of a jail cell, with a clean conscience, than I would standing outside while respecting the measures and collaborating with the lie.”

I’m going to read that again: “I feel more free within the four walls of a jail cell, with a clean conscience, than I would standing outside while respecting the measures and collaborating with the lie.”

François, in a cell, actually experiences freedom because he has peace of mind. He is freeing his mind. He does not have the spirit of slavery in his mind. So he actually will willingly take a jail cell to have that peace that comes from standing for your convictions in your mind, because he’s going to reject the spirit of slavery.

Let’s contrast that with you and me submitting to a curfew, wearing a mask,

[00:25:00]

while showing our ID papers with a mind of fear and slavery. So who is freer in that scenario: François in a jail cell or you eating caviar after you show your identification papers at a fancy restaurant?

And more importantly, whose children are seeing the example that is going to enable them to live like free and dignified human beings going forward? And I hope for all those listening that that is a rhetorical question.

Now, I will advise the audience, or those participating online, that at the present time we are still waiting for one of our four commissioners to arrive, and she should be here shortly. Our rules permit us to proceed with three commissioners and then there will be a responsibility on the commissioner that is not yet here to watch the evidence.

[00:26:38]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 1: Dr. Denis Rancourt

Full Day 1 Timestamp: 00:40:18–02:17:39

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

I'm pleased to announce our first witness this morning, Dr. Denis Rancourt. Denis, can you state your full name for the record, spelling your first and last name?

Dr. Denis Rancourt

Yes, Denis Rancourt. Denis is D-E-N-I-S. Rancourt is R-A-N-C-O-U-R-T, and if you say Rancourt, that's fine.

Shawn Buckley

I'm so sorry. I mean no offence by getting your name wrong there. Denis, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Denis Rancourt

I do.

Shawn Buckley

Now, by way of introduction, you have a Bachelor of Science, a Master of Science, and a PhD from the University of Toronto. These are degrees in physics.

Dr. Denis Rancourt

Yes.

Shawn Buckley

You have been a Natural Sciences and Engineering Research Council of Canada [NSERC] international postdoctoral candidate in prestigious research laboratories in both France and the Netherlands.

Dr. Denis Rancourt

Yes.

Shawn Buckley

You became, and I'll just use their anachronism [sic], a national NSERC university research fellow in Canada.

Dr. Denis Rancourt

Yes.

Shawn Buckley

You were a professor of physics at the University of Ottawa for 23 years, attaining the highest academic rank of tenured full professor.

Dr. Denis Rancourt

Yes.

Shawn Buckley

But more importantly, and I will ask you to explain this point, as a researcher at the university you were a researcher in interdisciplinary research. So you weren't just tied to physics, and I'm wondering if you can please explain that for the audience. After that, you've been invited here today to speak about some things that flow from all-cause mortality data, and I'm going to ask you to launch into your presentation.

Dr. Denis Rancourt

Okay. It's very common for physicists to be more interdisciplinary than some other areas of science. I ran a large laboratory that did interdisciplinary research, meaning that we use the methods of physics and mathematics to analyze problems in everything from environmental science to planetary science to theoretical physics to biogeochemistry, including interactions between bacteria and minerals, in the environment. Those kinds of things. So I was the head; I was the lead researcher in a laboratory that developed techniques to study these problems. We wrote more than a hundred articles, in scientific journals, about these questions.

Shawn Buckley

Thank you. I'll ask you to go into your presentation.

Dr. Denis Rancourt

Okay. Well, before I put the slides up, I'd like to say a few things. And I want to start by giving you my conclusions.

I've been working on all-cause mortality in its analysis for more than three years. I've written more than 30 reports about it, detailed scientific reports; some of them are more than 100 pages long with many figures and graphs and detailed interpretations. I've come

to the following conclusions, and I will try to demonstrate how you must come to these conclusions by my material here that I brought today.

The conclusions are as follows: First of all, if governments had done nothing out of the ordinary, if they had not announced a pandemic, had not responded to a presumed pathogen, had done nothing other than what we normally do when we have a high season of mortality in the winter, then there would have been no excess mortality. Nothing special would have happened. That is a conclusion that I hold firmly from analyzing the data. So, in that sense, there was no pandemic that caused excess mortality. None at all. There was the usual ecology of pathogens: viral, bacterial, whatever you want to imagine. There's a huge ecology of pathogens that we live with. They're always there. We get sick. We recover. Sometimes we die. That's all true. But there would have been no excess mortality beyond the historic trend if we had just left things alone. So there was no pandemic in that sense.

The second point I'm going to be making is that the measures that governments applied,

[00:05:00]

which I would think of as an assault: there were many different kinds of assaults against people. And those assaults definitely and quantitatively caused excess mortality in many jurisdictions and at various times during the pandemic period. Very significant deaths. In some jurisdictions, relatively little. And so on.

And the final point is that the vaccination campaign, the COVID-19 vaccination campaign itself, definitely caused excess mortality in definite peaks that are seen—that are directly associated with various vaccine rollouts of different doses to different age groups and in different jurisdictions. And you can see those excess mortalities immediately. There is no way to escape the conclusion that the vaccines definitely caused death in a significant number. And I'll give you what those numbers are in my presentation.

Shawn Buckley

Just before you start, I will advise the commissioners and the public that your CV has been entered as Exhibit OT-1a. I think it's 50 pages long. And you spoke about papers that you wrote that we have entered as Exhibit OT-1. The papers that you provided to us: those are available to both the commissioners and the public.

I'm going to ask if you are adopting those papers as true, as part of your evidence today.

Dr. Denis Rancourt

Absolutely. Those are all papers that I authored and co-authored, and everything in them is from me and is true to the best of my knowledge.

Shawn Buckley

Thank you.

Dr. Denis Rancourt

So I could move on to my slides now. That's just the header. I want to say a little bit more about my background. There are five areas of science that I'm an expert in as a result of studying these various questions.

One is nanoparticles, small particles in nature and in the environment. Even the new vaccines, the mRNA vaccines, are nanoparticles, surrounded lipids, and so on. I'm an expert in nanoparticles: their stability, their chemical reactions, how they form, how they disperse in a fluid, and so on. I've written scientific papers about this.

I'm an expert in molecular science, and by that, I mean chemical reactions of molecules. I worked in a prestigious national chemistry laboratory when I was a postdoctoral fellow, in France. I have done theoretical work on molecular dynamics. I know how molecules bind to various surfaces, to each other, and so on. I know a lot about the intimate details of molecules and atoms.

I know about statistical analysis. I've written scientific papers on advanced statistical analysis methods, such as Bayesian inference theory. I know about error propagation. I've written about that. I've taught it at the graduate level. All of these are areas of science I have taught to graduate students in every department I'm in. In science and engineering departments, I used to do a graduate course on scientific methodology which I had developed.

I'm an expert in modelling—meaning theoretical modelling. I've done modelling of the dynamics of environmental systems. And now I'm doing modelling with co-author Joseph Hickey on epidemiology: the classic theories of how things spread, the dynamics of that through a population. We have written two papers on that recently, and in both cases, the editors refused to even review them. We appealed one, and we won that appeal, and both have now been peer reviewed. And so I'm a modelling expert.

And finally, and not least, I'm an expert in measurement methods. I mean by that: How can we know things in science? There are a whole bunch of important measurement methods. They include diffraction; spectroscopies; microscopies, including electron microscopy; and various bulk property measurements. I have taught all of these methods at the graduate level. I had an electron microscope and several spectrometers in my laboratory when I was a lead researcher at the university.

That's my background. That's why I feel I can read a scientific paper and really understand what it's about. I do this work with several collaborators; we work closely. I want to name them here:

[00:10:00]

Marine Baudin; Joseph Hickey; Jérémie Mercier; John Johnson, who is a professor at Harvard University; and Christian Linard, who joined us in our discussions and in our work, very recently.

I have written more than 30 articles about COVID-related matters, large reports and articles. They are on my website. My website is very complete. It's organized by section: denisrancourt.ca. I prepared a book of exhibits for this testimony, which you have and is now entered as an exhibit. It contains almost 900 pages and many of the key articles for the conclusions of today. So this is just the index of that book of exhibits. The last one there, article number 87, is actually an article written in 2019 which is a very thorough analysis of geoeconomics and geopolitics since the Second World War. I think that gives the proper context to really understand, from a social point of view, what was going on here.

As I said earlier, these are my main points: There was no pandemic in the sense of causing excess mortality. It's the measures and the assaults that caused mortality during the COVID

period before vaccination. And then when they rolled out the vaccines, that caused definite excess mortality as well. All of this is based on all-cause mortality data, and I wanted to show you what that looks like.

This is all-cause mortality by month. You can do it by week, by day, and so on. But this is by month for the USA since the year 2000. Now, we've had this kind of data for more than 100 years in many Western countries. Because February has only 28 days, there's a little dip in February that you can see there, and that allows you to see where February is. You can see that the mortality is seasonal. In the northern latitude countries, it's always higher in the winter and then you come down to a trough of mortality in the summer. The y-scale here doesn't start at zero. You have to notice that; it's expanded. This goes right into the COVID period. So you can see that in the United States, that last one of a bluish colour there is the mortality in the entire COVID period, which is significantly higher than the mortality before, if you look at the historic mortality.

When the pandemic was announced on the 11th of March 2020, we start the COVID period there and we put that in a certain colour. Then you can add all the deaths per month for all the months of the COVID period, and you get the total deaths for the COVID period: that's the black dot that's higher than the others there. You can take the same duration period and move backwards in time and do that sum: that's the other black dots.

So the black dots allow you to see the historic trend of the mortality on the timescale of a COVID period, if you like. You can see that it increases very gradually. That's because the age structure of the population is changing. The baby boomers are coming of age to be older and are dying more, and you see those kinds of effects. But what you see also in the United States, this is for the entire U.S., is a stepwise dramatic increase right in the COVID period. That's the kind of data that we analyze. We can look at it by state (50 different states), by city, and by age group. That's the mortality.

This data cannot be biased. You're simply counting deaths irrespective of what people died from. There's no bias here. This is all-cause mortality. You've got that extra filter, which is by age, by sex, by jurisdiction, and as a function of time.

So it is very, very powerful data. This is the kind of data that allows you to spot heat waves, earthquakes, wars. Anything that will perturb the population to the degree that it will cause mortality is immediately seen in this kind of data. Just as a note, I want to make it clear that the various pandemics that were announced between the Second World War and before COVID, by the CDC, in Canada, where they estimated the number of deaths—none of those deaths are detected in all-cause mortality. In other words, there was no excess mortality related to the past so-called pandemics. That's clearly described in our papers.

We're still in the United States,

[00:15:00]

and now we're going to blow it up on the time scale. We're going to go from 2016 to the present. Now the data instead of being by month, is by week. There's a higher resolution there. You can see in detail the evolution of the all-cause mortality as a function of time, there. You can do that quantification. Just to show that you can go higher resolution here.

One of the very strange things in the United States is that for the first time in the historic record, there were peaks of excess death in mid-summer in the United States. In the southern states where it's very hot and where people's lives were basically dissolved and

they were dramatically perturbed in how they normally deal with poverty and heat, there were actual deaths—extra deaths—in the summer.

Now in the United States, when you integrate that all-cause mortality in the COVID period and then you look for social factors that correlate to that on a by state basis, this is the strongest correlation that we found for a single social factor. We looked at many, many. It shows a correlation of all-cause mortality integrated over the COVID period on the y-axis as a function of the fraction of the population that is living in poverty. This is what we call in science “technically a very strong correlation.” The Pearson correlation coefficient is plus 0.86, which is unheard of in the social sciences.

And it's not just a correlation; it goes through the origin, which means it's proportionality. Which means that in a state that would have had no poverty there would have been no excess deaths during the COVID period. So there's a strong correlation to poverty, which is one of the pieces of evidence that allows you to say that this is not a virus. Because a virus, and COVID in particular, is said from clinical studies to kill mainly elderly people—and it's even exponential with age. We find instead that we correlate the things like poverty. But if you did this kind of a map, which I didn't bring, as a function of age—median age, or number of people living in the state, the fraction of the population that is over 80 or over 65, and so on—no matter how you slice it, there is absolutely no correlation with age, which is a definitive proof that this cannot be COVID as studied in clinical studies.

Shawn Buckley

Can I just stop you, Denis? So you're basically sharing with us that this chart is showing that people that had more poverty were more likely to die. And that's not a function then of a virus, it's a function of something else?

Dr. Denis Rancourt

That's right. Not just “more likely,” as you would say, in a weak sense, if you were a scientist. This is the strongest correlation you'll generally see between a socioeconomic factor and something happening in the population. This is an incredible graph. This shows an absolute, not just correlation, but proportionality to the size of the population living in poverty. This shows that the COVID period, on the scale of the nation in the United States, killed the poor in proportion to how many poor there were.

The other strong population correlation factors are, for example, how many people are living with disability: are certified disabled, cannot function in society, and need to be supported by the state. The number of people with those programs in the United States is also a very strong correlation to whether or not you died.

And so the United States is a very special jurisdiction that has large amounts of both disabled, poor, obese, and people suffering from diabetes. All of these things correlate to whether or not you were going to survive the COVID period. And that is why the United States, in proportion to its population, had a much higher mortality than Canada did. So even if you take the population into account, taking the population into account, Canada had five times less excess mortality than the United States. Five times less.

In other words: if this was a virus, it refused to cross the Canadian/American border. It was presumably causing death in the U.S. to this degree but would not cross the border into Canada. That virulent pathogen did not act in Canada. So that is impossible,

[00:20:00]

in terms of epidemiological theory. That is strictly impossible if you want to believe that theory. It's thousands of kilometres of border, two of the biggest economic exchange partners in the world. That cannot happen. So that's yet another line of evidence that this was not a viral respiratory disease pandemic.

Shawn Buckley

Can I just ask you one more question, and I'm sorry. But do we know what factors of poverty might have played in? Like might it have been that the poor do not have as good nutrition or don't access treatment or things like that? Like, are there any others?

Dr. Denis Rancourt

Yes. We tried to answer those questions in our large papers, and we concluded— Well, that's a very interesting and deep question. What we found was that this death was occurring mainly in the poor states in the south of the United States, where it's also very hot. And those are populations that normally get many, many prescriptions of antibiotics in the winter. So they have a high susceptibility to bacterial pneumonia infection, and they normally get treated. But during the COVID period, all Western countries cut antibiotic prescriptions by 50 per cent or more, including the United States. So they were not treating bacterial pneumonia. And these people always get them, always have this problem, and were not being treated.

And so we believe— And the CDC [Centers for Disease Control and Prevention] has agreed based on death certificates that a co-cause of death in the great majority of the so-called COVID-19 deaths is bacterial pneumonia. So we know that there was a massive epidemic of bacterial pneumonia. We know that it was not being treated up to standards whatsoever, and we believe that mechanistically, this is what killed the poor, obese, and so on. There were other factors as well, and we discuss them in detail in our papers.

Now, we're still in the United States here, and this is the per cent increase in mortality. It's the excess mortality expressed as a percentage of what the mortality would normally be by age group. This is now by age group, and this is before vaccination was implemented in the COVID period. So we're starting at 11th of March 2020 and going up to the end of 2020 before we start vaccinating.

We can see that excess mortality expressed as a per cent for the 10 most populous states in the United States here—the different colours—goes from something like 5 or 10 per cent for these zero to 24-year-olds and up to something like 20, all the way up to 40 per cent for the other age groups. So it's very, very high, and it's high across the board in relative amounts, expressed this way for all the age groups of young adults all the way to the elderly.

Then, if we keep those 10 populous states and look at what happens in the period where you were vaccinating, because the rollout was very rapid, you get a very different pattern like this, where the 25- to 44-year-olds are affected up to 60 per cent excess mortality on a relative basis. So the age structure of the mortality has changed now as you move into the vaccination period. That's the kind of analysis that you can do. This is just to illustrate.

So that's the United States. So remember, in the United States, you have this massive increase of mortality in the COVID period, there at the end. Remember this mortality versus

time. And remember that step where you have a regime of higher mortality at the end in the COVID period. Now let's compare to Canada.

Here's Canada in blue. Forget the red line for now. The blue is the all-cause mortality by week in Canada from 2010 to the present. What you notice is that there is no stepwise increase. There's virtually—nothing happened relative to the summer trough baseline, if you like. There's nothing special happening that's visible in the mortality. This is in heavy contrast to what you would see if something real and important happened like a war or, for example, the Great Depression, the Dust Bowl in the United States. These give large mortality increases. There's nothing like that in Canada.

[00:25:00]

So nothing special happened in terms of mortality in Canada. At first look, coarse-grain looking. But now if we look at the details, we will see things.

Now I want to contrast that with what Theresa Tam and her co-authors said in a scientific paper. They actually said from a modelling study, a bogus model, that if they had not applied all the measures—masking, distancing, vaccination, and so on—that there would have been approximately one million extra deaths in the COVID period in Canada. So I represented what that would look like in red here in the COVID period. I distributed those million deaths uniformly, just a simple model to show what it looks like. And that's what the million extra deaths that they're saying they prevented would have looked like.

Now I have to explain: that is absurd. Nothing known historically can cause that kind of mortality. And to affirm something like this is absolutely ludicrous. For example, if that is true, then why did the measures not reduce it by only half? Why did the measures not reduce it by only 80 per cent? Why did we come down to a mortality that happens to be approximately exactly what you would expect historically? It makes no sense. There's one universe in a million where this could happen by accident. So this is absurd. This is the level of scientific propaganda that our government scientists are putting out these days.

Now we'll take a closer look at the mortality in Canada. I have now shown this on a scale where Y starts at zero, and we're seeing the all-cause mortality again. And now what I'm doing is I'm integrating over what we call a cycle year. So we go from summer trough to summer trough and we integrate the mortality. It's total mortality per cycle year, if you like. The integral points are there. And you can see a small increase relative to the linear historic trend in the COVID period for those two cycle years. Very small, but you can quantify it. And there's also details, of course. We'll look at those.

This is the same, but now it's on a different Y scale. So you blow it up a little more, and you can see it more clearly where the excess mortality is at the end. This is by cycle year again.

And now I'm showing it by calendar year. So actually, the last point there is the total number of deaths in 2022. This data for Canada just came out a few days ago and we made this graph. This shows that the excess mortality since the COVID period started in 2020, did not decrease whatsoever because of this huge vaccination campaign.

Remember, the vaccines were supposed to prevent serious illness—and that means prevent death. And there is no indication that this military-style vaccination of everyone reduced deaths whatsoever in Canada. In fact, 2022 has significantly higher deaths than the previous two years, one where you were vaccinating and one where you were basically not

vaccinating. So the deaths are higher now in Canada. That's the situation in Canada. They've created circumstances where the deaths are higher in 2022.

Now we can compare the all-cause mortality for Canada to the vaccine rollout in this graph. So the dark blue line is the cumulative number of vaccine doses administered to the population. You can see that when the rollout starts, you get an extra peak on the shoulder of that winter peak at the beginning of 2021. And that is a very strong peak, especially in Ontario, for people that are 59 years of age and older. And then you can see that the third dose rollout, which is this significant increase, gives you the highest winter peak we've seen in a long, long time. And there are other details.

So we can blow that region up and look at it again and label some of the peaks so that I can discuss them. That vertical line arrow pointing up is the start of the pandemic. That's when it was announced, the 11th of March, 2020.

[00:30:00]

What I call peak A is a very important peak because it is a surge in mortality that occurred immediately after the pandemic was announced. But you have to understand this peak. We're going to look at it in some detail. It is very heterogeneous from jurisdiction to jurisdiction. It did not occur in several Canadian provinces. It was very prominent in Quebec. And so it depended what you were doing in those jurisdictions to fragile people who were in hospital and ICUs and care homes, whether you were going to cause deaths during that peak. We're going to look at that peak some more.

I can point some things out. That peak C is the one that arises because of doses one and two rollout. Peak E is the very high peak related to the third dose rollout. Peak F is a peak that occurs when they rolled out a booster to the elderly. And some of these peaks come out more significantly when you look at different age groups. But this is just to give you a broad view. And D is an example of a heatwave peak. This was a heatwave that occurred in southern British Columbia at that time.

Now we're going to look at peak A, what we've been calling the COVID peak, that arises immediately after the pandemic was announced. And that peak is absolutely huge in the United States. We're showing some of the states where it is the largest. And this time, all-cause mortality by time by week in fact is normalized by the population of the state. So you see that you get this complete overlap normally and the seasonal variations. So we're looking at Connecticut, Maryland, Massachusetts, New Jersey, and New York. We see that that peak that fires up right after you announce the pandemic is massively different from state to state. There were about 30 states in the United States that did not have such a feature. It's exactly at the same time whenever it occurs. And it's very, very different in magnitude.

That same kind of peak happens at the same time in different parts of the world. So there are hot spots when, just after you announce the pandemic, you get these massive peaks. They're shown here for Lombardy, Italy, and the region of Madrid, and an area in France, and so on. These peaks occur in very specific hot spots, but synchronously around the world.

Now, I want to insist on this: that—from an epidemiological standpoint—is strictly impossible. Because the time from seeding of an infection to the sudden and measurable rise of mortality is completely uncertain. It is a factor that is extremely sensitive to the details of the population, the institutional structure, and so on. It cannot be the same

everywhere; even if you fly seeds out by airplanes at the same time to everyone on the same day, you will not get peaks of mortality that occur synchronously. It is impossible. That time between seeding—depending on the size of the seed—and the maximum in mortality varies by many, many months; it can even be years. So that's impossible.

The first thing I said when I saw these peaks, as I said: this is not a viral respiratory pandemic. This has to be peaks that were caused in those jurisdictions that were hot spots. And in fact, in Lombardy, Italy, in that region in particular, they said, "Don't stay home, come straight into the hospital, we'll treat you." And they were putting two people per mechanical ventilator when they were sick enough. And they were doing horrible things, and there was a massive killing of people, I believe, in that peak.

Now, we're going to study that peak in some detail across Europe. I'm going to show you some maps. This first map is just to remind you where the countries are when you look at the other maps. But also, I put in blue here some borders. Those borders are interesting because you'll notice in the maps I will show you of the magnitude of that mortality peak mapped on Europe, that the virus—if it was a virus—absolutely refused to cross these borders. Absolutely refused. There's no crossing of these borders.

Of course, that's absurd. A viral respiratory disease is believed

[00:35:00]

to spread, and it does not need a passport, and it does not respect borders. So that's yet another proof that this was not a viral respiratory disease pandemic.

Let's look at these maps. We're going to start in January 2020, before the pandemic was announced. What I'm representing here with the different colours is the intensity of the excess mortality integrated for January. So basically, January was an ordinary month and you're around zero for all of Europe. February, same scenario, nothing special is happening. Now we hit March, which was when the pandemic was announced and when this peak arose. And there you go. Those are the hotspots.

So you can see: northern Italy, large regions around Madrid and Spain, and so on. And what you'll notice is that you do not cross the border between Portugal and Spain. You do not cross the border between Spain and the south of France. You do not cross the border whatsoever into Germany: Germany was completely protected from this excess mortality at that time in the pandemic. Germany did not have these excess deaths whatsoever. And then as we go down off this peak, March into April, we're still on the tail of that large peak. Those regions are the same, basically, and those borders are not crossed whatsoever. And then we get into May and June and the peak is over. And you have to ask yourself, what caused that peak?

Well, we've talked about it somewhat. We are now looking at everything that was done in that period specifically that could have caused this excess mortality. What we're finding in many jurisdictions is that hydroxychloroquine, HCQ, had many, many prescriptions—a super-prescription of that drug in the jurisdictions that had this peak. Germany was not doing this and they did not have the peak. Spots that were doing it—counties, and so on, that had high prescriptions—had a lot of deaths. Now, this is not the only drug that had that peak.

So what basically was happening is: emergency MDs were told, "This is a pandemic, we don't know what it is. It's a new virus, do what you can." At the same time, there had been

the suggestion that hydroxychloroquine could be very effective. I'm not saying that's wrong, but I think that some people were very reckless in prescribing it to their seriously ill patients. And this drug has the property that it has a very narrow and well-defined window of utility for treating people. And if you go in excess of that, it becomes a toxic chemical. It is quite possible that in the jurisdictions that did not know how to use this drug— And we know they overprescribed it as much as two grams, so we believe that that's one of the drugs that would have caused this peak. Another one is various sedatives that were used often in combination with the mechanical ventilators. This is ongoing research that we're looking at.

Hopefully by now, I've convinced you that at least there exists evidence that there was no pandemic, and that it was the measures that were killing people before vaccination.

Now we want to look at vaccination. The first thing I want to say is that there is absolutely no doubt that the vaccines cause significant death. There are now dozens and dozens of autopsy studies that show a causal relationship between the vaccination and its effect on the cells and organs of the body, and that that would have caused death. There are many autopsy studies that show this.

Adverse-effect monitoring is showing a peak of death immediately following vaccination, in the first few days: a very definite peak of death, followed by an exponential decay of death that lasts at least two months. We showed this in detail in one of our papers.

There was a survey study done by Professor Mark Skidmore that just asked people, "Do you know anyone close who died that would have been due to the vaccine, just immediately after vaccination?" And on the basis of that scientifically-performed survey, they found that in the United States about 300,000 people would have been killed by the vaccine. There are many, many studies now showing that there are induced pathologies: meaning sicknesses, disease,

[00:40:00]

related to having been injected. There are more than 1,250 peer-reviewed scientific studies analyzing and showing vaccine harm. And our work is to look at all-cause mortality, and we calculate what is called the "vaccine-dose fatality rate," meaning: What is the risk that you will die from being injected on a per-injection basis? That's what we're going to look at now.

This is a list of some of the recent autopsy studies, and there's some more there. Now we're going to look at the vaccine period.

Shawn Buckley

Doctor Rancourt, we will make your slides an exhibit [Exhibit OT-1b] so that the public and commissioners can access and actually see the references.

Dr. Denis Rancourt

Perfect. Thank you.

When we started looking at the vaccines and whether or not the rollouts could cause death, one of the first things that drew my attention to this is: four studies came out in various scientific journals about India. India is a difficult case because they don't publish national

high-quality all-cause mortality data. So you have to actually go on site and go into the various provinces and the various institutions and gather the data yourself to some degree. So there were four studies that did this, and they all found the same thing. They found that there was no excess mortality when the pandemic was announced. Absolutely everything was normal. And then all of a sudden, many, many months later, there was a huge surge, a massive surge of deaths. So they showed this and they explained that India had this huge peak in mortality. And none of the four groups of researchers mentioned that that surge in mortality was occurring exactly when the vaccine was rolled out, military style. And I said, how is this possible? How could they not even mention it? So I wrote an article critiquing them and pointing out that this is exactly when the rollout occurred. And therefore, it allowed me to calculate that those deaths were due to the vaccine.

I showed, I single-authored that one: 3.7 million people were killed in India by the vaccine, 3.7 million. And this is because they targeted elderly and sick people. India actually put out a list of 12 comorbidities of very sick people: if you had those, you should be vaccinated right away. They did something that was called a “vaccine festival.” That’s what the prime minister called it. And they said, “Go and get your sick and elderly everywhere and make sure everyone gets vaccinated.” And they killed 3.7 million people. The vaccine fatality rate that I calculated for India was 1 per cent, which means that one out of every hundred injections caused a death in India.

Then we said, “Let’s look at this for Western countries and for other jurisdictions.” We looked at all the data we could from the UN [United Nations] and tried to identify countries that would be easiest to study at first. Australia jumped out at us because Australia is a country that had no excess mortality whatsoever during the pre-vaccination period and then a huge increase in mortality, a new regime of mortality, when they rolled out the vaccine. So we said, “Let’s target Australia and see what’s happened there.” And you can see the integral value in the vaccination period jump up for Australia there on this graph.

And this is a blow up of it. You see mortality by week in Australia. You see the vaccine rollout. And you see that as a consequence of the vaccine rollout, there’s the higher regime of mortality right there. We also see a peak in their summer, our winter. Remember, mortality is higher in the experienced winter. So in the Southern Hemisphere, mortality is higher during the period that is our summer, but it’s their winter. And there’s seasonality like we normally have. But here in the middle of their summer, they have a sharp peak right there. You can see it. And that coincides exactly with the very sudden rollout of the third dose of the vaccine.

I’ll show that in detail now. Here’s the rollout of the third dose superimposed on that peak of mortality for all of Australia. It is the same thing for each of the states in Australia. This is Victoria, New South Wales, Queensland, and so on.

[00:45:00]

You get this rollout of the third dose and a peak in mortality that accompanies it. On that basis, we can calculate things—which I’ll show you in a minute. But first I want to do a little bit of around-the-world of these kinds of correlations.

So this is Mississippi. Something happened that was very unusual and very sad in the United States: They decided that they needed to have vaccine equity. So large financiers and companies and pharma-tied interests decided that people were not being vaccinated enough in certain states in the United States, so they will have a vaccine equity program, which was highly funded.

They hired thousands of people and they went and vaccinated the most vulnerable people living in various homes. So in the poor states, you can see that vaccine rollout. You can see that increase in the cumulative doses being given there. That is the vaccine equity program. And then you can see that huge peak that is coincident with that in mortality for the 25- to 64-year-olds. Now we see that large peak, which is bigger than anything else, that coincides with vaccine equity in basically all of the poor states in the United States—so Alabama, and so on. In those jurisdictions where you get that state, you have the same vaccine-dose fatality rate as they had in India, so 1 per cent. It's massive for that peak.

This is a peak that occurred in Michigan coinciding with the initial rollout of doses one and two. And that same peak occurs, meaning the same properties occur, in Ontario, where it's very important.

Now, this is a summary of all this data. I'm getting to the end now. This is vaccine-dose fatality rate expressed as a percentage by age group. You can see that for the most elderly, it goes up to almost 1 per cent—even in Western countries. This is Australia and Israel, where they have really good data on a "by age group" basis, of both doses and mortality. We were the first to do this. This is the first data that was produced that shows that the risk of dying from the injection goes exponentially with the age of the person being injected. And the doubling time of that exponential is about five years. So for every five years in age, your risk of dying from the injection doubles.

And this proves that it was absolutely the opposite of what you should do, from a public health basis, to go and vaccinate the most vulnerable in terms of being elderly. The risk-to-benefit ratio is completely out of whack. You are injecting people that are at high risk of dying from the injection when you inject the elderly. And this is the first quantitative demonstration of that for Australia and Israel, where we were able to do it. You can blow up the bottom of that exponential, and you can see that the young adults are above the exponential, that holds for the more elderly adults, starting at around age 40. There is a plateau of risk of dying from the injection for young adults that is maintained.

And you see it if you do a semi-log. For those of you used to looking at these graphs on a semi-log basis, you can see that plateau in the mortality risk from the injection for the young adults there relative to— The linear part is the exponential part on this kind of graph. So you can see what people are talking about in terms of sudden deaths of athletes and young people in this kind of data.

This is just to show you for Israel, the coincidence between the various dose rollouts and peaks in mortality. Now, this graph here is for all ages. But it is even more noticeable when you do it by age group, you see? Look at the relationship here for the 80-plus-year-olds between when you roll out the doses and when there is a peak in mortality.

And this is for 70- to 79-year-olds.

And this is 60- to 69-year-olds.

[00:50:00]

So you vaccinate and that starts a whole period of induced deaths as a result of that.

And this is 50- to 59-year-olds.

We summarized that data for Israel by calculating the vaccine-dose fatality rate by age group, by dose number. We showed that as you go to further and further doses, the risk of dying is higher and higher—even when you discriminate by age group like this. So again, that particular graph is not published yet, but that's coming out in one of our next publications.

And that's on a semi-log basis, what it looks like.

So this is my conclusion: Every jurisdiction that we've looked at—India, Australia, Canada, Chile, Germany, Israel, New Zealand, USA, and many others, including all the European countries that you saw—always gives us the same result. There is a risk from dying from the injection on a per-injection basis that is between 0.05 per cent—that's for all ages in a Western country—all the way up to almost 3 per cent for the most elderly people that are fragile. So we always fall in that range in terms of the risk of dying from these injections. Consequently, we can calculate that that must be a property of the vaccines. And therefore, on the scale of the entire world, given the number of doses that were administered, the vaccine must have killed approximately 13 million people worldwide.

In India, we know for sure. We quantified it: 3.7 million people were killed in India. In the USA, we now have good reason to believe—and different methods giving the same results, the surveys that I mentioned, our method, and so on—about 300,000 deaths in the U.S., compared to 1.3 million deaths for the entire COVID period. So a large fraction of the COVID-period deaths in the U.S. can be directly associated with the injections.

In Canada, we're still quantifying, but the number's going to fall between about 10,000 and 35,000 deaths that were directly induced by the vaccine. And remember, I showed you the graph for that. Those deaths are larger [in number], they're not smaller, when you vaccinate. That concludes my presentation.

Shawn Buckley

Now, this is looking at deaths. I'm just curious. So it doesn't show whether there's any benefits, it just shows that we have excess deaths. I know that sounds like an odd question, but it's just that the public messaging has been: the purpose of the vaccine, the benefits, were that it would reduce our symptoms or make the experience of having COVID less severe. I'm wondering if you can give us your thoughts on that public messaging.

Dr. Denis Rancourt

Well, I have been concentrating on data that is robust, that is bias-free— and that data is mortality, all-cause mortality. So I confine myself to saying everything I can say about **mortality**. However, I note that they are claiming many times that the vaccination would have caused less severe illness. Well, if that's not related to death, I don't know what is.

Shawn Buckley

Right, death follows severe illness, generally speaking.

I understand that this is just speculation, but your speculation is that the public claim about reducing severity of illness is likely not—

Dr. Denis Rancourt

Well, as a scientist who reads the literature extensively, I can tell you that the trials, the pharmaceutical industry trials that would have looked at safety and efficiency of the vaccines, are highly flawed. They're completely rigged. I think rigged is not an exaggeration. They exclude vulnerable groups, which are exactly the groups that are being killed by these injections. They exclude them from the trials. So you cannot know if particularly fragile, very elderly people would have been killed by the injection because it was never tested.

Shawn Buckley

My other question is, and I appreciate you have to wait for the data to be published.

[00:55:00]

My understanding is vaccination intake has dropped, so fewer people, for example, are taking the boosters. Are you seeing any reflection in all-cause mortality with a less robust uptake of boosters?

Dr. Denis Rancourt

In most countries, excess mortality is now dropping and is coming back to normal. There's a subgroup of countries like Canada where, in 2022, the mortality is higher than it was even before. Those are countries of concern for us that we're studying now in detail.

Boosters, generally most of the population is refusing the more advanced boosters. Therefore, they're targeting the elderly more, supposedly to protect them. So that's part of the reason that we measure on average that the booster doses are more lethal—because they're also being given predominantly more to elderly people. But they appear to be even more lethal when you take age into account, as I showed today with these graphs, where there's somewhat higher risk of mortality with the higher doses. But all of this is occurring together, and sometimes we can't unpack the data enough to really answer some of these detailed questions.

Shawn Buckley

Thank you. Those are the questions I have. I'll see if the commissioners have any questions for you. And they do.

Commissioner Massie

Thank you very much, Dr. Rancourt, for this very comprehensive analysis. You did point to a number of conclusions that I think are pretty well-founded based on your analysis. But there are still more questions to be examined. For example, without getting into too much speculation, I was wondering whether you've examined causes for the targeted population of disabled, especially in the south of the United States, like Mississippi or other places, that also happen to be areas where the industrial agriculture is very, very active.

We know from many studies that industrial agriculture extensively uses glyphosate, which is in theory helping the yield, but that's something we can debate. But what we've learned from many studies that are coming in the last decade or so is that glyphosate is a very toxic component for the microbiota. We had a scientist presenting in Quebec City who was mentioning that there was a pretty good correlation with respect to sensitivity to all kinds

of infection, including COVID, as well as a propensity for people that had a bad microbiota to be more susceptible to vaccine toxicity.

I don't know whether you've explored that in terms of big numbers, and if you could at this point draw some sort of correlation between the exposure to glyphosate making the population much more susceptible to infection that if you don't treat, as you pointed out, will result in death.

Dr. Denis Rancourt

We did look in detail into glyphosate use on the U.S. territory. And we looked at maps of that, and we compared those maps to excess mortality maps and to poverty maps, and so on. So we did examine that in some detail. It's difficult because we're talking about correlations. We don't really know. We don't have specific patients where the presence of that toxic substance was analyzed in their blood, and we know that they died, and we know that they were injected. We don't have those things that you would have in clinical studies. So we're looking at correlations.

And what I can say is that it's difficult because there is heavy glyphosate use in some states that are very poor. So the two are together. But there is also heavy glyphosate use in agricultural regions which are not particularly poor and don't have a

[01:00:00]

high prescription of antibiotics, for example. So it's very difficult to unravel. But I would say that we did not find clear evidence of a glyphosate effect. Let's put it that way. On the scale of the nation, looking for correlations, we did not find that.

Commissioner Massie

My other question has to do with the number of, I would say, disabled population in the States that, according to your analysis, seems to be much higher than what we have in Canada.

Dr. Denis Rancourt

Oh, yeah.

Commissioner Massie

And that could explain one of the differences we see between the two countries. But do we have in Canada a population that, even though low in number, could be in that category and that suffer more from the measures?

Dr. Denis Rancourt

Absolutely, absolutely. Oh, absolutely. I didn't say everything we've done. There are 30 articles. But in Canada, it's clear, just to give you a few examples. Even though the mortality is much lower than the U.S., still, quantitatively, there is excess mortality.

So for example, in Alberta, young men at the beginning of the pandemic, when the energy sector was closed down, have a very high excess mortality—above anything else. So there was huge suffering among young men in Alberta that is directly seen in the excess

mortality. This correlates with an increase in homicides, suicides, drug deaths, and so on. So there's tremendous suffering that can be induced from the all-cause mortality in Canada, young men.

Now, there were also many Aboriginal working in that sector. And so we looked at Aboriginals. We found that the highest mortalities among young men were in provinces where there were many Aboriginal people. And not just young men. So there is definitely a correlation in Canada between the fraction of the population that is Aboriginal and the excess mortality. We definitely see that. It's going to be in our next paper about Canada. So that is certainly a fragile group in the same way that disabled people in the United States are a fragile group. Absolutely. I'm sure it's co-correlated with things like diabetes, obesity, and so on. But yes, that's an identifiable fragile group in Canada. So young men whose lives were devastated by losing their jobs in the energy sector and Aboriginal are the two in Canada that we found that were most striking, let's say.

Commissioner Massie

Another question I'd like to try to put in perspective: the magnitude of deaths that are correlating with the vaccines rolled out in the States. And you and other people are coming with numbers in the range of 300,000 over a fairly short period of time. If you put that in perspective with the significant excess deaths measured in the States from the opioid crisis that took place over a much longer period of time— But clearly, that was so important, according to some analyses, that it did decrease the life expectancy in the United States.

So what would be your assessment of the death toll deriving from the vaccine in terms of life expectancy? And how would you compare that to the opioid crisis in terms of death toll?

Dr. Denis Rancourt

When we identify mortality that we conclude is due to injections, due to the vaccine, we actually see peaks that are synchronous with vaccine rollouts, whether it's different doses, and so on. Like I showed you. And that includes in the United States. We see peaks that are synchronous with the rollouts. That's one thing.

Now in order to see that, it has to be strong enough. So there have to be enough elderly people or fragile people that are injected, and so on. The equity program was just shocking in the United States where you really see the peak associated with that. So that's one proof, if you like—even in Canada and in the United States—that the vaccines are definitely killing people.

But the other argument is we always see the same death risk by injection. So we tend to believe that even though the United States is very complex in terms of its mortality—peaks in the summer, all kinds of things,

[01:05:00]

and certainly, these other factors that you mentioned—that we expect that the risk of death by injection would be the same in the U.S. That's how we obtain our global number, our global estimate.

Now to be clear, we studied the U.S. in great detail before we first quantified in so many countries this vaccine-death fatality rate. So now, we're more certain than ever that this is a

real number and that it is a given for these types of vaccines. So that's how we estimate our 300,000.

So when I say that the vaccine has caused death, I mean that the death occurred soon after the injection and gave rise to a statistical feature that cannot be there by accident. But that doesn't mean there were not comorbidity conditions. Of course there were. There's age and many different illnesses and if someone is highly exposed to glyphosate, and so on, a clinician would be able to tell you.

So you're basically challenging, I think, the number for vaccine deaths in the U.S. on the basis that there are other cofactors. Yeah, it's true, there are other cofactors. But I have become convinced that this vaccine-dose fatality rate between 0.05 per cent, all ages combined, all the way to 3 per cent for the most elderly, including in Western nations, is a hard number. Every time we do it. And remember: we're doing it for peaks that should never occur there, that are exactly coincident with vaccine rollouts.

Just to give you an example of how much resistance we're getting in this work: The four articles on India that didn't even mention the vaccine rollout. There was a fifth article on India that looked at Bombay, I believe, in more detail, the large urban centre. And they saw the same peak again, but they argued that it was due to the Delta variant.

Now, we looked at that. We were critical of it because when you look at what they actually did, they adjusted the virulence of the so-called presumed Delta variant in order to get the mortality that they were observing. So it was not an *ab initio* determination of the virulence of the pathogen they were proposing; it was adjusted virulence in order to explain the death. That's the level that they are pushing these variants. When I read the literature on variants, I think, wow, this is incredible because they're very small populations that are being analyzed and not selected at random whatsoever. They go to clinics. They're analyzed. And from this they use computer models to, they claim, tell us what fraction of the infections are due to a particular variant. And they make these wonderful graphs with computers. It's completely unreliable.

When you read the methodology that they're using, they admit in all the footnotes how unreliable it is. I am shocked to see scientists reproducing those graphs of how many variants there are and which variants are arising and the proportion of— Making these beautiful graphs straight from these websites that are funded by pharma. I'm shocked to see scientists using them and believing them and interpreting their own studies in terms of the prevalence of these variants. I think it is garbage science. That's my impression. It's not my direct area of expertise. You asked me a question, so I'm overflowing a bit. But I think that the variants stories are garbage. That's me. And I have direct experience of that with India.

Now, there were peaks in Australia. At the same time— If you believe the scientific literature, at the same time that the Delta variant was causing this peak in India, it was the Omicron variant that was causing something in Australia. But really, the peaks in Australia that they were concerned about were exactly coincident with the rollouts of the vaccine. So I did a deep dive into how they determined these variants and decided for myself that it was garbage, and that every time I needed to challenge it, I would: I would look at what they did, and I would point out the errors and the incorrect assumptions.

[01:10:00]

So we did that for India. And I could go on about— Every time I read scientific articles claiming things about COVID-19, I find huge errors. This is bias. It's not science. It's bias. Sorry, I'm going overboard here. I'm stepping outside of my all-cause mortality expertise, but I'm shocked at the degradation of science in general.

Commissioner Massie

Maybe a last question. I mean, your analysis is very thorough, but you're using methods that are pretty standard methods, right? So how is it that no other team has done similar analysis and generated data that would either confirm or challenge your data in a meaningful way?

Dr. Denis Rancourt

Well, there's not a lot in the peer-reviewed scientific literature. A lot of our work is also not peer-reviewed. But there are people looking. There are more and more ad hoc scientists, if you like, looking at all-cause mortality data. And some of them are making very useful comments.

Now, with my statistics background our group was able to develop statistical analysis methods that go far beyond classic epidemiology. Because the classic epidemiological view before COVID was to simply put, essentially, a sinusoidal curve through the seasonal variations and to try to extract something from that. It's not a sinusoidal curve; there's big problems with that. So we had to, in a sense, reinvent the wheel to develop more robust methods that include error propagation and everything. So we've done that.

But any trained scientists of the government or an academic researcher who knows about statistics and understands data can do this. And Statistics Canada does do good work on mortality and does quantitative work and error propagation, so they can all do it. But for some reason they don't want to see it. They don't want to— It leads you— The data leads you to concluding things like, "There was no pandemic," and "The vaccines caused death." And they don't want to see that.

Commissioner Massie

Thank you very much.

Commissioner Drysdale

Good morning, Doctor. I have a couple of questions. You were, in your discussion, talking about different age stratifications and the effects of the vaccines and the peaks and what not. But you didn't specifically talk about probably two of the most helpless—two of the most at-risk age groups—at least, not specifically. And that is babies, both prior to birth and after birth. Did you look at the incidence of death in the womb and death of babies throughout that time period?

Dr. Denis Rancourt

No, we didn't look at it. We confined ourselves to all-cause mortality data that could be obtained on a per age group basis. For example, we have many countries where we can look at the zero to five-year-olds and things like that. But these are small numbers of deaths, relative deaths. You will remember one of the graphs I showed that the relative

increase in all-cause mortality for the youngest group was fairly small compared to the other age groups. So it's hard to detect quantitatively from this kind of method.

However, it's the kind of thing that's easy to do from clinical observations, right? All deaths are recorded and premature deaths, and so on. So other researchers using other methods should be able to do this very well.

Commissioner Drysdale

Yes. We heard testimony, I think it was in Quebec City, from one of the experts with regard to pregnant women getting the vaccines. I believe under questioning one of the witnesses said that it was conceivable that a pregnant woman through the course of her pregnancy could get three shots. The first one in the first trimester, the second one a month or so later, and the third booster just before delivery. They also talked about the correlation: I think it was a statistical correlation between the number of vaccine injections you got compared to the risks. Again, I'm guessing that you haven't looked at those numbers.

[01:15:00]

Dr. Denis Rancourt

Every time I read the safety evaluations done by the pharmaceutical industry in order to get these vaccines approved on an emergency basis, it's like I'm in a nightmare. It's incredible. That's all I can say.

Commissioner Drysdale

Well, one of the other things that came out in previous testimony was that doctors were seriously promoting the vaccines to pregnant women. We also heard that one of the reasons for that is they said pregnant women were susceptible to COVID. We also heard there were no or few studies confirming that pregnant women were. I'm wondering if you looked at the reported mortality rate of women in pregnancy. There are statistics available from Statistics Canada that report—I think the incidence of death prior to COVID in pregnant women was one in 15,000.

I was wondering if you looked at whether there was any kind of increase in that.

Dr. Denis Rancourt

Well, again, that's a specific area of mortality, if you like. Very targeted. And the numbers are small compared to an entire jurisdiction or by a whole age group. So I don't have the resolution to look into those things by the methods that we're using. But I have to say the following thing: When they justify these dangerous medical interventions on the basis that you may get COVID or that you're susceptible to getting the so-called COVID, you have to ask yourself, what the heck are they talking about? Because my all-cause mortality data, which is absolutely robust, suggests that there was no particularly virulent pathogen on the planet. It did not happen.

Now, clinicians and emergency people are wearing glasses where they look for it because they've been told. And they're seeing all kinds of things that they would see at other times if they'd been told the same kind of thing. So they're wearing their COVID glasses; everyone's getting kind of crazy. But in the end, there were not people dying in the street in most

places. There was no particularly virulent pathogen. People have to grasp that. There is no fundamental reason to do anything special. And this is now a completely firm conclusion.

I mean, if mortality cannot be used to draw this kind of conclusion, then we're living in a mad world where whatever they say is true. It's all about whether there was something that happened on the planet that killed people. I can look at all-cause mortality and I can see an earthquake in Chile. I can see a heat wave that lasted three days in Paris. I can see a World War. I can see the Vietnam War. I can see an economic downturn as causing an increased mortality. I cannot see any of the previously declared pandemics after the Second World War. They're not there.

So we have to reset our thinking and start to recognize that the virologists have been exploiting us and have been screaming fire where there's not really anything present, as far as I can see. If we can't go back and look at the actual data of who's dying, where, and when, and what does it correlate to, then we can't do anything.

Commissioner Drysdale

That kind of leads me into my next question. And that is, you were talking about estimated vaccine deaths in Canada and you put that number—estimated around 30,000 people. Being a statistician and interested in history, can you tell me when was the last time something happened in Canada that caused 30,000 deaths?

Dr. Denis Rancourt

Well, it sounds like a lot, but it's not a lot when you look from the perspective of all-cause mortality. In the sense that there's a seasonal variation and every winter far more people die than in the summer. So on that scale—and also the amplitude of that seasonal variation has been decreasing historically since the Second World War. It was much higher and it's been decreasing. It follows the health status of the population, the age of the population, but also the living conditions of the population.

It is dramatic to see in European countries, for example, how big it was just after the war and the very gradual decrease.

[01:20:00]

And then, beyond just the age structure changes, you can actually see large economic downturns and a shift in economics if you like: you can see that as a gradual increase in all-cause mortality. These are big effects. And so even though 30,000— From a forensic point of view, they killed maybe approximately 30,000 people. We're refining that number. They **definitely killed people. This was a huge crime. But in terms of the scale of the mortality for the whole nation, it's maybe not that great.**

Commissioner Drysdale

Well, perhaps I asked that question in the wrong way. Because you have an overall excess in mortality. And a portion of that in your presentation you said would have been caused by some of the measures, some of the other effects of the measures, and some of the vaccines. So in an all-cause excess mortality over that period of time, what was that number, plus or minus?

Dr. Denis Rancourt

Yeah, I think the mortality in Canada— Roughly speaking, because we're still doing the analysis for Canada in detail, I think even though the mortality on a per capita basis in Canada is much smaller than the U.S.—factor five, okay—the situation is similar to the U.S. in that there was a lot of mortality before the vaccine rollout. And then there's a lot of mortality that continues after the vaccine rollout, and there's a good portion of that mortality that's directly due to the injections.

I think that is generally true in Canada, as well. Like the mortality of young men in Alberta happened before the vaccine rollout. And the higher mortality in certain provinces is before the vaccine rollout. And that continues, there's still that trend. So the strongest evidence we have is when you get an actual peak in an unusual place that is directly synchronous with a rollout of a booster or a dose or something like that. It's similar in that sense to the U.S. But Canada is unique in that 2022 is a high mortality year compared to the previous two years. And there are only about 10 or 20 countries that are like that. Canada is one of them.

Commissioner Drysdale

You talked a little bit about Statistics Canada and we had witnesses in previous hearings that didn't use Canadian numbers. They talked about Australia, they talked about United States, they talked about Germany. And what they said was that the statistics available in Canada are not there and they are delayed significantly. For instance, Statistics Canada still has not released final numbers on mortality for 2021.

Did you experience issues with getting the detailed mortality numbers in Canada that this other researcher had?

Dr. Denis Rancourt

Yes. At the beginning of the pandemic, where I wanted to get to work as soon as possible, it was very hard to get good mortality data for Canada—even though many other Western countries, including the U.S., were putting them out very quickly. We wrote to the people responsible in Canada and basically, we shamed them. We said, "Look, here are the other jurisdictions. This is what they're doing. We're supposedly in a pandemic here; you cannot not put this data out." Within a month, we started getting data. I'm not saying we directly caused that, but we were among those that voiced very serious concern about their slowness. But they remain slow and behind many European countries and the U.S.

For example, I showed today the year 2022 for Canada. Well, that came out a few days ago, but it's been out for quite a while in most other places. So it's slow. And there are certain provinces on a by-province basis that really lag behind others. Manitoba is a good example. **They're very slow. We still don't have Manitoba's data. That should be up to date. It's far from it. So when we make comparisons between provinces, we have to leave Manitoba out just because it's so darn slow to get the data. But the national data is reliable and it has just come out for 2022.**

But most other jurisdictions in the Western world have many months more data. So Canada has been slow and I don't understand why that is.

Commissioner Drysdale

Mr. Buckley, after testimony previously, did we not send out an invitation to the head of Statistics Canada or a responsible person in Statistics Canada to attend these meetings and discuss this with us?

[01:25:00]

Shawn Buckley

Commissioner, I can't say from memory if we specifically sent one out to a Statistics Canada person, but I can get that over the break and report back.

Commissioner Drysdale

I appreciate that. Also, Doctor, your statistics deal with what has happened. And when we're talking about vaccine deaths, is it not reasonable to assume that if you're giving vaccines that are causing immediate death, there is a strong possibility, or a possibility that long-term deaths will continue to accrue because of that? And of course, we have no idea what that will be in the future.

Dr. Denis Rancourt

Yeah. In terms of answering that specific question, a more powerful approach is to look at adverse-effect monitoring. In one of our papers, we analyzed the VAERS [Vaccine Adverse Events Reporting System] database. In that study, which is among the studies that I've given you, we showed that there is an immediate peak that lasts a few days right after injection. And then we showed that there's an exponential decay, from the time of injection, of death that lasts at least two months. You cannot have an exponential decay with such an unusual decay time if it's not causally connected to the injection. We're sure of that.

Now, there are probably all kinds of other physiological effects and they may last a long time, and people are talking about accelerated cancers, and so on. What I can tell you from all-cause mortality is that there are many jurisdictions that from the time of the initial vaccine rollout, and where they're maintaining the vaccines, you enter a regime of higher mortality. It's a very definite regime of higher mortality. The summer troughs don't come back down to where they should be. It stays high. That is the case in Australia, Israel, many jurisdictions. So there are clean countries like that that allow you to conclude that there's probably a long-term resistant effect on the death.

And you have to appreciate that from jurisdiction to jurisdiction, it's extremely complex. The populations are different, the treatments are different, the pathogens are different, **everything's different. For example, it was a nightmare— We spent years analyzing the U.S. data just trying to understand why each state is so different. Finding the correlations that we did was a lot of work. It's going to be almost impossible from all-cause mortality to say that there are deaths induced by the injections that are a year later, for example. I think that's going to be impossible to say from all-cause mortality.**

So I think there, you have to rely on autopsies and things like that.

Commissioner Drysdale

I guess what we're saying is we're never going to know because, as we've heard from testimony, certain jurisdictions have forbidden autopsies on COVID-19 death patients.

When deaths go up in the long term in different areas— Of course, it wouldn't be a year later if there were rapid cancers or something else. You see that happening now, they wouldn't necessarily relate it to the vaccine. You would think that that would still be reflected in an increase in all-cause mortality, but I guess, due to the complexity overall between jurisdiction and jurisdiction and province to province and city to city, we're never going to know the answer to that.

Dr. Denis Rancourt

That's true, but I would add something else. When you study all-cause mortality, you quickly realize that it's a very robust feature of a population. It's really hard to get more deaths than usual. You have to have an earthquake or something really special. So you generally have a certain amount of death per population given the culture and the health status and everything. And that's very robust.

So any of these excess mortalities that we measure, that means something very dramatic is going on. And like I said, we've seen economic depressions, wars. We've seen those things directly. Everything that we see related to COVID looks like a societal transformation that was imposed. That's what we're seeing. It's really about the measures, including vaccines.

This was an assault against people, and it killed many people. That's really the conclusion.

[01:30:00]

I can't see how to get around that.

And the other big thing, which a lot of scientists have a hard time wrapping their heads around, is there was no especially virulent pathogen. There is no evidence of the spread of a viral respiratory disease. In fact, there is counterevidence that disproves that that could be the cause.

Scientists have got to look at our data and wrap their heads around that because many of their sentences start with, "They got COVID, we had to do something." "There is a high probability of being infected." "Which are the populations that are most at risk from getting COVID?" This kind of thing.

That thinking has to be reset. Otherwise, we're never getting out of this and they will keep doing this whenever they want. They will declare pandemics whenever they want. And they will assault the population in these kinds of ways anytime they want, if we don't start resetting it. The way to reset it is to use hard data that cannot be disputed— And that is mortality data.

Commissioner Drysdale

My last question. I wouldn't ask this of any other witness. And the reason I ask you this, Doctor, is because you are not only a statistician, you are a physicist, and that means a particular thing. Physics is a very fuzzy thing and you need to ask all kinds of basic questions and understand where you are going. You are a professor of business, as I understand as well, so you look at a broad range of things and causes.

And so my question to you is this: Why? Why did they do this? Why did they potentially cause the deaths of millions and millions of people worldwide? And I know the statistics numbers don't give you this answer, so I'm boxing you into a corner here, Professor.

But I'm asking: when you were looking at these numbers and you were seeing these conclusions, you must have asked yourself, or your team must have asked, "Why?" I would like to know what those discussions may have been. If you're comfortable—

Dr. Denis Rancourt

I don't know if I'll let you into that room.

One of the articles I included in my book of exhibits is an article I wrote in 2019, which is about geoeconomics and geopolitics since the Second World War. I believe that that really gives the proper analysis framework to answer a question like that. I believe that this was a military rollout of an injection. I believe that it was— They wanted to be able to practise and demonstrate that they could inject everyone. Many commentators have said, "Why would they want to inject people?" And injections are the most powerful bioweapon in the sense that you don't have to rely on transmission of a disease which could affect your own people and this kind of thing.

You're directly injecting the body of a person with something. That is a very powerful thing to be able to do. For the military to be able to roll out injections of an entire population is a very powerful thing. You can target certain groups, you can target certain jurisdictions, you can do whatever you want if you have a way of injecting everybody, in a military rollout, very quickly.

Now, therefore the injection itself can be a weapon. But also, it can be the antidote to a bioweapon. So it can be a way of providing an antidote to your population of a bioweapon that you have released. We're talking about biowarfare. In my view, this was an exercise in biowarfare. And the Russians have said that plainly. They have talked about the bio labs that are in Ukraine that they have now taken and have all the data for. They have talked about what's going on here. And they have given historic examples of bioweapons and what it looks like when they're used.

So this has been analyzed by other countries. Our media don't talk about it. But in my view, geopolitics did not disappear like they'd like us to believe. Geopolitics has been continuous and is the biggest wheel that drives the world. When you analyze it, you see what happened when the Bretton Woods Agreement was withdrawn from by the U.S. unilaterally. You see what happens when the USSR dissolved. You see huge tectonic shifts

[01:35:00]

in the economic structure of the planet and how populations are affected by that in Africa, Latin America, elsewhere—including Europe, Japan, and Canada. Canada had many social economic transformations as a direct consequence of the dissolution of the Soviet Union, and the accelerated so-called globalization that occurred immediately afterwards.

So these are the big trends and war is a big part of it. The Pentagon has said it is going to destroy China in the next 10 years. The biggest part of the Pentagon budget right now is to encase and encircle and isolate China. There's a military base and naval presence like we've never seen before around a country that is thinking, what do we do and how do we defend against this? And can we sign an agreement with Russia to have these supersonic weapons that destroy ships? This is the level that these people are thinking at right now. So, COVID is just part of that. It's just part of that. In my view. That is my view. I've dared to talk about it. I've analyzed it from my perspective, but it's just an opinion.

Commissioner Drysdale

Dr. Rancourt, I'd like to thank you for that testimony, your courage to give that testimony. It gives a perspective to this whole thing.

Folks sitting in the audience, including myself, when you're watching the numbers—and I have a numerical background, it has a certain meaning. But when you put it into human terms the way you just did: that's probably the first- or second-most chilling thing I've heard in the last 20-some odd days of testimony. Thank you, sir.

Dr. Denis Rancourt

My pleasure.

Shawn Buckley

Denis, there are no further questions from the commissioners. So on behalf of the National Citizens Inquiry, I sincerely thank you for coming and testifying today.

Dr. Denis Rancourt

It was my pleasure. It was my honour.

[01:37:30]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 2: Natasha Gonek

Full Day 1 Timestamp: 02:17:50–02:59:45

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

So our next witness today is attending virtually, Natasha Gonek. Natasha, can you hear me?

Natasha Gonek

Yes, I can hear you. Can you hear me?

Shawn Buckley

Yes, we can hear you fine. I know that you have a slide presentation that also introduces you. But I want to, after I swear you in, introduce you a little bit. But can we start just by having you state your full name for the record, spelling your first and last name?

Natasha Gonek

My name is Natasha Marie Gonek. First name is N-A-T-A-S-H-A. Last name is Gonek, G-O-N-E-K.

Shawn Buckley

And Natasha, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Natasha Gonek

I do.

Shawn Buckley

So my understanding is you have a lot of experience in investigation and regulatory colleges. You have been a workplace health and safety advisor. You have worked at the Office of the Chief Medical Examiner as an investigator. You have worked at the Alberta

College of Paramedics as a senior advisor, complaints, and investigations person. You have worked at the College of Registered Nurses of Alberta as an investigations officer [Exhibit OT-6].

You are currently a consultant, advisor, and advocate, and you are here to share with us some of your thoughts and findings concerning colleges and changes in their disciplinary procedures. So I think I will just ask you to start explaining that to us.

Natasha Gonek

Great. Thank you very much. All right, so I'm going to share my presentation [Exhibit OT-6q], and I do have some additional appendices, so hopefully they'll move smoothly as I go through them. Can you see my screen now?

Shawn Buckley

We can see your screen, although— Yes, now we see your slide.

Natasha Gonek

So you went through some of my background. And I'd just like to add a little bit to what I've been doing since the end of my employment, for not consenting to providing my personal medical information, as an investigations officer.

I have been consulting, advising, and advocating for professionals, patients, and their families. You know, this has included advising in relation to regulatory complaints, union issues, patient care concerns, and other employment-related issues. The level of harm that I'm witnessing due to everything from the COVID measures— It ranges from patient death, neglect, refusal of care for not submitting to either testing or masking. You know, it's abuse. There are suicides, alienation, inappropriate care from regulated professionals, and refusal of care because of vaccine injury. And then disciplinary action by employers and regulators, and this is what I want to get into today.

Okay, so like many others have testified here, I've been gathering information and evidence since COVID came into the picture. As an investigations officer at the time, I really looked at what our role in the investigation is—

Shawn Buckley

Natasha, can I just stop for a second? Can you turn your volume down a little bit on your side? Because we're getting an echo coming back.

Natasha Gonek

Sure. Hopefully that helps.

Shawn Buckley

No, I think we wanted your volume turned down a little bit.

Natasha Gonek

Yeah, I did turn it down on here.

Shawn Buckley

That is a little better, I'm sorry to interrupt.

Natasha Gonek

No, that's quite all right.

The first thing I want to talk about is the actual role of a regulator because I'm not sure that the public is well aware of what these regulatory colleges are. So just a brief little outline of what the colleges do.

So the colleges are private, not-for-profit corporations. It does vary with the setup a little bit, province to province. I'm just going to speak in some generalities. They are designated to self-govern the profession in their province. In Alberta we have the *Health Professions Act*. And the very number one mandate and role of the college,

[00:05:00]

probably the most important thing for people to understand as I share information, is that "the college must carry out activities and govern its regulated members in a manner that protects and serves the public interest." It's for this purpose that the colleges are 100 per cent membership funded. They do not receive any government funding, and the regulators are to be independent from the employers in the industry, any stakeholders, and are not to operate as an extension of the government. They are actually there to provide the oversight of the professionals that they regulate.

And so the oversight during the pandemic as this started to roll out, when, as an investigator, I looked at it: we had more obligation to protect the public at that time and even more obligation to ensure that the public was properly informed and that members were properly instructed to continue with open discussions—to discuss what they were seeing on the front lines. And number one, to make sure they were still acting in the best interests of their patients no matter what direction they were being given.

So I have a slide here to bring up first, and it is from the Canadian Nurses Association. In Canada, the Canadian Nurses Association sets the code of ethics and standards of practice. And these are adopted across Canada by most of the provinces to ensure consistency. This organization has put out a document called "Nurses' Ethical Considerations During a Pandemic." And for the purposes of this presentation, I have just cut and pasted page eight of this, and I have highlighted some sections on it that are extremely important.

I want people to keep in mind some of the previous testimony that they have heard, **especially from nurses who are being disciplined by their college, when I read these highlighted sections.**

The Canadian Nurses Association code of ethics establishes dignity as a primary nursing value. They go on to say here:

While nurses and nursing students are the primary whistleblowers in the healthcare system, too often they face negative consequences for speaking up about ethical issues in their practice. This potential for negative reprisal has a silencing effect on nurses' voices.

And yet, when we look further, there was a final report after the Ontario SARS Commission and they stated that:

Ethical practice is supported when health system administrators and governments listen to and act on the concerns raised by nurses, other care providers, and the unions that represent them. Nurses' voices are an essential resource in preventing and mitigating the harms a pandemic will cause to the dignity of people in their care.

We've heard a lot about the actions and the harm of vulnerable people and this ethical consideration actually addresses this as well. It says:

Vulnerable people, such as residents in long-term care, do not lose their right to be treated with dignity and respect, even in pandemic circumstances. In all situations, especially during a pandemic, it's essential that the health-care environments encourage nurses to use their voice. Such an environment "sponsors openness, encourages the act of questioning the status quo and supports those who speak out in good faith to address concerns."

They specifically identified the COVID-19 pandemic and said that "some nurses are speaking out through the media."

Nurses must not be made to fear using their voice in this way. Because nursing is one of society's most trusted professions, nursing administrators, regulators, and professional associations all share the responsibility to support nurses in speaking the truth about what's happening at the forefront of the pandemic response.

I think that document probably echoes quite heavily with a lot of the people listening who've heard the stories and witnessed,

[00:10:00]

even in their own groups of people, the practitioners that are being disciplined for following the guidelines of those who write their code of ethics for their profession.

So the big question is: Why are the regulators choosing to operate in a manner that actually questions their ability to self-govern the profession in accordance with their legislative requirements? I've been asking this question from the beginning: Where's the direction coming from? And why are they just going along with that instead of properly advising the profession?

So when looking at the regulatory structure, the thing I'm actually going to address right now is some information that hasn't been presented, as far as I'm aware, before. I haven't seen it in any other testimony. And it's related to fees. The regulatory structure specifically keeps the colleges and the regulators out of setting fees. They must not set fees and negotiate for any of those treatments for service or act as an agent for that.

And so at this point, we're going to move into the first of the examples that I have on that.

This was a document put out by the Alberta Healthcare Insurance Program [Exhibit OT-6c]. So just a little bit of a background: healthcare professionals in many fields have billing codes and they're able to charge fees and that's how they're reimbursed for their services. Nobody's saying that there's anything wrong with that. These professionals, however, are

very aware of their obligation to ensure that they're only performing and billing for care that the patient requires and has consented to.

So the regulatory bodies in this case are responsible for ensuring that the regulated members are following proper billing practices and that they're investigating complaints related to improper billing or fraudulent billing. And the regulatory bodies would also be responsible for cautioning their members should the government put out a fee for service that may put their members into a position of a potential ethics or practice violation.

And there's an overarching principle that we look at when doing an investigation when there's a fee for service involved: just because you have a billing code, just because one is provided and you can charge a fee for that service, does this mean you should? Does this mean they should have? And so when we look at, from an investigative standpoint, that being provided, it does raise flags here in relation to the fees I'm putting up now.

The Alberta Health Care Insurance Plan put out this COVID-19 Vaccine Awareness Program. Now, just prior to this coming out, our Chief Medical Officer of Health had publicly discussed the need to identify low vaccine uptake areas. And also, please remember: The Alberta government was offering in June of 2021, \$3 million in a lottery, so three prizes of \$1 million to uptake more vaccines into people. Later, in September of '21, it offered a \$100 gift certificate for anybody who took the shots. So there was a lot of incentivization going on at the time.

This bulletin went out to physicians. Hopefully it's easy for people to read, but this came out July 2nd, 2021. And I would like to scroll down to the "Physicians in Targeted Areas." So this is where local geographical areas were identified by the Alberta Health Care Plan and the officials. And I'd like people to take note of who was being targeted directly with this billing code.

And I'll go into what the criteria was for the physicians. So the detailed notes of this were: "telephone advice and counselling to a patient or their agent regarding COVID-19 vaccine."

[00:15:00]

And the billing code allowed them to bill \$20 for that telephone advice. It was a temporary code to support COVID-19 vaccine uptake in local geographical areas where vaccine uptake is lower than 50 per cent. And those are those previously identified in the table above.

There were some criteria that the physicians had to follow: that this [fee] could only be claimed for a patient who had not yet received a first dose of the COVID-19 vaccine; and it could only be claimed when the physician provided the counselling or education to the patient or their agent regarding COVID-19 vaccine, and that the physician or a qualified health care professional determined the eligibility of patients for the COVID-19 vaccine by accessing their immunization status, and that would be on Netcare.

Now, when I saw this information come out—and it's not easy to find—it raised a significant flag in the process that was involved in being able to access and call these patients. So this is a position already where there's an imbalance of power between a physician and a patient. These are patients who are not asking to have their doctor look into their COVID vaccination record; they're not consenting to that. They're not consenting to the nurse accessing that record, or whoever that other agent might be with access permissions to determine their eligibility.

And then the phone call from the physician, where the patient hasn't asked for that to occur. Those are all very significant patient/doctor issues that really could lead to some pretty heavy coercion or the inability for a patient to feel like they can say no. It really does damage that physician/patient relationship if that individual did not want that consultation and did not want to be assessed in that manner.

Shawn Buckley

Can I just stop you for a second, Natasha? So this billing code is also for promoting the vaccination, not for giving advice as to whether or not you should be vaccinated. Am I right about that?

Natasha Gonek

That's correct—and this was not for providing the vaccination. This was simply for calling and providing education. It was their awareness program. It was for them to call and provide education to that patient.

Shawn Buckley

Okay, thank you. Go on.

Natasha Gonek

Then there were two other bulletins that came out from Alberta Health Care. One was July 16th [Exhibit OT-6a], opening it up, and it was also relaying information, and opened it up to all physicians in the province. These were also allowed to be retroactively claimed. And then I did find one more bulletin, August 17th, 2021, again related to the same program. And then they were allowing an extended time to be able to bill for that service. So the criteria did not change.

Now, the other billing code that I want to address is in relation to pharmacists. I'm not sure if pharmacists themselves actually had a code for calling people. However, I have spoken to many seniors who did inform me that they received a call from their pharmacy. They were told they were eligible to book their COVID-19 vaccine, and they had said they didn't ask for that phone call.

It would be interesting to be able to go in and see all the billing codes that were provided. And in that, it would probably be the easiest investigation to complete because anybody who was participating in doing this would be tracked based on all their billing, plus all their access to the system,

[00:20:00]

where they're inappropriately looking into a patient's medical record without being asked for that assessment.

In relation to the pharmacies, the pharmacies had a program set up. And I will apologize for the look of this document [Exhibit OT-6j], but every time I open it, the document seems to degrade more. I'm not sure what that's about, but I've tried saving it about six times now.

This is a bulletin put out by Alberta Blue Cross. And there was a program set up in Alberta, Alberta COVID-19 Pharmacy Immunization Program. And there were a bunch of bulletins

coming out. And this one was from March of 2021, where the pharmacies could enroll to participate in this program. And they actually had to fill out a form and sign up, and there was some training involved for them and their staff to be able to be considered for expansion into providing vaccines. This document did not talk about any of the fees involved; however, when we moved forward into April of 2021, the next bulletin did indicate the fees that were coming [OT-6g].

And I'll just briefly say that pharmacies do administer publicly-funded vaccines and they are compensated for that. So that's not uncommon, that's not inappropriate; it is part of what they do. In Alberta, the publicly funded vaccines are influenza, pneumococcal, and DTaP, and the fees for those had just been increased to \$15. There was a ministerial order in March 22nd of 2022 for the increase—a couple dollar increase for those vaccines. However, when we roll out to this pharmacy immunization program, we now go down and there's codes for everything, for every age group eventually, that were added. But here's the claims process. And it's first mentioned in this April publication that claims for COVID-19 immunization will be eligible for a \$25 per service fee. There's a question here as to why, when pharmacies are already provided with the ability to provide these publicly-funded vaccinations, and they already had a fee schedule in place: Why was there a \$25 fee added for pharmacies that actually provided the COVID vaccine? And only related to the COVID vaccine, there wasn't an increase across the board.

In May of 2021, there was an update to this [Exhibit OT-6p] and this update is quite interesting. Because here, they announced that Alberta Health has applied a premium of \$10 per dose, increasing the fee from \$25 to \$35 for COVID-19 vaccination administration on a Saturday, Sunday, or statutory holiday. And they were able to retroactively bill for that increased fee. And you can see that these are Blue Cross documents.

Again, I haven't edited them; they're degrading on me for some reason. So there's not an issue with being reimbursed when they're providing care. But when you're looking at fees, you're looking at incentivization. And when you're personally witnessing advertising in your community and on social media for clinics: "this weekend we're going to have a clinic related to COVID-19 vaccine at such-and-such pharmacy." There were signs all over our neighbourhoods, there were signs on our social media pages, and there really needs to be a fulsome look at why. Why was this occurring? Why was the incentivization there? And why was there no oversight on this?

[00:25:00]

And doctors and nurses and pharmacists who were giving vaccinations: What other incentives were they potentially receiving? I think that's also something that needs to be looked at quite heavily. When healthcare providers are given a code by the government, **when a professional is given that opportunity to charge for their service, they are then knowingly making a choice to participate and follow whatever the steps are in order to obtain that.**

I want to make that really clear: these aren't people doing this without the knowledge of what they're doing; without knowing that they should be considering whether what they're doing to access patient records and cold-call patients, or put in for those extra fees and run extra clinics on a weekend. They have knowledge of what they're doing. So I believe that there really does need to be an investigation that traces that flow of money.

And we didn't just see that in healthcare; we saw it with governments, with service providers, with foundations, institutes, employers. Were the professionals actually cautioned over their ethical violations by their regulators?

There's a federal document I'm going to share that actually links into some of this [OT-6t]. And I encourage everybody to go to their regulator's website and look at the communications that went out. There were very specific communications going out, directing physicians, directing patients, telling them there's very few exemptions for any of these mandates, and really giving inappropriate communication about what should be discussed, and that other members should report somebody if they see that they're discussing something outside of the given speaking points of their health agencies.

Now, this fund actually gives some overarching look at where some of this information and where some of these programs might have come from. And I'm not sure if anybody's ever looked at this page, but it was actually kind of stomach-turning to go through and see all of the agencies, the institutions, the educational institutes, and who they're targeting.

I wanted to bring this in because it might close some of the gap on what we're seeing here. And I'm going to identify just a couple of lines out of here: "Through the Immunization Partnership Fund [IPF], the Government of Canada is helping close the gap among populations with lower vaccine uptake by enabling informed vaccination choices." So that's the purpose of this fund. And I'm only going to highlight the first point on here because it states that "This funding is designed to protect Canadians from COVID-19 and other vaccine preventable diseases by supporting our health partners in three [priority] areas." And again, the first one is the most significant. It says to: "Build capacity of healthcare providers as vaccinators and vaccination promoters."

Now, let that sink in for a minute. I mean, this directly undermines the duty of care that healthcare providers have when handling their patients. This type of statement looks to the grooming, the funding of education programs for professionals, so that they're pushing pharmaceuticals and government messaging. And again, I encourage every Canadian to go look and see where their \$45.5 million in funding went to. And I mean, you can just look at some of the first ones: Alberta International Medical Graduates Association. And they were targeting improving COVID-19 vaccine literacy acceptance among newcomers.

There are specific groups identified in here: native communities, black individuals. They have newcomers, they have long-term care targeted. They have youth targeted, pregnant women. The list goes on for pages and pages. Please go and look at your regulator's site

[00:30:00]

and to some of these documents that I'm pointing out. I'm not sharing anything that isn't publicly available. Some of it's just really, really hard to find.

When we look at all of this, the biggest part here is: How did our regulators fail? The biggest part, the biggest question, and the biggest thing that I've seen in the people I've been helping, the patients that I've been helping, and helping guide in the system is: Whose interest did these regulators act on when they were directing their members to only convey the government and health authorities' messaging? And that is very clear on the regulator site.

And there are a few that didn't put out communications to their members. Well, your silence as a regulator there, if you weren't saying anything and thought that that was okay as well, it's not.

Shawn Buckley

Natasha we're getting a little tight on time. I'm just going to ask you to focus as we move along.

Natasha Gonek

Yeah, most definitely. So you know, there was interference in the physicians and in their ability to treat their patients and direct their care—as well as in other caregivers. These regulated colleges have a check and balance [function] for our system and that completely failed here.

The disciplinary processes have been compromised, and there hasn't been procedural fairness awarded to those who have complaints against them—and I've been a direct witness to that. So every complaint that comes into a college needs to be addressed. But it needs to be addressed from the merit of the complaint, the risks to the public, and the violations of that professional's obligations.

But the regulator's role really must come before the parroting of the health authorities, those medical officers, the government, and media messaging. Because if they're not providing a check and balance, who then is watching over and making sure that they're following their first mandate: to protect the public?

I'd like to just close by saying that government regulators and health officials as well as the media "armed" medical professionals—and professionals in other fields and employers as well—with messaging that convinced them that it was acceptable for them to violate their code of ethics, standards of practice, and the laws of our province and our country. And they did it all under the guise of public safety.

Those people then used their free will to choose to act as agents to inflict that harm—whether it was mental, physical, social, psychological, or financial—on their patients, families, employees, customers, or their friends.

The level of harm that I've witnessed in our population could and should have been stopped, had the governance part been doing their job. I think the public should really seek to have some independent multidisciplinary investigation teams assigned to conduct some audits and to conduct in-full, wholesome investigations. You know, if we're going to hold some accountability. And everybody's seeking accountability—

Shawn Buckley

Natasha, I'm just going to ask you to focus again, just because we're tight on time. Can I turn you over to the commissioners for questions?

Natasha Gonek

Most definitely.

Shawn Buckley

And the commissioners do have some questions.

Commissioner Drysdale

Good morning, how are you?

Natasha Gonek

Not too bad, how are you.

Commissioner Drysdale

I want to make sure that I understood what you said. Did you say that a normal vaccine, like when they give you something that wasn't the COVID vaccine, they get about \$15, \$14, \$15 for that?

Natasha Gonek

Yes, that's correct. It was \$13 and that was changed, in Alberta, to \$15.

Commissioner Drysdale

Okay, so if a doctor was to give us whatever vaccine apart from the COVID, it was \$15.

Now if I understood you correctly that in Alberta, if they gave you a COVID-19 vaccine on a Sunday, they got \$35. And if they phoned you the day before, they got another \$20. So they were making \$55 a vax in Alberta under that program. Is that correct?

Natasha Gonek

So the \$35 was for the pharmacy fee. That \$20: there may be a fee for the pharmacist. I have yet to be able to find any fee schedules,

[00:35:00]

they're really hard to find. However, that \$20 fee was for the physician to contact a patient in relation to going for their first shot.

Commissioner Drysdale

So the doctor gets paid something for giving a vax, we just don't know what it is. And the \$20 for the phone call is above and beyond that, is that correct?

Natasha Gonek

That is correct.

Commissioner Drysdale

You also talked about this federal program, and you showed one organization in Alberta—at least when I was looking at the slide—they got, whatever it was, \$499,000. Did you look into the ownership of those organizations that were receiving the money?

Natasha Gonek

I have very briefly. But if you go to that site, you can see it's pages and pages and pages of organizations. And that's, again, one of those things as an investigator that I know I'm going to deep dive on when I have a few moments to do it. There's a very important link that, once I start diving into some of these documents, you see some of the organizations that are linked to it or people that are linked to it. And you see where that funding goes, you get that "COVID-19 to zero" kind of group. And you see there's pretty consistent funding when you start looking at the agencies. So yes, I haven't looked at it, but it is on my list to do.

Commissioner Drysdale

You also talked about programs. Generally speaking, we're talking about programs that were either from the Alberta government or the federal government, which were focused on promoting the vaccine. Did you find any programs, financing for doctors, to educate themselves about what was in the vax, what were the side effects of the vax, so that they could properly inform their patients, so they could make an informed consent?

Natasha Gonek

No, I did not see that. The only thing that I have found is, often on the regulator's websites or the associations' websites, they are linking back to Canadian government forms and documents. And it'll be deeply embedded in there.

Some of them are actually providing that link to the adverse event reporting system within Canada. I know the surveillance in Alberta has significant lists. I mean, it's probably 20 plus pages of adverse events that they're looking at, but nothing specific that educated doctors that I've found so far. It really is bumping them back to the Canadian guides that have been put out by Health Canada.

Commissioner Drysdale

In your words then, they were promoting— They were spending lots of money to promote it. They were spending money to inject it, but they weren't really promoting the—I don't know what you would call it—the owner's manual about the vax?

Natasha Gonek

Not that I've seen.

Commissioner Drysdale

Thank you.

Commissioner Massie

Thank you very much for your presentation. I'd like to summarize what I think I've heard from your talk, which is to some extent: If one agreed on the premise that we were in a very dangerous pandemic that needed to be contained using this unique approach, which is the massive vaccination, if one puts the right incentive in place—both positive to reward people that are going to engage in vaccination and to some extent negative for people that would do anything to undermine the vaccination—you end up with pretty good scores in terms of numbers of people being vaccinated.

My question is: To what extent does the regulatory framework call people to question the premise of this major social engineering that took place? And that to some extent on the positive side can show that a good collaboration between government and private sector can actually yield some very, I would say, positive results if your goal is really to deploy the vaccine rolled out?

[00:40:00]

But on the other hand, at the get-go, what's the countermeasure that could actually question the premise of the whole enterprise? Is it something in the framework of the regulator or in the culture of people that are working in these environments that could or should actually question the premise?

Natasha Gonek

Well, in the regulatory framework, these regulators had the responsibility to question what was coming out from government, right? Their mandate to protect the public and regulate their members isn't just to adopt the government message and adopt the government programs and to push the implementation of them.

The only way that the regulatory framework works is if those regulators are able to critique and criticize and push back when there is, number one, the potential for harm, or if the messaging puts their members into the position where it may create harm. So, you know, the regulatory function in this case just completely imploded.

Commissioner Massie

Thank you.

Shawn Buckley

And Natasha, that being all the questions from the commissioners on behalf of the National Citizens Inquiry, I sincerely thank you for attending and giving evidence today.

Natasha Gonek

Thank you for having me.

[00:41:59]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 3: Cathy Jones

Full Day 1 Timestamp: 03:10:07–03:33:33

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. As we recommence Day 1 of the Ottawa hearings, I'm pleased to announce our next witness, Cathy Jones. Cathy, can you please state your full name for the record, spelling your first and last name?

Cathy Jones

Catherine Frederica Jones; Cathy, C-A-T-H-Y J-O-N-E-S.

Shawn Buckley

And Cathy, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Cathy Jones

Yes.

Shawn Buckley

Now you're a fairly well-known media personality. Can you share with us a little bit about your career?

Cathy Jones

Yes, I'm from Newfoundland; and, as an actor and comedian and satirist and writer, I worked on CBC [Canadian Broadcasting Corporation] from 1986 in a show called "CODCO," where it wasn't strictly about the news. And then in '93, we started doing "This Hour has 22 Minutes." And I spent 28 years on that show—because I don't know when to quit, I guess.

Shawn Buckley

Right, so for people watching internationally, “This Hour has 22 Minutes” was a syndicated comedy program. You worked on that for 28 full years. Now, you were still there when COVID hit. You weren’t there for that long. Can you tell us what happened to “This Hour has 22 Minutes” and, I guess, basically the CBC that you experienced when COVID started to hit?

Cathy Jones

Yes, well, 22 Minutes was just basically trying to comply with the mandates and the protocols that came down with the pandemic. In March, as we were leaving work in 2020, we were off for the summer. I heard talk of a pandemic that was happening. And I was like, “Really? Okay.” I went back to work in the fall 2020, and I was a complete rebel with all of the rules and all of the stuff that was happening. It struck me as completely crazy-making that they would take my temperature to go into work. I fought this every day. I had a really rough time those last six months, and not because these people weren’t trying to be kind and wonderful to me, but because these protocols— I found them insane.

First of all, I’m a person who comes from a background of natural health and working with my own body. And I would be a person that wouldn’t take a flu shot because I’d be looking at the ingredients and stuff like that. So when I started investigating what was going on with the shots and what the PCR test was and all that, I was a pretty difficult person to deal with. Watching an audience watching comedy wearing masks was just like— I think there’s an emoji on my phone of a giraffe with its brain exploding, and that was me.

I found it really, really challenging. Just before that I had been reading a book by James Nestor called *Breath*, about how it’s important to breathe through your nose. The nose actually has all of these great qualities of having nitric oxide in it and these little hairs and everything, and the nose would block viruses. If we just breathe more through our noses, everything would be okay. The whole dismissal of the human body as capable of handling itself if it was healthy really jarred me. And I found it particularly offensive when people say, “Would you put that mask up over your nose please?” And I was like, “But the nose works!” You know, “The nose works for humans.”

So the whole thing just really— I hung in. I really was not fired for not taking a shot or any of that stuff. I was going to be leaving anyway. I just left a couple of weeks early because I was just breaking down. When they would say, “It’s time for your test,” I would start to like, look around. At some points I would actually look at the vent in the ceiling and think, “Maybe I can go out through that vent!”

I was really finding it very irritating. I was shocked. I realized how many people have spent their lives thinking “the doctor is right” and “the government is good.”

[00:05:00]

And I was like, “the government has never made any decisions except for based on profit.” And if you think this neighborhood should be preserved, if a guy comes in with money, they’re going to build condos there. And your beautiful buildings are going to be gone. The government— All of a sudden people who should have a healthy— You know, we used to make fun of the government. But suddenly it was like, “They’re right this time.”

And you know, I think it’s because of the fear, I think they made people afraid. I was listening to Robert Kennedy early on and he was like, “As long as people are afraid, they

will do anything. If they think they're doing the right thing, they will do anything. And a man will never believe a fact if his salary depends on not believing it."

There are all of these things that happened that I was insanely aware of. Of course, I was whipped up into somewhat of a frenzy. A lot of us, when we realized what was happening in this country, went into a complete overdrive that made our children get some help or something. Over the last three years, I think we've integrated the information and we've found a way to be within it. But it was a rough, rough couple of years realizing what was happening in this country. And being so shocked that more people—

It takes a long time to adjust to the fact that many people that previously I was intimidated by because they were "intellectuals," really didn't understand what was happening at all. It was really shocking to me.

Shawn Buckley

Right. You left the CBC early and you were very frustrated with the attitude they were taking. Now, after you left the CBC, what was your experience of the pandemic? You went back to Newfoundland.

Cathy Jones

No, no, I live in Halifax.

My experience was—and is today—that healthcare is in shambles. You only have to look at the documentary about Bernie Madoff to talk about regulatory boards. The regulatory boards have been asleep at the wheel forever, and everybody seems to be bought and owned. And I'm completely devastated by— Anytime that I turn on CBC and hear them whipping up the fear, it was just— The whole thing was crazy-making.

And then in 2021 finding out who was taking the shots, people that I loved, and being really scared for them. It's been a rough ride for many of us who saw what was going on. I feel like the media is complicit in a very disastrous scenario in this country.

Shawn Buckley

I just want to follow up on that because I understand your career was as a comedian, and yet you were at the state broadcaster for 28 years. So I imagine there was a culture there, and you kind of just vicariously would have known about their approach to journalism. We've heard from Mr. Rodney Palmer about a change, and I know we're going to be hearing from another witness tomorrow about a change.

And I'm just wondering, first of all, did you see a change in the culture with COVID at the CBC both when you were there and afterwards? And if so, what you thought about that?

Cathy Jones

Yeah, you know, we were free to be satirical. We were free to mock what was happening. I don't think a lot of people see what's happening in this country. What kind of country do we live in, and what is Canada becoming, when we can't— It gets pretty serious if people have been cancelled.

I mean, I'm pretty exasperated with the lack of coverage of what's really going on in this country. I wasn't part of the journalistic side of things, and I prided myself on not listening to the news. Which was kind of like, that's just my style. It's pretty disgusting what's happening:

[00:10:00]

that doctors who have dedicated their entire careers to science have lost their jobs and been disciplined for speaking up about things that make sense; that doctors whose patients maybe have a better outcome but they aren't adhering to the rules are doing okay. But doctors who actually have better patient outcomes are losing their jobs because they actually want to be healers.

There's never been a more crazy-making time in the history of the world, I don't think. And I'm shocked that CBC is still— You know, I listen every now and then to see what they're saying, and I hear them being sort of chirpy and kind of podcasty when they say things like, "Hey, the battery for the electric vehicle is going to weigh as much as the world!" And then they're like, "But, I guess that's just the way she's going." I don't understand why we aren't going, "Hey wait a minute, let's do some journalism here, and let's figure out what's really going on here." We're not really doing any investigative journalism in this country anymore.

If Mr. Johnson gives a lot of money to the country club, you don't get up at the talk and go, "Look at that guy!" You don't make fun of your sponsors. And unfortunately, that's the way we've gone. And I've been horrified— If your brother did a B&E [breaking & entering], he wouldn't be able to get a job in this country. But criminal pharmaceutical companies who have paid the biggest fines in history are able to offer anything. I don't inject things from criminals, I just don't. And these people shouldn't be able to walk the streets let alone tell us, mandate their product.

This is a dangerous situation that we're in. And it freaks me out, yeah.

Shawn Buckley

You're starting to become active. You're starting to do things to kind of try and wake people up, reluctantly. But just tell us what's going on with your mind and the journey that you're experiencing there.

Cathy Jones

You mean, am I becoming an activist?

Shawn Buckley

Yes.

Cathy Jones

I don't know! Obviously, you can tell that I'm a neurodiverse person. I have severe ADHD. I find it hard to be concise. But you know, there's nothing else to do. What I feel is that a lot of people who have an intuitive sense of what's going on, we're not the typical intellectual "straight people" as I used to call them. We're actually kind of the rebels and the black

sheep. A lot of us who meet each other realize that we are— We're not the people in the family who would do things in a very sensible way.

What we need, I feel, is to come back with simple messages. Like the messages people are getting through the narrative, "Do the right thing," kind of thing. I think we need to come back with a campaign of advertising to battle the advertising like, we've got, "DuMaurier is the best cigarette for pregnant people." We need to come back with, "Hey, have you thought about this?" We need messaging. And I would like to connect with other activists in the East Coast and start these campaigns of information.

And I think we need to work locally. I think that there are so many things that our government does without consultation. They need to be brought up short on what they're doing. City councils and local governments, we need to start locally. They put smart meters on our house and interfered with our electrical system; they never asked anyone. They don't ask us when they've increased the electromagnetic fields with small cell microwaves. They haven't asked us in this country for a long time.

There's nothing to trust about this government. And I'm on board with— Everyone feels like, "What are you going to do? What are you going to do?" The truth is this government has never been our friend really, and they've just been pretending. Now their true colours have come out. They really don't care as long as they're making a ton of money. And as far as I'm concerned, the money is in vaccines and the money is in telecommunications. And the people's health can just—who cares?

So, I'm crazy, as you can tell. But the government made me that way. Two years before this happened, it was worse than smoking for old people to be alone, to be isolated.

[00:15:00]

Two years before this happened, children should eat more dirt. Suddenly, everybody's taking the microbiome off their hands, everybody's not breathing properly, and they're not allowed to express themselves. The whole thing horrifies me on such a level. The isolation of old people, all of it goes against human life. We need each other. We need to breathe each other in. We need to smell each other. We need to be with each other.

And Canada is proving to be full of classist, ignorant people. And I'm worried for Canada unless these people wake up. The only way they wake up is when they have somebody in their family who they can quite clearly see was injured.

And people think that they're in with these guys, I think Canadians think they're "friendsy-wiendsy" with these people. But the fact is in a totalitarian regime, which this is quickly becoming, you're nobody's friend, really. There's no play there. You'll never please a psychopath, right? No matter how fast you dance, there's nothing you can do. Eventually they come for you. And there's no way to win in this situation. They really need to be, like, knocked back a couple notches. And the Members of Parliament, I don't know where they are but, if they'd stand up for the people, they'd still have a job in the future.

They're not going to have a job in the future sticking with this guy. The guy who's the prime minister up there? That guy—he's approximating human behavior.

Now I said bad things about the prime minister, so I won't have much of a future.

Shawn Buckley

Well, thank you. Those are my questions. I'll see if the commissioners have any questions for you. And there are.

Cathy Jones

Oh, hi.

Commissioner Massie

Thank you very much, Mrs. Jones.

Cathy Jones

Yeah. Thanks.

Commissioner Massie

My question is— I kind of relate to what you comment on. My question is, there's going to be a next time. So how do we prepare for that?

Cathy Jones

Well, if the people that are starting to wake up now know that we are here. And we have studied protocols. I think that we need to come back together, you know? People need to trust—trust the black sheep of the family. Trust us. We're here.

I don't know what we do next time, but I hope—gosh, don't tell me there's a next time. Oh, God. You know, that's the crazy-making part of all this, is that, there didn't seem to be— I think you wear yourself out trying to talk sense into people. If we can turn the tide so that people do become aware that they're being messed with then we'll have more people going, "Oh, gosh." I mean, there are people in this country who really think that because of the false flag thing in Ottawa, all of those blue-collar workers and wonderful people that came together were actually—

This is crazy. It's crazy, so I don't know. What do you think we should do? What do you think? I know you're supposed to answer the questions too. What should we do?

I think we need to have a campaign that shows people that we humans can survive this. We don't have to roll over for these people. We need to work locally. We need to say "All the people who live on Whiteway Street will not have a 5G tower on our street." We need to go **neighbourhood by neighbourhood and say to our city council, "by the way, you're not doing that over here."** We need to work locally and we need to let people know what's really going on—that masking is really obedience training.

I don't know. I really think people want it to be over so badly that they don't want to even watch the National Citizens Inquiry because they think, "Oh, for God's sake, that's over." It is not over for so many people who worked so hard in this country on their careers—fire chiefs, paramedics, nurses, teachers. All these people who worked so hard in good faith in this country, to be shocked out of their minds at what happened to them.

[00:20:00]

I don't think people understand the fallout and the effect on the healthcare system and what's being dismantled here. And for what? This is not the world we want to live in. They're trying to digitize humanity, and we need to fight back, fight for being allowed to be in this world. We need to be little tiny rebels every day.

A woman told me to put on a mask the other day and I said, "Yeah sure, and you promise to get your head examined, okay?" And my friend was like, "Cathy!" You got to fight every day. I mean, what else are you going to do? What do you think we should do?

Okay, you guys ask the questions. "Ve vill ask ze questions." Okay. I don't know.

Commissioner Massie

Thank you.

Cathy Jones

Anybody else?

Shawn Buckley

So one last question and then we'll take a break.

Commissioner Kaikkonen

I'll make this an easy one for you. In terms of the smart meters, are you saying the smart meters are not so smart? Wink, wink.

Cathy Jones

Wink, wink.

Commissioner Kaikkonen

You mentioned those who are owned and those who have sold their soul in some regard, or they're bought. I'm just wondering: you're free. I wonder how we can take your freedom and liberty and be an example to those who are bought and owned and change their perspective that being a slave is not the answer?

Cathy Jones

Yeah, you know, I am free. But all of us who have spoken up are— Luckily, I have \$100 in the bank to last me, hopefully, from saving. In this country when you're on TV you don't get royalties, you get bought out. But like a lot of people, I'll never do another comedy festival from CBC or another "Debaters," you know what I mean? I don't have a lot of sources of what I can do. I need to be independent, you're right.

I don't know. Yeah, I don't understand how I would convey that because I don't think people see it that way; because it comes down to security and feeding your family. But I do feel that a lot of people who refuse to see what's going on have been fooled into thinking that credentials really mean something. They don't know how to let go of what they think is their right in this country to have everything that they have. I think that the water is rising

and it has been for years. It used to be that only very poor people were treated very badly by this government. And then the water started rising, right?

It's going to rise so much that there'll be more people joining, and there'll be more people named "Karen" on our team.

Commissioner Kaikkonen

Thank you very much.

Cathy Jones

Thank you.

Shawn Buckley

Thank you. And we do have to take a break.

Cathy, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing with us today.

Cathy Jones

Thank you. Thank you.

[00:23:25]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 4: Catherine Austin Fitts

Full Day 1 Timestamp: 04:06:28–05:24:50

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry as we continue day one of three days in the nation's capital, Ottawa, Ontario. I'm pleased to announce our next witness, who is attending virtually, Catherine Austin Fitts. Catherine, can you hear me?

Catherine Austin Fitts

Yes, I can. Can you hear me?

Shawn Buckley

We can hear you fine. Catherine can we begin, I'd like to ask you to state your full name spelling your first and last name for the record.

Catherine Austin Fitts

Yes, my full name is Catherine with a C, Catherine Austin Fitts, F as in Frank-I-T-T-S.

Shawn Buckley

And, Catherine, do you promise to tell the truth, the whole truth, and nothing but the truth so help you God?

Catherine Austin Fitts

I do.

Shawn Buckley

Now, I want to introduce you and feel free to fill in after I'm done. It's just, the commissioners and many of the people that will be watching your testimony will not

understand that you operate in circles that are very high, and I want to stress that today. Right now, you are in the Netherlands, as I understand it.

Catherine Austin Fitts

Actually, today I'm in Switzerland.

Shawn Buckley

Okay well, thank you for correcting me.

You are currently president of Solari Incorporated, publisher of the Solari Report, and managing member of Solari Investment Screens LLC. You have served as managing director and member of the board of directors of the Wall Street investment bank Dillon Read & Co. You were the Assistant Secretary of Housing, and Federal Housing Commissioner at the United States Department of Housing and Urban Development in the first Bush Administration. My understanding is that the annual originations were roughly \$50 to \$100 billion of mortgage insurance servicing at the time, 320 billion of mortgage insurance, mortgages and property portfolio analysis, and pricing for 63,000 communities.

I'm just stressing that you're accustomed to dealing with big numbers and big organizations. You were president of Hamilton Securities Group. You designed and closed over \$25 billion of transactions and investments to-date and led the portfolio investment strategy for \$300 billion of financial assets and liabilities.

And basically, the point I'm trying to make is you travel in macroeconomic and political circles of the elite political class. Would that be fair to say?

Catherine Austin Fitts

Well, I would say I've certainly functioned in those circles. I would say that I function much more, not so much at a grassroots, but both at high and grassroots levels at the same time now. So I have a very wide breadth.

Shawn Buckley

Right. And it's interesting: we had a witness on before lunch who was stressing the need to find solutions locally and I thought of you immediately. So when we get to kind of solutions at the end, I'm hoping that you can share with us perhaps how getting involved at the local level can make a difference.

But my understanding—and I'll just ask you to give an explanation—but you basically see the COVID pandemic, not as a health event, but as a political and economic event. Can you share with us your thoughts on that?

Catherine Austin Fitts

Yes. So in 2019 the G7 central bankers voted on a plan called The Going Direct Reset. And what we've seen for centuries now, is every 75 or 100 years or so when the currency system gets long in the tooth, you get a reset.

And a reset is a reset of sort of the governance and management systems as well as the currency. So think of it as an economic event. And they voted on The Going Direct Reset, and we went into a reset.

If you want to do a radical re-engineering of how the financial system operates, both in governments and the private sector, obviously you can announce it and try and insist on everybody doing it, but that's not the effective way to implement. I think, part of what the reset was presented as was a health care crisis, which helped to drive and engineer many aspects of that reset, including significant centralization of the economy and much more assertion by the bankers of control of the national government. So I saw the pandemic as really, part of an operation to implement that reset.

Shawn Buckley

Okay, so just so that I understand: basically, the COVID pandemic had a purpose that was not a health purpose, but it was to facilitate the type of financial reset that we see every 75 to 100 years.

Catherine Austin Fitts

Right. And control system,

[00:05:00]

because what's very unique about the current reset is digital technology now permits for phenomenal central control. And we see the central bankers literally announce that they plan on changing us from a currency system to— They're basically talking about ending currencies and converting to a financial transaction control grid that will allow them to make the rules centrally and control centrally by controlling financial transactions.

So they are planning and have said so—that they're planning on essentially ending financial transaction freedom. And the pandemic, and whether it helps implement digital IDs or vaccine passports, is part of creating that financial transaction control grid.

Shawn Buckley

Now, many that will be watching your evidence today may not even understand what a digital currency is, and certainly would not understand the ramifications on their freedom and their privacy that a digital currency presents. And I'm wondering if you can give an explanation both of what a digital currency is and then the ramifications for both our freedom and privacy.

Catherine Austin Fitts

Sure. And I have to say I believe everybody in Canada knows what happened to the truckers, so they know what can happen with the digital currency. It's where government in that case asserts rules that say certain people can't transact, or certain people can't transact except with limits, or even bank accounts and assets get seized.

We have digital currency now. If you use a credit card, you're using a digital currency. If you make a bank transfer, you're using a digital currency. If you're not using cash, you're probably using digital currency. But what we see is an effort globally to implement something called central bank digital currencies [CBDCs], which according to the central

bankers, will allow them to have much tighter control of individual accounts and set the rules as to how money in an account can be used.

They insist that any money in your bank account is not only— It's not your money, it's theirs. They call it their expression, "central bank liability," so they think of it as theirs. And we've seen examples. For example, the nominee for the control of the currency several years ago in the United States had just published an article in the *Vanderbilt Law Review* saying: the great thing about central bank digital currencies, commonly known as CBDCs, is if we're concerned about inflation, you can just freeze everybody's bank accounts.

So one of the issues— The most important issue that comes out in your financial transaction is, we in the Western world practice a policy of taxation with representation. So the bankers may manage the monetary policy but our legislative representatives manage our tax proceeds and federal and national credit. And now you're talking about creating a financial transaction system where taxes can just be taken out of your account and you can't stop it, so you can have taxation without representation.

You're talking about— Think of it, if you're a Canadian, "We're all truckers now." You're putting together a system that can police and micromanage what you spend money on. So if they don't want you going more than five miles from your home, your money won't work more than five miles from your home. Or if they want to turn off the electricity on your car, if they want to turn off your bank account, they can and they can do it centrally.

Shawn Buckley

Right, so without there actually being physical cash, it all being digital. They'll have complete control—and basically be able to move us almost into a social credit-style system like the Chinese have?

Catherine Austin Fitts

Yes. So now what you do need is you need a smart grid in place. So they need the energy and electrical system components to make that work. And part of that is having satellites.

Whether it's the smart grid infrastructure in place or the payment systems and— Transformation of the central banks and the large banks and the Bank for International Settlements, which is the central bank of central banks. They need both a digital transaction system in place and a smart grid in place. And they've made extraordinary efforts in building that out during the pandemic.

Shawn Buckley

Now, one thing that you and I had discussed earlier, and so you've indicated that the COVID pandemic is really a political and economic event—

[00:10:00]

But really for people to understand that, I think they need to have you explain that there's kind of political systems and what's gone on with the money supply. And certainly, I expect that you'll be speaking to the U.S. experience.

Catherine Austin Fitts

Right. I'm much more knowledgeable about the U.S. I'm not knowledgeable about Canada, but I think a lot of what's happened in the U.S. has very much influenced and driven what's happening in Canada. So we're neighbours and we influence each other.

What happened in the United States in the pandemic is you had an explosion of wealth moving upward. When we started the pandemic in the United States, or if we go back to 1990 say, there were approximately 60 billionaires in the United States. By the start of the pandemic, there were 614. Within, I think, the first 12 months, the number of billionaires grew by 56 billion and wealth of the billionaire class grew by over a trillion dollars, estimated in the U.S. to be \$1.3 trillion.

Some of that came from the fact that, as part of going direct reset, the central bank injected approximately \$5 trillion into the economy. It was notable the way it was done, because it was injected— Instead of doing it through the reserve circuit, which is normally the way a central bank would inject money, it injected it directly into the economy. And what that did was that bubbled certain aspects of the economy at the same time the pandemic shut down others.

I'm going to grossly oversimplify just to help you understand how this worked conceptually. When I inject an enormous amount of money printed by the central bank into one group of people and, at the same time, I shut down all the businesses and the income of another group of people— I think, the estimate the first year was 75 million people lost their jobs— So if I inject a lot of capital available to the big companies and shut down all the small companies, then of course the big companies are in a position to significantly increase their market share by taking it from the small companies, and easily being able to pick up assets cheap. Because now people whose income has been lost or shut down or limited have reason to sell assets to generate money to survive.

So there was one fabulous moment on one of the popular media news shows where Rick Santelli, who covers the financial markets, was complaining that, in one shopping mall, all the little businesses were shut down on the theory that it wasn't safe, but in the meantime Costco was going gangbusters and everybody of course was going to Costco because all the small businesses were closed. And the other commentators were saying, "Well, yes that's science." It's science that it's dangerous to be in the small businesses but it's safe to be in Costco.

So you saw a double standard applied to the large publicly traded companies represented on Wall Street and small business. And it was devastating. I think the average after the first two years, with 34 percent of U.S. small businesses shut down and in San Francisco was as high as 49 percent. That's an extraordinary number of jobs—because small business is the job engine in the United States. So it set up two classes of characters and advantaged one very much and very much disadvantaged the other. And we saw an enormous shift in market share accordingly.

Shawn Buckley

Right, so we basically saw an incredibly large concentration of wealth at the top. And your position is that this was by design, not just some consequence of a health pandemic that hit the economy.

Catherine Austin Fitts

That's what I believe. If you look at all the efforts to implement pandemics in the past and you look at all the different steps made to plan them out, as well as the centralized control, it's very difficult to come up with a theory of most of the restrictions as relating to health as opposed to relating to re-engineering of the political and economic landscape.

Shawn Buckley

My understanding is you've done some research on basically— How there's a parallel political system in the West and basically there's not even an accounting of monies in the United States. And you've published—or there's a 2019 publication on missing money that we're going to make an exhibit in these proceedings [exhibit number unavailable].

[00:15:00]

Can you just share with us a little bit about that?

Catherine Austin Fitts

Yes. I was very concerned when I was Assistant Secretary of Housing with the extent of the mortgage fraud. And I was tasked with trying to clean up the Department of Housing and Urban Development and the mortgage insurance funds there after the S&L [Savings and Loans] Crisis and extraordinary losses in the mortgage funds. I became convinced that there was a form of systemic fraud going on.

And when I left the Administration, I went to work—having discovered GIS software—trying to map out how federal credit worked at a county-by-county level. What I discovered was there was an enormous gap between the official picture of what was happening with federal, whether it's spending or credit, and what was really happening in neighbourhoods on the ground. And it caused me to go back and look at the history of what's called the Black Budget.

From World War II on, we've had in the United States a series of laws and executive orders that make it possible for more and more of the federal budget to be kept on a quasi-secret or completely secret basis. And as that has happened, and also executive orders have made it possible to use those monies to fund corporations doing what used to be thought of as governmental—things that only highly secure military and intelligence could do—we've made more and more of this secret money accessible to corporations. And what I saw was that this money and this part of the economy was growing. I initially called it the Black Budget. And the Black Budget had grown and grown. And as it grew, more and more laws and regulations were changed to make that legal to do.

So, for example, one of the most important inflection points came in 2018, in October. During the Kavanaugh hearings, while everybody was very entertained about sort of the background check of our Supreme Court nominee, the House and the Senate—both Republican and Democrat—and the White House, who you thought at the time were fighting with each other, all got together and agreed to a new policy called Federal Accounting Standards Advisory Board Statement [FASB] 56, which basically said as an administrative policy that they could ignore the constitutional provisions, the legal provisions, and the regulatory provisions of financial management law.

If you look at our Constitution, there are two aspects of financial management described in the Constitution. One is that no money shall be spent unless it is approved by the people's

representatives, the Congress, number one. And number two, after it's spent, there shall be proper financial disclosure. And FASB 56 basically said a small secret group of people, by a secret process, can move as much of the federal budget and financial statements as they want private and secret—and no one can know what that is. So it basically meant non-appropriated money could be spent and there would be no disclosure.

And part of the problem is, if you look at how that is extended to corporations who do a large amount of business with the government and banks, so banks and corporations; if you combine that with the classification laws and some of the waivers available to private corporations through the government: essentially a vast amount of the U.S. securities market, in my opinion, does not have adequate disclosure to understand what the financial circumstances of those companies or those securities are.

We're really in a situation where progressively, particularly since starting with World War II but then a big change leap up in the 80s, we've seen less and less financial disclosure and more and more secrecy. And at this point, it's exceptionally hard for a citizen to understand how their tax dollar is being used or the money that's being borrowed in their name and where it's going.

Starting in 1998, I started to track— Again, I was tracking the mortgage fraud for the fact that large amounts of money started to go missing from the U.S. federal government. I had been told by one of the largest pension fund investors that spring, in the spring of 1997: he said they've given up on the country, they're moving all the money out starting in the fall.

[00:20:00]

And I thought he meant they're reallocating the equity investment in the pension funds to the emerging markets. I didn't understand. He meant, no, literally we're going to have a financial coup. Because at the beginning of the next fiscal year, which was October 1st, 1997, which is the beginning of the 1998 federal fiscal year, huge amounts of money started to go missing. And it got worse and worse and worse.

There was a real effort before 9-11 to get to the bottom of what was happening and stop it. 9-11 changed all of that and money continued to disappear, with the largest amount that we know of disappearing in fiscal 2015: \$6.5 trillion. And it was at that point that I was speaking publicly about the fact that the Department of Defense was missing \$6.5 trillion in one year, which is many times its budget. And, you know, a little bit less than 10 times its budget at that point. And Dr. Mark Skidmore, who's a full professor at Michigan State University and does government and government budgets, heard me and thought I must be making a mistake. He went out and checked the financial statements and discovered, no, I was right, and called me and said, "What can I do to help?" And I said, "If you and your students would do a survey, it would help tremendously."

The two agencies where money was going missing was HUD [Housing and Urban Development], which was my old housing agency, and the Department of Defense, who has run the pandemic. If you look at who really ran Operation Warp Speed and the pandemic in the United States, it was the Department of Defense. So he went out and did a survey and discovered that \$21 trillion was missing as of 2015. His study was published: it's up on our website. We have a whole website just dedicated to tracking the missing money. At that point, 21 trillion was missing from the federal budget. And interestingly enough, the official number of outstanding treasury securities on the federal balance sheet at that time was 21 trillion: same amount, which we thought was remarkable. It's up to about \$31 trillion and the federal finances since then have continued to deteriorate. We just saw the interest

payments on the federal debt have now risen and are matching and passing the total defence spending for the year.

Shawn Buckley

I'm sorry, what figure was that?

Catherine Austin Fitts

The U.S. interest payments on the debt has now just crossed the total amount of defence spending each year. So with higher interest rates, the interest rate payments are exploding.

Shawn Buckley

And I just want to recap so that the people listening to your testimony can understand some of this. So actually, under the U.S. Constitution, there is not supposed to be money spent by the government without Congress approving the budget. And that there's also then supposed to be accounting of the funds that are spent. So, right in the Constitution are requirements basically for elected officials to control the money that's being spent and there to be an accounting to the people, am I right about that?

Catherine Austin Fitts

Correct.

Shawn Buckley

But basically, so much money has gone into the black budgets or parallel system of government that it's—I just want to call it nosebleed—there's just so much money and it's not being accounted for. So no one can actually know what's happening with the finances of the nation.

Catherine Austin Fitts

Right. I would call it a financial coup d'état. So that's a change of governance system by, you know, the "just do it" method. It's a coup but it's by financial means. I liken it to: you get fed up with the old system, so you start a new system; you move all the money, the assets into the new system and you leave the liabilities in the old system.

And then, you know, from 1998 on, whenever I would talk with anybody about why the missing money story was so important, I kept saying, "Look, if the way they deal with the retirement obligations and the health care obligations of the society is by not funding them, but moving the assets out of the system where the obligations exist, then ultimately, if you don't fully fund your obligations, you're going to have to extend the retirement age, drain or dilute away the benefits with inflation or depopulate or some combination. You have to abrogate your contracts, inflate the money away or, you know, lower life expectancy."

And if you look at what has been happening since the money started to go missing, if you look at all the policies—I call it in the United States, the "Great Poisoning."

[00:25:00]

We have seen a steady diminution of the life expectancy. And now that is accelerated during the pandemic. And I hate to sound as— I don't mean to sound callous but if you look at the decisions of how we were going to fund the retirement obligations, if you don't fully fund them financially and you move the assets out in a coup, then it is a mathematical formula that you have to lower retirement age or extend retirement eligibility or abrogate the contracts, which is just a mathematical requirement.

Shawn Buckley

Great. Or depopulate, I think you said.

Catherine Austin Fitts

Yeah, or depopulate. So if you do not fund your obligations then how are you going to explain to the people that you're going to abrogate them or change them, or—? Funding retirement obligations, including health care, is a mathematical formula and if you don't fund it financially then you need to change them or change the population.

Shawn Buckley

Now, you had spoken— You used the word "Great Poisoning" and you've indicated that started some time ago. Can you just give us some examples of the types of government policies that have made up this Great Poisoning that you're speaking about?

Catherine Austin Fitts

So, in the United States, there's been a steady debasement of the food supply. Food has become steadily less nutritious. Part of this, I think, is a combination of things, whether it's genetically modified food or pesticides. We've seen a steady deterioration in the quality of the food. We've seen a significant rise in environmental pollution and toxicity. We've seen a deterioration in many parts of the country in the quality of the water and sewer systems.

And with it, we've also seen inflation and monetary policy by the central bank squeeze many of the retirees and elderly in a way that, I think, reduces their quality of life and lowers life expectancy.

Shawn Buckley

Right, there's a correlation between poverty and lower life expectancy.

It's interesting, we just had a witness, Denis Rancourt, who is a physicist by trade, but interdisciplinary researcher, who just using excess mortality figures— Oh now I just lost my train of thought, so what were we just discussing?

Catherine Austin Fitts

Denis, I've seen several of his presentations recently and I think they're extraordinary. What he's shown is the really extraordinary rise in all-cause mortality in many areas of the world, including—he's done a breakdown of all the states in the United States.

Shawn Buckley

I recall where I was going, is that he was showing a correlation between poverty in the U.S. States and basically excess mortality during the COVID pandemic.

It's interesting, we had a different witness, Dr. Magda Havas, who was showing with U.S. data a perfect correlation between worse COVID outcomes and high areas of 5G. And she was postulating that that could be a stressor on the immune system, so another factor. So you're kind of listing these types of things as the Great Poisoning.

Catherine Austin Fitts

If you look at what I consider to be the Great Poisoning, I consider it to be lots of different things. But one of the ways to significantly reduce the populations on a slow and steady basis is to increase toxicity levels and lower immune system. And then each person dies of their own individual weakness, but it's really, it's almost a pandemic of toxicity.

I would say one thing. When I explained to you that the president of the largest pension fund in the country said they've given up on the country, they're moving out all the money starting in the fall, I believe what he was referring to was the effort by the financial establishment to get a budget deal in 1995 and their inability to do that. You had a shutdown and a very messy political system. I think that's when they decided that this balance of power between the banks and the Congress— So Congress running the fiscal house

[00:30:00]

and then the bankers running the monetary house and that, in essence, democracy doesn't work. Because in the democratic process, the guy who hands out the most money wins and it's impossible to get a financially responsible solution.

I think the conclusion was, "Okay, let's move the assets into a new system. We'll move the liabilities back, then when we're basically in a position to reset the old, we've protected the assets; the bankers will take control and run both houses." And so it literally is a financial—it is a coup d'état because you are ending national sovereignty and putting the world under a dictatorship of the bankers, so to speak. And I think that was the plan.

Now, what's interesting is the deal, the budget deal in 1995, did a crash and burn. It was literally the next month that the predatory lending took off like a rocket and the FDA approved oxycontin and if you look at the extent to which the pill mills and the predatory lending targeted the same neighbourhoods; we also saw the private prison effort target the same neighbourhoods. I think what I call the Great Poisoning was off and running and I think it was intentional.

Shawn Buckley

Right, so at the same time you see three policies that are very destructive: predatory lending, oxycontin basically starting the opioid pandemic, and private prisons being established within the United States.

Catherine Austin Fitts

Yes, I have an online book called *Dillon Read & the Aristocracy of Stock Profits* about the extraordinary increases of narcotics trafficking in those communities. At the same time,

enforcement efforts to round people up often put them in private prison, where they would work at low cost for big corporations. So, you know, I describe a whole wave. At that time, it was targeted in the poor neighbourhoods. If you look at what happened, the pandemic— It basically was a way of rolling up a very similar process into the middle and upper middle class.

When I was a child, I grew up in an African-American neighbourhood in West Philadelphia. And we used to call it the “beatdown.” And literally what we saw with the pandemic was the “beatdown” simply move upscale.

Shawn Buckley

Right. My understanding is that you view the pandemic basically as an exercise in depopulating to cancel the contract to fund pension and health care.

Catherine Austin Fitts

I see the pandemic as an exercise in re-engineering the economy out of small business and concentrated into large corporations—mostly publicly traded companies. So one, a consolidation of business market share and employment under central control and a consolidation of capital. So whether it’s centralization of business market share, centralization of capital, but also enormous centralization of political powers.

And unfortunately, it comes with both an extraordinary amount of monetary or central banking largesse combined with extraordinary criminal conduct. For many, many years, if you read my online book, the one I just referred to, *Dillon Read & the Aristocracy of Stock Profits*, I’m talking about criminality by Wall Street and Washington that is supported in every county in America. So the corruption is deep. And I’ve always said crime that pays is crime that stays.

And unfortunately, we have now built globally in the financial system an extraordinary dependency on war and on organized crime. And you have way too many people making money from helping other people fail, as opposed to making money on helping other people succeed.

Shawn Buckley

Now, the description you just gave about economic matters: that could occur without them having to vaccinate us. They could have done a pandemic, they could have shut down the small businesses and kept the large businesses open without necessarily vaccinating us.

What are your thoughts on what we consider to be in Canada vaccine mandates and pushing this vaccine?

Catherine Austin Fitts

I looked at the vaccine mandates from a different point of view because, for many years, I worked as an investment advisor. And many of my clients came to me because they had been touched by

[00:35:00]

what I would describe as healthcare fraud, a lot of it associated with vaccinations. So they had had their finances terribly harmed by vaccine injury and the cost of vaccine injury. You can see a vaccine injury in a family can literally wipe out generations of savings; that can be very, very destructive.

And I had spent a lot of time researching and trying to understand why we wanted to inject poisons and why pharmaceutical companies were being allowed to do so much harm with less and less liability over time. And I have come to the conclusion, and this is a personal opinion— At one point, the chief financial officer at Moderna described the mRNA technology, because these are not really vaccinations, they're gene therapy. He described the mRNA technology in the Moderna and Pfizer injections as an operating system.

Just as the tech billionaires rose to great wealth by putting an operating system in your computer and then getting you to update it regularly with viruses and then presumably giving intelligence and military a back door so that they could do complete surveillance, this is the basis of much power and much wealth. I truly believe that there is a good possibility that the leadership believes that they can use gene and mRNA technology to literally install an operating system in all of us and use viruses to get us to update them just like they do on our computer.

Shawn Buckley

Right, so another mechanism of both finances and control, ultimately.

Catherine Austin Fitts

Right. Here's the question: If you've promised throughout the G7 nations, several generations, if you've promised them retirement savings, if you've promised them health care and they're watching billionaires lead more and more and more luxurious lives, how are you going to inform them that you've abrogated, you're going to abrogate your obligations to them? Right?

And so putting in a system of financial and physical controls, including using mind control technology to influence how they feel. So when the World Economic Forum says it's 2030 and you have no assets and you're happy, how are they going to make you feel happy when they've stripped you of your assets? Quite a trick.

But there is a reason to have complete control. And, one of the reasons to have complete control is digital technology allows you to do that. You know, it's very hard for people who feel empathy to fathom that anybody would want that kind of control. But make no mistake about it, the single most financially successful business in the history of the world, in my opinion, is slavery. Slavery is an enormously profitable business and has been.

And if you look at the problems that, you know, the risks that came with slavery that caused us to cancel the African slave trade, I think digital technology has solved those risk issues. And I absolutely believe they believe they can load an operating system into our bodies. If you go to Solari, my website at Solari.com, and you look at an article— Just do a search for CBDCs and you'll get an article called, "I Want to Stop CBDCs—What Can I Do?"

And your number 11 action is "bring transparency." And I list four or five of my favourite videos that show you what the central bankers say about what they're going to do with CBDCs and how much control they have. Because they are saying this openly and explaining it.

One of the videos is a speech by Richard Werner, who's the top academic scholar in the world on central banking and banking in Malmo, Sweden in May in 2020—describing one of the top central bankers in Europe, explaining to him that CBDC would be a chip and they would put it in your hand. They are talking openly about chipping humans to make them both, it solves the problems they ran into before slavery. So you have a digital ID for everybody who's implanted and then you can turn their money off and on.

Shawn Buckley

Right. And actually, this is central bankers saying that this is the plan.

Catherine Austin Fitts

This is Richard explaining that a central banker,

[00:40:00]

who's one of the top central bankers of Europe, telling him this. Now, there's another video that is my favourite, it's 56 seconds. It's Agustín Carstens, who is the general manager of the Bank of International Settlements [BIS], which is leading globally the push for BIS all around the world. They have innovation centres that they place all around the world in a partnership with the Fed. What he explains, and this was in October 2020 in an IMF [International Monetary Fund] payment panel, the fact that they will be able to make the rules of how you can use your money and they will be able to control and enforce them centrally.

Shawn Buckley

So basically speaking about what we see as the Chinese social credit system. If you're not, you make the wrong post on the internet, then all of a sudden you can't take the subway to work in the morning, type thing.

Catherine Austin Fitts

Correct.

Shawn Buckley

It's interesting, I don't know if you're aware, but when the federal government was seizing people [bank accounts] that donated to the truckers, it put an incredible chill on Canadians and their trust on the banks. And I think it's probably done irreparable harm for our international banking sector.

Catherine Austin Fitts

Right. And the same is now happening in the United States given what's going on with the banks right now.

Shawn Buckley

Now as bleak as this sounds, my understanding is that you are optimistic. And one of the roles of this inquiry is for the commissioners to come up with positive recommendations on changes that need to be made. And I'm wondering if you can share with us why you're

optimistic and the types of things that can be done to try and get our institutions and freedoms back?

Catherine Austin Fitts

I'm optimistic because if you look, clearly our economy and our financial system need a reset. One of my favourite performance artists is Tina Turner and she starts one of her songs saying, "We can do this nice or rough." And I would describe the current reset as rough. And I can see why the people who run the system find it to be safer for them. But I also think there are ways of doing a reset which can be much more market-oriented in solutions and much more decentralizing.

The problem with a decentralized reset, although it has the potential to create far more wealth than the current reset, it's going to require our system be governed by meritocracy. And it is going to require transparency. So if you look at the extraordinary secrecy that the, you know, sort of the governance system on the planet has enjoyed for the last 50 years, that secrecy is going to have to go away. So, we need a lot less secrecy and a lot more transparency, and that's going to lead to more meritocracy.

Having really studied the economy bottom up, community by community, I know it is possible to do a reset that is much more wealth-building and can result in a very human society. So it is possible. What it's going to require is basically rejecting the current reset. And that means, if you look at all the centralization that's occurring, the building of the smart grid, the creation of CBDCs, the institution of all the different digital payment system controls— If you look at who is doing that, we're doing that. The people who will end up as the slaves in the digital concentration camp, we're the ones who are building it. And we have the power to stop building it. We have the power to just say "no" and pull out of the control grid.

We can throw out our smartphones, we can refuse to adopt the digital ID. If you saw what happened with vaccine passports, there was an extraordinary effort to not comply and to not adopt. Because we're building the digital concentration camp and we have the power to see where this is going and to stop and pull out. And that's one of the reasons I wanted to come today. Because I think what you are doing is so important; you're showing people where this is going. And if every one of us can say, "You know something? I don't want to be in the control grid and I don't want to help build the control grid and I'm going to back out."

So if you read our article, "I Want to Stop CBDCs," there are lots of things to do. But one of the things we love to recommend is everybody use cash. So let's walk back the digital systems and start to rebuild some health into the analog systems.

[00:45:00]

What we're watching in our networks is an explosion of people using cash and sort of rebalancing and saying, "Well, wait a minute, a healthy system is part digital and part analog, let's rebuild and protect the analog because we need both." So that's one thing everybody can do.

The other thing you can do is start—everybody reach 10 other people and start talking about local solutions. Because a healthy reset rebuilds our decentralized economy. Look around you in your local area. Where are the opportunities to build great relationships with other people and start to build, whether it's food, energy, shelter, alternatives both for bartering real assets but then also making financial transactions locally without your

national currency. And finally, where are the opportunities with your local and regional governance to start protecting sovereignty? If you can't protect it at a national level, there is a great deal you can do at a regional or local level.

We have a wonderful new article by Richard Werner called "Why Tennessee Should Start a State Sovereign Bank." We have one of the states in the United States, North Dakota, that has a sovereign state bank and protects the citizens and businesses and banks in North Dakota to a much greater degree than any one of the other 49 states. I would encourage you to take a look at it. We wrote it about Tennessee, but it applies to any regional area.

There's a great deal— We have a whole wealth of materials. I do one interview with Senator Frank Nicely of Tennessee on sovereign state banks and protecting financial transaction freedom at the state level. You see several of the states moving to do this. Texas has started a buoyant depository. Tennessee has just authorized the treasurer to buy \$100 million of precious metals.

Anyway, there are hundreds of actions and we describe them in all of these interviews and in, "I Want to Stop CBDCs—What Can I Do?" But I assure you, for everybody listening to this, there are many, many things you can do to protect yourself and your family. Because remember, each person who backs out of the control grid and becomes more free makes it easier for the rest of us. So start with you and your family and start by protecting yourself from the incremental steps. Just remember, one of my favourite quotes is from Bobby Kennedy who says, "Nobody ever stopped tyranny by complying."

Shawn Buckley

Now, just so that I'm sure that I've understood you correctly, so there's a section at Solari.com "What can you do?" that basically lists these things. Some of the things that you've suggested are, let's get out of the control grid, so start operating with cash as an example. Basically, create local networks of wealth and then also find out at the local level, how you can take control of things.

I know one thing that's happening in Canada is the rural municipalities are imposing strict control of how many animals you can have. That you have to put a fence around your rain barrel and crazy things. And it's actually having the positive effect of getting rural people enraged and finally involved in their local government. And that's the type of thing you're speaking about, is we can no longer sit back and not be involved in our local governments. And try and find local financial institutions that are independent. So in the province I'm at in Alberta, there is in Calgary one that it's gold and silver backed, for example. This is the type of thing that you're talking about is get out of the control grid.

Catherine Austin Fitts

Well, here's the thing: the middle of the road is going away. And you have the most powerful people in the world who want to centralize complete control. And throughout society they have allies who see it in their best interest to help them. And then we have other people who are busy, they're raising kids, they're running businesses, they don't have time for politics.

And now what they're starting to realize is, "Wait a minute, I can't stay in the middle of the road. The road is parting and I've got to go with freedom or I've got to go with slavery." Which is it going to be? And I am going to have to get involved because this is going to be

trench warfare at our local and regional governments and national governments and we need to find our allies and do everything we can to protect our freedom.

[00:50:00]

Shawn Buckley

Thank you. I'm going to just ask you one more question and then I'll turn you over to the commissioners. But you had indicated that you were thinking that a decentralized economy has much more opportunity to create more wealth than a centralized economy. And I'm just wondering if you can explain your thoughts on why that is?

Catherine Austin Fitts

Sure. If we had an economy where we were simply trying to optimize economic performance, some things would be centralized and some things would be decentralized. It's not an either/or. But if you look at many of the economies around the world—but certainly at the United States economy—a lot is centralized in a way that is not economic. And you see this primarily through the use of the federal credit and budget.

I would regularly find neighbourhoods where, for example, HUD was spending \$250,000 per unit to build public housing. But \$50,000 could rehab a defaulted property in the HUD foreclosure property. And if you simply took five of the defaulted properties and rebuilt them, you get five homes for the price of one.

Or we were doing something in a community. We were paying somebody essentially what would cost us \$55,000 a year to have them in HUD housing on food stamps and welfare. But in fact, we could teleport jobs digitally into that community and have them working as taxpayers for relatively minor investment in their education. We were paying people to not work while we were paying contractors in Washington \$125 per hour to do things that somebody in that community would love to do and could be trained to do at \$20 to \$25 an hour.

So you had these enormous arbitrages where it would be highly economic to decentralize. But the problem was that, that centralization was great for throwing contracts into large companies, which helped their stock go up and that helped political contributions or simply facilitated central control.

If you go throughout—for example, in the United States—the federal credit and the federal budgets, what you'll find is there's extraordinary opportunities, particularly given the blessings of technology, to decentralize to make things much more economic.

But again, I just have to share one story. When I was Assistant Secretary of Housing, I'd been asked to bring in some of the people who'd been working on housing policy, who were sort of leaders in the industry. And they were meeting with the new secretary and some of his assistants. And finally, one of them is Jim Rouse—wonderful housing developer who started the Enterprise Foundation—turned and said to the Secretary, "But you're Republicans. I thought you wanted to decentralize; why are you proposing all highly centralized solutions?" And one of the assistants said to him, "Yeah well, we're here now." Meaning, "if we control the money centrally, then we have more political power."

Shawn Buckley
That speaks volumes.

Catherine Austin Fitts

Well, one of the great solutions for all of us is if we could have financial statements. Everybody who buys a publicly traded stock is required to get an annual report of financial statements, saying here's what we did with your money.

If we could have financial statements and there's no reason why we can't, other than secrecy and how desirable and profitable it is. If we could have financial statements for the areas for which we vote for political representation.

In America, if I could have a financial statement that showed all the sources and uses—essentially financial statements for government taxes and expenditures contiguous to my congressional district or contiguous to where I vote for county representation. To hold our representatives accountable, we need to see how the money works contiguous to the area that we vote for. And there's no reason we can't have that other than, of course, it would end a lot of the secrecy.

But if you could make it available, the opportunity to improve and re-engineer the money for a much more environmentally healthy world— Make no mistake about it, whatever our environmental problems, the number one cause of our environmental problems is a debt-based fiat currency. Now, a well-managed fiat currency can be fine,

[00:55:00]

but the debt is a killer. And we've run the monetary policy in a way that is destined to destroy the environment.

The idea that putting on more controls solves the environmental problems is ridiculous. That's just another excuse for more central control. If you want to solve our environmental problems and the secrecy; and start making governmental disclosure available; and kill the debt system and move to an equity system: not only will you solve our environmental problems, but you'll make money solving our environmental problems.

Shawn Buckley

Okay. Catherine, I'm going to turn you over to the commissioners to see if they have questions, and they do have questions.

Catherine Austin Fitts

Okay.

Commissioner Drysdale

Good afternoon, and thank you for your testimony. When you were talking about the government reducing population in order to reduce their financial obligations, when you were talking about that, I was thinking about what's going on in the United States and Canada from an immigration standpoint. Canada is now immigrating about a million people a year into a country of 38 million. If that was the United States, it would be 10 million. I

don't know what the numbers are in this United States. And the United States has an open border and we don't know how many people are coming across—millions.

How does that square with the seeming policy to reduce our obligations when they're bringing in millions of people—and very often unskilled people—into the country? How does that work into that strategy?

Catherine Austin Fitts

Those people are not the people that they have retirement obligations to necessarily. You have to look at it on a person-by-person scale. But if you have a person who has a pension fund and certain kinds of insurance policies and obligations for lifetime health care and also has the right to vote, you are replacing them with someone—particularly if they're young—who you haven't had to educate and is ready to go to work in a variety of ways and for which you have significantly less liabilities. So as a matter of solving a series of different problems, it's a very different profile than the person whose life expectancy is diminishing.

Commissioner Drysdale

Taking that answer and listening to one of the other testimonies we had this morning, they were talking about the actions during the COVID pandemic— The actions of the governments, the vaccines had killed millions and millions of people.

When I listened to that and I listened to what we're talking about now—about replacement of entire populations—and when I listened to what you were talking about a little earlier, and what you were saying was that the government was picking winners and losers and essentially eliminating small business and centralizing power and giant corporations, monopolizing it: Aren't we talking about fascism? You know, when the government colludes with big business, they eliminate areas of the population, they murder millions of people—potentially, at least according to some of our testimonies—Isn't that what we are talking about, global fascism?

Catherine Austin Fitts

We are talking about global fascism. I think that is correct except when I think of fascism, I think of examples of fascism historically. And if you look at the powers that the fascists had—so for example in World War II or the communists in China—they did not begin to have the invasive technology that this group has.

Some people call it a technocracy, and a technocracy is implementing control at a much more invasive level. So I call entrainment technology and subliminal programming a form of mind control technology. The ability to do surveillance on people's thoughts and inside their homes with all the different surveillance systems. So we're talking about something much more high-tech and invasive. Fascism used force to control people physically, now you're talking about using invasive technology to brainwash them in ways that was inconceivable 20 years ago.

[01:00:00]

I think of this as something far worse than fascism. I literally believe where they're going is slavery.

Commissioner Drysdale

What happens to populations historically and particularly in the 20th century—what happened to populations of civilians when these types of systems took over countries?

Catherine Austin Fitts

There's a wonderful chart. And I have it—I'm trying to remember where I have it linked, I have it linked several places on my website. But if you go, there's a wonderful group in the United States called Jews for the Preservation of the Ownership of Firearms. And they have a genocide chart on their website. I'm sure if you go to their website and do a search for genocide, you'll find it. And it shows you throughout history the many, many times they were able to basically confiscate the guns or achieve gun control, and then the genocide that followed.

And there's an author who studied a lot of genocide named Rommel who I would recommend to you. But what you find is when you can implement these extraordinary central controls, you then get impoverishment and genocide.

And I just was watching—I don't know if you've seen it—there's a scandal in the United States. It was a story broken by several people, but I think one of them was "60 Minutes," about the fact that the largest private equity firm owns a company that does cleaning of slaughterhouses and is using young children who appear to be illegal immigrants. But they're using 13/14-year-olds to clean slaughterhouses, including at night, in a way that's sort of burning their hands because of the acid and cleaning products and the kids are falling asleep in school and being reported by the teachers. And they're basically using child labor in a way that looks to me almost like slave labour. And this is a practice that's going on in the United States and it's clearly an institutionalized practice by a company owned by the largest private equity firm in the country, in the world.

So this is— I hate to say this, this is darker than just fascism.

Commissioner Drysdale

We see there's a number of other things going on in Canada that you may or may not be aware of either: state-sponsored euthanasia is here in Canada.

Catherine Austin Fitts

Yes, I've seen some of the information about that and somebody just sent me one of the songs that's promoting it.

Commissioner Drysdale

I mean, when we were still in lockdown in Canada and many of us could not travel, the Canadian government announced the highest quarterly rate of immigration into this country since World War II.

All of these things are— I guess my question is, and I'm thinking out loud here because you really made me think about a lot of things: Is there any limit to the atrocities that a government with overarching power and control, particularly of a hypnotized mass, is there any limit historically to what they'll do?

Catherine Austin Fitts

Yes. But that limit is coming off thanks to technology. The digital technology is giving them powers that they've never had before, and the invasive technology like mRNA and the other kinds of biotech technologies.

But I will say, first of all: I'm a Christian and I believe there's a spiritual component to this. But I also believe that one of the reasons that things have gotten so bad is for many decades— So I first started to warn people in 1998. It's basically 25 years that I've been working on warning people. And it's only been recently, in the last year or two, that I'm starting to see very capable professional people—the kind of people who have the skills to do something about this—finally recognize how absolutely psychopathic the current secret governance system is. And I used to have a wonderful pastor who'd say, "If we can face it, God can fix it." And I assure you, because there's so many of us who are building the control grid, we have the power to do something about this and really change the trajectory and move this into a completely different reset.

[01:05:00]

But it requires enough people facing it and saying something. Because I never worry about where these guys are going—because I'm not going to live in that world. I'm going to die fighting for a human civilization. I don't want to live in their world. And that was the decision I made in 1998 and I'm perfectly happy with it. And you can see why.

But you don't want to live in their world either. I think it's time for as many of us as possible to dedicate ourselves to building a human civilization, because there's no point. People always say to me, "Well, what are the chances we can win?" And I say, "Well, if we go with the flow, we have zero chance. If we commit to building a human civilization, I don't know if the chance is 1 per cent or 50 per cent, but it's better than zero."

I think there's a tremendous advantage in facing how absolutely dark we have allowed it to get and then proceed to say, "Okay, where do we go?" If you look at how centralized this is, it's what the English poet said, "They are few and we are many."

Commissioner Drysdale

Thank you for your wisdom and perspective.

Shawn Buckley

And there are further questions.

Commissioner Massie

Thank you very much for your very, I would say, lucid analysis of the whole situation we're in. You still want to provide us with some hope. And my understanding is you based it on the awareness that some people are growing to really appreciate the dire situation we're in and we have to get our act together and build community and thrive for sovereignty at the whole level.

But the world being what it is and the technology being so powerful, as you pointed out: one would hope that at some higher level we create some powerful institutions for resistance. I'm old enough to have seen the assassinations of John Kennedy and Robert Kennedy live on TV. At the time I was a kid, I didn't know what it meant. And it seems that

the United States and the world has not completely come to terms with the meaning of these tragic events.

And I'm wondering why now, if through maybe Robert Kennedy Jr., the spirit of the American freedom that has made this country such a great country could actually attract enough support from the population in order to make a difference at that level. What is your thought on that?

Catherine Austin Fitts

I would say two things and then let me talk about RFK's campaign. If you study the economy, one of the reasons for my profound optimism is words cannot express to you how expensive tyranny is. Our economy is so poor compared to what it could be if we were free to just optimize economically. The wealth potential of freedom combined with new technology, if we get the risk management right, is extraordinary.

And centralizing this way is very, very destructive of wealth. I'm an investment banker, I love to create wealth, and the opportunity—the thought of building a society where you could let that wealth really grow and happen is very exciting to me. I know, I have a sort of mathematically conceptual understanding of what is possible in terms of wealth creation. And that's one of my reasons for optimism.

Tyranny is just fantastically expensive, as is secrecy. I mean, it's very profitable for the billionaires but it's very wealth-destructing.

The other thing is, I think the closer and closer the people running the centralized systems get, the more and more they're going to risk killing each other. It's the only thing I can say. You're not creating a culture— You're creating a very psychopathic culture and it's not the kind of culture that holds together through thick and thin over long periods of time.

My favourite Bible story is the story of Gideon. And if you come to Solari, I have a great interview with Thomas Meyer about the story of Gideon.

[01:10:00]

It's a story where Gideon and his army attack and throw the Midianites out of Israel. The Midianites are so hateful and suspicious and so competitive, they kill each other. So I'm not so convinced we're going to win as the people trying to centralize control are going to end up kind of killing each other.

I think that RFK's candidacy in the United States can do extraordinary things, so I'm very hopeful, because I think it can resurrect the excitement and the love for the kind of values that you were talking about. He has a great book called *American Values* about his family values and he does do a good job, I think, of trying to live according to those values and teach them. So that's one thing I think he also has done, he and his colleagues, because he has a very deep and very talented team. I think they can do a lot to help people understand what's going on and why it doesn't have to be this way. So just as a way of bringing transparency, it can be very powerful.

He has built many workarounds the corporate media over the last 10 years. And now we're seeing the market share shift out of the corporate media and into those workarounds. And if you look at his market penetration, just through media, it's extraordinary and I think will be very good.

Now where does that go as a political matter? I don't know, but simply at a minimum bringing the kind of transparency and reminding us of the potential that we have if we resurrect our values and we don't let the lawlessness cause us to lose our love, has the potential to make an incredible contribution. If you look at the polls, it already has. And it's completely shifting the narrative to a real conversation about real problems and real corruption and real lawlessness and what are we all going to do about it?

So, I think it's going to be a very— At a minimum it's going to be a very positive contribution. And among other things we'll finally face the fact of what happened. You know, in the 60s there were four assassinations that basically shut down a lot of political discourse in the United States. And going back and looking at what happened healing from those, I think would be incredibly valuable to the American people.

Commissioner Massie

Thank you very much, Madam.

Commissioner Kaikkonen

Thank you for your testimony. I have a comment and then I have a quick question. For the last three years, a number of businesses in Canada have been shut down by oppressive government legislation and mandates and lockdown measures. And many of those people who ran those businesses have lost their life savings, their family investment for years. And now, three years later, we have Canada Revenue, the equivalent of IRS in the States, sending demand letters for taxes that the CRA has assessed them and says that they owe. And yet they don't have a business; their business was shut down.

I'm just kind of thinking about that in the context of what you have said here. And I'm just wondering, in terms of fighting back something that Canadians can do: a week and a half ago, CRA, Canada Revenue Agency, said that they're not going to accept any cheques. I'm going to assume that if everybody in Canada sent cheques next year when they're filing their income tax, that would be a way of fighting back in terms of peaceful civil disobedience.

But my question is, you have really great ideas and I love the idea of building a local community and networking with one another, but I'm just wondering: How do we filter that down to our education system where our students are being taught everything but how to work within a community and to strive for the best that they can be?

Catherine Austin Fitts

So, what you've brought up is the importance of the taxation system. If you go to [Solari](https://solari.com/taxation), we have at ourmoney.solari.com/taxation, my general counsel and I wrote a very long piece on the fact that we're going to have to find a way to re-engineer our taxes. If we continue to pay taxes to governments that send out IRS agents to target the people who've been destroyed by their mandates, there are no solutions.

If we continue to fund school boards that destroy the educational opportunities for our kids,

[01:15:00]

that can never work. So the question is: How do we, within jurisdictions, whether regional or local, assert control of the taxes and make sure the tax money is spent in both lawful ways but also productive ways. And that's the toughest nut we have to crack. And it takes real organization at the local level and at the regional level to do it. But that's what we're going to have to do.

Now there are many tactics that we can use short of organizing. One of the things we propose is organizing escrows to make sure our money is spent lawfully. But short of that there are other ways to do it. I always tell everybody who's trying to deal with their local school board to think of this as asymmetrical warfare. And instead of trying to debate with them on the issue upon which you've gotten involved over just simply do an audit and find out, where they're breaking the rules on the money and go there. There are all sorts of ways to get power and leverage over a local government institution if it's not obeying the law. But it takes real work, and that's the challenge.

I don't see any way— I would really encourage anybody who's interested in these very important questions to go to ourmoney.solari.com/taxation and look at our analysis of what can be done now. It's U.S. centric, but you'll be able to translate some of those ideas into ideas for Canada.

I would also say there's a wonderful book called *Harvest of Rage* by an author named Joel Dyer. It describes the same exact game that they did to the farmers in the United States after the 1980, sort of [bulker] slam on the economy. And he describes the same thing. They got these businesses to take on all sorts of debt and they pulled their subsidies. They had a recession then they default on their debt and then they send the IRS in to go after them on taxes for writing down the indebtedness. It was the same exact game.

And what's important is a broad-based coalition of citizens realize that these business owners have been targeted and this is not a legitimate enforcement. This is what we call an "op," it's an operation, and we need to organize to help protect them.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

And there being no further questions. Catherine, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and assisting us today. Your testimony has been very helpful.

Catherine Austin Fitts

Well, thank you and thank you for all your efforts. Just remember, transparency can make an enormous, enormous difference. So what you're doing is very important, and I'm very grateful for the opportunity to know you and be part of it. So you have a wonderful day.

Shawn Buckley

You too.

[01:18:23]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Wayne Lenhardt

Our next witness is Dr. Stephen Malthouse and I see him on the screen. So hello, Dr. Malthouse. There, you're on our screen as well. If you could give us your full name and spell it for us and then I'll do an oath with you.

Dr. Stephen Malthouse

Stephen Malthouse, S-T-E-P-H-E-N M-A-L-T-H-O-U-S-E.

Wayne Lenhardt

And do you promise that the testimony you will give today will be the truth, the whole truth, and nothing but the truth?

Dr. Stephen Malthouse

I do.

Wayne Lenhardt

Okay. You've been active in all sorts of ways. I think you've been a practitioner on Vancouver Island. Before we get into that, we've just heard Catherine Austin-Fitts give us a talk. I understand that you have just come back from Europe, where you've attended many functions over there. So I think it would be very appropriate if you could give us at least a small snapshot of what you're seeing over in Europe. And I'll leave it to you to either do it after your main testimony or do it now, but I think we'd find that very interesting.

Dr. Stephen Malthouse

Well, this was the third International COVID Summit, which was held in Brussels, in Belgium, and it was a three-day conference. Doctors, experts of every field, were invited from around the world to attend. And it was really focused around a presentation in the

European Union, which occurred on Day 2, in which 30 physicians and experts of other fields all spoke to the European Parliament, to the members there, but it was livestreamed out to the world. And in fact, my understanding is that there were more views of that livestream than had ever happened in the European Parliament in its history.

And what it was designed to do was to really present the whole COVID story from beginning to end. There were no holds barred. By that I mean that the speakers were invited to tell it as it is, and it was coming from personal experience and expertise and knowledge of the science. And it told quite a different story than what we're hearing as the general narrative about COVID-19 and what happened. So really, it was an attempt to tell the truth and get it out there. The conference was three days long. The first day was, in fact, a closed session among doctors and, again, experts from all over the world.

We had quite a few coming from Canada and the topics ranged from anything from the science of COVID, to vaccinations, to geoengineering. Many topics were discussed and we had some lively discussions among the people that were attending. It was a lot of fun.

And then the third day was dedicated to the media. There was the opportunity for media to ask questions, to have individual interviews with the speakers, the people that were attendees. And we had three panels at that time. And interestingly enough, those three panels, which contained about eight people at the front table, were very engaging in working over different topics, including how to prevent this from happening again.

So it was an excellent opportunity in many ways for doctors and epidemiologists, scientists, experts in many fields of life to come together to meet each other and to work over things. But also, to try to get the word out through the European Parliament, and to let those members in the Parliament themselves know what, I would say, the real scientific community knows about what's happened the last three years.

Wayne Lenhardt

Perhaps I'll just stop for two seconds and just say to the commissioners: do you have any questions for Dr. Malthouse relating to that? If not, we'll move on to his presentation.

The two groups that I think you've been associated with, or perhaps even had a hand at starting were, called Educate Before You Vax [Vaccinate] and also Justice for the Vaxxed. I think on that note you have a presentation with slides, so I'm going to let you launch into it and proceed [Exhibits OT-13, OT-13a].

Dr. Stephen Malthouse

Thank you very much. Well, first I'd like to perhaps introduce myself because many people may not know me. I'm a family physician from the west coast of Canada. I've been in the practice of medicine for 45 years in Canada. And I've worked in many different situations. I've worked in urban and rural situations. I've worked in emergency departments. I've done some palliative care. I've done some overseas research, particularly in the field of pediatrics.

[00:05:00]

And I do have a special interest in integrative medicine, which is the sort of seamless combination of both conventional and alternative medicine. I was a founding president of the Canadian Integrative Medicine Association; and also during these last few years, I was a

founding president of the Canada Health Alliance, which is a group of practitioners across Canada, including also volunteers. We have about 5,000 members. The Canada Health Alliance's mandate is really to help create a better medical system in Canada.

I've worked here on Denman Island, which is a small island off the coast of Canada, for about 13 years and I took a sabbatical in January 2020. I didn't really realize what was coming our way but I soon found out. And like most doctors, I was planning on being called back to work in some capacity, expecting a tsunami of death and suffering from the COVID-19 illness, which was coming out of China. But it didn't take long before we realized that that was not going to be the case exactly.

Before that, even in the early days—in February, actually in March and April—it became clear that our public health was not doing all that they could, particularly with regard to vitamin D, that we should have supplements to vitamin D for all our long-term care facilities. And in fact, Canadians should be taking vitamin D to prevent respiratory illness, which is what we thought COVID was.

So I sent letters up to different places trying to get some attention to the fact that we could give people vitamin D, and we could reduce the risks of infection. Also looking at what was coming out of China, we had vitamin C being used intravenously. So I called around to our local hospital and a few other people to see if, in fact, we had stocks of vitamin C for intravenous use in the hospitals, which we didn't.

I made some inquiries about vitamin D. In fact, I sent a letter to our public health and long-term care with evidence of the research on vitamin D and respiratory illnesses and how vitamin D supplements, at least to attain a healthy level of vitamin D in the blood, could be beneficial. That was ignored. In fact, the message was passed up the line and, essentially, they laughed at it, saying that people in the Comox Valley—not just doctors—think that vitamins can cure everything. So that's where that ended.

I also at the time was the president of the Canadian Integrated Medicine Association or CIMA. And if I could share my screen, I'll show you a few things which I think you'll find interesting [Exhibit OT-13]. I hope you can see this. Here we go.

When we saw this coming, actually in May, the Canadian Integrated Medicine Association created a statement policy on this. And I put it up here because it showed that vitamin D, which we subsequently learned was very helpful for treating COVID, at least preventing it from becoming serious: We knew this way in advance, and we put this out as not just a policy, but we put out a media press release.

There was no pickup of this in the media whatsoever, which was not entirely surprising because it was still considered alternative medicine. But the evidence in [using] this for deficiencies and people's nutrition was documented with studies and so forth. And I think if we had done this in the early days, we would have prevented a lot of the problems that came along.

The evidence became more and more clear that all these public health policies that were being pushed on us were not really valid; they were not based on any science. And that would include masking, social distancing, isolation, asymptomatic spread of a disease: all these things plus the subsequent effects of the policies that were being mandated that were causing overdoses and suicides. Increasingly, we were seeing the psychological effects on people—particularly on children, who were supposed to mask themselves so they didn't kill their grandparents. I mean, we started seeing this, and so I actually wrote some

material in our local newspaper called *The Grapevine*, and telling it how it was, and trying to get some community meetings together so we could discuss these things.

As you may know, across the country, whether you were living— In whatever province you were in or even if you were traveling in a car across the country, the number of people that were allowed to congregate in one location varied from province to province and this does not make any sense.

[00:10:00]

And so I tried to get the people together on Denman Island, where I live, to talk in an outside situation. And as soon as I put an invitation into our local newspaper for this, I found that I was getting a call from the College, from Dr. Puddester, who was in charge of complaints. And he said, "Yeah, you can do it, but you got to be careful. You don't say you're representing the College, that sort of thing." And he'd already had two complaints just from my insert into the local newspaper.

So we had two meetings. It was quite interesting, and a lot of people had questions. We tried to answer as many of them as we could.

And before I come to this, I'd just like to say that we also had some things by public health put in our local newspaper which were really not based on any science whatsoever. One was that the vaccines, which were coming along, were going to put us back into good health and protect this virus from spreading; and we were going to return to normal; and they were safe and effective. None of that had been shown, of course, in any of the studies, which as I'm sure everybody in the audience knows, were abbreviated and lacked appropriate animal studies.

When I saw this in our local newspaper, I wrote a letter saying that this doesn't make sense. It's not based on anything. And in response to that, I had 15 doctors—not all of them even actually worked on our island, but on the two islands, one, ours, Denman Island, and Hornby Island nearby me—write a letter saying essentially that all 15 of them did not agree with me. Essentially, that was all the doctors other than me on the island. And that they themselves were waiting to get their shot when it came around. And that they trusted the CDC [Centers for Disease Control and Prevention] and Dr. Bonnie Henry, who was our chief public health officer here in British Columbia; that they trusted her and they thought that the vaccine was going to get us all back to normal—and that it was the best way of preventing spread.

Of course, you know, a vaccine that does not prevent transmission cannot get herd immunity at all. So time went on and then we had masking in the summer. And then I wrote this letter in October 2020, to Dr. Bonnie Henry, our chief public health officer. By that time we knew— We knew quite clearly that all the measures that they had been using were fraudulent. In other words, when I say fraudulent, I mean they were not based on any real science. And I wrote this letter to her pointing out that the evidence, that contradicted all her policies.

This was in October 2020. And that's when the proverbial you-know-what hit the fan. I started getting complaints from the College asking me to defend what I'd said, and that I shouldn't be speaking about a colleague like this and so on. It was— I thought it was a pleasant letter but it just really asked her to reverse her policies because none of them were based on science. And that's kind of how it started with me in terms of the way my career went.

We did some further things after that. I think that that letter was important because I got a lot of things back from people saying that it actually validated what they were thinking despite everyone telling them they were crazy. And I think for that point it really did some good in that I got quite a few letters like that. But also, after that, a group of people on the Island—Vancouver Island—decided to send out my letter to Bonnie Henry with a cover letter from me. It was sent out to maybe a third of the doctors in British Columbia, mostly in the lower mainland of British Columbia. And the cover letter said to doctors that, “if you think something’s a bit fishy here, please reach out and contact me.” And some did. There’s how I met quite a few really good doctors, including Dr. Hoffe, Dr. Kindy, and many others in fact—who I’ll talk about later when I talk about the tours that we did.

But I just wanted to read you a letter that I got back from one of my colleagues. This is from a Dr. Michael Vance, who, I believe, lives in the Okanagan in British Columbia. And this is what he said after he received a copy of that letter from me. I think this will give you maybe an impression of the pushback that we have from our own colleagues.

He said, “Attention Mr. Malthouse,” he didn’t call me Doctor: “First of all, please do not refer to me as your colleague ever again. Secondly, I will be lodging a formal complaint to the CPSBC,” which is the College of Physicians and Surgeons of British Columbia, “and state that you constitute a danger to the public. I’ve also begun to reach out to the rest of my colleagues to do the same. I know you are close to retiring. Thank heavens for that.

[00:15:00]

So this may not matter to you but it is my professional duty.”

And then he went on to give me a psychological assessment of why I was doing this. He said:

You have traveled along in this life looking for validation and respect, and my guess is that it never quite came to you. My suspicion is that you’ve always been a bit inadequate, probably stemming from childhood experiences or inadequacies as a young adult. You’re near the end of your career and one might imagine you sitting down to rest, and you suddenly get divine inspiration and hope that you can change the course of your mediocrity. You wanted to change the world—or your world at least—and make a difference for once. You imagine that a letter reflecting YouTube videos, blogs, and alternative media sources to the person who actually has authority and respect, i.e., Dr. Henry, would change her mind, and, if not hers, your letter would influence the public enough that it would change something about our COVID-19 response. But then when nothing happened, you followed up with a **letter to your colleagues with the same wishful thinking that finally, this time, you will be able to make an impact in this world, and make a name for yourself.**

Alas, it would be so hilarious if this was in a comedy sketch, if it weren’t so sad.

It goes on in that sort of vein. But I think this gives sort of an impression of how this letter to Dr. Henry had an effect on other doctors in our province. I would say that this is evidence that these doctors are not doing their homework. In fact, they’re not doing proper research. They’ve all come to believe that any vaccine is safe and effective no matter what, so they don’t do their homework and they’re just following the guidelines without thinking it through. But it also shows a bit of a knee-jerk reaction that doctors had towards their

colleagues who were stepping out and speaking up about what they found to be inaccurate in the science that the public health people were calling upon to make their decisions.

Other things that I did, I got involved in creating these “Canadian Doctors Speak Out” videos. I think this was the first time that any doctors put out a video here in Canada, where there were quite a few of us on these videos. And we really each took a part in talking about how COVID is not something you need to be frightened of. Here’s a way to treat it, prevent it. And then when it came to the injections—particularly when they were going after our children with injections and masks and isolation—we spoke out against that. I think I was the first person in British Columbia, with my letter to Dr. Henry, to actually stand up and say that things were going awry in public health. It was a danger to its own citizens.

And of course, there were lots of things happening. The College called me up, and I had to have an interview with them. I had the Canadian Medical Protective Association, which is kind of like our insurance for most doctors against malpractice. I asked them to help me out, but I did not find that their lawyers were actually aggressive enough. By that I mean they seem to know all the secretaries of the College by first names, and you know what that means. And so I ended up essentially letting them go and hiring Rocco Galati. Many of you may be familiar with him; he’s a lawyer based in Toronto. And we actually had our few minutes with the College.

Normally, they invite a doctor to come to the College to have an interview to explain what they’ve been doing. And it really—it’s been like being led out over the quicksand unless you know what you’re doing. And when we had our 10-minute visit, which was supposed to be longer of course, but we asked that it be recorded. The College said, “We don’t record these meetings.” And the reason again is that the doctors don’t like it, which I found hard to believe. Mr. Galati, who was representing me, said that, well, even the highest courts in the land say that, with today’s technology, there’s no excuse for not recording these meetings. They said, “Well, we’re not going to record it, and you’re not cooperating.” We said, “We’re here, we’re cooperating. We just want it recorded.” And they said, “Well, we have nothing further to say,” and we were done. I think that’s a good example of a lawyer showing his teeth.

Then after that, I had no further meetings with the College. Although things are still in process. I did have to put in a suit against them regarding free speech because, as you know, both colleges—the Ontario college and the British Columbia college—were saying that doctors could not speak against public health at risk of having their licences revoked.

And of course, there were hit pieces as well against me and some of my colleagues in the press. Personally, I feel it was good advertising for what we were trying to get out to the public because there’s no other way of getting things out through the mainstream media.

[00:20:00]

And in fact, I was de-banked by the RBC, Royal Bank of Canada. The reason was unknown. In fact, they would not tell me the reason, but they gave me two months to take all my accounts out of the Royal Bank of Canada, the RBC.

Excuse me. I have a bit of a cold. That’s why I’m not in Ottawa. I would have preferred to be there to be able to testify in person, but it wasn’t meant to be.

Then there came a time where they were starting to push these vaccinations, these COVID shots, down onto our children, taking it down as far as five-year-olds. And we knew that it

was going to go down to the six-month-olds; we could see that in the wind. It was pretty obvious to those of us that were searching to look. But this is what Bonnie Henry said. She said— I'm not able to quite read it on my screen because it's blocked, give me one second here.

This is verbatim: "Like all COVID-19 vaccines in Canada, vaccines for children are free, safe and effective. When you get your child vaccinated, you protect them from severe illness from COVID-19 and reduce the spread and infection in your community."

Well, this was completely against what all the science showed. If we look at the children, we call them children between zero and 19. And in fact, only 15 children had died during the entire pandemic—so-called pandemic because, you know, there was no increased all-cause mortality during 2020. It wasn't until the vaccinations, so-called COVID shots, were rolled out that we started seeing the death toll mount, and the amount of suffering and adverse events from those shots were causing so much harm.

But before that, there actually was no pandemic. And in fact, you could hardly even find any children that didn't have serious comorbidities or pre-existing medical conditions that had died with a positive PCR test—which we all knew by that time was completely fraudulent. Because the number of cycle thresholds that they had used for this was about between 40 and 45 right across the country. And we know that anything above 25 was not going to give you accurate results. So we had so many false positive tests that it completely made the test useless. But even the founder of the test, the person that created the test, stated before he died in 2019 that this test was not designed to diagnose viral illnesses.

But as you can see from this chart here: the number of children that died across Canada with a positive PCR test was so small that statistically, it was zero. Also, we knew that this was not a safe shot. If we look at this, there were more injuries— This is just 2021 after the COVID jab was rolled out. We started to see this incredible increase in deaths reported to the Vaccine Adverse Events Reporting System [VAERS] in the United States, which really only collects between probably about 1 per cent—maybe a little bit more, maybe up to 5 per cent—of the injuries that are caused by the vaccinations.

And look at this rise in vaccine injuries. We knew it wasn't safe. So "safe and effective" really was kind of going out the window. And we'd already known about all these young adults who have been killed by the shots, and so we felt that something needed to be done about this. What I did is I kind of thought we needed to get on the road. And so I spoke to Kari Simpson of Canadian Voters Association, who helped to organize a series of doctors' tours. We went ahead and did six tours: three tours to talk about the vaccines and children, and three tours to talk about the vaccine injuries which had already occurred and for which people were being gaslit.

This is a map of the places that we went in our tours. We went to about 30 cities, some of them a couple of times. And this is what we spoke about in the first part of the touring. We started in December of 2021 going out there—and it was a little cold in a lot of places. You know, some places were really pleasant. And these are some of my colleagues that joined us on the tour. And this is an example of some of the places we stood outside in minus eight degrees temperature and talked to the public. But the public also came. They were desperate for information.

[00:25:00]

They would come and stay for two to three hours outside in the freezing cold, standing there listening to us talk. And we've got to hand it to them. That's Canadian spirit for you.

We had a lot of people who were out there supporting us. We actually had a bunch of trucks that gave us a little convoy on a couple of occasions, in fact—into the towns, and so on. So as we were talking to the audiences, we noticed that, over a bit of time, the audiences started changing. Not so much changing as we started noticing the questions were starting to change a little bit—because more and more people had the shots and they were wondering how they could take care of themselves or their family members who had been injured.

And they also seemed to be grieving deaths of many people in the family. We had one young woman who spoke who was crying in front of the audience telling us that she'd had six family members who had died from the shot. It seemed that some communities have been more affected than others.

I should just mention that getting into hot water was pretty easy for doctors. And I just want to put a shout out to those doctors that came on this tour because most of them, they knew what was going to happen to them if they joined us out there speaking to the public. But we knew that the government was not doing the job. They were not doing what they're supposed to do. And the College was fighting—well, persecuting—doctors who spoke out. Instead of protecting the public, they seemed intent on harming the public by not allowing them to be informed and to make informed decisions about what they were going to do for their health.

Informed consent is really impossible if you don't know what the contents of the vaccine are. Because not knowing that, you can't really make a proper judgment whether to get it or not. So everyone was really was being coerced into getting these shots. Or they were being, I would say "brainwashed" is a good term—but at least misinformed to the extent that they thought these shots were good for them, good for their families, and would protect other people.

We started seeing this come up pretty soon after we had started our first tour. So we changed the tour. And in September 2022, we decided to go out and try to give some hope to people and also to tell them that they were not wrong—that actually their injuries were stemming from this COVID shot. Because many people would get the shot then they would go to their family doctor, who would say, "No, it's not the vaccine, the vaccine is safe and effective." And then they would be told, "I don't know what's wrong with you, go home and let's see what happens later."

If they tried to get referrals to a neurologist for example for a neurological injury, sometimes when they heard that it occurred after the vaccine had been given to the patient, they would not be accepted into the specialist's list. It's as though nobody wanted to touch this hot potato of vaccine injury. And still, the slogan of "safe and effective" was being bandied about by our public health.

So what we did is we branded a big bus like this, "Justice for the Vaccinated," and we started going to the different communities. This is our team here, the first team anyway. And then the team changed as we went along. We had this on the back of the bus.

The bus really became like a museum, I would say, or a tribute to people who had had the shot and those that had died. We put posters on it like this, and people were asked to come and sign on behalf of people they knew or family members—or they themselves if they had

been injured after the COVID shot. And when we started driving along with this, between communities, we noticed we'd get lots of thumbs up from other drivers; people would start honking their horns to us, even truck drivers would give us a toot.

We became quite known. Whenever we pulled into a parking lot, people would come to the bus to talk to us and about what had happened to them and to tell their stories—because they were finding that there was no place else that they could do that.

This is Dr. Hoffe. I'm sure many of you know him. Dr. Hoffe, who was on most of the tours with me: we're putting up pictures of people who had been injured severely or died from having had the COVID shots.

[00:30:00]

And this is Kari Simpson. I think she needs a special shout-out because she was one of the main organizers of this through Canadian Voters Association. And without her, we would not have been able to do these tours.

But you can see we had packed audiences everywhere we went, pretty much. As the word got out, the bus became covered in signatures and stories. And we had a lot to tell people; we had a lot to tell them. We had the opportunity. We spoke for two to three hours usually per night. We spoke every night, and we had lots of discussion afterwards. People would come up— I think Dr. Hoffe, we used to drag him out of the venue in the end because he had so many people who wanted to ask him questions.

And we also had guests come. We had different people, doctors speak. We had doctors in the audience but often they would not want to be recognized, and they might come in and leave early. But we did have some doctors locally who spoke up. And you can recognize Dr. William Makis there on the right. And there's also a woman there, right next to the sign, who came up and spoke as a vaccine-injured person and told her story.

We had people come on the stage who would tell us what had happened to them after they'd been given the COVID-19 shot, and the injuries they had sustained, and what their experience was when they went to talk to their doctors about it. How many of them were just told to go home and suck it up, or, "it wasn't the vaccine, and I don't know what's wrong with you." And "It's all in your head." It was a common story. As I mentioned, we had lots of people come and attend, and I just wanted to show a little brief video here. Hopefully it will work. I will see.

[Speaker on the video Dr. Malthouse shows asks how many people know someone who was vaccine injured, requests that they give a show of hands.]

Dr. Stephen Malthouse

I'm not sure you could hear the video very well but those were people who knew one or more people that had been injured by the COVID shots, and a lot of people had two hands up. And because of that our audience was getting quite large. Before that question, we also asked how many people knew someone who had been injured or died from COVID itself—and only a few hands were put up in the audience. So it was becoming very obvious that the COVID shot was much worse than the disease itself.

And we travelled all over the place—we went to 30 different locations. We had quite a time on the bus. It was tiring. Here's a little picture of our support squad, trying to get revived.

And no, that's not an intravenous line running across there. But it was tiring. We went to someplace every night to put on this presentation.

This is the last tour. Just as we were ready to finish up our fifth tour, three for the "Educate Before You Vaccinate" and two of the "Justice for the Vaccinated"— Because, you see, "Justice for the Vaccinated" was the idea that everybody was a victim, whether you were vaccinated or unvaccinated. Our enemy was not each other. We were trying to bring people together and to give them solutions, but the first step is they had to recognize that they were a victim whether they've been vaxed or not. And that their enemy was somebody else; that essentially, it was the government and public health that seemed really intent as far as I can tell, on trying to kill and maim people. And still seem to be intent on doing that. That's my personal opinion.

But then we heard that in Regina, they were going to have the Grey Cup and we thought this was a great opportunity for us to go to Regina and to talk to people about athlete collapse after having the COVID shots. You can see that, after the shots were rolled out in 2021, December 2020 and onward actually, a lot of athletes around the world had dropped dead suddenly on the field. And no one was really paying attention to this. And this was true for little kids as well: children were dying as well on the fields. People were dying in football practice all over the show.

In fact, my licence was suspended in March 2022. And the reason it was suspended by my college

[00:35:00]

was because I was writing vaccine and mask exemptions for people across Canada and allegedly attempting to bypass public health policies.

Well, you know the public health policies were such that, unless you had two shots from two different manufacturers and had near death experiences from both, you would not be exempt. It was pretty much like that. And if you had an allergy to one of the ingredients— even an anaphylactic reaction, in other words, to something like polyethylene glycol (PEG)— then doctors were informed that we were to send you on an urgent basis to an allergist, and that allergist was supposed to assess you and determine whether you could have the shot or not. And invariably they assessed you that, "Yes, you could," and they would send you back to the doctor and say, "Yeah, go ahead and give the shot but divide into five parts and give five different little shots of the same substance and stand by with adrenaline just in case."

So you know, I have no regrets in signing those exemptions. In fact, I think there may be a small hockey league that was created in Ontario because of those. I'm actually quite proud that I probably saved some lives. Particularly when kids were forced to get these shots just to go out and play sports. And you know what it's like for teenagers, they want to be part of the crowd or even teens looking to make some athletic endeavor their career. I feel proud that actually I was able to protect them to some extent.

But we decided, "Hey, we're going to go to the Grey Cup." And so we got the bus rolling and we headed out from Vancouver. We were joined by the team as we went along. And, as you know, we were actually, it was a bit prophetic: we went out there to tell people about athletes dropping dead, and subsequently we did see Damar Hamlin of the Buffalo Bills, who did die twice on the field and was resuscitated. It's interesting when they interviewed him as to what his doctors told him the cause of it was. He said, "um, that's something I

want to stay away from.” In other words, he was not willing to discuss the reason that his heart stopped beating.

And I’m just going to show a little video because it tells you a little bit about how we approach this issue.

[Dr. Malthouse plays a skit of Dr. Hoffe and Dr. Malthouse on their Grey Cup tour, restarts after 35 seconds due to poor audio.]

[Video skit] Dr. Charles Hoffe
Hey, Steve.

[Video skit] Dr. Stephen Malthouse
Hi, Charles! How are you doing?

Dr. Charles Hoffe
I’m doing well.

Dr. Stephen Malthouse
What are you doing?

Dr. Charles Hoffe
I’m just playing a bit of football.

Dr. Stephen Malthouse
Me, too! Me, too.

Dr. Charles Hoffe
No, but your football is looking a little strange.

Dr. Stephen Malthouse
What do you mean? It looks okay to me.

Dr. Charles Hoffe
No, no, no, no. This looks a bit swollen, I’d say.

Dr. Stephen Malthouse
Well, I never noticed any difference. Let’s compare.

Dr. Charles Hoffe
Yeah, yeah, look.

Dr. Stephen Malthouse
Well, what’s— What do you think? Wait a minute! I think my football has got myo-football-itis.

Dr. Charles Hoffe
Did it get a jab?

Dr. Stephen Malthouse
Yeah, it had two COVID-19 jabs and a booster.

Dr. Charles Hoffe
No wonder it's swollen.

Dr. Stephen Malthouse
Yeah. Whoa, I never knew that. And you know, it's amazing how you can play football and you don't even know you've got a swollen one.

Dr. Charles Hoffe
That's—that is very dangerous. Well, I think we should tell some people about this.

Dr. Stephen Malthouse
I think we should. You know what? We're doing this little skit because we're showing how people can get inflamed hearts after the COVID-19 shot and not even know about it. And it's kind of like the football is an analogy. You know, those COVID-19 shots cause inflammation of the heart or myocarditis, pericarditis. And you know, more than 50 per cent of the people that get it don't even know they have this disease going on in the body.

Dr. Charles Hoffe
And that's very dangerous because that inflammation, that swelling of the heart, causes scarring in the heart. And when they get out on the field and the adrenaline and the noradrenaline is going, it puts them into a fatal arrhythmia and they drop dead.

Dr. Stephen Malthouse
Yes. And you know what? The ones that die, even when they try to resuscitate them, more than 75 per cent cannot be resuscitated because of the severity of the disease in their hearts. And the thing is they don't even know it.

Dr. Charles Hoffe
And you didn't even know that your ball was swollen.

Dr. Stephen Malthouse
I had no idea. Well, I'm not going to get another one of those boosters.

Dr. Charles Hoffe
I don't think you should. I'm glad you've woken up.

Dr. Stephen Malthouse
Yeah.

Dr. Charles Hoffe
Yeah, yeah.

Dr. Stephen Malthouse
Thanks, Charles. Nice to see you.

Dr. Charles Hoffe
Thanks, Steve.

Dr. Stephen Malthouse
Ciao!

Dr. Charles Hoffe
Yeah, take care!

Wayne Lenhardt

Perhaps that's a good time to stop and ask the commissioners if they have any questions.

[00:40:00]

Okay. Sorry, Dr. Malthouse, is there anything you wanted to wrap up with before I interrupted you?

Dr. Stephen Malthouse

Yes, first of all, I want to thank the doctors. In fact, I want to name the doctors that came on the tour. I'm sorry if I'm a little bit over time but I think this is important. I wanted to thank Dr. Charles Hoffer, Dr. Daniel Nagase, Dr. Anna Kindy, Dr. Rachel Maurice, Dr. Sofia Bayfield, Dr. Kevin Sclater, Dr. Biz Bastian, Dr. Eric Payne, and Dr. William Makis, who all presented on our tours; and also, our organizers, Kari Simpson, Shelly Semmler, Dennice Pearce, Elizabeth Chapman, and Cris Vleck.

I just also want to thank the communities and the hosts that organized our events and put us up. It took a lot of effort. I want to thank the pastors, because many of them opened their churches to us. I think in the beginning, when we weren't allowed to congregate anywhere, we had a lot of public health people trying to shut down the venues, phoning them up and threatening them. And I want to thank those people that gave testimony.

I'd just like it to be known that those doctors that talked on our tour, they knew what they were getting into. In other words, they knew the risks that the colleges would be after them, and they were willing to risk their livelihoods to be able to speak out on behalf of their patients. And what else? I just wanted to say, just briefly, that really there were two pandemics: there was the fake pandemic, which is really the psyop, and then there was a real one, which was caused by the public health issues. Similarly, there are really two wars going on here. One is the war that we see on the surface, in which we're being attacked in many different fields with the full court press, whether it's food or whether it's the shots or whether it's lockdowns, or finances, religion, education in our schools.

But also, there's an inner battle, too. And that inner battle is really what we call an integrity test. It's where people are being asked to stand up. And I just hope that— I just want to speak to my colleagues, other doctors that know what's going on and haven't really stood up for their patients. I just want to say that when your opportunity comes, I hope that you take it and not choose to sit down, and rather that you choose to stand up.

Thank you very much for having me.

Wayne Lenhardt

On behalf of the National Citizens Inquiry, I want to thank you for your testimony and for all that you've done with your colleagues. Thank you.

[00:42:49]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 17, 2023

Day 1

EVIDENCE

Witness 6: Sheila Lewis

Full Day 1 Timestamp: 06:08:43–06:54:50

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness is attending virtually: Sheila Lewis. Sheila, can you hear me? If you can, I can't hear you because your mic is muted. Now I can see you. And can you talk just so I can see? Oh, there we go. Sheila, thanks for joining us. I'd like to start by asking if you could state your full name for the record, spelling your first and last name.

Sheila Lewis

My full name is Sheila Annette Lewis, and my first name is spelled S-H-E-I-L-A. Last name Lewis, L-E-W-I-S.

Shawn Buckley

Sheila, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Sheila Lewis

I do, so help me God.

Shawn Buckley

Now, Sheila, I have to explain to people that you and I need to proceed with caution because you're under a court order, aren't you?

Sheila Lewis

Correct.

Shawn Buckley

In fact, you're basically under a gag order.

Sheila Lewis

Correct.

Shawn Buckley

So you can't mention the name of an organ, that you're going to not mention but kind of talk about today, is that right?

Sheila Lewis

Yes.

Shawn Buckley

And you can't mention the names of doctors?

Sheila Lewis

Correct.

Shawn Buckley

And you can't mention the location of hospitals.

Sheila Lewis

Correct. Or the name of the hospital.

Shawn Buckley

Right. Or the location, too, or its name. So we have to be very careful because actually you and I could be violating that order if we don't. But I want to be clear. And when you're giving your testimony, that basically, you have truthful information about your health condition, and what specific treatments you need, but you are under a court order preventing you from telling your whole story with us.

Sheila Lewis

Correct.

Shawn Buckley

Now can you tell us, as best you understand it, how this court order came about, basically gagging you from speaking about some things?

Sheila Lewis

One of the doctors in the transplant team—in the lower court, the first court case I had—mentioned and stated to the judge that she had received a threatening email. I didn't see it. She didn't have it to show the court. But anyway, she stated she had got a threatening email, and she was scared for her life, as she stated. And I guess they asked the courts to put a gag order—to hide their names, and location, and what we mentioned—against me in order to protect them.

Shawn Buckley

How many doctors are involved in this lawsuit?

Sheila Lewis

I believe there's five or six.

Shawn Buckley

Okay. So one out of five claims to have received an email that's not produced to you or the court, and there's a gag order covering all five?

Sheila Lewis

Correct.

Shawn Buckley

Without violating the order, I'm going to lead you a little bit. And just so that the people watching your testimony understand, leading is where the question kind of suggests the answer. And we're just doing that so that we don't inadvertently violate the court order. It's a severe restriction on Sheila's ability to testify, but we don't want to violate the court order.

You have a life-threatening condition?

Sheila Lewis

Yes, I do.

Shawn Buckley

When did that develop?

Sheila Lewis

It started in June of 2019, when I found out.

Shawn Buckley

Okay. And because of this life-threatening condition, you were told that you needed something. Don't mention the organ, but tell us what you needed.

Sheila Lewis

I needed a transplant. A double organ transplant, that's what I needed.

Shawn Buckley

Okay. And I will just indicate for the commissioners that a copy of the court order has been entered as Exhibit OT-5. When you need an organ transplant how do you get on the list?

Sheila Lewis

By doing a very thorough series of tests from head to toe. When they say head to toe,

[00:05:00]

believe me it's head to toe: there's a lot of testing.

They go through, they test all your organs to make sure they're healthy and in good working order. They test everything: your bones, your blood, your bone density, CT [Computed Tomography] scans. They do everything you can imagine. They test to make sure that you will pass and be able to get through this organ transplant, which usually takes, they said, eight to ten hours for this transplant.

Shawn Buckley

Okay. And I just want to make sure that I understand. So you basically have to go through an entire range of tests to make sure that your other organs are all good and you're strong enough so that you a) survive the surgery and then also, it wouldn't be a waste of time: you would survive it.

Sheila Lewis

And your heart is a big one too. They test that, make sure there's no blockage. You've got to go into day surgery for that. If there's a blockage, they have to put a stint in. And I was told, if there is blockage, I probably wouldn't get the transplant.

I had absolutely no blockage and they said my heart is very strong. So yeah, I was really, really happy when I heard that. I went through a lot of testing; I redid all the vaccinations as well, the childhood vaccinations.

Shawn Buckley

And how long did this testing take?

Sheila Lewis

The testing for my organs and whatnot and to make sure my body was in very healthy condition: it took pretty much the year. By the time they did them all, spread them out and did everything, it took a long time.

Shawn Buckley

Okay, so you basically went through a year of testing to be able to qualify to get on the organ transplant list and the testing went well.

Sheila Lewis

Very well. Yes, very well.

Shawn Buckley

Okay. Did you smoke, drink, or do any drugs, or anything like that?

Sheila Lewis

I've never done drugs in my life, I've never drank, I think maybe when I was 16 or something like that, I drank beer or something, and I didn't like the taste of it. And I tasted—I think back then it was Kelly's wine or something, and it was absolutely atrocious. So that kind of just threw me right off the alcohol. And then I had alcohol in my past—not by me—and that put a big damper on it. So I just never got into the alcohol.

Then I had children. I dedicated my life to my kids and my work and whatever. And smoking, yes, I did. I smoked cigarettes, but I quit smoking in 2015. I was just tired of smoking, didn't want to do it anymore, so I just quit in 2015.

Shawn Buckley

My understanding is that you were considered to be a very good candidate for transplant.

Sheila Lewis

Yes, they told me I was ideal—that's the word they used. One of the doctors looked at me in one of the meetings that I had with them in Alberta here. She had mentioned that I was an ideal candidate for a transplant. They said they actually looked forward to transplanting me because I was in such good health other than the organ that I need, and they said they couldn't wait to get it done.

I was happy. I was so excited. It meant if I got the transplant, a gift of life, that I was going to live, possibly; and further my life; and go on. And I was really happy.

Shawn Buckley

Now, my understanding is that, in going through this process to get on the organ transplant list, they wanted to know if you had completed your childhood vaccination schedule.

Sheila Lewis

Yes, they did. They couldn't find my records.

Shawn Buckley

Okay, so tell us what happened. Because that was one of the requirements, so tell us what happened and what you did.

Sheila Lewis

They couldn't find my vaccination records from my childhood. So they called me up and told me I would have to get all my childhood vaccinations. And I'm, "Oh my gosh, that's a lot of vaccinations again." They said, "Yes, but it needs to be done if you want to transplant." And I said, "Oh, definitely." I said, "Well, just schedule them up and get them to call me, and I'll go get them done."

It's exactly what I did but it took a year: it took a full year. I remember we started it in January—I believe it was January 2021.

[00:10:00]

And in December, I got the very last. There was one needle that took three—there was three parts to it. Something telling me it's hepatitis B maybe. Or one of the, I think, hepatitis C or hepatitis B. But any way, I got the last one in December of that year. Because they had to span them out every three months, it took a year to get all my vaccinations from childhood, again. I got them all done.

Shawn Buckley

Right. My understanding is you were vaccinated as a child, but because they couldn't find the records of that, you consented to go through all those vaccinations again.

Sheila Lewis

Yeah, because I wanted my transplant.

Shawn Buckley

Okay. Then the COVID vaccine came along. And can you tell us what occurred with the COVID vaccine?

Sheila Lewis

COVID vaccine, COVID-19. They called me up one day and they said— It was just after it was rolled out. And they said they would have to have a meeting because at that point they weren't sure if transplant patients needed to get the COVID vaccine.

Shawn Buckley

Can I back you up and just ask you kind of the position you took towards whether you were willing to get the vaccine, and why you made the decision that you did?

Sheila Lewis

Well, that goes with what they said to me when I get in the office. When they called me up and told me they would have to sit around the table and make a decision whether transplant patients that needed organ transplants would need to get this COVID vaccine. So I said, "Okay." In a couple weeks they called me back, and they said I would have to get it.

When I was in the next visit in the office, I asked one of the doctors—he's actually the top doctor that I see a lot, or seen a lot of. And I asked him, when he spoke about how I would have to get it if I wanted to continue on with a transplant I said, "How safe is this vaccine?" And he looked at me, and he didn't even blink. He said, "One hundred per cent safe." And I said, "There's no data. Hasn't even been out very long, there's nothing on it, we don't know anything about it. How could it be 100 per cent safe?" He said, "It's 100 per cent safe." He said he'd bet his life on it. I said, "Okay."

I went home; I thought about it. I told him I'd get back to him. But when I did get back to him— I got searching in the meantime online, there wasn't a whole lot out about it. And I just kept putting it off and putting it off. The more I put it off, the more I found out, the more I didn't feel good about it. It was just a gut feeling, just something— I don't know, because I've never ever said no; I wanted this transplant so bad; I've never said no to them.

It was a hard, hard decision. It was either, “Well, you either take it or you’re going to die.” That’s basically what it come down to. And I knew it was no good. They didn’t even do the testing on it— They stopped all testing. It’s supposed to go through a series of tests. And not only that, a vaccine takes years to come up with—a safe and effective vaccine. They certainly didn’t take years, unless it was done long before.

Shawn Buckley

Okay, so you had looked into it and first of all, you became suspicious when the head doctor just assured you, “100 per cent safe,” and that made you suspicious. And then as you looked into it more, you became more concerned.

What happened? They’re telling you that you need this to stay on the list and you weren’t willing to do it. So what happened?

Sheila Lewis

I kind of guess at one point I said, “Yeah I will, I’ll take it” because I was terrified not to get the transplant. And then I wouldn’t go get it, and then when he called again in a couple weeks, he said, “Did you make your decision?” And I said, “I just can’t take it, it’s not safe.

[00:15:00]

I know it’s not. And there’s so much coming out now.”

It was at the point then when Pfizer was told by the Supreme Court of Canada [sic] that they couldn’t hide the secrets for 75 years—or the data for 75 years, which they wanted to. That they would have to do a dump every month. And that’s when it started coming out. I was researching the heck out of it all, and that’s when I started finding things out.

And I just said, “No way.”

And then in the lower courts— But I guess that’s down after; I won’t get into that yet. But anyway, yeah.

Shawn Buckley

They weren’t willing to bend at all?

Sheila Lewis

No, not at all. It’s either I take it or I die. That’s exactly what they told me.

Shawn Buckley

Okay. Now, was basically the problem, if you refused to take it they would take you off the list?

Sheila Lewis

Correct. They said, “no transplant.”

Shawn Buckley

Okay, now this is an important question. Tell us, what happens if you're taken off the list?

Sheila Lewis

When I'm taken off the list, I go to Status 0. And what happens when you get on the list first, you go to Status 1, that's the first step of getting on the list. They called me; they said I'm on the list. It was like heaven opened up. I was so happy when they told me that. Then they put me up to Status 2. Status 2 is the highest you go on a donor list. And it means that you progressed and you need one right away—a transplant as soon as possible. When they take you off the list, they take you from Status 2, to the top of the tier, right down to the bottom, which means 0, and you're inactive. They are no longer looking for an organ for you.

Shawn Buckley

Do you know if it is possible to really get back on the list again once you're taken off?

Sheila Lewis

It is if you're at Status 0, but it's not if they remove you all together. And the only reason I'm not moved, in a sense, is because I have court action—like, going through court.

Shawn Buckley

Right, okay. Before we go into the court proceedings— Because they just made these rules themselves, right? This wasn't a provincial rule. This was just a local hospital rule. Am I right about that?

Sheila Lewis

As far as they tell me, yes.

Shawn Buckley

Okay. And am I also right that some hospitals don't require hospitalization for organ transplants?

Sheila Lewis

Correct. There's only two major cities in Canada—and that's Alberta and Toronto—that perform the organ transplant that I need. Other hospitals perform other transplants but not the organ that I need.

Shawn Buckley

Okay.

Sheila Lewis

I was told by my transplant doctors in 2019 or early 2020 that there's only two hospitals that does this. And that's Toronto and Alberta.

Shawn Buckley

Okay. You're now facing a life and death situation because, if they take you off the list and you go to a zero, likely you're going to die. Am I correct about that?

Sheila Lewis

Yes, I'm at zero now. I have been for a long time, two years.

Shawn Buckley

But you started court proceedings to try and get your ranking back. Am I right about that?

Sheila Lewis

Correct. Two years ago, yes.

Shawn Buckley

So your life basically depends on the court proceedings.

Sheila Lewis

Correct.

Shawn Buckley

My understanding is that the Justice Centre for Constitutional Freedoms basically stepped in to help you.

Sheila Lewis

Thank goodness, yes.

Shawn Buckley

Do you recall your lawyer's name?

Sheila Lewis

Allison Pejovic. Forgive me if I'm saying it wrong, Allison, I know you're watching, but forgive me if I said your last name wrong.

Shawn Buckley

I think it might be Pejovic, right?

Sheila Lewis

Yeah.

Shawn Buckley

Right. And Allison was a volunteer at our Red Deer hearings, so the NCI knows Allison. The JCCF basically stepped in to help you, likely without charge. Am I right about that?

Sheila Lewis

That is very correct, yes.

Shawn Buckley

I just bring that up for those watching because it's important to support groups like that.

Sheila Lewis

Yes.

Shawn Buckley

So that people like you have a chance.

[00:20:00]

Sheila Lewis

Yes. They gather donations in order to help people like myself and other people that need legal proceedings, need a lawyer. They step in and help, and society donates to the JCCF in order for them to do this, to help people like me.

Shawn Buckley

Right, because you didn't have the resources to hire a lawyer yourself.

Sheila Lewis

No, definitely not. It costs a lot, a lot, a lot of money.

Shawn Buckley

Okay. My understanding is you brought a constitutional case basically arguing— I haven't looked at the pleadings, but I know you would have argued your section 7 right for life, liberty, and security of the person, amongst other things.

So you guys brought a constitutional argument. What happened in the Court of (now) King's Bench?

Sheila Lewis

Basically, what it came down to was that they went with the Bill of Rights, and they agreed with the doctors that I should get the vaccine in order to get a transplant. They also agreed with the doctors to put a gag order on me. And I lost. It didn't matter. It was no longer my choice, my body. I lost, plain and simple. They went with the Charter.

Shawn Buckley

Okay. So you're basically going to court saying, "My life depends on this transplant, and the only reason they're saying I can't do it is because I won't take a vaccine." And you would have been pointing out that the vaccine is very new. And the court basically said, "Too bad." You can literally— I mean, the effect is, you can die or take the vaccine. Am I right about that?

Sheila Lewis

That's correct.

Shawn Buckley

And if you took the vaccine, you still would be at zero and have to work your way back up?

Sheila Lewis

No, they would reinstate me, they would have to reinstate me. That is true.

Shawn Buckley

It's the lower court that then also issued the gag order, am I right about that?

Sheila Lewis

Yes.

Shawn Buckley

Your life depends on this. So you did the only thing you could do, you appealed.

Sheila Lewis

That's correct.

Shawn Buckley

What happened in the Alberta Court of Appeal?

Sheila Lewis

Pretty much the same thing, but in the Court of Appeal the judges had stated that they didn't know if they could or should intervene—that's what was stated—in a medical procedure, from the lower courts. So they stayed with the decision that the lower courts made and dismissed, but kept the gag order in place.

Shawn Buckley

Okay. So your life depends on them actually looking at this on the merits. And the Alberta Court of Appeal would have known that, am I right?

Sheila Lewis

Correct.

Shawn Buckley

But rather than choose to look at it on the merits, they said, "Well, we shouldn't interfere," and just upheld the lower court's decision.

Sheila Lewis

That's right.

Shawn Buckley

How did you feel about that?

Sheila Lewis

I really had a lot of hope in the appeal court, I really did—the Court of Appeals, I guess. I was hoping upon hope that somebody had a heart and some kind of, I was going to say "brain." But some kind of compassion or something. But I guess not.

I was angry; I was very angry. But I also was angry when I'd seen the Minister of Health from Alberta. When the decision come down from the Court of Appeals, the Minister of Health stated on Twitter that he agreed with the Court of Appeals' decision to stay with the Charter for the doctors and say I had to get the vaccine if I wanted the transplant. Jason Copping agreed with him. I was really angry about it; I was hurt; I was scared. I didn't know what my next move was.

All I wanted to do was to live. I didn't want to hurt anybody.

[00:25:00]

And I didn't want to go to court. I never went to court in my life. All I wanted to do was be able to breathe. And I did everything that the doctors asked me to do.

I'm sorry.

Shawn Buckley

Take your time.

Sheila Lewis

I did everything in my power to do what I was supposed to do. And I didn't drink and I didn't smoke and I didn't do drugs and I took all my vaccinations. I ate healthy. I've lost some weight. I didn't need to lose hardly any; they said I didn't need to lose any. But you know I did my exercises; I went to the programs; I did everything. All I want to do is live. I want to see my grand babies raised. But it's not going to happen now; they just won't bend. For no reason at all they won't bend. It doesn't matter what I do or how hard I try or if I have natural immunity. It doesn't matter; they just won't bend.

Shawn Buckley

So even if you had natural immunity.

Sheila Lewis

Which I do.

Shawn Buckley

Oh, so you've been tested? You've already had COVID. And you have natural immunity and they still will not bend.

Sheila Lewis

That's correct. They wouldn't do the test. I asked the head doctor in the transplant team to do a natural immunity test on me twice. And he refused. He said they don't do it anymore. And I said, "Well, can you just file the paperwork with the lab, the requisition? And I'll pay for it, I'll do whatever." He said, "I'll see what I can do." So I waited again. And in a couple weeks he did a Zoom call with me and I asked him about it. He said, "No, we don't do it anymore." I said, "Okay."

Then a lady I know; the name is Tanya Rollins; she's a wonderful lady from BC. She knew who Steven Pelech was. He is the one who does the natural immunity test from Kinexus, and she got a hold of him. He reached out to me. Long story short, he sent me the test. We did the test. I sent it back in. They did the testing. Three weeks later come back that I have high—he said extreme—antibodies to COVID-19. So yes, I've had COVID twice.

Shawn Buckley

But I just want to make sure I understand. So you have been tested. There's no doubt in anyone's mind that you have had COVID, you beat COVID. You have natural immunity. You have antibodies to COVID in your blood.

Sheila Lewis

Extreme high levels. He said more so than most people—that's what he said on the report. And he said I should not ever get a vaccine. Because I have such extreme high levels of antibodies to COVID-19, he said I should never get the COVID-19 vaccine of any kind. Because of the millions and millions of nanoparticles that will go through my cells and damage my cells. He said it would do a lot of damage to me. And another scientist told me about a spike protein in the vaccine that will do a lot of damage as well because I already have a damaged organ.

Shawn Buckley

Now, how long does this gag order last?

Sheila Lewis

As far as I know— I don't really know a lot about the gag order, but I know it lasts until I'm gone, I guess. I can never, ever mention.

Shawn Buckley

So it goes on until you're dead or something else happens at a different court. Because you've done the only thing—

Sheila Lewis

Pretty much. I guess if I have a new case with a different lawyer altogether and a different case altogether,

[00:30:00]

I guess the new lawyer wouldn't have the gag order on him. But I have the gag order on me until I'm gone.

Shawn Buckley

So because your life depends on it, my understanding is you have applied for leave to the Supreme Court of Canada.

Sheila Lewis

Yes.

Shawn Buckley

And my understanding is that the Court of Appeal, all three judges ruled against you.

Sheila Lewis

Yes.

Shawn Buckley

So you don't have a right to appeal; you have to actually ask the Supreme Court of Canada if they would accept your case.

Sheila Lewis

Correct. And that's the process we're in now. And I guess— My lawyer mentioned to me last evening that they are looking at the case now but have not made a decision.

Shawn Buckley

So you guys have applied for leave to the Supreme Court of Canada, and you have not yet heard from the court whether or not they will choose to hear your case.

Sheila Lewis

No, not yet.

Shawn Buckley

And if they don't choose to hear your case, that's the end, isn't it?

Sheila Lewis

That's the end. And I'm taken off the list altogether. And if, like you mentioned before, if I'm taken off the list altogether, I'll never get back on. Because they won't put me back on.

Shawn Buckley

Okay. So they've left you on the list solely because you have court proceedings going. But if the Supreme Court of Canada refuses to hear your appeal, you will be taken off the transplant list. Is that right?

Sheila Lewis

That's correct. Yeah.

Shawn Buckley

What is your life expectancy right now without the transplant?

Sheila Lewis

It ain't long. It's not long now. I'm on about 25 liters per minute of oxygen. I have three machines, oxygen machines going. Each one is at 10. I wear two hoses 90 per cent of the time. If I just walk a few steps, go to do the dishes, I have to have a face mask on with a bag and hold oxygen so I can press it every so often to get a little bit extra. I can never finish a pan of dishes or whatever. I can't cook anymore. Can't make a bed. I really can't do anything anymore.

I'm sorry. You just feel useless.

Shawn Buckley

Don't be sorry.

Sheila Lewis

Like you're just here, and there's nothing— It's like nothing nobody can do to help you.

When you can't breathe it's one of the most scariest, scariest things in the world—when you can't breathe. If you laugh you lose your oxygen, and if you cry you lose your oxygen, and if you move you lose your oxygen. So you have to be void of emotion of any kind because you're scared to lose that oxygen. And it's an awful way to be, an awful way to be. **Because one time when you laughed, or you cried, or you reached out for a hug, you could do all them things. You no longer can do it because you're going to not be able to breathe if you do.**

So help me God, that's all I wanted—was just a transplant. I was hoping to get the gift of life and be blessed to get one. I didn't do anything wrong. I just couldn't take that vaccine because it was going to do a lot more damage. And I know it was going to when the scientists, or the science tells you that it's going to.

[00:35:00]

Why take it? It's going to do you in before the transplant is going to do you in. At least without the vaccine you got to live a little bit longer, but with the vaccine, you're not going at all. The science tells us that. Because my organs already critically damaged and the vaccine is going to do the rest in. So why take it?

Shawn Buckley

We sure appreciate you sharing with us, Sheila, so that we can understand what you've gone through. How has this been for your family?

Sheila Lewis

It's really hard. It's really hard on my boys, especially because they're the ones that see it every day. They go through it every day with me. They rearranged their life so one of them could be at home at all the time: one in the daytime, one in the evening. They do everything. They've learned to do dishes and cook, make beds, everything I can't do. They vacuum, they scrub. They're actually wonderful, wonderful, wonderful young men.

For them to go through every day and watch me. Because basically what they're doing is watching me die. And it's got to be tough. And they never say anything. And they never complain. And they never, you know, give up, and they never get angry. They're there 100 per cent of the time for me. And what better children can you ask for than that?

Unfortunately, I didn't have any girls. I had all boys. I had four boys and they're great boys. I'm blessed in that area. Anybody that has children, hang on tight, and don't forget to tell them that you love them every day because they're pretty precious people. Because you never know when the day is going to come that you can't, so make sure you hang on tight to them.

Shawn Buckley

Sheila, before I ask the commissioners if they have any questions, is there anything else you'd like to say?

Sheila Lewis

Yeah, these doctors: there's no reason why they can't give me the transplant, there's none. I have natural immunity, very high levels of natural immunity, as I stated. There's no reason why they can't. Natural immunity is much better than any vaccine ever out there. So there's no—to me, and it's just my opinion on it—there's no other reason. And everybody has stated: scientists, there's doctors that state it in courts. There's, you know, the doctor that **does the testing for natural immunity: they've all stated I cannot have this vaccine.**

So what's stopping them? Your guess is good as mine. But there's something evil in this world or in this country even, that's happening. And I know a lot of people don't agree with me, and I'm sorry if you don't. But for the love of God, look at the science. But these doctors, for whatever reason, they won't bend. And I've pleaded with them, and I've asked them to please give me this transplant—or at least try to look for the organ that I need. I always said they were great people; they really were. They were great doctors. And what happened I don't know, surrounding this vaccine. I have lots of questions. But there's no reason why they won't give it, so why won't they?

[00:40:00]

There's no science surrounding the fact that they won't give it to me. There's something else wrong here, and it comes from the top. And I know it does. I mean, doctors and nurses are losing their licence[s] if they speak out about it. I mean, when does that ever happen in history? You know something's wrong and something's got to be fixed—fast.

There's a lot of people dying and it's not just me. I'm not the only one that was refused the transplant because they chose not to get a vaccine. There's a lot of people in Canada, and I always said I was fighting for them. Because they deserve to get their transplant just as much as I do. It doesn't matter what organ it is, dear God, there's a lot of people that need help. And I feel for every one of them because I know what I'm going through, and they're going through the same damn thing. They need help and they need a lot of prayers.

Whatever these doctors are doing: they're evil. There's no other word for it. You're evil to let people die for no reason. I always thought a doctor took their oath, the Hippocratic oath: Do No Harm. Well, there's an awful lot of harms going on. And I'm going to plead with you: please, please, for the love of God, give people their transplants. They're not asking for anything else; they just want the gift of life. If it's there and it's possible, please give it.

I don't want to die, God help me. I'm so sorry.

Shawn Buckley

Don't be sorry.

Sheila Lewis

One thing I said I wasn't going to do was this when I come on. But I guess when you talk about it, emotions unfortunately get in the way.

Shawn Buckley

We appreciate your honesty. I'll ask the commissioners if they have any questions.

Commissioner Kaikkonen

Sheila, you have a purpose. And as difficult as this may seem right now, you are standing in the gap for every other Canadian who is experiencing the same—and standing up and fighting for justice and compassion in our country. Your testimony is a reminder that our government has lost— has forgotten how to govern. Your testimony is a reminder that our courts have lost their way in terms of justice. I don't know if you heard the woman here, **but she's in the audience. And she said that we are praying for you in the name of the Lord Jesus, and we are. Keep looking up. And know that your testimony has given us a further purpose at the National Citizens Inquiry to continue to share the real-life experiences of Canadians. You matter.**

Thank you for your testimony.

Sheila Lewis

Thank you. And thank you for your prayers.

Shawn Buckley

Sheila, there aren't any more questions. And the room is full, and there's people watching you live online. And I think I could safely say that every Canadian watching is very ashamed to be a Canadian right now. And on behalf of the National Citizens Inquiry,

[00:45:00]

we sincerely thank you for testifying, and you will be in our prayers.

Sheila Lewis

Thank you. Thank you for giving me the opportunity to speak on the National Citizens Inquiry, Shawn. And thank you for everything you guys have done. I appreciate it. And stay safe. Go home and hug your family.

Shawn Buckley

You can't see, but there's a standing ovation for you, Sheila.

Sheila Lewis

Thank you. I appreciate it.

Shawn Buckley

Thanks again, Sheila.

Sheila Lewis

God bless the people in Canada.

Shawn Buckley

God bless you.

[00:46:12]

Final Review and Approval: Jodi Bruhn, September 1, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

[00:00:00]

Wayne Lenhardt

Our next witness is Kristen Nagle, and I think I have you on my screen. Kristen, can you hear me?

Kristen Nagle

Yes, I can.

Wayne Lenhardt

Okay, thank you. Oh, I was also told to say my name up here. I'm Wayne Lenhardt. So just as long as the commissioners don't make me take an oath!

Anyway, if you could say your name, please Kristen, and spell it for us. And then I'll make you take an oath.

Kristen Nagle

It's Kristen Nagel, K-R-I-S-T-E-N N-A-G-L-E.

Wayne Lenhardt

And do you promise that the testimony you'll give will be the truth, the whole truth, and nothing but the truth, so help you?

Kristen Nagle

Yes.

Wayne Lenhardt

Just to do a quick intro, you got your nursing degree in 2006, and your nursing licence. And you've been a nurse ever since. And things were going fine.

One item that should be mentioned is that, in 2018—interesting fact—the nurses union actually won a challenge to the wearing of masks during your employment, to the point you didn't have to do that anymore. Which is interesting as to what they did when COVID came along. Could you perhaps pick it up at 2018 and tell us what happened after that?

Kristen Nagle

Sure. It was several years of fighting with—our union fought for us—and it was because during flu season, from November till April, if you did not receive the flu shot you would have to wear a mask throughout your whole shift, whether you had symptoms or not.

So we fought for years. And finally in 2018, through our nurse's union, we won. The union proved that the masks were discriminatory and did not stop transmission of viruses. And we no longer had to wear a mask during flu season if we did not receive the flu shot.

Wayne Lenhardt

Two years later, what happened?

Kristen Nagle

Two years later I was shocked to see when they mandated the masks—not just masks but now goggles for virus that we had to wear throughout our entire 12-hour shift. We were handed four masks total for the shift to rotate through and everyone complied. After years of fighting to not have to wear a mask for this very purpose, right on the unit, everyone was back to putting on masks and this time, no end in sight.

Wayne Lenhardt

Okay, so what happened in your employment as the mandates came into force? Which would have been, what, 2020, 2021 in there? Just perhaps give us a timeline as you go.

Kristen Nagle

Yeah. March 2020 is when really things kind of got really heavy, I think—around the world, in Ontario, and in the workplace where I was working. I worked as a neonatal intensive care nurse. And yes, we had to wear the PPE—so the masks, the goggles—and a lot of restrictions were put in place on visitors.

Working in a neonatal intensive care unit, we have premature babies that are 23 weeks old. And sometimes they're in our unit up to 100 days or more. Parents had to wear a mask the entire time they were with their baby at their bedside. And we know from the 1960s Still Face Experiment that that's detrimental for a baby's development for anyone.

Parents were also— Only one parent was allowed at the bedside in 24 hours. A premature baby is a very scary, detrimental time, and they had to take in all that information by themselves and be alone and isolated at the bedside. They weren't allowed to share that with a partner.

If a mother had to have a C-section, even though there is a whole bunch of personnel in the room, the husband was not allowed to be in the room with his wife during the C-section. He was not allowed to witness the birth of his baby or support his wife. If the mother was put under general anesthetic, both parents missed the birth of their baby.

Sometimes we would have antenatal mothers and pregnant women that were in high risk, that were there for weeks, if not months at a time. They were only allowed one individual the entire time. They had to choose one individual that could come in and out of the hospital to see them, to visit them. And so that would mean going without seeing family, friends, loved ones, sometimes even their own children for that time.

[00:05:00]

It was quite sad, what was happening. I was speaking out about it. I'm also a holistic nutritionist and a mother myself. And I was seeing the harms that was happening. And being a holistic nutritionist, I knew that there was preventative measures. You know, there's things that you could do. You could—there's vitamin D and C and, you know, a whole bunch of things you can do through nutrition and things like that on a holistic approach.

I was speaking out about this to my colleagues. I was living life normally outside of work. I was not living in fear because I knew that the measures that they had in place—the lockdowns, the masks, the isolation—were actually causing more harm than good. My colleagues did not like that I was living my life this way and would put in complaints about me to management, saying that I was not wearing proper PPE. Because when I was sitting at a desk by myself, I'd put the goggles on my head to do charting, so that I could see. Apparently, that was scary for them.

I ended up being suspended from work in November of 2020 for being insubordinate for not wearing proper PPE. Prior to that, I had spoken out in September of 2020 at City Hall as a delegate about the harms of masks on children. After doing that, I received a flood of emails from parents about how their children were coping, which they were not, through this. Remember, the schools were shut down. They closed down the playgrounds, they closed programs and activities, and completely isolated children. And I was getting floods of emails from parents—of some as young as six years old, talking about how they hate their life and they were using parents credit cards to try and pretend to cut their wrists.

So I continue to speak out. And I'm feeling very emotional from that last testimony. It just reminded me of why we were speaking out, as well for the children and for all Canadians. I ended up hosting a freedom rally in my hometown in November of 2020. And CBC News picked up on that and completely defamed me. It was "LHSC NICU nurse Kristen Nagle puts premature babies in danger." Said I was a reckless nurse and of course, you can just imagine the slander that came from that.

My entire reputation and character was destroyed in my community. I was put under indefinite suspension at this time and then placed under investigation by the College of Nurses of Ontario. By this point, it was a 600-page disclosure of social media posts, things I had said, talks, and then reports from colleagues and people in my community that had written in about me after I'd spoke at City Hall in the rally.

So from then—no longer working, under investigation—I found another nurse, Sarah Choujounian, who was speaking out in Toronto. Her and I connected with six other nurses from the United States. We formed Global Frontline Nurses and we traveled to Washington,

D.C. in 2021 to speak at a health and freedom rally at the Supreme Court. This just so happened to be January 6th. I will admit that I was politically naïve. We just wanted to share what we were seeing: the harms that were happening from lockdowns and public health measures and what I was seeing in the community with children. We just wanted to do what nurses do, which is advocate for the public and to protect them.

When we flew home from Washington, D.C., Sarah, and I were both deemed domestic terrorists for the storming and rioting of the Capitol. We were terminated from our jobs and we were internationally defamed at this point. We received incredible amount of hate through social media, through other avenues that could reach us. And it was quite—it was a really hard, dark time. The RCMP even came to our house to ask about our involvement in the storming and rioting of the Capitol. I had nursing colleges teaching their students about me, about accountability and what not to do. “Don’t do what Kris Nagle did in storming and rioting at the Capitol.” So it was— Yeah, it was pretty dark.

However, after all the hate, a bunch of love and support came in. And many from nurses from around the world supporting us and wanting to speak out. But I think what a lot of people don’t realize is that on December 16th, 2020, the College of Nurses of Ontario put out a statement

[00:10:00]

saying that nurses were not allowed to speak out about masks, social distancing, anti-vaccination, or anything to do with public health measures or they will be reprimanded and their licence revoked. This silenced nurses from speaking out and coming out and saying what they saw wrong.

We had this flood of support come in, anonymous, and so we decided to host a press release on January 25th of 2021. It was the first virtual press release that we had nurses, doctors, and other healthcare professionals come in. And we got testimonies from all across Canada: from nurses and PSWs [personal support workers] and healthcare professionals about what they saw happening in 2020 and 2021, the start of it. Empty hospitals, the emergency not busy, very slow, and then the harms that were happening to elderly patients.

I should say that, even in my unit, they told our respiratory therapists that they would have to float down to adult ICU because it was going to get so busy that they were going to need the extra help. And they never left our unit. They never had to float down—because ICU never got busy. They closed down an entire gynecology wing outside our unit as well for COVID overflow. And we did not see one single patient on that floor, it just remained empty the whole time.

So that was after January 6th, where we were defamed and we created Canadian Frontline Nurses. We kept going. Another nurse, Kristal Pitter, she was the first one to be defamed in the media and was put under investigation as well and terminated from her job. We held a rally, a protest in front of the College of Nurses of Ontario, to let them know that they would not silence us. We would not be bullied. We would not be scared from protecting the public and doing our job, which is advocating and protecting and doing what was right. So we held our rally on April 14th of 2021.

Sorry. She was doing good [the witness is tending to her baby]. She slept throughout the whole process. I’m trying to kind of continue on as best as I can, so I’m sitting on the floor.

Wayne Lenhardt
Okay, take your time.

Kristen Nagle
So we held that rally in front of the College of Nurses. It was the first ever regulatory body protest to take place.

Wayne Lenhardt
You got to participate with the truckers I think at some point, did you not?

Kristen Nagle
Yes. Yes, we did. We spoke across Canada, bringing awareness to what was happening all throughout 2021. We held the national hospital rallies September 1st and September 13th, which was all across Canada. It was in support of healthcare workers about the mandates because it was job or job. We wanted to bring awareness to what was happening to the healthcare workers and that many were going to be terminated. And tens of thousands across Canada had been, whether it was termination, sick leave, mental health, or early retirement.

Yes—after the hospital rallies, we were again defamed, put under another investigation. So three investigations by our college at this point. We were defamed by the media. This time we actually were concerned for our lives and our children's. We were doxed: the threats were quite vile at this point and even threatening our children. All across Canada, it was the same statement: that we interfered with ambulance access; we stopped cancer treatments from happening; and we assaulted healthcare workers. Which was not the case, because we were there in support of healthcare workers.

So yes, after that, you're right, I was involved. We had a Canadian Frontline Nurses truck there. I was there personally every day at the convoy: boots on the ground, interviewing truckers, people that were there, listening to their stories about why they came, what brought them there, what motivated them. And I was there right till the very end when the police violently removed all the peaceful protesters from the streets. I myself was pushed down to the ground by an officer at that time.

Canadian Frontline Nurses and myself, we did put forward a lawsuit at that time too. We were the first one to put forward a case against the federal government for wrongfully invoking the Emergency Measures Act.

Wayne Lenhardt
I suppose the pinnacle for all of this was when you attended the rally at the Capitol in the U.S.

Kristen Nagle
Absolutely.

Wayne Lenhardt

And then you were labeled a domestic terrorist and you had a visit from a couple of RCMP, if I recall our discussion.

Kristen Nagle

Yes.

Wayne Lenhardt

And then did anything come of that?

Kristen Nagle

It did not,

[00:15:00]

because there was no involvement, so there was nothing to come of it.

Wayne Lenhardt

So as far as your job goes, you basically have had no income from 2020. Am I correct?

Kristen Nagle

Yes, you're correct.

Wayne Lenhardt

And you were terminated in early 2021 for that incident in Washington D.C.

Have you gotten any tickets along the way for this activity of yours?

Kristen Nagle

Yes. I received 11 summonses throughout 2021 as well as one \$880 fine. The summonses were for going against the *Reopening Ontario Act*, speaking at protests and rallies. One of them so happened to be Easter service mass April 25th, 2021. I was attending the Church of God in Aylmer. And that case, that summons has since gone to trial. And I was found guilty and fined \$10,000 plus court costs of \$2,500 for attending church at that time.

We are appealing it. The judge would not allow the appeal to go forward without the fine being paid, so I have to pay the full amount of the fine before the appeal will be heard. Four others of those events are going to trial, so they're still pending four trials coming up. And then, yes, we have three ongoing lawsuits with our Canadian Frontline Nurses organization, which are quite large.

Wayne Lenhardt

I think I'm going to stop at that point and ask the commissioners if they would like to explore anything via questions. Yes, Ken.

Commissioner Drysdale

Good afternoon.

Kristen Nagle

Hi.

Commissioner Drysdale

When I was listening to your testimony and—obviously it's still very much in my mind, the previous person's testimony.

Kristen Nagle

Yes.

Commissioner Drysdale

And I think you said that the CBC had done an attack piece on you. Various media groups did, and then you were getting threats.

Kristen Nagle

Yes.

Commissioner Drysdale

You were getting hate email and threats.

Did no court intervene on your behalf and issue a gag order to the CBC or to any of the media outlets that slandered you? I ask that question because in listening to Ms. Lewis's testimony, one of her doctors claimed that they got one piece of email, a hate email, but didn't produce it in court. And yet she got the protection of a gag order.

Did you get the protection of our courts against this hate mail or this threatening mail you got?

Kristen Nagle

No. At one point I was scared. Especially after the hospital rallies, because they painted us, they actually stated— People believed that we had blood on our hands. That we, you know, **hurt people. And I did actually think people were going to come after us. They posted our home addresses; they told people to show up. And it became scary about where I could go in public and where it would feel safe to go out, where I'd be welcomed or not.**

But interesting enough— We unfortunately did not have a legal team when CBC put out that hit piece, that original one about me in 2020. But we did have a legal team in '21 with the hospital rallies. And we did put out a libel defamation lawsuit against Canadian Nurses Association as well as Together News Media, and they turned it against us. They used the slap-motion, the anti-slap, and they put that against us. And we lost. So it worked in their favour—to protect their voice and not ours.

Commissioner Drysdale

Were you surprised when the RCMP showed up on your doorstep? I'm assuming you thought they were there for your protection and they were accusing you of terrorism? Is that what they were accusing you of?

Kristen Nagle

Yes. Because they had reports that we were domestic terrorists and we were involved in the Capitol event, and so they were investigating who we were. And yes, I was surprised. I had two young boys at that time; they would have been five and two, I think. And yeah, we were all there together. And it was scary and very off-putting, absolutely.

Commissioner Drysdale

So obviously right now, you're making it known that you've been threatened and you've got hate mail and people are threatening you and you're afraid.

Do you expect that the law enforcement will come to protect you and offer you protection?

Kristen Nagle

I don't expect that of them, no. I used to have an officer that would—I got to know his first name and he'd knock on our door 8:00 in the morning to hand me my summonses that I got throughout '21. And after what I experienced in Ottawa, with looking directly at some of the officers in their eyes and filming them,

[00:20:00]

I was very close to them. I don't expect to have the same protection. No, I don't expect that.

Commissioner Drysdale

How much confidence do you now have in our legal system?

Kristen Nagle

Very little at this point. Very little. I've seen— Yeah, with even my one appeal—I'm trying not to say too much about our current legal cases. The one appeal, we put in an application for the appeal to be heard without the fine being paid. The Crown prosecutor suggested I pay \$5,000, my lawyer suggested \$500, and the judge came back and said he wanted all of it paid—the full amount. So \$12,500 before the appeal will be heard. Still disciplining many of us.

There's a case going on right now with Sarah Choujounian where she's in disciplinary hearing with the regulatory body. And this is about social media posts that were put up. We're fighting for this under Canadian Frontline Nurses as well. We're fighting to get nurses back their voice because they've been silenced. We're supposed to be the last line of defense for the public; we're supposed to stand up to doctors; we're supposed to ask questions; we're supposed to critically think. This is what we're trained to do and they've taken that away. And if nurses can't speak out, if nurses can't advocate for you, then I don't know who will anymore in that system.

Commissioner Drysdale

Thank you very much.

Wayne Lenhardt

Are there any more questions from the commissioners?

I think that's a no. So on behalf of National Citizens Inquiry, I want to thank you very much for giving us your testimony today. And good luck with the tickets in the future. Thank you again.

Kristen Nagle

Thank you very much. Thank you. Bye.

[00:22:40]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 17, 2023

Day 1

EVIDENCE

Witness 8: Madison Peake (Parts I and II)

Full Day 1 Timestamp: 07:17:52–07:25:05/07:44:31–07:46:09

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

PART I

[00:00:00]

Wayne Lenhardt

Next up, we have Madison Peake. So Madison, if you could give us your full name and spell it for us, and then I'll do an oath with you.

Madison Peake

My name is Madison Peake, M-A-D-I-S-O-N P-E-A-K-E.

Wayne Lenhardt

And do you promise that the evidence you'll give will be the truth, the whole truth, and nothing but the truth, so help you God?

Madison Peake

I do.

Wayne Lenhardt

Okay, a little bit of background. You're 21 now, and you've just gotten your degree this year, a Bachelor of Science in Psychology. But you were at Nipissing College when the mandates came out and you were still working on that degree. Is that correct?

Madison Peake

That's correct.

Wayne Lenhardt

Maybe I'll just let you start and tell me what developed as the mandates came into force in—I think that would have been in, what—2020, '21? Tell us what happened, and I'll bother you if I need to.

Madison Peake

Okay. So in 2020, when the pandemic started, I was 19 years old.

I have three younger siblings and I'm testifying today to speak on behalf of my family in terms of the psychological turmoil that we were under throughout the past few years. So at 19, I was home alone when the pandemic was declared.

Wayne Lenhardt

The vaccine mandate didn't come in right away, but it did come in for students at some point. Am I right?

Madison Peake

Yes.

Wayne Lenhardt

You would have been forced to take the vaccine, but you applied for an exemption, correct? Tell us about that.

Madison Peake

Yes. My post-secondary institution required that all students be vaccinated to be on campus. I immediately applied for an exemption under religious reasons.

And I felt really guilty about even doing that because I knew that so many others were not being accommodated. I still don't know to this day why I was granted the accommodation, but I was granted the exemption while many others weren't. My institution constantly put out emails that were—

Wayne Lenhardt

Your exemption was on religious grounds, correct?

Madison Peake

That's right.

Wayne Lenhardt

And although you were concerned you wouldn't get it, they did give it to you at some point, did they not?

Madison Peake

They did.

Wayne Lenhardt

But also, your mother and father were employed, so what was happening to them?

Madison Peake

Yeah. My father worked for a private company full-time from home. His company put into place a mandate that all employees be vaccinated, regardless of where they were working. He was told he should apply for an exemption. He did and it was denied. He applied for the same religious exemption that I had applied with to my post-secondary institution. And so he was left from November of 2021 to March of 2022 wondering if he would be let off, but in the end he wasn't. Our whole family was struggling at that point with severe mental health issues. This was the first time my siblings and I had to face possible financial issues.

And especially I'd like to speak to what happened with my mom. She was able to keep her job, but she underwent a severe mental break in January 2022.

Wayne Lenhardt

And there are three younger siblings as well as you in the family, correct?

Madison Peake

Yeah. So my mother had a major anxiety attack.

Wayne Lenhardt

Did anyone end up on medication during all of this stress?

Madison Peake

Yes. I ended up on anxiety—anti-depressants. And my mother was dysfunctional at this point because she was concerned for her kids in the face of the mandates. So I escorted her to the doctor. I really didn't know what to do. We tried telehealth. And we ended up fighting to get her in an in-person appointment at our family doctor.

[00:05:00]

And at that point, she was prescribed medication and also given leave from work for two months.

Wayne Lenhardt

And you dropped out for a semester, correct, so you could look after parts of the family?

Madison Peake

Yeah. I made the decision at that point that I needed to drop out, so I withdrew from my courses for that term.

Wayne Lenhardt

What about church services? What can you tell us there?

Madison Peake

Part of the complication, mentally, for all of us: our faith community was stripped away. As many people were, we were barred from attending our church. My teen brothers weren't able to play badminton at the club anymore. My younger sister and my brother were no longer welcome at the volunteer symphony locally because they were unvaccinated.

Just without these community supports we all were just crumbling. And we still describe it to this day as some of the darkest times, our darkest days. The only thing that brought us through it was that our family unit was very strong. One of my brothers, at 17, lost 30 pounds at this time. I ended up taking him to the doctor to assess his mental health.

Wayne Lenhardt

And for a good while there, it looked as if your father was going to lose his job. Although it turned out that he didn't, but if that had happened, it would have been pretty catastrophic for the family, correct?

Madison Peake

Yeah. We weren't sure what we were going to do. Earlier on in the pandemic, we were debating whether at least the breadwinners should get vaccinated. The culture at school was so intense in terms of pushing the government's— We were silenced.

And the university did not give scientific sources for their reasoning for the mandates that they put in place.

[00:07:13]

PART II

[00:00:00]

Wayne Lenhardt

We're back. Just so everybody knows, we were off air just because we lost our internet connection.

So Madison, I'm going to start you back where I asked you the question as to what we could easily do to have made that situation of yours better?

Madison Peake

I would have hoped that our leaders and our institutions would have allowed for discourse. Allowed for conversation without silencing. Allowed for us students to critically think and investigate, and to not treat us as dumb by just giving us slogans—but giving us scientific reasoning, scientific studies, to back up what they were saying and what they were forcing us to do.

And I'd also— I think, for the future, it'd be important for all of us to self-reflect on how we've treated people the last few years. Whether that was actively treating people, saying things, or just passively watching as it unfolded.

If we can have compassion for the individual rather than some abstract greater good, that would probably go a long way. It would make us feel more supported as youth and as young adults.

Wayne Lenhardt

Any last questions from the commissioners? No.

Okay. So Madison—

[Livestream cut off again].

[00:01:36]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 9: Mallory Flank

Full Day 1 Timestamp: 07:49:07–08:38:00

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry. We apologize: the internet has gone down now, I think, three times in the last half hour, so please be patient with us. Hopefully things will go okay from here on.

Our next witness is Mallory Flank. Mallory, I can see you. Can you hear me?

Mallory Flank

I can hear you.

Shawn Buckley

And I can hear you also. I'd like to start by asking you to state your full name for the record, spelling your first and last name.

Mallory Flank

It's Mallory Flank: Mike, Alpha, Lima, Lima, Oscar, Romeo, Yankee, and then Foxtrot, Lima, Alpha, November, Kilo.

Shawn Buckley

And Mallory, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Mallory Flank

I do, yes.

Shawn Buckley

Now, Mallory, you're here to share about your experience with the vaccine. I'd like to start by asking why you chose to get vaccinated.

Mallory Flank

I was actually mandated for the vaccine in Alberta. It was required for all healthcare professionals. So in order to work, I had to be vaccinated.

Shawn Buckley

And I'll just back up. I forgot to introduce that. So you were a critical care paramedic deployed overseas. You were also a medical student.

Mallory Flank

Yes.

Shawn Buckley

Yeah, so when you say it was mandated, you mean as a health care worker it was mandated for you.

Mallory Flank

Yes, it was mandated for me.

Shawn Buckley

Okay, so that's why you chose to get vaccinated. Can you tell us when? Or I can lead you on that if you want. I know it's May 14th, 2021.

Mallory Flank

It's been just over two years now. It was definitely May 14th 2021.

Shawn Buckley

Tell us what happened.

Mallory Flank

Within ten minutes of getting the vaccine, I had an anaphylactic reaction to the vaccine. I started off with hives, hoarse voice, started coughing, had some stridor, which is that nice high-pitched squeal that comes out when your throat starts to swell. My tongue was swollen, face was swollen.

Thankfully, we had some medication and stuff with us, so we were able to mitigate most of the reaction right away. Following that point, I ended up having more reactions. The following day, I ended up going into the ER, utilizing epinephrine.

Shawn Buckley

I'm just going to slow you down. So the first day you're having these reactions. What, in addition, started happening the second day?

Mallory Flank

The second day the reaction was worse, so in that sense— We kind of weren't really expecting it to go like that but the reaction was infinitely worse, to the point where I had to use an EpiPen. After that happened, we went to the hospital.

Upon getting into the hospital—I was kind of rushed in on that one—I was given more epinephrine, a bunch of antihistamines, some steroids, and then watched for a bit and then sent home.

Shawn Buckley

Okay, so you end up in the hospital that day, so that's May 15th. Now my understanding is basically you were in the hospital every day until you were admitted, like May 15th to May 20th. Can you kind of walk us through those days and tell us what happened?

Mallory Flank

For sure. So essentially the same things was happening, except they were just randomly coming on. We weren't really understanding what was going on. On a daily basis, I was ending up having to use EpiPens. Because of course I was sent home with epinephrine from the first time I went to the hospital. So the Sunday, same thing happened again, ended up back in the hospital, ended up getting kind of the same roll, with the steroids, the antihistamines, more epinephrine, sent home. That happened every single day.

And then we switched up hospitals because we were told to avoid our community hospital because they weren't well-equipped for airway issues. So they said if there are any airway issues, try to go past and go to a bigger facility. So that's what we did. And on that one, I think it was three EpiPens on the way into the hospital.

Shawn Buckley

So I'm just going to slow you down. Prior to being vaccinated, would you be using EpiPens?

Mallory Flank

No.

Shawn Buckley

Did you even have EpiPens?

Mallory Flank

No.

Shawn Buckley

Okay, so the hospital is sending you home with a lot of EpiPens.

Mallory Flank

A prescription for unlimited.

Shawn Buckley

Okay. Just for those that would be watching your testimony that aren't familiar with what an EpiPen is, can you explain to them what an EpiPen is and why it's so important?

Mallory Flank

For sure. So this is what it looks like.

[00:05:00]

But the EpiPens are set with a specific dose amount of epinephrine. The epinephrine is designed to kind of help take down the swelling. That way your airway—like, if you can't breathe, it should take it away enough that you're able to get some air in. It's not an end-all be-all, though. Like, I've had to use upwards of six plus. There was one day I think it had ten. So it's equipped to stop reactions but at the same time, it is a very limited time frame that it does it in.

Shawn Buckley

I'm just going to slow you down again. Like, if somebody— We hear about people that are allergic to bees, where they're going to die if they get— That's what they have to carry with them every day in case they get stung. And if they don't get that in, they're not going to be able to breathe.

Mallory Flank

Yes, that's exactly it.

Shawn Buckley

You were experiencing this up to ten times a day, where you wouldn't be able to breathe unless you used an EpiPen?

Mallory Flank

Yes.

Shawn Buckley

Yes, okay. I just wanted people to understand how serious what you're going through is. I'm sorry, I'll let you carry on, but I think it's important that people understand. This is actually life and death if you don't have an EpiPen.

Mallory Flank

Yeah, I would have died if I hadn't had an EpiPen with me. Even now, I have to carry six with me at any given time. So it's very important to have around. In that first week, we ended up bypassing and going to a different facility. Same thing kind of happened there. Same medications given, several rounds of Epi, discharged again. I went back the next day,

actually by ambulance—because I had a massive reaction trying to get a prescription for antihistamines that was given to me the previous day. And when we went in there, the poor pharmacist: she was actually on the phone with the GP that was assisting with what was going on with me, and getting orders, and then throwing us medication that could be injected. So like, injectable Benadryl, several EpiPens, then called EMS, went in by EMS; they gave, I think, two rounds of Epi in the ambulance, went back once we got to the hospital, another round of epinephrine, more IV antihistamines.

And then at that point, I had a scope that was done about three hours past being treated. So of course, they just saw redness and whatnot in there, but I was supposed to be admitted on that one. I was told by the ER physician, who was the same one as the previous day: unfortunately, this time when he saw me when I came in, he's like, "Oh, it's you again." And kind of rolled his eyes and then didn't treat the situation as seriously as the previous day. Which I don't understand what happened, with this change in mentality for it. However, in there again, the nurses were advocating for me. I kind of hung out in there. Reactions happened a couple of times. I was treated for two of them and then another one happened and they were kind of hemming and hawing about actually doing any treatment. We ended up being treated for it eventually, but again, then discharged afterwards. He changed his mind, so he discharged me again. And then finally on the Friday, I was admitted to the University Hospital.

Shawn Buckley

So that that would be May 21st by my count.

Mallory Flank

Yes.

Shawn Buckley

And your vaccination was on May 14th. So basically, for seven days you were having to go to the hospital every single day and then finally they just admit you.

Mallory Flank

Yeah, my partner injected me with Epi in the middle of the night because I didn't wake up to my airway being compromised. The high-pitched squeal from the stridor woke him up.

Shawn Buckley

How long were you in the hospital before you were released?

Mallory Flank

I was in the hospital for seven days, five of which were in the ICU.

Shawn Buckley

Okay, so tell us about that. I mean, ICU, that means you're on death's door with like a one-on-one nurse.

Mallory Flank

Yes. I had initially been put into what they call iCare, which is like an intermediate version of it where I'm completely monitored, but the nurses aren't one-to-one. But I had so many calls with the medical emergency team because I needed epinephrine and immediate intervention for reactions that it got to the point where I was too unstable to be able to sit there in that area. Because that team was called, I think, six times prior to me being put into the ICU.

So they brought me down to the ICU so that I could have that close monitoring. So when a reaction happened, they could be right there and they had everything available to them instead of being locked up in cabinets.

[00:10:00]

My partner did have to come and treat me a couple of times. He had medication with him. Because in ICU they don't have the stuff immediately available. And because of that, any delay of course causes bigger issues. When they weren't able to source the medication, they weren't giving me the medication I required on time, that kind of stuff: it all kind of compounded and then reactions would start to happen. And then of course, the med team would be called, the team would come in, and then they would treat according to what they had; or just watch, whichever, because most of the time we had it treated with Epi by the time they got there. And then finally, after having to tell one of the physicians exactly what our background was and what my background was, he finally went, "Oh, she's like me, just without the certificate." And this is coming from an ICU physician. And he said, okay.

Shawn Buckley

I'm just going to slow you down there for a second. So what are you reacting to? Because it's your throat that's swelling, am I right?

Mallory Flank

Yeah.

Shawn Buckley

What are you reacting to where you're needing this constant epinephrine?

Mallory Flank

We did find out a couple of months later that I do have a severe allergy to the S1 protein. That is what was causing the reactions.

Shawn Buckley

I'm going to slow you down. This protein is in the vaccine, right?

Mallory Flank

It is. And it's what is developed by the mRNA vaccine so that you can create the antibodies to attack it, which means your antibodies also have a component of it. So as long as there is even a tiny version of the S1 protein in my body, I will react to it.

Shawn Buckley

So for two weeks, you could die at any time, except you're getting these EpiPens. And it's death by suffocation. What was that experience like for you emotionally and mentally?

Mallory Flank

It's scary. I mean, I've transported really sick patients. I've been a part of people with anaphylactic reactions and that kind of stuff. But I was not ever anticipating to be someone to experience something like this. To have it happen so frequently, on a daily basis, is scary. I don't know what's going to happen. Even now, I don't know what's going to happen. When it does happen, you fear for your life. I hate to say this: I've kind of gotten used to it a little bit. It's not as right in your face, but that initial phase is so scary. I didn't think I would ever see my children grow up. I thought the last time that I spoke to them, prior to going into the ICU, was the last time I would ever see them again.

It's just, it's a horrible, horrible experience. It's so incredibly difficult to put into words what it's like. I guess, to showcase it would be the equivalent of, you know, in the movies where mobsters and stuff like that, they'll put a plastic bag over somebody's face and then you can see them trying to suck in the air and there's nothing there and they're panicking and scratching at their neck? That's what it's like. Even now, I have to do this to pull my shirt and stuff away from my neck as it swells. Like, you can probably see now my neck has actually swollen a little bit. But it's very, very scary. And it's scary for people around you that know you too, especially when your hands are tied and you can't do anything to help.

Shawn Buckley

Do you mind us discussing the email you sent me earlier today?

Mallory Flank

Not at all.

Shawn Buckley

Okay, so basically, you knew you were going to be testifying. And you basically were communicating that you're having a bad day and you might actually have an attack while you're testifying, which is why you have an EpiPen right there. It's just because otherwise, you could die in front of us.

Mallory Flank

So yeah, I thought I would give you the heads up just in case. You hear my voice is changing a little bit. I've got an EpiPen, I've got even IV Benadryl and I have half bag of fluid that's behind me that's still running.

Shawn Buckley

I'm sorry, I didn't even notice. So you have an IV bag behind you that's running, so it's dripping into you. What's in the bag?

Mallory Flank

It's just a saline at the moment, but I have drawn up medication, Benadryl—

[00:15:00]

the injectable version—because I have a central line still in.

Shawn Buckley

Okay, so can you just show us that again for the camera? So this is normal for you, right? To have an IV line into your arm so that you can inject Benadryl directly into your system rather than have to ingest it because your throat will be constricting.

Mallory Flank

Yes, and to provide fluids and whatnot. After a reaction, most often I'm not able to eat or digest stuff. And the more reactions that happen, the worse that gets. I can't break down pill capsules, I drink a lot of the medication. The IV stuff works infinitely faster as well, because I don't have time with some of them where I've gone unconscious in less than thirty seconds. Even the other day, somebody was smoking outside and the door was partially open, and the smoke came in. I ran to the door to close it, managed to close the door, and then just collapsed down because I was so dizzy. My dog had brought me an EpiPen and helped me with its administration. So it is dangerous. Like, it's scary and dangerous and little things set it off. So it's difficult to live with.

I'm thankful for having the central line in right now because it's what is saving my life when it comes to having to administer medication quickly.

Shawn Buckley

And I just want people to understand: it has been a full two years since your single shot.

Mallory Flank

Yes, two years. Now it caused autoimmune disorders. So essentially, it's a secondary mast cell activation syndrome where my body attacks itself. It also causes me to be reactive to pretty much everything in my environment. They call it being allergic to life. Prior to this, I had three allergies to medications. Now—

Shawn Buckley

Right, okay. So when you say three allergies, you mean you were allergic to three drugs?

Mallory Flank

Yes.

Shawn Buckley

So you weren't allergic to cats or dogs or pollen or anything like that. You were able to go out and do whatever you wanted?

Mallory Flank

Yes.

Shawn Buckley
Until May 14th, 2021.

Mallory Flank
Yes.

Shawn Buckley
And then you haven't had a single day off?

Mallory Flank
That single day. And now, every single day, I have reactions. It doesn't stop. I'm on a lot of high-dose antihistamines and medications to try to suppress the mast cell response; lots of supplements, specialized diet. I get exercise-induced anaphylaxis, so I have to be careful. My heart rate can't go above 110, otherwise it causes a reaction. Stress will cause it, environmental stuff. Like, the smoke right now is predominantly what the issue is. And even yesterday, the smoke in general has been pretty bad. But it causes, again, reactions that require epinephrine and Benadryl.

Shawn Buckley
I'll just slow you down. Because you live in Alberta and people here in Ottawa and people online may not understand that there are forest fires happening in Alberta, and so there's smoke in the city you live in?

Mallory Flank
Yes, almost the whole province is on fire. We're well coated in smoke and ash across the province. It's pretty bad here at this point. I think we're on, "very severe" is the risk level for us. It's a ten plus.

Shawn Buckley
Now, you've told us that you've got mast cell activation syndrome, which basically makes you allergic to life. I wanted to just, before we go on: you had an episode where you actually became allergic to your own hair?

Mallory Flank
Yes.

Shawn Buckley
Can you tell us about that and then I'm going to pull up some photos from your website.

Mallory Flank
For sure. It was August 2021. I had been progressively becoming more allergic to stuff as we went along, so I would all of a sudden have reactions to random things that I had never been allergic to ever in my life. And then at one point, something weird was going on. I was

developing, like, sores and stuff on my head around my hair follicle. And it turned out that the mast cells were actually attacking my hair follicle,

[00:20:00]

so I still have some bald spots from it. But because of that my hair would fall out. We just kind of went to the point where, like, "Well, we'll just shave your head and see what happens," which helped exponentially because even my hair touching my neck or my face would cause swelling in that area. It was completely out of the blue. Now I use shampoo that has Benadryl in it to kind of mitigate that aspect, but it was, again, something that we didn't even consider and something that's so odd, right; it's the epitome of your body attacking itself.

Shawn Buckley

Okay, I'm going to pull up some pictures. David, if you want to put the exhibit up that I have on the computer at the lawyers table up. So now you have a website because you want to share your story with people. And we've entered your web page as Exhibit OT-12. And can you just explain to us these two pictures here? And then I'll scroll down to the next two pictures.

Mallory Flank

For sure. The first picture is my daughter and I. This is before getting the vaccine, so it is in early 2021. And the following picture is partially of a reaction. So that's some of the swelling that's from a reaction. And it is after my head was shaved. From the looks at the back, I was in the hospital at that time. So that is a photo of me in the hospital having a reaction with my face swelling up completely.

Shawn Buckley

Okay.

Mallory Flank

And at this time frame, my weight can fluctuate up to 30 pounds in 24 hours from just swelling alone. This is, again, one of those incidents that—I had been put on steroids as well, so it didn't help. This actually makes that part infinitely worse. So that is—yes, just a lot of swelling.

Shawn Buckley

Okay, so I'm going to scroll down. And I'm thankful that you had sense of humour, even doing the Dr. Evil pose.

Mallory Flank

I had to.

Shawn Buckley

So share with us these two pictures.

Mallory Flank

The first one is a picture towards the end of my time frame when I was working overseas, so that is late 2020.

Shawn Buckley

And that's when you're working basically as an emergency paramedic overseas.

Mallory Flank

Yes.

Shawn Buckley

A critical care paramedic.

Mallory Flank

Yes. And then, the next picture is two days after we had shaved my head, when all the swelling had gone down out of my face. So we had taken a picture that just had a "before" and "after" of what had happened. We're joking around because, I mean, it's weird having a shaved head when you've never had one before.

Shawn Buckley

Right. And so for the swelling, I'll just scroll up so people can compare. So everyone, just have a look at the Dr. Evil shot, and again, it's important to have a sense of humour. So you see the difference there in swelling. That's why you put those pictures on your website, as you wanted us to understand—or just anyone to understand—what you were experiencing. So David, you can take that down so we can see Mallory again.

So Mallory, you told us about mast cell activation syndrome. My understanding is you also have POTS, and can you tell us about that and what that stands for?

Mallory Flank

Sure. So POTS is, again, an autoimmune disorder. It is a disorder where your nervous system, its automatic functions don't function as well. So it's Postural Orthostatic Tachycardia Syndrome. So postural, meaning changes in position make my heart rate go extremely high. If I go from laying down to sitting or standing, my heart rate could go, say, from fifty to one hundred and thirty. The blood doesn't return as easily back to my heart to be able to get to my brain. So then of course, it causes a lot of dizziness. You get a lot of kind of pressure in your head. Sometimes I've passed out from it. You get, like, a tinnitus sound afterwards. So you get that high-pitched, like, whistle for quite a while in your ears. It can cause extreme pain in your head with that pressure. And then finally, say, if I were to sit down or return to the previous position, it would go away within about thirty seconds.

[00:25:00]

But again, each time I have to get up I now have to get into a position and wait in that position in order to be able to get up into another position. So if I'm laying in bed, I have to sit up and wait, and then I have to stand up and wait, and then I can go and walk around. So it's very frustrating, but—

Shawn Buckley

Okay. I want to now talk about your interaction with the Alberta health care system. Because my understanding is that for the first time in your life, you got calls from AHS, which stands for Alberta Health Services. They never call you for any other purpose, but they call you for the purpose of your vaccination. And can you tell us about those calls? And then I also want you to tell us about doctors filling out reports and whether you found those reports to be veracious.

Mallory Flank

Okay. So the calls that I got, the first two were from a nurse who was calling in regards to the vaccine reaction. So she got all the information down. She found out that I was still having reactions on a daily basis and that we were kind of trying to find help to deal with it. She called a second time just to see if I was still having reactions and then to see if anything else had progressed. She was lovely. She did say that the immunologist would potentially call if they thought it was an important aspect for them to make contact on.

The immunologist did call several months later. And at the time, I was in really bad condition. I was having multiple reactions per day. Even when she called, I had just had a reaction, so I was exhausted in speaking with her. And on that phone call, she, as I was speaking, she'd be like, "mm-hmm, mm-hmm, mm-hmm," and then I would get interrupted and she would say— One of the comments was, "Well, there was a woman in ICU that had a reaction to the first shot, but she received her second shot successfully." Which to me, at that time, that didn't really pertain to the situation. Also, everybody's different. Chances are that woman and I do not have the same physiology or had the same response. We don't know why she was in ICU, the whole nine yards.

Shawn Buckley

Right. So just to be clear: she actually told you to get the second shot, didn't she?

Mallory Flank

She did, yeah. She told me that I needed to get the second shot. She wanted me to schedule a second shot with her right there. She said, "Well, if you are that so scared about this, I can have the pharmacist split the dose in half and I can stand there and watch while they give it."

Shawn Buckley

I just want to make sure that I understand what you're telling us: so you've basically become completely disabled, where you're only alive on a daily basis because you're jabbing EpiPens into yourself, and the immunologist is telling you to go and get a second shot?

Mallory Flank

Yes.

Shawn Buckley

Had this immunologist ever seen you as a patient?

Mallory Flank

No.

Shawn Buckley

Just phoning from AHS and telling you to get a second shot?

Mallory Flank

Yes, and then she phoned my GP at the time as well.

Shawn Buckley

To tell your GP to tell you to get a second shot?

Mallory Flank

Yeah.

Shawn Buckley

Now, my understanding is that you have concerns about some of the reports the doctors have written. Can you share with us that?

Mallory Flank

Yes, so when I was admitted into the hospital for a month, the majority of the time, the physicians wouldn't be around when reactions happened. However, the reports that went in said that, "Oh, yeah, she had all these reactions. We didn't see anything happen on our full assessment. So we think that, we don't know exactly what's going on and she's administering EPI three times a day all of the time. She's administering Benadryl all of the time. So we think that she has an addiction to Benadryl. We have concerns that this is psychiatric in nature." And essentially, it was a lot of, "We saw nothing happen."

Now, when you look at the nurses' notes, the nurses' notes document all of the swelling and documents that they were unable to get a hold of the physicians. It was documented that they were not able to get medication orders because the doctors refused to give them. There were times that it was documented that I didn't have a reaction,

[00:30:00]

and yet because medication was withheld for so long for the reaction, I was out—vomiting everywhere in the room, not able to breathe, and just everything is coming out. It was ridiculous. Completely swollen, my eyes swollen shut.

The reports that went, those are the progress notes that the physicians do. And those are the notes that go to the specialists. Those were sent to the specialists. They didn't include the fact that psychiatric evaluations had been done and we had been told that everything was fine, that the reactions were actually happening, that they couldn't have been induced in any other manner. Like, it's not psychiatric in nature. So it was really frustrating to see that they had actually changed everything, hadn't assessed me.

None of the physicians actually did a full assessment, barring one: one out of the nine did a head-to-toe assessment. The others, even if they came up to talk to me and they would document that they did a full assessment and what they found, but there was no assessment actually completed.

Shawn Buckley

We're getting a little short on time. But I want a full answer on this next question, and then I'm going to lead you on some financial stuff. I want you to take your time on explaining the impact on your children and on you because it's affected your ability to care for them, and I want you to share that with us.

Mallory Flank

Yes. So my daughters— Starting off, we didn't really know what was going on. I unfortunately was unable to look after them because of how sick I was, so I lost a lot of parenting time. Plus, some of the reactions happened in front of my kids. One was because my daughters had cats at the time and I, all of a sudden, was a little bit deathly allergic to cats. And her jacket was in the bathroom and I had gone into the washroom for maybe ten seconds and had a massive reaction, came out, and I was having a hard time breathing, I was turning grey, my lips were blue, and my daughters were right there in front of me. So my partner of course explained what was going on. He put an IV and treated me and we asked them to go in the other room and then he went and he spoke to them afterwards.

We've had to try to normalize what's going on with me because of the number of times I've had reactions. So they're very well-versed now with EpiPens and stuff like that. And that's just— I mean, general knowledge-wise, it's wonderful. But I have been kind of pushed on by the court system and by my ex—in the sense that me being the way that I am, they don't want to deem it as being normal—that if I have to treat something, the kids can't ever see anything that's happening. I can't show them when I'm sick. I can't show them that I'm having a reaction, all because it shouldn't ever be normalized that this is happening.

These are permanent issues.

Shawn Buckley

I just want to stop. So you're in family court and the family court's basically telling you: you can't live the life that you have now been dealt in front of your kids?

Mallory Flank

And if I have to go away for treatment if it's for an extended period of time, I would have to reapply for things like parenting and whatnot when I come back.

I've lost so much time with them, the more I react, the sicker I get, and then I can't look after them. It's horrible to know that they're so close yet I can't be with them because I'm too sick to be able to facilitate what they need.

Shawn Buckley

Just hang on a second. We've lost sound, so just hang on a second. Can you talk again? I think we've got it back. There we go.

Mallory Flank

Like even this week, I've had to give up parenting time because of the smoke and I can't leave the house, so I can't facilitate anything for them. If people come in and out,

[00:35:00]

it brings smoke into the house and then I have anaphylactic reactions, so it's a very difficult balance. My daughters want, like, to bring friends over and they love animals and whatnot. Of course, we have parameters in place for safety purposes. We're able to mitigate a lot of the stuff so that they have some normalcy for everything.

But again, at the same time, things like wildfires and stuff like that, things that I can't predict, I end up losing parenting time because of it because I can't facilitate being a parent. I miss that time. I can't advocate for what they need. And then it goes into the court system as, "She's too sick to do this and do that, is she well enough to make decisions, is she well enough to actually be a parent?" And it's hard to hear that because this isn't something that I asked for to begin with. Like, nobody would ask for something like that. But it came off of me doing what I thought was right at the time I'm mandated so that I could facilitate bringing income to support our family.

And then all of this stuff happening and me not being able to see my daughters, having to go and stay with my parents in a different province, having to seek out-of-province care—again, time frame away from my kids. And my partner has lost jobs; my parents have had difficulty with this as well. And then to see what happens on top of that? Like, my daughters saw me almost die a couple of times. They're eleven and thirteen, so they were nine and eleven at the time that this started. And that's not something a kid should ever have to see. They should never have to see their parents go through something like that in front of them over and over again.

At that time, of course, we didn't have control over it. The reactions were much worse and we couldn't anticipate when they were coming. Now it's easier and it's trackable. But to have them see that and have to deal with that and not know. When I talk to them on the phone, they can see one of the reactions happening or, if I'm not feeling well, have them worried. Because they don't know if they get to see me again even in the hospital. There was one really bad reaction that wasn't treated properly to begin with. I thought that was the last one that I was going to have. I thought that the conversation I had with them three days prior to that was the last one I would ever have. It's horrible.

Shawn Buckley

I'm just going to rush through the financial stuff, just so that it makes it into the record. But you had been employed by the U.S. government in casualty evacuations for a special evacuations medical team—basically, you know, war zone stuff. And you were also a medical student. And because of this you can't work and you couldn't be a medical student. Your parents have basically used up an enormous amount of their savings to help you out. You've paid over \$200,000 out-of-pocket for treatments and you're still extremely sick. And it's really too expensive for you to live on the small disability pension that you're now on. So this has just been a financial disaster for you and your family.

Mallory Flank

Yes, absolutely. It's destroyed everything; we've lost all that we have. We used all of my pension that I had built for years, used all of that to pay for medical. Like you said, my

parents' retirement fund, again, used all that for medical. I still have to pay out-of-pocket for stuff; like I need to see a specialist in the States, that again comes out of pocket. Nothing has really been covered. Only recently— So it's only been a few weeks that I was actually approved for the provincial disability. Then this is two years later and it's off of course, the diagnosis overarching being post-vaccine reaction syndrome. And like,

[00:40:00]

how do you expect to function? My costs for medication alone: we're sitting over \$8,000 a month.

Now of course, a lot of it is covered. It's not all covered. But I require specialized purification systems, specialized water treatment systems, all of the stuff that can be used in the house for cleaning: that stuff has to be specially ordered. When it comes to clothing, shampoo, conditioner, that kind of stuff, personal care items: all has to be specially ordered. There's nothing in our life that I can use that is commercial. And we've tried and tried over and over again to be able to find ways around it that were cheaper, easier, that kind of stuff, and we can't, so life—

Shawn Buckley

And Mallory, I'm just going to, for time, cut that short. And I'm going to ask the commissioners if they have any questions for you. And they do.

Commissioner Massie

Good afternoon, Ms. Flank. Thank you very much for sharing with us your very touching horror story with a touch of humour. I mean, I appreciate that you still struggle to keep up with that.

My first question is: Did I understand well from your testimony that they were asking you to get a second shot? Does that imply that they didn't appreciate the seriousness of the side effect from the first shot? Did they acknowledge it at all?

Mallory Flank

There is no acknowledgement whatsoever on what I said and what was documented for what was going on. It was just a blatant "uh-huh, uh-huh." You could hear kind of writing down a few things. And then, "Okay, so we're going to schedule your second shot." And there was no ask or no follow-up of, "Hey, maybe we need to get you in to see her," whoever, as an immunologist, to kind of nail down what was going on; or go to one of the **adverse vaccine reaction clinics. There was none of that. After that conversation with her my report was removed from the provincial system. And that's when nobody can find it anymore. No physicians have been able to access it since that point. It was like I didn't exist. So the reaction didn't exist. Moderna didn't find out, actually, until a couple of months ago when I contacted them.**

It was a blatant, "You're getting the second shot." And any way to get it done was how it was going to happen.

Commissioner Massie

So does that follow that the healthcare system will never compensate for vaccine injury in your case?

Mallory Flank

I'm not sure. I mean, vaccine reactions happen all the time. They've happened with every vaccine. We should have been learning from this one, not just blockading what was going on with it. There was a huge stigma attached to it. There still is. It's not as bad as it was before but during that time frame, as soon as anyone found out that this came from the vaccine, I wouldn't get treated or I would be treated completely differently. And it became really frustrating. And the fact that we couldn't actually get proper treatment was also a big component of it. It has, I guess, assisted in making me permanently like this.

But the Alberta government, of course, is who approves the disability stuff. And when my application went into H, which is the disability component, it went in as post-vaccine reaction syndrome, and that is what I was approved on. So I think the acceptance is there from that side of things. But it'll be a matter of still working through and it's practitioner-dependent. So it's a little bit difficult, it's hit or miss if I end up going into the hospital. But now I carry out a wad of paperwork and assigned protocol and stuff like that so I'm treated properly. Versus having to explain everything over and over again and then getting the dodgy, "Oh, maybe we'll get psych down and we'll get them to talk to her first" and whatnot.

But yeah, I don't know if it'll change anybody's mind. I'm hoping that the province takes it into consideration as to what's going on, that there are a lot of people that have had issues. So that recognition, I'm hoping, will come fully—like come full loop—but it is up to those who are in charge and those who want to encompass and learn.

[00:45:00]

But you can't learn unless you accept and acknowledge, so—

Commissioner Massie

What's the prognostic for your current situation? Is there any hope that this will improve over time with any specific treatment? Or is it something that is completely, for the time being, not well-understood?

Mallory Flank

Right now, they're saying it's not well-understood because I have a kind of an off-variant of mast cell. It's a very multi-level immune response, so they don't really know what's going to happen. They do know: now that it's been like this for two years, we haven't really seen improvement unless I can live completely free of any type of allergen or trigger. Not exacerbated in any way, the symptoms can kind of resolve. I still have reactions, but they don't escalate as quickly.

But then if I'm exposed over and over again, it starts getting back to the way it was right at the beginning. So it's very hit or miss right now. There are treatments. If I had actually been treated in hospital properly in the first month, I would have been completely fine. This wouldn't have escalated to the point that it is right now and become permanent. There are treatments that will suppress my immune system. I still haven't been able to get access to them because no one will take my case.

It's a little hard when you can't get someone who's actually willing to look at the fact that it did come from the vaccine. And that it is a huge problem and that there are tons and tons of symptoms and it's dangerous. Still waiting on that fact to be able to access the proper testing and the treatment to go with it. With that treatment, it could potentially allow me to come off of some of the medications, live a little bit more normally. I still have to be well aware of the allergens and triggers and still have a lot of safety mechanisms in place, but it could have a better effect for me. Outside of that, there isn't anything else. I will be like this for the rest of my life. And we don't know how long that actually is.

Commissioner Massie

I'm wondering: When you took the decision to get vaccinated because of your work that you didn't want to lose, but you had already allergy conditions before the vaccination. So were you specifically warned that under those conditions, you might experience more side effects because of your previous condition?

Mallory Flank

No, not at all. There is no warning of it. We did a ton of research on the vaccines. The reason I used Moderna was because Pfizer couldn't guarantee that there wasn't penicillin or sulfonamides in their vaccine. And I had allergies to both of those. So we stepped away from that one and utilized Moderna.

But not once was anything ever said that that would cause any extra reactivity. We did find a study afterwards that showcased people with those types of allergies. Especially female had a higher incidence of severe reactions to the vaccine, which would have been nice to know ahead of time. But again, it was a small group of individuals off of one of the primary studies. But nobody said anything here. It was actually, in the U.K., it was part of their algorithm where it was one of those, "Yeah, you need to see somebody before you get it." Here it was just, "Get vaccinated."

Commissioner Massie

Thank you very much.

Mallory Flank

Thank you.

Shawn Buckley

So Mallory, there being no further questions on behalf of the National Citizens Inquiry, I sincerely thank you for coming and sharing your story today. It's been very valuable.

Mallory Flank

Thank you very much. I appreciate your time.

[00:49:19]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

[00:00:00]

Wayne Lenhardt

Our next witness is going to be quite unusual; let me explain what's going to happen first. This is a fellow who is severely disabled. He is in a wheelchair and we're going to put his picture up on the screen. And what he does is: I can ask him a question, he will hear it, and then he types into his computer. The computer then becomes a person and takes the typed message and gives it to us audibly. So I'm going to be leading him more than I normally would. I'll try to give a question with some information in it that he can answer "yes" or "no."

So that's what's going to happen now. I believe he is on the feed right now. There's a picture of him up there. So let me do an oath with him first.

Adam, your name is Adam Zimpel, spelled A-D-A-M Z-I-M-P-E-L. Do you promise that the testimony you will give today will be the truth, the whole truth, and nothing but the truth, so help you?

Adam Zimpel

Yes.

Wayne Lenhardt

That was a yes into the phone. Okay, let me just explain who you are to the commissioners and then we'll see how we can do this. You're a 39-year-old man who's severely disabled. And in early 2020, you got a job working as a travel agent, which was your dream job. Is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

Thank you. The clicking that you hear, by the way, is his typing on his computer. Because of the COVID in 2020, there was a declaration of a state of emergency in Ontario. And at that point, you basically lost this job as a travel agent, is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

Thank you. At that point, your life routine significantly altered in the sense that you lost all of your personal support workers and your mother had to become your primary caregiver. Is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

Because you would work from home as a travel agent, in the evenings you normally would like to go out and socialize. But once the mandates came in, that was taken away from you. Is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

You never did get the so-called vaccination and you refused to take it. And at this point, you are still not so-called vaccinated. Is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

As the lockdown continued and the passport system was rolled out, not having taken the jab, you would not have been able to do much in the evenings even if you had been able to go out. Is that correct?

Adam Zimpel

Yes.

Wayne Lenhardt

I think it's pretty obvious that you've been impacted far more than most people would have been impacted by this, these mandates and whatnot.

At this point, I think I will let you tell us anything else that you would like. We will listen for the computer clicks. At this point also perhaps,

[00:05:00]

the commissioners could be thinking of any questions they might have. Perhaps you could do that for us. And if you have your mother or someone there, perhaps she could indicate to us when you're done.

Adam Zimpel

I like to eat at a local restaurant—like, neighbourhood. That was brutally taken away. Even McDonald's was deemed dangerous. During the weekend I like to go downtown, that was

[00:10:00]

deemed unhealthy. While altering routines is hard for any person, in the disabled, it is especially unbearable.

Wayne Lenhardt

How do we get the question? Did you get what he said?

Adam Zimpel

My mother and I were never afraid of the virus. We even drove to

[00:15:00]

empty hospitals at the height of the supposed pandemic. No ambulances to it. Nowadays, there are a lot of ambulances because of the safe and effective vaccine.

Wayne Lenhardt

Okay. I have three questions from the commissioners.

So let me ask the first one and then we'll stop and get your response. Did your support workers stop coming because they were afraid of the virus? I'll say that again: Did your support workers stop coming because they were afraid of the virus? Okay, go ahead.

Adam Zimpel

Yes. I asked who is

[00:20:00]

the doctor from [inaudible] strategy ordered them. I made the mistake of letting them go. I think it is the biggest mistake of my life.

Wayne Lenhardt

Okay. Thank you for that. Okay, I think we have your answers here.

So given the lateness of the hour, thank you very much for your testimony on behalf of the National Citizens Inquiry. And we wish you the very best in the future with your job search and all the rest of your situation. Thank you again.

[00:24:53]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 17, 2023

Day 1

EVIDENCE

Witness 11: M Tisir Otahbachi

Full Day 1 Timestamp: 09:04:13–09:25:27

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Wayne Lenhardt

Mr. Tisir Otahbachi. I hope I didn't mangle that too badly. I'm Wayne Lenhardt and I'll be asking you the questions today. Could you spell your name, your full name, and then I'll do an oath with you.

M Tisir Otahbachi

First of all, hello everyone. My full name is Mohammed Tisir Otahbachi.

Wayne Lenhardt

Okay, and could you spell that for us?

M Tisir Otahbachi

Yes. So it's written, my first name is M, space, T-I-S-I-R, and my last name is O-T-A-H-B-A-C-H-I.

Wayne Lenhardt

And do you promise to tell the truth, the whole truth, and nothing but truth?

M Tisir Otahbachi

I will tell you one trillion billion per cent the truth and exactly what I've been through and what happened with me so far.

Wayne Lenhardt

Thank you. Maybe I'll just start you in 2021, where I think your issues happened after the vaccine. So maybe just tell your story and I'll stop you if I need to.

M Tisir Otahbachi

Since the Government of Canada put many restrictions on everybody, on Canadians, preventing us going to grocery shopping, going to hospitals, working, and doing many things, so we had to take the vaccine. And they were pushing us indirectly or directly to take the vaccine. And as soon as my wife—she was pregnant at that time—has regular visits to her doctor and the hospital, we had to take the vaccine. So on 15 of July 2021, I took the first shot of the COVID vaccine, Moderna. Ten days later exactly, there is a tiny, small bubble that started on my right hand, and that bubble has a yellow liquid.

At the beginning, I never recognized or thought that that bubble is because of the COVID vaccine at all. I went to the pharmacy because I don't have any family doctor or any other doctor—either in Quebec or any other province. I went to the pharmacy and then I saw the pharmacist and then they gave me, like, a syrupy cream to apply three times daily on it. I was doing that but unfortunately, that bubble was getting bigger and bigger every day.

Until 13 of August 2021, I got my second shot of the Moderna COVID vaccine. Then 48 hours later exactly the whole of my body—almost the whole of my body—got the same reaction. And my body was feeling: if you take your body, your full body, and just throw it out on the fire, that's the feeling of my body, how it was.

At that time actually, I went to the hospital to get in a hospital. And I waited for almost 23 hours without seeing any doctor. They asked me just to wait outside on the seat and there's no doctors to see at all. When we asked the receptionist over there, she said, "Now, 9.5 hours left to see a doctor." If we like, if I like, I can go to any walk-in clinic or to any other clinic to see a doctor.

So I gave up. I went back to the pharmacy again. And then the pharmacist checked on my body, my hands. They gave me different creams from over the shelf and the pharmacist told me, "You have to see a doctor as soon as possible, because there is something wrong going on in your body".

Then here, my journey started. I was looking for a doctor, for any family doctor or any doctor in Quebec. And I think it's much easier to win a lotto of \$20 million than to find any family doctor or any doctor in Quebec.

[00:05:00]

So for eight months, I was looking for any doctor in Quebec, with the help of some people that are working at the government in Quebec. But nothing happened. It was with negative results.

In September 2021, I was unable to work. I used to work as a mover, like moving furniture, and a Uber driver. At that time actually my body was burning. I was unable to take a shower, wash my hands, my body, for more than 18 months so far.

So tell me please: Who is in the world can handle that? But I did handle it.

Wayne Lenhardt

Okay, so to summarize then. The problem was you had some sort of a skin reaction. Were you able to shower and take baths and that type of thing?

M Tisir Otahbachi

I was using water wipes, 99.9 per cent for the babies, to clean my body.

Wayne Lenhardt

Have any of those symptoms resolved yet? Are they still bothering you?

M Tisir Otahbachi

They are still bothering me. Because right now, I'm living on an injection, it's called Dupixent. And I have to take this injection for the rest of my life. I have to take it twice a month. So once I take an injection, it gives me some relief for 10 to 12 days. And then after that, if I don't take the second or the next one, the reaction—it gets back exactly as the beginning. Like, I feel I never get anything or any improvement.

Wayne Lenhardt

Do they know when the symptoms will resolve, or do they think it will be for four or five years but they're not sure?

M Tisir Otahbachi

So, this is— Actually after that, after I gave up in Quebec to find any doctor, I started borrowing money from my dad to go and see doctors in Ontario: Ottawa city exactly. I've seen many doctors in Ottawa. Once I was going there and I was telling every doctor that I got that reaction after the COVID vaccine, most of the doctors were saying like, "No, this is not because of the COVID vaccine; don't say it's because of the COVID vaccine, the COVID vaccine is very safe." And I was telling them "I got it after the COVID vaccine." They said, "No. Just take this prescription." And every doctor was giving a different reason for my condition and gave me different prescription and I was buying all that from my pocket.

Then one of the doctors I've been to in Ottawa: she was yelling at me once I told her I got this after the COVID vaccine, 10 days after the first shot. Her face turned, like, aggressively and she looked at me like this and then she said, "Don't say that it's because of the COVID vaccine! No, it's not because of the COVID vaccine!" That day, actually, I was crying. I got back home and I was crying. I was super frustrated.

Then in 2022, one of the people working at the Government of Quebec, she arranged for me an appointment with a doctor in Quebec, just to sign a paper for the compensation and for the treatment of Dupixent, to start getting that. I went to him. It was a walk-in for only a one-time visit. I went to him. I told him my story. He looked at me, he told me— I'm going to say exactly what he said and that's the truth, one million per cent. He told me, "I'm so sorry to say that that topic is very sensitive for me and I cannot sign any paper because I might lose my license."

[00:10:00]

And I told him: "This is my life." Then he said, "I cannot do anything, I'm so sorry. But leave the paper that you have right now, I'm going to go over just to read what you have."

Here, I give up. Then after my baby daughter was born, they found a family doctor for her very far away from where we live, in Ontario. It's around 100 kilometres. The doctor that we've been to, the family doctor of my daughter: the first visit, he looked at my hand. I

never told him anything. He told me, "What you have in your hand, did you get it after the COVID vaccine?" I told him, "Yes." I was crying at that moment. And then he told me, "Okay, I'm going to refer you to a doctor here in Ottawa. Hopefully he would help you."

He referred me to a doctor here in Ottawa. And then that doctor, he checked my body, everything. After he's seen all the medications, ointments, capsules, creams, tablets, all the prescriptions I've been taking, he told me: "Look, I'm going to tell you something very honest and you have to accept it and I'm very sorry for that. I strongly suggest that what you have of the symptoms, it's because of the COVID vaccine, Moderna. And right now, the only option that we have: you have to take a Dupixent injection twice a month until we see what could happen."

And then after many months, they send a request to the government. Nobody was responding at all, nobody was listening. I was trying to contact with many people at the Government of Canada, Government of Quebec. Nobody was listening to me. I went to the media. Because that's my health. I was suffering, I was dying.

Then after that, from nowhere, I have no idea. There's, like, something that's called Freedom Support. They called me and they asked me to give me the injection of Dupixent. So right now, I'm taking that injection. He said, "For now, I can say you have to take it at least, minimum, four or five years. You could take it more—for the rest of your life. We have no idea." And that's it, that's what happened with the doctor here in Ottawa.

Then after that, I found a doctor in Quebec who was far away from me—a 13-hour drive—to sign the paper for me of the compensation. He told me: "Even this case, it's a permanent case. And for the Dupixent injection, it's the best option to have it right now because there is no final treatment."

I gave up at that time. The only option was—or the plan B—was for me to just finish or final my disaster. My wife, she's originally from Morocco. So we made the decision to travel there to Morocco and to try to find any final treatment for my injury.

I went there, I've seen three different doctors. And then they told me the same thing, after they gave me different medications—medical medications and natural treatments as well. Nothing worked at all. And then they told me: "Your condition, it's a lifetime condition. Dupixent, it's a good option for now. It gives you some relief. Yes, it doesn't end the problem at all." They gave me a very big example. One of them, he said, "You know, the person who was addicted to drugs and every day they have to take like a special quantity? Your body should be addicted to Dupixent every two weeks. You have to take it right now for the rest of your life. Because there's no options unless Moderna or Pfizer or those companies who made the vaccine, they make or invent a special treatment for the side effects that happened because of the vaccine."

Wayne Lenhardt

I'm going to ask the commissioners if they have any questions for you now.

[00:15:00]

Anyone?

Commissioner Kaikkonen

Thank you for your testimony. I just wondered: the reaction that you got from the doctor when she yelled at you. Do you think maybe she's been hearing a lot that it is because of the COVID vaccines and that was why she reacted the way she did?

M Tisir Otahbachi

She was reacting like this because I was mentioning that I got that reaction after the COVID vaccine. And once I mentioned that, she stopped me. She said, "You have to listen to me. I'm not going to listen to you anymore."

And she started yelling at me. She said, "Don't! You have genetic problems. You have allergic—" something else. She started making many excuses and many reasons without giving me any test. She just wanted to make different excuses. And just the reason of the COVID vaccine, she just wanted to take it away from my case. And I never had any skin problem in the whole of my life. You can check that with my medical history with RAMQ [Régie de l'assurance maladie du Québec].

Commissioner Kaikkonen

And then my other question is, do you think that the healthcare system is broken, given the number of doctors or the doctors that you tried to seek out, and maybe that the public health authority should have been focusing on that part of life? Because you're not the only one in Canada without a doctor. They should have prioritized differently and gone after looking for doctors for people.

M Tisir Otahbachi

I would like to say something, but I hope from everybody not being upset with me. In Canada, we have the worst healthcare system in the world. To find any doctor, if you are sick— I've never seen, I never expected that to happen in Canada, like, one of the best countries in the world.

We're going back home. Like, for me, I gave up here. I went to Morocco. A lot of people, they go back to their homes to have treatments even if they are sick from something simple as a virus. Here the healthcare system, it's super, super, super, super, super negative. It needs a lot of improvements. There is no doctors. It's impossible. Like when I told, like, everybody about my wait at the hospital for almost 23 hours, nobody believed that. It's a disaster.

I don't know how we going to continue our life and our future like this if there is not any kind of improvements. And I know that's in not only in Quebec, even in other provinces like Ontario or like many, many, like almost everywhere around Canada.

So yes, Canada has the worst healthcare system. And actually, after what I've been through right now, I'm super disappointed. I'm super frustrated because I never expected that to happen in such a country like Canada. I never. I'm so sorry to say that.

Commissioner Kaikkonen

Thank you very much.

M Tisir Otahbachi
You're very welcome.

Commissioner Kaikkonen
Thank you.

Commissioner Massie

Thank you, sir, for your testimony. I had a question about the symptoms that you experienced, that you couldn't get serious consideration that it could actually result from the vax. And then out of the blue you come across a doctor that seems to acknowledge that. So my question is: Do you know whether this doctor had seen similar kind of symptoms before associated with the vaccine? And do you know of other people that would have a similar condition, like yours?

M Tisir Otahbachi

The doctor that said, "I strongly suggest what you have of the symptoms, that it's because of the COVID vaccine," he told me, "I've seen different people have this kind of reactions because of the vaccine, but yours is the worst so far I've seen."

And after my story was posted in the media, there is thousands,

[00:20:00]

thousands, thousands of people around Canada: they did contact with me via social media and by emails. They are talking about the same reactions. But unfortunately, and that's the worst part, their doctors— Even some of them, they have family doctors for more than 20 years, 15, 16 years. When they went back to them to say that we got this because, after the COVID vaccine, that reaction, their doctors cancelled their files after 15, 16, 20 years of being their patients. Just because they said this was after we got that reaction, after the COVID vaccines.

I got shocked of what's happening. It's unbelievable. It's totally unbelievable that Canada: something happening like this in our country here.

Commissioner Massie
Thank you, sir.

M Tisir Otahbachi
You're very welcome.

Wayne Lenhardt

Any other questions? No? Okay, on behalf of the National Citizens Inquiry, I want to thank you for coming and giving your testimony today.

M Tisir Otahbachi

Thank you so much. Thanks. Have a good afternoon.

[00:21:21]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Witness 12: Louise MacDonald

Full Day 1 Timestamp: 09:25:48–10:17:15

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Shawn Buckley

Our next witness is attending virtually, Louise MacDonald. Louise, can you hear me? So Louise, if you can turn your camera and your mic on, that would be great. There you go. I can see you. Can you speak so I can see if I can hear you? Okay, so can you speak again?

Louise MacDonald

I can hear you now.

Shawn Buckley

Okay and I can hear you. I'd like to start by asking you to state your full name for the record, spelling your first and last name.

Louise MacDonald

Louise MacDonald, L-O-U-I-S-E M-A-C-D-O-N-A-L-D.

Shawn Buckley

Louise, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Louise MacDonald

Yes, I do.

Shawn Buckley

Now, you're here to actually share with us your analysis of government data. But I want to give a bit of your background, so just to introduce you. You were a manager at Sobeys for 25 years.

Louise MacDonald

Yes.

Shawn Buckley

And you managed the deli department, which did, yearly, a million dollars in sales.

Louise MacDonald

Approximately, yeah.

Shawn Buckley

Yeah. And you had to reconcile the accounts.

Louise MacDonald

Yes.

Shawn Buckley

So basically, you had to track all the money going in and out, to reconcile them.

Louise MacDonald

Yeah.

Shawn Buckley

Through that experience for a quarter century, you developed very strong analytical skills.

Louise MacDonald

I had to.

Shawn Buckley

Right, and you smile.

Louise MacDonald

Yeah.

Shawn Buckley

Okay. Also you had the misfortune, in 2015, to have acute kidney failure caused by a medication, and—

Louise MacDonald

Yes.

Shawn Buckley

That then set you on the path to researching medications because you had to be extremely careful.

Louise MacDonald

Correct.

Shawn Buckley

Okay. So you became familiar with researching medications. When the vaccine came along, you noticed that it contained polyethylene glycol, and that's something you need to avoid.

Louise MacDonald

Yes, it was in the medication that caused my acute kidney failure.

Shawn Buckley

So because of your background in analyzing things and your interest in the medications, you started collecting and collating government data on adverse reactions.

Louise MacDonald

Yes.

Shawn Buckley

You prepared a little presentation for us. I'm wondering if you can just launch into that and share your findings and your thoughts.

Louise MacDonald

Okay, so when I was doing the research, I came across Canada's website. What better place to find out the ingredients of the vaccines and as much information as possible. All the screenshots I'm going to share today are from the Canadian government website. They are from the case by vaccination status report, the vaccine adverse event reports, and a lot of screenshots are from NACI [National Advisory Committee on Immunization] statements.

I'm just trying to find where everything is. I know we're short for time, so I'm going to start not where I'd originally planned. Actually, no I will. Just bear with me.

Shawn Buckley

You're just looking for the screen share, I presume. And while you do that . . .

Louise MacDonald

Sorry, yeah.

Shawn Buckley

I'll just indicate that Louise had shared with me that she took an entire year documenting what she's synthesized for us as a presentation today [Exhibits OT-7 to OT-71. Slide names are included in square brackets throughout this transcript as a guide to the exhibits].

Louise MacDonald

Sorry, I'm not very good with Zoom and technical stuff.

Shawn Buckley

Now, there you go. We've got screen sharing.

Louise MacDonald

Yeah.

Shawn Buckley

And we've got a slide that says "Since Dec. 14, 2020."

Louise MacDonald

[Government of Canada (GoC), Health InfoBase, Case by vaccination status report, as of December 25, 2021]

This is the case by vaccination status report and it's the report for December 25th 2021, at the top.

Now this is how the government reports the case by vaccination status, and they used data collected since December 14th, 2020. Now that immediately raised a bell because in December 14th, 2020, next to no Canadians were fully vaccinated. Down at the bottom where there's the yellow #2— I just want to make a point that there's only one fully vaccinated category. And then,

[00:05:00]

when I saw #3, the gray columns—those are the number of unvaccinated cases, hospitalizations, and deaths compared to the fully vaccinated, not yet protected, and partially vaccinated. That almost had me second guessing whether I should get the vaccine.

[GoC, Health InfoBase, archived page, Percent of people vaccinated, as of May 29, 2021]

So I did a little bit more research. And up until May 27th, 95 to 100 per cent Canadians weren't vaccinated. So it overinflated the unvaccinated numbers.

[GoC, Health InfoBase, Case by vaccination status report, 12 months of data, up to December 25, 2021]

This is how the Government of Canada reports it. So the top one is 12 months of data. If you look at the graph down below, the unvaccinated cases were counted for the full 12 months. Fully vaccinated was only counted for about five, five-and-a-half months. So it made me think "Well, it's not really the same playing field that you're comparing 12 months to 6 months."

[GoC, Health InfoBase, Case by vaccination status report, for Dec 18 to Dec. 25, 2021]
So this screenshot is the same report. So the week of December 18th to December 25th, 2021. Now this chart shows only one week of data, which is highlighted in the [vertical] red line below.

[GoC, Health InfoBase, Case by vaccination status reports, comparing charts of 12-month data with 1-week data]

Now when you look at the charts together and compare them together, it's totally different. So the top graphs [#1] show the unvaccinated cases to appear to be so much higher than the fully vaccinated. But when you just show one week of data [#2] where 75 per cent of Canadians were fully vaccinated and 25 per cent weren't, that week 97 per cent of cases were in fully vaccinated Canadians.

[GoC, Health InfoBase, Case by vaccination status report, Figure 5, as of January 30, 2022]
So because the fully vaccinated were getting really high, they divided the fully vaccinated into two categories on January 30th [2022].

[GoC, Health InfoBase, Vaccination Coverage, Figure 2. Cumulative number of people who have received COVID-19 vaccine, as of May 22, 2022]

And then, they started comparing unvaccinated to fully vaccinated and boosted. So again, they're comparing 17 months of unvaccinated cases to only five months worth of data for fully vaccinated and boosted because they were only just fully vaccinated and boosted for five months.

[GoC, Health InfoBase, Case by vaccination status report, Figure 5, as of June 5, 2022]
And then again on June 5th 2022, they split the fully vaccinated categories into three again. This also divides the numbers, divides the percentages, and grossly overinflates the unvaccinated numbers.

Shawn Buckley

Just so we're clear. The unvaccinated would include people that are not fully vaccinated. So they could have had one shot. Or they could have had two shots but not cleared the 14 or 21 days or whatever after the second shot.

Louise MacDonald

Oh, sorry. I'm just going back.

[GoC, Health InfoBase, Case by vaccination status report, Figure 5, as of January 30, 2022]
In January [2022], they reported cases not yet protected and partially. If you look down at the bottom left corner.

Shawn Buckley

Okay, so it is broken up at that point.

Louise MacDonald

It is broken up at that point.

[GoC, Health InfoBase, Case by vaccination status report, Figure 5, as of June 5, 2022]

But when they split it into three [fully vaccinated], they stopped reporting the cases not yet protected and the partially vaccinated. But they still counted the numbers. So from here on in, any of my numbers are excluding the partially vaccinated and the not yet protected.

[GoC, Health InfoBase, Vaccination Coverage, Figure 2. Cumulative percent of people who have received a COVID-19 vaccine, as of September 11, 2022]

When they did this, they started comparing the unvaccinated, which is 21 months worth of data, to people that had the primary series completed and one booster, in the red—only six months worth of data. And when they were compared against people that had the primary series completed plus two additional doses, that's only four months worth of data.

[GoC, Health InfoBase, Case by vaccination status reports, Comparing 20 months of data with 4 weeks of data, as of September 25, 2022]

This is the last updated case by vaccination status report on the government website. The top one shows how the government reports it since December 14th, 2020. They're using 20 months worth of data,

[00:10:00]

and it makes the unvaccinated look like a big problem. Now in the middle graphs, this is just four weeks of data. From August 28th to September 25th, this is how it looks and this is with the three primary-series-completed categories separate. Now when you go down to the bottom graphs, this is the same four weeks, August 28, 2022, to September 25th, 2022. This is the unvaccinated compared to the three primary-series-completed all together. It's quite a different picture from the top one.

Shawn Buckley

Now can I ask you a question? I appreciate that the government . . . [connection lost] thousand or anything like that so that we could compare between the categories for a specific population size.

Louise MacDonald

No, not on any of the reports that I've seen.

Shawn Buckley

Okay.

Louise MacDonald

[GoC, Health InfoBase, Case by vaccination status report, Figure 1, as of September 25, 2022]

When they did divide it into the primary-series-completed categories and they stopped reporting the part-vaxxed and the not yet protected, they still counted those numbers. So just to give you an idea: of the cases, 6.2 per cent of the cases were not yet protected or partially vaccinated; 7.7 per cent of the hospitalizations were not yet protected or partially vaccinated; and in the deaths, 8.1 per cent. Just to give you an idea of the amount of cases that are missing. I could only do percentages because they didn't give the numbers.

Okay, so I'm going to go back to the next presentation. It's going to be on the safe and effective vaccines. I've got to go back. Sorry about this. I'm really not good with . . .

Shawn Buckley

Actually, we understand and appreciate that. When you were showing us the COVID cases, did they change how they were classifying COVID cases? Because some witnesses have told us that early on, if you had a list of symptoms, you would be classed as a COVID case; then later, when PCR tests became available, you would be a case. Some have suggested that they would run more cycles on an unvaccinated person than a vaccinated person, which would change the numbers again. I'm just wondering if you ran across any information there or did they not clarify things like that?

Louise MacDonald

Over the two-and-a-half years that I dabbled in this, I heard a lot of other people saying that the cycles are that and all these other things. But I only ever concentrated on case by vaccination status and the serious adverse events. Any of the data that I'm going to show you and the numbers are regarding serious adverse events only.

[GoC, Health Canada, COVID-19 Vaccines: Authorized vaccines, AstraZeneca]
So this is the little presentation on safe and effective. So AstraZeneca Vaxzevria COVID vaccine was, I believe, approved around September 2021. They say, "All COVID-19 vaccines . . . are proven safe, effective and of high quality."

[GoC, Health Canada Statement, March 24, 2021]
Again, on March 24th, 2021, Health Canada issued a label change and guidance on the AstraZeneca COVID vaccine. They state, "Health Canada reassures . . . that the AstraZeneca COVID-19 vaccine continues to be safe and effective . . ."

[GoC, Health InfoBase, Vaccine Safety Report, March 3, 2022]
This is the vaccine safety report from March 3rd, 2023. It's the last one they updated. On the bottom [connection lost] . . . and that equals one serious adverse event

[00:15:00]

in every—on average—every 2,923 doses administered [AstraZeneca]. Now I don't know what's classed safe and effective, but I don't think I would be wanting to put that into my body.

Now in the middle there, where it says 841 and 1,782, the original report has "Not applicable."

[GoC, Health InfoBase, Table 1. Cumulative number of COVID-19 vaccines doses administered by vaccine product and dose number, as of March 2023]
Now, they did have those numbers and where I got the 1,782 is on this report on a different page on the Canadian government website. This is where I got the number of doses administered.

[GoC, Health InfoBase, Vaccine Safety Report, March 3, 2022]
So I calculated it, and on dose three, there was one serious adverse event in every 118 doses administered. There were only 1,782 third doses administered. I still think that's 1,782 too many. Thank God, there was only 28 fourth and fifth doses because they were

one serious adverse event in 14. So for the 28 doses administered, there was two serious adverse events.

[GoC, Health Canada, COVID-19 Vaccines: Authorized vaccines, Moderna]

So this is the Moderna Spikevax COVID vaccine. And again, approved by Health Canada: "All COVID-19 vaccines . . . are proven safe, effective, and of high quality." Now this includes, on the right-hand side, the Spikevax Bivalent, the original/Omicron BA1 and the original/Omicron BA4(5). So these are proven safe and effective and of high quality.

[GoC, archived page, Public Health Agency of Canada, NACI Statement]

This is the NACI statement. NACI is the National Advisory Committee on Immunization, and they advise the Public Health Agency of Canada (PHAC) on everything to do with COVID.

This was released at the same time, and it states, "There are currently no data on the efficacy, immunogenicity or safety of the Moderna Spikevax Bivalent . . . COVID-19 vaccine . . ." Then they go on to say that the benefit "may outweigh any potential risks that are unknown . . ." If you don't know the efficacy or immunogenicity, then how do you know the benefit? And how can you determine that the benefit outweighs the risk if the risk is unknown?

[GoC, Health InfoBase, Vaccine Safety Report, March 3, 2023]

This is the vaccine safety report, and this one gives the serious reporting rates for vaccine, dose numbers, and for the Moderna Bivalent. The serious reporting rate is 32.96 serious adverse events for every 100,000 doses administered. That equals one serious adverse event for every 3,033 doses administered.

[GoC, Health Canada, COVID-19 Vaccines: Authorized vaccines, Janssen Johnson & Johnson COVID-19 vaccine]

The Janssen Johnson & Johnson COVID-19 vaccine. Now this one, "All COVID-19 vaccines . . . are proven safe, effective and of high quality." Approved for Health Canada.

[GoC, Health InfoBase, Vaccine Safety Report, March 3, 2023]

Now this one, again, is at the top, March 3rd, 2023. All this data is still on the internet. For all Johnson & Johnson's Janssen COVID vaccine, the serious reporting rate was 148.05 per 100,000 doses administered. That equals one serious adverse event in every 675 doses administered. I don't see how that could be proven safe.

[GoC, Health Canada Statement, September 1, 2022]

And again, so "Health Canada authorizes first bivalent COVID-19 booster" dose, September 1st, "safe and effective."

[GoC, Health Canada, News Release, October 7, 2022]

Again, October 7th, COVID vaccine booster with the bivalent vaccine, Omicron vaccine, "safe and effective."

[GoC, PHAC, Summary of NCAI's Updates, November 3, 2022]

On November 3rd, 2022,

[00:20:00]

the update says, "Vaccine effectiveness has not yet been established for the bivalent booster products."

[GoC, PHAC, NACI Statement, Safety and Ethics, November 2022]

Now the next few screenshots are all on the NACI statements. So this one is "The risk of myocarditis and . . . pericarditis associated with additional doses is currently unknown."

[GoC, PHAC, NACI Statement, Efficacy]

"Currently, there are no estimates of vaccine efficacy available for the Pfizer-BioNTech Comirnaty . . . Bivalent [vaccine]."

[GoC, PHAC, NACI statement, Summary of evidence on Pfizer-BioNTech Comirnaty]

"There [is] currently no clinical evidence on the safety, immunogenicity or efficacy of the Pfizer-BioNTech Comirnaty . . . Bivalent . . . vaccine in children 5 to 11 years . . ." And these kids were recommended to get the dose.

[GoC, PHAC, NACI Statement, Fertility, Pregnant Women]

Now, this one is on the Vaxzevria, which is AstraZeneca's. It states, "It is unknown whether VAXZEVRIA may impact fertility in humans. No data are available in humans." Below that, "The safety and efficacy of VAXZEVRIA in pregnant women have not yet been established." They were advised to get vaccinated.

[GoC, PHAC, NACI Statement, Additional Considerations and Rationale]

"There are currently no data available on the efficacy, immunogenicity or safety of [the] bivalent Omicron-containing mRNA . . . vaccines in adolescents 12 to 17 years of age."

I have thousands of screenshots like this.

[GoC, PHAC, NACI Statement, Currently authorized vaccine: Pfizer, December 12, 2020]

"There[']s currently insufficient evidence on the duration of protection and on the efficacy of [the] vaccine in preventing death, hospitalization, infection and reducing transmission . . . although studies are ongoing."

[GoC, PHAC, NACI archived page]

"Summary of evidence [of] an additional dose of COVID-19 vaccine following a 2-dose [primary] series." "There[']s currently no data on the efficacy [or] effectiveness . . ."

[GoC, PHAC, NACI, The risk of myocarditis]

"Currently, the risk of myocarditis/pericarditis in children following immunization with the . . . Pfizer . . . vaccine is unknown."

[GoC, Health InfoBase, Approved vaccines]

These vaccines [AstraZeneca, Janssen, Moderna] are still approved for use in Canada, and these vaccines are still being mandated to government workers.

The last little presentation I have, I will cut some of them out because I know we are very behind.

Shawn Buckley

Before you jump to the next presentation.

Louise MacDonald

Yeah.

Shawn Buckley

You're giving us the numbers that are reported as serious adverse reactions. Do you know how robust that data is? So for example, in the United States, there have been estimates done of how inadequate the VAERS [Vaccine Adverse Event Reporting] system is, in that hardly any get reported out of the total number of deaths and serious adverse reactions.

Do you have any idea in Canada how many adverse reactions or what percentage of adverse reactions actually make it into that database?

Louise MacDonald

Well, I'm not an expert. I don't know that answer. I've heard lots of stories. I've heard doctors say less than 2 per cent. But I'm not an expert. I don't know the answer to that.

Shawn Buckley

Okay.

Louise MacDonald

These numbers that I'm giving you are the numbers that have been reported. So they're at least this high. Again, I said all the numbers that I'm giving are for only the serious adverse events.

[GoC, Health InfoBase, Vaccine Safety, Definitions, February 11, 2022]

Now on the Canada Health InfoBase website, "An event is considered serious if it results in death; is life-threatening, an event or reaction in which the patient was at real, rather than hypothetical, risk of death at the time of the event or reaction; or requires in-patient hospitalization or prolongation of an existing hospitalization; it [could result] in persistent or significant disability . . ." [connection lost]

[GoC, Health InfoBase, Vaccines for COVID-19, Reported side effects following COVID-19 vaccination, up to and including March 3, 2023]

This is the report that I stumbled on when I was researching what were in the vaccines. This is the beginning of the webpage. When you go down further,

[00:25:00]

you get a summary of the data for that report. I just want to make a little note. It says there was a signal of ischemic stroke in people 65 years of age and over. And it says—and I'm make a note of this—"The signal has not been found in other vaccine safety monitoring systems in the [U.S.], nor in other countries, including Canada." That'll come in handy later.

[GoC, Health InfoBase, Vaccines for COVID-19, Figure 1. Number of COVID-19 adverse events reports received and total doses administered in a 4-week reporting period, up to and including March 3, 2023]

So down further, this shows all the historical reports. So each column represents a report. Then down below that, it says, "Figure 1: Text Description."

[GoC, Health InfoBase, Vaccines for COVID-19, Figure 1. Text Description]

When you click on that, it takes you to this report. This is basically all the historical reports. So each line here represents a column in this chart here [previous slide].

Now, I went over this data every day for two years. And every time they update the new report, they say that these numbers can change to reflect any delays in reporting serious adverse events. This might be a little bit hard to explain. So the middle column that's highlighted in red is for cumulative serious adverse events only.

So every week or every month this report comes out, I noticed that these changed. I started having a really hard time tracking because I could say, "Well, if I remember correctly, it wasn't that the week before." And I would go back the week before and sure enough, I was correct. It wasn't that. So this was updated every report.

So the column in the middle here highlighted in red, I put it in a spreadsheet.

[Louise's spreadsheet, Monthly serious adverse event reports]

March 3rd, 2023. In the black highlighted one, those are all the numbers. So here in this one [previous slide, Figure 1] is January, February, March, April, and May down—and the numbers. The box in red [Figure 1] is this box in black [spreadsheet]. So every column in this spreadsheet represents an updated report.

[Louise's spreadsheet, Weekly serious adverse event reports]

From January 2021 to April 8th, 2022, these reports were weekly. Now, each column represents the updated numbers and the [yellow] coloured columns represent the number that changed from the week before. So it was pretty consistent from January 1st, 2021, to April 8th—all except for those three red columns—serious adverse events were updated to include these numbers. And some of them were quite high: 200 added in one report.

[Louise's spreadsheet, Breakdown of the monthly serious adverse event reports]

Then they went to monthly reports, and this is a breakdown of the monthly reports. Now on the left-hand side is April 1st [2022], and these are the first monthly reports. Again, each column represents one month's updated data, the historical data. Now from April 1st, May, June, July and August 19th, those numbers continued. Those are serious adverse events that were added or updated in the historical reports.

On August 19th, something really strange happened.

[Louise's spreadsheet, Enlarged monthly vaccine serious adverse event reports, red columns]

From August 19th [2022] to March 3rd [2023], most recently, these numbers started to be updated and these are the numbers [red columns] of serious adverse events that were—removed—from these historical reports.

[00:30:00]

[GoC, Health InfoBase, Vaccine Safety Report, Figure 2. Serious adverse events, up to and including March 3, 2023]

This one here is a little bit further down on the same report. This is the breakdown of the vaccine doses: the serious adverse events by vaccine and dose number.

[GoC, Health InfoBase, Vaccine Safety Report, Figure 1. Text Description, Serious adverse events, up to and including March 3, 2023]

This is the last vaccine adverse event report that was updated March 3rd, 2023. Now for all doses administered that month, the serious adverse event reporting rate was 36.83 per 100,000 doses administered. That equals one serious adverse event for every 2,715 doses administered. That was for the most recent month. I'm not an expert; I'm not a

vaccinologist or a doctor. I don't know what "safe" is. But one serious adverse event in 2,715 doses administered. I'm not getting that.

That wasn't a one-time event either.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events up to and including November 11, 2022]

So this is the report for November 11th [2022] and these are the updated historical numbers for January 8th [2021]. And that's even more. So the reporting rate of 37.57 per 100,000 doses administered, that equates to one . . . [connection lost] [in] 1,715. The first month of the report of the vaccine rollout was one in 2,661.

Now these aren't the original numbers reported.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events reported for January 8, 2021]

So for January 8th, 2021, these are the original numbers that were reported. So 10 serious adverse events in the middle in the top chart, and 338,423 doses administered. This equates to one serious adverse event for every 33,842 doses administered. That could be "safe," I'm not sure.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events reported up to and including November 11, 2022]

But one year and 44 weeks later, the number of serious adverse events, the first arrow, tripled to 31, and the cumulative number of doses administered dropped by, I believe it was around 255,000 doses. So we went from one serious adverse event every 33,842 doses administered to one serious adverse event for every 2,661 doses administered.

Shawn Buckley

For the same reporting period.

Louise MacDonald

Yeah. So this goes back to how many were added since the original report. And, like I said, basically, it took one year and 44 weeks to have the last serious adverse event that happened on the first month of the vaccine rollout to be documented. This again, is not a one-time event.

Shawn Buckley

Can I ask—

Louise MacDonald

Sorry?

Shawn Buckley

You had spoken earlier and showed us some charts. You've told us how numbers get added. So let's say for January 2021. If they're reporting in February of 2021, let's say they have—I'm just making figures up—they have a hundred cases. I can understand that as the year goes by that cases that haven't been processed or were held up in the provincial side trickle

in and so that the number goes up. But what I don't understand is you've been talking about some numbers going down and that doesn't make sense. How do reports get pulled out that had been . . .? [connection lost]

Louise MacDonald

Subtracted? All I know is that this is the data.

[00:35:00]

Up until August 19th [2022], they were added. And then, after August 19th, the cumulative number of serious adverse events started to decline, right up until the last report.

Shawn Buckley

Right, so the total number was higher in August of 2022 than it is in March of 2023.

Louise MacDonald

That's right, yeah.

Shawn Buckley

And no explanation by Health Canada as to why they removed reports.

Louise MacDonald

No, no. Why they were added— Well, obviously, they said that the numbers in the historic reports will change to reflect any delays in reporting in the previous weeks, but there's been delays. . .

Shawn Buckley

Well, like I say, I can understand the numbers going up because of delay. But I can't see the numbers going down because of delay. That's what's confusing me.

Louise MacDonald

Well, it confuses me, too. I don't know why. I don't know why it is. But these are just the numbers. I'm just reporting what the Canadian government is releasing. So how they're subtracting them, I don't know. Again, like I said, it's not a one-time event.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events for Feb 12, 2021, up to and including March 12, 2021]

These are the original numbers reported for February, which is the second month of the vaccine rollout. The serious adverse event reporting rate was 22.86. Now, that still to me seems a little bit high. It equals one serious adverse event on average for every 4,374 doses administered.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events for Feb 12, 2021, up to and including February 11, 2022]

Now, one year later, the serious adverse event reporting rate more than doubled. It is now 50.83. So these were added on to the original reports. A reporting rate of 50.83 is the

equivalent of, on average, one serious adverse event in every 1,967 doses administered. That's all vaccines.

[GoC, Health InfoBase, Vaccine Safety Report, archived page, Serious adverse events up to and including July 23, 2021]

This will be the last one for the change. So July 23rd, 2021, the original cumulative total of serious adverse events was 2,672.

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events, up to and including August 19, 2022]

And one year and four weeks later, on August 19th, 2022, that number is now 4,283. That's an additional 1,6[11]. . . . [connection lost]

Shawn Buckley

Louise, you just froze. We'll just give a sec to see if Zoom catches up with us. So we've actually had our technical difficulties today, and usually they begin in the morning. So today, at the end of the day.

I'll just ask David, Do we still have internet? For those watching, we're just doing a reconnect. We're almost done with this witness, but we'll see if we can log her back in and finish her evidence.

Okay, so are we still online? Okay, so we've lost the ability to have Wi-Fi, so we've lost this witness. I think, fortunately, we were close to the end, but we'll just wait another moment to see if we can get her back as the commissioners might have had some questions.

And there we go. Louise, we had some internet problems at our end and you had just frozen. We lost you for a little bit. Now, we've run out of time, so I'm wondering if there's something important for you to sum up. And then I'll see if the commissioners have some questions for you.

Louise MacDonald

Yeah, I'm almost done.

Shawn Buckley

Okay.

Louise MacDonald

[Louise's Chart, Time it took to document last serious adverse event (AEFI)]

Okay, this shows how long it took to document serious adverse events. So from January to August [2021], it was over a year,

[00:40:00]

up to one year and 44 weeks, to document a serious adverse event. If it's taking that long to document them, how can any safety issue be triggered that they're unsafe?

[GoC, List of authorized drugs, vaccines and expanded indications for COVID-19]

May 11, 2022, the Janssen, Johnson & Johnson's vaccine, was authorized for a first booster dose . . . [connection lost]

[GoC, Health InfoBase, Vaccine Safety Report, Serious adverse events, up to and including April 29, 2022]

. . . 888 doses administered. Two weeks later, that vaccine's authorized as a booster dose [See previous slide, List, May 11, 2022]. Like I said, if it's taking a year to document serious adverse events, then it's just mind-blowing. I'll pass that one; we don't need that.

[Louise's spreadsheet, Updated adverse events before and after August 19, 2022]

So this is the last screenshot. This is from January 2021 up until March 3rd, 2023. It shows the numbers that were updated that are yellow to August 19th. And then after that [a decline in numbers in red]. These are still on the website. If you want to, you can check all this stuff.

[Louise's spreadsheet, enlarged, blue column, November 11 and December 9]

And the last thing. November 11th and December 9th was the only report where there was no serious adverse events added or removed [blue column].

Shawn Buckley

Okay. So thank you for that presentation. I'll ask the commissioners if they have any questions.

Louise MacDonald

You're welcome. Yeah.

Shawn Buckley

And there are questions.

Louise MacDonald

I would imagine.

Commissioner Massie

Well, where to start? Thank you very much for your presentation. I will have to probably go back to it in order to get a better picture. But one of the things that I notice in your analysis is, well, first there's a lag in reporting. Sometimes, it goes up and down. We don't know why.

Louise MacDonald

Yep.

Commissioner Massie

Do you expect to get a final picture on what the number will be or do you see lately that it's still fluctuating?

Louise MacDonald

I could give you my opinion. But this is two-and-a-half years of 8 hours to 12 hours a day of studying these. I have tens of thousands of screenshots of this data. Like I said, I'm not an expert. But to me, it shows that they underreported serious adverse events and delayed up to one year. It took one year and 44 weeks to document a serious adverse event. How can any serious adverse event be triggered if it's taking a year to document them? Obviously with these numbers, approving a vaccine for a booster dose when you get one serious adverse event for every 888 doses administered, I just don't know what to say.

How can they be approving them with that safety record? If they're taking one year, 44 weeks to document, how can a safety issue be triggered?

Commissioner Massie

My other question has to do with the AstraZeneca vaccine that has been removed in many places because the serious adverse event was deemed to be too high.

Louise MacDonald

Yeah.

Commissioner Massie

It's very difficult to pinpoint the exact number, but I thought the number that I've seen, at least from Europe, was like much, much higher than this one in 888 that you're mentioning for J&J, so—

Louise MacDonald

No, no, that was Janssen's, the 188.

Commissioner Massie

Yeah, but I'm talking about, if that's the number that they are using to recommend a booster for J&J, and the number for AstraZeneca was way lower than that when they removed it...

[00:45:00]

Louise MacDonald

Yeah.

Commissioner Massie

I fail to see the rationale or the scientific basis to make that kind of a recommendation.

Louise MacDonald

Well, if they're making the recommendation and the serious adverse events haven't been reported yet because it's taking a year to report them, then— I seriously, I just don't know what to say. It shouldn't be taking over a year to document serious adverse events. . . [connection lost] . . . so this is administered.

But the Janssen's vaccine, which is one serious adverse event in 888 doses administered: there never should have been a second, third, fourth or fifth dose administered. But because the delay in documenting these serious adverse events is up to a year and 44 weeks, that's why it's being allowed or being approved. They're not documenting the serious adverse events when they happen.

Commissioner Massie

We've seen from another presentation that there's been, I would say, measures put in place to increase the rate of vaccination by partnering with pharmacy and giving bonuses to doctors in order to accelerate that. If we measure the rate of vaccination we accomplish in Canada, we can see it's a success. I mean, we get a fairly high rate of vaccination in Canada, probably due to the—I would say—efficient deployment of all of these measures that have been put in place to accelerate that.

In order to get the number that you spend thousands of hours to compute and maybe get a more on-time, I would say, assessment of the safety of the vaccine: Could you recommend something that could have been done in order to get to these numbers on a more regular basis?

Louise MacDonald

Well, yeah. Don't threaten doctors with their jobs for speaking out about vaccine injuries. If a vaccine injury comes through, put it through. They should all go through. One hundred per cent of vaccine injuries should be recorded. And apparently, if I'm not mistaken, do they not have to be—a serious adverse event has to be reported... [connection lost]... Story after story of doctors being fired for reporting adverse events. If these are the numbers that they are reporting, I would hate to see if 100 per cent of the vaccine injuries were documented.

Commissioner Massie

Thank you very much.

Louise MacDonald

You're welcome.

Shawn Buckley

Louise, I'll just indicate before any other questions that you live—for the commissioners and people watching—in the Maritimes. When you're talking about hearing reports of doctors being fired for submitting adverse reports, that's in the Maritimes area.

Louise MacDonald

Yeah, well, I know Chris Milburn was... [lost connection]...

Shawn Buckley

[Missing words]... have any other questions.

Louise MacDonald

Thank you.

Shawn Buckley

You know, Louise, they don't have any further questions. But you've spent a lot of time and you've screen-captured a lot of information. I'm going to suggest that you maybe—you and somebody else—figure out some way of collating and making that available for other researchers.

Louise MacDonald

Oh, I will. I actually have every vaccine safety report,

[00:50:00]

every number, every vaccine by dose number, every case by vaccination status report, all in Excel spreadsheets.

Shawn Buckley

That's quite incredible. I'm just suggesting that you could be of great service to making a point of making that public and available.

Louise MacDonald

I've been trying to make it public and available. But I keep getting my social media accounts shut down for misinformation for reporting the Canadian government reports on vaccine injuries.

Shawn Buckley

Well, now we know what to think of government reports.

Louise, there'll be no further questions. On behalf of the National Citizens Inquiry, I want to thank you dearly for attending and—

Louise MacDonald

Thank you very much for having me.

Shawn Buckley

And thank you for all the research you've done. One of the things that we've been trying to do is to encourage people to take action. And you, for the last two years, have wanted to dig down and discover some truth. You've been of great service, so I just want to thank you for that.

Louise MacDonald

Okay, thank you, and I will. It's literally tens of thousands of data that I will have to find a way to have—

I will send them to you. And somehow, I'll get them documented on the NCI website [Exhibits OT-7 to OT-7I].

Shawn Buckley
Thank you.

Louise MacDonald
Thank you very much for giving me the opportunity to share this.

Shawn Buckley
Thank you, Louise.

Louise MacDonald
Okay.

[00:51:35]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 1

May 17, 2023

EVIDENCE

Closing Statement: Ches Crosbie

Full Day 1 Timestamp: 10:17:23–10:21:12

Source URL: <https://rumble.com/v2oackw-national-citizens-inquiry-ottawa-day-1.html>

[00:00:00]

Ches Crosbie

Thank you, Shawn. Thank you, Commissioners. Shawn has asked me to close off today, and those who have watched my closings on prior days would know that I don't take long, and I also like cartoons and memes. So, David, if you would put up the meme of the day.

Through the course of these hearings, we've been turning up the heat on those who would like to keep their activities shrouded in darkness: government, government figures of authority, and Pharma. You can go on down the list of suspects. If you know anything about *The Lord of the Rings* trilogy and Tolkien— the Ring of Power, you can only see the coded script on it when you heat the ring and then you can decode what's there. The script, according to this translation, is one lie to rule them all— fear, possibly? Be afraid. One lie to find them— the vaccine passport. One lie to scare them all and in their terror bind them— mass psychosis?

This is not finished. This is not finished. I think what I sensed—and perhaps all of us sensed who paid attention to the testimony, in particular, of Denis Rancourt and Catherine Austin Fitts earlier today—we could sense that there was more script not yet visible, yet to be decoded, on that ring that has to do with vast underlying geopolitical forces and vast movement of tectonic plates in the world of finance, where, we were told by Catherine Austin Fitts, they are busy denuding the real economy, the visible economy, and leaving us **with debts and transferring assets into the criminal economy.**

Somewhere the truth lies when we stitch together that kind of analysis of what we're seeing in the financial system that Catherine has been documenting for 25 years now and what Denis Rancourt, a brilliant scientist, is able to detect applying his techniques to the world scene. I won't try and stitch it together any further right now.

But what we've achieved in these hearings is we've been turning up the heat, turning up the heat, and turning up the heat on those who want to keep the truth hidden from us. Eventually, we will fully decode the evil behind the script by turning up the heat. But in order to keep turning up that heat, we need the help of all the volunteers out there and all of those brave citizens who've helped us by funding the efforts of the National Citizens

Inquiry. We exist only because of your generosity. Please continue with that generosity.
Thank you.

Shawn Buckley

Before we adjourn for the day, I'll just indicate for those present and those watching online that we are starting earlier tomorrow. So, we're going to start at 8:30 AM EDT instead of our usual start time of 9 AM, so we'll see everyone at 8:30 EDT.

[00:04:22]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE OTTAWA HEARINGS

**Ottawa, Ontario, Canada
May 17 to 19, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

Welcome to the National Citizens Inquiry as we commence the second day of proceedings in the nation's capital, Ottawa, Ontario. For those of you that aren't familiar with the National Citizens Inquiry, we are a citizen-organized, a citizen-led, and a citizen-financed group that have decided to appoint independent commissioners and march them across the country.

We had no idea how ambitious that vision was and soon learned that it was something that we couldn't do. But it's happening, and it's happening because you're participating: you have volunteered, you have encouraged, you have donated. You have allowed this to happen. And if you have been watching the NCI proceedings, I've been saying—and everyone agrees who's done it—that if you watch a single full day of the National Citizens Inquiry, you will never be the same again. It changes you. Yesterday was no exception. The witnesses that we had, some of them, will be with us—their testimony—for the rest of our lives.

I'd like to start this morning, Commissioners, by stating my name is Buckley, initial S. I'm attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie. Before we move to our first witness, I'd like to share some opening remarks. I ask that you bear with me today.

We're having to interview witnesses, and we're having to see them testify day after day. And it's frankly emotionally exhausting at times. All of us that have been following these proceedings are aware of that. I was particularly touched yesterday by the testimony of Sheila Lewis. If you recall, Sheila is the one who needs an organ transplant, is under a gag order, so she can't tell us what organs she needs transplanted, nor can she identify the doctors or the hospitals involved. But she was on the stand yesterday, literally sobbing. She was just saying she wants to live. Her life is in the hands of a group of doctors that made a policy—and it's just their policy; they can change it. But they made a policy decision that she could only have the organ transplant that her life depends on if she gets vaccinated for COVID-19.

The irony is that she has had COVID. She has had her blood tested and she is filled with antibodies to the COVID-19 virus. She has strong natural immunity. We have had doctors explain to this Commission how actually someone in her position shouldn't be vaccinated because the vaccine would not be helpful, and, in fact, could be dangerous for somebody in her position. Any concern that she would get COVID-19 is non-existent. Because we've also had witnesses tell us that natural immunity is more robust, and we've seen government data to support that.

So she asked, and I asked, how can people do this? How can they basically be making decisions and taking actions that are leading to the deaths and the suffering of a large number of people? We had a gentleman on the stand yesterday who could not find a doctor to admit that it was vaccine injury. We've had witness after witness basically giving shameful testimony about how people that are vaccine-injured are being treated in our healthcare system.

When I ask the question—how can we do this?—I'm asking it as a rhetorical question because I know the answer. It comes down to personal responsibility and fear. The fear one is interesting because I've indicated in other openings how fear is a weapon used against us.

[00:05:00]

The minute you start to feel fear and you start to have that chemical reaction that you have no control over, you have to start training yourselves to keep that link to your logical mind and understand that you're having a physical reaction, that you can't control it. But you can keep connection to your logical and rational thinking.

But what I thought of this morning, we've had doctors explain that their colleagues, some of them, have gotten vaccinated knowing they shouldn't for health reasons but saying things like, "I've got kids in private school, I've got a mortgage, like I've got to do it." There's financial fear. We've had witnesses back out because they're concerned about economic repercussions. And so the thought came to me this morning that we need to understand that our debt model is part of our slavery framework.

We live in a society that is self-based and greed-based. The phrase—keeping up with the Joneses—we all know what that means. If you drive an old rusty car, you're going to feel self-conscious. Why? Because we're taught to privilege people that display wealth, and we have been encouraged. The system is designed for us to pursue things and to have a lifestyle that we can't afford, so we go into debt. And then we find ourselves in a situation where we actually have no room to move when we're placed in that ethical dilemma: where to do the right thing would actually put our family and our children at risk economically. **And so, going forward, I think we have to understand that we cannot allow ourselves to be dependent upon not just government but also institutions like banks for our well-being. I just want you to understand that our debt-based model is deliberate. We have participated in it, and we've participated in this drive to look like we have wealth, to fit in, to not be "less than."**

I've spoken before about personal responsibility, that people will do terrible things to other people—in the Second World War, rounding up Jewish people, locking them into a church, and lighting the church on fire, or lining them up in front of a pit and executing them. We will do those things—the authorities know—things that we would never do on our own if our personal responsibility is taken away. I spoke about this in Toronto.

I first became aware of this idea in the Dostoevsky novel, *The Brothers Karamazov*. There's a chapter about the Grand Inquisitor—so the Spanish Inquisition, and Christ had returned. So the Grand Inquisitor is having a conversation with Jesus. And the idea comes up that people will do atrocious things if someone else takes the responsibility for their actions. Himmler, who was the head of the SS, understood this and in one of his speeches—I think it was before the Night of the Long Knives—but it was a speech before they were being sent out to murder people. And he literally said, "You're not pulling the trigger. I am." He understood that if he took the personal responsibility from them that they would follow his orders. It's why when we got to the Nuremberg Trials after the Second World War—when people were saying, who did atrocious things, "I was just following orders, I was just following orders"—we had to, from a legal principle, establish that following orders is not an excuse for harming and murdering people, as if that had to become some new legal principle.

In fact, I wonder going forward when we get our institutions back, if anyone who has committed a heinous crime, who says, "I was following orders," if the maximum penalty should be double in that case. Because as a society, our worst problem that we're facing right now—

[00:10:00]

the most harm is being caused by people following orders. And we structure our laws actually to protect ourselves.

The doctors in Alberta, I'll take them as an example; it's the province I live in. Their college told them you are not to treat early-COVID. I know of one doctor who volunteers with the NCI who voluntarily gave up his licence to practise because, for ethical reasons, this person was not willing to be part of an organization that would tell physicians that you cannot treat early-COVID—because it is unethical and it is going to lead to death and it's going to lead to harm. But it's an example of personal responsibility being taken away from the doctors. They're being told by their college that they "can't." So now, they're just following orders and well, "I'm helpless. I will lose my licence." These are lies. But it explains how we find ourselves in a situation where people that we have entrusted with our very lives and health have turned against us.

And it's still happening. I can't think of a single institution in Canada that is now working for the people again. Name me one institution in Canada that has stood up during this COVID experience to protect us: to act as a shield between us and the government; to act in the public interest. And it's still happening. Here we are in May 2023 and vaccine-injured people are being treated as lepers and second-class citizens and shamed and humiliated and left to suffer by our medical system. Their existence is being denied. It's like we can't admit they're there. They're an inconvenience to us because we can't admit that the vaccine caused injuries. Because we're still pushing it on children. We're still murdering children. The attack is still happening. We're still censoring doctors. They're still afraid. Professionals are afraid to follow their ethics and do their job.

So we know that this spell that we've been under, it's literally like people are asleep. And language is deliberate; when we use language, the truth sneaks out. I've done a lot of criminal law and I think of statement analysis where most people lie by omission. There are simple things that people can't hide. When they're lying, things happen: they drop personal pronouns like clockwork. We cannot—you know the word, Freudian slip—we can't hide the truth. It comes out in different ways. We can obscure it. But our language speaks volumes.

And isn't it interesting that in the freedom movement if you don't know somebody or where they're at, but you're starting to think, "Oh, just wait a second, maybe they do know what's going on," you ask them, "Oh, are you awake?" We ask each other when we're feeling each other out: "Are you awake?" That's not an accident. It tells us that there are people among us, and we know that, that are asleep. They're literally asleep: They're having a dream. Their eyes are not open. They do not see what is going on. So that tells us the spell is still in force.

There's two problems that these people who are asleep are having. First of all, they still believe. Many of them actually still believe the lie. The other problem they have—and we need to pity them for this, but many people who are awake still have this problem too; denial is a great self-protection mechanism—is they just want it to get back to normal. "Don't hold this Inquiry." "Don't reveal the truth about what happened." "We don't need to figure out how not to do this again." "Just stop. We just want to get back to normal. We just want to forget this happened and go back to normal."

That is a delusion because there is no normal to get back to.

[00:15:00]

That is a complete failure to understand that we are in right now "the Great Reset." Now, what the Great Reset looks like at the end depends on us. But we know when we hear people like Klaus Schwab saying, the Great Reset—the leaders are using the term the Great Reset—it's not something that's going to happen in the future. It's something we're in right now; we are experiencing. There is no going back to the way we were. Our past is done. It's finished.

Just on the vaccine alone. From the evidence we've heard, we can predict that there will be more people becoming disabled. I recall Ed Dowd using the data of the working population in the United States, traditionally, the healthiest people, that the number becoming disabled—well, the percentage isn't rising, although it's dramatically higher than it was pre-vaccination and alarmingly high. It's levelled off, but it's still there. We're experiencing more and more people at a very high rate of what should be our most healthy population becoming disabled and the deaths will follow. So we'll peak with disabilities first and then we'll peak with deaths. But we're still facing it. These people that we heard from yesterday with their lives literally—literally—being destroyed. It was hard to believe what it would be like to have their experience. We're going to have more of those.

The problem of sterilization caused by the vaccines has not been dealt with much in these proceedings. We were hoping to have Naomi Wolf testify, but she wasn't available for the date of the Ottawa hearings that we had wanted. But it appears that's another issue going forward that we're going to have to face. It's interesting, I have a friend in Alberta who is a health care practitioner who's been reporting to me that if a child dies *in utero*—so while the mother's carrying the child—it used to be that the hospital would take care of that and get the dead fetus out, and then it would be recorded in our statistics. But the mothers are now being sent to abortion clinics for that to be done, so it will not be included in our statistics. So we're hiding information.

I saw a disturbing billboard about a month ago in Alberta. There's a support line for mothers who have miscarried to phone. So it's now, obviously, enough of an issue. This is happening in large enough numbers that there are now billboards telling mothers that they can get support for this. I've never seen anything like that in my life and it tells us that we're still there.

Catherine Austin Fitts testifying yesterday, and we've heard it from other people, telling us this isn't an accident. This is planned, what we're going through, this Great Reset. The world leaders tell us. Google the term. Well, no, don't Google it; DuckDuckGo it because you'll get different results because of the censorship. That in itself should tell you volumes. This isn't an accident; it's an attack.

It came up during her testimony, one of the commissioners said, "Well, we've had more immigration than since the Second World War." We're going to have a witness testify today about seeing, during the pandemic, just tons of immigrants arriving while we were all locked down. It's almost like the population is being replaced as part of the Reset. So we've been taken down. We have been judged. And understand that they can't stop—you can't pull that trigger and call the bullet back. You can't stop because otherwise, we will get control of our institutions again and we will hold them accountable.

So we have to expect that what we're experiencing will continue.

[00:20:00]

And what we're experiencing is that our government and our institutions have become the weapons against us. Catherine Austin Fitts referred to it yesterday as "the great poisoning." She spoke about our food supply and how it's basically become a weapon against us. She spoke about 5G and cell towers. We've had Dr. Magda Havas speak about that. But understand that our wireless technology, it could be done safely, but it's not done safely. It's done in such a way that reduces our health and reduces our lifespan, and this is deliberate. We are facing economic collapse. We're in it now. It is likely because they're telling us that we're going to have starvation.

We've already seen religious prosecution in Canada. We have called some of the pastors who have been jailed as witnesses, and that is not going to stop. We're literally in a situation where you need to prepare both physically and spiritually. Physically, I think you need to get out of debt, you need to have extra food, you need to have currency. I'm not here to give advice on that, but you need to be prepared because we are entering the next phase of this information war, and you need to act accordingly. We also need to prepare ourselves spiritually, and I'm going to go back to the evidence of Sheila Lewis yesterday.

Again, she was the one whose life depends on an organ transplant, and she's going to die. She's the one that was sobbing and telling us she just wants to live: she wants to see her grandchildren grow up. That's all she wants. She told us that this was evil, that what was happening to her was evil. As if evil is a tangible thing. And the thing is, evil is a tangible thing. If you open your eyes and look around, you will see it. We've seen it in these proceedings. You can hear it. You can taste it.

I've spoken several times about my opinion that the way back for us are what's called the first and second commandments in the Bible. I've explained that they're not just the basis of our legal system. But it's important for us to understand as we find ourselves in a situation where our government is adversarial to us, where institutions have become adversarial to us—that's because we actually moved away from the principles upon which our society and our legal system is based. When you move away from your foundations, your society falls. And I've explained to you how the second commandment, basically, is the foundation of freedom. Both of those commandments are intended for freedom. I'm going to explain that a little differently, and I think some of you are going to be shocked by how I end this.

There was a deliberate decision to remove God from our society. We all know that we can't speak about God. That it's almost like a conspiracy theory that or you're a climate denier or you're an anti-vaxxer. God needs to be separated from our society: He needs to be removed from the schools. He needs to be removed from our institutions. This was deliberate. We have been taught to put ourselves first, and we live our lives to put ourselves first. We all do it; we've all been taught to do that. Our society is based on greed. I have two trucks. I have an old truck with 447,000 kilometres on it that's rusting, and I have a 2012 truck. Well, if I'm going to pick somebody up from the airport, I'm not using my old truck. Why? Oh, because I'm worried about being judged. I'm just using that as an example, and you all know what I'm talking about. Our society is based on greed, which is putting ourselves first.

[00:25:00]

We also view God's law or following God as restrictive. And that is the greatest lie. I'm going to explain that to you, and you're going to go, "Oh, my gosh. I see it; it's our greatest lie."

For those of you who have no idea what I'm talking about when I say first and second commandment, I'll just tell the story. It comes up in different ways. But when Jesus was on the earth in Israel, it was a rules-based society and it had become oppressive. It was a religious rules-based society. They actually referred to it as The Law. It wasn't meant to be restrictive. It was meant to be helpful. We're all aware of the Ten Commandments: don't murder, don't steal, don't commit adultery. Well, that was the beginning. But there was just rule after rule, and it actually had been turned against the people. So it was extremely, extremely restrictive. But it gave the religious leaders power over the people.

Then this Jesus comes along. He's talking about the law but in a way that's freeing—in a way that actually serves the people—literally that becomes so popular, he can't move around. He has to, at times, get into a boat and cross a water body just so that he's not surrounded by people. And the religious leaders are going crazy: "We've got to stamp this guy out." He's a political threat to them. So they plot several ways to try and get rid of this guy. But one of the ways was, they were going to ask Him a question. They were going to get Him tied up in a legal argument.

So they decide, "Well, let's ask him what the greatest commandment is, and it almost doesn't matter how he answers. Then we can argue with him and just show people he's not as clever as he thinks he is." Because they knew the law; they were the lawyers, so to speak. So they ask Him, "Teacher, what's the greatest commandment?" And He gives them an answer. He says, "Well the greatest commandment is to love the Lord your God with all your heart, all your strength, and all your mind." Now Jesus was out of the trap. He was out of the trap. That first commandment comes up in other places in the Bible but basically love God first, not self. You see, we're a self-based society now. But you're not supposed to put **self first; you're supposed to put God first.**

Now understand, Jesus was out of the trap. But he continued, and he didn't have to continue. He said, "And the second commandment is to love your neighbour like yourself." Basically, to treat others like you would like to be treated but further than that because he used the word "love." Now that is following the second commandment and the reason why every single Western liberal democracy—which have been the freest societies that we are aware of in history—they're based on the second commandment. Because if you teach your people and base your laws on the principle that you treat others like yourself and you don't put yourself first—God goes first—then you're not murdering each other. You're not stealing from each other; you're not sleeping with your neighbour's wife because you don't

want your wife sleeping with another neighbour. Basically, you have a freer and more civilized society if you are putting other people first.

So understand—because remember, I told you the greatest lie is that following God is restrictive. Well, if you believe that you have to be first, then—“Oh jeez, I don’t want any restrictions on myself”—you misunderstand, completely, that actually you are more free. When you love God with all that you are, you’re no longer putting yourself first. That’s how it works: you’re not number one anymore. And then, you’re forced to realize that you’re just one of His children. We are the same; we’re together. Do you see how, all of a sudden, it’s not adversarial? So when you’re not first and you’re just one person following God, we’re just all His kids. We’re all together; we’re all the same. It’s not about us anymore. That’s why the first commandment serves us,

[00:30:00]

and I’ve already explained how the second commandment leads to our freedom.

Now here’s where it gets interesting. Because one of the popular myths to get people to hate God and think that the first and second commandments are just crazy is—“Well, this is all fire and brimstone and judgment.” So I want to describe how the New Testament refers to judgment. What are we going to be judged on if this is fire and brimstone? I probably can’t go through this without choking up. It’s just so touching.

So you would think if God’s real— Because in the New Testament, it says that at the end of time, Jesus is basically going to separate the sheep from the goats, much like a shepherd which separates the sheep from the goats. The sheep are the people that lived right, and the goats are the people that lived wrong. You’d think the touchstone would be, “Well, you murdered and you stole and you’re totally unethical.” No, no, no. That’s not how He’s going to judge us.

You know what He said? Well, He’s going to turn to the sheep and He’s going say:

When I was hungry, you fed me; when I was thirsty, you gave me something to drink; when I was a stranger, you took me in; when I was naked, you clothed me; and when I was sick, you took care of me.

And the Bible says:

Well, these sheep are going to say, Lord, we never, ever saw you. When did we feed you or clothe you or take care of you? And Jesus will say, when you did it to the least of these—meaning anyone else—when you did it to the least of these, you did it to me. And then, He’s going to turn to the goats and He’s going to say, when I was hungry, you didn’t feed me; when I was thirsty, you didn’t give me anything to drink; when I was a stranger, you didn’t take me in; when I was naked, you didn’t clothe me; and when I was sick, you didn’t take care of me. And they’re going to say, well, Jesus, we never saw you, so what are you talking about? Obviously, we couldn’t have fed you or given you something to drink or clothed you or taken care of you when you were sick. And He’s going to say to them, well, when you didn’t do it to the least of these, you didn’t do it to me.

So the whole point—the whole point—of these commandments and our basis of our society, is to take care of each other. So when we have Sheila Lewis on the stand, sobbing

and begging the unnamed doctors—that she can't name because she's under a gag order—saying, "I just want to live. I just want to see my grandchildren grow up, that's all I want," she doesn't understand why they will not reverse their decision. They're not feeding her when she's hungry. They're not giving her a drink of water when she's thirsty. They're not taking her in. They're not clothing her. And they're definitely not treating her when she's sick. Do you see how this serves us?

We can use these as the basis for understanding how we are to proceed going forward because it's all about standing together. You have no choice. We're in this together. You are not alone. You're not alone. And we have a task. You can't avoid it. We're in the Great Reset. And we're going to decide whether those that have pushed us into this get to decide the outcome or whether the outcome is going to be one based upon the first and second commandments. You have a choice. This is a historical moment.

There are times when a generation is asked to define who they're going to be. What are the history books going to write about this generation? I think of Churchill, remembering how he was so stirring in his oratory. In the darkest days of the Second World War, when he's saying,

[00:35:00]

"We'll fight on the beaches, we'll fight on the streets," he had a phrase. He said, "If the British Empire lasts for a thousand years, they'll look back and say that this generation was their finest hour out of a thousand years."

We're there. It's this hour. It's this hour for Canadians. Our actions will define whether this will be referred to as our finest hour or will we be a footnote in history of a civilization that fell to its knees without a whimper. I'm participating. I'm volunteering. I'm putting my neck on the line because I want the history books to say this was our finest hour.

[00:36:13]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 1: James Corbett

Full Day 2 Timestamp: 01:09:56–02:25:20

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

I'd like to call our first witness of the day, who is joining us virtually from Japan. So, James, can you hear me?

James Corbett

I can hear you. Can you hear me?

Shawn Buckley

Yeah, I can hear you. I'll ask our AV person to turn your volume up a little bit. I'd like to begin today by asking you to state your full name for the record, spelling your first and last name.

James Corbett

My name is James Corbett, that's J-A-M-E-S, Corbett, C-O-R-B-E-T-T.

Shawn Buckley

And James, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

James Corbett

I do.

Shawn Buckley

Now, James, you are an independent journalist. You have the Corbett Report, which is an independent, listener-supported, alternative news source, and it operates on the principle of open-source intelligence. You've got a different history in your background, and I have to

tell you that I've heard from several people comments about you that are just full of respect for the work that you do and the integrity of your research. So you come to us with a very good reputation, and we're pleased to have you join us today.

And you are here to discuss with us some kind of global issues, like the Global Pandemic Treaty, the International Health Regulations, and One Health. And I'm just going to let you march into the presentation that you've prepared, and then we may have questions along the way and certainly afterwards.

James Corbett

Okay, excellent. Thank you for that. Thank you for inviting me here to talk about this. I think this is incredibly important and, in fact, in some ways goes to the heart of what all of the craziness of the past few years has really been about. So I hope I can do it justice. I do have a presentation prepared, but obviously please do interrupt and ask for clarification at any point you need to.

In order to start in on these subjects, I think we need to establish some ground facts. And so, it would help probably to know what is the World Health Organization [WHO]. And for those who don't know, the World Health Organization was founded as a specialized agency of the United Nations in 1948 specifically to promote, quote, "the attainment by all peoples of the highest possible level of health." And it proposes to achieve this task by acting as, quote, "the directing and coordinating authority on international health" work. All right, excellent. That sounds noble. It sounds like something that people could get behind. But as always, the devil is in the details.

So some questions that might arise, as we hear these words that come from the founding Charter of the World Health Organization: What is health? And who determines the highest possible level of health, let alone how to attain it? These aren't idle questions, as I know you know from the very impactful harrowing testimony that you have heard over the course of this Inquiry.

The answers to those questions really do go to the heart of what we are facing: what we have seen over the past three years, certainly, and what we might see again in the future if we allow this to continue—lockdowns, mandates, travel restrictions, forced medical interventions and procedures, and rule by decree of governmental or presumed health authorities.

So this is an extremely important subject. And I just want to lay that out before we start diving into the details. Because although the worst of the COVID hysteria may or may not be behind us, I think the real battle is only now beginning. And that battle is a battle over **the definition of, and the declaration of, and the ability to govern over the next, quote-unquote, "the next pandemic," which we are constantly assured is right around the corner.** So this is an incredibly important issue.

So today I want to talk about two separate but related processes that are taking place under the auspices of the World Health Organization. One is, well, it's being referred to officially as the WHO convention, agreement or other international instrument on pandemic prevention, preparedness and response [WHO CA+], which is a very, very long roundabout way of not saying Global Pandemic Treaty. But they, I think, specifically do not call this a Pandemic Treaty because the word "treaty" brings with it certain legal obligations and would require ratification by legislatures, at least in those states where they have constitutional procedures for governing the signing treaties.

[00:05:00]

But conventions and agreements are covered under the WHO Constitution itself, which grants the governing body of the World Health Organization, the World Health Assembly, the power to, quote, “adopt conventions or agreements with respect to any matter within the competence of the organization,” which when ratified, will oblige each member of the WHO—which for the record is almost every nation-state on earth, of course, Canada, no exception there—would oblige them to adopt those conventions or to notify the WHO’s Director-General of rejection of those, or reservations to those, stipulations within 18 months.

So that’s kind of the framework for why it is not being called a Global Pandemic Treaty. But at any rate, this treaty, in all but name, is being drafted behind closed doors right now. This process has been going on for the better part of a year now and is expected to be unveiled with an agreement or other instrument at the 77th World Health Assembly, which will be taking place next May.

In the meantime, they are having closed door briefings and sessions that are not open to the public in which they are negotiating the text of this document. There is an entire bureaucracy that has been set up to handle this process of the drafting of this not-a-treaty called the INB, the Intergovernmental Negotiating Body. And that has held, I believe, a couple of hearings now for public input into this process. But all that means is that accredited institutions and organizations that get permission can Zoom in and basically make a short presentation about their feelings about what the treaty should include. Very few people given a chance, of course, to speak out against the process itself, and I think that’s instructive in and of itself. But the meat of the negotiations of this draft treaty are taking place behind closed doors, and there is very little transparency on this process.

We do have a zero draft of this treaty that was unveiled earlier this year [February 1, 2023] and that we can at least see the text that they started with from ground zero, which gives us some insight into this process. It includes increased tools for epidemiological genomic surveillance and integrated One Health surveillance systems, which might raise the question, what does any of that mean? And those are good questions, but unfortunately not ones you will find the answers to in this zero draft of the treaty. Because in the definitions section of the zero draft, you will note that, for example, it says, under definitions, “‘One Health surveillance’ means . . .” And then, of course, that’s left blank because they have not come up with a definition of One Health surveillance yet, but it is included in the text of this zero draft [February 1, 2023]. They talk about the need for integrated One Health surveillance systems without telling you what One Health surveillance means.

Other such things like that abound in this document. There are obligations for member states to, quote, “tackle false, misleading, misinformation or disinformation.” And I think given the events of the past few years, we know exactly what that looks like and what form that takes. As someone who had his YouTube channel of nearly 600,000 subscribers scrubbed for daring to talk about such things as the philosophy of science and other things related to the events that are going on, I know firsthand what that legalese text implies.

The zero draft also includes verbiage about control over when, where, and how a pandemic is declared within each member state’s borders. So it says, quote, “the INB is encouraged to conduct discussions on the matter of the declaration of a ‘pandemic’ by the WHO Director-General under the WHO CA+ . . .”—which is what they’re calling this not-a-treaty— “. . . and the modalities and terms for such a declaration, including interactions with the International Health Regulations and other relevant mechanisms and instruments.”

So yes, even the process by which a pandemic will be declared by the World Health Organization under this new treaty, or whatever they're calling it, is left open to negotiation. And again, negotiations which we do not have access to as lowly members of the public who will simply be subjected to whatever rules end up getting forced into this document.

I think that should be concerning in and of itself. But actually, it's in some ways, maybe even worse than most people realize. Because at least at this point,

[00:10:00]

the World Health Organization does not officially declare a pandemic to have started or over. There is no official declaration of pandemic. There is an official declaration of a public health emergency of international concern (PHEIC), which is a different declaration altogether.

People might have heard recently that the WHO has declared the pandemic over. But that's not quite true, as even the fact checkers will, in this case, correctly tell you, "No, they declared the end of the public health emergency of international concern," but they did not say that the pandemic is over. So this document is at least putting on the table the possibility of literally a declaration of pandemic by the WHO Director-General, in particular, which is interesting for reasons that relate to that PHEIC.

But let's delve into the other side of this. Because as it says in that text, talking about this rule of the WHO Director-General declaring a pandemic, it says, "including interactions with the International Health Regulations." And that is the other document that I want to talk about. One is this treaty, which they are not calling a treaty. The other is amendments to the International Health Regulation.

Shawn Buckley

James, can I just slow you down for a sec before you go to the International Health Regulations. Because to some of the people that will be watching your testimony today, this will be brand new. So you're basically saying that we should be calling this a "Global Pandemic Treaty," what they're negotiating. But even the title—they're using words to kind of confuse so that we don't understand what it is. And that this is being negotiated behind closed doors, so it's not a public process. Is that right?

James Corbett

That is correct in substance. Obviously, it's my supposition that the unwieldy title **contributes to the confusion around this process. But it is not supposition that the word "treaty," specifically brings with it certain legal obligations that I think are being obviously avoided in this lengthy appellation.**

Shawn Buckley

And then I just want people to understand. So when you're saying definitions are left blank—when laws are drafted or treaties are drafted, they'll actually put a definition in and then start using those words. So the definition is very, very, very important. So when James is saying, "One Health surveillance"—which sounds very Orwellian—or "One Health surveillance systems," saying these terms are being used, so they have a specific meaning. But the text that's been released, they're not telling us what the meaning is.

So I just want people to understand how important that point is that James has brought up. It makes it impossible for us reviewing the text that has been released to really understand the significance. And I can tell you, having drafted legislation for government, that when you actually already have a term, you have a definition in mind. You know what that term means; you're not throwing it in there for good measure. So to me that's quite concerning what you brought up.

And also, just slow this down before you move on. You're telling us there's actually provisions in there to deal with misinformation. So they're already anticipating censoring information that goes against what they say?

James Corbett

That is the certainly the implication. There is no language, at least in the zero draft, that's been provided to the public to specifically say how member states are committing to tackling false, misleading, misinformation or disinformation. But I think we've seen exactly how that has been done over the past few years, including direct governmental interference in social media. For example, trying to censor—not trying, but actively censoring people who go against the pronouncements of any declared public health authority. So I think that's essentially what is being declared.

But specifically, it's from Article 17, paragraph 1 [zero draft, February 1, 2023]: "The Parties commit to increase science, public health and pandemic literacy in the population, as well as access to information on pandemics and their effects, and tackle false, misleading, misinformation or disinformation, including through promotion of international cooperation," which is an interesting addition.

And just to clarify, yes, Chapter I, the Introduction, Article 1, Definitions and use of terms. They do have in the zero draft [February 1, 2023], four of the terms defined. But they leave "pathogen with pandemic potential," "One Health approach," "One Health surveillance," "infodemic," "inter-pandemic," "current health expenditure," "universal health coverage," and "recovery" are all left undefined at this point.

Shawn Buckley

Interesting. Okay, sorry for interrupting, please continue.

James Corbett

Valuable things to elaborate on.

[00:15:00]

All right, so let's talk about the other process that is going on. And I think, again, supposition, this is another part of the deliberately confusing nature of this process. In addition to this treaty, or whatever they're calling it, there is a proposal to amend the International Health Regulations. So what are the International Health Regulations?

Back in 1951, the World Health Assembly, the governing body of the WHO, adopted the International Sanitary Regulations, which was an attempt to consolidate the multiple and overlapping international agreements that then pertained governing quarantine procedures and other international health controls—that were, at that time, a series of bilateral deals between various countries and that was quite confusing, obviously, for an

increasingly globalized society, international trade, et cetera. So that was consolidated into this International Sanitary Regulations. And that was ultimately turned into the International Health Regulations in 1969. And those IHR, International Health Regulations, were amended in 1973 and 1981.

At that time, the entirety of the International Health Regulations covered specifically six diseases, but specifically focused on three of them: cholera, yellow fever, and plague. But after the SARS-1 hysteria of 2003, there was a push for amendment and sweeping reform of these IHR, International Health Regulations, to take into account the new and novel diseases that could appear in the future. So that push led to the adoption of the last round of amendments to the IHR in 2005. So that is the most recent edition of the International Health Regulations. And that was the addition of the International Health Regulations that introduced that aforementioned public health emergency of international concern, which is a specific declaration that is made ultimately by the Director-General of the World Health Organization.

Although, supposedly, theoretically, there is an independent advisory board that advises the Director-General whether or not to declare a public health emergency of international concern for any emerging virus or pandemic, or what have you. And that independent advisory board, really—according to what I think the drafters or, at least, what was presented to the public—it was the advisory board that's ultimately making this decision, and the Director-General just gives the rubber stamp to their recommendation.

Of course, that turned out not to be the case with the declaration of the monkeypox public health emergency of international concern last year, in which, according to reports, apparently, the Director-General Tedros broke the deadlock in the advisory panel by declaring that it was a public health emergency of international concern. And it's interesting that it's even portrayed as a deadlock when, in fact, the majority of the independent advisory board recommended against declaring a PHEIC.

But what is a PHEIC? Why is it important? What does it do?

Essentially, the declaration of public health emergency of international concern opens up a number of powers for the World Health Organization up to and including—as was reported back in the mid-2000 “teens” during the *Ebola* public health emergency of international concern; it was reported even in Newsweek and other places—that the powers that are unlocked by such a declaration could even include, conceivably, NATO boots on the ground in order to enforce quarantines or deliver medical aid or intervention, or what have you.

So this is a significant declaration. And of course, it also brings into effect a number of contracts that are signed for various governments that ultimately obligate them to **purchase prophylactics, including vaccines or whatever else may be available for the declared health emergency. And that became a significant factor in the first ever declaration of a PHEIC back in 2009, during the swine flu pandemic, which ultimately ended up being a less deadly flu season than regular. But that being what it is, the declaration of PHEIC obligated countries around the world, including, of course, in Canada, to purchase swine flu vaccines that, ultimately, a lot of them ended up getting destroyed, unused. But whatever, at any rate, it was there. And an awful lot of money was made on the back of those vaccines.**

[00:20:00]

And an independent investigation from the Council of Europe the following year, as well as a British Medical Journal investigation, found that there were serious conflicts of interest between the independent advisory board that advised then WHO Director-General Margaret Chan to declare that PHEIC and the very pharmaceutical manufacturers who ended up benefiting from that declaration. So that's kind of the context of this International Health Regulations and what's on the table.

This current round of negotiations for further amendments to those IHR include a grab bag of proposals of potential amendments. Some of the ones that pop out immediately include the idea of striking out the words, quote, "full respect for the dignity, human rights, and fundamental freedoms of persons," from the IHR principles, giving WHO greater authority over surveillance monitoring and control of health threats—including greatly expanding the PHEIC power with proposals suggesting giving the Director-General the authority to declare not a public health emergency of international concern but an "intermediate public health alert" where a public health event does not actually reach the threshold of declaration of PHEIC but "requires heightened international awareness" and preparedness activity.

So, whatever that means.

Granting the WHO the power of a global emergency health legislature, including proposals to potentially change the currently "non-binding" and "standing recommendations" on medical and/or non-medical countermeasures to address a PHEIC that the Director-General shall issue to WHO member states after a consultation into binding recommendations. So they are actually proposing to change that wording from non-binding to binding, which ultimately does make the WHO into a de facto government, at least, public health emergency legislature.

It includes proposals for working with partners to establish a Global Digital Health Certification Network, which is intended to enable member states to verify the authenticity of vaccination certificates issued under IHR, as well as other health documents. And proposals to expand the scope of the International Health Regulations to cover not just demonstrable ongoing public health emergencies, but all risks with a potential to impact public health.

In other words, this is an astounding power grab that is, again, represented in these two parallel processes: the treaty that they're not calling a treaty and the International Health Regulations amendments that are separate processes, that are being run by separate governing bodies, but that, as the WHO states, could overlap. And there are meetings that again are going on behind closed doors as to whether or how these two processes should merge. Or maybe there should be two separate processes. Maybe they should continue with one of them, but not the other. It's all left completely opaque at the moment.

So those are the two processes. And in order to understand, I think, what's really on the table, we have to understand the overall idea behind the concept of public health in general and where it is going in the future. I'll pause for a moment in case you need any further clarification on anything I've presented so far, though.

Shawn Buckley

And actually, that's a perfect time for pause. It's interesting. We had a witness yesterday, Denis Rancourt. I don't know if you're familiar with him. He's a physicist by training but had been a full professor for years at the University of Ottawa and an interdisciplinary

researcher. He's presented on all-cause mortality using Canadian and U.S. data. And one of the points he brought up a couple of times was, in the past when pandemics were declared be that avian flu or swine flu or whatever, there was no indication in all-cause mortality that there was ever a pandemic. So, in other words, you couldn't see it. But he says you could see a heat wave for three days; that would show up, other things would show up.

But actually, every single time a pandemic had been declared, there was no rise in all-cause mortality. So basically, the implication is that these pandemics are declared when there is no public health emergency. And here you are telling us that basically, countries like Canada would lose their sovereignty so that if a pandemic was declared by the World Health Organization, we would have no choice but to allow them to basically counter some pandemic. Are we hearing you correctly about that?

James Corbett

Member states are already obligated to do a number of things under the WHO Constitution,

[00:25:00]

including implementing the conventions and agreements that are decided upon by the World Health Assembly. So really, there are already obligations that are in place for Canada, as we've seen, I think, through the course of the past few years, let alone decades. That in fact, for example, there is a stipulation in the existing International Health Regulations that all countries have to comply and actively assess their compliance with the International Health Regulations and pandemic preparedness generally. And Canada, as you may or may not know, actually, the Government of Canada posts on their website, occasionally, their updates as to their self-assessment of their compliance with the International Health Regulations. So there are already stipulations in place. I think the proposed amendments just give the potential for these obligations to expand.

Shawn Buckley

It's interesting. So that explains why, I mean, it seems that most of the world, certainly the Western world, followed kind of one plan. And James, what I've always found interesting—and this is just my thinking—but let's say we were facing a serious threat by a virus and we've got to figure out what to do. It would seem to me you'd actually want different countries trying different things so that you could see what works and allow different theories to be tested.

But we basically have entered a world where one organization has the power to decide how we deal with a serious threat. And if they get it wrong, then the whole world will face the consequences of that. Because that's the flip side. But if they get it right, well, great; all's well and off we go. But if they get it wrong, it means the catastrophe is magnified. But basically, that's where we're at legally.

James Corbett

I concur wholeheartedly. I think that gets actually to the real heart of the philosophical issue, let alone the legal issue, that we're facing here—which is the question of the centralization of power over “public health” in fewer and fewer hands. And, in fact, that's kind of how I'm planning to end this presentation. But perhaps we should cover One Health before wrapping up with that.

Shawn Buckley

Sure, can I just ask one more thing? Because you just went over it quickly. You were saying they were striking out some principle. Can you just read that text slower for us? I think it's important for us to understand.

So there's principles in the current International Health Regulations. So it means, principles—just so that people hearing your testimony understand—they're supposed to be what guides the interpretation and application of these regulations. So they're kind of fundamental to what our goals are. But please share with us what is being removed or being proposed to be removed as a principle.

James Corbett

Yes. So the text that is being proposed to be struck out from Article 3, which is the principles of the IHR document, is "... with full respect for the dignity, human rights and fundamental freedoms of persons." And the proposed alternate text—again, people can find this on the WHO's own website; they have a post of the proposed amendments [IHR proposed amendments, WHA75(9) (2022)]. The proposed alternate text: instead of "... with full respect for the dignity, human rights and fundamental freedoms of persons" is "... based on the principles of equity, inclusivity, coherence and in accordance with their common but differentiated responsibilities of the States Parties, taking into consideration their social and economic development." I will let you parse that for yourself. But, anyway, that's what they want to replace the text with.

Shawn Buckley

I think George Orwell would be proud of that one.

James Corbett

I concur.

Shawn Buckley

Yeah, please continue this. And I can just share with you that I believe everyone is finding this very interesting and we haven't had somebody speak to us about these issues. So we certainly appreciate you sharing with us.

James Corbett

All right, so what we have heard, so far, I think is fairly concerning. But actually, where I think this is going demonstrably is even more concerning. And what this is raising the spectre of, is the concept of the One Health approach or One Health agenda, which is being adopted by many different health authorities in many different countries. The CDC in the United States, the World Health Organization is talking about it. In fact, there's an entire institutional framework that's taking place, taking shape around it.

One Health: that phrase was apparently coined in the wake of the SARS-1 events,

[00:30:00]

back in 2003–2004, to discuss the threat of emerging diseases—diseases emerging from animal populations and the contact of animal and human populations, so zoonotic diseases.

And that concept started to come on board that public health is not just about your individual health as a human being, it is about the health of nature, including animals. So the CDC, for example, defines the One Health approach as “a collaborative, multisectoral, and transdisciplinary approach—working at the local, regional, national, and global levels—with the goal of achieving optimal health outcomes recognizing the interconnection between people, animals, plants, and their shared environment.”

So again, I think like the founding principles and definitions in the World Health Organization Charter, this is language that is designed to sound very appealing. But I think quite quickly starts to get into some very interesting philosophical areas, shall we say.

So I think we have to recognize what is being done here is a rhetorical move to essentially make every corner of the globe, every natural resource, every plant, every animal, including every person, as part of an interconnected web that forms this new definition of public health: One Health. And so, embedded within this idea, within this concept, is if we have a centralized, specialized agency of the UN, like the World Health Organization, which is in charge of coordinating international public health, we need some sort of centralized control that will have jurisdiction essentially over every one of these constituent elements—every habitat, every resource, every animal, every plant, and every person—in order to coordinate not public health but international One Health.

So I think we see where this is starting to go. And of course, it doesn't just involve the World Health Organization. Again, by its very nature, this is such a broad concept that it applies to every nook and cranny of every bureaucratic infrastructure in at least the UN panoply, as evidenced by the fact that the World Health Organization has just joined a quadripartite coalition—consisting of the Food and Agriculture Organization [FAO] of the United Nations, bringing in that food concept that was referred to by Catherine Austen Fitts; the United Nations Environment Programme [UNEP], bringing in the spectre of Rio Summit and UNFCCC [United Nations Framework Convention on Climate Change] and the IPCC [Intergovernmental Panel on Climate Change], et cetera. The World Organization for Animal Health [WOAH] and the World Health Organization have now combined forces to tackle this One Health approach idea. And they have set up a new “high-level expert panel,” to coordinate activities on One Health, which is defined as “an integrated, unifying approach that aims to sustainably balance and optimize the health of people, animals, and ecosystems.”

So again, this sounds laudable. But it is predicated on a devaluing of human life in order [inaudible: 0:33: 19] equity, which I guess we're supposed to assume is always, in every context, a wonderful word—equity with nature. So humans have to be devalued to the point where we do not prioritize human health over the health of, say, an animal species or something along those lines. And I think people understand where that concept is going or where it could go. But at any rate, that is the One Health approach that is now being fostered under the auspices of not just the WHO but a number of international organizations.

Shawn Buckley

So that's how we end up locked down in 15-minute cities and eating crickets.

James Corbett

Unfortunately so, or at least I believe that is part of the plan. So yes, as you indicate there, this is not just about the concept of health as we tend to think of it—as in you feel sick and

you go to the doctor and you get some medicine, or something along those lines. It has to do with every aspect of your life: where you live, how you live, what you eat, et cetera, et cetera. It would be difficult to think of any aspect of your life that would not come under the purview of this One Health idea.

Shawn Buckley

That's quite striking actually. So did you have more to share?

James Corbett

I can talk about the next steps in this process.

So with regards specifically to the International Health Regulations, again, they are being proposed to be adopted at the 77th World Health Assembly next May by a simple majority vote.

[00:35:00]

And so, given the scope of the Constitution of the WHO and specifically Article 21, the amendments of the IHR—when and if they are adopted—will come into force within all member states within 12 months of adoption unless a state proactively files rejections or reservations within a 10-month period after the adoption. At any rate, this is a very, very short timetable and I think, again, the momentum is on the side of the bureaucratic meddlers here, shall we say.

As regards to the treaty, that they're not calling a treaty, that would require—I think there are different interpretations of this—but I have read that it would require a two-thirds majority vote in the World Health Assembly with each member state being able to sign and ratify the treaty in accordance with their own domestic laws.

But, as I say, I think overall, the World Health Organization Constitution, as it is written, is interpretable in ways that would suggest that any World Health Organization member state is obligated to enact whatever convention or agreement is signed. So, again, I think that there are different legal opinions of what this is. But I think we have a very narrow window in which to act. And I guess the question for Canadians is, what can be done or what should be done?

So I guess on the most basic legal/political level—obviously, given the fact that a formal registration of concern is required to at least stop this from being automatically implemented in Canada within one year of its adoption—then obviously, I think, politically, **people's energy should be directed in that direction, at least at this moment. And there are movements afoot in a number of different countries right now not only attempting to preventatively get their member states out of this process for the negotiation but actually to withdraw from the WHO altogether. And I note that there was a press conference on the steps of the U.S. Capitol just this week involving several U.S. congressmen, I hear 21 of them, actually, were there demanding a complete withdrawal of the United States from the World Health Organization.**

So that is, I think, at least a sign of the type of political movement that could be happening if people were engaged and aware on these issues. Although, obviously, the Canadian political context may be a little bit different than the American context. And I think one thing that we could be assured of is that the establishment media would ignore or denigrate such a

political movement, to the extent that they acknowledged it at all, in the exact same way as they did with the Freedom Convoy.

But more to the point, I think, perhaps more hopefully, I see the formation of communities of interest—public and private membership associations and other organizations—forming on the basis of the principle that human beings have natural bodily autonomy, and medical interventions cannot be enforced or forced upon anyone against their will. And so, I think the idea of people coming together on that basis, including doctors and other medical professionals and regular people, coming together on that basis to form their own sort of splinter medical system, to me, seems the more thoroughgoing approach here, not recognizing the diktats of centralized health authorities.

However, obviously, nothing is going to change unless and until there is a widespread recognition among Canadians, and people all over the world, of the fundamental underlying issue: What is “health”? And who gets to define that word? Who gets to describe what a health crisis is, and what states, let alone individuals, must do in the event of a declared health crisis?

These are the fundamental questions. And who controls those powers? Which really raises, I think, the fundamental underlying question of all of this. Because what I’ve been describing with regards to these powers that are coming into view might raise the spectre of medical martial law—essentially times of suspension of regular law in which health authorities essentially act as martial authorities, being able to dictate law into law just by saying it. Which is exactly what we saw over the past few years.

But I think it’s even worse than that. What we are seeing is the erection of an infrastructure

[00:40:00]

for a new paradigm of governance: the biosecurity state. And if you are unfamiliar with the writings of Giorgio Agamben, he is a famed and noted Italian philosopher who has been writing about this subject for the past few years. I highly recommend his work, including an article he wrote in March of 2020 called “Biosecurity and Politics,” where he identified this as the crux of the issue. He wrote, “the total organization of the body of citizens in a way that strengthens maximum adherence to institutions of government, producing a sort of superlative good citizenship in which imposed obligations are presented as evidence of altruism and the citizen no longer has a right to health (health safety) but becomes juridically obliged to health (biosecurity).” And I think that is the spectre of what we are facing: the imposition of medical interventions in the name of health but essentially as a new paradigm of governance that we are looking at.

And so, I think we need to fundamentally question the need for health authorities’ centralized control over the medical system rather than the idea that people can choose for themselves what medical interventions and what medical precautions they are willing to take or not take. And also, the acknowledgement that with our fundamental right of bodily autonomy comes with it our right to essentially ignore and to go against the outward imposition of dictates and obligations by any presumed health authority. So, any treaty, any convention—International Health Regulations—that are signed that do not recognise, fundamentally, informed medical consent and the right to bodily autonomy, it’s null and void.

Shawn Buckley

James, I'm just going to step in if you'll let me. It's interesting. So you're telling us stuff. And I've just, when I do have time to see non-mainstream media, you hear about International Health Regulations and that this is going on. But I can tell you personally, I've not heard this type of detail that you're providing. So basically, Canada is walking into the situation where really our entire sovereignty could be given up in the name of this One Health initiative where everything from our food supply to our complete medical system to our freedoms could be dictated from an outside source. That's basically what's happening and we're not hearing anything about it.

James Corbett

Yes, I think it is already happening and yes, we are not hearing about it.

Shawn Buckley

Are you aware of a single group or anyone that is on this issue in Canada that should be given some support, or we could be directed to?

James Corbett

There are a number of individuals and independent media that are talking about these issues. But in terms of actual coordinated political movement on this front, I don't know. As I say, I live in Japan, so I am not in touch with any particular group.

Shawn Buckley

No, I was just asking because if you're not aware of one, then perhaps that there's a need that needs to be filled here and that's important for us to know.

Also, it's interesting, just as the National Citizens Inquiry has been moving about province to province, I ended up being out for dinner with some of the people involved in the NCI, including local organizers in Vancouver. And sitting to my left was a person from Quebec that lives on a fairly sizable acreage, he is telling me that his chickens have to be registered and he's only allowed three chickens. And then somebody living on a farm in BC is saying, "Oh, I have to register every cow, every sheep, every chicken," like, the amount of control. And then I have a personal friend in Alberta who's being told that, well, any water body, they have to have a fence this size and that would include their rain barrel. Like, it's just, all of a sudden, this micromanagement of rural properties and animals being imposed from above, which makes zero sense unless there is an effort to basically have total control over food supply and animals and rural properties. And it sounds like this would be connected.

James Corbett

I think it is. But on that note, I think that the pushback that we're seeing from Alberta, from Saskatchewan, the Alberta Sovereignty Act [*Alberta Sovereignty within a United Canada Act*], or whatever these things are being called—which I'm not following the passage of these bills closely—but I understand would essentially be a declaration of the provincial government's right to exclude federal authorities from butting in on their jurisdiction,

[00:45:00]

which, of course, health is actually a provincial jurisdiction not federal.

Shawn Buckley

Right, okay. I'm going to turn you over to the commissioners to see if the commissioners have questions. And they do.

Commissioner Drysdale

Good morning and thank you for coming and providing your testimony.

You know, we've completed 22 days of testimony across the country at the NCI right now, and it's like a large jigsaw puzzle that seems to be coming together. And when I was listening to your testimony, it reminded me of some testimony I think we had in Vancouver, and one of the witnesses held up a document that they said was prepared by Theresa Tam. And what it was is that the climate emergency was the biggest threat to human health in Canada. And I kind of wondered about that. But are you aware of that document? And does that kind of fit in with this whole WHO control and pandemics that you're talking about?

James Corbett

I am not familiar with that document in particular, but I am certainly aware of many pronouncements along those lines that have been made over the past few years. And I certainly do see that as absolutely a fundamental part of the One Health agenda. I think the preparation of the public for the idea of a climate crisis, climate emergency, and ultimately lockdowns on the basis of such an emergency has been foreseen, has been talked about, has been openly written about by a number of people and institutions, the World Economic Forum and others, for years now. And so I definitely see that as part of the unfolding One Health agenda.

Commissioner Drysdale

And I forgot to mention, and I don't know whether she still is, but I know Theresa Tam was the head of one of the WHO health committees. I can't quite recall which one it was, but I believe it just started a few years ago, and again, I don't recall whether she's still the head of that or not. But it certainly, it goes right along with what you're saying.

We had another witness in, I think it was Vancouver, and she was an expert in international law and human rights. And in her testimony, she had demonstrated how Canada, during the pandemic, had violated, or allegedly violated, a number of the human rights, which are guaranteed under the UN treaties, underneath a number of health treaties. And it's just interesting, then, how these human rights guaranteed under similar documentation by the UN are being trampled on by the health care directives that are being contemplated or being implemented by the WHO through the UN. Are you aware of that contradiction between human rights treaties and what you're talking about here, the proposed WHO?

James Corbett

Yes, in a sense. But I think that the legal documents and constitutions and other things that presumably we are ruled by, or that constitute the rule of law, are not really worth the paper that they're written on, generally speaking. And in fact, that's, of course, I would say, exactly what we've seen over the evisceration of the *Canadian Charter of Rights and Freedoms* over the past few years. In fact, Giorgio Agamben, who I mentioned earlier, wrote an entire book about *State of Exception*, talking about that issue and exploring it from the philosophical and jurisprudence and historical angle, that there is always a moment of

aporia in these constitutional documents that essentially allow for the declaration of some sort of emergency that says all the rules are aside.

And I would note specifically with regards to the United Nations and the *Universal Declaration of Human Rights* that it propounds, they all sound wonderful and woolly until you get to Article 29, paragraph 3, which says, “these rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.” Essentially, yes, you can have all these wonderful rights unless and until the United Nations says you can’t, and then you can’t. So I think those are the types of legal trickery that are played in these documents.

Commissioner Drysdale

Well, I think that’s why you rightly pointed out definitions and the grab bag of words that were in definitions. And Canadians, if they aren’t, should be very much aware of how their constitutional rights or their *Charter of Rights and Freedoms* was completely neutralized by what seemed to be innocuous words,

[00:50:00]

high-minded words.

I mean, if we’re not aware of those things now and scared to death about these definitions that go on and on and on and could mean anything. But it seems, to me, that you’re saying that this is a common practice, that they put in these kinds of words they can manipulate any way they wish.

James Corbett

I think that is the case. As I say, I would definitely direct you to Agamben on that issue. He has written extensively about this, and it is demonstrable in a number of documents. And there is, generally speaking, some sort of emergency clause or an emergency act, a public order emergency, for example, that can be declared that will suspend basic constitutional rights.

Commissioner Drysdale

The last thing. You know, when I was listening to your presentation and also listening to some comments made by Mr. Buckley, it reminded me of what’s happened so many times in the past. I mean, in Soviet Russia, they got a hold of the food production and they murdered or starved to death 20 million Ukrainians, I can’t remember what the number is; **they argue about what that number is. In China, they did the same thing during the late 1950s and early 1960s, and they took control of all of the food production. Are we seeing that same thing happening today in Canada and in the Western world, but more importantly, at least to me, in Canada?**

James Corbett

I would say, anyone who isn’t paying attention to the consolidation of the food supply in the hands of fewer and fewer corporate interests—but also governed over by an international institutional infrastructure, the Food and Agricultural Organization and other associated institutions—if you’re not concerned by that process, then you’re probably not paying attention.

And in fact, the consolidation is getting worse and worse as we step forward into the Great Food Reset, which has been declared. And that involves such things as lab-grown meat to try to cut down on the horrible pollution that we know that actual regular farming and ranching are wreaking on our environment. Except for a recent report—that may or may not throw any kind of spanner in those works—that apparently, the lab-grown meat will be 25 times more energy- and resource-intensive than regular farming. I wonder if that will in any way derail the plans.

But at any rate, this is definitely a part, again, of that One Health agenda and that One Health approach. And the consolidation of the food supply in the hands of a few corporations cannot be ultimately for the benefit of all humanity. There is, at the most basic level, a very obvious financial incentive for corporations to do this. But from the perspective of people who are literally thinking about trying to manage the human population in general, there could be no greater choke point for doing that than by controlling and manipulating and rationing the food supply.

Commissioner Drysdale

You know, historically speaking—except for a handful of people at the top, some of those names that we know—central planning, state Soviet-style planning, has never been successful. I mean, have we not learned our lesson in history? I mean, the 20th century was predicted to be the century of the masses, mass control; there were a number of books written in the late 1800s about that. And have we not learned our lesson?

We had a witness yesterday, we talked about the definition of fascism, and these are not their words, these are my words. They were talking about us going into fascism on steroids because, you know, in the past, they never had the technological and electronic control and brainwashing that we have today. I mean, have we not—will we not—learn our lessons from history?

James Corbett

Unfortunately, it doesn't seem so. And, actually, history would give us the proper terminology for this because people are grasping around for historical precedents and political analogues—and they talk about fascism; they talk about communism. What they should be talking about is technocracy, and that was a movement that was quite popular in the United States and in Canada in the 1930s. In fact, Elon Musk's Canadian grandfather was a prominent member in the Canadian technocratic political movement who ultimately ended up fleeing Canada and going to South Africa, but that's another story.

[00:55:00]

But technocracy was an idea that was predicated on the idea, not of a fascist system, not a communist system, but the control of society, the engineering of society, at a scientific and technical level by technical experts who would decide—who would calculate—the entire energy inputs and outputs of the entire economy and base the economy around that calculation. And they would issue energy credits to the people who would then use those energy credits to purchase items. And that was a truly bizarre and crazy idea in the 1930s because it would have required systems for continuously monitoring and surveilling every transaction in the entire economy in real time, which, of course, didn't exist in the 1930s.

That technology exists now. And although the historical technocratic movement and Technocracy Inc., which was one of its products, has not exactly disappeared, but it's

certainly not a prominent political part. But I think that ideology is still around and that really starts to explain some of the directions that we're heading.

For example, the concept of carbon rationing and the concept of universal basic income, and some of these other concepts that are floating around, are at base technocratic ideas that have been adapted and adopted for the terminology that appeals to us in the 21st century. But I think if we don't understand that history and where that idea developed from, I think we will not truly be able to understand what is happening until it's too late.

Commissioner Drysdale

Well, yeah, I mean, we now have state-sponsored euthanasia. We have the state holding back life-saving medical procedures from a lady who testified yesterday because she wouldn't comply with something, you know, a procedure that had nothing to do with the transplant. We have state-based racism, where they're pitting every different group of people against each other, regardless of what measure you want to look at. We have unprecedented propaganda, 24 hours a day. People are acting like cyborgs where they carry a device in their pocket and they think because it's not under their skin, they're not a cyborg. But even in this room, we hear the phones ringing and beeping and clinking and clanging. I mean, from what I understand from you, and I understand from some of the other witnesses, this is at an unprecedented level of control. And therefore, we as a human race are at an unprecedented risk to their will. Can you comment on that statement?

James Corbett

Yes, let me underline and underscore exactly what you're saying there. For any of the Commissioners who do not know about it, I would wholeheartedly exhort you to look into Policy Horizons Canada, which is an arm of Canadian government that a few years ago produced a document on biodigital convergence, which talks exactly about what you're talking about: ultimately towards the creation of that cyborg-intermediate species, whatever we are becoming with this increasing adoption of technology, where they actually talk about the ways that at the medical level, we will be more and more merged with machines. And again, you have to read this document in its own words; don't take my word for it.

But one of the things that they talk about in the document is the breakdown of the philosophy of vitalism, which is the idea that there is actually a real and meaningful distinction between organic life and inorganic matter. And they say that those lines are blurring because now people and animals and plants are engineerable, and we can put various biomechanical devices inside of them, and we can tinker and alter them. So the actual distinction between life and nonlife is beginning to break down. And they, I believe, frame that in a positive context in their documents. So yes, these are some very fundamental questions that we're facing.

This agenda is really about much more than simply public health. I think this is about the real question of the definition of human: What does it mean to be human? What is the value of human life itself? And obviously, it does raise the spectre of eugenics and other really terrible ideas from history. Ultimately, I think you could trace it back to Malthus and the fundamental Malthusian idea that there are too many people and that we must get rid of some portion of the population so that we can continue to live. Those fundamental philosophical wrong turns, I would say, continue to haunt humanity.

[01:00:00]

And that is the direction in which I think all of this institutional momentum is heading.

Commissioner Drysdale

Thank you, sir.

Commissioner DiGregorio

Thank you so much for your testimony today. It's been a while since I studied international law, a number of decades, I guess, back in law school. But my understanding was always that international law isn't really a set of rules that are imposed on countries, but it's more a set of agreements that countries reach with each other about how they're going to behave both with each other and internally.

And so, I guess with that framework in mind and thinking about the treaty that you've talked about today and the International Health Regulations—should we be thinking about these documents, and these amendments to these, as things that really Canada is signing up to be binding and to be bound by? Or should we really be looking at these as something that maybe just will give our politicians legal cover: if they want to implement things that maybe aren't in the best interests of Canadians, but they can then turn to and say, "Well, but it's the law, we've signed up to this"?

James Corbett

There is absolutely an element of that. And I think the underlying principle that we have to understand here is that, exactly right: there is nothing that would stop Canada from tomorrow declaring we are not part of the World Health Organization and making it so by fiat. It can be done. And of course, there is actually a process for withdrawing from the World Health Organization, et cetera. But what would happen if Canada just simply declared themselves to be out of the World Health Organization? Well, then by decree, it could essentially be manifested in reality. Because as you say, there is no international courts that could adjudicate this in a way that they could impose rules from the outside. It has to be done to some extent willingly.

So yes, it is important to keep that in mind because I think that is part of what I'm gesturing towards: not just with the political solution, but the political solution as a manifestation of that change in public perception and public consciousness—that, in fact, actually, it is what we are deciding.

Now, of course, there could be and presumably would be many different knock-on effects in terms of Canada's relation with the United Nations, and with various other states, et cetera, **if they were to make such a declaration. But at the end of the day, it is essentially a choice that each member state makes.**

Commissioner DiGregorio

Thank you.

Commissioner Massie

Thank you very much for your root cut analysis of this very, very complex situation. It actually goes in many different dimensions in terms of the definitions, as you mentioned. The One Health, to me, evoked immediately this notion by a lot of technocrats that they

really dream of a one-size-fits-all solution because they think they know it all, right? And if we just listen, then everything would be fine.

It seems, to me, as you pointed out, that we are living a paradigm shift in terms of governance. But to some extent, it seems to me that since the dawn of civilization, there's been a kind of a dream by rulers to control everything. It was not possible sometime if they had more control by fiat with soldiers and stuff. But nowadays, the main way to control is information and the connection of people across the world. And because it seems to be able to connect in a virtual world with internet and stuff, I think that people in the ruling class, the technocrats, think that it's now possible to actually control the world because they have technology that will allow them to do that.

So we are sort of back to the same sort of conflicts between what I would call the subsidiarity principle as a model of governance versus a top-down governance with wise people that know it all and will do it for our own good. The issue I found in terms of fighting that, and you've mentioned a few areas where we could actually be more active and combat it, is that human beings, being what they are, no human being is infallible and can actually fall prey to corruption. Some people are more susceptible to that than others, but in the end, if you have good institutions,

[01:05:00]

this will actually keep that under control to some extent.

So as you move the control or the regulation or the exercise of power in any area higher and higher, what is going to be the control mechanism to ensure that the wise people on those boards are smart enough and, I would say, honest enough to do the right thing? And if they don't, then what? Who's going to be the arbiter that says, "Guys, you're not doing the right thing. We need to change you. We need to take care of your conflict of interest." Who's going to rule that? That to me seems to be the issue. And I don't see any solution to do that in a really high-level, international governance where the people there are not elected. Where's the accountability in this system? And is it possible to do it effectively?

James Corbett

It has always struck me as a kind of a strange conundrum that we can recognize that people are inherently fallible at the very least and corrupt, corruptible at any rate. And yet, those from that very same pool of fallible and corrupt people, we should be able to pick people who will then rule over vast swaths of humanity for the best interest of all. It's always struck me as a strange contradiction in terms.

But the question ultimately, I think, answers itself. Because as you say, as we get further up that ladder towards more and more centralized control, by fewer and fewer people, over more and more of the globe's population with less and less accountability, obviously there is less and less mechanism for there to be actual control when people start to act in fallible and corrupt ways. So the obvious answer to that is—well, then, we need to decentralize and get down closer to a local level where people have more accountability over what's going on.

As was raised earlier in the questioning, I think it's important to understand that the idea isn't that that would somehow solve the problem of corruption or fallibility. Of course, there would still be problems in various places. But there would, at the very least, be a plethora of different alternatives that people could turn to. Well, if I don't agree or like this

particular paradigm of governance, well, there's this other one just over there. And I think the expansion of basically the competing systems of control, at any rate, competition is generally good. And it is, I think, good in the concept of creating positions of power and control.

Of course, I, being myself, I tend to take that to its logical conclusion, which is, ultimately, power should be decentralized all the way down to the individual. But I know that's seen as a radical idea for many. At any rate, I would be happier if the institutional momentum was going in the opposite direction and less power was being ceded to the centralized authorities rather than more.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

Good morning, James. Thank you for your testimony. I tend to judge organizations by the mantra that you use, and I noticed that you mentioned DIE, diversity, inclusion, and equity. So when I think of that from the WHO perspective, I think of Taiwan. And I don't want to get into the one-China-two-states issue. But I think of Taiwan wanting to apply to be a member of the WHO since 1971. They've continued to make that request, and they continue to be denied. And then I think of your testimony that there should be a parallel kind of movement for democracies of people who are free.

Would it be possible, and just kind of taking all of those thoughts together, and make it a possibility for Taiwan and Canada to agree to move forward as a free and democratic society where persons have personal autonomy and continue to work outside of WHO, instead of Taiwan trying to become a member? I know in 2022, they were looking at observer status, but even as an observer status, as you allude, we don't really have input and the opportunity for feedback. So I'm just wondering, would that be a starting point if we could get democracies outside of WHO, who were rejected, to start the movement?

James Corbett

It certainly would be a possibility. In fact, often, I find it interesting that we get so normalized and conditioned into the status quo

[01:10:00]

that we forget that there was a time before the status quo.

So thinking, for example, about the International Sanitary Regulations that became the International Health Regulations—as I say, there was a vast sea of bilateral and trilateral and other deals between various nations for quarantine regulations and other medical procedures that pertained at that time. And it was seen as just this horribly complex mess—Well, we have to sort out, you know, where is this coming from? And what needs to be done with it? and blah, blah, blah—rather than just one overall International Health Regulations that all of these states will agree to, and it'll make it easier.

But in fact, the very same technologies and other things that are being talked about now—that could make, for example, digital health certificates, i.e., vaccine passports, feasible—is the very same technology that would make those types of bilateral relations, Canada

agreeing to work with Taiwan and “we will set up this particular regime of health regulations and controls, and whatever, between our two nations.” Imagine if Canada did that bilaterally with every country that they traded with or had relations with: Why would that be difficult in this technological age where knowing the process for importing goods, or whatever, can be obviously put into an app and put on everyone’s phone? It wouldn’t be a difficult thing to do in this case.

But now we’ve been so trained into the idea that it must be handled in one overarching International Health Regulations that governs almost every state on the planet. Why? So I think we do need to interrogate that fundamental assumption. And it should be noted that there are alternate organizations to the World Health Organization that are out there.

The World Council for Health and other things, which are predicated on the idea of individual human autonomy, bodily autonomy, health freedom, et cetera, rather than the principles of the World Health Organization. It’s just most people don’t know about the World Council for Health because they don’t have the funding of the pharmaceutical industry and others behind them.

Commissioner Kaikkonen

And then my last question is just about Taiwan itself and how they managed through the pandemic. When you think of Taiwan being a little bit bigger than Vancouver Island and housing 23 million residents, I’m just wondering, somewhere in the pandemic when I checked on how they were doing, they had eight deaths. And I just kind of think that maybe we should be following what they were doing. And so, when we talk about health and WHO being mandated to protect our health and then still rejecting Taiwan, as a viable example, I just wonder what your thoughts are there.

James Corbett

Well, as I understand, you did hear testimony from Denis Rancourt, and I have interviewed him about the mortality statistics surrounding the so-called pandemic, et cetera, that, as he testifies, indicates that there was no identifiable wave of deaths that were attributable to some novel virus, et cetera. So, at any rate, I think that does show something about the way that we count and order these statistics could have an effect on how the country managed them.

But even if we were to accept at face value just the terms of the World Health Organization and other presumed health authorities about how to measure these statistics, I will note that the Independent Panel for Pandemic Preparedness and Response has an interesting admission on their recommendation report, which is available on their website: Namely, **that they look at the different measures that different countries took for pandemic preparedness before this so-called declared pandemic took place. And they plotted them against, at least, the reported death rate in each country. And you can look at the graph that they came up with, which shows that there was absolutely no correspondence whatsoever between the compliance with various pandemic preparedness ideas that are being propounded by the World Health Organization and the ultimate outcome in terms of measured death rate from the pandemic.**

So, I don’t take those statistics seriously, but those are the official statistics. And you can look at them and see that, for example, Canada, highly compliant, getting a 93 out of 100 score for external evaluation of pandemic preparedness and yet having one of the top death rates in this graph. So it shows that whatever they are proposing in terms of pandemic

preparedness and in terms of how we should position ourselves for the future is demonstrably, quantifiably, according to their own statistics, clearly made-up nonsense. So I don't know why we should be putting any faith whatsoever in these proposals from the World Health Organization and others about what to do for pandemic preparedness.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

James, those are the Commissioners' questions. There being no further commissioner questions, on behalf of the National Citizens Inquiry, I sincerely thank you for joining us today and sharing this information.

James Corbett

Thank you for the opportunity.

[01:15:35]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 2: Rodney Palmer

Full Day 2 Timestamp: 02:25:33–03:14:10

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness today is Mr. Rodney Palmer. Now for those of you that have been following the National Citizens Inquiry, Mr. Palmer testified as a witness at the Toronto hearings. He has come back today to testify about something that's come up since then, but I will introduce him again.

Mr. Palmer, can we start by having you state your full name for the record, spelling your first and last name.

Rodney Palmer

My name is Rodney James Palmer, R-O-D-N-E-Y P-A-L-M-E-R.

Shawn Buckley

And Rodney, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Rodney Palmer

I do.

Shawn Buckley

Now, you're not a journalist now, but you were a journalist for 20 years. You had been a general assignment reporter for *The Globe and Mail* newspaper. You've worked as a daily news reporter at the *Vancouver Sun*. You were a CBC producer and investigative reporter. From 1996 to 2004, you were a foreign correspondent and bureau chief for CTV News based in India, Israel, and China and, in fact, in that role, you participated in reporting on the SARS pandemic as it first came out in China, as I understand it.

Rodney Palmer
That's all correct, yes.

Shawn Buckley

Okay, now you're here today to add to the testimony that you've given earlier, so I'll just let you launch in [Exhibit OT-15].

Rodney Palmer

Since my first testimony in March, there was quite a big story where Twitter decided, basically, at the behest of Elon Musk, to label the CBC's Twitter page as government-funded media. And this, to me, wasn't that surprising. He'd already done it for the BBC; he'd already done it for National Public Radio. And the CBC is government-funded media: it receives its funding from the government; it is media. I wasn't that surprised by it.

The 16th of April was when it was done, and the next day, the CBC paused its Twitter activity and made quite a big fuss and a public announcement that it didn't like being labelled government-funded media, which I found a little bit surprising. And there was an announcement made on the CBC website which quoted Brodie Fenlon, the CBC's editor-in-chief, the top journalist at the CBC, saying, "According to Twitter, 'government-funded' media means 'outlets where the government provides some or all of the outlet's funding and may have varying degrees of government involvement over the editorial content.'"

That, specifically, what he objected to and what the CBC brass objected to was not being called government-funded media but Twitter's definition of that—meaning the government is involved in the journalism. The next day, Mr. Brodie Fenlon wrote on his blog explaining why they've paused the CBC News Twitter accounts: "Editorial independence is a bedrock principle of CBC journalism." And then he had three sentences: "We are beholden to no one. We report without fear or favour. We act only in the public interest."

It seemed to me that this was right out of a Marvel comic, where somehow the CBC was the *Justice League* and had these great principles, and I knew all of these to be false. When I read it, I was quite concerned about this. He went on to say that "while CBC/Radio-Canada is publicly funded," there is "no —" and he emphasizes "zero — involvement in our editorial content or journalism." No involvement. Zero involvement. I did an entire testimony for an hour and a half here that showed that they're basically carrying out government propaganda. I described the transition of the CBC News & Current Affairs from a news-gathering organization into a propaganda organization on behalf of the Trudeau government during the COVID period.

So I knew this not to be true, what Mr. Fenlon was writing. Especially because I keep hearing the same experts on the CBC—this is what tweaked me to it initially, as a listener and a viewer. They were going to independent experts over and over and over again, and these people did not sound like the scientists I've come to know and work with in the last 10 or 20 years in my business. These were people who had clearly had corporate media training: the type of people who begin an interview with, "Well, that's a very good question. I'm so glad you asked it." This is somebody who's had training. Politicians speak this way. Scientists generally don't. People pushing a product on behalf of a company talk that way when they're in the media.

The one at the centre, Professor Timothy Caulfield, is a great Canadian. He is a Canadian Research Chair in Law and Public Policy [sic] [Canada Research Chair in Health Law and

Policy] at the University of Alberta in Calgary [sic] [Edmonton]. And for people who don't know, the Canadian research chairs are at every university, and they're funded entirely by the Canadian government.

[00:05:00]

Something like \$140 million every year pays for these research chairs to be representatives as the greatest in their field in their area, which Mr. Caulfield has held that position for some time.

On April 2nd of 2020, however, just a couple of weeks into the emergency, Mr. Caulfield was granted \$380,000 of government money to push a government agenda. This came from the Government of Alberta and the Government of Canada combined. And specifically, what he said he was going to do was focus "on misinformation around cures and treatments for COVID-19." Well, two weeks into an emergency, there is no misinformation: there is only information, and scientists are looking for any information they can get worldwide. But Mr. Caulfield, a law professor, was going to focus on misinformation about cures and treatments. And he took \$380,000 from the government to do it. And this is how he did it: he went on the CBC and talked about the government policy—whatever the government wanted to say, that's what he was saying.

One of the first appearances was in May of 2020, where he appeared with Nancy Carlson, the CBC TV Edmonton six o'clock news host. This is one of the most important people in journalism in all of Alberta. Nancy Carlson brought him on and said, "You have a very impressive resume. Calling you an expert is incredibly valid," as if she was trying to convince herself of this line. She didn't say he'd received \$381,000 from the government to push the government COVID response agenda. That was not mentioned. That was suppressed information; that was a lie by concealment. She said, "Everybody watching, this is a chance for you to get the facts right from an expert." Now, Mr. Caulfield is not a scientist and doesn't pretend to be one. He wasn't introduced as one. He was introduced as a law professor and said, "Today we are debunking all of the myths around COVID-19."

I didn't know three or four months into it that there were myths. I thought there was just lockdown, distancing, getting my groceries at a certain hour, wearing a mask when I didn't want to. And Mr. Caulfield came on and said, "Do not take hydroxychloroquine." I don't know how he knew that this was a drug that people shouldn't take. He also said, "Don't think you can boost your immune system in any way." This is when people were taking vitamin D3, vitamin C, quercetin, zinc. These are the things that were recommended for boosting the immune system, and Mr. Caulfield said, "Don't think you can boost your immune system." And Nancy Carlson didn't tell her viewers on CBC Edmonton that he was speaking on behalf of the government.

About a year after that, in April 2021, they upped the ante. Professor Timothy Caulfield, the Canada Research Chair in Law and Public Policy [sic] [Canada Research Chair in Health Law and Policy] at the University of Alberta, helped to form an organization of actual scientists called ScienceUpFirst. And they had a foundational grant of \$1.75 million from the federal government's Immunization Partnership Fund whose mandate says that it is important that as many Canadians as possible get vaccinated against COVID-19. This is ScienceUpFirst, the organization, a new organization.

Mr. Caulfield appears in October of 2021 when people were starting to realize that ivermectin was preventing COVID, treating early COVID, and helping people get out of the intensive care units much more quickly. There were many, many studies emerging around

the world showing this. And there was a push to suppress ivermectin that, I understand from witnesses who have been here at this Inquiry, was designed so that it would appear there was no medicine so that it could satisfy an American requirement for the emergency use of a vaccine that was not fully tested. And so he's on this political show called "The House" with a guy named Chris Hall. And Chris Hall is an amazing CBC reporter, host, anchor. I liken him to Freddie Van Fleet of the Toronto Raptors. He was steady as she goes. Chris could do anything. And he ended his career as the host of "The House."

And in his last season, he betrayed Canada by allowing Tim Caulfield to lie to them about ivermectin. And Chris actually uttered the words, "Have we heard the end of ivermectin overdoses yet?" Meaning, are Canadians going to stop overdosing on ivermectin? Well, Chris apparently didn't know that nobody ever overdosed on ivermectin. There are more overdoses from aspirin causing death every year in America than there have been in the 50-year history of ivermectin. And he said this. And he didn't tell anyone that his expert on misinformation, as he was introduced to us on "The House,"

[00:10:00]

was actually part of ScienceUpFirst, which received \$1.75 million from the Trudeau government to push vaccines. He suppressed that information. He told us he was an expert on something that he wasn't and didn't tell us he was working for the government.

Mr. Caulfield showed up on "The National" with our friend Adrienne Arsenault talking about the truth about immune boosters, during which Mr. Caulfield was not introduced as a member of ScienceUpFirst, which gets its money from the Canadian government, from the Trudeau government, to promote vaccines—this was not mentioned. He was introduced as a law professor and the Canada Research Chair. So Mr. Caulfield said that "immune boosting," this is a quote, "is kind of a myth. Because it's not a muscle." So, as a medical person, he made a good lawyer when he said that because he clearly doesn't understand much about the human immune system. He then said, "You don't want to boost your immune system. That's anaphylaxis. That's an autoimmune disease." He said a healthy immune system is anaphylaxis, and it's an autoimmune disease. It's neither of those things. That's why we have different language for all of those things. They're not the same. We didn't get to hear that he's being paid by the Canadian government to say this. We were lied to by omission by Adrienne Arsenault in that story. She ended it by saying, "You're a wise man as always."

Now, "[Cross] Country Checkup," one of my favourite shows on the CBC. I used to work in phone-in-shows, and it really brings together Canada on a weekly basis. And it's hosted by Ian Hanomansing, a longtime veteran of CBC television. He had a section called, Ask Me Anything, which was all about COVID. Ask the doctor. And he had Dr. Isaac Bogoch on there, innumerable times. And on this occasion, December 2021, he brought him on. He introduced him as an infectious disease specialist at Toronto General Hospital, which he is. But he didn't say he's a scientific advisor for ScienceUpFirst, which receives \$1.75 million from the Trudeau government to make us take vaccines. Didn't mention that. During this interview, he declared, "Two doses won't be enough Canada." He said, quote, "This is clearly a three-dose vaccine."

Dr. Bogoch showed up on multiple shows after that. In September 2022, he was on CBC "Metro Morning" in Toronto. This is the morning show in the Toronto area. And he said it was called "When to get your Fourth Dose." Previously, it was a three-dose vaccine. In October 2022, he was on CBC News saying, "You got to get your next dose every six months." And Andrew Chang introduced him as an infectious disease specialist, Dr. Isaac

Bogoch. Didn't mention ScienceUpFirst. Didn't mention he's a spokesman for the Canadian government, or he advises ScienceUpFirst, which is paid for by the Canadian government.

He also appeared on "The Dose" with Dr. Brian Goldman. Dr. Brian Goldman has these great shows called "White Coat, Black Art." He's a great guy. I really like this show. He kind of takes you as a listener, as a patient, which we've all been, into the world of medicine as he sees it. He's so curious, which is really the greatest attribute of any broadcaster, the curiosity. And he brought on a doctor named Tara Moriarty, an infectious disease researcher at the University of Toronto, which she is, top person, so decorated, so accomplished. Didn't mention an executive of ScienceUpFirst, paid for by the Canadian government to promote vaccination. Didn't tell us that. And during this interview in June of 2021, Dr. Tara Moriarty said, "Anything that states..." This was the red flag—how do you recognize misinformation? Well, this was their lesson to Canada. "Anything that states that vaccines cause or may cause something is a red flag for misinformation. We don't have any evidence," said Tara Moriarty, "that the vaccines cause anything but immunity against COVID-19." We don't have any evidence. So, she said, don't believe anybody.

Well, the Canadian government seems to have evidence. They had a list that these numbers of Canadians have been injured or killed by the vaccines. They say it caused Guillain-Barre syndrome 27 times. They say it caused low blood platelets 196 times.

[00:15:00]

Canadian government says that the COVID vaccines caused 55 cardiac arrests, 73 cardiac failures—I'm pretty sure that's death—145 heart attacks, 1153 predicted cases of myocarditis and pericarditis, 376 cases of deep vein thrombosis, 524 pulmonary embolisms. I feel like I want to say a partridge in a pear tree here. Blood clots, 324. These numbers are really small. These are the ones that are admitted to on a Canadian government website that the CBC just told us didn't exist—78 acute kidney injuries; 37 liver injuries; 187 Canadians with Bell's palsy; 281 Canadians got a stroke from the COVID vaccine, according to the Government of Canada website; 16 of them had a very rare inflammation of the spinal cord, never heard of it; 776 cases of anaphylaxis; 5 fetal growth restrictions; 87 spontaneous abortions; and independent of all of the above, 427 deaths.

Let's just go back up to the slide. "We don't have any evidence," said the ScienceUpFirst spokesperson for the Canadian government—disguised as an expert on Dr. Brian Goldman's show—misleading Canadians that everything was safe and effective when, in fact, it's a game of Russian roulette and the CBC suppressed that information and told you to go ahead and do it. They said it's safe—there's no evidence.

There's a story this month that we're starting to recognize excess deaths, excess all-cause mortalities. The province of Nova Scotia recently noted 262 excess deaths, and the CBC was quick to report that they're not saying why. And the province has repeatedly declined an interview as to why. They have no official word on why. So they put the ScienceUpFirst scientists and spokespeople, lawyers, on the air, or in this story, where they said, Tara "Moriarty believes the excess mortality is mostly being caused by COVID-19..." This is now: this is May 2023, "... caused by COVID-19, urging people...", and the World Health Organization says it's over. So it's caused by COVID-19, according to her, or she believes it, and she's "urging people to wear masks and get vaccinated." This is the solution in May 2023. They didn't mention that she's paid, that ScienceUpFirst is paid—and she's an executive—\$1.75 million to say these things on behalf of the Trudeau government. Tim Caulfield was in the same piece, identified as "a misinformation expert" now. I agree.

Caulfield said, “The COVID-19 vaccines are safe, despite some claims that they’re causing large numbers of people to die.” “Some claims” by the government of Canada, Mr. Caulfield.

“The Current” on CBC Radio used to be one of my favourite things to wake up to in the morning with Matt Galloway, one of the greatest hosts that the CBC has. And one of his stories was that “our best shot at getting back to normal is getting everyone a shot in the arm.” So he put on this cute little story with a researcher named Samantha Yammine. She’s a scientist and she’s afraid of needles, and they go through this really cute little conversation about how she overcame her fear of needles. But they never mentioned that she is on the executive of ScienceUpFirst, which received \$1.75 million from the Trudeau government to promote vaccines. Not a word, he tricked us. If I’m listening to that, I think they found it. Where did they find this person? Well, they found her because that’s all they do.

The CBC is using ScienceUpFirst and not telling us where the information or where the point of view is coming from. It’s coming from the Trudeau government. And they’re not telling us that on a daily basis.

So now ScienceUpFirst has got quite a coup. They’ve embedded one of their own in the CBC staff. CBC “The Nature of Things,” you know David Suzuki at, I think, 80 years old, finally retired, and he’s been replaced with a co-host, Anthony Morgan. I looked this guy up: He’s great, I’d hire him too. He’s fantastic. He’s engaging, he’s a molecular scientist. He is one of these curious fellows who just lets you feel that he really wants to learn, but he’s on the executive of ScienceUpFirst, paid for by the Trudeau government to promote vaccines. And now he’s the host of a CBC,

[00:20:00]

one of the most important science shows we have in Canada, “The Nature of Things.” He’s embedded.

ScienceUpFirst has its prime directive to stop the spread of misinformation. What is misinformation, and who decides? Apparently, it’s the Trudeau government that pays them; otherwise, why would they pay them?

When Brodie Fenlon says the government has no or zero involvement in our editorial content of journalism, that’s not true. And when they got caught, this is the graph they showed from the CBC annual report. Now you’ll notice up the left side, it goes up— Basically, it’s a snapshot. A bar graph is designed to give you a quick visual snapshot of what all the numbers mean. The blue is the revenue that CBC earns, and the burgundy or the purple is the government funding. So it looks as though it’s a little bit less than 50 per cent. Except if you look up, it’s going up in increments of hundreds of millions until it gets to very near the top when it goes from 700 million to 1.7 billion. It jumps from increments of 100 million to increments of a billion partway up, so the graph visual is actually not accurate.

Now, this was pointed out by one of the great Canadian academics, Dr. Jordan Peterson, who then put out what it actually looks like. And it shows you, and it’s no big deal. I mean, we know the CBC gets all of its money from the government, or CBC Radio does; CBC Television gets most of its money from the government. So why would they obscure that fact? Why would they give that half-truth? Why would they mislead us into that visual snapshot that they don’t? I would put forth to the Commission—because that’s how they roll now. The CBC is all about misleading. It’s not about news gathering or the

dissemination of truth. Brodie Fenlon oversaw the betrayal of the audience, the betrayal of Canadians, the betrayal of every Canadian who listened to an expert on the CBC and thought they were an expert, not a spokesperson for the Trudeau government. But who he didn't betray was the Liberal Government. He was a good soldier there.

This is from the Liberal Government website today: "A re-elected Liberal Government will require [that] Canadian travellers on inter-provincial trains, commercial flights" and "cruise ships, and other federally regulated vessels to be vaccinated" for COVID. "A re-elected Liberal Government will ensure vaccination across the federal public service." So if you are a public service worker and you dodged the vaccine because you didn't want it, because maybe you figured out it was the same Russian roulette that the Canadian government info base describes, a re-elected Liberal Government will ensure you're vaccinated or fired, according to this platform. And they'll work with "Crown corporations [and] federally regulated workplaces to ensure vaccination is prioritized for workers [in these sectors]." We know now the thing doesn't work. Your own websites show that people are dying from it. Thousands of people are permanently injured from it. And your platform is more—or lose your job. And the CBC is your way to convince us to do that.

A week after, Twitter removed the government-funded media tags. It came after the Global Task Force on Public Media called on Twitter to correct the description of public broadcasters. Now, I mentioned in my previous testimony that the Global Task Force on Public Media is an amalgamate or conglomeration or a cartel of serious public broadcasters that do real journalism or used to across the world: the CBC, the BBC, ABC Australia, Korean Broadcasting, France Television, Radio New Zealand, ZDF Germany, and SVT Sweden. They have this Global Task Force to develop a consensus and speak with a single strong voice. So they came down heavy on Twitter. The current president of the Global Task Force is our own CBC president, Catherine Tate. They noted that Twitter's own policy defines government-funded media as those with varying degrees of government involvement and editorial content, which I've just shown that it has. So Twitter dropped it all and, in, I think, a cheeky little move, also dropped it from China's Xinhua News Agency and Russia's RT, saying, "Okay, none of you are government-funded now." They're all state broadcasters, including the CBC, in the strictest sense of the phrase.

I have a few story ideas that the public will be interested in hearing because I used to sit in story meetings daily with some of the best journalists I've ever worked with in my life when I worked at CBC.

[00:25:00]

We used to put out story ideas that were kind of the obvious things to cover that day. Here are a few that would be a good idea for the CBC to cover: investigate the number of **Canadians killed by COVID vaccines; investigate the number of Canadians disabled by COVID vaccines; investigate the details of vaccine approval safety standards that were waived in order to get the COVID vaccines into Canadian arms. Investigate the source of the SARS-CoV-2 virus: Where did it come from? What are we doing with all this stuff? We don't know where it came from. We know where it came from—but let's admit it. Let's talk about it. Let's investigate it. That's your job.**

What is the purpose of gain-of-function research and development of pathogens? Who benefits from that? What is Canada's involvement in gain-of-function research and development of pathogens? Why did we fire those two Chinese nationals who were running the Canadian Level 4 Virus Lab in Winnipeg six months before COVID broke out? What's that story? Because we still don't know. Go find out. And investigate the conflicts of interest

between Health Canada and the pharmaceutical companies. That one you could do with Google.

But you're not going to hear any of those stories on the CBC because these are the people you're going to hear over and over again as the experts. And these are the shows you're going to hear them on. And these are the broadcasters who are going to tell you they're experts and suppress the fact that they all are affiliated with ScienceUpFirst, which gets all of its funding from the Trudeau government—and significant funding. This is the way they're going to explain themselves when they get caught with their hand in the cookie jar. And these are the phrases that they're going to pull off the Marvel comic movies when they're going to say that they report without fear or favour in the public interest. And I changed his name to Chief Propagandist. In case you didn't notice.

So I have to tell you that it is with great regret that I'm going to make six recommendations to the Commission. I recommend that the CBC President Catherine Tate be dismissed from her position, all vice presidents and executives be dismissed from their positions. They can no longer work there, having committed the atrocity on Canada of suppressing the identity of spokesmen for the Trudeau government as experts for years to trick us into taking this vaccine. Certainly, dismiss the editor-in-chief Brodie Fenlon. Although he might become a senator before you get a chance to do that.

Dismiss all on-air staff who are evidenced to have participated in the propaganda disguised as journalism since March 2020. Detach from the Trusted News Initiative and all other fact-suppressing organizations which currently determine which experts and which stories Canadians are allowed to hear on the CBC. Replace the position of ombudsman with a board, including journalistic, legal, and scientific expertise, and give them the power to fire journalists who breach the corporation's journalistic standards instead of apologizing. You can go on the CBC's apology page, I call it—it's their correction page. There's half a dozen every month for the last three years. "Big deal. We're sorry. We got it wrong again." Fire them. We don't need them. And this new board that replaces the ombudsman, I recommend you task it with investigating who in the CBC participated in misleading Canadians by routinely suppressing the identity of government spokespeople for the purpose of promoting ineffective and potentially harmful experimental vaccines during the COVID emergency.

The CBC is government-funded news. We know that. And Twitter is right because they're using government-funded experts, disguising them as "independent" to give us government-loyal messaging.

I just wanted to thank the Commission for allowing me to come back. As a Canadian citizen with some expertise, I feel compelled to come forward and say what I know to be true.
Thank you.

Shawn Buckley

No, we're not done. I don't have any questions for you, Rodney, I'll ask if the Commissioners have questions. And they do.

Commissioner Drysdale

I'd like to refer to some of your graphs. Can you bring up the graph where you showed the Canadian government counts of the various deaths and vaccine reactions?

Rodney Palmer

This is from health-infobase.canada.ca. It was updated on the 7th of March, which seems to me a while ago. This one here?

[00:30:00]

Commissioner Drysdale

Right. My question there is, and you may not know the answer, but under pregnancy outcomes, it says spontaneous abortions, 87. And then it's got deaths, 427. Are the 87 deaths of the babies in the mothers' tummies not included in the 427?

Rodney Palmer

I don't know that. And the reason is this is not an easy website to navigate. So the information is there, but it is more than likely intentionally obfuscated. You have to go through link to link to link to link. So there is something under deaths, and it says 427, and more than likely, you will be able to find if they are included or if they are additional. But I don't know what the answer is.

Commissioner Drysdale

My second question has to do with the slide you have on the Liberal Government platform, three points that it had on there. And my question to you about that—is that the current Liberal platform?

Rodney Palmer

I downloaded that today.

Commissioner Drysdale

You don't know if that's the current one?

Rodney Palmer

That's today. That's up there. You can look that up under platform re-election, I think it is something like that. Yeah.

Commissioner Drysdale

So today, I just want to make sure I've got this right. So today, the platform that the Liberals are running on is—require that travellers must be vaccinated; ensure that vaccines are across the federal public service; and that Crown corporations and federally regulated workplaces will ensure that vaccines are prioritized. That is still their government platform today?

Rodney Palmer

"A re-elected liberal government will," is what it says, and then it gives those ones. And I've not augmented them all, except to add the highlights for my own notes.

Commissioner Drysdale

I wanted to make sure I understood that. Could you also now show the graph of the income for CBC?

Rodney Palmer

That is off the CBC's annual report, and the second one on the right was provided by Dr. Jordan Peterson.

Commissioner Drysdale

My question on that is, I'm looking at some of the other—and I'm asking this question because I've seen it from other witnesses. There's various other items there. They've got government-funding revenue; they've got advertising. How much federal government is in their advertising income? Because we see the federal government advertising on CBC constantly. Is there additional government funding hidden in some of those other stripes that should be in the government funding?

Rodney Palmer

I don't know the answer to that. But I'll tell you that I certainly suspect that the whole thing's a sham. So then, more than likely, they're hiding other things. But what's very interesting, what you say about the federal government advertising: When I travel to America, I see almost entirely pharmaceutical advertising, and there are very strict rules that they must announce the side effects. And it's almost comedic to listen to the side effects. They list these horrible lists of side effects to their pills, and then they say, "but ask your doctor about getting it." In Canada, we don't have pharma advertising on television. But we have a de facto pharma advertising in this ScienceUpFirst group that is disguising itself as experts going on the CBC and denying the side effects—saying they don't exist.

Commissioner Drysdale

Yes. Also, in your slide—and you don't have to bring it up—but your slide about CBC story ideas, and you listed a few things about investigation. I mean, I ask you, wouldn't a good source of those stories be for some CBC reporter to be sitting here following the National Citizens Inquiry? And why do you think none of them have done that?

Rodney Palmer

I think they would have a hard time wiping the egg off their face once they realize they have blood on their hands. They're not coming. They don't want to hear this.

Commissioner Drysdale

You know, I believe, I hope I get this right. I believe I saw a story on CBC not that long ago and I could be wrong, it might have been one of the other stations. But the point is they did an entire investigation: They had an investigative news team out to decide whether or not Starbucks was recycling their paper cups or not. They put sensors in them, and they traced them to the garbage cans, and they did an incredible investigation as to whether they were recycling their coffee cups or not. And they can't do any research on this? They don't have the capability? Do they not have the will?

Rodney Palmer

Won't—not can't. My dad used to say, "Can't lives on won't street."

Commissioner Drysdale

Thank you.

Commissioner Massie

Well, thank you very much, Mr. Palmer, for this second enlightening presentation.

[00:35:00]

It seems to me that we are in a very, very hard conundrum with respect to financing this major news institution in Canada. You're making suggestions to reform it. But the business model that they're living on right now seems to be struggling to get, I would say, other sources of finance besides the government, for whatever reason. And even if you reformed it, if you maintain the finance from the government, what would guarantee that with this current government or a future government—that would want to be as, I would say, intrusive in the agenda of CBC—what would allow to maintain the independence of the CBC with the government? Because they need money, and the money's coming from the government.

Rodney Palmer

But the money's come from the government since the beginning, and there have been multiple different parties, two, you know, rotating. And the CBC's always been there. To your point, I think there needs to be an investigation about how it happened. Just like we have to have an investigation into where the virus came from. Otherwise, we can't stop it from happening again.

But there's a lot of talk about defunding the CBC, which makes me nervous because I think it means dismantling CBC News and Current Affairs, and I think it's foundational to our democracy. Without journalism, we have no democracy because democracy requires the transparent distribution of facts on a daily basis. From those same facts, we all make our opinions. And then in an ideal situation in a democracy, the majority of the opinions are where the decisions are made. But how can we possibly form an opinion when the facts are fake? When we don't agree on what's true, we can't possibly agree on what's right.

Commissioner Massie

Aren't you describing some of the, I would say, political platforms for some of the current political parties we have in Canada? Are they basing their promise and ruling of society based on true facts? Or their representation of reality? Which sometimes is, I would say, not aligned with reality. But as long as people believe it, they will be re-elected, as you've shown from the platform, which is a copy-paste from the previous platform that they ran on in the previous election.

Rodney Palmer

I think that there's two different things there. One is what the government says, and one is what the CBC says, and today, they're one and the same. So this is the problem, is that the CBC has let itself become a propagandist in an indefensible cause—which is promoting a

vaccine that doesn't work, that hurts people, that doesn't do its job, and continues to promote it, even in May, this month, are saying, "Get vaccinated, wear a mask." All those people that died probably from the vaccine, we don't know, in Nova Scotia, it's being denied. It's not being investigated properly. They could find out if they tried, but they don't try. It just goes back to, it's not that they can't do it—it's that they won't do it.

They have to get reassigned back to what their job was. I don't know exactly what the mechanism is. It's going to take more people than me to figure it out, but that's an excellent suggestion about putting them back on track in a way that they're not going to get off the rails again. We need some new mechanism in place to ensure on a daily basis that the CBC is doing the job.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

Good morning. Thank you for your testimony. The Canada Research Chair selection program used to be very rigorous, and it used to give new researchers who had a PhD that opportunity to build on that body of research. Given the timing of Dr. Timothy Caulfield's Canada Research selection and his research, I'm just wondering at what point he would have been able to build on a body of research when the pandemic is only three years old. Taking that thought further, is it not incumbent on CBC journalists—and other mainstream journalists—to actually investigate the qualifications and not just accept that Canada Research Chair title? Before declaring that the person they're interviewing as an expert?

[00:40:00]

Because Canada Research Chair is usually given to a person who is brand new in creating that body of research. And the exception would be if they had a renewed contract under the Canada Research Chair, where they would already have that body of research. But if we're declaring indiscriminately everybody to be an expert, at what point do we consider that maybe they're not, as a journalist?

Rodney Palmer

Well, I don't think this is an error that these people have been put on; I think it's by design. There's too many examples, and I've only shown a handful of them. It's just too obvious that in every single case, they suppressed the fact that they're with this separate organization that's largely a slush fund for the Trudeau government to promote vaccines and to put experts.

Caulfield is the only one who's not a scientist among them, but he's declared himself, self-declared, misinformation expert, and the CBC to my feeling has never defined what misinformation is. I've written to Brodie Fenlon and to others at the CBC asking to please define misinformation: How do you define it? And provide examples outside of the COVID model of where you've applied it. And why you feel that you have to correct it? And that's almost the only thing that they do because they're not correcting misinformation. They're promoting a propaganda message. That's what they're doing. So your question suggests that there's a mistake being made and there's not. This is intentional.

Commissioner Kaikkonen

I also note he's not a doctor. Thank you very much.

Rodney Palmer

Yes.

Commissioner Drysdale

Sorry, I couldn't resist, seeing as I have you here.

Can you comment on the effect that the latest changes to the Canadian *Broadcasting Act* will have, I mean, on the CBC and on social media? You know, you talked about changes that we could consider to the CBC. But it sounds like it's going the other way. It sounds like they're making changes to independent broadcasters and bringing them into this model that was created in the '70s or '90s, or whenever it came up. Second part of that question, can you comment on the independence of the members of the CRTC?

Rodney Palmer

I can't comment on that because I'm not familiar with the makeup of the CRTC at the moment. However, in the past, there has been a bit of a revolving door with tech companies and the CRTC.

On the first part of the question about the *Broadcasting Act*, we saw an almost instantaneous reaction where the CRTC was openly discussing eliminating Fox News, like it or not, one of the biggest networks, news networks in the world, banning it from cable in Canada. On what grounds? On the grounds that they can, it appears. We should expect more of it. We are seeing censorship on a daily basis on the CBC. We're seeing the elevation of the government agenda for COVID vaccines and the suppression of independent voices. We are seeing the censorship of people who want to speak out. We're seeing the censorship of vaccine-injured people, the entire stories are being censored. And the censors are never the good guys. The censors are the Dr. Evil in Brodie Fenlon's Marvel comic universe that he lives in.

Commissioner Drysdale

Thank you.

Shawn Buckley

Mr. Palmer, are you aware whether the CBC is under any specific legal duty in its enabling or enacting legislation to report fairly to the public?

Rodney Palmer

Most likely. That's a good question. I'm not intimate with all the language in the *Broadcasting Act*, but more than likely it is there, and certainly in their foundational documents to report the news of the day. I remember when you couldn't have advertising in the newscast. And then they changed it so you could have it after the first, I believe it was, eight or nine minutes so that the first chunk was advertising free—normally, when they do their political reporting of the day—and then you can have an advertisement afterwards. So there are very strict rules about how much commercial voice can get into a

newscast. But there's commercial voices daily in the newscast now that I've just demonstrated.

Shawn Buckley

I'm just curious because you just think as a Canadian citizen that in funding, creating a broadcaster, a state broadcaster, that there would be a duty in the legislation creating it for that broadcaster to report fairly to the Canadian public.

[00:45:00]

Where I was going is I'm just going to read to you two different sections of our *Criminal Code*. And the first one I'm reading with in mind—because you're saying we should fire the leadership of the CBC, and so this is 217.1 of the Canadian *Criminal Code*.

"Everyone who undertakes or has the authority to direct how another person does work or performs a task is under a legal duty to take reasonable steps to prevent bodily harm to that person or any other person arising from that work or task." I can tell you I read that as including—if you're running the CBC or some other news organization and you're directing basically propaganda on health issues that if that leads to harm in the public, you could be criminally liable.

Now, I'll just read you another section of the *Criminal Code* and then I'm going to ask your thoughts. This other section I would think would apply to the leadership of the CBC, the public face, the journalists, and to any experts that would be attending and spreading misinformation with the view to having people vaccinated—if it leads to harm or death. And that is section 219 of the *Criminal Code* dealing with criminal negligence, and so listen carefully.

"Everyone is criminally negligent who in doing anything, or in omitting to do anything that is his duty to do, shows wanton or reckless disregard for the lives or safety of other persons." I'm wondering, just because you're familiar with how journalism works, if that section could be applied to journalists and the CBC?

Rodney Palmer

It could be applied to so many people. I think it should be applied to the guy who turns the microphone on and lets somebody lie—live to Canada. Every single person down to the technicians who participate knowingly in this fraud should be investigated. There's two sections of the *Criminal Code* you mentioned; I mentioned one in my previous testimony about fomenting hatred against an identifiable group. The unvaccinated became identifiable based on their absence of proof of vaccination and the social outcasting that the CBC promoted. I think that maybe another recommendation would be to investigate for criminal wrongdoing among the journalists at the CBC—right down to the producers, the writers, the story editors, the technicians, as well as the anchors, the hosts, the editors, and the executives.

Shawn Buckley

Well, it'll be interesting because there's not an example in history of a Western democracy experiencing what we've experienced with a state broadcaster. If we can get control of our institutions back, it'll be interesting to see how we deal with that.

Rodney Palmer

The problem here is that they have the full support of the current government, and they're acting on behalf of the current government. To get back to your point about whether there's an obligation to tell the truth, I can assure you that in the foundational documents of the Canadian Broadcasting Corporation, it did not say that the purpose is to espouse the views of the government of the day. It did not say that.

Shawn Buckley

Thank you. I have no further questions.

Rodney Palmer

Thank you.

Shawn Buckley

Mr. Palmer, on behalf of the National Citizens Inquiry, I'd like to sincerely thank you for returning and sharing this testimony with us.

Rodney Palmer

It's my pleasure, thank you, and my duty.

[00:49:01]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 3: Marianne Klowak

Full Day 2 Timestamp: 03:27:46–04:56:32

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry as we continue our proceedings in Ottawa, Ontario. Our next witness is Marianne Klowak.

Marianne, can you please state your full name for the record, spelling your first and last name.

Marianne Klowak

It's Marianne Klowak, M-A-R-I-A-N-N-E, Klowak, K-L-O-W-A-K.

Shawn Buckley

Marianne, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Marianne Klowak

I do.

Shawn Buckley

Now, Marianne, my understanding is, and it might be easier for you to give the highlights, but I'll try and go through some of them.

You have been a veteran senior reporter for the CBC, which for our international participants is the Canadian Broadcast Corporation, for thirty-four years. And as a journalist, you've been involved in all aspects of news gathering and investigative reporting for radio, television, web live reporting, short and long-form documentaries. You have been involved with current affairs as a current affairs news anchor for radio and television. You've filed stories nationally for "World Report," "The World This Weekend" and the hourlies. You've basically done regional stories published on CBC National's digital

platform. And the highlights could go on and on. Are there any other highlights that you'd like to just, kind of, describe your career? Because you've been at this for thirty-four years, and I've got a whole list of highlights. I just don't know which ones to touch.

Marianne Klowak

The only other thing I'd want to touch on is the year I left, I was given an award for a series I pitched on "Pandemic Perspectives." And the piece that won the award was a homeless person's perspective of how their life had changed. So that was a national award.

Shawn Buckley

Good. And David, I'll ask if you can turn Marianne up because I'm having trouble hearing her. Or if you can speak clearly into the microphone, Marianne.

Marianne Klowak

Thank you. Is this better? Is that better?

Shawn Buckley

Thank you. Now you're here to share your experiences while you were still at the CBC and working as a reporter and some of the stories you tried to run and what happened. So I'm wondering if you can just start into that and then if we need any clarifications, I'll jump in.

Marianne Klowak

Before I get into that, I think there's a little bit of background that's required. I know that as a public broadcaster, you expect us to be telling you the truth, and we'd stop doing that. And there was another number of stories that I had put forward that were blocked. But it would seem to me as a journalist who'd been there thirty-four years, it's like the rules had changed overnight. And it changed so quickly that it left me just dizzy in disbelief.

I was blocked and prevented from doing stories that I'd pitched, that I'd put forward. They never saw the light of day: they never made it to air or print. And some of those stories were protests against vaccine mandates, people's safety concerns about the vaccines, and also the many problems with reporting adverse reactions in Canada. And for me what was so disorienting about this was that, you know, I had learned from the best of the best at the CBC. This is where I learned to think critically and fearlessly hold power to account, to break stories and uncover information that you, the public, has a right to know.

And I also would like to mention that the newsroom I worked in, in CBC Manitoba, that they were a leader in investigative journalism across the entire network, second only to Toronto. And this was a newsroom that produced award-winning stories that sparked change at the highest level of corporations and government. By the time I left in December of 2021, I no longer recognized the CBC. And I really didn't think my career would end this way, that the skills I learned and honed at the CBC would be used to hold power to account within the corporation.

Shawn Buckley

Can I just slow you down because I think it's important for people to understand what you're saying. And especially because you were working as a journalist and as an

investigative reporter for much of the thirty-four years. So my understanding is, when you're a senior reporter like yourself, you can just follow a story, like, "Okay, I'm going to report on this," and you can do the story.

[00:05:00]

And generally speaking, you're not second-guessed or your story isn't changed. So your experience in learning from true journalists in the past was just to run a story, to be fair, and that was your experience until COVID hit.

Marianne Klowak

Absolutely. I would say, like, prior to COVID, I was expected to come into that editorial meeting. I would have two or three original stories, what we call enterprising journalism, original stories. And I was able to work on those unless there was big breaking news that day. But normally, I would be assigned that story, given the time. And within, you know, a day or two, I could turn those stories around on all three platforms, radio, TV, and web. And I would also like to mention that I had one producer vetting for TV and radio. And rarely were there any changes made in my script or the content. And for web, it was another producer, but it was minor things like, let's move this sentence, let's change this word, we'll tighten lead. That was prior to COVID.

Shawn Buckley

So I'll just follow up on that again because I think it's important for people to understand. So basically, your stories were standing as you made them.

Marianne Klowak

Absolutely, and they backed me in doing that. I was supported in doing it. That's what they wanted: original enterprising journalism.

Shawn Buckley

Okay. And so that ties into when you're saying the Manitoba news desk at the CBC prior to COVID, I mean, that was a hardcore journalistic news desk. They were expecting you to get truthful fair stories. And they were not censoring. They were wanting the news.

Marianne Klowak

That's the way it was prior to COVID.

Shawn Buckley

Okay. So COVID—that was a completely new ballgame when COVID hit. So even the swine flu? Because we experienced that, you know, during your career.

Marianne Klowak

Yes.

Shawn Buckley

None of this. It just started with COVID.

Marianne Klowak

No, it changed so quick that it left me spinning. And I mean, the way I saw it, I'm just going to give you a little bit of a synopsis, and then I'll get into specifics in terms of what was done with my stories.

But we betrayed the public, we broke their trust. And we had been riding on a reputation of excellence for years. And now we were quickly shutting down one side of the debate. And how were we doing that? We branded the doctors and the experts the CBC chose that we used in our stories: we branded them as competent and trustworthy. And those who questioned and challenged the narrative were portrayed as dangerous and spreading disinformation. And that was regardless of what their specialty was, what their background was, and what their experience was.

And I just also want to sort of give you a window into how this affected me personally. As a veteran journalist, I had solid contacts in the community. I had people calling me with stories. So I was seeing and I was hearing and I was absorbing all their stories of suffering and pain. And they were sharing them with me, and these stories weren't being told. Some of those were from the vaccine-injured. Some were from people who had lost their job because of their vaccination status. Those whose families had been blown apart, and they'd been ostracized. University students who were depressed over repeated lockdowns and mandates. And parents who were calling me that were agonizing on whether they should vaccinate their child or not. So all these stories were sitting inside of me. They were left with me. And I felt the crushing burden and the weight of their truth not being given a voice. And it affected my well-being because these people trusted me, and I felt I had failed them and I had let them down.

Shawn Buckley

So can I just interject? So when you're a journalist and people are coming to you with stories that should be reported, you're feeling a responsibility to give voice to those stories, but you're not being allowed to do so for the first time. And that's what was causing the distress internally.

Marianne Klowak

Absolutely. I was losing sleep, it was distressing. It was like I had failed these people as a journalist to give voice to their truth.

So I had witnessed in a very short time the collapse of journalism, newsgathering, investigative reporting. The way I saw it is that we were in fact pushing propaganda. And to define propaganda: it's information, ideas, opinions, or images that give one part of an argument which are broadcast, published, in order to influence a person's opinion.

[00:10:00]

And mental health workers have their own definition of propaganda as manipulative persuasion in the service of an agenda.

In a published article written by a former CBC editor-in-chief in 2018, she outlines what's called the Journalistic Standards and Practices [JSP] [Exhibit OT-4]. And these are the most fundamental principles that govern who we are as journalists and who we are as a public broadcaster. Basically, these are the pillars—the holy grail for journalists. This is what every story we do can be measured against these: they are accuracy, fairness, balance, impartiality, and integrity. She goes on to say that “the JSP is not merely a guide for the people who work at CBC/Radio-Canada. It's a key component of our promise to Canadians that the work we do is, first and foremost, a public service.” Then she says, “The real test, of course, is ensuring that our journalism is credible, reliable and worthy of your trust.” So in other words, you the audience decide if we're trustworthy, if we're telling the truth. It's not up to us to hammer you with what we define, decide, or think that the truth is because the pillars of balance and fairness require us to present both sides. And after you examine them, you ultimately decide what the truth is. She says, “. . . you can hold CBC News accountable against the principles that are laid out in the Journalistic Standards and Practices.”

In my last year and a half at the CBC, we violated all of them. Not only had we shut down one side by silencing and discrediting anyone opposing the narrative, we had elevated and designated ourselves as the gatekeeper of the truth. We no longer believed our audience was capable of critically thinking for themselves. I'm going to give you very specific examples of that. But before that, I'd like to read you a page out of a journal that I wrote a month after I left the CBC. It gives you a sense of the culture and the toxic work environment that led me to leave before I had wanted to.

For months prior to my departure in December 2021, the complaints and criticism from listeners and viewers continued to mount from the public. Calls, emails, people stopping me on the street and saying, “What the heck is going on at the CBC?” People telling me they felt betrayed, lied to. A gut feeling that they weren't being told the whole truth. They no longer trusted the CBC to tell them both sides of an issue. What was most troubling for me as a journalist is that they no longer felt safe to tell me their story and have their voice heard by their beloved public broadcaster.

Passion for the truth has been my driving force as a journalist, and we become journalists because we see ourselves as truth tellers. The vast disconnect between the stories people were telling me and what we were broadcasting and publishing just tore me apart. So armed with documented examples and specifics, I voiced my dismay about our editorial direction to all levels of management over several months—both locally and at the highest level of power in Toronto. And I did this; I brought in a witness to every scheduled meeting who would document what happened in those meetings.

The narrative among mainstream media including the CBC emerged early on in the pandemic. By narrative, I mean presenting one side of a complex issue and effectively censoring, cancelling and silencing the other side—only giving voice to experts who control and reinforce the narrative. I'd seen it happen on issues in the past but never to this degree. For the most part, logic, common sense, and critical thinking are suspended, preventing deep dives on stories holding power to account. Facts may be omitted if they don't fit into the narrow focus of the narrative.

Who were we to deliberately withhold information the public needed to know and had a right to know in order to make a decision based on informed consent about their health? Canadians were starting to see this, and they were calling us out on it.

So for me things started to escalate, I would say it was early 2021.

[00:15:00]

And I was disturbed and alarmed about the language that was being used in some of our editorial meetings. All of a sudden, the term “anti-vaxxer” came up and I said, “Whoa, whoa, let’s stop right there. What is an anti-vaxxer? Who is an anti-vaxxer? What do they believe? Because are you saying it’s someone who’s against all vaccines? Because the people I’m speaking to, who are vaccine hesitant, have had all their other shots, but they have problems with this particular one.” I also brought up those who couldn’t get it for health reasons because of allergies. And what about people who just needed more time and information to make a decision. And yet we were lumping them all in this same pot as being an “anti-vaxxer.” I said, “Using this term is dangerous. It’s discriminatory. And why are we talking about these people with such hostility and such contempt?”

Shawn Buckley

So Marianne, can I just stop you there because that’s a term that’s become very sensitive at this hearing. And I’ll explain that in a second. So when the term comes up in the newsroom, it’s being used in a really negative term? Like, it’s meant to be pejorative?

Marianne Klowak

Almost laughing, ridiculing. It’s like these people aren’t educated: that was the kind of term that was being used and that was what was inferred.

Shawn Buckley

And I’ll tell you why I’ve stopped you with that. So we’ve had, and I think it was the Saskatoon hearings where I started to notice it. So we’d have witnesses, like literally vaccine-injury witnesses, talking about how their lives were literally destroyed by this particular vaccine. But then they would add during their testimony, just literally out of context, “but I’m not an anti-vaxxer.” And then, we had a lady that really was part of one of the biggest freedom groups in Saskatoon that arose because of the mandates and things like that. And she made a point, “but we’re not an anti-vaxxer group.” So that told me—because my understanding, and it’s based on a lot of the evidence that was here, but also, you know, prior to me coming here—is that these terms are created basically to ridicule and basically to close our minds, right? Because no one wants to be labelled as an “anti-vaxxer.” So if somebody is labelled as an anti-vaxxer, you’ll close your mind to them, right? So it’s just interesting. I’m sorry to stop you, but it’s interesting to hear because you basically used laughter as a description: that these people would be laughed at in a newsroom.

Marianne Klowak

And ridiculed. And I think that was the prevailing consensus in the newsroom. That if you were educated and if you were intelligent, you got the shot. To question it meant you weren’t intelligent, which really flies in the face of critical thinking. And it’s opposite of journalistic practice.

In June of 2021, the Manitoba government had carried out its own survey on vaccine hesitancy.

Shawn Buckley

And we'll just pull up your slide for a second [Exhibit OT-4]. There we go.

Marianne Klowak

So in the next slide, you see the reasons for vaccine hesitancy—why you're not in a rush to get it/not sure if you will get it/you're not going to get it at all. Look at the top three: It found 25 per cent were concerned about long-term effects; 18 per cent were concerned about side effects and reactions; and 15 per cent said the vaccine was experimental and unproven. So more than half, that's 58 per cent, almost 60 per cent had concerns about safety and that it was experimental. Now notice where religion comes in, it comes in at 4 per cent.

So more than half of the people were listening to their gut and they weren't convinced by the mantra of "safe and effective." But instead of critically thinking, doing newsgathering and real journalism on safety concerns, scrutinizing the Pfizer data, and asking some of the hard questions people were asking me—like, "Why is the CBC the arm of public health?"—we chose to focus on that four per cent. Those who were hesitant for religious reasons. So our mission at the CBC now was to educate these people, or for that matter, educate anyone who was vaccine hesitant and eliminate it, because surely if they were educated, they would have changed their mind.

This to me was arrogant, it was condescending, and we were telling people what to think because we didn't trust them to think for themselves. Our tone implied they were a danger to society if their thinking didn't fall in line with the narrative. And to me,

[00:20:00]

this was mind boggling because I understood our mandate of the CBC was to elevate the voice of Canadians to tell stories on a local, a regional, and a national level, reflecting Canadians to Canadians to promote understanding and unity. And instead, we were fanning the flames of fear, of division, of segregation and hatred against a particular group, the unvaccinated. So the stereotype we were creating emerged early on: The person who was unvaccinated was uneducated; they were likely a person of faith. They were denying that COVID was real. They probably lived in a rural community. And they were branded—"a danger to public safety."

Shawn Buckley

So I'm just going to stop you. So these are themes that the CBC in their newsroom came up, to actually use, to basically denigrate, create a group called "the anti-vaxxers" and denigrate them. So we actually have our state-funded news organization coming up with themes to create a separate group and to make them look uneducated and basically like "Luddites."

Marianne Klowak

That was the image that was portrayed.

Shawn Buckley

And this was a deliberate decision.

Marianne Klowak

It was a deliberate decision because look at the government survey: it showed that almost 60 per cent of people were concerned about safety, and yet we were focusing on religion. I'll give you a couple examples of the stories.

Shawn Buckley

And if I can just interact a little bit. Because it would seem to me the story is, "Here's what people's concerns are, and let's go talk to those people." Right?

Marianne Klowak

That would be the common thinking, wouldn't it?

Shawn Buckley

And then see what flows from that as the story develops. Okay.

Marianne Klowak

That would be the common thinking.

This is a story we ran in May of 2021: "Death bed denials" in southern Manitoba hospital patients, the doctor says. So it was a fact that pockets of Southern Health in Manitoba did have the lowest uptake of the vaccine. But I challenged the stereotype: I'm saying, you know, "I know doctors, I know educated people, I know people in the trades, I know people working in garment factories, social workers, people all over the province that are vaccine hesitant. They do not fit this stereotype." But many of them, by now, were too afraid to be interviewed because they knew it wasn't safe. They knew what would happen to them—that they would be labelled, stigmatized, and they would likely lose their job.

Here was another story we did in targeting people in faith communities that we ran a few months later. And that was in September of 2021. Manitoba health officials were targeting the low vaccination rate in the southern part of the province. They thought the best way to get through to these people is to get the community leaders and the religious leaders on board, and then "we can convince people to get the shot." The story says: There's "no legitimate reason for religious exemptions" to get the shot "across several major belief systems, the leaders say."

That's not what I was hearing from people. People were applying for exemptions and on their deeply held spiritual beliefs. And their applications were consistently being rejected, and they were losing their jobs because of it. These were gut wrenching stories that people were calling me saying, "I'm being escorted out of my workplace right now. I can't believe this is happening. I'm being discriminated against because of my faith." They said, "Where's the right to religion, freedom of religion and where's the right to bodily autonomy," and where was the CBC and why weren't we telling their stories?

I mean, there was one man that I had spoken with, he'd been with a company for 25 years and he was in a management position, and he was working from home and he applied for an exemption that was rejected. He lost his job and he was—because he wouldn't get the shot and he was continuing to work from home. It was ludicrous. It was absolutely ludicrous. And we didn't do these stories.

So this was all sort of coming to a head and on June 3rd, 2021, I called for a meeting with the managing editor of CBC Manitoba, the executive producer. And I asked that a witness be present at all of the meetings to hear my concerns about our editorial direction. Now that witness was a person who was recently hired as the executive producer of diversity and inclusiveness. So in that meeting, I raised a number of issues. I said, "Why weren't we investigating the safety of the vaccines when that's what came up at 60 per cent in a government survey? Why were we creating a dangerous stereotype of who we thought a vaccine-hesitant person was? Why were we creating a hate culture against them and demonizing these people as a threat to public safety?"

[00:25:00]

"Why were we endorsing and promoting an experimental drug that we didn't know much about other than what the government and the manufacturer were telling us?"

And I'm going to give you an example of how that happened. Going back to the journalistic standards about how we're supposed to be impartial: We had reporters posting on their CBC Facebook page at the local and national level with a sticker on their arm and their hand up in the air saying, "I'm part of Team Pfizer and Team Moderna" with their hand up. And I said, "How is that being impartial and how is that being objective? And why were we getting behind Pfizer, which paid out huge criminal settlements? And would these images convince people who were not sure to get the shot?" I said, "Clearly, this is a journalistic breach." When I flagged this to management, they didn't have an issue with it. They didn't think it was a problem.

I also brought up to them.

Shawn Buckley

Let me just stop. The management didn't view those issues as a problem?

Marianne Klowak

No, they said if they want to do that, that's their choice.

Shawn Buckley

You mean, if who wants to do it?

Marianne Klowak

If a reporter wants to post on Facebook they've gotten the shot and they've got a sticker and they're part of Team Pfizer or Moderna, they didn't have an issue with that.

Shawn Buckley

Okay.

Marianne Klowak

I also brought up at that meeting what happened with thalidomide. That's a drug that was endorsed in the early 1960s for pregnant women who were nauseated: a drug that caused

severe birth defects. And that we shouldn't be getting on this bandwagon—we should be very cautious because this was a brand-new vaccine that had just become available.

Now I'm going to give you a specific example of a story that I was shut down on. So June 2021 was the time when Israel was starting to see some links between the Pfizer vaccine and heart inflammation. And I was getting calls from parents who were really distressed and just saying, "There's the potential risk of heart inflammation in young people. I don't know if I should vaccinate my child, I don't know what to do. How safe is this vaccine?" They were in angst about—they wanted more information. And at that time, the Center for Disease Control and the FDA had put a warning on their fact sheet about rare cases of myocarditis.

Some parents in Manitoba thought, you know, Manitoba should be doing the same for their fact sheet on Pfizer because that was the only one that was authorized in Canada for those twelve and older. They had sent letters to the province, the health minister, public health officials, and they shared all these documents with me. So I pitched this story on the June 3rd meeting, and I was given the go-ahead and I interviewed several parents.

And I approached this story like I would approach any other story: Is this true? The government and the manufacturer are saying it's safe and effective, and yet we've got parents worried about some evidence that's emerging that there could be some health concerns. So I set out to news gather, investigate, do the research, and find the answers to the questions people were asking.

And for me, this story was reflective of that 60 per cent where people were saying, "This is what we're concerned about." So I thought, great, we're going to do a story that the public has a right to know. And these were some of the things that parents said to me on the record. They said, "Giving youth a drug that's still in the trial phase is a terrible idea. It's dangerous." They wanted to know "who would be responsible if their child had an adverse reaction?" Most troubling in their opinion was that some of these children didn't need to have their parents' consent to get the shot. "Why was the state taking control of their children?" They were asking me this. This is all credible and legitimate questions. They were fed up with their kids being threatened and bullied in and out of school for not being vaccinated.

I'll tell you one story. There was a rural community, and this mother phoned me and there were two families. One family was vaccinated; one wasn't. And the daughters were best friends. And one of the daughters said, "Well, you know, if you want to get the shot, you can come over to my house on the weekend and my mom will take you. And your mother never has to know." So that was the end of that friendship. That was the end of that. And it divided the whole community.

And these people were questioning, they were asking me, they were saying, "Well, if this vaccine is safe, then why does someone who's vaccinated have to be afraid of someone who's unvaccinated?" Very logical questions. And they were angry with the CBC. They expressed that to me. They said, "Why was the CBC and the media cheerleading the government's message that the vaccine was safe and effective?" because they weren't convinced by it.

[00:30:00]

So that's basically what they said to me on the record.

And most of them had referenced and voiced their support for a body of scientific research that was put forward by the Canadian COVID Care Alliance [CCCA]. Specifically, by Byram Bridle, a world-class immunologist from the University of Guelph. And the Alliance had been raising flags about the safety of the vaccine based on scientific studies. They'd even filed a petition with the federal government, and they were calling the feds to suspend the use of the vaccines in children, in youth, in adults, in women of childbearing age until there would be long-term and short-term safety trials that were completed and this would be published in peer-reviewed journals. Many of the parents I spoke with had signed this petition. Certainly, this was newsworthy and something the public had a right to know. These were Canadians that were voicing a different or dissenting voice, and up until now, all we were airing and publishing were experts aligned with the government's view. This is a story I thought that would bring some fairness and balance to our one-sided coverage, and it would punch a hole in the narrative.

I contacted the Alliance, and I spoke with a scientist by the name of Stephen Pelech. He's a highly reputable scientist. He's a professor of neurology in the Department of Medicine at the University of British Columbia. He had been doing COVID research in his lab for two and a half years. He also published more than two hundred scientific papers over the course of his career. He praised the parents I interviewed and he said, "You know, they're wise. They're wise to question this narrative" because he had serious concerns with vaccinating children with this new vaccine.

He shared with me the Pfizer data that showed with children, there's the least amount of data from testing on whether there's a long-term or short-term side effect. So according to the document I was looking at from Pfizer, it was just over 1130 adolescents between 12 and 15 in the U.S. were vaccinated in phase III trials. And in his opinion that was problematic. He said the tests were done on a very small number of children and the test wasn't powered enough: so what that meant is there wasn't enough participants to determine if, let's say, there was a reaction of one in five thousand, that wouldn't have been picked up by Pfizer. So I had Pelech on camera; I had these parents all lined up. And I told you what my workflow was like prior to COVID. But it changed with this story.

When it came to this story, I never had more hands in the vetting of this story. While it was cleared by the Manitoba managing exec and the director, a local web writer flagged it. And she said, "You know, maybe we should get a response from Pfizer." I said, "No, I think we've heard more than enough from Pfizer." Then she said, "You know, I don't think the vaccine is still in the trial phase." And I produced a document saying it is until 2023. But she sent out an internal email to several people in the newsroom, and she decided that my story should be forwarded to the Toronto Health Unit. Now this is a special unit within the CBC, and she wanted them to do a final vet of my story. So now the CBC Toronto Health Unit was in charge of my story. It was the end of June, and I was really getting anxious over how long this was taking because as I mentioned before, I was used to turning stories around in a day or two. But to me, it was critical timing because the rollout was ramping up for the vaccination of young people in Manitoba. It was in full swing. Finally, five weeks later on July 8th—

Shawn Buckley
Five weeks?

Marianne Klowak

Five weeks. Remember, I could turn around stories in two or three days—this was five weeks. So I think they were sitting on the story. Maybe they were just hoping that I would go away and not persist in doing this story.

But five weeks after, July 8th, I pitched the story, I was called into a meeting. Well, this was on Zoom because we were all working from home by then, and they had a verdict from Toronto. And you know, I should mention to you that over three decades at the CBC, I'd say 30 to 35 per cent of the stories I did were health stories. Never had I had a story that had to go to the Toronto Health Unit. And never was a story given this level of scrutiny.

Shawn Buckley

So I just want to emphasize this because you had told us earlier that basically things changed at COVID. So what you're saying is, for your thirty-five years as a journalist

[00:35:00]

like, 35 to 40 per cent of your stories were health stories. So you knew what it took to run a health story and that never before had it been sent to this Toronto Health Unit or no story in your career had ever been put under this much scrutiny.

Marianne Klowak

Never. Like I had mentioned, it was one producer, and the story was put through and it was published. And all of a sudden now, there were all these hands in the story.

And what I want to mention to you, which is key to know here, is that before I tell you what happened, that none of the facts, none of the data, none of the research, nothing I put forward in that story in terms of any of the information was contested. It was rock solid journalism. And I knew that I could put my name to that and defend every word I had written.

They raised two concerns that was an issue for them: Did I know that the Alliance promoted ivermectin? And did I know that some of the members of the Alliance chose to be anonymous? Those were their two concerns. So my thought was, okay, now the story is being blocked further up the chain.

I did know they supported ivermectin, but that was not the focus of the piece. And I had been sending for weeks links to management from medical journals about the success of ivermectin in treating COVID. I got no response. I said, We should be having a debate about ivermectin on air and hear from experts who support its use. But that was not the focus of this piece."

As for members being anonymous, I was confused by that because, I thought, I interviewed Stephen Pelech. He went full-face on camera with his credentials. So there was no anonymity there. And I could only guess that maybe some were choosing to be anonymous because they wanted to be able to continue to practise without fear of being disciplined anyway.

But what came next left me just speechless. I was just astonished. They said, "While there's a story to be told about the parents' concerns, the Canadian COVID Care Alliance was problematic." I should "drop them out of the story, keep the parents' concerns in, but

interview two experts that CBC Toronto was recommending.” And of course, I did my research, “Well, who are these people?” One of them was a pediatric immunologist who told me both of her kids were vaccinated. She had worked with the federal government. She chaired a national committee overseeing the approval process of COVID-19 vaccines in Canada. I was being told to drop Pelech out of the story who was raising flags about safety concerns and put this woman in.

I was just stunned. I was shocked. I could not believe that they were asking me to do this. I said, “This is unethical. This is immoral. You’re violating all our principles of fairness and balance and accuracy and being impartial and acting with integrity.” And I said, “What you’re asking me to do is dishonest and it’s manipulative.” The parents I had on tape, I’d interviewed, they were backing the science of Bridle and to include them in the story but leave the Alliance out, to me, defied logic. It didn’t make any sense. We were effectively censoring people in the scientific community with impeccable credentials because they just didn’t fall in line with the narrative.

I said to the managing editor, “I’m standing down. I’m walking away from this story. I’m not going to do what you’re asking me to do. I’ve invested too much in this. I’m not going to sell these people out. And why should I have to include two doctors that Toronto has picked out?”

And then I think, you know, what if this story had made it through and it went national? Wouldn’t that have changed the narrative across the country? If parents had been armed with this information, would we have seen fewer vaccine injuries?

Shawn Buckley

Can I just stop you. Because another thing just kind of occurred to me when you were sharing that story and you mentioned how they were actually critical of the CCCA—and I’m thinking, well just wait, just so people that don’t know the term—so that stands for the Canadian COVID Care Alliance. My understanding is, I mean, if it’s not hundreds, it’s thousands of scientists and doctors. Like we’re talking very credentialed people that have formed an organization to basically look into COVID issues objectively and to provide fair and balanced information.

[00:40:00]

And you know if that leads them in a direction that goes against the government narrative. But isn’t the fact that that group formed and exists, itself, a story that should be covered, let alone cutting them out of a story. I was just thinking that in itself is somewhat fantastic and likely would be a story.

Marianne Klowak

And they formed specifically because of COVID and to give an alternative perspective. And I had pitched, “Let’s do a story on them,” but it was like, they weren’t interested in it. They weren’t interested in hearing what these people have to say because they figured they supported ivermectin. So they didn’t want to do any of those stories.

Shawn Buckley

And just to give perspective—because I know when we had a conversation and likely you’ll get to it—like, a reporter will go to a demonstration on an issue where there’s twelve

people and report a story. But when tens of thousands of people show up for a demonstration, that might not be covered if it's going against the government narrative now. So, just kind of along those veins, like just even the size of the CCCA itself is quite—

Marianne Klowak

The numbers.

Shawn Buckley

Yeah, and it's quite something.

Marianne Klowak

The fact that they had filed this national petition was to me huge. They were saying, "No, we need to stop, we need to pause, we need more information before we roll this out across the country for young people," and that story was shut down.

Shawn Buckley

And that was a petition backed by scientists and medical doctors citing peer-reviewed evidence.

Marianne Klowak

Correct.

Shawn Buckley

Okay.

Marianne Klowak

So the day that that happened to me, which was July 8th, it's burned in my memory because for me, part of me died that day with that story. And that was the death of journalism for me, July 8th, 2021. Instead, we were clearly pushing propaganda.

So I had to call back everyone. And I thought, how am I going to handle this? So I apologized and I told them the truth. And it was shameful and it was humiliating because these people had put themselves on the line to tell me their story. And I said, "This is why I can't do it. This is why I won't do it, and it wouldn't see the light of day." And I said, "I'm sorry that I have failed you and I have let you down."

I didn't go to work the next day because I thought I have to strategize. How am I going to deal with this? Do I quit right now? Do I stay and try to push stories through even harder? The following day I asked for a conference call with the managing editor, the exec, and the witness and I said, "Here's the deal." I say, "You know that story was solid journalism. I'm asking you to publish it. You have that power." And I said the timing was key as the province was ramping up the vaccinations of young people. It was urgent that this critical information get out there. And I said, "I'm asking you to do this despite what Toronto has said." And if they wouldn't, I could no longer continue to work in this environment. They didn't publish it.

It was also at that time I decided I had to start reaching out to other journalists because I felt like I was just losing my mind. Surely other people were seeing what I was seeing. And I did reach out. I reached out locally to a competing network. I also talked to someone south of the border. Through internal email at CBC, I sent out notes saying, "This is what I'm seeing. What are you seeing?" And I didn't hear back from anybody.

So I thought, you know, I'm going to call the CBC Union. I called the CBC Union and they said, "Oh yeah, we're getting all kinds of calls about people concerned about our biased reporting." And I said, "Well, where are they? Put me in touch with them." And she said, "Oh no, they're not, it's staying with the union. They're not going to go past the union." I say, "What does that mean?" And she says, "Well, they're not prepared to do what you're doing. They're not prepared to go all up the ladder and call power to account."

So then I reached out to somebody. And I guess, you know, I understand that because I was sort of at the end of my career, but a lot of the journalists that were calling the union were midway in their career and they were afraid of losing their jobs. I contacted a senior reporter from a competing network and I said to her, "What are you seeing?" She said, "Oh, I'm seeing the same thing, you know, why has the media become the mouthpiece of public health?" Then I managed to contact a reporter who worked for *The New York Times* who told me what was happening to me was exactly what was happening to him. His stories were being shut down: he was being blocked. As he saw it, we had two options. One of them was quit and be a whistleblower,

[00:45:00]

or to stay and fight it out and keep trying to push those stories through. He also gave me some advice. He said, "document everything that's happened to you, as you would cover a news story. Who said what, when, who was present and the date." I was just reeling from all this because I thought, you know, we have betrayed our audience on a massive scale, massive.

And even the CBC acknowledged that erosion of trust in a blog that was written by the editor-in-chief Brodie Fenlon in March of 2021. Forty-nine per cent of Canadians think journalists are purposely trying to mislead them. About half of the fifteen hundred people of the Canadians surveyed felt the CBC was more concerned with supporting an ideology or a political position than informing the public. And that the media was not doing well at being objective. How is the CBC going to rebuild trust in journalism?

In 2019, it became a member of the Trusted News Initiative—so that brings together news organizations from all over the world and tech platforms to combat coronavirus disinformation: to identify and stop the spread of it, false claims, half-truths, conspiracy theories, basically, a way to filter news through its own filter system. I saw it basically as a mechanism to "call people out" who disagreed with the narrative and to label them dangerous and extreme.

Why do you need a trust filter system if you're consistently telling the truth? Why are tech platforms involved in combating disinformation? And who are these people in this Initiative? Are they journalists? Are they scientists? Is artificial intelligence involved? Who is the Trusted News Initiative? This was an effective way to stop the flow of information: to censor one side, skew reporting, and label opposing opinion and thought as disinformation. Sometime after signing on with the Trusted News Initiative, there was a shift in the lens of how we saw news. It was no longer from the bottom up—it was from the top down.

Let me give you a specific example of how this played out in the newsroom in another story that I was blocked in doing. I'd gotten a tip about a peaceful protest in Winnipeg about vaccine mandates, and it was in September of 2021. There was about two thousand people out on the street. We didn't cover it because it was decided at the editorial level these people were spreading disinformation. This was just unbelievable. I was stunned because I had been sent in, you know, to cover stories and do live hits from protests with twelve people present. But we were going to ignore a group this large and not send a camera and find out what these people had to say. I thought not only is the size of the group newsworthy, it was the fact that it was both vaccinated and unvaccinated people were walking together and they were united in their opposition to vaccine mandates.

I had gotten a call from someone on the protest line who says, "Where's the CBC? There's people here that are cutting up their vaccine passports as a show of solidarity against the mandates." And I thought, wow, this is a great story. This is great visuals. This is a powerful story of people at the grassroots uniting. Why wasn't the CBC there? It was a decision made at the top level rather than looking at the news that was unfolding on the ground.

When I asked why we weren't there, I didn't get an answer. It wasn't worthy of covering because in the CBC's eyes, these people were disseminating disinformation. How could we say that if we never even spoke to any of them? We ran a few lines of copy that day saying, "More than 250 people in Winnipeg held a protest against mandates." That was misleading and it was a half truth. There was at least 2000 people. By saying more than 250, we were trying to minimize, in fact, how large it was. And to me, we missed the story entirely, which was people uniting against a cause.

Instead that day, I was assigned a story about a cricket infestation. No one was sent to cover the protests, and the cricket story went national.

[00:50:00]

But there was nothing about the Manitoba protest.

Shawn Buckley

So, Marianne, just so that we have contrast because you've told us about, listen, there's this protest, 2000 people. The real story is that both sides are coming together, that people with the passport are so concerned about the mandate, they're cutting that up. So tell us about the exciting cricket story that became national news in Canada. What was the story, just so we're not left in suspense?

Marianne Klowak

That people's back lanes and garages and houses are being filled with crickets. And I'm thinking, really, we're going to tell that story, and we're going to basically ignore two thousand people walking through the city uniting in a cause. We are just going to ignore these people. To me that was just unconscionable.

Shawn Buckley

And was the cricket story urgent? Like—

Marianne Klowak

No, I don't— Well, I guess if you were living in a house full of crickets, it might be, but that was not the story to be told that day. But that was the story they decided should be told that day. Later that month, I pitched another story, and it was shut down.

Shawn Buckley

Can I just stop and I'm sorry. So we have, literally, vaccinated people and not vaccinated people coming together against the mandate. And we have crickets from the CBC. I'm sorry I couldn't resist.

Marianne Klowak

It's shameful.

Shawn Buckley

That was just too easy. So okay, and I'm sorry to interrupt, I just truly couldn't resist.

Marianne Klowak

So later that month, I pitched another story that was also shut down. And it was about what vaccine mandates were going to look like at universities in Manitoba. I had a professor lined up, an immunologist lined up from Ontario. They were on a committee there helping to draft the rollout of mandatory vaccines at the University of Guelph and McGill. They talked about students having less freedom on campus: There'd be more security, more policing of students. Those who refuse to wear a mask could be hauled off by campus police. I also had an ethicist lined up who was willing to talk about his concerns over mandatory vaccinations for students.

And both the experts were saying they were worried about the mental health of students that were going into a second year of restrictions. Both were getting contacted by parents and students who just were not in support of this. And I thought this would be an excellent discussion to have in Manitoba with faculty and parents and students for our audience to hear because it was already rolling out in Ontario, and it was going to be coming into Manitoba; they were ahead of us. And I also said I had spoken with two legal firms that were fighting mandatory vaccines on campuses, and they felt the court ruling in Ontario could set a precedent for the rest of the country. There was no response to what I pitched that day. Instead, I was assigned another story about an infestation. This time it was bedbugs in a local housing complex. And no one else had been assigned to that story that I had pitched.

So I interpreted that as I was quickly becoming silenced and cancelled for trying to get the other side of the story out. I was battle weary. I was exhausted from fighting. I never felt more alone in my profession. And as a veteran journalist who is usually fearless and outspoken, I no longer felt it was safe to pitch stories that I knew that we should be telling. And I quickly felt that my existence there was becoming null and void. But I wasn't done yet.

In September, I decided I'm going to go directly to Toronto to voice my concerns about our editorial direction. And I was going to tell them what I was experiencing. I started sending emails to Brodie Fenlon, CBC's editor-in-chief, and Paul Hambleton, who was the head of Journalistic Standards. Now he's no longer with the CBC, he left a month after I did. I shared

with them what I'd documented about what was happening with my stories, specific details what was going on in the newsroom in Winnipeg, the language that was being used. How we had created this culture of hate and division, feeding people's fears. And why were we so hostile to people who had an opinion that was different from ours? And while I applauded the CBC's initiative of diversity and inclusiveness in hiring people of different cultures and ethnic backgrounds,

[00:55:00]

I said, "Where is our diversity in thought? Where is that?"

Again, I was hearing the word "anti-vaxxer" being used in the newsroom, and this is already a year and a half into the pandemic. We'd failed to create a safe environment for people to speak to us on the record so their voices could be heard. I told them we had violated all our journalistic standards. We'd broken the public trust. And we withheld information the public had a right to know, and we were guilty. I asked to have a conversation with them before I left. And Brodie Fenlon emailed me back. He thanked me for what I sent, said he'd be happy to talk to me. But with the federal election going on, could we schedule a time afterwards in October, and he would invite Paul Hambleton into this discussion as well. I was pleased he had responded.

At that point like I knew, I had my end date. I'd spoken to HR; I knew when I was going to be leaving the CBC, but I had one more story in the queue I wanted to get out. And it was about a woman who was vaccine-injured. I had several calls and conversations with people who had contacted me about they had been vaccine-injured, they knew someone who had been vaccine-injured, or there was a family member.

One of them was the mother of a teenage boy. He was an elite athlete, he had gotten the shots, he had chest pain. He was told he was going to have to spend his summer lying on a sofa recovering, and he could not do any sports that summer. A woman called me who got her first shot and she was really sick. And she was anxious because she went for medical help, and she was told that she should still get the second shot, but maybe she should be admitted to hospital to get the second shot in case she had a worse reaction. This to me was madness, was madness. The rest were afraid that they wouldn't be believed because of, you know, the media mantra we were putting there, "safe and effective."

The way I saw it, we were gaslighting these people. You know, let's say you have a refugee coming into the country, and you know they've suffered trauma and they've been through hell. How do we treat them? We treat them with mercy and compassion and kindness. And yet these people who were being injured—we were gaslighting them. One man who had an adverse reaction said to me, it had to be him, "It's got to be me. There's got to be something wrong with me because it's safe and effective."

So getting back to the woman I did the interview with. She had had an adverse reaction after her first shot in May of 2021. It took me weeks to gain her trust, for her to go on the record. She was thirty years old. She was an avid runner and she worked with the federal government. She had no previous heart condition. The very next day after getting the shot, May 27th, she had chest pain. Then she said she was short of breath. She felt like she had this huge weight sitting on her chest. The pain got worse, she had trouble breathing. She described it as the feeling like there was thick smoke in her lungs, but she wasn't a smoker. She knew something was really wrong.

She went to emergency at St. Boniface Hospital where she was diagnosed with pericarditis. And that's inflammation of the tissue around the heart. She shared her written medical report with me from the emergency room doctor. Since her shot in May—within the next month—she'd been to emergency five more times with increased chest pain. She could no longer run. She was winded from walking up a flight of stairs. And she said she thought that she was dying. And I had interviewed a cardiologist as well who told me, "if there's damage to heart cells as an adult, they don't regenerate. The damage is permanent." And yet we were running stories saying, "Take a couple of Advil, and there shouldn't be any lasting symptoms from heart inflammation." This woman was on anti-inflammatory medication for months. She was battling depression and anxiety because she was no longer the outgoing, active, happy-go-lucky person she used to be.

She also told me how difficult it was to get someone to document what happened to her as an adverse reaction. She said the first doctor who diagnosed it was hesitant to put it in writing. Some doctors didn't know how to fill out the form. Finally, a nurse had filed it for her, and that was another story I pitched.

The problems with doctors reporting adverse reactions in Canada.

[01:00:00]

They have to download a PDF, takes about fifteen minutes to fill it out. The doctor has to sign it. Then it goes to a health authority who has to approve it. And some of the doctors were telling me that their reports were getting rejected. And I was hearing more and more about the problems with reporting these adverse reactions in Canada. And there was even a period during the pandemic that the line that they used to report these adverse reactions was down, the link wasn't working. Surely, this was newsworthy. No interest in that story.

But getting back to the woman, I interviewed. I stayed in touch with her. After doing her own research, she connected with three other women who were diagnosed with heart inflammation after being vaccinated. I wrote her story. Here was my first line based on what she told me. This was the original before it was edited: "A 30-year-old Winnipeg woman says she's not confident the COVID-19 vaccine is safe for everybody and is advising people to do their research. She admits she was hesitant at first to get the shot, but she felt pressure from people posting online that she was selfish if she didn't." Two words the editors didn't like in there: "vaccine" and "hesitant." Again, several hands were in this story, several. A managing editor, two web writers, another producer, and I fought several edits that were made. By now at this point, I was sort of afraid because I thought if I pushed them too hard, they could pull the story entirely.

Okay, here's the story the CBC published on July 12th, 2021. This is my story, and this is **what they changed:** "Winnipeg woman shocked by heart lining inflammation after COVID vaccine, but experts say the risk remains low." Look at the first line. "A 30-year-old Winnipeg woman says she was shocked to be diagnosed with the condition involving inflammation of the lining around her heart days after she got her COVID-19 vaccination in late May."

The changes that they made didn't reflect what she was saying to me about the safety concerns. It was propaganda editing to change the meaning entirely. Any reference to vaccine hesitancy was taken out. I fought the web writer on that first sentence. He says, "Well, no, we can't say that; we don't want to scare people." I say, "That's not journalism." I said, "Maybe we should be concerned, look what happened to her." And I said, "We can't negate her personal lived experience: her story is one of caution and to do research."

And if you look at the next sentence which says, “But a Winnipeg cardiologist says despite concerns about heart inflammation, vaccines are preventing illness from COVID-19.” Why would anyone read any further in my story. Basically, the message was it happened to her, it’s too bad, it’s unfortunate, but vaccines are still doing what they’re supposed to be doing.

But there were medical experts who were disputing this, but they had been cancelled by the CBC because according to the CBC, they were spreading disinformation. The fact she was an avid runner was taken out of the story, and I fought to have that put back in. I say, “No, I think that’s important. You know, she was a runner and now she can barely walk up the stairs. It shows what happened before and after the shot.” And she never got the second one because her reaction was so severe after the first. And I also didn’t think there should be experts or stats negating what she was saying. Because we’d heard more than enough from all of the experts. It should be just a straight-ahead story about someone who suffered an adverse reaction, and we shouldn’t downplay it. Instead, the way I saw it, her story was buried in experts and health officials and stats—it was sanitized.

I lost sleep the night before that story was published. I knew we didn’t do justice to her story. I spoke with her the next day, and she was so traumatized she couldn’t read the story. I should also tell you I contacted her five months after I left the CBC, and she was still suffering from health problems, blood clots. That story was the breaking point for me. I was waiting for that final exit meeting with Fenlon and Hambleton in October. And when I had it, I told them what had happened to my stories. How devastated I was to be leaving the CBC after spending three decades in a career that I loved.

I asked them what’s the makeup of the CBC Toronto Health Unit, like who are these people: “Are they journalists, are they scientists, like who are they?”

[01:05:00]

I was basically told they were experts who are really good at what they do. But I still don’t know who they are. Then I brought up the issue of mandatory training and seminars for journalists that we had to take on what was called conscious and unconscious bias. We had to sign off on this training. It was to identify any bias we may have in doing a story. And to be aware of it, to make sure it doesn’t impact the story that we’re doing and that we are more inclusive. I said, “You know what, we the CBC have a glaring bias, both conscious and unconscious, when it came to stories involving experts opposing the narrative and with those who were unvaccinated, we had a glaring bias.” I said, “I was worried about the next generation of journalists. They’re young, they’re inexperienced. And that the editorial meeting is not a safe place to have a different opinion. Why are we so mean and hostile to people with different opinions?”

And I said, “Did you know how we were being branded outside the walls, the corporate walls of the CBC?” I’ve seen those protests; I’ve seen those signs. We were being known as the Canadian Brainwashing Corporation or in faith circles, the Christian Bashing Corporation. Some of my final words to them, as I saw it, I said, “The CBC is morally and ethically culpable of the narrative that it pushed to the public, and we are going to be held accountable. We failed to hold power to account, and no one was holding the media to account. We failed to serve the public. We broke their trust.”

I told them, “You can silence and cancel scientists with impeccable credentials, you can even cancel me.” But I said, “My solace is that the truth will come out; it will come out.” Brodie thanked me, and he said he was sorry that it had ended this way and that he didn’t think the CBC had done all that bad. He wished me well. Hambleton, who is the head of

journalistic standards, he was still on the screen, and he told me, that the most heat that he took during COVID was over ivermectin. People calling and writing with letters with no let up. I said, "The CBC should have listened on many fronts. The truth will come out." That's what I said in October 2021.

So here we are a year and a half later, the truth has come out. Even though people still do not want to believe the truth. According to Health Canada's own website up and to including March 3rd, a total 427 deaths were reported following vaccination, 427. Each and every one of those deaths was worthy of a story. Where was the CBC? Where was any media on this? And is that number accurate? The same Health Canada website posted more than 10,000 serious injuries for the same time period. Are those numbers accurate? Are they higher because of all the problems with reporting adverse reactions in Canada? Who are the injured? What are their names? What are their stories? What are they suffering?

Lawsuits are going on, and there's a few people of the vaccine-injured who are getting settlements. We have one before the courts right now in Manitoba involving a young man from Steinbach.

If reporters were doing their jobs, we would not be here today in this forum, funded by citizens, telling our stories. Mainstream media would have done it. Where are they? Where are they?

On February 27th of this year, papers with hundreds of profiles of suspected COVID vaccine injuries and deaths were plastered onto the doors and windows of CBC Toronto. I had a really hard time looking at those pictures because that to me was proof and evidence that the public had trusted us and they had listened. And some of them paid dearly for it. I waited to see, is CBC going to cover this? Is any media going to cover this? How could you ignore this? It was just unconscionable and appalling that nobody covered it. I thought, I wonder how employees felt that day when they came to work and they saw that—those posters on the outside of the building. Did they stop? Did they look? Did they read? Did they look at the names, or did they just go into the building and carry on with work that day? The same thing happened in Winnipeg on a smaller scale.

[01:10:00]

Again, no media coverage.

And as mentioned earlier, CBC decided to pause its Twitter activity after it was labelled "government-funded media" by Elon Musk. Brodie Fenlon had responded by publishing a piece saying, "Journalistic independence is the cornerstone of who we are as a public broadcaster." Then that tweet was removed. CBC is not impartial—it is not independent. I think what I shared with you gives witness to that.

There was some excitement over the fact CBC Manitoba covered the NCI when it stopped in Winnipeg in mid-April. Maybe, finally, the CBC was going to report the other side. But it was a low-impact piece in that it didn't talk to anyone who was vaccine-injured. It didn't delve into any of the Pfizer data. And it didn't talk about safety concerns or side effects.

Shawn Buckley

Can I give you even more shocking information? Can you go back to that slide? So Jay Bhattacharya is on the screen—while CBC is there—talking about CBC censoring him. And there was no mention about that.

Marianne Klowak

Those stories should have gotten out. And there's so much more that should have gotten out. I mean, basically, it was a low-ball story, in the sense, the bar was low. They didn't delve into what they should have dug into there.

I don't know if any of you have heard of Naomi Wolf. She's a famous American author and journalist. She posted a video on YouTube last month exposing what is in the Pfizer documents. I think it's something that all critically thinking journalists should have been digging into. The FDA wanted the documents to be hidden for 75 years. A judge said, "No." So Pfizer was ordered to release 55,000 documents a month. And according to Wolf, around 2,500 experts from all over the world are interpreting this data. They're churning out reports to tell everybody what's in it. The evidence in her words is dark, devastating.

One of the many findings is that Pfizer knew the vaccine didn't stop the transmission of COVID one month after rollout in November of 2020. But yet public health officials were telling us, were running campaigns to say, "Get the shot to protect those you love." And the media, including the CBC, was still demonizing the unvaccinated as a danger to public safety.

I'm inspired by Wolf and those outside of legacy media who are tenacious and fearless about reporting the truth, and they're truly independent. For me, that would be, on this side of the border: True North, *Western Standard*, podcast by Trish Wood.

I was fortunate that when I left, I was at the end of my career. I still wanted to work for two or three years, but to leave the way I did was crushing. It was heartbreaking, and it was definitely a journey of grief. I was able to take an early retirement.

Shawn Buckley

Marianne, I'm going to have to focus you just because we're really running over.

Marianne Klowak

I got 30 seconds. Maybe even less.

So my heart goes out to those who are starting out or midway in their careers. And for them the challenge is even more daunting. When I was asked to testify, I said, "You know it's dangerous to tell the truth but I think"—as someone with the Inquiry said to me—"it's even more dangerous to not tell the truth."

So getting our institutions back: Will we get the CBC, our public broadcaster back? I don't know. But I do know that more journalists need to stand up, speak out, and stand firm as a truth-teller.

Thank you.

Shawn Buckley

Wait, wait, we have commissioner questions. So, and the Commissioners have questions.

Commissioner Massie

Thank you very much for your testimony. I'm learning on a specific story that you illustrated, what I have witnessed from the outside So it's interesting to have this confirmation. I'd like to ask one question because I'm not a journalist, so I don't know. But when we, I would say, use or abuse the term "expert" in journals, shouldn't there be some sort of gold standard that,

[01:15:00]

first of all, you cannot cite experts that are faceless, you don't know who they are. And if you cite them, you give their credentials so everybody can judge by themselves what is their expertise.

Secondly, you mentioned that in many stories that were produced over the pandemic, it was one-sided, and it was the official narrative. And every time somebody was trying to come up with a different version, another expert, they were either dismissed or denigrated.

So about your story that went to be checked in Toronto, wouldn't that be a good idea to say, "Okay, you're proposing these other experts. I will accept if you agree that this expert has a public debate with the expert I'm citing in my article." What do you think of that idea?

Marianne Klowak

That would be the ideal. But that was not something they were open to. And I think in Mr. Palmer's presentation earlier, in terms of that term "expert." You know, it goes back to when they were giving me the names of those two people. You know, do your research: Who are these people? Are they really experts? Are we just designating them experts? And that was a problem that I saw throughout the pandemic. It was very specific about who their experts were going to be, and they were going to be portrayed as competent and trustworthy.

But to have a debate. I mean, that's something I challenged them on many topics: like, ivermectin in terms of experts on both sides; the vaccine injuries, being concerned about safety. I was constantly putting that before them, but it was like, I wasn't being heard. And that was coming from the highest level of the CBC.

To be fair to CBC Manitoba, I mean, they cleared the story except for that one web writer. And then it was shut down in Toronto. And I had no power at that point in terms of— You know, I said, "I think these people should have a say, for the sake of fairness and balance, they should be heard." And I even challenged them to publish the story without Toronto's consent, but they wouldn't do that.

Commissioner Massie

So just a complementary question. Was that a common practice in the past to do that sort of confrontation of expert with different view? Or is it something that was never practiced in journalism? You would do it like a common way of reporting on different opinion, [where] you had to really make sure that when two different views are presented that they were framed in a way that the reader could actually make it their own judgment about it. And now it seems that it's completely disappeared from what we're being exposed to. And I can tell you it's not only CBC; we see the same thing in Quebec with all of the journals. We are seeing the same story.

Marianne Klowak

It just happened to this degree I would say during COVID. Before we would do thorough vetting of people we put on the air as experts and thorough checking of their credentials and what their experience was. And usually, we'd even check them out with two or three other sources if they were legitimate. And were they in good standing? But that seemed to have all gone by the wayside.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

I was going to say good morning, but I realize it's now good afternoon. Thank you for your testimony.

When I think of the daily PMO news releases that are sent out every day from the PMO's office to which CBC journalists would receive and how religious holidays are identified, recognized, and celebrated. And I should also add rightly welcomed in a democratic nation that recognizes freedom of religion and beliefs as a fundamental right in this country and, similarly, as a foundational principle in our constitution under the supremacy of God and rule of law. These PMO releases often offer very lengthy and detailed descriptions of respective religious traditions.

And then I think back to a comment made by the PMO prior to his first election—Christians need not apply. And then I combine it with a very short PMO release that came out one year, I believe it was 2017 or 2018. I believe it was one paragraph regarding the Christian holiday, the traditional Christmas.

[01:20:00]

Two things come to mind. It appears CBC is broadcasting the PM's personal opinion publicly, essentially becoming the PM's mouthpiece. But even more so, targeting specific faith groups, using hatred for these faith groups to which the PM has publicly disagreed. And if this is the case, how can Canadians be confident in a publicly funded broadcaster that deliberately and intentionally ignores entrenched protected grounds under human rights legislation? And two, should we as Canadians be considering CBC in its current mindset, a danger to society for not adhering to their own "DIE" ideology? That is diverse, inclusive, and equitable treatment of all persons regardless of their faith and personal beliefs to which they subscribe?

Marianne Klowak

Which part of that do you want me to respond to? That was—

Commissioner Kaikkonen

Whatever you think you should respond to.

Marianne Klowak

You know. Here's the thing. That was an issue I had brought forward a number of times in CBC, about the fact of how do we cover different faith groups? And we even had a working

group on that and we invited a number of people in from different faith communities to you know, say, “What are the stories that you think we should be telling?” And for a while there, we were doing that. We had a forum, and it was a wonderful forum: we had a rabbi in there, we had Muslim people, we had Catholics, we had Evangelicals, we had Mennonites, we had Jewish people in there. And there was a consensus working group on, how do we move forward stories that are faith based? And we were going in the right direction for a while.

And then all of a sudden, it just swung the other way where we’d become hostile again. And anyone who expressed their faith in a story— I mean, I look at all the pastors in Manitoba that stood out during the pandemic and defied rules and said, “How can you have 300 people in Costco when you’re telling us we can only have 25 people in our church at a service on Sunday? We’re not going to stand for this.” And they didn’t. And you know, they were hammered by the media for expressing their faith and standing up for it.

So there’s definitely a hostility towards faith in, I mean, just my experience at the CBC. And I was constantly bringing that to the forefront and trying to do more stories that way. And sometimes I was able to get those stories out and in some, I wasn’t able to. But clearly, like, we made a specific decision here in our coverage during the pandemic to hammer those communities in southern Manitoba that were faith-based, that were pushing back against this narrative in the agenda. And that was so wrong.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

I’m from Manitoba, and I mourn the loss of the CBC as a fair and unbiased news reporter. I had personal friends who were on the I-Team years ago, and I remember the stories they used to bring out.

One of the things that we’ve heard over and over and over again in the testimony is that prior to 2020, things changed: Words changed. Definition of pandemic changed. Definition of vaccine changed. Definition of human rights changed. A lot of things changed. And my question is, usually, you know, there’s an old expression that a leopard can’t change its spots. Was there significant changes in the higher management of the CBC prior to 2020, like in 2018, ’19? How did they accomplish this complete change of philosophy without changing the management?

Marianne Klowak

Well, I think the management just bought into it. I think, you know, I look at other stories where the language changes in order to make it acceptable to the public. And that’s basically what was being done. The whole thing, the mantra of “safe and effective,” you know, like we didn’t even investigate that. And yet the people that were in management, I mean, these were people that had worked that I-Team you’re talking about.

So, for me, I was shocked and sort of disoriented about, why wasn’t there any pushback about the language and the words we were choosing to use that were dangerous and misleading?

Commissioner Drysdale

You know, we heard testimony from many witnesses about how they were treated,

[01:25:00]

specifically, by the CBC. And according to those witness testimony, didn't the CBC go beyond just ignoring certain stories? We heard testimony after testimony of personal character assassinations carried out by the CBC. Were you aware of any of that? Can you corroborate any of that?

Marianne Klowak

I was aware of that. I mean, to give the best example would be Byram Bridle. Look what was done to him. I mean, this guy is impeccable credentials, immunologist, and the smear campaign against him was just, it was unconscionable. What was done to his career was a character assassination to discredit him for all the safety concerns he was raising. And I raised that with management because I wanted to interview him in a story. And actually, what was interesting is I wanted to interview, as well, Dr. Christiansen in Saskatoon. He was the doctor, Dr. Francis Christian, he was the doctor who stood up and said, "You know, I haven't met a twelve-year-old yet that understands informed consent." And I wanted to interview him, and I was blocked from doing that as well. It was like, "Oh, no, his reputation, he stood up; he's pushing against the narrative." And I'm thinking that's exactly the people we should be talking to, to have fairness and balance.

Commissioner Drysdale

There was also something that you said that I just want to make sure I understood properly. When you were doing one of your original stories and you were quoting the doctors from the Canadian COVID Care Alliance, when comments came back from Toronto, I thought you said one of the comments was, "Well, some of the members are anonymous there." Is that what you said?

Marianne Klowak

That's right. That's what they said to me.

Commissioner Drysdale

But then, didn't you also tell us that when you asked the Toronto people who the members of the Toronto CBC health group was that you were told they were anonymous?

Marianne Klowak

I wasn't told they were anonymous. I was told they were experts at what they did, but I didn't know if that meant they were journalists or were they scientists. I still don't know who they are, but they were not anonymous. But the reference was the Toronto Health Unit was concerned that some members of the Canadian COVID Care Alliance were anonymous. And I said I didn't think that was an issue because the fellow I interviewed had gone full-face on camera. But the reason for their anonymity, they were concerned, like, what did that mean? And I said, "Maybe it meant the fact that they're trying to continue in their practice without being disciplined." But for them that was an issue.

Commissioner Drysdale

But they were—

Marianne Klowak

But it was unrelated to the story.

Shawn Buckley

Can I just break in for a second because we've got a couple of hard starts that I just need to inform you of. We have a person online that basically if we don't start immediately, she'll be a short witness. And then I was hoping, you know, then we have a shorter lunch break to hit another hard start. We could bring Marianne back like we had done with Rodney for questions at the end of the day.

Commissioner Drysdale

It's not necessary.

Shawn Buckley

So, yeah, and I'm sorry to cut that short, Marianne. It's just we're trying to manage some other witnesses too. So on behalf of the National Citizens Inquiry, I sincerely thank you for coming and attending. I know that it was a big step, but we really appreciate you sharing with us some insight that we couldn't get unless you came and shared with us. So deeply, thank you.

Marianne Klowak

Thank you for this opportunity. Thank you.

[01:28:58]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 4: Samantha Monaghan

Full Day 2 Timestamp: 04:57:12–05:07:58

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Samantha, can you hear me?

Samantha Monaghan

Yes, I can.

Wayne Lenhardt

Okay, and we can hear you. Could you spell your full name for me? And then I'll do an oath with you.

Samantha Monaghan

Samantha Monaghan, S-A-M-A-N-T-H-A M-O-N-A-G-H-A-N.

Wayne Lenhardt

Do you promise that the evidence you'll give is the truth, the whole truth, and nothing but the truth?

Samantha Monaghan

I do.

Wayne Lenhardt

Samantha, to set the stage here, this is about your son who died after he got a blood transfusion. And I think the issue for the Commission is, is this an issue with respect to COVID relating to tainted blood?

And to just set that stage for a second, there was a commission years ago by a law professor by the name of Horace Krever relating to tainted blood related to HIV. So I think this is probably the only time the Commission is going to touch on this issue is with you, so could you give us a quick summary of what happened to your son?

Samantha Monaghan

I took my son to the hospital. I think it was back in September 2022. He had a swollen elbow. So we just were coming from his naturopath and getting a panel done—

Wayne Lenhardt

Could you turn your volume up a tiny bit? I think we're having trouble hearing you. I am at least, anyway.

Samantha Monaghan

I think it's up as high as it'll go. Can you hear me?

Wayne Lenhardt

Yeah. Do we need our volume turned up?

Samantha Monaghan

Yeah, it's up as high as it will go.

Wayne Lenhardt

Okay, I'm sorry, could you start again?

Samantha Monaghan

I took my son into the IWK [Izaak Walton Killian Hospital for Children] hospital in September, and he had a swollen elbow. So I was getting it checked out and they ended up doing his blood work. To make a long story short, his hemoglobin came back and it was very low: it was extremely low to the point that he was going to need a blood transfusion. I said, "Oh, no problem. I have no problem giving my blood for blood transfusion."

Given all my research and studies that I have done with the blood supply and the vaccines and everything, I wanted to make sure that the blood that he was given was safe. So I ended up rallying about 300 donors to give blood to my child because he was O positive and myself was O positive. And I was denied by the blood supply in Nova Scotia that this couldn't be done and that I couldn't be a donor to my son as well. It was all denied, and then I ended up having to give him donated blood from the blood bank.

Wayne Lenhardt

And at that point he died relatively shortly after that, correct?

Samantha Monaghan

He died November the 21st.

Wayne Lenhardt

Do you have any evidence that it was because of tainted blood? Have you looked into that?

Samantha Monaghan

No. No, my son was cremated, and there was an autopsy done. They said that he died from underlying conditions, which possibly could have happened. But it's the way he died that kind of struck home for me. There was no evidence that he was going to die or that he was sick in any way. He got his blood transfusion. We got out of the hospital. It was around three weeks after we were in the hospital, I think, a good couple of weeks. And we were getting our blood done. We'd seen the pediatrician. He was, everything was good. On November the 21st at 5:24 pm, he was sitting on my knee, and he just stopped blinking and he passed away. There was no indication that he was sick or he was going to pass away, and he didn't have any heart conditions.

Wayne Lenhardt

Yeah. He did have some sort of conditions though, did he not?

Samantha Monaghan

He did. He had fumarase deficiency and polymicrogyria, but it doesn't affect the heart. And it wouldn't cause him to have blood clots or anything like that.

Wayne Lenhardt

Okay, and how old was he when this happened?

Samantha Monaghan

He was 11 years old. It happened 12 weeks after the blood transfusion.

Wayne Lenhardt

And I understand he died of cardiac arrest.

Samantha Monaghan

That's what my doctor thinks he had passed away with. But the autopsy said that he passed away from underlying condition.

[00:05:00]

Which possibly could have been because I didn't have anything tested or any means to test his blood after he had the blood to make sure that his blood was okay.

Wayne Lenhardt

And you had rallied some people that had the same blood type as he did, and I understand you have the same blood type as he?

Samantha Monaghan
I have O positive, yeah.

Wayne Lenhardt
And the hospital either didn't want to, or wasn't able to use any of your blood, is that fair?

Samantha Monaghan
Yeah, my parental rights would have been taken away if I hadn't chosen to go the route of the blood donation from the blood clinic. I tried to rally them, but there was no way that I could have used my blood or anybody else's blood. My fear was that he would have gotten vaccinated blood and then he would have died from that.

Wayne Lenhardt
I think I'm going to stop and ask the commissioners if they have any questions or any issues they'd like to explore on this.

Commissioner Kaikkonen
You made a comment, your parental rights would be taken away. Can you add to that and just let us know how?

Samantha Monaghan
Well, if I didn't agree to the blood transfusion, the pediatrician on at that point in time said that my parental rights would have been removed and I would have to leave the hospital. And Luke would have ended up getting the transfusion anyways. So I decided to stay and okay the transfusion under duress.

Commissioner Kaikkonen
So just to make sure I got this right, the pediatrician said that if you didn't agree to a blood transfusion that—

Samantha Monaghan
Yeah, there wasn't any option. I couldn't use my blood, nor could I use the donors' or anybody else that would want to donate to my son. The only option I had was to use blood from the Nova Scotia blood bank. There was no talk. There was nothing: either I did it this way, or they would have took my parental rights away and I would have ended up having to do it anyways. He would have ended up getting the blood transfusion.

Commissioner Kaikkonen
So did Canadian Blood Services and Halifax inform you that there is an option for putting your blood aside when you're expecting to have some sort of blood transfusion in the future?

Samantha Monaghan
No, I wasn't given an option.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Yes, Dr. Massie.

Commissioner Massie

I have a question about the underlying condition or the situation that actually led to the necessity of blood transfusion. Are they related or are they completely two separate medical conditions?

Samantha Monaghan

Fumarase deficiency controls the Krebs cycle, so it could have been a factor for his iron getting low, his ferritin getting low. But he never had hemoglobin getting low because of his condition before. His survival rate was infancy, and he was 11 years old. And I did all natural treatments with him.

Commissioner Massie

My other question, you had concern about getting blood from the Canadian blood bank. What was the kind of information that you gathered in order to raise some questions about that?

Samantha Monaghan

It would have been what was in the vaccine that was killing people or making people sick. My worry is that it was going to be in the blood if it was infused out, spike proteins or graphene oxide would have been in the blood that would have harmed him in some way.

Commissioner Massie

Thank you very much.

Wayne Lenhardt

Are there any other questions from the Commissioners? One question that I have is what was on the documents as to the cause of death of your son?

Samantha Monaghan

"Underlying conditions," I do believe.

Wayne Lenhardt

Okay. Any last questions? No. Okay, I want to thank you very much on behalf of the National Citizens Inquiry for giving us your testimony today. And thank you again.

Samantha Monaghan

Thank you very much. Thank you.

[00:10:00]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 5: Dr. David J. Speicher

Full Day 2 Timestamp: 06:00:07–06:44:31

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Welcome back to the National Citizen Inquiry. My name is Wayne Lenhart, and our next person to testify is David Speicher. David, can you hear me?

Dr. David Speicher

Yes.

Wayne Lenhardt

I can hear you. I believe you have some slides set up with AV here. So I'll just quickly introduce you, and then you can launch into your presentation [exhibit number unavailable]. You did your university, I believe, in Ontario. You have a PhD from McMaster.

Dr. David Speicher

No. No, I do not.

Wayne Lenhardt

Okay, you have a doctorate from somewhere. Can you tell me where that is, please?

Dr. David Speicher

I will launch into my slides, if can you see them?

Wayne Lenhardt

We've got your first slide. But before we do that, could you spell your full name for me and then I'll do an oath with you.

Dr. David Speicher

Dr. David Jeremiah Speicher, it is D-A-V-I-D S-P-E-I-C-H-E-R.

Wayne Lenhardt

Do you promise that the testimony you'll give today will be the truth, the whole truth, and nothing but the truth?

Dr. David Speicher

Yes, it is. Absolutely.

Wayne Lenhardt

Thank you. I see from your slide there, you're a visiting professor of health science at Redeemer University in Ontario, and I believe you have a position at McMaster as well.

Dr. David Speicher

No, I used to. So if I can go to my next slide.

Wayne Lenhardt

There it is.

Dr. David Speicher

My undergrad is in Biology at Redeemer. I have stuttered my whole life. It gets worse when I'm tested up. And that is okay. I know my things well. I have a Master's in Diagnostics of Coronaviruses, and a PhD in Viral Diagnostics, both of which are from Griffith University in Queensland, Australia. I have worked in Kenya, India, Australia, Egypt, and here in Canada. I've done two post-doctoral fellowships at McMaster University, in molecular microbiology and in epidemiology.

I have run as a lab director two COVID-testing labs during the pandemic, doing between 5 and 15 thousand PCR tests per week, all on asymptomatic transmission. I have taught at Redeemer University since last fall in the courses of microbiology, genetics,

[00:05:00]

and PCR testing. I am now a visiting prof here in a paid job. And to disclaim: I am a co-applicant on a new SSHRC [Social Sciences and Humanities Research Council] grant a few months ago.

All of these are all scientific observations I have made during the pandemic. And I have 34 publications. Most, if not all, use PCR. And I have co-authored a method paper with the Wuhan Institute of Virology on Whole-Genome Sequencing of SARS-CoV-2 in Saliva.

Would you like me to keep going and dive into my thing or just my background?

Wayne Lenhardt

I think you are very well equipped to deal in this area, Dr. Speicher. I wonder if perhaps you could go to your slides relating to PCR testing, and maybe we'll have a look at that.

Dr. David Speicher

Sure. I'd like to say, too: I worked on the team that first isolated the virus. I was removed off the team before I could see things. A FOI [Freedom of Information] request has shown that McMaster records has found no responsive records about isolates of this virus apart from this published paper. So, it begs the question: either there's scientific misinformation going on or something isn't right at McMaster for them to give false information on the FOI.

There's been millions in Gates funding poured into McMaster. Millions, including their new NEXUS pandemic hub for \$12 million given to McMaster by Bill Gates to look into COVID-related issues.

There is also a potential conflict of interest. One of their profs in the field of ethics and policy for innovation on their NEXUS hub—before the pandemic—was paid \$278,000. In 2021, this jumped up

[00:10:00]

to \$623,000 and last year \$461,000. She has ties with Bill Gates and the WHO. So are these people funding our Canadian institutions? Absolutely, they are.

I work on PCR. I love it. It's a very elegant, super test. However, it cannot tell us if we are sick. It can just tell us—is this DNA or RNA sample sequence in my sample? And that's it. Is this viral RNA in my sample?

And so, a lot of people on our side, I've heard things said: "PCR assays are 97 per cent false positive. It should not be used." Well, let's not throw the baby out with the bath water.

So all of this occurred in the first paper looking at Sars-CoV-2 by PCR. It was poorly designed and improperly validated and made.

Well, my team put out this. And the main point is the bottom line here: "If someone tested positive by PCR at a threshold above 35 cycles, the probability that said person is actually infected is about 3 per cent."

Why is it 35 cycles? If we go beyond that, it does not work. This is the limit of the detection of the amplification. On the left is right out of the Seegene package insert. These are for E gene, RdRP gene, and the N. These are highly conservative rates areas and great PCR targets. It says below on the left: a positive is anything before 40 cycles. If we look on the right—this is all my own data—and it shows the cutoff limit of detection of the test is 37 cycles.

And therefore, we can't tell. The lower Cts cannot be compared between labs. It's all dependent on when the sample is tested, which swab, the hour things are extracted, amplified, and looked at. And so, a cycle between institutions

[00:15:00]

varies sometimes two or three, sometimes five cycles, and this is why CTs from a clinical lab never report these to a physician. So, a Ct value might change, except a positive in one lab should be a positive in another lab.

So Public Health Ontario put out a report in September of 2020, and said, on the left, any amplification that occurs before 37 cycles is a true positive. If it's between 38 and 40, it needs to be retested.

In my lab, on the right-hand side, this is what we did—if it's two or three [positive genes] before 37, things are positive. And key values are never given out to a physician. We need a better link-up between a physician and the clinical lab, and, too, a PCR assay, most times if it is a true positive with symptoms amplified before 30 cycles. And, therefore, I think we should have had two cut-offs: One between 35 and 37, which is the assay limit of detection—"Is this virus in my sample or not?" And then at about 30—"Is this individual infected or not?"

So, if we look at PCR versus a RATs [Rapid Antigen Test]: Is this thing actually replication incompetent? The PCR is very, very sensitive, although it doesn't tell—is this replication competent? Or is it replication incompetent and, therefore, is not in fact infected? And so we needed to not run things basically off of a single PCR test.

Now, how were our samples worked out? Well, most people drove, in a big line-up, to a collection facility,

[00:20:00]

and they had a nasopharyngeal swab rammed right to the back of their nose. Is this the best test? Sure, it's the gold standard. But if you are sick with symptoms, a simple mid-turb [mid-turbinate nasal swab, MTS] right in here, works just as well.

As well, if you look at the lower right, if you're doing a nasopharyngeal, it's going right in the back: it is 97, 98 per cent. But a mid-swab [MTS] is about 87 [per cent], which is just as good as an oral swab of the mouth. And so why didn't we swab people's mouth, swab inside their nose? And not ram things right to the back, and then in some instances cause harm.

This is a case-demic. It's not a pandemic of all sick individuals. We need to work out: Is this individual infected at a low level and has no symptoms? Or do they have a high enough viral load to infect other people?

And if you are infectious, most times you have symptoms. These are all numbers of people with COVID. COVID is a disease, and therefore, you must have symptoms. Except most of these—and all of these case counts—are off of a PCR positive test where the individual is either asymptomatic or with symptoms. Those things were not differentiated at all. And so, this is not just sick folks: these are sick people carrying the virion and those who are not sick.

We've all heard of HPV, which is the cause of cervical cancer. HPV is found easily on your forehead, on your hands, on your skin. Unless it infects your cervical cells, it will not cause harm. Therefore, I don't care if you are infected or if you have it and don't have symptoms. You need to be sick with a high enough load to pass on things to make other people sick.

This brought up the whole thing of asymptomatic transmission. If you are asymptomatic, you could pass on things and make other people sick and “kill Grandma.” And this is highly unlikely.

[00:25:00]

An infectious dose is between 500 and 2000 replication competent virion, which is around a Ct of 24 to 27. Therefore, we must have two cut-offs: one at the 35, which is at the limit of detection; and one at 30—is this high enough to cause someone else to get sick?

The viral load always jumps up within two days before the symptoms, then comes back down around day six to eight. And an individual can be PCR-positive 90 days post-symptoms. This is all non-infectious, non-replication competent virion being sent out of the system.

Therefore, asymptomatic transmission is rare. If you are sick, you don't lock down an entire city. If you are sick, stay home. It's that simple.

Last point: rapid antigen tests. We've all seen them; we've all done them. You stuff things in, you add the stuff, wait 15 minutes. If you don't do it right, if you don't add enough stuff, or if you add too much sample, if you don't add any stuff first: these here will give a false positive test.

And Public Health knew this. We were all informed. These are a cheap, quick screening tool. They are about \$16 per test. A PCR test is between \$50 and \$100 per sample. However, a rapid antigen test has a limit of detection of about 1 million viral copies and that's it. One million, which is around a PCR cycle between 25 and 21.

Therefore, you will develop symptoms before these here turn positive, except for Delta. And therefore, a RAT test should never have been used on people which are asymptomatic and only in people with symptoms. A RAT is a presumptive test, and any positive test must be confirmed by PCR.

Now, last point. We have wasted millions on PCR testing

[00:30:00]

of people which were asymptomatic. These should only have been used on people with symptoms. There's been five or six non-health care providers that have set them up and most of those are now shut after the PCR has been pulled. They did between 5,000 and 15,000 tests per week and charged between 50 and 100 bucks per test. You can work out **the math on how much they made.**

And so they are now folded. Most of those said, “Oh, we'll do asymptomatic testing to take things off of our main hospital labs.” They made millions.

As soon as PCRs ended, they were pulled. There were five Thermo Amplitude systems set up across Ontario in our government labs. They were about \$500,000 per system and can just run a full plate of 384 samples per plate, 10,000 bucks per run. And if someone messed something up and you had to repeat the whole thing, you've just wasted \$10,000 of taxpayers' money.

Most of these systems have not been used since April of last year, April 2022. And there are thousands of expired reagents sitting on shelves, all purchased by taxpayer funding.

Therefore:

Bill Gates has infiltrated most of our institutions to push these vaccines.

The PCR is an elegant, sensitive lab technique when it is used right and not to inflate numbers of asymptomatic folks with COVID when they aren't actually sick.

We don't need a nasal pharyngeal swab if a mid [MTS] or an oral swab will suffice.

It's not a high cycle count thing, which I've heard some folks say. Any sample beyond 35 cycles should not be called as a positive test ever.

We need more relations between a clinical lab and bedside to work out if they are "infected" or if they are "infectious," and not rely just on the PCR test for our numbers to represent a pandemic.

And a PCR and a RAT

[00:35:00]

should only have been used ever in people with symptoms.

That is all I have. And I am more than happy to answer any questions from anyone, ever.

Wayne Lenhardt

Are there any questions from the Commissioners? Yeah, Dr. Massie.

Dr. David Speicher

Dr. Massie.

Commissioner Massie

Thank you, Dr. Speicher, for your presentation. I have a couple of quick questions. First one is about the comparison between the rapid antigenic tests and the PCR.

It was argued by some people doing, I would say, monitoring of the epidemiology that, **although the PCR test was more sensitive than the rapid antigenic test, the advantage of the rapid antigenic test is that you would get the answer immediately instead of waiting for whatever—sometimes it was days, depending on the system you were relying on. And it would give you the answer: Am I infectious now? Versus, am I potentially infectious? And I would get the answer by the time, I don't know, I'm isolated or I risk contaminating other people.**

For the management of this kind of— If one assumed that any contamination has to be avoided at all costs, which is a different topic altogether, having a rapid response to tell the people, "Okay, you have symptoms; you seem to have the virus because we can detect the antibody. You can self-isolate for a couple of days and wait until you're no longer infectious."

So why is it that this has not been more readily implemented? Because I don't think that the delay between the time the PCR was available and the rapid antigenic test was made public to people was that significant in terms— So why is it that we have not proposed this approach instead of the massive PCR testing?

Dr. David Speicher

What is your question simplified, Dr. Massie?

Commissioner Massie

What I'm asking you is—were we technically limited in the deployment of the rapid antigenic tests? And that would explain why it took so long before we had them available? To my knowledge in Canada, I don't think we've seen cases where the monitoring of the waves of infection was relying on this method versus the PCR. The PCR had always been the gold standard to monitor the number of cases.

Dr. David Speicher

It is the gold standard. And you're right there. A PCR test is made faster; it's much more easy to make and to use. Our first tests were deployed around late March, most of which are lab-developed tests. I think, though, that if we are looking at infectious loads, a rapid test is actually better. Because if you are sick and you have a high enough load, you will get a positive test. But if you are before symptoms when it's low or you are post-symptoms, you're not going to get a positive test. And so, there is a very short step, a shortened

[00:40:00]

window of about five days when they are actually useful. And that's it.

Commissioner Massie

My other question has to do with following of the different way that we always focus on cases based on PCR positivity. If we're not arguing at this point about the threshold that has been established and was not well-communicated—sometimes it was higher; sometimes it was lower, we didn't know. But my point is: If you want to look at historical data since the beginning of the pandemic up to now, why is it that we don't see more frequently what I would call the positivity rate, which is how many positive cases you get per number of people you've tested? Because if you want to compare whether you are in a very big wave or small wave, you could be misled by the number of tests you're doing.

So why is it that this was not implemented from the get-go?

Dr. David Speicher

It should have been. I talked early on with a colleague and I'm like, "Why are we calling all of these 'COVID-positive tests' and not a 'SARS-2 positive test?' One has symptoms and one doesn't." It was all because "COVID" would make things easier. And I'm sure it also inflated the count from a lab. All we receive is a tube with a name, date of collection, birth date, and that's it. There's no vaccine status; there's no symptoms. And all we give back is a positive or a negative result. And that's it. And so, it could be a positive with symptoms or without. On a lab end, we have no idea at all. That is all the physicians.

Commissioner Massie

Thank you very much. Thank you for your answer.

Commissioner Kaikkonen

I have more of a comment. I just want to applaud you in speaking or confronting the stereotypes that go along with stuttering. You did a great job and you're certainly a prime example of someone who pursued education and stands as an equal. Thank you for your testimony.

Dr. David Speicher

Just for the record, I thank you for that. I have now lost five jobs during the pandemic because of my stance on things. So you just have to keep fighting and keep to the scientific facts, that's it.

Wayne Lenhardt

Are there any other questions from the Commissioners? No.

Dr. Speicher, I want to thank you very much for your testimony today on behalf of the National Citizens Inquiry. Thank you for coming.

Dr. David Speicher

Thank you so much. Thank you.

[00:44:35]

Final Review and Approval: Margaret Phillips, September 24, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 6: Jean-Philippe Chabot

Full Day 2 Timestamp: 06:44:50–07:28:08

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Good afternoon, Mr. Chabot. Can you please spell and state your name for the record?

Jean-Philippe Chabot

Yeah, it's J-E-A-N, dash, P-H-I-L-I-P-P-E. Chabot, C-H-A-B-O-T.

Kassy Baker

I apologize for my mispronunciation. Do you promise to tell the truth, the whole truth, and nothing but the truth regarding your testimony to us this afternoon?

Jean-Philippe Chabot

Yes.

Kassy Baker

Very good. Now I understand that you were employed by the CBC and that you were subsequently suspended because you refused to disclose your vaccination status. Is that correct?

Jean-Philippe Chabot

That's correct.

Kassy Baker

Before you tell us a little bit more about that experience, can you just start by telling us a little bit more about yourself? I understand that you're married, is that correct?

Jean-Philippe Chabot

Yeah, I'm married. I have four children: three girls, ages seven, five, three, and a seven-month-old boy. I'm a French Canadian. I was born in Montreal in 1982. I've worked as an analyst most of my career, including 10 years in mainstream media. Software quality analyst, mostly.

Kassy Baker

Very good. And were you trained for this line of work or how did you come to have this profession?

Jean-Philippe Chabot

Yeah, I had a little bit of training, did a little bit of computer science in CÉGEP [Collège d'enseignement général et professionnel]. But mostly I'm self-taught. I mostly learned on the job.

Kassy Baker

Very good. When did you first start working for the CBC?

Jean-Philippe Chabot

I joined the CBC in 2018, specifically, Radio-Canada's Médias numériques. And by the way, I'm going to be saying CBC a lot. But most of the time I mean CBC/Radio-Canada. So I joined the Médias numériques, which is where they do most digital projects for the French-speaking audience. So websites, mobile apps, all the infrastructure underneath the streaming services. Myself, I worked mostly on TOU.TV when I was there. So it's the equivalent of CBC Gem. It's the streaming service, the French streaming service.

Kassy Baker

I understand from your description that this was a largely digital role or something that you largely performed with computers. Is that correct?

Jean-Philippe Chabot

Yeah.

Kassy Baker

Where were you required to perform these duties?

Jean-Philippe Chabot

Well, when I joined, we were at the office in Montreal. But when the pandemic started, I was on parental leave. And when I came back from parental leave, everyone was already working 100 per cent from home. Everyone at Médias numériques.

Kassy Baker

When you returned to work after the pandemic had started, were you able to fulfill all of your duties from home or only most of them?

Jean-Philippe Chabot

Oh, yeah.

Kassy Baker

Sorry, all of them?

Jean-Philippe Chabot

Yeah, all of them we could fulfill from home. There was no use case that required me to go on the premises. And it was the same for almost everyone.

Kassy Baker

And so, most employees at that point in your division were working from home at that point. Is that correct?

Jean-Philippe Chabot

Yeah, to my knowledge all of them. All of us were working at home.

Kassy Baker

Prior to having left for a parental leave and the onset of COVID, what was your relationship like with the CBC, your employer?

Jean-Philippe Chabot

Well, I really enjoyed working there. I would describe it as an extremely positive experience. Professionally, it was an ideal place for someone in my field because there were many issues to tackle and a lot of freedom to use our creativity, our problem solving. It was just incredibly positive. For me, it was a source of motivation that it's a public entity. I felt like a civic responsibility working there. So that was important. Overall, I felt it was an important institution. And the work we did there, even though it's not life or death deciding services that we worked on, but it's every Canadians': we're all co-owners of the CBC and what they produce there. So that felt good working on that kind of thing.

And overall, like the culture there, the attitudes of my colleagues, they were a good fit.

[00:05:00]

The three years and a half that I was there, I met a substantial amount of people that I really enjoyed working with and being around. It's basically where I wanted to be for the rest of my career. I just loved it there. I made plans to keep working there, and it didn't happen.

Kassy Baker

Alright, so you are no longer working for the CBC at this point in time, correct?

Jean-Philippe Chabot

That's correct.

Kassy Baker
Why is that?

Jean-Philippe Chabot

Well, they implemented mandatory vaccination, and I didn't disclose my vaccination status. I was put on indefinite leave without pay for a while. But overall, all the measures they took for that policy, it just led to me not being able to continue working there or to work there ever again, I feel.

Kassy Baker

When was the idea or the suggestion of a vaccination policy first raised or introduced by your employer?

Jean-Philippe Chabot

Well, we'd have to go back to spring or summer of 2021. During that time, mandatory vaccination, or just vaccination in general, was a heavily discussed topic. I think it's June or July, the CBC felt compelled to, at one point, state its position on mandatory vaccination on the internal employee website. They posted a statement that basically said that vaccination was a personal choice and that they couldn't impose it unless a law was requiring it. So that's the first time we started hearing about it internally. So, yeah, that's the first time.

Kassy Baker

Obviously, at some point, that policy changed. When did that policy change?

Jean-Philippe Chabot

Well, not long after that. I think it was the early fall or the end of August or September. I was hearing the federal government talking about mandating the vaccines for federal workers. So I was concerned. Even though the CBC stated that it was a personal choice and that they couldn't impose it, I wasn't really reassured by that. But at one point, the CBC announced that they would ask us to disclose our vaccination status. I think they announced it at the end of September, and on October 1st, we got the form that we needed to fill to disclose our status.

Kassy Baker

Did you complete the form?

Jean-Philippe Chabot

No, I didn't complete it because I didn't want to disclose. I didn't think, at that point, it was even in their right to ask for our vaccination status, which I consider to be personal medical information. So I didn't disclose. And on the form, there was not even an option, something like—I opt out; I prefer not to disclose. There wasn't that on there. But I screenshotted the form and photoshopped in an additional option that said I prefer not to disclose. That's what I sent in just because I didn't want them to accuse me of not replying. So I did reply in that way.

Kassy Baker

What response did you receive when you submitted this altered form?

Jean-Philippe Chabot

They acknowledged my response, and they basically just said thank you. But at that point, they had already given us a deadline up until October 31st to do it. But, yeah, they acknowledged it.

Kassy Baker

I understand you did some research in coming to the decision of whether or not you would complete the form. Can you tell us a little about that?

Jean-Philippe Chabot

Yes. So the reason I didn't want to disclose, like I mentioned earlier, I didn't think they were in their right. And that's because I'd found out on the CRHA website, which is the l'Ordre des conseillers en ressources humaines agréé, which is a professional association in Quebec— Well, I guess these HR directors, there's a few of them, but those that were communicating this stuff to us at the CBC,

[00:10:00]

I guess they were part of this association because they have this title in their signature, CRHA.

So they put out a statement, not a statement but more like a dossier, like a webpage with information on vaccine status disclosure. And in there, it said very clearly that disclosure had to be voluntary and that no reprisals could be brought upon an employee who refused to disclose. They cited different laws: they cited the Charter; they cited the Code civile du Québec and other laws. So I felt pretty confident that I was right, that I didn't need to disclose. Like I said, I was working remotely, so it didn't even matter whether I was vaccinated or not for me at this point.

Kassy Baker

If I understand correctly, the form was due October 1st, is that correct? The disclosure form.

Jean-Philippe Chabot

Yeah, they sent it to us October 1st, but we had a month to reply to it.

Kassy Baker

When was the mandatory vaccination policy brought into effect?

Jean-Philippe Chabot

Well, the federal government brought its directive for mandatory vaccination of the federal— Well, not all federal workers, but it was central administration workers and the

RCMP. That came down on October 6th. I don't know when it was announced, but they had been talking about it for a couple of months earlier. And not long after, October 21st, the CBC announced its own mandatory vaccination policy. Most people had disclosed their status at this point. But this new policy was announced, and we had until December 1st to show proof of having had two doses. This applied to every employee, pretty much like it was announced by the federal government. There were also people working remotely in the central administration, but probably the RCMP, as well. It affected even people who worked 100 per cent from home. So the CBC pretty much copied the federal government in that sense.

Kassy Baker

You've said that the policy required all employees to show that they had received two doses by December 1st or that they would be put on indefinite leave without pay. Was there any option to test instead of receiving the vaccination?

Jean-Philippe Chabot

Nope.

Kassy Baker

I think you've already answered this, but just to be very clear—was there any exemption offered to those employees who were working 100 per cent remotely?

Jean-Philippe Chabot

Yes, there were exemptions offered to everyone, even people working on premises. So you could request a medical exemption or a religious exemption. But what bothered me is that when they announced that, right from the start they said that— Well, medical exemptions, probably they would honour that. But it's rare that people have a medical condition that prevents them from getting those vaccines.

But the religious exemptions, a lot of people applied for them. But right from the start, the CBC told us that very few would be granted. So I don't know. That just didn't resonate well with me. I didn't apply for one myself. That's not the path I chose to defend my case. I spoke to many people who applied for one, and every single one was rejected. Even those who seemed bulletproof, basically, who were signed by their bishop, and they were all turned down. So that was kind of disappointing.

But the way they announced it, I kind of expected that. It was supposed to be based on your sincere belief. So if you hold a sincere belief, you'll be able to get an exemption. But I think there was something else going on with the process. It seemed like it was based on something other than the person's sincere belief—the decision to grant the exemption or not. Some people even received

[00:15:00]

their letter informing them that they were being put on leave without pay. Around November, just before the deadline of December 1st hit, some people even received confirmation that—"Yes, you're being put on leave without pay for not complying to the policy," while they were still waiting for a decision on their religious exemption. So something's not right there.

Kassy Baker

What did you do in those few weeks between when the policy was announced and when it was actually going to be implemented?

Jean-Philippe Chabot

I wanted to resolve this, so I wrote to HR. They had set up this generic email for all of these issues that had to do with the policy. So I wrote to that email and I asked them if it was legal, what they were doing, if it was constitutional. The answer I got back was that it was mandated by the government. So one of those HR directors told me that it had been mandated and that the mandate applied to the Crown. Well, it was mandated through a directive that applied to federal workers, including Crown corporations.

I also brought all these arguments that the CRHA, the l'Ordre des conseillers en ressources humaines agréé, put out; I also sent that to my union. So I was in discussion with both the CBC and my union at that time.

That's also what my union told me: that it had been mandated by the federal government. After that, I asked them— Because I had read the directive. So when they mentioned that, I had already read it. And I knew, at least from what it seemed—and I had other people read it as well, just to make sure—it didn't apply to Crown corporations. It didn't apply to us. It was limited to the central administration and RCMP, and there was no mention of Crown corporations in there.

Kassy Baker

Did you specifically point that out to your employer and to the union that it appeared from your reading that it did not apply to Crown corporations?

Jean-Philippe Chabot

I did.

Kassy Baker

What was their reply?

Jean-Philippe Chabot

Well, I pointed it out to the union. I sent them the text. I basically walked them through it. And my union ignored it. What I asked the CBC—when they mentioned that directive—I just asked them very simply, “Which directive is that? Can you tell me where it says who it applies to, just to verify that it applies to Crown corporations?” And they basically shut the door to any further discussion when I mentioned that.

Kassy Baker

I understand that the CBC also has an appointed ethics commissioner. Did you attempt to raise this issue with the Commissioner?

Jean-Philippe Chabot

Not myself. But because we were able to form a little group of people who were in the same situation, we reached out to each other via different means. I know that one person in the group wrote the ethics commissioner at the CBC and basically showed her that the mandatory vaccination policy violated many, many points in the CBC's own Code of Conduct. I don't remember a reply exactly, but it was something like— Well, she just basically stated that it was out of her purview. She didn't seem to want to get involved with us at all.

Kassy Baker

Okay, and what did you do when the deadline came along finally?

Jean-Philippe Chabot

I'm just checking to see if we missed anything.

Kassy Baker

You mentioned to me at one point that you believed, you referred to the CBC Code of Conduct. I believe that you've mentioned certain criteria that you believed they would be required to meet in order to implement a mandatory vaccination policy. Is that right?

Jean-Philippe Chabot

Yeah, exactly. That's a very important point. One thing I want to mention before that. You know those statements that l'Ordre des conseillers en ressources humaines agréé put out on their website. I found out later that Radio-Canada, in French, put out an article where Manon Poirot,

[00:20:00]

which was the head—I don't know if she's still the head of that order—but she basically stated in the article exactly those points: that a vaccine disclosure had to be voluntary and that no reprisals could come to employees who refused to do it.

So regarding these other points that I brought to the attention of my union— Because the CBC had refused to discuss this with me and since my collective agreement and my contract didn't allow me to represent myself, I had to go through my union. So at this point, I was basically trying to convince my union. And one way I attempted to do this is using Charter law. Because I read that— Well, to me, mandatory vaccination was pretty clear that it was **by itself a violation of your Charter rights. There were limited circumstances under which Charter rights could be suspended, I guess. But from what I'd read, the law really seemed to be on my side. Because I'd read, for example, that it had to be demonstrably justified. It had to be the least infringing measure available. And it had to be proportional. This principle of proportionality, it has to do with the means of attaining an end being no more than what's necessary.**

When I read those things and I considered the CBC's policy and my context—I'm being remote, working from home all this time. I didn't think the policy met those criteria. So I felt pretty confident that if I demonstrated that and showed all that to my union they would have to, even though I knew that they were reluctant. It was obvious that they didn't want to represent me. I thought that if I did the work—that's supposed to be their work—if I did

that, like in a well put out manner, that it would have to represent me. But yeah, that's not what happened.

Kassy Baker

Did your union ever end up filing a grievance on your behalf?

Jean-Philippe Chabot

No, they refused to do it. And I did multiple demands for a grievance. Because initially, I argued on that front using Charter case law—that it was just that the CBC could meet that threshold of implementing mandatory vaccination. They rejected that demand for a grievance based on that. I also asked them to grieve the fact that the CBC was using “leave without pay” as a disciplinary measure, which is not something that's in the collective agreement. It's not something that's in my contract, either. But my union basically just said that the CBC was fully in their right in doing those things. They cited a clause, I don't remember exactly, but there's a clause in the collective agreement that says something like, “for every point that's not stated explicitly in the collective agreement, well the employer can do pretty much carte blanche whatever it wants.”

Kassy Baker

When the mandatory policy took effect on December 1st, what happened to you on that date?

Jean-Philippe Chabot

Well, you know, I'd been working from home all this time. So that morning, just like usual—I knew this was coming, and, at that point, I was pretty sure that they would enforce it—but I went on the computer, tried to log in to do my work and meet my team, and all my access were revoked. So even basic things like email, access to the employee portal. Like email and employee portal, I don't think someone— Because usually leave without pay, the employee has to ask for it; it's something that the employee requests. When they do it under normal circumstances, I don't think their email access is cut off. I don't think their access to employee services, like the portal we have, is cut off, either. So seeing all that was kind of a shock. To me, it just meant that they really didn't want us even communicating amongst ourselves,

[00:25:00]

or communicating easily, at least, with each other using our work email. So, yeah, that was a shock on December 1st.

Kassy Baker

What impact did the suspension have on you and your family financially?

Jean-Philippe Chabot

Well, I lost my income. And we didn't have access to EI [employment insurance]. I say “we” because that's basically the experience of everyone I've spoken to that was in my situation. We didn't have access to EI because it was considered misconduct to not comply to these

policies. So having to find work—this was December—so having to find work or other sources of income during the holiday season, that's not ideal.

Kassy Baker

Were you the sole earner of the family?

Jean-Philippe Chabot

Yeah, I was. Yeah, my salary was my family's only income. So that was stressful not only for me but for my wife as well. And when two parents are stressed out or anxious about something like that, about the financial strain like that, it had an impact on my children, as well. And they're young, so they're sensitive to this kind of stuff. They can't understand yet what was going on.

Kassy Baker

Now, something you've mentioned to me earlier that I would just like to talk about a little bit. So you were not dismissed or terminated, but, instead, you were suspended without pay. I understand that you were also required to maintain your insurance and benefits. Is that correct?

Jean-Philippe Chabot

Yeah, that's correct. That's part of the policy. The CBC told us that— Well, they didn't leave us a choice, really. They said, "You will be keeping your insurance and benefits, and the cost will effectively double because we won't be covering half of it," like they normally do. So that was an extra financial burden that they were putting on us. I guess what bothered me about that is that the union didn't bat an eye at that. They seem to endorse that kind of stuff as well.

Kassy Baker

Were you aware of other employees who were similarly suspended as you were on December 1st?

Jean-Philippe Chabot

Yeah, like I mentioned, we were able to organize a small group so that was incredibly beneficial because none of us had to go through this alone. I can't imagine having gone through this. I wouldn't be here. If I had gone through this alone, I'm pretty sure I wouldn't be here testifying because it would have made things much, much worse.

I heard their stories, as well. Because I was one of the lucky ones. I found work pretty quickly. I mean, the kind of work I do, there's a ton of demand for it right now. So even during the holidays, I was able to use my remaining vacation time, use just a little bit of my savings to keep everything going, basically feed my family. And then I could work again pretty quickly. Even though I had no EI, it went pretty smoothly. So I'm one of the lucky ones.

But some of the stories I've heard. People were put in very vulnerable positions by these measures. I'll give you an example or two. I know this woman who's 58 and she was employed at the CBC. She has a specialized skill set in broadcasting, TV broadcasting, so

there wasn't any work for her in her field when she was put on leave without pay. She's a single mom. She has a house; she has a daughter in university. So just to keep things together, keep her house, keep her daughter in school, she had to look for a job. Basically, she found a minimum wage job, and she had to burn through all her retirement savings, her RRSPs, just to keep things going. And she's not seeing that money again. So that's one example.

Other examples, well, just in general, there were other measures affecting the unvaccinated at this time. So people couldn't travel.

[00:30:00]

I had a colleague who had family overseas who wanted them to come over because a family member was dying. They were sick. They were dying. They wanted to see their family one last time. This person, on top of being put on leave without pay, they couldn't travel. So that's compounded pressure on these people. That's just horrific.

Kassy Baker

Now, we're nearly out of time. I don't want to rush you, but there's just a couple of more quick points that I would like to talk about. The vaccine policy was actually suspended at some point. I believe you told me it was June of 2022, is that correct?

Jean-Philippe Chabot

Yes.

Kassy Baker

Were you asked to return to work at that point?

Jean-Philippe Chabot

Yeah, I was asked to come back to work after being on leave for seven-plus months, receiving no communication from the CBC. I considered personally myself constructively dismissed at that point. So I told them, "No, I won't come back to work."

And one of the other reasons is that because— They had basically mirrored what the federal government was doing, and the federal directive that applied to federal workers also ended just before the CBC ended theirs. And it was clear in one of the documents that the Treasury Board put out—that they called the manager's toolkit that talked about **people coming back from leave without pay—that they were only suspending the policy. They weren't revoking it. So I couldn't see myself going back there and having this Damocles' sword above my head that this could happen all over again. It was just too much pressure.**

People in my group, some of them wanted to go back. Some of them considered it, but they engaged with the CBC. They asked questions: "Well, if I come back, what will happen? If you decide to bring the mandate?" All that stuff. Well, first of all, the delay that they gave us to come back was very short. So in those short few days or weeks, the people asking questions weren't really getting the answers that they were expecting. The CBC was putting pressure on them, and some of them were resigned. Without even resigning themselves, the CBC just

stopped talking to them, stopped answering to them, and they learned through employee services that they had been effectively resigned.

Kassy Baker

My final question, subject to any questions that the commissioners of course may have, is why did you want to testify today?

Jean-Philippe Chabot

Yeah, so the main reason I wanted to testify was because I want people to be able to have an informed opinion on the CBC and what it stands for. It's an important institution, like I said, and I think you can learn a lot about an organization by the way it treats its employees.

We haven't really talked about this, but the stated goal of the CBC, by implementing mandatory vaccination, was to ensure the safety and the security of its employees in the workplace. So I don't understand why that would apply to people working remotely. I mean, it's not even logical. So it looks like they put aside even the most basic logic in favour of this all-vaccine ideology. Everyone had to be vaccinated. I was supposed to continue working from home. During those seven-plus months, almost everyone in my department was working from home. Here and there, people who wanted to could go to the office. But they were allowed to work from home during all this time. Even today, remote work continues. This had been communicated to us that the remote work would continue, by the way, even before the policy began. So everything pointed to remote work, and this is what the union should even have pushed for. There's no better measure to ensure the safety and security of people in the workplace than remote work.

So I don't know why they coerced me. But when you have a stated goal that there's no logic with the measures you're taking—this has to do with also being demonstrably justified and the least infringing and all that stuff. If they followed the law, they would just have kept the status quo and allowed me to continue working from home. But they didn't. So that really bothers me.

[00:35:00]

And to me, it feels like that's not the real goal. The official one that they stated is not the real goal. It bothers me that the CBC seemingly tried to use one ostensible purpose "safety in the workplace" to make this policy appear acceptable, while they don't disclose the real reasons behind it.

So I want people to think about that and to reflect on the fact that, yes, you can learn about an institution or any organization as a whole by the way it treats its employees. There was no justification to treat us this way, to prevent us from keeping working from home. And I wonder, I want people to ask themselves—if the CBC can't be trusted to be ethical in the way it treats its employees, people should ask themselves if it can be trusted to be ethical in its other activities, including news reporting and all that stuff.

So that's the main reason I wanted to come and tell this story.

The other reason is because I don't know how many people the CBC coerced into getting these vaccines. I know some people didn't want them and some people had to betray their own conscience to comply to the CBC's policy. So those people, I want to acknowledge that

they exist. I know that some of them have been harmed physically by the vaccines. I wish I could have reached out to them just for mutual support and to tell them that they were not alone. So those are the reasons.

Kassy Baker

Thank you. Okay, there's one question. Please go ahead.

Commissioner Massie

Thank you, Mr. Chabot, for your testimony. Do you consider yourself as an informed citizen?

Jean-Philippe Chabot

Yes, yes, I do. I'm an analyst by trade, so I'm used to dealing with information in general, and I'm someone who grew up with the internet at their fingertips. So, yeah, I do consider myself pretty informed.

Commissioner Massie

What kind of research would you have done to raise doubt about the vaccination to the point that you were willing to put everything on the line not to get vaccinated?

Jean-Philippe Chabot

Very simply, I just thought that the risk-benefit ratio was not in favour of the vaccines at all, at all. The risks were scary, and the benefits, I didn't see any evidence of that. The CBC, when they tell you, "Well, we have this objective of ensuring safety and security in the workplace," I would assume that they would show evidence that it has an effect on safety and security in the workplace. I haven't seen that evidence myself. And the CBC certainly hasn't produced any to show to its employees. So from the research I did, the benefits didn't seem to be there, and the risks seemed huge. I have four young children—so I can't afford to be injured or killed by these injections and leave them without a father. So for me, it was out of the question, mostly because I'm a father and I didn't want to put that risk.

Commissioner Massie

Did you have the opportunity to discuss your analysis or your questioning with some of your colleagues within your environment?

Jean-Philippe Chabot

Yes, I did. I discussed it. It's something I talked about openly with my colleagues. But my environment was—we were not news people. We were analysts, programmers, project leaders, and our world, it's digital. And most people there already had gone and gotten two doses of their own volition. People were scared at that time. They weren't really open to—Even though I thought my arguments were good, now is a much better time to use reason. People are much more open to those kinds of arguments. So I wasn't able to have a huge impact, even though I tried.

But yeah, it's sad because even though I discussed it, and I discussed not only the reasons for not getting vaccinated—the risk–benefits and all that stuff—I also discussed the ethical implications.

[00:40:00]

People at the CBC, not just people close to me but people in general at the CBC—what I heard from my other colleagues who went through this—there was very much a lack of empathy and indifference over there. Friends that I'd been friends with for 10, 15 years, I mean, people who actually got me to join the CBC, and I was very close with, who just willfully looked the other way while this was going on. I lost those friendships. That's the same experience my other colleagues have gone through. So yeah, at that time, most people over there were really in the narrative. I've wondered a lot about why that is: why did people stick to that narrative and have this very narrow way of navigating through it?

Commissioner Massie

What is your current condition with respect to your family or people around you? How do you feel about the decision and even though it was somewhat hurtful, how do you feel about the whole situation right now?

Jean-Philippe Chabot

Yeah, it went good for me. I found work. I found a consulting firm that hired me, and they gave me a contract for a big bank. And while the CBC had mandatory vaccination in place, at that bank, even though it was mostly remote work, I could go meet my team. And I did. There was testing that was offered to people who weren't vaccinated, and we could meet in the office. You wore your mask when in the corridors and when you're in the meeting room with your team, you can take off the mask. And really quickly even that requirement of testing went away. I don't know if it's because public health guidance changed, but the experience I had in that bank was so refreshing because it was a good example, basically, of proportionality. They didn't go beyond what was absolutely necessary and what made sense.

So really quickly, even though I was unvaccinated—I couldn't go in the CBC—I could go meet my team there at the bank and work remotely. People had such a different culture. It didn't really matter to anyone. They hadn't been subjected to this very strong pro-vaccine bias that was present at the CBC. So it was an incredible experience to get out of the CBC and feel like in a normal work environment again where it's just not a concern. So that was good. I don't work for that bank anymore because I went on parental leave again. But I'm still with the consulting firm and am very happy now.

Commissioner Massie

Thank you very much.

Jean-Philippe Chabot

Thank you.

Kassy Baker

Very good. On behalf of the National Citizens Inquiry, I'd like to thank you very much for your testimony here today.

Jean-Philippe Chabot

Thank you.

[00:43:30]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 7: Dr. Edward Leyton

Full Day 2 Timestamp: 07:29:38–08:27:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is Dr. Edward Leyton, and Dr. Leyton, I thank you for your patience. You were scheduled this morning, and we kept bumping you back.

Dr. Edward Leyton

I think I can get into my doctor sooner than that. I've had to wait.

Shawn Buckley

I'm sorry?

Dr. Edward Leyton

That's a joke.

Shawn Buckley

Yeah, can I ask you to start by stating your full name for the record, spelling your first and last name?

Dr. Edward Leyton

Edward Leyton, E-D-W-A-R-D L-E-Y-T-O-N.

Shawn Buckley

Dr. Leyton do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Edward Leyton

I do.

Shawn Buckley

Now I want to introduce you a little bit, and then I'm going to let you tell the evidence that you've come to share with us today.

You had practised for a full 40 years as a complementary and alternative medicine physician. You graduated from medical school in 1975. You practised medicine. You focused on chronic illness and psychotherapy; you're practised in those areas also. You actually retired just before COVID hit, back in 2018. And then when this global pandemic starts, you thought, okay, I better renew my licence and go and help because we're facing a crisis. Since you renewed your licence, I want you to start from there and share with us then what was your experience like going back and where did that lead you?

Dr. Edward Leyton

Okay, thank you. Thank you for the opportunity, Commissioners, and thank you for doing this. Good afternoon to the audience.

So yes, I decided to go back in 2020. It was mainly to help out with COVID stress-related illness, and I did that for about the first eight months. I was treating people with psychotherapy, which was my focus. And that went on for that length of time.

I do want to make a little disclaimer before I start. That this is my personal experience that I'm talking about today, and it doesn't in any way represent an official corporate response of the Canadian COVID TeleHealth (CCTH) group of which I was a part. I was a director for a number of months. So I just want to make sure that that's the case. I guess I'm ready with slides.

Shawn Buckley

Yes, please start your slideshow. They'll show up on your computer screen and that will tell you they're on the screen behind you also.

Dr. Edward Leyton

Yeah, the screen is up. Okay, great, thank you.

So I'm going to talk about why I treated COVID-19 and long COVID and what was the response to treatment. And also, how did the media and the CPSO—which is the College of Physicians and Surgeons of Ontario, which is the regulating body of physicians that acts under the RHPA, which is the Regulated Health Practitioners Act [sic] [*Regulated Health Professions Act*].

So I'm going to be talking about all of those things.

You've got most of my resume already outlined. I want to take you back for a moment to before the College even started. The reason I'm doing this is some people might think that the College and the way they've behaved towards practitioners who are trying to treat COVID is something that started with COVID.

But in fact, physicians have been operating under the shroud of a College which is extremely detrimental towards physicians who are practising alternative kinds of medicine. And this has been going on for a long time.

So this quote here from 1859 will show you that. It's from the York County medical practitioners meeting minutes. And it says, "that the members of the Medical Profession, considering themselves the best, [as] . . . the only true judges of the requisite qualifications of the Art of Medicine claim the power of regulating the amount of those to be possessed by candidates for practice and of granting licences accordingly."

So that paragraph, I think, demonstrates the arrogance, I guess, of the medical profession,

[00:05:00]

thinking that they're the best and that nobody else can come close to them. That was prevalent even in the 1850s when, in fact, medical treatments were pretty primitive. Blistering and arsenicals, and all kinds of things were being used. The germ theory hadn't even been introduced into medicine at that point.

It was clear also that when the College was eventually formed that even legally qualified physicians who wanted to practise what was called heterodox medicine or alternative kinds of practices—that would be chiropractic manual therapies, naturopathy, homeopathy, that kind of thing—they were actually denounced by their colleagues and regulating bodies as violating the terms of their licence.

So this is the shroud of secrecy under which we practise. All doctors practise under this, and many people don't realize that. The College has been investigated on a couple of occasions, two or three occasions actually. I'm going to quote now from an investigation that was initiated by patients and physicians back in around 1998, finished in 2001, and became known as the Glasnost Report—referring to transparency is needed in medicine.

This investigation was headed by a lawyer, now Justice Michael Code, who was a former attorney general, and he investigated the practice of six physicians who had been treating for chronic pain and other difficult situations.

He came to the following conclusion: "These are College-driven fishing expeditions, which are initiated under Section 75"—that's the *Regulated Health [Professions] Act*, section 75—"they can be misused in such a way that they do not serve the public or the evolution of medicine.

"They can ruin the life of the doctor involved and have done so in several cases. It is highly unusual that even people under criminal investigation in prison attempt suicide, yet we know of four doctors who committed suicide while under CPSO investigation. None had patient complaints against them." These are all College-driven issues.

Mr. Code refers to a particular case, saying that this case allowed Mr. Code to assert that it provides "*prima facie* evidence that CPSO officials may have committed the criminal offence of obstructing justice by repeatedly misleading the Executive Committee as to the true state of the evidence in this case."

This is our College—the College that is supposed to regulate practitioners involved possibly in criminal offences, a very serious charge. It's almost impossible to launch a complaint against the College of Physicians and Surgeons. I tried to do that in 1998 around the time of this investigation and was told that I couldn't really launch a complaint against them unless I launched it with the actual prosecution.

So there's no recourse; there's no way of launching a complaint against the College at all. So given that, it wouldn't perhaps surprise us to see the edict that came out in May 2021. I'll just read it because it's probably not terribly clear:

The College is aware and concerned about the increase of misinformation circulating on social media and other platforms regarding those physicians who are publicly contradicting public health orders and recommendations. Physicians hold a unique position of trust with the public and have a professional responsibility to not communicate anti-vaccine, anti-masking, anti-distancing, and anti-lockdown statements

[00:10:00]

and/or promoting unsupported, unproven treatments for COVID-19. Physicians must not make comments or provide advice that encourages the public to act contrary to public health orders and recommendations.

Physicians who put the public at risk may face an investigation by the CPSO and disciplinary action when warranted. When offering opinions, physicians must be guided by the law, regulatory standards, and the code of ethics and professional conduct. The information shared must not be misleading or deceptive and must be reported by available evidence and science.

It's an interesting wording because they use "a position of trust": we have a position of trust with the public and a responsibility not to communicate these things. Do we have trust in the CPSO who are supposed to protect the public and guide physicians? No, we don't. There've been at least two demonstrations by physicians and patients outside of the College in this pandemic, maybe three, and those demonstrations have been met with silence by the College.

In fact, the College has vacated the premises for a number of months during the pandemic because they were afraid that their safety was in danger. So that's the position that we were working under during the pandemic.

This is the position of the CPSO on vaccine anxiety. It's an interesting concept that having anxiety about a new drug—or in this case, quotes "a vaccine"—can be considered an illness, but in this case, it is. Here's one of those statements from their website: "It is [also] important that physicians work with their patients to manage anxieties related to the vaccine and not enable avoidance behaviour. In cases of serious concern, responsible use of **prescription medications and/or referral to psychotherapy are available options.**"

So if I offer you a high blood pressure medication in my office, and I say, "I want you to take this," I would obviously go through whatever is important about the side effects, the positive effects, the negative effects of this medication. And if the patient said, "Well, I'm anxious about that," according to this—and a vaccine is kind of like that—I would have to say, "Well, take five milligrams of Valium and come and see me tomorrow, and you'll feel better about the whole thing." That's what they're suggesting.

In November 2022, they added for some reason, I'm not sure why, the "extreme fear of needles, (trypanophobia)," it's called, or other areas of concern—I don't know what that means—and that we should be treating that with medication or with psychotherapy. Well,

first of all, you can't get a psychotherapist for love, nor money. And second of all, the prescription medications that would be used for that—I'm not sure how I would treat trypanophobia other than by giving a sedative of some kind so that you are half asleep when you have your vaccination. It's really an outrageous suggestion.

And then there is the circumstances of the pandemic which "support physicians declining to write notes or complete forms when the patient is making a request." Usually that's a natural thing that we would do if a patient came with a request to have medical forms completed. They're saying, in this case, you don't have to do that. So you don't have to write prescriptions for exemptions and so on. You have to "sensitively explain to your patient that you can't provide them" with that.

Shawn Buckley

Dr. Layton, can I just ask— Because you practise psychotherapy, I imagine that some patients will legitimately, not just for a vaccine like this, but legitimately have anxiety that reaches a medical condition, a mental health condition,

[00:15:00]

and that it would be reasonable in some situations to exempt people. Is that a fair comment?

Dr. Edward Leyton

To accept people?

Shawn Buckley

No, to exempt somebody. If they legitimately are anxious about it, that could be a valid ground for an exemption, actually having undue anxiety about a treatment.

Dr. Edward Leyton

Yes.

Shawn Buckley

Yeah, but physicians are basically being told no, not for this one.

Dr. Edward Leyton

Right.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

So we weren't allowed to write exemptions unless there was anaphylactic shock. I wrote a couple of exemptions during the first year or two, and it was because of very significant

side effects that I figured might happen as a result of genetic thromboembolic disorders and so on. But I wasn't supposed to do that.

So the other thing about the RHPA in section 75 that's important to know is that section 75 allows the College to investigate our practice completely and to remove files, that is to remove patient files. This has been challenged in the last six months by a couple of challenges.

If you refer to the second paragraph, second bullet point: "about 100 patients of Dr. Sonja Kustka, under investigation for writing two mask exemptions"—that's apparently enough for an investigation—"during COVID, unsuccessfully filed their motion to stop CPSO investigators from gaining access to their private medical records."

I want you to go down to the fourth paragraph, and this reflects the attitude of the College, which I brought up at the beginning, which says—this was the lead counsel for the College. She stated: "Patients should not have any say about their own medical records or how the CPSO wishes to use them when a physician is under investigation for potentially putting a patient at risk of harm."

So to come back to my story. After 2020, when I was practising mainly psychotherapy, I joined a Facebook group in February of 2021. That was just when the vaccines were starting to come in. And the Facebook group was a professional group with, I think, nurse practitioners and physicians. I noticed two things happening. I noticed that physicians and nurses who were actually starting to give vaccines were starting to see side effects, even at that early stage. They would come back with reports of aches and pains, orthopedic issues, arthritic issues, swelling of joints, brain fog, musculoskeletal symptoms, and so on.

Also at that time, ivermectin was being touted as a useful tool in the treatment of COVID, because there was no treatment given. Doctors were told to send their patients home with Tylenol, and they should go to the hospital if they couldn't breathe anymore. That was the only treatment that was on.

So I started to bring up questions on this Facebook page about ivermectin and also about the fact that vaccines seem to be detrimental in some cases. I was immediately pounced upon by a number of people in that group saying, "You cannot talk about this because this is a public health recommendation, and they are our colleagues, and we shouldn't be criticizing them." So naturally, I went on to criticize them and, eventually, I was ousted from the group; I was removed.

So then I joined the Canadian COVID TeleHealth organization. I came to know about it because I started to look into what was going on. I found a group that was definitely on my side and was open to different opinions about things.

[00:20:00]

I also started looking into ivermectin. And several people in the CCCA [Canadian COVID Care Alliance] talked to me about the possibility of prescribing ivermectin, and so I looked at that. And I thought, there's a lot of evidence to show that ivermectin is very useful. One of the people in the group said, "Well, why don't you prescribe it?" So I said, "Well, I'm a psychotherapist. That's my focus."

But I was a family physician at one time, and so I thought about it a lot and I researched it. And so in the summer of 2021, I decided to start prescribing ivermectin. I was fortunate at

that time to be able to be in touch with Dr. Ira Bernstein, who some of you may know was a prominent physician who had been treating COVID quite successfully for some period of time with ivermectin and other treatments. And in fact, he attended the first international conference in Rome and was very up to date on COVID treatment.

So I began to use ivermectin in my private practice and found excellent results. I used it for prevention for simple COVID, which is COVID which we treat in the first few days or one week, and then for more complex COVID, which lasts longer than a week. Eventually, we decided that it would be good to form a clinic.

So a number of us got together and we formed Canadian COVID TeleHealth. This was a telehealth group: We had at that time about half a dozen physicians and an equal number of nurse practitioners and nurses. We operated throughout Canada and we saw patients in every province except Manitoba, which didn't allow us to do telemedicine without a licence. But we could in other provinces.

That went on, well, it still goes on; I'm still prescribing ivermectin. But it went on at a fairly good clip because that was right in the middle, if you'll recall, of the Delta variant, which was probably the worst variant that we've seen. People were getting really quite sick with that. And one of the things that was very noticeable about our patient population is that people were terrified of COVID. They had been completely propagandized, if you like, to believe that COVID was a terrible disease and a lot of people wanted prevention.

Most of our patients called up wanting ivermectin prevention, and we had at that time about half a dozen pharmacies in Ontario and a few out west that were dispensing ivermectin freely. They were compounding pharmacies. They weren't using the Merck product. Merck didn't want us to use their product, so they pretty much stopped making it. But the raw materials were available to pharmacies and pharmacies were dispensing it freely. So we were very busy at that time. And we saw a lot of patients. I myself personally prescribed, I think, around 800, 900 prescriptions for ivermectin over that period of time and on into 2022.

But there was a problem. We had a hit piece in the Global News and also in the *Toronto Star*. The reporter from the *Toronto Star* had impersonated a patient and called our clinic asking for ivermectin. And of course, our physician responded appropriately. And she then proceeded to write about us in the *Toronto Star* and denigrate us as a clinic, saying it was all misinformation and we shouldn't be doing that.

As a result of that,

[00:25:00]

or maybe it was happening anyway, the College decided to raid the office of Dr. Ira Bernstein and that contained the electronic medical records of our clinic. The CPSO went in without asking, without Dr. Bernstein being there, being present. They took all the information, information that they had no business taking. And they used that information to target all of our physicians. They did that over a period of time so that we lost all of our physicians, except myself, over a period of about six months. We also lost nurse practitioners and nurses.

I have to tell you, we had an amazing team of people. We did full assessments on everybody; we did full histories. We couldn't do physicals, of course. But we made every attempt to follow up, and nurses spent hours on the phone, often with patients who were

anxious, and either sick and anxious or anxious about getting sick. We treated them all. It wasn't just ivermectin. I'll come in a moment to how we treated them. But we treated them all.

Then in 2022, of course, Omicron came along, and we actually had a decrease in the number of patients because Omicron was much less—although it was more infectious, it was much less serious. And so people started to accept that they had COVID and they would get over it on their own.

I don't know if there are any questions up until this point and how much time I have. But I'd like to go into some of the treatments that we did and how those worked and didn't work.

Shawn Buckley

I just wanted to ask, how did you guys lose the doctors and nurses after the CPSO? So the CPSO raided, and you said you've lost all of the doctors except yourself. What was the cause of losing the doctors? How did that happen?

Dr. Edward Leyton

Some of the doctors had privileges at hospitals and worked at hospitals. Often the hospitals made complaints to the CPSO that the doctors were either unvaccinated and shouldn't be working or they were prescribing ivermectin. The College took it from there: they either de-licensed them completely or they restricted their licence.

Dr. Bernstein, for example, had his licence restricted. He wasn't able to treat COVID anymore. He wasn't able to use ivermectin, and he had to put a notice up in his office saying, "I do not treat COVID."

Shawn Buckley

So these are medical doctors.

Dr. Edward Leyton

Yes.

Shawn Buckley

That are fully licenced.

Dr. Edward Leyton

Yes.

Shawn Buckley

There are not complaints against them by patients.

Dr. Edward Leyton

No.

Shawn Buckley

And basically, their right to practise is either fully or largely restricted.

Dr. Edward Leyton

Correct.

Shawn Buckley

Just because they are treating COVID patients in this clinic.

Dr. Edward Leyton

Yes.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

The other thing, for example, I don't know if Dr. Patrick Phillips testified. I think he did. For example, he and Dr. Hoffe out west both reported side effects from vaccines because they were both emergency physicians, reported that to public health. As a result of that, they lost their jobs and couldn't work. So it was either the hospitals complaining or it was the CPSO saying that they couldn't prescribe ivermectin.

Shawn Buckley

Now, just so that it's clear—especially for people that are participating online to watch your evidence—my understanding, though, is that it's federal law that a physician is to report a suspected vaccine injury.

Dr. Edward Leyton

That is correct.

Shawn Buckley

You just cited the names of two physicians that were disciplined for following the law?

Dr. Edward Leyton

Yes.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

Who should really be disciplined is the CPSO for not following the law.

[00:30:00]

So we treated COVID using the Frontline COVID Critical Care Alliance protocols. Now, the Frontline Critical COVID Care. You've heard from Peter McCullough. You're probably aware of Dr. Pierre Kory and Dr. Paul Marik: these physicians were ICU physicians, intensivists, boots on the ground people, who saw that something was wrong and wanted a primary treatment for COVID, found out about ivermectin and did very thorough research into that. We're extremely grateful to them for putting together protocols that we could use. These protocols came from physicians all over the world who were communicating with Dr. Kory and Dr. Marik. They were very thorough, and they worked well.

So you can see that we divided treatments into prevention, early treatment, and complex COVID. I'm not going to go over those treatments. And I don't expect you to read the protocols, but we used to send the protocol to the patient after each consultation so they knew exactly what to do and how to manage it.

We treated viral entry points because there was some research that showed that this was very important. Because the virus starts in the nasal passages and that's where you need to treat it first of all. So we used simple things like povidone-iodine sprays and cetylpyridinium chloride, which is in things like Scope and Act.

We also had a cocktail of immune modulators. I don't like to use the word booster because you don't always need to boost your immune system. But what you do is you give the body the orthomolecular ability to correct whatever is wrong with the immune system by using these kinds of things, and they would include, of course, vitamin D, zinc, quercetin, sometimes melatonin. We also sent patients home—sent patients home, I think I'm seeing them in my office. We also gave patients over the internet things like this: this was a home treatment put out by the World Council for Health, which was a really good home treatment that people could follow.

So we made sure that not only they got the treatments; they knew how to take care of themselves and that we followed up with them. Some of the nurses were on the phone with them two, three times a week reassuring them that they were doing okay. And of course, in the more advanced cases, we had to measure oxygen uptake, and sometimes, we even had to give IV fluids. And this was all through home care that we had to arrange for them because we weren't physically present in the same city as them.

As I mentioned, the patient volume dropped with Omicron, and that was a good thing in some ways. And now, we don't even actually give ivermectin for prevention anymore because the virus is pretty mild.

So in October of 2022, I got the dreaded section 75 from the College of Physicians and Surgeons. They started an investigation into my practice. There was no patient complaint: I've practised for 40 years without a complaint. There was no patient complaint in this case. They sent me 400 pages of documents to read, most of which were propaganda from Health Canada about ivermectin. They didn't really send me anything substantial in terms of research. The complaint was that I was prescribing hydroxychloroquine and ivermectin. That was it. They were correct; that's what I was doing. But it's not illegal to do that. It's what's called off-label prescribing. Happens all the time.

Example: Metoprolol is a blood pressure medication.

[00:35:00]

It's often used for stage fright. Doctors do that all the time; they prescribe off-label because there are indications that it might help other conditions. That is exactly what ivermectin is: ivermectin is a safe, widely used drug that's been used for many, many years, particularly in the tropics for river blindness and, sometimes, here in the west for scabies. Very safe and very available.

When Omicron came along, we also started to see a number of patients who were vaccine-injured. The Front Line Covid Care Alliance, once again, started to put out protocols. Now you have to remember that vaccine injury is something we knew nothing about. Until a vaccine came along, it didn't exist. So here we are, faced with an illness that nobody knows anything about.

It has extraordinary breadth of spread in terms of what it does to the body, and we didn't know really how to treat it. So again, we relied on the Front Line COVID Care people to gather information again from the rest of the world about vaccine injury. And they put together some protocols.

It turns out that ivermectin also binds spike protein. The spike protein is the protein that the body makes as a result of the vaccine.

Of course, we were told that the spike protein was short-lived: it didn't live in the body; it just stimulated the immune system, stayed in the shoulder, as did the mRNA. Neither of those things were true. The spike protein goes into every tissue in the body, including the brain. It's been found there in pathology and histology slides. You can stain for it. We know it does that.

That's why we see so many symptoms throughout the whole body. We get brain fog; we get things like POTS, which is orthostatic hypertension. It affects the autonomic nervous system. The spike protein can affect the neurological system. It's all over the place. So these are some of the things that we used for treating that.

I want to give you a couple of case histories just to finish up here. I don't want you to get the impression that this is easy to treat. Acute COVID was relatively easy to treat because it worked really quickly, and you knew when you were over it.

Vaccine injury is completely different. It's a complex illness about which we knew very little. I would say that in my experience, treating vaccine injury, probably 50 per cent of people respond to treatments. It often takes a long time and a lot of work on the part of the patient, as well as the practitioner.

[Case #3—Vax Injury]

This is the case of a 40-year-old mother breastfeeding a 19-month-old child. She had an immediate reaction to a mandated Pfizer vaccine in January 2022. These are some of the symptoms. You can see them there. The main ones were chest pressure and facial rash, cold extremities, twitching all over the body.

These are symptoms that we generally don't see as physicians. If you saw this as a physician and you had no knowledge of the fact that they had a vaccine, you would say, "What kind of illness is this that does this?" Completely new.

A lot of those symptoms are neurological. They affect a nervous system—shooting pains, paresis, weakness of the limbs, difficulty getting up and moving around. And the tests are often normal. This lady's vitamin D was low and her nutrition wasn't that great.

[00:40:00]

She says after three and a half months, she was left with “intermittent pressure, tightness and numbness in face, head, neck and soft tissues inside the mouth. Chest pressure feels like squeezing and a push [outwards that made] me dry cough. “

Can you imagine having chest pressure and going to the emergency, thinking you’re having a heart attack and being told, “No, it’s not a heart attack. We don’t know what it is, but just go home, take some Advil.” Now it could be myocarditis. It’s possible; sometimes it’s not. But it would terrify you, and especially, it would terrify you not knowing what that is.

[Video from patient]

So this patient had some changes in her extremities. I’ll just demonstrate for you. Normally when you hold your hand, for example, at heart level, your veins are not filled because that’s the blood going back to your heart. When you drop your hand down below heart level, your veins will fill up. But you’ll watch this video; you’ll see that her veins and her skin and the swelling in her hands develops as she drops her hand. So there you see the normal hand and now you’ll see the veins filling. Some of this is normal; veins will fill up. But you see how engorged they become and then the swelling and the redness of the knuckles. Very bizarre symptoms that you might not see, that don’t fit any disease category at all.

So we treated her with ivermectin. Now some people respond to ivermectin very well, and she happened to be one of the fortunate ones. We increased her vitamin D to 5,000 units a day, put her on an anti-inflammatory diet and started her on some gentle exercise. She had 30 per cent improvement within two weeks and 60 per cent in three months.

[MSQ Totals]

How do we know this? We do a very careful, what’s called functional inquiry. We question people about every organ system in the body. So you can see them all there: head, eyes, ears, nose, mouth, throat and so on. The patient scores them as to how much problem a symptom is within that particular group. You can see that she scored 154 at the beginning. And then after her treatment, a couple of months later, she was scoring 65.

So we’re measuring change. We’re trying to be objective about it and measure how much improvement people are getting. It’s helpful for the patient to see this, that they are improving.

[Case #5—Vax Injury]

Another case of a vaccine injury was a 51-year-old female, former athlete, actually, a very athletic person. She, after the second vaccine, had significant symptoms that developed less than a month later. You might say, “Well, how do you know it’s the vaccine that’s doing this?” Skeptics will say that. You can ask that question. It’s important. From a temporal point of view, if I’m working in my workshop and I hit a nail and then I hit my finger, I can be pretty sure the pain is due to the fact that I hit my finger with a hammer.

So the closer the temporal relationship, the closer the cause is likely to be something. If somebody has a vaccine in a pharmacy and drops dead, which has happened, you can be pretty sure it was probably the vaccine, not a coincidence.

The longer between the vaccine and when you have symptoms, the more difficult it is to assess. But you can tell, in a sense, because the symptoms are so unusual and they’re so varied.

Now, her D-dimer was elevated, and she had blood clots. She knew that something was wrong and she had chest pain as well. Again, an MRI and colonoscopy and stress test, they were all normal. By the time we see these patients, sometimes they'd had a lot of tests.

So I said, she gave some very typical symptoms

[00:45:00]

of post-vax inflammation and injury, on-set within a month—probably the vaccine, given the kinds of symptoms that she was having. Headaches too, helmet-like headaches that can last for hours, shooting nerve pain, extreme fatigue—that's a very common symptom—increased brain fog.

When the spike protein gets into the brain, it creates inflammation. And then, of course, increased anxiety as a result of all of this. So again, we treated her with ivermectin and we started her on an antihistamine. Sometimes these people get what's called mast cell activation: so their mast cells are producing a lot of histamine, which produce symptoms. So we give an antihistamine and that helps, that it's a non-drowsy antihistamine.

[Symptom Scores]

And she, after this treatment, could actually bike five kilometres without being short of breath. So she was very pleased about that. Again, looking at the scores, you can see the scores going down over a period of time. So we know we're having an impact with our treatments.

[LH—VI-Treatment]

Now, she had a drooping of the face, sometimes known as Bell's palsy. She's given us permission to show this. Next slide. So on the left, you can see that the right side of her face, she's trying to smile. And she can't smile because the facial muscle is paralyzed on the right side. But she can smile on the left. You can see the crease. You can see the facial crease on the right side is almost non-existent. But then after treatment, her facial smile is almost normal. You might say, "Well, Bell's palsy is self-limiting." True. But she'd had this for, I think, over a year. And then suddenly, it gets better. Well, could be a coincidence.

So in summary: We've had a disease with a 99.5 per cent survival rate. We've had poor testing: our speaker showed a diagnosis of PCR with false positives. Rushed vaccine development; absence of treatment until hospitalized; lack of recognition of vaccine injury; and persecution of doctors and other health care practitioners by regulating bodies with their loss of licences. I'll stop there.

Shawn Buckley

Before I turn you over to the commissioners, I just wanted to clarify, you had practised a full 40 years. Longer now, right? Because you got your licence back in 2020. So how many years have you practised medicine in total?

Dr. Edward Leyton

Well, I graduated in '75, so '78 to 2018. So that's 40 years.

Shawn Buckley

Right, and then, now, for a couple more years.

Dr. Edward Leyton

Two years now and I'm now into my third year.

Shawn Buckley

Right, so 42 and a half years. You have never had a patient complaint in that 42 and a half years. Am I right that in the next month or so, you might lose your licence to practise because of the activities that you've just shared, where you're trying to help people with vaccine injuries and in preventing and treating COVID?

Dr. Edward Leyton

Possibly. It's ironic that when I renewed my licence in 2020, the College gave me a free licence for a year because they wanted doctors to come back. And I've been rewarded with an investigation. So I might lose my licence. I might be restricted. I have no idea. I might retire, too. I think it's a race.

Shawn Buckley

Right. I think I can speak for pretty well everyone that we're thankful for people like you that are willing to do what you think is ethically correct—actually being a doctor and using your discretion to help your patients.

I will turn you over to the commissioners for questions.

Dr. Edward Leyton

Thank you.

Commissioner Massie

Thank you very much, Doctor.

[00:50:00]

I have a couple of questions. This is not a medical consultation but close.

I'd like to know—given that we've heard from many other doctors and patients that during COVID, the people that were more likely to be affected by the disease were, in general, people affected by other conditions that would somewhat compromise their ability to build a strong immune reaction to the infection.

So it could be because they are old and their immune system is not as active. Or it could be because they have other immune suppression of some sort. So these so-called frail people, or more fragile people, were initially targeted to be vaccinated to protect them from the disease.

Dr. Edward Leyton

Right.

Commissioner Massie

So it's my understanding, based on my research, that the vaccinations should work by triggering the immune response in order to protect against the infection. But if the reason why you're mainly susceptible to the infection is because your immune system is not properly functioning, how come vaccination will solve that?

I'm asking that to a practising doctor.

Dr. Edward Leyton

Well, vaccination doesn't solve it.

First of all, this isn't a vaccine in the true sense of the word. We think that it actually makes the immune system worse, and in fact, you're more likely to get COVID the more vaccines you have.

That's a Cleveland Clinic study that, I think, has already been reported on in the Inquiry. The more people are vaccinated, the more likely they are to get COVID, which is kind of weird. I don't know if that answers your question or not.

Commissioner Massie

Yeah, it does.

My other question has to do with the CPSO, which we have the equivalent in Quebec. We've heard from other doctors that testified recently in Quebec that they went to interrogate the Collège des médecins and asked them a number of questions about the scientific rationale to promote vaccination of children and pregnant women.

These doctors had several questions that were never answered, ultimately, by the College. And the Collège de médecins said, "We're not a society that generates new knowledge. This is not our role. You should consult with the official society and SPQ and the other society."

So I'm just wondering, if such a question would be addressed to the CPSO, would they come up with a similar explanation—that it's not their role to generate new knowledge and to ask those very specific questions that arose from the deployment of the vaccine with respect to the risk-benefit balance for children and pregnant women, and so on. What would be their position in your opinion?

Dr. Edward Leyton

The College doesn't answer questions like that. The College is a regulatory body. It investigates people on a whim.

I don't know what goes on inside the College, to be honest with you. But it's something pretty nefarious. So in terms of asking the College to explain something like that, they don't do that. Their motto is protect the public, which they don't do, and guide physicians, which they don't do.

Commissioner Massie

My last question is about—what's the state-of-the-art in terms of the practice of medicine?

Did the practice of medicine evolve in your experience through, I would say, the practice of science observation and medical treatment that any given physician can actually do

[00:55:00]

in their normal activity? Or does it evolve solely when some new treatment or protocol has been checked very rigorously through these randomized control trials—that is the only way to come up with new solutions for treatments?

Dr. Edward Leyton

Well, it should be a combination of those things, in my opinion. It's a complicated question.

The problem is that when somebody comes up with a solution for something that's unusual, for example, I'm thinking of Barry Marshall, who is an Australian physician who came up with the idea that an ulcer was caused by a bacteria called *Helicobacter pylori*. This was many, many years ago. And he couldn't convince anybody in the scientific community that this was valid, despite publishing.

So it's very difficult to convince the medical community of new things. Eventually, he had to give himself an ulcer and then take the treatment and cure himself. And now, antibacterials are used for ulcer treatment with success, killing *H. pylori*. But that was a hard fight.

There's multiple examples of people who've come up with innovative solutions, who have been put down and not recognized throughout the history of medicine. I'm not a philosopher, so I can't answer why that might be.

What has happened, also, is that in a regular doctor's office, you get visits from a pharmaceutical company with the latest and greatest medication for something. Physicians are heavily influenced by that. And as we know, the only way to get grants for research is through money from pharmaceutical companies. So there's a built-in bias that is quite extraordinary. Does that answer your question?

Commissioner Massie

Yeah. Thank you very much.

Shawn Buckley

Thank you. There being no further commissioner questions, Dr. Leyton, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing this information and sincerely thank you for the service you've given as a physician.

Dr. Edward Leyton

Thank you for the Inquiry. Appreciate all you guys are doing.

Shawn Buckley

I will just state for the online audience that cannot participate that there was a standing ovation for Dr. Leyton. He is very well-respected for the service that he has given.

[00:59:00]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 8: Dr. Keren Epstein-Gilboa

Full Day 2 Timestamp: 08:38:23–09:28:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Good afternoon. Can you please spell and state your name for the record?

Dr. Keren Epstein-Gilboa

My name is Dr. Keren Epstein-Gilboa.

Kassy Baker

And can you please spell that?

Dr. Keren Epstein-Gilboa

Keren is K-E-R-E-N, sometimes K-A-R-E-N E-P-S-T-E-I-N, hyphen, G-I-L-B-O-A.

Kassy Baker

Very good. And do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony here this afternoon?

Dr. Keren Epstein-Gilboa

Yes, I do.

Kassy Baker

Very good. Now, I understand that you're here today to describe various childhood traumas that were suffered largely as a result of COVID or COVID measures. Just to start with, can you give us a little bit of your background? Can you briefly describe that for us, please?

Dr. Keren Epstein-Gilboa

Well, I graduated with an undergrad degree in a health-related area, more than 40 years ago. My master's is in Counselling and Applied Psychology, and my doctorate is in Developmental Psychology.

Kassy Baker

So you're here today to speak to us as an independent scholar, is that right?

Dr. Keren Epstein-Gilboa

Yes, I'm an independent scholar.

Kassy Baker

Now I know that you have a presentation that's ready to go and my intention is just to let you carry on with that [Exhibit number unavailable]. I will interrupt if I have any questions, but we're in your capable hands for the moment, so please start.

Dr. Keren Epstein-Gilboa

Okay. Thank you very much. I'm going to be presenting insights from behavioural science.

My agenda, my question in 2020 was, "What is the reason that existing and long-standing research practices related to social determinants of health were discarded," and now I would say, "during the past three years?" I'm going to provide insights from behavioural science, a little bit on systems models, and the individual—and that's when I'm going to be talking about children as well, infants and children. A little bit on bioethics. And then I'm going to be presenting about the psychological model used to circulate systemic messages, which is often called the Nudge model.

Kassy Baker

Dr. Epstein-Gilboa, if I can interrupt you for one moment. The Commissioners have just brought it to my attention that I didn't swear you in. Did I swear you in or did I not?

Dr. Keren Epstein-Gilboa

Okay. Sorry.

Kassy Baker

I apologize.

Dr. Keren Epstein-Gilboa

Do I start again?

Kassy Baker

Do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Keren Epstein-Gilboa
Absolutely. Yes, I do.

Kassy Baker

Now that we have that out of the way, I will let you continue. My apologies.

Dr. Keren Epstein-Gilboa

I'm going to go insights from behavioural sciences. Systems model: a systems model is used in family therapy to explain organizations, to explain child development, and essentially states that, "Interaction occurs between multiple different systems and affects development at multiple levels, affects function and development, which means everything that's going on now, everything that goes on in general, is affected by multi-levels of interaction."

So there's the individual. The individual interacts with the family, with the health system. This is at the micro level: so with the health care centre, with the school. That's the media at the next level. All those systems, by the way, interact with one another and the individual. And the individual influences the systems. And the systems affect the individual.

There's the media at the higher level. There are different systems: health system, educational system, the legal system, politics. And all of these are affected by our beliefs, the belief system. So our beliefs can be affected at the individual level and go up all these levels. And by the same token, the belief system will then go down, be in all the different systems along the way, and then affect the individual. I based this model here on Bronfenbrenner's model. And Bronfenbrenner didn't originally have the chrono system in. Later he added it.

And the chrono system means we can look at history: it means events over time, which means to me that we can assess events by also looking at the events in history. So that's the systems model. Please bear that in mind as I now go to the different levels. And I'm going to look at the individual by using developmental models regarding social and emotional development.

[00:05:00]

So what is human development?

It's a change over time in multiple body systems, meaning that all the different systems also affect one another. And we have developmental tasks and sensitive periods: this means that **specific events have to take place at a time when the organism, meaning the child or the adult, is ready. And if we miss it, there might be problems.**

Resilience. Resilience implies that one can bounce back. And one's ability to bounce back is dependent on a balance between protective and risk factors.

So there's diverse interconnected domains of development: The domains are associated with specific areas in the brain. And there's specific neurons, and there's interactions between the neurons. And that's how development occurs. That's how these functions take place.

I'm going to look specifically at social and emotional development. Because social has a lot of meaning for what we've been going through in the past three years.

Let's look first at emotional development. So emotions are feelings, affect, mood. Emotions take place from birth and become more complex. Yes, little, tiny newborns have feelings. There's emotional regulation. That's also a process: So we understand we have feelings. We understand what we feel. We define the feelings. We share the emotions with another person. That's how all of this process takes place. And we understand eventually that others also feel, and we're able to emote properly in the context. Emotions affect all domains, including the capacity to learn. So, in other words, a child who's very anxious, feels stressed, feels sad, might have problems learning. Social interaction, therefore, plays an important role in emotional development.

What's also very important is that emotions are associated with specific neurotransmitters or hormones. And what's really interesting is these emotions either enhance or reduce immune function. So we would want people during a time where there's pathogens to engage in actions that are going to enhance their immune function, not stress that reduces immune function.

So social well-being: those are the emotions in all the neurotransmitters and the hormones. Social well-being is also central to overall well-being. If you know Maslow's hierarchy of needs, there are needs such as physiological needs: water, food, air, essential. Think about it, essential. Security means job security, for example, that's the next level. Love and connection mean social needs, means social connection, not distancing, and so on. These are the three lower needs: means that they are very basic to human function.

And we start off with symbiosis with mother, meaning, of course, pregnancy. That's the primary relationship. You could have a primary relationship, of course, with an adoptive parent and with the partner, and the father or the other partner. We have individual capacities and needs; individual capacities and needs vary over the lifespan. There are critical periods, such as infancy, adolescence, and older age, when social interaction is extremely important. Social interaction, then, is a protective factor. It's a determinant of health. As I said, when you feel good, you have enhanced immune function. Loneliness, sadness are risk factors.

So as you can see, these are some of the researchers who looked at social isolation and loneliness. And by the way, to the panel, I have sent, I think it's a 40-page list of references for everything I'm presenting today. So this is the research on social isolation, loneliness, which is a risk factor for multiple pathology. Now, I knew that in 2020. And I would think that most people who are in similar professions to the ones that I have would also know that because this is a known fact for many years. It's a known fact because it's based on research.

[00:10:00]

So stress increases the HPA [hypothalamic-pituitary-adrenal axis] axis. One of the reasons that these researchers, as well as others, believe that people of older age are more at risk for cardiovascular risks, cancers, reduced immune function, and other diseases and death are due to stress—stress due to loneliness, being separated from significant people. As I said, all of this was known before 2020.

And here's some evidence: if you don't believe me, the evidence is that we changed the hospital system. Initially, we didn't have visitors all day long. Until 2020, people could bring

their families in. And it's not because the nurses and the physicians loved the family so much. It was because they knew—because the research stated, because they engaged in critical thinking—that bringing the family in makes people healthy or prevents illness.

Just to show you how important social-emotional function is, I'm going to show you social-emotional development in infancy and early childhood. And we're going to talk about sensitive interaction, proximity behaviours, and neurobiology. These are some of the researchers. You can see, you probably can only see little black dots. These are only some of the researchers in this area, which means there was loads of research on the importance of maternal-infant proximity, smell, touch, everything that I'm going to talk about, before 2020. And if you could see these references better, you'd see that some are even, well, **Melanie Klein, she didn't know about neurobiology. But she did research and she wrote about her theory, object relations, starting in the 1920s.**

I'm going to focus specifically on infancy and early childhood for one reason because it is my area of specialty. But also because we barely have spoken about infants and young children during the past three years.

The first 45 months of life are the most rapid stage of brain development. So it's a very critical period. And during that time, like other periods of development, the child, the infant, is sensitive to specific stimuli. Factors that affect development, of course, are intrinsic: so genes and temperament. But there's also extrinsic factors, and they work together. Nature and nurture work together, and that's environment and parent and epigenetics, changes to the gene expression based on the environment. The most important factor is the toned, sensitive relationships with the primary caregiver, also in other models called holding containment. And this is the capacity of the parent or caregiver to notice, interpret, and match responses to the infant's cues. And cues are conveyed through interactional components: visual, to see each other; hearing, hearing well; tactile; olfactory; and just being close and listening and smelling and touching. Sensory, it's very sensory: face-to-face interaction is vital at the beginning of life.

So here's what happens. The first task is, we need to make connections between the synapses, and when there are connections between the synapses, we then have optimal development. Synapses, the connections between the nerves, cause the messages to flow. The messages to flow, together with myelin that makes the messages flow quicker, mean that this person—this little person, this growing person—can engage in multiple tasks. The brain controls the task that we engage in. Trauma, for example, will cause overabundant synapses in the amygdala, meaning this happens for adults as well, but this is at the time of the development when the brain is structured. So a traumatic or an anxious, depressive situation will change and alter the child's, the human's brain. The brain is plastic and can change; however, there's specific tasks that are more difficult to change, such as lack of **early interaction, appropriate interaction in early life.**

Factors that protect interaction are calm and confident parents, a positive birthing experience, sense of being supportive—

[00:15:00]

They need support: they need to be with people, and smelling and seeing and touching, all of these are very important to the infant—an uninterrupted interaction, uninterrupted breastfeeding, the ability to engage in synchronous, mutual, and intersubjective interaction. Intersubjective means shared emotional interactions.

But look at this side. If a parent is anxious or worried, if they have birth trauma, if they have to birth alone without their support system, if they believe that the birth experience was terrible, if they have birth trauma, they have lack of support, limited touching, face covered, distancing from infancy—then the infant, then this puts people at risk. It's a risk factor. Not all mothers are going to have difficulty with those risk factors; it's multiple risk factors that occur at the same time.

So I spoke about that, but just to go over: it's proximity behaviours, tactile interaction, cue-based breastfeeding. And here's really interesting, this is Schore's work. Schore, I'm sorry, I didn't put it here, but it is in the reference list. Schore found that when mothers and infants are looking at one another, their brains fire at the same time in the prefrontal cortex. In other words, when mothers and babies are engaging in facial interactions, both brains develop. The sense of being heard, engaging with the primary caregiver—these all lead to adequate synaptic connection and pruning. Pruning means getting rid of the cells, the area that we don't need; so instead of connection, we take out, like in the garden.

Actions that are perceived as traumatic or anxiety-provoking may affect memory, especially implicit memory, that's the memory, like a feeling memory.

So here's what we need: "I see your face." And here, you see a father and a son, and I said there, "I'm not sure what you're feeling" because we have to learn. How do we learn what others are feeling if we don't see their faces?

So healthy interaction versus blocked: answering cues; joint attention means we both look at the same thing at the same time; intersubjectivity, we share emotions; sense of self—all this leads to a sense of self, emotional regulation, social capacities, cognitive development and learning. And what we don't want is a hidden face, limited interaction and connection, the interactional components are stifled.

So if you don't believe me, then again, bringing in some research: touch, loving, seeing and feeling are essential for healthy growth. And by the way, touch causes the secretion of oxytocin. Oxytocin is a hormone that makes us feel good. It does a lot of other things as well, and it causes people to attach to one another, feel good about one another. For example, a father does not have to breastfeed a child in order to make the connection; they can just take off their shirt and there will be a connection forming due to oxytocin.

But on the other hand, maternal deprivation leads to anaclitic depression, which is depression in infants: they look totally muted. Loss is detrimental for life. This still-face experiment—that I won't be able to show you here, that I had hoped to show you—I will explain in a moment, is more evidence about the importance of the face-to-face interaction. And the lost sensitive period: I spoke before about neuroplasticity, but there are specific tasks that the brain cannot correct, and one is lost interaction.

And Nelson, Fox, and Zeanah did research on that. They looked at children adopted from Romanian orphanages, and even though those children were adopted to wonderful, caring families, there were specific tasks they had problems with because that part of the brain was not developed at the right time. And a very important part of the interaction is the parent's feeling. Parental anxiety and depression lead to muted affect; lack of stimulation; maybe hyperarousal and anxiety in the child, which impair learning; trauma. These are only some of the researchers in that area.

[00:20:00]

What is the still-face experiment? If you're watching now, you can press that YouTube link, you can watch this experiment. This experiment has been replicated multiple times. In this experiment, the mother or the father sits opposite the child in a normal way, and all of a sudden, the experimenter tells the parent to stop using expressions, to stand like this, opposite the child, opposite the infant. They're about 18 months. And the baby who's used to interaction gets very, very upset. And you can see how they're trying to bring the parent in, and they're unable to because the experiment is that kind of a face.

The child who has a secure attachment will immediately return and be okay; they're resilient, even though they just went through that momentary trauma. But it's very upsetting to see that. I always used to warn students before I showed that video because it is upsetting. Now think of this: what happens to our infants and some of our young children during the past three years who didn't see faces for hours, for hours? Watch that experiment if you can, and you'll see what I mean.

What happens to the mother? The mother needs to be very sensitive, so let's look at the mother during pregnancy. Look at all this stress that she's had, threat. You might have to birth at home because some parents over the world—for example, one of my references here, I believe it was the Jewish General in Montreal where they didn't allow birth partners to come in. Now here in Ontario, where I live, mothers could only bring one person. So you had to choose between your doula—who knew how to support birth, who was a woman and maybe gave birth—and the father who loves the child or the other partner but who might not have given birth.

So mothers had that difficult and I know from experience many mothers struggled with that. And they hear: “danger, danger, danger,” “inject, inject, inject,” “You're going to harm your baby.” “You're going to get a virus; you could die because mothers who are pregnant are more likely to die from COVID-19.” “The virus is going on hard; it's going to harm your unborn baby.” “Strangers covered,” “That's where your support,” “You have lots of risks.” Fear: “You can harm your baby; your baby can harm you.” Imagine that—no support, separation—that's what our mothers went through and how they started this.

So I'm just going to go quickly through these. This is one if you are pregnant, recently pregnant, you're more likely to get sick. The reference, sorry, do you need to see the reference? No, okay.

This is one some people might remember that the Almonte, if I'm saying that right, General Hospital asked all moms to have an epidural when they arrive just in case they need a caesarean. Imagine that. What does that tell you about birth? “Birth is dangerous.” You're already nervous. “Birth is dangerous. You might need a caesarean. Get the epidural.” Who cares about natural birth? And Blakely's work on the hormones during the birthing process and so on. Birth alone. And this is a petition by some Canadian mothers who were afraid they were going to have to birth alone, and they asked not to.

And this you won't believe, but first of all, some fathers could only FaceTime with the mothers during birth. I wish I had time to read you all these quotes, but I don't. But this was on CTV, and they were talking about parents who were FaceTiming with their newborns who were in the NICU [Neonatal Intensive Care Unit]. Imagine that, imagine that. Now, compare that to what I just told you very briefly about what young humans require. Imagine you're in your mom's uterus, you come out, and “hello?” There's no mother there, but she's on FaceTime. I just have to read you this one quote: “We were asked, ‘if you would like to FaceTime?’ to see our daughter. And it's been amazing,” said 28-year-old Mary McKenna, who recently gave birth to her daughter Harper at 26 weeks. “But I'm also

struggling so much not seeing her.” That’s not just a struggle. That’s essential for human growth and development.

This is from a professional journal, just to show you some of the messages to breastfeeding mothers. So if everybody notices, look carefully at the picture. Notice there’s no faces. And notice the messages:

[00:25:00]

Faceless, no interaction, hygienic. Use a mask during breastfeeding. This is a mother with COVID-19. Yes, but before this, we had mothers with strep and staph and all sorts of things, and we didn’t tell them to wear a mask. We just told them, “Nurse a lot because your antibodies will go through,” right? Isn’t that what we, the public, were told? Anyhow, so this is a mom with COVID-19: Use a mask. Wash hands and clean. Passive immunity in breast milk, well they even say it. And here’s a mom breastfeeding with a mask on. Yes, this really did happen. Might still be happening.

And this is from Health Canada, advises:

Keep the baby at a distance and hide your face. Once a baby is born, they can get COVID-19 from other people. So it’s important to limit their contact with others. To protect yourself and your baby, you should continue to follow recommended individual public health measures, such as wearing a mask, improving ventilation, maximizing physical distance from others, cleaning your hands. We recommend breastfeeding when possible. It has many health benefits . . .

Although in the breastfeeding world, they started talking about risks of not, but that’s okay.

. . . and offers the most protection against infection and illness throughout infancy and childhood. Breast milk isn’t known to transmit COVID-19.

Yet we’re scaring them. And then of course, about the mRNA COVID vaccine have antibodies, apparently mothers have in their breast milk. These are the messages to the new mom. And if you’ve ever worked with new moms, you know, and if you’ve ever been a new mom, you know, that the transition to parenting is difficult.

So we have a disrupted family and support system. Families aren’t supposed to visit, grandmothers aren’t supposed to come over. I’m a grandmother, that would be terrible. **Visitors after your baby is born: “Visitors should be limited to reduce the risk of possible exposure to COVID-19. This can be very difficult, but it’s important to keep your baby safe.”** Look at these other messages.

These are some of the findings so far. I don’t know if the research, you know, how great the research is or not. But they’re saying that obstructed interaction seems to affect development, and they’re looking specifically at apparent decline in cognitive performance in children and so on. I’m not sure if it’s true or not, but these are references, and we can check them out; we should. In other words, we are at risk for failed developmental milestones, disrupted social-emotional interaction, and at risk for reduced capacity for emotional and behavioural regulation.

So I'm just going to talk very briefly about other children, older children, I should say. The main thing to remember is that there are specific developmental tasks for each level, each age group: children develop at different rates throughout the years. And these developmental tasks were forgotten during this time. Or the people who worked with children did not display that they remembered or that they took enough steps to protect children at the time. There was a wonderful bulletin put out by the Hospital for Sick Children in June 2020. It was about the return to school. It was great, it noticed everything about development. It was based on sound, critical thinking, and research, and development, and it was cancelled a month later. They put out a different brochure.

The main point there is children need scaffolding support, which means you can't just put something on the computer online and expect a child to learn. They need someone to support them. And *Time In*, this is a book by my, he was the most wonderful late Professor Otto Weininger, and he talked about how "timing out" children is very detrimental to their well-being. It says to the child, "You're so bad, even I don't want to be with you." And so, timing out, I'm not talking about isolating. Timing out is very difficult for children, so we should bear that in mind.

Concrete to abstract thinking, so let me find here. The fearful idea: "kill grandmothers." So one teacher told me that one day she saw a child at the end of the school day who was hiding and didn't want to go home and sat crying. She said to her, "Why are you crying?" And she said, "Because my grandparents are coming to get me and I'm afraid I'm going to kill them." And that's a true story.

[00:30:00]

At the concrete stage, children also, when they see a rule, for example, a rule is a rule: "so if you don't wear a mask and it's a rule, you're bad." Things like these kinds of ideas.

A risk measure—the opposite of time in—is self-isolation. And I have some examples here. This was Public Health Ontario where they advise people how to self-isolate, a child has to self-isolate. Imagine, a child has to self-isolate: we're punishing that child and some children did not understand why. And some parents might not have been able to contain properly because they were trying to follow the rules and for some children that might be traumatic.

So some things for child, "wear a mask." Now, if you have children, you know that it's not so easy for a child to wear a mask, keep it clean, not touch it and so on, might not be comfortable. They advise children over the age of two, even children coming for therapy to wear masks. At the age of two, try getting a snow suit on. So how can you get a mask on? Anyhow, so self-isolation for children really did happen.

The proof is here, this is from Peel Health. I think they're called Peel Health [sic] [Peel Public Health], not Peel Public Health. What to do if your child is dismissed from school or childcare? "The child must self-isolate," which means stay in a separate room. These are real. And for those of you who are watching this 20 years from now, this really happened. So there's that one, again, okay. Yeah, imagine this, if a child must leave the room, they should wear a mask and stay two metres apart from others, and so on. Okay, so I'm not going to go over all the tasks just for time. Can anybody tell me the time?

Kassy Baker

You have roughly 20 minutes remaining.

Dr. Keren Epstein-Gilboa
Oh, Okay.

Kassy Baker
But we'd also like to save some time for the questioners.

Dr. Keren Epstein-Gilboa
Yes, okay.

Kassy Baker
So I'm just going to actually, are there any questions from the Commissioners at this point?

Yes, we'll save them for the end.

Dr. Keren Epstein-Gilboa
Okay, so I'm not going to go over all of the different stages. Just let you know that, as I said before, developmental tasks were not taken into account, and an appropriate risk-benefit analysis of the condition and child development did not take place to the best of my knowledge. And why? Why?

So I've tried to figure out why, and I looked at bioethics. I love bioethics. It's something that I actually read about and I'm interested in. And here are a few researchers if you are interested in looking at researchers just to understand more about bioethics. Beauchamp and Childress is very easy to understand if people just want to start reading about this.

And bioethics are there because there's a power balance between people who are health care providers and the people they serve. And by the way, I use the word person. I don't use the word patient. You can, if you wish, sometimes client. And I just heard lately the word "participant," one that I really like because it's very respectful. And the principles that all health care professions follow—albeit in different ways in accordance with their scope of practice—are autonomy, beneficence, justice, and non-maleficence. This applies to direct interaction, of course, between the health care provider and the person. And also public health.

Public health: it's interesting because public health, unless they're a public health nurse or physician, they don't serve individuals only. They look at the population. So I looked at different research on this issue. How do we deal with this?

And apparently, they should still be engaging in a benefit analysis that takes into account these four principles. This quote I took from the book *Doctors from Hell, Horrific Accounts of Nazi Experiments on Humans*. This is Abrams; it's the book by Spitz (2005). And they state, "need to care for the population need." This is not a quote, I'm paraphrasing: Still need to look after the population need and good citizenship. But it's a slippery slope when physicians, and I'm saying physicians here because the person who wrote this book was a physician, when the physician—and I'll add there, health care provider—begins to exclude or uses professional skills against people.

And Parasidis and Fairchild wrote,

[00:35:00]

There has been, during the past three years, “a lack of adequate involvement of ethicists.” This is a quote: “Might have to embed ethicists in public health teams.” Apparently, there weren’t enough involved at this time. Remember again, I started with a system. So when we have failed ethics, that’s related to chaos at all levels of the system. Risk for harm at all levels.

I’m going to focus mainly on autonomy because autonomy is part of all of the other principles. And autonomy talks about regard for the person. The person is worthy and this part is very important: Able to make decisions about their health. And the health care provider must respect the person’s goals; they must gear the treatment towards the person’s goals. We have dignity, privacy, confidentiality, informed decision making. Informed decision making, a lot of people talk about informed consent: You can’t talk about informed consent without knowing and talking about autonomy. Informed consent does not stand alone. Autonomy upholds the health system.

So let’s look at respect for humans as worthy beings and compare it to compliance—trust in authority, follow without question. Dignity. Dignity means compassion, respect: one does not only ensure that the person is covered physically, but we also think about their needs and things that are important to them. And dignity also implies birthing, thinking about the needs of birthing, and sick dying people who need people near them and the families who are left behind—that’s dignity.

Privacy and confidentiality. So Dr. Layton talked a lot about what the regulatory colleges are doing, including demanding files of private citizens. So here are two cases. Dr. Layton referred to the case of the clients or the people who tried to stop their private files from being viewed by the CPSO [College of Physicians and Surgeons of Ontario] and, so far, have not been successful. And of course, there’s also Dr. Mary O’Connor who was threatened with prison for not showing her files, for not providing her files.

So now informed consent or informed decision making, informed choice. Actual informed decision making means we use clear, tangible—Tangible means you don’t show people to wash their hands like this, that’s the wheels on the bus. You show how to wash hands, and it’s my understanding that health care providers learn how to wash their hands. They also learn how to wear masks, and we were not taught that. It’s valid, reliable, current [information]. But it’s also different views, second opinions. We listen to the person; we engage in respectful discourse, respect [person’s decisions]. And respect for the person as a worthy being, able to make decisions.

Let’s compare that to censoring—and here’s the really important one that Dr. Layton also talked about—prevented health care professionals from providing diverse viewpoints. Sanctions: you should know that all health care providers from all provisions have been reported, investigated—some not just about informed consent but about things that would never be considered in regular times. And yet the investigation went on, goes on. And tomorrow, for example, there’s two tribunals going on, one for a nurse and one for a physician, tomorrow. Public can view it. And the public can’t discuss what we really think. There’s only one view. You saw the letter from the College of Physicians and Surgeons.

Actually, the nurses were the first people to get their letter and it says: “Nurses are expected to adhere to standards of practice in carrying out their professional responsibilities. Nurses have a professional responsibility to not publicly communicate,” and now, look at these terms, “anti-vaccination, anti-masking, and anti-distancing

statements. . . .” You’ll see later on why the word “anti” is a bit problematic. “Doing so may result in investigation by the CNO [Colleges of Nurses of Ontario] and disciplinary proceedings warranted.”

And there’s a statement about the physicians. Physicians, as Dr. Layton said, also received a lot of information on how to talk to people. And one model that they were told about was to use motivational interviewing.

Motivational interviewing is actually a very respectful model. It comes from Rogerian, client-centred therapy. But if you read the material, if you go to PrOTCT [Presume Offer Tailor Concerns Talk]— Let’s see if I have a letter where the physicians were told to engage

[00:40:00]

with what Dr. Leyton was talking about: how to speak to your, they would say patients, I would say to their people.

You can look this up, PrOTCT [at Centre for Effective Practice], all of this is online. There it is. And it really, in short, tells physicians how to speak to clients. And I’ll just give you one sentence: “. . . starting the conversation with a Presumptive statement. Talking tip: ‘I will get/have already gotten the COVID vaccine and I’m happy to help you get it too, so you can protect yourself and your loved ones.’” And it is my understanding that health care providers don’t immediately disclose; disclosure is fine if it can help the person, but that is not the way that one would probably start a person-centred conversation. And there’s more points, you can look that up if you’re interested, and I think we should all be interested.

And you might notice, this is also from the PrOTCT and they’re saying, “What do you think of the COVID-19 vaccine?” and it tells the physician how to speak. And you might notice, if you were my students, I’d ask you, what do you notice here? Do you notice they don’t have faces? Yep. Okay. And, you know, what do you think about that? How warm and fuzzy is this interaction when everybody’s covered up? We don’t really know what they’re thinking because you can’t see their face.

So I want to remind everybody that telling health care providers not to speak with one another, not to speak their view, is not the way things work. Yes, there were arguments; yes, people disagreed. But they were allowed to speak; otherwise, we might still be spraying DTT on people. And as Dr. Layton, it’s interesting, we both use the same example: stomach ulcers, the change, the treatment has changed; imagine if we couldn’t speak about it. Mothers are no longer put to sleep and birth with twilight sleep, and they weren’t birthing alone from the 1960s. Reverence for artificial feeding, destroyed breastfeeding. It was actually the health care professionals who destroyed breastfeeding and put mothers to sleep at the beginning of the last century.

And allergies were perceived as mental health, there you can see a quote. And my father was actually one of the first allergists and immunologists, my late father I should say. And I know from my own experience how he was always told that allergies, “It’s all in your head.” We know now that allergies, that whole field is very well developed and accepted.

So just very quickly, the other principles: beneficence means we do good and we advance the health status. So I saw some of the witnesses who spoke, talking about not being able to go to parks and so on. Nobody told them about nutrition: well that’s a violation of beneficence. Justice means health equity and that means everybody can use the services. So

think about all these people who couldn't use computers. So how do they even get to speak to someone about health?

And, non-maleficence means, do no harm. I think many people here have spoken about the harm. But an important way that we do no harm or health care professionals do no harm is by engaging in a risk-benefit analysis. And that was my first question, by the way, in 2020: "Where's the risk-benefit analysis?"

Research on humans, I'm not going to go over, we all know that. But one of the main ideas there is that it's voluntary—it's the same as autonomy. And what I found very interesting, and you might find it interesting as well, is that the main theme is autonomy: respect for human beings, their goals and capacities to make personal decisions. So notice the similarity. The code for research on humans is different than codes for bioethics. They're different: what is—not—in the ethical code is trust.

Trust can also mean— It's wonderful if you can develop a trusting and mutually respectful relationship with a client. But it's not always there. And that's not our goal: to get us, the people, to trust them; that's not what it's about. Because that kind of trust is compliance, infantilization, like, trust versus mistrust in infancy; adults are not infants. But there's also transference: transference means that the practitioner might seem to be someone else to the client. So you're not going to have trust there, and that's okay. Or if the physician is the person who tells the client, "You have cancer,"

[00:45:00]

that client might be very angry at the physician. What, you're going to stop treating them? No. Trust also must be earned. So our goal is not trust—it's not trust—that's not what it is. What also is not in the ethical codes: follow orders.

Kassy Baker

Now, I'm sorry Dr. Epstein-Gilboa, I know that you have much more information, this has been very interesting, but we only have a couple of minutes left.

Dr. Keren Epstein-Gilboa

Oh my god, I didn't do the nudge. I have to get to nudge.

Kassy Baker

You know what, I'm sorry, we just don't have time.

Dr. Keren Epstein-Gilboa

But that's so important. I really have to speak about the nudge, I'll do it fast. I won't show the pictures.

Kassy Baker

You have three minutes.

Dr. Keren Epstein-Gilboa

Three minutes. But if you wonder—it's not my psychosis, everybody. There's a real program: it's called Nudge; it's behavioural insights. You can read about it. The government told us about it. What is the Nudge program? Go to Impact Canada.

What is the Nudge program? It is all over the world. It is a program based on behavioural science. Impact Canada is the group in Canada who work on it. They did things like, they used language. Sounds: sounds quiet to induce fear. Jubilance, because it's not just fear. Everybody talks about "fear, fear, fear." No, it wasn't just fear. They also used euphoria.

Images: people standing in line, circles. The same messages all over the world: stay home—stay safe. Foot in the door: that means, "Hear ye, hear ye! There's a virus." But we only start with a little thing. Boil the frog: we slowly increase the restrictions.

Priming. "Oh, no, this is what to do if a child has a heart attack." That means we begin to realize that heart attacks are normal: that's priming. Information without information: You'll see the graph there. There's no numbers. There's another one, no numbers.

Pressure. Threats. And sanctions. But that's not really part of the original Nudge program, but it's there now. Stay home, false equivalence: stay home—stay safe, which doesn't mean safe. They used "messenger effect," which is specific people that we supposedly value and listen to them.

Emotion. Please note again: they didn't only use fear, also, euphoria and hope. It's really important that we know this, so we're mindful. Emotion, we do not always know— Okay, wait, that's an example.

Social interaction. And this is a quote from the Impact Canada: "Emphasizing collective action, altruism/moral responsibility; emphasizing that self-isolating and physical distancing are altruistic," in other words, that whole term, social responsibility. That's part of the Nudge program. There was a continuum.

Let me just show the continuum. Normalize and idealize distancing so that eventually we will also be prejudiced and segregate. Stay home, physical distancing, conform, breathing barriers, small groups, cohorts, and discrimination. These are just quick— People standing in line; lines were used. I'm almost done. Just quickly going through these pictures. Lineups, circle: "we're in this together" when we're not really. No faces, and I showed that throughout: there's no faces. By the way, the facial coverings were actually used as part of the Nudge program to make sure fear stayed there, that we were reminded. Stay safe, be kind, be COVID, and so on. You remember this one, for the future generations: they really did tell us to have intimacy with the mask on, and that's about it.

I'll leave it with segregation.

Kassy Baker

Thank you very much. I apologize that we had to rush through the end here, but just so the commissioners are aware, we will be entering your slides as an exhibit [Exhibit number unavailable], so they can have some time to review that at their leisure, so to speak.

I believe we are out of time for questions, is that correct? We have time for short questions if any.

Commissioner Kaikkonen

I don't have a question; I just have a quick comment to add to your presentation. I think between Dr. Layton's presentation and yours, I'm probably traumatized here.

But I just want to add that there were parents having newborn babies and the babies were taken away from them in Ontario hospitals until the mother's COVID test came back. And I can think of one example where that baby was taken away for 36 hours until the COVID test was returned. And I'm just thinking, I wonder what happened to that baby in that 36 hours because they weren't with mom. So your examples are very real, and I think it should be a wake-up call for all of us, to think about exactly what that messaging that was sent out by so-called health authorities has done. And the other side of this is we've heard testimony as we travel across the country that talks about the generation that we've lost and that's our children. Thank you for your testimony.

Kassy Baker

Thank you very much. I have no further questions, and Dr. Karen Epstein-Gilboa, I would just very much like to thank you for your testimony here today.

Dr. Keren Epstein-Gilboa

Thank you. And thank you for doing this Inquiry. It's very important. Thank you.

[00:50:54]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 9: David Freiheit

Full Day 2 Timestamp: 09:29:17–10:18:10

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

So our next witness is attending virtually, Mr. David Freiheit. David, can you hear me?

David Freiheit

I can hear you. Can you hear me?

Shawn Buckley

We can hear you and we can see you. I probably pronounced your last name incorrectly. I know you're known with your online commentary as Viva Frei. Is that right? Or Viva Free?

David Freiheit

Yeah, my last name is Freiheit. It's verbatim: freedom in German. So it's a good name to have.

Shawn Buckley

So, David, can you state your full name for the record, spelling your first and last name?

David Freiheit

David Andrew Freiheit. D-A-V-I-D, Andrew, F-R-E-I-H-E-I-T; F like Fred and T like tango.

Shawn Buckley

David, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

David Freiheit

So help me God, yes.

Shawn Buckley

Now, you have a very interesting background. So you were a lawyer. You used to practise in litigation, but you've gone on to other things. You've become quite a celebrity as an online commentator. I've heard of you from individual after individual after individual. And I actually got to know your brother a little bit on some Zoom calls to see if I could get him to be volunteer counsel for the NCI. So I'm very pleased to meet you. You're being called primarily to talk about your experience with the Trucker Convoy because we're in Ottawa, and that was an experience that was really significant to people living in Ottawa. So I'm wanting you to share—because you weren't living in Ottawa at the time—how you got involved and what your experience was.

David Freiheit

Well, I'll let everyone out there know I didn't always look like this. I didn't always have the grimace wrinkle of a world-gone-mad on my forehead. I used to be a clean-shaven young lawyer. And some people might have seen me online from old videos, like the squirrel stealing a GoPro. But yeah, when the world went crazy, I had already started doing online legal analysis, sort of explaining lawsuits and breaking things down. Then the world fell off a cliff in 2020. If I may start, I'll share my screen for one second.

Shawn Buckley

Absolutely.

David Freiheit

I didn't make a PowerPoint presentation, but I've got my backups here. For what I'm about to talk about, it's worth starting off with a quote from Benito Mussolini. This is not the exact quote, but it's close enough: "The definition of fascism is the marriage of corporatism and state." What I have lived through and what we have all lived through over the last, starting March 2020, it has been fascism not in the juvenile sense of throwing the word around; it has been fascism in the actual Benito Mussolini sense: where I've witnessed the government working in tandem with corporations, working in tandem with the media, not to inform, not to control information but to purvey and propagate disinformation.

Shawn Buckley

Can I just slow you down? Because fascism is a term that is used very loosely now. And it's used, actually, to deflect and to make people—that aren't fascists at all—be not heard from. It is almost like the term "anti-vax" or "climate denier" now. My understanding, and you can correct me if I'm wrong, is the word corporatism simply refers to where the state interests and the corporate interests have largely become one and the two are working together. I guess Mussolini is very famous [for], when people would be talking about corporatism, saying, "No, no, you should call that fascism." You brought that definition up, and so fascism—just so people understand who are watching your testimony today—when they see the word "fascism," they need to understand that just describes the state of affairs where the state interests and the corporate interests are intertwined and working together. Is that right?

David Freiheit

Well, that's my understanding of the actual historical definition, not the way it's used this day. Like, you know, everyone's a fascist—and not to get too distracted—if you don't believe in certain things, you're a fascist. It's thrown around today, but it actually has a meaning. And it's a meaning that I've come to understand the importance of, which is corporation and government working in tandem because they have shared interests.

I've now witnessed firsthand in my evolution how this happens. I was young enough to remember people saying defund the CBC, you know, pre-2016. I had no idea what that meant, why it was being said. And now I understand because we've lived through this together. We lived through the shutdown of the world. We lived through—literally, it's come out now, and I'll bring up some articles if the world needs to see the homework—a world in which the government

[00:05:00]

decided the pandemic was a good time to test propaganda techniques on the citizens that they were currently locking down, shutting down, subjecting to unconstitutional and unconscionable restrictions.

And what way to do that? Well, it helps when you have the media in your hand. And so how did all this happen?

I had my YouTube channel. I was doing legal analysis, trying to keep my opinion out of it, thinking you can make everybody happy by not sharing your own personal opinion. Little did I know that at some point silence became violence. And then the world shut down. And I started, you know, I didn't want the channel—and I didn't want my entire life—to turn into COVID stuff. But lo and behold, there was nothing left: we were shut in our homes literally for years. I was in Quebec where we had five and a half months of curfew in 2021, and then because it worked so well and it was such a good idea, we had another month and a half of curfew in 2022 despite Arruda, the chief medical officer of Quebec, saying, "You don't use curfews to fight a virus."

So all of this culminated in the trucker protest, which was, for a great many people, not the light at the end of the tunnel but the only ray of sunshine that they had seen in years. I mean that is where my awakening comes into this. My experience in Ottawa, which was life altering and trajectory altering, where— I'm doing my daily stuff complaining about the lockdowns in Quebec, the tyrannical governments, doing my Viva walking on the streets. And it started off with people in my chat saying, "Viva, why aren't you covering the Convoy?" "And I'm sitting there saying, "What convoy?"

I now understand the same MO—the same *modus operandi* that happens every time—it's first a media that is reliant or adherent or subservient to the government. Well, their system is the same: Ignore something until you can't ignore it. Minimize it once you can't ignore it. Demonize it once you can't successfully minimize it. And that's exactly what happened with legacy media in Canada.

Shawn Buckley

So can I get you to slow that down because I think you're saying something really important. We have quite a large audience, and the demographics actually mimics vaccine injury, which is quite interesting. So there will be people watching your testimony that will never have heard what you just said. So I'm just wondering if you can say it again but kind

of slow it down to parse that out because it's somewhat important. And then carry on with explaining how you found out what was really going on.

David Freiheit

I was doing my best to slow things down.

Shawn Buckley

Yes.

David Freiheit

I've been told that I talk fast. Step by step, it's the MO of the media when they have an interest and they want to propagate a narrative: Ignore until the point that you can't ignore it anymore, and then you either minimize or distract. Minimize or distract to the point where you can no longer do that because it's gained sufficient momentum. And then you have to move into the demonize and lambaste. You can see this over and over again for populist movements, political candidates. It's the classic MO.

So I was doing my daily rants on the street because I was allowed out of my house because I had a dog, after 8 o'clock. The joys of COVID. So people are telling me, "Viva, why aren't you talking about the Convoy?" And this is a month or two before the Convoy, maybe a month before. And I'm saying, "I haven't even heard of this." Because the CBC and the state-subsidized and state-funded legacy media wasn't talking about it. Then I start going on CBC to see what's going on. And then, after the ignoring, we had the distraction.

CBC starts reporting about an alleged convoy in British Columbia going from one British Columbia town to another, but they're protesting road conditions. Nothing to see here, move on. Then I notice the CBC, at one point, updated that article and said, "Oh, that convoy is not the one that's headed to Ottawa." And that's when the CBC understood that this Convoy going to Ottawa was too big to ignore. Too big to distract or misrepresent, and so what did they have to do?

Step right up to item 3: demonize and lambaste. For the viewers watching, for everybody watching, if they don't truly understand—CBC/Radio Canada is subsidized to the tune of 1.2 billion dollars a year under the federal law. It is true that the federal law was enacted prior to Trudeau. In theory, it is whatever federal government is in power at that time that subsidizes them.

But when you see the indirect distorted interests of the media to placate or favour one government that doesn't want to defund them and to dehumanize the other— You'll notice that the CBC, once upon a time,

[00:10:00]

sued the Conservative Party of Canada for copyright infringement for using some of their material for a campaign ad—but never sued the Liberal government similarly—using our taxpayer dollars to sue a political party, one of the two big federal political parties.

Understanding this now, the CBC could no longer ignore this Convoy that was coming from all corners of Canada. So once they can't ignore, once they can't misrepresent, they then have to move into demonizing. And that's when they start demonizing the truckers as

extremists, anti-science, anti-vaxxers, yada, yada. At this point none of us really understood how big it was ever going to get. And they're doing their best to try to ignore the young children and the people with their flags of hope on overpasses across the country.

Shawn Buckley

And I'll just stop you there because people that are watching internationally won't understand. So when the truckers started moving from different parts of the country and driving towards Ottawa, the citizens would literally line up along the road, every overpass covered in flags and placards. And they couldn't buy a meal and they couldn't pay for their diesel—like, people were supporting them along the way and that was part of the experience that Canadians had. Because we have people watching internationally, I felt the need to jump in and fill that in.

David Freiheit

Please, don't worry. And they were doing it everywhere. I mean, they did it in Montreal; they would stand on overpasses. You had these wonderful images of hope and people standing behind the truckers—the truckers who would ultimately become an international movement, which obviously upset Justin Trudeau even more. So the media has to demonize them, and so they start calling them all sorts of names at first. But at this time, also, nobody understood what this protest was going to turn into.

You had truckers driving across the country, not knowing how they were going to pay for fuel or not knowing— Just, enough is enough, we're going to the capital. People also should appreciate Ottawa is not a random town. It's the capital of Canada; it's where protest occurs when protest needs to occur. So all of this is happening, and I'm starting to pay attention to it, starting to understand this is turning into something special. As luck would then have it—or bad luck would have it, although I think it all ended up well—I was in Florida for a Project Veritas event, back before Project Veritas turned into what it is today. But then people were saying, "Viva, what are you doing at a Project Veritas event? Get your butt to Ottawa." So I'm like, "Okay, I'll get back to Canada and I'll go."

In the meantime, I'm starting to see what the CBC and other legacy media are reporting from Ottawa: I'm seeing reports of Nazi flags. I'm seeing reports of Confederate flags. I'm seeing reports about defacing the Terry Fox memorial. People urinating or desecrating the [National] War Memorial that is in downtown Ottawa. But I'm simultaneously, literally, getting tweets, messages, video clips from people on the street saying, "This is all a big fat lie."

I'm sitting there; it's like, I'm seeing not one screen, two films. I'm seeing—someone's telling me that they're seeing blue when it's red. And so, it's like okay, "Well, I'm going to get to Ottawa the Monday I get back," which is after it started on the Friday.

I had never done this before. I did livestream where we talk about subjects, but I've never done a walking around real-time livestream. I said, "Look, I'm going to drive down to Ottawa. I see what the CBC is saying. I'm going to drive down and I'm going to livestream. And if there are Nazi flags there, the world's going to see it for good or for bad, for right or for wrong. If there's Confederate flags, violence, and mayhem, then the world is going to see it in real time as I see it."

I get down there. I drive down from Montreal. I drove down there and back every day, except for one night when I tried to stay in a hotel. But that was when I think the

government either bought up all the hotel rooms or forced them to cancel reservations because they cancelled my reservation.

I get down there. And you understand them: It's like eyes wide open for the first time, ever. I understood we're being lied to. And not just lied to—because it's one thing if you know someone's lying to you—it's a more insidious type of lie when they try to make you think that it's reality. It worked on so many people. I get down there, the Monday after reading news about Nazi flags, desecrating the War Memorial, and desecrating the Terry Fox memorial.

At this point, let me bring up one of my footnotes here: the article about the desecration of the Terry Fox memorial. This is CBC and this is how they reported it, and it's so subtly insidious: "Anger over defacement of Terry Fox statue, a sign of his 'unique' legacy, says mayor of icon's hometown."

[00:15:00]

When I talk about the fake news—and people are going to immediately think of the Trumpian term—this is government-subsidized propaganda. And you'll notice, in all of these CBC articles that I'm going to bring up, the tactic: They make a statement, but then they quote someone else, "says mayor of icon's hometown." So they're not making the statement, but they're saying the statement, referring to another government official who makes the statement—it's misleading, and it's utterly dishonest. So you read the headline, and for anybody who gets past it, you might see this picture of the defacement of Terry Fox [image of Terry Fox statue with a Team Canada baseball cap and Canadian Flag wrapped around his neck].

Words have meaning, as a lawyer, my father always said, "Words are the tools of your trade." Defacement typically means something semi-permanent, more permanent than a cap, even if one were inclined to think that a cap is defacing a statue. They don't show you the bottom of the statue, at least yet. So anybody who gets this far, and says, "Oh, my goodness"—well, even I thought this at the time—"there must be something going on at the bottom of that statue." Spray paint, dirt, something along those lines. You get down to it—once you scroll down far enough—and this is the defacing of the Terry Fox memorial that they were complaining about [image of Terry Fox statue holding a sign: Mandate Freedom]. Now, again, they didn't make the statement; they're just quoting the mayor of Terry Fox's hometown. Why is this so gleamingly insidious? That's defacement.

And when you want to talk about a media that has a vested interest to demonize one group while lionizing another, this is a tweet from Sheila Gunn-Reed from back in the day. Let's see if I can find this. Can we see that now?

Shawn Buckley

Yes, we can.

David Freiheit

Okay, it's tucked down here somewhere behind all this.

You have a tweet from Sheila Gunn Reed, which compares, you know, historical defacement of the Terry Fox—sorry, alleged defacement—from the Convoy with what is otherwise "just celebration" [Sheila Gunn Reid Tweet comparing image of Terry Fox statue at the

Convoy, with Team Canada baseball cap, Canadian Flag, and Mandate Freedom sign, with another image of Terry Fox statue celebrating Pride week, holding a Pride flag and flowers]. It's the same media that's doing this: they'll take two images, which are by and large the same, and demonize one based on ideology while lionizing another based on ideology.

Who does it benefit?

Well, it benefits the government, and it benefits Justin Trudeau in effectively shaping—and as you say, not just Justin Trudeau but Doug Ford, all the provincial leaders—it helps them mislead an entire population as to what's actually going on for anybody who gets past the headline, which is already a very small percentage, and even then, it's buried in there.

And they do this so that they can create, promote a narrative that favours the government, a government which subsidizes them, and then people see this and think that they are informed. I knew people in Ottawa, not to identify anybody who doesn't want to be part of this. I've known people who live in Ottawa who thought what was going on was what was being depicted in the CBC; none of them stepped foot in downtown. And they all believed that they knew what was going on and that the truckers were Nazis, that they were desecrating statues, urinating on them.

I went down there with my camera, and I ran around, literally, everywhere. And I go past the memorial: it's clean; it's shovelled. There might have been what looked like coffee on the side of it, but, by that point, the lie has travelled around the world and the truth, as they say, is still putting on its pants. I did this for 13 or 14 days: just drive in, see what's going on and talk to people—just talk to people and hear them in the same way that they're talking now and sharing their stories with the world now because our elected officials refused. They didn't even have the courage or the dignity to come down and talk with any of the protesters—people who just wanted to be heard and share their story after two years of what can only be described as unconscionable inhumane abuse. They didn't have the courage to step down and talk to them. I just went around hearing people's stories, see what was going on firsthand. It wasn't to misrepresent; it was just to show without a filter what was going on. And that, without a filter, led to CTV News' "W5" attempting to make me look bad, as if to say, "This guy goes around with a camera with no filter; he's very popular. What's going on? Why are people watching this?"

Without understanding that that's exactly what the people want: it's just the truth of what was going on. And I went down there and I saw it with my own eyes. You know, when the CBC was talking about kids—hold on, I'll bring this one up as well—kids being among the crowd, making it hard for police to do their numbers. Here, I think this is it; yes, this looks like it. Look at this. CBC, notice the tactic: They make a statement, "Large number of **children among protesters hampering response, police say.**" Oh, well, we'll just unquestionably and unquestioningly repeat what the police say so that we can then continue with demonizing. And not just demonizing, by the way,

[00:20:00]

because I was there seeing people in tears because the implicit threat was that the government was going to come in and take children away.

This is not just demonizing and calling people Nazis or whatever. This is, you know, saying these parents are putting their children at risk, using them as human shields. But CBC says it again, "Large number of children among protesters hampering response, police say." CBC

is not saying it. They're just repeating it for and on behalf of the government to the benefit of the government.

And then, look at this, if anyone thought— Is this the right one here? Yeah, this is it. Ottawa police [an Ottawa Police tweet]: The CBC is just repeating the Ottawa police, repeating it and not condemning it. When the Ottawa police come in and say, "Protesters have put children between police operations and the unlawful protest site," they deemed a constitutional right unlawful just like that, willy-nilly. But set that aside. "The children will be brought to a place of safety." To me that is a very sinister threat of government-sanctioned kidnapping, but it didn't actually get there—but not for lack of trying from the CBC media. So I'm down there, oh, goodness. Yeah, sorry, go for it.

Shawn Buckley

Well, I'm just wondering, describe what you saw. So you're telling us about all this demonizing and you're telling us you were down there. So what did you see?

David Freiheit

I said I wasn't going to cry because I think it's weird when people cry. I cry when I get upset, but I also cry when I get really, really frustrated. What I saw there was one of the few times where I was on the verge of tears because of how magnificent it was. It was noisy: there's no doubt about it. There were horns and there was a beauty in the horns. But it was nothing but the most beautiful thing I have ever seen, for those of us who had spent two years under psychological, economic, financial, and spiritual abuse.

You know the previous witness talking about how Peel region was talking about locking kids up as young as five years if they just came across someone who's— We had lived through that. I saw people smiling. Hugging. And I'm never one to hug; I'm a bit of a germophobe even before all this. I even started to hug. You saw people smiling; you saw people wearing masks mingling among the crowd. But the media was saying that, you know, the truckers were demonizing people who were wearing masks.

Another grotesque lie because a lot of people, known to everybody there, were wearing masks so they wouldn't get identified and fired from their jobs for participating, partaking, or even being at the protest site. I saw kids playing hockey. There was the jacuzzi towards the end of it, the hot tub. Kids playing hockey, dancing, smiling. There was a section by Wellington and the main intersection, right in front of that hotel, the fancy hotel—

Shawn Buckley
Elgin.

David Freiheit
I called it the dance-dance. It was, say it again.

Shawn Buckley
Elgin.

David Freiheit

Elgin Street, yes absolutely. There was this section, I called it the dance-dance revolution because they had trucks—they were playing dance music; people were dancing. I'm not saying this, because I don't look at people and immediately see race, religion, identity, sexual orientation, I'm saying this because for a group that was called misogynist, there were women all over the place. For a group that was called racist, I interviewed Iraqis. There were black—I don't know if they were Canadians, but there were people of all races there. They were called anti-trans; I interviewed a trans person who was at the protest, Ari was their name. I interviewed this person and we had a good time. And Ari said that the only time they felt any form of hatred was when they crossed the line from the counter-protesters to the protesters, when the counter-protesters realized, "Oh, this is no longer an ally, Ari is an enemy." I interviewed people from all over the world. I interviewed Big Bear, a native man. And I'm listening to the media say that this group of trucker protesters was anti-black, racist, anti-Semitic, misogynist.

It was hogwash from day one, and I learned that after day one. Trista Suke, day one, I meet a beautiful young woman who's walking around with a guitar. I had no idea who she was. She says, "I want to sing you a song," and this was at the far end of the protest. And I was nervous for her because, you know, I was worried it was going to be like an "America's Got Talent" bad audition. She started singing and she sang Amazing Grace, and it was the most beautiful thing I've ever heard.

This was what the protest was.

And then for two and a half weeks, you had the CBC running around with that lone picture of a swastika on a flag. No one ever knew who that person was. But, you know, very fortunately there was a professional photographer right near him, so he could get that shot. You know, diffuse it to the media who would then run it around saying, "Oh, we're just reporting."

[00:25:00]

For anybody who doesn't know that one scene on day one when someone was there with a Nazi swastika flag: The media ran with that. Politicians ran with that. Marco Mendicino ran with that. Justin Trudeau, Jagmeet Singh, they all ran with it. The media helped them, and they had their disinformation-laundering campaign perfectly set up. It's unclear what that person was even doing because there are some people who suggest the person was there with the Nazi flag to suggest that Justin Trudeau's regime was behaving like previous Hitlerian regimes. Others are saying he was a plant. Who knows? Bottom line: that flag existed on one person for one moment, never came back. And after that, it was nothing but love, peace, and a sense of joy that Canadians had not felt—and the world had not felt—in two years. Sorry, I heard you want to say something.

Shawn Buckley

Well, no, you answered my question because we've all seen that image because the mainstream media just kept repeating that image. So, you know, it's now a famous image in Canada, and it's burned into our minds regardless of whether we bought into the government narrative or not. And so I was just going to ask you, because you were literally walking around live streaming day after day, if you ever saw a Nazi or Confederate flag at the trucker protest?

David Freiheit

I never saw one and I didn't edit anything. I went for five and a half hours, sometimes every day, and I saw what I saw. And it's not just that I saw what I saw because I asked cops. I asked the police: "Have you guys seen any vandalism? Have you seen any violence?" They said, "No, it's cleaner and safer now than it's ever been." And I should add this, I'm very familiar with the city of Ottawa. I never felt comfortable in the city of Ottawa; I might be a bit neurotic and nervous, in general. But nobody liked downtown Ottawa at night because it's not a place where you would go walk at night. No judgment. There might be, you know, reasons why the government has sort of failed the homeless population and the addicts of Ottawa. But it's not a place where you would walk around; the Rideau area, it's not a place where you'd walk around at night. I had never seen the downtown core of Ottawa cleaner, safer. The homeless people were being fed. And so when you read these bogus rubbish stories coming out that the truckers went and harassed a homeless shelter and demanded food—they were literally cooking food on the streets and feeding the homeless people.

And it was so in your face and so shocking what I saw. And I went to ask the cops, "Have you guys seen anything?" At one point, one of the policemen said to me, "Yeah, actually, there's a broken window across the street." I was like, "Oh, where?" And then he giggles saying, "I'm joking; it has nothing to do with the protest." You could not understand what it—wasn't—unless you had been there. But they did a good job doing what they're doing in terms of making people think they understood what was going on, and it has its impact. And I always say, "The toxicity is a trickle-down and a trickle-up."

Let me play a clip. I interviewed a counter-protester. I'm just going to play one section of this interview. Let me see if I can bring it up here. And I'm not bringing this up to mock the person. I have no idea who this person was, ironically enough, wearing masks, and nobody cared. But listen to what the protester said. I thought this rang interesting.

[Video] Counter-protester

The occupation of Ottawa has to end. I live just outside the Red Zone. It's appalling. I cannot go to an office building. I can't shop. I can't go to church. I can't—

Viva Frei

You can't shop. You can't go to an office. You can't go to church. What do you have to say to the people who are protesting because they can't go to church, they can't go shopping, and they can't go to the office because of the government.

Counter-protester

Get vaccinated,

David Freiheit

"Get vaccinated." Listen.

[Video] Counter-protester

and do what you can.

Viva Frei

Okay, but now, if I may ask, could you recognize a certain inconsistency in telling someone that they have to do something with their body to do the thing that you're complaining you can't do now because it's an inconvenience?

Counter-protester

It's not an inconvenience, that's an occupation.

David Freiheit

"Occupation."

[Video] Counter-protester

I'm not telling them that they have to be vaccinated. I'm saying that if they want certain things, certain rights then they have to be vaccinated. If they want certain rights, you can't drive a car without a seat belt without facing the consequences.

David Freiheit

Where she says, "without facing the consequences," she goes on to say, "Get vaccinated or there will be consequences."

[Video] Counter-protester

You can't drive drunk without facing the consequences. If you don't want to be vaccinated, then you have to face the consequences.

David Freiheit

Where did we hear that terminology being used? I had to go back and double-check.

Shawn Buckley

So this is a counter-protester, just so it's clear for everyone watching. This isn't anyone involved at the Trucker Convoy, but they were counter-protesters. You went and interviewed this counter-protester.

David Freiheit

I interviewed a couple. I wasn't there to pick fights or start fights, but I went to interview this counter-protester. The one thing people should remark from that interview is that you could hear it,

[00:30:00]

and this was barely four blocks down from the core of the protest. She went on later to say that it's torture, the noise. We were conducting an outdoor interview on my iPhone, and you could barely hear the horns from up the street.

But "get vaccinated or there will be consequences": where did I hear that terminology? This was February 2022. Well, lo and behold, you know, this was the exact terminology Justin Trudeau had used in August 2021. I had to double-check the dates to see which one came first. And you see how this all works: It comes from the "top down," recycled and regurgitated by the media that doesn't hold the government's feet to the fire. I've been saying that the Canadian media has gone from being the government watchdog to being the government lap dog. And so you get the government, you get Justin Trudeau, the highest person in political power in Canada: "If you don't get vaccinated, there will be consequences." You don't get a media grilling him for this Nuremberg-level violation of everything that history has taught us.

And then it trickles down, recycled, and then, lo and behold, you get your citizens regurgitating and repeating what would otherwise be atrocity-speak in different ages. I interviewed this protester. You could hear the interview. They were claiming it was an occupation: She said, you know, "The horns, it's torture. It's a violation of international law." And I asked her if she knew about the Nuremberg Code, and, lo and behold, you know, CBC wasn't exactly teaching people about the Nuremberg Code.

But that's what happened. I walked around. I talked to people and I heard their stories. I interviewed a woman whose two sons died of overdose during the pandemic. You can't listen to something like that and not have your heart hurt beyond any way that you can ever repair. But, you know, Jagmeet Singh, who goes down on Parliament Hill to protest with the federal workers, didn't step down. They like to use the word "step up." That's the propaganda, you know, "people step up."

The government wouldn't even take a foot down into the protest to listen to these people. A woman who lost both of her sons to overdose during the pandemic. She was telling me how, you know, they were good; they got their lives back on track. And then everything shut down: they lost their jobs, and they relapsed and died. No, the government doesn't have the courage to talk to her. The media doesn't have the courage to talk to her.

You get the CBC down there, and this I saw also. The most interesting was not just seeing the distortion of reality but seeing how they do it. So you get the CBC—and others, I mean, I don't want to only pick on them, but they really deserve it—looking for the drunkest people to interview, then interview the drunk people, and then say, "Look at this representative of the crowd down here. It's a bunch of bums, drunken; they're just looking for excuses to do this." They look for the exceptions to make the rule, and they don't actually talk to the people themselves. It was revelatory, but well, let me bring this one up.

This is just something that the world needs to see, speaking to what the CBC does in terms of reporting. This was an actual article. We're talking about state-funded media that is there to parrot and condition the population to accept unconscionable government measures. Why? Because they're subsidized by them directly and/or indirectly. This was an article, "The pleasure and peril of snitching on your neighbours during a pandemic." And their only problem with it, by the way, "Experts say reporting on neighbours offers a sense of control but adversely affects minorities." This is Canadian media, fully subsidized by government taxpayer dollars, and what they're out there doing is parroting, pre-suasion—planting the seeds—preconditioning people to accept the unacceptable and normalizing it.

Shawn Buckley

You know, it's interesting that reporter obviously hadn't learned what we learned in Manitoba. Because when the Commission has been travelling to different provinces, we've had one of our video people assemble news clips of the government speaking during the pandemic. In Manitoba, they didn't call them snitches; they called them "ambassadors." It was really Orwellian. I mean, it was upsetting to watch. And what the government was saying, they were basically encouraging people to snitch as if we were in East Germany, and, you know, there was the Stasi.

David Freiheit

It's the Orwellian newspeak like the previous witness was saying, you know, "We're closer together by being further apart." What is it? "War is peace, freedom is slavery, ignorance is strength." I forget the exact order, but it's nothing less than Orwellian newspeak.

[00:35:00]

Just to show receipts as well, this was the CBC, and notice the tactic again; it's the third time we've noticed it: "Protest convoy had 'worst display of Nazi propaganda in this country,' anti-hate advocate says." So the CBC is not saying it. They're just repeating what someone else says without holding their feet to the fire, without challenging it: it's the "worst display of Nazi propaganda in this country." This is, I like to say, "confession through projection," on my channel: accuse your enemies of doing what you're doing. This is the worst display of propaganda imaginable. You have the CBC, not saying it, just repeating someone else—the anti-hate network has its own problems in terms of reputation—but just repeating it: the "worst display of Nazi propaganda the country" has ever seen. And I went down there. Didn't see one Nazi flag, and it wasn't for lack of trying. Didn't see anything but the most beautiful unification I had ever seen.

I should say, it was the most beautiful thing I'd ever seen until Justin Trudeau deployed the stormtroopers after having invoked the *Emergencies Act*. I didn't see a lick of violence until the cops came in. Police, I should say the police—the RCMP, Sudbury Police, OPP, who are the other ones, Sûreté du Québec from Québec. It was the most beautiful thing I'd ever seen until the government said, "We have been embarrassed enough," and then called in the police.

I was down there the Friday and Saturday when they broke it up. And they came in, at the direction of Justin Trudeau, like literal stormtroopers in flank. One step at a time, knocking people, what do they call it, "the shove and grab," knocking people over, arresting them. I was there the day that they had assaulted, violently arrested, Chris Deering, an Afghanistan war veteran. A war veteran—his body had been literally destroyed in battle where his other mates did not survive—violently arrested, cuffed, had his hands behind his back for two hours. Then they drove them outside of the city and dumped them off like trash and let them make their way back.

I was there the Friday and the Saturday, and they had snipers on roofs, drones in the sky. They were detonating concussive grenades. I was like five feet from a concussive grenade as it detonated, as they're clearing the streets one after the other. Because Justin Trudeau, who promotes protest in India, promotes the rights of the citizens to protest in China— It wasn't even a question of negotiating. We now know from the Commission [Public Order Emergency Commission, (POEC)] that they had effectively negotiated some form of an agreement whereby the trucks would leave. But Justin Trudeau was so desperate to turn this into a quasi-January 6th—

Shawn Buckley

Let me just stop you, and I do want you to continue. But I just want the people that are watching your testimony to understand. So what you're communicating is the *Emergencies Act* was being invoked. So people understood that the troops were coming, so to speak, and the truckers had arranged to negotiate and had communicated "We will leave." So it wasn't necessary for the police to come in. And we've actually had one, I think, two witnesses that were involved in those communications, "We will leave." So I think it's important for people to understand, especially those that watched the troops come in—and there's still the videos online—that was completely unnecessary. That basically the truckers had agreed to leave and disembark and vacate the capital.

David Freiheit

I have sort of taken for granted and, wrongly, that everybody knows exactly what I'm thinking. Yes, so the protest goes on for near three weeks and peaceful, but it wasn't ending. The Windsor Bridge blockade, which everyone knows because that blockaded the border between America and Canada, Ontario and Michigan, had already been resolved via court order.

But Justin Trudeau was hellbent on invoking the *Emergencies Act*, which used to be the *War Measures Act*, which is the invocation of last resort for when there's a national emergency for which existing laws are inadequate to remedy. So Trudeau was hellbent on doing this. We now know this from the Commission (POEC), which revealed that they were discussing it. And even though a negotiation had been reached between the truckers and the city to at least clear up certain areas, that settlement was basically set aside so they could invoke the *Emergencies Act*, which was after the Windsor Bridge blockade, if you want to call it that, had already been resolved via court order.

So I don't care what the Commissioner Rouleau concluded.

[00:40:00]

It was the most egregious, unjustified, unconstitutional overreach to invoke the *Emergencies Act* for an issue of national security—a national crisis that cannot be resolved by existing laws—as relates to a protest in a four-block Red Zone, in pinpoint, geographically limited to Ottawa.

If nobody knows what an overreach that was, I've broken it down quite a bit on my channel. He invoked the *Emergencies Act* and then the police start coming in. Everybody knew it was going to end badly or more badly. The police came in flanks. You had multiple police [forces]. You had some with no identification badges coming in on the Thursday, Friday, Saturday, setting up fences, which people thought were for kettling, which is, you know, crowding people in so they can get arrested. You had heavily militarized police, armored vehicles, and police people, no badges. You didn't know who they were, just numbers. You don't know where they came from. And then all hell breaks loose of violence on the Friday and the Saturday when they decide it's over.

I said during this event, "If this event does not end in reshaping and revolutionizing where the world is headed, it'll be the biggest black pill following the biggest white pill that I've ever had." The day that this protest was violently ended, violently suppressed, it was one of the darkest moments for me after having seen the last three weeks of peace, love, and beauty. Nationalism in the best possible way—Canadians proud to be Canadian again. The amount of people who said it to me while I was down there: "I've never been prouder to be Canadian. I've been depressed and sad for the last two years. I've driven 13 hours from Nova Scotia. I've driven 12 hours from Northern Ontario. I've driven from Vancouver." The people were happy to be among other people. They were proud to be Canadians yet again, and then it was suppressed. The way it was suppressed also further illustrated the government-subsidized propaganda to downplay and deflect from the egregious over-the-top violence.

There was an image accidentally caught by the CBC, I think, of the police beating the ever-loving mercy—just kneeing a human being as though they were a sack of potatoes that they were trying to turn into mashed potatoes for dinner. It was accidentally caught live; they never spoke of it again. The media is covering this, you know, talking about violence—that could possibly warrant this action—when there never was. At one point during the protest,

the police cordoned off the cenotaph, the War Memorial, to protect it. To suggest that the protesters, who were military veterans in large part—

Shawn Buckley

Many wearing medals at the time and telling the police that they were not going to be violent.

David Freiheit

Wearing their medals. When Chris Deering was violently assaulted, he lost one of his medals in the snow when they shoved him to the ground, when they kneed and assaulted him. They were wearing their medals. They were—and I learned this by being there and asking them because CBC sure as hell was not reporting on this—they had set up 24-7 video surveillance of the War Memorial. They were shovelling the snow every time I was there, salting it, because the city was no longer salting. They had a drummer in front of the War Memorial, doing the military drums, and then the police come in and section it off as if to suggest that it was out of control and that people were desecrating it or vandalizing it. The military veterans that I was talking to—I've never served; I don't have this experience; I don't have this, you know, reflex of my soul—they were outraged. They said, "This monument is a monument for me to go pay tribute—honour—to my fallen brethren. And now I can't go step on it because the government is doing this as a sick ploy to make us look bad."

Did the media ever talk about how it was the military— It was spinning. I interviewed these guys, shovelling the snow, salting the walks, and watching over the War Memorial.

Shawn Buckley

Viva, I just need to focus us, and somebody just flashed that we have five minutes left.

I want to give the commissioners an opportunity to ask you questions because you've brought us a very important perspective, and the fact that you actually went there to deliberately see what was happening and contrast it with government narrative is of vital importance. So I'm just going to ask the commissioners if they have some questions, and they do.

Commissioner Drysdale

Good afternoon, Mr. Freiheit. We had previous witnesses who were at the protest in Ottawa, as you were,

[00:45:00]

and you were talking about how the CBC only presented certain pictures and so did the rest of the mainstream media. But that area, Elgin and Wellington, in and around and in front of the Parliament buildings, is probably the most surveilled, video-taped place in the whole country. Have you seen or have you asked for or has anybody to your knowledge demanded that the Government of Canada release some of that surveillance tape so we can see, using the government's own video cameras, what happened?

David Freiheit

I would say there's—I haven't done it. There's no need to do it because with all of the live streamers there who captured all of this in real time, there's no room for doubt. Thank you for reminding me of another fake news story that the media ran with but only corrected once it was well too late.

The arson, the alleged arson that the truckers had attempted to carry out on an apartment building. It had nothing to do with the protests and nothing to do with the protesters. By the time they go to correct that story, or attenuate it, it doesn't matter; it's already left its impact. When I was talking to the counter-protesters, they were just repeating the same things. They were just repeating the same things: people getting assaulted for wearing masks, the harassment. It was nonsense. But you don't need to ask the government for these videos. Everything was documented in real time.

The only issue really became, say, algorithmic suppression or soft censorship on social media where that video of the police kneeling, I think, a veteran in the torso as they're arresting him—that systematically gets demonetized on YouTube, which affects its visibility to others. But it was all captured. The only violence that occurred, in my experience and that I've seen, was at the hands of the government that came in to end this peaceful protest in the most non-peaceful way imaginable.

Commissioner Drysdale

Well, my only point, and I agree with you, it was documented by many people, including yourself. But my only point in getting the government videotape is it would be nice to hear from the voices of the government themselves, showing their own cameras, what their own cameras have shown. It would be difficult for people to say that the government edited or selectively videotaped when they have hundreds and hundreds of cameras. It reminds me a little bit of the Tucker Carlson thing earlier this year with their January 6th fiasco. It would be hard for the government to deny their own camera feeds, I think.

David Freiheit

Absolutely. Also, some of those camera feeds might show stuff that the government doesn't want you to see. Like there was a video of the police, while arresting someone, appearing to butt them repeatedly with the firing end of a gun. I'm reflexively a back-the-blue type person. But what I saw on the days when the protest was crushed violently was just following-orders-type conduct, which will leave a lingering bad taste in my mouth.

Commissioner Drysdale

Thank you.

Shawn Buckley

And there being no further questions, David, what a pleasure it has been to have you share this, your personal testimony with us. On behalf of the National Citizens Inquiry, I sincerely thank you for coming and testifying today.

David Freiheit

Thank you for having me. I wanted to do this during the Commission, but I think too many people wanted to do that as well. But thank you for having me. I hope everyone really

appreciates—it's attributed to Denzel Washington, but I think it's more Mark Twain: "If you don't read the news, you're uninformed and if you read the news, you're misinformed." You have to know the tricks in order to understand how to digest what's being fed to you and make more people wake up to what is actually going on.

Shawn Buckley

Thank you.

David Freiheit

Thank you.

[00:49:10]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Kassy Baker

Hello?

Anita Krishna

Hello.

Kassy Baker

Hello, Anita. We're on right now. Can I please get you to state and spell your name for the record, please?

Anita Krishna

Anita Krishna, A-N-I-T-A, last name is K-R-I-S-H-N-A.

Kassy Baker

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Anita Krishna

I do.

Kassy Baker

Very good. Now I understand that you're here today to tell us about your termination from Global News from your position as a control room director. Is that correct?

Anita Krishna

Correct. Yes.

Kassy Baker

Before we get into that, I would just like you to tell us a little bit more about yourself. Can you please describe your education?

Anita Krishna

I have a bachelor's degree in Radio and Television that I got from Ryerson University and I've taken other college courses, but I have a bachelor's in Radio and Television from there.

Kassy Baker

And how long have you been working in journalism and broadcasting?

Anita Krishna

Twenty-five years, long time.

Kassy Baker

Can you please tell us about your work and duties as a control room director?

Anita Krishna

Okay, at Global News, I was a technician, I was a control room director. So what that means is when you're watching your newscast on TV at home, we are making the TV happen, so that's part of my job. The producers line up a show, and we all work out of a rundown: the software that we used there was called ENPS [Electronic New Production System]. So they build the show, and what we do is we run all the elements in the show technically. We roll the opening, the big dramatic music that says, "Tonight, on Global News," and then we do all the camera moves and decide what the look is, whatever the top story is. Let's say it's about a mudslide blocking traffic on a highway or something, then I put in pictures of the mudslide, things like that. If we're going to reporters live on the scene, I make sure that's technically all good to go.

My job is preparing the technical execution and executing a show. But I work in a newsroom, so I work alongside all the directors, or sorry, all the producers and stuff. So even though I'm in my own world kind of lining up, kind of technically figuring out the elements I'm going to use for the show, I'm listening to what's going on in the newsroom. And I've done that type of work for 20 years or so.

Kassy Baker

And how long have you been working for Global specifically?

Anita Krishna

Since 1997, that's when I started there and I worked there for a few years. There was a period of time, right around 2001 and '02 that I started working at other stations. So I was just freelancing around different stations in Vancouver. I worked for CTV and I worked for City TV and worked for Global and Shaw, kind of all at the same time. So yeah, so I did that. Then I got married, and then we moved to New Zealand and then we came back here in 2007, and then I started working again. I picked up a little bit of work at CTV, and then I went back to Global.

Kassy Baker

You were working for Global in this position when the COVID-19 pandemic arrived in 2019. Is that correct?

Anita Krishna

Yes, I was a director of newscast when COVID-19 happened.

Kassy Baker

So what did you observe about the virus and how it was reported in those early days?

Anita Krishna

Oh, well, I mean, obviously in 2019, you know, it seemed to be a thing that just was happening over there in a different country. You know, here we go, it's another SARS type-of-thing. And you know, we're just waiting; nobody was really freaking out too, too much about it then. When it hit big was March, like 2020. I remember I was working at Global National, I was directing that show, March 11th. And oh, boy oh boy, like, yeah, that's when the hysteria really, really hit hard I would say.

Kassy Baker

Can you give us an example of this hysteria, as you've called it?

Anita Krishna

Well, the funny thing is, is that— Okay, working on Global National, some of the headlines that we were running that day on the 11th is like, we had reported that "The WHO declares the coronavirus a global pandemic." This is like just in our headlines, right?

[00:05:00]

And then we ran a little clip of Trudeau saying, "We're going to give Canadians everything they need," you know, "don't worry." And then we ran another clip saying, Patty Hajdu. And then before we got into that, we said, "Are Canadian hospitals going to be able to cope?" And then we went to this clip of Patty saying, "Oh, about 30 to 70 per cent of the population could get it." Then we ended it by saying, "Social distancing, what you need to know about keeping your distance and flattening the curve." And so that was in one minute, we had outlined all those things—all those things like panic, fear, just trying to scare everybody when I could see that nothing was really happening yet, like nothing had happened.

At that point, I'm not sure if there were—who had it? I didn't see anybody in my community that had it; I didn't know anybody that had it. Yet all these measures, these crazy measures and these fear tactics were coming fast and furious. And it was also right around that time that all the sports had cancelled, like the MLB, the NBA put their season on hold. The NCAA cancelled all their championships. It just seemed to be like—whoa, how did all these corporations or institutions, how did they all come to do this? Bang, bang, bang, like shut down, shut down, shut down, when we hadn't seen anything happen yet.

So my gut instinct was just telling me that this was like a massive overreaction but, you know, the horse had sort of left the gate already. Everybody was sort of in on this and nobody seemed to question the hysteria. Because, at the same time, we're also telling

people, “Children could get it. Children could test positive. If you’ve travelled outside the country, make sure you isolate; nobody, non-essential travel—” and all our clips of running people like Bonnie Henry saying, “This is going to get worse.” Well, I didn’t even see anything happen yet, so I just thought it was a massive overreaction. But everybody was just sort of going along with it.

Kassy Baker

And from your perspective, how did that reporting change over time, over the next several months that came to pass?

Anita Krishna

Sometimes an event happens and then you see the reaction. Now people can argue whether you see controlled events happening in news and then you see the controlled newscast. Sometimes that does happen, right? But for this situation, it was like nothing happens and then you see this kind of overreaction. Okay, so fair enough. So maybe at the time people were just being prudent and being cautious.

As time wore on, it just seemed to be that there were things that we were not reporting. You could easily find these things on the internet or find these things in other sources, but for some reason, our own newscasts were neglecting to tell people that perhaps the origins, like where this came from, was not the wet market. We actually just made people believe that it came from a wet market and never addressed this laboratory, the Wuhan Lab. Which was a big concern of mine because if you don’t know where this thing came from, how it came to be, how can you propose to know what it is and propose to stop it? So the fact that—

Kassy Baker

I was just going to ask, when you observed this, what was your reaction to the news being covered in this way?

Anita Krishna

Well, I just thought, how can we neglect this? How can we neglect to tell people this? How can we lead people to believe something which is not 100 per cent accurate? And we were leading people to believe things, about several things, that didn’t seem to be accurate, and yet we were not reporting this other side to so many pieces of this story.

Kassy Baker

Did you raise your concerns with your colleagues or with your supervisors and superiors?

Anita Krishna

Yes, yes, I did, I did, yeah.

Kassy Baker

Sorry, what was their response?

Anita Baker

I was raising concerns left, right and centre about absolutely everything. So let's see here, I had a meeting—I mean, as soon as you raised an issue, let's say you talked about the Wuhan lab. At one time, I said I thought this was a synthetic virus, in the newsroom:

[00:10:00]

that did not go over well, people just ended up getting mad at you. Other things that I raised was why we were not telling people about medications that could possibly help you, right? All of a sudden, everybody had these very strong opinions on hydroxychloroquine, and they had already formed their opinions. But my opinion is, if it's something that could possibly help you, do you not have the right to try it?

My cousin ended up getting COVID and she takes hydroxychloroquine because she takes it anyway, because she's ill with something else. So she got COVID and described how awful it was for her, but that she got better in about eight days and she thinks she got better because she was taking hydroxychloroquine. She said, "I think that that made a difference, you know?" So I told this to an anchor at work. I said, "Hey, my cousin took this and she thinks she got better." And he just said, "Oh, she thinks she got better, eh; she thinks she does; she thinks she got better." Like he got mad about it, but why would you get mad? Wouldn't your answer be, "Hey, that's awesome. You know, I'm glad that that worked for her, maybe we should look into it. Maybe this is something we should do a story on."

I'll tell you something else. I brought up ivermectin to one of the assignment editors there, too. Because there was so much negativity going on in the newsroom and so much judgment of people that were questioning the vaccine and stuff at the time that you knew what you couldn't really even speak about. But you couldn't really even speak about drugs. So one time in the newsroom, I brought this up because somebody called up to say some story about how unvaccinated people were taking up beds in the Children's Hospital, like, "look at these unvaccinated people." And this one guy was just sort of saying, "Oh, what a bunch of idiots these people are." And then somewhere in this conversation, I had brought up early treatment. And I said to him, "What about ivermectin?" And he said, "That's debunked." He said, "That whole drug is debunked."

Kassy Baker

Sorry, and just to be clear, this was a colleague in the newsroom or in your work environment, correct?

Anita Krishna

Like a senior colleague. The reason that this is important is because this man helps shape the newscast. This man decides what goes on our newscast, particularly the big ones, the five o'clock and the six o'clock. And he's calling people—I mean, a lot of people there were calling people names, like covidiot and stuff like that. But then when I bring up a drug, he says, "That drug is debunked." And I said, "What? What do you mean the whole drug is debunked? You know, what are you talking about?" I said, "Did you not see that big, big study in India?" And he said, "That's debunked." That's all he could say was "that is debunked."

But to my mind, at that time in Uttar Pradesh, there was like 241 million people. They barely had any COVID because they had been using ivermectin. So that is a story. That is something that we should at least be looking into. And even if you don't believe that that

medication works, you still should be talking to doctors, talking to somebody who might have taken it and gotten better. And you should be showing that side of the story. Then you can show the other side, of someone saying, “No, it doesn’t work.” But you have to show both. And the problem is with him saying that this isn’t even a thing— And right after he said that, my boss sent me an email saying, “Anita, you need to stop talking about COVID.” So I wasn’t even allowed to talk about this.

But the dangerous part of it is, these are people shaping your newscast. By them not telling you that there are medications that are not “horse medications,” you are doing a disservice to the public. People have the right to try it because they might get better if they try it. But if you hide that information, I mean—that is misinformation. That is 100 per cent misinformation coming from Global News in Burnaby. I can attest to that.

Kassy Baker

You’ve touched a little bit on the vaccines already, but as we’re all aware at this point, they were rolled out in early 2021. Can you describe the coverage that you saw regarding vaccines and vaccinations specifically?

Anita Krishna

Sorry, one other thing I wanted to say about that is we also ran stories making Joe Rogan look like an idiot for taking ivermectin: that was done on purpose and that is wrong. That is wrong and it just led people to believe that.

But vaccine. Well, yeah, I mean, the vaccine was like a religion.

[00:15:00]

All we did was constantly run stories of, okay, “Look at this person in the hospital, this person who made a bad choice and didn’t get the vaccine. Oh, they ended up in the hospital.” It’s like all our stories were slanted to that. Everything we were saying was “pandemic of the unvaccinated. If you’re unvaccinated, you’ll be holding everybody back.” And that we now know isn’t true.

Kassy Baker

I apologize for interrupting. In your experience, have you seen any other event reported in this manner?

Anita Krishna

I’ve never seen an event in my life where you cannot go to someone to talk about it like a senior producer, like a news director, and express your concern. They would be open to your concerns. If you had a news tip to give someone, they would at least take it on board. They wouldn’t say, “No, no, no. Stop talking.” I don’t know how many times there I was told to stop talking about something. So there’s an absolute reluctance to provide accurate information and to cover things that you should be doing that could help you. All there was—what I would say—was propaganda that didn’t speak up for people.

We would do things like on the 5 o’clock news where we would just say, “and sadly, another business has shut down due to COVID.” And we were not actually holding anyone to account saying, “Is what we’re doing fair?” You know, when people are using plexiglass

and sitting outside and you can go up to the counter and order, but you can't have a waitress come to you, or you've got to mask—you know, all the things that didn't make any sense. We were just shoving it in your face like it was something you needed to accept rather than questioning, "Is this really making sense for a business owner, for this person's livelihood?" We never stood up for the people. We just, as far as I'm concerned, shoved propaganda in your face.

Kassy Baker

Thank you. Now as an employee, I understand that Global did institute a vaccine mandate at some point. Can you describe the circumstances that led up to that and describe what the mandate required from you?

Anita Krishna

Well, they just pressured a lot of people to get vaccinated, and they'd make you fill out forms and they'd always want to know your vaccine status. And a lot of people were quite upset about that because we were trying to say, "Hey, we have a right to privacy." The people who believed in the vaccine just willingly went with it, as if they're in the good club. And the people who were reluctant and hesitant, "Oh, well, you're in the bad club," you know. So I didn't really even fill out the forms. And it should be noted that I didn't even get fired for not taking the jab. I got fired for speaking up.

Kassy Baker

We're coming up to that right away. So on that point, I understand there were a few things that led up to your termination. But in particular on, I believe it was December 12th of 2021, you attended a rally or a protest that was held in North Vancouver. Can you explain what prompted you to attend this rally?

Anita Krishna

Working at Global was like working in a twilight zone during the pandemic. Everything that you thought would have ever made sense for choice, for freedom, for your health just went out the window. And at this point, I was very concerned because we were running stories telling pregnant women to take this jab, and I personally had run those stories on some of the shows I was working on where we had some doctors telling pregnant women to take it. In my lifetime, I don't think you would ever tell a pregnant woman to take anything experimental because I'm old enough to remember thalidomide. I just think that for pregnant women, you have to be so careful, you can't even eat certain cheeses and things like that.

Why would we be telling women to take this vaccine that's never even been tested on women? How dare we even do that? I was feeling actually sick about that. But as time went on, then you started to hear [about] miscarriages. There were these reports in Scotland and Waterloo. And it was very hard to get a sense of like, was this really happening? And of course, our newsroom isn't even following up on any of this. Then I heard about this rally with this doctor, Dr. Mel Bruchet, and he had done some stuff and he had some videos online talking about it. I really was really wanting to know—were people becoming harmed by this and are people losing their babies?

[00:20:00]

So I just went to this rally which, by the way, Global News should have been at because if you're part of the community, you should be covering this stuff. And they did not. They don't care.

Kassy Baker

Did you attend the rally on behalf of Global or as an employee or identify yourself as such?

Anita Krishna

No, I did not. I went just out of my own curiosity as a private citizen and I knew no one there. But when I got there, I recognized a cameraman that used to work at Global. But I went as a private, curious citizen looking for answers.

Kassy Baker

Now I understand that you ended up speaking at this rally, is that correct?

Anita Krishna

I did. I did.

Kassy Baker

Can you describe the circumstances that led to you giving this speech? Was it planned or unplanned? Explain to us what happened.

Anita Krishna

Totally unplanned. It was just unplanned. I went up to a lady that I saw. She was a nurse, and I'd seen her online in one of these videos because I'd been watching videos of Daniel Nagase and Mel Bruchet. I saw this nurse and I just went up and said, "Hi," and I said, "I'm really interested in what's going on here," yada, yada. I said, "I can't really stay too long" because I had to go back to work. And then she asked me where I worked and then I said, "I actually work at Global," and she was like, "What?" And she just grabbed me, didn't want to let me go. She's like, "We cannot get anybody from the news to talk to us." And I said, "I'm not here as, like, I'm not a reporter." I've always said that: I'm not a reporter. I'm just here because I'm just curious. Then I ended up speaking because I just thought, well, what the heck?

Kassy Baker

I understand that your speech is recorded and available online if anyone wants to look at it. We have not got it here today. But more to the point, I understand that the speech was recorded. Is that correct? And obviously it was if it's online.

Anita Krishna

It was recorded. So many camera phones and then somebody sent it to Global, and then I ended up getting in trouble. I ended up getting suspended after that for violating journalistic principles, and they still have not been able to tell me how I violated those principles. They have violated their own principles by not reporting on community events. They have violated their own principles by not showing up to the National Citizens Hearing

when it occurred in Langley, not even sending a camera or a reporter, not even doing a voiceover on something like this. Who is violating journalistic principles? I can only say they are, by preventing this information to get out to people.

Kassy Baker

So when you were suspended, can you describe the circumstances of that suspension and the terms of your suspension? How long was it? Was it with or without pay?

Anita Krishna

This one was three days with pay, just because they had claimed I'd violated the journalistic principles, of which they still have not told me what principle I had violated. Show me. They could never show me. I said, "What article in this JPP [Journalistic Principles and Practices] did I violate?" They weren't able to ever even tell me that. So that first one was a three-day suspension.

Kassy Baker

And I see that I missed something so I just want to go back and clarify that. When you gave this speech, I understand that someone introduced you and how did they introduce you?

Anita Krishna

Oh, they said I was a Global TV director, yeah.

Kassy Baker

So you didn't make this assertion yourself. It was offered by someone else who was also speaking at the rally. Is that correct?

Anita Krishna

Correct, correct.

Kassy Baker

Following the suspension what was your relationship like with your supervisors and your colleagues at work?

Anita Krishna

Well, I guess in secret there are a lot of people that supported me because a lot of people felt the same way: They felt scared. They felt nervous. They didn't want to take it. They felt completely violated and threatened and bullied by management at Global which—they turned into bullies instead of managers.

My relationship became strained with the people who disagreed with me who thought that I was becoming radicalized. So lifelong friends, we ended up just completely disagreeing. Like my little cousin, he's 24 now, he took a Pfizer jab; he ended up paralyzed in the hospital. I was still working at Global at the time, and this happened right after his Pfizer shot. He got Guillain-Barré syndrome. And I said to people at work, this is what happened to my cousin. One of my good friends who's an editor there, and he just said, "Well, what

pre-existing condition did he have?" That doesn't matter. You don't end up not being able to walk for nothing.

[00:25:00]

He wasn't skydiving. Nothing happened. He took a jab. He can't walk. Now we've heard many stories of things like that. So there's just an absolute refusal to believe.

There are some reporters there that do and people that work there—they know what's going on, but they're not going to say anything because you're really not going to want to lose your job. I should say, though, I actually was so concerned with maybe children getting hurt, I told my operations manager when he was telling me to be quiet, and I said, "I'm really worried about children and pregnant women. They're the most vulnerable." But prior to all this, the news director—I encourage anyone to contact the news director at that station if you have any questions as to the news that's being presented to you—and I said to him, "I'm really worried about, like, there is very perverse incentives behind this vaccine. Are you not worried? How do you think they came up with this so quickly? How is this even possible?" And he just said, "All the scientists in the world got together, and when everybody gets together, then they can make this happen," which is a completely nonsensical answer. And then at the end of it, he just told me that I needed to get vaccinated.

Kassy Baker

Okay. Now, I understand that you were in fact terminated. Is that correct?

Anita Krishna

Yes.

Kassy Baker

And what date were you terminated?

Anita Baker

January 18th, I believe.

Kassy Baker

So roughly, and just for clarity, that was about, not quite a month after the rally?

Anita Krishna

I'm sorry it was January 6th.

Kassy Baker

Yeah January 6th. So a few weeks really after the rally, is that right?

Anita Krishna

Yeah, yeah. Right around Christmas time.

Kassy Baker

Can you describe what led to your termination or the reason that was given?

Anita Krishna

I think they gave me three. They told me something in my termination letter, one of which was that I had violated a social media journalistic principle policy. I don't even know how. They've never even shown me what clause I've actually violated of that. And I had said, "Can someone ask the Provincial Health Officer why the casinos, liquor stores, and strip clubs are open and the gyms and the churches are closed?" which is a valid question. But they fired me because on my Twitter profile, it just said Anita, Global BC director. So I guess they felt I was putting them in some kind of disrepute by asking them that question. But it's a valid question.

Kassy Baker

Sorry just for clarity, can you repeat the tweet that you had posted in which you were ultimately terminated for?

Anita Krishna

I said, "Can someone please ask the Provincial Health Officer why the casinos, liquor stores and strip clubs are open and the gyms and churches are closed?"

Kassy Baker

And that was it? That was the last tweet? Okay and I understand that you were terminated "with cause" is that correct?

Anita Krishna

So they say. That's what it says on my—actually, it doesn't even say that on my termination letter. So if anyone knows a good lawyer, please reach out to me, but it doesn't even say that on my termination letter. But they will say it was "with cause."

Kassy Baker

Okay. Were you eligible to apply for EI or any other benefits?

Anita Krishna

No.

Kassy Baker

Okay. I actually don't have any other questions. Are there any questions from the Commissioners?

Kassy Baker

Okay, I believe that's everything. On behalf of the National Citizens Inquiry, I would like to thank you very much for your testimony here today. Thank you.

Anita Krishna

Well, thank you for having me. Thank you very much.

[00:29:02]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 11: William Bigger

Full Day 2 Timestamp: 10:47:55–10:56:12

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Our next witness is Mr. William Bigger. William, could you give us your full name and spell it for us, and then I'll do an oath with you.

William Bigger

William Bigger, W-I-L-L-I-A-M B-I-G-G-E-R.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony?

William Bigger

Yes, sir.

Wayne Lenhardt

What you're going to do today, I guess, is just outline the problems that you had as COVID developed in your community. You live in St. Catherine's, Ontario, correct?

William Bigger

Yes.

Wayne Lenhardt

And you've lived there for quite a while.

William Bigger
My whole life.

Wayne Lenhardt

Okay. In 2020, you were 18 years old. Tell us what you were doing in 2020, just as the COVID problems were developing.

William Bigger

Yes, so as you said, I was 18 at the time, freshly out of high school and was a very active member in my church as a kids administration leader with younger kids. I also was a competitive swimmer for our local Special Olympics swim team. I competed with them since I was very young. I was born with autism, so I always swim with them as a form of physical therapy and was pursuing a job out of high school, just at a local sports venue.

Wayne Lenhardt

And you had a job at that time?

William Bigger

I did yes, at the time. I had held that after high school and then once everything shut down, all of our events were cancelled, so I lost that job. Our churches closed, so I lost my leading opportunities and I couldn't swim anymore.

Wayne Lenhardt

So by August of 2020, you were out of work.

William Bigger

Yes, sir.

Wayne Lenhardt

By the end of 2020, you did get another job. Correct?

William Bigger

Yes, I did. After being off work due to lockdowns for several months, I was able to find work in our city as a new sub restaurant was opening up.

Wayne Lenhardt

Your family sort of was having problems as well during this period of COVID, correct?

William Bigger

Yes, unfortunately, both my parents both work in what were considered high-risk sectors, the hospital and a firefighter, and this became very challenging for them.

Wayne Lenhardt

Were both of your parents working at the time?

William Bigger

Yes. During the whole time, they were still able to work with challenges, with all the PPE and all that in their jobs.

Wayne Lenhardt

And there was concern about your father's job, which would have caused some serious problems, correct?

William Bigger

Yeah, sorry. It was just, very emotional.

Wayne Lenhardt

So you managed to get a job in a submarine shop in 2021 by April. Did you still have that job? What was happening?

William Bigger

Yes, I did have that job for nine to ten months in total. Through those nine to ten months, it was very challenging. They had all the social distancing and masks in place. At that time, there was talks about the vaccine as it rolled out, but nothing in place in terms of mandates. But it was just a challenging work environment, having to be careful where you stood and wearing the mask was difficult for me. Just to be able to understand and communicate with people and read their facial expressions.

Wayne Lenhardt

You did get a job at Costco at some point, correct?

William Bigger

Yes, I did.

[00:05:00]

At the beginning of 2021, around March, I was able to get another job there. Just out of my previous job, I had a fear that if I stayed there any longer, I would eventually have lost it due to vaccines. So I was trying to pursue work, and then I was able to find work.

Wayne Lenhardt

And you never did get the so-called vaccine, did you?

William Bigger

No, sir.

Wayne Lenhardt

Okay. Was there a reason for that?

William Bigger

As a family we decided that it was best to not participate. When I was very young, I'd had a bad response to my year one boosters, which I was, after, in the hospital for a short period of time. And so I just let my parents consult with family doctors and experts that they were in contact with to decide the course of action, so they decided to avoid taking them.

Wayne Lenhardt

Okay. I think I'll stop there and ask the commissioners if they have any questions for you. Anyone? Any last items you want to tell the commissioners?

William Bigger

I just really want people to know that if they're watching this that their stories can be heard and that they're not alone. These past few years have been challenging for everyone and I just want it all to be over.

Wayne Lenhardt

Okay, on behalf of the National Citizens Inquiry, I want to thank you for coming and telling us your evidence. Thank you again.

Commissioner Kaikkonen

I just have a quick question about you worked with youth. Do you know what happened with the youth when everything shut down? Did they feel the same way you did?

William Bigger

Can you repeat the question?

Commissioner Kaikkonen

You said that you worked with youth,

William Bigger

Yep.

Commissioner Kaikkonen

prior to the lockdowns? Do you have any understanding of what happened with them in terms of lockdown? Do they feel the same way you do, or do you have anything to add about the youth?

William Bigger

Over the past little while I've been slowly reconnecting with that group that I have served in my church. Although I have not maybe asked what their experiences have been, I've been

really wanting to, just over the past couple years of how it's affected them as even younger than I am—especially those that are younger and were still in school and how that would affect them. I haven't really gotten a chance to ask, but I would really love to.

Commissioner Kaikkonen

Thank you very much.

William Bigger

You're welcome.

Wayne Lenhardt

Any other last questions for Mr. Bigger? Okay, I want to thank you on behalf of the commission of inquiry for your testimony. Thank you again.

William Bigger

Thank you.

[00:08:32]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 12: Scott Routly

Full Day 2 Timestamp: 10:56:34–11:21:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is going to be attending virtually, Captain Scott Routly. Scott, can you hear us?

Scott Routly

I sure can. Can you hear me okay?

Shawn Buckley

We can hear you, but we can't see you.

Scott Routly

Oh. Let me see what I can do here. Okay. Can you see me now?

Shawn Buckley

We can see you now. So, Scott, I'd like to start by asking you to state your full name for the record, spelling your first and last name.

Scott Routly

Okay. My name is Scott Routly, S-C-O-T-T R-O-U-T-L-Y.

Shawn Buckley

And, Captain Routly, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Scott Routly

So help me God. All glory to God.

Shawn Buckley

So my understanding is that leaving aside your other military service, you served fifteen years as a military pilot, and then you served an additional fifteen years in civil aviation [Exhibit OT-10].

Scott Routly

Yeah, that's correct, sir, yes.

Shawn Buckley

And you ended your career prematurely because of COVID, but at the time you were a chief pilot for an airline.

Scott Routly

That's correct.

Shawn Buckley

I appreciate we don't want to name the airline, but most people listening to your testimony are not going to understand what a chief pilot is. Can you briefly explain what a chief pilot is?

Scott Routly

Yeah, the chief pilot, he's a middle manager; he's in charge of the whole pilot group. In my case, I had roughly about 100 pilots in my charge. He's appointed, not only hired by the airline, but also appointed by Transport Canada because of the regulatory requirements.

Each airline in Canada, in the industry, basically has a few accountable executives that Transport Canada considers their go-to people: that would be the chief executive officer of an airline; that would be the operations officer or director of flight operations; that would be the director of maintenance; and that would be the chief pilot. The reason for that is because of the Canadian aviation regulations, the requirements and regulations and rules that need to be adhered to. So they then screen individuals for this role. The airline cannot just hire a chief pilot, they also have to be screened and approved by Transport Canada. So of course, I had to go to meetings and do knowledge tests. I had to have a certain amount of expertise—

Shawn Buckley

Okay, and I'm just going to shorten this because what I want people to appreciate is that in that role that you had, not only are you responsible to the airline for taking care of the flight crews, but you're also responsible to Transport Canada for taking care of the flight crews.

Scott Routly

Absolutely, yes.

Shawn Buckley

So you have a responsibility to two different parties and, literally, what would be described as the fiduciary duty to the pilots to take care of them.

Scott Routly

That's right. So of course, all the training standards are part of the Canadian aviation regulations as mandated by Transport Canada [Exhibits OT-10f, OT-10g, OT-10h]. So it's my duty and my role to ensure that all the training and all the standards, proficiency checks, evaluations, standard operating procedures, operation manuals—

Shawn Buckley

I'm just going to truncate because I'm watching a timer go down and we're at eleven minutes and twenty-eight seconds. I think people understand that it's a highly—there's a lot of responsibility. But I just wanted to get—because of what follows in your testimony—that people understand you're also responsible to Transport Canada.

So COVID hits, you're a chief pilot. Can you share with us your experience and, kind of, the steps that you ended up taking to try and protect the pilots under your charge?

Scott Routly

Yeah, so we all know what happened, of course, in 2020. We were subject to all the same measures, the lockdowns that were happening throughout the country. Now because we were considered as essential workers, we continued to operate. We were operating up in the north country and around Ontario for the most part. And so throughout that time period, it really didn't affect us very much. We just continued on with our operations.

Now for the passengers and what-not, protocols started coming out. You know, the social distancing, the masks, testing, and all these different requirements. So the airline, they tried to follow the best they could for Health Canada—as everybody was trying to do in all aspects of the industries.

[00:05:00]

In our particular case, this continued on until pretty much as the vaccine rollouts started to happen in late 2020, early 2021. I could see the writing—I'd been doing a lot of research and critical thinking, my background, and already starting to look outside the mainstream media into other avenues to see all about these so-called vaccines that were being rolled out, for obvious reasons.

The medical requirements for pilots, it's a fifty-fifty split in our licencing [Exhibit OT-10a]. We hold a licence for our type rating on the aircraft itself that we fly; we have to do training every six months to maintain our type rating. But more importantly, or just as important, on the other side is our medical requirements [Exhibits OT-10c, OT-10i], which without the two, in our aviation booklet, you can pass a check ride for your aircraft type rating but if you fail your medical, you do not fly, and vice versa. So in some cases, the pilots consider—depending on age and healthiness—that passing the medical is the highest priority because it's obvious they're really knowledgeable, highly skilled individuals. We're probably the most regulated industry out there, for obvious reasons. We fly in the air. We can't pull over when anything happens. You know, critical thinking, decision-making, and emergency procedures.

So all of a sudden, the vaccine started to get rolled out. I had my suspicions. I started seeing it happening—

Shawn Buckley

So can I just ask you beforehand— Because you were responsible, actually, for a large number of flight crew people. And you guys would have had to have been doing the testing before the vaccine rolls out. Were you finding that pilots were off work because they were actually sick?

Scott Routly

No, as a matter of fact, it was just like any other year and, you know, we're getting into the low vitamin D season, better known as the flu season. And so there was the odd sickness but nothing abnormal from previous years. But what was happening was through family members and through all the COVID testing, we started getting into these issues where pilots are calling in and they're saying, well, they phoned Health Canada and "my wife, you know, has tested positive, although she's not sick." And everybody was— They just started making things up, really, off the top of their head, in this region: so basically, "Well then, you better ground those people for, you know, forty-eight hours," and then it was seven days and then fourteen days.

So the pilots themselves were not getting sick. But they were being grounded because of Health Canada protocols that they were in the same household as apparently somebody who tested positive, although not sick.

Shawn Buckley

Right, okay. I just wanted to pull that out. So you weren't having pilots going down with COVID, but they were getting grounded because of the testing protocols.

Scott Routly

That's right.

Shawn Buckley

Okay, sorry to have interrupted. Now there was one other thing. My understanding is that you guys had to go for your six-month SIM training [simulation training], and you had related to me something that you observed in the hotel. I want you to describe that just because it's come up in some other testimony at the Ottawa hearings. So can you share with us please, what you observed when you were staying in Toronto for the SIM trainings?

Scott Routly

Yeah. So finally, there was a lot of exemptions, unfortunately, with medicals and training, so there was a little bit of a lapse. We finally were able, just after the second lockdown, to start going to Toronto and continue with our simulator training, which we do every six months. We rolled into Toronto and, of course, the country's been locked down for the last three months at that period of time, and we had a hard time finding hotel rooms.

So how could this be? Long story short, we get to the hotel, and we're being told that six of the seven floors are quarantined from international travellers coming into Canada through

the COVID protocol. We're going to stay on the seventh floor. Now you walk into the lobby, and half of it has a glass, of course, opened at the top, as we've seen in stores and whatnot. And so we had use of one side of the elevators, and the other side was for all these so-called passengers coming in. So I didn't really think a whole lot of it the first day, where it was late, got in.

The next day before I had to do SIM training, I just thought, you know, I'm going to go down to the lobby and see what's going on here. This seems a little crazy for my kind of thinking. So I just sat in the lobby to see who was coming in and out on the other side.

[00:10:00]

Anyway, I was starting to see busloads of people come in, and nobody could speak English. They were coming in not with a suitcase that you would pack for a week vacation or two-week vacation. They were coming in with carts full of baggage that you would bring if you were staying for a lifetime. And food was being provided to them. It was all kept separate. We couldn't communicate with them on the other side. I did ask the person at the front desk, and the cone of silence came down and I was pushed back, and they didn't have any answers for me. So I watched this the one day, went out, and did my SIM training.

The next day I thought I'd better go down and watch it again for a few hours before my next day of training and, sure enough, the same thing happened. Now what was happening too though, was the next morning, they were actually getting loaded up in buses, disappearing. And then more buses would show up, and they were being offloaded into the entryway, given rooms, given food. Then they would disappear into the hotel in the so-called quarantined areas of the hotel. So I thought that very suspicious from my background and of course, with my critical thinking, that what I was watching happened for the last, you know, year and a half at that point.

Shawn Buckley

Okay. Yeah, thank you. It had come up about the number of immigrants coming in, almost like the population was being replaced.

Scott Routly

My thoughts were too, Shawn, absolutely.

Shawn Buckley

Okay, so back to the airline. Can you tell us the story of what happened? You were kind of telling us that things were getting phased in and then the mandates came in. I'm wanting you to share with us what you thought, what you did, and what happened. I'll tell you, we've got about eight minutes left.

Scott Routly

So the red flags started coming up, obviously, when there was rumors with these vaccine rollouts that it could possibly affect everybody. Right away, I had done a lot of research, started listening [to], you know, off-media sites where Dr. Peter McCullough, Dr. Theresa Long from the United States Army, flight surgeon, Paul Alexander. All these experts you've already had; you've had them as witnesses. All these people were already speaking out now.

It's been a year and a half in, and we already know at this point that these experimental jabs are dangerous, a lot of adverse effects happening with them. They're also not stopping COVID, not stopping transmission. So what are they there for?

Well, from an aviation point of view, and certainly for the health and welfare of my pilots, I raised the flag. And so I got a meeting together, and I said, "Look, if these things are going to start to happen, we need to have a close look at this. This is against all rules, protocol. You know, we have thirty years from my experience anyway in aviation, where safety has just been the paramount ideal that we strive for all the time. With all the training and everything else we do in the safety management system—for actual flying airplanes and what-not; our medical categories and fitness of the pilots, including fatigue—we have to stress this point to find out what is going on here [Exhibit OT-10e]. There's no way that we can give this to pilots that are flying, an experimental drug, until we get further information. Here's information I have."

Now at one of the meetings, the first thing I got, you know, I stressed to the Air Line Pilots Association [ALPA] union members—because we did belong to ALPA—and they said, "Oh, yeah, no, we know about these incapacitations, and they're all false narrative." And I said, "Well, I don't think so. It's been reported by actual pilots on the flight line in the United States and elsewhere." And anyway, they said, "Well, Health Canada has said that no, they're safe and effective [Exhibit OT-10d]. Therefore, the union's all in."

I went to management. I said, "Look, you know, regardless of what's going to hopefully not come down the pipe, but there are rumors that we need to be careful of this because we are responsible for this. These are our people. We cannot, you know, put these unknown drugs—" You can't even give blood as a pilot and fly for forty-eight hours. You can't go scuba diving. You can't take prescription drugs unless a civil aviation medical examiner approves it, right? That's how serious and regulated our medicals are.

Anyway, that was at that point. Shortly afterwards, then the rumor came down that Transport Canada was, in fact, going to enforce mandates for all the federally regulated airlines, trains, or anything in transportation. That's when I really raised the flags and put together data packages, which we already had at this point. And I once again had another meeting. Once again, I was pushed back.

[00:15:00]

I went to the senior management. I explained to them that absolutely we cannot do this. I explained Nuremberg Code; I explained all the laws of Canada, Charter of Rights, just the medical safety side of it: "We cannot do this, not only for our own people, but for the travelling public, the safety for them." And it was pushed back.

I eventually ended up writing a letter. They had a mandate come out that if we were not all double-vaxxed by 15 November of 2021, that we would be fired or suspended. Now I'm the chief pilot; I'm the man that's in charge of all the pilots for their health and welfare for Transport Canada. I reached out to Transport Canada, I said, "What's going on here? You know, we cannot allow this to happen, this is insanity." And I don't blame any of the lower-level people, you know, they're just following direction from above—unfortunately, blindly. And they said, "Well, this is going to go through." So anyway, I put up my fight against it. I said, "What about exemptions for people?" [Exhibit OT-10k]

I've got the first third of the pilot group—like everybody else in Canada—just ran right out in fear. About the middle third, they heard, "Well, I'm not going to be able to travel, so I'm

going to go take it—what the heck, it's just another flu shot." I warned everybody it's not. And of course, there was the other third of the pilots that were extremely nervous and said, 'Look, we don't want to take these shots. What can we do? It's going to affect us possibly for the rest of our life; if we lose our medical because of these shots, then we've lost our career.'" And I totally agreed. So I went to Transport Canada who said, "There's nothing we can do."

Now they did roll out exemptions. But of course, it was all a big farce. It was all pre-planned that nobody would get one and, in fact, the people that did apply got refused. I didn't even bother as a man of God, as Jesus, my Lord Saviour Christian; I'm not going to allow somebody in Ottawa decide my faith, so I didn't even apply. So at the end, I did not get jabbed; in the end, I was the only one [Exhibits OT-10i, OT-10j]. They all, through fear and coercion, scared of losing their careers and their jobs, their paychecks, unfortunately, the rest of them submitted. And it's extremely unfortunate because I know they're all flying around right now, wondering—you know, with all the reports of myocarditis. It's insanity; it's criminal that these people should be out there.

Shawn Buckley

I just want to slow you down. My understanding is that you were terminated because you wouldn't get vaccinated or you were—

Scott Routly

I was put on the infamous "suspended without pay" for eight months or whatever. Until through the pressure of the—thank God—Trucker Convoy, the only reason, you see, that the mandates were suspended. Everybody needs to understand, the mandates are still in place. They were just suspended. I know everybody's having the summer of love, but they were merely suspended. And the reason they're only suspended is because I'm sure that they're going to bring them back in again. So after that, then I was terminated.

Shawn Buckley

Now, do you know, following vaccination were there any changes to the medical requirements for pilots?

Scott Routly

Well, during the whole time there—at least, the first year through 2020 and into 2021—they basically had exemptions for medical. So they suspended the medical requirements.

Shawn Buckley

Just wait, so 2020 into 2021. So once they roll out the vaccines in 2021, there's, basically, an exemption from having to get the medicals.

Scott Routly

That's correct, yeah.

Shawn Buckley

Now, the medicals were mandatory every six months, were they not?

Scott Routly

That's correct. Six months to a year, depending on your age, or if you have any underlying issues. That's always been the case with CAT-1 medicals. As I say, that's fifty per cent of our licence, right? And of course, we have to go to civil aviation medical examiners [Exhibit OT-10b]. We don't just go to normal doctors. We have to be approved by civil aviation inspectors who actually give us physicals. And the older you get, you have to get ECGs, urine tests, eye tests, all these different things, right? X-rays, if required, depending. Now they stopped all this because of COVID. But then, even after the vaccine rollouts,

[00:20:00]

which I found quite insane, is that knowing everything that's going on, they've now increased these medical requirements, the exemptions, basically to telecoms. So you can phone into the civil aviation inspector and tell him, "Yeah, I'm feeling good, doc. It's all good." "Okay, good to go."

Shawn Buckley

Let me just be clear. So you used to have to go in and actually see a doctor and get tested.

Scott Routly

Of course.

Shawn Buckley

And you would normally have to get an ECG. I mean, these were really strict and complete tests, am I right? But they included ECGs.

Scott Routly

Yeah. Now it's for initial testing. For the younger pilots, you're not required to get ECGs until you're a little bit older. Once you're at the age of forty years old, then you have to get an annual ECG.

Shawn Buckley

Okay, but that's been exempted, hasn't it?

Scott Routly

Sorry?

Shawn Buckley

That's been changed, hasn't it? Isn't there an exemption now from needing to get ECGs for a couple of years?

Scott Routly

That's correct, yes. Yeah, so even with all the knowledge, even more so now than we had prior to the rollout, they've now extended it even again for another couple of years to 2025. Now, within that, there's about a three-year period. But every two years, you will have to go

in to do a physical. But the point is, a lot can happen in two years when you used to go every six months to a year.

Shawn Buckley

So, I want to make sure that no one's misunderstanding you. So, you know, in this most regulated industry—because, obviously, we don't want pilots having heart attacks or strokes or anything while they're up in the air flying us places—

Scott Routly

That's right.

Shawn Buckley

there were strict requirements for them to go "in person" for medicals. But here we hit a global pandemic where, in theory, the pilots are at more risk of being sick, and they actually relax the medical requirements, including mandatory ECGs.

Scott Routly

That's right.

Shawn Buckley

And that's after they roll out experimental vaccines. So pilots are now being tested less than they were before.

Scott Routly

That's correct, yeah, yeah. Of course, logical common sense would be, you know, you'd be tested more now just to confirm if there's any issues.

Shawn Buckley

Okay, now we've run out of time so I'm going to ask you one last question, and then I'm going to turn you over to the commissioners for questions. My last question is, are you concerned about airline safety?

Scott Routly

Yes, I am. There's already been reports. I think you've already talked to Greg Hill with Free to Fly. There's also Josh Yoder down in the States, Freedom Flyers, two great organizations; I belong to one of them. And these jets are getting calls all the time from the flight line. Now pilots by nature, they do not want to lose their medical because that means you lose your licence, which means you just lost your career. They put a lot of time, a lot of effort, a lot of expense to this highly dedicated profession. But they were forced and coerced into this, and so now they're out there, they're phoning in. They don't know what to do.

The reason you're seeing a lot of—you'll hear from Transport Canada rep here and in the airline—issues that we had at the airports, these were airlines that couldn't find crews to fly. They were calling in sick for whatever reason, and they were just short of crews—that's why flights were getting cancelled. They were trying to, you know, they had their own

narrative they were trying to use at the time. But the real reality is they were short of crews on the line due to sickness. And let's face it, they also fired forty per cent of their pilots throughout the country, like nurses, like firemen, like police, right? So you're wondering why you have a shortage? Well, that's because you fired forty per cent of them. And we're talking highly experienced individuals, right? You cannot replace these individuals.

Shawn Buckley

But we're short on time, and I was asking you if you were concerned about airline safety. And you are. So I'll turn you over to the commissioners to see if they have any questions for you. The commissioners do not have questions for you. So Scott, on behalf of the National Citizens Inquiry, I sincerely thank you for attending and sharing this information with us. Your testimony is appreciated.

Scott Routly

Well, my pleasure. I would just like to say thank you for you and your team for all the good work you're doing for this very noble cause for the future of this country. It's extremely important where we go from here. And I just remember—in the face of evil—not to do anything is to be a part of the evil. So I hope Canadians can grow some courage here and stand up for this country. And you know what? Put our faith in God, the living God of the Bible. Thank you so much and God bless.

Shawn Buckley

Thank you.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 13: Laurier Mantil

Full Day 2 Timestamp: 11:22:23–11:31:50

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Hello, Laurier. Could you give us your full name, and spell it for us, and then I'll do an oath with you.

Laurier Mantil

My name is Laurier Mantil, L-A-U-R-I-E-R M-A-N-T-I-L.

Wayne Lenhardt

And you promise that the testimony you'll give today will be the truth, the whole truth, nothing but the truth?

Laurier Mantil

Yes.

Wayne Lenhardt

Thank you.

You have been a letter carrier with a federally regulated corporation and you've done that for some time.

Laurier Mantil

Mm-hmm.

Wayne Lenhardt

So maybe let's pick up the story in 2021, and you can tell us what happened.

Laurier Mantil

Yeah, so in 2021, November, to be specific, my employer imposed a vaccine mandate. And at the time, at the end of November 2021, I was about six weeks pregnant.

Wayne Lenhardt

Okay, so a vaccine mandate came in. Everyone had to get it, no exceptions.

Laurier Mantil

Yeah, it was a blanket policy, so everyone had to get it. They weren't offering any rapid testing. It was no jab, no job.

Wayne Lenhardt

But you had a specific reason for not getting it, correct?

Laurier Mantil

Yeah, I was pregnant.

Wayne Lenhardt

So you were pregnant for about a month at that point?

Laurier Mantil

Yeah, about six weeks.

Wayne Lenhardt

You weren't going to tell anybody, but at a certain point you ended up having to do that just because of the mandates, correct?

Laurier Mantil

Yeah.

Wayne Lenhardt

So your privacy got violated. But also, were you concerned about your baby?

Laurier Mantil

Yeah, absolutely. At the time, there was no evidence of safety. My employer did not provide any sort of handouts about any evidence of safety or why we should be taking these to keep our jobs. So I was really, really concerned. I was just trying to be really diligent and kind of decide my next steps because I was facing the loss of my employment, my job that I love, and I just wanted to be at work. I was an essential worker and I had worked the whole pandemic. And for my pregnancy, I felt for my mental health and for my physical health being pregnant, for me, the best thing was to stay at work and keep working and getting the exercise that I was getting. So I was really, really concerned, yeah.

Wayne Lenhardt

And at some point, did you apply for an exemption?

Laurier Mantil

I did. We had to attest our vaccine status and by a certain date. And if we hadn't attested, we would be kicked out and on an unpaid leave for we didn't know how long, if it was going to end up in a termination. So I did attest at the very last minute because I just wanted to stay at work, and so I tried to apply for an exemption at that time.

Wayne Lenhardt

And what happened with that?

Laurier Mantil

So I applied under a human rights exemption, not a medical exemption. I didn't really hear back from them right away. I was just allowed to be at work and keep working. But every day, I didn't know what was going to happen. I didn't know when I showed up to work if I was going to be booted out, like my other co-workers already had been at that time.

So here I was. I was waiting for them to get back to me about my exemption, waiting, waiting. Time went on. Months went on. And I never heard from them, and the only time I heard from them was at the very end, towards the end of my pregnancy. They contacted me and said, "This seems to be a medical case. Do you want to change your exemption to medical?" So I had gone this whole time—I guess I had an unofficial exemption—but I didn't hear from them. And they tried to get me to change over to medical, and I refused. And I went off on mat leave a couple months later.

Wayne Lenhardt

Okay, so you continued to work, but some of your cohorts ended up being put on leave without pay. Correct?

Laurier Mantil

Yeah, all my fellow employees that did not want to attest or did not get the jab were put on leave without pay—for seven months they were out without an income.

Wayne Lenhardt

So you kind of lucked out on that one and didn't suffer seven months without pay like some of your other cohorts.

Laurier Mantil

I was the only one in my post office that was unvaccinated, working.

Wayne Lenhardt

Okay.

[00:05:00]

So what other negatives did you suffer?

Laurier Mantil

Just the utter despair of not knowing where my career was going. I'm seven years in to my career, which is fairly new in my position, so I was just trying to figure things out. My partner and I just bought a house. This is our first baby, so there's a lot of things going on. I was having difficulty sleeping at night, difficulty even going into work because I felt so alone. All my other co-workers were not there, and I was the only that was allowed to be there, so it was very difficult.

Wayne Lenhardt

So again, you couldn't go to movie theatres; you couldn't go to gatherings; you couldn't go to restaurants, all that stuff.

Laurier Mantil

I was denied entry to a movie theatre, a local one, actually for not wearing a mask while I was pregnant.

Wayne Lenhardt

And given that you were pregnant, was there any issues with respect to your partner assisting you during that time?

Laurier Mantil

Yeah, like my partner was my rock. I wouldn't have got through this without him. At one point, he even said that he would get it if I had to get it. But I thought, you know what, there's too many red flags. I had worked outside the whole pandemic. I worked mostly alone, walking on an average 20 kilometres a day. I was very healthy and I said, "No, I'm not getting this. If I'm going to lose everything, I'm going to have to fight for it." So that's why I applied for the exemption and tried to get around it.

Wayne Lenhardt

And did you have to wear a mask during this period of time?

Laurier Mantil

Yeah, we had to wear a mask, and if I didn't, you'd be suspended.

Wayne Lenhardt

Okay.

Laurier Mantil

Inside. Outside, I didn't wear it when I was outside, delivering.

Wayne Lenhardt

Did you feel you were allowed informed consent when you made your decision, or did they pressure you to proceed?

Laurier Mantil

Well, I thought it was my job, or, you know, so there was coercion there. No, I didn't have informed consent because at the time there was no evidence that it was safe for the fetus. That's what I was concerned about. They were saying it was okay for pregnant women, go ahead and get it. But I never saw anything about the fetus specifically. So that's what I was really concerned about.

Wayne Lenhardt

Okay. Is there anything else you want to tell us about your situations at that time?

Laurier Mantil

No, I just want to say I'm a very private person, so it was very hard. It took courage to come here today. But I really wanted to do this for all the other pregnant women during this time that may have had a similar story to mine. Also, all the babies that are not here. All my co-workers that took seven months without pay. And obviously my baby and my partner, because I wouldn't be here without them.

Wayne Lenhardt

Are there any questions from the Commissioners?

Commissioner Kaikkonen

Real quick, did all of your co-workers that went without pay for seven months, did they come back?

Laurier Mantil

Yeah, they were asked to come back after seven months. They were allowed to come back.

Commissioner Kaikkonen

And did you suffer anything from anybody who remained at the post office that would have known that you were not vaxxed. Did anybody say anything?

Laurier Mantil

They said it was going to be a private matter, people wouldn't know. But everyone knew. I had a few comments, but everyone knew everyone's status pretty much there. So there was no privacy of people's decisions. Everyone who wasn't there, you knew that they weren't complying with the mandate. And there was nothing in our collective agreement about this either.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Any other questions from the Commissioners? On behalf of the National Citizens Inquiry, I want to thank you very much for coming and telling us your story.

Laurier Mantil

Thank you.

Wayne Lenhardt

Thank you.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 14: Maurice Gatien

Full Day 2 Timestamp: 11:33:08–12:39:00

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Hello, Mr. Gatien. Can you please spell and state your name for the record?

Maurice Gatien

First name Maurice, M-A-U-R-I-C-E, last name Gatien, G-A-T-I-E-N.

Kassy Baker

And, sir, do you promise to tell the truth, the whole truth, and nothing but the truth this afternoon?

Maurice Gatien

I do.

Kassy Baker

Very good. Now, Mr. Gatien, I'm hoping that you can provide us with some background about yourself and how you came to be a witness at this hearing. I understand that you were called to the bar of Ontario in 1971, which is "lawyer speak" for saying that you are, in fact, a lawyer. Can you tell us a bit about your background and what's happened more recently that might be of interest to this hearing?

Maurice Gatien

Yes, I graduated in 1969 from the downtown location of Osgoode Hall, since moved to York University, and it was a real privilege to be at their downtown location. I still return from time to time when I'm in Toronto to the great library. I'm always amazed at the contrast between the stacks of books, and they have high speed internet. So I can work and I can access the knowledge that's on those shelves faster than I could if I were to stand up and go fetch the book. So it's been an amazing evolution in the state of the law.

After I graduated, I returned to my hometown of Cornwall, practised for approximately ten years and, during that time, was involved in real estate primarily and contracts. I negotiated two large transactions in my last year there, which really left me with a lot of satisfaction. One was the purchase of the utility Cornwall Electric, and the other was the assembly for a large shopping centre.

I decided I would look in other directions and lived for the next 22 years from 1980 to 2002 in various big cities, Atlanta, Montreal, Toronto. And my last year 2001 and '02, I lived in New York City. I spent a lot of time in Houston, as well. So it gave me a perspective of having a footprint in both large markets and small ones.

When I came back to Cornwall in 2002, I built a substantial practice and ultimately ended up representing people who needed representation with regard to the vaccines. Ultimately, in September 29th, 2022, I was suspended by the Law Society of Upper Canada, well actually, Law Society of Ontario now.

I found myself in January of 2023 addressing a group of the people that I had represented at a potluck dinner at a barn in Dunvegan, and it was heartwarming to be addressing these people who had shown tremendous courage. Some of them had been vaccine-injured, some of them had lost their jobs, and I told them about three situations that were interesting from my perspective. One was sort of a legend story of a farmer in North Glengarry by the name of Oded Saint-Onge who had been run over by a truck, he and his two cows, Isabelle and Annabelle, and he went to court to sue the large trucking company.

In court, the lawyer for the big Toronto law firm, head of litigation, asked him, "Did you not, Mr. Saint-Onge, say to the police officer at the scene of the accident, 'I'm fine, see I'm fine'?" And the farmer started to explain and he said, "Well, I was taking my two cows across the road," and the lawyer interrupted him again and said, "No, no, Mr. Saint-Onge, didn't you say at the scene of the accident to the police officer, 'I'm fine, see I'm fine'?" And the farmer again started with his story. And the judge interrupted and said, "I'd like to hear this man's story, I'd like to know what happened."

So the farmer explained that he was going across the road with his two cows, Isabelle and Annabelle, and the truck ran a stop sign and smacked into them and knocked him into the one ditch and the two cows into the other ditch. The farmer explained, "I was lying in the ditch. I was hurt; my ribs were cracked. I could hardly breathe and I could hear my two cows.

[00:05:00]

"They were moaning and groaning and in great pain. And the police came along, and he could see the cows in great discomfort. He took his gun out. He walked over to Isabelle, and he shot her right between the eyes. Then he walked over to Annabelle and also shot her right between the eyes. And he came over to me and he said, 'And you, sir, how are you?'" And he said, "See, I'm fine, I'm fine."

So we can see where there's a form of intimidation that can take place, you don't have to shoot everybody or fire everybody. When one or two people—or animals or whatever it happens to be—when something happens to them, we get a signal. And when I was experiencing my discussions, I had Zoom calls continuously throughout the preceding year or two with people from different walks of life, and it was pretty clear that there was a lot of intimidation.

One of the people I also met in my various travels and different business ventures, I met Pierre Trudeau in the late 1980s; he had left politics at that point. He had successfully brought the Charter and the Canadian Constitution back to Canada. And when one of my staff found out that Pierre Trudeau was going to be coming to a reception that we were hosting, Trudeau was his hero. He asked me if I could arrange for him to just shake his hand. I said, "Sure, I'll ask when he arrives," which I did. Mr. Trudeau very gracefully excused himself from the group of VIPs with whom he was chatting and spent ten to fifteen minutes with this employee, and I could just see the glow on this person's face and how emotional they were about it. And afterwards, I thanked Pierre for taking the time and he said, "Well, he showed respect for me, and I was going to show respect for him."

Now we transport that to 2022, in February of last year in Ottawa, and we saw that the son, Justin Trudeau, perhaps didn't have the same respect for the small individuals, the average people, wouldn't even walk across the street in Wellington Street in Ottawa to talk to anybody. I walked there from Cornwall in the middle of winter to address the [Trucker] Convoy, and he didn't even walk across the street.

So when we look at intimidation, part of what brought me into this is, I received a phone call in May of 2021. At that point, one of my clients who owned a gym had been charged, and he asked me if I would also speak to a woman who had also been charged with him for attending a public rally. What had happened is that she had simply sung "O Canada," the national anthem. When the person who was supposed to sing couldn't make it, the speaker asked the crowd if someone would step up and sing the national anthem, and she did. And when I heard about this, I'm thinking, how could I not also step up and help her?

She was charged under the *Reopening Ontario Act*—which is really a lockdown act misnamed as the *Reopening Ontario Act*—pursuant to which she was subject to a \$100,000 fine and up to a year in jail. So this hung over her head. We finally were able to get the Crown to agree to stand down from these charges in September of the following year. This hung over her head for fifteen, sixteen months, and it was not actually ultimately dismissed until December, so well over a year and a half to have this hanging over her head and also my client's head. He also was charged, and these charges are still pending against some of the people, including Randy Hillier, who was one of the speakers that day.

So just, sort of, to come to terms with a situation where people are showing tremendous courage, I as a lawyer felt that I had to do at least as much—not as much as they were doing because they were putting their livelihoods on the line,

[00:10:00]

and they were experiencing a lot of bullying and intimidation. Because I was dealing with this particular matter, my name sort of got passed around. There weren't a lot of lawyers who were stepping forward, and I would spend one or two evenings a week on Zoom calls, speaking with EMTs, teachers, firefighters, police, nurses from Brockville, from Hawkesbury, from Ottawa, from Cornwall, all coming back with the same stories of intimidation, bullying, HR departments releasing their names to indicate who was vaccinated and who wasn't within their institution or their place of work.

So there were a lot of threats and intimidation, and I formed a company to raise some money for women's shelters and to create goodwill towards these people because they didn't know how to do it themselves. They asked me to be the director of the company because they themselves were running into all kinds of intimidation. Within 24 hours, my home address was doxxed online. I live in a small hamlet of 350 people and shortly

thereafter, within about 48 hours, somebody came banging on the door at two in the morning. And then the harassment and intimidation continued. My car was stolen out of my driveway. I was assaulted at my office, and probably the scariest thing was one evening in October, this past year, my engine completely failed. I was on the 401 ramp, and somebody had put a contaminant in my fuel tank and it was a very, very scary moment.

So going back to February, I walked to Ottawa in the freezing cold to bring attention to the intimidation of lawyers, and I was joined on my walk—it was really inspiring—by three individuals, because I had to do it over three days. It's quite a distance. All three were former members of the Canadian Armed Forces. Two of them were police, and one was a firefighter, all suspended for not being prepared to take the vaccine. Each of the three had served at least 10 years in the Canadian Armed Forces and different stages overseas, involved in "black ops" and things of that nature. And all three made the same comment to me, which was "it wasn't over." There would be more, and there was, as I experienced.

Kassy Baker

Mr. Gatien, I hate to interrupt you, but you rather glossed over how far a walk it is exactly from your home to Ottawa? Can you tell us?

Maurice Gatien

It's 110 kilometres.

Kassy Baker

That's right.

Maurice Gatien

And at the time, I was 74 years old. So it was quite arduous, but I was joined along the way by people from all different walks. One was a doctor who—he's got very bad knees—was only able to walk about 100 metres, but I really appreciated it. And I also received more hugs. Lawyers don't get a lot of hugs, so it was pretty emotional for me.

Kassy Baker

Can you tell us, in the immediate period around the time of the Convoy in February, what else was happening to you before and after that?

Maurice Gatien

Well, the one thing I noticed is there was a complete radio silence from the Law Society, also from the point of view of the College of Physicians and Surgeons of Ontario. No messaging about civility; no messaging about being nice to each other. We could disagree about things, maybe everybody could have a different perspective, but the attitude of civility was not being cultivated. It wasn't being cultivated by the federal government as we saw with some of the interviews from our Prime Minister about people being racist or misogynist. I never heard those topics come up, and I spent hundreds of hours with people and those topics never came up. It was about health; it was about the pressure at work; it was about family. It was certainly not about misogyny or racism. I never saw it.

I did see one situation when I came to Ottawa,

[00:15:00]

not when I walked up here. But another time I came on a Saturday, and somebody had a Confederate flag. They were the only person wearing a full-face mask. People were very, very civil to this individual, basically saying, "Please leave, you don't fit here with that messaging, please leave." There was no bullying of them; it was just a gentle, "Please leave." He got edged to the side of the crowd where there was a TV camera to capture this messaging, which was really out of keeping with the whole tenor of the convoy protest. I was here four times. And each time, I can say that the atmosphere was joyous and positive, and the people were wonderful.

Kassy Baker

Now, I understand you have a PowerPoint presentation for us [Exhibit OT-9]. Would you like to take this opportunity to set that up?

Maurice Gatien

Well, I think it's supposed to be—

Kassy Baker

Thank you.

Maurice Gatien

So one of the things I'd like to talk about is the bold lie technique. When I was working in Montreal managing office towers and shopping centres, one project was an office tower that had defaulted on its mortgage, and one of my staff went around with the lender. It was a New York-based lender. It was their largest defaulting mortgage in North America, so it was a very significant file. And when they got to the building and went around to different office suites, there were signs on some of the office suites. They'd open the door. There was no furniture. There was no equipment. There was nothing. And in other suites, there would be someone there. But they would look at the rent roll and say, "Well, those are not the terms of my lease." And what was evident was, it was either a combination of ghost tenants or leases that were just not the same. And yet the bank, a very sophisticated bank, had lent, at the time, \$86 million. So it was a significant amount of money. But it was an example of a Bold Lie.

My next-door neighbour, at the time we're living in Montreal, was a TV producer, and he wanted to do a TV program about a forensic accountant who went around discovering fraud, and he asked me to help him with this. So I ended up, even though I was a small-town lawyer and am now managing large real estate projects, ended up becoming quite knowledgeable about fraud.

And the most interesting fraud that we came across was after the First World War in Paris. This fellow had contrived a scheme whereby he had gotten a printer to produce a very fancy letter head from the Ministère de l'Approvisionnement, Ministry of Supply and Services, which he had sent to the five largest contractors in Paris, basically saying, "I've got a very confidential project. I cannot meet you at the ministry offices. I have set up a suite at the Hôtel Crillon"—which is a very fancy hotel in Paris—"and your designated time" And each of the contractors had a different time slot, "Please come and we can discuss this confidential project." Of course, all five bit and all five showed up.

The pitch was the following. He said, "Once you know what I've got to discuss with you, you'll realize how you must keep this very secret. The government is looking under every manhole cover. We need money. We've come out of the First World War owing a lot of money. And we want to disassemble the Eiffel Tower and sell the scrap steel. However, I can probably steer this contract to you if you can come back a week from today, no obligation, with an envelope full of" — I forget the amount, 100,000 francs, 200,000 francs, whatever the amount was. Of course, they bit, and this guy absconded with the money and everybody laughed. But no one wanted to fess up or prosecute this individual because it was extremely embarrassing and very clever. But it showed the originality and the planning that goes into the Bold Lie. That was the phrase that this TV producer and I came up with: not just the lie, not the Big Lie—but the Bold Lie.

And we saw the Bold Lie with Bernie Madoff with—I just looked at the amounts today—it was about \$65 billion U.S. that he was able to pull out of investors, and they only got back maybe about 20 of that.

[00:20:00]

The rest just disappeared into a massive Ponzi scheme.

The 2008 mortgage funding fraud, which took place, had gone on for a couple of years in the United States. Now as a lawyer, we know that a document called a mortgage is something secured on real estate. But if the mortgage is for \$500,000 and the house is worth \$400,000, you can still call it a mortgage, but now it's become a hybrid: it's now a partly unsecured loan. What the banks did at the time is they bundled hundreds of millions of dollars of these types of instruments and sold them to unsophisticated investors and sometimes, also, very sophisticated investors. And when this finally imploded in 2008, as it would, people lost many dollars, huge amounts. Several films have been made of this and books, and everybody could see it coming except the investors because they were buying in to the Bold Lie: they were buying something safe called a mortgage and a mortgage fund.

Since that time, we've seen these things repeated. There's been Bre-X, Nortel, FTX. They're all the same model where it's a Bold Lie: you're going to make a lot of money. We wondered, the TV producer and I, tried to analyze things as to why the Bold Lie works and we came to the conclusion, it works for two primary reasons. One is most people have a sense of morality. Most people would not exploit the other person to their detriment. The other aspect is practical, which is most of us also don't want to face the consequences of going to jail. We are concerned for ourselves, our families but the main one, though, is that moral inhibitor, which is we don't want to exploit other people to that extent. But the Bold Lie is the foundational element to a lot of things that have transpired.

So going from the Bold Lie, okay, we can also see that with COVID— The way I would like to describe it is that there's two Bold Lies that were coexisting at the same time. So to get a sense of it, I'd like to take you on a bit of a journey of imagination. I'd like you to think of March 2020, and we're in the Mediterranean. We're on this beautiful yacht, and there's Kassy, you, me, at a table. We're on a yacht to celebrate the profits from a company, and we're going to call it Geyser Pharma. There's no such company as Geyser Pharma, so I'm not suggesting, aiming at anybody. And we're at our table. There's a gentleman, it's a fictional person by the name of Gill Bates. It's a situation where there's the finest champagne being poured into the finest crystal glasses. There's caviar, there's the finest shrimp, and there's a classic trio flown in from Milan to play for our entertainment. And off in the distance, we can suddenly hear the voice of somebody who's crying for help and someone who's drowning.

So Kathy, you and I would probably jump up, and we would look for some rope to throw to this drowning person. And Gill says, "Well, don't worry. I've got it." So he goes up to the side of the wall and picks out a rope. He mentions to us, he says, "Well, this rope cost \$1.50 a foot, but I'm going to see if I can get this guy to pay \$30 a foot." And he goes to the railing and starts to negotiate and, ultimately, in order to help the negotiations, says, "Gee, I think I see some shark fins there. It could be dangerous." And you could just hear the person crying.

That's the setup for a Bold Lie: when we're desperate, when we're scared, we're more likely to make bad decisions. So with COVID, there were two Bold Lies. One was, you're going to die. COVID will kill you. And we'll go into some of the reasons why that was not true in our area and in our province. And the second Bold Lie was, only the vaccine will save you. No other strategy,

[00:25:00]

don't worry about losing weight or taking vitamin D or whatever. Nothing was offered as an alternative except the vaccine. So it'd be like going back to the fellow in the water drowning and not telling him, "Oh, there's a sandbar five feet away. If you just go over there, you won't have to worry about paying \$30 a foot for some rope."

So when we looked at the situation, we saw no promotion of good health. The gyms were closed. Liquor stores remained open. And at the same time, with all the stores, the small businesses that were closed, it was a massive wealth transfer. When I was choosing a photo for this particular slide, I could not get all of this yacht—this is the new yacht that Jeff Bezos just took delivery on a couple of days ago. Cost \$500 million. It's the length of a football field. In recent weeks, I've also noticed that yachts are backordered 30 months. So, Kathy, even if you made a billion dollars, I'd have to tell you bad news: you're going to have to wait for your yacht. Ferrari SUVs are back ordered till 2026. And there's been a whole raft of new billionaires that have achieved this status in the last three years. It's been an amazing transfer of wealth. And I've had people coming into my office, restaurateurs in particular, have been decimated by what happened in the last three years.

So when we look at the numbers, and it was very interesting for me in a small town to be in touch with the numbers. I speak to other lawyers on a continuous basis. I personally—and I'm in an age group that would be very much in the right profile—I personally, after three years, don't know anybody who's died from COVID in the Cornwall area. I ask other lawyers, "Well, do you know anybody who's died from COVID?" And they'll say, "Well, no, not really." "Have you noticed the surge in your probate files?" "Well, no, not really." "Have you been called to the hospital to do a will or a power of attorney for somebody who's imminently going to be dying from COVID?" The answer has been, "Well, no, not really." So after a while when you hear enough anecdotal evidence, it becomes statistical.

Partly because of my background in managing large real estate projects, I became quite acquainted with software and statistics. And one day, there was an article in the local paper about the COVID deaths, and there was a link on their online version to the Eastern Ontario Health Unit database, which I clicked on. I ended up in a database of about 6,000 scrambled pieces of information, which I organized into 10 lines. Basically, by decade of life of each of the people who had theoretically died from COVID. So, from 0 to 10; 10 to 20; 20 to 30; 30 to 40. Under 40, there was not one single COVID death. So I was kind of amazed with that fact because the schools were closing. There was panic. And it was, to me, a piece of good news that should have been out there instead of being suppressed and buried in this very scrambled database.

So when I looked at this, and also looked at the profile of the other, there were only two people between the ages of 40 and 50, and most of the deaths were from 70 to 100, with most of those being from 80 to 100. There was no listing of comorbidities. Yet I knew from all my reading that a lot of COVID deaths were accompanied by people being overweight, people having had strokes or other problems.

In March of 2020 on my way back from—my wife and I were in Hilton Head—I had read that COVID affected the pulmonary system. So I downloaded a book on breathing. I started doing breathing exercises.

[00:30:00]

I immediately experienced better sleep, felt better. And I kept waiting for that big, big government push on improving your breathing. That big push never came. We're three years later, and it still hasn't arrived. I went through a number of evaluations of different initiatives that could have been taken by government. My daughter and I drew up a list, A to Z, whether it was breathing, weight loss, reducing alcohol consumption, you name it. There was nothing that was done to encourage better health.

So this vacuum created this anxiety that the vaccine was the holy grail. The vaccines were going to save everybody, but nobody had done anything to mitigate this big fear. So when I looked at the numbers, I looked at numbers, not just for the Cornwall area—I just took one at random because one of my friends was from Niagara—I looked at figures from Ottawa, Toronto. All the figures were under four one-hundredths of one per cent. I'm not a statistician, but by the same token, I'm not a journalist. But I would have thought that the newspapers would have been filled with this good news.

There was a day, a couple of Februarys ago, when I was looking at the weather channel predictions and there was a beautiful blue sky day, quite cold, but good day for cross-country skiing or snowshoeing. At the top of the weather channel prediction was a big red bar warning me of snow squalls. So I clicked on it, and it was warning me about snow squalls around Lake of the Woods, which is about a thousand kilometres from where I live. So I took my chances, and I went out and had a wonderful day of snowshoeing. The next day, I also looked at the weather channel. It was a Sunday and again another blue sky day. And I looked at the weather channel radar map, it was one of those polar highs that covered all of North America, and there was no clouds, there was nothing, it was just going to be beautiful everywhere. But the red bar warned me about solar storms on the planet Venus. Again, I took a chance, and I went out and had a wonderful day again.

So in the media, it seems there's an overemphasis, even on something as fundamental as weather, an overemphasis on the negative and on alarming us. When I grew up, the newspaper in the top right-hand corner of the front page would have two, maybe three lines about the weather. Things like, "It will be cold tomorrow." That was it. So we've now put ourselves in a position where the media are constantly bombarding us as much as possible it seems with negative news as opposed to, you know, "Get out there, enjoy yourself, be positive." And I've turned it into a game for myself when clients come into the office and I'll ask, "How's it going?" And they'll say, "Oh, it's supposed to rain tomorrow." So, I always know the weather forecast. I always know that the rain will end. And I'll shift the conversation to, "Gee, it's supposed to be nice on Sunday. Do you think you could go and play some golf?" And all of a sudden, the conversation has turned to something positive. And I feel that it's a fun thing to do, but the media doesn't seem to have that optic on things—it's how do I make people anxious? And the weather network now has it set up so

that it'll say at the bottom of the screen, "This will refresh in 30 seconds, do you want to hang on and see?" And I'm thinking to myself, "What could change in 30 seconds?"

So we're always on this edge of anxiety. And COVID came along and amped that up tremendously, and we were bombarded with bad news, bombarded with statistics all the time. It got to the point where I had to turn my radio off. I live about 20 kilometres from Cornwall, and I just had to stop listening because it was just always, always panicky.

One of the things I talked about when I was at that potluck supper—which I have very fond memories of in a barn in Dunvegan. I wouldn't call it the big time of the speaking tour in Canada, but certainly in terms of satisfaction was there.

[00:35:00]

Talked about the Charter of Rights. I talked about it when I addressed the crowd at the Convoy. And we tend to forget that our rights originated with something called the Magna Carta, which was signed in 1215 after a war against the king, who was a very tough king at the time. He died the following year, and the Regency Council tried to renege on the Magna Carta. It ended up having to have another war, and it was re-signed and ratified in 1217. And what most people don't realize is, it only applied at the time to 25 people, 25 lords and barons, and they were given a very short list of rights. One of the rights was the right against arbitrary imprisonment, which would be equivalent to being stuck in a home imprisonment, which we saw with COVID, "shelter in place," they called it. But it was really home imprisonment. And the other was the right against arbitrary taxation, arbitrary decisions being made. So it took until 1911 for the *Act of Parliament* to be passed in England whereby the House of Lords could no longer veto bills from Parliament.

So almost 700 years have to go by and every year the rights got a little wider. And I'm sure after 1217, some of the lords went back to their fiefdoms and there would have been somebody tapping them on the shoulder saying, "Well, my Lord, you have certain rights, can we have some too?"

When we looked at the history of this situation as well, it was something that seemed so incremental, it took so long. In the 1600s, there was a concept that evolved under the first King Charles called the "divine right of kings." In other words, "My king is plugged into God, you have no right to question the decision." And at the time, the king had no problem getting reports and studies and scholarly works to support the notion of that, just by promising an earldom or a manor house to somebody. And things haven't changed a lot since that time. If you want a report, and I do remember when I was working for this large company, we paid \$250,000 for a report, and the president of the company picked it up, looked at it and said, "huh, \$250,000 to tell me I've got a nose in the middle of my face." **When we look at the studies and reports that were surrounding COVID, who paid for it was certainly going to determine a lot of the outcome of what the report was going to say.**

So when we look at the Magna Carta, what evolved in Canada, it wasn't until 1982 that we got our Constitution repatriated; the Charter of Rights was implemented by Pierre Trudeau. And in literally a week, in March of 2020, we lost all those rights. Parliament did not sit; it stopped sitting. And I'd like to joke to my friends, "Well, the Ottawa Senators have not made the playoffs in a while. The arena should have been open; there could have been plenty of social distancing, they should have met." But by not meeting and by defaulting on any discussion, all of a sudden, a handful of people were making all of the decisions for millions and millions of Canadians. We had no outlet. We had no way to express any of our concerns.

So when we look at the Charter— And it was interesting for me to also look at the history of marketing and advertising. Because what happened over the hundreds of years of evolution of the Charter of our rights, something happened in the 20th century. From 1900 on, it really evolved after the First World War. During the First World War, we saw the first forms of advertising with any sophistication. So think of how much it would take to persuade somebody to go from New Zealand or Australia or Canada or Newfoundland,

[00:40:00]

to go into the fields in Europe and to live in trenches for months at a time. And at the sound of a whistle, to jump out of the trench, and because the colonials were the lucky ones, to lead the first charges. And nobody had told them, by the way, the machine gun has been invented. So they were being persuaded for glory, for God and country, to give up their lives.

So when the 1920s came around, the advertisers of everything from Pepsodent toothpaste to whatever, realized, wow, there's something available to us to push our products. Radio came along, then television, then the internet, telephones. Now with social media, we are constantly bombarded by messaging, and these expanding platforms have meant that we can almost find no safe harbour. I try to get out snowshoeing or cross-country skiing, get out into nature, if only to shelter myself from this constant bombardment. Our bandwidth, if you will, of available brain power to deal with everything is getting increasingly compressed.

There were some experiments that I read about and the first one I read about— I had actually read about it in 1965 when I was at Carleton University. We had to take a mandatory course in psych 101, and they were called the Milgram experiments. The Milgram experiments were designed to explore the proposition about people following orders. At the time, a fellow by the name of Adolf Eichmann had been detained by the Israelis in Argentina and had been brought for trial. His basic excuse, even though he put millions of people to death running the concentration camps was, "I was just following orders."

In the Milgram experiments, which were conducted at Yale University in 1961, Professor Milgram set it up so there were three people involved. One was called "the learner" and that person sat in a chair with electrodes and was electrified. It really wasn't, but it looked like it was, and it contained an actor who sat in it. The second person was called the "person of authority," wearing a lab coat and clipboard, and he would be telling the person upon whom the experiment was going to be conducted that they would have to give the learner some electric shocks. You'll notice that one of the settings on the electric shock board was DANGER: SEVERE SHOCK. So the person who was controlling the experiment, controlling the amount of power, was being alerted that this could cause harm.

The professor asked his students to estimate how many people would dial it up right to the top. Most people figured, well, one, maybe 3 per cent, there's always somebody who's a bit of a jerk out there. The actual number turned out to be 65 per cent; 100 per cent of the people were willing to give at least a mild shock. And the actor, by the way, in the other room, was trained to yell in pain as the shocks increased. So it was pretty amazing that somebody would suspend their judgment, suspend their critical thinking if someone in a lab coat, someone of authority, would tell them to do something.

The next set of experiments—in the 60s, there was a TV show called "Candid Camera," and it evolved out of that—and they were called the elevator conformity experiments. It

consisted of a person getting on an elevator, and there would be one person on the elevator initially, and they'd be facing the back wall. Almost everybody would face the normal way: they'd pivot, they'd look at the door, they'd look at the buttons. But once they got up to five people on the elevator, 100 per cent of the people would pivot and face the back wall, as well. That's the pull—the gravitational pull that we experience from the tribe—from people around us.

Now, if there was a sixth person on the elevator facing the right way,

[00:45:00]

a person would feel encouraged to use their critical thinking, would feel encouraged to be separate from the crowd and would face the right way. So it just shows our inclination to abandon our judgment, if you will, if there's enough people doing something. We saw this happening during COVID many, many times.

The third set of experiments were conducted in 1971 at Stanford. They're known as the Stanford prison experiments, and it consisted of 12 students who were designated as prisoners and were put in prison garb and 12 who were designated as guards. They actually built some cells in the basement of the psych building, and the experiments were to be conducted over a period of 14 days. They had to suspend them after six days because the guards were getting out of control. They were becoming abusive and what happened is that once the first guard started to go over the line, that would encourage others to do the same and before you knew it, they had to suspend the experiments. That shows that you need rules. The rules have to be thought out before you do something. Trying to implement rules on the fly doesn't work very well. You try to implement rules when you're calm, when you're rational, not when you're panicked.

So what we saw during COVID was the opposite of these things: we saw rules invented on the fly; we saw rights being suspended; we saw the tribe, the herd basically running and influencing each other in their panicked state.

Foundational documents like the Charter of Rights—the right to assemble, the right to speak—became suppressed; censorship became the norm, and even to disagree became in and of itself almost demonized. I can't tell you how many evenings I spent on Zoom calls with people who were upset: who were threatened, who were worried. They'd lost friends; they'd lost family, just for expressing an opinion. So we did engage in a form of groupthink, which from a lawyer's perspective were very troubling because under our Charter of Rights, we have the right to express our thoughts and opinion.

Now one of the things I also noticed in my research, in 1930s Germany, there were a lot of **parallels with what we saw, and people were reluctant to state it. But one of the things I found alarming in 1930s Germany is group after group were mobilized and purged from their ranks people of Jewish background. The first group to do so were judges and lawyers; the last group to do so were midwives, presumably because they valued all life. So in 1933, first group, judges and lawyers. And after that, quickly after, followed doctors, veterinarians, architects, engineers. It's pretty amazing that they were able to do this. And one of the other things I found troubling was I looked for any comments; I looked for any writing from the 1930s from Canadian lawyers, Canadian judges, American judges, American lawyers. Nobody criticized what had occurred, and yet we know, it led to some very, very bad outcomes.**

So when we give up rights, when we treat people as “the other,” as we saw, these are very troubling tendencies in society. And when these institutions of trust—like law societies, like colleges of physicians—go in a direction, a lot of people take it as a cue that, well, it must be all right. And there wasn’t the critical thinking that was applied.

As lawyers, normally, we rely on evidence. And as you saw, with a death rate of four one-hundredths of one per cent, with almost a negligible change in the number of probate files and whatnot, where was the evidence?

Kassy, to your point, when we were talking earlier, where were the lawyers? We, I guess, unfortunately,

[00:50:00]

were subject to the Milgram experiment; we were subject to the elevator conformity experiment; we were subject to the Stanford prison experiment without being aware of it.

As far as I’m concerned, these things, these experiments should be taught in our ethics courses. They should be taught in medical school, in law school, as part of our ethics courses, and we should never forget how vulnerable we are and how important it is to have these foundational concepts always borne in mind. That’s how important they are. They are the guardrails against bad decisions.

The last observation I’d like to make about this aspect, too, is sometimes when I go to Toronto, I will buy all four newspapers. A story, it could be any story, might receive a favourable treatment on the front page of the *Globe*, might be front page of the *Post*, will have a different slant on it. It might be on page 37 of the *Toronto Star*; it may not even appear in the *Toronto Sun*. And by the way, the story, what I’ve expressed, could just as easily be the other way around. And sometimes when I engage people in discussion about this, they read the same newspaper every day. And they don’t realize what a silo they have been placed in and how they have been compartmentalized from getting a range of ideas, a range of thought. So it’s important to basically get your news sources from more than one place because, otherwise, it’s very easy to divide and conquer if we’re in compartments.

I need to go back a bit here, sorry. One of the things I do want to talk about is the clown deals. I’ve done a lot of negotiating and large deals, small deals. One deal I did was for a fellow who came to our house—he arrived on his riding lawnmower because he didn’t have any other way of getting to our house—and he was trying to buy a \$5,000 piece of property that his house sat on. And I worked out the deal with the church that owned the land whereby he could work off some of the purchase price by mowing the lawn at the cemetery. And the pastor and I joked about the “art of the deal.”

So when we look at deals, most deals start out—if you think of, in your mind, a table—the contract, the proposed deal, will be in the centre of the table, and typically it will migrate a little bit to one side or the other. It might be 50-50, in most instances; it might be 52-48. At 55-45, most deals start to fall apart. If the person is asking too much or if the terms are too onerous, something happens to break the momentum of the deal. If you have a million dollar house and you want 10 million for it, that won’t work. And if somebody offers you \$100,000, that also won’t work; you’ll walk away. Most lawyers also understand that if you ask too much, people won’t want to negotiate with you. And if you ask too little, nobody will want to use your services because you’re not in the middle of the table and you might refine the deal. When we look at the vaccine supply contracts, they did not end up in the middle of the table.

The other thing that I would mention with regard to most deals, if you look at TTC [Toronto Transit Commission], you look at the OTC, you look at Hydro, where there's a potential for abuse of pricing and for the benefit of people, it makes more sense to own it yourself. Just like it sometimes makes more sense for a company to run its own trucking fleet. If the trucking costs are too high by externalizing it, they'll bring it inside. So I've read articles indicating that vaccines may be with us for a long, long time. Why aren't we making our own vaccines? Why are we passing on these huge profits? When I looked at the profits for Pfizer

[00:55:00]

that increased to \$35 billion in 2022; it's an enormous amount of money to transfer to a private corporation.

The other thing we should be looking at is the history of Big Pharma. I like doing research, and one of the things I notice is that Big Pharma has paid massive fines in the past. Nobody has ever gone to jail. Even something as bad as the oxy crisis in the United States, which they estimate killed 60,000 people, the company there, Purdue pharmaceutical, the family that owns Purdue, the Sackler family, their only consequence is that they had to resign from the board of the Metropolitan Museum of Art in New York. I know that tickets to the Met Gala are hard to get, but it seems like that would be not exactly the penalty you'd expect of 60,000 people that died as a result of a product being sold. They kept about \$10 billion out of the \$18 billion that they made. When we look at Pfizer, for instance, has paid \$1 billion in fines in the past, for lying, for misrepresenting their products.

And the other element that really troubled me in all of this as a lawyer, when I looked at the self-testing aspect of the deals that were put together, can you imagine hiring a lawyer who graduated from a law school where people graded their own exams? I would expect that everybody would say—anybody graduating from such a school would say, "I was at the top of my class; I tied for first." And then just to have that law school say not only do people self-mark their exams, but instead of a three-year course, you can get it done in 90 days. So on its face—preposterous, preposterous—and yet, this is what transpired with the vaccines in terms of testing.

So when we look at the "clown deals," and again, keeping in mind how a contract normally is in the middle of the table, these are the benefits that were accrued to the vaccine makers: There were massive amounts paid to them for their R&D. All of the vaccine jab clinics were paid for by the taxpayer. All the marketing costs, all the massive advertising was paid for by you, by the taxpayer. There was massive support on air, on radio, on TV, everywhere, and censorship as well of anybody expressing a contrary point of view. The vaccine manufacturers had no liability for their product. If it didn't work, they didn't bear any of the costs. There were no outlets—like I've looked at the various health unit websites, there's nowhere to file for a vaccine injury. There's no information about how to communicate with anybody about a vaccine injury. There were mandates that were imposed that put a person at risk of holding onto their job, and I know from having talked to people who had come into my office, people with mortgages, people with families to feed, they didn't have huge savings. They were at risk, and they were subject to enormous stress and pressure as a result.

The doctors as well were placed in a position of—how would you describe it—duress, suspension of their licence if they gave a vaccine exemption certificate. I had one woman call me, she was five months pregnant. She had had two very difficult pregnancies. Her children were now eight and 10. She herself had almost died from a vaccine given to her

when she was eight years old. So here she was wondering about placing her unborn child at risk, and herself.

[01:00:00]

And the irony was that if she had wanted to have an abortion, it was my body, my choice, was the mantra. But if it was about whether or not she should take a vaccine, it was a totally different mantra.

In discussing these clown deals, and I'm being generous to call them clown deals. Because I wonder if there's an association of clowns somewhere and one of them wanted to get his driveway paved, he'd pay a certain price. But if he had a thousand other clowns who also wanted to get their driveway paved, and they said to him, "Do you think you can get us a better price?" We know he'd get a better price. So we had thousands of vaccines, millions of vaccines being purchased with no discount, no claw back, no price adjustment if they didn't work. It was all, all full price. And at different times, there were also vaccines being thrown away because they'd become outdated.

So there was a tremendous amount of waste. And, normally, in a deal, again, going back to contracts, if somebody's putting up all the money, they get stock options or they get some kind of profit sharing or they get a royalty, something for the taxpayer. Instead, we got nothing. So again, I'm probably insulting clowns to be calling these clown deals. I don't know what else to call them. Perhaps hostage deals would be close, as well, because people were feeling like they were being held hostage.

Kassy Baker

Mr. Gaten, thank you very much for everything that you've testified to today. I'm aware that we are officially out of time and I just wondered if you perhaps had another something else quite pertinent that you wanted to add and if not, I mean everything you've said has been quite—what's the word I'm looking for—not intriguing but very compelling. Do you have anything final to say or should I go to the commissioners?

Maurice Gaten

Well, I would like to just perhaps leave on this one anecdote. Because it's been difficult but, at the same time, very rewarding. I was assaulted in my office, and I'm fairly wary. This is in February; this is what caused me to walk to Ottawa. The following week, I was at the grocery store in Lancaster—it's a little town of 600 people—and I noticed that this one person was paying attention to me. They were wearing a mask, and I was kind of aware, a little bit anxious, perhaps. I paid for my groceries. I went out to the parking lot. As I was putting my groceries into my vehicle, this gentleman came running up to me and I was momentarily taken aback. But he took his mask off and he said, "Can I give you a hug?" He said "My wife almost died from the first shot. She was feeling suicidal. You don't know how important she is to me, to my children, and I just want to thank you." Moments like that made it possible for me to live with all of the things that I've had to deal with in terms of the threats and the intimidation. And people like that are to be cherished and honoured. As much as it's been a challenge, I just tell my friends I'm fine.

Kassy Baker

Are there any questions from the Commissioners?

Commissioner Kaikkonen

At the beginning of your presentation, you contrasted Trudeau Senior and Trudeau Junior. I'm going to add an extra contrast. If it was Trudeau Senior, Pierre Elliott, who was in Parliament right now, I'm quite sure that he would have wandered down here himself or at least sent some of his MPs down this way to see if any of their constituents were in the room and testifying at some point since we are in Ottawa. Seeing that it's Trudeau Junior, Justin, that's in Parliament, I would like to add that he has censored his MPs, and his MPs don't think that we're valued enough to come down the road, down the street, to see who's in the room,

[01:05:00]

whether it's some of their constituents. So there is that contrast.

The other thing, as you mentioned, the Milgram experiment. Some of us do teach at every opportunity those experiments to any youth or students that we have and have done so consistently, as well as encouraging people to take the Tri-Council Research Ethics course, which is two hours online. And what I've found is that when I speak to my colleagues and my peers as to why they don't do the same, it's because they don't think that anybody is ever going to come for them when this lets go.

I thank you for your testimony, it was very intriguing, but it was also very enlightening. I hope someone's listening that can make a difference in people's lives. Thank you very much.

Maurice Gatien

Thank you.

Kassy Baker

And I would also like to thank you on behalf of the Inquiry. Thank you very much.

[01:06:10]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE OTTAWA HEARINGS

**Ottawa, Ontario, Canada
May 17 to 19, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

Welcome to the National Citizens Inquiry as we commence the second day of proceedings in the nation's capital, Ottawa, Ontario. For those of you that aren't familiar with the National Citizens Inquiry, we are a citizen-organized, a citizen-led, and a citizen-financed group that have decided to appoint independent commissioners and march them across the country.

We had no idea how ambitious that vision was and soon learned that it was something that we couldn't do. But it's happening, and it's happening because you're participating: you have volunteered, you have encouraged, you have donated. You have allowed this to happen. And if you have been watching the NCI proceedings, I've been saying—and everyone agrees who's done it—that if you watch a single full day of the National Citizens Inquiry, you will never be the same again. It changes you. Yesterday was no exception. The witnesses that we had, some of them, will be with us—their testimony—for the rest of our lives.

I'd like to start this morning, Commissioners, by stating my name is Buckley, initial S. I'm attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie. Before we move to our first witness, I'd like to share some opening remarks. I ask that you bear with me today.

We're having to interview witnesses, and we're having to see them testify day after day. And it's frankly emotionally exhausting at times. All of us that have been following these proceedings are aware of that. I was particularly touched yesterday by the testimony of Sheila Lewis. If you recall, Sheila is the one who needs an organ transplant, is under a gag order, so she can't tell us what organs she needs transplanted, nor can she identify the doctors or the hospitals involved. But she was on the stand yesterday, literally sobbing. She was just saying she wants to live. Her life is in the hands of a group of doctors that made a policy—and it's just their policy; they can change it. But they made a policy decision that she could only have the organ transplant that her life depends on if she gets vaccinated for COVID-19.

The irony is that she has had COVID. She has had her blood tested and she is filled with antibodies to the COVID-19 virus. She has strong natural immunity. We have had doctors explain to this Commission how actually someone in her position shouldn't be vaccinated because the vaccine would not be helpful, and, in fact, could be dangerous for somebody in her position. Any concern that she would get COVID-19 is non-existent. Because we've also had witnesses tell us that natural immunity is more robust, and we've seen government data to support that.

So she asked, and I asked, how can people do this? How can they basically be making decisions and taking actions that are leading to the deaths and the suffering of a large number of people? We had a gentleman on the stand yesterday who could not find a doctor to admit that it was vaccine injury. We've had witness after witness basically giving shameful testimony about how people that are vaccine-injured are being treated in our healthcare system.

When I ask the question—how can we do this?—I'm asking it as a rhetorical question because I know the answer. It comes down to personal responsibility and fear. The fear one is interesting because I've indicated in other openings how fear is a weapon used against us.

[00:05:00]

The minute you start to feel fear and you start to have that chemical reaction that you have no control over, you have to start training yourselves to keep that link to your logical mind and understand that you're having a physical reaction, that you can't control it. But you can keep connection to your logical and rational thinking.

But what I thought of this morning, we've had doctors explain that their colleagues, some of them, have gotten vaccinated knowing they shouldn't for health reasons but saying things like, "I've got kids in private school, I've got a mortgage, like I've got to do it." There's financial fear. We've had witnesses back out because they're concerned about economic repercussions. And so the thought came to me this morning that we need to understand that our debt model is part of our slavery framework.

We live in a society that is self-based and greed-based. The phrase—keeping up with the Joneses—we all know what that means. If you drive an old rusty car, you're going to feel self-conscious. Why? Because we're taught to privilege people that display wealth, and we have been encouraged. The system is designed for us to pursue things and to have a lifestyle that we can't afford, so we go into debt. And then we find ourselves in a situation where we actually have no room to move when we're placed in that ethical dilemma: where to do the right thing would actually put our family and our children at risk economically. **And so, going forward, I think we have to understand that we cannot allow ourselves to be dependent upon not just government but also institutions like banks for our well-being. I just want you to understand that our debt-based model is deliberate. We have participated in it, and we've participated in this drive to look like we have wealth, to fit in, to not be "less than."**

I've spoken before about personal responsibility, that people will do terrible things to other people—in the Second World War, rounding up Jewish people, locking them into a church, and lighting the church on fire, or lining them up in front of a pit and executing them. We will do those things—the authorities know—things that we would never do on our own if our personal responsibility is taken away. I spoke about this in Toronto.

I first became aware of this idea in the Dostoevsky novel, *The Brothers Karamazov*. There's a chapter about the Grand Inquisitor—so the Spanish Inquisition, and Christ had returned. So the Grand Inquisitor is having a conversation with Jesus. And the idea comes up that people will do atrocious things if someone else takes the responsibility for their actions. Himmler, who was the head of the SS, understood this and in one of his speeches—I think it was before the Night of the Long Knives—but it was a speech before they were being sent out to murder people. And he literally said, "You're not pulling the trigger. I am." He understood that if he took the personal responsibility from them that they would follow his orders. It's why when we got to the Nuremberg Trials after the Second World War—when people were saying, who did atrocious things, "I was just following orders, I was just following orders"—we had to, from a legal principle, establish that following orders is not an excuse for harming and murdering people, as if that had to become some new legal principle.

In fact, I wonder going forward when we get our institutions back, if anyone who has committed a heinous crime, who says, "I was following orders," if the maximum penalty should be double in that case. Because as a society, our worst problem that we're facing right now—

[00:10:00]

the most harm is being caused by people following orders. And we structure our laws actually to protect ourselves.

The doctors in Alberta, I'll take them as an example; it's the province I live in. Their college told them you are not to treat early-COVID. I know of one doctor who volunteers with the NCI who voluntarily gave up his licence to practise because, for ethical reasons, this person was not willing to be part of an organization that would tell physicians that you cannot treat early-COVID—because it is unethical and it is going to lead to death and it's going to lead to harm. But it's an example of personal responsibility being taken away from the doctors. They're being told by their college that they "can't." So now, they're just following orders and well, "I'm helpless. I will lose my licence." These are lies. But it explains how we find ourselves in a situation where people that we have entrusted with our very lives and health have turned against us.

And it's still happening. I can't think of a single institution in Canada that is now working for the people again. Name me one institution in Canada that has stood up during this COVID experience to protect us: to act as a shield between us and the government; to act in the public interest. And it's still happening. Here we are in May 2023 and vaccine-injured people are being treated as lepers and second-class citizens and shamed and humiliated and left to suffer by our medical system. Their existence is being denied. It's like we can't admit they're there. They're an inconvenience to us because we can't admit that the vaccine caused injuries. Because we're still pushing it on children. We're still murdering children. The attack is still happening. We're still censoring doctors. They're still afraid. Professionals are afraid to follow their ethics and do their job.

So we know that this spell that we've been under, it's literally like people are asleep. And language is deliberate; when we use language, the truth sneaks out. I've done a lot of criminal law and I think of statement analysis where most people lie by omission. There are simple things that people can't hide. When they're lying, things happen: they drop personal pronouns like clockwork. We cannot—you know the word, Freudian slip—we can't hide the truth. It comes out in different ways. We can obscure it. But our language speaks volumes.

And isn't it interesting that in the freedom movement if you don't know somebody or where they're at, but you're starting to think, "Oh, just wait a second, maybe they do know what's going on," you ask them, "Oh, are you awake?" We ask each other when we're feeling each other out: "Are you awake?" That's not an accident. It tells us that there are people among us, and we know that, that are asleep. They're literally asleep: They're having a dream. Their eyes are not open. They do not see what is going on. So that tells us the spell is still in force.

There's two problems that these people who are asleep are having. First of all, they still believe. Many of them actually still believe the lie. The other problem they have—and we need to pity them for this, but many people who are awake still have this problem too; denial is a great self-protection mechanism—is they just want it to get back to normal. "Don't hold this Inquiry." "Don't reveal the truth about what happened." "We don't need to figure out how not to do this again." "Just stop. We just want to get back to normal. We just want to forget this happened and go back to normal."

That is a delusion because there is no normal to get back to.

[00:15:00]

That is a complete failure to understand that we are in right now "the Great Reset." Now, what the Great Reset looks like at the end depends on us. But we know when we hear people like Klaus Schwab saying, the Great Reset—the leaders are using the term the Great Reset—it's not something that's going to happen in the future. It's something we're in right now; we are experiencing. There is no going back to the way we were. Our past is done. It's finished.

Just on the vaccine alone. From the evidence we've heard, we can predict that there will be more people becoming disabled. I recall Ed Dowd using the data of the working population in the United States, traditionally, the healthiest people, that the number becoming disabled—well, the percentage isn't rising, although it's dramatically higher than it was pre-vaccination and alarmingly high. It's levelled off, but it's still there. We're experiencing more and more people at a very high rate of what should be our most healthy population becoming disabled and the deaths will follow. So we'll peak with disabilities first and then we'll peak with deaths. But we're still facing it. These people that we heard from yesterday with their lives literally—literally—being destroyed. It was hard to believe what it would be like to have their experience. We're going to have more of those.

The problem of sterilization caused by the vaccines has not been dealt with much in these proceedings. We were hoping to have Naomi Wolf testify, but she wasn't available for the date of the Ottawa hearings that we had wanted. But it appears that's another issue going forward that we're going to have to face. It's interesting, I have a friend in Alberta who is a health care practitioner who's been reporting to me that if a child dies *in utero*—so while the mother's carrying the child—it used to be that the hospital would take care of that and get the dead fetus out, and then it would be recorded in our statistics. But the mothers are now being sent to abortion clinics for that to be done, so it will not be included in our statistics. So we're hiding information.

I saw a disturbing billboard about a month ago in Alberta. There's a support line for mothers who have miscarried to phone. So it's now, obviously, enough of an issue. This is happening in large enough numbers that there are now billboards telling mothers that they can get support for this. I've never seen anything like that in my life and it tells us that we're still there.

Catherine Austin Fitts testifying yesterday, and we've heard it from other people, telling us this isn't an accident. This is planned, what we're going through, this Great Reset. The world leaders tell us. Google the term. Well, no, don't Google it; DuckDuckGo it because you'll get different results because of the censorship. That in itself should tell you volumes. This isn't an accident; it's an attack.

It came up during her testimony, one of the commissioners said, "Well, we've had more immigration than since the Second World War." We're going to have a witness testify today about seeing, during the pandemic, just tons of immigrants arriving while we were all locked down. It's almost like the population is being replaced as part of the Reset. So we've been taken down. We have been judged. And understand that they can't stop—you can't pull that trigger and call the bullet back. You can't stop because otherwise, we will get control of our institutions again and we will hold them accountable.

So we have to expect that what we're experiencing will continue.

[00:20:00]

And what we're experiencing is that our government and our institutions have become the weapons against us. Catherine Austin Fitts referred to it yesterday as "the great poisoning." She spoke about our food supply and how it's basically become a weapon against us. She spoke about 5G and cell towers. We've had Dr. Magda Havas speak about that. But understand that our wireless technology, it could be done safely, but it's not done safely. It's done in such a way that reduces our health and reduces our lifespan, and this is deliberate. We are facing economic collapse. We're in it now. It is likely because they're telling us that we're going to have starvation.

We've already seen religious prosecution in Canada. We have called some of the pastors who have been jailed as witnesses, and that is not going to stop. We're literally in a situation where you need to prepare both physically and spiritually. Physically, I think you need to get out of debt, you need to have extra food, you need to have currency. I'm not here to give advice on that, but you need to be prepared because we are entering the next phase of this information war, and you need to act accordingly. We also need to prepare ourselves spiritually, and I'm going to go back to the evidence of Sheila Lewis yesterday.

Again, she was the one whose life depends on an organ transplant, and she's going to die. She's the one that was sobbing and telling us she just wants to live: she wants to see her grandchildren grow up. That's all she wants. She told us that this was evil, that what was happening to her was evil. As if evil is a tangible thing. And the thing is, evil is a tangible thing. If you open your eyes and look around, you will see it. We've seen it in these proceedings. You can hear it. You can taste it.

I've spoken several times about my opinion that the way back for us are what's called the first and second commandments in the Bible. I've explained that they're not just the basis of our legal system. But it's important for us to understand as we find ourselves in a situation where our government is adversarial to us, where institutions have become adversarial to us—that's because we actually moved away from the principles upon which our society and our legal system is based. When you move away from your foundations, your society falls. And I've explained to you how the second commandment, basically, is the foundation of freedom. Both of those commandments are intended for freedom. I'm going to explain that a little differently, and I think some of you are going to be shocked by how I end this.

There was a deliberate decision to remove God from our society. We all know that we can't speak about God. That it's almost like a conspiracy theory that you're a climate denier or you're an anti-vaxxer. God needs to be separated from our society: He needs to be removed from the schools. He needs to be removed from our institutions. This was deliberate. We have been taught to put ourselves first, and we live our lives to put ourselves first. We all do it; we've all been taught to do that. Our society is based on greed. I have two trucks. I have an old truck with 447,000 kilometres on it that's rusting, and I have a 2012 truck. Well, if I'm going to pick somebody up from the airport, I'm not using my old truck. Why? Oh, because I'm worried about being judged. I'm just using that as an example, and you all know what I'm talking about. Our society is based on greed, which is putting ourselves first.

[00:25:00]

We also view God's law or following God as restrictive. And that is the greatest lie. I'm going to explain that to you, and you're going to go, "Oh, my gosh. I see it; it's our greatest lie."

For those of you who have no idea what I'm talking about when I say first and second commandment, I'll just tell the story. It comes up in different ways. But when Jesus was on the earth in Israel, it was a rules-based society and it had become oppressive. It was a religious rules-based society. They actually referred to it as The Law. It wasn't meant to be restrictive. It was meant to be helpful. We're all aware of the Ten Commandments: don't murder, don't steal, don't commit adultery. Well, that was the beginning. But there was just rule after rule, and it actually had been turned against the people. So it was extremely, extremely restrictive. But it gave the religious leaders power over the people.

Then this Jesus comes along. He's talking about the law but in a way that's freeing—in a way that actually serves the people—literally that becomes so popular, he can't move around. He has to, at times, get into a boat and cross a water body just so that he's not surrounded by people. And the religious leaders are going crazy: "We've got to stamp this guy out." He's a political threat to them. So they plot several ways to try and get rid of this guy. But one of the ways was, they were going to ask Him a question. They were going to get Him tied up in a legal argument.

So they decide, "Well, let's ask him what the greatest commandment is, and it almost doesn't matter how he answers. Then we can argue with him and just show people he's not as clever as he thinks he is." Because they knew the law; they were the lawyers, so to speak. So they ask Him, "Teacher, what's the greatest commandment?" And He gives them an answer. He says, "Well the greatest commandment is to love the Lord your God with all your heart, all your strength, and all your mind." Now Jesus was out of the trap. He was out of the trap. That first commandment comes up in other places in the Bible but basically love God first, not self. You see, we're a self-based society now. But you're not supposed to put **self first; you're supposed to put God first.**

Now understand, Jesus was out of the trap. But he continued, and he didn't have to continue. He said, "And the second commandment is to love your neighbour like yourself." Basically, to treat others like you would like to be treated but further than that because he used the word "love." Now that is following the second commandment and the reason why every single Western liberal democracy—which have been the freest societies that we are aware of in history—they're based on the second commandment. Because if you teach your people and base your laws on the principle that you treat others like yourself and you don't put yourself first—God goes first—then you're not murdering each other. You're not stealing from each other; you're not sleeping with your neighbour's wife because you don't

want your wife sleeping with another neighbour. Basically, you have a freer and more civilized society if you are putting other people first.

So understand—because remember, I told you the greatest lie is that following God is restrictive. Well, if you believe that you have to be first, then—“Oh jeez, I don’t want any restrictions on myself”—you misunderstand, completely, that actually you are more free. When you love God with all that you are, you’re no longer putting yourself first. That’s how it works: you’re not number one anymore. And then, you’re forced to realize that you’re just one of His children. We are the same; we’re together. Do you see how, all of a sudden, it’s not adversarial? So when you’re not first and you’re just one person following God, we’re just all His kids. We’re all together; we’re all the same. It’s not about us anymore. That’s why the first commandment serves us,

[00:30:00]

and I’ve already explained how the second commandment leads to our freedom.

Now here’s where it gets interesting. Because one of the popular myths to get people to hate God and think that the first and second commandments are just crazy is—“Well, this is all fire and brimstone and judgment.” So I want to describe how the New Testament refers to judgment. What are we going to be judged on if this is fire and brimstone? I probably can’t go through this without choking up. It’s just so touching.

So you would think if God’s real— Because in the New Testament, it says that at the end of time, Jesus is basically going to separate the sheep from the goats, much like a shepherd which separates the sheep from the goats. The sheep are the people that lived right, and the goats are the people that lived wrong. You’d think the touchstone would be, “Well, you murdered and you stole and you’re totally unethical.” No, no, no. That’s not how He’s going to judge us.

You know what He said? Well, He’s going to turn to the sheep and He’s going say:

When I was hungry, you fed me; when I was thirsty, you gave me something to drink; when I was a stranger, you took me in; when I was naked, you clothed me; and when I was sick, you took care of me.

And the Bible says:

Well, these sheep are going to say, Lord, we never, ever saw you. When did we feed you or clothe you or take care of you? And Jesus will say, when you did it to the least of these—meaning anyone else—when you did it to the least of these, you did it to me. And then, He’s going to turn to the goats and He’s going to say, when I was hungry, you didn’t feed me; when I was thirsty, you didn’t give me anything to drink; when I was a stranger, you didn’t take me in; when I was naked, you didn’t clothe me; and when I was sick, you didn’t take care of me. And they’re going to say, well, Jesus, we never saw you, so what are you talking about? Obviously, we couldn’t have fed you or given you something to drink or clothed you or taken care of you when you were sick. And He’s going to say to them, well, when you didn’t do it to the least of these, you didn’t do it to me.

So the whole point—the whole point—of these commandments and our basis of our society, is to take care of each other. So when we have Sheila Lewis on the stand, sobbing

and begging the unnamed doctors—that she can't name because she's under a gag order—saying, “I just want to live. I just want to see my grandchildren grow up, that's all I want,” she doesn't understand why they will not reverse their decision. They're not feeding her when she's hungry. They're not giving her a drink of water when she's thirsty. They're not taking her in. They're not clothing her. And they're definitely not treating her when she's sick. Do you see how this serves us?

We can use these as the basis for understanding how we are to proceed going forward because it's all about standing together. You have no choice. We're in this together. You are not alone. You're not alone. And we have a task. You can't avoid it. We're in the Great Reset. And we're going to decide whether those that have pushed us into this get to decide the outcome or whether the outcome is going to be one based upon the first and second commandments. You have a choice. This is a historical moment.

There are times when a generation is asked to define who they're going to be. What are the history books going to write about this generation? I think of Churchill, remembering how he was so stirring in his oratory. In the darkest days of the Second World War, when he's saying,

[00:35:00]

“We'll fight on the beaches, we'll fight on the streets,” he had a phrase. He said, “If the British Empire lasts for a thousand years, they'll look back and say that this generation was their finest hour out of a thousand years.”

We're there. It's this hour. It's this hour for Canadians. Our actions will define whether this will be referred to as our finest hour or will we be a footnote in history of a civilization that fell to its knees without a whimper. I'm participating. I'm volunteering. I'm putting my neck on the line because I want the history books to say this was our finest hour.

[00:36:13]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 1: James Corbett

Full Day 2 Timestamp: 01:09:56–02:25:20

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

I'd like to call our first witness of the day, who is joining us virtually from Japan. So, James, can you hear me?

James Corbett

I can hear you. Can you hear me?

Shawn Buckley

Yeah, I can hear you. I'll ask our AV person to turn your volume up a little bit. I'd like to begin today by asking you to state your full name for the record, spelling your first and last name.

James Corbett

My name is James Corbett, that's J-A-M-E-S, Corbett, C-O-R-B-E-T-T.

Shawn Buckley

And James, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

James Corbett

I do.

Shawn Buckley

Now, James, you are an independent journalist. You have the Corbett Report, which is an independent, listener-supported, alternative news source, and it operates on the principle of open-source intelligence. You've got a different history in your background, and I have to

tell you that I've heard from several people comments about you that are just full of respect for the work that you do and the integrity of your research. So you come to us with a very good reputation, and we're pleased to have you join us today.

And you are here to discuss with us some kind of global issues, like the Global Pandemic Treaty, the International Health Regulations, and One Health. And I'm just going to let you march into the presentation that you've prepared, and then we may have questions along the way and certainly afterwards.

James Corbett

Okay, excellent. Thank you for that. Thank you for inviting me here to talk about this. I think this is incredibly important and, in fact, in some ways goes to the heart of what all of the craziness of the past few years has really been about. So I hope I can do it justice. I do have a presentation prepared, but obviously please do interrupt and ask for clarification at any point you need to.

In order to start in on these subjects, I think we need to establish some ground facts. And so, it would help probably to know what is the World Health Organization [WHO]. And for those who don't know, the World Health Organization was founded as a specialized agency of the United Nations in 1948 specifically to promote, quote, "the attainment by all peoples of the highest possible level of health." And it proposes to achieve this task by acting as, quote, "the directing and coordinating authority on international health" work. All right, excellent. That sounds noble. It sounds like something that people could get behind. But as always, the devil is in the details.

So some questions that might arise, as we hear these words that come from the founding Charter of the World Health Organization: What is health? And who determines the highest possible level of health, let alone how to attain it? These aren't idle questions, as I know you know from the very impactful harrowing testimony that you have heard over the course of this Inquiry.

The answers to those questions really do go to the heart of what we are facing: what we have seen over the past three years, certainly, and what we might see again in the future if we allow this to continue—lockdowns, mandates, travel restrictions, forced medical interventions and procedures, and rule by decree of governmental or presumed health authorities.

So this is an extremely important subject. And I just want to lay that out before we start diving into the details. Because although the worst of the COVID hysteria may or may not be behind us, I think the real battle is only now beginning. And that battle is a battle over **the definition of, and the declaration of, and the ability to govern over the next, quote-unquote, "the next pandemic," which we are constantly assured is right around the corner.** So this is an incredibly important issue.

So today I want to talk about two separate but related processes that are taking place under the auspices of the World Health Organization. One is, well, it's being referred to officially as the WHO convention, agreement or other international instrument on pandemic prevention, preparedness and response [WHO CA+], which is a very, very long roundabout way of not saying Global Pandemic Treaty. But they, I think, specifically do not call this a Pandemic Treaty because the word "treaty" brings with it certain legal obligations and would require ratification by legislatures, at least in those states where they have constitutional procedures for governing the signing treaties.

[00:05:00]

But conventions and agreements are covered under the WHO Constitution itself, which grants the governing body of the World Health Organization, the World Health Assembly, the power to, quote, “adopt conventions or agreements with respect to any matter within the competence of the organization,” which when ratified, will oblige each member of the WHO—which for the record is almost every nation-state on earth, of course, Canada, no exception there—would oblige them to adopt those conventions or to notify the WHO’s Director-General of rejection of those, or reservations to those, stipulations within 18 months.

So that’s kind of the framework for why it is not being called a Global Pandemic Treaty. But at any rate, this treaty, in all but name, is being drafted behind closed doors right now. This process has been going on for the better part of a year now and is expected to be unveiled with an agreement or other instrument at the 77th World Health Assembly, which will be taking place next May.

In the meantime, they are having closed door briefings and sessions that are not open to the public in which they are negotiating the text of this document. There is an entire bureaucracy that has been set up to handle this process of the drafting of this not-a-treaty called the INB, the Intergovernmental Negotiating Body. And that has held, I believe, a couple of hearings now for public input into this process. But all that means is that accredited institutions and organizations that get permission can Zoom in and basically make a short presentation about their feelings about what the treaty should include. Very few people given a chance, of course, to speak out against the process itself, and I think that’s instructive in and of itself. But the meat of the negotiations of this draft treaty are taking place behind closed doors, and there is very little transparency on this process.

We do have a zero draft of this treaty that was unveiled earlier this year [February 1, 2023] and that we can at least see the text that they started with from ground zero, which gives us some insight into this process. It includes increased tools for epidemiological genomic surveillance and integrated One Health surveillance systems, which might raise the question, what does any of that mean? And those are good questions, but unfortunately not ones you will find the answers to in this zero draft of the treaty. Because in the definitions section of the zero draft, you will note that, for example, it says, under definitions, “‘One Health surveillance’ means . . .” And then, of course, that’s left blank because they have not come up with a definition of One Health surveillance yet, but it is included in the text of this zero draft [February 1, 2023]. They talk about the need for integrated One Health surveillance systems without telling you what One Health surveillance means.

Other such things like that abound in this document. There are obligations for member states to, quote, “tackle false, misleading, misinformation or disinformation.” And I think given the events of the past few years, we know exactly what that looks like and what form that takes. As someone who had his YouTube channel of nearly 600,000 subscribers scrubbed for daring to talk about such things as the philosophy of science and other things related to the events that are going on, I know firsthand what that legalese text implies.

The zero draft also includes verbiage about control over when, where, and how a pandemic is declared within each member state’s borders. So it says, quote, “the INB is encouraged to conduct discussions on the matter of the declaration of a ‘pandemic’ by the WHO Director-General under the WHO CA+ . . .”—which is what they’re calling this not-a-treaty— “. . . and the modalities and terms for such a declaration, including interactions with the International Health Regulations and other relevant mechanisms and instruments.”

So yes, even the process by which a pandemic will be declared by the World Health Organization under this new treaty, or whatever they're calling it, is left open to negotiation. And again, negotiations which we do not have access to as lowly members of the public who will simply be subjected to whatever rules end up getting forced into this document.

I think that should be concerning in and of itself. But actually, it's in some ways, maybe even worse than most people realize. Because at least at this point,

[00:10:00]

the World Health Organization does not officially declare a pandemic to have started or over. There is no official declaration of pandemic. There is an official declaration of a public health emergency of international concern (PHEIC), which is a different declaration altogether.

People might have heard recently that the WHO has declared the pandemic over. But that's not quite true, as even the fact checkers will, in this case, correctly tell you, "No, they declared the end of the public health emergency of international concern," but they did not say that the pandemic is over. So this document is at least putting on the table the possibility of literally a declaration of pandemic by the WHO Director-General, in particular, which is interesting for reasons that relate to that PHEIC.

But let's delve into the other side of this. Because as it says in that text, talking about this rule of the WHO Director-General declaring a pandemic, it says, "including interactions with the International Health Regulations." And that is the other document that I want to talk about. One is this treaty, which they are not calling a treaty. The other is amendments to the International Health Regulation.

Shawn Buckley

James, can I just slow you down for a sec before you go to the International Health Regulations. Because to some of the people that will be watching your testimony today, this will be brand new. So you're basically saying that we should be calling this a "Global Pandemic Treaty," what they're negotiating. But even the title—they're using words to kind of confuse so that we don't understand what it is. And that this is being negotiated behind closed doors, so it's not a public process. Is that right?

James Corbett

That is correct in substance. Obviously, it's my supposition that the unwieldy title **contributes to the confusion around this process. But it is not supposition that the word "treaty," specifically brings with it certain legal obligations that I think are being obviously avoided in this lengthy appellation.**

Shawn Buckley

And then I just want people to understand. So when you're saying definitions are left blank—when laws are drafted or treaties are drafted, they'll actually put a definition in and then start using those words. So the definition is very, very, very important. So when James is saying, "One Health surveillance"—which sounds very Orwellian—or "One Health surveillance systems," saying these terms are being used, so they have a specific meaning. But the text that's been released, they're not telling us what the meaning is.

So I just want people to understand how important that point is that James has brought up. It makes it impossible for us reviewing the text that has been released to really understand the significance. And I can tell you, having drafted legislation for government, that when you actually already have a term, you have a definition in mind. You know what that term means; you're not throwing it in there for good measure. So to me that's quite concerning what you brought up.

And also, just slow this down before you move on. You're telling us there's actually provisions in there to deal with misinformation. So they're already anticipating censoring information that goes against what they say?

James Corbett

That is the certainly the implication. There is no language, at least in the zero draft, that's been provided to the public to specifically say how member states are committing to tackling false, misleading, misinformation or disinformation. But I think we've seen exactly how that has been done over the past few years, including direct governmental interference in social media. For example, trying to censor—not trying, but actively censoring people who go against the pronouncements of any declared public health authority. So I think that's essentially what is being declared.

But specifically, it's from Article 17, paragraph 1 [zero draft, February 1, 2023]: "The Parties commit to increase science, public health and pandemic literacy in the population, as well as access to information on pandemics and their effects, and tackle false, misleading, misinformation or disinformation, including through promotion of international cooperation," which is an interesting addition.

And just to clarify, yes, Chapter I, the Introduction, Article 1, Definitions and use of terms. They do have in the zero draft [February 1, 2023], four of the terms defined. But they leave "pathogen with pandemic potential," "One Health approach," "One Health surveillance," "infodemic," "inter-pandemic," "current health expenditure," "universal health coverage," and "recovery" are all left undefined at this point.

Shawn Buckley

Interesting. Okay, sorry for interrupting, please continue.

James Corbett

Valuable things to elaborate on.

[00:15:00]

All right, so let's talk about the other process that is going on. And I think, again, supposition, this is another part of the deliberately confusing nature of this process. In addition to this treaty, or whatever they're calling it, there is a proposal to amend the International Health Regulations. So what are the International Health Regulations?

Back in 1951, the World Health Assembly, the governing body of the WHO, adopted the International Sanitary Regulations, which was an attempt to consolidate the multiple and overlapping international agreements that then pertained governing quarantine procedures and other international health controls—that were, at that time, a series of bilateral deals between various countries and that was quite confusing, obviously, for an

increasingly globalized society, international trade, et cetera. So that was consolidated into this International Sanitary Regulations. And that was ultimately turned into the International Health Regulations in 1969. And those IHR, International Health Regulations, were amended in 1973 and 1981.

At that time, the entirety of the International Health Regulations covered specifically six diseases, but specifically focused on three of them: cholera, yellow fever, and plague. But after the SARS-1 hysteria of 2003, there was a push for amendment and sweeping reform of these IHR, International Health Regulations, to take into account the new and novel diseases that could appear in the future. So that push led to the adoption of the last round of amendments to the IHR in 2005. So that is the most recent edition of the International Health Regulations. And that was the addition of the International Health Regulations that introduced that aforementioned public health emergency of international concern, which is a specific declaration that is made ultimately by the Director-General of the World Health Organization.

Although, supposedly, theoretically, there is an independent advisory board that advises the Director-General whether or not to declare a public health emergency of international concern for any emerging virus or pandemic, or what have you. And that independent advisory board, really—according to what I think the drafters or, at least, what was presented to the public—it was the advisory board that's ultimately making this decision, and the Director-General just gives the rubber stamp to their recommendation.

Of course, that turned out not to be the case with the declaration of the monkeypox public health emergency of international concern last year, in which, according to reports, apparently, the Director-General Tedros broke the deadlock in the advisory panel by declaring that it was a public health emergency of international concern. And it's interesting that it's even portrayed as a deadlock when, in fact, the majority of the independent advisory board recommended against declaring a PHEIC.

But what is a PHEIC? Why is it important? What does it do?
