Essentially, the declaration of public health emergency of international concern opens up a number of powers for the World Health Organization up to and including—as was reported back in the mid-2000 “teens” during the *Ebola* public health emergency of international concern; it was reported even in Newsweek and other places—that the powers that are unlocked by such a declaration could even include, conceivably, NATO boots on the ground in order to enforce quarantines or deliver medical aid or intervention, or what have you.

So this is a significant declaration. And of course, it also brings into effect a number of contracts that are signed for various governments that ultimately obligate them to **purchase prophylactics, including vaccines or whatever else may be available for the declared health emergency. And that became a significant factor in the first ever declaration of a PHEIC back in 2009, during the swine flu pandemic, which ultimately ended up being a less deadly flu season than regular. But that being what it is, the declaration of PHEIC obligated countries around the world, including, of course, in Canada, to purchase swine flu vaccines that, ultimately, a lot of them ended up getting destroyed, unused. But whatever, at any rate, it was there. And an awful lot of money was made on the back of those vaccines.**

[00:20:00]

And an independent investigation from the Council of Europe the following year, as well as a British Medical Journal investigation, found that there were serious conflicts of interest between the independent advisory board that advised then WHO Director-General Margaret Chan to declare that PHEIC and the very pharmaceutical manufacturers who ended up benefiting from that declaration. So that's kind of the context of this International Health Regulations and what's on the table.

This current round of negotiations for further amendments to those IHR include a grab bag of proposals of potential amendments. Some of the ones that pop out immediately include the idea of striking out the words, quote, "full respect for the dignity, human rights, and fundamental freedoms of persons," from the IHR principles, giving WHO greater authority over surveillance monitoring and control of health threats—including greatly expanding the PHEIC power with proposals suggesting giving the Director-General the authority to declare not a public health emergency of international concern but an "intermediate public health alert" where a public health event does not actually reach the threshold of declaration of PHEIC but "requires heightened international awareness" and preparedness activity.

So, whatever that means.

Granting the WHO the power of a global emergency health legislature, including proposals to potentially change the currently "non-binding" and "standing recommendations" on medical and/or non-medical countermeasures to address a PHEIC that the Director-General shall issue to WHO member states after a consultation into binding recommendations. So they are actually proposing to change that wording from non-binding to binding, which ultimately does make the WHO into a de facto government, at least, public health emergency legislature.

It includes proposals for working with partners to establish a Global Digital Health Certification Network, which is intended to enable member states to verify the authenticity of vaccination certificates issued under IHR, as well as other health documents. And proposals to expand the scope of the International Health Regulations to cover not just demonstrable ongoing public health emergencies, but all risks with a potential to impact public health.

In other words, this is an astounding power grab that is, again, represented in these two parallel processes: the treaty that they're not calling a treaty and the International Health Regulations amendments that are separate processes, that are being run by separate governing bodies, but that, as the WHO states, could overlap. And there are meetings that again are going on behind closed doors as to whether or how these two processes should merge. Or maybe there should be two separate processes. Maybe they should continue with one of them, but not the other. It's all left completely opaque at the moment.

So those are the two processes. And in order to understand, I think, what's really on the table, we have to understand the overall idea behind the concept of public health in general and where it is going in the future. I'll pause for a moment in case you need any further clarification on anything I've presented so far, though.

Shawn Buckley

And actually, that's a perfect time for pause. It's interesting. We had a witness yesterday, Denis Rancourt. I don't know if you're familiar with him. He's a physicist by training but had been a full professor for years at the University of Ottawa and an interdisciplinary

researcher. He's presented on all-cause mortality using Canadian and U.S. data. And one of the points he brought up a couple of times was, in the past when pandemics were declared be that avian flu or swine flu or whatever, there was no indication in all-cause mortality that there was ever a pandemic. So, in other words, you couldn't see it. But he says you could see a heat wave for three days; that would show up, other things would show up.

But actually, every single time a pandemic had been declared, there was no rise in all-cause mortality. So basically, the implication is that these pandemics are declared when there is no public health emergency. And here you are telling us that basically, countries like Canada would lose their sovereignty so that if a pandemic was declared by the World Health Organization, we would have no choice but to allow them to basically counter some pandemic. Are we hearing you correctly about that?

James Corbett

Member states are already obligated to do a number of things under the WHO Constitution,

[00:25:00]

including implementing the conventions and agreements that are decided upon by the World Health Assembly. So really, there are already obligations that are in place for Canada, as we've seen, I think, through the course of the past few years, let alone decades. That in fact, for example, there is a stipulation in the existing International Health Regulations that all countries have to comply and actively assess their compliance with the International Health Regulations and pandemic preparedness generally. And Canada, as you may or may not know, actually, the Government of Canada posts on their website, occasionally, their updates as to their self-assessment of their compliance with the International Health Regulations. So there are already stipulations in place. I think the proposed amendments just give the potential for these obligations to expand.

Shawn Buckley

It's interesting. So that explains why, I mean, it seems that most of the world, certainly the Western world, followed kind of one plan. And James, what I've always found interesting—and this is just my thinking—but let's say we were facing a serious threat by a virus and we've got to figure out what to do. It would seem to me you'd actually want different countries trying different things so that you could see what works and allow different theories to be tested.

But we basically have entered a world where one organization has the power to decide how we deal with a serious threat. And if they get it wrong, then the whole world will face the consequences of that. Because that's the flip side. But if they get it right, well, great; all's well and off we go. But if they get it wrong, it means the catastrophe is magnified. But basically, that's where we're at legally.

James Corbett

I concur wholeheartedly. I think that gets actually to the real heart of the philosophical issue, let alone the legal issue, that we're facing here—which is the question of the centralization of power over “public health” in fewer and fewer hands. And, in fact, that's kind of how I'm planning to end this presentation. But perhaps we should cover One Health before wrapping up with that.

Shawn Buckley

Sure, can I just ask one more thing? Because you just went over it quickly. You were saying they were striking out some principle. Can you just read that text slower for us? I think it's important for us to understand.

So there's principles in the current International Health Regulations. So it means, principles—just so that people hearing your testimony understand—they're supposed to be what guides the interpretation and application of these regulations. So they're kind of fundamental to what our goals are. But please share with us what is being removed or being proposed to be removed as a principle.

James Corbett

Yes. So the text that is being proposed to be struck out from Article 3, which is the principles of the IHR document, is "... with full respect for the dignity, human rights and fundamental freedoms of persons." And the proposed alternate text—again, people can find this on the WHO's own website; they have a post of the proposed amendments [IHR proposed amendments, WHA75(9) (2022)]. The proposed alternate text: instead of "... with full respect for the dignity, human rights and fundamental freedoms of persons" is "... based on the principles of equity, inclusivity, coherence and in accordance with their common but differentiated responsibilities of the States Parties, taking into consideration their social and economic development." I will let you parse that for yourself. But, anyway, that's what they want to replace the text with.

Shawn Buckley

I think George Orwell would be proud of that one.

James Corbett

I concur.

Shawn Buckley

Yeah, please continue this. And I can just share with you that I believe everyone is finding this very interesting and we haven't had somebody speak to us about these issues. So we certainly appreciate you sharing with us.

James Corbett

All right, so what we have heard, so far, I think is fairly concerning. But actually, where I think this is going demonstrably is even more concerning. And what this is raising the spectre of, is the concept of the One Health approach or One Health agenda, which is being adopted by many different health authorities in many different countries. The CDC in the United States, the World Health Organization is talking about it. In fact, there's an entire institutional framework that's taking place, taking shape around it.

One Health: that phrase was apparently coined in the wake of the SARS-1 events,

[00:30:00]

back in 2003–2004, to discuss the threat of emerging diseases—diseases emerging from animal populations and the contact of animal and human populations, so zoonotic diseases.

And that concept started to come on board that public health is not just about your individual health as a human being, it is about the health of nature, including animals. So the CDC, for example, defines the One Health approach as “a collaborative, multisectoral, and transdisciplinary approach—working at the local, regional, national, and global levels—with the goal of achieving optimal health outcomes recognizing the interconnection between people, animals, plants, and their shared environment.”

So again, I think like the founding principles and definitions in the World Health Organization Charter, this is language that is designed to sound very appealing. But I think quite quickly starts to get into some very interesting philosophical areas, shall we say.

So I think we have to recognize what is being done here is a rhetorical move to essentially make every corner of the globe, every natural resource, every plant, every animal, including every person, as part of an interconnected web that forms this new definition of public health: One Health. And so, embedded within this idea, within this concept, is if we have a centralized, specialized agency of the UN, like the World Health Organization, which is in charge of coordinating international public health, we need some sort of centralized control that will have jurisdiction essentially over every one of these constituent elements—every habitat, every resource, every animal, every plant, and every person—in order to coordinate not public health but international One Health.

So I think we see where this is starting to go. And of course, it doesn't just involve the World Health Organization. Again, by its very nature, this is such a broad concept that it applies to every nook and cranny of every bureaucratic infrastructure in at least the UN panoply, as evidenced by the fact that the World Health Organization has just joined a quadripartite coalition—consisting of the Food and Agriculture Organization [FAO] of the United Nations, bringing in that food concept that was referred to by Catherine Austen Fitts; the United Nations Environment Programme [UNEP], bringing in the spectre of Rio Summit and UNFCCC [United Nations Framework Convention on Climate Change] and the IPCC [Intergovernmental Panel on Climate Change], et cetera. The World Organization for Animal Health [WOAH] and the World Health Organization have now combined forces to tackle this One Health approach idea. And they have set up a new “high-level expert panel,” to coordinate activities on One Health, which is defined as “an integrated, unifying approach that aims to sustainably balance and optimize the health of people, animals, and ecosystems.”

So again, this sounds laudable. But it is predicated on a devaluing of human life in order [inaudible: 0:33: 19] equity, which I guess we're supposed to assume is always, in every context, a wonderful word—equity with nature. So humans have to be devalued to the point where we do not prioritize human health over the health of, say, an animal species or something along those lines. And I think people understand where that concept is going or where it could go. But at any rate, that is the One Health approach that is now being fostered under the auspices of not just the WHO but a number of international organizations.

Shawn Buckley

So that's how we end up locked down in 15-minute cities and eating crickets.

James Corbett

Unfortunately so, or at least I believe that is part of the plan. So yes, as you indicate there, this is not just about the concept of health as we tend to think of it—as in you feel sick and

you go to the doctor and you get some medicine, or something along those lines. It has to do with every aspect of your life: where you live, how you live, what you eat, et cetera, et cetera. It would be difficult to think of any aspect of your life that would not come under the purview of this One Health idea.

Shawn Buckley

That's quite striking actually. So did you have more to share?

James Corbett

I can talk about the next steps in this process.

So with regards specifically to the International Health Regulations, again, they are being proposed to be adopted at the 77th World Health Assembly next May by a simple majority vote.

[00:35:00]

And so, given the scope of the Constitution of the WHO and specifically Article 21, the amendments of the IHR—when and if they are adopted—will come into force within all member states within 12 months of adoption unless a state proactively files rejections or reservations within a 10-month period after the adoption. At any rate, this is a very, very short timetable and I think, again, the momentum is on the side of the bureaucratic meddlers here, shall we say.

As regards to the treaty, that they're not calling a treaty, that would require—I think there are different interpretations of this—but I have read that it would require a two-thirds majority vote in the World Health Assembly with each member state being able to sign and ratify the treaty in accordance with their own domestic laws.

But, as I say, I think overall, the World Health Organization Constitution, as it is written, is interpretable in ways that would suggest that any World Health Organization member state is obligated to enact whatever convention or agreement is signed. So, again, I think that there are different legal opinions of what this is. But I think we have a very narrow window in which to act. And I guess the question for Canadians is, what can be done or what should be done?

So I guess on the most basic legal/political level—obviously, given the fact that a formal registration of concern is required to at least stop this from being automatically implemented in Canada within one year of its adoption—then obviously, I think, politically, **people's energy should be directed in that direction, at least at this moment. And there are movements afoot in a number of different countries right now not only attempting to preventatively get their member states out of this process for the negotiation but actually to withdraw from the WHO altogether. And I note that there was a press conference on the steps of the U.S. Capitol just this week involving several U.S. congressmen, I hear 21 of them, actually, were there demanding a complete withdrawal of the United States from the World Health Organization.**

So that is, I think, at least a sign of the type of political movement that could be happening if people were engaged and aware on these issues. Although, obviously, the Canadian political context may be a little bit different than the American context. And I think one thing that we could be assured of is that the establishment media would ignore or denigrate such a

political movement, to the extent that they acknowledged it at all, in the exact same way as they did with the Freedom Convoy.

But more to the point, I think, perhaps more hopefully, I see the formation of communities of interest—public and private membership associations and other organizations—forming on the basis of the principle that human beings have natural bodily autonomy, and medical interventions cannot be enforced or forced upon anyone against their will. And so, I think the idea of people coming together on that basis, including doctors and other medical professionals and regular people, coming together on that basis to form their own sort of splinter medical system, to me, seems the more thoroughgoing approach here, not recognizing the diktats of centralized health authorities.

However, obviously, nothing is going to change unless and until there is a widespread recognition among Canadians, and people all over the world, of the fundamental underlying issue: What is “health”? And who gets to define that word? Who gets to describe what a health crisis is, and what states, let alone individuals, must do in the event of a declared health crisis?

These are the fundamental questions. And who controls those powers? Which really raises, I think, the fundamental underlying question of all of this. Because what I’ve been describing with regards to these powers that are coming into view might raise the spectre of medical martial law—essentially times of suspension of regular law in which health authorities essentially act as martial authorities, being able to dictate law into law just by saying it. Which is exactly what we saw over the past few years.

But I think it’s even worse than that. What we are seeing is the erection of an infrastructure

[00:40:00]

for a new paradigm of governance: the biosecurity state. And if you are unfamiliar with the writings of Giorgio Agamben, he is a famed and noted Italian philosopher who has been writing about this subject for the past few years. I highly recommend his work, including an article he wrote in March of 2020 called “Biosecurity and Politics,” where he identified this as the crux of the issue. He wrote, “the total organization of the body of citizens in a way that strengthens maximum adherence to institutions of government, producing a sort of superlative good citizenship in which imposed obligations are presented as evidence of altruism and the citizen no longer has a right to health (health safety) but becomes juridically obliged to health (biosecurity).” And I think that is the spectre of what we are facing: the imposition of medical interventions in the name of health but essentially as a new paradigm of governance that we are looking at.

And so, I think we need to fundamentally question the need for health authorities’ centralized control over the medical system rather than the idea that people can choose for themselves what medical interventions and what medical precautions they are willing to take or not take. And also, the acknowledgement that with our fundamental right of bodily autonomy comes with it our right to essentially ignore and to go against the outward imposition of dictates and obligations by any presumed health authority. So, any treaty, any convention—International Health Regulations—that are signed that do not recognise, fundamentally, informed medical consent and the right to bodily autonomy, it’s null and void.

Shawn Buckley

James, I'm just going to step in if you'll let me. It's interesting. So you're telling us stuff. And I've just, when I do have time to see non-mainstream media, you hear about International Health Regulations and that this is going on. But I can tell you personally, I've not heard this type of detail that you're providing. So basically, Canada is walking into the situation where really our entire sovereignty could be given up in the name of this One Health initiative where everything from our food supply to our complete medical system to our freedoms could be dictated from an outside source. That's basically what's happening and we're not hearing anything about it.

James Corbett

Yes, I think it is already happening and yes, we are not hearing about it.

Shawn Buckley

Are you aware of a single group or anyone that is on this issue in Canada that should be given some support, or we could be directed to?

James Corbett

There are a number of individuals and independent media that are talking about these issues. But in terms of actual coordinated political movement on this front, I don't know. As I say, I live in Japan, so I am not in touch with any particular group.

Shawn Buckley

No, I was just asking because if you're not aware of one, then perhaps that there's a need that needs to be filled here and that's important for us to know.

Also, it's interesting, just as the National Citizens Inquiry has been moving about province to province, I ended up being out for dinner with some of the people involved in the NCI, including local organizers in Vancouver. And sitting to my left was a person from Quebec that lives on a fairly sizable acreage, he is telling me that his chickens have to be registered and he's only allowed three chickens. And then somebody living on a farm in BC is saying, "Oh, I have to register every cow, every sheep, every chicken," like, the amount of control. And then I have a personal friend in Alberta who's being told that, well, any water body, they have to have a fence this size and that would include their rain barrel. Like, it's just, all of a sudden, this micromanagement of rural properties and animals being imposed from above, which makes zero sense unless there is an effort to basically have total control over food supply and animals and rural properties. And it sounds like this would be connected.

James Corbett

I think it is. But on that note, I think that the pushback that we're seeing from Alberta, from Saskatchewan, the Alberta Sovereignty Act [*Alberta Sovereignty within a United Canada Act*], or whatever these things are being called—which I'm not following the passage of these bills closely—but I understand would essentially be a declaration of the provincial government's right to exclude federal authorities from butting in on their jurisdiction,

[00:45:00]

which, of course, health is actually a provincial jurisdiction not federal.

Shawn Buckley

Right, okay. I'm going to turn you over to the commissioners to see if the commissioners have questions. And they do.

Commissioner Drysdale

Good morning and thank you for coming and providing your testimony.

You know, we've completed 22 days of testimony across the country at the NCI right now, and it's like a large jigsaw puzzle that seems to be coming together. And when I was listening to your testimony, it reminded me of some testimony I think we had in Vancouver, and one of the witnesses held up a document that they said was prepared by Theresa Tam. And what it was is that the climate emergency was the biggest threat to human health in Canada. And I kind of wondered about that. But are you aware of that document? And does that kind of fit in with this whole WHO control and pandemics that you're talking about?

James Corbett

I am not familiar with that document in particular, but I am certainly aware of many pronouncements along those lines that have been made over the past few years. And I certainly do see that as absolutely a fundamental part of the One Health agenda. I think the preparation of the public for the idea of a climate crisis, climate emergency, and ultimately lockdowns on the basis of such an emergency has been foreseen, has been talked about, has been openly written about by a number of people and institutions, the World Economic Forum and others, for years now. And so I definitely see that as part of the unfolding One Health agenda.

Commissioner Drysdale

And I forgot to mention, and I don't know whether she still is, but I know Theresa Tam was the head of one of the WHO health committees. I can't quite recall which one it was, but I believe it just started a few years ago, and again, I don't recall whether she's still the head of that or not. But it certainly, it goes right along with what you're saying.

We had another witness in, I think it was Vancouver, and she was an expert in international law and human rights. And in her testimony, she had demonstrated how Canada, during the pandemic, had violated, or allegedly violated, a number of the human rights, which are guaranteed under the UN treaties, underneath a number of health treaties. And it's just interesting, then, how these human rights guaranteed under similar documentation by the UN are being trampled on by the health care directives that are being contemplated or being implemented by the WHO through the UN. Are you aware of that contradiction between human rights treaties and what you're talking about here, the proposed WHO?

James Corbett

Yes, in a sense. But I think that the legal documents and constitutions and other things that presumably we are ruled by, or that constitute the rule of law, are not really worth the paper that they're written on, generally speaking. And in fact, that's, of course, I would say, exactly what we've seen over the evisceration of the *Canadian Charter of Rights and Freedoms* over the past few years. In fact, Giorgio Agamben, who I mentioned earlier, wrote an entire book about *State of Exception*, talking about that issue and exploring it from the philosophical and jurisprudence and historical angle, that there is always a moment of

aporia in these constitutional documents that essentially allow for the declaration of some sort of emergency that says all the rules are aside.

And I would note specifically with regards to the United Nations and the *Universal Declaration of Human Rights* that it propounds, they all sound wonderful and woolly until you get to Article 29, paragraph 3, which says, “these rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.” Essentially, yes, you can have all these wonderful rights unless and until the United Nations says you can’t, and then you can’t. So I think those are the types of legal trickery that are played in these documents.

Commissioner Drysdale

Well, I think that’s why you rightly pointed out definitions and the grab bag of words that were in definitions. And Canadians, if they aren’t, should be very much aware of how their constitutional rights or their *Charter of Rights and Freedoms* was completely neutralized by what seemed to be innocuous words,

[00:50:00]

high-minded words.

I mean, if we’re not aware of those things now and scared to death about these definitions that go on and on and on and could mean anything. But it seems, to me, that you’re saying that this is a common practice, that they put in these kinds of words they can manipulate any way they wish.

James Corbett

I think that is the case. As I say, I would definitely direct you to Agamben on that issue. He has written extensively about this, and it is demonstrable in a number of documents. And there is, generally speaking, some sort of emergency clause or an emergency act, a public order emergency, for example, that can be declared that will suspend basic constitutional rights.

Commissioner Drysdale

The last thing. You know, when I was listening to your presentation and also listening to some comments made by Mr. Buckley, it reminded me of what’s happened so many times in the past. I mean, in Soviet Russia, they got a hold of the food production and they murdered or starved to death 20 million Ukrainians, I can’t remember what the number is; **they argue about what that number is. In China, they did the same thing during the late 1950s and early 1960s, and they took control of all of the food production. Are we seeing that same thing happening today in Canada and in the Western world, but more importantly, at least to me, in Canada?**

James Corbett

I would say, anyone who isn’t paying attention to the consolidation of the food supply in the hands of fewer and fewer corporate interests—but also governed over by an international institutional infrastructure, the Food and Agricultural Organization and other associated institutions—if you’re not concerned by that process, then you’re probably not paying attention.

And in fact, the consolidation is getting worse and worse as we step forward into the Great Food Reset, which has been declared. And that involves such things as lab-grown meat to try to cut down on the horrible pollution that we know that actual regular farming and ranching are wreaking on our environment. Except for a recent report—that may or may not throw any kind of spanner in those works—that apparently, the lab-grown meat will be 25 times more energy- and resource-intensive than regular farming. I wonder if that will in any way derail the plans.

But at any rate, this is definitely a part, again, of that One Health agenda and that One Health approach. And the consolidation of the food supply in the hands of a few corporations cannot be ultimately for the benefit of all humanity. There is, at the most basic level, a very obvious financial incentive for corporations to do this. But from the perspective of people who are literally thinking about trying to manage the human population in general, there could be no greater choke point for doing that than by controlling and manipulating and rationing the food supply.

Commissioner Drysdale

You know, historically speaking—except for a handful of people at the top, some of those names that we know—central planning, state Soviet-style planning, has never been successful. I mean, have we not learned our lesson in history? I mean, the 20th century was predicted to be the century of the masses, mass control; there were a number of books written in the late 1800s about that. And have we not learned our lesson?

We had a witness yesterday, we talked about the definition of fascism, and these are not their words, these are my words. They were talking about us going into fascism on steroids because, you know, in the past, they never had the technological and electronic control and brainwashing that we have today. I mean, have we not—will we not—learn our lessons from history?

James Corbett

Unfortunately, it doesn't seem so. And, actually, history would give us the proper terminology for this because people are grasping around for historical precedents and political analogues—and they talk about fascism; they talk about communism. What they should be talking about is technocracy, and that was a movement that was quite popular in the United States and in Canada in the 1930s. In fact, Elon Musk's Canadian grandfather was a prominent member in the Canadian technocratic political movement who ultimately ended up fleeing Canada and going to South Africa, but that's another story.

[00:55:00]

But technocracy was an idea that was predicated on the idea, not of a fascist system, not a communist system, but the control of society, the engineering of society, at a scientific and technical level by technical experts who would decide—who would calculate—the entire energy inputs and outputs of the entire economy and base the economy around that calculation. And they would issue energy credits to the people who would then use those energy credits to purchase items. And that was a truly bizarre and crazy idea in the 1930s because it would have required systems for continuously monitoring and surveilling every transaction in the entire economy in real time, which, of course, didn't exist in the 1930s.

That technology exists now. And although the historical technocratic movement and Technocracy Inc., which was one of its products, has not exactly disappeared, but it's

certainly not a prominent political part. But I think that ideology is still around and that really starts to explain some of the directions that we're heading.

For example, the concept of carbon rationing and the concept of universal basic income, and some of these other concepts that are floating around, are at base technocratic ideas that have been adapted and adopted for the terminology that appeals to us in the 21st century. But I think if we don't understand that history and where that idea developed from, I think we will not truly be able to understand what is happening until it's too late.

Commissioner Drysdale

Well, yeah, I mean, we now have state-sponsored euthanasia. We have the state holding back life-saving medical procedures from a lady who testified yesterday because she wouldn't comply with something, you know, a procedure that had nothing to do with the transplant. We have state-based racism, where they're pitting every different group of people against each other, regardless of what measure you want to look at. We have unprecedented propaganda, 24 hours a day. People are acting like cyborgs where they carry a device in their pocket and they think because it's not under their skin, they're not a cyborg. But even in this room, we hear the phones ringing and beeping and clinking and clanging. I mean, from what I understand from you, and I understand from some of the other witnesses, this is at an unprecedented level of control. And therefore, we as a human race are at an unprecedented risk to their will. Can you comment on that statement?

James Corbett

Yes, let me underline and underscore exactly what you're saying there. For any of the Commissioners who do not know about it, I would wholeheartedly exhort you to look into Policy Horizons Canada, which is an arm of Canadian government that a few years ago produced a document on biodigital convergence, which talks exactly about what you're talking about: ultimately towards the creation of that cyborg-intermediate species, whatever we are becoming with this increasing adoption of technology, where they actually talk about the ways that at the medical level, we will be more and more merged with machines. And again, you have to read this document in its own words; don't take my word for it.

But one of the things that they talk about in the document is the breakdown of the philosophy of vitalism, which is the idea that there is actually a real and meaningful distinction between organic life and inorganic matter. And they say that those lines are blurring because now people and animals and plants are engineerable, and we can put various biomechanical devices inside of them, and we can tinker and alter them. So the actual distinction between life and nonlife is beginning to break down. And they, I believe, frame that in a positive context in their documents. So yes, these are some very fundamental questions that we're facing.

This agenda is really about much more than simply public health. I think this is about the real question of the definition of human: What does it mean to be human? What is the value of human life itself? And obviously, it does raise the spectre of eugenics and other really terrible ideas from history. Ultimately, I think you could trace it back to Malthus and the fundamental Malthusian idea that there are too many people and that we must get rid of some portion of the population so that we can continue to live. Those fundamental philosophical wrong turns, I would say, continue to haunt humanity.

[01:00:00]

And that is the direction in which I think all of this institutional momentum is heading.

Commissioner Drysdale

Thank you, sir.

Commissioner DiGregorio

Thank you so much for your testimony today. It's been a while since I studied international law, a number of decades, I guess, back in law school. But my understanding was always that international law isn't really a set of rules that are imposed on countries, but it's more a set of agreements that countries reach with each other about how they're going to behave both with each other and internally.

And so, I guess with that framework in mind and thinking about the treaty that you've talked about today and the International Health Regulations—should we be thinking about these documents, and these amendments to these, as things that really Canada is signing up to be binding and to be bound by? Or should we really be looking at these as something that maybe just will give our politicians legal cover: if they want to implement things that maybe aren't in the best interests of Canadians, but they can then turn to and say, "Well, but it's the law, we've signed up to this"?

James Corbett

There is absolutely an element of that. And I think the underlying principle that we have to understand here is that, exactly right: there is nothing that would stop Canada from tomorrow declaring we are not part of the World Health Organization and making it so by fiat. It can be done. And of course, there is actually a process for withdrawing from the World Health Organization, et cetera. But what would happen if Canada just simply declared themselves to be out of the World Health Organization? Well, then by decree, it could essentially be manifested in reality. Because as you say, there is no international courts that could adjudicate this in a way that they could impose rules from the outside. It has to be done to some extent willingly.

So yes, it is important to keep that in mind because I think that is part of what I'm gesturing towards: not just with the political solution, but the political solution as a manifestation of that change in public perception and public consciousness—that, in fact, actually, it is what we are deciding.

Now, of course, there could be and presumably would be many different knock-on effects in terms of Canada's relation with the United Nations, and with various other states, et cetera, **if they were to make such a declaration. But at the end of the day, it is essentially a choice that each member state makes.**

Commissioner DiGregorio

Thank you.

Commissioner Massie

Thank you very much for your root cut analysis of this very, very complex situation. It actually goes in many different dimensions in terms of the definitions, as you mentioned. The One Health, to me, evoked immediately this notion by a lot of technocrats that they

really dream of a one-size-fits-all solution because they think they know it all, right? And if we just listen, then everything would be fine.

It seems, to me, as you pointed out, that we are living a paradigm shift in terms of governance. But to some extent, it seems to me that since the dawn of civilization, there's been a kind of a dream by rulers to control everything. It was not possible sometime if they had more control by fiat with soldiers and stuff. But nowadays, the main way to control is information and the connection of people across the world. And because it seems to be able to connect in a virtual world with internet and stuff, I think that people in the ruling class, the technocrats, think that it's now possible to actually control the world because they have technology that will allow them to do that.

So we are sort of back to the same sort of conflicts between what I would call the subsidiarity principle as a model of governance versus a top-down governance with wise people that know it all and will do it for our own good. The issue I found in terms of fighting that, and you've mentioned a few areas where we could actually be more active and combat it, is that human beings, being what they are, no human being is infallible and can actually fall prey to corruption. Some people are more susceptible to that than others, but in the end, if you have good institutions,

[01:05:00]

this will actually keep that under control to some extent.

So as you move the control or the regulation or the exercise of power in any area higher and higher, what is going to be the control mechanism to ensure that the wise people on those boards are smart enough and, I would say, honest enough to do the right thing? And if they don't, then what? Who's going to be the arbiter that says, "Guys, you're not doing the right thing. We need to change you. We need to take care of your conflict of interest." Who's going to rule that? That to me seems to be the issue. And I don't see any solution to do that in a really high-level, international governance where the people there are not elected. Where's the accountability in this system? And is it possible to do it effectively?

James Corbett

It has always struck me as a kind of a strange conundrum that we can recognize that people are inherently fallible at the very least and corrupt, corruptible at any rate. And yet, those from that very same pool of fallible and corrupt people, we should be able to pick people who will then rule over vast swaths of humanity for the best interest of all. It's always struck me as a strange contradiction in terms.

But the question ultimately, I think, answers itself. Because as you say, as we get further up that ladder towards more and more centralized control, by fewer and fewer people, over more and more of the globe's population with less and less accountability, obviously there is less and less mechanism for there to be actual control when people start to act in fallible and corrupt ways. So the obvious answer to that is—well, then, we need to decentralize and get down closer to a local level where people have more accountability over what's going on.

As was raised earlier in the questioning, I think it's important to understand that the idea isn't that that would somehow solve the problem of corruption or fallibility. Of course, there would still be problems in various places. But there would, at the very least, be a plethora of different alternatives that people could turn to. Well, if I don't agree or like this

particular paradigm of governance, well, there's this other one just over there. And I think the expansion of basically the competing systems of control, at any rate, competition is generally good. And it is, I think, good in the concept of creating positions of power and control.

Of course, I, being myself, I tend to take that to its logical conclusion, which is, ultimately, power should be decentralized all the way down to the individual. But I know that's seen as a radical idea for many. At any rate, I would be happier if the institutional momentum was going in the opposite direction and less power was being ceded to the centralized authorities rather than more.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

Good morning, James. Thank you for your testimony. I tend to judge organizations by the mantra that you use, and I noticed that you mentioned DIE, diversity, inclusion, and equity. So when I think of that from the WHO perspective, I think of Taiwan. And I don't want to get into the one-China-two-states issue. But I think of Taiwan wanting to apply to be a member of the WHO since 1971. They've continued to make that request, and they continue to be denied. And then I think of your testimony that there should be a parallel kind of movement for democracies of people who are free.

Would it be possible, and just kind of taking all of those thoughts together, and make it a possibility for Taiwan and Canada to agree to move forward as a free and democratic society where persons have personal autonomy and continue to work outside of WHO, instead of Taiwan trying to become a member? I know in 2022, they were looking at observer status, but even as an observer status, as you allude, we don't really have input and the opportunity for feedback. So I'm just wondering, would that be a starting point if we could get democracies outside of WHO, who were rejected, to start the movement?

James Corbett

It certainly would be a possibility. In fact, often, I find it interesting that we get so normalized and conditioned into the status quo

[01:10:00]

that we forget that there was a time before the status quo.

So thinking, for example, about the International Sanitary Regulations that became the International Health Regulations—as I say, there was a vast sea of bilateral and trilateral and other deals between various nations for quarantine regulations and other medical procedures that pertained at that time. And it was seen as just this horribly complex mess—Well, we have to sort out, you know, where is this coming from? And what needs to be done with it? and blah, blah, blah—rather than just one overall International Health Regulations that all of these states will agree to, and it'll make it easier.

But in fact, the very same technologies and other things that are being talked about now—that could make, for example, digital health certificates, i.e., vaccine passports, feasible—is the very same technology that would make those types of bilateral relations, Canada

agreeing to work with Taiwan and “we will set up this particular regime of health regulations and controls, and whatever, between our two nations.” Imagine if Canada did that bilaterally with every country that they traded with or had relations with: Why would that be difficult in this technological age where knowing the process for importing goods, or whatever, can be obviously put into an app and put on everyone’s phone? It wouldn’t be a difficult thing to do in this case.

But now we’ve been so trained into the idea that it must be handled in one overarching International Health Regulations that governs almost every state on the planet. Why? So I think we do need to interrogate that fundamental assumption. And it should be noted that there are alternate organizations to the World Health Organization that are out there.

The World Council for Health and other things, which are predicated on the idea of individual human autonomy, bodily autonomy, health freedom, et cetera, rather than the principles of the World Health Organization. It’s just most people don’t know about the World Council for Health because they don’t have the funding of the pharmaceutical industry and others behind them.

Commissioner Kaikkonen

And then my last question is just about Taiwan itself and how they managed through the pandemic. When you think of Taiwan being a little bit bigger than Vancouver Island and housing 23 million residents, I’m just wondering, somewhere in the pandemic when I checked on how they were doing, they had eight deaths. And I just kind of think that maybe we should be following what they were doing. And so, when we talk about health and WHO being mandated to protect our health and then still rejecting Taiwan, as a viable example, I just wonder what your thoughts are there.

James Corbett

Well, as I understand, you did hear testimony from Denis Rancourt, and I have interviewed him about the mortality statistics surrounding the so-called pandemic, et cetera, that, as he testifies, indicates that there was no identifiable wave of deaths that were attributable to some novel virus, et cetera. So, at any rate, I think that does show something about the way that we count and order these statistics could have an effect on how the country managed them.

But even if we were to accept at face value just the terms of the World Health Organization and other presumed health authorities about how to measure these statistics, I will note that the Independent Panel for Pandemic Preparedness and Response has an interesting admission on their recommendation report, which is available on their website: Namely, **that they look at the different measures that different countries took for pandemic preparedness before this so-called declared pandemic took place. And they plotted them against, at least, the reported death rate in each country. And you can look at the graph that they came up with, which shows that there was absolutely no correspondence whatsoever between the compliance with various pandemic preparedness ideas that are being propounded by the World Health Organization and the ultimate outcome in terms of measured death rate from the pandemic.**

So, I don’t take those statistics seriously, but those are the official statistics. And you can look at them and see that, for example, Canada, highly compliant, getting a 93 out of 100 score for external evaluation of pandemic preparedness and yet having one of the top death rates in this graph. So it shows that whatever they are proposing in terms of pandemic

preparedness and in terms of how we should position ourselves for the future is demonstrably, quantifiably, according to their own statistics, clearly made-up nonsense. So I don't know why we should be putting any faith whatsoever in these proposals from the World Health Organization and others about what to do for pandemic preparedness.

Commissioner Kaikkonen

Thank you very much.

Shawn Buckley

James, those are the Commissioners' questions. There being no further commissioner questions, on behalf of the National Citizens Inquiry, I sincerely thank you for joining us today and sharing this information.

James Corbett

Thank you for the opportunity.

[01:15:35]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 2: Rodney Palmer

Full Day 2 Timestamp: 02:25:33–03:14:10

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness today is Mr. Rodney Palmer. Now for those of you that have been following the National Citizens Inquiry, Mr. Palmer testified as a witness at the Toronto hearings. He has come back today to testify about something that's come up since then, but I will introduce him again.

Mr. Palmer, can we start by having you state your full name for the record, spelling your first and last name.

Rodney Palmer

My name is Rodney James Palmer, R-O-D-N-E-Y P-A-L-M-E-R.

Shawn Buckley

And Rodney, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Rodney Palmer

I do.

Shawn Buckley

Now, you're not a journalist now, but you were a journalist for 20 years. You had been a general assignment reporter for *The Globe and Mail* newspaper. You've worked as a daily news reporter at the *Vancouver Sun*. You were a CBC producer and investigative reporter. From 1996 to 2004, you were a foreign correspondent and bureau chief for CTV News based in India, Israel, and China and, in fact, in that role, you participated in reporting on the SARS pandemic as it first came out in China, as I understand it.

Rodney Palmer
That's all correct, yes.

Shawn Buckley

Okay, now you're here today to add to the testimony that you've given earlier, so I'll just let you launch in [Exhibit OT-15].

Rodney Palmer

Since my first testimony in March, there was quite a big story where Twitter decided, basically, at the behest of Elon Musk, to label the CBC's Twitter page as government-funded media. And this, to me, wasn't that surprising. He'd already done it for the BBC; he'd already done it for National Public Radio. And the CBC is government-funded media: it receives its funding from the government; it is media. I wasn't that surprised by it.

The 16th of April was when it was done, and the next day, the CBC paused its Twitter activity and made quite a big fuss and a public announcement that it didn't like being labelled government-funded media, which I found a little bit surprising. And there was an announcement made on the CBC website which quoted Brodie Fenlon, the CBC's editor-in-chief, the top journalist at the CBC, saying, "According to Twitter, 'government-funded' media means 'outlets where the government provides some or all of the outlet's funding and may have varying degrees of government involvement over the editorial content.'"

That, specifically, what he objected to and what the CBC brass objected to was not being called government-funded media but Twitter's definition of that—meaning the government is involved in the journalism. The next day, Mr. Brodie Fenlon wrote on his blog explaining why they've paused the CBC News Twitter accounts: "Editorial independence is a bedrock principle of CBC journalism." And then he had three sentences: "We are beholden to no one. We report without fear or favour. We act only in the public interest."

It seemed to me that this was right out of a Marvel comic, where somehow the CBC was the *Justice League* and had these great principles, and I knew all of these to be false. When I read it, I was quite concerned about this. He went on to say that "while CBC/Radio-Canada is publicly funded," there is "no —" and he emphasizes "zero — involvement in our editorial content or journalism." No involvement. Zero involvement. I did an entire testimony for an hour and a half here that showed that they're basically carrying out government propaganda. I described the transition of the CBC News & Current Affairs from a news-gathering organization into a propaganda organization on behalf of the Trudeau government during the COVID period.

So I knew this not to be true, what Mr. Fenlon was writing. Especially because I keep hearing the same experts on the CBC—this is what tweaked me to it initially, as a listener and a viewer. They were going to independent experts over and over and over again, and these people did not sound like the scientists I've come to know and work with in the last 10 or 20 years in my business. These were people who had clearly had corporate media training: the type of people who begin an interview with, "Well, that's a very good question. I'm so glad you asked it." This is somebody who's had training. Politicians speak this way. Scientists generally don't. People pushing a product on behalf of a company talk that way when they're in the media.

The one at the centre, Professor Timothy Caulfield, is a great Canadian. He is a Canadian Research Chair in Law and Public Policy [sic] [Canada Research Chair in Health Law and

Policy] at the University of Alberta in Calgary [sic] [Edmonton]. And for people who don't know, the Canadian research chairs are at every university, and they're funded entirely by the Canadian government.

[00:05:00]

Something like \$140 million every year pays for these research chairs to be representatives as the greatest in their field in their area, which Mr. Caulfield has held that position for some time.

On April 2nd of 2020, however, just a couple of weeks into the emergency, Mr. Caulfield was granted \$380,000 of government money to push a government agenda. This came from the Government of Alberta and the Government of Canada combined. And specifically, what he said he was going to do was focus "on misinformation around cures and treatments for COVID-19." Well, two weeks into an emergency, there is no misinformation: there is only information, and scientists are looking for any information they can get worldwide. But Mr. Caulfield, a law professor, was going to focus on misinformation about cures and treatments. And he took \$380,000 from the government to do it. And this is how he did it: he went on the CBC and talked about the government policy—whatever the government wanted to say, that's what he was saying.

One of the first appearances was in May of 2020, where he appeared with Nancy Carlson, the CBC TV Edmonton six o'clock news host. This is one of the most important people in journalism in all of Alberta. Nancy Carlson brought him on and said, "You have a very impressive resume. Calling you an expert is incredibly valid," as if she was trying to convince herself of this line. She didn't say he'd received \$381,000 from the government to push the government COVID response agenda. That was not mentioned. That was suppressed information; that was a lie by concealment. She said, "Everybody watching, this is a chance for you to get the facts right from an expert." Now, Mr. Caulfield is not a scientist and doesn't pretend to be one. He wasn't introduced as one. He was introduced as a law professor and said, "Today we are debunking all of the myths around COVID-19."

I didn't know three or four months into it that there were myths. I thought there was just lockdown, distancing, getting my groceries at a certain hour, wearing a mask when I didn't want to. And Mr. Caulfield came on and said, "Do not take hydroxychloroquine." I don't know how he knew that this was a drug that people shouldn't take. He also said, "Don't think you can boost your immune system in any way." This is when people were taking vitamin D3, vitamin C, quercetin, zinc. These are the things that were recommended for boosting the immune system, and Mr. Caulfield said, "Don't think you can boost your immune system." And Nancy Carlson didn't tell her viewers on CBC Edmonton that he was speaking on behalf of the government.

About a year after that, in April 2021, they upped the ante. Professor Timothy Caulfield, the Canada Research Chair in Law and Public Policy [sic] [Canada Research Chair in Health Law and Policy] at the University of Alberta, helped to form an organization of actual scientists called ScienceUpFirst. And they had a foundational grant of \$1.75 million from the federal government's Immunization Partnership Fund whose mandate says that it is important that as many Canadians as possible get vaccinated against COVID-19. This is ScienceUpFirst, the organization, a new organization.

Mr. Caulfield appears in October of 2021 when people were starting to realize that ivermectin was preventing COVID, treating early COVID, and helping people get out of the intensive care units much more quickly. There were many, many studies emerging around

the world showing this. And there was a push to suppress ivermectin that, I understand from witnesses who have been here at this Inquiry, was designed so that it would appear there was no medicine so that it could satisfy an American requirement for the emergency use of a vaccine that was not fully tested. And so he's on this political show called "The House" with a guy named Chris Hall. And Chris Hall is an amazing CBC reporter, host, anchor. I liken him to Freddie Van Fleet of the Toronto Raptors. He was steady as she goes. Chris could do anything. And he ended his career as the host of "The House."

And in his last season, he betrayed Canada by allowing Tim Caulfield to lie to them about ivermectin. And Chris actually uttered the words, "Have we heard the end of ivermectin overdoses yet?" Meaning, are Canadians going to stop overdosing on ivermectin? Well, Chris apparently didn't know that nobody ever overdosed on ivermectin. There are more overdoses from aspirin causing death every year in America than there have been in the 50-year history of ivermectin. And he said this. And he didn't tell anyone that his expert on misinformation, as he was introduced to us on "The House,"

[00:10:00]

was actually part of ScienceUpFirst, which received \$1.75 million from the Trudeau government to push vaccines. He suppressed that information. He told us he was an expert on something that he wasn't and didn't tell us he was working for the government.

Mr. Caulfield showed up on "The National" with our friend Adrienne Arsenault talking about the truth about immune boosters, during which Mr. Caulfield was not introduced as a member of ScienceUpFirst, which gets its money from the Canadian government, from the Trudeau government, to promote vaccines—this was not mentioned. He was introduced as a law professor and the Canada Research Chair. So Mr. Caulfield said that "immune boosting," this is a quote, "is kind of a myth. Because it's not a muscle." So, as a medical person, he made a good lawyer when he said that because he clearly doesn't understand much about the human immune system. He then said, "You don't want to boost your immune system. That's anaphylaxis. That's an autoimmune disease." He said a healthy immune system is anaphylaxis, and it's an autoimmune disease. It's neither of those things. That's why we have different language for all of those things. They're not the same. We didn't get to hear that he's being paid by the Canadian government to say this. We were lied to by omission by Adrienne Arsenault in that story. She ended it by saying, "You're a wise man as always."

Now, "[Cross] Country Checkup," one of my favourite shows on the CBC. I used to work in phone-in-shows, and it really brings together Canada on a weekly basis. And it's hosted by Ian Hanomansing, a longtime veteran of CBC television. He had a section called, Ask Me Anything, which was all about COVID. Ask the doctor. And he had Dr. Isaac Bogoch on there, innumerable times. And on this occasion, December 2021, he brought him on. He introduced him as an infectious disease specialist at Toronto General Hospital, which he is. But he didn't say he's a scientific advisor for ScienceUpFirst, which receives \$1.75 million from the Trudeau government to make us take vaccines. Didn't mention that. During this interview, he declared, "Two doses won't be enough Canada." He said, quote, "This is clearly a three-dose vaccine."

Dr. Bogoch showed up on multiple shows after that. In September 2022, he was on CBC "Metro Morning" in Toronto. This is the morning show in the Toronto area. And he said it was called "When to get your Fourth Dose." Previously, it was a three-dose vaccine. In October 2022, he was on CBC News saying, "You got to get your next dose every six months." And Andrew Chang introduced him as an infectious disease specialist, Dr. Isaac

Bogoch. Didn't mention ScienceUpFirst. Didn't mention he's a spokesman for the Canadian government, or he advises ScienceUpFirst, which is paid for by the Canadian government.

He also appeared on "The Dose" with Dr. Brian Goldman. Dr. Brian Goldman has these great shows called "White Coat, Black Art." He's a great guy. I really like this show. He kind of takes you as a listener, as a patient, which we've all been, into the world of medicine as he sees it. He's so curious, which is really the greatest attribute of any broadcaster, the curiosity. And he brought on a doctor named Tara Moriarty, an infectious disease researcher at the University of Toronto, which she is, top person, so decorated, so accomplished. Didn't mention an executive of ScienceUpFirst, paid for by the Canadian government to promote vaccination. Didn't tell us that. And during this interview in June of 2021, Dr. Tara Moriarty said, "Anything that states..." This was the red flag—how do you recognize misinformation? Well, this was their lesson to Canada. "Anything that states that vaccines cause or may cause something is a red flag for misinformation. We don't have any evidence," said Tara Moriarty, "that the vaccines cause anything but immunity against COVID-19." We don't have any evidence. So, she said, don't believe anybody.

Well, the Canadian government seems to have evidence. They had a list that these numbers of Canadians have been injured or killed by the vaccines. They say it caused Guillain-Barre syndrome 27 times. They say it caused low blood platelets 196 times.

[00:15:00]

Canadian government says that the COVID vaccines caused 55 cardiac arrests, 73 cardiac failures—I'm pretty sure that's death—145 heart attacks, 1153 predicted cases of myocarditis and pericarditis, 376 cases of deep vein thrombosis, 524 pulmonary embolisms. I feel like I want to say a partridge in a pear tree here. Blood clots, 324. These numbers are really small. These are the ones that are admitted to on a Canadian government website that the CBC just told us didn't exist—78 acute kidney injuries; 37 liver injuries; 187 Canadians with Bell's palsy; 281 Canadians got a stroke from the COVID vaccine, according to the Government of Canada website; 16 of them had a very rare inflammation of the spinal cord, never heard of it; 776 cases of anaphylaxis; 5 fetal growth restrictions; 87 spontaneous abortions; and independent of all of the above, 427 deaths.

Let's just go back up to the slide. "We don't have any evidence," said the ScienceUpFirst spokesperson for the Canadian government—disguised as an expert on Dr. Brian Goldman's show—misleading Canadians that everything was safe and effective when, in fact, it's a game of Russian roulette and the CBC suppressed that information and told you to go ahead and do it. They said it's safe—there's no evidence.

There's a story this month that we're starting to recognize excess deaths, excess all-cause mortalities. The province of Nova Scotia recently noted 262 excess deaths, and the CBC was quick to report that they're not saying why. And the province has repeatedly declined an interview as to why. They have no official word on why. So they put the ScienceUpFirst scientists and spokespeople, lawyers, on the air, or in this story, where they said, Tara "Moriarty believes the excess mortality is mostly being caused by COVID-19..." This is now: this is May 2023, "... caused by COVID-19, urging people...", and the World Health Organization says it's over. So it's caused by COVID-19, according to her, or she believes it, and she's "urging people to wear masks and get vaccinated." This is the solution in May 2023. They didn't mention that she's paid, that ScienceUpFirst is paid—and she's an executive—\$1.75 million to say these things on behalf of the Trudeau government. Tim Caulfield was in the same piece, identified as "a misinformation expert" now. I agree.

Caulfield said, “The COVID-19 vaccines are safe, despite some claims that they’re causing large numbers of people to die.” “Some claims” by the government of Canada, Mr. Caulfield.

“The Current” on CBC Radio used to be one of my favourite things to wake up to in the morning with Matt Galloway, one of the greatest hosts that the CBC has. And one of his stories was that “our best shot at getting back to normal is getting everyone a shot in the arm.” So he put on this cute little story with a researcher named Samantha Yammine. She’s a scientist and she’s afraid of needles, and they go through this really cute little conversation about how she overcame her fear of needles. But they never mentioned that she is on the executive of ScienceUpFirst, which received \$1.75 million from the Trudeau government to promote vaccines. Not a word, he tricked us. If I’m listening to that, I think they found it. Where did they find this person? Well, they found her because that’s all they do.

The CBC is using ScienceUpFirst and not telling us where the information or where the point of view is coming from. It’s coming from the Trudeau government. And they’re not telling us that on a daily basis.

So now ScienceUpFirst has got quite a coup. They’ve embedded one of their own in the CBC staff. CBC “The Nature of Things,” you know David Suzuki at, I think, 80 years old, finally retired, and he’s been replaced with a co-host, Anthony Morgan. I looked this guy up: He’s great, I’d hire him too. He’s fantastic. He’s engaging, he’s a molecular scientist. He is one of these curious fellows who just lets you feel that he really wants to learn, but he’s on the executive of ScienceUpFirst, paid for by the Trudeau government to promote vaccines. And now he’s the host of a CBC,

[00:20:00]

one of the most important science shows we have in Canada, “The Nature of Things.” He’s embedded.

ScienceUpFirst has its prime directive to stop the spread of misinformation. What is misinformation, and who decides? Apparently, it’s the Trudeau government that pays them; otherwise, why would they pay them?

When Brodie Fenlon says the government has no or zero involvement in our editorial content of journalism, that’s not true. And when they got caught, this is the graph they showed from the CBC annual report. Now you’ll notice up the left side, it goes up— Basically, it’s a snapshot. A bar graph is designed to give you a quick visual snapshot of what all the numbers mean. The blue is the revenue that CBC earns, and the burgundy or the purple is the government funding. So it looks as though it’s a little bit less than 50 per cent. Except if you look up, it’s going up in increments of hundreds of millions until it gets to very near the top when it goes from 700 million to 1.7 billion. It jumps from increments of 100 million to increments of a billion partway up, so the graph visual is actually not accurate.

Now, this was pointed out by one of the great Canadian academics, Dr. Jordan Peterson, who then put out what it actually looks like. And it shows you, and it’s no big deal. I mean, we know the CBC gets all of its money from the government, or CBC Radio does; CBC Television gets most of its money from the government. So why would they obscure that fact? Why would they give that half-truth? Why would they mislead us into that visual snapshot that they don’t? I would put forth to the Commission—because that’s how they roll now. The CBC is all about misleading. It’s not about news gathering or the

dissemination of truth. Brodie Fenlon oversaw the betrayal of the audience, the betrayal of Canadians, the betrayal of every Canadian who listened to an expert on the CBC and thought they were an expert, not a spokesperson for the Trudeau government. But who he didn't betray was the Liberal Government. He was a good soldier there.

This is from the Liberal Government website today: "A re-elected Liberal Government will require [that] Canadian travellers on inter-provincial trains, commercial flights" and "cruise ships, and other federally regulated vessels to be vaccinated" for COVID. "A re-elected Liberal Government will ensure vaccination across the federal public service." So if you are a public service worker and you dodged the vaccine because you didn't want it, because maybe you figured out it was the same Russian roulette that the Canadian government info base describes, a re-elected Liberal Government will ensure you're vaccinated or fired, according to this platform. And they'll work with "Crown corporations [and] federally regulated workplaces to ensure vaccination is prioritized for workers [in these sectors]." We know now the thing doesn't work. Your own websites show that people are dying from it. Thousands of people are permanently injured from it. And your platform is more—or lose your job. And the CBC is your way to convince us to do that.

A week after, Twitter removed the government-funded media tags. It came after the Global Task Force on Public Media called on Twitter to correct the description of public broadcasters. Now, I mentioned in my previous testimony that the Global Task Force on Public Media is an amalgamate or conglomeration or a cartel of serious public broadcasters that do real journalism or used to across the world: the CBC, the BBC, ABC Australia, Korean Broadcasting, France Television, Radio New Zealand, ZDF Germany, and SVT Sweden. They have this Global Task Force to develop a consensus and speak with a single strong voice. So they came down heavy on Twitter. The current president of the Global Task Force is our own CBC president, Catherine Tate. They noted that Twitter's own policy defines government-funded media as those with varying degrees of government involvement and editorial content, which I've just shown that it has. So Twitter dropped it all and, in, I think, a cheeky little move, also dropped it from China's Xinhua News Agency and Russia's RT, saying, "Okay, none of you are government-funded now." They're all state broadcasters, including the CBC, in the strictest sense of the phrase.

I have a few story ideas that the public will be interested in hearing because I used to sit in story meetings daily with some of the best journalists I've ever worked with in my life when I worked at CBC.

[00:25:00]

We used to put out story ideas that were kind of the obvious things to cover that day. Here are a few that would be a good idea for the CBC to cover: investigate the number of **Canadians killed by COVID vaccines; investigate the number of Canadians disabled by COVID vaccines; investigate the details of vaccine approval safety standards that were waived in order to get the COVID vaccines into Canadian arms. Investigate the source of the SARS-CoV-2 virus: Where did it come from? What are we doing with all this stuff? We don't know where it came from. We know where it came from—but let's admit it. Let's talk about it. Let's investigate it. That's your job.**

What is the purpose of gain-of-function research and development of pathogens? Who benefits from that? What is Canada's involvement in gain-of-function research and development of pathogens? Why did we fire those two Chinese nationals who were running the Canadian Level 4 Virus Lab in Winnipeg six months before COVID broke out? What's that story? Because we still don't know. Go find out. And investigate the conflicts of interest

between Health Canada and the pharmaceutical companies. That one you could do with Google.

But you're not going to hear any of those stories on the CBC because these are the people you're going to hear over and over again as the experts. And these are the shows you're going to hear them on. And these are the broadcasters who are going to tell you they're experts and suppress the fact that they all are affiliated with ScienceUpFirst, which gets all of its funding from the Trudeau government—and significant funding. This is the way they're going to explain themselves when they get caught with their hand in the cookie jar. And these are the phrases that they're going to pull off the Marvel comic movies when they're going to say that they report without fear or favour in the public interest. And I changed his name to Chief Propagandist. In case you didn't notice.

So I have to tell you that it is with great regret that I'm going to make six recommendations to the Commission. I recommend that the CBC President Catherine Tate be dismissed from her position, all vice presidents and executives be dismissed from their positions. They can no longer work there, having committed the atrocity on Canada of suppressing the identity of spokesmen for the Trudeau government as experts for years to trick us into taking this vaccine. Certainly, dismiss the editor-in-chief Brodie Fenlon. Although he might become a senator before you get a chance to do that.

Dismiss all on-air staff who are evidenced to have participated in the propaganda disguised as journalism since March 2020. Detach from the Trusted News Initiative and all other fact-suppressing organizations which currently determine which experts and which stories Canadians are allowed to hear on the CBC. Replace the position of ombudsman with a board, including journalistic, legal, and scientific expertise, and give them the power to fire journalists who breach the corporation's journalistic standards instead of apologizing. You can go on the CBC's apology page, I call it—it's their correction page. There's half a dozen every month for the last three years. "Big deal. We're sorry. We got it wrong again." Fire them. We don't need them. And this new board that replaces the ombudsman, I recommend you task it with investigating who in the CBC participated in misleading Canadians by routinely suppressing the identity of government spokespeople for the purpose of promoting ineffective and potentially harmful experimental vaccines during the COVID emergency.

The CBC is government-funded news. We know that. And Twitter is right because they're using government-funded experts, disguising them as "independent" to give us government-loyal messaging.

I just wanted to thank the Commission for allowing me to come back. As a Canadian citizen with some expertise, I feel compelled to come forward and say what I know to be true.
Thank you.

Shawn Buckley

No, we're not done. I don't have any questions for you, Rodney, I'll ask if the Commissioners have questions. And they do.

Commissioner Drysdale

I'd like to refer to some of your graphs. Can you bring up the graph where you showed the Canadian government counts of the various deaths and vaccine reactions?

Rodney Palmer

This is from health-infobase.canada.ca. It was updated on the 7th of March, which seems to me a while ago. This one here?

[00:30:00]

Commissioner Drysdale

Right. My question there is, and you may not know the answer, but under pregnancy outcomes, it says spontaneous abortions, 87. And then it's got deaths, 427. Are the 87 deaths of the babies in the mothers' tummies not included in the 427?

Rodney Palmer

I don't know that. And the reason is this is not an easy website to navigate. So the information is there, but it is more than likely intentionally obfuscated. You have to go through link to link to link to link. So there is something under deaths, and it says 427, and more than likely, you will be able to find if they are included or if they are additional. But I don't know what the answer is.

Commissioner Drysdale

My second question has to do with the slide you have on the Liberal Government platform, three points that it had on there. And my question to you about that—is that the current Liberal platform?

Rodney Palmer

I downloaded that today.

Commissioner Drysdale

You don't know if that's the current one?

Rodney Palmer

That's today. That's up there. You can look that up under platform re-election, I think it is something like that. Yeah.

Commissioner Drysdale

So today, I just want to make sure I've got this right. So today, the platform that the Liberals are running on is—require that travellers must be vaccinated; ensure that vaccines are across the federal public service; and that Crown corporations and federally regulated workplaces will ensure that vaccines are prioritized. That is still their government platform today?

Rodney Palmer

"A re-elected liberal government will," is what it says, and then it gives those ones. And I've not augmented them all, except to add the highlights for my own notes.

Commissioner Drysdale

I wanted to make sure I understood that. Could you also now show the graph of the income for CBC?

Rodney Palmer

That is off the CBC's annual report, and the second one on the right was provided by Dr. Jordan Peterson.

Commissioner Drysdale

My question on that is, I'm looking at some of the other—and I'm asking this question because I've seen it from other witnesses. There's various other items there. They've got government-funding revenue; they've got advertising. How much federal government is in their advertising income? Because we see the federal government advertising on CBC constantly. Is there additional government funding hidden in some of those other stripes that should be in the government funding?

Rodney Palmer

I don't know the answer to that. But I'll tell you that I certainly suspect that the whole thing's a sham. So then, more than likely, they're hiding other things. But what's very interesting, what you say about the federal government advertising: When I travel to America, I see almost entirely pharmaceutical advertising, and there are very strict rules that they must announce the side effects. And it's almost comedic to listen to the side effects. They list these horrible lists of side effects to their pills, and then they say, "but ask your doctor about getting it." In Canada, we don't have pharma advertising on television. But we have a de facto pharma advertising in this ScienceUpFirst group that is disguising itself as experts going on the CBC and denying the side effects—saying they don't exist.

Commissioner Drysdale

Yes. Also, in your slide—and you don't have to bring it up—but your slide about CBC story ideas, and you listed a few things about investigation. I mean, I ask you, wouldn't a good source of those stories be for some CBC reporter to be sitting here following the National Citizens Inquiry? And why do you think none of them have done that?

Rodney Palmer

I think they would have a hard time wiping the egg off their face once they realize they have blood on their hands. They're not coming. They don't want to hear this.

Commissioner Drysdale

You know, I believe, I hope I get this right. I believe I saw a story on CBC not that long ago and I could be wrong, it might have been one of the other stations. But the point is they did an entire investigation: They had an investigative news team out to decide whether or not Starbucks was recycling their paper cups or not. They put sensors in them, and they traced them to the garbage cans, and they did an incredible investigation as to whether they were recycling their coffee cups or not. And they can't do any research on this? They don't have the capability? Do they not have the will?

Rodney Palmer

Won't—not can't. My dad used to say, "Can't lives on won't street."

Commissioner Drysdale

Thank you.

Commissioner Massie

Well, thank you very much, Mr. Palmer, for this second enlightening presentation.

[00:35:00]

It seems to me that we are in a very, very hard conundrum with respect to financing this major news institution in Canada. You're making suggestions to reform it. But the business model that they're living on right now seems to be struggling to get, I would say, other sources of finance besides the government, for whatever reason. And even if you reformed it, if you maintain the finance from the government, what would guarantee that with this current government or a future government—that would want to be as, I would say, intrusive in the agenda of CBC—what would allow to maintain the independence of the CBC with the government? Because they need money, and the money's coming from the government.

Rodney Palmer

But the money's come from the government since the beginning, and there have been multiple different parties, two, you know, rotating. And the CBC's always been there. To your point, I think there needs to be an investigation about how it happened. Just like we have to have an investigation into where the virus came from. Otherwise, we can't stop it from happening again.

But there's a lot of talk about defunding the CBC, which makes me nervous because I think it means dismantling CBC News and Current Affairs, and I think it's foundational to our democracy. Without journalism, we have no democracy because democracy requires the transparent distribution of facts on a daily basis. From those same facts, we all make our opinions. And then in an ideal situation in a democracy, the majority of the opinions are where the decisions are made. But how can we possibly form an opinion when the facts are fake? When we don't agree on what's true, we can't possibly agree on what's right.

Commissioner Massie

Aren't you describing some of the, I would say, political platforms for some of the current political parties we have in Canada? Are they basing their promise and ruling of society based on true facts? Or their representation of reality? Which sometimes is, I would say, not aligned with reality. But as long as people believe it, they will be re-elected, as you've shown from the platform, which is a copy-paste from the previous platform that they ran on in the previous election.

Rodney Palmer

I think that there's two different things there. One is what the government says, and one is what the CBC says, and today, they're one and the same. So this is the problem, is that the CBC has let itself become a propagandist in an indefensible cause—which is promoting a

vaccine that doesn't work, that hurts people, that doesn't do its job, and continues to promote it, even in May, this month, are saying, "Get vaccinated, wear a mask." All those people that died probably from the vaccine, we don't know, in Nova Scotia, it's being denied. It's not being investigated properly. They could find out if they tried, but they don't try. It just goes back to, it's not that they can't do it—it's that they won't do it.

They have to get reassigned back to what their job was. I don't know exactly what the mechanism is. It's going to take more people than me to figure it out, but that's an excellent suggestion about putting them back on track in a way that they're not going to get off the rails again. We need some new mechanism in place to ensure on a daily basis that the CBC is doing the job.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

Good morning. Thank you for your testimony. The Canada Research Chair selection program used to be very rigorous, and it used to give new researchers who had a PhD that opportunity to build on that body of research. Given the timing of Dr. Timothy Caulfield's Canada Research selection and his research, I'm just wondering at what point he would have been able to build on a body of research when the pandemic is only three years old. Taking that thought further, is it not incumbent on CBC journalists—and other mainstream journalists—to actually investigate the qualifications and not just accept that Canada Research Chair title? Before declaring that the person they're interviewing as an expert?

[00:40:00]

Because Canada Research Chair is usually given to a person who is brand new in creating that body of research. And the exception would be if they had a renewed contract under the Canada Research Chair, where they would already have that body of research. But if we're declaring indiscriminately everybody to be an expert, at what point do we consider that maybe they're not, as a journalist?

Rodney Palmer

Well, I don't think this is an error that these people have been put on; I think it's by design. There's too many examples, and I've only shown a handful of them. It's just too obvious that in every single case, they suppressed the fact that they're with this separate organization that's largely a slush fund for the Trudeau government to promote vaccines and to put experts.

Caulfield is the only one who's not a scientist among them, but he's declared himself, self-declared, misinformation expert, and the CBC to my feeling has never defined what misinformation is. I've written to Brodie Fenlon and to others at the CBC asking to please define misinformation: How do you define it? And provide examples outside of the COVID model of where you've applied it. And why you feel that you have to correct it? And that's almost the only thing that they do because they're not correcting misinformation. They're promoting a propaganda message. That's what they're doing. So your question suggests that there's a mistake being made and there's not. This is intentional.

Commissioner Kaikkonen

I also note he's not a doctor. Thank you very much.

Rodney Palmer

Yes.

Commissioner Drysdale

Sorry, I couldn't resist, seeing as I have you here.

Can you comment on the effect that the latest changes to the Canadian *Broadcasting Act* will have, I mean, on the CBC and on social media? You know, you talked about changes that we could consider to the CBC. But it sounds like it's going the other way. It sounds like they're making changes to independent broadcasters and bringing them into this model that was created in the '70s or '90s, or whenever it came up. Second part of that question, can you comment on the independence of the members of the CRTC?

Rodney Palmer

I can't comment on that because I'm not familiar with the makeup of the CRTC at the moment. However, in the past, there has been a bit of a revolving door with tech companies and the CRTC.

On the first part of the question about the *Broadcasting Act*, we saw an almost instantaneous reaction where the CRTC was openly discussing eliminating Fox News, like it or not, one of the biggest networks, news networks in the world, banning it from cable in Canada. On what grounds? On the grounds that they can, it appears. We should expect more of it. We are seeing censorship on a daily basis on the CBC. We're seeing the elevation of the government agenda for COVID vaccines and the suppression of independent voices. We are seeing the censorship of people who want to speak out. We're seeing the censorship of vaccine-injured people, the entire stories are being censored. And the censors are never the good guys. The censors are the Dr. Evil in Brodie Fenlon's Marvel comic universe that he lives in.

Commissioner Drysdale

Thank you.

Shawn Buckley

Mr. Palmer, are you aware whether the CBC is under any specific legal duty in its enabling or enacting legislation to report fairly to the public?

Rodney Palmer

Most likely. That's a good question. I'm not intimate with all the language in the *Broadcasting Act*, but more than likely it is there, and certainly in their foundational documents to report the news of the day. I remember when you couldn't have advertising in the newscast. And then they changed it so you could have it after the first, I believe it was, eight or nine minutes so that the first chunk was advertising free—normally, when they do their political reporting of the day—and then you can have an advertisement afterwards. So there are very strict rules about how much commercial voice can get into a

newscast. But there's commercial voices daily in the newscast now that I've just demonstrated.

Shawn Buckley

I'm just curious because you just think as a Canadian citizen that in funding, creating a broadcaster, a state broadcaster, that there would be a duty in the legislation creating it for that broadcaster to report fairly to the Canadian public.

[00:45:00]

Where I was going is I'm just going to read to you two different sections of our *Criminal Code*. And the first one I'm reading with in mind—because you're saying we should fire the leadership of the CBC, and so this is 217.1 of the Canadian *Criminal Code*.

"Everyone who undertakes or has the authority to direct how another person does work or performs a task is under a legal duty to take reasonable steps to prevent bodily harm to that person or any other person arising from that work or task." I can tell you I read that as including—if you're running the CBC or some other news organization and you're directing basically propaganda on health issues that if that leads to harm in the public, you could be criminally liable.

Now, I'll just read you another section of the *Criminal Code* and then I'm going to ask your thoughts. This other section I would think would apply to the leadership of the CBC, the public face, the journalists, and to any experts that would be attending and spreading misinformation with the view to having people vaccinated—if it leads to harm or death. And that is section 219 of the *Criminal Code* dealing with criminal negligence, and so listen carefully.

"Everyone is criminally negligent who in doing anything, or in omitting to do anything that is his duty to do, shows wanton or reckless disregard for the lives or safety of other persons." I'm wondering, just because you're familiar with how journalism works, if that section could be applied to journalists and the CBC?

Rodney Palmer

It could be applied to so many people. I think it should be applied to the guy who turns the microphone on and lets somebody lie—live to Canada. Every single person down to the technicians who participate knowingly in this fraud should be investigated. There's two sections of the *Criminal Code* you mentioned; I mentioned one in my previous testimony about fomenting hatred against an identifiable group. The unvaccinated became **identifiable based on their absence of proof of vaccination and the social outcasting that the CBC promoted. I think that maybe another recommendation would be to investigate for criminal wrongdoing among the journalists at the CBC—right down to the producers, the writers, the story editors, the technicians, as well as the anchors, the hosts, the editors, and the executives.**

Shawn Buckley

Well, it'll be interesting because there's not an example in history of a Western democracy experiencing what we've experienced with a state broadcaster. If we can get control of our institutions back, it'll be interesting to see how we deal with that.

Rodney Palmer

The problem here is that they have the full support of the current government, and they're acting on behalf of the current government. To get back to your point about whether there's an obligation to tell the truth, I can assure you that in the foundational documents of the Canadian Broadcasting Corporation, it did not say that the purpose is to espouse the views of the government of the day. It did not say that.

Shawn Buckley

Thank you. I have no further questions.

Rodney Palmer

Thank you.

Shawn Buckley

Mr. Palmer, on behalf of the National Citizens Inquiry, I'd like to sincerely thank you for returning and sharing this testimony with us.

Rodney Palmer

It's my pleasure, thank you, and my duty.

[00:49:01]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 3: Marianne Klowak

Full Day 2 Timestamp: 03:27:46–04:56:32

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry as we continue our proceedings in Ottawa, Ontario. Our next witness is Marianne Klowak.

Marianne, can you please state your full name for the record, spelling your first and last name.

Marianne Klowak

It's Marianne Klowak, M-A-R-I-A-N-N-E, Klowak, K-L-O-W-A-K.

Shawn Buckley

Marianne, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Marianne Klowak

I do.

Shawn Buckley

Now, Marianne, my understanding is, and it might be easier for you to give the highlights, but I'll try and go through some of them.

You have been a veteran senior reporter for the CBC, which for our international participants is the Canadian Broadcast Corporation, for thirty-four years. And as a journalist, you've been involved in all aspects of news gathering and investigative reporting for radio, television, web live reporting, short and long-form documentaries. You have been involved with current affairs as a current affairs news anchor for radio and television. You've filed stories nationally for "World Report," "The World This Weekend" and the hourlies. You've basically done regional stories published on CBC National's digital

platform. And the highlights could go on and on. Are there any other highlights that you'd like to just, kind of, describe your career? Because you've been at this for thirty-four years, and I've got a whole list of highlights. I just don't know which ones to touch.

Marianne Klowak

The only other thing I'd want to touch on is the year I left, I was given an award for a series I pitched on "Pandemic Perspectives." And the piece that won the award was a homeless person's perspective of how their life had changed. So that was a national award.

Shawn Buckley

Good. And David, I'll ask if you can turn Marianne up because I'm having trouble hearing her. Or if you can speak clearly into the microphone, Marianne.

Marianne Klowak

Thank you. Is this better? Is that better?

Shawn Buckley

Thank you. Now you're here to share your experiences while you were still at the CBC and working as a reporter and some of the stories you tried to run and what happened. So I'm wondering if you can just start into that and then if we need any clarifications, I'll jump in.

Marianne Klowak

Before I get into that, I think there's a little bit of background that's required. I know that as a public broadcaster, you expect us to be telling you the truth, and we'd stop doing that. And there was another number of stories that I had put forward that were blocked. But it would seem to me as a journalist who'd been there thirty-four years, it's like the rules had changed overnight. And it changed so quickly that it left me just dizzy in disbelief.

I was blocked and prevented from doing stories that I'd pitched, that I'd put forward. They never saw the light of day: they never made it to air or print. And some of those stories were protests against vaccine mandates, people's safety concerns about the vaccines, and also the many problems with reporting adverse reactions in Canada. And for me what was so disorienting about this was that, you know, I had learned from the best of the best at the CBC. This is where I learned to think critically and fearlessly hold power to account, to break stories and uncover information that you, the public, has a right to know.

And I also would like to mention that the newsroom I worked in, in CBC Manitoba, that they were a leader in investigative journalism across the entire network, second only to Toronto. And this was a newsroom that produced award-winning stories that sparked change at the highest level of corporations and government. By the time I left in December of 2021, I no longer recognized the CBC. And I really didn't think my career would end this way, that the skills I learned and honed at the CBC would be used to hold power to account within the corporation.

Shawn Buckley

Can I just slow you down because I think it's important for people to understand what you're saying. And especially because you were working as a journalist and as an

investigative reporter for much of the thirty-four years. So my understanding is, when you're a senior reporter like yourself, you can just follow a story, like, "Okay, I'm going to report on this," and you can do the story.

[00:05:00]

And generally speaking, you're not second-guessed or your story isn't changed. So your experience in learning from true journalists in the past was just to run a story, to be fair, and that was your experience until COVID hit.

Marianne Klowak

Absolutely. I would say, like, prior to COVID, I was expected to come into that editorial meeting. I would have two or three original stories, what we call enterprising journalism, original stories. And I was able to work on those unless there was big breaking news that day. But normally, I would be assigned that story, given the time. And within, you know, a day or two, I could turn those stories around on all three platforms, radio, TV, and web. And I would also like to mention that I had one producer vetting for TV and radio. And rarely were there any changes made in my script or the content. And for web, it was another producer, but it was minor things like, let's move this sentence, let's change this word, we'll tighten lead. That was prior to COVID.

Shawn Buckley

So I'll just follow up on that again because I think it's important for people to understand. So basically, your stories were standing as you made them.

Marianne Klowak

Absolutely, and they backed me in doing that. I was supported in doing it. That's what they wanted: original enterprising journalism.

Shawn Buckley

Okay. And so that ties into when you're saying the Manitoba news desk at the CBC prior to COVID, I mean, that was a hardcore journalistic news desk. They were expecting you to get truthful fair stories. And they were not censoring. They were wanting the news.

Marianne Klowak

That's the way it was prior to COVID.

Shawn Buckley

Okay. So COVID—that was a completely new ballgame when COVID hit. So even the swine flu? Because we experienced that, you know, during your career.

Marianne Klowak

Yes.

Shawn Buckley

None of this. It just started with COVID.

Marianne Klowak

No, it changed so quick that it left me spinning. And I mean, the way I saw it, I'm just going to give you a little bit of a synopsis, and then I'll get into specifics in terms of what was done with my stories.

But we betrayed the public, we broke their trust. And we had been riding on a reputation of excellence for years. And now we were quickly shutting down one side of the debate. And how were we doing that? We branded the doctors and the experts the CBC chose that we used in our stories: we branded them as competent and trustworthy. And those who questioned and challenged the narrative were portrayed as dangerous and spreading disinformation. And that was regardless of what their specialty was, what their background was, and what their experience was.

And I just also want to sort of give you a window into how this affected me personally. As a veteran journalist, I had solid contacts in the community. I had people calling me with stories. So I was seeing and I was hearing and I was absorbing all their stories of suffering and pain. And they were sharing them with me, and these stories weren't being told. Some of those were from the vaccine-injured. Some were from people who had lost their job because of their vaccination status. Those whose families had been blown apart, and they'd been ostracized. University students who were depressed over repeated lockdowns and mandates. And parents who were calling me that were agonizing on whether they should vaccinate their child or not. So all these stories were sitting inside of me. They were left with me. And I felt the crushing burden and the weight of their truth not being given a voice. And it affected my well-being because these people trusted me, and I felt I had failed them and I had let them down.

Shawn Buckley

So can I just interject? So when you're a journalist and people are coming to you with stories that should be reported, you're feeling a responsibility to give voice to those stories, but you're not being allowed to do so for the first time. And that's what was causing the distress internally.

Marianne Klowak

Absolutely. I was losing sleep, it was distressing. It was like I had failed these people as a journalist to give voice to their truth.

So I had witnessed in a very short time the collapse of journalism, newsgathering, investigative reporting. The way I saw it is that we were in fact pushing propaganda. And to define propaganda: it's information, ideas, opinions, or images that give one part of an argument which are broadcast, published, in order to influence a person's opinion.

[00:10:00]

And mental health workers have their own definition of propaganda as manipulative persuasion in the service of an agenda.

In a published article written by a former CBC editor-in-chief in 2018, she outlines what's called the Journalistic Standards and Practices [JSP] [Exhibit OT-4]. And these are the most fundamental principles that govern who we are as journalists and who we are as a public broadcaster. Basically, these are the pillars—the holy grail for journalists. This is what every story we do can be measured against these: they are accuracy, fairness, balance, impartiality, and integrity. She goes on to say that “the JSP is not merely a guide for the people who work at CBC/Radio-Canada. It's a key component of our promise to Canadians that the work we do is, first and foremost, a public service.” Then she says, “The real test, of course, is ensuring that our journalism is credible, reliable and worthy of your trust.” So in other words, you the audience decide if we're trustworthy, if we're telling the truth. It's not up to us to hammer you with what we define, decide, or think that the truth is because the pillars of balance and fairness require us to present both sides. And after you examine them, you ultimately decide what the truth is. She says, “. . . you can hold CBC News accountable against the principles that are laid out in the Journalistic Standards and Practices.”

In my last year and a half at the CBC, we violated all of them. Not only had we shut down one side by silencing and discrediting anyone opposing the narrative, we had elevated and designated ourselves as the gatekeeper of the truth. We no longer believed our audience was capable of critically thinking for themselves. I'm going to give you very specific examples of that. But before that, I'd like to read you a page out of a journal that I wrote a month after I left the CBC. It gives you a sense of the culture and the toxic work environment that led me to leave before I had wanted to.

For months prior to my departure in December 2021, the complaints and criticism from listeners and viewers continued to mount from the public. Calls, emails, people stopping me on the street and saying, “What the heck is going on at the CBC?” People telling me they felt betrayed, lied to. A gut feeling that they weren't being told the whole truth. They no longer trusted the CBC to tell them both sides of an issue. What was most troubling for me as a journalist is that they no longer felt safe to tell me their story and have their voice heard by their beloved public broadcaster.

Passion for the truth has been my driving force as a journalist, and we become journalists because we see ourselves as truth tellers. The vast disconnect between the stories people were telling me and what we were broadcasting and publishing just tore me apart. So armed with documented examples and specifics, I voiced my dismay about our editorial direction to all levels of management over several months—both locally and at the highest level of power in Toronto. And I did this; I brought in a witness to every scheduled meeting who would document what happened in those meetings.

The narrative among mainstream media including the CBC emerged early on in the pandemic. By narrative, I mean presenting one side of a complex issue and effectively censoring, cancelling and silencing the other side—only giving voice to experts who control and reinforce the narrative. I'd seen it happen on issues in the past but never to this degree. For the most part, logic, common sense, and critical thinking are suspended, preventing deep dives on stories holding power to account. Facts may be omitted if they don't fit into the narrow focus of the narrative.

Who were we to deliberately withhold information the public needed to know and had a right to know in order to make a decision based on informed consent about their health? Canadians were starting to see this, and they were calling us out on it.

So for me things started to escalate, I would say it was early 2021.

[00:15:00]

And I was disturbed and alarmed about the language that was being used in some of our editorial meetings. All of a sudden, the term “anti-vaxxer” came up and I said, “Whoa, whoa, let’s stop right there. What is an anti-vaxxer? Who is an anti-vaxxer? What do they believe? Because are you saying it’s someone who’s against all vaccines? Because the people I’m speaking to, who are vaccine hesitant, have had all their other shots, but they have problems with this particular one.” I also brought up those who couldn’t get it for health reasons because of allergies. And what about people who just needed more time and information to make a decision. And yet we were lumping them all in this same pot as being an “anti-vaxxer.” I said, “Using this term is dangerous. It’s discriminatory. And why are we talking about these people with such hostility and such contempt?”

Shawn Buckley

So Marianne, can I just stop you there because that’s a term that’s become very sensitive at this hearing. And I’ll explain that in a second. So when the term comes up in the newsroom, it’s being used in a really negative term? Like, it’s meant to be pejorative?

Marianne Klowak

Almost laughing, ridiculing. It’s like these people aren’t educated: that was the kind of term that was being used and that was what was inferred.

Shawn Buckley

And I’ll tell you why I’ve stopped you with that. So we’ve had, and I think it was the Saskatoon hearings where I started to notice it. So we’d have witnesses, like literally vaccine-injury witnesses, talking about how their lives were literally destroyed by this particular vaccine. But then they would add during their testimony, just literally out of context, “but I’m not an anti-vaxxer.” And then, we had a lady that really was part of one of the biggest freedom groups in Saskatoon that arose because of the mandates and things like that. And she made a point, “but we’re not an anti-vaxxer group.” So that told me—because my understanding, and it’s based on a lot of the evidence that was here, but also, you know, prior to me coming here—is that these terms are created basically to ridicule and basically to close our minds, right? Because no one wants to be labelled as an “anti-vaxxer.” So if somebody is labelled as an anti-vaxxer, you’ll close your mind to them, right? So it’s just interesting. I’m sorry to stop you, but it’s interesting to hear because you basically used laughter as a description: that these people would be laughed at in a newsroom.

Marianne Klowak

And ridiculed. And I think that was the prevailing consensus in the newsroom. That if you were educated and if you were intelligent, you got the shot. To question it meant you weren’t intelligent, which really flies in the face of critical thinking. And it’s opposite of journalistic practice.

In June of 2021, the Manitoba government had carried out its own survey on vaccine hesitancy.

Shawn Buckley

And we'll just pull up your slide for a second [Exhibit OT-4]. There we go.

Marianne Klowak

So in the next slide, you see the reasons for vaccine hesitancy—why you're not in a rush to get it/not sure if you will get it/you're not going to get it at all. Look at the top three: It found 25 per cent were concerned about long-term effects; 18 per cent were concerned about side effects and reactions; and 15 per cent said the vaccine was experimental and unproven. So more than half, that's 58 per cent, almost 60 per cent had concerns about safety and that it was experimental. Now notice where religion comes in, it comes in at 4 per cent.

So more than half of the people were listening to their gut and they weren't convinced by the mantra of "safe and effective." But instead of critically thinking, doing newsgathering and real journalism on safety concerns, scrutinizing the Pfizer data, and asking some of the hard questions people were asking me—like, "Why is the CBC the arm of public health?"—we chose to focus on that four per cent. Those who were hesitant for religious reasons. So our mission at the CBC now was to educate these people, or for that matter, educate anyone who was vaccine hesitant and eliminate it, because surely if they were educated, they would have changed their mind.

This to me was arrogant, it was condescending, and we were telling people what to think because we didn't trust them to think for themselves. Our tone implied they were a danger to society if their thinking didn't fall in line with the narrative. And to me,

[00:20:00]

this was mind boggling because I understood our mandate of the CBC was to elevate the voice of Canadians to tell stories on a local, a regional, and a national level, reflecting Canadians to Canadians to promote understanding and unity. And instead, we were fanning the flames of fear, of division, of segregation and hatred against a particular group, the unvaccinated. So the stereotype we were creating emerged early on: The person who was unvaccinated was uneducated; they were likely a person of faith. They were denying that COVID was real. They probably lived in a rural community. And they were branded—"a danger to public safety."

Shawn Buckley

So I'm just going to stop you. So these are themes that the CBC in their newsroom came up, to actually use, to basically denigrate, create a group called "the anti-vaxxers" and denigrate them. So we actually have our state-funded news organization coming up with themes to create a separate group and to make them look uneducated and basically like "Luddites."

Marianne Klowak

That was the image that was portrayed.

Shawn Buckley

And this was a deliberate decision.

Marianne Klowak

It was a deliberate decision because look at the government survey: it showed that almost 60 per cent of people were concerned about safety, and yet we were focusing on religion. I'll give you a couple examples of the stories.

Shawn Buckley

And if I can just interact a little bit. Because it would seem to me the story is, "Here's what people's concerns are, and let's go talk to those people." Right?

Marianne Klowak

That would be the common thinking, wouldn't it?

Shawn Buckley

And then see what flows from that as the story develops. Okay.

Marianne Klowak

That would be the common thinking.

This is a story we ran in May of 2021: "Death bed denials" in southern Manitoba hospital patients, the doctor says. So it was a fact that pockets of Southern Health in Manitoba did have the lowest uptake of the vaccine. But I challenged the stereotype: I'm saying, you know, "I know doctors, I know educated people, I know people in the trades, I know people working in garment factories, social workers, people all over the province that are vaccine hesitant. They do not fit this stereotype." But many of them, by now, were too afraid to be interviewed because they knew it wasn't safe. They knew what would happen to them—that they would be labelled, stigmatized, and they would likely lose their job.

Here was another story we did in targeting people in faith communities that we ran a few months later. And that was in September of 2021. Manitoba health officials were targeting the low vaccination rate in the southern part of the province. They thought the best way to get through to these people is to get the community leaders and the religious leaders on board, and then "we can convince people to get the shot." The story says: There's "no legitimate reason for religious exemptions" to get the shot "across several major belief systems, the leaders say."

That's not what I was hearing from people. People were applying for exemptions and on their deeply held spiritual beliefs. And their applications were consistently being rejected, and they were losing their jobs because of it. These were gut wrenching stories that people were calling me saying, "I'm being escorted out of my workplace right now. I can't believe this is happening. I'm being discriminated against because of my faith." They said, "Where's the right to religion, freedom of religion and where's the right to bodily autonomy," and where was the CBC and why weren't we telling their stories?

I mean, there was one man that I had spoken with, he'd been with a company for 25 years and he was in a management position, and he was working from home and he applied for an exemption that was rejected. He lost his job and he was—because he wouldn't get the shot and he was continuing to work from home. It was ludicrous. It was absolutely ludicrous. And we didn't do these stories.

So this was all sort of coming to a head and on June 3rd, 2021, I called for a meeting with the managing editor of CBC Manitoba, the executive producer. And I asked that a witness be present at all of the meetings to hear my concerns about our editorial direction. Now that witness was a person who was recently hired as the executive producer of diversity and inclusiveness. So in that meeting, I raised a number of issues. I said, "Why weren't we investigating the safety of the vaccines when that's what came up at 60 per cent in a government survey? Why were we creating a dangerous stereotype of who we thought a vaccine-hesitant person was? Why were we creating a hate culture against them and demonizing these people as a threat to public safety?"

[00:25:00]

"Why were we endorsing and promoting an experimental drug that we didn't know much about other than what the government and the manufacturer were telling us?"

And I'm going to give you an example of how that happened. Going back to the journalistic standards about how we're supposed to be impartial: We had reporters posting on their CBC Facebook page at the local and national level with a sticker on their arm and their hand up in the air saying, "I'm part of Team Pfizer and Team Moderna" with their hand up. And I said, "How is that being impartial and how is that being objective? And why were we getting behind Pfizer, which paid out huge criminal settlements? And would these images convince people who were not sure to get the shot?" I said, "Clearly, this is a journalistic breach." When I flagged this to management, they didn't have an issue with it. They didn't think it was a problem.

I also brought up to them.

Shawn Buckley

Let me just stop. The management didn't view those issues as a problem?

Marianne Klowak

No, they said if they want to do that, that's their choice.

Shawn Buckley

You mean, if who wants to do it?

Marianne Klowak

If a reporter wants to post on Facebook they've gotten the shot and they've got a sticker and they're part of Team Pfizer or Moderna, they didn't have an issue with that.

Shawn Buckley

Okay.

Marianne Klowak

I also brought up at that meeting what happened with thalidomide. That's a drug that was endorsed in the early 1960s for pregnant women who were nauseated: a drug that caused

severe birth defects. And that we shouldn't be getting on this bandwagon—we should be very cautious because this was a brand-new vaccine that had just become available.

Now I'm going to give you a specific example of a story that I was shut down on. So June 2021 was the time when Israel was starting to see some links between the Pfizer vaccine and heart inflammation. And I was getting calls from parents who were really distressed and just saying, "There's the potential risk of heart inflammation in young people. I don't know if I should vaccinate my child, I don't know what to do. How safe is this vaccine?" They were in angst about—they wanted more information. And at that time, the Center for Disease Control and the FDA had put a warning on their fact sheet about rare cases of myocarditis.

Some parents in Manitoba thought, you know, Manitoba should be doing the same for their fact sheet on Pfizer because that was the only one that was authorized in Canada for those twelve and older. They had sent letters to the province, the health minister, public health officials, and they shared all these documents with me. So I pitched this story on the June 3rd meeting, and I was given the go-ahead and I interviewed several parents.

And I approached this story like I would approach any other story: Is this true? The government and the manufacturer are saying it's safe and effective, and yet we've got parents worried about some evidence that's emerging that there could be some health concerns. So I set out to news gather, investigate, do the research, and find the answers to the questions people were asking.

And for me, this story was reflective of that 60 per cent where people were saying, "This is what we're concerned about." So I thought, great, we're going to do a story that the public has a right to know. And these were some of the things that parents said to me on the record. They said, "Giving youth a drug that's still in the trial phase is a terrible idea. It's dangerous." They wanted to know "who would be responsible if their child had an adverse reaction?" Most troubling in their opinion was that some of these children didn't need to have their parents' consent to get the shot. "Why was the state taking control of their children?" They were asking me this. This is all credible and legitimate questions. They were fed up with their kids being threatened and bullied in and out of school for not being vaccinated.

I'll tell you one story. There was a rural community, and this mother phoned me and there were two families. One family was vaccinated; one wasn't. And the daughters were best friends. And one of the daughters said, "Well, you know, if you want to get the shot, you can come over to my house on the weekend and my mom will take you. And your mother never has to know." So that was the end of that friendship. That was the end of that. And it divided the whole community.

And these people were questioning, they were asking me, they were saying, "Well, if this vaccine is safe, then why does someone who's vaccinated have to be afraid of someone who's unvaccinated?" Very logical questions. And they were angry with the CBC. They expressed that to me. They said, "Why was the CBC and the media cheerleading the government's message that the vaccine was safe and effective?" because they weren't convinced by it.

[00:30:00]

So that's basically what they said to me on the record.

And most of them had referenced and voiced their support for a body of scientific research that was put forward by the Canadian COVID Care Alliance [CCCA]. Specifically, by Byram Bridle, a world-class immunologist from the University of Guelph. And the Alliance had been raising flags about the safety of the vaccine based on scientific studies. They'd even filed a petition with the federal government, and they were calling the feds to suspend the use of the vaccines in children, in youth, in adults, in women of childbearing age until there would be long-term and short-term safety trials that were completed and this would be published in peer-reviewed journals. Many of the parents I spoke with had signed this petition. Certainly, this was newsworthy and something the public had a right to know. These were Canadians that were voicing a different or dissenting voice, and up until now, all we were airing and publishing were experts aligned with the government's view. This is a story I thought that would bring some fairness and balance to our one-sided coverage, and it would punch a hole in the narrative.

I contacted the Alliance, and I spoke with a scientist by the name of Stephen Pelech. He's a highly reputable scientist. He's a professor of neurology in the Department of Medicine at the University of British Columbia. He had been doing COVID research in his lab for two and a half years. He also published more than two hundred scientific papers over the course of his career. He praised the parents I interviewed and he said, "You know, they're wise. They're wise to question this narrative" because he had serious concerns with vaccinating children with this new vaccine.

He shared with me the Pfizer data that showed with children, there's the least amount of data from testing on whether there's a long-term or short-term side effect. So according to the document I was looking at from Pfizer, it was just over 1130 adolescents between 12 and 15 in the U.S. were vaccinated in phase III trials. And in his opinion that was problematic. He said the tests were done on a very small number of children and the test wasn't powered enough: so what that meant is there wasn't enough participants to determine if, let's say, there was a reaction of one in five thousand, that wouldn't have been picked up by Pfizer. So I had Pelech on camera; I had these parents all lined up. And I told you what my workflow was like prior to COVID. But it changed with this story.

When it came to this story, I never had more hands in the vetting of this story. While it was cleared by the Manitoba managing exec and the director, a local web writer flagged it. And she said, "You know, maybe we should get a response from Pfizer." I said, "No, I think we've heard more than enough from Pfizer." Then she said, "You know, I don't think the vaccine is still in the trial phase." And I produced a document saying it is until 2023. But she sent out an internal email to several people in the newsroom, and she decided that my story should be forwarded to the Toronto Health Unit. Now this is a special unit within the CBC, and she wanted them to do a final vet of my story. So now the CBC Toronto Health Unit was in charge of my story. It was the end of June, and I was really getting anxious over how long this was taking because as I mentioned before, I was used to turning stories around in a day or two. But to me, it was critical timing because the rollout was ramping up for the vaccination of young people in Manitoba. It was in full swing. Finally, five weeks later on July 8th—

Shawn Buckley
Five weeks?

Marianne Klowak

Five weeks. Remember, I could turn around stories in two or three days—this was five weeks. So I think they were sitting on the story. Maybe they were just hoping that I would go away and not persist in doing this story.

But five weeks after, July 8th, I pitched the story, I was called into a meeting. Well, this was on Zoom because we were all working from home by then, and they had a verdict from Toronto. And you know, I should mention to you that over three decades at the CBC, I'd say 30 to 35 per cent of the stories I did were health stories. Never had I had a story that had to go to the Toronto Health Unit. And never was a story given this level of scrutiny.

Shawn Buckley

So I just want to emphasize this because you had told us earlier that basically things changed at COVID. So what you're saying is, for your thirty-five years as a journalist

[00:35:00]

like, 35 to 40 per cent of your stories were health stories. So you knew what it took to run a health story and that never before had it been sent to this Toronto Health Unit or no story in your career had ever been put under this much scrutiny.

Marianne Klowak

Never. Like I had mentioned, it was one producer, and the story was put through and it was published. And all of a sudden now, there were all these hands in the story.

And what I want to mention to you, which is key to know here, is that before I tell you what happened, that none of the facts, none of the data, none of the research, nothing I put forward in that story in terms of any of the information was contested. It was rock solid journalism. And I knew that I could put my name to that and defend every word I had written.

They raised two concerns that was an issue for them: Did I know that the Alliance promoted ivermectin? And did I know that some of the members of the Alliance chose to be anonymous? Those were their two concerns. So my thought was, okay, now the story is being blocked further up the chain.

I did know they supported ivermectin, but that was not the focus of the piece. And I had been sending for weeks links to management from medical journals about the success of ivermectin in treating COVID. I got no response. I said, We should be having a debate about ivermectin on air and hear from experts who support its use. But that was not the focus of this piece."

As for members being anonymous, I was confused by that because, I thought, I interviewed Stephen Pelech. He went full-face on camera with his credentials. So there was no anonymity there. And I could only guess that maybe some were choosing to be anonymous because they wanted to be able to continue to practise without fear of being disciplined anyway.

But what came next left me just speechless. I was just astonished. They said, "While there's a story to be told about the parents' concerns, the Canadian COVID Care Alliance was problematic." I should "drop them out of the story, keep the parents' concerns in, but

interview two experts that CBC Toronto was recommending.” And of course, I did my research, “Well, who are these people?” One of them was a pediatric immunologist who told me both of her kids were vaccinated. She had worked with the federal government. She chaired a national committee overseeing the approval process of COVID-19 vaccines in Canada. I was being told to drop Pelech out of the story who was raising flags about safety concerns and put this woman in.

I was just stunned. I was shocked. I could not believe that they were asking me to do this. I said, “This is unethical. This is immoral. You’re violating all our principles of fairness and balance and accuracy and being impartial and acting with integrity.” And I said, “What you’re asking me to do is dishonest and it’s manipulative.” The parents I had on tape, I’d interviewed, they were backing the science of Bridle and to include them in the story but leave the Alliance out, to me, defied logic. It didn’t make any sense. We were effectively censoring people in the scientific community with impeccable credentials because they just didn’t fall in line with the narrative.

I said to the managing editor, “I’m standing down. I’m walking away from this story. I’m not going to do what you’re asking me to do. I’ve invested too much in this. I’m not going to sell these people out. And why should I have to include two doctors that Toronto has picked out?”

And then I think, you know, what if this story had made it through and it went national? Wouldn’t that have changed the narrative across the country? If parents had been armed with this information, would we have seen fewer vaccine injuries?

Shawn Buckley

Can I just stop you. Because another thing just kind of occurred to me when you were sharing that story and you mentioned how they were actually critical of the CCCA—and I’m thinking, well just wait, just so people that don’t know the term—so that stands for the Canadian COVID Care Alliance. My understanding is, I mean, if it’s not hundreds, it’s thousands of scientists and doctors. Like we’re talking very credentialed people that have formed an organization to basically look into COVID issues objectively and to provide fair and balanced information.

[00:40:00]

And you know if that leads them in a direction that goes against the government narrative. But isn’t the fact that that group formed and exists, itself, a story that should be covered, let alone cutting them out of a story. I was just thinking that in itself is somewhat fantastic and likely would be a story.

Marianne Klowak

And they formed specifically because of COVID and to give an alternative perspective. And I had pitched, “Let’s do a story on them,” but it was like, they weren’t interested in it. They weren’t interested in hearing what these people have to say because they figured they supported ivermectin. So they didn’t want to do any of those stories.

Shawn Buckley

And just to give perspective—because I know when we had a conversation and likely you’ll get to it—like, a reporter will go to a demonstration on an issue where there’s twelve

people and report a story. But when tens of thousands of people show up for a demonstration, that might not be covered if it's going against the government narrative now. So, just kind of along those veins, like just even the size of the CCCA itself is quite—

Marianne Klowak

The numbers.

Shawn Buckley

Yeah, and it's quite something.

Marianne Klowak

The fact that they had filed this national petition was to me huge. They were saying, "No, we need to stop, we need to pause, we need more information before we roll this out across the country for young people," and that story was shut down.

Shawn Buckley

And that was a petition backed by scientists and medical doctors citing peer-reviewed evidence.

Marianne Klowak

Correct.

Shawn Buckley

Okay.

Marianne Klowak

So the day that that happened to me, which was July 8th, it's burned in my memory because for me, part of me died that day with that story. And that was the death of journalism for me, July 8th, 2021. Instead, we were clearly pushing propaganda.

So I had to call back everyone. And I thought, how am I going to handle this? So I apologized and I told them the truth. And it was shameful and it was humiliating because these people had put themselves on the line to tell me their story. And I said, "This is why I can't do it. This is why I won't do it, and it wouldn't see the light of day." And I said, "I'm sorry that I have failed you and I have let you down."

I didn't go to work the next day because I thought I have to strategize. How am I going to deal with this? Do I quit right now? Do I stay and try to push stories through even harder? The following day I asked for a conference call with the managing editor, the exec, and the witness and I said, "Here's the deal." I say, "You know that story was solid journalism. I'm asking you to publish it. You have that power." And I said the timing was key as the province was ramping up the vaccinations of young people. It was urgent that this critical information get out there. And I said, "I'm asking you to do this despite what Toronto has said." And if they wouldn't, I could no longer continue to work in this environment. They didn't publish it.

It was also at that time I decided I had to start reaching out to other journalists because I felt like I was just losing my mind. Surely other people were seeing what I was seeing. And I did reach out. I reached out locally to a competing network. I also talked to someone south of the border. Through internal email at CBC, I sent out notes saying, "This is what I'm seeing. What are you seeing?" And I didn't hear back from anybody.

So I thought, you know, I'm going to call the CBC Union. I called the CBC Union and they said, "Oh yeah, we're getting all kinds of calls about people concerned about our biased reporting." And I said, "Well, where are they? Put me in touch with them." And she said, "Oh no, they're not, it's staying with the union. They're not going to go past the union." I say, "What does that mean?" And she says, "Well, they're not prepared to do what you're doing. They're not prepared to go all up the ladder and call power to account."

So then I reached out to somebody. And I guess, you know, I understand that because I was sort of at the end of my career, but a lot of the journalists that were calling the union were midway in their career and they were afraid of losing their jobs. I contacted a senior reporter from a competing network and I said to her, "What are you seeing?" She said, "Oh, I'm seeing the same thing, you know, why has the media become the mouthpiece of public health?" Then I managed to contact a reporter who worked for *The New York Times* who told me what was happening to me was exactly what was happening to him. His stories were being shut down: he was being blocked. As he saw it, we had two options. One of them was quit and be a whistleblower,

[00:45:00]

or to stay and fight it out and keep trying to push those stories through. He also gave me some advice. He said, "document everything that's happened to you, as you would cover a news story. Who said what, when, who was present and the date." I was just reeling from all this because I thought, you know, we have betrayed our audience on a massive scale, massive.

And even the CBC acknowledged that erosion of trust in a blog that was written by the editor-in-chief Brodie Fenlon in March of 2021. Forty-nine per cent of Canadians think journalists are purposely trying to mislead them. About half of the fifteen hundred people of the Canadians surveyed felt the CBC was more concerned with supporting an ideology or a political position than informing the public. And that the media was not doing well at being objective. How is the CBC going to rebuild trust in journalism?

In 2019, it became a member of the Trusted News Initiative—so that brings together news organizations from all over the world and tech platforms to combat coronavirus disinformation: to identify and stop the spread of it, false claims, half-truths, conspiracy theories, basically, a way to filter news through its own filter system. I saw it basically as a mechanism to "call people out" who disagreed with the narrative and to label them dangerous and extreme.

Why do you need a trust filter system if you're consistently telling the truth? Why are tech platforms involved in combating disinformation? And who are these people in this Initiative? Are they journalists? Are they scientists? Is artificial intelligence involved? Who is the Trusted News Initiative? This was an effective way to stop the flow of information: to censor one side, skew reporting, and label opposing opinion and thought as disinformation. Sometime after signing on with the Trusted News Initiative, there was a shift in the lens of how we saw news. It was no longer from the bottom up—it was from the top down.

Let me give you a specific example of how this played out in the newsroom in another story that I was blocked in doing. I'd gotten a tip about a peaceful protest in Winnipeg about vaccine mandates, and it was in September of 2021. There was about two thousand people out on the street. We didn't cover it because it was decided at the editorial level these people were spreading disinformation. This was just unbelievable. I was stunned because I had been sent in, you know, to cover stories and do live hits from protests with twelve people present. But we were going to ignore a group this large and not send a camera and find out what these people had to say. I thought not only is the size of the group newsworthy, it was the fact that it was both vaccinated and unvaccinated people were walking together and they were united in their opposition to vaccine mandates.

I had gotten a call from someone on the protest line who says, "Where's the CBC? There's people here that are cutting up their vaccine passports as a show of solidarity against the mandates." And I thought, wow, this is a great story. This is great visuals. This is a powerful story of people at the grassroots uniting. Why wasn't the CBC there? It was a decision made at the top level rather than looking at the news that was unfolding on the ground.

When I asked why we weren't there, I didn't get an answer. It wasn't worthy of covering because in the CBC's eyes, these people were disseminating disinformation. How could we say that if we never even spoke to any of them? We ran a few lines of copy that day saying, "More than 250 people in Winnipeg held a protest against mandates." That was misleading and it was a half truth. There was at least 2000 people. By saying more than 250, we were trying to minimize, in fact, how large it was. And to me, we missed the story entirely, which was people uniting against a cause.

Instead that day, I was assigned a story about a cricket infestation. No one was sent to cover the protests, and the cricket story went national.

[00:50:00]

But there was nothing about the Manitoba protest.

Shawn Buckley

So, Marianne, just so that we have contrast because you've told us about, listen, there's this protest, 2000 people. The real story is that both sides are coming together, that people with the passport are so concerned about the mandate, they're cutting that up. So tell us about the exciting cricket story that became national news in Canada. What was the story, just so we're not left in suspense?

Marianne Klowak

That people's back lanes and garages and houses are being filled with crickets. And I'm thinking, really, we're going to tell that story, and we're going to basically ignore two thousand people walking through the city uniting in a cause. We are just going to ignore these people. To me that was just unconscionable.

Shawn Buckley

And was the cricket story urgent? Like—

Marianne Klowak

No, I don't— Well, I guess if you were living in a house full of crickets, it might be, but that was not the story to be told that day. But that was the story they decided should be told that day. Later that month, I pitched another story, and it was shut down.

Shawn Buckley

Can I just stop and I'm sorry. So we have, literally, vaccinated people and not vaccinated people coming together against the mandate. And we have crickets from the CBC. I'm sorry I couldn't resist.

Marianne Klowak

It's shameful.

Shawn Buckley

That was just too easy. So okay, and I'm sorry to interrupt, I just truly couldn't resist.

Marianne Klowak

So later that month, I pitched another story that was also shut down. And it was about what vaccine mandates were going to look like at universities in Manitoba. I had a professor lined up, an immunologist lined up from Ontario. They were on a committee there helping to draft the rollout of mandatory vaccines at the University of Guelph and McGill. They talked about students having less freedom on campus: There'd be more security, more policing of students. Those who refuse to wear a mask could be hauled off by campus police. I also had an ethicist lined up who was willing to talk about his concerns over mandatory vaccinations for students.

And both the experts were saying they were worried about the mental health of students that were going into a second year of restrictions. Both were getting contacted by parents and students who just were not in support of this. And I thought this would be an excellent discussion to have in Manitoba with faculty and parents and students for our audience to hear because it was already rolling out in Ontario, and it was going to be coming into Manitoba; they were ahead of us. And I also said I had spoken with two legal firms that were fighting mandatory vaccines on campuses, and they felt the court ruling in Ontario could set a precedent for the rest of the country. There was no response to what I pitched that day. Instead, I was assigned another story about an infestation. This time it was bedbugs in a local housing complex. And no one else had been assigned to that story that I had pitched.

So I interpreted that as I was quickly becoming silenced and cancelled for trying to get the other side of the story out. I was battle weary. I was exhausted from fighting. I never felt more alone in my profession. And as a veteran journalist who is usually fearless and outspoken, I no longer felt it was safe to pitch stories that I knew that we should be telling. And I quickly felt that my existence there was becoming null and void. But I wasn't done yet.

In September, I decided I'm going to go directly to Toronto to voice my concerns about our editorial direction. And I was going to tell them what I was experiencing. I started sending emails to Brodie Fenlon, CBC's editor-in-chief, and Paul Hambleton, who was the head of Journalistic Standards. Now he's no longer with the CBC, he left a month after I did. I shared

with them what I'd documented about what was happening with my stories, specific details what was going on in the newsroom in Winnipeg, the language that was being used. How we had created this culture of hate and division, feeding people's fears. And why were we so hostile to people who had an opinion that was different from ours? And while I applauded the CBC's initiative of diversity and inclusiveness in hiring people of different cultures and ethnic backgrounds,

[00:55:00]

I said, "Where is our diversity in thought? Where is that?"

Again, I was hearing the word "anti-vaxxer" being used in the newsroom, and this is already a year and a half into the pandemic. We'd failed to create a safe environment for people to speak to us on the record so their voices could be heard. I told them we had violated all our journalistic standards. We'd broken the public trust. And we withheld information the public had a right to know, and we were guilty. I asked to have a conversation with them before I left. And Brodie Fenlon emailed me back. He thanked me for what I sent, said he'd be happy to talk to me. But with the federal election going on, could we schedule a time afterwards in October, and he would invite Paul Hambleton into this discussion as well. I was pleased he had responded.

At that point like I knew, I had my end date. I'd spoken to HR; I knew when I was going to be leaving the CBC, but I had one more story in the queue I wanted to get out. And it was about a woman who was vaccine-injured. I had several calls and conversations with people who had contacted me about they had been vaccine-injured, they knew someone who had been vaccine-injured, or there was a family member.

One of them was the mother of a teenage boy. He was an elite athlete, he had gotten the shots, he had chest pain. He was told he was going to have to spend his summer lying on a sofa recovering, and he could not do any sports that summer. A woman called me who got her first shot and she was really sick. And she was anxious because she went for medical help, and she was told that she should still get the second shot, but maybe she should be admitted to hospital to get the second shot in case she had a worse reaction. This to me was madness, was madness. The rest were afraid that they wouldn't be believed because of, you know, the media mantra we were putting there, "safe and effective."

The way I saw it, we were gaslighting these people. You know, let's say you have a refugee coming into the country, and you know they've suffered trauma and they've been through hell. How do we treat them? We treat them with mercy and compassion and kindness. And yet these people who were being injured—we were gaslighting them. One man who had an adverse reaction said to me, it had to be him, "It's got to be me. There's got to be something wrong with me because it's safe and effective."

So getting back to the woman I did the interview with. She had had an adverse reaction after her first shot in May of 2021. It took me weeks to gain her trust, for her to go on the record. She was thirty years old. She was an avid runner and she worked with the federal government. She had no previous heart condition. The very next day after getting the shot, May 27th, she had chest pain. Then she said she was short of breath. She felt like she had this huge weight sitting on her chest. The pain got worse, she had trouble breathing. She described it as the feeling like there was thick smoke in her lungs, but she wasn't a smoker. She knew something was really wrong.

She went to emergency at St. Boniface Hospital where she was diagnosed with pericarditis. And that's inflammation of the tissue around the heart. She shared her written medical report with me from the emergency room doctor. Since her shot in May—within the next month—she'd been to emergency five more times with increased chest pain. She could no longer run. She was winded from walking up a flight of stairs. And she said she thought that she was dying. And I had interviewed a cardiologist as well who told me, "if there's damage to heart cells as an adult, they don't regenerate. The damage is permanent." And yet we were running stories saying, "Take a couple of Advil, and there shouldn't be any lasting symptoms from heart inflammation." This woman was on anti-inflammatory medication for months. She was battling depression and anxiety because she was no longer the outgoing, active, happy-go-lucky person she used to be.

She also told me how difficult it was to get someone to document what happened to her as an adverse reaction. She said the first doctor who diagnosed it was hesitant to put it in writing. Some doctors didn't know how to fill out the form. Finally, a nurse had filed it for her, and that was another story I pitched.

The problems with doctors reporting adverse reactions in Canada.

[01:00:00]

They have to download a PDF, takes about fifteen minutes to fill it out. The doctor has to sign it. Then it goes to a health authority who has to approve it. And some of the doctors were telling me that their reports were getting rejected. And I was hearing more and more about the problems with reporting these adverse reactions in Canada. And there was even a period during the pandemic that the line that they used to report these adverse reactions was down, the link wasn't working. Surely, this was newsworthy. No interest in that story.

But getting back to the woman, I interviewed. I stayed in touch with her. After doing her own research, she connected with three other women who were diagnosed with heart inflammation after being vaccinated. I wrote her story. Here was my first line based on what she told me. This was the original before it was edited: "A 30-year-old Winnipeg woman says she's not confident the COVID-19 vaccine is safe for everybody and is advising people to do their research. She admits she was hesitant at first to get the shot, but she felt pressure from people posting online that she was selfish if she didn't." Two words the editors didn't like in there: "vaccine" and "hesitant." Again, several hands were in this story, several. A managing editor, two web writers, another producer, and I fought several edits that were made. By now at this point, I was sort of afraid because I thought if I pushed them too hard, they could pull the story entirely.

Okay, here's the story the CBC published on July 12th, 2021. This is my story, and this is **what they changed:** "Winnipeg woman shocked by heart lining inflammation after COVID vaccine, but experts say the risk remains low." Look at the first line. "A 30-year-old Winnipeg woman says she was shocked to be diagnosed with the condition involving inflammation of the lining around her heart days after she got her COVID-19 vaccination in late May."

The changes that they made didn't reflect what she was saying to me about the safety concerns. It was propaganda editing to change the meaning entirely. Any reference to vaccine hesitancy was taken out. I fought the web writer on that first sentence. He says, "Well, no, we can't say that; we don't want to scare people." I say, "That's not journalism." I said, "Maybe we should be concerned, look what happened to her." And I said, "We can't negate her personal lived experience: her story is one of caution and to do research."

And if you look at the next sentence which says, “But a Winnipeg cardiologist says despite concerns about heart inflammation, vaccines are preventing illness from COVID-19.” Why would anyone read any further in my story. Basically, the message was it happened to her, it’s too bad, it’s unfortunate, but vaccines are still doing what they’re supposed to be doing.

But there were medical experts who were disputing this, but they had been cancelled by the CBC because according to the CBC, they were spreading disinformation. The fact she was an avid runner was taken out of the story, and I fought to have that put back in. I say, “No, I think that’s important. You know, she was a runner and now she can barely walk up the stairs. It shows what happened before and after the shot.” And she never got the second one because her reaction was so severe after the first. And I also didn’t think there should be experts or stats negating what she was saying. Because we’d heard more than enough from all of the experts. It should be just a straight-ahead story about someone who suffered an adverse reaction, and we shouldn’t downplay it. Instead, the way I saw it, her story was buried in experts and health officials and stats—it was sanitized.

I lost sleep the night before that story was published. I knew we didn’t do justice to her story. I spoke with her the next day, and she was so traumatized she couldn’t read the story. I should also tell you I contacted her five months after I left the CBC, and she was still suffering from health problems, blood clots. That story was the breaking point for me. I was waiting for that final exit meeting with Fenlon and Hambleton in October. And when I had it, I told them what had happened to my stories. How devastated I was to be leaving the CBC after spending three decades in a career that I loved.

I asked them what’s the makeup of the CBC Toronto Health Unit, like who are these people: “Are they journalists, are they scientists, like who are they?”

[01:05:00]

I was basically told they were experts who are really good at what they do. But I still don’t know who they are. Then I brought up the issue of mandatory training and seminars for journalists that we had to take on what was called conscious and unconscious bias. We had to sign off on this training. It was to identify any bias we may have in doing a story. And to be aware of it, to make sure it doesn’t impact the story that we’re doing and that we are more inclusive. I said, “You know what, we the CBC have a glaring bias, both conscious and unconscious, when it came to stories involving experts opposing the narrative and with those who were unvaccinated, we had a glaring bias.” I said, “I was worried about the next generation of journalists. They’re young, they’re inexperienced. And that the editorial meeting is not a safe place to have a different opinion. Why are we so mean and hostile to people with different opinions?”

And I said, “Did you know how we were being branded outside the walls, the corporate walls of the CBC?” I’ve seen those protests; I’ve seen those signs. We were being known as the Canadian Brainwashing Corporation or in faith circles, the Christian Bashing Corporation. Some of my final words to them, as I saw it, I said, “The CBC is morally and ethically culpable of the narrative that it pushed to the public, and we are going to be held accountable. We failed to hold power to account, and no one was holding the media to account. We failed to serve the public. We broke their trust.”

I told them, “You can silence and cancel scientists with impeccable credentials, you can even cancel me.” But I said, “My solace is that the truth will come out; it will come out.” Brodie thanked me, and he said he was sorry that it had ended this way and that he didn’t think the CBC had done all that bad. He wished me well. Hambleton, who is the head of

journalistic standards, he was still on the screen, and he told me, that the most heat that he took during COVID was over ivermectin. People calling and writing with letters with no let up. I said, "The CBC should have listened on many fronts. The truth will come out." That's what I said in October 2021.

So here we are a year and a half later, the truth has come out. Even though people still do not want to believe the truth. According to Health Canada's own website up and to including March 3rd, a total 427 deaths were reported following vaccination, 427. Each and every one of those deaths was worthy of a story. Where was the CBC? Where was any media on this? And is that number accurate? The same Health Canada website posted more than 10,000 serious injuries for the same time period. Are those numbers accurate? Are they higher because of all the problems with reporting adverse reactions in Canada? Who are the injured? What are their names? What are their stories? What are they suffering?

Lawsuits are going on, and there's a few people of the vaccine-injured who are getting settlements. We have one before the courts right now in Manitoba involving a young man from Steinbach.

If reporters were doing their jobs, we would not be here today in this forum, funded by citizens, telling our stories. Mainstream media would have done it. Where are they? Where are they?

On February 27th of this year, papers with hundreds of profiles of suspected COVID vaccine injuries and deaths were plastered onto the doors and windows of CBC Toronto. I had a really hard time looking at those pictures because that to me was proof and evidence that the public had trusted us and they had listened. And some of them paid dearly for it. I waited to see, is CBC going to cover this? Is any media going to cover this? How could you ignore this? It was just unconscionable and appalling that nobody covered it. I thought, I wonder how employees felt that day when they came to work and they saw that—those posters on the outside of the building. Did they stop? Did they look? Did they read? Did they look at the names, or did they just go into the building and carry on with work that day? The same thing happened in Winnipeg on a smaller scale.

[01:10:00]

Again, no media coverage.

And as mentioned earlier, CBC decided to pause its Twitter activity after it was labelled "government-funded media" by Elon Musk. Brodie Fenlon had responded by publishing a piece saying, "Journalistic independence is the cornerstone of who we are as a public broadcaster." Then that tweet was removed. CBC is not impartial—it is not independent. I think what I shared with you gives witness to that.

There was some excitement over the fact CBC Manitoba covered the NCI when it stopped in Winnipeg in mid-April. Maybe, finally, the CBC was going to report the other side. But it was a low-impact piece in that it didn't talk to anyone who was vaccine-injured. It didn't delve into any of the Pfizer data. And it didn't talk about safety concerns or side effects.

Shawn Buckley

Can I give you even more shocking information? Can you go back to that slide? So Jay Bhattacharya is on the screen—while CBC is there—talking about CBC censoring him. And there was no mention about that.

Marianne Klowak

Those stories should have gotten out. And there's so much more that should have gotten out. I mean, basically, it was a low-ball story, in the sense, the bar was low. They didn't delve into what they should have dug into there.

I don't know if any of you have heard of Naomi Wolf. She's a famous American author and journalist. She posted a video on YouTube last month exposing what is in the Pfizer documents. I think it's something that all critically thinking journalists should have been digging into. The FDA wanted the documents to be hidden for 75 years. A judge said, "No." So Pfizer was ordered to release 55,000 documents a month. And according to Wolf, around 2,500 experts from all over the world are interpreting this data. They're churning out reports to tell everybody what's in it. The evidence in her words is dark, devastating.

One of the many findings is that Pfizer knew the vaccine didn't stop the transmission of COVID one month after rollout in November of 2020. But yet public health officials were telling us, were running campaigns to say, "Get the shot to protect those you love." And the media, including the CBC, was still demonizing the unvaccinated as a danger to public safety.

I'm inspired by Wolf and those outside of legacy media who are tenacious and fearless about reporting the truth, and they're truly independent. For me, that would be, on this side of the border: True North, *Western Standard*, podcast by Trish Wood.

I was fortunate that when I left, I was at the end of my career. I still wanted to work for two or three years, but to leave the way I did was crushing. It was heartbreaking, and it was definitely a journey of grief. I was able to take an early retirement.

Shawn Buckley

Marianne, I'm going to have to focus you just because we're really running over.

Marianne Klowak

I got 30 seconds. Maybe even less.

So my heart goes out to those who are starting out or midway in their careers. And for them the challenge is even more daunting. When I was asked to testify, I said, "You know it's dangerous to tell the truth but I think"—as someone with the Inquiry said to me—"it's even more dangerous to not tell the truth."

So getting our institutions back: Will we get the CBC, our public broadcaster back? I don't know. But I do know that more journalists need to stand up, speak out, and stand firm as a truth-teller.

Thank you.

Shawn Buckley

Wait, wait, we have commissioner questions. So, and the Commissioners have questions.

Commissioner Massie

Thank you very much for your testimony. I'm learning on a specific story that you illustrated, what I have witnessed from the outside So it's interesting to have this confirmation. I'd like to ask one question because I'm not a journalist, so I don't know. But when we, I would say, use or abuse the term "expert" in journals, shouldn't there be some sort of gold standard that,

[01:15:00]

first of all, you cannot cite experts that are faceless, you don't know who they are. And if you cite them, you give their credentials so everybody can judge by themselves what is their expertise.

Secondly, you mentioned that in many stories that were produced over the pandemic, it was one-sided, and it was the official narrative. And every time somebody was trying to come up with a different version, another expert, they were either dismissed or denigrated.

So about your story that went to be checked in Toronto, wouldn't that be a good idea to say, "Okay, you're proposing these other experts. I will accept if you agree that this expert has a public debate with the expert I'm citing in my article." What do you think of that idea?

Marianne Klowak

That would be the ideal. But that was not something they were open to. And I think in Mr. Palmer's presentation earlier, in terms of that term "expert." You know, it goes back to when they were giving me the names of those two people. You know, do your research: Who are these people? Are they really experts? Are we just designating them experts? And that was a problem that I saw throughout the pandemic. It was very specific about who their experts were going to be, and they were going to be portrayed as competent and trustworthy.

But to have a debate. I mean, that's something I challenged them on many topics: like, ivermectin in terms of experts on both sides; the vaccine injuries, being concerned about safety. I was constantly putting that before them, but it was like, I wasn't being heard. And that was coming from the highest level of the CBC.

To be fair to CBC Manitoba, I mean, they cleared the story except for that one web writer. And then it was shut down in Toronto. And I had no power at that point in terms of— You know, I said, "I think these people should have a say, for the sake of fairness and balance, they should be heard." And I even challenged them to publish the story without Toronto's consent, but they wouldn't do that.

Commissioner Massie

So just a complementary question. Was that a common practice in the past to do that sort of confrontation of expert with different view? Or is it something that was never practiced in journalism? You would do it like a common way of reporting on different opinion, [where] you had to really make sure that when two different views are presented that they were framed in a way that the reader could actually make it their own judgment about it. And now it seems that it's completely disappeared from what we're being exposed to. And I can tell you it's not only CBC; we see the same thing in Quebec with all of the journals. We are seeing the same story.

Marianne Klowak

It just happened to this degree I would say during COVID. Before we would do thorough vetting of people we put on the air as experts and thorough checking of their credentials and what their experience was. And usually, we'd even check them out with two or three other sources if they were legitimate. And were they in good standing? But that seemed to have all gone by the wayside.

Commissioner Massie

Thank you very much.

Commissioner Kaikkonen

I was going to say good morning, but I realize it's now good afternoon. Thank you for your testimony.

When I think of the daily PMO news releases that are sent out every day from the PMO's office to which CBC journalists would receive and how religious holidays are identified, recognized, and celebrated. And I should also add rightly welcomed in a democratic nation that recognizes freedom of religion and beliefs as a fundamental right in this country and, similarly, as a foundational principle in our constitution under the supremacy of God and rule of law. These PMO releases often offer very lengthy and detailed descriptions of respective religious traditions.

And then I think back to a comment made by the PMO prior to his first election—Christians need not apply. And then I combine it with a very short PMO release that came out one year, I believe it was 2017 or 2018. I believe it was one paragraph regarding the Christian holiday, the traditional Christmas.

[01:20:00]

Two things come to mind. It appears CBC is broadcasting the PM's personal opinion publicly, essentially becoming the PM's mouthpiece. But even more so, targeting specific faith groups, using hatred for these faith groups to which the PM has publicly disagreed. And if this is the case, how can Canadians be confident in a publicly funded broadcaster that deliberately and intentionally ignores entrenched protected grounds under human rights legislation? And two, should we as Canadians be considering CBC in its current mindset, a danger to society for not adhering to their own "DIE" ideology? That is diverse, inclusive, and equitable treatment of all persons regardless of their faith and personal beliefs to which they subscribe?

Marianne Klowak

Which part of that do you want me to respond to? That was—

Commissioner Kaikkonen

Whatever you think you should respond to.

Marianne Klowak

You know. Here's the thing. That was an issue I had brought forward a number of times in CBC, about the fact of how do we cover different faith groups? And we even had a working

group on that and we invited a number of people in from different faith communities to you know, say, “What are the stories that you think we should be telling?” And for a while there, we were doing that. We had a forum, and it was a wonderful forum: we had a rabbi in there, we had Muslim people, we had Catholics, we had Evangelicals, we had Mennonites, we had Jewish people in there. And there was a consensus working group on, how do we move forward stories that are faith based? And we were going in the right direction for a while.

And then all of a sudden, it just swung the other way where we’d become hostile again. And anyone who expressed their faith in a story— I mean, I look at all the pastors in Manitoba that stood out during the pandemic and defied rules and said, “How can you have 300 people in Costco when you’re telling us we can only have 25 people in our church at a service on Sunday? We’re not going to stand for this.” And they didn’t. And you know, they were hammered by the media for expressing their faith and standing up for it.

So there’s definitely a hostility towards faith in, I mean, just my experience at the CBC. And I was constantly bringing that to the forefront and trying to do more stories that way. And sometimes I was able to get those stories out and in some, I wasn’t able to. But clearly, like, we made a specific decision here in our coverage during the pandemic to hammer those communities in southern Manitoba that were faith-based, that were pushing back against this narrative in the agenda. And that was so wrong.

Commissioner Kaikkonen

Thank you.

Commissioner Drysdale

I’m from Manitoba, and I mourn the loss of the CBC as a fair and unbiased news reporter. I had personal friends who were on the I-Team years ago, and I remember the stories they used to bring out.

One of the things that we’ve heard over and over and over again in the testimony is that prior to 2020, things changed: Words changed. Definition of pandemic changed. Definition of vaccine changed. Definition of human rights changed. A lot of things changed. And my question is, usually, you know, there’s an old expression that a leopard can’t change its spots. Was there significant changes in the higher management of the CBC prior to 2020, like in 2018, ’19? How did they accomplish this complete change of philosophy without changing the management?

Marianne Klowak

Well, I think the management just bought into it. I think, you know, I look at other stories where the language changes in order to make it acceptable to the public. And that’s basically what was being done. The whole thing, the mantra of “safe and effective,” you know, like we didn’t even investigate that. And yet the people that were in management, I mean, these were people that had worked that I-Team you’re talking about.

So, for me, I was shocked and sort of disoriented about, why wasn’t there any pushback about the language and the words we were choosing to use that were dangerous and misleading?

Commissioner Drysdale

You know, we heard testimony from many witnesses about how they were treated,

[01:25:00]

specifically, by the CBC. And according to those witness testimony, didn't the CBC go beyond just ignoring certain stories? We heard testimony after testimony of personal character assassinations carried out by the CBC. Were you aware of any of that? Can you corroborate any of that?

Marianne Klowak

I was aware of that. I mean, to give the best example would be Byram Bridle. Look what was done to him. I mean, this guy is impeccable credentials, immunologist, and the smear campaign against him was just, it was unconscionable. What was done to his career was a character assassination to discredit him for all the safety concerns he was raising. And I raised that with management because I wanted to interview him in a story. And actually, what was interesting is I wanted to interview, as well, Dr. Christiansen in Saskatoon. He was the doctor, Dr. Francis Christian, he was the doctor who stood up and said, "You know, I haven't met a twelve-year-old yet that understands informed consent." And I wanted to interview him, and I was blocked from doing that as well. It was like, "Oh, no, his reputation, he stood up; he's pushing against the narrative." And I'm thinking that's exactly the people we should be talking to, to have fairness and balance.

Commissioner Drysdale

There was also something that you said that I just want to make sure I understood properly. When you were doing one of your original stories and you were quoting the doctors from the Canadian COVID Care Alliance, when comments came back from Toronto, I thought you said one of the comments was, "Well, some of the members are anonymous there." Is that what you said?

Marianne Klowak

That's right. That's what they said to me.

Commissioner Drysdale

But then, didn't you also tell us that when you asked the Toronto people who the members of the Toronto CBC health group was that you were told they were anonymous?

Marianne Klowak

I wasn't told they were anonymous. I was told they were experts at what they did, but I didn't know if that meant they were journalists or were they scientists. I still don't know who they are, but they were not anonymous. But the reference was the Toronto Health Unit was concerned that some members of the Canadian COVID Care Alliance were anonymous. And I said I didn't think that was an issue because the fellow I interviewed had gone full-face on camera. But the reason for their anonymity, they were concerned, like, what did that mean? And I said, "Maybe it meant the fact that they're trying to continue in their practice without being disciplined." But for them that was an issue.

Commissioner Drysdale

But they were—

Marianne Klowak

But it was unrelated to the story.

Shawn Buckley

Can I just break in for a second because we've got a couple of hard starts that I just need to inform you of. We have a person online that basically if we don't start immediately, she'll be a short witness. And then I was hoping, you know, then we have a shorter lunch break to hit another hard start. We could bring Marianne back like we had done with Rodney for questions at the end of the day.

Commissioner Drysdale

It's not necessary.

Shawn Buckley

So, yeah, and I'm sorry to cut that short, Marianne. It's just we're trying to manage some other witnesses too. So on behalf of the National Citizens Inquiry, I sincerely thank you for coming and attending. I know that it was a big step, but we really appreciate you sharing with us some insight that we couldn't get unless you came and shared with us. So deeply, thank you.

Marianne Klowak

Thank you for this opportunity. Thank you.

[01:28:58]

Final Review and Approval: Margaret Phillips, September 6, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 4: Samantha Monaghan

Full Day 2 Timestamp: 04:57:12–05:07:58

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Samantha, can you hear me?

Samantha Monaghan

Yes, I can.

Wayne Lenhardt

Okay, and we can hear you. Could you spell your full name for me? And then I'll do an oath with you.

Samantha Monaghan

Samantha Monaghan, S-A-M-A-N-T-H-A M-O-N-A-G-H-A-N.

Wayne Lenhardt

Do you promise that the evidence you'll give is the truth, the whole truth, and nothing but the truth?

Samantha Monaghan

I do.

Wayne Lenhardt

Samantha, to set the stage here, this is about your son who died after he got a blood transfusion. And I think the issue for the Commission is, is this an issue with respect to COVID relating to tainted blood?

And to just set that stage for a second, there was a commission years ago by a law professor by the name of Horace Krever relating to tainted blood related to HIV. So I think this is probably the only time the Commission is going to touch on this issue is with you, so could you give us a quick summary of what happened to your son?

Samantha Monaghan

I took my son to the hospital. I think it was back in September 2022. He had a swollen elbow. So we just were coming from his naturopath and getting a panel done—

Wayne Lenhardt

Could you turn your volume up a tiny bit? I think we're having trouble hearing you. I am at least, anyway.

Samantha Monaghan

I think it's up as high as it'll go. Can you hear me?

Wayne Lenhardt

Yeah. Do we need our volume turned up?

Samantha Monaghan

Yeah, it's up as high as it will go.

Wayne Lenhardt

Okay, I'm sorry, could you start again?

Samantha Monaghan

I took my son into the IWK [Izaak Walton Killian Hospital for Children] hospital in September, and he had a swollen elbow. So I was getting it checked out and they ended up doing his blood work. To make a long story short, his hemoglobin came back and it was very low: it was extremely low to the point that he was going to need a blood transfusion. I said, "Oh, no problem. I have no problem giving my blood for blood transfusion."

Given all my research and studies that I have done with the blood supply and the vaccines and everything, I wanted to make sure that the blood that he was given was safe. So I ended up rallying about 300 donors to give blood to my child because he was O positive and myself was O positive. And I was denied by the blood supply in Nova Scotia that this couldn't be done and that I couldn't be a donor to my son as well. It was all denied, and then I ended up having to give him donated blood from the blood bank.

Wayne Lenhardt

And at that point he died relatively shortly after that, correct?

Samantha Monaghan

He died November the 21st.

Wayne Lenhardt

Do you have any evidence that it was because of tainted blood? Have you looked into that?

Samantha Monaghan

No. No, my son was cremated, and there was an autopsy done. They said that he died from underlying conditions, which possibly could have happened. But it's the way he died that kind of struck home for me. There was no evidence that he was going to die or that he was sick in any way. He got his blood transfusion. We got out of the hospital. It was around three weeks after we were in the hospital, I think, a good couple of weeks. And we were getting our blood done. We'd seen the pediatrician. He was, everything was good. On November the 21st at 5:24 pm, he was sitting on my knee, and he just stopped blinking and he passed away. There was no indication that he was sick or he was going to pass away, and he didn't have any heart conditions.

Wayne Lenhardt

Yeah. He did have some sort of conditions though, did he not?

Samantha Monaghan

He did. He had fumarase deficiency and polymicrogyria, but it doesn't affect the heart. And it wouldn't cause him to have blood clots or anything like that.

Wayne Lenhardt

Okay, and how old was he when this happened?

Samantha Monaghan

He was 11 years old. It happened 12 weeks after the blood transfusion.

Wayne Lenhardt

And I understand he died of cardiac arrest.

Samantha Monaghan

That's what my doctor thinks he had passed away with. But the autopsy said that he passed away from underlying condition.

[00:05:00]

Which possibly could have been because I didn't have anything tested or any means to test his blood after he had the blood to make sure that his blood was okay.

Wayne Lenhardt

And you had rallied some people that had the same blood type as he did, and I understand you have the same blood type as he?

Samantha Monaghan
I have O positive, yeah.

Wayne Lenhardt
And the hospital either didn't want to, or wasn't able to use any of your blood, is that fair?

Samantha Monaghan
Yeah, my parental rights would have been taken away if I hadn't chosen to go the route of the blood donation from the blood clinic. I tried to rally them, but there was no way that I could have used my blood or anybody else's blood. My fear was that he would have gotten vaccinated blood and then he would have died from that.

Wayne Lenhardt
I think I'm going to stop and ask the commissioners if they have any questions or any issues they'd like to explore on this.

Commissioner Kaikkonen
You made a comment, your parental rights would be taken away. Can you add to that and just let us know how?

Samantha Monaghan
Well, if I didn't agree to the blood transfusion, the pediatrician on at that point in time said that my parental rights would have been removed and I would have to leave the hospital. And Luke would have ended up getting the transfusion anyways. So I decided to stay and okay the transfusion under duress.

Commissioner Kaikkonen
So just to make sure I got this right, the pediatrician said that if you didn't agree to a blood transfusion that—

Samantha Monaghan
Yeah, there wasn't any option. I couldn't use my blood, nor could I use the donors' or anybody else that would want to donate to my son. The only option I had was to use blood from the Nova Scotia blood bank. There was no talk. There was nothing: either I did it this way, or they would have took my parental rights away and I would have ended up having to do it anyways. He would have ended up getting the blood transfusion.

Commissioner Kaikkonen
So did Canadian Blood Services and Halifax inform you that there is an option for putting your blood aside when you're expecting to have some sort of blood transfusion in the future?

Samantha Monaghan
No, I wasn't given an option.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Yes, Dr. Massie.

Commissioner Massie

I have a question about the underlying condition or the situation that actually led to the necessity of blood transfusion. Are they related or are they completely two separate medical conditions?

Samantha Monaghan

Fumarase deficiency controls the Krebs cycle, so it could have been a factor for his iron getting low, his ferritin getting low. But he never had hemoglobin getting low because of his condition before. His survival rate was infancy, and he was 11 years old. And I did all natural treatments with him.

Commissioner Massie

My other question, you had concern about getting blood from the Canadian blood bank. What was the kind of information that you gathered in order to raise some questions about that?

Samantha Monaghan

It would have been what was in the vaccine that was killing people or making people sick. My worry is that it was going to be in the blood if it was infused out, spike proteins or graphene oxide would have been in the blood that would have harmed him in some way.

Commissioner Massie

Thank you very much.

Wayne Lenhardt

Are there any other questions from the Commissioners? One question that I have is what was on the documents as to the cause of death of your son?

Samantha Monaghan

"Underlying conditions," I do believe.

Wayne Lenhardt

Okay. Any last questions? No. Okay, I want to thank you very much on behalf of the National Citizens Inquiry for giving us your testimony today. And thank you again.

Samantha Monaghan

Thank you very much. Thank you.

[00:10:00]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 5: Dr. David J. Speicher

Full Day 2 Timestamp: 06:00:07–06:44:31

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Welcome back to the National Citizen Inquiry. My name is Wayne Lenhart, and our next person to testify is David Speicher. David, can you hear me?

Dr. David Speicher

Yes.

Wayne Lenhardt

I can hear you. I believe you have some slides set up with AV here. So I'll just quickly introduce you, and then you can launch into your presentation [exhibit number unavailable]. You did your university, I believe, in Ontario. You have a PhD from McMaster.

Dr. David Speicher

No. No, I do not.

Wayne Lenhardt

Okay, you have a doctorate from somewhere. Can you tell me where that is, please?

Dr. David Speicher

I will launch into my slides, if can you see them?

Wayne Lenhardt

We've got your first slide. But before we do that, could you spell your full name for me and then I'll do an oath with you.

Dr. David Speicher

Dr. David Jeremiah Speicher, it is D-A-V-I-D S-P-E-I-C-H-E-R.

Wayne Lenhardt

Do you promise that the testimony you'll give today will be the truth, the whole truth, and nothing but the truth?

Dr. David Speicher

Yes, it is. Absolutely.

Wayne Lenhardt

Thank you. I see from your slide there, you're a visiting professor of health science at Redeemer University in Ontario, and I believe you have a position at McMaster as well.

Dr. David Speicher

No, I used to. So if I can go to my next slide.

Wayne Lenhardt

There it is.

Dr. David Speicher

My undergrad is in Biology at Redeemer. I have stuttered my whole life. It gets worse when I'm tested up. And that is okay. I know my things well. I have a Master's in Diagnostics of Coronaviruses, and a PhD in Viral Diagnostics, both of which are from Griffith University in Queensland, Australia. I have worked in Kenya, India, Australia, Egypt, and here in Canada. I've done two post-doctoral fellowships at McMaster University, in molecular microbiology and in epidemiology.

I have run as a lab director two COVID-testing labs during the pandemic, doing between 5 and 15 thousand PCR tests per week, all on asymptomatic transmission. I have taught at Redeemer University since last fall in the courses of microbiology, genetics,

[00:05:00]

and PCR testing. I am now a visiting prof here in a paid job. And to disclaim: I am a co-applicant on a new SSHRC [Social Sciences and Humanities Research Council] grant a few months ago.

All of these are all scientific observations I have made during the pandemic. And I have 34 publications. Most, if not all, use PCR. And I have co-authored a method paper with the Wuhan Institute of Virology on Whole-Genome Sequencing of SARS-CoV-2 in Saliva.

Would you like me to keep going and dive into my thing or just my background?

Wayne Lenhardt

I think you are very well equipped to deal in this area, Dr. Speicher. I wonder if perhaps you could go to your slides relating to PCR testing, and maybe we'll have a look at that.

Dr. David Speicher

Sure. I'd like to say, too: I worked on the team that first isolated the virus. I was removed off the team before I could see things. A FOI [Freedom of Information] request has shown that McMaster records has found no responsive records about isolates of this virus apart from this published paper. So, it begs the question: either there's scientific misinformation going on or something isn't right at McMaster for them to give false information on the FOI.

There's been millions in Gates funding poured into McMaster. Millions, including their new NEXUS pandemic hub for \$12 million given to McMaster by Bill Gates to look into COVID-related issues.

There is also a potential conflict of interest. One of their profs in the field of ethics and policy for innovation on their NEXUS hub—before the pandemic—was paid \$278,000. In 2021, this jumped up

[00:10:00]

to \$623,000 and last year \$461,000. She has ties with Bill Gates and the WHO. So are these people funding our Canadian institutions? Absolutely, they are.

I work on PCR. I love it. It's a very elegant, super test. However, it cannot tell us if we are sick. It can just tell us—is this DNA or RNA sample sequence in my sample? And that's it. Is this viral RNA in my sample?

And so, a lot of people on our side, I've heard things said: "PCR assays are 97 per cent false positive. It should not be used." Well, let's not throw the baby out with the bath water.

So all of this occurred in the first paper looking at Sars-CoV-2 by PCR. It was poorly designed and improperly validated and made.

Well, my team put out this. And the main point is the bottom line here: "If someone tested positive by PCR at a threshold above 35 cycles, the probability that said person is actually infected is about 3 per cent."

Why is it 35 cycles? If we go beyond that, it does not work. This is the limit of the detection of the amplification. On the left is right out of the Seegene package insert. These are for E gene, RdRP gene, and the N. These are highly conservative rates areas and great PCR targets. It says below on the left: a positive is anything before 40 cycles. If we look on the right—this is all my own data—and it shows the cutoff limit of detection of the test is 37 cycles.

And therefore, we can't tell. The lower Cts cannot be compared between labs. It's all dependent on when the sample is tested, which swab, the hour things are extracted, amplified, and looked at. And so, a cycle between institutions

[00:15:00]

varies sometimes two or three, sometimes five cycles, and this is why CTs from a clinical lab never report these to a physician. So, a Ct value might change, except a positive in one lab should be a positive in another lab.

So Public Health Ontario put out a report in September of 2020, and said, on the left, any amplification that occurs before 37 cycles is a true positive. If it's between 38 and 40, it needs to be retested.

In my lab, on the right-hand side, this is what we did—if it's two or three [positive genes] before 37, things are positive. And key values are never given out to a physician. We need a better link-up between a physician and the clinical lab, and, too, a PCR assay, most times if it is a true positive with symptoms amplified before 30 cycles. And, therefore, I think we should have had two cut-offs: One between 35 and 37, which is the assay limit of detection—"Is this virus in my sample or not?" And then at about 30—"Is this individual infected or not?"

So, if we look at PCR versus a RATs [Rapid Antigen Test]: Is this thing actually replication incompetent? The PCR is very, very sensitive, although it doesn't tell—is this replication competent? Or is it replication incompetent and, therefore, is not in fact infected? And so we needed to not run things basically off of a single PCR test.

Now, how were our samples worked out? Well, most people drove, in a big line-up, to a collection facility,

[00:20:00]

and they had a nasopharyngeal swab rammed right to the back of their nose. Is this the best test? Sure, it's the gold standard. But if you are sick with symptoms, a simple mid-turb [mid-turbinate nasal swab, MTS] right in here, works just as well.

As well, if you look at the lower right, if you're doing a nasopharyngeal, it's going right in the back: it is 97, 98 per cent. But a mid-swab [MTS] is about 87 [per cent], which is just as good as an oral swab of the mouth. And so why didn't we swab people's mouth, swab inside their nose? And not ram things right to the back, and then in some instances cause harm.

This is a case-demic. It's not a pandemic of all sick individuals. We need to work out: Is this individual infected at a low level and has no symptoms? Or do they have a high enough viral load to infect other people?

And if you are infectious, most times you have symptoms. These are all numbers of people with COVID. COVID is a disease, and therefore, you must have symptoms. Except most of these—and all of these case counts—are off of a PCR positive test where the individual is either asymptomatic or with symptoms. Those things were not differentiated at all. And so, this is not just sick folks: these are sick people carrying the virion and those who are not sick.

We've all heard of HPV, which is the cause of cervical cancer. HPV is found easily on your forehead, on your hands, on your skin. Unless it infects your cervical cells, it will not cause harm. Therefore, I don't care if you are infected or if you have it and don't have symptoms. You need to be sick with a high enough load to pass on things to make other people sick.

This brought up the whole thing of asymptomatic transmission. If you are asymptomatic, you could pass on things and make other people sick and “kill Grandma.” And this is highly unlikely.

[00:25:00]

An infectious dose is between 500 and 2000 replication competent virion, which is around a Ct of 24 to 27. Therefore, we must have two cut-offs: one at the 35, which is at the limit of detection; and one at 30—is this high enough to cause someone else to get sick?

The viral load always jumps up within two days before the symptoms, then comes back down around day six to eight. And an individual can be PCR-positive 90 days post-symptoms. This is all non-infectious, non-replication competent virion being sent out of the system.

Therefore, asymptomatic transmission is rare. If you are sick, you don't lock down an entire city. If you are sick, stay home. It's that simple.

Last point: rapid antigen tests. We've all seen them; we've all done them. You stuff things in, you add the stuff, wait 15 minutes. If you don't do it right, if you don't add enough stuff, or if you add too much sample, if you don't add any stuff first: these here will give a false positive test.

And Public Health knew this. We were all informed. These are a cheap, quick screening tool. They are about \$16 per test. A PCR test is between \$50 and \$100 per sample. However, a rapid antigen test has a limit of detection of about 1 million viral copies and that's it. One million, which is around a PCR cycle between 25 and 21.

Therefore, you will develop symptoms before these here turn positive, except for Delta. And therefore, a RAT test should never have been used on people which are asymptomatic and only in people with symptoms. A RAT is a presumptive test, and any positive test must be confirmed by PCR.

Now, last point. We have wasted millions on PCR testing

[00:30:00]

of people which were asymptomatic. These should only have been used on people with symptoms. There's been five or six non-health care providers that have set them up and most of those are now shut after the PCR has been pulled. They did between 5,000 and 15,000 tests per week and charged between 50 and 100 bucks per test. You can work out **the math on how much they made.**

And so they are now folded. Most of those said, “Oh, we'll do asymptomatic testing to take things off of our main hospital labs.” They made millions.

As soon as PCRs ended, they were pulled. There were five Thermo Amplitude systems set up across Ontario in our government labs. They were about \$500,000 per system and can just run a full plate of 384 samples per plate, 10,000 bucks per run. And if someone messed something up and you had to repeat the whole thing, you've just wasted \$10,000 of taxpayers' money.

Most of these systems have not been used since April of last year, April 2022. And there are thousands of expired reagents sitting on shelves, all purchased by taxpayer funding.

Therefore:

Bill Gates has infiltrated most of our institutions to push these vaccines.

The PCR is an elegant, sensitive lab technique when it is used right and not to inflate numbers of asymptomatic folks with COVID when they aren't actually sick.

We don't need a nasal pharyngeal swab if a mid [MTS] or an oral swab will suffice.

It's not a high cycle count thing, which I've heard some folks say. Any sample beyond 35 cycles should not be called as a positive test ever.

We need more relations between a clinical lab and bedside to work out if they are "infected" or if they are "infectious," and not rely just on the PCR test for our numbers to represent a pandemic.

And a PCR and a RAT

[00:35:00]

should only have been used ever in people with symptoms.

That is all I have. And I am more than happy to answer any questions from anyone, ever.

Wayne Lenhardt

Are there any questions from the Commissioners? Yeah, Dr. Massie.

Dr. David Speicher

Dr. Massie.

Commissioner Massie

Thank you, Dr. Speicher, for your presentation. I have a couple of quick questions. First one is about the comparison between the rapid antigenic tests and the PCR.

It was argued by some people doing, I would say, monitoring of the epidemiology that, **although the PCR test was more sensitive than the rapid antigenic test, the advantage of the rapid antigenic test is that you would get the answer immediately instead of waiting for whatever—sometimes it was days, depending on the system you were relying on. And it would give you the answer: Am I infectious now? Versus, am I potentially infectious? And I would get the answer by the time, I don't know, I'm isolated or I risk contaminating other people.**

For the management of this kind of— If one assumed that any contamination has to be avoided at all costs, which is a different topic altogether, having a rapid response to tell the people, "Okay, you have symptoms; you seem to have the virus because we can detect the antibody. You can self-isolate for a couple of days and wait until you're no longer infectious."

So why is it that this has not been more readily implemented? Because I don't think that the delay between the time the PCR was available and the rapid antigenic test was made public to people was that significant in terms— So why is it that we have not proposed this approach instead of the massive PCR testing?

Dr. David Speicher

What is your question simplified, Dr. Massie?

Commissioner Massie

What I'm asking you is—were we technically limited in the deployment of the rapid antigenic tests? And that would explain why it took so long before we had them available? To my knowledge in Canada, I don't think we've seen cases where the monitoring of the waves of infection was relying on this method versus the PCR. The PCR had always been the gold standard to monitor the number of cases.

Dr. David Speicher

It is the gold standard. And you're right there. A PCR test is made faster; it's much more easy to make and to use. Our first tests were deployed around late March, most of which are lab-developed tests. I think, though, that if we are looking at infectious loads, a rapid test is actually better. Because if you are sick and you have a high enough load, you will get a positive test. But if you are before symptoms when it's low or you are post-symptoms, you're not going to get a positive test. And so, there is a very short step, a shortened

[00:40:00]

window of about five days when they are actually useful. And that's it.

Commissioner Massie

My other question has to do with following of the different way that we always focus on cases based on PCR positivity. If we're not arguing at this point about the threshold that has been established and was not well-communicated—sometimes it was higher; sometimes it was lower, we didn't know. But my point is: If you want to look at historical data since the beginning of the pandemic up to now, why is it that we don't see more frequently what I would call the positivity rate, which is how many positive cases you get per number of people you've tested? Because if you want to compare whether you are in a very big wave or small wave, you could be misled by the number of tests you're doing.

So why is it that this was not implemented from the get-go?

Dr. David Speicher

It should have been. I talked early on with a colleague and I'm like, "Why are we calling all of these 'COVID-positive tests' and not a 'SARS-2 positive test?' One has symptoms and one doesn't." It was all because "COVID" would make things easier. And I'm sure it also inflated the count from a lab. All we receive is a tube with a name, date of collection, birth date, and that's it. There's no vaccine status; there's no symptoms. And all we give back is a positive or a negative result. And that's it. And so, it could be a positive with symptoms or without. On a lab end, we have no idea at all. That is all the physicians.

Commissioner Massie

Thank you very much. Thank you for your answer.

Commissioner Kaikkonen

I have more of a comment. I just want to applaud you in speaking or confronting the stereotypes that go along with stuttering. You did a great job and you're certainly a prime example of someone who pursued education and stands as an equal. Thank you for your testimony.

Dr. David Speicher

Just for the record, I thank you for that. I have now lost five jobs during the pandemic because of my stance on things. So you just have to keep fighting and keep to the scientific facts, that's it.

Wayne Lenhardt

Are there any other questions from the Commissioners? No.

Dr. Speicher, I want to thank you very much for your testimony today on behalf of the National Citizens Inquiry. Thank you for coming.

Dr. David Speicher

Thank you so much. Thank you.

[00:44:35]

Final Review and Approval: Margaret Phillips, September 24, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 6: Jean-Philippe Chabot

Full Day 2 Timestamp: 06:44:50–07:28:08

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Good afternoon, Mr. Chabot. Can you please spell and state your name for the record?

Jean-Philippe Chabot

Yeah, it's J-E-A-N, dash, P-H-I-L-I-P-P-E. Chabot, C-H-A-B-O-T.

Kassy Baker

I apologize for my mispronunciation. Do you promise to tell the truth, the whole truth, and nothing but the truth regarding your testimony to us this afternoon?

Jean-Philippe Chabot

Yes.

Kassy Baker

Very good. Now I understand that you were employed by the CBC and that you were subsequently suspended because you refused to disclose your vaccination status. Is that correct?

Jean-Philippe Chabot

That's correct.

Kassy Baker

Before you tell us a little bit more about that experience, can you just start by telling us a little bit more about yourself? I understand that you're married, is that correct?

Jean-Philippe Chabot

Yeah, I'm married. I have four children: three girls, ages seven, five, three, and a seven-month-old boy. I'm a French Canadian. I was born in Montreal in 1982. I've worked as an analyst most of my career, including 10 years in mainstream media. Software quality analyst, mostly.

Kassy Baker

Very good. And were you trained for this line of work or how did you come to have this profession?

Jean-Philippe Chabot

Yeah, I had a little bit of training, did a little bit of computer science in CÉGEP [Collège d'enseignement général et professionnel]. But mostly I'm self-taught. I mostly learned on the job.

Kassy Baker

Very good. When did you first start working for the CBC?

Jean-Philippe Chabot

I joined the CBC in 2018, specifically, Radio-Canada's Médias numériques. And by the way, I'm going to be saying CBC a lot. But most of the time I mean CBC/Radio-Canada. So I joined the Médias numériques, which is where they do most digital projects for the French-speaking audience. So websites, mobile apps, all the infrastructure underneath the streaming services. Myself, I worked mostly on TOU.TV when I was there. So it's the equivalent of CBC Gem. It's the streaming service, the French streaming service.

Kassy Baker

I understand from your description that this was a largely digital role or something that you largely performed with computers. Is that correct?

Jean-Philippe Chabot

Yeah.

Kassy Baker

Where were you required to perform these duties?

Jean-Philippe Chabot

Well, when I joined, we were at the office in Montreal. But when the pandemic started, I was on parental leave. And when I came back from parental leave, everyone was already working 100 per cent from home. Everyone at Médias numériques.

Kassy Baker

When you returned to work after the pandemic had started, were you able to fulfill all of your duties from home or only most of them?

Jean-Philippe Chabot

Oh, yeah.

Kassy Baker

Sorry, all of them?

Jean-Philippe Chabot

Yeah, all of them we could fulfill from home. There was no use case that required me to go on the premises. And it was the same for almost everyone.

Kassy Baker

And so, most employees at that point in your division were working from home at that point. Is that correct?

Jean-Philippe Chabot

Yeah, to my knowledge all of them. All of us were working at home.

Kassy Baker

Prior to having left for a parental leave and the onset of COVID, what was your relationship like with the CBC, your employer?

Jean-Philippe Chabot

Well, I really enjoyed working there. I would describe it as an extremely positive experience. Professionally, it was an ideal place for someone in my field because there were many issues to tackle and a lot of freedom to use our creativity, our problem solving. It was just incredibly positive. For me, it was a source of motivation that it's a public entity. I felt like a civic responsibility working there. So that was important. Overall, I felt it was an important institution. And the work we did there, even though it's not life or death deciding services that we worked on, but it's every Canadians': we're all co-owners of the CBC and what they produce there. So that felt good working on that kind of thing.

And overall, like the culture there, the attitudes of my colleagues, they were a good fit.

[00:05:00]

The three years and a half that I was there, I met a substantial amount of people that I really enjoyed working with and being around. It's basically where I wanted to be for the rest of my career. I just loved it there. I made plans to keep working there, and it didn't happen.

Kassy Baker

Alright, so you are no longer working for the CBC at this point in time, correct?

Jean-Philippe Chabot

That's correct.

Kassy Baker
Why is that?

Jean-Philippe Chabot

Well, they implemented mandatory vaccination, and I didn't disclose my vaccination status. I was put on indefinite leave without pay for a while. But overall, all the measures they took for that policy, it just led to me not being able to continue working there or to work there ever again, I feel.

Kassy Baker

When was the idea or the suggestion of a vaccination policy first raised or introduced by your employer?

Jean-Philippe Chabot

Well, we'd have to go back to spring or summer of 2021. During that time, mandatory vaccination, or just vaccination in general, was a heavily discussed topic. I think it's June or July, the CBC felt compelled to, at one point, state its position on mandatory vaccination on the internal employee website. They posted a statement that basically said that vaccination was a personal choice and that they couldn't impose it unless a law was requiring it. So that's the first time we started hearing about it internally. So, yeah, that's the first time.

Kassy Baker

Obviously, at some point, that policy changed. When did that policy change?

Jean-Philippe Chabot

Well, not long after that. I think it was the early fall or the end of August or September. I was hearing the federal government talking about mandating the vaccines for federal workers. So I was concerned. Even though the CBC stated that it was a personal choice and that they couldn't impose it, I wasn't really reassured by that. But at one point, the CBC announced that they would ask us to disclose our vaccination status. I think they announced it at the end of September, and on October 1st, we got the form that we needed to fill to disclose our status.

Kassy Baker

Did you complete the form?

Jean-Philippe Chabot

No, I didn't complete it because I didn't want to disclose. I didn't think, at that point, it was even in their right to ask for our vaccination status, which I consider to be personal medical information. So I didn't disclose. And on the form, there was not even an option, something like—I opt out; I prefer not to disclose. There wasn't that on there. But I screenshotted the form and photoshopped in an additional option that said I prefer not to disclose. That's what I sent in just because I didn't want them to accuse me of not replying. So I did reply in that way.

Kassy Baker

What response did you receive when you submitted this altered form?

Jean-Philippe Chabot

They acknowledged my response, and they basically just said thank you. But at that point, they had already given us a deadline up until October 31st to do it. But, yeah, they acknowledged it.

Kassy Baker

I understand you did some research in coming to the decision of whether or not you would complete the form. Can you tell us a little about that?

Jean-Philippe Chabot

Yes. So the reason I didn't want to disclose, like I mentioned earlier, I didn't think they were in their right. And that's because I'd found out on the CRHA website, which is the l'Ordre des conseillers en ressources humaines agréé, which is a professional association in Quebec— Well, I guess these HR directors, there's a few of them, but those that were communicating this stuff to us at the CBC,

[00:10:00]

I guess they were part of this association because they have this title in their signature, CRHA.

So they put out a statement, not a statement but more like a dossier, like a webpage with information on vaccine status disclosure. And in there, it said very clearly that disclosure had to be voluntary and that no reprisals could be brought upon an employee who refused to disclose. They cited different laws: they cited the Charter; they cited the Code civile du Québec and other laws. So I felt pretty confident that I was right, that I didn't need to disclose. Like I said, I was working remotely, so it didn't even matter whether I was vaccinated or not for me at this point.

Kassy Baker

If I understand correctly, the form was due October 1st, is that correct? The disclosure form.

Jean-Philippe Chabot

Yeah, they sent it to us October 1st, but we had a month to reply to it.

Kassy Baker

When was the mandatory vaccination policy brought into effect?

Jean-Philippe Chabot

Well, the federal government brought its directive for mandatory vaccination of the federal— Well, not all federal workers, but it was central administration workers and the

RCMP. That came down on October 6th. I don't know when it was announced, but they had been talking about it for a couple of months earlier. And not long after, October 21st, the CBC announced its own mandatory vaccination policy. Most people had disclosed their status at this point. But this new policy was announced, and we had until December 1st to show proof of having had two doses. This applied to every employee, pretty much like it was announced by the federal government. There were also people working remotely in the central administration, but probably the RCMP, as well. It affected even people who worked 100 per cent from home. So the CBC pretty much copied the federal government in that sense.

Kassy Baker

You've said that the policy required all employees to show that they had received two doses by December 1st or that they would be put on indefinite leave without pay. Was there any option to test instead of receiving the vaccination?

Jean-Philippe Chabot

Nope.

Kassy Baker

I think you've already answered this, but just to be very clear—was there any exemption offered to those employees who were working 100 per cent remotely?

Jean-Philippe Chabot

Yes, there were exemptions offered to everyone, even people working on premises. So you could request a medical exemption or a religious exemption. But what bothered me is that when they announced that, right from the start they said that— Well, medical exemptions, probably they would honour that. But it's rare that people have a medical condition that prevents them from getting those vaccines.

But the religious exemptions, a lot of people applied for them. But right from the start, the CBC told us that very few would be granted. So I don't know. That just didn't resonate well with me. I didn't apply for one myself. That's not the path I chose to defend my case. I spoke to many people who applied for one, and every single one was rejected. Even those who seemed bulletproof, basically, who were signed by their bishop, and they were all turned down. So that was kind of disappointing.

But the way they announced it, I kind of expected that. It was supposed to be based on your sincere belief. So if you hold a sincere belief, you'll be able to get an exemption. But I think there was something else going on with the process. It seemed like it was based on something other than the person's sincere belief—the decision to grant the exemption or not. Some people even received

[00:15:00]

their letter informing them that they were being put on leave without pay. Around November, just before the deadline of December 1st hit, some people even received confirmation that—"Yes, you're being put on leave without pay for not complying to the policy," while they were still waiting for a decision on their religious exemption. So something's not right there.

Kassy Baker

What did you do in those few weeks between when the policy was announced and when it was actually going to be implemented?

Jean-Philippe Chabot

I wanted to resolve this, so I wrote to HR. They had set up this generic email for all of these issues that had to do with the policy. So I wrote to that email and I asked them if it was legal, what they were doing, if it was constitutional. The answer I got back was that it was mandated by the government. So one of those HR directors told me that it had been mandated and that the mandate applied to the Crown. Well, it was mandated through a directive that applied to federal workers, including Crown corporations.

I also brought all these arguments that the CRHA, the l'Ordre des conseillers en ressources humaines agréé, put out; I also sent that to my union. So I was in discussion with both the CBC and my union at that time.

That's also what my union told me: that it had been mandated by the federal government. After that, I asked them— Because I had read the directive. So when they mentioned that, I had already read it. And I knew, at least from what it seemed—and I had other people read it as well, just to make sure—it didn't apply to Crown corporations. It didn't apply to us. It was limited to the central administration and RCMP, and there was no mention of Crown corporations in there.

Kassy Baker

Did you specifically point that out to your employer and to the union that it appeared from your reading that it did not apply to Crown corporations?

Jean-Philippe Chabot

I did.

Kassy Baker

What was their reply?

Jean-Philippe Chabot

Well, I pointed it out to the union. I sent them the text. I basically walked them through it. And my union ignored it. What I asked the CBC—when they mentioned that directive—I just asked them very simply, “Which directive is that? Can you tell me where it says who it applies to, just to verify that it applies to Crown corporations?” And they basically shut the door to any further discussion when I mentioned that.

Kassy Baker

I understand that the CBC also has an appointed ethics commissioner. Did you attempt to raise this issue with the Commissioner?

Jean-Philippe Chabot

Not myself. But because we were able to form a little group of people who were in the same situation, we reached out to each other via different means. I know that one person in the group wrote the ethics commissioner at the CBC and basically showed her that the mandatory vaccination policy violated many, many points in the CBC's own Code of Conduct. I don't remember a reply exactly, but it was something like— Well, she just basically stated that it was out of her purview. She didn't seem to want to get involved with us at all.

Kassy Baker

Okay, and what did you do when the deadline came along finally?

Jean-Philippe Chabot

I'm just checking to see if we missed anything.

Kassy Baker

You mentioned to me at one point that you believed, you referred to the CBC Code of Conduct. I believe that you've mentioned certain criteria that you believed they would be required to meet in order to implement a mandatory vaccination policy. Is that right?

Jean-Philippe Chabot

Yeah, exactly. That's a very important point. One thing I want to mention before that. You know those statements that l'Ordre des conseillers en ressources humaines agréé put out on their website. I found out later that Radio-Canada, in French, put out an article where Manon Poirot,

[00:20:00]

which was the head—I don't know if she's still the head of that order—but she basically stated in the article exactly those points: that a vaccine disclosure had to be voluntary and that no reprisals could come to employees who refused to do it.

So regarding these other points that I brought to the attention of my union— Because the CBC had refused to discuss this with me and since my collective agreement and my contract didn't allow me to represent myself, I had to go through my union. So at this point, I was basically trying to convince my union. And one way I attempted to do this is using Charter law. Because I read that— Well, to me, mandatory vaccination was pretty clear that it was **by itself a violation of your Charter rights. There were limited circumstances under which Charter rights could be suspended, I guess. But from what I'd read, the law really seemed to be on my side. Because I'd read, for example, that it had to be demonstrably justified. It had to be the least infringing measure available. And it had to be proportional. This principle of proportionality, it has to do with the means of attaining an end being no more than what's necessary.**

When I read those things and I considered the CBC's policy and my context—I'm being remote, working from home all this time. I didn't think the policy met those criteria. So I felt pretty confident that if I demonstrated that and showed all that to my union they would have to, even though I knew that they were reluctant. It was obvious that they didn't want to represent me. I thought that if I did the work—that's supposed to be their work—if I did

that, like in a well put out manner, that it would have to represent me. But yeah, that's not what happened.

Kassy Baker

Did your union ever end up filing a grievance on your behalf?

Jean-Philippe Chabot

No, they refused to do it. And I did multiple demands for a grievance. Because initially, I argued on that front using Charter case law—that it was just that the CBC could meet that threshold of implementing mandatory vaccination. They rejected that demand for a grievance based on that. I also asked them to grieve the fact that the CBC was using “leave without pay” as a disciplinary measure, which is not something that's in the collective agreement. It's not something that's in my contract, either. But my union basically just said that the CBC was fully in their right in doing those things. They cited a clause, I don't remember exactly, but there's a clause in the collective agreement that says something like, “for every point that's not stated explicitly in the collective agreement, well the employer can do pretty much carte blanche whatever it wants.”

Kassy Baker

When the mandatory policy took effect on December 1st, what happened to you on that date?

Jean-Philippe Chabot

Well, you know, I'd been working from home all this time. So that morning, just like usual—I knew this was coming, and, at that point, I was pretty sure that they would enforce it—but I went on the computer, tried to log in to do my work and meet my team, and all my access were revoked. So even basic things like email, access to the employee portal. Like email and employee portal, I don't think someone— Because usually leave without pay, the employee has to ask for it; it's something that the employee requests. When they do it under normal circumstances, I don't think their email access is cut off. I don't think their access to employee services, like the portal we have, is cut off, either. So seeing all that was kind of a shock. To me, it just meant that they really didn't want us even communicating amongst ourselves,

[00:25:00]

or communicating easily, at least, with each other using our work email. So, yeah, that was a shock on December 1st.

Kassy Baker

What impact did the suspension have on you and your family financially?

Jean-Philippe Chabot

Well, I lost my income. And we didn't have access to EI [employment insurance]. I say “we” because that's basically the experience of everyone I've spoken to that was in my situation. We didn't have access to EI because it was considered misconduct to not comply to these

policies. So having to find work—this was December—so having to find work or other sources of income during the holiday season, that's not ideal.

Kassy Baker

Were you the sole earner of the family?

Jean-Philippe Chabot

Yeah, I was. Yeah, my salary was my family's only income. So that was stressful not only for me but for my wife as well. And when two parents are stressed out or anxious about something like that, about the financial strain like that, it had an impact on my children, as well. And they're young, so they're sensitive to this kind of stuff. They can't understand yet what was going on.

Kassy Baker

Now, something you've mentioned to me earlier that I would just like to talk about a little bit. So you were not dismissed or terminated, but, instead, you were suspended without pay. I understand that you were also required to maintain your insurance and benefits. Is that correct?

Jean-Philippe Chabot

Yeah, that's correct. That's part of the policy. The CBC told us that— Well, they didn't leave us a choice, really. They said, "You will be keeping your insurance and benefits, and the cost will effectively double because we won't be covering half of it," like they normally do. So that was an extra financial burden that they were putting on us. I guess what bothered me about that is that the union didn't bat an eye at that. They seem to endorse that kind of stuff as well.

Kassy Baker

Were you aware of other employees who were similarly suspended as you were on December 1st?

Jean-Philippe Chabot

Yeah, like I mentioned, we were able to organize a small group so that was incredibly beneficial because none of us had to go through this alone. I can't imagine having gone through this. I wouldn't be here. If I had gone through this alone, I'm pretty sure I wouldn't be here testifying because it would have made things much, much worse.

I heard their stories, as well. Because I was one of the lucky ones. I found work pretty quickly. I mean, the kind of work I do, there's a ton of demand for it right now. So even during the holidays, I was able to use my remaining vacation time, use just a little bit of my savings to keep everything going, basically feed my family. And then I could work again pretty quickly. Even though I had no EI, it went pretty smoothly. So I'm one of the lucky ones.

But some of the stories I've heard. People were put in very vulnerable positions by these measures. I'll give you an example or two. I know this woman who's 58 and she was employed at the CBC. She has a specialized skill set in broadcasting, TV broadcasting, so

there wasn't any work for her in her field when she was put on leave without pay. She's a single mom. She has a house; she has a daughter in university. So just to keep things together, keep her house, keep her daughter in school, she had to look for a job. Basically, she found a minimum wage job, and she had to burn through all her retirement savings, her RRSPs, just to keep things going. And she's not seeing that money again. So that's one example.

Other examples, well, just in general, there were other measures affecting the unvaccinated at this time. So people couldn't travel.

[00:30:00]

I had a colleague who had family overseas who wanted them to come over because a family member was dying. They were sick. They were dying. They wanted to see their family one last time. This person, on top of being put on leave without pay, they couldn't travel. So that's compounded pressure on these people. That's just horrific.

Kassy Baker

Now, we're nearly out of time. I don't want to rush you, but there's just a couple of more quick points that I would like to talk about. The vaccine policy was actually suspended at some point. I believe you told me it was June of 2022, is that correct?

Jean-Philippe Chabot

Yes.

Kassy Baker

Were you asked to return to work at that point?

Jean-Philippe Chabot

Yeah, I was asked to come back to work after being on leave for seven-plus months, receiving no communication from the CBC. I considered personally myself constructively dismissed at that point. So I told them, "No, I won't come back to work."

And one of the other reasons is that because— They had basically mirrored what the federal government was doing, and the federal directive that applied to federal workers also ended just before the CBC ended theirs. And it was clear in one of the documents that the Treasury Board put out—that they called the manager's toolkit that talked about **people coming back from leave without pay—that they were only suspending the policy. They weren't revoking it. So I couldn't see myself going back there and having this Damocles' sword above my head that this could happen all over again. It was just too much pressure.**

People in my group, some of them wanted to go back. Some of them considered it, but they engaged with the CBC. They asked questions: "Well, if I come back, what will happen? If you decide to bring the mandate?" All that stuff. Well, first of all, the delay that they gave us to come back was very short. So in those short few days or weeks, the people asking questions weren't really getting the answers that they were expecting. The CBC was putting pressure on them, and some of them were resigned. Without even resigning themselves, the CBC just

stopped talking to them, stopped answering to them, and they learned through employee services that they had been effectively resigned.

Kassy Baker

My final question, subject to any questions that the commissioners of course may have, is why did you want to testify today?

Jean-Philippe Chabot

Yeah, so the main reason I wanted to testify was because I want people to be able to have an informed opinion on the CBC and what it stands for. It's an important institution, like I said, and I think you can learn a lot about an organization by the way it treats its employees.

We haven't really talked about this, but the stated goal of the CBC, by implementing mandatory vaccination, was to ensure the safety and the security of its employees in the workplace. So I don't understand why that would apply to people working remotely. I mean, it's not even logical. So it looks like they put aside even the most basic logic in favour of this all-vaccine ideology. Everyone had to be vaccinated. I was supposed to continue working from home. During those seven-plus months, almost everyone in my department was working from home. Here and there, people who wanted to could go to the office. But they were allowed to work from home during all this time. Even today, remote work continues. This had been communicated to us that the remote work would continue, by the way, even before the policy began. So everything pointed to remote work, and this is what the union should even have pushed for. There's no better measure to ensure the safety and security of people in the workplace than remote work.

So I don't know why they coerced me. But when you have a stated goal that there's no logic with the measures you're taking—this has to do with also being demonstrably justified and the least infringing and all that stuff. If they followed the law, they would just have kept the status quo and allowed me to continue working from home. But they didn't. So that really bothers me.

[00:35:00]

And to me, it feels like that's not the real goal. The official one that they stated is not the real goal. It bothers me that the CBC seemingly tried to use one ostensible purpose "safety in the workplace" to make this policy appear acceptable, while they don't disclose the real reasons behind it.

So I want people to think about that and to reflect on the fact that, yes, you can learn about an institution or any organization as a whole by the way it treats its employees. There was no justification to treat us this way, to prevent us from keeping working from home. And I wonder, I want people to ask themselves—if the CBC can't be trusted to be ethical in the way it treats its employees, people should ask themselves if it can be trusted to be ethical in its other activities, including news reporting and all that stuff.

So that's the main reason I wanted to come and tell this story.

The other reason is because I don't know how many people the CBC coerced into getting these vaccines. I know some people didn't want them and some people had to betray their own conscience to comply to the CBC's policy. So those people, I want to acknowledge that

they exist. I know that some of them have been harmed physically by the vaccines. I wish I could have reached out to them just for mutual support and to tell them that they were not alone. So those are the reasons.

Kassy Baker

Thank you. Okay, there's one question. Please go ahead.

Commissioner Massie

Thank you, Mr. Chabot, for your testimony. Do you consider yourself as an informed citizen?

Jean-Philippe Chabot

Yes, yes, I do. I'm an analyst by trade, so I'm used to dealing with information in general, and I'm someone who grew up with the internet at their fingertips. So, yeah, I do consider myself pretty informed.

Commissioner Massie

What kind of research would you have done to raise doubt about the vaccination to the point that you were willing to put everything on the line not to get vaccinated?

Jean-Philippe Chabot

Very simply, I just thought that the risk-benefit ratio was not in favour of the vaccines at all, at all. The risks were scary, and the benefits, I didn't see any evidence of that. The CBC, when they tell you, "Well, we have this objective of ensuring safety and security in the workplace," I would assume that they would show evidence that it has an effect on safety and security in the workplace. I haven't seen that evidence myself. And the CBC certainly hasn't produced any to show to its employees. So from the research I did, the benefits didn't seem to be there, and the risks seemed huge. I have four young children—so I can't afford to be injured or killed by these injections and leave them without a father. So for me, it was out of the question, mostly because I'm a father and I didn't want to put that risk.

Commissioner Massie

Did you have the opportunity to discuss your analysis or your questioning with some of your colleagues within your environment?

Jean-Philippe Chabot

Yes, I did. I discussed it. It's something I talked about openly with my colleagues. But my environment was—we were not news people. We were analysts, programmers, project leaders, and our world, it's digital. And most people there already had gone and gotten two doses of their own volition. People were scared at that time. They weren't really open to—Even though I thought my arguments were good, now is a much better time to use reason. People are much more open to those kinds of arguments. So I wasn't able to have a huge impact, even though I tried.

But yeah, it's sad because even though I discussed it, and I discussed not only the reasons for not getting vaccinated—the risk–benefits and all that stuff—I also discussed the ethical implications.

[00:40:00]

People at the CBC, not just people close to me but people in general at the CBC—what I heard from my other colleagues who went through this—there was very much a lack of empathy and indifference over there. Friends that I'd been friends with for 10, 15 years, I mean, people who actually got me to join the CBC, and I was very close with, who just willfully looked the other way while this was going on. I lost those friendships. That's the same experience my other colleagues have gone through. So yeah, at that time, most people over there were really in the narrative. I've wondered a lot about why that is: why did people stick to that narrative and have this very narrow way of navigating through it?

Commissioner Massie

What is your current condition with respect to your family or people around you? How do you feel about the decision and even though it was somewhat hurtful, how do you feel about the whole situation right now?

Jean-Philippe Chabot

Yeah, it went good for me. I found work. I found a consulting firm that hired me, and they gave me a contract for a big bank. And while the CBC had mandatory vaccination in place, at that bank, even though it was mostly remote work, I could go meet my team. And I did. There was testing that was offered to people who weren't vaccinated, and we could meet in the office. You wore your mask when in the corridors and when you're in the meeting room with your team, you can take off the mask. And really quickly even that requirement of testing went away. I don't know if it's because public health guidance changed, but the experience I had in that bank was so refreshing because it was a good example, basically, of proportionality. They didn't go beyond what was absolutely necessary and what made sense.

So really quickly, even though I was unvaccinated—I couldn't go in the CBC—I could go meet my team there at the bank and work remotely. People had such a different culture. It didn't really matter to anyone. They hadn't been subjected to this very strong pro-vaccine bias that was present at the CBC. So it was an incredible experience to get out of the CBC and feel like in a normal work environment again where it's just not a concern. So that was good. I don't work for that bank anymore because I went on parental leave again. But I'm still with the consulting firm and am very happy now.

Commissioner Massie

Thank you very much.

Jean-Philippe Chabot

Thank you.

Kassy Baker

Very good. On behalf of the National Citizens Inquiry, I'd like to thank you very much for your testimony here today.

Jean-Philippe Chabot

Thank you.

[00:43:30]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 7: Dr. Edward Leyton

Full Day 2 Timestamp: 07:29:38–08:27:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is Dr. Edward Leyton, and Dr. Leyton, I thank you for your patience. You were scheduled this morning, and we kept bumping you back.

Dr. Edward Leyton

I think I can get into my doctor sooner than that. I've had to wait.

Shawn Buckley

I'm sorry?

Dr. Edward Leyton

That's a joke.

Shawn Buckley

Yeah, can I ask you to start by stating your full name for the record, spelling your first and last name?

Dr. Edward Leyton

Edward Leyton, E-D-W-A-R-D L-E-Y-T-O-N.

Shawn Buckley

Dr. Leyton do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Edward Leyton

I do.

Shawn Buckley

Now I want to introduce you a little bit, and then I'm going to let you tell the evidence that you've come to share with us today.

You had practised for a full 40 years as a complementary and alternative medicine physician. You graduated from medical school in 1975. You practised medicine. You focused on chronic illness and psychotherapy; you're practised in those areas also. You actually retired just before COVID hit, back in 2018. And then when this global pandemic starts, you thought, okay, I better renew my licence and go and help because we're facing a crisis. Since you renewed your licence, I want you to start from there and share with us then what was your experience like going back and where did that lead you?

Dr. Edward Leyton

Okay, thank you. Thank you for the opportunity, Commissioners, and thank you for doing this. Good afternoon to the audience.

So yes, I decided to go back in 2020. It was mainly to help out with COVID stress-related illness, and I did that for about the first eight months. I was treating people with psychotherapy, which was my focus. And that went on for that length of time.

I do want to make a little disclaimer before I start. That this is my personal experience that I'm talking about today, and it doesn't in any way represent an official corporate response of the Canadian COVID TeleHealth (CCTH) group of which I was a part. I was a director for a number of months. So I just want to make sure that that's the case. I guess I'm ready with slides.

Shawn Buckley

Yes, please start your slideshow. They'll show up on your computer screen and that will tell you they're on the screen behind you also.

Dr. Edward Leyton

Yeah, the screen is up. Okay, great, thank you.

So I'm going to talk about why I treated COVID-19 and long COVID and what was the response to treatment. And also, how did the media and the CPSO—which is the College of Physicians and Surgeons of Ontario, which is the regulating body of physicians that acts under the RHPA, which is the Regulated Health Practitioners Act [sic] [*Regulated Health Professions Act*].

So I'm going to be talking about all of those things.

You've got most of my resume already outlined. I want to take you back for a moment to before the College even started. The reason I'm doing this is some people might think that the College and the way they've behaved towards practitioners who are trying to treat COVID is something that started with COVID.

But in fact, physicians have been operating under the shroud of a College which is extremely detrimental towards physicians who are practising alternative kinds of medicine. And this has been going on for a long time.

So this quote here from 1859 will show you that. It's from the York County medical practitioners meeting minutes. And it says, "that the members of the Medical Profession, considering themselves the best, [as] . . . the only true judges of the requisite qualifications of the Art of Medicine claim the power of regulating the amount of those to be possessed by candidates for practice and of granting licences accordingly."

So that paragraph, I think, demonstrates the arrogance, I guess, of the medical profession,

[00:05:00]

thinking that they're the best and that nobody else can come close to them. That was prevalent even in the 1850s when, in fact, medical treatments were pretty primitive. Blistering and arsenicals, and all kinds of things were being used. The germ theory hadn't even been introduced into medicine at that point.

It was clear also that when the College was eventually formed that even legally qualified physicians who wanted to practise what was called heterodox medicine or alternative kinds of practices—that would be chiropractic manual therapies, naturopathy, homeopathy, that kind of thing—they were actually denounced by their colleagues and regulating bodies as violating the terms of their licence.

So this is the shroud of secrecy under which we practise. All doctors practise under this, and many people don't realize that. The College has been investigated on a couple of occasions, two or three occasions actually. I'm going to quote now from an investigation that was initiated by patients and physicians back in around 1998, finished in 2001, and became known as the Glasnost Report—referring to transparency is needed in medicine.

This investigation was headed by a lawyer, now Justice Michael Code, who was a former attorney general, and he investigated the practice of six physicians who had been treating for chronic pain and other difficult situations.

He came to the following conclusion: "These are College-driven fishing expeditions, which are initiated under Section 75"—that's the *Regulated Health [Professions] Act*, section 75—"they can be misused in such a way that they do not serve the public or the evolution of medicine.

"They can ruin the life of the doctor involved and have done so in several cases. It is highly unusual that even people under criminal investigation in prison attempt suicide, yet we know of four doctors who committed suicide while under CPSO investigation. None had patient complaints against them." These are all College-driven issues.

Mr. Code refers to a particular case, saying that this case allowed Mr. Code to assert that it provides "*prima facie* evidence that CPSO officials may have committed the criminal offence of obstructing justice by repeatedly misleading the Executive Committee as to the true state of the evidence in this case."

This is our College—the College that is supposed to regulate practitioners involved possibly in criminal offences, a very serious charge. It's almost impossible to launch a complaint against the College of Physicians and Surgeons. I tried to do that in 1998 around the time of this investigation and was told that I couldn't really launch a complaint against them unless I launched it with the actual prosecution.

So there's no recourse; there's no way of launching a complaint against the College at all. So given that, it wouldn't perhaps surprise us to see the edict that came out in May 2021. I'll just read it because it's probably not terribly clear:

The College is aware and concerned about the increase of misinformation circulating on social media and other platforms regarding those physicians who are publicly contradicting public health orders and recommendations. Physicians hold a unique position of trust with the public and have a professional responsibility to not communicate anti-vaccine, anti-masking, anti-distancing, and anti-lockdown statements

[00:10:00]

and/or promoting unsupported, unproven treatments for COVID-19. Physicians must not make comments or provide advice that encourages the public to act contrary to public health orders and recommendations.

Physicians who put the public at risk may face an investigation by the CPSO and disciplinary action when warranted. When offering opinions, physicians must be guided by the law, regulatory standards, and the code of ethics and professional conduct. The information shared must not be misleading or deceptive and must be reported by available evidence and science.

It's an interesting wording because they use "a position of trust": we have a position of trust with the public and a responsibility not to communicate these things. Do we have trust in the CPSO who are supposed to protect the public and guide physicians? No, we don't. There've been at least two demonstrations by physicians and patients outside of the College in this pandemic, maybe three, and those demonstrations have been met with silence by the College.

In fact, the College has vacated the premises for a number of months during the pandemic because they were afraid that their safety was in danger. So that's the position that we were working under during the pandemic.

This is the position of the CPSO on vaccine anxiety. It's an interesting concept that having anxiety about a new drug—or in this case, quotes "a vaccine"—can be considered an illness, but in this case, it is. Here's one of those statements from their website: "It is [also] important that physicians work with their patients to manage anxieties related to the vaccine and not enable avoidance behaviour. In cases of serious concern, responsible use of **prescription medications and/or referral to psychotherapy are available options.**"

So if I offer you a high blood pressure medication in my office, and I say, "I want you to take this," I would obviously go through whatever is important about the side effects, the positive effects, the negative effects of this medication. And if the patient said, "Well, I'm anxious about that," according to this—and a vaccine is kind of like that—I would have to say, "Well, take five milligrams of Valium and come and see me tomorrow, and you'll feel better about the whole thing." That's what they're suggesting.

In November 2022, they added for some reason, I'm not sure why, the "extreme fear of needles, (trypanophobia)," it's called, or other areas of concern—I don't know what that means—and that we should be treating that with medication or with psychotherapy. Well,

first of all, you can't get a psychotherapist for love, nor money. And second of all, the prescription medications that would be used for that—I'm not sure how I would treat trypanophobia other than by giving a sedative of some kind so that you are half asleep when you have your vaccination. It's really an outrageous suggestion.

And then there is the circumstances of the pandemic which "support physicians declining to write notes or complete forms when the patient is making a request." Usually that's a natural thing that we would do if a patient came with a request to have medical forms completed. They're saying, in this case, you don't have to do that. So you don't have to write prescriptions for exemptions and so on. You have to "sensitively explain to your patient that you can't provide them" with that.

Shawn Buckley

Dr. Layton, can I just ask— Because you practise psychotherapy, I imagine that some patients will legitimately, not just for a vaccine like this, but legitimately have anxiety that reaches a medical condition, a mental health condition,

[00:15:00]

and that it would be reasonable in some situations to exempt people. Is that a fair comment?

Dr. Edward Leyton

To accept people?

Shawn Buckley

No, to exempt somebody. If they legitimately are anxious about it, that could be a valid ground for an exemption, actually having undue anxiety about a treatment.

Dr. Edward Leyton

Yes.

Shawn Buckley

Yeah, but physicians are basically being told no, not for this one.

Dr. Edward Leyton

Right.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

So we weren't allowed to write exemptions unless there was anaphylactic shock. I wrote a couple of exemptions during the first year or two, and it was because of very significant

side effects that I figured might happen as a result of genetic thromboembolic disorders and so on. But I wasn't supposed to do that.

So the other thing about the RHPA in section 75 that's important to know is that section 75 allows the College to investigate our practice completely and to remove files, that is to remove patient files. This has been challenged in the last six months by a couple of challenges.

If you refer to the second paragraph, second bullet point: "about 100 patients of Dr. Sonja Kustka, under investigation for writing two mask exemptions"—that's apparently enough for an investigation—"during COVID, unsuccessfully filed their motion to stop CPSO investigators from gaining access to their private medical records."

I want you to go down to the fourth paragraph, and this reflects the attitude of the College, which I brought up at the beginning, which says—this was the lead counsel for the College. She stated: "Patients should not have any say about their own medical records or how the CPSO wishes to use them when a physician is under investigation for potentially putting a patient at risk of harm."

So to come back to my story. After 2020, when I was practising mainly psychotherapy, I joined a Facebook group in February of 2021. That was just when the vaccines were starting to come in. And the Facebook group was a professional group with, I think, nurse practitioners and physicians. I noticed two things happening. I noticed that physicians and nurses who were actually starting to give vaccines were starting to see side effects, even at that early stage. They would come back with reports of aches and pains, orthopedic issues, arthritic issues, swelling of joints, brain fog, musculoskeletal symptoms, and so on.

Also at that time, ivermectin was being touted as a useful tool in the treatment of COVID, because there was no treatment given. Doctors were told to send their patients home with Tylenol, and they should go to the hospital if they couldn't breathe anymore. That was the only treatment that was on.

So I started to bring up questions on this Facebook page about ivermectin and also about the fact that vaccines seem to be detrimental in some cases. I was immediately pounced upon by a number of people in that group saying, "You cannot talk about this because this is a public health recommendation, and they are our colleagues, and we shouldn't be criticizing them." So naturally, I went on to criticize them and, eventually, I was ousted from the group; I was removed.

So then I joined the Canadian COVID TeleHealth organization. I came to know about it because I started to look into what was going on. I found a group that was definitely on my side and was open to different opinions about things.

[00:20:00]

I also started looking into ivermectin. And several people in the CCCA [Canadian COVID Care Alliance] talked to me about the possibility of prescribing ivermectin, and so I looked at that. And I thought, there's a lot of evidence to show that ivermectin is very useful. One of the people in the group said, "Well, why don't you prescribe it?" So I said, "Well, I'm a psychotherapist. That's my focus."

But I was a family physician at one time, and so I thought about it a lot and I researched it. And so in the summer of 2021, I decided to start prescribing ivermectin. I was fortunate at

that time to be able to be in touch with Dr. Ira Bernstein, who some of you may know was a prominent physician who had been treating COVID quite successfully for some period of time with ivermectin and other treatments. And in fact, he attended the first international conference in Rome and was very up to date on COVID treatment.

So I began to use ivermectin in my private practice and found excellent results. I used it for prevention for simple COVID, which is COVID which we treat in the first few days or one week, and then for more complex COVID, which lasts longer than a week. Eventually, we decided that it would be good to form a clinic.

So a number of us got together and we formed Canadian COVID TeleHealth. This was a telehealth group: We had at that time about half a dozen physicians and an equal number of nurse practitioners and nurses. We operated throughout Canada and we saw patients in every province except Manitoba, which didn't allow us to do telemedicine without a licence. But we could in other provinces.

That went on, well, it still goes on; I'm still prescribing ivermectin. But it went on at a fairly good clip because that was right in the middle, if you'll recall, of the Delta variant, which was probably the worst variant that we've seen. People were getting really quite sick with that. And one of the things that was very noticeable about our patient population is that people were terrified of COVID. They had been completely propagandized, if you like, to believe that COVID was a terrible disease and a lot of people wanted prevention.

Most of our patients called up wanting ivermectin prevention, and we had at that time about half a dozen pharmacies in Ontario and a few out west that were dispensing ivermectin freely. They were compounding pharmacies. They weren't using the Merck product. Merck didn't want us to use their product, so they pretty much stopped making it. But the raw materials were available to pharmacies and pharmacies were dispensing it freely. So we were very busy at that time. And we saw a lot of patients. I myself personally prescribed, I think, around 800, 900 prescriptions for ivermectin over that period of time and on into 2022.

But there was a problem. We had a hit piece in the Global News and also in the *Toronto Star*. The reporter from the *Toronto Star* had impersonated a patient and called our clinic asking for ivermectin. And of course, our physician responded appropriately. And she then proceeded to write about us in the *Toronto Star* and denigrate us as a clinic, saying it was all misinformation and we shouldn't be doing that.

As a result of that,

[00:25:00]

or maybe it was happening anyway, the College decided to raid the office of Dr. Ira Bernstein and that contained the electronic medical records of our clinic. The CPSO went in without asking, without Dr. Bernstein being there, being present. They took all the information, information that they had no business taking. And they used that information to target all of our physicians. They did that over a period of time so that we lost all of our physicians, except myself, over a period of about six months. We also lost nurse practitioners and nurses.

I have to tell you, we had an amazing team of people. We did full assessments on everybody; we did full histories. We couldn't do physicals, of course. But we made every attempt to follow up, and nurses spent hours on the phone, often with patients who were

anxious, and either sick and anxious or anxious about getting sick. We treated them all. It wasn't just ivermectin. I'll come in a moment to how we treated them. But we treated them all.

Then in 2022, of course, Omicron came along, and we actually had a decrease in the number of patients because Omicron was much less—although it was more infectious, it was much less serious. And so people started to accept that they had COVID and they would get over it on their own.

I don't know if there are any questions up until this point and how much time I have. But I'd like to go into some of the treatments that we did and how those worked and didn't work.

Shawn Buckley

I just wanted to ask, how did you guys lose the doctors and nurses after the CPSO? So the CPSO raided, and you said you've lost all of the doctors except yourself. What was the cause of losing the doctors? How did that happen?

Dr. Edward Leyton

Some of the doctors had privileges at hospitals and worked at hospitals. Often the hospitals made complaints to the CPSO that the doctors were either unvaccinated and shouldn't be working or they were prescribing ivermectin. The College took it from there: they either de-licensed them completely or they restricted their licence.

Dr. Bernstein, for example, had his licence restricted. He wasn't able to treat COVID anymore. He wasn't able to use ivermectin, and he had to put a notice up in his office saying, "I do not treat COVID."

Shawn Buckley

So these are medical doctors.

Dr. Edward Leyton

Yes.

Shawn Buckley

That are fully licenced.

Dr. Edward Leyton

Yes.

Shawn Buckley

There are not complaints against them by patients.

Dr. Edward Leyton

No.

Shawn Buckley

And basically, their right to practise is either fully or largely restricted.

Dr. Edward Leyton

Correct.

Shawn Buckley

Just because they are treating COVID patients in this clinic.

Dr. Edward Leyton

Yes.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

The other thing, for example, I don't know if Dr. Patrick Phillips testified. I think he did. For example, he and Dr. Hoffe out west both reported side effects from vaccines because they were both emergency physicians, reported that to public health. As a result of that, they lost their jobs and couldn't work. So it was either the hospitals complaining or it was the CPSO saying that they couldn't prescribe ivermectin.

Shawn Buckley

Now, just so that it's clear—especially for people that are participating online to watch your evidence—my understanding, though, is that it's federal law that a physician is to report a suspected vaccine injury.

Dr. Edward Leyton

That is correct.

Shawn Buckley

You just cited the names of two physicians that were disciplined for following the law?

Dr. Edward Leyton

Yes.

Shawn Buckley

Okay, thank you.

Dr. Edward Leyton

Who should really be disciplined is the CPSO for not following the law.

[00:30:00]

So we treated COVID using the Frontline COVID Critical Care Alliance protocols. Now, the Frontline Critical COVID Care. You've heard from Peter McCullough. You're probably aware of Dr. Pierre Kory and Dr. Paul Marik: these physicians were ICU physicians, intensivists, boots on the ground people, who saw that something was wrong and wanted a primary treatment for COVID, found out about ivermectin and did very thorough research into that. We're extremely grateful to them for putting together protocols that we could use. These protocols came from physicians all over the world who were communicating with Dr. Kory and Dr. Marik. They were very thorough, and they worked well.

So you can see that we divided treatments into prevention, early treatment, and complex COVID. I'm not going to go over those treatments. And I don't expect you to read the protocols, but we used to send the protocol to the patient after each consultation so they knew exactly what to do and how to manage it.

We treated viral entry points because there was some research that showed that this was very important. Because the virus starts in the nasal passages and that's where you need to treat it first of all. So we used simple things like povidone-iodine sprays and cetylpyridinium chloride, which is in things like Scope and Act.

We also had a cocktail of immune modulators. I don't like to use the word booster because you don't always need to boost your immune system. But what you do is you give the body the orthomolecular ability to correct whatever is wrong with the immune system by using these kinds of things, and they would include, of course, vitamin D, zinc, quercetin, sometimes melatonin. We also sent patients home—sent patients home, I think I'm seeing them in my office. We also gave patients over the internet things like this: this was a home treatment put out by the World Council for Health, which was a really good home treatment that people could follow.

So we made sure that not only they got the treatments; they knew how to take care of themselves and that we followed up with them. Some of the nurses were on the phone with them two, three times a week reassuring them that they were doing okay. And of course, in the more advanced cases, we had to measure oxygen uptake, and sometimes, we even had to give IV fluids. And this was all through home care that we had to arrange for them because we weren't physically present in the same city as them.

As I mentioned, the patient volume dropped with Omicron, and that was a good thing in some ways. And now, we don't even actually give ivermectin for prevention anymore because the virus is pretty mild.

So in October of 2022, I got the dreaded section 75 from the College of Physicians and Surgeons. They started an investigation into my practice. There was no patient complaint: I've practised for 40 years without a complaint. There was no patient complaint in this case. They sent me 400 pages of documents to read, most of which were propaganda from Health Canada about ivermectin. They didn't really send me anything substantial in terms of research. The complaint was that I was prescribing hydroxychloroquine and ivermectin. That was it. They were correct; that's what I was doing. But it's not illegal to do that. It's what's called off-label prescribing. Happens all the time.

Example: Metoprolol is a blood pressure medication.

[00:35:00]

It's often used for stage fright. Doctors do that all the time; they prescribe off-label because there are indications that it might help other conditions. That is exactly what ivermectin is: ivermectin is a safe, widely used drug that's been used for many, many years, particularly in the tropics for river blindness and, sometimes, here in the west for scabies. Very safe and very available.

When Omicron came along, we also started to see a number of patients who were vaccine-injured. The Front Line Covid Care Alliance, once again, started to put out protocols. Now you have to remember that vaccine injury is something we knew nothing about. Until a vaccine came along, it didn't exist. So here we are, faced with an illness that nobody knows anything about.

It has extraordinary breadth of spread in terms of what it does to the body, and we didn't know really how to treat it. So again, we relied on the Front Line COVID Care people to gather information again from the rest of the world about vaccine injury. And they put together some protocols.

It turns out that ivermectin also binds spike protein. The spike protein is the protein that the body makes as a result of the vaccine.

Of course, we were told that the spike protein was short-lived: it didn't live in the body; it just stimulated the immune system, stayed in the shoulder, as did the mRNA. Neither of those things were true. The spike protein goes into every tissue in the body, including the brain. It's been found there in pathology and histology slides. You can stain for it. We know it does that.

That's why we see so many symptoms throughout the whole body. We get brain fog; we get things like POTS, which is orthostatic hypertension. It affects the autonomic nervous system. The spike protein can affect the neurological system. It's all over the place. So these are some of the things that we used for treating that.

I want to give you a couple of case histories just to finish up here. I don't want you to get the impression that this is easy to treat. Acute COVID was relatively easy to treat because it worked really quickly, and you knew when you were over it.

Vaccine injury is completely different. It's a complex illness about which we knew very little. I would say that in my experience, treating vaccine injury, probably 50 per cent of people respond to treatments. It often takes a long time and a lot of work on the part of the patient, as well as the practitioner.

[Case #3—Vax Injury]

This is the case of a 40-year-old mother breastfeeding a 19-month-old child. She had an immediate reaction to a mandated Pfizer vaccine in January 2022. These are some of the symptoms. You can see them there. The main ones were chest pressure and facial rash, cold extremities, twitching all over the body.

These are symptoms that we generally don't see as physicians. If you saw this as a physician and you had no knowledge of the fact that they had a vaccine, you would say, "What kind of illness is this that does this?" Completely new.

A lot of those symptoms are neurological. They affect a nervous system—shooting pains, paresis, weakness of the limbs, difficulty getting up and moving around. And the tests are often normal. This lady's vitamin D was low and her nutrition wasn't that great.

[00:40:00]

She says after three and a half months, she was left with “intermittent pressure, tightness and numbness in face, head, neck and soft tissues inside the mouth. Chest pressure feels like squeezing and a push [outwards that made] me dry cough. “

Can you imagine having chest pressure and going to the emergency, thinking you’re having a heart attack and being told, “No, it’s not a heart attack. We don’t know what it is, but just go home, take some Advil.” Now it could be myocarditis. It’s possible; sometimes it’s not. But it would terrify you, and especially, it would terrify you not knowing what that is.

[Video from patient]

So this patient had some changes in her extremities. I’ll just demonstrate for you. Normally when you hold your hand, for example, at heart level, your veins are not filled because that’s the blood going back to your heart. When you drop your hand down below heart level, your veins will fill up. But you’ll watch this video; you’ll see that her veins and her skin and the swelling in her hands develops as she drops her hand. So there you see the normal hand and now you’ll see the veins filling. Some of this is normal; veins will fill up. But you see how engorged they become and then the swelling and the redness of the knuckles. Very bizarre symptoms that you might not see, that don’t fit any disease category at all.

So we treated her with ivermectin. Now some people respond to ivermectin very well, and she happened to be one of the fortunate ones. We increased her vitamin D to 5,000 units a day, put her on an anti-inflammatory diet and started her on some gentle exercise. She had 30 per cent improvement within two weeks and 60 per cent in three months.

[MSQ Totals]

How do we know this? We do a very careful, what’s called functional inquiry. We question people about every organ system in the body. So you can see them all there: head, eyes, ears, nose, mouth, throat and so on. The patient scores them as to how much problem a symptom is within that particular group. You can see that she scored 154 at the beginning. And then after her treatment, a couple of months later, she was scoring 65.

So we’re measuring change. We’re trying to be objective about it and measure how much improvement people are getting. It’s helpful for the patient to see this, that they are improving.

[Case #5—Vax Injury]

Another case of a vaccine injury was a 51-year-old female, former athlete, actually, a very athletic person. She, after the second vaccine, had significant symptoms that developed less than a month later. You might say, “Well, how do you know it’s the vaccine that’s doing this?” Skeptics will say that. You can ask that question. It’s important. From a temporal point of view, if I’m working in my workshop and I hit a nail and then I hit my finger, I can be pretty sure the pain is due to the fact that I hit my finger with a hammer.

So the closer the temporal relationship, the closer the cause is likely to be something. If somebody has a vaccine in a pharmacy and drops dead, which has happened, you can be pretty sure it was probably the vaccine, not a coincidence.

The longer between the vaccine and when you have symptoms, the more difficult it is to assess. But you can tell, in a sense, because the symptoms are so unusual and they’re so varied.

Now, her D-dimer was elevated, and she had blood clots. She knew that something was wrong and she had chest pain as well. Again, an MRI and colonoscopy and stress test, they were all normal. By the time we see these patients, sometimes they'd had a lot of tests.

So I said, she gave some very typical symptoms

[00:45:00]

of post-vax inflammation and injury, on-set within a month—probably the vaccine, given the kinds of symptoms that she was having. Headaches too, helmet-like headaches that can last for hours, shooting nerve pain, extreme fatigue—that's a very common symptom—increased brain fog.

When the spike protein gets into the brain, it creates inflammation. And then, of course, increased anxiety as a result of all of this. So again, we treated her with ivermectin and we started her on an antihistamine. Sometimes these people get what's called mast cell activation: so their mast cells are producing a lot of histamine, which produce symptoms. So we give an antihistamine and that helps, that it's a non-drowsy antihistamine.

[Symptom Scores]

And she, after this treatment, could actually bike five kilometres without being short of breath. So she was very pleased about that. Again, looking at the scores, you can see the scores going down over a period of time. So we know we're having an impact with our treatments.

[LH—VI-Treatment]

Now, she had a drooping of the face, sometimes known as Bell's palsy. She's given us permission to show this. Next slide. So on the left, you can see that the right side of her face, she's trying to smile. And she can't smile because the facial muscle is paralyzed on the right side. But she can smile on the left. You can see the crease. You can see the facial crease on the right side is almost non-existent. But then after treatment, her facial smile is almost normal. You might say, "Well, Bell's palsy is self-limiting." True. But she'd had this for, I think, over a year. And then suddenly, it gets better. Well, could be a coincidence.

So in summary: We've had a disease with a 99.5 per cent survival rate. We've had poor testing: our speaker showed a diagnosis of PCR with false positives. Rushed vaccine development; absence of treatment until hospitalized; lack of recognition of vaccine injury; and persecution of doctors and other health care practitioners by regulating bodies with their loss of licences. I'll stop there.

Shawn Buckley

Before I turn you over to the commissioners, I just wanted to clarify, you had practised a full 40 years. Longer now, right? Because you got your licence back in 2020. So how many years have you practised medicine in total?

Dr. Edward Leyton

Well, I graduated in '75, so '78 to 2018. So that's 40 years.

Shawn Buckley

Right, and then, now, for a couple more years.

Dr. Edward Leyton

Two years now and I'm now into my third year.

Shawn Buckley

Right, so 42 and a half years. You have never had a patient complaint in that 42 and a half years. Am I right that in the next month or so, you might lose your licence to practise because of the activities that you've just shared, where you're trying to help people with vaccine injuries and in preventing and treating COVID?

Dr. Edward Leyton

Possibly. It's ironic that when I renewed my licence in 2020, the College gave me a free licence for a year because they wanted doctors to come back. And I've been rewarded with an investigation. So I might lose my licence. I might be restricted. I have no idea. I might retire, too. I think it's a race.

Shawn Buckley

Right. I think I can speak for pretty well everyone that we're thankful for people like you that are willing to do what you think is ethically correct—actually being a doctor and using your discretion to help your patients.

I will turn you over to the commissioners for questions.

Dr. Edward Leyton

Thank you.

Commissioner Massie

Thank you very much, Doctor.

[00:50:00]

I have a couple of questions. This is not a medical consultation but close.

I'd like to know—given that we've heard from many other doctors and patients that during COVID, the people that were more likely to be affected by the disease were, in general, people affected by other conditions that would somewhat compromise their ability to build a strong immune reaction to the infection.

So it could be because they are old and their immune system is not as active. Or it could be because they have other immune suppression of some sort. So these so-called frail people, or more fragile people, were initially targeted to be vaccinated to protect them from the disease.

Dr. Edward Leyton

Right.

Commissioner Massie

So it's my understanding, based on my research, that the vaccinations should work by triggering the immune response in order to protect against the infection. But if the reason why you're mainly susceptible to the infection is because your immune system is not properly functioning, how come vaccination will solve that?

I'm asking that to a practising doctor.

Dr. Edward Leyton

Well, vaccination doesn't solve it.

First of all, this isn't a vaccine in the true sense of the word. We think that it actually makes the immune system worse, and in fact, you're more likely to get COVID the more vaccines you have.

That's a Cleveland Clinic study that, I think, has already been reported on in the Inquiry. The more people are vaccinated, the more likely they are to get COVID, which is kind of weird. I don't know if that answers your question or not.

Commissioner Massie

Yeah, it does.

My other question has to do with the CPSO, which we have the equivalent in Quebec. We've heard from other doctors that testified recently in Quebec that they went to interrogate the Collège des médecins and asked them a number of questions about the scientific rationale to promote vaccination of children and pregnant women.

These doctors had several questions that were never answered, ultimately, by the College. And the Collège de médecins said, "We're not a society that generates new knowledge. This is not our role. You should consult with the official society and SPQ and the other society."

So I'm just wondering, if such a question would be addressed to the CPSO, would they come up with a similar explanation—that it's not their role to generate new knowledge and to ask those very specific questions that arose from the deployment of the vaccine with respect to the risk-benefit balance for children and pregnant women, and so on. What would be their position in your opinion?

Dr. Edward Leyton

The College doesn't answer questions like that. The College is a regulatory body. It investigates people on a whim.

I don't know what goes on inside the College, to be honest with you. But it's something pretty nefarious. So in terms of asking the College to explain something like that, they don't do that. Their motto is protect the public, which they don't do, and guide physicians, which they don't do.

Commissioner Massie

My last question is about—what's the state-of-the-art in terms of the practice of medicine?

Did the practice of medicine evolve in your experience through, I would say, the practice of science observation and medical treatment that any given physician can actually do

[00:55:00]

in their normal activity? Or does it evolve solely when some new treatment or protocol has been checked very rigorously through these randomized control trials—that is the only way to come up with new solutions for treatments?

Dr. Edward Leyton

Well, it should be a combination of those things, in my opinion. It's a complicated question.

The problem is that when somebody comes up with a solution for something that's unusual, for example, I'm thinking of Barry Marshall, who is an Australian physician who came up with the idea that an ulcer was caused by a bacteria called *Helicobacter pylori*. This was many, many years ago. And he couldn't convince anybody in the scientific community that this was valid, despite publishing.

So it's very difficult to convince the medical community of new things. Eventually, he had to give himself an ulcer and then take the treatment and cure himself. And now, antibacterials are used for ulcer treatment with success, killing *H. pylori*. But that was a hard fight.

There's multiple examples of people who've come up with innovative solutions, who have been put down and not recognized throughout the history of medicine. I'm not a philosopher, so I can't answer why that might be.

What has happened, also, is that in a regular doctor's office, you get visits from a pharmaceutical company with the latest and greatest medication for something. Physicians are heavily influenced by that. And as we know, the only way to get grants for research is through money from pharmaceutical companies. So there's a built-in bias that is quite extraordinary. Does that answer your question?

Commissioner Massie

Yeah. Thank you very much.

Shawn Buckley

Thank you. There being no further commissioner questions, Dr. Leyton, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and sharing this information and sincerely thank you for the service you've given as a physician.

Dr. Edward Leyton

Thank you for the Inquiry. Appreciate all you guys are doing.

Shawn Buckley

I will just state for the online audience that cannot participate that there was a standing ovation for Dr. Leyton. He is very well-respected for the service that he has given.

[00:59:00]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 8: Dr. Keren Epstein-Gilboa

Full Day 2 Timestamp: 08:38:23–09:28:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Good afternoon. Can you please spell and state your name for the record?

Dr. Keren Epstein-Gilboa

My name is Dr. Keren Epstein-Gilboa.

Kassy Baker

And can you please spell that?

Dr. Keren Epstein-Gilboa

Keren is K-E-R-E-N, sometimes K-A-R-E-N E-P-S-T-E-I-N, hyphen, G-I-L-B-O-A.

Kassy Baker

Very good. And do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony here this afternoon?

Dr. Keren Epstein-Gilboa

Yes, I do.

Kassy Baker

Very good. Now, I understand that you're here today to describe various childhood traumas that were suffered largely as a result of COVID or COVID measures. Just to start with, can you give us a little bit of your background? Can you briefly describe that for us, please?

Dr. Keren Epstein-Gilboa

Well, I graduated with an undergrad degree in a health-related area, more than 40 years ago. My master's is in Counselling and Applied Psychology, and my doctorate is in Developmental Psychology.

Kassy Baker

So you're here today to speak to us as an independent scholar, is that right?

Dr. Keren Epstein-Gilboa

Yes, I'm an independent scholar.

Kassy Baker

Now I know that you have a presentation that's ready to go and my intention is just to let you carry on with that [Exhibit number unavailable]. I will interrupt if I have any questions, but we're in your capable hands for the moment, so please start.

Dr. Keren Epstein-Gilboa

Okay. Thank you very much. I'm going to be presenting insights from behavioural science.

My agenda, my question in 2020 was, "What is the reason that existing and long-standing research practices related to social determinants of health were discarded," and now I would say, "during the past three years?" I'm going to provide insights from behavioural science, a little bit on systems models, and the individual—and that's when I'm going to be talking about children as well, infants and children. A little bit on bioethics. And then I'm going to be presenting about the psychological model used to circulate systemic messages, which is often called the Nudge model.

Kassy Baker

Dr. Epstein-Gilboa, if I can interrupt you for one moment. The Commissioners have just brought it to my attention that I didn't swear you in. Did I swear you in or did I not?

Dr. Keren Epstein-Gilboa

Okay. Sorry.

Kassy Baker

I apologize.

Dr. Keren Epstein-Gilboa

Do I start again?

Kassy Baker

Do you promise to tell the truth, the whole truth, and nothing but the truth?

Dr. Keren Epstein-Gilboa
Absolutely. Yes, I do.

Kassy Baker

Now that we have that out of the way, I will let you continue. My apologies.

Dr. Keren Epstein-Gilboa

I'm going to go insights from behavioural sciences. Systems model: a systems model is used in family therapy to explain organizations, to explain child development, and essentially states that, "Interaction occurs between multiple different systems and affects development at multiple levels, affects function and development, which means everything that's going on now, everything that goes on in general, is affected by multi-levels of interaction."

So there's the individual. The individual interacts with the family, with the health system. This is at the micro level: so with the health care centre, with the school. That's the media at the next level. All those systems, by the way, interact with one another and the individual. And the individual influences the systems. And the systems affect the individual.

There's the media at the higher level. There are different systems: health system, educational system, the legal system, politics. And all of these are affected by our beliefs, the belief system. So our beliefs can be affected at the individual level and go up all these levels. And by the same token, the belief system will then go down, be in all the different systems along the way, and then affect the individual. I based this model here on Bronfenbrenner's model. And Bronfenbrenner didn't originally have the chrono system in. Later he added it.

And the chrono system means we can look at history: it means events over time, which means to me that we can assess events by also looking at the events in history. So that's the systems model. Please bear that in mind as I now go to the different levels. And I'm going to look at the individual by using developmental models regarding social and emotional development.

[00:05:00]

So what is human development?

It's a change over time in multiple body systems, meaning that all the different systems also affect one another. And we have developmental tasks and sensitive periods: this means that **specific events have to take place at a time when the organism, meaning the child or the adult, is ready. And if we miss it, there might be problems.**

Resilience. Resilience implies that one can bounce back. And one's ability to bounce back is dependent on a balance between protective and risk factors.

So there's diverse interconnected domains of development: The domains are associated with specific areas in the brain. And there's specific neurons, and there's interactions between the neurons. And that's how development occurs. That's how these functions take place.

I'm going to look specifically at social and emotional development. Because social has a lot of meaning for what we've been going through in the past three years.

Let's look first at emotional development. So emotions are feelings, affect, mood. Emotions take place from birth and become more complex. Yes, little, tiny newborns have feelings. There's emotional regulation. That's also a process: So we understand we have feelings. We understand what we feel. We define the feelings. We share the emotions with another person. That's how all of this process takes place. And we understand eventually that others also feel, and we're able to emote properly in the context. Emotions affect all domains, including the capacity to learn. So, in other words, a child who's very anxious, feels stressed, feels sad, might have problems learning. Social interaction, therefore, plays an important role in emotional development.

What's also very important is that emotions are associated with specific neurotransmitters or hormones. And what's really interesting is these emotions either enhance or reduce immune function. So we would want people during a time where there's pathogens to engage in actions that are going to enhance their immune function, not stress that reduces immune function.

So social well-being: those are the emotions in all the neurotransmitters and the hormones. Social well-being is also central to overall well-being. If you know Maslow's hierarchy of needs, there are needs such as physiological needs: water, food, air, essential. Think about it, essential. Security means job security, for example, that's the next level. Love and connection mean social needs, means social connection, not distancing, and so on. These are the three lower needs: means that they are very basic to human function.

And we start off with symbiosis with mother, meaning, of course, pregnancy. That's the primary relationship. You could have a primary relationship, of course, with an adoptive parent and with the partner, and the father or the other partner. We have individual capacities and needs; individual capacities and needs vary over the lifespan. There are critical periods, such as infancy, adolescence, and older age, when social interaction is extremely important. Social interaction, then, is a protective factor. It's a determinant of health. As I said, when you feel good, you have enhanced immune function. Loneliness, sadness are risk factors.

So as you can see, these are some of the researchers who looked at social isolation and loneliness. And by the way, to the panel, I have sent, I think it's a 40-page list of references for everything I'm presenting today. So this is the research on social isolation, loneliness, which is a risk factor for multiple pathology. Now, I knew that in 2020. And I would think that most people who are in similar professions to the ones that I have would also know that because this is a known fact for many years. It's a known fact because it's based on research.

[00:10:00]

So stress increases the HPA [hypothalamic-pituitary-adrenal axis] axis. One of the reasons that these researchers, as well as others, believe that people of older age are more at risk for cardiovascular risks, cancers, reduced immune function, and other diseases and death are due to stress—stress due to loneliness, being separated from significant people. As I said, all of this was known before 2020.

And here's some evidence: if you don't believe me, the evidence is that we changed the hospital system. Initially, we didn't have visitors all day long. Until 2020, people could bring

their families in. And it's not because the nurses and the physicians loved the family so much. It was because they knew—because the research stated, because they engaged in critical thinking—that bringing the family in makes people healthy or prevents illness.

Just to show you how important social-emotional function is, I'm going to show you social-emotional development in infancy and early childhood. And we're going to talk about sensitive interaction, proximity behaviours, and neurobiology. These are some of the researchers. You can see, you probably can only see little black dots. These are only some of the researchers in this area, which means there was loads of research on the importance of maternal-infant proximity, smell, touch, everything that I'm going to talk about, before 2020. And if you could see these references better, you'd see that some are even, well, **Melanie Klein, she didn't know about neurobiology. But she did research and she wrote about her theory, object relations, starting in the 1920s.**

I'm going to focus specifically on infancy and early childhood for one reason because it is my area of specialty. But also because we barely have spoken about infants and young children during the past three years.

The first 45 months of life are the most rapid stage of brain development. So it's a very critical period. And during that time, like other periods of development, the child, the infant, is sensitive to specific stimuli. Factors that affect development, of course, are intrinsic: so genes and temperament. But there's also extrinsic factors, and they work together. Nature and nurture work together, and that's environment and parent and epigenetics, changes to the gene expression based on the environment. The most important factor is the toned, sensitive relationships with the primary caregiver, also in other models called holding containment. And this is the capacity of the parent or caregiver to notice, interpret, and match responses to the infant's cues. And cues are conveyed through interactional components: visual, to see each other; hearing, hearing well; tactile; olfactory; and just being close and listening and smelling and touching. Sensory, it's very sensory: face-to-face interaction is vital at the beginning of life.

So here's what happens. The first task is, we need to make connections between the synapses, and when there are connections between the synapses, we then have optimal development. Synapses, the connections between the nerves, cause the messages to flow. The messages to flow, together with myelin that makes the messages flow quicker, mean that this person—this little person, this growing person—can engage in multiple tasks. The brain controls the task that we engage in. Trauma, for example, will cause overabundant synapses in the amygdala, meaning this happens for adults as well, but this is at the time of the development when the brain is structured. So a traumatic or an anxious, depressive situation will change and alter the child's, the human's brain. The brain is plastic and can change; however, there's specific tasks that are more difficult to change, such as lack of **early interaction, appropriate interaction in early life.**

Factors that protect interaction are calm and confident parents, a positive birthing experience, sense of being supportive—

[00:15:00]

They need support: they need to be with people, and smelling and seeing and touching, all of these are very important to the infant—an uninterrupted interaction, uninterrupted breastfeeding, the ability to engage in synchronous, mutual, and intersubjective interaction. Intersubjective means shared emotional interactions.

But look at this side. If a parent is anxious or worried, if they have birth trauma, if they have to birth alone without their support system, if they believe that the birth experience was terrible, if they have birth trauma, they have lack of support, limited touching, face covered, distancing from infancy—then the infant, then this puts people at risk. It's a risk factor. Not all mothers are going to have difficulty with those risk factors; it's multiple risk factors that occur at the same time.

So I spoke about that, but just to go over: it's proximity behaviours, tactile interaction, cue-based breastfeeding. And here's really interesting, this is Schore's work. Schore, I'm sorry, I didn't put it here, but it is in the reference list. Schore found that when mothers and infants are looking at one another, their brains fire at the same time in the prefrontal cortex. In other words, when mothers and babies are engaging in facial interactions, both brains develop. The sense of being heard, engaging with the primary caregiver—these all lead to adequate synaptic connection and pruning. Pruning means getting rid of the cells, the area that we don't need; so instead of connection, we take out, like in the garden.

Actions that are perceived as traumatic or anxiety-provoking may affect memory, especially implicit memory, that's the memory, like a feeling memory.

So here's what we need: "I see your face." And here, you see a father and a son, and I said there, "I'm not sure what you're feeling" because we have to learn. How do we learn what others are feeling if we don't see their faces?

So healthy interaction versus blocked: answering cues; joint attention means we both look at the same thing at the same time; intersubjectivity, we share emotions; sense of self—all this leads to a sense of self, emotional regulation, social capacities, cognitive development and learning. And what we don't want is a hidden face, limited interaction and connection, the interactional components are stifled.

So if you don't believe me, then again, bringing in some research: touch, loving, seeing and feeling are essential for healthy growth. And by the way, touch causes the secretion of oxytocin. Oxytocin is a hormone that makes us feel good. It does a lot of other things as well, and it causes people to attach to one another, feel good about one another. For example, a father does not have to breastfeed a child in order to make the connection; they can just take off their shirt and there will be a connection forming due to oxytocin.

But on the other hand, maternal deprivation leads to anaclitic depression, which is depression in infants: they look totally muted. Loss is detrimental for life. This still-face experiment—that I won't be able to show you here, that I had hoped to show you—I will explain in a moment, is more evidence about the importance of the face-to-face interaction. And the lost sensitive period: I spoke before about neuroplasticity, but there are specific tasks that the brain cannot correct, and one is lost interaction.

And Nelson, Fox, and Zeanah did research on that. They looked at children adopted from Romanian orphanages, and even though those children were adopted to wonderful, caring families, there were specific tasks they had problems with because that part of the brain was not developed at the right time. And a very important part of the interaction is the parent's feeling. Parental anxiety and depression lead to muted affect; lack of stimulation; maybe hyperarousal and anxiety in the child, which impair learning; trauma. These are only some of the researchers in that area.

[00:20:00]

What is the still-face experiment? If you're watching now, you can press that YouTube link, you can watch this experiment. This experiment has been replicated multiple times. In this experiment, the mother or the father sits opposite the child in a normal way, and all of a sudden, the experimenter tells the parent to stop using expressions, to stand like this, opposite the child, opposite the infant. They're about 18 months. And the baby who's used to interaction gets very, very upset. And you can see how they're trying to bring the parent in, and they're unable to because the experiment is that kind of a face.

The child who has a secure attachment will immediately return and be okay; they're resilient, even though they just went through that momentary trauma. But it's very upsetting to see that. I always used to warn students before I showed that video because it is upsetting. Now think of this: what happens to our infants and some of our young children during the past three years who didn't see faces for hours, for hours? Watch that experiment if you can, and you'll see what I mean.

What happens to the mother? The mother needs to be very sensitive, so let's look at the mother during pregnancy. Look at all this stress that she's had, threat. You might have to birth at home because some parents over the world—for example, one of my references here, I believe it was the Jewish General in Montreal where they didn't allow birth partners to come in. Now here in Ontario, where I live, mothers could only bring one person. So you had to choose between your doula—who knew how to support birth, who was a woman and maybe gave birth—and the father who loves the child or the other partner but who might not have given birth.

So mothers had that difficult and I know from experience many mothers struggled with that. And they hear: “danger, danger, danger,” “inject, inject, inject,” “You're going to harm your baby.” “You're going to get a virus; you could die because mothers who are pregnant are more likely to die from COVID-19.” “The virus is going on hard; it's going to harm your unborn baby.” “Strangers covered,” “That's where your support,” “You have lots of risks.” Fear: “You can harm your baby; your baby can harm you.” Imagine that—no support, separation—that's what our mothers went through and how they started this.

So I'm just going to go quickly through these. This is one if you are pregnant, recently pregnant, you're more likely to get sick. The reference, sorry, do you need to see the reference? No, okay.

This is one some people might remember that the Almonte, if I'm saying that right, General Hospital asked all moms to have an epidural when they arrive just in case they need a caesarean. Imagine that. What does that tell you about birth? “Birth is dangerous.” You're already nervous. “Birth is dangerous. You might need a caesarean. Get the epidural.” Who cares about natural birth? And Blakely's work on the hormones during the birthing process and so on. Birth alone. And this is a petition by some Canadian mothers who were afraid they were going to have to birth alone, and they asked not to.

And this you won't believe, but first of all, some fathers could only FaceTime with the mothers during birth. I wish I had time to read you all these quotes, but I don't. But this was on CTV, and they were talking about parents who were FaceTiming with their newborns who were in the NICU [Neonatal Intensive Care Unit]. Imagine that, imagine that. Now, compare that to what I just told you very briefly about what young humans require. Imagine you're in your mom's uterus, you come out, and “hello?” There's no mother there, but she's on FaceTime. I just have to read you this one quote: “We were asked, ‘if you would like to FaceTime?’ to see our daughter. And it's been amazing,” said 28-year-old Mary McKenna, who recently gave birth to her daughter Harper at 26 weeks. “But I'm also

struggling so much not seeing her.” That’s not just a struggle. That’s essential for human growth and development.

This is from a professional journal, just to show you some of the messages to breastfeeding mothers. So if everybody notices, look carefully at the picture. Notice there’s no faces. And notice the messages:

[00:25:00]

Faceless, no interaction, hygienic. Use a mask during breastfeeding. This is a mother with COVID-19. Yes, but before this, we had mothers with strep and staph and all sorts of things, and we didn’t tell them to wear a mask. We just told them, “Nurse a lot because your antibodies will go through,” right? Isn’t that what we, the public, were told? Anyhow, so this is a mom with COVID-19: Use a mask. Wash hands and clean. Passive immunity in breast milk, well they even say it. And here’s a mom breastfeeding with a mask on. Yes, this really did happen. Might still be happening.

And this is from Health Canada, advises:

Keep the baby at a distance and hide your face. Once a baby is born, they can get COVID-19 from other people. So it’s important to limit their contact with others. To protect yourself and your baby, you should continue to follow recommended individual public health measures, such as wearing a mask, improving ventilation, maximizing physical distance from others, cleaning your hands. We recommend breastfeeding when possible. It has many health benefits . . .

Although in the breastfeeding world, they started talking about risks of not, but that’s okay.

. . . and offers the most protection against infection and illness throughout infancy and childhood. Breast milk isn’t known to transmit COVID-19.

Yet we’re scaring them. And then of course, about the mRNA COVID vaccine have antibodies, apparently mothers have in their breast milk. These are the messages to the new mom. And if you’ve ever worked with new moms, you know, and if you’ve ever been a new mom, you know, that the transition to parenting is difficult.

So we have a disrupted family and support system. Families aren’t supposed to visit, grandmothers aren’t supposed to come over. I’m a grandmother, that would be terrible. **Visitors after your baby is born: “Visitors should be limited to reduce the risk of possible exposure to COVID-19. This can be very difficult, but it’s important to keep your baby safe.”** Look at these other messages.

These are some of the findings so far. I don’t know if the research, you know, how great the research is or not. But they’re saying that obstructed interaction seems to affect development, and they’re looking specifically at apparent decline in cognitive performance in children and so on. I’m not sure if it’s true or not, but these are references, and we can check them out; we should. In other words, we are at risk for failed developmental milestones, disrupted social-emotional interaction, and at risk for reduced capacity for emotional and behavioural regulation.

So I'm just going to talk very briefly about other children, older children, I should say. The main thing to remember is that there are specific developmental tasks for each level, each age group: children develop at different rates throughout the years. And these developmental tasks were forgotten during this time. Or the people who worked with children did not display that they remembered or that they took enough steps to protect children at the time. There was a wonderful bulletin put out by the Hospital for Sick Children in June 2020. It was about the return to school. It was great, it noticed everything about development. It was based on sound, critical thinking, and research, and development, and it was cancelled a month later. They put out a different brochure.

The main point there is children need scaffolding support, which means you can't just put something on the computer online and expect a child to learn. They need someone to support them. And *Time In*, this is a book by my, he was the most wonderful late Professor Otto Weininger, and he talked about how "timing out" children is very detrimental to their well-being. It says to the child, "You're so bad, even I don't want to be with you." And so, timing out, I'm not talking about isolating. Timing out is very difficult for children, so we should bear that in mind.

Concrete to abstract thinking, so let me find here. The fearful idea: "kill grandmothers." So one teacher told me that one day she saw a child at the end of the school day who was hiding and didn't want to go home and sat crying. She said to her, "Why are you crying?" And she said, "Because my grandparents are coming to get me and I'm afraid I'm going to kill them." And that's a true story.

[00:30:00]

At the concrete stage, children also, when they see a rule, for example, a rule is a rule: "so if you don't wear a mask and it's a rule, you're bad." Things like these kinds of ideas.

A risk measure—the opposite of time in—is self-isolation. And I have some examples here. This was Public Health Ontario where they advise people how to self-isolate, a child has to self-isolate. Imagine, a child has to self-isolate: we're punishing that child and some children did not understand why. And some parents might not have been able to contain properly because they were trying to follow the rules and for some children that might be traumatic.

So some things for child, "wear a mask." Now, if you have children, you know that it's not so easy for a child to wear a mask, keep it clean, not touch it and so on, might not be comfortable. They advise children over the age of two, even children coming for therapy to wear masks. At the age of two, try getting a snow suit on. So how can you get a mask on? Anyhow, so self-isolation for children really did happen.

The proof is here, this is from Peel Health. I think they're called Peel Health [sic] [Peel Public Health], not Peel Public Health. What to do if your child is dismissed from school or childcare? "The child must self-isolate," which means stay in a separate room. These are real. And for those of you who are watching this 20 years from now, this really happened. So there's that one, again, okay. Yeah, imagine this, if a child must leave the room, they should wear a mask and stay two metres apart from others, and so on. Okay, so I'm not going to go over all the tasks just for time. Can anybody tell me the time?

Kassy Baker

You have roughly 20 minutes remaining.

Dr. Keren Epstein-Gilboa
Oh, Okay.

Kassy Baker
But we'd also like to save some time for the questioners.

Dr. Keren Epstein-Gilboa
Yes, okay.

Kassy Baker
So I'm just going to actually, are there any questions from the Commissioners at this point?

Yes, we'll save them for the end.

Dr. Keren Epstein-Gilboa
Okay, so I'm not going to go over all of the different stages. Just let you know that, as I said before, developmental tasks were not taken into account, and an appropriate risk-benefit analysis of the condition and child development did not take place to the best of my knowledge. And why? Why?

So I've tried to figure out why, and I looked at bioethics. I love bioethics. It's something that I actually read about and I'm interested in. And here are a few researchers if you are interested in looking at researchers just to understand more about bioethics. Beauchamp and Childress is very easy to understand if people just want to start reading about this.

And bioethics are there because there's a power balance between people who are health care providers and the people they serve. And by the way, I use the word person. I don't use the word patient. You can, if you wish, sometimes client. And I just heard lately the word "participant," one that I really like because it's very respectful. And the principles that all health care professions follow—albeit in different ways in accordance with their scope of practice—are autonomy, beneficence, justice, and non-maleficence. This applies to direct interaction, of course, between the health care provider and the person. And also public health.

Public health: it's interesting because public health, unless they're a public health nurse or physician, they don't serve individuals only. They look at the population. So I looked at different research on this issue. How do we deal with this?

And apparently, they should still be engaging in a benefit analysis that takes into account these four principles. This quote I took from the book *Doctors from Hell, Horrific Accounts of Nazi Experiments on Humans*. This is Abrams; it's the book by Spitz (2005). And they state, "need to care for the population need." This is not a quote, I'm paraphrasing: Still need to look after the population need and good citizenship. But it's a slippery slope when physicians, and I'm saying physicians here because the person who wrote this book was a physician, when the physician—and I'll add there, health care provider—begins to exclude or uses professional skills against people.

And Parasidis and Fairchild wrote,

[00:35:00]

There has been, during the past three years, “a lack of adequate involvement of ethicists.” This is a quote: “Might have to embed ethicists in public health teams.” Apparently, there weren’t enough involved at this time. Remember again, I started with a system. So when we have failed ethics, that’s related to chaos at all levels of the system. Risk for harm at all levels.

I’m going to focus mainly on autonomy because autonomy is part of all of the other principles. And autonomy talks about regard for the person. The person is worthy and this part is very important: Able to make decisions about their health. And the health care provider must respect the person’s goals; they must gear the treatment towards the person’s goals. We have dignity, privacy, confidentiality, informed decision making. Informed decision making, a lot of people talk about informed consent: You can’t talk about informed consent without knowing and talking about autonomy. Informed consent does not stand alone. Autonomy upholds the health system.

So let’s look at respect for humans as worthy beings and compare it to compliance—trust in authority, follow without question. Dignity. Dignity means compassion, respect: one does not only ensure that the person is covered physically, but we also think about their needs and things that are important to them. And dignity also implies birthing, thinking about the needs of birthing, and sick dying people who need people near them and the families who are left behind—that’s dignity.

Privacy and confidentiality. So Dr. Layton talked a lot about what the regulatory colleges are doing, including demanding files of private citizens. So here are two cases. Dr. Layton referred to the case of the clients or the people who tried to stop their private files from being viewed by the CPSO [College of Physicians and Surgeons of Ontario] and, so far, have not been successful. And of course, there’s also Dr. Mary O’Connor who was threatened with prison for not showing her files, for not providing her files.

So now informed consent or informed decision making, informed choice. Actual informed decision making means we use clear, tangible—Tangible means you don’t show people to wash their hands like this, that’s the wheels on the bus. You show how to wash hands, and it’s my understanding that health care providers learn how to wash their hands. They also learn how to wear masks, and we were not taught that. It’s valid, reliable, current [information]. But it’s also different views, second opinions. We listen to the person; we engage in respectful discourse, respect [person’s decisions]. And respect for the person as a worthy being, able to make decisions.

Let’s compare that to censoring—and here’s the really important one that Dr. Layton also talked about—prevented health care professionals from providing diverse viewpoints. Sanctions: you should know that all health care providers from all provisions have been reported, investigated—some not just about informed consent but about things that would never be considered in regular times. And yet the investigation went on, goes on. And tomorrow, for example, there’s two tribunals going on, one for a nurse and one for a physician, tomorrow. Public can view it. And the public can’t discuss what we really think. There’s only one view. You saw the letter from the College of Physicians and Surgeons.

Actually, the nurses were the first people to get their letter and it says: “Nurses are expected to adhere to standards of practice in carrying out their professional responsibilities. Nurses have a professional responsibility to not publicly communicate,” and now, look at these terms, “anti-vaccination, anti-masking, and anti-distancing

statements. . . .” You’ll see later on why the word “anti” is a bit problematic. “Doing so may result in investigation by the CNO [Colleges of Nurses of Ontario] and disciplinary proceedings warranted.”

And there’s a statement about the physicians. Physicians, as Dr. Layton said, also received a lot of information on how to talk to people. And one model that they were told about was to use motivational interviewing.

Motivational interviewing is actually a very respectful model. It comes from Rogerian, client-centred therapy. But if you read the material, if you go to PrOTCT [Presume Offer Tailor Concerns Talk]— Let’s see if I have a letter where the physicians were told to engage

[00:40:00]

with what Dr. Leyton was talking about: how to speak to your, they would say patients, I would say to their people.

You can look this up, PrOTCT [at Centre for Effective Practice], all of this is online. There it is. And it really, in short, tells physicians how to speak to clients. And I’ll just give you one sentence: “. . . starting the conversation with a Presumptive statement. Talking tip: ‘I will get/have already gotten the COVID vaccine and I’m happy to help you get it too, so you can protect yourself and your loved ones.’” And it is my understanding that health care providers don’t immediately disclose; disclosure is fine if it can help the person, but that is not the way that one would probably start a person-centred conversation. And there’s more points, you can look that up if you’re interested, and I think we should all be interested.

And you might notice, this is also from the PrOTCT and they’re saying, “What do you think of the COVID-19 vaccine?” and it tells the physician how to speak. And you might notice, if you were my students, I’d ask you, what do you notice here? Do you notice they don’t have faces? Yep. Okay. And, you know, what do you think about that? How warm and fuzzy is this interaction when everybody’s covered up? We don’t really know what they’re thinking because you can’t see their face.

So I want to remind everybody that telling health care providers not to speak with one another, not to speak their view, is not the way things work. Yes, there were arguments; yes, people disagreed. But they were allowed to speak; otherwise, we might still be spraying DTT on people. And as Dr. Layton, it’s interesting, we both use the same example: stomach ulcers, the change, the treatment has changed; imagine if we couldn’t speak about it. Mothers are no longer put to sleep and birth with twilight sleep, and they weren’t birthing alone from the 1960s. Reverence for artificial feeding, destroyed breastfeeding. It was actually the health care professionals who destroyed breastfeeding and put mothers to sleep at the beginning of the last century.

And allergies were perceived as mental health, there you can see a quote. And my father was actually one of the first allergists and immunologists, my late father I should say. And I know from my own experience how he was always told that allergies, “It’s all in your head.” We know now that allergies, that whole field is very well developed and accepted.

So just very quickly, the other principles: beneficence means we do good and we advance the health status. So I saw some of the witnesses who spoke, talking about not being able to go to parks and so on. Nobody told them about nutrition: well that’s a violation of beneficence. Justice means health equity and that means everybody can use the services. So

think about all these people who couldn't use computers. So how do they even get to speak to someone about health?

And, non-maleficence means, do no harm. I think many people here have spoken about the harm. But an important way that we do no harm or health care professionals do no harm is by engaging in a risk-benefit analysis. And that was my first question, by the way, in 2020: "Where's the risk-benefit analysis?"

Research on humans, I'm not going to go over, we all know that. But one of the main ideas there is that it's voluntary—it's the same as autonomy. And what I found very interesting, and you might find it interesting as well, is that the main theme is autonomy: respect for human beings, their goals and capacities to make personal decisions. So notice the similarity. The code for research on humans is different than codes for bioethics. They're different: what is—not—in the ethical code is trust.

Trust can also mean— It's wonderful if you can develop a trusting and mutually respectful relationship with a client. But it's not always there. And that's not our goal: to get us, the people, to trust them; that's not what it's about. Because that kind of trust is compliance, infantilization, like, trust versus mistrust in infancy; adults are not infants. But there's also transference: transference means that the practitioner might seem to be someone else to the client. So you're not going to have trust there, and that's okay. Or if the physician is the person who tells the client, "You have cancer,"

[00:45:00]

that client might be very angry at the physician. What, you're going to stop treating them? No. Trust also must be earned. So our goal is not trust—it's not trust—that's not what it is. What also is not in the ethical codes: follow orders.

Kassy Baker

Now, I'm sorry Dr. Epstein-Gilboa, I know that you have much more information, this has been very interesting, but we only have a couple of minutes left.

Dr. Keren Epstein-Gilboa

Oh my god, I didn't do the nudge. I have to get to nudge.

Kassy Baker

You know what, I'm sorry, we just don't have time.

Dr. Keren Epstein-Gilboa

But that's so important. I really have to speak about the nudge, I'll do it fast. I won't show the pictures.

Kassy Baker

You have three minutes.

Dr. Keren Epstein-Gilboa

Three minutes. But if you wonder—it's not my psychosis, everybody. There's a real program: it's called Nudge; it's behavioural insights. You can read about it. The government told us about it. What is the Nudge program? Go to Impact Canada.

What is the Nudge program? It is all over the world. It is a program based on behavioural science. Impact Canada is the group in Canada who work on it. They did things like, they used language. Sounds: sounds quiet to induce fear. Jubilance, because it's not just fear. Everybody talks about "fear, fear, fear." No, it wasn't just fear. They also used euphoria.

Images: people standing in line, circles. The same messages all over the world: stay home—stay safe. Foot in the door: that means, "Hear ye, hear ye! There's a virus." But we only start with a little thing. Boil the frog: we slowly increase the restrictions.

Priming. "Oh, no, this is what to do if a child has a heart attack." That means we begin to realize that heart attacks are normal: that's priming. Information without information: You'll see the graph there. There's no numbers. There's another one, no numbers.

Pressure. Threats. And sanctions. But that's not really part of the original Nudge program, but it's there now. Stay home, false equivalence: stay home—stay safe, which doesn't mean safe. They used "messenger effect," which is specific people that we supposedly value and listen to them.

Emotion. Please note again: they didn't only use fear, also, euphoria and hope. It's really important that we know this, so we're mindful. Emotion, we do not always know— Okay, wait, that's an example.

Social interaction. And this is a quote from the Impact Canada: "Emphasizing collective action, altruism/moral responsibility; emphasizing that self-isolating and physical distancing are altruistic," in other words, that whole term, social responsibility. That's part of the Nudge program. There was a continuum.

Let me just show the continuum. Normalize and idealize distancing so that eventually we will also be prejudiced and segregate. Stay home, physical distancing, conform, breathing barriers, small groups, cohorts, and discrimination. These are just quick— People standing in line; lines were used. I'm almost done. Just quickly going through these pictures. Lineups, circle: "we're in this together" when we're not really. No faces, and I showed that throughout: there's no faces. By the way, the facial coverings were actually used as part of the Nudge program to make sure fear stayed there, that we were reminded. Stay safe, be kind, be COVID, and so on. You remember this one, for the future generations: they really did tell us to have intimacy with the mask on, and that's about it.

I'll leave it with segregation.

Kassy Baker

Thank you very much. I apologize that we had to rush through the end here, but just so the commissioners are aware, we will be entering your slides as an exhibit [Exhibit number unavailable], so they can have some time to review that at their leisure, so to speak.

I believe we are out of time for questions, is that correct? We have time for short questions if any.

Commissioner Kaikkonen

I don't have a question; I just have a quick comment to add to your presentation. I think between Dr. Layton's presentation and yours, I'm probably traumatized here.

But I just want to add that there were parents having newborn babies and the babies were taken away from them in Ontario hospitals until the mother's COVID test came back. And I can think of one example where that baby was taken away for 36 hours until the COVID test was returned. And I'm just thinking, I wonder what happened to that baby in that 36 hours because they weren't with mom. So your examples are very real, and I think it should be a wake-up call for all of us, to think about exactly what that messaging that was sent out by so-called health authorities has done. And the other side of this is we've heard testimony as we travel across the country that talks about the generation that we've lost and that's our children. Thank you for your testimony.

Kassy Baker

Thank you very much. I have no further questions, and Dr. Karen Epstein-Gilboa, I would just very much like to thank you for your testimony here today.

Dr. Keren Epstein-Gilboa

Thank you. And thank you for doing this Inquiry. It's very important. Thank you.

[00:50:54]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

[00:00:00]

Shawn Buckley

So our next witness is attending virtually, Mr. David Freiheit. David, can you hear me?

David Freiheit

I can hear you. Can you hear me?

Shawn Buckley

We can hear you and we can see you. I probably pronounced your last name incorrectly. I know you're known with your online commentary as Viva Frei. Is that right? Or Viva Free?

David Freiheit

Yeah, my last name is Freiheit. It's verbatim: freedom in German. So it's a good name to have.

Shawn Buckley

So, David, can you state your full name for the record, spelling your first and last name?

David Freiheit

David Andrew Freiheit. D-A-V-I-D, Andrew, F-R-E-I-H-E-I-T; F like Fred and T like tango.

Shawn Buckley

David, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

David Freiheit

So help me God, yes.

Shawn Buckley

Now, you have a very interesting background. So you were a lawyer. You used to practise in litigation, but you've gone on to other things. You've become quite a celebrity as an online commentator. I've heard of you from individual after individual after individual. And I actually got to know your brother a little bit on some Zoom calls to see if I could get him to be volunteer counsel for the NCI. So I'm very pleased to meet you. You're being called primarily to talk about your experience with the Trucker Convoy because we're in Ottawa, and that was an experience that was really significant to people living in Ottawa. So I'm wanting you to share—because you weren't living in Ottawa at the time—how you got involved and what your experience was.

David Freiheit

Well, I'll let everyone out there know I didn't always look like this. I didn't always have the grimace wrinkle of a world-gone-mad on my forehead. I used to be a clean-shaven young lawyer. And some people might have seen me online from old videos, like the squirrel stealing a GoPro. But yeah, when the world went crazy, I had already started doing online legal analysis, sort of explaining lawsuits and breaking things down. Then the world fell off a cliff in 2020. If I may start, I'll share my screen for one second.

Shawn Buckley

Absolutely.

David Freiheit

I didn't make a PowerPoint presentation, but I've got my backups here. For what I'm about to talk about, it's worth starting off with a quote from Benito Mussolini. This is not the exact quote, but it's close enough: "The definition of fascism is the marriage of corporatism and state." What I have lived through and what we have all lived through over the last, starting March 2020, it has been fascism not in the juvenile sense of throwing the word around; it has been fascism in the actual Benito Mussolini sense: where I've witnessed the government working in tandem with corporations, working in tandem with the media, not to inform, not to control information but to purvey and propagate disinformation.

Shawn Buckley

Can I just slow you down? Because fascism is a term that is used very loosely now. And it's used, actually, to deflect and to make people—that aren't fascists at all—be not heard from. It is almost like the term "anti-vax" or "climate denier" now. My understanding, and you can correct me if I'm wrong, is the word corporatism simply refers to where the state interests and the corporate interests have largely become one and the two are working together. I guess Mussolini is very famous [for], when people would be talking about corporatism, saying, "No, no, you should call that fascism." You brought that definition up, and so fascism—just so people understand who are watching your testimony today—when they see the word "fascism," they need to understand that just describes the state of affairs where the state interests and the corporate interests are intertwined and working together. Is that right?

David Freiheit

Well, that's my understanding of the actual historical definition, not the way it's used this day. Like, you know, everyone's a fascist—and not to get too distracted—if you don't believe in certain things, you're a fascist. It's thrown around today, but it actually has a meaning. And it's a meaning that I've come to understand the importance of, which is corporation and government working in tandem because they have shared interests.

I've now witnessed firsthand in my evolution how this happens. I was young enough to remember people saying defund the CBC, you know, pre-2016. I had no idea what that meant, why it was being said. And now I understand because we've lived through this together. We lived through the shutdown of the world. We lived through—literally, it's come out now, and I'll bring up some articles if the world needs to see the homework—a world in which the government

[00:05:00]

decided the pandemic was a good time to test propaganda techniques on the citizens that they were currently locking down, shutting down, subjecting to unconstitutional and unconscionable restrictions.

And what way to do that? Well, it helps when you have the media in your hand. And so how did all this happen?

I had my YouTube channel. I was doing legal analysis, trying to keep my opinion out of it, thinking you can make everybody happy by not sharing your own personal opinion. Little did I know that at some point silence became violence. And then the world shut down. And I started, you know, I didn't want the channel—and I didn't want my entire life—to turn into COVID stuff. But lo and behold, there was nothing left: we were shut in our homes literally for years. I was in Quebec where we had five and a half months of curfew in 2021, and then because it worked so well and it was such a good idea, we had another month and a half of curfew in 2022 despite Arruda, the chief medical officer of Quebec, saying, "You don't use curfews to fight a virus."

So all of this culminated in the trucker protest, which was, for a great many people, not the light at the end of the tunnel but the only ray of sunshine that they had seen in years. I mean that is where my awakening comes into this. My experience in Ottawa, which was life altering and trajectory altering, where— I'm doing my daily stuff complaining about the lockdowns in Quebec, the tyrannical governments, doing my Viva walking on the streets. And it started off with people in my chat saying, "Viva, why aren't you covering the Convoy?" "And I'm sitting there saying, "What convoy?"

I now understand the same MO—the same *modus operandi* that happens every time—it's first a media that is reliant or adherent or subservient to the government. Well, their system is the same: Ignore something until you can't ignore it. Minimize it once you can't ignore it. Demonize it once you can't successfully minimize it. And that's exactly what happened with legacy media in Canada.

Shawn Buckley

So can I get you to slow that down because I think you're saying something really important. We have quite a large audience, and the demographics actually mimics vaccine injury, which is quite interesting. So there will be people watching your testimony that will never have heard what you just said. So I'm just wondering if you can say it again but kind

of slow it down to parse that out because it's somewhat important. And then carry on with explaining how you found out what was really going on.

David Freiheit

I was doing my best to slow things down.

Shawn Buckley

Yes.

David Freiheit

I've been told that I talk fast. Step by step, it's the MO of the media when they have an interest and they want to propagate a narrative: Ignore until the point that you can't ignore it anymore, and then you either minimize or distract. Minimize or distract to the point where you can no longer do that because it's gained sufficient momentum. And then you have to move into the demonize and lambaste. You can see this over and over again for populist movements, political candidates. It's the classic MO.

So I was doing my daily rants on the street because I was allowed out of my house because I had a dog, after 8 o'clock. The joys of COVID. So people are telling me, "Viva, why aren't you talking about the Convoy?" And this is a month or two before the Convoy, maybe a month before. And I'm saying, "I haven't even heard of this." Because the CBC and the state-subsidized and state-funded legacy media wasn't talking about it. Then I start going on CBC to see what's going on. And then, after the ignoring, we had the distraction.

CBC starts reporting about an alleged convoy in British Columbia going from one British Columbia town to another, but they're protesting road conditions. Nothing to see here, move on. Then I notice the CBC, at one point, updated that article and said, "Oh, that convoy is not the one that's headed to Ottawa." And that's when the CBC understood that this Convoy going to Ottawa was too big to ignore. Too big to distract or misrepresent, and so what did they have to do?

Step right up to item 3: demonize and lambaste. For the viewers watching, for everybody watching, if they don't truly understand—CBC/Radio Canada is subsidized to the tune of 1.2 billion dollars a year under the federal law. It is true that the federal law was enacted prior to Trudeau. In theory, it is whatever federal government is in power at that time that subsidizes them.

But when you see the indirect distorted interests of the media to placate or favour one government that doesn't want to defund them and to dehumanize the other— You'll notice that the CBC, once upon a time,

[00:10:00]

sued the Conservative Party of Canada for copyright infringement for using some of their material for a campaign ad—but never sued the Liberal government similarly—using our taxpayer dollars to sue a political party, one of the two big federal political parties.

Understanding this now, the CBC could no longer ignore this Convoy that was coming from all corners of Canada. So once they can't ignore, once they can't misrepresent, they then have to move into demonizing. And that's when they start demonizing the truckers as

extremists, anti-science, anti-vaxxers, yada, yada. At this point none of us really understood how big it was ever going to get. And they're doing their best to try to ignore the young children and the people with their flags of hope on overpasses across the country.

Shawn Buckley

And I'll just stop you there because people that are watching internationally won't understand. So when the truckers started moving from different parts of the country and driving towards Ottawa, the citizens would literally line up along the road, every overpass covered in flags and placards. And they couldn't buy a meal and they couldn't pay for their diesel—like, people were supporting them along the way and that was part of the experience that Canadians had. Because we have people watching internationally, I felt the need to jump in and fill that in.

David Freiheit

Please, don't worry. And they were doing it everywhere. I mean, they did it in Montreal; they would stand on overpasses. You had these wonderful images of hope and people standing behind the truckers—the truckers who would ultimately become an international movement, which obviously upset Justin Trudeau even more. So the media has to demonize them, and so they start calling them all sorts of names at first. But at this time, also, nobody understood what this protest was going to turn into.

You had truckers driving across the country, not knowing how they were going to pay for fuel or not knowing— Just, enough is enough, we're going to the capital. People also should appreciate Ottawa is not a random town. It's the capital of Canada; it's where protest occurs when protest needs to occur. So all of this is happening, and I'm starting to pay attention to it, starting to understand this is turning into something special. As luck would then have it—or bad luck would have it, although I think it all ended up well—I was in Florida for a Project Veritas event, back before Project Veritas turned into what it is today. But then people were saying, "Viva, what are you doing at a Project Veritas event? Get your butt to Ottawa." So I'm like, "Okay, I'll get back to Canada and I'll go."

In the meantime, I'm starting to see what the CBC and other legacy media are reporting from Ottawa: I'm seeing reports of Nazi flags. I'm seeing reports of Confederate flags. I'm seeing reports about defacing the Terry Fox memorial. People urinating or desecrating the [National] War Memorial that is in downtown Ottawa. But I'm simultaneously, literally, getting tweets, messages, video clips from people on the street saying, "This is all a big fat lie."

I'm sitting there; it's like, I'm seeing not one screen, two films. I'm seeing—someone's telling me that they're seeing blue when it's red. And so, it's like okay, "Well, I'm going to get to Ottawa the Monday I get back," which is after it started on the Friday.

I had never done this before. I did livestream where we talk about subjects, but I've never done a walking around real-time livestream. I said, "Look, I'm going to drive down to Ottawa. I see what the CBC is saying. I'm going to drive down and I'm going to livestream. And if there are Nazi flags there, the world's going to see it for good or for bad, for right or for wrong. If there's Confederate flags, violence, and mayhem, then the world is going to see it in real time as I see it."

I get down there. I drive down from Montreal. I drove down there and back every day, except for one night when I tried to stay in a hotel. But that was when I think the

government either bought up all the hotel rooms or forced them to cancel reservations because they cancelled my reservation.

I get down there. And you understand them: It's like eyes wide open for the first time, ever. I understood we're being lied to. And not just lied to—because it's one thing if you know someone's lying to you—it's a more insidious type of lie when they try to make you think that it's reality. It worked on so many people. I get down there, the Monday after reading news about Nazi flags, desecrating the War Memorial, and desecrating the Terry Fox memorial.

At this point, let me bring up one of my footnotes here: the article about the desecration of the Terry Fox memorial. This is CBC and this is how they reported it, and it's so subtly insidious: "Anger over defacement of Terry Fox statue, a sign of his 'unique' legacy, says mayor of icon's hometown."

[00:15:00]

When I talk about the fake news—and people are going to immediately think of the Trumpian term—this is government-subsidized propaganda. And you'll notice, in all of these CBC articles that I'm going to bring up, the tactic: They make a statement, but then they quote someone else, "says mayor of icon's hometown." So they're not making the statement, but they're saying the statement, referring to another government official who makes the statement—it's misleading, and it's utterly dishonest. So you read the headline, and for anybody who gets past it, you might see this picture of the defacement of Terry Fox [image of Terry Fox statue with a Team Canada baseball cap and Canadian Flag wrapped around his neck].

Words have meaning, as a lawyer, my father always said, "Words are the tools of your trade." Defacement typically means something semi-permanent, more permanent than a cap, even if one were inclined to think that a cap is defacing a statue. They don't show you the bottom of the statue, at least yet. So anybody who gets this far, and says, "Oh, my goodness"—well, even I thought this at the time—"there must be something going on at the bottom of that statue." Spray paint, dirt, something along those lines. You get down to it—once you scroll down far enough—and this is the defacing of the Terry Fox memorial that they were complaining about [image of Terry Fox statue holding a sign: Mandate Freedom]. Now, again, they didn't make the statement; they're just quoting the mayor of Terry Fox's hometown. Why is this so gleamingly insidious? That's defacement.

And when you want to talk about a media that has a vested interest to demonize one group while lionizing another, this is a tweet from Sheila Gunn-Reed from back in the day. Let's see if I can find this. Can we see that now?

Shawn Buckley

Yes, we can.

David Freiheit

Okay, it's tucked down here somewhere behind all this.

You have a tweet from Sheila Gunn Reed, which compares, you know, historical defacement of the Terry Fox—sorry, alleged defacement—from the Convoy with what is otherwise "just celebration" [Sheila Gunn Reid Tweet comparing image of Terry Fox statue at the

Convoy, with Team Canada baseball cap, Canadian Flag, and Mandate Freedom sign, with another image of Terry Fox statue celebrating Pride week, holding a Pride flag and flowers]. It's the same media that's doing this: they'll take two images, which are by and large the same, and demonize one based on ideology while lionizing another based on ideology.

Who does it benefit?

Well, it benefits the government, and it benefits Justin Trudeau in effectively shaping—and as you say, not just Justin Trudeau but Doug Ford, all the provincial leaders—it helps them mislead an entire population as to what's actually going on for anybody who gets past the headline, which is already a very small percentage, and even then, it's buried in there.

And they do this so that they can create, promote a narrative that favours the government, a government which subsidizes them, and then people see this and think that they are informed. I knew people in Ottawa, not to identify anybody who doesn't want to be part of this. I've known people who live in Ottawa who thought what was going on was what was being depicted in the CBC; none of them stepped foot in downtown. And they all believed that they knew what was going on and that the truckers were Nazis, that they were desecrating statues, urinating on them.

I went down there with my camera, and I ran around, literally, everywhere. And I go past the memorial: it's clean; it's shovelled. There might have been what looked like coffee on the side of it, but, by that point, the lie has travelled around the world and the truth, as they say, is still putting on its pants. I did this for 13 or 14 days: just drive in, see what's going on and talk to people—just talk to people and hear them in the same way that they're talking now and sharing their stories with the world now because our elected officials refused. They didn't even have the courage or the dignity to come down and talk with any of the protesters—people who just wanted to be heard and share their story after two years of what can only be described as unconscionable inhumane abuse. They didn't have the courage to step down and talk to them. I just went around hearing people's stories, see what was going on firsthand. It wasn't to misrepresent; it was just to show without a filter what was going on. And that, without a filter, led to CTV News' "W5" attempting to make me look bad, as if to say, "This guy goes around with a camera with no filter; he's very popular. What's going on? Why are people watching this?"

Without understanding that that's exactly what the people want: it's just the truth of what was going on. And I went down there and I saw it with my own eyes. You know, when the CBC was talking about kids—hold on, I'll bring this one up as well—kids being among the crowd, making it hard for police to do their numbers. Here, I think this is it; yes, this looks like it. Look at this. CBC, notice the tactic: They make a statement, "Large number of **children among protesters hampering response, police say.**" Oh, well, we'll just unquestionably and unquestioningly repeat what the police say so that we can then continue with demonizing. And not just demonizing, by the way,

[00:20:00]

because I was there seeing people in tears because the implicit threat was that the government was going to come in and take children away.

This is not just demonizing and calling people Nazis or whatever. This is, you know, saying these parents are putting their children at risk, using them as human shields. But CBC says it again, "Large number of children among protesters hampering response, police say." CBC

is not saying it. They're just repeating it for and on behalf of the government to the benefit of the government.

And then, look at this, if anyone thought— Is this the right one here? Yeah, this is it. Ottawa police [an Ottawa Police tweet]: The CBC is just repeating the Ottawa police, repeating it and not condemning it. When the Ottawa police come in and say, "Protesters have put children between police operations and the unlawful protest site," they deemed a constitutional right unlawful just like that, willy-nilly. But set that aside. "The children will be brought to a place of safety." To me that is a very sinister threat of government-sanctioned kidnapping, but it didn't actually get there—but not for lack of trying from the CBC media. So I'm down there, oh, goodness. Yeah, sorry, go for it.

Shawn Buckley

Well, I'm just wondering, describe what you saw. So you're telling us about all this demonizing and you're telling us you were down there. So what did you see?

David Freiheit

I said I wasn't going to cry because I think it's weird when people cry. I cry when I get upset, but I also cry when I get really, really frustrated. What I saw there was one of the few times where I was on the verge of tears because of how magnificent it was. It was noisy: there's no doubt about it. There were horns and there was a beauty in the horns. But it was nothing but the most beautiful thing I have ever seen, for those of us who had spent two years under psychological, economic, financial, and spiritual abuse.

You know the previous witness talking about how Peel region was talking about locking kids up as young as five years if they just came across someone who's— We had lived through that. I saw people smiling. Hugging. And I'm never one to hug; I'm a bit of a germophobe even before all this. I even started to hug. You saw people smiling; you saw people wearing masks mingling among the crowd. But the media was saying that, you know, the truckers were demonizing people who were wearing masks.

Another grotesque lie because a lot of people, known to everybody there, were wearing masks so they wouldn't get identified and fired from their jobs for participating, partaking, or even being at the protest site. I saw kids playing hockey. There was the jacuzzi towards the end of it, the hot tub. Kids playing hockey, dancing, smiling. There was a section by Wellington and the main intersection, right in front of that hotel, the fancy hotel—

Shawn Buckley
Elgin.

David Freiheit
I called it the dance-dance. It was, say it again.

Shawn Buckley
Elgin.

David Freiheit

Elgin Street, yes absolutely. There was this section, I called it the dance-dance revolution because they had trucks—they were playing dance music; people were dancing. I'm not saying this, because I don't look at people and immediately see race, religion, identity, sexual orientation, I'm saying this because for a group that was called misogynist, there were women all over the place. For a group that was called racist, I interviewed Iraqis. There were black—I don't know if they were Canadians, but there were people of all races there. They were called anti-trans; I interviewed a trans person who was at the protest, Ari was their name. I interviewed this person and we had a good time. And Ari said that the only time they felt any form of hatred was when they crossed the line from the counter-protesters to the protesters, when the counter-protesters realized, "Oh, this is no longer an ally, Ari is an enemy." I interviewed people from all over the world. I interviewed Big Bear, a native man. And I'm listening to the media say that this group of trucker protesters was anti-black, racist, anti-Semitic, misogynist.

It was hogwash from day one, and I learned that after day one. Trista Suke, day one, I meet a beautiful young woman who's walking around with a guitar. I had no idea who she was. She says, "I want to sing you a song," and this was at the far end of the protest. And I was nervous for her because, you know, I was worried it was going to be like an "America's Got Talent" bad audition. She started singing and she sang Amazing Grace, and it was the most beautiful thing I've ever heard.

This was what the protest was.

And then for two and a half weeks, you had the CBC running around with that lone picture of a swastika on a flag. No one ever knew who that person was. But, you know, very fortunately there was a professional photographer right near him, so he could get that shot. You know, diffuse it to the media who would then run it around saying, "Oh, we're just reporting."

[00:25:00]

For anybody who doesn't know that one scene on day one when someone was there with a Nazi swastika flag: The media ran with that. Politicians ran with that. Marco Mendicino ran with that. Justin Trudeau, Jagmeet Singh, they all ran with it. The media helped them, and they had their disinformation-laundering campaign perfectly set up. It's unclear what that person was even doing because there are some people who suggest the person was there with the Nazi flag to suggest that Justin Trudeau's regime was behaving like previous Hitlerian regimes. Others are saying he was a plant. Who knows? Bottom line: that flag existed on one person for one moment, never came back. And after that, it was nothing but love, peace, and a sense of joy that Canadians had not felt—and the world had not felt—in two years. Sorry, I heard you want to say something.

Shawn Buckley

Well, no, you answered my question because we've all seen that image because the mainstream media just kept repeating that image. So, you know, it's now a famous image in Canada, and it's burned into our minds regardless of whether we bought into the government narrative or not. And so I was just going to ask you, because you were literally walking around live streaming day after day, if you ever saw a Nazi or Confederate flag at the trucker protest?

David Freiheit

I never saw one and I didn't edit anything. I went for five and a half hours, sometimes every day, and I saw what I saw. And it's not just that I saw what I saw because I asked cops. I asked the police: "Have you guys seen any vandalism? Have you seen any violence?" They said, "No, it's cleaner and safer now than it's ever been." And I should add this, I'm very familiar with the city of Ottawa. I never felt comfortable in the city of Ottawa; I might be a bit neurotic and nervous, in general. But nobody liked downtown Ottawa at night because it's not a place where you would go walk at night. No judgment. There might be, you know, reasons why the government has sort of failed the homeless population and the addicts of Ottawa. But it's not a place where you would walk around; the Rideau area, it's not a place where you'd walk around at night. I had never seen the downtown core of Ottawa cleaner, safer. The homeless people were being fed. And so when you read these bogus rubbish stories coming out that the truckers went and harassed a homeless shelter and demanded food—they were literally cooking food on the streets and feeding the homeless people.

And it was so in your face and so shocking what I saw. And I went to ask the cops, "Have you guys seen anything?" At one point, one of the policemen said to me, "Yeah, actually, there's a broken window across the street." I was like, "Oh, where?" And then he giggles saying, "I'm joking; it has nothing to do with the protest." You could not understand what it—wasn't—unless you had been there. But they did a good job doing what they're doing in terms of making people think they understood what was going on, and it has its impact. And I always say, "The toxicity is a trickle-down and a trickle-up."

Let me play a clip. I interviewed a counter-protester. I'm just going to play one section of this interview. Let me see if I can bring it up here. And I'm not bringing this up to mock the person. I have no idea who this person was, ironically enough, wearing masks, and nobody cared. But listen to what the protester said. I thought this rang interesting.

[Video] Counter-protester

The occupation of Ottawa has to end. I live just outside the Red Zone. It's appalling. I cannot go to an office building. I can't shop. I can't go to church. I can't—

Viva Frei

You can't shop. You can't go to an office. You can't go to church. What do you have to say to the people who are protesting because they can't go to church, they can't go shopping, and they can't go to the office because of the government.

Counter-protester

Get vaccinated,

David Freiheit

"Get vaccinated." Listen.

[Video] Counter-protester

and do what you can.

Viva Frei

Okay, but now, if I may ask, could you recognize a certain inconsistency in telling someone that they have to do something with their body to do the thing that you're complaining you can't do now because it's an inconvenience?

Counter-protester

It's not an inconvenience, that's an occupation.

David Freiheit

"Occupation."

[Video] Counter-protester

I'm not telling them that they have to be vaccinated. I'm saying that if they want certain things, certain rights then they have to be vaccinated. If they want certain rights, you can't drive a car without a seat belt without facing the consequences.

David Freiheit

Where she says, "without facing the consequences," she goes on to say, "Get vaccinated or there will be consequences."

[Video] Counter-protester

You can't drive drunk without facing the consequences. If you don't want to be vaccinated, then you have to face the consequences.

David Freiheit

Where did we hear that terminology being used? I had to go back and double-check.

Shawn Buckley

So this is a counter-protester, just so it's clear for everyone watching. This isn't anyone involved at the Trucker Convoy, but they were counter-protesters. You went and interviewed this counter-protester.

David Freiheit

I interviewed a couple. I wasn't there to pick fights or start fights, but I went to interview this counter-protester. The one thing people should remark from that interview is that you could hear it,

[00:30:00]

and this was barely four blocks down from the core of the protest. She went on later to say that it's torture, the noise. We were conducting an outdoor interview on my iPhone, and you could barely hear the horns from up the street.

But "get vaccinated or there will be consequences": where did I hear that terminology? This was February 2022. Well, lo and behold, you know, this was the exact terminology Justin Trudeau had used in August 2021. I had to double-check the dates to see which one came first. And you see how this all works: It comes from the "top down," recycled and regurgitated by the media that doesn't hold the government's feet to the fire. I've been saying that the Canadian media has gone from being the government watchdog to being the government lap dog. And so you get the government, you get Justin Trudeau, the highest person in political power in Canada: "If you don't get vaccinated, there will be consequences." You don't get a media grilling him for this Nuremberg-level violation of everything that history has taught us.

And then it trickles down, recycled, and then, lo and behold, you get your citizens regurgitating and repeating what would otherwise be atrocity-speak in different ages. I interviewed this protester. You could hear the interview. They were claiming it was an occupation: She said, you know, "The horns, it's torture. It's a violation of international law." And I asked her if she knew about the Nuremberg Code, and, lo and behold, you know, CBC wasn't exactly teaching people about the Nuremberg Code.

But that's what happened. I walked around. I talked to people and I heard their stories. I interviewed a woman whose two sons died of overdose during the pandemic. You can't listen to something like that and not have your heart hurt beyond any way that you can ever repair. But, you know, Jagmeet Singh, who goes down on Parliament Hill to protest with the federal workers, didn't step down. They like to use the word "step up." That's the propaganda, you know, "people step up."

The government wouldn't even take a foot down into the protest to listen to these people. A woman who lost both of her sons to overdose during the pandemic. She was telling me how, you know, they were good; they got their lives back on track. And then everything shut down: they lost their jobs, and they relapsed and died. No, the government doesn't have the courage to talk to her. The media doesn't have the courage to talk to her.

You get the CBC down there, and this I saw also. The most interesting was not just seeing the distortion of reality but seeing how they do it. So you get the CBC—and others, I mean, I don't want to only pick on them, but they really deserve it—looking for the drunkest people to interview, then interview the drunk people, and then say, "Look at this representative of the crowd down here. It's a bunch of bums, drunken; they're just looking for excuses to do this." They look for the exceptions to make the rule, and they don't actually talk to the people themselves. It was revelatory, but well, let me bring this one up.

This is just something that the world needs to see, speaking to what the CBC does in terms of reporting. This was an actual article. We're talking about state-funded media that is there to parrot and condition the population to accept unconscionable government measures. Why? Because they're subsidized by them directly and/or indirectly. This was an article, "The pleasure and peril of snitching on your neighbours during a pandemic." And their only problem with it, by the way, "Experts say reporting on neighbours offers a sense of control but adversely affects minorities." This is Canadian media, fully subsidized by government taxpayer dollars, and what they're out there doing is parroting, pre-suasion—planting the seeds—preconditioning people to accept the unacceptable and normalizing it.

Shawn Buckley

You know, it's interesting that reporter obviously hadn't learned what we learned in Manitoba. Because when the Commission has been travelling to different provinces, we've had one of our video people assemble news clips of the government speaking during the pandemic. In Manitoba, they didn't call them snitches; they called them "ambassadors." It was really Orwellian. I mean, it was upsetting to watch. And what the government was saying, they were basically encouraging people to snitch as if we were in East Germany, and, you know, there was the Stasi.

David Freiheit

It's the Orwellian newspeak like the previous witness was saying, you know, "We're closer together by being further apart." What is it? "War is peace, freedom is slavery, ignorance is strength." I forget the exact order, but it's nothing less than Orwellian newspeak.

[00:35:00]

Just to show receipts as well, this was the CBC, and notice the tactic again; it's the third time we've noticed it: "Protest convoy had 'worst display of Nazi propaganda in this country,' anti-hate advocate says." So the CBC is not saying it. They're just repeating what someone else says without holding their feet to the fire, without challenging it: it's the "worst display of Nazi propaganda in this country." This is, I like to say, "confession through projection," on my channel: accuse your enemies of doing what you're doing. This is the worst display of propaganda imaginable. You have the CBC, not saying it, just repeating someone else—the anti-hate network has its own problems in terms of reputation—but just repeating it: the "worst display of Nazi propaganda the country" has ever seen. And I went down there. Didn't see one Nazi flag, and it wasn't for lack of trying. Didn't see anything but the most beautiful unification I had ever seen.

I should say, it was the most beautiful thing I'd ever seen until Justin Trudeau deployed the stormtroopers after having invoked the *Emergencies Act*. I didn't see a lick of violence until the cops came in. Police, I should say the police—the RCMP, Sudbury Police, OPP, who are the other ones, Sûreté du Québec from Québec. It was the most beautiful thing I'd ever seen until the government said, "We have been embarrassed enough," and then called in the police.

I was down there the Friday and Saturday when they broke it up. And they came in, at the direction of Justin Trudeau, like literal stormtroopers in flank. One step at a time, knocking people, what do they call it, "the shove and grab," knocking people over, arresting them. I was there the day that they had assaulted, violently arrested, Chris Deering, an Afghanistan war veteran. A war veteran—his body had been literally destroyed in battle where his other mates did not survive—violently arrested, cuffed, had his hands behind his back for two hours. Then they drove them outside of the city and dumped them off like trash and let them make their way back.

I was there the Friday and the Saturday, and they had snipers on roofs, drones in the sky. They were detonating concussive grenades. I was like five feet from a concussive grenade as it detonated, as they're clearing the streets one after the other. Because Justin Trudeau, who promotes protest in India, promotes the rights of the citizens to protest in China— It wasn't even a question of negotiating. We now know from the Commission [Public Order Emergency Commission, (POEC)] that they had effectively negotiated some form of an agreement whereby the trucks would leave. But Justin Trudeau was so desperate to turn this into a quasi-January 6th—

Shawn Buckley

Let me just stop you, and I do want you to continue. But I just want the people that are watching your testimony to understand. So what you're communicating is the *Emergencies Act* was being invoked. So people understood that the troops were coming, so to speak, and the truckers had arranged to negotiate and had communicated "We will leave." So it wasn't necessary for the police to come in. And we've actually had one, I think, two witnesses that were involved in those communications, "We will leave." So I think it's important for people to understand, especially those that watched the troops come in—and there's still the videos online—that was completely unnecessary. That basically the truckers had agreed to leave and disembark and vacate the capital.

David Freiheit

I have sort of taken for granted and, wrongly, that everybody knows exactly what I'm thinking. Yes, so the protest goes on for near three weeks and peaceful, but it wasn't ending. The Windsor Bridge blockade, which everyone knows because that blockaded the border between America and Canada, Ontario and Michigan, had already been resolved via court order.

But Justin Trudeau was hellbent on invoking the *Emergencies Act*, which used to be the *War Measures Act*, which is the invocation of last resort for when there's a national emergency for which existing laws are inadequate to remedy. So Trudeau was hellbent on doing this. We now know this from the Commission (POEC), which revealed that they were discussing it. And even though a negotiation had been reached between the truckers and the city to at least clear up certain areas, that settlement was basically set aside so they could invoke the *Emergencies Act*, which was after the Windsor Bridge blockade, if you want to call it that, had already been resolved via court order.

So I don't care what the Commissioner Rouleau concluded.

[00:40:00]

It was the most egregious, unjustified, unconstitutional overreach to invoke the *Emergencies Act* for an issue of national security—a national crisis that cannot be resolved by existing laws—as relates to a protest in a four-block Red Zone, in pinpoint, geographically limited to Ottawa.

If nobody knows what an overreach that was, I've broken it down quite a bit on my channel. He invoked the *Emergencies Act* and then the police start coming in. Everybody knew it was going to end badly or more badly. The police came in flanks. You had multiple police [forces]. You had some with no identification badges coming in on the Thursday, Friday, Saturday, setting up fences, which people thought were for kettling, which is, you know, crowding people in so they can get arrested. You had heavily militarized police, armored vehicles, and police people, no badges. You didn't know who they were, just numbers. You don't know where they came from. And then all hell breaks loose of violence on the Friday and the Saturday when they decide it's over.

I said during this event, "If this event does not end in reshaping and revolutionizing where the world is headed, it'll be the biggest black pill following the biggest white pill that I've ever had." The day that this protest was violently ended, violently suppressed, it was one of the darkest moments for me after having seen the last three weeks of peace, love, and beauty. Nationalism in the best possible way—Canadians proud to be Canadian again. The amount of people who said it to me while I was down there: "I've never been prouder to be Canadian. I've been depressed and sad for the last two years. I've driven 13 hours from Nova Scotia. I've driven 12 hours from Northern Ontario. I've driven from Vancouver." The people were happy to be among other people. They were proud to be Canadians yet again, and then it was suppressed. The way it was suppressed also further illustrated the government-subsidized propaganda to downplay and deflect from the egregious over-the-top violence.

There was an image accidentally caught by the CBC, I think, of the police beating the ever-loving mercy—just kneeing a human being as though they were a sack of potatoes that they were trying to turn into mashed potatoes for dinner. It was accidentally caught live; they never spoke of it again. The media is covering this, you know, talking about violence—that could possibly warrant this action—when there never was. At one point during the protest,

the police cordoned off the cenotaph, the War Memorial, to protect it. To suggest that the protesters, who were military veterans in large part—

Shawn Buckley

Many wearing medals at the time and telling the police that they were not going to be violent.

David Freiheit

Wearing their medals. When Chris Deering was violently assaulted, he lost one of his medals in the snow when they shoved him to the ground, when they kneed and assaulted him. They were wearing their medals. They were—and I learned this by being there and asking them because CBC sure as hell was not reporting on this—they had set up 24-7 video surveillance of the War Memorial. They were shovelling the snow every time I was there, salting it, because the city was no longer salting. They had a drummer in front of the War Memorial, doing the military drums, and then the police come in and section it off as if to suggest that it was out of control and that people were desecrating it or vandalizing it. The military veterans that I was talking to—I've never served; I don't have this experience; I don't have this, you know, reflex of my soul—they were outraged. They said, "This monument is a monument for me to go pay tribute—honour—to my fallen brethren. And now I can't go step on it because the government is doing this as a sick ploy to make us look bad."

Did the media ever talk about how it was the military— It was spinning. I interviewed these guys, shovelling the snow, salting the walks, and watching over the War Memorial.

Shawn Buckley

Viva, I just need to focus us, and somebody just flashed that we have five minutes left.

I want to give the commissioners an opportunity to ask you questions because you've brought us a very important perspective, and the fact that you actually went there to deliberately see what was happening and contrast it with government narrative is of vital importance. So I'm just going to ask the commissioners if they have some questions, and they do.

Commissioner Drysdale

Good afternoon, Mr. Freiheit. We had previous witnesses who were at the protest in Ottawa, as you were,

[00:45:00]

and you were talking about how the CBC only presented certain pictures and so did the rest of the mainstream media. But that area, Elgin and Wellington, in and around and in front of the Parliament buildings, is probably the most surveilled, video-taped place in the whole country. Have you seen or have you asked for or has anybody to your knowledge demanded that the Government of Canada release some of that surveillance tape so we can see, using the government's own video cameras, what happened?

David Freiheit

I would say there's—I haven't done it. There's no need to do it because with all of the live streamers there who captured all of this in real time, there's no room for doubt. Thank you for reminding me of another fake news story that the media ran with but only corrected once it was well too late.

The arson, the alleged arson that the truckers had attempted to carry out on an apartment building. It had nothing to do with the protests and nothing to do with the protesters. By the time they go to correct that story, or attenuate it, it doesn't matter; it's already left its impact. When I was talking to the counter-protesters, they were just repeating the same things. They were just repeating the same things: people getting assaulted for wearing masks, the harassment. It was nonsense. But you don't need to ask the government for these videos. Everything was documented in real time.

The only issue really became, say, algorithmic suppression or soft censorship on social media where that video of the police kneeling, I think, a veteran in the torso as they're arresting him—that systematically gets demonetized on YouTube, which affects its visibility to others. But it was all captured. The only violence that occurred, in my experience and that I've seen, was at the hands of the government that came in to end this peaceful protest in the most non-peaceful way imaginable.

Commissioner Drysdale

Well, my only point, and I agree with you, it was documented by many people, including yourself. But my only point in getting the government videotape is it would be nice to hear from the voices of the government themselves, showing their own cameras, what their own cameras have shown. It would be difficult for people to say that the government edited or selectively videotaped when they have hundreds and hundreds of cameras. It reminds me a little bit of the Tucker Carlson thing earlier this year with their January 6th fiasco. It would be hard for the government to deny their own camera feeds, I think.

David Freiheit

Absolutely. Also, some of those camera feeds might show stuff that the government doesn't want you to see. Like there was a video of the police, while arresting someone, appearing to butt them repeatedly with the firing end of a gun. I'm reflexively a back-the-blue type person. But what I saw on the days when the protest was crushed violently was just following-orders-type conduct, which will leave a lingering bad taste in my mouth.

Commissioner Drysdale

Thank you.

Shawn Buckley

And there being no further questions, David, what a pleasure it has been to have you share this, your personal testimony with us. On behalf of the National Citizens Inquiry, I sincerely thank you for coming and testifying today.

David Freiheit

Thank you for having me. I wanted to do this during the Commission, but I think too many people wanted to do that as well. But thank you for having me. I hope everyone really

appreciates—it's attributed to Denzel Washington, but I think it's more Mark Twain: "If you don't read the news, you're uninformed and if you read the news, you're misinformed." You have to know the tricks in order to understand how to digest what's being fed to you and make more people wake up to what is actually going on.

Shawn Buckley

Thank you.

David Freiheit

Thank you.

[00:49:10]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

[00:00:00]

Kassy Baker

Hello?

Anita Krishna

Hello.

Kassy Baker

Hello, Anita. We're on right now. Can I please get you to state and spell your name for the record, please?

Anita Krishna

Anita Krishna, A-N-I-T-A, last name is K-R-I-S-H-N-A.

Kassy Baker

And do you promise to tell the truth, the whole truth, and nothing but the truth?

Anita Krishna

I do.

Kassy Baker

Very good. Now I understand that you're here today to tell us about your termination from Global News from your position as a control room director. Is that correct?

Anita Krishna

Correct. Yes.

Kassy Baker

Before we get into that, I would just like you to tell us a little bit more about yourself. Can you please describe your education?

Anita Krishna

I have a bachelor's degree in Radio and Television that I got from Ryerson University and I've taken other college courses, but I have a bachelor's in Radio and Television from there.

Kassy Baker

And how long have you been working in journalism and broadcasting?

Anita Krishna

Twenty-five years, long time.

Kassy Baker

Can you please tell us about your work and duties as a control room director?

Anita Krishna

Okay, at Global News, I was a technician, I was a control room director. So what that means is when you're watching your newscast on TV at home, we are making the TV happen, so that's part of my job. The producers line up a show, and we all work out of a rundown: the software that we used there was called ENPS [Electronic New Production System]. So they build the show, and what we do is we run all the elements in the show technically. We roll the opening, the big dramatic music that says, "Tonight, on Global News," and then we do all the camera moves and decide what the look is, whatever the top story is. Let's say it's about a mudslide blocking traffic on a highway or something, then I put in pictures of the mudslide, things like that. If we're going to reporters live on the scene, I make sure that's technically all good to go.

My job is preparing the technical execution and executing a show. But I work in a newsroom, so I work alongside all the directors, or sorry, all the producers and stuff. So even though I'm in my own world kind of lining up, kind of technically figuring out the elements I'm going to use for the show, I'm listening to what's going on in the newsroom. And I've done that type of work for 20 years or so.

Kassy Baker

And how long have you been working for Global specifically?

Anita Krishna

Since 1997, that's when I started there and I worked there for a few years. There was a period of time, right around 2001 and '02 that I started working at other stations. So I was just freelancing around different stations in Vancouver. I worked for CTV and I worked for City TV and worked for Global and Shaw, kind of all at the same time. So yeah, so I did that. Then I got married, and then we moved to New Zealand and then we came back here in 2007, and then I started working again. I picked up a little bit of work at CTV, and then I went back to Global.

Kassy Baker

You were working for Global in this position when the COVID-19 pandemic arrived in 2019. Is that correct?

Anita Krishna

Yes, I was a director of newscast when COVID-19 happened.

Kassy Baker

So what did you observe about the virus and how it was reported in those early days?

Anita Krishna

Oh, well, I mean, obviously in 2019, you know, it seemed to be a thing that just was happening over there in a different country. You know, here we go, it's another SARS type-of-thing. And you know, we're just waiting; nobody was really freaking out too, too much about it then. When it hit big was March, like 2020. I remember I was working at Global National, I was directing that show, March 11th. And oh, boy oh boy, like, yeah, that's when the hysteria really, really hit hard I would say.

Kassy Baker

Can you give us an example of this hysteria, as you've called it?

Anita Krishna

Well, the funny thing is, is that— Okay, working on Global National, some of the headlines that we were running that day on the 11th is like, we had reported that "The WHO declares the coronavirus a global pandemic." This is like just in our headlines, right?

[00:05:00]

And then we ran a little clip of Trudeau saying, "We're going to give Canadians everything they need," you know, "don't worry." And then we ran another clip saying, Patty Hajdu. And then before we got into that, we said, "Are Canadian hospitals going to be able to cope?" And then we went to this clip of Patty saying, "Oh, about 30 to 70 per cent of the population could get it." Then we ended it by saying, "Social distancing, what you need to know about keeping your distance and flattening the curve." And so that was in one minute, we had outlined all those things—all those things like panic, fear, just trying to scare everybody when I could see that nothing was really happening yet, like nothing had happened.

At that point, I'm not sure if there were—who had it? I didn't see anybody in my community that had it; I didn't know anybody that had it. Yet all these measures, these crazy measures and these fear tactics were coming fast and furious. And it was also right around that time that all the sports had cancelled, like the MLB, the NBA put their season on hold. The NCAA cancelled all their championships. It just seemed to be like—whoa, how did all these corporations or institutions, how did they all come to do this? Bang, bang, bang, like shut down, shut down, shut down, when we hadn't seen anything happen yet.

So my gut instinct was just telling me that this was like a massive overreaction but, you know, the horse had sort of left the gate already. Everybody was sort of in on this and nobody seemed to question the hysteria. Because, at the same time, we're also telling

people, “Children could get it. Children could test positive. If you’ve travelled outside the country, make sure you isolate; nobody, non-essential travel—” and all our clips of running people like Bonnie Henry saying, “This is going to get worse.” Well, I didn’t even see anything happen yet, so I just thought it was a massive overreaction. But everybody was just sort of going along with it.

Kassy Baker

And from your perspective, how did that reporting change over time, over the next several months that came to pass?

Anita Krishna

Sometimes an event happens and then you see the reaction. Now people can argue whether you see controlled events happening in news and then you see the controlled newscast. Sometimes that does happen, right? But for this situation, it was like nothing happens and then you see this kind of overreaction. Okay, so fair enough. So maybe at the time people were just being prudent and being cautious.

As time wore on, it just seemed to be that there were things that we were not reporting. You could easily find these things on the internet or find these things in other sources, but for some reason, our own newscasts were neglecting to tell people that perhaps the origins, like where this came from, was not the wet market. We actually just made people believe that it came from a wet market and never addressed this laboratory, the Wuhan Lab. Which was a big concern of mine because if you don’t know where this thing came from, how it came to be, how can you propose to know what it is and propose to stop it? So the fact that—

Kassy Baker

I was just going to ask, when you observed this, what was your reaction to the news being covered in this way?

Anita Krishna

Well, I just thought, how can we neglect this? How can we neglect to tell people this? How can we lead people to believe something which is not 100 per cent accurate? And we were leading people to believe things, about several things, that didn’t seem to be accurate, and yet we were not reporting this other side to so many pieces of this story.

Kassy Baker

Did you raise your concerns with your colleagues or with your supervisors and superiors?

Anita Krishna

Yes, yes, I did, I did, yeah.

Kassy Baker

Sorry, what was their response?

Anita Baker

I was raising concerns left, right and centre about absolutely everything. So let's see here, I had a meeting—I mean, as soon as you raised an issue, let's say you talked about the Wuhan lab. At one time, I said I thought this was a synthetic virus, in the newsroom:

[00:10:00]

that did not go over well, people just ended up getting mad at you. Other things that I raised was why we were not telling people about medications that could possibly help you, right? All of a sudden, everybody had these very strong opinions on hydroxychloroquine, and they had already formed their opinions. But my opinion is, if it's something that could possibly help you, do you not have the right to try it?

My cousin ended up getting COVID and she takes hydroxychloroquine because she takes it anyway, because she's ill with something else. So she got COVID and described how awful it was for her, but that she got better in about eight days and she thinks she got better because she was taking hydroxychloroquine. She said, "I think that that made a difference, you know?" So I told this to an anchor at work. I said, "Hey, my cousin took this and she thinks she got better." And he just said, "Oh, she thinks she got better, eh; she thinks she does; she thinks she got better." Like he got mad about it, but why would you get mad? Wouldn't your answer be, "Hey, that's awesome. You know, I'm glad that that worked for her, maybe we should look into it. Maybe this is something we should do a story on."

I'll tell you something else. I brought up ivermectin to one of the assignment editors there, too. Because there was so much negativity going on in the newsroom and so much judgment of people that were questioning the vaccine and stuff at the time that you knew what you couldn't really even speak about. But you couldn't really even speak about drugs. So one time in the newsroom, I brought this up because somebody called up to say some story about how unvaccinated people were taking up beds in the Children's Hospital, like, "look at these unvaccinated people." And this one guy was just sort of saying, "Oh, what a bunch of idiots these people are." And then somewhere in this conversation, I had brought up early treatment. And I said to him, "What about ivermectin?" And he said, "That's debunked." He said, "That whole drug is debunked."

Kassy Baker

Sorry, and just to be clear, this was a colleague in the newsroom or in your work environment, correct?

Anita Krishna

Like a senior colleague. The reason that this is important is because this man helps shape the newscast. This man decides what goes on our newscast, particularly the big ones, the five o'clock and the six o'clock. And he's calling people—I mean, a lot of people there were calling people names, like covidiot and stuff like that. But then when I bring up a drug, he says, "That drug is debunked." And I said, "What? What do you mean the whole drug is debunked? You know, what are you talking about?" I said, "Did you not see that big, big study in India?" And he said, "That's debunked." That's all he could say was "that is debunked."

But to my mind, at that time in Uttar Pradesh, there was like 241 million people. They barely had any COVID because they had been using ivermectin. So that is a story. That is something that we should at least be looking into. And even if you don't believe that that

medication works, you still should be talking to doctors, talking to somebody who might have taken it and gotten better. And you should be showing that side of the story. Then you can show the other side, of someone saying, “No, it doesn’t work.” But you have to show both. And the problem is with him saying that this isn’t even a thing— And right after he said that, my boss sent me an email saying, “Anita, you need to stop talking about COVID.” So I wasn’t even allowed to talk about this.

But the dangerous part of it is, these are people shaping your newscast. By them not telling you that there are medications that are not “horse medications,” you are doing a disservice to the public. People have the right to try it because they might get better if they try it. But if you hide that information, I mean—that is misinformation. That is 100 per cent misinformation coming from Global News in Burnaby. I can attest to that.

Kassy Baker

You’ve touched a little bit on the vaccines already, but as we’re all aware at this point, they were rolled out in early 2021. Can you describe the coverage that you saw regarding vaccines and vaccinations specifically?

Anita Krishna

Sorry, one other thing I wanted to say about that is we also ran stories making Joe Rogan look like an idiot for taking ivermectin: that was done on purpose and that is wrong. That is wrong and it just led people to believe that.

But vaccine. Well, yeah, I mean, the vaccine was like a religion.

[00:15:00]

All we did was constantly run stories of, okay, “Look at this person in the hospital, this person who made a bad choice and didn’t get the vaccine. Oh, they ended up in the hospital.” It’s like all our stories were slanted to that. Everything we were saying was “pandemic of the unvaccinated. If you’re unvaccinated, you’ll be holding everybody back.” And that we now know isn’t true.

Kassy Baker

I apologize for interrupting. In your experience, have you seen any other event reported in this manner?

Anita Krishna

I’ve never seen an event in my life where you cannot go to someone to talk about it like a senior producer, like a news director, and express your concern. They would be open to your concerns. If you had a news tip to give someone, they would at least take it on board. They wouldn’t say, “No, no, no. Stop talking.” I don’t know how many times there I was told to stop talking about something. So there’s an absolute reluctance to provide accurate information and to cover things that you should be doing that could help you. All there was—what I would say—was propaganda that didn’t speak up for people.

We would do things like on the 5 o’clock news where we would just say, “and sadly, another business has shut down due to COVID.” And we were not actually holding anyone to account saying, “Is what we’re doing fair?” You know, when people are using plexiglass

and sitting outside and you can go up to the counter and order, but you can't have a waitress come to you, or you've got to mask—you know, all the things that didn't make any sense. We were just shoving it in your face like it was something you needed to accept rather than questioning, "Is this really making sense for a business owner, for this person's livelihood?" We never stood up for the people. We just, as far as I'm concerned, shoved propaganda in your face.

Kassy Baker

Thank you. Now as an employee, I understand that Global did institute a vaccine mandate at some point. Can you describe the circumstances that led up to that and describe what the mandate required from you?

Anita Krishna

Well, they just pressured a lot of people to get vaccinated, and they'd make you fill out forms and they'd always want to know your vaccine status. And a lot of people were quite upset about that because we were trying to say, "Hey, we have a right to privacy." The people who believed in the vaccine just willingly went with it, as if they're in the good club. And the people who were reluctant and hesitant, "Oh, well, you're in the bad club," you know. So I didn't really even fill out the forms. And it should be noted that I didn't even get fired for not taking the jab. I got fired for speaking up.

Kassy Baker

We're coming up to that right away. So on that point, I understand there were a few things that led up to your termination. But in particular on, I believe it was December 12th of 2021, you attended a rally or a protest that was held in North Vancouver. Can you explain what prompted you to attend this rally?

Anita Krishna

Working at Global was like working in a twilight zone during the pandemic. Everything that you thought would have ever made sense for choice, for freedom, for your health just went out the window. And at this point, I was very concerned because we were running stories telling pregnant women to take this jab, and I personally had run those stories on some of the shows I was working on where we had some doctors telling pregnant women to take it. In my lifetime, I don't think you would ever tell a pregnant woman to take anything experimental because I'm old enough to remember thalidomide. I just think that for pregnant women, you have to be so careful, you can't even eat certain cheeses and things like that.

Why would we be telling women to take this vaccine that's never even been tested on women? How dare we even do that? I was feeling actually sick about that. But as time went on, then you started to hear [about] miscarriages. There were these reports in Scotland and Waterloo. And it was very hard to get a sense of like, was this really happening? And of course, our newsroom isn't even following up on any of this. Then I heard about this rally with this doctor, Dr. Mel Bruchet, and he had done some stuff and he had some videos online talking about it. I really was really wanting to know—were people becoming harmed by this and are people losing their babies?

[00:20:00]

So I just went to this rally which, by the way, Global News should have been at because if you're part of the community, you should be covering this stuff. And they did not. They don't care.

Kassy Baker

Did you attend the rally on behalf of Global or as an employee or identify yourself as such?

Anita Krishna

No, I did not. I went just out of my own curiosity as a private citizen and I knew no one there. But when I got there, I recognized a cameraman that used to work at Global. But I went as a private, curious citizen looking for answers.

Kassy Baker

Now I understand that you ended up speaking at this rally, is that correct?

Anita Krishna

I did. I did.

Kassy Baker

Can you describe the circumstances that led to you giving this speech? Was it planned or unplanned? Explain to us what happened.

Anita Krishna

Totally unplanned. It was just unplanned. I went up to a lady that I saw. She was a nurse, and I'd seen her online in one of these videos because I'd been watching videos of Daniel Nagase and Mel Bruchet. I saw this nurse and I just went up and said, "Hi," and I said, "I'm really interested in what's going on here," yada, yada. I said, "I can't really stay too long" because I had to go back to work. And then she asked me where I worked and then I said, "I actually work at Global," and she was like, "What?" And she just grabbed me, didn't want to let me go. She's like, "We cannot get anybody from the news to talk to us." And I said, "I'm not here as, like, I'm not a reporter." I've always said that: I'm not a reporter. I'm just here because I'm just curious. Then I ended up speaking because I just thought, well, what the heck?

Kassy Baker

I understand that your speech is recorded and available online if anyone wants to look at it. We have not got it here today. But more to the point, I understand that the speech was recorded. Is that correct? And obviously it was if it's online.

Anita Krishna

It was recorded. So many camera phones and then somebody sent it to Global, and then I ended up getting in trouble. I ended up getting suspended after that for violating journalistic principles, and they still have not been able to tell me how I violated those principles. They have violated their own principles by not reporting on community events. They have violated their own principles by not showing up to the National Citizens Hearing

when it occurred in Langley, not even sending a camera or a reporter, not even doing a voiceover on something like this. Who is violating journalistic principles? I can only say they are, by preventing this information to get out to people.

Kassy Baker

So when you were suspended, can you describe the circumstances of that suspension and the terms of your suspension? How long was it? Was it with or without pay?

Anita Krishna

This one was three days with pay, just because they had claimed I'd violated the journalistic principles, of which they still have not told me what principle I had violated. Show me. They could never show me. I said, "What article in this JPP [Journalistic Principles and Practices] did I violate?" They weren't able to ever even tell me that. So that first one was a three-day suspension.

Kassy Baker

And I see that I missed something so I just want to go back and clarify that. When you gave this speech, I understand that someone introduced you and how did they introduce you?

Anita Krishna

Oh, they said I was a Global TV director, yeah.

Kassy Baker

So you didn't make this assertion yourself. It was offered by someone else who was also speaking at the rally. Is that correct?

Anita Krishna

Correct, correct.

Kassy Baker

Following the suspension what was your relationship like with your supervisors and your colleagues at work?

Anita Krishna

Well, I guess in secret there are a lot of people that supported me because a lot of people felt the same way: They felt scared. They felt nervous. They didn't want to take it. They felt completely violated and threatened and bullied by management at Global which—they turned into bullies instead of managers.

My relationship became strained with the people who disagreed with me who thought that I was becoming radicalized. So lifelong friends, we ended up just completely disagreeing. Like my little cousin, he's 24 now, he took a Pfizer jab; he ended up paralyzed in the hospital. I was still working at Global at the time, and this happened right after his Pfizer shot. He got Guillain-Barré syndrome. And I said to people at work, this is what happened to my cousin. One of my good friends who's an editor there, and he just said, "Well, what

pre-existing condition did he have?" That doesn't matter. You don't end up not being able to walk for nothing.

[00:25:00]

He wasn't skydiving. Nothing happened. He took a jab. He can't walk. Now we've heard many stories of things like that. So there's just an absolute refusal to believe.

There are some reporters there that do and people that work there—they know what's going on, but they're not going to say anything because you're really not going to want to lose your job. I should say, though, I actually was so concerned with maybe children getting hurt, I told my operations manager when he was telling me to be quiet, and I said, "I'm really worried about children and pregnant women. They're the most vulnerable." But prior to all this, the news director—I encourage anyone to contact the news director at that station if you have any questions as to the news that's being presented to you—and I said to him, "I'm really worried about, like, there is very perverse incentives behind this vaccine. Are you not worried? How do you think they came up with this so quickly? How is this even possible?" And he just said, "All the scientists in the world got together, and when everybody gets together, then they can make this happen," which is a completely nonsensical answer. And then at the end of it, he just told me that I needed to get vaccinated.

Kassy Baker

Okay. Now, I understand that you were in fact terminated. Is that correct?

Anita Krishna

Yes.

Kassy Baker

And what date were you terminated?

Anita Baker

January 18th, I believe.

Kassy Baker

So roughly, and just for clarity, that was about, not quite a month after the rally?

Anita Krishna

I'm sorry it was January 6th.

Kassy Baker

Yeah January 6th. So a few weeks really after the rally, is that right?

Anita Krishna

Yeah, yeah. Right around Christmas time.

Kassy Baker

Can you describe what led to your termination or the reason that was given?

Anita Krishna

I think they gave me three. They told me something in my termination letter, one of which was that I had violated a social media journalistic principle policy. I don't even know how. They've never even shown me what clause I've actually violated of that. And I had said, "Can someone ask the Provincial Health Officer why the casinos, liquor stores, and strip clubs are open and the gyms and the churches are closed?" which is a valid question. But they fired me because on my Twitter profile, it just said Anita, Global BC director. So I guess they felt I was putting them in some kind of disrepute by asking them that question. But it's a valid question.

Kassy Baker

Sorry just for clarity, can you repeat the tweet that you had posted in which you were ultimately terminated for?

Anita Krishna

I said, "Can someone please ask the Provincial Health Officer why the casinos, liquor stores and strip clubs are open and the gyms and churches are closed?"

Kassy Baker

And that was it? That was the last tweet? Okay and I understand that you were terminated "with cause" is that correct?

Anita Krishna

So they say. That's what it says on my—actually, it doesn't even say that on my termination letter. So if anyone knows a good lawyer, please reach out to me, but it doesn't even say that on my termination letter. But they will say it was "with cause."

Kassy Baker

Okay. Were you eligible to apply for EI or any other benefits?

Anita Krishna

No.

Kassy Baker

Okay. I actually don't have any other questions. Are there any questions from the Commissioners?

Kassy Baker

Okay, I believe that's everything. On behalf of the National Citizens Inquiry, I would like to thank you very much for your testimony here today. Thank you.

Anita Krishna

Well, thank you for having me. Thank you very much.

[00:29:02]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 11: William Bigger

Full Day 2 Timestamp: 10:47:55–10:56:12

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Our next witness is Mr. William Bigger. William, could you give us your full name and spell it for us, and then I'll do an oath with you.

William Bigger

William Bigger, W-I-L-L-I-A-M B-I-G-G-E-R.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth in your testimony?

William Bigger

Yes, sir.

Wayne Lenhardt

What you're going to do today, I guess, is just outline the problems that you had as COVID developed in your community. You live in St. Catherine's, Ontario, correct?

William Bigger

Yes.

Wayne Lenhardt

And you've lived there for quite a while.

William Bigger
My whole life.

Wayne Lenhardt

Okay. In 2020, you were 18 years old. Tell us what you were doing in 2020, just as the COVID problems were developing.

William Bigger

Yes, so as you said, I was 18 at the time, freshly out of high school and was a very active member in my church as a kids administration leader with younger kids. I also was a competitive swimmer for our local Special Olympics swim team. I competed with them since I was very young. I was born with autism, so I always swim with them as a form of physical therapy and was pursuing a job out of high school, just at a local sports venue.

Wayne Lenhardt

And you had a job at that time?

William Bigger

I did yes, at the time. I had held that after high school and then once everything shut down, all of our events were cancelled, so I lost that job. Our churches closed, so I lost my leading opportunities and I couldn't swim anymore.

Wayne Lenhardt

So by August of 2020, you were out of work.

William Bigger

Yes, sir.

Wayne Lenhardt

By the end of 2020, you did get another job. Correct?

William Bigger

Yes, I did. After being off work due to lockdowns for several months, I was able to find work in our city as a new sub restaurant was opening up.

Wayne Lenhardt

Your family sort of was having problems as well during this period of COVID, correct?

William Bigger

Yes, unfortunately, both my parents both work in what were considered high-risk sectors, the hospital and a firefighter, and this became very challenging for them.

Wayne Lenhardt

Were both of your parents working at the time?

William Bigger

Yes. During the whole time, they were still able to work with challenges, with all the PPE and all that in their jobs.

Wayne Lenhardt

And there was concern about your father's job, which would have caused some serious problems, correct?

William Bigger

Yeah, sorry. It was just, very emotional.

Wayne Lenhardt

So you managed to get a job in a submarine shop in 2021 by April. Did you still have that job? What was happening?

William Bigger

Yes, I did have that job for nine to ten months in total. Through those nine to ten months, it was very challenging. They had all the social distancing and masks in place. At that time, there was talks about the vaccine as it rolled out, but nothing in place in terms of mandates. But it was just a challenging work environment, having to be careful where you stood and wearing the mask was difficult for me. Just to be able to understand and communicate with people and read their facial expressions.

Wayne Lenhardt

You did get a job at Costco at some point, correct?

William Bigger

Yes, I did.

[00:05:00]

At the beginning of 2021, around March, I was able to get another job there. Just out of my previous job, I had a fear that if I stayed there any longer, I would eventually have lost it due to vaccines. So I was trying to pursue work, and then I was able to find work.

Wayne Lenhardt

And you never did get the so-called vaccine, did you?

William Bigger

No, sir.

Wayne Lenhardt

Okay. Was there a reason for that?

William Bigger

As a family we decided that it was best to not participate. When I was very young, I'd had a bad response to my year one boosters, which I was, after, in the hospital for a short period of time. And so I just let my parents consult with family doctors and experts that they were in contact with to decide the course of action, so they decided to avoid taking them.

Wayne Lenhardt

Okay. I think I'll stop there and ask the commissioners if they have any questions for you. Anyone? Any last items you want to tell the commissioners?

William Bigger

I just really want people to know that if they're watching this that their stories can be heard and that they're not alone. These past few years have been challenging for everyone and I just want it all to be over.

Wayne Lenhardt

Okay, on behalf of the National Citizens Inquiry, I want to thank you for coming and telling us your evidence. Thank you again.

Commissioner Kaikkonen

I just have a quick question about you worked with youth. Do you know what happened with the youth when everything shut down? Did they feel the same way you did?

William Bigger

Can you repeat the question?

Commissioner Kaikkonen

You said that you worked with youth,

William Bigger

Yep.

Commissioner Kaikkonen

prior to the lockdowns? Do you have any understanding of what happened with them in terms of lockdown? Do they feel the same way you do, or do you have anything to add about the youth?

William Bigger

Over the past little while I've been slowly reconnecting with that group that I have served in my church. Although I have not maybe asked what their experiences have been, I've been

really wanting to, just over the past couple years of how it's affected them as even younger than I am—especially those that are younger and were still in school and how that would affect them. I haven't really gotten a chance to ask, but I would really love to.

Commissioner Kaikkonen

Thank you very much.

William Bigger

You're welcome.

Wayne Lenhardt

Any other last questions for Mr. Bigger? Okay, I want to thank you on behalf of the commission of inquiry for your testimony. Thank you again.

William Bigger

Thank you.

[00:08:32]

Final Review and Approval: Margaret Phillips, September 6, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 12: Scott Routly

Full Day 2 Timestamp: 10:56:34–11:21:55

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Shawn Buckley

Our next witness is going to be attending virtually, Captain Scott Routly. Scott, can you hear us?

Scott Routly

I sure can. Can you hear me okay?

Shawn Buckley

We can hear you, but we can't see you.

Scott Routly

Oh. Let me see what I can do here. Okay. Can you see me now?

Shawn Buckley

We can see you now. So, Scott, I'd like to start by asking you to state your full name for the record, spelling your first and last name.

Scott Routly

Okay. My name is Scott Routly, S-C-O-T-T R-O-U-T-L-Y.

Shawn Buckley

And, Captain Routly, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Scott Routly

So help me God. All glory to God.

Shawn Buckley

So my understanding is that leaving aside your other military service, you served fifteen years as a military pilot, and then you served an additional fifteen years in civil aviation [Exhibit OT-10].

Scott Routly

Yeah, that's correct, sir, yes.

Shawn Buckley

And you ended your career prematurely because of COVID, but at the time you were a chief pilot for an airline.

Scott Routly

That's correct.

Shawn Buckley

I appreciate we don't want to name the airline, but most people listening to your testimony are not going to understand what a chief pilot is. Can you briefly explain what a chief pilot is?

Scott Routly

Yeah, the chief pilot, he's a middle manager; he's in charge of the whole pilot group. In my case, I had roughly about 100 pilots in my charge. He's appointed, not only hired by the airline, but also appointed by Transport Canada because of the regulatory requirements.

Each airline in Canada, in the industry, basically has a few accountable executives that Transport Canada considers their go-to people: that would be the chief executive officer of an airline; that would be the operations officer or director of flight operations; that would be the director of maintenance; and that would be the chief pilot. The reason for that is because of the Canadian aviation regulations, the requirements and regulations and rules that need to be adhered to. So they then screen individuals for this role. The airline cannot just hire a chief pilot, they also have to be screened and approved by Transport Canada. So of course, I had to go to meetings and do knowledge tests. I had to have a certain amount of expertise—

Shawn Buckley

Okay, and I'm just going to shorten this because what I want people to appreciate is that in that role that you had, not only are you responsible to the airline for taking care of the flight crews, but you're also responsible to Transport Canada for taking care of the flight crews.

Scott Routly

Absolutely, yes.

Shawn Buckley

So you have a responsibility to two different parties and, literally, what would be described as the fiduciary duty to the pilots to take care of them.

Scott Routly

That's right. So of course, all the training standards are part of the Canadian aviation regulations as mandated by Transport Canada [Exhibits OT-10f, OT-10g, OT-10h]. So it's my duty and my role to ensure that all the training and all the standards, proficiency checks, evaluations, standard operating procedures, operation manuals—

Shawn Buckley

I'm just going to truncate because I'm watching a timer go down and we're at eleven minutes and twenty-eight seconds. I think people understand that it's a highly—there's a lot of responsibility. But I just wanted to get—because of what follows in your testimony—that people understand you're also responsible to Transport Canada.

So COVID hits, you're a chief pilot. Can you share with us your experience and, kind of, the steps that you ended up taking to try and protect the pilots under your charge?

Scott Routly

Yeah, so we all know what happened, of course, in 2020. We were subject to all the same measures, the lockdowns that were happening throughout the country. Now because we were considered as essential workers, we continued to operate. We were operating up in the north country and around Ontario for the most part. And so throughout that time period, it really didn't affect us very much. We just continued on with our operations.

Now for the passengers and what-not, protocols started coming out. You know, the social distancing, the masks, testing, and all these different requirements. So the airline, they tried to follow the best they could for Health Canada—as everybody was trying to do in all aspects of the industries.

[00:05:00]

In our particular case, this continued on until pretty much as the vaccine rollouts started to happen in late 2020, early 2021. I could see the writing—I'd been doing a lot of research and critical thinking, my background, and already starting to look outside the mainstream media into other avenues to see all about these so-called vaccines that were being rolled out, for obvious reasons.

The medical requirements for pilots, it's a fifty-fifty split in our licencing [Exhibit OT-10a]. We hold a licence for our type rating on the aircraft itself that we fly; we have to do training every six months to maintain our type rating. But more importantly, or just as important, on the other side is our medical requirements [Exhibits OT-10c, OT-10i], which without the two, in our aviation booklet, you can pass a check ride for your aircraft type rating but if you fail your medical, you do not fly, and vice versa. So in some cases, the pilots consider—depending on age and healthiness—that passing the medical is the highest priority because it's obvious they're really knowledgeable, highly skilled individuals. We're probably the most regulated industry out there, for obvious reasons. We fly in the air. We can't pull over when anything happens. You know, critical thinking, decision-making, and emergency procedures.

So all of a sudden, the vaccine started to get rolled out. I had my suspicions. I started seeing it happening—

Shawn Buckley

So can I just ask you beforehand— Because you were responsible, actually, for a large number of flight crew people. And you guys would have had to have been doing the testing before the vaccine rolls out. Were you finding that pilots were off work because they were actually sick?

Scott Routly

No, as a matter of fact, it was just like any other year and, you know, we're getting into the low vitamin D season, better known as the flu season. And so there was the odd sickness but nothing abnormal from previous years. But what was happening was through family members and through all the COVID testing, we started getting into these issues where pilots are calling in and they're saying, well, they phoned Health Canada and "my wife, you know, has tested positive, although she's not sick." And everybody was— They just started making things up, really, off the top of their head, in this region: so basically, "Well then, you better ground those people for, you know, forty-eight hours," and then it was seven days and then fourteen days.

So the pilots themselves were not getting sick. But they were being grounded because of Health Canada protocols that they were in the same household as apparently somebody who tested positive, although not sick.

Shawn Buckley

Right, okay. I just wanted to pull that out. So you weren't having pilots going down with COVID, but they were getting grounded because of the testing protocols.

Scott Routly

That's right.

Shawn Buckley

Okay, sorry to have interrupted. Now there was one other thing. My understanding is that you guys had to go for your six-month SIM training [simulation training], and you had related to me something that you observed in the hotel. I want you to describe that just because it's come up in some other testimony at the Ottawa hearings. So can you share with us please, what you observed when you were staying in Toronto for the SIM trainings?

Scott Routly

Yeah. So finally, there was a lot of exemptions, unfortunately, with medicals and training, so there was a little bit of a lapse. We finally were able, just after the second lockdown, to start going to Toronto and continue with our simulator training, which we do every six months. We rolled into Toronto and, of course, the country's been locked down for the last three months at that period of time, and we had a hard time finding hotel rooms.

So how could this be? Long story short, we get to the hotel, and we're being told that six of the seven floors are quarantined from international travellers coming into Canada through

the COVID protocol. We're going to stay on the seventh floor. Now you walk into the lobby, and half of it has a glass, of course, opened at the top, as we've seen in stores and whatnot. And so we had use of one side of the elevators, and the other side was for all these so-called passengers coming in. So I didn't really think a whole lot of it the first day, where it was late, got in.

The next day before I had to do SIM training, I just thought, you know, I'm going to go down to the lobby and see what's going on here. This seems a little crazy for my kind of thinking. So I just sat in the lobby to see who was coming in and out on the other side.

[00:10:00]

Anyway, I was starting to see busloads of people come in, and nobody could speak English. They were coming in not with a suitcase that you would pack for a week vacation or two-week vacation. They were coming in with carts full of baggage that you would bring if you were staying for a lifetime. And food was being provided to them. It was all kept separate. We couldn't communicate with them on the other side. I did ask the person at the front desk, and the cone of silence came down and I was pushed back, and they didn't have any answers for me. So I watched this the one day, went out, and did my SIM training.

The next day I thought I'd better go down and watch it again for a few hours before my next day of training and, sure enough, the same thing happened. Now what was happening too though, was the next morning, they were actually getting loaded up in buses, disappearing. And then more buses would show up, and they were being offloaded into the entryway, given rooms, given food. Then they would disappear into the hotel in the so-called quarantined areas of the hotel. So I thought that very suspicious from my background and of course, with my critical thinking, that what I was watching happened for the last, you know, year and a half at that point.

Shawn Buckley

Okay. Yeah, thank you. It had come up about the number of immigrants coming in, almost like the population was being replaced.

Scott Routly

My thoughts were too, Shawn, absolutely.

Shawn Buckley

Okay, so back to the airline. Can you tell us the story of what happened? You were kind of telling us that things were getting phased in and then the mandates came in. I'm wanting you to share with us what you thought, what you did, and what happened. I'll tell you, we've got about eight minutes left.

Scott Routly

So the red flags started coming up, obviously, when there was rumors with these vaccine rollouts that it could possibly affect everybody. Right away, I had done a lot of research, started listening [to], you know, off-media sites where Dr. Peter McCullough, Dr. Theresa Long from the United States Army, flight surgeon, Paul Alexander. All these experts you've already had; you've had them as witnesses. All these people were already speaking out now.

It's been a year and a half in, and we already know at this point that these experimental jabs are dangerous, a lot of adverse effects happening with them. They're also not stopping COVID, not stopping transmission. So what are they there for?

Well, from an aviation point of view, and certainly for the health and welfare of my pilots, I raised the flag. And so I got a meeting together, and I said, "Look, if these things are going to start to happen, we need to have a close look at this. This is against all rules, protocol. You know, we have thirty years from my experience anyway in aviation, where safety has just been the paramount ideal that we strive for all the time. With all the training and everything else we do in the safety management system—for actual flying airplanes and what-not; our medical categories and fitness of the pilots, including fatigue—we have to stress this point to find out what is going on here [Exhibit OT-10e]. There's no way that we can give this to pilots that are flying, an experimental drug, until we get further information. Here's information I have."

Now at one of the meetings, the first thing I got, you know, I stressed to the Air Line Pilots Association [ALPA] union members—because we did belong to ALPA—and they said, "Oh, yeah, no, we know about these incapacitations, and they're all false narrative." And I said, "Well, I don't think so. It's been reported by actual pilots on the flight line in the United States and elsewhere." And anyway, they said, "Well, Health Canada has said that no, they're safe and effective [Exhibit OT-10d]. Therefore, the union's all in."

I went to management. I said, "Look, you know, regardless of what's going to hopefully not come down the pipe, but there are rumors that we need to be careful of this because we are responsible for this. These are our people. We cannot, you know, put these unknown drugs—" You can't even give blood as a pilot and fly for forty-eight hours. You can't go scuba diving. You can't take prescription drugs unless a civil aviation medical examiner approves it, right? That's how serious and regulated our medicals are.

Anyway, that was at that point. Shortly afterwards, then the rumor came down that Transport Canada was, in fact, going to enforce mandates for all the federally regulated airlines, trains, or anything in transportation. That's when I really raised the flags and put together data packages, which we already had at this point. And I once again had another meeting. Once again, I was pushed back.

[00:15:00]

I went to the senior management. I explained to them that absolutely we cannot do this. I explained Nuremberg Code; I explained all the laws of Canada, Charter of Rights, just the medical safety side of it: "We cannot do this, not only for our own people, but for the travelling public, the safety for them." And it was pushed back.

I eventually ended up writing a letter. They had a mandate come out that if we were not all double-vaxxed by 15 November of 2021, that we would be fired or suspended. Now I'm the chief pilot; I'm the man that's in charge of all the pilots for their health and welfare for Transport Canada. I reached out to Transport Canada, I said, "What's going on here? You know, we cannot allow this to happen, this is insanity." And I don't blame any of the lower-level people, you know, they're just following direction from above—unfortunately, blindly. And they said, "Well, this is going to go through." So anyway, I put up my fight against it. I said, "What about exemptions for people?" [Exhibit OT-10k]

I've got the first third of the pilot group—like everybody else in Canada—just ran right out in fear. About the middle third, they heard, "Well, I'm not going to be able to travel, so I'm

going to go take it—what the heck, it's just another flu shot." I warned everybody it's not. And of course, there was the other third of the pilots that were extremely nervous and said, 'Look, we don't want to take these shots. What can we do? It's going to affect us possibly for the rest of our life; if we lose our medical because of these shots, then we've lost our career.'" And I totally agreed. So I went to Transport Canada who said, "There's nothing we can do."

Now they did roll out exemptions. But of course, it was all a big farce. It was all pre-planned that nobody would get one and, in fact, the people that did apply got refused. I didn't even bother as a man of God, as Jesus, my Lord Saviour Christian; I'm not going to allow somebody in Ottawa decide my faith, so I didn't even apply. So at the end, I did not get jabbed; in the end, I was the only one [Exhibits OT-10i, OT-10j]. They all, through fear and coercion, scared of losing their careers and their jobs, their paychecks, unfortunately, the rest of them submitted. And it's extremely unfortunate because I know they're all flying around right now, wondering—you know, with all the reports of myocarditis. It's insanity; it's criminal that these people should be out there.

Shawn Buckley

I just want to slow you down. My understanding is that you were terminated because you wouldn't get vaccinated or you were—

Scott Routly

I was put on the infamous "suspended without pay" for eight months or whatever. Until through the pressure of the—thank God—Trucker Convoy, the only reason, you see, that the mandates were suspended. Everybody needs to understand, the mandates are still in place. They were just suspended. I know everybody's having the summer of love, but they were merely suspended. And the reason they're only suspended is because I'm sure that they're going to bring them back in again. So after that, then I was terminated.

Shawn Buckley

Now, do you know, following vaccination were there any changes to the medical requirements for pilots?

Scott Routly

Well, during the whole time there—at least, the first year through 2020 and into 2021—they basically had exemptions for medical. So they suspended the medical requirements.

Shawn Buckley

Just wait, so 2020 into 2021. So once they roll out the vaccines in 2021, there's, basically, an exemption from having to get the medicals.

Scott Routly

That's correct, yeah.

Shawn Buckley

Now, the medicals were mandatory every six months, were they not?

Scott Routly

That's correct. Six months to a year, depending on your age, or if you have any underlying issues. That's always been the case with CAT-1 medicals. As I say, that's fifty per cent of our licence, right? And of course, we have to go to civil aviation medical examiners [Exhibit OT-10b]. We don't just go to normal doctors. We have to be approved by civil aviation inspectors who actually give us physicals. And the older you get, you have to get ECGs, urine tests, eye tests, all these different things, right? X-rays, if required, depending. Now they stopped all this because of COVID. But then, even after the vaccine rollouts,

[00:20:00]

which I found quite insane, is that knowing everything that's going on, they've now increased these medical requirements, the exemptions, basically to telecoms. So you can phone into the civil aviation inspector and tell him, "Yeah, I'm feeling good, doc. It's all good." "Okay, good to go."

Shawn Buckley

Let me just be clear. So you used to have to go in and actually see a doctor and get tested.

Scott Routly

Of course.

Shawn Buckley

And you would normally have to get an ECG. I mean, these were really strict and complete tests, am I right? But they included ECGs.

Scott Routly

Yeah. Now it's for initial testing. For the younger pilots, you're not required to get ECGs until you're a little bit older. Once you're at the age of forty years old, then you have to get an annual ECG.

Shawn Buckley

Okay, but that's been exempted, hasn't it?

Scott Routly

Sorry?

Shawn Buckley

That's been changed, hasn't it? Isn't there an exemption now from needing to get ECGs for a couple of years?

Scott Routly

That's correct, yes. Yeah, so even with all the knowledge, even more so now than we had prior to the rollout, they've now extended it even again for another couple of years to 2025. Now, within that, there's about a three-year period. But every two years, you will have to go

in to do a physical. But the point is, a lot can happen in two years when you used to go every six months to a year.

Shawn Buckley

So, I want to make sure that no one's misunderstanding you. So, you know, in this most regulated industry—because, obviously, we don't want pilots having heart attacks or strokes or anything while they're up in the air flying us places—

Scott Routly

That's right.

Shawn Buckley

there were strict requirements for them to go "in person" for medicals. But here we hit a global pandemic where, in theory, the pilots are at more risk of being sick, and they actually relax the medical requirements, including mandatory ECGs.

Scott Routly

That's right.

Shawn Buckley

And that's after they roll out experimental vaccines. So pilots are now being tested less than they were before.

Scott Routly

That's correct, yeah, yeah. Of course, logical common sense would be, you know, you'd be tested more now just to confirm if there's any issues.

Shawn Buckley

Okay, now we've run out of time so I'm going to ask you one last question, and then I'm going to turn you over to the commissioners for questions. My last question is, are you concerned about airline safety?

Scott Routly

Yes, I am. There's already been reports. I think you've already talked to Greg Hill with Free to Fly. There's also Josh Yoder down in the States, Freedom Flyers, two great organizations; I belong to one of them. And these jets are getting calls all the time from the flight line. Now pilots by nature, they do not want to lose their medical because that means you lose your licence, which means you just lost your career. They put a lot of time, a lot of effort, a lot of expense to this highly dedicated profession. But they were forced and coerced into this, and so now they're out there, they're phoning in. They don't know what to do.

The reason you're seeing a lot of—you'll hear from Transport Canada rep here and in the airline—issues that we had at the airports, these were airlines that couldn't find crews to fly. They were calling in sick for whatever reason, and they were just short of crews—that's why flights were getting cancelled. They were trying to, you know, they had their own

narrative they were trying to use at the time. But the real reality is they were short of crews on the line due to sickness. And let's face it, they also fired forty per cent of their pilots throughout the country, like nurses, like firemen, like police, right? So you're wondering why you have a shortage? Well, that's because you fired forty per cent of them. And we're talking highly experienced individuals, right? You cannot replace these individuals.

Shawn Buckley

But we're short on time, and I was asking you if you were concerned about airline safety. And you are. So I'll turn you over to the commissioners to see if they have any questions for you. The commissioners do not have questions for you. So Scott, on behalf of the National Citizens Inquiry, I sincerely thank you for attending and sharing this information with us. Your testimony is appreciated.

Scott Routly

Well, my pleasure. I would just like to say thank you for you and your team for all the good work you're doing for this very noble cause for the future of this country. It's extremely important where we go from here. And I just remember—in the face of evil—not to do anything is to be a part of the evil. So I hope Canadians can grow some courage here and stand up for this country. And you know what? Put our faith in God, the living God of the Bible. Thank you so much and God bless.

Shawn Buckley

Thank you.

[00:25:36]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 2

May 18, 2023

EVIDENCE

Witness 13: Laurier Mantil

Full Day 2 Timestamp: 11:22:23–11:31:50

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Wayne Lenhardt

Hello, Laurier. Could you give us your full name, and spell it for us, and then I'll do an oath with you.

Laurier Mantil

My name is Laurier Mantil, L-A-U-R-I-E-R M-A-N-T-I-L.

Wayne Lenhardt

And you promise that the testimony you'll give today will be the truth, the whole truth, nothing but the truth?

Laurier Mantil

Yes.

Wayne Lenhardt

Thank you.

You have been a letter carrier with a federally regulated corporation and you've done that for some time.

Laurier Mantil

Mm-hmm.

Wayne Lenhardt

So maybe let's pick up the story in 2021, and you can tell us what happened.

Laurier Mantil

Yeah, so in 2021, November, to be specific, my employer imposed a vaccine mandate. And at the time, at the end of November 2021, I was about six weeks pregnant.

Wayne Lenhardt

Okay, so a vaccine mandate came in. Everyone had to get it, no exceptions.

Laurier Mantil

Yeah, it was a blanket policy, so everyone had to get it. They weren't offering any rapid testing. It was no jab, no job.

Wayne Lenhardt

But you had a specific reason for not getting it, correct?

Laurier Mantil

Yeah, I was pregnant.

Wayne Lenhardt

So you were pregnant for about a month at that point?

Laurier Mantil

Yeah, about six weeks.

Wayne Lenhardt

You weren't going to tell anybody, but at a certain point you ended up having to do that just because of the mandates, correct?

Laurier Mantil

Yeah.

Wayne Lenhardt

So your privacy got violated. But also, were you concerned about your baby?

Laurier Mantil

Yeah, absolutely. At the time, there was no evidence of safety. My employer did not provide any sort of handouts about any evidence of safety or why we should be taking these to keep our jobs. So I was really, really concerned. I was just trying to be really diligent and kind of decide my next steps because I was facing the loss of my employment, my job that I love, and I just wanted to be at work. I was an essential worker and I had worked the whole pandemic. And for my pregnancy, I felt for my mental health and for my physical health being pregnant, for me, the best thing was to stay at work and keep working and getting the exercise that I was getting. So I was really, really concerned, yeah.

Wayne Lenhardt

And at some point, did you apply for an exemption?

Laurier Mantil

I did. We had to attest our vaccine status and by a certain date. And if we hadn't attested, we would be kicked out and on an unpaid leave for we didn't know how long, if it was going to end up in a termination. So I did attest at the very last minute because I just wanted to stay at work, and so I tried to apply for an exemption at that time.

Wayne Lenhardt

And what happened with that?

Laurier Mantil

So I applied under a human rights exemption, not a medical exemption. I didn't really hear back from them right away. I was just allowed to be at work and keep working. But every day, I didn't know what was going to happen. I didn't know when I showed up to work if I was going to be booted out, like my other co-workers already had been at that time.

So here I was. I was waiting for them to get back to me about my exemption, waiting, waiting. Time went on. Months went on. And I never heard from them, and the only time I heard from them was at the very end, towards the end of my pregnancy. They contacted me and said, "This seems to be a medical case. Do you want to change your exemption to medical?" So I had gone this whole time—I guess I had an unofficial exemption—but I didn't hear from them. And they tried to get me to change over to medical, and I refused. And I went off on mat leave a couple months later.

Wayne Lenhardt

Okay, so you continued to work, but some of your cohorts ended up being put on leave without pay. Correct?

Laurier Mantil

Yeah, all my fellow employees that did not want to attest or did not get the jab were put on leave without pay—for seven months they were out without an income.

Wayne Lenhardt

So you kind of lucked out on that one and didn't suffer seven months without pay like some of your other cohorts.

Laurier Mantil

I was the only one in my post office that was unvaccinated, working.

Wayne Lenhardt

Okay.

[00:05:00]

So what other negatives did you suffer?

Laurier Mantil

Just the utter despair of not knowing where my career was going. I'm seven years in to my career, which is fairly new in my position, so I was just trying to figure things out. My partner and I just bought a house. This is our first baby, so there's a lot of things going on. I was having difficulty sleeping at night, difficulty even going into work because I felt so alone. All my other co-workers were not there, and I was the only that was allowed to be there, so it was very difficult.

Wayne Lenhardt

So again, you couldn't go to movie theatres; you couldn't go to gatherings; you couldn't go to restaurants, all that stuff.

Laurier Mantil

I was denied entry to a movie theatre, a local one, actually for not wearing a mask while I was pregnant.

Wayne Lenhardt

And given that you were pregnant, was there any issues with respect to your partner assisting you during that time?

Laurier Mantil

Yeah, like my partner was my rock. I wouldn't have got through this without him. At one point, he even said that he would get it if I had to get it. But I thought, you know what, there's too many red flags. I had worked outside the whole pandemic. I worked mostly alone, walking on an average 20 kilometres a day. I was very healthy and I said, "No, I'm not getting this. If I'm going to lose everything, I'm going to have to fight for it." So that's why I applied for the exemption and tried to get around it.

Wayne Lenhardt

And did you have to wear a mask during this period of time?

Laurier Mantil

Yeah, we had to wear a mask, and if I didn't, you'd be suspended.

Wayne Lenhardt

Okay.

Laurier Mantil

Inside. Outside, I didn't wear it when I was outside, delivering.

Wayne Lenhardt

Did you feel you were allowed informed consent when you made your decision, or did they pressure you to proceed?

Laurier Mantil

Well, I thought it was my job, or, you know, so there was coercion there. No, I didn't have informed consent because at the time there was no evidence that it was safe for the fetus. That's what I was concerned about. They were saying it was okay for pregnant women, go ahead and get it. But I never saw anything about the fetus specifically. So that's what I was really concerned about.

Wayne Lenhardt

Okay. Is there anything else you want to tell us about your situations at that time?

Laurier Mantil

No, I just want to say I'm a very private person, so it was very hard. It took courage to come here today. But I really wanted to do this for all the other pregnant women during this time that may have had a similar story to mine. Also, all the babies that are not here. All my co-workers that took seven months without pay. And obviously my baby and my partner, because I wouldn't be here without them.

Wayne Lenhardt

Are there any questions from the Commissioners?

Commissioner Kaikkonen

Real quick, did all of your co-workers that went without pay for seven months, did they come back?

Laurier Mantil

Yeah, they were asked to come back after seven months. They were allowed to come back.

Commissioner Kaikkonen

And did you suffer anything from anybody who remained at the post office that would have known that you were not vaxxed. Did anybody say anything?

Laurier Mantil

They said it was going to be a private matter, people wouldn't know. But everyone knew. I had a few comments, but everyone knew everyone's status pretty much there. So there was no privacy of people's decisions. Everyone who wasn't there, you knew that they weren't complying with the mandate. And there was nothing in our collective agreement about this either.

Commissioner Kaikkonen

Thank you.

Wayne Lenhardt

Any other questions from the Commissioners? On behalf of the National Citizens Inquiry, I want to thank you very much for coming and telling us your story.

Laurier Mantil

Thank you.

Wayne Lenhardt

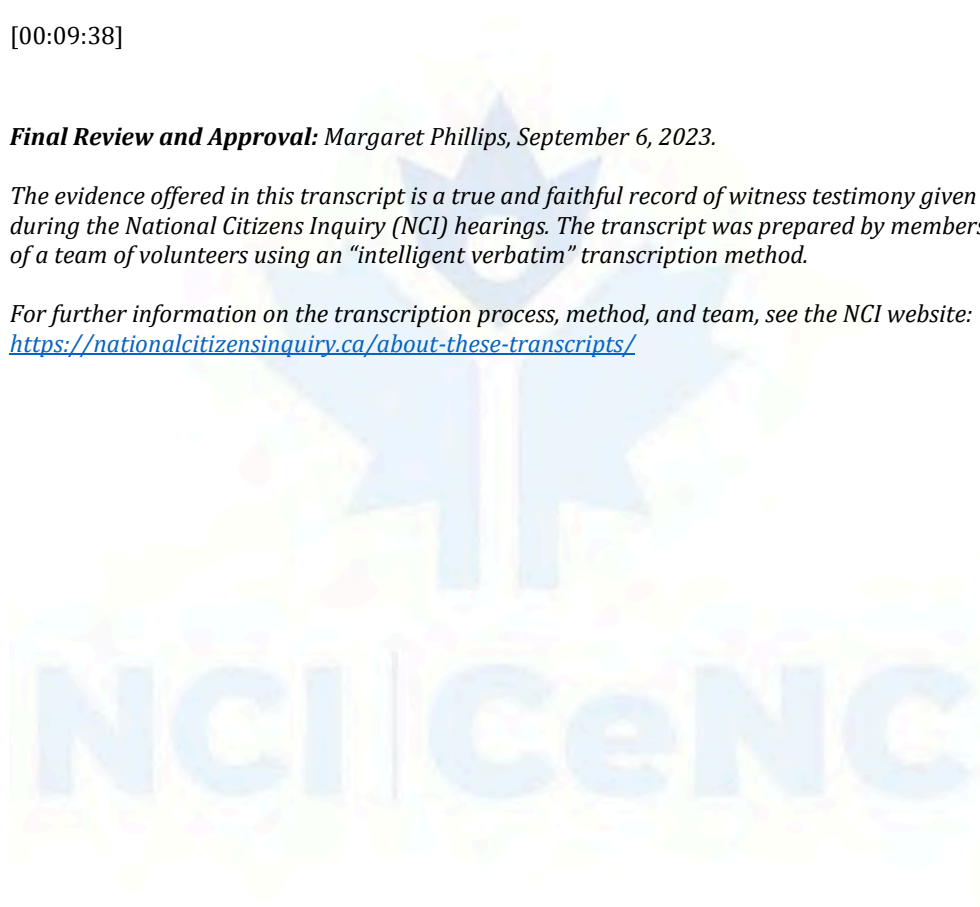

Thank you.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 18, 2023

Day 2

EVIDENCE

Witness 14: Maurice Gatien

Full Day 2 Timestamp: 11:33:08–12:39:00

Source URL: <https://rumble.com/v2ogkb8-national-citizens-inquiry-ottawa-day-2.html>

[00:00:00]

Kassy Baker

Hello, Mr. Gatien. Can you please spell and state your name for the record?

Maurice Gatien

First name Maurice, M-A-U-R-I-C-E, last name Gatien, G-A-T-I-E-N.

Kassy Baker

And, sir, do you promise to tell the truth, the whole truth, and nothing but the truth this afternoon?

Maurice Gatien

I do.

Kassy Baker

Very good. Now, Mr. Gatien, I'm hoping that you can provide us with some background about yourself and how you came to be a witness at this hearing. I understand that you were called to the bar of Ontario in 1971, which is "lawyer speak" for saying that you are, in fact, a lawyer. Can you tell us a bit about your background and what's happened more recently that might be of interest to this hearing?

Maurice Gatien

Yes, I graduated in 1969 from the downtown location of Osgoode Hall, since moved to York University, and it was a real privilege to be at their downtown location. I still return from time to time when I'm in Toronto to the great library. I'm always amazed at the contrast between the stacks of books, and they have high speed internet. So I can work and I can access the knowledge that's on those shelves faster than I could if I were to stand up and go fetch the book. So it's been an amazing evolution in the state of the law.

After I graduated, I returned to my hometown of Cornwall, practised for approximately ten years and, during that time, was involved in real estate primarily and contracts. I negotiated two large transactions in my last year there, which really left me with a lot of satisfaction. One was the purchase of the utility Cornwall Electric, and the other was the assembly for a large shopping centre.

I decided I would look in other directions and lived for the next 22 years from 1980 to 2002 in various big cities, Atlanta, Montreal, Toronto. And my last year 2001 and '02, I lived in New York City. I spent a lot of time in Houston, as well. So it gave me a perspective of having a footprint in both large markets and small ones.

When I came back to Cornwall in 2002, I built a substantial practice and ultimately ended up representing people who needed representation with regard to the vaccines. Ultimately, in September 29th, 2022, I was suspended by the Law Society of Upper Canada, well actually, Law Society of Ontario now.

I found myself in January of 2023 addressing a group of the people that I had represented at a potluck dinner at a barn in Dunvegan, and it was heartwarming to be addressing these people who had shown tremendous courage. Some of them had been vaccine-injured, some of them had lost their jobs, and I told them about three situations that were interesting from my perspective. One was sort of a legend story of a farmer in North Glengarry by the name of Oded Saint-Onge who had been run over by a truck, he and his two cows, Isabelle and Annabelle, and he went to court to sue the large trucking company.

In court, the lawyer for the big Toronto law firm, head of litigation, asked him, "Did you not, Mr. Saint-Onge, say to the police officer at the scene of the accident, 'I'm fine, see I'm fine'?" And the farmer started to explain and he said, "Well, I was taking my two cows across the road," and the lawyer interrupted him again and said, "No, no, Mr. Saint-Onge, didn't you say at the scene of the accident to the police officer, 'I'm fine, see I'm fine'?" And the farmer again started with his story. And the judge interrupted and said, "I'd like to hear this man's story, I'd like to know what happened."

So the farmer explained that he was going across the road with his two cows, Isabelle and Annabelle, and the truck ran a stop sign and smacked into them and knocked him into the one ditch and the two cows into the other ditch. The farmer explained, "I was lying in the ditch. I was hurt; my ribs were cracked. I could hardly breathe and I could hear my two cows.

[00:05:00]

"They were moaning and groaning and in great pain. And the police came along, and he could see the cows in great discomfort. He took his gun out. He walked over to Isabelle, and he shot her right between the eyes. Then he walked over to Annabelle and also shot her right between the eyes. And he came over to me and he said, 'And you, sir, how are you?'" And he said, "See, I'm fine, I'm fine."

So we can see where there's a form of intimidation that can take place, you don't have to shoot everybody or fire everybody. When one or two people—or animals or whatever it happens to be—when something happens to them, we get a signal. And when I was experiencing my discussions, I had Zoom calls continuously throughout the preceding year or two with people from different walks of life, and it was pretty clear that there was a lot of intimidation.

One of the people I also met in my various travels and different business ventures, I met Pierre Trudeau in the late 1980s; he had left politics at that point. He had successfully brought the Charter and the Canadian Constitution back to Canada. And when one of my staff found out that Pierre Trudeau was going to be coming to a reception that we were hosting, Trudeau was his hero. He asked me if I could arrange for him to just shake his hand. I said, "Sure, I'll ask when he arrives," which I did. Mr. Trudeau very gracefully excused himself from the group of VIPs with whom he was chatting and spent ten to fifteen minutes with this employee, and I could just see the glow on this person's face and how emotional they were about it. And afterwards, I thanked Pierre for taking the time and he said, "Well, he showed respect for me, and I was going to show respect for him."

Now we transport that to 2022, in February of last year in Ottawa, and we saw that the son, Justin Trudeau, perhaps didn't have the same respect for the small individuals, the average people, wouldn't even walk across the street in Wellington Street in Ottawa to talk to anybody. I walked there from Cornwall in the middle of winter to address the [Trucker] Convoy, and he didn't even walk across the street.

So when we look at intimidation, part of what brought me into this is, I received a phone call in May of 2021. At that point, one of my clients who owned a gym had been charged, and he asked me if I would also speak to a woman who had also been charged with him for attending a public rally. What had happened is that she had simply sung "O Canada," the national anthem. When the person who was supposed to sing couldn't make it, the speaker asked the crowd if someone would step up and sing the national anthem, and she did. And when I heard about this, I'm thinking, how could I not also step up and help her?

She was charged under the *Reopening Ontario Act*—which is really a lockdown act misnamed as the *Reopening Ontario Act*—pursuant to which she was subject to a \$100,000 fine and up to a year in jail. So this hung over her head. We finally were able to get the Crown to agree to stand down from these charges in September of the following year. This hung over her head for fifteen, sixteen months, and it was not actually ultimately dismissed until December, so well over a year and a half to have this hanging over her head and also my client's head. He also was charged, and these charges are still pending against some of the people, including Randy Hillier, who was one of the speakers that day.

So just, sort of, to come to terms with a situation where people are showing tremendous courage, I as a lawyer felt that I had to do at least as much—not as much as they were doing because they were putting their livelihoods on the line,

[00:10:00]

and they were experiencing a lot of bullying and intimidation. Because I was dealing with **this particular matter, my name sort of got passed around. There weren't a lot of lawyers who were stepping forward, and I would spend one or two evenings a week on Zoom calls, speaking with EMTs, teachers, firefighters, police, nurses from Brockville, from Hawkesbury, from Ottawa, from Cornwall, all coming back with the same stories of intimidation, bullying, HR departments releasing their names to indicate who was vaccinated and who wasn't within their institution or their place of work.**

So there were a lot of threats and intimidation, and I formed a company to raise some money for women's shelters and to create goodwill towards these people because they didn't know how to do it themselves. They asked me to be the director of the company because they themselves were running into all kinds of intimidation. Within 24 hours, my home address was doxxed online. I live in a small hamlet of 350 people and shortly

thereafter, within about 48 hours, somebody came banging on the door at two in the morning. And then the harassment and intimidation continued. My car was stolen out of my driveway. I was assaulted at my office, and probably the scariest thing was one evening in October, this past year, my engine completely failed. I was on the 401 ramp, and somebody had put a contaminant in my fuel tank and it was a very, very scary moment.

So going back to February, I walked to Ottawa in the freezing cold to bring attention to the intimidation of lawyers, and I was joined on my walk—it was really inspiring—by three individuals, because I had to do it over three days. It's quite a distance. All three were former members of the Canadian Armed Forces. Two of them were police, and one was a firefighter, all suspended for not being prepared to take the vaccine. Each of the three had served at least 10 years in the Canadian Armed Forces and different stages overseas, involved in "black ops" and things of that nature. And all three made the same comment to me, which was "it wasn't over." There would be more, and there was, as I experienced.

Kassy Baker

Mr. Gatien, I hate to interrupt you, but you rather glossed over how far a walk it is exactly from your home to Ottawa? Can you tell us?

Maurice Gatien

It's 110 kilometres.

Kassy Baker

That's right.

Maurice Gatien

And at the time, I was 74 years old. So it was quite arduous, but I was joined along the way by people from all different walks. One was a doctor who—he's got very bad knees—was only able to walk about 100 metres, but I really appreciated it. And I also received more hugs. Lawyers don't get a lot of hugs, so it was pretty emotional for me.

Kassy Baker

Can you tell us, in the immediate period around the time of the Convoy in February, what else was happening to you before and after that?

Maurice Gatien

Well, the one thing I noticed is there was a complete radio silence from the Law Society, also from the point of view of the College of Physicians and Surgeons of Ontario. No messaging about civility; no messaging about being nice to each other. We could disagree about things, maybe everybody could have a different perspective, but the attitude of civility was not being cultivated. It wasn't being cultivated by the federal government as we saw with some of the interviews from our Prime Minister about people being racist or misogynist. I never heard those topics come up, and I spent hundreds of hours with people and those topics never came up. It was about health; it was about the pressure at work; it was about family. It was certainly not about misogyny or racism. I never saw it.

I did see one situation when I came to Ottawa,

[00:15:00]

not when I walked up here. But another time I came on a Saturday, and somebody had a Confederate flag. They were the only person wearing a full-face mask. People were very, very civil to this individual, basically saying, "Please leave, you don't fit here with that messaging, please leave." There was no bullying of them; it was just a gentle, "Please leave." He got edged to the side of the crowd where there was a TV camera to capture this messaging, which was really out of keeping with the whole tenor of the convoy protest. I was here four times. And each time, I can say that the atmosphere was joyous and positive, and the people were wonderful.

Kassy Baker

Now, I understand you have a PowerPoint presentation for us [Exhibit OT-9]. Would you like to take this opportunity to set that up?

Maurice Gatien

Well, I think it's supposed to be—

Kassy Baker

Thank you.

Maurice Gatien

So one of the things I'd like to talk about is the bold lie technique. When I was working in Montreal managing office towers and shopping centres, one project was an office tower that had defaulted on its mortgage, and one of my staff went around with the lender. It was a New York-based lender. It was their largest defaulting mortgage in North America, so it was a very significant file. And when they got to the building and went around to different office suites, there were signs on some of the office suites. They'd open the door. There was no furniture. There was no equipment. There was nothing. And in other suites, there would be someone there. But they would look at the rent roll and say, "Well, those are not the terms of my lease." And what was evident was, it was either a combination of ghost tenants or leases that were just not the same. And yet the bank, a very sophisticated bank, had lent, at the time, \$86 million. So it was a significant amount of money. But it was an example of a Bold Lie.

My next-door neighbour, at the time we're living in Montreal, was a TV producer, and he wanted to do a TV program about a forensic accountant who went around discovering fraud, and he asked me to help him with this. So I ended up, even though I was a small-town lawyer and am now managing large real estate projects, ended up becoming quite knowledgeable about fraud.

And the most interesting fraud that we came across was after the First World War in Paris. This fellow had contrived a scheme whereby he had gotten a printer to produce a very fancy letter head from the Ministère de l'Approvisionnement, Ministry of Supply and Services, which he had sent to the five largest contractors in Paris, basically saying, "I've got a very confidential project. I cannot meet you at the ministry offices. I have set up a suite at the Hôtel Crillon"—which is a very fancy hotel in Paris—"and your designated time" And each of the contractors had a different time slot, "Please come and we can discuss this confidential project." Of course, all five bit and all five showed up.

The pitch was the following. He said, "Once you know what I've got to discuss with you, you'll realize how you must keep this very secret. The government is looking under every manhole cover. We need money. We've come out of the First World War owing a lot of money. And we want to disassemble the Eiffel Tower and sell the scrap steel. However, I can probably steer this contract to you if you can come back a week from today, no obligation, with an envelope full of" — I forget the amount, 100,000 francs, 200,000 francs, whatever the amount was. Of course, they bit, and this guy absconded with the money and everybody laughed. But no one wanted to fess up or prosecute this individual because it was extremely embarrassing and very clever. But it showed the originality and the planning that goes into the Bold Lie. That was the phrase that this TV producer and I came up with: not just the lie, not the Big Lie—but the Bold Lie.

And we saw the Bold Lie with Bernie Madoff with—I just looked at the amounts today—it was about \$65 billion U.S. that he was able to pull out of investors, and they only got back maybe about 20 of that.

[00:20:00]

The rest just disappeared into a massive Ponzi scheme.

The 2008 mortgage funding fraud, which took place, had gone on for a couple of years in the United States. Now as a lawyer, we know that a document called a mortgage is something secured on real estate. But if the mortgage is for \$500,000 and the house is worth \$400,000, you can still call it a mortgage, but now it's become a hybrid: it's now a partly unsecured loan. What the banks did at the time is they bundled hundreds of millions of dollars of these types of instruments and sold them to unsophisticated investors and sometimes, also, very sophisticated investors. And when this finally imploded in 2008, as it would, people lost many dollars, huge amounts. Several films have been made of this and books, and everybody could see it coming except the investors because they were buying in to the Bold Lie: they were buying something safe called a mortgage and a mortgage fund.

Since that time, we've seen these things repeated. There's been Bre-X, Nortel, FTX. They're all the same model where it's a Bold Lie: you're going to make a lot of money. We wondered, the TV producer and I, tried to analyze things as to why the Bold Lie works and we came to the conclusion, it works for two primary reasons. One is most people have a sense of morality. Most people would not exploit the other person to their detriment. The other aspect is practical, which is most of us also don't want to face the consequences of going to jail. We are concerned for ourselves, our families but the main one, though, is that moral inhibitor, which is we don't want to exploit other people to that extent. But the Bold Lie is the foundational element to a lot of things that have transpired.

So going from the Bold Lie, okay, we can also see that with COVID— The way I would like to describe it is that there's two Bold Lies that were coexisting at the same time. So to get a sense of it, I'd like to take you on a bit of a journey of imagination. I'd like you to think of March 2020, and we're in the Mediterranean. We're on this beautiful yacht, and there's Kassy, you, me, at a table. We're on a yacht to celebrate the profits from a company, and we're going to call it Geyser Pharma. There's no such company as Geyser Pharma, so I'm not suggesting, aiming at anybody. And we're at our table. There's a gentleman, it's a fictional person by the name of Gill Bates. It's a situation where there's the finest champagne being poured into the finest crystal glasses. There's caviar, there's the finest shrimp, and there's a classic trio flown in from Milan to play for our entertainment. And off in the distance, we can suddenly hear the voice of somebody who's crying for help and someone who's drowning.

So Kassy, you and I would probably jump up, and we would look for some rope to throw to this drowning person. And Gill says, "Well, don't worry. I've got it." So he goes up to the side of the wall and picks out a rope. He mentions to us, he says, "Well, this rope cost \$1.50 a foot, but I'm going to see if I can get this guy to pay \$30 a foot." And he goes to the railing and starts to negotiate and, ultimately, in order to help the negotiations, says, "Gee, I think I see some shark fins there. It could be dangerous." And you could just hear the person crying.

That's the setup for a Bold Lie: when we're desperate, when we're scared, we're more likely to make bad decisions. So with COVID, there were two Bold Lies. One was, you're going to die. COVID will kill you. And we'll go into some of the reasons why that was not true in our area and in our province. And the second Bold Lie was, only the vaccine will save you. No other strategy,

[00:25:00]

don't worry about losing weight or taking vitamin D or whatever. Nothing was offered as an alternative except the vaccine. So it'd be like going back to the fellow in the water drowning and not telling him, "Oh, there's a sandbar five feet away. If you just go over there, you won't have to worry about paying \$30 a foot for some rope."

So when we looked at the situation, we saw no promotion of good health. The gyms were closed. Liquor stores remained open. And at the same time, with all the stores, the small businesses that were closed, it was a massive wealth transfer. When I was choosing a photo for this particular slide, I could not get all of this yacht—this is the new yacht that Jeff Bezos just took delivery on a couple of days ago. Cost \$500 million. It's the length of a football field. In recent weeks, I've also noticed that yachts are backordered 30 months. So, Kassy, even if you made a billion dollars, I'd have to tell you bad news: you're going to have to wait for your yacht. Ferrari SUVs are back ordered till 2026. And there's been a whole raft of new billionaires that have achieved this status in the last three years. It's been an amazing transfer of wealth. And I've had people coming into my office, restaurateurs in particular, have been decimated by what happened in the last three years.

So when we look at the numbers, and it was very interesting for me in a small town to be in touch with the numbers. I speak to other lawyers on a continuous basis. I personally—and I'm in an age group that would be very much in the right profile—I personally, after three years, don't know anybody who's died from COVID in the Cornwall area. I ask other lawyers, "Well, do you know anybody who's died from COVID?" And they'll say, "Well, no, not really." "Have you noticed the surge in your probate files?" "Well, no, not really." "Have you been called to the hospital to do a will or a power of attorney for somebody who's imminently going to be dying from COVID?" The answer has been, "Well, no, not really." So after a while when you hear enough anecdotal evidence, it becomes statistical.

Partly because of my background in managing large real estate projects, I became quite acquainted with software and statistics. And one day, there was an article in the local paper about the COVID deaths, and there was a link on their online version to the Eastern Ontario Health Unit database, which I clicked on. I ended up in a database of about 6,000 scrambled pieces of information, which I organized into 10 lines. Basically, by decade of life of each of the people who had theoretically died from COVID. So, from 0 to 10; 10 to 20; 20 to 30; 20 to 40. Under 40, there was not one single COVID death. So I was kind of amazed with that fact because the schools were closing. There was panic. And it was, to me, a piece of good news that should have been out there instead of being suppressed and buried in this very scrambled database.

So when I looked at this, and also looked at the profile of the other, there were only two people between the ages of 40 and 50, and most of the deaths were from 70 to 100, with most of those being from 80 to 100. There was no listing of comorbidities. Yet I knew from all my reading that a lot of COVID deaths were accompanied by people being overweight, people having had strokes or other problems.

In March of 2020 on my way back from—my wife and I were in Hilton Head—I had read that COVID affected the pulmonary system. So I downloaded a book on breathing. I started doing breathing exercises.

[00:30:00]

I immediately experienced better sleep, felt better. And I kept waiting for that big, big government push on improving your breathing. That big push never came. We're three years later, and it still hasn't arrived. I went through a number of evaluations of different initiatives that could have been taken by government. My daughter and I drew up a list, A to Z, whether it was breathing, weight loss, reducing alcohol consumption, you name it. There was nothing that was done to encourage better health.

So this vacuum created this anxiety that the vaccine was the holy grail. The vaccines were going to save everybody, but nobody had done anything to mitigate this big fear. So when I looked at the numbers, I looked at numbers, not just for the Cornwall area—I just took one at random because one of my friends was from Niagara—I looked at figures from Ottawa, Toronto. All the figures were under four one-hundredths of one per cent. I'm not a statistician, but by the same token, I'm not a journalist. But I would have thought that the newspapers would have been filled with this good news.

There was a day, a couple of Februarys ago, when I was looking at the weather channel predictions and there was a beautiful blue sky day, quite cold, but good day for cross-country skiing or snowshoeing. At the top of the weather channel prediction was a big red bar warning me of snow squalls. So I clicked on it, and it was warning me about snow squalls around Lake of the Woods, which is about a thousand kilometres from where I live. So I took my chances, and I went out and had a wonderful day of snowshoeing. The next day, I also looked at the weather channel. It was a Sunday and again another blue sky day. And I looked at the weather channel radar map, it was one of those polar highs that covered all of North America, and there was no clouds, there was nothing, it was just going to be beautiful everywhere. But the red bar warned me about solar storms on the planet Venus. Again, I took a chance, and I went out and had a wonderful day again.

So in the media, it seems there's an overemphasis, even on something as fundamental as weather, an overemphasis on the negative and on alarming us. When I grew up, the newspaper in the top right-hand corner of the front page would have two, maybe three lines about the weather. Things like, "It will be cold tomorrow." That was it. So we've now put ourselves in a position where the media are constantly bombarding us as much as possible it seems with negative news as opposed to, you know, "Get out there, enjoy yourself, be positive." And I've turned it into a game for myself when clients come into the office and I'll ask, "How's it going?" And they'll say, "Oh, it's supposed to rain tomorrow." So, I always know the weather forecast. I always know that the rain will end. And I'll shift the conversation to, "Gee, it's supposed to be nice on Sunday. Do you think you could go and play some golf?" And all of a sudden, the conversation has turned to something positive. And I feel that it's a fun thing to do, but the media doesn't seem to have that optic on things—it's how do I make people anxious? And the weather network now has it set up so

that it'll say at the bottom of the screen, "This will refresh in 30 seconds, do you want to hang on and see?" And I'm thinking to myself, "What could change in 30 seconds?"

So we're always on this edge of anxiety. And COVID came along and amped that up tremendously, and we were bombarded with bad news, bombarded with statistics all the time. It got to the point where I had to turn my radio off. I live about 20 kilometres from Cornwall, and I just had to stop listening because it was just always, always panicky.

One of the things I talked about when I was at that potluck supper—which I have very fond memories of in a barn in Dunvegan. I wouldn't call it the big time of the speaking tour in Canada, but certainly in terms of satisfaction was there.

[00:35:00]

Talked about the Charter of Rights. I talked about it when I addressed the crowd at the Convoy. And we tend to forget that our rights originated with something called the Magna Carta, which was signed in 1215 after a war against the king, who was a very tough king at the time. He died the following year, and the Regency Council tried to renege on the Magna Carta. It ended up having to have another war, and it was re-signed and ratified in 1217. And what most people don't realize is, it only applied at the time to 25 people, 25 lords and barons, and they were given a very short list of rights. One of the rights was the right against arbitrary imprisonment, which would be equivalent to being stuck in a home imprisonment, which we saw with COVID, "shelter in place," they called it. But it was really home imprisonment. And the other was the right against arbitrary taxation, arbitrary decisions being made. So it took until 1911 for the *Act of Parliament* to be passed in England whereby the House of Lords could no longer veto bills from Parliament.

So almost 700 years have to go by and every year the rights got a little wider. And I'm sure after 1217, some of the lords went back to their fiefdoms and there would have been somebody tapping them on the shoulder saying, "Well, my Lord, you have certain rights, can we have some too?"

When we looked at the history of this situation as well, it was something that seemed so incremental, it took so long. In the 1600s, there was a concept that evolved under the first King Charles called the "divine right of kings." In other words, "My king is plugged into God, you have no right to question the decision." And at the time, the king had no problem getting reports and studies and scholarly works to support the notion of that, just by promising an earldom or a manor house to somebody. And things haven't changed a lot since that time. If you want a report, and I do remember when I was working for this large company, we paid \$250,000 for a report, and the president of the company picked it up, looked at it and said, "huh, \$250,000 to tell me I've got a nose in the middle of my face." **When we look at the studies and reports that were surrounding COVID, who paid for it was certainly going to determine a lot of the outcome of what the report was going to say.**

So when we look at the Magna Carta, what evolved in Canada, it wasn't until 1982 that we got our Constitution repatriated; the Charter of Rights was implemented by Pierre Trudeau. And in literally a week, in March of 2020, we lost all those rights. Parliament did not sit; it stopped sitting. And I'd like to joke to my friends, "Well, the Ottawa Senators have not made the playoffs in a while. The arena should have been open; there could have been plenty of social distancing, they should have met." But by not meeting and by defaulting on any discussion, all of a sudden, a handful of people were making all of the decisions for millions and millions of Canadians. We had no outlet. We had no way to express any of our concerns.

So when we look at the Charter— And it was interesting for me to also look at the history of marketing and advertising. Because what happened over the hundreds of years of evolution of the Charter of our rights, something happened in the 20th century. From 1900 on, it really evolved after the First World War. During the First World War, we saw the first forms of advertising with any sophistication. So think of how much it would take to persuade somebody to go from New Zealand or Australia or Canada or Newfoundland,

[00:40:00]

to go into the fields in Europe and to live in trenches for months at a time. And at the sound of a whistle, to jump out of the trench, and because the colonials were the lucky ones, to lead the first charges. And nobody had told them, by the way, the machine gun has been invented. So they were being persuaded for glory, for God and country, to give up their lives.

So when the 1920s came around, the advertisers of everything from Pepsodent toothpaste to whatever, realized, wow, there's something available to us to push our products. Radio came along, then television, then the internet, telephones. Now with social media, we are constantly bombarded by messaging, and these expanding platforms have meant that we can almost find no safe harbour. I try to get out snowshoeing or cross-country skiing, get out into nature, if only to shelter myself from this constant bombardment. Our bandwidth, if you will, of available brain power to deal with everything is getting increasingly compressed.

There were some experiments that I read about and the first one I read about— I had actually read about it in 1965 when I was at Carleton University. We had to take a mandatory course in psych 101, and they were called the Milgram experiments. The Milgram experiments were designed to explore the proposition about people following orders. At the time, a fellow by the name of Adolf Eichmann had been detained by the Israelis in Argentina and had been brought for trial. His basic excuse, even though he put millions of people to death running the concentration camps was, "I was just following orders."

In the Milgram experiments, which were conducted at Yale University in 1961, Professor Milgram set it up so there were three people involved. One was called "the learner" and that person sat in a chair with electrodes and was electrified. It really wasn't, but it looked like it was, and it contained an actor who sat in it. The second person was called the "person of authority," wearing a lab coat and clipboard, and he would be telling the person upon whom the experiment was going to be conducted that they would have to give the learner some electric shocks. You'll notice that one of the settings on the electric shock board was DANGER: SEVERE SHOCK. So the person who was controlling the experiment, controlling the amount of power, was being alerted that this could cause harm.

The professor asked his students to estimate how many people would dial it up right to the top. Most people figured, well, one, maybe 3 per cent, there's always somebody who's a bit of a jerk out there. The actual number turned out to be 65 per cent; 100 per cent of the people were willing to give at least a mild shock. And the actor, by the way, in the other room, was trained to yell in pain as the shocks increased. So it was pretty amazing that somebody would suspend their judgment, suspend their critical thinking if someone in a lab coat, someone of authority, would tell them to do something.

The next set of experiments—in the 60s, there was a TV show called "Candid Camera," and it evolved out of that—and they were called the elevator conformity experiments. It

consisted of a person getting on an elevator, and there would be one person on the elevator initially, and they'd be facing the back wall. Almost everybody would face the normal way: they'd pivot, they'd look at the door, they'd look at the buttons. But once they got up to five people on the elevator, 100 per cent of the people would pivot and face the back wall, as well. That's the pull—the gravitational pull that we experience from the tribe—from people around us.

Now, if there was a sixth person on the elevator facing the right way,

[00:45:00]

a person would feel encouraged to use their critical thinking, would feel encouraged to be separate from the crowd and would face the right way. So it just shows our inclination to abandon our judgment, if you will, if there's enough people doing something. We saw this happening during COVID many, many times.

The third set of experiments were conducted in 1971 at Stanford. They're known as the Stanford prison experiments, and it consisted of 12 students who were designated as prisoners and were put in prison garb and 12 who were designated as guards. They actually built some cells in the basement of the psych building, and the experiments were to be conducted over a period of 14 days. They had to suspend them after six days because the guards were getting out of control. They were becoming abusive and what happened is that once the first guard started to go over the line, that would encourage others to do the same and before you knew it, they had to suspend the experiments. That shows that you need rules. The rules have to be thought out before you do something. Trying to implement rules on the fly doesn't work very well. You try to implement rules when you're calm, when you're rational, not when you're panicked.

So what we saw during COVID was the opposite of these things: we saw rules invented on the fly; we saw rights being suspended; we saw the tribe, the herd basically running and influencing each other in their panicked state.

Foundational documents like the Charter of Rights—the right to assemble, the right to speak—became suppressed; censorship became the norm, and even to disagree became in and of itself almost demonized. I can't tell you how many evenings I spent on Zoom calls with people who were upset: who were threatened, who were worried. They'd lost friends; they'd lost family, just for expressing an opinion. So we did engage in a form of groupthink, which from a lawyer's perspective were very troubling because under our Charter of Rights, we have the right to express our thoughts and opinion.

Now one of the things I also noticed in my research, in 1930s Germany, there were a lot of **parallels with what we saw, and people were reluctant to state it. But one of the things I found alarming in 1930s Germany is group after group were mobilized and purged from their ranks people of Jewish background. The first group to do so were judges and lawyers; the last group to do so were midwives, presumably because they valued all life. So in 1933, first group, judges and lawyers. And after that, quickly after, followed doctors, veterinarians, architects, engineers. It's pretty amazing that they were able to do this. And one of the other things I found troubling was I looked for any comments; I looked for any writing from the 1930s from Canadian lawyers, Canadian judges, American judges, American lawyers. Nobody criticized what had occurred, and yet we know, it led to some very, very bad outcomes.**

So when we give up rights, when we treat people as “the other,” as we saw, these are very troubling tendencies in society. And when these institutions of trust—like law societies, like colleges of physicians—go in a direction, a lot of people take it as a cue that, well, it must be all right. And there wasn’t the critical thinking that was applied.

As lawyers, normally, we rely on evidence. And as you saw, with a death rate of four one-hundredths of one per cent, with almost a negligible change in the number of probate files and whatnot, where was the evidence?

Kassy, to your point, when we were talking earlier, where were the lawyers? We, I guess, unfortunately,

[00:50:00]

were subject to the Milgram experiment; we were subject to the elevator conformity experiment; we were subject to the Stanford prison experiment without being aware of it.

As far as I’m concerned, these things, these experiments should be taught in our ethics courses. They should be taught in medical school, in law school, as part of our ethics courses, and we should never forget how vulnerable we are and how important it is to have these foundational concepts always borne in mind. That’s how important they are. They are the guardrails against bad decisions.

The last observation I’d like to make about this aspect, too, is sometimes when I go to Toronto, I will buy all four newspapers. A story, it could be any story, might receive a favourable treatment on the front page of the *Globe*, might be front page of the *Post*, will have a different slant on it. It might be on page 37 of the *Toronto Star*; it may not even appear in the *Toronto Sun*. And by the way, the story, what I’ve expressed, could just as easily be the other way around. And sometimes when I engage people in discussion about this, they read the same newspaper every day. And they don’t realize what a silo they have been placed in and how they have been compartmentalized from getting a range of ideas, a range of thought. So it’s important to basically get your news sources from more than one place because, otherwise, it’s very easy to divide and conquer if we’re in compartments.

I need to go back a bit here, sorry. One of the things I do want to talk about is the clown deals. I’ve done a lot of negotiating and large deals, small deals. One deal I did was for a fellow who came to our house—he arrived on his riding lawnmower because he didn’t have any other way of getting to our house—and he was trying to buy a \$5,000 piece of property that his house sat on. And I worked out the deal with the church that owned the land whereby he could work off some of the purchase price by mowing the lawn at the cemetery. And the pastor and I joked about the “art of the deal.”

So when we look at deals, most deals start out—if you think of, in your mind, a table—the contract, the proposed deal, will be in the centre of the table, and typically it will migrate a little bit to one side or the other. It might be 50-50, in most instances; it might be 52-48. At 55-45, most deals start to fall apart. If the person is asking too much or if the terms are too onerous, something happens to break the momentum of the deal. If you have a million dollar house and you want 10 million for it, that won’t work. And if somebody offers you \$100,000, that also won’t work; you’ll walk away. Most lawyers also understand that if you ask too much, people won’t want to negotiate with you. And if you ask too little, nobody will want to use your services because you’re not in the middle of the table and you might refine the deal. When we look at the vaccine supply contracts, they did not end up in the middle of the table.

The other thing that I would mention with regard to most deals, if you look at TTC [Toronto Transit Commission], you look at the OTC, you look at Hydro, where there's a potential for abuse of pricing and for the benefit of people, it makes more sense to own it yourself. Just like it sometimes makes more sense for a company to run its own trucking fleet. If the trucking costs are too high by externalizing it, they'll bring it inside. So I've read articles indicating that vaccines may be with us for a long, long time. Why aren't we making our own vaccines? Why are we passing on these huge profits? When I looked at the profits for Pfizer

[00:55:00]

that increased to \$35 billion in 2022; it's an enormous amount of money to transfer to a private corporation.

The other thing we should be looking at is the history of Big Pharma. I like doing research, and one of the things I notice is that Big Pharma has paid massive fines in the past. Nobody has ever gone to jail. Even something as bad as the oxy crisis in the United States, which they estimate killed 60,000 people, the company there, Purdue pharmaceutical, the family that owns Purdue, the Sackler family, their only consequence is that they had to resign from the board of the Metropolitan Museum of Art in New York. I know that tickets to the Met Gala are hard to get, but it seems like that would be not exactly the penalty you'd expect of 60,000 people that died as a result of a product being sold. They kept about \$10 billion out of the \$18 billion that they made. When we look at Pfizer, for instance, has paid \$1 billion in fines in the past, for lying, for misrepresenting their products.

And the other element that really troubled me in all of this as a lawyer, when I looked at the self-testing aspect of the deals that were put together, can you imagine hiring a lawyer who graduated from a law school where people graded their own exams? I would expect that everybody would say—anybody graduating from such a school would say, "I was at the top of my class; I tied for first." And then just to have that law school say not only do people self-mark their exams, but instead of a three-year course, you can get it done in 90 days. So on its face—preposterous, preposterous—and yet, this is what transpired with the vaccines in terms of testing.

So when we look at the "clown deals," and again, keeping in mind how a contract normally is in the middle of the table, these are the benefits that were accrued to the vaccine makers: There were massive amounts paid to them for their R&D. All of the vaccine jab clinics were paid for by the taxpayer. All the marketing costs, all the massive advertising was paid for by you, by the taxpayer. There was massive support on air, on radio, on TV, everywhere, and censorship as well of anybody expressing a contrary point of view. The vaccine manufacturers had no liability for their product. If it didn't work, they didn't bear any of the costs. There were no outlets—like I've looked at the various health unit websites, there's nowhere to file for a vaccine injury. There's no information about how to communicate with anybody about a vaccine injury. There were mandates that were imposed that put a person at risk of holding onto their job, and I know from having talked to people who had come into my office, people with mortgages, people with families to feed, they didn't have huge savings. They were at risk, and they were subject to enormous stress and pressure as a result.

The doctors as well were placed in a position of—how would you describe it—duress, suspension of their licence if they gave a vaccine exemption certificate. I had one woman call me, she was five months pregnant. She had had two very difficult pregnancies. Her children were now eight and 10. She herself had almost died from a vaccine given to her

when she was eight years old. So here she was wondering about placing her unborn child at risk, and herself.

[01:00:00]

And the irony was that if she had wanted to have an abortion, it was my body, my choice, was the mantra. But if it was about whether or not she should take a vaccine, it was a totally different mantra.

In discussing these clown deals, and I'm being generous to call them clown deals. Because I wonder if there's an association of clowns somewhere and one of them wanted to get his driveway paved, he'd pay a certain price. But if he had a thousand other clowns who also wanted to get their driveway paved, and they said to him, "Do you think you can get us a better price?" We know he'd get a better price. So we had thousands of vaccines, millions of vaccines being purchased with no discount, no claw back, no price adjustment if they didn't work. It was all, all full price. And at different times, there were also vaccines being thrown away because they'd become outdated.

So there was a tremendous amount of waste. And, normally, in a deal, again, going back to contracts, if somebody's putting up all the money, they get stock options or they get some kind of profit sharing or they get a royalty, something for the taxpayer. Instead, we got nothing. So again, I'm probably insulting clowns to be calling these clown deals. I don't know what else to call them. Perhaps hostage deals would be close, as well, because people were feeling like they were being held hostage.

Kassy Baker

Mr. Gatien, thank you very much for everything that you've testified to today. I'm aware that we are officially out of time and I just wondered if you perhaps had another something else quite pertinent that you wanted to add and if not, I mean everything you've said has been quite—what's the word I'm looking for—not intriguing but very compelling. Do you have anything final to say or should I go to the commissioners?

Maurice Gatien

Well, I would like to just perhaps leave on this one anecdote. Because it's been difficult but, at the same time, very rewarding. I was assaulted in my office, and I'm fairly wary. This is in February; this is what caused me to walk to Ottawa. The following week, I was at the grocery store in Lancaster—it's a little town of 600 people—and I noticed that this one person was paying attention to me. They were wearing a mask, and I was kind of aware, a little bit anxious, perhaps. I paid for my groceries. I went out to the parking lot. As I was putting my groceries into my vehicle, this gentleman came running up to me and I was momentarily taken aback. But he took his mask off and he said, "Can I give you a hug?" He said "My wife almost died from the first shot. She was feeling suicidal. You don't know how important she is to me, to my children, and I just want to thank you." Moments like that made it possible for me to live with all of the things that I've had to deal with in terms of the threats and the intimidation. And people like that are to be cherished and honoured. As much as it's been a challenge, I just tell my friends I'm fine.

Kassy Baker

Are there any questions from the Commissioners?

Commissioner Kaikkonen

At the beginning of your presentation, you contrasted Trudeau Senior and Trudeau Junior. I'm going to add an extra contrast. If it was Trudeau Senior, Pierre Elliott, who was in Parliament right now, I'm quite sure that he would have wandered down here himself or at least sent some of his MPs down this way to see if any of their constituents were in the room and testifying at some point since we are in Ottawa. Seeing that it's Trudeau Junior, Justin, that's in Parliament, I would like to add that he has censored his MPs, and his MPs don't think that we're valued enough to come down the road, down the street, to see who's in the room,

[01:05:00]

whether it's some of their constituents. So there is that contrast.

The other thing, as you mentioned, the Milgram experiment. Some of us do teach at every opportunity those experiments to any youth or students that we have and have done so consistently, as well as encouraging people to take the Tri-Council Research Ethics course, which is two hours online. And what I've found is that when I speak to my colleagues and my peers as to why they don't do the same, it's because they don't think that anybody is ever going to come for them when this lets go.

I thank you for your testimony, it was very intriguing, but it was also very enlightening. I hope someone's listening that can make a difference in people's lives. Thank you very much.

Maurice Gatien

Thank you.

Kassy Baker

And I would also like to thank you on behalf of the Inquiry. Thank you very much.

[01:06:10]

Final Review and Approval: Margaret Phillips, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:

NATIONAL CITIZENS INQUIRY

EVIDENCE OTTAWA HEARINGS

**Ottawa, Ontario, Canada
May 17 to 19, 2023**

ABOUT THESE TRANSCRIPTS

The evidence offered in these transcripts is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. These hearings took place in eight Canadian cities from coast to coast from March through May 2023.

Raw transcripts were initially produced from the audio-video recordings of witness testimony and legal and commissioner questions using Open AI's Whisper speech recognition software. From May to August 2023, a team of volunteers assessed the AI transcripts against the recordings to edit, review, format, and finalize all NCI witness transcripts.

With utmost respect for the witnesses, the volunteers worked to the best of their skills and abilities to ensure that the transcripts would be as clear, accurate, and accessible as possible. Edits were made using the "intelligent verbatim" transcription method, which removes filler words and other throat-clearing, false starts, and repetitions that could distract from the testimony content.

Many testimonies were accompanied by slide show presentations or other exhibits. The NCI team recommends that transcripts be read together with the video recordings and any corresponding exhibits.

We are grateful to all our volunteers for the countless hours committed to this project, and hope that this evidence will prove to be a useful resource for many in future. For a complete library of the over 300 testimonies at the NCI, please visit our website at <https://nationalcitizensinquiry.ca>.

[00:00:00]

Shawn Buckley

Welcome to the National Citizens Inquiry as we commence our third and final day in Ottawa, the nation's capital. After actually walking across the land, this is the last of eight cities in our original vision of marching commissioners across Canada to seek the truth. I have to confess that I kind of feel like summer camp is ending. You know that feeling you get where you've participated in an activity, you had to get to know the people that you were sharing that activity with. I worked through a lot of experiences, literally trials and tribulations, and tears and laughter. There's been lots of tears, and fortunately, there's been some laughter. And we'll have a closing at the end of the day, but I just wanted to start by saying that I've been tremendously honoured to be a part of this and to stand with the people that I've had the opportunity to stand with. And I'm not just speaking about the commissioners and the volunteers, I'm speaking really about the entire nation, just all the support, all the prayers, the gratitude. It's been quite tremendous.

And so I'm going to ask: We have to decide what we're supposed to be doing. And I use the word "supposed" deliberately, not "decide" what we should do next. What are we supposed to be doing next? Because something's changed in this nation, as people have heard other Canadians speak and share their voices. And none of us know what that looks like going forward. We just know that there's been a change and we have to decide what to do in relation to that.

So let me start a little more formally. Commissioners, my name is Buckley, initial S. I'm attending this morning as agent for the Inquiry Administrator, the Honourable Ches Crosbie. I'm always asked by the volunteer staff: "please ask people to go to our website and please ask people to donate." So for those of you who aren't familiar with the National Citizens Inquiry, we're a group of volunteers and we had this vision of basically seeking the truth and having an independent inquiry where witnesses testified under oath and where Canadians were able to share their stories. And we just kind of started, and we just thought, "Well, we'll stop when we have to stop, but maybe we can make this happen." And it's only happened— And it has happened, and it's happening, and solely because you help us. And you volunteer, you support us, you encourage us, and you also support us financially. Each set of hearings costs about \$35,000. I'm confident that I can say I'm pretty sure we don't

have the money in the bank to pay for this last one, and so we would ask that you continue to contribute and donate. We've really kind of been walking by faith, literally, on this, that you would participate and support us, and we appreciate that.

So I also have another ask. I've mentioned it a couple of times, that I think one of our biggest failings is that some people that have stood up for us in the recent past are not being supported. The truckers are the first group that come to mind, but they're not the only ones. So I'm going to be asking internally in the NCI if we would consider setting a group up to identify those. So let's say we've got some truckers that they can't afford their legal costs, or the bank accounts are frozen and things like that: like, who's in need in our group? And supporting them. It's just been a very emotional ride, this NCI, as you all know. So if there are some people that feel that they would be competent and committed to be able to spend some significant amount of time helping us to organize that, if you would send a message to the NCI through their emails for my attention on that topic, it's just something that I'm going to ask them to consider supporting.

[00:05:00]

I want to give my opening this morning. We've been talking about freedom a lot, and freedom begins in the mind. And I want you to just think about that for a moment, that your freedom begins in your mind. It's not something external, it's a state of being. And freedom is an alignment with the truth. I want you to think about that, also, because we act and we react based on what we believe to be true. You're in a situation, you're going to react based on what you believe is happening. If you have been lied to, if you've been led to believe that a lie is truth, then basically you're not free to react appropriately. Your behavior has been modified and controlled because of the deception. And so true freedom depends on you understanding what is real, what is not real, what is true, what is not true.

And we all know right from wrong. We know it intuitively. I think it was in Toronto when I was speaking about this concept, I brought up— For those of you who have read C.S. Lewis's book, *Mere Christianity*, he's at one point making the case for Christianity, and one of the points that he makes is he says: regardless of the culture, regardless of the religion, basically the moral code, the ethical code is the same. It's pretty well identical. And he brings that up to bring the point up that we all know right from wrong. Intuitively there's something happening and he would say that it's God's moral code. But it is true, we all have the same sense of right and wrong.

I have been shaken by the testimony of Sheila Lewis. If you recall, she testified on the first day. She was the lady who needs an organ transplant. And she's there, she's got the oxygen tube under her nose, she's sharing her story about how, basically, even though she's redone all of her childhood vaccination schedule to be able to qualify for the organ transplant, and even though her blood has been tested and she has natural immunity to COVID, so she's got tons of antibodies to COVID, they are refusing to give her an organ transplant because she won't take the COVID vaccine. We watched her sob and just tell us she just wants to see her grandchildren grow up. She just wants to live. And we sobbed with her but not just because we empathized with her. We didn't react just because we were empathetic; we also reacted because we knew that it was wrong. Everyone listening to her testimony knew that what was happening was wrong.

She shared with us; she said what was happening was evil. She used the word, and we all saw it.

We all know right from wrong, and we all have an intuition. We call it a gut feeling. Some of us will use other terms and explain it differently. But we know things, and when I say we know things, it's not "Oh, I was taught this." There are some things we just know. And there are some points in our life where we have great clarity. And we understand things differently. We all know that slavery is wrong, that tyranny is wrong.

[00:10:00]

We watched James Corbett testify yesterday about the World Health Organization and this One Health, what he calls a pandemic treaty, although it's been labelled as something else to deceive us. And this One Health Initiative that basically would lead to just the worst type of totalitarian control, the worst type of slavery that this planet has ever seen, that the human race will have ever experienced, if it happens. That scares us, but more importantly, we understand: It's evil. There's a difference there, do you understand that? We can react going, "this scares me; I don't want to live under this tyranny." But we also understand it's evil. And the worst part of the experience, if we allow that to happen, will be that we will know that we're experiencing evil.

See, under some tyrannies, some people live really well. There's winners and losers. We can look at every police state and those that were on the right side of it did very well. We could have this form of tyranny and some of us materially, and just quality of life, might actually find it tolerable. But our gut—our gut will tell us that it's wrong and that it's evil.

I started by saying that you can't actually be free if you don't operate on truth, if you don't know the truth. I think we need to go to a basic level here today because most of us are operating under the greatest lie: that we're a body, that we're a body, that we're a material being and that's it. And we're not a body. Some people say that we have a soul and I don't disagree with that. I just think that it's a more meaningful way of communicating to not say that you have a soul. I think it's more important for you to consider that you *are* a soul, that you have a body, but that you are a soul. That you are a person who is separate from your body, and that you are a person that is separate from your mind.

We all have the experience where sometimes we're examining our thoughts, literally, where we might even ask ourselves, why did I think that? Where we're examining our mind. We have those experiences where we actually understand that we are separate from our mind. And we have those experiences where we understand that we're just occupying a body.

This is a fundamental truth that I think we need to understand if we're going to deal with our fear—which is why I'm speaking about it. If you believe that you are a body, then living for the here and now makes sense. Keeping up with the Joneses, being concerned about just **your standard of living and all of that, it makes sense, right? You've only got a limited amount of time and then it ends. Your fear of death makes a lot of sense. Because if you're just a body and they can kill your body, that's really something to be afraid of. But if you're a soul occupying a body, then the fear of death—not only does it not make sense, it's absurd.**

[00:15:00]

It's absurd. And the slavery of pursuing wealth and keeping up with the Joneses doesn't make sense.

And so I think we need to get down to the basics and understand that the biggest lie that has been perpetuated upon the Western world is that we are basically just a material being, that we are a body, that that's all we are. And our society has been structured to operate on that principle, which is why we are on a debt- and greed-based system. And it serves the state well. Because if you believe that you're a material being that ends when your body dies, then you're going to be afraid of death. They can use that fear to control you. And the fear of death is used to control us. We all experienced that over the last three years. We all bought into it. So I need you to understand that your fear of death is based on a lie, that it's not true, that you've been tricked. And you can't fix things, and you can't address your fear unless you understand that you have no reason to be afraid.

Now, I appreciate that when we are confronted with what comes next, when we are confronted with what they've planned for us coming forward, we're going to have that physical reaction. I get that when we get information that is designed to make us afraid, we have a physical reaction that we have no control over. The hormones get pumped into our bloodstream, we go into fight-and-flight mode. We are designed to basically leave that part of the brain that is used for critical thinking. But I've told you that every time you have that physical experience of fear—I mean, even if you open the garbage and there's a hornet's nest in there, like it's something that just triggers it—use that as an opportunity to go, “Okay, I'm afraid, I'm having a physical reaction, but I'm going to keep that link to my thinking mind.”

It's important for you to train your mind to remain attached to your critical thinking when we're facing fear. But it's also going to be very helpful for you to dampen your fear if you understand that you don't need to be afraid. Dying, our body dying: if, as I say, if you're just a body, it's very meaningful, but if you understand that you are a soul, dying actually is neither important nor is it meaningful.

And think about that for a second. Because we've just all been so terrified. We've all been so terrified that sometimes we feel like we don't even have any ground to stand on. But if you're a soul—and you are a soul—how is physical death meaningful? How is that important? What's important is who you are. What is meaningful is who you are at the moment you die because that's who you are when you transition. And you will know who you are, we all know who we are inside. I remember one person telling me, it was during a lecture that, you know, we have those inner thoughts: that if they could be broadcast on a movie screen for everyone in your hometown to see and watch what you really think and what you have thought, every single one of us would have to leave town. Right?

We know who we are. And it's important for us to understand who we are, so we can choose if we want to be somebody different.

[00:20:00]

But it is truly important and truly meaningful for when we transition, when we die, to be the person that we want to be. Because that's who we're going to be when we move on.

Whether you believe in the Bible or not, I shared with you yesterday—because it's a good touchstone for how we should treat each other at least—that the Bible teaches how we're going to be judged. And, you know, most people would be, “Oh, fire and brimstone.” No, it's actually— It's beautiful, isn't it, what I shared yesterday? You know, the story that Jesus is going to separate the sheep and the goats. And He's going to say to the sheep, and this is the judgment. He's going to say, you know: “When I was hungry, you fed me. When I was thirsty, you gave me a drink. When I was a stranger in your town, you took me in. When I

was naked, you clothed me. When I was sick, you took care of me.” And the Bible reports that the sheep are going to say, “Well, Jesus, we didn’t, you weren’t here. We didn’t do any of that.” And He’s going to say, “No, but when you did it to the least of these, when you did it to each other, you did it to me.”

And likewise, He’s going to judge the goats. He’s going to say, “When I was hungry, you didn’t feed me. When I was thirsty, you didn’t give me a drink. When I was a stranger, you didn’t take me in. When I was naked, you didn’t clothe me. When I was sick, you didn’t take care of me.” There’s also in there, “When I was in prison, you didn’t visit me.” And they’re going to say to Him, “Well, Jesus, we didn’t, we didn’t see you. Obviously, we didn’t, this isn’t true at all.” And He’ll say, “No, when you didn’t do it to the least of these, when you didn’t do it to each other, you didn’t do it to me.”

What a beautiful way to be judged. It’s all, did we love each other?

When you decide who you want to be when you transition, I think it would be a beautiful thing if you’re that person that loved. So I have a couple of questions. Will you be that soul that, when you leave, loved others? And will you be that soul that when you leave, you stood against the evil of tyranny and oppression? Because that’s what we’re facing.

I’m going to read that quote from François Amalega that I had read at an earlier opening. And he wrote, “I feel more free within the four walls of a jail cell with a clear conscience than I would standing outside whilst respecting the measures and collaborating with a lie.” Let me read that again: “I feel more free within the four walls of a jail cell with a clear conscience than I would standing outside whilst respecting the measures and collaborating with a lie.” François Amalega is somebody who knows he is a soul and he knows who he wants to be. Souls who want to love, who want to stand for truth, understand that that is why they’re here.

Now, I just made an important point and so I’m just going to repeat it: that souls that want to love, that want to stand for truth, they understand that is why they are here. It’s why you are here.

We’ve all felt at some point in our life that we were here for something important. That we were here to act differently. That there was something else going on and that sometimes it almost would feel like we could touch it, it was so close. And at other times, it would seem distant. And we all know, and I know it certainly happened for me, I get caught up with working,

[00:25:00]

and this and that, and taking care of kids, and you totally lose track of that feeling that we were here for something else. We lose track of that feeling that we were here for something important.

But the truth is you are here for something important. You’re here to choose who you are going to be. That’s why you’re here. And it may sound odd, but our present circumstances are a gift. Because I was expecting to go to university, get married, have kids, work, save, maybe have a retirement cottage at the lake, then retire, watch my grandkids grow up, and then have a peaceful death. And that’s not a life that makes it very clear to me why I’m here. Because I’m not here for that, I’m here to choose who I’m going to be.

But now I'm faced with a world where I see evil running wild, where I see tyranny being imposed, where I see people like Sheila Lewis sobbing because she is being the victim of pure evil. And it's clear, isn't it? Isn't it clear for all of us that we really are here to make a choice? Like it or not, we're here to make a choice. And so this is a gift, because we're not going to be confused why we're here.

And it's not all doom and gloom because the worst of times are also the best of times. You will experience the deepest friendships that you have ever experienced. You will feel peace when you look in the mirror. You will feel part of something bigger than yourself. And so, I think we need to understand that we're actually in for the best of times. It's not going to be easy. Some of us, it's really not going to be easy. But we are in for the most important and the most meaningful part of our life going forward.

And the most important thing—and the NCI has shown us this—is we're not alone. We're the majority and we stand with each other.

[00:28:32]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 3

May 19, 2023

EVIDENCE

Witness 1: Dr. Christopher Shoemaker

Full Day 3 Timestamp: 01:09:05–01:56:06

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

I now want to turn to our first witness, Dr. Chris Shoemaker. Dr. Shoemaker, can I start by asking you to state your full name for the record, spelling your first and last name?

Dr. Christopher Shoemaker

Yes. My name is Christopher Allen Shoemaker, spelling of the last name is S-H-O-E-M-A-K-E-R, and the first name Christopher, C-H-R-I-S-T-O-P-H-E-R.

Shawn Buckley

And Dr. Shoemaker, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Christopher Shoemaker

I do so.

Shawn Buckley

Now, I'm going to introduce you and I may not do justice, so if I don't, please feel free to fill in. You are a comprehensive physician in Ontario. You're a member of the College of Family Physicians of Canada. In your 45-year career since 1977, you've worked initially in emergency medicine in both Ontario and British Columbia. You later did family practice on two military bases in Ontario, assisting in the direct care of Canadian Forces members and their families. More recently, in 2020 through 2022, you worked in direct patient care at the West Ottawa COVID Care Clinic and were part of the Eastern Ontario Response Team to COVID-19. You have been an active member of the World Council for Health and their worldwide response to COVID, including therapy protocols for vaccine-induced spike injury.

And I think that that's not a bad introduction. You have been literally in the trenches as a physician for 45 years.

Dr. Christopher Shoemaker

Yes, indeed.

Shawn Buckley

I will tell those watching and the commissioners that I've entered your CV as Exhibit OT-2.

Now, you're here to discuss—really to sum it up—vaccine issues, but there's several different issues and I don't know where you want to start. Do you want to start with your thoughts on them being safe and effective or do you want to start somewhere else?

Dr. Christopher Shoemaker

Well, I think that's certainly central to everything, but as I discuss it, we will be on other topics of course over time, including sources of the vaccine and including other measures that could have been used instead of them.

To begin with, if I may, Mr. Buckley, I'd just like to introduce myself a little bit further, a little more personally to the audience and then carry forward, if I may, for at least three or four minutes.

Shawn Buckley

Sure.

Dr. Christopher Shoemaker

Thank you. Good morning, Commissioners, I'm honoured to be with you. I've observed the tremendous work that you've been doing across Canada. I was there in the room all three days that you were in Toronto and I think this is the most important activity going on in the world right now, to bring light to all of this. So thank you. And thank you, Mr. Buckley.

I like to help people. I'm a doctor, that's what I do. If I was introducing myself to you three years ago, I would have told you of my quiet practice taking care of children with difficult symptoms of Asperger's condition, anxiety, ADHD, autism spectrum, and obsessive-compulsive disorder. That's what I was doing in the last eight years of my clinical practice. But those days are behind me now.

Because of things that I learned, I had to speak to the greatest issue of childhood mortality and morbidity ever to happen in my 70 years on this planet. We were all children once. I was a child, the oldest of four. I still have a lovely sister. I had two lovely brothers who have pre-deceased me. When I was 44, my closest brother, Frederick, got pancreas cancer. And he was gone in six or seven months from having incurred that terrible, terrible illness. So, I lost my closest amigo back in 1995. But it made me reflect upon all of us.

All of us here are talking about losses of loved ones, losses of our own good health, the frailty, in a sense, of the human body. And no one thing causes our body to become frail. It can be a large truck that hits us when we don't look the right way crossing the street. And it can be a subtle little infectious organism in us that takes over and is unable to be treated.

[00:05:00]

And additionally, it can be a poisoning of some kind, something in the environment that sets things in motion that means you're going to get quite ill with an autoimmune disease of some kind against that poison.

Essentially, what we have been forced to fight here with COVID-19 is the latter, is the last of those three things. It's a subtle, purposeful immunologic poison that's been put into our bodies and for which there was a plan—a plan that I'll outline for you a little later. I would just like to say why I'm going to be using a few videos and not speaking every word neutrally and straightforwardly. It's because it's what I did.

When I learned what I learned, I felt I had to go out and speak the real truth, even if it was just independent videographers that were covering me. And so I did that. And the reason I'd like you to see some of them is that, well, it's why the College took away my licence. The College [of Physicians and Surgeons of Ontario] decided that me speaking these truths was something that they considered not compatible with me being a licensed physician in Ontario.

So if I might ask for the first video and simply to show the commissioners and yourselves what I began to say in September of 2022 when I became fully informed. Thank you.

Shawn Buckley

Sorry, we just asked the sound to be adjusted so that you're more understandable.

Dr. Christopher Shoemaker

Very good. And in a couple of seconds, we'll have this first video.

Shawn Buckley

We always have obligatory technical issues. But actually, we've done really well and our team is just excellent. So, just bear with us.

Dr. Christopher Shoemaker

Oh yeah, no worries. I'll just set it up a little further. I was at old City Hall and new City Hall of Toronto. I was meeting with anyone that would come down to see me. I stood there and kneeled there both, for 10 straight days, as a vigil for the harm to children.

The reason that I chose to do it around that time was Denmark had just cancelled all vaccines for the children on September the 1st of 2022. And they'd cancelled them because of the added risk that was perceived and known. And they were the first country to ban vaccines for those 18 and under. They did that September 1st, 2022. We're nine months since then. And our countries here on this side of the Atlantic Ocean are still suggesting, inappropriately, that these shots be given to children of any age.

[Technician in background indicates that the videos were submitted without audio.]

Shawn Buckley

Oh dear, okay. Well, that's going to change things. And we can't actually log in with the Rumble link, right?

Okay. Dr. Shoemaker, we're just going to try Plan B technically. So we'll just have you continue. You're sharing with us actually a very important point that on September 1st of 2022, a full nine months ago, the country of Denmark actually banned using COVID-19 vaccines on children. And yet here we are in Canada: literally, our governments are still pushing vaccination on children when another country has banned them, concluding that that it's too dangerous.

Dr. Christopher Shoemaker

Yeah, in Denmark, for example, a child like Sean Hartman would still be alive because even when they were giving it to children, it was not mandated. It was available, but the parent could make their own decision and their child could attend to sports and anything to do with school without the vax. It was just determined because it was an experimental vaccine, it should be the legal choice of both the child and the parent whether to get vaccinated or not.

But they took away even that aspect. They just didn't let children get it at all as of September 1st of last year.

Shawn Buckley

Okay. While we're looking for that video, can you share with us your thoughts— Because obviously, you're against vaccinating children. And can you share with us why that is?

Dr. Christopher Shoemaker

Certainly. It's because the shots are immuno-toxic to everyone that receives it, whether you're 50 or whether you're five years of age. It's worse in childhood because the children have such a strong immune system. Strong immune systems are what react to spike being inappropriately in their cells. And if your cells, your myocardial cells

[00:10:00]

are filled up with 40 trillion— And that's the number by the way, that's the number that the video I had hoped would surprise you with. Forty trillion mRNAs are in every shot you take, 40,000 billion.

There are only 80 viral entities that are in every polio shot you take. So if you get your four shots of polio over a lifetime or circumstance as a young child, you've had 320 little viral entities enter your body. Entities that are inert. Entities that can't reproduce or make more polio spike, if there was such a thing, inside you. It just won't happen. It's just the inert shell of the virus and the body can make a proper immune response to that.

And this is bad news whether you're an adult or a child. Specifically problematic for children because their innate immune system has to develop over the first 10 years. And when you give this sludge into the bodies of children, you are making your innate immune system not develop. The kind of things that keep you safe in the sandbox. The kind of things that keep you safe as a 16-year-old moving around the world, being exposed to new things. You need a strong innate immune system that has not been hijacked by an inappropriate

item put into you at age five. So that's why it was so important for it to stop in children as quickly as it did in Denmark. And that's why it's equally important that it happen here in Canada.

Shawn Buckley

Right. And so when you use the word immuno-toxic, you're meaning basically that it harms the immune system rather than helps.

Dr. Christopher Shoemaker

Yes. And if I could give you a picture of it. Everyone, we all understand transplants. We understand if someone's kidney is put into you or someone's heart is put into you, your own natural immune system would attack the heck out of that transplanted kidney or attack the heck out of that transplanted heart if the surgeons and internists didn't give a great degree of immune suppression. Very heavy drugs that would make your immune system basically go to sleep, so that that new heart or that new kidney could settle into your body.

Here's the problem with spike protein. When spike protein goes into your body, you got 30,000 billion cells in your body. You got 40,000 billion mRNAs, enough to go into every cell of your body. So they're all going in and they're all creating a flag. They are all creating the fact that your body recognizes your heart is no longer your heart; it's a transplanted heart. Your kidney is no longer your kidney; it's a transplanted kidney, the body thinks.

And that's why the body goes after it and that's why the attacks are so varied. That's why one person could be suffering massively from a hepatic or a kidney ailment and another person will have a dissection in the aorta: because the aorta is being inflamed by the attack. Or the heart, the typical one is myocarditis in children: young adolescents, male and female, getting pain and troponin elevations and all the features of myocarditis. It's because your immune system is— It's not the spike itself that's harming you, it's your immune system going after the spike that has changed the genetic image of your heart. And your body thinks it's not your heart and that's why it attacks the heck out of it. This is basic immunologic science.

The makers of this immuno-toxic vaccine knew this; they knew this for a purpose. You can't make something this damaging to humanity without doing it on purpose. That is actually my major message of my talk today. I accuse someone, I can't name them right now, but I accuse some entity of highly purposefully making things in the fashion that they did. Because it would not be as toxic as it is, it would not be so able to hijack your immune system, to kill you slowly or quickly, if it was not done purposely. It has been done purposely.

Shawn Buckley

And just so people watching your testimony understand, you use the polio vaccine as an example. And some people don't understand what a traditional vaccine is. So in the case of polio, a shot would contain 20 pieces of the polio virus that is inactive.

Dr. Christopher Shoemaker

That is correct.

Shawn Buckley

And so, we're talking 20 pieces.

Dr. Christopher Shoemaker

Eighty sorry, was the number, 80.

Shawn Buckley

Okay, 80. And then so those pieces are enough for your immune system to look at and go, "Oh, this is foreign, let's make an antibody against this." And that's how in the theory of vaccination, you would become immune.

But the COVID-19 vaccines, it's not 80 pieces. You used— How many? Like, you used the word trillion.

Dr. Christopher Shoemaker

Forty trillion. Everybody knows the trillion; governments talk about trillions of dollars all the time. But 40 trillion factories. It's factories that were sent into us, that's what a strand of mRNA is.

[00:15:00]

It's a factory and it produces whatever its product says to make. Whatever its genetic code says to make, it makes, and it makes these spike proteins and those have a life to them. Spike protein, once it's physically in a cell, is as alive as the cell, so that's very, very different.

One terribly important thing to add, and this is probably the best time to mention it. In the last three to four weeks, it has been spoken out extensively by Canada's PhD Dr. Jessica Rose and Sasha Latypova from the United States. They have made extremely clear that actually, it's one-third DNA that's in the weight of the shots and two-thirds RNA. So fine, two-thirds RNA is only 27 trillion. Meanwhile, there's 13 trillion actual DNA capsids: DNA, deoxyribonucleic acid, the kind of stuff that can get into the nucleus of your cell and change that part of you. So now not just the flag from the RNA is on the surface, there's actually changed DNA physically inside the nucleus of your many, many, cells. The reason that's there is ostensibly its poor design, poor manufacturing.

The Department of Defense in the United States, which assisted in manufacturing this, didn't care that it didn't meet vaccine standards. In fact, they did paperwork that specifically described the injection as—I don't want to use the wrong word here—a military countermeasure, a military countermeasure. They didn't call it a bioweapon, but they did call it a military countermeasure. And they specifically didn't call it a vaccine. And the reason was that if you call it a vaccine, it has to be made to vaccine standards, proper world standards for vaccines.

By calling it what they did, saying that there was an urgency to it, "We'll just call it a military countermeasure," the standards can be dropped. And so what if there's one-third as much DNA in this as there is RNA? And this happens when they stir the soup. When they make this stuff in great big kettles and cauldrons, there's going to be sludge. There's going to be the original DNA inside of a bacteria that's helped to make the RNA, but it was allowed to have inefficient and painfully, painfully almost soiled— What's going into you is

one-third DNA, two-thirds RNA, and that is the truth from Dr. Jessica Rose and Dr. Latypova, if I have the name correct. Horrible.

Shawn Buckley

While we're waiting to see if they can pull that video up, one thing that we haven't had a lot of evidence on is the effect on pregnancy and reproductive issues. But I'm getting the signal that we think the video's good to go, so we'll put that question on hold for a second and see if we can run that video now.

Dr. Christopher Shoemaker

Thank you.

[Video plays briefly, is still inaudible.]

Shawn Buckley

Oh, okay, so we're going to be out of luck on that.

Dr. Christopher Shoemaker

Would that be the case for all of the videos or just this particular one?

Shawn Buckley

David, do you want to check with the other ones that we had done last night? We apologize for those, Dr Shoemaker. We did ask our team to download those videos from the links you sent.

Dr. Christopher Shoemaker

No need to worry. We'll just go ahead as you're saying.

Shawn Buckley

So, I was kind of switching gears because one of the areas that we haven't had much evidence on is effect on pregnancy and potential effect on reproduction And I know that you have some thoughts on that and you've looked into that.

Dr. Christopher Shoemaker

Yes, indeed. Pregnancy. The Golden Rule of pregnancy: never use an unproven drug in pregnancy and never vaccinate in pregnancy. Never. Somehow "never" went away; "never" went away during COVID. That golden rule was broken. The last people that should get new drugs, unproven drugs, or vaccines should be pregnant women and the fetus inside them. They should be 10, 15 years out if you've got a wonderful new vaccine to use.

Polio would not have been given to pregnant mothers in the early days—not a chance—and actually has been discouraged ever since.

You don't vaccinate pregnant mothers. It's medical malpractice. Why have we allowed ourselves to do a medical malpractice, ostensibly recommending it?

[00:20:00]

And what has been the result? What has been the result? Well, Pfizer knew the results just as things were rolling out. They did a post-marketing analysis. And in their post-marketing analysis, there was a specific— There was about 300 people that they didn't tell you what happened to the other 270 or so. They didn't give the answer back. But they did give the answer for 29 pregnant mothers. And the 29 pregnant mothers that they gave the answer to, what happened to the pregnancy?

And it's published; it's part of the 75,000 pages of Pfizer data. And the published data by Pfizer showed that of the 29 pregnancies that they were willing to say what the results were (and the others that they hid), 28 out of 29 lost the pregnancy. A horrific number. Ninety-seven per cent of the fetuses were lost of those 29 that they were willing to tell us about. Of course, they weren't really willing to tell us about it because they thought that these data would be hidden for 75 years.

But the truth, when Dr. Naomi Wolf and others got to the truth, is that this cache of dear families who lost the ability to have this child in a ratio like that, 97 per cent in that group lost. The actual real-world data, the real-world data where it's really being spoken of and proven: hospital systems in Florida, hospital systems in other parts of the States that are being honest about it show that 50 to 67 per cent of pregnancies— Where the woman has received the vaccine while pregnant, 50 to 67 per cent of those pregnancies are lost, either early or late.

Incredible numbers. Anyone in the obstetrical units really knows the truth. They've seen stillbirth numbers that are obscene. They've seen early pregnancy losses, extra bleeding, spontaneous bleedings, and spontaneous abortion losses that have happened that are obscene numbers. And this is what happens when you break the Golden Rule of pregnancy. You never break the Golden Rule of pregnancy. Do not vaccinate—and especially do not vaccinate with a toxic spike protein into a viable human who's only this big.

A little viable human that's only this big and nanoparticles take the toxic stuff across through the placenta and into the cord and into the baby and into the baby's brain. And the mother received the shot when the baby was three months old inside her body because society was telling her, "That's the way you can protect yourself. That's the way you can protect grandma. You just do it too."

We were lied to. We were lied to. We didn't know if it was safe or not. We now know absolutely that it's not safe. And one of the biggest evidence that it's not safe was in this highly risked population: mothers and the children within them.

Shawn Buckley

I just want to make sure that people understand: so you're talking about the Pfizer data. This is the data that Pfizer would have submitted to the Food and Drug Administration in the United States to get their so-called emergency authorization and that Pfizer didn't want that disclosed to the public. There actually was a fight in court for it to become publicly available. And that's kind of your first clue, there's a problem. But now there's a team of doctors and scientists that I understand—I mean, it's thousands analyzing this data. And so this is actually Pfizer's own data that they record. There're 300 females in pregnancy that get the shot, but they don't report on 271 of those. They only report on 29.

Dr. Christopher Shoemaker

And those 29 were of the ratio of loss that I just described to you. Virtually, the vaccine functioned more efficiently as an abortogenic drug than RU-82.

Shawn Buckley

Okay. And then when you're talking about states like Florida, this is government data reporting basically a stillbirth rate of 50 to 60 per cent in mothers that are taking the vaccine during pregnancy.

Dr. Christopher Shoemaker

Again, I will say that, yes, that's government data and information from actual individual hospital boards and circumstances taken into totality. Yes.

Shawn Buckley

Now, I believe we have your video up, so we're going to try again.

[VIDEO plays but is barely audible. Dr. Shoemaker's videos are available on the NCI website as Exhibits OT-2a, OT-2b, OT-2c, OT-2h, OT-2i, OT-2j, and OT-2k.]

Dr. Christopher Shoemaker

To be honest, I think we could drop this video. I think we've touched the points that are on this. The key point ladies and gentlemen

[00:25:00]

is that skilled immunologists, skilled virologists, skilled pathologists have stated that the 100 micrograms of RNA and DNA combined—100 micrograms, the weight of a thyroid pill—is enough for 40 trillion virtually weightless mRNAs. These extremely small, have of course minuscule weight. You don't need tons of it. You just need 100 micrograms. And 100 micrograms is 40,000 billion viral entities. It's on their labelling. They say on the label how much is going into you. And that is how much is going into us every three to six months, if we keep listening to the morons above us.

Shawn Buckley

Now one of the things that we've been told when we're being told to take this vaccine is that we should really take one for the team. So that, and you already used the example for a pregnant mother, "Take one so grandma doesn't get sick." The whole idea is, at least as communicated, that we're supposed to take these vaccines so that we're protecting others: we're not catching COVID and we're not transmitting COVID.

And I'm wondering if you can share with us whether that is truthful messaging or false messaging—what your thoughts on that are.

Dr. Christopher Shoemaker

Well, very good. Just as I begin, could I ask David to see if he can bring up slide two and perhaps put it in the background on the screen? If what we call slide two, that's in the bar

graph with the angled look [Exhibit OT-2e], that would be the one. If that can be brought up onto the screen it will allow me to speak to your question. Very good.

So the topic is—Are we protecting others, are we reducing infection in ourselves, is the vaccine working? This is from the Cleveland Clinic, which is a group of five or six hospitals in Cleveland. It has 40,000 staff—40,000 staff in this huge hospital system. In September of 2022, for 90 straight days, they followed the symptomatology of all 40,000 staff at the Cleveland Clinic.

The black line at the bottom that starts at zero cases and wanders its way up to a fairly low number—I won't try to quote it right now, but that's the unvaccinated staff. Unvaccinated staff at the Cleveland Clinic had very, very, very little, low numbers of COVID events in themselves. Each line above it is more and more vaccinations. The red line was one shot, the green line was having had two shots, the purple line above that was having had three shots, and the pale orange line at the top was having had four or five shots.

So they had a spectrum of numbers of shots that people had taken who worked in the clinic. And in an absolutely arithmetic progressive way, you went from whatever was the rate for the unvaccinated—very modest down there at the bottom right—it was doubled and tripled and 3.5. Once you'd had four shots you were 3.5 times, as a staff member, more likely to be carrying COVID, having COVID, passing it on to patients, having positive PCR tests, getting sick, going to the ICU. Every factor went up by a factor of 3.5 when you were highly vaccinated.

If you were left alone— And they did have 8,000 staff who worked unvaccinated in the hospital. And don't you dare blame them that they were somehow the source of all this; forget it, they weren't. They were healthy. They had the least amount of time off for illness themselves. They were like most unvaccinated people. They had an innate immunity. They weren't having COVID nearly as long as their colleagues.

And this 3.5 to 1 ratio: being more likely to transmit it to granny, more likely to transmit it to the patient, more likely to transmit it within your own family the more vaccinated you got. This is settled science now, ladies and gentlemen. It's settled science that the more you get vaccinated with this non-vaccine—and it is a non-vaccine—the sicker you are and will be of many diseases, but especially sicker when it comes to COVID itself.

Shawn Buckley

It's just interesting that you had to add "and don't say that the unvaccinated were causing this." Because one thing I've never been able to get my mind around with all the hysteria to force people to take the vaccination, is that, well, logically, if the vaccine worked, if it protected you from getting COVID, then why would you care if anyone else is vaccinated? You could be the only one in the herd and you shouldn't care—if it works, right?

[00:30:00]

It's just interesting that you added that. So when we're being told the vaccine is effective, "effective" means, at least in the public mind, "Well, I'm less likely to catch COVID and transmit COVID, if I get vaccinated." But the truth is it's really negative efficacy: So with each shot, you're more likely to catch COVID and hence more likely to spread COVID than if you hadn't had any shots.

Dr. Christopher Shoemaker

That is exactly what we have learned and found. And what we learned and found was enough to turn everything off in September of 2021. In September of 2021, these data—not from the Cleveland Clinic but from other sources—were beginning to show up. And they absolutely knew before they started giving it to children. And they absolutely knew before they moved into mandates in 2021, September. It was absolutely known that this was the trend. The vaccine was not working as a vaccine. It was doing zero to prevent you from getting COVID.

A true vaccine means—forget about symptom-lowering—a true vaccine means you don't get the disease. When you get a rabies vaccine, is the dog or cat expected to get rabies? No, not at all. It's supposed to be totally 100 per cent effective. And this is negatively effective. It makes you more likely to get the disease. It's tragic. We'll move on to other things, but that's the best I can describe it.

Shawn Buckley

Let's move on to other things. Which topic would you like to cover next?

Dr. Christopher Shoemaker

I guess just briefly to ask, would any of the videos be available, or basically not? Okay, that's fine. Okay, so I'll just speak to one topic that I was going to be speaking on. On two short videos that were connected. And that topic is: Who made this and why?

In its origins, it originated when Dr. Fauci was told by Barack Obama, President of the United States, "Do not do gain of lethality research anywhere. It's too dangerous." The year was 2014. The year was 2014, Dr. Fauci was told, "Do not do this kind of research anywhere." He specifically went around what the president told him. He specifically went to the military within the U.S. and asked if they could do it. They were incredulous. They said, "What are you coming here for? You know that you've been told by the President not to do it. You can't do it. You won't do it under our aegis. You won't be doing it anywhere, Dr. Fauci." So that was the second time he was told, "Do not do this."

He went around them. He took it to EcoHealth Alliance. He took it to Peter Daszak. He said, "Peter, this sucker that I got working with Dr. Baric out of North Carolina, we really want to do gain of lethality research on coronaviruses. Could you take it over to Wuhan? Could you generate it there?" They exchanged emails over those three or four years as it was being worked on initially. And then in December of 2015, after knowingly for one year working in Wuhan to create something that was perhaps dangerous or toxic or testable, whatever the ostensible purpose was, they exchanged a final email where Peter Daszak said, "We've got it."

And what "we've got it" meant was that they had an impressive improvement in lethality of the coronavirus with the genetic genomes that we're now also familiar with.

And what happened after 2015 is that those same genomes were brought back to the States. Because, of course, it was to a degree a U.S. product and they wanted any vaccine that was related to this genetic genome to be produced in the United States. And so it was worked on in the United States for the next three years. Between 2016 and 2018-19, during those three years, they continued in Wuhan to make whatever it was that could be released in an aerosolized form or a fashion that was going to create a version of flu. That was happening over there.

Meanwhile in the U.S., Fauci, Baric and now at that point, the U.S. Department of Defense, which was cooperating with them—those three entities had the vax being worked on at the ready. So, it was not Operation Warp Speed that just started suddenly in 2019-20 to get a vaccine within a year. No. The purposefully damaging non-vaccine was being worked on for four years, between 2015 and 2019. Maliciously worked on because everybody who was in the real know about this—Pfizer, Moderna, and especially the U.S. Department of Defense knew that they were creating something that if it went into the human body would harm the human body

[00:35:00]

and would make it more likely to have that tragic immune reactivity that I talked about 12 minutes ago. So there it was, not Warp Speed [but] a three-year program to make a dangerous immune-damaging and, basically, body-damaging shot.

What their reasons were, I'll have a comment at the end as to what I think the entity really is. It isn't just Fauci, it isn't just the Department of Defense. There is a different entity that's actually in charge of all of this, and I'll share that at the end of my talk.

Shawn Buckley

And just by way of timing, we've got about nine and a half minutes left. I want to allow time for commissioners to ask you questions also because I anticipate there's going to be some of those. What I'd like to do is ask you a specific question and then have you go into what you were just speaking about.

But you had sent me some notes about these lipid nanoparticles that surround these RNA and DNA packages. And I want you to comment on those and what happened to the animals that were tested. Because I think people need to understand what they knew before they rolled out this program.

Dr. Christopher Shoemaker

And can I just ask is the microphone adequate for the room? Is it okay? Okay.

Lipid nanoparticles, LNPs. RNA or DNA cannot move from place to place unless it's got a little vehicle to travel in and this vehicle was invented by a Canadian company. The company was Acuitas [Therapeutics] out of British Columbia. And neither Pfizer, Moderna, nor the U.S. Department of Defense would have been able to use any of these carriers—lipid nanoparticles or plasmids, which is another version of it. They would not have been able to use either of them to carry RNA or DNA into the human body unless they paid a **royalty to Acuitas. Acuitas has been paid. Acuitas continues to get paid. It gets lots and lots and lots and billions and billions of dollars for their intellectual property.**

Sadly, when these lipid nanoparticles were tested for danger and for safety with no RNA in it, with no DNA in it, just to see, what does it really do to animals, can it be used liberally? All the animals died. All the animals. They're a lot smaller than humans, but they died, a hundred percent. Because the LNPs were going to their brains. It would go into their hearts, it would go into their kidneys, it would go into their ovaries. Within a few days, every animal given LNPs was deceased.

Therefore, we are using a carrier that is known to be lethal on some level. And we're using it without, certainly, having proved its true safety in humans because we sure as heck

didn't prove its safety in animals. And it doesn't matter the names attached to the invention of this.

The fact is that the science and Dr. Roger Hodkinson showed it. Roger Hodkinson has told us about the hundred-fold elevation of density in the ovaries compared to the body in general. These lipid nanoparticles are good at crossing two or three barriers in particular. They go across the ovary barrier and the testes barrier into the reproductive system, massively, and they go across the brain barrier into all structures of the brain, massively.

Do they go anywhere else with some degree? Well of course they do. We have a blood system and the blood system can take these lipid nanoparticles to heart and to liver and to other areas of body, of course. But the highest density—the three places, our genetic productive system of ovaries and testicles and our brain cognitive system—and that's what LNPs do. They are toxic to those areas even with nothing in them and they sure as heck are toxic when they're carrying spike or the mRNA/DNA to create spike.

Shawn Buckley

And I'll just ask, because we've got six minutes left, if you want to switch to— There was something that you wanted to make sure was covered.

Dr. Christopher Shoemaker

Oh, thank you. Actually, it's on this general topic that we're into, as it were, right now. Just give me a moment to collect my thoughts. Because we've had quite a different presentation than we originally thought.

So, how could it go well? Lies after lies with people not taking direction from the people who, in a true chain of command, should have had control over them.

[00:40:00]

President Obama should have had a true control over this rogue, Dr. Fauci. He just didn't. Dr. Fauci did what he did. Certain people had Dr. Fauci's ear. And this is why I would like to give a name to this "they" that we talk about. "They" do this, "they" do that. We never know who "they" is. Well, I'm going to give them a name. They are the unelected-people-control-entity. Unelected-people-control-group or -entity. The unelected-person-control-group or -entity. That entity clearly exists because that entity is above the U.S. Department of Defense. That entity is above any specific prime minister that we have in this country.

That entity has arms and tentacles. That entity is the World Economic Forum. That entity is the WHO [World Health Organization]. And that entity is the Bill and Melinda Gates Foundation. And that is the entity that is driving, and has always driven, this malicious creation of a toxic agent to go into humanity. So to that entity I say, "We don't know you right down to the core puzzle who you are, but we've got a pretty good picture. We know who could have had massive influence and financing and assist to this program. A program that had no scientific merit, zero scientific merit, and has had massive scientific human negative effect."

So to the UPCE, the unelected-person-control-entity, I say to you, "Shame on you. Shame on you." We people who had to yell and scream in our speeches, the dear people who have been at this table talking about the hemorrhagic events happening to them after a shot, or after shedding, or the deceased child that they mourn for. The ladies who spoke of their

mother who died within 10 minutes of getting a COVID shot in the pharmacy in Saskatchewan.

I mean, every one of these cases have a source. And the source in the true, true sense of the word is the unelected-person-control-entity.

And it's time for the world to march in the streets. It's time for the world to realize this is not just a medical problem. It is a medical problem: fifty million extra deaths a year is a medical problem. And that's what the numbers are showing. Numbers out of Germany, numbers out of the U.S., numbers out of the United Kingdom just in the last week showing that all-cause mortality elevation is creeping up every month, another few percentage points higher. So if it's 45 per cent or 100 per cent more than it should be now, well, it's going to go to 200 per cent; it's going to 300 per cent; it's going to go to 400 per cent. These are slow, immune, toxic, lethal shots. I call on the world to stop them. And that I think, is where I'll end.

Shawn Buckley

Thank you, Doctor. So Commissioners, we only have two minutes left for questions because we do have to be tight. Are there any questions?

And there being no questions, Dr. Shoemaker, I apologize that we had technical difficulties. It was not for lack of trying on our team.

Despite that I can assure you, you gave some really valuable testimony to us and shared some very important things we hadn't heard specifically. Some things come to mind about the sheer numbers and about the animal deaths and your contribution on the pregnancy thing was information that we were lacking. So I'm just telling you that you've made a valuable contribution.

Dr. Christopher Shoemaker

Absolutely Shawn. And if I could just take 60 seconds then just to conclude if I may.

Shawn Buckley

Yes.

Dr. Christopher Shoemaker

We talked about numbers in animal labs and why lipid nanoparticles with royalties in Canada should never have been used for anything. And they should now never be used to go into pork or cows or anything in the world. They just shouldn't be. We should get real about this.

And it does have a Canadian aspect to it. This company, Acuitas, and the foundations that supported it: I invite people to look very carefully at which foundations, a foundation, that specifically profited from backing Acuitas and continues to profit with every shot. I leave it to lawyers and RCMP folks to look into who supported this nefarious research and ultimately nefarious research in Canada.

Shawn Buckley

And Dr. Shoemaker, I just want one more comment from you.

[00:45:00]

Because, according to worldfamilydoctorday.org, today is World [Family]Doctor Day. And I would ask, what message you would send to the doctors of the world today, May 19th, 2023?

Dr. Christopher Shoemaker

Well, on World Doctors Day, I send to my colleagues, and we are colleagues—

My medical school graduation was 1975. My first days in clinical practice, post internship and residency were in 1977. We've all been working at this for a while and many of us for fewer years. We should take pride in looking at real science. We should take pride at protecting the true health of our patients. This is tough to look at. It's tough to point and say, "The emperor has no clothes." It's tough to say that the people above us, the medical agencies above us, have been fooled into advising us incorrectly. But their advice to not speak on these topics, to have us not speak on this topic, was illogical advice and it was advice that they were tricked into.

So dear doctors of the world, let's none of us be trapped. Let's none of us be tricked. We are tricked no more. We will help the human population. We will refuse to put these shots into our shoulders. We'll refuse, like Denmark did. And Denmark, by the way, bans it now for adults as well. Things have moved along. Denmark now bans it for just about everybody in their country to get these shots. So let's ban it for ourselves. Ban it for ourselves by taking back our shoulders, taking back the recommendations, doctors.

We know that it's creating turbo cancers in patients. We know it. There're other slides I would have showed you of cancers just exploding in people because they've had a shot [Exhibit OT-2f]. Their MRI goes from looking pretty neutral and 10 days after the shot, their whole body is blacked out with metastasis because it's 10 days after they just received this death vax.

So that is my message to my fellow doctors of the world. Again, thank you to the NCI.

Shawn Buckley

Thank you, Dr. Shoemaker. On behalf of the National Citizens Inquiry, we sincerely thank you for coming to testify.

[00:47:39]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 2: Melanie Alexander

Full Day 3 Timestamp: 01:57:12–02:12:48

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Wayne Lenhardt

Could you give us your first and last names and spell them for us, please? And then I'll do an oath with you.

Melanie Alexander

My name is Melanie Alexander and it's spelled M-E-L-A-N-I-E A-L-E-X-A-N-D-E-R.

Wayne Lenhardt

And do you promise that the evidence you give today will be the truth, the whole truth, and nothing but the truth?

Melanie Alexander

I do.

Wayne Lenhardt

I think as you've just heard, we have some fairly strict timelines today. So I think what I'd like to do is do a timeline on your husband, and then we can come back and discuss it.

I'll lead you a bit here if I might. In March of 2020, your husband was diagnosed with cancer, correct?

Melanie Alexander

Yes.

Wayne Lenhardt

And he received treatment. And by November of 2020, he had gone into remission.

Melanie Alexander

That's correct.

Wayne Lenhardt

In June of 2021, he got the first dose of the Pfizer vaccine, correct?

Melanie Alexander

Yes.

Wayne Lenhardt

And this was in the Ottawa General Hospital?

Melanie Alexander

Yes.

Wayne Lenhardt

There was no reaction at that point to the vaccine.

Melanie Alexander

None at all.

Wayne Lenhardt

Then in November of 2021, you both came down with the Delta variant, correct?

Melanie Alexander

Yes.

Wayne Lenhardt

Okay. And you're both sick. Your husband ended up in the hospital for three months at that point.

At that point, you weren't able to see him because of the restrictions because you weren't so-called "vaccinated."

Melanie Alexander

That's right.

Wayne Lenhardt

That was in 2021. In February of 2022, your husband was discharged from the hospital. Then in March—11th to the 30th—he was back in the hospital. Then on, perhaps you can help me with the timeline here, April the 16th, he was back into the hospital.

Melanie Alexander

Yes.

Wayne Lenhardt

April the 18th. And that would have been 2022. Correct?

Melanie Alexander

Yes.

Wayne Lenhardt

April the 18th, your husband was back in the hospital. But they wanted him to test for COVID, which finally happened. After that, they moved him to a COVID ward where another patient that was ill was put into his room.

April the 20th, he got very ill. And he passed away shortly after that, correct?

Melanie Alexander

Correct.

Wayne Alexander

Okay. So perhaps you could tell me, then, what type of treatment and how it went during that journey?

Melanie Alexander

Greg— When he went back on the 16th of April, they wanted to do a COVID test right away. And he declined that. On the Sunday, the next day, he also declined a COVID test. But on the Monday, he received a COVID test. And when I asked him about it, I said, "How did that happen?" And he said, "I'd rather not talk about it." That test came back at midnight on that same day. Positive.

They woke him up in the middle of the night. He was a sick man. He had chronically damaged lungs and his body had been very dependent on prednisone. So every time they tried to reduce his prednisone, he had a setback and his breathing would get worse. But anyway, they woke him up in the middle of the night after midnight and said, "You have COVID, and we're taking you to the COVID ward." And he tried to advocate. He said, "No." He says, "I don't have COVID. I've had COVID before and I know what it's like and I don't have COVID. You're doing this against my wishes." But they took him to the COVID ward anyway. And it was a double room. And they put him in the room by himself, which was fine; he was okay with that.

But early the next morning, they wheeled in a lady who had been at home and had broken her hip. She was an elderly lady. And she explained to him that she and her whole family had been quarantining because of Omicron and they were quite sick with Omicron. So this caused Greg great distress because he knew that he could never survive a reinfection. He asked his nurse more than once. And it's actually recorded in his medical records that he wants to be discharged because he doesn't feel safe in the hospital.

When he told me about it, I said, "Call me when the doctor comes in and I'll try and talk to the doctor."

[00:05:00]

So he did that. It was before lunch. The doctor came in and I asked the doctor, I said, "What are you doing bringing a symptomatic patient into my husband's room? He's immuno-compromised because of his cancer, but he also has chronic damage to his lungs. He's very vulnerable." I said to the doctor, "You're standing here with your N95, your face shield, your gown, and your gloves. And yet you're leaving my husband unprotected." I said, "Please get my husband out of this room with this sick patient."

He said to me, "You make a good point, and I'll see what I can do." That doctor didn't do anything. My husband stayed in that room for 24 hours.

There was a very marked change in Greg's health condition on Wednesday morning. Instead of a temperature of 36 degrees, his temperature was above 39. Greg had been on four litres of oxygen. They tried giving him 10 litres of oxygen through the nasal prongs and it wasn't sufficient; they were trying to do damage control. They had to put him on the next level of humidified oxygen at 92 per cent plus a rebreather on top of 100 per cent. Greg had almost 200 per cent oxygen to try and be stabilized. They did put him in a private room on this Wednesday and they were doing damage control all day long.

On Thursday morning, they took him to the ICU [Intensive Care Unit]. Greg spent seven days in the ICU and then he died.

Wayne Lenhardt

I take it the questions that arise are first of all, he was immunocompromised because of all of his cancer treatment, so by putting him in with someone with an active case of Delta or whatever it was, that really is a serious issue, in that if he gets it, being immuno-compromised—

Melanie Alexander

Correct and if I could just say something. Greg had Delta in November, and we are talking about April of 2022 when Omicron is the variant of the day in our society. Everyone had Omicron. And so when Greg tested positive on that late Monday night, Greg and I asked the doctors— We asked the hospital to analyse his COVID test to find out what variant he tested positive for.

Well, the result came back that he tested positive for Delta, which suggests that he did not have Omicron at the time. So he didn't have COVID when they took him to the COVID ward. He didn't have Omicron, and yet they brought a sick person who was symptomatic into his room.

Wayne Lenhardt

And I assume you were not able to even visit him because you were not classified as quote "fully vaccinated" at the time.

Melanie Alexander

That's correct. Do you mind if I explain a little bit about that? Is that okay?

Wayne Lenhardt

Sure.

Melanie Alexander

So we had started our ordeal with the hospital and with COVID— It was COVID that was really hard on us. It had been five months by the time Greg died. I found out in January that patient advocacy and the ombudsman have no authority. They totally defer any decision to be made to the nurse manager on each floor. So I had found that out in January already. So when Greg went to the ICU, I left. I called his nurse every single day, numerous times a day saying, "Please let me see my husband. I need to be with him, he's very sick. Please leave a message for your nurse manager telling her that I want to come in and be with Greg." They assured me they'd leave a message for the nurse manager. I asked the ICU doctor as well, "Please advocate for me, please ask the nurse manager for permission for me to come in and be with my husband."

We had been married 34 years and we'd done life together. And now he was dying slowly and painfully, and they were not allowing me to be in because I only had one shot. I also left messages on the nurse manager's voicemail pleading in tears saying, "Please let me be with him."

As the week progressed, Greg got worse. They had to put a feeding tube in his nose and he couldn't Facetime me anymore; he wasn't strong enough to hold the phone.

I remember, one day I messaged him. I said, "I just need to hear from you to know that you're doing okay. Please let me know." And I got two words back from him in a text; he said, "Call nurse." He couldn't call me; he couldn't speak to me. So eventually I got a phone call back on Wednesday morning, the 27th of April, from the nurse manager. She said to me "I'm not allowing you into the hospital for two reasons. Firstly, because you're not vaccinated and that is the hospital policy and I'm upholding the policy.

[00:10:00]

Secondly," she said, "I've gone to and spoken to your husband's nurse. I've looked at his chart and I've looked into his case. And he's not palliative at this moment, so we're not allowing you to come in."

How can that possibly be that he was not palliative? It was barely 12 hours later I was called by the doctor on duty in the night, at about three in the morning. So just the same day, I was called by the doctor on duty saying, "Your husband is asking for comfort measures because he cannot take it anymore. He's suffering, he's gasping for breath, and he's exhausted. And he wants comfort measures. We explained to him that if we give him comfort measures, he's going to die. And he's okay with that because he's so exhausted, he can't keep battling to breathe. But he's very concerned about you and he wanted me to call you and tell you that this is his choice, that he's choosing this." And I must be okay with this.

The doctor called to Greg and said, "Greg, is this your choice, to have comfort measures?" And I heard Greg shout out, "Yes, it is my choice."

I resent enormously that I wasn't allowed to be there with my husband these last seven days in the hospital as he's suffering and dying. And he was definitely palliative, on a feeding tube, not able to even hold a telephone. I resent that I wasn't able to be with him.

But I have a bigger question for the hospital. I have a bigger question. My question is, how can they explain to me what protocol or what policy justifies them bringing a symptomatic patient, someone who's already so compromised, into his room? Even if they believed that he had COVID because of that test, even if they actually believed he had COVID—which he didn't; we found out afterwards that he didn't have COVID; he didn't have Omicron—how do they justify bringing a symptomatic patient into his room and not protecting him?

I believe—this was Greg's third admission to the hospital—that he was seen as a drain on the system. He was costing too much. I actually found a text from a friend yesterday. She was a friend. She wrote a text to me on January the 31st last year. And she said to me, "Melanie, love you to bits, but you really have your head in the sand. Thousands of dollars have been spent keeping Greg alive. I work in healthcare and have seen firsthand the effect of non-vaccinated people. People can't come to church out of fear of getting sick because of the unvaccinated."

To be in the hospital in 2021 and 2022 was a horrendous situation for an unvaccinated person. The hatred, the animosity, the anger was very real. Greg never felt safe in the hospital. In January he was receiving terrible care. And I was getting very upset about it. I said "Greg, I need to complain. I need to ask for better care." He said, "No, Mel," he said, "Don't complain. I do not want to raise the ire of the medical staff any more than they already feel toward me." He didn't want me to complain because he felt at their mercy.

It was a terrible time to be in the hospital as an unvaccinated person. And I do question the hospital, how they justify putting a sick person in my husband's room.

Wayne Lenhardt

I'm being reminded of the time. But let me perhaps fill in a couple more facts and then we'll ask the commissioners if they have any questions.

It was back in November of 2021 where both you and your husband, you think, came down with the Delta variant. And you recovered from it in November 2021. When your husband went back into the hospital in April of the following year it related to, apparently, the prednisone that he was taking, which was part of the cancer therapy. And you had been told to reduce that over time. And his oxygen level had gone down to 88 at that point, which is why you had him in the hospital. It wasn't because he had COVID.

Melanie Alexander

That's correct. During his COVID illness, it wasn't a cancer treatment. Greg was totally in remission. He had been declared in remission in November of 2020. But to treat his COVID, he was given a high dose of prednisone and his body had become quite dependent on it. And the goal of the medical staff was to reduce the prednisone, so I had been told to reduce it at home.

And with the reduction, each day his oxygen levels got lower and lower. And that is why he went to the hospital. He didn't have a fever. He didn't have a cold. He didn't have a sore throat, no cough, no symptoms. And that's why he declined the COVID test.

Wayne Lenhardt

Okay. I'm going to ask the commissioners if they have any questions.

No questions? I think our time is essentially up.

On behalf of the National Citizens Inquiry, I want to thank you very much for coming and giving your testimony.

Melanie Alexander

Thank you for having me.

[00:15:36]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 3: Dr. Kyle Grice

Full Day 3 Timestamp: 02:14:14–02:37:17

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Kassy Baker

First things first. Mr. Grice, can I please have you state and spell your name for the record?

Dr. Kyle Grice

It's Kyle Grice, K-Y-L-E G-R-I-C-E.

Kassy Baker

Now do you promise that you will tell the truth, the whole truth, and nothing but the truth during your testimony here with us this afternoon?

Dr. Kyle Grice

I do.

Kassy Baker

Very good. Now I understand that you are here to speak to us about community response. It's a bit of a, hopefully, more optimistic look towards the future than we have sometimes been hearing about during the Inquiry.

Can you begin by just telling us a little bit about yourself? Where are you from? Are you married?

Dr. Kyle Grice

Yes. I'm from Milton, Ontario. And my family is there; two teenage boys and my wife live there. I'm a chiropractor in Toronto. I have a family practice there with my sister.

Kassy Baker
And that's you.

So just to clarify: you are a chiropractor, but you are actually not here speaking as a chiropractor or on behalf of the chiropractic community, is that correct?

Dr. Kyle Grice
That's correct, yes. This is more about my community engagement and some of the endeavors that have happened from that community engagement.

Kassy Baker
Very good. With that introduction, if you would like to start your slide presentation, I believe that we're ready.

Dr. Kyle Grice
I'm not going to start it yet because I was asked to actually tell the story of how I got to being involved in the community.

And what inspired me was actually the harms that I was seeing.

I was seeing harms in my family. My father had an injury in 2016 and became a quadriplegic. From that time, he worked like an Olympian to regain his mobility. And he had limited mobility, but he was able to walk. And he had a safe place to walk and that was in his community centre. It was a flat, open track, and he would call me up and say, "Hey, son, I did two laps today without having to sit." In 2020, he was continuing to improve his mobility and his function. And with lockdowns, they closed that community centre.

With closing that— It was the only safe place for him with his walker to walk. And there was a significant, rapid decline, as an 84-year-old man, in his capacity to walk. To this day now he has such trouble, he can barely transition from his chair to his chair. He's not able to regain the function that he lost because of that.

My wife's mother developed breast cancer in the spring of 2021. She had successful surgery to remove the cancer and was instructed to have radiation therapy. Because of COVID measures, there was improper follow-up to her radiation. And what ensued was the burning of her left lung and her left heart from the radiation. This caused her to have to be hospitalized for this. And the nine days that she was alone in hospital, with difficulty breathing and hearing impaired, it was hell for her. She would call my wife every night **crying, not knowing what was going on with her, not understanding what was happening, and just wondering when she could come to the hospital. When my wife did finally get to see her— The decline in her health was significant when she did eventually get to see her. She did succumb eventually to those injuries from the radiation.**

There were also dozens and dozens of stories that we were getting in our practice from patients, just revealing what they were experiencing and the stresses they were going through because of the COVID response. We were helping them through that as best we can.

One such gentleman I remember, a married father of two, lost his job because of his choice. And he said, "I'm okay about that." But I realized he wasn't. He was recognizing the greater picture of what was going on

[00:05:00]

and he was significantly stressed. This man—from the beginning when I met him: healthy, strong, he was a wrestler—declined significantly in that year. He lost body weight, lost lean body mass; he developed a bowel disorder, it seemed like it was an inflammatory bowel disorder from the stress. That has yet to be diagnosed, but there was a significant decline in his health.

We all heard stories like this; we just got repeated stories. My life's work has been about helping people. I've dedicated my life to helping people. And when I was seeing this go on, it compelled me to get more involved. That's when I started to get involved in the community. I was hearing of these meetings that were going on all over Ontario. And I started attending these meetings.

And if I could start the slide show now [no exhibit number available].

It was quite amazing, actually. People were coming together because of COVID response. These were people who lost relationships: they lost relationships with their family; they lost relationships with their friends; they lost their ability to socialize in the establishments that they could once go to. They lost their ability to go to their churches. They were, in essence, excluded from society.

When they were coming together and I was meeting with them, the fear that I had with these people, that I felt from these people and heard: they were talking about what was in the news—with perhaps the loss of healthcare that they might have, that was put through the news. These people got afraid of that. They thought, they've been shut out of all these other establishments, what if they shut us out of the grocery store? This is what these community people were feeling.

And what they started to do was they started to come together. They found a place to socialize. Because society excluded them, they came together through this network of support. They started to develop solutions of, "Where will we get our healthcare if they take that away? Where will we get our food if they take that away?" They started making connections to local farmers and getting these food hubs organized. And it was amazing because, in essence, they were building community.

In one of these meetings, I met Dr. Jeff Wilson. He will be testifying after me. And I met several other scientists and professors during these meetings as well. In one of them, we ran a designed thinking process through the guidance of Dr. Jeff Wilson, where we did a National Consensus Conference on COVID Response.

This was using the process that I'll talk about later. It's called community network integration. I learned this from Dr. Jeff Wilson. What it does is solicit insights from the experts, stakeholders, and the public. It's bringing people together to come up with the solutions we need to do in order to overcome what is happening. We created a report based on the summary of this designed thinking process. The results of this are being written up in a summary that we are submitting as a joint submission to the *Canadian Journal of Veterinary Medicine* and the *Canadian Journal of Public Health*. That's ongoing right now.

What's interesting: when the COVID measures began to wane, these communities that were coming together, they stayed together. And they started to look at what happened; what was going on; who's responsible—how do we not let this happen to us again? They stayed meeting. And still to this day, all over Canada, there are people in communities that are coming together—and I'll talk about that in a little bit, what's formed.

They recognized some of the same players that brought us COVID response are now also involved in these international institutions like the WHO and the UN. They are ushering in community solutions. They see this transition, and it is called Agenda 2030, the Sustainable Development Goals. Interestingly enough— I didn't put it in my presentation; I didn't have time to change it, but I just spoke with one of the principal investigators yesterday. Because he wrote a Substack this week that piqued my interest and I had to speak with him about it before today. Because what's happening is that the UN, the Government of Canada, and the Canadian Health Research Institutes are also funding and giving research money to look at COVID recovery.

[00:10:00]

This particular investigator, this researcher, has now been given a nice lump sum of money to look at COVID response. And the first place they're starting is by looking back at the last three years, doing an evidence-based approach to investigating what happened, what went right, what went wrong. They actually, in this grant, have been asked to submit this to the United Nations as one of the grant's requirements.

It's interesting, I've been looking at— The UN Research Roadmap [for the COVID-19 Recovery] is what they have because there is this interest in investigating what's happened and what we need to do about it. And they are putting a lot of emphasis on Agenda 2030 and the Sustainable Development Goals as part of COVID recovery. And we're doing our best—and I'll talk about this, how we are going to bring everybody together. That's our motion, is bringing those in the UN, those in the public, the researchers, the stakeholders together. Our process that we're doing—and I'm working with Jeff Wilson and many others across the country—is to bring people together so that we can design these solutions together.

One of the concerns—I'm sure this has been talked about in other testimony—of those in the community that I've been meeting with on a regular basis is the WHO pandemic treaty. Canada has signed on to this treaty and the people in the communities are fearful and distrustful that they may not handle a pandemic properly. There's evidence through— They feel the COVID response has been mishandled. They're leery of giving up sovereignty of a pandemic response to the WHO. And Dr. Jeff Wilson, who's speaking after me, is going to be talking about outbreak response. And that Canada has the expertise; we have the **knowledge; we have the manpower to make our own pandemic response that's Canadian-made and will suit what we need to do for Canadians.**

This is just more about— The UN and the World Economic Forum did make a strategic partnership in 2019. And this was about putting forward Agenda 2030, the Sustainable Development Goals. When we look at those goals, they are noble goals to have. And people in communities, though, are concerned: What are we going to be doing and how are we going to be achieving these goals? That's vitally important. What measures and what initiatives will we be putting forward for us to achieve these goals?

This is a big concern. People do not want to be dictated to. They don't want a top-down centralized control mechanism telling them how to run their communities. They'd like to be part of it. This, I feel, is the epitome of public interest, is involving the public in this process.

This just shows that partnership— The 17 Sustainable Development Goals, which is being rolled into COVID recovery as far as the UN and Canada is concerned— This is one of the ways in which they're bringing about these Sustainable Development Goals, this ICLEI, it's I-C-L-E-I. If you look up their website, it's an international organization of local governments for sustainability. Canada has its own chapter of this institution, and there are different regions, cities, and communities that have signed on as members of ICLEI Canada. And this is where the people in the communities are working to collaborate with these organizations to be part of what the solutions are, rather than being dictated to. This is how the UN and the World Economic Forum are getting into our local communities.

[Witness moves forward to slide entitled Canada Smart City Challenge]: Canada is participating in this. I'm just going to show a couple of examples of this. This just reminds me too— Sorry, I didn't mention this earlier, but I completed my master's in Integrative Population Health through doing that pandemic response paper. I looked into things like this as well: the Canadian Smart City Challenge. Different municipalities participated across Canada, looking at how to build infrastructure to meet the Sustainable Development Goals.

Most of it was geared around technology. And here's a list of the technology of putting this in place in the cities. You may have seen different things happen in your city: the new lights, there's all the different LED lights that are connected to the network. Just little simple things like that, augmented reality, Internet of Things, the list is there. This is what initiatives are happening as infrastructure to Canada.

[00:15:00]

I like this quote from Albert Einstein, "We can't solve problems using the same kind of thinking we used that created them."

There is a transformation that's happening; it is written all over the United Nations Roadmap to Research. They're talking about transformation. They're talking about, "Are [we] going to go back to 2019 as the status quo?" And this isn't me talking, this is quoted from them: "Are we going back to the status quo of 2019 or are we going to do things differently?" There is a social reorganization that's happening. And Canadians in the communities that I'm connected to are concerned: How we are going to do that?

And we feel we've brought forth some solutions.

This is happening already, there's a national collaborative network. Those communities that were coming together across Canada, that built their community and they're staying together: there's a national collaborative network of them across this country. It's actually across the world, but we're connected mostly to your local regions and further. We're using the process called Community Network Integration [CNI]. Dr. Jeff Wilson will talk a little bit more about that in his testimony as well.

You can see it's a leaderless network of communities and people that are coming together to solve these big problems that we're having in our society.

Another such example of this Community Network Integration is the National Poultry Network. I happen to be in that network. I do not know much about the poultry industry, but for whatever I do know, I can provide some support to this network.

This CNI approach is bringing together all the stakeholders: the business owners and the government is coming on board. We've got— The Canadian Food Inspection Agency is on this network. PHAC, the Public Health Agency of Canada people are there to help with their input, right down to chicken farmers and all the stakeholders in between. Because there's a problem with avian influenza potentially. Dr. Jeff Wilson will talk more about this, but there's the development underway of outbreak response for avian influenza, respecting the pillars of outbreak [response]. Also what's going on in here is looking at regenerative agriculture practices that we can implement in the poultry industry.

In this format, if we do a collaborative process like this, this industry can solve any problems that they're faced with, in our opinion.

This one is my favourite. Food security has been talked about. This is part of the Sustainable Development Goals. And that word "sustainability" has been thrown around a lot; it's been used a lot, "sustainable." And it is noble. It is— In essence, its definition is to do less harm now so that we have resources for the future. It's a noble cause. But what I've found— My family has purchased a farm and what we've done is we have implemented a regenerative farming practice into that. We have connected with people in regenerative agriculture. And what I've found through doing this is that there is a network of people across the country involved in regenerative agriculture. And it's different than sustainability.

Kassy Baker

Just, sorry, if I can interrupt you for one second. Can you just explain what you mean by regenerative agriculture?

Dr. Kyle Grice

The principles of regenerative agriculture are looking at restoring and rejuvenating the natural world and respecting the laws that God put in place for how nature has created life on earth and has the abundancy that it has. There's certain laws and rules that apply that nature provides us. And it's respecting those rules in how we grow our food.

Kassy Baker

Can you give us an example of one of those rules?

Dr. Kyle Grice

I'm just learning this process myself because we've just done that, but it's about how— And I took ecology in university. And it's just the circular nature of all aspects and the interrelationship of living organisms. For instance, we breathe out carbon dioxide and trees breathe in carbon dioxide. We all know this, we all learned this in Grade 6—that there's this cyclical nature to how it works. And it's respecting those laws in how we grow our food.

Our industrialization of food production has been fantastic for providing food for us,

[00:20:00]

although the UN is also talking about this. We have to change the way we're doing things. And they're going to use COVID recovery to do this. We've brought together a national regenerative agriculture network bringing people together to see, how we can scale up regenerative agriculture to meet the food needs of our nation?

One of the other principles of regenerative agriculture is to increase productivity out of a square footage or square acreage or hectares. So there's less that goes into regenerative agriculture because it's based on principles of recycling and reusing. And then it intensifies the food production per square acreage of an area. So as a business model, this is a fantastic business model. Less in, more out, right?

It also makes sense as far as wanting us to meet our goals of— Whatever sustainable goals that we have put before us, whatever that might be, regenerative agriculture is one of the answers to this.

And we've created a network to come together to create these solutions. There's so much that's gone on and it is so hopeful for what we've seen in the communities, of what's transpired, what's motivated. We're connecting to people who've been working on things for decades, people who've been working on removing hunger and removing poverty and increasing well-being and health for people.

We're connecting all these people and we hope— We know. Actually, we know. We're going to bring trust, cohesion, and collaboration back together with the public, the stakeholders, the government, the agencies. We have to do it if we're going to solve these problems. And what's amazing is it's already happening. So I'm incredibly hopeful.

I've heard some of the testimony of the harms that people have experienced, and I can only imagine that there are several feelings that people might have. I know that there's anger. There's a lot of anger in the community. There's also a lot of despair. People feel helpless and hopeless against these big things and those are the people we don't see. But I hope we can reach out to them to say, "You know what? There's things happening. And there's a way for you to get involved. And don't let what's happened to you go to waste. Let's do something about it. Get out there and help."

That can probably help some of the despair that they're feeling. It can help to create some energy and channel that anger into some fruitful endeavours. We feel that's happening. It's naturally happening, we want more people to get involved.

Kassy Baker

And if people do want to get involved, what steps specifically can they take to work towards this model?

Dr. Kyle Grice

Across Canada. And no matter what community you're in, there will be people that are coming together. You have to just start talking to people. Just start talking to people. And that's all I did. To get connected to the community, I just started asking. I just started asking around and people just started connecting— That's how the network works, they just start connecting to people. And it won't be hard, it won't be too far away.

And if you don't find it, create one yourself, right?

Kassy Baker

Very good. Is there anything else that you would like to add at this time?

Dr. Kyle Grice

No, I think that's it.

Kassy Baker

Very good. Are there any questions from the commissioners?

Kassy Baker

Okay, I think that's everything.

We thank you very much for your testimony, Mr. Grice. And on behalf of the National Citizens Inquiry, we'd like to thank you.

[00:24:04]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 3

May 19, 2023

EVIDENCE

Witness 4: Dr. Jeff Wilson

Full Day 3 Timestamp: 03:04:40–03:36:45

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Kassy Baker

Mr. Wilson, welcome. Can you please state and spell your name for the record?

Dr. Jeff Wilson

Yeah, it's Jeff Wilson, J-E-F-F W-I-L-S-O-N.

Kassy Baker

And do you promise that you will tell the truth, the whole truth, and nothing but the truth this afternoon—or morning, pardon me?

Dr. Jeff Wilson

I do.

Kassy Baker

Very good. Now I understand that you're here to talk to us today about the pillars of outbreak response. Before we get into that can you please just give me a little bit more information about yourself, including your education and your career up until this point?

Dr. Jeff Wilson

Yeah. By training I'm a veterinarian. I also have doctorates in pathology and I have a PhD in Epidemiology, Public Health, and Infectious Disease. I was a professor of public health/epi. at the University of Guelph for nearly 18 years. I was cross-appointed to what's now the Public Health Agency of Canada [PHAC], started the group which does foodborne, waterborne, and zoonotic disease epidemiology, including outbreak response.

And particularly, I think why I'm here is I'm one of the very few people in Canada who actually understand outbreak response—how it's done. And I may be the only one who's actually stepping forward and talking about it in the context of COVID.

I just add, understanding what to do about COVID and understanding how to prepare for subsequent pandemics is— In order to do that, it's absolutely essential to understand how to run an outbreak. Without that, we will just continue to swirl indefinitely—complaining about government, complaining about pharma, recounting our tragic stories, but nothing will change. That's why I'm here.

Kassy Baker

Very good. Now I understand that you in particular were involved with the outbreak in Walkerton. Can you briefly tell us a little bit about that as we go into your presentation?

Dr. Jeff Wilson

Sure. Anybody over 30 probably has heard of the Walkerton outbreak. Before COVID, it was the most famous outbreak in Canada. Seven people died; half the town got violently ill.

I had taken the PHAC field epidemiology training program for two years and then I was heavily involved in managing those outbreaks. I was asked by the medical officer responsible for Walkerton to come in and help out with the epidemiology, so we ran the epidemiology for it.

Kassy Baker

Okay. Now of course that was a waterborne illness.

Can you explain to us just briefly—and perhaps you'll get into this in a little bit more detail—how that is different, or alike, with a respiratory illness such as COVID?

Dr. Jeff Wilson

Right. It's one of these things. All outbreaks are fundamentally the same and their management is fundamentally the same, but they all have differences. But the key to managing outbreaks is not to focus on the differences, it's to focus on the commonality of the process.

Walkerton was a waterborne disease outbreak. It's what we call a point source outbreak. Person-to-person transmission was not a major part of it. It was mainly caused by drinking water. And it was caused by a bacterium, not a virus.

Kassy Baker

Those are all my questions. Are you prepared to start your presentation [Exhibit OT-8] at this point?

Dr. Jeff Wilson

Sure.

I know there's a time crunch so I'm going to move through reasonably quickly here. I'm president of Novometrix now, that's my company. It's a social enterprise. We link networks together to solve complex problems. Because of things like COVID, they have to be solved by bringing people together—including people who have differences of opinion, which is also key to management of this whole thing.

As we work through an outbreak—and particularly as we're coming now into the “lessons learned” phase—it's very important to recognize that we have to move from the critical evaluation phase, i.e., “What went wrong?” That's important, but it's not enough.

We have to now move into the “What do we do now?” phase. The world is just starting to get thinking in my opinion, about what we're going to do now.

We can make a bunch of recommendations out of a group like this or from the federal government or anything else.

[00:05:00]

The problem is: How do you get the recommendations implemented? This is critical. Without that we will just all be frustrated. And what happens in the future? It's not good enough simply to— Even if we could fix up the COVID situation, what if there's a new bug, a new drug, or yet another novel form of government or corporate or citizen dysfunction? How do we solve those problems? Well, I'll flip through this.

Basically, how [do] you solve problems that are new? And Canadians largely are. When they're working with things like COVID, it's new to most Canadians. It's not new to somebody like me because I've done it many times before. What you do when you're dealing with something new, you talk to people who actually have done the thing. Doctors, physicians are normally not trained in outbreak response. Nor are immunologists. Nor are politicians.

There's a very small group of people who are trained in how to do this. They have training in outbreak response. This is not just patting myself on the back. We need to listen to actually how to do this and how to prepare for the future or we will fail, potentially with very disastrous consequences.

Fortunately, there is a very well-established protocol for how you manage outbreaks. Canada has managed hundreds and hundreds of outbreaks successfully, like Walkerton. Thousands have been managed successfully around the world. There are textbooks written on this. The Public Health Agency of Canada has a two-year mentorship program on how to do this. It's known what to do. What happened in Walkerton was we simply didn't do it.

In order to change this, what we want to do is start focusing on what we do want, which is proper outbreak response, not simply churning our pain and frustration and description of what we didn't like or what didn't appear to work. It's important, but now we need to move on. So that's what I'm about. We call the process the Pillars of Outbreak Response.

These are the pillars. Build proper leadership teams. If you think about it, you may recall there was never identified a leadership team for COVID. Those leadership teams have to be transparent. They have to include all of the correct people who know how to do this: the medical community, business community, all the different players. We didn't do that. If we don't do that, we will fail.

Once you've put in place proper leadership— And this is absolutely known in outbreak response, so in Walkerton, this is job one: Make the leadership team. Make it transparent. Make it inclusive. Have the right people around the table. Then after that, a lot of it's technical. It's based on proven principles.

Then I go, "Okay. My problem with this is, I'm one of maybe five people in Canada who have actually done this, who actually can see that with COVID, it failed." Most of those people I know are people that I trained. Also my boss, who helped to train me.

It's essential that we get this into the minds of people, like in this group but also in public health and the public in general and the media. So people can actually understand what to do. Otherwise, we'll just repeat; we're absolutely destined to repeat what we're doing in a new form.

So my question is: How do I do that? How do I explain how to properly manage an outbreak? Well, what I've decided to do is I'll show you how we ran Walkerton and why it worked. And then we'll go, "Now this is what we should have done with COVID." COVID is done now, largely. Now we have to prepare, put in place all the tools so we can do this nationally in preparation for the next one, or whatever other debacle we encounter.

So I'm going to talk briefly about Walkerton. I think everybody knows it was a bad outbreak caused by bad water. As I'm doing this, what I'm hoping is, the bells can go off and people can go, "Oh, there's actually a known process that we could have done with COVID,

[00:10:00]

and we for some reason didn't do it?" Yes. The answer is not mysterious, it's not even complicated. So as you're working through this in your mind, you can think, "Okay, could this apply to COVID? Could we do that? Could we have done this with COVID? Can we do this with influenza if that's the next one? Can we do it with another one?" If we don't start thinking this way, we're done. And we could easily have a next one which is vastly more virulent than COVID.

We got off—I know it was ridiculous, it was bad—but we got off easy because it was a relatively non-virulent bug. Now that's not— Obviously anybody who suffered from this, I totally accept that and empathize with that. But the reality is that is nothing compared to what is on the table, okay? And that's just— That's well known within the medical community.

So we built the leadership team. How do we do this? We actually connected out to these people in Walkerton: local public health, physicians, pharmacists, local government, public health agency, Ontario Public Health, the Ministry of Agriculture, multiple academics. We actively sought out multiple academics with different opinions so we could figure out what was going on. This is standard, standard practice in outbreak response.

We had to bring in the RCMP because there was a bunch of malfeasance going on. We brought in local politicians—but the relationship with them was managed. Because everyone running an outbreak knows you can't have the mayor or the premier running an outbreak because it will fail. Because they don't know anything about outbreak response, of course, or rarely do they and they have ulterior— They just have, they're incentivized differently. Because they're primarily incentivized to get votes, not to solve problems actually, of any kind. I'm not trying to insult politicians, I'm going: that's the system we've got.

Then we started building an evidence base. We got the right tests in place. You've heard about the PCR test for COVID. That's not— I'm not an expert in the PCR test, but I know enough about it— I'm able to talk to a lot of different people because my job is outbreak response, which is mainly a management and leadership job, not a "knowing every answer" job. It's bringing in the right people, not prescriptively saying, "Hey, this is the best vaccine" or what have you. So you have to get the right test in place, then you have to start building an evidence base.

I'll go through what that means. You actually have to find out: who's sick, how many people are sick, what is causing it? How can you put in place interventions if you don't actually know what is causing the problem? Does that make sense?

So the tests. The main bug was *E. coli* O157. A PCR test was available, but everybody in the field knew that it wasn't nearly as good a test as simply culturing the bacteria on a plate because that's well established and has much lower problems with false positives and false negatives. So you have to actually put that in place.

If we're going to be preparing for the next bug, we have to have an ability to get the right experts together and find those right tests based on the evidence. Based on the evidence, not based on what you're reading in the paper, not based [on] what your sister-in-law says, but on the actual evidence.

And as a community, the people need to understand this: Politicians will not do this for us. Pharma will not do this for us. The church will not do this for us. We have to do it. And that means we the people have to understand this stuff—or we are done. Because we have to build an accountability for it and it has to be done community by community. There's nobody out there that's going to fix this for us.

You bring together the right literature. So that means the team comes together once a week. They start looking at the problem. They start going, "Okay, what's known about this in the literature?" They bring in the proper literature and it's all stored in one place. If you do that, then you don't get alternative sides hurling their literature over the ramparts to attack the other person. It's all in one place and it's transparent, under transparent leadership.

[00:15:00]

You have to bring the data and the papers together. This is critical stuff. Whether or not to vaccinate is critical, but without this, it will be impossible to determine whether to vaccinate and it'll be impossible to get consensus on what to do about vaccination.

That's what happened during this thing. It was primarily a leadership and management debacle, where I consider all of us to be complicit. Because we're members of the public and we didn't see this coming and we bought into a system, which some of us are not buying into any more. But we were complicit in allowing this to take place.

No more. It's about leadership. All of us have to take leadership—personally. And that means we have to understand how this works or we're potentially dead.

Very briefly, as you bring a leadership team together and you have proper tests, you can start testing people in the community. And then you can find out who's actually sick, who's actually dying. Not sick with *E. coli*, but sick due to *E. coli*. This is critical. And actually infected—not a false positive. You start building out that as a series of spreadsheets with

actual people's names. This is exactly what we did in Walkerton and this is the kind of thing that must be done in— We have to be prepared for this for the next pandemic.

Then we start asking people about what are called “risk factors.” We simply question them about—Did you drink the water? Did you play in a swimming pool? Did you squirt water with a squirt gun at your brother? Did you eat hamburger? Did you pet a calf? All of that data, hundreds and hundreds of variables, all went into a coherent database that was shared with the whole leadership team, which represented all the key stakeholders.

With that in place then they just— Our team simply started doing some simple correlations. They found, “Oh look, being actually infected with *E. coli* is correlated with 15 measures of exposure to the water.” But it wasn't correlated with drinking bottled water, or swimming in a swimming pool in a neighbouring county. People are, “Okay, this is definitely looking like the water.”

Then some things came up like, well, it seems that eating hamburger is a minor risk factor for this. And so is having a kid in daycare. Then what happens— And again, you never saw in this thing, although it's basic, basic stuff at the health unit level to run those associations, they're called attack rate tables. They all know it. I can tell you right now they're running out foodborne disease outbreaks and they're doing those things. But they never did it with COVID. Why is another question. But anyway, we have to now start having these things done.

Then they did a multivariable model where they put all this stuff into a big model, and the only one that came up positive was the water. Now they knew that it was the water. You can't possibly manage something like Walkerton if you don't know where it's coming from. There's no point in guessing that it's coming from a cow or that it's person-to-person and then putting in place an *E. coli* vaccine program or something ridiculous. If you follow the steps—starting with a leadership team and then collecting the right data and doing the analysis—all the things fall out into place.

Briefly, in Ontario certainly a huge deal was made about using predictive spreadsheet modelling. I'm an epidemiologist. I have a PhD in this. Spreadsheet models are good for some things. They are not very good at all for predictive modelling of infectious diseases where we know nothing about the disease or the risk factors. This movement to using spreadsheet models as predictors, it's just— Like, this is actually a first-year epidemiology undergraduate exam question.

Disinformation, there was lots of misinformation. People lied. There were lawsuits.

The interventions. Once we could tell what it was,

[00:20:00]

we didn't have to run around and try and fix up daycares and stop you from touching cows. The medical officer just put in a boil water order. The cases went down. Then we put in place more of this epidemiology and we found out the exact—analytically, where it was coming from. Then they shut down the well. It was over.

Communications, the fourth pillar. Everybody who runs outbreaks knows that communication has to be complete; it has to be correct; it has to be transparent. This is all in textbooks. This is all in the PHAC field epidemiology training program. That's where I learned it from some of the best in the world. It has to be multidirectional by everybody.

Might Walkerton have descended into chaos? Absolutely. It could have been just an utter debacle. Why wasn't it? Proper leadership by people who understand the pillars of outbreak response.

It's literally like if you had your grandmother in the kitchen and a bunch of the neighbours came together in the family and said, "We think she needs brain surgery." They're starting to say, "Well, anybody know anything about brain surgery?" "Well, I watched it on TV once. I think we should just start opening up her head." A brain surgeon is actually in the room and he says, or she says, "I don't think that's a good idea." That's what the pillars of outbreak response are. This is why people need to understand this.

COVID? I would just go, "every pillar was violated, every single one, by people who know better."

The details matter. It doesn't count to say some leadership meetings happened, some data were collected, some interventions were tried, some communications happened. The pillars only work when they're done properly by people that know what they're doing. With a proper leadership team for something like COVID—of course vaccination as an option comes onto the table, but it's managed coherently based on the risk factor data. And then it's implemented with a coherent team that includes not just vaccine proponents but other people who know a bunch of stuff about vaccines.

Kassy Baker

I just wanted to let everyone know that we do have a hard stop at noon today, which gives us ten more minutes. I'm sure that we'll have some questions that—I just want to make sure we save a bit of room for the commissioners. Thank you.

Dr. Jeff Wilson

In the interest of brevity, the question then becomes: Can you run something as big as COVID like we ran Walkerton?

I'm here to say, the main difference between Walkerton and COVID is the size. It's the number of people. When you have something that's big, all manner of opportunities for confusion, malfeasance, gaming the system, fear, and whatnot come into play.

What you need to do then is to actually have a way to bring the people of Canada together. Starting with groups like this but also like-minded people within the public health system, the academic system, and members of the public. You might go, "Well, that sounds like a hard thing. How are we going to bring everybody together?" It is a hard thing and it's a new thing, but it's absolutely essential. In Walkerton, we brought a hundred people together to manage this. In Canada, we've got thousands to help millions.

What our company did was: After watching things like Walkerton and working as a pharmaceutical consultant and an academic and a whole bunch of other stuff, I realized that our primary problem is that all the easy problems are solved. We know how to chlorinate the drinking water. What remains are wicked problems. They're complex. And to solve them, you need to bring together a lot of stakeholders.

What we did was we developed a process, which is part business process, part social psychology, to bring people together coherently to solve these problems. We call it CNI

[Community Network Integration]. I've been working on this with our team and multiple networks across Canada like Kyle alluded to.

[00:25:00]

To start showing people how to do this. One of those, as Kyle mentioned, is the avian influenza network. Now you might say, what does avian influenza have to do with COVID? Well, let's think. What might be the thing? Well, it might be the next pandemic, right?

What I discovered was that I could start bringing together the— I've already begun, and our team is going to bring together the public health people to solve things like COVID.

But COVID is so triggering for people, if I go to the mayor of Guelph or the head of the poultry association and say "COVID," the word makes them go apoplectic. What we did was we said, "What issues would you like to work on?" Because I know a lot of people in the poultry network and I could see it's very parallel to solving COVID. They said, "We want to work on avian influenza." It turns out, now, we've brought together most of the major players across Canada in that network. It's solving a chicken disease problem, but it's also a potential public health problem. Everything that I described that we did in Walkerton, we have the leadership teams coming together. We have the data frameworks coming together. We have the initial pilot projects. We even have ways to fund it through industry, through crowd funding, because we're setting it up so it actually makes money. We even have pharma as part of it—but they're on a tight leash—and they're funding it.

I wanted people to see this is very real. This is the kind of thing that— Theresa Tam, who I know quite well, connected me to Howard Njoo. PHAC is now a part of this because they want to bring in and understand better how to manage outbreaks.

Kassy Baker

Sorry, just on that note, we have three minutes left. I think I have to—

Dr. Jeff Wilson

It's all good. If there are any questions, I'd be happy to answer them.

Kassy Baker

Very good. Do we have any questions? Okay. We have one.

Dr. Jeff Wilson

And I apologize for my stridency, but anyway—

Commissioner Massie

Yeah, I have a couple of question which— I really like your model. I think it can work except for the one variable which is very difficult, which is the human element. And I'm going to bring something that was mentioned by many other witnesses at this Commission, which is the conflicts of interest that really corrupt a well-functioning or well-intended process. Because people that are at the table—that have some expertise and knowledge that can contribute—are trying to move the agenda towards what they would want to see

for their own benefit. So how do you ensure that the conflict of interest of such a fantastic network is not going to be derailing the network?

Dr. Jeff Wilson

I'll try to give a brief answer. There's a few moving parts to it.

With the poultry network, for example, what we did was we decided we're running this network. It's going to be collaborative and transparent, and we simply will not allow conflict of interest—there's always some, but significant conflict of interest—in the network. I simply started connecting to people across the network—so people in public health, animal health—and I told them, "Here's what we're doing." I said, "You know how this avian influenza thing is a big problem and we're only going to solve it if we come together." And I brought together, to begin with, the people who psychologically don't like to do conflict of interest. We started at that point, but some of them are major players in the industry and in public health. They all said, this is exactly like you're saying: "Jeff, this is a good idea. We have to stop this."

The first step was, we simply named it as part of the leadership framework: "Everything here will be transparent—excluding, you know, proprietary secrets that are legitimate. It's all going to be transparent and we simply won't allow— We love you dearly, but we're not going to allow backstabbing, cheating, lying, stealing, or any of that stuff."

And you know what people said? They said, "Excellent,

[00:30:00]

what an amazing idea."

And then we started building it out from there. So I broached people in pharma. I've worked in the pharmaceutical industry for years. There are really good people in pharma and there are really bad people in pharma. I reached out to a bunch of them who I know are good people and I explained what we're doing. And they said, "Excellent. Finally, someone who's disrupting all the malfeasance across our industry, including from pharma."

Now they like that. And they also can see they can be part of a network which will help with their sales, for example, but only if they are transparent and actually work to contribute to the whole. And you might go, "Why would that work?" I'd say, "Come join our poultry network and I'll show you." And I'm quite serious.

Commissioner Massie

My second question, which I think you illustrate in your model at Walkerton, I think it's a very nice illustration. Because we had other people at the testimony that were talking about this whole notion of epidemic versus pandemic.

And the question was: Given the environment, the complexity of the environment, the territory, the people there, and all of the encounters of—in the case of COVID—the respiratory virus, how can we propose a one-size-fits-all model top-down?

Dr. Jeff Wilson

You can't. It makes no sense.

Commissioner Massie

And why is it that we've been trapped in that mindset?

Dr. Jeff Wilson

Mass stupidity, I would say. I'm being irreverent obviously; there's different names for it. But I kind of think the level of fear and greed and just overwhelm came to the point where it normalized highly dysfunctional destructive behaviour, which is now threatening to take down pharma. And the federal government.

Is that helpful at all?

Shawn Buckley

Commissioners, I'm sorry to interrupt, but because we have to vacate this room at six o'clock and the schedule that we have— You'll see that with every witness, we've been really tight on the timeline. I had to apologize to Dr. Shoemaker, I apologize to you.

I'm going to suggest that we do take a lunch break but a truncated one for 35 minutes. And commence early. Because some of the estimates on our witness schedule you'll see are not very optimistic and we have a hard stop. And we want to protect those closing statements from several people. So I'm going to adjourn us to 12:35.

[00:32:48]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 5: Dr. Daniel Nagase

Full Day 3 Timestamp: 04:29:20–05:02:20

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Wayne Lenhardt

Hello, Dr. Nagase. Good afternoon. Can you hear me?

Dr. Daniel Nagase

Yes, I can hear you clearly. Thank you for having me on.

Wayne Lenhardt

I can hear you as well. First of all, if you could spell your full name, I'll do an oath with you.

Dr. Daniel Nagase

I'm Dr. Daniel Nagase. D-A-N-I-E-L N-A-G-A-S-E, all rights reserved.

Wayne Lenhardt

Do you do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

Dr. Daniel Nagase

I promise to speak only the truth.

Wayne Lenhardt

Thank you. Okay, Dr. Nagase, I gather you have some slides today. You're a bit of a hard person to get a hold of on the telephone. I know that you're going to deal with censorship today and not much else.

If you could give us a snapshot of what you're going to talk about today and then we'll let you launch into your presentation.

Dr. Daniel Nagase

I don't have any slides actually for today. The reason is I'm dealing mainly with patient medical records, which wouldn't be appropriate to put online. But I will be speaking to facts documented in medical records and perceptions of what has happened to me in my medical practice.

I graduated from medical school in 2004. I'm 47 years old and I was an emergency doctor for my entire medical career. And in the course of treating three elderly patients who were critically ill in Rimbey Hospital in northwestern Alberta, I decided that the balance of benefits and risks favoured trying ivermectin to help with their COVID pneumonia.

All three elderly patients were critically ill. And from my emergency experience, they were about four to six hours away from needing mechanical ventilation. That is, they were failing to get enough oxygen into their lungs by breathing using their normal respiratory muscle. So doing everything possible, I gave the patients ivermectin and hydroxychloroquine, vitamin D, zinc. And I gave them standard therapy for viral pneumonia, which is bronchodilators such as Ventolin and Flovent and nebulized medications. Also, for the patients that seem to have fluid overload in the lungs, I also gave them a diuretic to help remove the fluid to help improve their oxygenation.

Less than 18 hours after receiving ivermectin, these patients made a remarkable clinical turnaround. Now again: this is based on data that had been published throughout 2020 and 2021 because this was September 11th, 2021 that I treated these patients with ivermectin. The scientific data was abundant.

The next day I was removed from my medical duties as the ER doctor on call in Rimbey Hospital in Alberta. All the work I had scheduled for the rest of the year was rescheduled and I was left without work for the rest of 2021. For a further shift in 2022, Alberta Health Services refused to schedule me for any further shift.

Furthermore, the Director of the Central Zone in Alberta—so the Central Zone of Alberta Health Services—Dr. Jennifer Bestard, filed a complaint with the Alberta College against me because I had successfully treated three patients who recovered from COVID pneumonia following my treatment with ivermectin and hydroxychloroquine. And her complaint to the College [of Physicians and Surgeons of Alberta] was that I had used a medication that I was not supposed to use, despite the medical and scientific evidence showing its immense benefit in the treatment of COVID-19 pneumonia.

So subsequent to the complaint initiated by Alberta Health Services, the Alberta College investigated me and put restrictions on my practice. These restrictions that the Alberta College put—allegedly for patient safety—was that I was not supposed to treat anyone with COVID or suspected COVID. So given that the symptoms of COVID pneumonia or COVID illness can be anything from a belly ache to a cough,

[00:05:00]

that effectively ended my ability to practise emergency medicine within the province of Alberta. However, at that time I still did hold a British Columbia medical licence. However, a month and a half later the British Columbia College [College of Physicians and Surgeons of BC] investigated me in spite of the fact that I had not taken care of any patients in BC for years. And they took action that they suspended my British Columbia medical licence, allegedly for being out of province.

Wayne Lenhardt

Can I stop you for a minute, Dr. Nagase? Ivermectin and hydroxychloroquine have been used in various parts of the world in order to treat this type of an illness for some time, have they not?

Dr. Daniel Nagase

Yes, they have. This was September 2021, so these medications had been used for over a year in the treatment of COVID pneumonia.

Wayne Lenhardt

So you used them successfully and what you got in return was an investigation by your college. Is that—

Dr. Daniel Nagase

And although Alberta Health Services refused to state that they fired me, effectively they did fire me by refusing to allow me to pick up extra shifts in the emergency department and cancelling all the shifts that I had scheduled to effectively leave me without work.

And in order to put a roadblock in my ability to work further, they filed a complaint with the Alberta College and the Alberta College placed restrictions on my practice, basically making it impossible for me to work as an emergency doctor—

Wayne Lenhardt

Okay.

Dr. Daniel Nagase

Any patient that I saw could not be treated by me if they had any symptoms of COVID or even a bellyache, for example.

Now I tried to push the issue with the Alberta College of Physicians and said this restriction they put on my practice—that I'm not allowed to see any patient with COVID or suspected COVID—would be a violation of the *Canadian Human Rights Act* because they would be forcing me to discriminate against my patients based on their illness.

The Alberta College had no response to that and they maintained their restriction. They refused to acknowledge that by placing a restriction on my medical licence, forcing me to **discriminate against people, they were in violation of the *Canadian Human Rights Act* from 1976 I believe, if I'm quoting the date correctly. So again, a gross violation but the medical college here in Alberta has no qualm—and to this date has not been reprimanded for—violating the *Canadian Human Rights Act* by trying to force me to discriminate against patients.**

Wayne Lenhardt

What was the reason that they gave for preventing you from using ivermectin and hydroxychloroquine? Was it that there was something wrong with your treatment protocols or what?

Dr. Daniel Nagase

No, they offered no explanation other than their policy that ivermectin was not to be used in the treatment of COVID. And this was a policy that they published shortly after I had successfully treated the three elderly patients in Rimbey. So I believe this policy came out in October of 2021 and shortly thereafter, British Columbia came up with the same policy.

So then because I had not treated any patients in British Columbia, the British Columbian College could not suspend me for any patient work that I did. In fact, they suspended me allegedly for the reason that I was out of the province for too long.

Since my college licence was suspended in BC and restricted to the point of being unable to work in Alberta, I did not renew my Alberta or British Columbia licence, as the cost would have been significant to try and renew both licences. Shortly after not renewing my licence in British Columbia with the College of Physicians and Surgeons of BC, the College of Physicians and Surgeons of BC sent me a demand letter that I must renew my licence even though it was suspended or face a penalty of \$100 a month.

[00:10:00]

I said, "Well, that would be certainly a first that a membership organization can charge a penalty for not renewing membership." It seemed absolutely ludicrous. But the BC College insisted that if I wanted to not be charged a \$100 per month penalty for not renewing my suspended BC licence, I would have to resign or retire from the BC College. So I filled out their resignation and retirement form.

However, about eight months after my retirement and resignation, the British Columbia College served me with a disciplinary notice. They were initiating a disciplinary proceeding against me because I had made a speech on December 9th, 2021 warning about the dangers of mRNA injection and the safety of ivermectin in the treatment of COVID-19 illnesses.

Because of the content of a public speech I made, the British Columbia College, even though I no longer held the licence—I had retired from the college—was pursuing for disciplinary action. Under the British Columbia *Health Professions Act*, if I fail to attend a disciplinary hearing for a college for which I am no longer a member, the British Columbia College of Physicians and Surgeons can apply to the Supreme Court of BC to have me confined for contempt. That's written into the legislation in BC.

So I attended their hearing. Ironically enough, when I submitted my evidence to the British Columbia College explaining the justifications for the statements I made publicly, the British Columbia College of Physicians and Surgeons wanted an adjournment to the hearing that they had scheduled—from February 21 to 24th of this year. I said to the BC College, "Adjournment is refused. If you don't have the evidence in February of 2023 that any of my statements from December of 2021, a year and a half prior, are in any way incorrect, then you can't—I refuse an adjournment. I'm not going to give you guys another six months to try and dig up evidence, or try and make up evidence, that any of my statements were factually inaccurate."

Every statement I made in December of 2021 during that public speech in Victoria, BC turned out to be true. I refused adjournment. The British Columbia College disciplinary committee declined to show up at their own disciplinary hearing. So I conducted the disciplinary hearing without them, hosted online publicly as per the BC *Health Professions Act*. And public record already exists now for that disciplinary hearing for which I refused

adjournment. Yet the British Columbia College is still trying to reschedule another hearing, in spite of the fact they failed to show up to their first hearing.

So these are the— This is the cancel culture. This is the rotten, corrupt actions of these regulatory bodies, both the BC College and the Alberta College.

But one of the things more important to my heart— Because from my own personal perspective, I really don't like to dwell on my own personal grievances. Because when I look at the awful treatment, the criminal negligence, and perhaps even worse than criminal negligence that patients have suffered—patients who have died because of COVID hysteria from medical professionals—these people have suffered far worse.

And the two cases I wanted to touch on today was one case of a 47-year-old father of five who was transferred to Edmonton hospital, the University of Alberta. So one of only two university hospitals in Alberta: one is the University of Calgary, one is the University of Alberta in Edmonton. And the emergency doctor, without any medical reason— And I poured through this patient's medical record for hours looking for some, any indication why a 47-year-old with no prior lung problem,

[00:15:00]

with oxygen saturations of 93 per cent throughout the airplane transfer flight before being sent to Edmonton. And while in the emergency department in Edmonton, this patient was awake, alert, responsive, with pre-physical signs of having enough oxygen to sustain all the normal activities of life. And yet for some reason Dr. Craig Domke—and I named his name because his name needs to be mentioned—put this healthy 47-year-old, whose only medical issue was that he was suffering from a COVID-19 pneumonia. Stable vital signs, adequate oxygenation, Dr. Craig Domke put him on a ventilator.

And this was in November of 2021, after there was almost two entire years of evidence showing that ventilators caused harm in COVID pneumonia. Therefore, unless somebody had inadequate oxygenation there is no reason to put someone on a ventilator, which in most cases according to the scientific evidence, hastened the decline and deterioration of patients with COVID pneumonia.

Yet that wasn't the end of it. After the patient was put on a ventilator for no medical reason, an infectious diseases specialist from the University of Alberta—this is the ivory tower of medicine in Alberta— Dr. Brittany Kula put this 47-year-old man on a medication called baricitinib, a medication that is no longer used by rheumatologists because it has such deadly side effects of blood clots. This medication was originally developed to reduce inflammation in the lung that some rheumatoid arthritis patients get. For some reason, this subspecialist of internal medicine, Brittany Kula, put this patient on baricitinib for no medical indication.

The patient had stable oxygenation before being put on a ventilator. And while the patient was on the ventilator in the emergency department, his oxygen saturation remained stable. If this doctor had literally done nothing, this patient would probably still be alive today. A day after being taken off the ventilator, five days after starting baricitinib, this 47-year-old without any prior lung problem died. And the autopsy shows massive bilateral—that is both sides—blood clots in his lung: the exact black box warning that is on the medication, baricitinib.

From my perspective, if multiple individuals—the emergency doctor, Craig Domke and the infectious diseases doctor, Dr. Brittany Kula—took action that hastened, that resulted in, the death of a patient, and they had no medical reason to start the medication baricitinib or put the patient on a ventilator? To me, that appears to be a homicide. Yet as far as I last checked on the Alberta Health Services website, neither Alberta Health Services nor the Alberta College is investigating either of these two doctors in the death of a healthy 47-year-old patient. Yet I have been put through the wringer—being investigated by Alberta Health Services and the Alberta College—and all three of my patients survived.

Where is the justice in that? Individuals calling themselves doctors working in the ivory towers of medicine take actions that result in death, no investigation? But you save three lives and you get investigated and run out of the medical system? It's as if this public health care system that I've known for my entire life has turned into a death care system.

But the criminality does not end there. That's just one example in Alberta. In British Columbia, the head of ICU in Trail Hospital in BC, Dr. Peachell: Seven days after a 69-year-old woman

[00:20:00]

recovered from COVID pneumonia, she was seven days off of a ventilator. Remarkably, she survived COVID pneumonia despite being on a ventilator. Was put on a T-piece, which is one of the recovery surgeries where they have you breathing through a little port in your neck that they put in any situation where a patient needs extended mechanical ventilation. This patient recovered to the point where she was off the ventilator completely for seven days. Dr. Peachell then orders the patient to get the Pfizer mRNA injection. This is with the background knowledge of an internal medicine specialist who is the head of internal medicine at Trail Hospital.

Every family doctor, every medical student even, knows: You never give any vaccination while a patient is still ill. This patient was less than a week off of a mechanical ventilator and the head of ICU orders an mRNA injection for COVID-19.

Four days after ordering this deadly injection, the doctor, Dr. Peachell, makes a verbal order to the nurse to remove COVID-19 vaccination from the medication administration record. Unless I had seen this medical record with my own eyes, I would not believe that any doctor would be so criminal as to try and forge and remove a medical record that showed evidence of deliberate harm to a patient who just recovered from a ventilator.

Later that week, the patient died. As far as I know, Dr. Peachell in British Columbia, head of the ICU, still has his British Columbia medical licence and is practising.

Wayne Lenhardt

Okay, I think at this point I'm going to ask the commissioners if they have any questions of the doctor.

Yeah, Ken.

Commissioner Drysdale

Good afternoon. If I understand your testimony correctly, you had three elderly patients and you administered a protocol for COVID-19 and each and every one of those three patients got well and survived. Is that correct?

Dr. Daniel Nagase

That's correct. I had to supply the ivermectin to the patients because Alberta Health Services refused to dispense ivermectin to the patients. So I had to supply the patients directly for themselves so they could take the medication on their own, as nurses in the hospital refused to administer the medication and do their job.

Commissioner Drysdale

And those patients— Prior to your treatment you said they were probably a few hours or days away from having to go on a mechanical ventilator. Is that also correct?

Dr. Daniel Nagase

In my emergency department knowledge and having examined and listened to their lungs, they were approximately four hours away from needing life support: that is, having a mechanical ventilator try and put enough oxygen into their lungs because they were not able to get enough oxygen into their lungs through laboured breathing, through their own—

Commissioner Drysdale

So you were— And I apologize for kind of jumping in, we're on a tight schedule I'm told. And you were punished for doing that.

Dr. Daniel Nagase

Yes.

Commissioner Drysdale

We seem to have a lot of testimony from Alberta.

And have you got any commentary on the lady that testified here in the last several days? She was waiting for a transplant, which I'm not allowed to say what it was, but she's waiting for a transplant in Alberta. And the doctor— The hospital is refusing to give that lifesaving transplant unless she takes the COVID-19 vaccine. And not having that transplant is likely going to result in her death.

Can you comment or contrast that to what you've gone through?

[00:25:00]

Dr. Daniel Nagase

From what I've witnessed reading medical charts of patients, it is a consistent—I have no other word to describe it other than "criminality" or "homicidal." These injections are

known to be unsafe, known to have deadly side effects. And to try and coerce a patient, "Take one deadly medication, or die," that's criminal. I have no other way to describe it.

For the head of an ICU to give a patient a substance that— Every medical student, you should never give any vaccination when a patient is still recovering from an illness. And to deliberately do so with foreknowledge and then to try and tell a nurse to remove the record of COVID-19 injection from a patient who already has COVID-19 antibodies and is still in the recovery phase, and then the patient dying? That is criminal.

For an emergency doctor— I don't care how tired an emergency doctor is at 2 a.m. If a patient is talking to you and has oxygen saturations of 93 per cent, you leave them alone. You say, "I'm going to come back and check on you in half an hour, while I see all the other emergency patients to make sure no one else in the department is critically ill or dying." The number of times I have put somebody on a mechanical ventilator who is able to speak a full sentence in my entire career is zero.

And the doctor, Craig Domke, in his own emergency department note, says a time out was made for a compassionate phone call to the patient's family. So I talk to the patient's wife. Yeah, the doctor didn't call the wife. The patient himself called the wife. And his last words to his wife was, "They are putting me under," all spoken in one breath. Anyone who can speak a full sentence in one breath does not need a mechanical ventilator. And yet that's exactly what Craig Domke did.

And once the patient was paralyzed, on a ventilator, unable to refuse a dangerous experimental medication, baricitinib, Dr. Brittany Kula, infectious diseases specialist at the University of Alberta in Edmonton, comes along and orders baricitinib. And guess what? Five days later, the patient is dead from the exact black box warning for baricitinib.

Commissioner Drysdale

I just want to—

Dr. Daniel Nagase

I only have one description for this type of behaviour.

Commissioner Drysdale

I only have a minute or so left. My next question has to do with informed consent. Is it permissible under informed consent to withhold treatment in order to get the patient to agree to a different procedure? In other words, can you say, "I will not give you this operation unless you do XYZ," unrelated to that operation?

Dr. Daniel Nagase

Well, I'd go one step higher than informed consent. That's just unethical. It's completely immoral. I know people get fixated on catch terms in ethics like "informed consent." The CMA [Canadian Medical Association] Code of Ethics is pages and pages of, I hate to say it, drivel. Ethics is simply morality. There's no such thing as medical ethics. There's just ethics, based on morality, which is based on reason, which is based on humanity.

There's no different ethics for medicine and a different ethics in a church. All ethics is based on humanity. And to say that, "Well, informed consent is a special subset of ethics," no, that

is wrong. Ethics is simple. It's right versus wrong. And to try and coerce someone upon the threat of death or harm that you aren't going to get this medication to save you unless you take this deadly injection? That is just wrong.

[00:30:00]

And I don't want any party to try and claim, "Well, informed consent was denied." Because by using the term informed consent, it's almost like, "Well, they didn't commit a real crime of coercion, coercion, threat, extortion. Oh, they just made a violation of informed consent."

I'd like us all to get rid of that term and call it for what it is. If it was a thug on the street that said, "Take this cocaine or else I'll shoot you," that's basically what medical doctors have been doing here in Canada in the public health system, getting paid for it, with the mRNA injection.

Let's call it for what it is: an actual crime. Not an informed consent violation, an actual crime.

Commissioner Drysdale
Thank you. Thank you, sir.

Wayne Lenhardt
Are there any other questions from the commissioners? Any more questions? No.

Okay, any last words?

Dr. Daniel Nagase
If I could summarize just briefly, you know, a big concern for me is: How is it that colleagues that I've worked with for years have come to do such awful, unconscionable acts? And as far as my deep soul searching and trying to figure out my colleagues has gone, thus far I've boiled it down to three issues: fear, a lack of reason, and obedience.

And that combination of fear—fear of losing your job, fear of not making enough money in a year—is combined with a lack of reason and this unreasonable blind obedience to hospital administrators and policy that every doctor knows will cause harm to their patients.

And yet between the fear, the obedience, and the complete lack of reason causing a **complete lack of morality: this is a deadly triad resulting in the deaths of mothers, fathers, men, and women. And this is— This is unbelievable.**

Wayne Lenhardt
We're getting close to our time limit. But yeah, I'll add— One more thing is that I think this is the mark of a profession, where you are able to make an informed decision within your profession without having somebody else tell you exactly how to do it.

Anyway, in any event, thank you for your testimony today on behalf of the National Citizens Coalition [sic]. Thank you again.

Dr. Daniel Nagase

Thank you for having me on.

[00:33:33]

[00:00:00]

Shawn Buckley

Our next witness is joining us virtually, Pascal Najadi. Pascal, can you hear me?

Pascal Najadi

Yes, sir. I can.

Shawn Buckley

Okay, and I can hear and see you. Pascal, can we begin with you stating your full name for the record, spelling your first and last name?

Pascal Najadi

Yes, my name is Pascal Najadi.

Shawn Buckley

And Pascal, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Pascal Najadi

Yes, I promise to tell the truth, nothing but the truth, so help me God.

Shawn Buckley

Now, I'm going to try and introduce you, but if I don't do you service, please add. Because I want people to appreciate that you kind of have travelled in other circles than most of us.

You are a Swiss-born British citizen, so you have dual citizenship. Your great grand uncle from your mother's side was the president of Switzerland during World War II. His name was Rudolf Minger. You have served in the Swiss Air Force. You were an investment banker

with Merrill Lynch International in New York and London. You were a director on the management board of Dresner Bank AG London and was in charge of advising heads of state and ministers in strategic, advisory, and crisis. The territories were Central Europe, Central Asia, the Russian Federation, the Middle East from Lebanon down to Oman, including Saudi Arabia and the African continent.

Does that fairly introduce you or should we add some more?

Pascal Najadi

No, that's perfectly fine. Thank you very much, sir.

Shawn Buckley

Okay. And again I just wanted, because there'll be people watching you online and there'll be people here that won't know your background. And you're testifying from Switzerland today.

Pascal Najadi

That is correct, yes. This is from Switzerland, live.

Shawn Buckley

Now, I wanted to start because you have a personal story to share concerning the COVID-19 vaccine. And so if you want to share that with us and then we'll move on to some of the legal activities you've been involved with.

Pascal Najadi

Okay. Sir, if I could just ask you the time maybe that I have please.

Shawn Buckley

Oh, so we've got 45 minutes.

Pascal Najadi

Okay, wonderful.

Shawn Buckley

Yeah. So actually, take your time. Because, like I say, there will be many people that are not familiar with your story.

Pascal Najadi

Sure. Thank you, sir. Well, first of all, I'd like to say the following, if I may, as an intro. I would say dear honourable judges, experts of the National Citizens Inquiry, dear ladies and gentlemen, dear supporters, friends, and colleagues, and victims of COVID-19 vaccinations from Canada and around the world: I greet you all warmly from Switzerland. It's a great honour for me to give you my testimony here today.

Before I start, I wish to share with you my thoughts and essence about this genocide of Biblical dimensions against humanity—

Shawn Buckley

Pascal, can I interrupt you a little bit? Is it okay if we not read and we just have more of a dialogue?

Pascal Najadi

Sure.

Shawn Buckley

Yeah, because it's just we're in a format where, you know, it truly is testimony. Some people get uncomfortable with that, but I know when we've spoken in person that you're very animated and very good at communicating.

Pascal Najadi

Sure. Sorry, I just wanted to greet everybody. And the personal story is the following.

Like many people, unfortunately billions, I trusted my Minister of Health, the Swiss Minister of Health, Mr. Alain Berset—who is now also President and still Minister of Health of Switzerland—when he came on board after the psyops started, showing people dying and people on ventilators in hospitals; saying that there is good news, that there is a vaccine coming, and it's safe, it is tested like any other vaccine, and it's effective.

And we then got introduced and pushed into a vaccine mandate with a QR code on the telephone, whereby people with a vaccination—or with an injection, I dare say—got the QR code, the green pass, to go and have a normal life. Whereas the un-injected people were discriminated [against] and many of them in some companies lost their jobs, like the pilots or cabin crew of Swiss International Airlines that were not agreeable to get injected with an experimental substance.

[00:05:00]

The consequence was that me and my family—my mother included, she's 81—agreed to the injections. We got three times Pfizer mRNA into our bodies. And we did not, at that moment, have any second thoughts. Because again, the whole system—all multilateral channels of communication by the government, by the media mainstream—were saying, **"You must vaccinate; you must protect others and yourself; it's good; it's effective; it's tested."**

The shock I got was on the 10th of October 2022, when Janine Small, a senior manager of Pfizer Inc., was called into the European Parliament and had to testify and had to answer questions to parliamentarians. One—I believe he was a Dutch parliamentarian—asked a very simple question. He said, **"Mrs. Small, could you please give me a direct answer, a yes or a no: Did you test the vaccine before you went to market?"**

He switched off the microphone and then the lady said, **"Of course not, we had to go with the speed of science."** So—

Shawn Buckley

Now, can I just interject because I think— That's a pretty famous video and I think you just inadvertently left out— She was being asked, if I remember it correctly, whether or not they tested it for transmission, whether it would protect against transmission.

Pascal Najadi

The end points, so the end points: immunity and transmission. Correct.

Shawn Buckley

Right. So how did that affect you? Because you had three shots and you're watching her basically say it wasn't tested for that.

Pascal Najadi

Yes, for me it was clear. What she was telling me was, "The stuff doesn't work." Okay. Then I got worried. I start to calculate in my head that I have something experimental here. What was the purpose of it, I didn't know.

I went straight through the messages of the Swiss Ministry of Health. I didn't go to newspaper reports. I went backwards in communication statements given to us by the Ministry of Health.

First, I started December 2020. The video's still there. Alain Berset saying, "We have a vaccine, it's safe, it's effective, and it's tested like any other vaccine according to the Swiss regulator's standard." Then I went on and on where the same message was "safe, effective, vaccinate, safe, effective." And then I came to the official press conference, which is still in the website of the Ministry of Health, where Dr. Virginie Masserey, the Director of Infection Control of the Swiss Ministry of Health, Public Health said— That was the 3rd of August, 2021, she said—end of July, I believe it was the 26th of July, 2021—they received a report from CDC of the United States saying that vaccinated people transmit the virus as easy and often as unvaccinated people.

Then a journalist interjected in the press room—it's all on video—and said, "Dr. Masserey, can you confirm this? Is this really true?" And she said—it was in French she replied—she said, "Yes, vaccinated people transmit as easily and often as unvaccinated people." So I made a note. That was 3rd of August 2021.

I went on towards my time, towards the present time. And on the 27th of October 2021, a few weeks before the COVID law of Switzerland was going for public vote to be prolonged or not, the Swiss Minister of Health, Alain Berset, on primetime live national TV, Channel One, said: "With the certificate," means you are injected, "you can be sure that you are not contagious." Okay, so I made a note.

There were lies in the room. Now who was lying? Was it the CDC of the United States and Dr. Masserey and the experts of the Ministry of Health? Or was it the Minister of Health himself trying to promote the COVID law with the Swiss voters? I didn't know.

[00:10:00]

I took the consequences: I went to the Swiss police in my city and I went to file criminal charges against Alain Berset. It was the 2nd of December 2022 when I filed, at the police

station, the police report for criminal charges for Article 312 of the Swiss criminal code: "Abuse of office." Because clearly, I wanted this to be investigated. How come a Minister of Health, who is in charge of eight million people in the country, claims that it protects when his own Director of Infection Control, three months earlier, and the United States said that it does not protect?

This criminal charge report went to the state level—we have cantons like you have provinces or states in the United States—went on that prosecution level for about seven days. And then it ascended to the federal prosecution level, where federal prosecutor Nils Ekman confirmed to me in writing that he has given me a case number, in writing of course, and that he is in charge of these criminal charges to be investigated: whether or not they will open a procedure against Alain Berset—by then become president, in January 2023, of Switzerland.

He also asked me to supply him with more evidence or more causality regarding my own consequences. Unfortunately, I had to supply to him my blood reports. I had my own blood, six vials, taken in early March by my doctor, Dr. Weigl. And we transported them within 48 hours to the special laboratory of Professor Dr. Brigitte König in Magdeburg, Germany. She has established the most modern lab process to find out what the damage is of these mRNA injections. And three vials for evidence went, or are now still in cryonic freezing, and three vials were used for the lab tests in the laboratory.

The results are devastating because the nanolipids are the packaging of both Moderna and Pfizer mRNA. The nanolipids are toxic. You can Google that. They are synthetic; you can buy them; they are traded for laboratory, for tests for research. And they're labelled, "Toxic, Not for Human Use or Animal Use." Clear. So we have a toxin already in the packaging. Every shot delivers about 15 billion nanolipids into your body. They are charged positively electrically; the blood cells of your body are negatively charged. What happens, the nanolipids shoot into your blood cell, go inside, and destroy your energy system.

Professor Dr. Bhakdi, who many of you know worldwide, one of the leading experts, made me the expert report—unfortunately, reading 10 pages of complicated laboratory language which I don't even understand—and concluded that I have lost at least 20 years of my life. And that the nanolipids have done the first damage: three shots cumulative 15 billion or 20 billion each, between 50 and 60 billion nanolipids hitting my blood cells. We unfortunately also determined one year and three months after the last shot that I still have 183 MPO [myeloperoxidase] per millilitre of my blood, of spike proteins running through the body, attacking my organs and systems.

Shawn Buckley

I just want to slow down to make sure that people understand. So how many years of your life did Dr. Bhakdi predict you're likely to have lost?

Pascal Najadi

Twenty.

Shawn Buckley

Twenty. And one year and three months after your last injection, they're finding spike protein circulating in your blood.

And I'll just let both the commissioners and those watching your testimony know that you've consented to your medical records forming part of this record. And so the report on your blood with spike protein is now Exhibit OT-3c and the letter from Dr. Bhakdi is OT-3a. And thank you for consenting to that. Because it verifies what you're saying and I think it's important for people to realize,

[00:15:00]

your body is still obviously manufacturing or retaining spike protein after 15 months.

Pascal Najadi

Yes. The regulators wrote to me by email that it will be gone after three to six weeks. Obviously not. The doctors who have administered those injections have violated the criminal law in Switzerland because they were giving to me injections without informed consent. They should have had a form where they should have read out to me the severe possible consequences or side effects, and on the same page, there should be a line to sign that I understood the above. That would go into a ten-year saving of my medical history. That didn't happen. Therefore, I have also filed criminal charges against the two medical doctors, Swiss medical doctors, that have given me those jabs without informing me.

Shawn Buckley

I'm going to ask you what's happened with that. But we're curious, what did your doctors tell you? I mean, you are telling us for sure they didn't give you informed consent, but do you recall what was said to you when you were vaccinated?

Pascal Najadi

Yeah, it was like in a train station. We had to wait in a tent and then one after the other was going through—green light, red light—into a box. You could sit down. I remember I had a pullover and he said, "Please, you want it here or here?" I said, "here." And I said, "Does it hurt?" He said, "No. Maybe you have a bit of a swelling today or tomorrow but don't worry." And he went on with the disinfectant and the jab was not painful and I was given the pass—no, not the pass. I had to leave the box to go and pick up my vaccination certificate booklet and went out.

Shawn Buckley

Okay, so what happened with— You charged the doctors. Can you share with us what's happened with that?

Pascal Najadi

Okay, so I filed those charges as well as a whole package to the federal prosecutor.

I said, "The whole line is defunct because obviously promoting it as safe and effective for protecting, it was obviously not true by the Minister of Health statement in television." I said, "The doctors didn't ask for informed consent and signature, which they should." I also submitted the lab report and the spike report. And Professor Dr. Bhakdi sent directly, in German, his conclusions.

I've done all the job actually, what the justice should have done. But it then got rejected. All of these three charges got rejected. The federal prosecutor rejected [them] a few weeks ago saying that the Minister actually did publicly, on several occasions, say that it's not quite effective and that it could be dangerous.

Shawn Buckley

I just want to put that into context. So the public prosecutor isn't saying that you're incorrect about him lying publicly on the occasion you complained about, but he didn't break the law on other days, so he's not going to proceed with charges.

Pascal Najadi

Correct.

Shawn Buckley

I used to practise defence law. I'll have to try that on a judge and see how far I get.

Pascal Najadi

Yeah, so the federal prosecutor came back with a different statement. I said, "How come in August 2021, the Director of Infection Control says it doesn't protect and it's not— et cetera? And how come three months later, in October 2021 the Minister says it protects?" That was my point. That was not answered or investigated or anything.

So I've taken a criminal lawyer in Zurich and we have now taken this—filed within the deadline, comfortably fine—to the federal criminal court of Switzerland. And it's now there, where my lawyer has written a piece proving that the entire COVID vaccination policy was a lie and was fake. I mean, wrong. And we are now at that stage.

With the two doctors, we took them to the cantonal—in your case would be provincial—supreme court proving well that informed consent was necessary. Why? The prosecution claimed it was not a poisonous injection;

[00:20:00]

therefore, I should have given these criminal charges within three months after the jab. But if it's a poisonous injection—that's our argument—we have 10 years. And the nanolipids on the packaging, that's clear: nanolipids are toxins. Therefore, it's a toxic injection. Therefore, you know, we will see where this goes now, but it's at the Supreme Court of Lucerne.

Shawn Buckley

It's curious, we had a witness this morning, a Dr. Shoemaker, that was telling us with regards to those lipid nanoparticles that basically a hundred percent of the animals, the mammals, would die in animal testing. So it basically didn't even get to human testing until our current vaccine rollout.

Pascal Najadi

Yeah, I'm not an expert, but that's what Professor Bhakdi told me about the nanolipids. Yes.

Shawn Buckley

Now, you're also involved in a civil lawsuit in the state of New York.

Pascal Najadi

Yeah.

Shawn Buckley

Can you tell us kind of how that came about and what that case is about and how it might apply to us in Canada?

Pascal Najadi

Yes. Well, I got in touch with Ana McCarthy; she's Panamanian American citizen. She's not an attorney, she's not a lawyer, but she studied law. And she has filed two active cases that are now active at the New York State Supreme Court in Manhattan. These are cases 101048/22, filed in November 2022, *Ana McCarthy v. Pfizer, Inc.* New York. And the case I'm involved is case 100197/23, filed on the 6th of March of this year, 2023, at the same court. Both cases are active. The justice assigned is Honourable Justice Lori Sattler.

These cases are very important. Why? Because Ana McCarthy argued, correctly, that actually President Biden's national emergency and vaccination mandate of the 9th of September, 2021 in the United States—that was Order 3414042—was unconstitutional. Because the U.S. Supreme Court has ruled on the 13th of January '22—remember that's the same power like the White House, the U.S. Supreme Court—that under the First Amendment of the United States Constitution, there is exemption for religion. This was not communicated by Biden to his own military and his own people or all of the nations worldwide.

That means there is an exemption: it's religion. Which means you don't have to specify. If you're on American territory or anywhere in the world, the injection—no matter which vaccine—is a U.S.-manufactured, U.S.-patented, U.S. company product, you can say the simple thing: "I don't vaccinate. I am religious." You don't have to say which religion, you don't have to say if you're a priest or not, you just say, "I feel religious." That's fine.

Shawn Buckley

And I just want to slow this down. Because this is important, what you're talking about. Now my understanding is—and this is from an earlier conversation—that by U.S. law, U.S. companies have to obey U.S. law, even abroad. So U.S. companies acting abroad, they can be **subject to court proceedings in the United States.**

Pascal Najadi

They are not allowed to violate U.S. law that prevails at home abroad. Very simple. The United States did not have a nationwide vax mandate which made a two-tiered society between vaxxed and unvaxxed. Yet in my example, Switzerland—I'm Swiss-British—or Britain, Pfizer came to our country, violated those rules by selling their product, making money in a two-tiered or apartheid market, vaxxed/unvaxxed. Already that as well is a violation because in the USA, everybody is the same in front of the law. Okay?

In Switzerland with the COVID law, not. Because if you're not vaxxed, you cannot go to the restaurant. So it's apartheid. If you're vaxxed, you can, you could. They are not allowed to violate U.S. laws abroad.

[00:25:00]

It sounds simple, but it was a lot of work to file. And it only was possible because I'm Swiss and British; I could attach the criminal filing—not the procedure, just the criminal filing in Swiss precedent—to this case, 100197/23. And I was able to attach a ruling that files a loss in London in the administrative court in '22 for frivolous marketing. I could attach that ruling as a British citizen onto the case that we submitted, or she submitted, into the New York State Supreme Court in Manhattan against Pfizer.

Shawn Buckley

Right. And again, I'm just going to try and explain this because I want people to understand. What you're saying is that U.S. companies, so Pfizer acting in Canada is subject to U.S. law, not just Canadian law but, according to the U.S. system, U.S. law. So they can be held liable for violating U.S. law as they act in Canada and so that would require a religious exemption.

And it would also prevent a two-tiered system; you call it an apartheid system and that's quite appropriate, actually: identity papers for the state to grant you privileges to access certain activities. So that's basically why you believe this is an important case.

Pascal Najadi

It's very important.

Shawn Buckley

Yeah, I just, I'm trying to make sure people understand what you're saying.

Pascal Najadi

Yeah, sure. And don't forget, people can also sue the U.S. president now because he did not communicate on the 13th of January 2022 that actually every human being on the planet has a right to say, under the First Amendment of the United States of America, "I don't need to vaccinate."

Shawn Buckley

Right.

Pascal Najadi

One more legal fact. On the 23rd of March of this year, President Biden lost in the Fifth Circuit Court of Appeals of New Orleans. He lost the claim, his claim. He said, "I'm the CEO of the United States of America. Like a company CEO, I have the right to force-vaccinate my employees of the federal agencies." Well, the judges ruled, "No U.S. president has such authority." And they reaffirmed in their decision that on U.S. territory, vaccinations are an exclusive affair between the doctor and the patient. Been ruled on the 23rd of March, 2023, in the Appeals Court of New Orleans. He cannot go to the U.S. Supreme Court with this because he lost already in '21 with the same question at the U.S. Supreme Court.

Shawn Buckley

Which is likely why he lost in New Orleans the second time around. So, okay. Now you were telling me about something happening in Germany regarding their military.

Pascal Najadi

Yeah, the German Ministry of Defence is still force-vaccinating their soldiers and officers. That is obviously in violation of what I just told you. Ana McCarthy has—and I witnessed this call—called the Ministry of Defence a few days ago and has made them aware that they are in violation by using, in our case, Pfizer U.S. product force-vaccinating soldiers, or under vaccination mandate. Ana McCarthy also has issued temporary restraining orders, has notified Pfizer—via their lawyers, Davis Polk in New York—and the judges in New York that the German military is still doing that.

We are now watching every day to see when the German military, the *Bundeswehr*, will stop this illegal activity.

Shawn Buckley

So it's another example of using the U.S. courts to try and influence what is happening in other countries.

Pascal Najadi

Well, it is clear: it's a violation. I mean, it's not just trying to influence. We report them and say, "This is a violation." This is serious. It's not trying to—they have been notified. The TROs [temporary restraining orders] have been issued. They are in force.

We will see, but the German government cannot continue with this. Impossible.

Shawn Buckley

No. And you see, you're describing a procedure that Canadians don't appear to have attempted. We've had a lot of lawyers speak in frustration about our constitutional rights being overlooked during this in court cases, but we haven't actually heard of attempting to use U.S. law to influence what happens in Canada.

[00:30:00]

And that's why I'm kind of going over this again and again, just so that we get to understand that.

Now, you had kind of presented a presentation and I stopped you from reading it. Are there some points that you wanted to cover that I haven't asked you about yet?

Pascal Najadi

No, it was just maybe my closing remarks, but I can wait. I'm here for questions, really.

I've said what I had to say, what I have done, attempted to do, and the Swiss criminal charges are now at the Swiss criminal court and the two Swiss doctors are in the Lucerne Supreme Court. I will update people—you, maybe—as soon as we get more information

through my channels. My Twitter is @najadi4justice and I update and make legal statements there.

Shawn Buckley

And I'll also indicate that some of the court proceedings that you've referred to we've entered as exhibits for the commissioners and the public to access, so that they have a better understanding of what you're referring to [Exhibits OT-3, OT-3a to OT-3g].

I will open you up then to the commissioners, if they have any questions. We're doing decently for time.

Pascal Najadi

Thank you.

Shawn Buckley

No, and the commissioners don't have any questions.

So Pascal did you want to just share briefly some of the remarks that you had for closing?

Pascal Najadi

Yes, I would like to, if I may.

Shawn Buckley

Yes.

Pascal Najadi

I call this The Devil's Rules Explained. But we are battling always that recognition that we have been duped. How do you get someone to admit that they have been duped and triple-injected or double-injected with an mRNA bioweapon substance? How do you get someone to admit that they have been duped into giving these injections to their own children? This psychological trap makes the duped the guardians of the dogma. These, the duped, have been placed in the position of having to lie to themselves in order to maintain psychological equilibrium and avoid harming themselves. This trap of pride makes the Machiavellianism of their crimes, they have been allowed to harm themselves.

This is—for the bad, evil people—the perfect genocide, is perpetrated through the victims themselves. But no, we will break this and obliterate these rules, with strong determination have begun to stop this genocide, promoted by truth. Thank you.

Shawn Buckley

Thank you, Pascal. And Pascal, we really appreciate you. I know you're in a different time zone and you've been very kind to attend.

On behalf of the National Citizens Inquiry, I want to sincerely thank you for participating and sharing this important information with us.

Pascal Najadi

Thank you, sir, and thank you for the Commission and thank you to everybody. Greetings to Canada and all over the world, thank you.

[00:33:15]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 7: Aidan Coulter

Full Day 3 Timestamp: 05:36:21–05:44:10

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Wayne Lenhardt

Our next witness is going to be Aidan Coulter. So Aidan, if you could give us your full name and spell it for us, I'll do an oath with you.

Aidan Coulter

Aidan Coulter. So that's A-I-D-A-N C-O-U-L-T-E-R.

Wayne Lenhardt

And do you promise that the evidence you give today will be the truth, the whole truth, and nothing but the truth?

Aidan Coulter

I promise that the evidence I give today will be the whole truth and nothing but the truth.

Wayne Lenhardt

Okay, we're going to talk for ten minutes about the problems you had when you were about to enroll at Ryerson [University] when the mandates came into place. So you were going to enter your first year, your freshman year, at Ryerson?

Aidan Coulter

Mm-hmm.

Wayne Lenhardt

And that was in the fall of 2021, correct?

Aidan Coulter

Yes, correct.

Wayne Lenhardt

So tell us what happened.

Aidan Coulter

I had applied and gotten an acceptance letter for the Fall of 2021 semester. And then about a week or two before, that would have been July 2021, I received a response back from my application to residency and paying for residency. And they said that in order to attend residency, one would have to be fully vaccinated in order to interact with their peers and the residency community.

I did not have any intention of taking an experimental gene therapy that had at that point been untested. They said there was a form that you could fill out. And that form, ordinarily, would be for a person with a disability who is seeking a human rights accommodation. So I modified that form and sent it to them, saying that they were basically breaking various healthcare laws, so that was the personal private healthcare information act [Ontario's *Personal Health Information Protection Act*], the Nuremberg Code, and the Helsinki Declaration, among others. And saying that this request to have me have an experimental gene therapy was against the law.

They responded back saying that there was nothing that they could do about that, that I had not given them sufficient evidence or sufficient documentation. But by that point, the deadline to apply for residency had passed. I had to find very last-minute co-op housing within the Toronto area to live.

Wayne Lenhardt

And at that point, were you able to go to classes?

Aidan Coulter

Two out of my four classes were promised to be hybrid; these were classes that required a technical component because I was taking film. I was film and visual and media design. So that was film tech and silent film that required a technical component—were promised to be hybrid, meaning that there would be an in-person component. The first day of in-person classes, I attempted to attend being aware that there was a screening requirement, like an app that you had to fill out and also that you would have to test yourself.

Wayne Lenhardt

You completed one semester then, is that right?

Aidan Coulter

Yes, that is correct.

Wayne Lenhardt

And what happened during second semester?

Aidan Coulter

The second semester, or the fall semester: basically, the upshot was that, for the winter, they said that my classes were frozen and they would not provide me with automatically signing me into my coursework for Winter 2022.

Wayne Lenhardt

Okay, so you basically went back home for the second semester because of the situation.

Aidan Coulter

Yes.

Wayne Lenhardt

Okay. After you got back home, how did you fare?

Aidan Coulter

So primarily due to the stress and isolation that was inflicted upon me and not being able to access equipment during the winter and fall semesters, I had an episode of psychosis. That would have been, sorry— May 2022, I had a brief episode of psychosis, which consisted of intrusive thoughts and basically, kind of synchronicities or making connections that weren't there.

So basically, I was in an unstable mental condition. And I went to the hospital to receive psychiatric evaluation. I was put under a Form F,

[00:05:00]

which would mean 72 hours under the observation of an overseeing psychiatrist. And in order to be admitted into hospital, I would have had to take a PCR test.

I initially refused because the cycles that they're normally run on mean that the likelihood of a false positive was very high. But in order to be admitted, I had to take the PCR test and I resulted in a positive—or false positive as I understand it—for COVID-19, meaning that I could have been contained for more than the 72 hours in the hospital.

Wayne Lenhardt

Okay. And you never had an episode of psychosis before?

Aidan Coulter

Prior to this, never.

Wayne Lenhardt

Great. Have you had any since, just that one?

Aidan Coulter

I was put on a Abilify, which is a mood stabilizing drug. And had a brief episode a little bit later. But since then, I have fully recovered, yes. I was on for about— It was nine months that I was on the drug.

Wayne Lenhardt

In September then of 2022, did you go back to university or college, or what did you do?

Aidan Coulter

No, I was worried about a reintroduction of the mandates since in the public consciousness, it's still perceived to be an emergency and that the measures warranted in regards to the mandates were valid.

So I was worried about a return of the mandates. And then also due to my own mental health.

Wayne Lenhardt

In other words, you worked at a provincial park. You never did go back to Ryerson, is that right?

Aidan Coulter

No, I did not return to Ryerson due to their treatment of me.

Wayne Lenhardt

And you are going to go back to a college this September, though?

Aidan Coulter

Yes.

Wayne Lenhardt

Tell us about that.

Aidan Coulter

I applied to King's College University in Halifax. They have a foundation year program that studies classical literature. And that sort of narrative is as close to film as I can get. I'm a bit nervous because they still have a masking policy in effect, so we will see how that goes.

Wayne Lenhardt

Just out of curiosity, any of your Ryerson courses that you got in the first semester, are they transferable?

Aidan Coulter

Not to my understanding, no.

Wayne Lenhardt

No. Okay, at this point do the commissioners have any questions?

Is there anything we've missed with respect to the problems you had during this period?

Aidan Coulter

No.

Wayne Lenhardt

Okay. On behalf of the National Citizens Inquiry, I want to thank you for coming and giving us your testimony today. And good luck in Halifax next year.

Aidan Coulter

Have a great day, thank you.

[00:08:17]

Final Review and Approval: Jodi Bruhn, September 6, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website: <https://nationalcitizensinquiry.ca/about-these-transcripts/>

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 8: Navid Sadikali

Full Day 3 Timestamp: 05:45:08–06:20:59

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Wayne Lenhardt

The next witness is going to be Navid Sadikali, I hope I pronounced that correctly. And I see him on the screen.

Good afternoon, Navid, my name is Wayne Lenhardt and I'm going to be doing an oath with you and asking you some questions today. Could you give us your full name, spell it for us, and then I'll do an oath.

Navid Sadikali

Navid Sadikali, N-A-V-I-D S-A-D-I-K-A-L-I.

Wayne Lenhardt

Do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony today?

Navid Sadikali

I do.

Wayne Lenhardt

Okay. I understand that you have some slides that you want to show us.

Navid Sadikali

Yes, I do.

Wayne Lenhardt

Sure, if you want to just launch into it and—

Navid Sadikali
Absolutely.

Wayne Lenhardt
And we'll stop if we need to along the way.

Navid Sadikali
Absolutely. So just to give some background on myself and then I'll jump into my slides. Like many of you, I've been navigating the world of some complex decision-making in health care and other matters for the last few years. But unlike some of you, I have experience leading innovation in healthcare firms, and that's for 23 years.

In some sense we're already connected. If you go into most hospitals in the world, there's technology that I designed in the radiology department, cardiology department, so I'll tell you a little bit about that. Then we're going to go into something quite exciting and stay to the finish because there's a really optimistic ending to this.

I'm going to share my screen now. I hope this comes through okay. All right. Has that come through?

Wayne Lenhardt
Okay. I believe you have a slide with all your credentials on it. I wonder if we could have that one next.

Navid Sadikali
Sure. Yeah, I'll tell you a little bit about myself and then we'll go through the rest.

In a sense I started after going to school in the United States, being recruited for rowing there, to Brown University. I got two degrees there and I went to University of Waterloo for my master's. I have experience in science and in computer science technology and so the integration of that was medical imaging. I helped to disrupt the world medical industry, which was all film in the early 90s. And it's Mitra, and then at Agfa, which— We were purchased as a startup. We ended the medical film industry and it all became digital.

And since then—for like I said, 23 years—I've been leading product design at different companies, most recently Canon Medical, where we had a \$200 million portfolio. I designed big imaging systems used across the world in pretty much every hospital and many clinics. **It impacts at least 200 million patients a year today. Those are products in radiology, cardiology, oncology, and surgery.**

We started with this, which is— Here are some of the hospitals I've been in.

Why does this matter to you? Well, basically, I've had to go into pretty difficult environments where there's— Both fun and difficult, where there's a lot of opinions. Experts are at play and my job is to figure out what we should do as a company, where we should take medicine forward. We don't just listen to experts because we're the experts in medical device creation and that's me. And so I have to sort of integrate many perspectives. And to do that you have to be quite open-minded, to listen to all sorts of opinions. And if

you go to an academic teaching hospital versus a regular community hospital, things are very different.

Medicine looks many different ways in many different places. And my job as designer and the scientist is to bring that all together and help the engineers build the right products. So just to show you what that looks like, this is some of the technology that I've designed. So stroke imaging, cardiology imaging, general radiology. And so these are actual products where I've been in surgical wards to figure out how to push surgery forward. And I've seen many interactions with patients and oncologists to understand what we need to do better. So that's my background.

I want to really focus it on us, which is you. And our goal today is to cut through the complexity—which is what I have to do anyway in medicine, right? To cut through all the complexity because most physicians aren't interested in academic stuff, they've just got to get their work done.

There's six stories I'm going to be telling. And those bring together three business stories and three scientific stories. And if you understand those, the world will be a very different place.

[00:05:00]

It'll be a safer place. And if we can get the doctors out there—there's a million doctors roughly in North America—if we get them to understand these stories in these 20 minutes, we won't have another pandemic like we did. In fact, we may not have any more in some sense. And we'll have to get into the specifics to see what I mean by that.

The first story I want to tell is just that in October 2019, "The Business" was preparing for a pandemic. And Event 201—some of you may not know about it; watch on YouTube—was an economic and business event to prepare for a coronavirus pandemic. They actually ran it like a war game; they ran a simulated pandemic for coronavirus.

And then what's interesting to me, because I'm saying that business was leading, was that no physicians were invited to this simulation of a pandemic. And there's a lot more to say about this. But really what we need to say is that this is business leading the charge; some of the biggest pharmaceutical companies on earth are there. What's important is that it wasn't science leading.

Who was inviting the people to this? It was the World Economic Forum. They were the ones who took the stand, gave the intro keynote. And what Ryan Morhard, the lawyer from the World Economic Forum said, "One of these days, a pandemic, a fast-moving pandemic." That's October 27, 2019. And then, if you look at what was said on day one of the pandemic, March 12, 2020: "There's not going to be a way back to normal." That's what Ryan said on March 12, the first day of the pandemic.

This is business leading the way, because the scientific community had no idea that there was not going to be a back to normal. In fact, it wasn't really clear what was happening in terms of the scientific community at that point.

I want to move on to the second story. I already did one, it's great.

Now second story, a business story, is that December 12th, 2019—which is about three months before the pandemic was declared by the WHO [World Health Organization]—we

have a legal agreement, a material transfer agreement between the University of North Carolina at Chapel Hill, Moderna, and Fauci's NIAID [National Institute of Allergy and Infectious Disease]. And they were testing the mRNA corona vaccine candidate and this coronavirus vaccine candidate was a joint venture between Fauci's NIAID and Moderna. And the University of North Carolina received this for animal challenge testing. Here's the most well-known, prolific coronavirus spike protein researcher Ralph Baric signing this agreement. The patent holders of the spike protein that was used to create the vaccine—which has a long history and patent history, which I put links to there—was signing this. And Moderna signed.

So it's a work that was happening before. Now what does this mean? We can't really dive into that right now but just to say that, "Hey, look. Again, business was leading the way." This is a business agreement, right? To do some business.

The third business story I want to tell is that billions were spent to market a lockdown. Some of you remember the NHS's [U.K. National Health Service's] Stay Home, Save Lives campaign. There was the same type of messaging through the world, actually. Campaigns were used, "Look them in the eyes and tell them to always keep a safe distance." So quite in-your-face, hard-hitting advertising. This advertising was created in an agreement in the U.K. with the world's top—I think it's near the top—marketing agency called Omnicom, on March 2nd, 2020.

So that means they were in discussions in February to sign an agreement on March 2nd. That's all before the pandemic was declared on March 11th. There's a marketing business event happening before the pandemic started. And what's really important to note if you're an epidemiologist is: look, on March 3rd, the day after they signed a contract for lockdown or stay-at-home campaigns, there was only four cases in the U.K., and that's 68 million people, and there were zero deaths. So the U.K. spent more than even World War II on an ad blitz—proportionally even more, accounting for inflation, than World War II—to market lockdowns and the sort of measures they wanted to take. And by the way, those measures were discussed at Event 201 in October 2019.

We could go into some of the agreements that were signed: the HHS [Department of Health and Human Services] in the United States signed \$1 billion dollars for advertising;

[00:10:00]

\$328 million with the Omnicom Group for "Stay Home, Stay Safe," et cetera. You can see this. Nations spent heavily on lockdowns.

Now we're going to move to the science. You've kind of got three business stories that I think, for those interested in science or in academia, they could look into those more. It's a little bit of a push to spend more effort on this. So now to the science. Now the science was obviously being—had not advanced. So now we have Neil Ferguson. I won't go into the full story, but he's a modeller who's had some bad successes in the past. He works for Imperial College. And his Excel file went around the world.

He had Imperial College, which is heavily funded by a private foundation called Gates Foundation. He created an Excel file and that Excel file went around the world. And it said something that's quite dangerous: It said that we were going to have unmitigated, without lockdowns, which he was saying we needed trying to sell lockdowns— In Canada, we'd destroy Halifax, the equivalent of Halifax, in months. In the United Kingdom, it would be like 489,000, you can see their deaths. This is the Excel file, there's a link to it. And in the

United States, there'd be 2 million deaths—and we're talking about in months. Like, that would be like the city of Houston.

And so obviously that kind of a scientific message from an individual somehow—and we think it's through WHO and all the national governments—scared people. If you're going to destroy Houston, well, you probably should lock down. So that's the first scientific story. There's a lot more to dive into there, but I think you need to know that that's what actually happened.

So now we're going to go to the fifth story. We're advancing at a good pace here and I'm going to slow it down a little bit. The last two pieces, these two things are a little more technical. But everybody can understand these, so I'm going to go a little slower. And if everybody understands this, you're going to be 99 per cent ahead of all the scientists and all the physicians on the earth—probably 99.99 per cent, to tell you the truth.

We're going to go through the PCR test first. And the PCR test caused mass medical confusion. You've probably heard of this during the last few days, and I know many of the speakers have touched on it. We're going to understand a little deeper and a little more visually. And you're going to get it.

So first, you know that a virus is like computer codes; it actually is a coding system. This screen is all these letters that are proposed base pairs for coding for the length of the viral virus RNA, this proposed coronavirus. We can't find them. We actually have no technology to find them very well, at least not at mass scale. What they actually do is they find this PCR test that finds a little bit of a bigger thing and say, "Well, if I find that, that's indicative of the big thing." And that's already a bit of a hint. You're not actually looking for it, you're looking for something that looks like the thing you're looking for, right? Sort of like, a bit of a clue.

When you do a PCR swab, it's important to note: there's billions of DNA bases in that swab. If you took all those bases like a code and overlay them all and put them over seven million kilometres of highway in North America—so that's how much is coming in that little swab. DNA is really small and RNA is really small. Then how much would the PCR be looking for? We would be looking for, like, a 50-metre section of road in seven million kilometres. So we're looking for something very small. And like I said, the virus is a lot smaller; it's like 15 kilometres. We're only looking for a 50-metre section and saying, "If we see that in all that stuff, we really have a virus." What's interesting about that is, obviously that's really difficult. We can't really look with a microscope for something that small.

So what PCR is, this is what you really need to know right here: it's just a photocopier. If I take one page and I photocopy it and I get two pages, and I collate them, and I photocopy again, what am I going to get? I'm going to do one, two, I'll get four. And I take all four and photocopy each one again, I'm going to get eight, right? So we get this doubling idea, which is what PCR is. It's a photocopier just like this one, except it's doing it with this little thing I found. Let's photocopy it, make two. If I make two, I make four; and I make four, I make eight, and that's the two to the power.

[00:15:00]

If you do that 35 times, you've lined up 35 photocopiers; you'll get 34 billion viral PCR segment copies. Now really, it becomes DNA copy. It's not the virus—remember that. And if you have 35 billion of something, you can imagine: well, now you can maybe see it. And you can because they sort of tag it with a light emitting element, a chemical that is going to light

up. So basically, that's how PCR works. It works by taking something small and making it really—amplifying, amplifying, amplifying, photocopying, photocopying, photocopying.

What's the result of that? The result of that is that you take one: if I have one of these little pieces in my nose and if I duplicated that through that doubling 24 times, two to the 24[th power] is 16 million. Okay, does that mean you're sick or not? Well, actually nobody could say on the earth. If I have 60 fragments, those little 60 pieces, and I do that 24 times, I have a billion. Am I now positive? But if I have one and I do that 30 photocopying duplications, I get a billion. Oh, and is that—?

This is not a test. This is a duplication thing that through some interpretive event says, "Maybe that's a positive; maybe you're sick, maybe you're not." It's not a diagnostic test of sickness. So that's one of the first and early confusions. And obviously it was sprung across all the physicians who, "Well, I guess the test works." But they don't really know the science of it, right? Because they don't go to school for this: this is molecular genetics; it's not something they're really familiar with.

And so really, we don't really know— With this test, the problem comes about that this duplication process, we don't really know what is true or not.

Because of that, you have a lot of ways that this can be a false positive test. For example, if a kid breaks up the virus really quickly in his nose and he gets these little fragments, his snot will be positive, potentially for 90 days. That's a false positive. If you walk into hospital Tim Hortons, let's say, and you're in the coffee line: someone sneezes and a little fragment goes in your nose, the virus or even a broken piece of it, then you'll be positive. And you're going to the hospital for something. So you could actually be there with another illness, but now you're positive because you were in the hospital coffee line. Well, that's not fair.

And of course, poor lab processes lead to contamination and that happens. And then high amplification leads to bad protocols—which we can't even get into, there's so many ways that can happen. With the reagents and different temperatures. Then you can just amplify the wrong RNA or DNA. You could actually have—and some people said you could make something that's—you know, a brown trout matches, has sequenced like the one that they're looking for in the PCR test. Now is brown trout in your nose? Well, probably not. But maybe. All right, we're talking about little small elements of it.

There are many ways to get false positives. We're not going to cover them, but here's two scenarios that happened that impacted all of us. Fifty kids in a school—or all the kids in the school—are tested, but they're all exposed a month ago. None were ever sick. Their natural killer cells broke that virus up, let's say, and there are little fragments in there. You go to amplify them and they're positive. Now you've got 50 quarantined kids that have no infection. And that can happen up to 90 days after they were exposed. And so for example, if you— That is unfair because you quarantine truly healthy people because of a test that's really very iffy. It's not a test of sickness, right? It's a test of viral pieces.

The next thing that can happen is that our patient, like I said, goes into the hospital, short of breath, viral fragments in his nose; he's lined up in the coffee shop. He goes for a PCR test so they can start treating him. He tests positive. Now he's in the COVID funnel. And maybe he gets remdesivir because they think he's a COVID patient. And maybe he gets put on a ventilator because he's now tested positive. So now a whole protocol gets enacted because of a test that's not even diagnostic, a real test, itself. This is sort of like a factory system, right? And medicine has to kind of work like that, but when you put a new technology in, it

doesn't always work well. And trust me, I've done— I've built FDA [Food and Drug Administration] products in the world, so I know about safety.

Okay. I can't go into all the details. There's so much here you can see I've put links to. But what this means for us is that all COVID statistics are uncertain and overstated: We have studies used to show 50 per cent, some doctors say 90 per cent. In certain cases, in certain times, right? This is a complex thing of when,

[00:20:00]

what PCR tests. There's many vendors: some PCR tests could be completely bogus; some may be cycled less; and so, there's, you know, the number of false cases will be 50 per cent.

What that means is that we don't have any good data on cases, hospitalizations, and deaths. We know they're overstated. What would have the world looked like if there was far less cases? Would they have been able to— Would the fear have been instilled as well if there were less cases? No, absolutely not. Because the more you test, the more you're getting cases; just from the false positive rate itself, you could create a steady line of positives.

Okay. What we want to say next is: the vaccine was never going to work. So now we're going right into fundamentals. We don't have to— We can debate about statistics and we'll get into that a little bit, but what really we need to know is that when you inject into the arm, you make something called IgG blood-borne antibodies. You see that little guy with the hat? He's orange. Those antibodies are in your blood; they're circulating, I just get a portion of his body.

Now, when you get a natural infection in those cells, you get IgA antibodies. That vaccine can't put those IgA antibodies in your mucosa, which is where you start getting infected. You don't get infected in your arm, right? It goes through your mucosa and that's how the system's designed to block this. Basically, what this means is that the injection could never make IgA antibodies in your mucosa—nose, throat, intestinal tract is also mucosal entry point. So it could never stop infection; it couldn't stop transmission because that thing will never make the things you need, the IgA in your mucosa. So by first principle, it was impossible. And of course, Gates now admits that.

So how did they get efficacy? And everyone's wondering this and you're going to get the answer now. How did they get efficacy from a vax that couldn't work? How can they say "95 per cent" when you know that it couldn't even work?

What's happening here is that, when you get injected, it's an immunosuppressant, right? There's foreign technology in that shot. People have talked about polyethylene glycol and cationic lipids. And that stuff, your body's immune system is like, "Oh, that's a foreigner. I'm going to attack that." What happens is you get the immune suppression and you'll potentially get sick—especially if you're exposed. Or it's already there and you've already had it, but now you're actually weakened and now your immune system can't fight it off. So COVID cases rise after the first dose and after the second dose. We kind of can get that because it suppresses your immune system.

You get injected, you get a little bit of a fever—Israel had data that it was happening en masse to the whole population. I have to go back and look at the numbers, but it was well-documented this happened. And it has to happen because you're injecting a foreign item in your body. So all we have to do to get efficacy is withdraw those people who get that after the first week or second. Don't count those people, right? That's what happened. In some

studies, they call them “partially vaccinated”; in some they’re “unvaccinated”; and in some they’re actually—and I’m going to show you in the Pfizer study—we believe that some of them were just completely trashed. Like that data is not used, so they’re not in the study, ejected from the study.

Let’s look at the Pfizer data, which is the only— Remember, this is the only randomized control trial we have. We have 311 withdrawals in the vaccine arm and 60 in the placebo arm. Well, why would that be? Why’d you have five times more withdrawals? They call it protocol deviation. Let’s say that we were injecting people and those 251 people got the— 311 minus 60, right? The vaccine had this many withdrawals. With the placebo, it’s only 60. It’s 251 that were just removed. If we take those 251, say, “maybe some of them got sick.” Let’s pronounce it: “They got sick, they got a fever, and the protocol said they have to be removed from the study.”

So then what does that mean? That means that on the left, we’re being told the vaccinated sickness was 9 in 169. That’s actually the numbers. That’s how you get— Over 18,000: you divide those numbers, you get 95 per cent, right? If you put those people back, the 251 and the 9, you have more vaccinated getting sick than placebo. You have negative 53 per cent efficacy.

[00:25:00]

I’m saying on the left is what’s published, on the right is what’s likely. We would want— We’d have to go back and get all of that data, all of the site’s data. And what each person would happen to them out of the 260 that we’re saying were perhaps withdrawn because they got sick in the first few days.

But we don’t actually have to even look there. We have good published data that show this is actually happening for sure. The Government of Alberta proves that the newly vaccinated are at risk but counted as “unvaccinated.” So here we have—and they published this—time from immunization date to their COVID diagnosis. And these are the first 14 days. You can see that the graph goes way up the first 14 days. These are the deaths.

So you inject someone and they die. And I’m not saying causality. But if they die in the first few days, what’s important here is not causality: it’s that they’re removed from the study and put into “unvaccinated,” right? That’s what’s important. The first 14 days, they’re considered unvaccinated and all other days they’re considered vaccinated—even though they’re all injected. So when we look at their data, 56 per cent of the deaths were in the first 14 days and 44 per cent of the vaccinated deaths were in the other days. So these people are being put into the wrong bin.

If we look at Ontario, and this is right from the website: “Unvaccinated cases,” by definition, are “where symptoms started between zero and less than 14 days after receiving the first dose of a COVID-19 vaccine.”

This is the world’s biggest problem right now. This is it. This is right into the heart of it. Because you don’t have to debate statistics and say, “Well, this study shows that.” If you rerun all the data—and I’m proposing that scientists do this—rerun all the data thinking about this and saying, “Well, we’ve binned them this way. What if we binned them the other way? What if we consider them actually vaccinated if they got injected?” This is the source of the distortion.

And there's studies coming out and people trying to talk about this. Thirty Sweden doctors published pushback on distorted mortality data in Sweden. And that link is on the bottom right. Like I mentioned, there's lots of links in this presentation that I didn't cover that you should look at.

Okay, so that covers all the six stories. The breadth of it is that there's a business cycle that's happening first, and then the scientific cycles coming, happening. It's really, there's vaccine cycles coming. And that constitutes, I think, the most important things the public really needs to understand and go, "Oh, wait, that's kind of really a bit confusing and that's not really telling me how it is."

I want to leave with a sort of an optimistic future. My key point is that if people are being sickened by this vaccine technology, then we have to reconsider: is it really ready for prime time? That's going to be up to many other people to do that. But we have to sort of be aware and mindful that potentially the statistics are leading this way—if we rerun the statistics, which we have to rerun.

But the optimistic future I want to leave is a perspective about, we're kind of under-appreciating something scientific. Not just a little bit, a lot under-appreciating something that we all believe. I think really the heroes of this, really the potential way out of this—I think, and this is the big reveal: we have a pretty amazing set of fighting systems, probably the world's greatest army we have. And it's broad and it's got a lot of pieces to it.

We have natural killer cells, which children have in some studies, five times greater than older adults. We have T cells. No one's talking about, "Hey, how many people were immune already from T cells? How many people were immune from natural killer cells? We have a lot of technologies that are already built, purpose-built for this.

The optimistic message is that if we can keep ourselves healthy and really appreciate what we already have— We need to rerun statistics but, you know what? We were actually good. And secondly, we should appreciate that, look, that T cell right there with the sword: If he sees foreigners, if he sees mRNA technology in your heart, his job is to destroy it. If he sees that in your brain, his job is to destroy it.

So you need to be more careful what you're putting in and saying:

[00:30:00]

Look, if this is causing your immune systems to fight and damage, you're fighting yourselves, right? We need to be on side with "Hey, this is, by estimation, \$100 trillion technology." I don't even think mankind could recreate it. And it's extremely complex. One of the most complex systems on the earth are the way all these characters work together. I haven't even talked about neutrophils and macrophages and mast cells and B cells and helper T cells. And there's a lot of pieces, right? And we're not even talking about the complement system.

But I think, and sort of leaving it here, that if we're able to really appreciate and re-look at this scientifically—I mean physicians and scientists and the general public—we're going to come to, "Hey, we're actually good." When we look back, maybe things could have been a lot different.

Thank you for your time. And if there's any questions, I'm happy to take them.

Wayne Lenhardt

Are there any questions? Yes, Dr Massie.

Commissioner Massie

Well, thank you very much for this very lively presentation showing some pictures that are probably easier to grasp for most people. My first question is about the analysis that you show in terms of, I would say, reframing of the vaccine efficacy.

I've been following that literature for the past two years. My question to you is: When is it exactly, to the best of your knowledge, that we had initiated some suspicion about the data that was coming from the initial, I would say, advertisements from the pharmaceutical companies that we were getting these somewhat interesting protection levels in terms of efficacy? When is it that we started to question that?

Navid Sadikali

Well, I can only speak to my personal experience. That for me was quite into 2021 already. Because everyone was looking at the Pfizer data. I was in a sort of private scientific group. I don't think it's a big deal to say that people like Dr. Jay Bhattacharya was in that group. And we were discussing things. He wasn't discussing this, by the way, I'm not saying he was. But I was discussing with some other scientists, two others, and we were rerunning numbers. And we were like, "Hmm, that's really weird. And maybe that's all that's going on, is just binning things inappropriately."

I think that for the general public, they're probably still confused, like, "What did he say?" I'm going to say it very clearly now: If you injected everybody, right now, with a statistic run today and everybody died, you would have 100 per cent vaccine efficacy against death. Okay? That's how obvious this is. We don't have to look at nuances of things, this is extremely simple. It's a built-in bias in the statistics.

And you're like, "Well, how did that happen?" Well, I don't know, but I'm not the one who created these studies, right? Those pharmaceutical companies—they're very good at design of the studies to show things that they would like. So maybe that was by design. It has to be by design; someone designed the trial length.

To answer your question though succinctly: that was definitely in 2021. Maybe somewhere in 2020. I wasn't really looking in 2020. It was December when the Pfizer thing, I think, was released—and there was this study earlier than that. But anyway, 2021 is my answer for that question.

Commissioner Massie

My second question has to do with what you've shown, which I think now has been demonstrated in many studies, that with the mRNA vaccine, there are a number of ways that we can postulate that this injection will actually suppress the immune response for a window of time immediately following the injection. And that results, as we've shown in the data, in increased numbers of positive COVID infections. But the DNA vaccine with the adenovirus, would it be Johnson & Johnson or AstraZeneca: I haven't seen data that would show that following the injection, you would have this window of increased number of cases. Have you come across data like that?

Navid Sadikali

Well, I haven't run this for their trial, so that's what the first thing to do is. And the most important thing we can do is, it's like, these are randomized trials. So why don't we get the data? That should be the best data we have on the earth,

[00:35:00]

and every patient should be tracked, and we should know everything about everything that happened.

As you probably know, in some of these cases, some of these farmed out institutes had bad record-keeping and protocol deviations from their own protocols, and there's lots of things that happened there.

But I would say that the first place to start would be to have people look at the actual RCTs [Randomized Controlled Trials]. So I can't say I've seen study on the other types of vaccines with respect to the same, but I would suspect that they have adjuvants and they're going to do the same thing. The adjuvants, their job is to drive the immune system.

Commissioner Massie

Thank you.

Wayne Lenhardt

Are there any more questions from the commissioners? No. Okay on behalf of the National Citizens Inquiry I want to thank you very much for your interesting presentation. Thank you again.

Navid Sadikali

Thank you.

[00:36:24]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 9: Kimberly Warren

Full Day 3 Timestamp: 06:21:29–06:35:24

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Kassy Baker

Good afternoon, Ms. Warren. Can you hear me?

Kimberly Warren

I can.

Kassy Baker

Very good. Just to start off, can you please state and spell your name for the record?

Kimberly Warren

Yes, my name is Kimberly Warren, K-I-M-B-E-R-L-Y, last name W-A-R-R-E-N.

Kassy Baker

And do you promise to tell the truth, the whole truth, and nothing but the truth during your testimony here this afternoon?

Kimberly Warren

I do.

Kassy Baker

Very good. Now, I understand that you're here to talk to us about your vaccine injury. Is that correct?

Kimberly Warren

Correct.

Kassy Baker

Before we get into that, can you just please give us a little bit of your background information, including your current area of employment—which was also your area of employment when you were injured?

Kimberly Warren

Of course. I work at two hospitals. At the time of first vaccination, I worked at Groves Memorial [Community] Hospital and the Orangeville Headwaters Health Care [Centre] hospital.

As of the third booster, we moved to Ottawa. I work at the Ottawa Hospital General Campus and Queensway-Carleton Hospital. I am a medical administrative assistant in one of my roles. And the other role, I am a ward clerk.

Kassy Baker

Now, when you received the first dose, can you give us the reason why you received it?

Kimberly Warren

I'm sure, as everyone is now aware, health care workers were forced to have all vaccines in order to keep our employment. And many people were escorted out of our facility due to not complying with that mandated vaccination rule.

I of course was not in a position to lose my job and I complied.

Kassy Baker

I understand. Sorry, it's just come to my attention that we don't have your camera on. Are you able to turn your camera on?

Kimberly Warren

Let's see if I can do that.

Kassy Baker

Thank you. It doesn't appear to be on. Can you still hear me?

Kimberly Warren

I can and I can see you.

Kassy Baker

You can see me. In the bottom left-hand corner is there a little video camera that you can click? Should be next to the microphone.

Kimberly Warren

Yes, can you—?

Kassy Baker

I'm just looking at our tech team. I don't think we have you up yet, but perhaps I will continue at this point.

You've described to us the circumstances under which you received your first vaccination. Can you tell us when you received the second?

Kimberly Warren

Yes, so first vaccination was January 7th and then approximately just over four weeks later, February 11th, 2021, was the second. And the booster followed November 23rd, 2021.

We were one of the very first people that were given the vaccine due to being health care workers. And I worked at a COVID testing clinic, so we were sent among the first groups. After our elderly were sent, we were then sent in our area.

Kassy Baker

When you received any of the vaccinations, were you at any time told that there could be risks associated with the vaccine?

Kimberly Warren

No.

Kassy Baker

Were you at any time asked if you had any pre-existing medical conditions?

Kimberly Warren

No.

Kassy Baker

And do you have any pre-existing medical conditions?

Kimberly Warren

I did. Yes, I have pre-existing chronic kidney disease, CKD.

Kassy Baker

And just for the sake of clarity: your third dose, was that also required by the mandate? Or did you choose to have it?

Kimberly Warren

The third dose was not. We just kept getting all this—I don't know what the word is to call it—propaganda? But we kept getting emails saying that we all needed to have the booster.

The third was not mandated, however heavily suggested. And we kept getting a lot of internal literature on getting the booster.

Kassy Baker

Okay. And did you ask any questions when you attended any of your vaccination appointments?

Kimberly Warren

I did not. And in hindsight, I don't know if I would have gotten the answer I was looking for at that time anyway. To be quite frank, I went along with the narrative that this was a safe and effective vaccine and that it was required for me to keep my employment.

Kassy Baker

Okay. Now I understand that shortly, or sometime after your third dose, you started to have some complications, is that correct?

[00:05:00]

Kimberly Warren

That is correct.

Kassy Baker

Can you describe those to us?

Kimberly Warren

Yes. Since the series of three vaccinations— So after the booster, within 48–72 hours, I was having hematuria, so blood in the urine; and proteinuria, signs of that, which is foamy urine. And I was just feeling very unwell, fatigued. And I just knew something was wrong, but I didn't exactly know what. And, you know, you attribute it to— At this time as a health care worker, we were working more than 40 hours a week; we were working more like 60 hours a week. So I just attributed it to, you know, my workload.

And it was the morning— December 15th is when I was hospitalized. So that morning, I had called my nephrologist because I was in so much pain that I could hardly take a breath. And the bleeding was so— I really had no idea kidneys could bleed the way I was bleeding. I thought it was another problem, like a female problem I was having. I had no idea kidneys could bleed like that.

When I called my nephrologist, he immediately told me to get to a hospital ASAP. And he had already sent over all my file so it was there and waiting for them when I went into triage.

Kassy Baker

These symptoms that you've described: have these abated at this point or are they a continuing issue for you?

Kimberly Warren

No, they're a continuing issue. I always now have gross haematuria and proteinuria. This is a permanent condition now that will require dialysis and transplant in my future, 100 percent.

Kassy Baker

Were you able to continue working through the early stages after your third vaccination?

Kimberly Warren

I was off work for over a year: December 15th, 2021 to February 6th, 2022 I was unemployed.

Kassy Baker

Have you reported this apparent injury to your doctor and/or any other medical body?

Kimberly Warren

Yes. I was quite fortunate that my doctors immediately recognized that this was a vaccine injury. They had ruled out via CT scans, blood work; I had a kidney biopsy. During this series of three vaccines, I've had two kidney biopsies.

So with all that information, my doctors, thankfully, did report it as a vaccine injury. So I was very fortunate in that regard.

Kassy Baker

And to which body was the injury reported?

Kimberly Warren

It was reported to the Adverse— So the Ministry of Health, Public Health. My doctors filed a report of adverse events following immunization under the "special interest" category because it's an acute kidney injury.

So that report was filed off through Public Health and they also signed the paperwork for me to continue my claim with the Vaccine Injury Support Program.

Kassy Baker

And I understand that if your claim is accepted, the Vaccine Injury Support Program could potentially provide you with some compensation, is that right?

Kimberly Warren

That is correct. And this is where this journey takes a very wrong turn.

Kassy Baker

Can you please tell us about that journey?

Kimberly Warren

The Vaccine Injury Support Program and their exact wording is that, “The board considered the emerging evidence around flares of IgA nephropathy in the context of exposure to mRNA vaccines and a plausible biological mechanism for this. Although no definitive causality has been confirmed, the temporal association with this patient’s flare of IgA nephropathy in the context of vaccination does suggest a causal association between the flare of IgA nephropathy and vaccination.”

What this letter in essence says is that the medical review board themselves has determined, in fact, this is— They have concurred with my doctors that this is a vaccine injury. So they have taken on that ownership, that responsibility that this is a vaccine injury. However, they then—

Kassy Baker

Sorry, can I interrupt you just for one second? I just recognized you read a portion from a letter that you received, which I do have a copy here in front of me.

And I believe— It’s not dated but it’s entitled Appendix and the letterhead indicates that it’s from the Vaccine Injury Support Program.

Just for the sake of the record, can you confirm that that is in fact what you have just read from?

Kimberly Warren

That is correct.

Kassy Baker

Okay, and we will enter that as an exhibit for the commissioners to read at their leisure later [exhibit number unavailable].

I’m sorry for the interruption. Please continue.

Kimberly Warren

That’s okay.

[00:10:00]

The very next sentence, they go on to say that “fortunately this flare did not require an initiation of an immunosuppressant therapy and her acute kidney injury was managed with hydration.”

And I’d like to point out that is in fact false. That is a false, inaccurate statement. They had all my medical records. I also, as a medical admin, have all my medical records. And I was definitely put on an immunosuppressant therapy. I was put on high-dose prednisone, steroids. We had a conversation, also documented, and I have the paperwork, that I had a choice of going on a chemo drug—so a chemo radiation type of drug—to enhance, to have a remission of my IgA nephropathy, or I had a choice of this high-dose steroid. And between my nephrologist and I, we decided that we would go with the immunosuppressive therapy as my treatment in order to, hopefully, get a response.

However, that did not happen. I only got a partial response after being on steroids for seven months, so this is a permanent vital organ injury.

They also stated during their medical review board—this is the Vaccine Injury Support Program—that there was no evidence of progression. Again, false. I have had two biopsies. My official diagnosis is IgA glomerulonephritis with cellular crescents and necrotizing lesions.

Take note of the word “necrotizing.” That’s a scary word when we’re talking about a vital organ. So my diagnosis is permanent and that is evidence of progression. And they also said that I was put on prednisone for my inflammatory arthritis. And so they took—

Kassy Baker

Sorry, sorry. I’m just, we’re very, very short of time here.

I just wanted to clarify for the record: at what stage is your appeal in currently?

Kimberly Warren

Well, I am in the appeal process. I have sent the appeal in as of January of this year. And the last email I received was that they “did not have doctor availability.”

So they are pending doctors to have an appeal, which I also find quite ludicrous, that we’ve got a support vaccine injury program set up and we don’t have doctors ready to review people’s medical records when they’ve appealed. I cannot believe that.

Also the Ministry of Health: When my adverse report was sent to them, they also came back and claimed that it was okay, that I could go have a fourth one. There was no change to my immunization schedule. And my doctor had signed, saying that this is an acute kidney injury and that I was still undergoing treatment, that there was not a resolution to this situation.

My GFR [glomerular filtration rate] kidney function sits at 33. Every time I’ve taken one of these vaccines, I’ve taken a hit on my GFR by about 20 points. And when you get a GFR of 20, that’s dialysis and transplant. So at 33, if I go get a booster, I am 100 per cent within three days on dialysis and on a transplant list.

I’m not sure where the disconnect is between public health and what’s best for a patient in my circumstance. And how did they come to this conclusion without the medical documentation? How do they just say, “It’s okay, I can go have a fourth shot.”

Kassy Baker

I understand. That actually is the end of my questions, but I would just like to ask the commissioners if they have any further questions for you. We do not.

I would just like to thank you so much for your testimony here today on behalf of the National Citizens Inquiry.

Kimberly Warren

Thank you.

[00:14:12]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Witness 10: James Lunney

Full Day 3 Timestamp: 06:35:37–07:04:42

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

So our next witness is James Lunney. James, can you please state your full name for the record, spelling your first and last name?

James Lunney

James Lunney, L-U-N-N-E-Y.

Shawn Buckley

And James, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

James Lunney

I do.

Shawn Buckley

Now, you have had two, I guess, careers. You started practising as a chiropractic doctor back in 1976. And you practised as a chiropractic doctor for 24 years.

James Lunney

Yes.

Shawn Buckley

And then in the year 2000, you entered politics and became a Member of Parliament for the Nanaimo–Alberni riding, and you were first elected as an Alliance MP.

James Lunney
That's correct.

Shawn Buckley
And then later, when the Alliance Party merged with the Conservative Party, you were a Conservative MP. And you served as a Member of Parliament for that riding until 2015.

James Lunney
Correct.

Shawn Buckley
And then at that time you just resigned from politics altogether. You didn't even run.

James Lunney
I retired—five times undefeated.

Shawn Buckley
Right okay. Now I will let people know, I'm familiar with Mr. Lunney because—I don't even know, is it two decades ago? Where we met and you introduced Bill C-420, an *Act to amend the Food and Drugs Act*.

James Lunney
Yeah, it was before 2004 because it was the first term for me.

Shawn Buckley
Right. And just so— People aren't aware, so that was an act I had drafted to amend the *Food and Drugs Act* to protect natural health products. And Mr. Lunney has been a champion in Parliament literally for decades in the area of natural health and trying to protect our health rights and our access to natural health products.

James, you are here today because you want to share with this Commission your thoughts on vitamin D and how that played a role in the COVID pandemic and how we should be addressing vitamin D issues going forward.

James Lunney
Exactly.

Shawn Buckley
You have a presentation. I'm just going to let you launch in. And I'll let you know if we start running short of time.

James Lunney

The title is, you can see, “Vitamin D3 and COVID, Canada’s Response.” A lot has been said about vitamin D. And I hope today to give you a different perspective, an aspect that hasn’t been discussed. An aspect that hasn’t been caught by a lot of the good doctors because they trust the data that our regulatory authorities, all that Health Canada puts out on a variety of subjects, as authoritative.

I have three objectives here today.

One, to briefly talk about the importance of vitamin D in human health and the pandemic. But to talk about the serum levels that determine the outcomes. Your blood level is what determines the outcomes. And that’s going to vary for individuals depending on your body size and the tone of your skin—I’ll get to that in a minute. But the failure of Health Canada and the Institute of Medicine, which is now known as the National Academy of Sciences, to protect the public interest. And that’s a real phenomenon, I’m afraid to say.

So just a quick thing about vitamin D. Look, here’s an example. There’s three bottles of vitamin D there. On the left is what Health Canada was permitting in Canada. It’s a thousand international units (IU). That was based on an analysis of 600 to 800 and being generous, they rounded up to a thousand IUs. In the middle is a bottle you can pick up in the United States but not in Canada. At the bottom, if you can see that: on the green bottle, there’s a tiny little soft gel there. The middle, 5,000 IUs and then on the right, 10,000 IUs, which are available in the United States but not in Canada.

I just wanted to say that some people might think: if Health Canada actually recommends 4000 IUs as max, that 10,000 might be a lot. Or when the French Academy of Medicine recommends 100,000 IUs to shut down the acute respiratory distress syndrome that could put somebody on a ventilator, that sounds like a lot. But I tell you what: if you knew what an IU is you might get a different perspective. The actual data has been challenged by these two research groups that met with Health Canada. And I’ll want to detail that.

But the first thing I want to say is that who is most vulnerable has not been understood. And many of our good doctors that are speaking about vitamin D and saying 5,000 is part of a recovery program.

[00:05:00]

Well, for the dark-skinned people in Canada—and there’s quite a few now and more coming all the time—Health Canada denies that skin colour makes a difference. And it does.

And I’ll get to that.

But I’ll just say up front: if I fail to get this across, I will have failed in my mission to get some information across to people, so I hope you understand this. And that is, the dark-skinned people— For example, *British Medical Journal* wrote it up first: Sweden didn’t lock down and forty per cent of the early deaths were Somali immigrants, equatorial people, the darkest skinned. They were working with the mothers, beautiful dark-skinned young women, but if they’d been in the U.K. long enough to go through a winter season, your D depletes by, 35 to 42 days, fifty per cent.

Shawn Buckley

James, can I just slow you down for a sec? Because some people might not understand that vitamin D is a vitamin that the human body manufactures. And we manufacture it when we're in the sunlight. So when we're in the winter in the northern hemisphere, we're not getting much sunlight. For several reasons: it's cold and we're all bundled up and then we're in the northern hemisphere. So some people might not understand what you're trying to explain without understanding you need to be out, you need to be in the sun to actually have healthy vitamin D levels if you're not supplementing.

James Lunney

Thank you for clarifying. Exactly. We've turned away from the sun for a good part of the year in the northern climates and your D, without supplementation, will deplete by 50 per cent every 35 to 42 days, depending on your body size.

Shawn Buckley

And if I can also interject. And you may want to just explain that vitamin D is an essential vitamin for the healthy immune system. So we hear about vitamin C, but when you're going to be relating that people are getting sick by not having D, I think you need to back the bus up a little bit and explain why it's important.

James Lunney

Thank you.

Well, vitamin D drives at least 2,000 genes that are known so far. And they're involved in, so far we've identified three systems: the immune system, inflammation management, and glucose metabolism. And those three systems together are most of our chronic illness. So your blood level of vitamin D is crucial. It'll be different depending on your body size, how much body fat you have. I'll just move ahead, but thank you for putting that out there.

How do I know about this file? Well, I had a bill on vitamin D. I may get to it, I shortened my presentation and put the most important stuff first, but I would have established all these things if we had more time.

This reports here—Dr. Malone, you all know. This is a doctor from Italy; this is March. Now that COVID is over, these guys disregarded the advice from their regulatory agencies. They had a friend working in Africa who was getting brilliant outcomes. Even in Africa, there were some COVID cases where there's brilliant sunlight, but anyway, "We treat COVID at home and the mortality rate is almost zero."

They had 6,000 cases. This network of doctors, they called themselves after Hippocrates. They just followed their oath to do no harm and to keep the patient's interest first. Six thousand patients so far, at the time this report was written; mortality is practically zero. And this is Dr. Paolo Martino Allegri. And the oldest patient they treated was 95 years and they were working on somebody who's 98 with very promising results so far.

Dr. Malone put this out in his Substack. This is a quote from Dr. Malone: "Mortality risk correlates inversely with the vitamin D3 status, and a mortality rate close to zero could theoretically be achieved at 50 nanograms per millilitre." And that's American measure. In Canada, we use nanomoles per litre [nmol/L], so you have to multiply by two and a half. So that's great. At 125 nanomoles per litre, you could have zero.

And I should ask, I wonder how many people in this room have had their blood tested for vitamin D levels? I see a few hands back there. Those are informed people. Did you have to pay for it? Yeah, we have to pay for vitamin D testing. And somebody just told me in Ontario now it's \$140. So that's a disincentive, I would say. You need to know what your numbers are because it'll depend on your body type. And vitamin D is fat soluble, so if you have extra weight—including me; I'm losing some weight—it's fat soluble. Some of that vitamin D will be parked in the parking garage. It will not be in circulation to help the cells that need it around the body.

Okay, so this is Dr. Malone. He says in his own words, "How many people could have been saved from just having their levels of vitamin D3 brought up to 50 nanograms per mL, or higher?"

[00:10:00]

We knew about vitamin D3. It really didn't take a randomized clinical trial to understand the link between D3 and RNA respiratory virus morbidity and mortality. Vitamin D will shut down respiratory viruses in the lung. It produces specific antiviral peptides and antibacterial peptides, meaning it actually would work for tuberculosis in a respiratory way. If you have enough in your body. And most people in Canada are low. I'll get to that statistic in a second.

Okay, so early in 2020 as COVID terror circulated the globe, you can see this, reports from all over the world: severe infections, hospitalizations, and deaths attributed to COVID-19 directly related to the serum levels. Now I mentioned this: in Sweden, 40 per cent of the early deaths were Somali immigrants. I checked afterwards with the U.K. Very early in the pandemic, 25 per cent of the early deaths were Middle East and Southeast Asian, they have a lot of—

Shawn Buckley

I think I need to stop you again so that people understand. We've established that you need sunlight on your skin, actually on your skin, to make vitamin D. But the darker skinned you are, the pigment prevents the sunlight from getting through, so it's harder for you to make vitamin D. When you're speaking about people that immigrated from Somalia, it's because of their dark skin; they would need way, way, way, way, way more sunlight to get anywhere near that amount of vitamin D that a Caucasian person, a lighter-skinned person, would manufacture. So that people understand the meaning of what you're saying.

James Lunney

There's nothing wrong with their beautiful dark skin, it's just that that's population genetics at work. They had to upgrade the melanin production in order to protect themselves from too much sunlight that could damage the DNA. And we pale-faces come from northern climates. We had to down-regulate the melanocyte production in order to let enough sunlight in to be well. So 90 per cent of our vitamin D does not come from food, which is what Health Canada puts out there. They dismiss the importance of the sun because they're keeping us safe. The secret with the sun would be, don't burn.

This is an important thing I want to get to here. The vitamin D recommendations were made in error. It was 2010-2011, I could pull that right off the Health Canada website; it's still there. On November 30th, the recommendations came out. There were 14 experts on the panel. The data they analyzed showed 600 to 800 IUs. They limited the study to bone

health and ignored all the data that was available on autoimmune diseases being down, cancers being down, heart disease being down, mental health being up. There was lots of literature then, but the study was restricted to bone health.

Anyway, since then, scientists from the University of Alberta, University of California San Diego, and Creighton University took another look. And they found there was a problem. The problem was the data, even limited to bone health, that they reviewed showed the average person needs 6,000 to 8,000 IUs, not 600 to 800 as they proposed.

Shawn Buckley

You're meaning daily.

James Lunney

That, as a full order of magnitude, is a significant mistake. Now everybody makes mistakes. But I will witness to this because I had a bill on vitamin D that I introduced in 2012, and the top vitamin D doctors came to Ottawa May 4th, 2014 to try and persuade Health Canada to fix the mistake they made. A total of 15 doctors spoke in turn and Health Canada was represented. The man seemed rather stressed through the day.

At the end of the day, a woman went to the microphone—I found out later she was his boss—and she said, didn't the people in the room realize how hard Health Canada had been working to figure out how much vitamin D was in a cup of yoghurt and how much was in a cup of milk? Well, it's nice that there's a little bit there, but it's so low. For the needs in the body— There's 80 to 100 trillion cells in your body. Every single one of them has receptors for vitamin D. And it's doing something very important because it regulates your immune system, inflammation management, and the glucose metabolism. And possibly others that we haven't identified so far.

So the average Canadian has a blood level of about 67 nanomoles per litre. Now what Dr. Malone mentioned there was 125 nanomoles per litre. The average Canadian is at 67. But who is the lowest in Canada?

[00:15:00]

That would be the people with the darkest skin tone. And there's nothing wrong with their beautiful skin. They just need more sun access in order to get their D levels up.

And many of the people from countries with dark skin, they're very modest, they're covered most of the time. And Canadians, our numbers are actually dropping. Sixty-seven was average, but that was a while ago, way back in 2010. And they seem to be slow in coming up with new numbers because they don't seem to want to let people know how important this is.

Health Canada, look: the top line here, mysteriously, just at the beginning of COVID they revised the website. You can see the date at the top, I put it on there: "Health Canada continues to recommend that people over age 50 take a daily supplement of 400 International Units." You know, that's a baby dose. Four hundred IUs is a baby dose, one little 400 IU drop. But adults need far more than that to achieve the appropriate blood level.

Now, here we go. There was a study done in Florida, that's 37th parallel. All the way down there, that's where the division is, for dark-skinned people below that; they have a hard time north of the 37th parallel. We're at 40-45 here in Ottawa. North of the 37th parallel, they did a study in mid-Florida. They matched black males, co-matched for age and comorbidities with a white group that were not supplementing. They gave them the maximum Health Canada recommends, 4,000 IUs a day. It's tested every two months; it took a whole year to catch up with the matched group of white people that were not supplementing. A whole year. So if you want to get your blood level up, you have to supplement. Even in Florida, where there's lots of sun.

And you know, one of my heroes would be Dr. Mercola. He was in the top 10 misinformation people according to some authorities. I followed Dr. Mercola for years, but even he didn't recognize vitamin D deficiency in Florida because they had so much sunlight. It's in the dark-skinned people. If you don't check their blood levels— That's why they're overrepresented in a myriad of diseases: obesity, diabetes, thirteen different cancers. They're overrepresented because our officials misrepresented how important vitamin D is and don't tell people.

What is an IU by the way? Who knows? Anybody know what an IU is for vitamin D? I bet if they were all physicians in this room, most of you wouldn't know, because it's not a standard you can— Here we have micrograms and milligrams. You might have a chewable vitamin C as 500 milligrams. Or if you go to the hospital with a chest pain, they want you to take two baby aspirins at 81 milligrams. So an IU for vitamin D is 0.025 micrograms. And 100,000, which could have saved a life from the acute respiratory distress syndrome according to the French Academy of Medicine, that's what they recommended for people heading into acute respiratory distress. A hundred thousand IUs equals 2.5 milligrams. It is one of the safest things you can take.

If you have an organ transplant you might want to be careful, we can't overstimulate. But I do know people with organ transplants have successfully taken 5,000 IUs and several that are taking 2,000 a day. You can still take it, but that's something where you can't take massive doses. But a short-term dose, it's not clear. For two or three days, probably would not over-affect— We don't know for sure. That's the caution there should be.

All right, going on.

Vitamin D blood levels: the blood levels are so important. You should know what your numbers are. But I know, I'm talking to people here in this room, you know, attending here, who are vitamin D deficient just by the symptoms they're having. Everything is better when your D levels are up. And if you haven't tested, you don't know how bad it is. And if you go to Health Canada's website, what you will see is a misrepresentation of the truth.

Fifty nanomoles per litre will protect bone health for most Canadians. Great, but experts say raising blood levels to 100 to 150 nanomoles per litre. Dr. Malone was talking about 125 nanomoles per litre and other experts are saying between 100 and 150. It's clear. It depends on your body size, but the quicker you get your blood levels up when you're dealing with any serious illness,

[00:20:00]

the better that's going to work out for you.

Oh, this is the French Academy of Medicine by the way. Right there, 50[,000] to 100,000 IUs in the case of deficiency could help limit respiratory complications.

Okay. We knew this in Canada. This is Edmonton 2015, Dr. Gerry Schwalfenberg. Also, he called out the mistake that Health Canada had made in a letter to the Canadian Medical Association. "Regrettably, a statistical error resulted in erroneous recommendations by the Institute of Medicine leading to this conclusion. It might actually take 8,800 IUs of vitamin D to achieve this level in 97 per cent of the population." Health Canada was recommending 800. Now, this is a serious public health blunder. That's 2015 in our own Canadian Medical Association Journal.

He's an Edmonton doctor. And he and his colleagues, you might see at the bottom of the screen there, "The Vitamin D Hammer." They get the blood level over 100 nanomoles per litre, they rarely see a patient in their practice, the two of them—in the hospital, according to what he wrote. But if they do end up with one landing in the hospital, they immediately give them what they call The Vitamin D Hammer. And that would be between 50,000 and 100,000—50,000 one-time dose in one day, or 30,000 (10,000 three times a day) for three days, and it's gone.

So that's a pretty powerful medicine and virtually, it's without complications. Now this is from Medscape. The key to managing the sun is: do not burn. It's estimated if you had full-body exposure, just until you get a little bit of pink on you, that would produce 20,000 to 25,000 IUs. It'd take a long time to get there at 400 a day—a baby dose.

There's the question I already asked you, so we'll move on. You should know what your levels are and it's outrageous we have to pay for them.

By the way, the story on that is that our own physicians in Ontario persuaded the government to stop testing for vitamin D because Health Canada said 1000 is enough and they were negotiating for a fee increase. And they—actually, I couldn't believe this when I read it—they were working with the government to identify unnecessary procedures. So "save the public purse," you know? That's the story here.

Now: save lives, reduce deaths. You raise the levels between 100 and 150 nanomoles per litre, a 50 to 80 per cent reduction in breast and colorectal cancers. That's published literature. They expect a reduction of three-quarters of the deaths from breast and colorectal cancers. That's something the public should be interested in, I would think. Garland et. al. is that article on the front of the slide. It's *Epidemiology*, that's 2009.

Now, here's the issue about the skin and vitamin D. Health Canada dismisses the role of skin colour and vitamin D. This is from their own website: "Additional requirements are not required for sub-populations such as those at higher latitudes and those with dark pigmentation or those wearing heavy clothing that inhibits the sun." The lowest vitamin D levels they've measured anywhere in the world is in an area with a lot of sunlight. And they're people wearing a burka in the Middle East. They're clothed. But you see, the UV light doesn't get through clothing. It's filtered out. And that's a strange thing, but that's where it's at.

So just to illustrate this, I've jumped right ahead here in the presentation to the closing of our meat plants. Our Cargill plant was shut down. Cargill in High River, Alberta: 2,000 employees. Seventy per cent of them are Mexican, Filipino, Vietnamese and, you know, other dark-skinned people—70 per cent of the workforce. And yet it caused terror for the

town because of the test. A lot of people tested positive; a few were getting sick. The headlines are about cold, crowded circumstances there that causes this.

But, what's the vitamin D level for these people? The longer they're in Canada, they're the lowest in Canada.

[00:25:00]

And it's easily remedied and cheap. But there's no mention of that from Health Canada. Unfortunately, it's dismissed.

By the way, the Inuit would have died out if it was not for their traditional diet where they ate the mammal blubber. The mammal blubber of course is where the vitamin D is stored. I know, time is sensitive, so I'm trying to get some of this in.

By the way, in Hazelton, the meat plant quickly became the area's biggest private employer. It's an hour from New York. Largely from Dominican families like the Benjamins. And the Latino population jumped sevenfold from 2000 to 2010, to 37 per cent of the city's inhabitants, and has risen to more than 60 per cent.

And many of them in the meat plant are like this man I'm going to introduce you to here. This is Raphael Benjamin. Thousands of these workers. This man—I tell you, I wept when I read this—this man was just before his retirement. He wanted to top up his pension. His family wanted him to quit and get out of there because people were testing positive. Well, he was admitted to the intensive care unit and spent his work anniversary on a ventilator. He died on April 19th.

This is criminal and the people responsible for this need to be held accountable. Can we say it's the vitamin D level? There's enough studies to verify that dark-skinned people without supplementation are the lowest, even north of the 37th latitude.

Shawn Buckley

Now James, if we can just kind of focus this back on COVID.

James Lunney

Yes. But that's a COVID death.

Shawn Buckley

Right.

James Lunney

And I'll tell you what. In Canada, Health Canada put out statistics: Toronto and Montreal, hardest hit. They called them racialized Canadians.

Shawn Buckley

As COVID deaths.

James Lunney

COVID deaths—hardest hit in Canada.

Shawn Buckley

You're basically saying that it's a co-factor to be considered when we're assessing mortality and hospitalizations related to COVID, having a look at the vitamin D levels in the blood.

James Lunney

Well, reports go: nine out of ten COVID deaths could have been prevented if the blood level was elevated. And who's the most vulnerable? Not racialized Canadians, but people with low vitamin D. And there's some in the room here today.

So 115 meat and poultry plants reported COVID infections: 5,000 workers. That's a 500,000 workforce. There were 20 deaths amongst them. If you look at mortality, like Dr. Rancourt the other day, you won't see where this is coming from—if you only look at the deaths. But if you look at who's dying, you see that they're mostly dark-skinned people. Not always, it depends. There's lots of shut-in seniors. But the darker the skin, the lower the vitamin D, so it's your serum level. The question would be, how were their employees' vitamin D levels?

Here is just another Israeli study. All over the world, these studies were coming in. That's still 2020. Real world data. They found a vitamin D deficiency and infection relationship. Israel, like Florida, most of the physicians were not looking for vitamin D deficiency. But the deaths in Israel—

Shawn Buckley

James, I'm just I'm going to cut you short because we're short on time. So I'm going to the commissioners if they have any questions.

James Lunney

Can I finish the sentence?

Shawn Buckley

You can finish the sentence.

James Lunney

Most of the severe infections were in the people covered up. That would be the Orthodox Jewish people wearing the dark clothing and dark hats for the men and the Arabs were in the traditional galabeya and keffiyeh. So they're covered even though there's intense sunlight. Okay.

Shawn Buckley

Thank you. I'll ask the commissioners if they have any questions. And they don't.

So James, on behalf of the National Citizens Inquiry, sincerely thank you for coming and testifying today.

James Lunney
Thank you.

[00:29:05]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 3

May 19, 2023

EVIDENCE

Witness 11: Lyne Vandenplas

Full Day 3 Timestamp: 07:24:54–07:33:45

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

Welcome back to the National Citizens Inquiry as we come to the closing part of our third day of hearings and the last day of our eight-city tour. We're going to have a presentation by a few different volunteers that have been involved in this project, sharing their different roles and perspectives, and just actually whatever they want to say. So we have Lyne Vandenplas who is attending. Lyne, can you hear us?

Lyne Vandenplas

Yes, I can. I hear you very well.

Shawn Buckley

Okay, well we can see and hear you, so you're actually just ready to do a presentation and share what your involvement was.

Lyne Vandenplas

I will do that.

Shawn Buckley

Okay.

Lyne Vandenplas

I just want to say I was responsible for creating the list of individuals who would receive a summons from the National Citizens Inquiry across Canada. I worked with another volunteer out in British Columbia and we spent most of January and February trying to identify the correct Canadian government officials that have the titles of Public Health Officer, Minister of Health, Chief Medical Officer, and of that kind.

It took us about a month to find everyone for the ten provinces and the three territories. It was particularly challenging because a lot of the individuals changed positions, went to a different government or a different ministry, a different province, and there were a lot of former ministers and so on. Finding the addresses that were not P.O. boxes, because you can't deliver a summons to a P.O. box. And finding their email was particularly challenging. It's as if they didn't want us to find them.

But finally, we did succeed and we made a lengthy list [Exhibit OT-14b]. Then I started issuing summonses as of early March 2023. There were basically eight batches. Each hearing had a different venue and different dates and everyone was invited in each province and all the territories. So basically, what I did is: I submitted a list of all the names of the individuals who had received a summons and whether they received one by email or by mail. It was registered mail—all of them were registered mail. For all of them, I have a receipt date and a signature. And basically, I have the province, the title, the name, the address, the email, and the hearing date and location that everyone was invited to.

So a total of 63 government officials were sent summonses across Canada. Fifty-seven of them received it by email and I sent it with a read receipt request. Also, I sent 58 registered mail summonses. And I also had tracking numbers that had to be tracked and I have all the received dates and signatures. And of the 57 email summonses, I only received eight read receipts, so only eight individuals actually opened it up and confirmed that they read it.

I got two responses saying they were unable to attend. I got one response stating that they were not legally permitted to attend. I got one who declined the invitation. And for the 58 summonses sent by registered mail, I got two letters that were never picked up. I have one delivery that was inexplicably delayed and remains as is. And we received two COVID responses with reports by email that had been done by that province.

My observations are: I did observe that of the 63 individual summonses, no one accepted the invitation. No one agreed to testify with the NCI. I also observed that of 13 provinces and territories, out of those 13 provinces,

[00:05:00]

there have been at least 13 changes in either the Chief Medical Officer or the Health Officer during three years. And that is it, that's my report.

Shawn Buckley

Lyne— Just before you guys clap, hang on; I'm just going to talk with Lyne a little bit. So, Lyne, you had said that a couple had indicated that they couldn't attend. Am I right that the summonses are actually drafted so we'd invite them to attend at a specific hearing, but it would include, "Hey, we're travelling across other cities and if you can't make it at this time, we'll schedule you in virtually otherwise or we could even accommodate you by scheduling you when we're not having a city and to attend virtually." That's how the summons is drafted, isn't it?

Lyne Vandenplas

Yes, it was. It was very clear in the summons that they were invited to do so virtually, or we were very willing to accommodate them. So they just decided not to—to declare they were unable to attend without asking for any kind of accommodation or interest in participating.

Shawn Buckley

Right. Can I just ask you before we let you go: how did that make you feel not to have any response? Because people may not appreciate how much work it is to send these out, get all the registered mail things done, actually get down to the post office, do all of this, and then be tracking it to see what happens. It's a lot of work.

How did it make you feel that basically no government official decided to attend?

Lyne Vandenplas

Well, they made it really obvious that they didn't want to speak with the citizens of Canada. They were not interested in coming to listen and to share their point of view. So I really felt that we were dismissed. It was not a good feeling. But the longer this went on, the less and less I was surprised; it became the expectation, which is not a good thing.

Shawn Buckley

No, and I see that you're emotional about that. I'm sorry. I didn't mean to—

Lyne Vandenplas

That's okay.

Shawn Buckley

So, are there any other thoughts that you wanted to add? We're actually so pleased that you shared this.

Lyne Vandenplas

I just think that the upside to my doing this was the fact that I met so many wonderful Canadians from coast to coast. That was the gift because the gift was not the responses or the lack thereof. And I want to thank the NCI for allowing me to participate and do something, my little bit. That would be it.

Shawn Buckley

Okay, and just so people know, Lyne also attended at the Quebec City hearings and was instrumental in helping find interpreters and things like that. She's very modest, but she has just been a tremendous help. And Lyne, we're so thankful to have you as part of the team.

Lyne Vandenplas

Thank you.

Shawn Buckley

And I know I share that— I know the team's been very pleased and honoured to work with you, so.

Lyne Vandenplas

Thank you.

Shawn Buckley

Okay. Thanks, Lyne. And now you guys can clap.

So, Lyne, you can't see it, but you're basically getting a standing ovation, so people are appreciating what you've done.

[00:08:55]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

Day 3

May 19, 2023

EVIDENCE

Witness 12: Jerry Managre

Full Day 3 Timestamp: 07:33:51–07:50:55

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

So the next person attending is Jerry. Jerry, can you hear us?

Jerry Managre

Yes, I can.

Shawn Buckley

So do you want to just introduce who you are and kind of your background? And then I think you've got kind of a presentation or a—

Jerry Managre

Sure, I've got a few remarks.

I live in St. Albert, Alberta. And I am retired from a career in media and in corporate communications. I worked for a natural gas utility in Alberta and I was manager of corporate communications and also director of government and customer relations. And I've had roles in the media as a reporter and news director.

My involvement with the National Citizens Inquiry began on March the 4th of this year, just about two and a half months ago. Some of my communications—some of my testimony here today—relates to communications prior to that date. So I'm relying on documents, some of which were prepared by others. However, I've gathered them and developed knowledge about them which I believe to be true. I'm also reporting on the activities of other members of the communications team, who were responsible for the internet site and our social media platforms.

The National Citizens Inquiry has issued about 18 media releases. And I'm just going to begin sharing my screen here. I say about 18 because I'm aware that one release was a duplicate, replacing one that became outdated. And the releases included information

about the establishment of the NCI; announcements about media conferences; calls for expert witnesses and witnesses with personal stories; the call for commissioners; the appointment of commissioners; media invitations to the hearings in each of the cities; and, as the hearings progressed, information about the expert witnesses that were going to be testifying. Copies of the media releases are available for filing as exhibits.

The media releases were mainly issued via email. And prior to my joining the NCI, an email list was established. Since I've been involved that email list has expanded with more than 800 emails sent to various individuals and media organizations. So the mailing list includes legacy media, alternative media, and citizen journalists. And a copy of the current email list is provided for identification as an exhibit.

It should be noted that with each mailing, there are bounce-backs, as some emails are returned as undeliverable, and sometimes it's because people are away from the office and they have an automatic response.

With searches by other NCI volunteers, as well as by me, we've located more than 100 reports by alternative media, citizen journalists, and legacy media. The bulk of the reports might be described as being produced by alternative media. Although, I have to say, that these organizations do have large audiences as well. And I'm referring here to media outlets such as Epoch News [*The Epoch Times*], Rebel News, and the *Western Standard*.

To my knowledge, only a handful of the legacy media ever attended the NCI hearings, including CBC Manitoba, CKOM Radio in Saskatoon, Bridge City News in Lethbridge and Winnipeg, and the *Red Deer Advocate*. Although CBC Manitoba and CKOM Radio carried reports about the hearings being held, neither carried stories which described the testimonies of the witnesses. A report with links to the stories will be filed as an exhibit and an update will be provided on the coverage sometime after the hearings conclude [exhibit number unavailable].

So attached to my report is a summary of the social media activities on the NCI website, which is nationalcitizensinquiry.ca, and the NCI social media channels on Twitter, Rumble, Facebook, YouTube, and TikTok. These summaries are incomplete right now because the hearings are ongoing,

[00:05:00]

and updated summaries will be provided after the hearings conclude.

For today, I'm just going to provide some highlights from the summary.

We've witnessed a remarkable surge in the social media presence. Since the inaugural hearings in Truro on March 17th, our cumulative followers have soared from 16,000 to an impressive 60,000 across all platforms as of May 19th. So I think this rapid growth is a testament to the significance of the NCI and the eagerness of Canadians as well as NCI's global audience to engage with an inquiry of this nature.

The substantial increase in impressions further highlights the broad reach of the NCI content. And over the same timeframe, impressions skyrocketed from 236,000 to well over 14 million. So this demonstrates the widespread interest in NCI's mission and the pressing need to investigate and improve Canada's response to COVID-19 and potential future health emergencies.

As we've experienced censorship in the legacy media, NCI's journey of growth has been accompanied by significant challenges from censorship in the social media platforms. Despite initial success on TikTok, where we developed 11,000 followers, we were subsequently deplatformed. Then as we attempted to re-platform, we had further bans. Basically, that has impeded our ability to showcase the analytics from these inaccessible accounts.

YouTube also played a role in censoring us. Short clips of Dr. Peter McCullough's testimony, which mirrored the content shared during the hearings, were swiftly removed under the guise of medical misinformation. NCI's account also faced a temporary suspension of seven days, resulting in the inability to stream the hearings from Toronto live on YouTube. And a second suspension followed when NCI hosted the live roundtable featuring Dr. Mark Trozzi and the embalmers who testified in Toronto and in Winnipeg. Within hours, that video was removed and the NCI account received another strike. And that led to a 14-day suspension. And now, YouTube has warned us that another strike on that account will result in a permanent ban.

More recently, the individual account's social media manager on Facebook has been suspended for 30 days. So that restricts him from posting on his personal Facebook account, as well as the NCI Facebook page. This has, without saying, resulted in a sharp decline in posting on Facebook and we're restricted to only sharing the live streams. So despite amassing nearly 20,000 followers, the NCI Facebook has encountered increasing trouble with Facebook. And they mainly cite "community guideline violations" as the reasons for our account suspensions.

Furthermore, our Twitter account has experienced shadow banning, as reported by some of our vigilant audience members. Despite being search banned, our audience has actively shared inquiry posts and that has contributed to the NCI presence and reach on the Twitter platform.

I think these censorship challenges underscore the importance and the urgency of the National Citizens Inquiry in total. And NCI remains committed to fostering open dialogue, encouraging critical thinking, and amplifying the voices of concerned Canadians. And we need to continue the mission of transparency and accountability.

I'd like to turn now to the internet site: nationalcitizensinquiry.ca. Basically, this website has performed like what you might expect from a medium-sized business. We've registered 240,000 page views over six months and 137,000 of them during the two months of hearings. So that's like, 60,000 per month, which is very respectable.

So typical website statistics: over five months,

[00:10:00]

a typical website would see about 5,000 new visitors. And the average time spent would be about 52 seconds.

When you look at how we're acquiring the people that are visiting the site, almost 120,000 of them are coming direct—that is, by typing in the URL in the URL area. That's excellent that people are finding out about the site. We're getting references from Google (about 30,000), Facebook Mobile (29,000), Facebook, itself on the internet (27,000). So when you look at Facebook itself, that's an excellent representation of referrals. Then from Twitter,

we got about 15,000. I'd also like to give a special mention to Dr. Trozzi, who was responsible for 1,000 people coming over to the website.

When we look at the acquisition of visitors to the site, if you look at the top line graph, you'll see that when the NCI was first announced, that generated a lot of activity. It kind of slowed down, with people mainly signing the petition over the summer and winter. And then as the hearings started, you see the spikes. And then if you look at the lower line graph, you get a close-up of the spikes that occurred. If you look at the lower left-hand side of this slide, then you'll see that you get the representation of that 775,000 total page views and 2.3 million human interactions. And the top three pages on the site were the homepage, NCI Live, and the petition.

When it comes to the petition, as of yesterday, we're at 68,179. And I know we've grown again today.

From a demographics point of view, we're at 232,000. And Canada is by far the majority of that, with representation from the United States and countries over in Europe, as well as Australia and New Zealand. From an engagement point of view, the people who spend the most time on the site are from Canada, the Netherlands, New Zealand, and Mexico.

From a language perspective, English is dominant with 215,000, followed by French with over 14,000. And from an engagement point of view as well, it's English, French, German, Dutch, and Spanish.

Across Canada, Ontario is in the lead position as the most populous province with 66,000, followed by British Columbia, Alberta, Quebec, Saskatchewan, Nova Scotia, and Manitoba, New Brunswick, and Newfoundland.

This is a very telling slide about how we currently operate in the world. And this tells you where we're getting the traffic from—what types of devices that we're getting the traffic from. And this indicates that about two-thirds of the people on our website are following us on their mobile devices; about a third on the desktop; and a smaller amount on tablets.

So that concludes my presentation. I just want to say that it's been an honour to be a part of the communications team here and a part of the effort overall. It's been a great experience to be involved.

Shawn Buckley

Jerry, if you don't mind me asking, why did you decide to get involved in the NCI?

Jerry Managre

Well, I guess I identified early on with— As being a former reporter, I was noticing that the reporters weren't asking the right questions, that we weren't getting the right information from people in government. As has been pointed out significantly during the hearings, the media has not been forthright in their reporting. They haven't been doing newsgathering, as has been pointed out.

And then I did research and I learned a lot of things and I just developed— I can say, too, that I've held elected office and I have been very surprised by the lack of the— All of the political parties seem to be singing from the same hymn book. And that was a red flag for me as well.

I just knew that something wasn't right. And so like everybody else, we've been impacted through family and friends. And it's just been a terrible three years;

[00:15:00]

something that we never, ever expected to experience in our home country of Canada.

Shawn Buckley

That's well said. And I think there's some people nodding with you going forward.

Is there anything you want to add before we go? Any encouragement or advice that you would have for us going forward? And by advice, I mean to people, not to the NCI. You're being watched by a fairly large group, as you know. And I'm just wondering if you have any advice for us going forward.

Jerry Managre

Well, we've gone through a very bad three years, but I can tell you that the thing I think that we can always hold on to is hope. And that one of these days we will have the breakthrough in the media. We'll get the attention of some of the political parties in Canada—federally and provincially, municipally, and through the school boards. All of these people play very important roles and we have to do what we can, particularly at the community level. I think community involvement is key in order for us to regain the country that we once knew.

Shawn Buckley

Thank you, Jerry. We'll let you go and we'll let Ches come up. I know that you're watching and I just want to say that it's been a pleasure to be serving with you and I look forward to serving with you going forward.

Jerry Managre

It's been an honour.

Shawn Buckley

Just for you guys who don't know, Jerry is just tireless. And he's kind of that calm voice when the rest of us, myself included, are getting excited. So he's the steady hand, so I've really appreciated him.

And so now it's time for the Administrator— Oh yes. Jerry, people are clapping and standing up for you. You can't see that.

Jerry Managre

Thank you very much.

Shawn Buckley

You're getting a standing ovation.

[00:17:19]

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Closing Statement: Ches Crosbie

Full Day 3 Timestamp: 07:50:58–07:58:34

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

I'm pleased to have the Honourable Ches Crosbie, who is the Administrator of this Inquiry. He holds a key role of ensuring that the evidence is brought forward, that the Commission is run properly. And I've been very honoured and pleased to act as his agent, as counsel. And so, Ches, if you'd come and say some words.

Ches Crosbie

Shawn is so kind. Acting as my agent. Indeed, Shawn.

Commissioners, I gave an opening statement at the first hearings of the National Citizens Inquiry in Truro in March. I submitted that a threat to our very way of life in the democracies arose during the 1930s. It was called the Great Depression. Many were afraid, but when Franklin D. Roosevelt made his inaugural address as President of the United States in 1932, he did not tell people to be afraid. Instead, he told Congress and the free world that we had nothing to fear but fear itself.

No great nation prospers and grows strong on a platform of fear, but governments chose to ignore their own previously-approved pandemic plans in favour of fear. These discarded plans required that government should protect the vulnerable, allow others to continue **their lives normally, and maintain public confidence. Instead, they panicked into a war, a futile war against a virus. And the first casualty of war is the truth.**

Jordan Peterson told us in Truro that our political leaders panicked and copied the draconian SARS-CoV-2 response of the Communist Party of China. Peterson said that we don't put political leaders in office in order to panic. And every politician involved in this panic is unworthy of office. But more, these leaders told lie after lie and manipulated public opinion to use fear to impose tyranny, what James Corbett yesterday called medical martial law. To quote Jeff Wilson this morning, "COVID was primarily a debacle of leadership."

Commissioners, Mr. Peterson's statement was brief and not intended to be a full account. A fuller account would incorporate the evidence you have heard that drives us to conclude

that planning and deliberation was involved in our government's COVID crisis response and in their campaign of fear: a campaign of fear so sophisticated that Robert Malone described it to you as a military-grade psyops or fifth-generation psychological operation waged against the entire civilian population. This planning and deliberation involves sinister, deep military strategic and financial system agendas, as touched on before you by Denis Rancourt and Catherine Austin Fitts, the exact outlines of which are yet to be defined.

The evidence from Dr. Rancourt and others is that there was no COVID-19 viral pandemic. Heresy. Heresy against the COVID cult. The spread of the virus, as with numerous other so-called pandemics before it, was invisible through the lens of excess death analysis of great robustness. What caused excess death was not a virus,

[00:05:00]

but the partly panicked and partly planned response by authorities to the virus.

In particular, the injectable gene therapy products caused excess death, which Dr. Rancourt calculated in a peer-reviewed journal at 13 million worldwide and 10[,000] to 30,000 in Canada. These are human lives. Human lives. And Canadian governments market this deadly therapy today.

That brings us to the sad fact that this Inquiry is not a truth and reconciliation inquiry. It is a truth inquiry only, because none of the officeholders who managed the COVID crisis had the courage to appear before a commission of their fellow citizens and explain their actions. Witnesses before you documented this role of shame. Until there is accountability, there can be no reconciliation. There can be neither truth nor reconciliation while legacy and social media maintain a dam of censorship against the truth.

But the dam of truth has many cracks and many leaks. These cracks will deepen and become a fatal fissure. We cannot know when the dam will burst—but burst it will. And journalists who chose, or choose, to have their fingers in this dike will be swept away in the torrent of truth. While the truth dam strains and grumbles, evil remains abroad in the world and preys on fear.

The antidote to fear is courage. And as the supporters, volunteers, and truth-tellers before this Inquiry well know: Practise the habit of courage. Teach your children courage. And remember, evil knows how to divide and conquer. Courage knows how to unite and build. Thank you.

Shawn Buckley

For those of you online—and I'm not trying to stop—there was a standing ovation for the Honourable Ches Crosbie, and a well-deserved one.

NATIONAL CITIZENS INQUIRY

Ottawa, ON

May 19, 2023

Day 3

EVIDENCE

Closing Statement: Shawn Buckley

Full Day 3 Timestamp: 07:59:18–08:40:53

Source URL: <https://rumble.com/v2ood6q-national-citizens-inquiry-ottawa-day-3.html>

[00:00:00]

Shawn Buckley

I've been given the honour of being able to be the last person to speak. We pencilled this in as a closing. And a couple of weeks ago, I realized I can't give a closing. Because I think we're at the beginning of something.

When we got together, just a small group, to just see if we could do this— You know, you start meeting, you start talking, you sort out rules of how you're going to conduct your meetings and what a quorum is and all this stuff that is really kind of tiring and tedious. And then you kind of go, "What are our goals?" and all of this. And we were just adamant we wanted to have an inquiry that was independent.

The frustration was, this was the event that had affected us more than anything else. This has been more intrusive on our rights and privileges than many Canadians experienced during the First and Second World Wars. But for our First Nations people, confined to reserves until the Bill of Rights in a shameless apartheid system, they suffered more than us. But apart from that population, which unfortunately also had to experience this with us, this was brand new. And this was a magnitude that I think confused and frightened most of us in a way that we never thought we would experience.

And this small little group, we just wanted this looked into in a fair way, in an impartial way. And so we get our rules and we get our goals and anyone can criticize what we've done. But we've really tried to do that. And we had Lyne talk about sending out these subpoenas. And, you know, we tried to get the government officials there. And the commissioners will tell you—because I was involved on the commissioner process—that before they were selected, they had to endure my lectures on impartiality. We just wanted them to understand that they needed to act differently, that they were basically taking on a semi-judicial role. That as hard as it can be, that we were charging them with the responsibility of acting impartially. And we're still entrusting them with that.

And that's kind of interesting too, isn't it? That a group of citizens that literally are just feeling terrorized and feeling afraid would decide to do this. And I can tell you, if we had any idea at all—even an inkling of an understanding of how impossible this task was—I

don't think we would even have met. Because how does a small group with no funds, like as in zero funds, we've never had— You know, you hear about groups that have a big sponsor or something; I don't believe it and I've never experienced that. And the NCI certainly hasn't.

So yeah, how do you do that? So well, we just organized. We started putting committees together—saying, “Oh, we need a communications committee. Oh, you need a committee to select commissioners. Oh well, then that committee's got to figure out, well, what questions are we going to ask? What are we looking for? What are our criteria?” Like, it just—it seems it never ends. I think if I have to attend another Zoom meeting, I'm going to break out in hives. I mean, it's just—it's crazy.

And then because almost every one of us, we had other lives and other responsibilities, every time you needed something done, you're trying to get volunteers, right?

[00:05:00]

I don't know if you've ever tried— I'm just laughing because it's so funny. So many times, I kind of— Me and another person, Dale. This wouldn't have happened without her kind of having this eye in the sky: “Oh, look at all the things that aren't working. Maybe we need to look at them.” I kind of became, I felt like a fire chief. So okay, well, we've got this burning, destructive problem, or complete hole. And so you have to try and cobble together a bunch of volunteers. And there's some in the room, which is fun. So you try and get that done and you learn just how ineffective that is. So, yeah, it's terribly ineffective.

Tips for anyone going forward: if you don't have a minimum of three that agree to form a committee and you've got to charge one of them as being the one responsible, you're just wasting your time. So you know, we had to learn stuff like that. And many failures, but many blessings.

So this has been an impossible task that has actually happened. One thing I learned is—I don't think it's any secret that I think God's involved in this, from my morning openings. And I'll even share how that came about. But when you get involved in something that God's involved with, you don't know where it will lead. So this thing was really, I would say, just one crisis from another. I mean, I just looked at Michelle [Leduc Catlin], who's our public face. We were— [To Michelle] Do you mind if I share the story?

We were losing our other public spokesperson, who was also a volunteer, getting really close to our first hearings. And it's like, you've got to have a spokesperson and our social media was just in its infancy. Do you know that when we held the Truro meetings, or the first hearing date on March 17th, we had not had a Twitter account long enough to become verified? Yeah, and you laugh. Can you imagine? Because you know the media is not going to pay any attention to you. You know you rely on social media. But we hadn't organized the team yet because that hadn't been a fire yet, right? Which gives you a really clear view of kind of how we're really just kind of patching this together.

And Garrett, who's our social media guy, is sitting here; I'll get back to you Michelle in a second. I mean, I think—and this will be weeks old—but I think two weeks ago when we had a meeting, he had reported back to us that in the last 30 days, we had had 10 million impressions on social media. It's probably like 1.5 million a week or something now from—I don't know, did we have, like, 200 followers on all our platforms on March 17th? Maybe? If we exaggerate?

Getting back to Michelle. So here we are, we're approaching these hearings, we have no media presence. Or one spokesperson, who was a volunteer is having to leave. And it's like, "Oh my gosh." I'm on a Zoom call with a bunch of other freedom groups and I just say, "We need a media team. Like, we need a media team."

And I called for that. And so Jerry, who's just been an absolute blessing, who's already shared with us: both him and Michelle, from that call for help, responded. And Michelle, it's kind of funny. And I don't know, it was a couple of weeks ago, she said, "Well, why did you pick me?" You know, I just kept the poker face; I didn't say, "Well, you're all we had." So we're not going to pick somebody that we don't trust, but this was an example of God stepping in and filling the need. Because here we had Michelle, who had worked professionally in TV production and direction

[00:10:00]

and had her own program on the women's network, understood what it took to put a story together and to communicate in front of a camera and to interview people.

And so here we had this professional person volunteer: volunteer to go to all of our hearings for no charge. We reimburse her for travel expenses—but for no charge. Jerry, he's literally full-time. And it seems that media crises, we can time them to when he has an important personal event in his life for which he announces in advance, "I'm not working for the NCI that day." So we know we're going to have a media crisis that day and he's not—Like, volunteer, volunteer.

How does that happen? And always at the last minute. You know, these Quebec hearings. What was it, three days before, four days before, Philippe—who's sitting here—when we finally got some lawyers? How do you have a hearing when you're calling witnesses and not having some volunteer lawyers to help you out? And interpreters. Lyne, who was on here, helped us find an interpreter team like, literally at the last hour. And then our AV team, David, is just a miracle worker. I mean, he's creating an interpreter booth out of, I think, a drum case and plywood and Styrofoam and stuff like that. And it works. It worked.

It's just kind of been interesting that—at every time, at every turn, just at the last moment, just when we needed it—God stepped in and gave us what we needed. And right down to finances. Like, it was funny, the meeting after Truro: it's like, "It cost that much, really?" And it's not cheap to rent a venue and have an AV team travel across the country and have to fly your commissioners and other volunteers around. It adds up. It's actually quite staggering. And yet we've kept up. And we've kept up because you've participated.

But what I didn't anticipate, and why this can't be a closing but an opening is: we had this vision and then we just picked eight cities, right? Like, why eight? Why didn't we go here? Why didn't we go there? And why three days? I can tell—if anyone from another country is thinking of doing this, I will give you the biggest mistake we ever made. Why did we do this weekly? We needed a week in between.

But we have been going now for two months. We started on March 17th, 2023. First time in history that citizens in any country have appointed independent commissioners, sat them down, and started calling witnesses. March 17th, 2023 history was made. And it is now May 19th, isn't it? Life's just been a blur. So May 19th, 2023, three months later, eight cities later, 24 hearing days. I have encountered the witnesses: probably around 350 witnesses testifying under oath in front of independent commissioners. All citizen-run. That is something that I think you all should be extremely proud of.

And the most interesting part was— And I have to tell a story about my wife, Teresa. It was probably about five weeks before Truro. [To Teresa] Do you mind if I share the story?

So about five weeks before Truro, we were just so far behind in getting it together. And some of us were just like, just dusk 'til dawn. And I'm just getting stressed out to the yin yang. And I told you, we had no social media,

[00:15:00]

nothing happening.

And I had a couple of days I just couldn't sleep. Like, you know, can we actually do this? We put in all this effort; we've gone this far; do we just have to collapse it now? Because we were on the verge for so long of just having to say, "No, we can't do it." And then, why I'm not sleeping—in addition to just the stress that, "are we failing here?"—was even if we succeed on getting witnesses in front of the commissioners, if we can possibly even do that, who's going to watch? What's the point? Why are we bothering? Because we have no social media. We have no team. Our miracle worker Garrett had started, but he had no content. And we had nobody to make content, and you can't succeed on social media.

So my precious wife said to me, just really seeing the crisis that I was in: "I will give you one day." So there was a fellow at our church who—he's retired, but he used to be a video guy. And he had let me know that he'd be willing to volunteer. So Teresa arranged for 10 or 12 people to be videoed. She just tracked down people who were willing to go in front of the camera and share a story. And finally, we had some content.

And then she continued working. And there was kind of, I don't know—was it the "quote of the day" or something? I don't even remember. They're just trying to come up with little ideas. And she's literally been working day after day after day even though she's got another job and things to do. And I don't even know how many volunteers— There's a volunteer here that put together our commercial. So somebody was willing to introduce us at that World Health Council big meeting and we needed some commercial. And if we had paid 50 grand for that, we'd be going, "That was well done." And we're thankful. We're thankful, Mr. Dahl, for doing that for us.

I don't know if I have permission to mention names, but there's some people on the social media team that have taken on the role of organizing other volunteers. And there's teams that we don't even know about. The chair of our support group, David Ross: for those of you who know him, he's just a steady hand. And it's just a pleasure to work with people that are solid. And for the entire support group.

It's funny, where I have to be in the role of kind of thanking everyone because I'm giving the opening. And it's funny, whenever I talk like this, I never have gone through one of my openings once before I give them. Usually what I'm going to say comes to me at about 7:30 to 8:00 in the morning. I wish it would come earlier, but it seems to work. But when I was jotting down notes where I kind of wanted to go, after I was going to say, "This is a beginning," one of the thoughts that came to me is— You know the Matrix movie? The very first one. And we're at the very end and Neos is back in the matrix. And he makes a phone call to the machines, basically saying, "I'm here. I don't know where it goes from here." And then he flies up into the sky. But you know, it's going to have to be sorted out.

And I think that's where we are. So I've kind of shared with you kind of where the NCI started and that it's literally an act of God, a miracle that we're here. But one of the things that happened is this started resonating. Canadians watching other Canadians tell their story resonated. So it tells us that we need to hear each other.

[00:20:00]

It tells us that we need to listen to each other. It tells us that we're together.

You know, there have been days where I've had trouble keeping it together because I've just been so emotionally wrecked by some of the testimony. And we experienced that a couple of days ago. Sheila Lewis keeps coming to mind, but she wasn't the only one that day. We had—I think we had three or four in a row where I couldn't help not breaking into tears. And in interviewing witnesses— And for all the witnesses that take the stand, I mean, there's many that kind of got through the first selection process that we interview and then they drop out. And some die before we get to the hearing that we had selected them for.

Some drop out. They drop out because they're afraid of social consequences, some because they're afraid of economic consequences. Some, we don't know the reasons. But we hear their stories before they drop out and we get to know them. And then those that testify, even though they're afraid and we have to coach them through, they're grateful. I had one of the witnesses who testified earlier this week basically say, in their own way, that this was healing. That person was really apprehensive and really scared to testify and take the stand. And it helped.

So there's something about being listened to. There's something about finally being brave enough to speak. Like, what a country that we're not able to speak together. And that's been the most touching thing in my life. But we've also just been the people out there—the people on the other side of the camera. I'm not a camera guy, so you know I'm always looking around. I haven't been trained to do this correctly. But you guys, you email us and you text us and you send us messages.

I'm going to read an email. This person was so, I guess, intent on getting communication to me that it came through several sources, including a different group not connected to the NCI. I got a couple of copies of this. David, can you pull up the screen on the lawyer computer?

The email came with this picture attached. And I'm going to read to you the email.

Dearest Shawn Buckley,

I hope I am sending this email to the right address for Shawn Buckley. (And this one came from another group). I think I have finally found a place inside of me that is brave, thanks to your profound NCI presentations. I was on the fence for a long time. And thank you for shining a light on how to draw a line in the sand.

How to draw a line in the sand. I took this picture with my cell phone. The sun is shining through the fence. I could not help but think this is how to draw a line in the sand.

Thank you, again and again.

But that's what this is all about. I just happened to be one of the public faces of what's going on. But I'm just one cog in thousands of volunteers, and I'm very honoured to be here.

I feel, and I've said this in some openings, I feel indebted to the truckers. And I feel that we need to— Yes.

[00:25:00]

For you truckers out there, everyone in the room was standing and giving you a standing ovation.

I know that I was scared when the Trucker Convoy started. I was cowering in my home. I think that I'm here and that we're here because of you. And our governments backed down because of you. Can you imagine what it would have been like if the truckers hadn't done what they did? I mean, the mandates started dropping province after province because of them. The government was not going to drop the mandates. I forget which witness said, you know, that the plan was two years. Lock them up for two years. Now we're Canadians, we're northern hemisphere; they had to let us out in the summer or we would have blown a fuse. But we were going to be locked up again.

And I believe the only reason we're not wearing masks and having to go through the police state ritual of showing passports right now is because of what the truckers did. I think we need to understand that they showed us something. And they showed us that sometimes you just have to stand up. And sometimes you have to get punished. And sometimes you have to pay a price.

But aren't we proud of them?

And I'm proud of the NCI team. I'm proud of everyone in this room. I'm proud of all the volunteers. I'm proud that we collectively got together and helped give some people a voice. I'm proud of the volunteers and I can't mention them all. You know, there's Peyman, who is just a guy that came to mind that has been so instrumental in the social media and getting video clipping done and encouraging Teresa on many levels. And there's this whole team. There are whole teams I don't even know exist—like, I find out about them.

You know, each venue— The local team here in Ottawa, do you have any idea how much work they put in? It's not just renting a venue. There's so much that goes into this. The team that sorted out what our guidelines are and selecting commissioners and witness selection. There's— Colm, you're amazing. Like, some people have really sacrificed. Some people you know, have really sacrificed. And the witness selection: there's people in this room that have been involved in that. That's just a monumental task. And I've already mentioned the **communications and social media, the support group.**

We're not supposed to mention our names so I won't. Just the thinking was, is: this is supposed to be independent. And some of us are tied to other freedom groups and that's not what it was about, right? It wasn't to tout groups we were involved with; it was to try and put on an independent commission. The lawyers that volunteered, people like Lyne that were doing the subpoenas, there was a whole team. I only knew one person who catalogued—this will end up in our archive and our website—all of the government communications and all the provinces, with links. It's just— It goes on and on.

[00:30:00]

And I want to say thank you. On behalf of the NCI, for all of you out there that I know and don't know, I sincerely thank you. And I feel honoured to be here and to be able to share.

I'm not done, so just hang on. There's a danger some judges have learned over the years, that if you give me a microphone and I don't have a time limit, bad things can happen. But I wanted to talk about— Well actually, so I have to talk about my talks.

I wasn't supposed to be involved publicly at all. That wasn't what I wanted to do. I wanted to just be involved in helping to organize and kind of put the fires out. And so I had no intention on attending. I thought maybe I'd go to the Saskatoon hearing and the Red Deer hearing as a spectator. Had no plans on leading witnesses or giving openings or anything like that. And all that happened was, for whatever reason— We have a whole bunch of, I wouldn't say a whole bunch, but a reasonable number for each place of lawyers' names, who had earlier on expressed interest in volunteering. We actually weren't thinking we were going to have problems getting lawyers to volunteer once it actually got to the hearing. But it turned out that they just dropped like flies as it got closer.

And I'm very thankful for Kassy and Wayne, both who have flown in from different provinces, because we didn't have local lawyers volunteering here.

It turned out in Toronto, we didn't have a single lawyer for the first day. So I'm thinking, "Okay, now I have no choice. I have to go and do this." And the second day when we had one and so it's, "Okay, I'm doing the lawyer thing." But that just continued. I show up in Toronto on the schedule—day one—as an opening. I got to figure out what I'm going to do there. So I actually prepared for that one. It's not that I would have run through it, but I sat at least a day or two before, I kind of figured out what I was going to say. And then lo and behold, I'm there on day one and I noticed they got a slot for an opening on day two. It's like, "Okay, well I better figure out something to say on day two." And then after day two, some of the commissioners—who I won't name to protect the guilty— "Oh, we actually liked your openings. I'm looking forward to your next one." So now I felt the pressure, right?

So I just continued doing openings. And some days I feel I've walked the line. But I want you to know that I've taken that role, once that role fell on me, really seriously. And I took it seriously because first of all, there's no reason why you would listen to me at all. Like why do I have a mic and why do I get the honour of actually speaking to you? And I took that seriously.

And just so you know, I would pray that God would just tell me what to say—whether I was going to go, whatever that direction would lead. And I felt the responsibility to give people hope and to try and give us unity. And I can tell you: if you had told me before some of the things that I would be saying, that I might be sharing a Bible parable or anything like that, I would not have believed it. And yet that's what happened. And a lot of people have commented that they have appreciated what I've said. I need to make it very clear: I didn't say anything to you. And I see some people nodding their heads and know exactly what I'm talking about. Because those weren't my words. And half the time what I was saying, I didn't have notes about. It's just what He said. And that— That is an honour.

And we know that God is moving in Canada.

[00:35:00]

We know that people are beginning to understand that what we've been taught is an illusion. We don't even know— I'm sure there's things that we still believe to be true that

are completely false. And for the first time in our lives, we find ourselves actually not knowing our way. Just because, like I spoke this morning, if you've been lied to about something—if you don't know what's really true—you're being controlled. Because you can't decide. Your agency, your ability to decide has been taken away from you.

I actually feel that when the words would come out that we're under a spell—and again, those weren't my words—that we've been under a sleeping spell. And I think we're waking up. I think we're coming out. I think the sun is shining. I think there's a line in the sand. There's sun shining through the fence, and we know the sun is there.

We're going to have a long journey. But I think we understand that we're in a historical time. Like it's interesting, isn't it? I was a Second World War buff. It fascinated me. And when I was a little teenager, before I made a music CD for my car, I would throw in a little Churchill speech first. You know, "We will fight on the beaches, we will never surrender whatever the cost." When I used that Churchill quote the other day that he used— And you have to understand when Churchill became prime minister, everyone was expecting Britain to surrender, including his cabinet, including the King. Because it looked hopeless. And do you know what? It was hopeless. It was absolutely hopeless and yet they didn't surrender.

I read a really interesting book. I'm totally off script, so we know who's speaking. I read a really interesting book in the last year about how, when the Germans started their bombing campaign—and I mean, there's some exceptions, like when Bristol got just totally gutted—the British morale actually went up. They got used to it. They would, especially the young: they would party harder. The people, they got used to it. They got used to bombs falling on their head. And they stood tall. And then they started to feel proud. And they never surrendered.

And that's where we are. We're starting to party again. We're starting to go out again. We're starting to feel strong again. And we realize that we can't surrender. They're going to lock us down again. I don't know what that's going to look like this time. They're going to tell us to wear masks again. They're going to try and force treatments on us again. I live in St. Albert. We're designated as a 15-minute city, so they're going to eventually block off the roads so we can't drive in and out because the whole idea says you're supposed to walk. Which is why it's called the 15-minute city. You can walk a mile in 15 minutes.

All this stuff is going to happen. We watched James Corbett. But this time, we're not asleep. And there'll be times that we're afraid—but we know how to handle our fear now and we know we're not alone. And that's why this isn't the closing, it's an opening.

And what we have that we didn't have before is, we have each other. And we have an understanding that we're not alone. And we have an understanding that— We are **Canadians. And Canadians don't cower.**

Do you know where the word "stormtrooper" came from? It's what the Germans called the Canadians in World War One.

[00:40:00]

Stormtroopers. They didn't like going against the Canadians. And we have a reputation. One of our witnesses who had been stationed in the military in Germany related that the Germans would tell their children, "If ever you get lost, just go to the home of a Canadian stationed in Germany and you'll be okay." Because we have a reputation of treating people decently. We have a reputation of loving each other and loving others. Because that's who

we are. And I think maybe why this experience has been so traumatic for us, is because we didn't recognize that, that we lost our way.

And I'm just going to end there, saying that I don't know where it goes from here. And I don't know what stands we're going to make together. But we're not going to stand alone anymore.

It's been a pleasure and an honour. And I will say to the commissioners that I've been very honoured to get to know you guys and to help you with your role.

And I'll just end there. Thank you, everyone.

[00:41:35]

[00:00:00]

Shawn Buckley

... short opening. Well, actually, let's have the commissioners up because I'll address them.

So welcome to the National Citizens Inquiry as we make history today. We're starting our very first virtual testimony.

By way of update, the commissioners had requested that we bring Denis Rancourt back to deal with a couple of specific things, which we will be doing. But I also wanted to give you a little bit of an update on the National Citizens Inquiry. The commissioners, who are all in attendance—Janice is also listening in and may appear on camera a little later. But the commissioners had made a request because of a couple of studies that—one which is published and one which is not published yet but is awaiting publication. They wanted Mr. Rancourt to speak to those, and so we've invited him back.

But the commissioners are also working quite hard on their report. For those of you who aren't aware, the National Citizens Inquiry held testimony in eight cities, in eight provinces, for a full 24 days. There is an amazing 300 separate witnesses that testified under oath on issues related to how all levels of government in Canada addressed the COVID-19 pandemic, which is just a monumental amount of evidence for the commissioners to digest. So I just wanted to thank them for the hard work that they're doing.

The NCI is also now in the process— There's a team of volunteers, I believe there's 70 of them, all volunteers, that have taken it upon themselves to go through three separate readings of each witness's testimony so that at the end of this we will have accurate transcripts of all of the testimony. And then there's a separate team working on the website so that each of the 300 witnesses will have their own webpage linking to their testimony, linking to their transcript, linking to exhibits and all done in a very highly searchable way. The NCI has accumulated the most impressive body of evidence on COVID of any group— government or non-government—in the world to date.

And I'm thankful for all of you that have participated and are participating. We actually haven't done a tally of volunteers, but we're probably 800 to 1,000 volunteers that, in one

way or another, have participated to make this a reality. As I indicated during our live hearings, we're a citizen-run, a citizen-led, and a citizen-funded initiative, and I'm so pleased to announce that with all of your donations, we are able to cover the cost of the hearings, and we're extremely grateful to you.

I'm almost going to choke up again because every time I talk about this, I'm just totally—I find myself in awe of what's happened, and I feel that what's happened is divine, and I feel that what's happened is unusual. I feel now that I'm part of a wider community, and no one anticipated that this would happen. But we're still getting report after report of persons telling us that they feel that they're part of something bigger, that they don't feel that they're alone anymore. And I know that I personally feel that. I feel that I've participated in something much larger, and I feel that I'm not alone, and I feel much more hopeful. I know that things are coming at us going forward, but I know that I'm going to act and stand differently than I did before and that I'm not going to be standing alone. And sometimes I still find myself really just unable to process what's happened.

I was on a Twitter call or, you know, a Twitter Spaces that the NCI did, so probably about four weeks ago now. And during the call, somebody stepped up from just being a listener to share that they had printed off a one-page form and had been, you know, trying to bring awareness to the NCI. So I assume this person even had created the form. And just how difficult it was and how some other people stood up to help her do this. So she had found this really emotionally difficult.

[00:05:00]

And what was interesting about her description and what was so touching about it was she almost seemed ashamed that that's all she was doing.

And I couldn't help but think about the Widow's Mite, you know, where Jesus is at the temple and he's watching people come and donate huge amounts—this was all done publicly. And this little widow comes and just puts in, you know, literally a cent. And he points out to his disciples that she gave more than anyone else. And they're like, "Well, what do you mean?" "Well, she gave all that she had."

And so I was touched because this person telling us on this Twitter Spaces call what she had done—it was clear that this was a big effort for her and that she found it very challenging, and yet it was so meaningful. And it was so meaningful for those listening. And that's what the NCI is. The NCI is people just stepping up and doing things because they feel led to do it, and it's their way of participating.

And so I want to thank everyone out there that has been doing what they feel they should be doing, because that's what this is all about. It's not about this small group of the NCI that got together to organize these hearings. It's about you deciding what you're going to do and stepping forward. And I think that's why we all just feel so touched. And we all—and I know the commissioners feel the same way—just honoured to be part of this process. So thank you for letting me give a short introduction.

Commissioners, for the record, my name is Buckley, initial S. I'm attending as agent for the Commission Administrator, the Honourable Ches Crosbie. I'm pleased to introduce again to the NCI, Mr. Denis Rancourt.

Denis, can you please state your full name for the record, spelling your first and last name?

Dr. Denis Rancourt

Yes, Denis Rancourt, D-E-N-I-S, and then Rancourt is R-A-N-C-O-U-R-T.

Shawn Buckley

And Denis, do you promise to tell the truth, the whole truth, and nothing but the truth today?

Dr. Denis Rancourt

I do.

Shawn Buckley

Now, for those who have not seen Mr. Rancourt testify before, he testified in Quebec City in French; he testified in Ottawa in English. His curriculum vitae is attached to the NCI record as Exhibit OT-1a, and anyone can go to the website and review that. It's quite impressive.

But by way of introduction, Mr. Rancourt, you have a Bachelor of Science, a Master of Science, and a PhD in Physics from the University of Toronto. You have been a Natural Sciences and Engineering Research Council of Canada [NSERC] international postdoctoral candidate in prestigious research laboratories in both France and the Netherlands. You became a National NSERC University Research Fellow in Canada. You were a professor of physics at the University of Ottawa for 23 years, attaining the highest academic rank of full tenured professor. And as a researcher at the university, you were a researcher in interdisciplinary research.

And I'm going to ask you to explain that because it's important for the audience to understand. You became much more than somebody who just researched physics and focused on physics.

Dr. Denis Rancourt

Yes, I mean, it's not uncommon for physicists to work in other areas, but I was working in many other areas and actually had large research grants and a large research team working on biogeochemistry for many years and things like that. So I prepared a slide to illustrate the interdisciplinary nature of my background, as well. Yeah.

Shawn Buckley

Well, we'll get to that in a second. I'll just inform those that are participating online that you were invited back to speak about a couple of studies, which we will get to later. But then, since you have testified, there's been further information released concerning all-cause mortality—not just in Canada, but some other countries—and we've invited you to give an updated presentation.

And I'd like to invite you to do that now. And so, if you want to bring up your slide presentation and present that to the commissioners [Exhibits VT-1a, VT-1b].

[00:10:00]

Dr. Denis Rancourt

Okay. Well, thank you again for this invitation. I consider it an honour and a privilege. I'm going to talk about Canada a lot more this time because I think there were so many concepts to cover in the first part of my testimony that I didn't go into much depth with Canada. So I'm going to do that more this time.

[Interdisciplinary scientist]

This is to describe that I'm an interdisciplinary scientist, and this is a list of all the different areas of science that I've published scientific articles in and that I've worked on. As you go down the list, you get closer and closer to tenure and to retirement, so you have much more freedom and you can really get into the in-depth things that, normally, granting councils wouldn't let you do. And so I achieved a high level of proficiency in all of these areas and was given large research grants in the great majority of them, as well.

And the last one is theoretical epidemiology. So with first author, Joseph Hickey, we now have two articles that have been peer-reviewed in that field. So it goes all the way into mortality, disease, health, psychology effects, individual psychology effects on health, and so on. Those have been my more current research areas.

[Nanoparticles / molecular science / statistical analysis / modelling / measurement]

This is a slide I showed last time just to explain the main areas of science that I'm an expert in, that I've written papers on and done research and made discoveries in. And there are five main ones that are especially relevant to study of COVID questions: nanoparticles; nanoparticles in the environment; molecular science, meaning everything from molecular dynamics to how molecules form and react and stick to surfaces, chemical reactions, and so on; statistical analysis, getting into sophisticated methods, like Bayesian inference theory, and so on—I've written papers about that; modelling, in the broad sense—everything from modelling at the molecular level to modelling cycles of nutrients in the environment, how they cycle in the environment, and now, recently, epidemiology; and measurement theory, which is a broad— It's the way in science that we know things.

So I'm an expert in all the ways that scientists can measure things. So the main areas are microscopy—I had an electron microscope in my laboratory, for example; diffraction methods, which there's a whole array there; and spectroscopic methods and various kinds of characterizations of substances, whether they're live or not. And so those are all areas that I've developed techniques in and actually written scientific papers about. And so it gives me that broad knowledge to be able to read scientific papers.

[Collaborators]

My main collaborators on the COVID research are the following people, and I especially want to mention Marine Baudin and Joseph Hickey because they contributed most of the new material for this particular update that I'm going to give now.

[Bilingual First Installment of this Testimony]

So this is a continuation of the testimony that I gave in Quebec City and in Ottawa. And the exhibits, you can find them now, there's a large Book of Exhibits on the website of the National Citizens Inquiry [Exhibit OT-1]

[Book of Exhibits of Expert Witness, NCI]

And the Book of Exhibits that I had prepared is up there—and it's almost 900 pages—and it contains the key scientific reports and articles that I have written about COVID and COVID-related matters. So this is just a screenshot to show what the index of that Book of Exhibits looks like. That index runs for three pages [slides 6, 7, 8].

[BoE, NCI]

And I put an arrow there for the very first scientific report that I wrote about all-cause mortality, and it was way back on the 2nd of June 2020. And at that time, I concluded that there was not excess deaths from a pandemic but that instead, there were hot spots where very aggressive methods had been used in hospitals and caused the death of people. And that was even the title of that paper. And we just then went on from there and made that research more and more specific and looking at more and more countries.

[My website, COVID section]

And also, you can go to my website. There are more than 30 articles about COVID-related things there on my website in the COVID section.

[00:15:00]

[First Installment – Conclusion]

And in the first installment of this testimony, I concluded that there was no pandemic causing excess mortality; that measures caused excess mortality; that COVID-19 vaccination caused excess mortality; and that if there had not been pandemic propaganda and if governments had not done anything special—had not responded because there was nothing to respond to—and there had not been all these coercive methods—

Basically, if the medical establishment and governments had just done business as usual, there would have not been any excess mortality. That is the conclusion of all my work on all-cause mortality, studied by jurisdiction, by age group, and as a function of time. And looking at vaccine rollouts in coincidence with that, and so on.

[First Installment – Made These Points]

So in the first installment, I mentioned that none of the modern pandemics that are promoted by the CDC that are said to have occurred—there have been three of them since the Second World War: in '57/'58, in 1968, and in 2009—none of them cause excess mortality that can be detected in any country. So that's very important. All of this noise about pandemics has not created excess mortality that one can measure.

Shawn Buckley

Can I just interrupt you, Denis?

Dr. Denis Rancourt

Yes.

Shawn Buckley

So I just want to make sure that I understand and that those watching understand. So, like, the 1968, that was called the Hong Kong flu, I think. And then 2009, we all remember that; there was actually, I think, a vaccine rushed out. And 1957–58, I don't recall that. But what you're saying is in every single country, there is not a single detection of all-cause mortality going up to indicate that there actually was a pandemic happening.

Dr. Denis Rancourt

That's correct. All the countries where you can get data, that I've looked for a signal that could be assigned and that would be comparable in magnitude to the various theoretical

estimates of deaths and so on—what I see is nothing. There is no signal. There is no measurable excess mortality that can be associated with those pandemics anywhere in the world.

Shawn Buckley

Okay, and you've told us the same in your first testimony in Quebec City and in Ottawa concerning COVID-19.

Dr. Denis Rancourt

Yes.

Shawn Buckley

Because I think the average person is concerned that they're going to die.

Dr. Denis Rancourt

COVID-19 is a little bit—it requires more explanation. There is significant excess mortality in the COVID period. I explained in my testimony how you can prove that it cannot be due to a viral respiratory disease and why, instead, it is due to the measures and then, later, to the vaccines. But there is very significant measurable excess mortality in the COVID period, and it has a detailed time and spatial dependence and so on.

But these particular past pandemics, that were claimed, do not give a signal of all-cause mortality whatsoever. That's the point. And the CDC will bring us back to 1918 and claim that that was the Spanish Flu and that that is certainly an example of a pandemic that caused a lot of mortality. And it's true that there was a large peak in mortality in certain places, where a lot of deaths were occurring at that time. But it has been proven now by four or five independent studies from the preserved lung tissue of people who died that they all died of bacterial pneumonia. Okay?

And in addition to that, if you look at the all-cause mortality of that period, no one over 50 years old died, which is basically impossible for a classic viral respiratory disease. If you believe what we think we know about viral respiratory diseases, it normally kills elderly people. And so this is completely unusual but can be explained in terms of what was happening in the society at the time—just after world war and horrendous living conditions—families with their parents out of work in conditions that are just unbearable, these younger people and young adults died. But none of the elderly people who were established, who already were set for life,

[00:20:00]

they were not affected by this so-called pandemic.

So one can demonstrate logically and with known empirical data that that was most likely not the claimed viral respiratory disease pandemic, okay? And that's going to tie into what I'm going to explain today. I'm going to get into more of that, what actually causes death that you can measure in all-cause mortality.

[First Installment, cont'd]

So that was something I explained last time. I also explained last time that the excess mortality refused to cross national borders or state lines. In other words, this invisible virus targeted the poor and the disabled. There's very strong associations with whether you're poor and disabled and carried a passport, because it wouldn't cross borders. And it never killed until governments imposed these harsh socioeconomic and care-structure transformations—it never killed in jurisdictions until they did that.

And there was this vicious, new treatments that were applied in hospitals at the beginning, in the first months of the declared pandemic, and that caused death in hot spots—but nowhere else—and that death did not spread. And this was followed by very severe coercive measures that were squarely contrary to what is recommended for individual health. And we know what I'm talking about, all the horrible things that were done. And so those are the things that ultimately caused death. I explained that in some detail last time.

[Today: Testimony Update]

But today I'm going to concentrate on telling you much more about Canada and showing you the diversity of what death looks like in Canada as a function of time and place, so you can appreciate that it depends very much on their jurisdiction: what was happening to whom is what determines death, and so it can be dramatically different from one province to the next or one region to the next. I'm going to try to illustrate that with data. And then I'll take a quick look at the world because there's something very unusual happening in Canada that's also happening in many parts of the world, and I want to talk about that at the end.

And then in the second part, I'll be critiquing those articles that you asked me to look at, which are articles about—they tend to be large review articles which try to ascertain what we should have learned from the pandemic; what we can learn going forward.

[Theresa Tam and co.: 1M extra deaths scenario]

This is from the first part of my testimony where I showed that all-cause mortality in Canada basically didn't vary during the COVID period. So you can see a kind of flat line with the usual seasonal dependence there, and there's no big step. And I showed in red, there, what Theresa Tam and co-authors are saying would have been the mortality if they had not applied all the measures and vaccinated everyone: they are claiming that, in Canada, there would have been approximately a million extra deaths—which is completely absurd and impossible because what they're saying is, the complex measures that they applied would have brought us down to, basically, what is exactly the same level as if nothing was happening.

So it's important to understand that in Canada, the signal of excess all-cause mortality is very weak. It's very hard to see. There's almost no increase in excess mortality, unlike many other places in the world, like the United States, the Eastern Bloc countries, and Russia, and so on. There are many places where there's huge, immediate rises that are visible on a scale like this, of mortality, but you don't see that in Canada.

Shawn Buckley

And if I can just pause you for the benefit of the international viewers.

Dr. Denis Rancourt

Yes.

Shawn Buckley

So Theresa Tam is our federal [Chief] Public Health Officer that led for the federal government in imposing different restrictions upon Canadians, as far as the federal government had jurisdiction during COVID. And so, Mr. Rancourt, as I understand, so the blue line that you've got there just shows, basically, our excess mortality—

Dr. Denis Rancourt

No, no, no, no.

Shawn Buckley

Just our total mortality

Dr. Denis Rancourt

Yes.

Shawn Buckley

through normal years. And I'm sorry, thank you for correcting me. And for those international viewers that didn't experience this—so Theresa Tam claimed that the government measures saved one million deaths. And so, the red line is, you're showing what the mortality rate in Canada would have been

[00:25:00]

if what she said had any veracity at all.

Dr. Denis Rancourt

Yes.

Shawn Buckley

And by putting it on there, it kind of shows—it looks silly to us on the chart.

Dr. Denis Rancourt

And it should look silly. I mean, the y scale there, the axis, starts at zero. So they're claiming that overall mortality in the country would have more than doubled. More. Than. Doubled. It's absurd. You have to have a major war, a major meltdown of society, the economy. There are almost no times in history where this ever happened anywhere. It's just impossible. It's just crazy.

Shawn Buckley

I presume that other areas of the world that didn't impose the restrictions that Canada did, don't show a huge jump at all, either.

Dr. Denis Rancourt

That's right, that's right. And we'll get into that more as I show you the data. That's right.

So this was just to show that Theresa Tam and her co-authors—these scientists—are able to publish a scientific article where they claim, based on these very tenuous models and all kinds of incorrect assumptions, that they have saved a million lives. And they're able to get that published in a scientific journal which is funded by the state of Canada.

[All-cause mortality by Week – Canada 2019–2023]

So this is also from the last presentation. Okay, if I go back here [previous slide], I'm now going to concentrate on this region—the COVID period—and look at mortality in that region, just to show you a blowup of that. I showed this last time and I started describing the various features.

There are some features that are not the usual seasonal dependence of mortality. The seasonal dependence is a high of mortality in the winter, a trough of mortality in the summer, a high in the winter, and so on. There are many more features here. For example, *D* is simply a heat wave that occurred in British Columbia. And this is a common and known phenomenon. It lasts a few days or a week or so. And heat waves, very intense heat waves, always cause peaks in mortality like that.

This peak [*A*] is the peak of deaths from the aggressive protocols that were applied immediately in hospitals right after they announced the pandemic at this point [upward pointing arrow]. This is a very large winter peak [*B*], that is very large, that is right after they started applying the vaccine, starting in priority with the most elderly and the most frail. And this is a peak [*C*] that occurs mainly in Ontario, and it coincides exactly with the biggest rollout of the first injections: dose one.

Shawn Buckley

Which letter are you referring to?

Dr. Denis Rancourt

C. I'm talking about *C* now; I just talked about *B* before.

And *E* coincides to a peak that's higher than the last decade or more, and it coincides with a rapid rollout of the third dose of the vaccine, and so on. The fourth dose is over here, gives rise to this peak, *F*. And so we're going to look at that in some detail in the coming slides. But this is a blow-up. So even though overall mortality level did not increase very much in Canada, there are all these features that one can analyze and try to understand.

[All-cause mortality by week, Canada – all ages, 2010–2023]

And then this is what that region looks like when you look at more years, so a decade or more. And you can see the seasonal pattern there and you can see the details that I was just describing. And on this graph, now, what I've done is I've shown a dashed vertical line for the date at which the pandemic was announced—or the date at which “a pandemic” was declared, let's put it that way. And then, this is just a straight line that runs through the summer troughs in recent times. So it's the historic expectation of summer troughs in here. And you can see that mortality doesn't come back down to these summer trough levels during the COVID period. So, there is an excess mortality here. That is for all ages in Canada.

[All-cause mortality by week, Canada – 85+ years, 2010–2023]

And then we can look at what happens for different ages. So this is 85-plus-year-olds and you can see, now, that the summer troughs go lower than what you would expect

historically. And that's proof that you accelerated deaths here in hospitals in this large peak so that there were less 85-plus-year-olds to die immediately in the summer that followed. That's why the mortality comes down like that.

Same here. This was a very intense death period, and the mortality comes lower than you would expect historically

[00:30:00]

because there was some excess mortality in here that normally would not have occurred if you just follow the historic trend. So that's what we—

Shawn Buckley

And Mr. Rancourt, on your computer, are you using a mouse with an arrow?

Dr. Denis Rancourt

Yes.

Shawn Buckley

Okay, we're not seeing that. So just be aware you need to describe for us what you're referring to.

Dr. Denis Rancourt

Oh, sorry. Thank you for pointing this out to me. All right. That's why you're asking me about the letters. I am glad I realized that.

So the summer trough that follows the dashed vertical line is the first summer trough that is lower than the historic trend because of that very high peak that occurs immediately after the pandemic was announced. And then there is another pair of peaks, followed by a lower than normal trough after that. So it's just to illustrate that point in the 85-plus-year-olds.

[All-cause mortality by week, Canada – 65–84 years, 2010–2023]

And then if I go to the 65- to 84-year-olds, you can see that now you're in a higher regime of mortality. You've really raised the mortality up above the trend you'd expect from the summer troughs there. And so you can see that as you lower the age group, the seasonal amplitude decreases—this is well known—and the level of mortality, of course, decreases. Mortality decreases exponentially with age. That's a law of nature for humans.

[All-cause mortality by week, Canada – 45–64 years, 2010–2023]

And here we have these 45- to 64-year-olds, and I've again shown by this dashed line that's there, the vertical dashed line, that that's the date at which the pandemic was declared. And you can clearly see a different regime of higher mortality there for that age group.

[All-cause mortality by week, Canada – 0–44 years, 2010–2023]

And we can go to the group of younger people, so 0- to 44-year-olds. You really see a very sudden shift to a higher plateau of mortality that pretty closely coincides to the announcement of the pandemic and when all these measures were put in place across Canada. And so the younger people, in proportion, were dying far more than the older

people, in proportion, because they normally don't die that much. So you're increasing by more than 50 per cent the death of this group. And as you go younger, the amount by which you increase death—you anomalously have a high death rate—is greater and greater as you go to younger people.

But the point is that the vaccines— There is absolutely no evidence that the vaccine reduced death in any way. In fact, everything suggests that as soon as the measures were put in place, it had devastating effects on all age groups. And the rapid, military-style rollout of the vaccines, which started in the very end of 2020, had no net or visible systematic beneficial impact on mortality for any of these age groups but caused a large part of that mortality, especially for the elderly. And that's what I'm going to show a little later on. That is what the all-cause mortality for the different age groups in Canada looks like.

We can also look at specific provinces, and it's important to do that because the behaviour of the mortality is very different when you go to different provinces.

[All-cause mortality by week, Alberta (Canada) – all ages, 2010–2023]

This is Alberta, and now we see that same vertical dashed line is that same date at which a pandemic was declared. And we see that there is not a very large peak of deaths caused in hospitals by aggressive protocols. Alberta did not have that, unlike these very large peaks that occurred in Quebec and Ontario and in many hot spots in the world, such as New York City, Northern Italy, and so on. Alberta didn't have that.

But Alberta has a higher regime of mortality starting somewhat later, starting at the end of 2020. There's that very large winter peak, which is unlike anything in recent times. And then you see the next winter peak in mortality has a double peak structure, and that's directly associated with vaccination.

[All-cause mortality by week, Vaccine doses rollouts, Alberta (Canada) – all ages, 2018–2023]

I'll show that in another slide here. This is a blow up for Alberta, and the dark blue line is the cumulative rollout of all the vaccines.

[00:35:00]

And you can see that there's an increase in slope there that gives rise to that second peak in the winter—centred on 2022 there—and, generally speaking, the higher regime of mortality is occurring in the period when you're vaccinating.

Now, in addition to this problem of the COVID vaccines, the state decided that it would be a good idea, also, to vaccinate more than ever before and especially the elderly people for flu at the same time, especially that first winter after the pandemic was declared. So I don't have data for the rollout of the flu shots—which would typically be September, October, November—but we believe that's associated/partly causes the very high magnitude of that very first winter after the pandemic was announced. And then you've got the summer baseline trough there, just to give you a point of reference to show you that there's a regime of higher mortality in Alberta.

[All-cause mortality by week, Alberta (Canada) – 0–44 ages, 2010–2023]

And Alberta, for the younger group, 0- to 44-year-olds, looks like this. So for the younger people, you again have this sudden turn-on of a higher rate of mortality, pretty much exactly coincident with declaring the pandemic and then, a little later on, imposing all these

horrendous measures. And no sign of a beneficial effect from any vaccination or anything like that but rather, a steady plateau that does not appear to be coming back down to what we historically had in recent times. So, there's a permanent death effect for younger people in Alberta there.

Shawn Buckley

And I'll interject, just to ensure that people understand your chart. So on the left-hand side, going up, you have deaths per *W*. What's the *W* stand for?

Dr. Denis Rancourt

Per week.

Shawn Buckley

Oh, per week. Okay.

Dr. Denis Rancourt

Yes.

Shawn Buckley

So I noticed with different age groups, those numbers are larger and smaller. So that's important for us to pay attention to when you say, like, for the younger age group, maybe the overall numbers aren't significant, but the percentage of rise can be significant.

Dr. Denis Rancourt

Exactly.

Shawn Buckley

Sorry for interrupting, I just thought it was important.

Dr. Denis Rancourt

No, thank you. Thank you. I really appreciate that. Don't hesitate.

In Alberta, this rise in death for younger adults, and so on, is especially important in young adult males. I'm not showing the data here, but it's mostly due— Among the young adults, like 25 to 45, it's mostly males that died. Females almost did not die. And this, we believe, is associated with closing down the energy sector and the devastating effects of that and loss of livelihood, loss of meaningful work, and so on.

And I think that this is the population phenomenon that would have largely been catalyzing the truckers and that movement and so on—is the immense amount of suffering that you can see directly in the mortality. So if people are dying at this higher rate, it means that the suffering that does not include death is even much higher. And there is an increase in homicides at that time, an increase in suicides, as well, among young men. Okay, so Alberta was a hot spot of suffering for young men because of what was done in the name of the pandemic. Yeah.

[All-cause mortality by week, Ontario & Quebec (Canada) – 0–44 years, 2010–2023]

This is what Ontario and Quebec look like, and this is for the 0- to 44-year-olds. So again, the young people. This is interesting because you see that stepwise rise in mortality in Ontario. It's not as important as in Alberta, but it's very visible—you have a higher plateau of mortality—but there is no such change in Quebec. So Quebec society, my interpretation is Quebec society is very different. Individual psychology, cultural differences, and so on are such that when you impose the measures that were imposed, it did not dramatically affect young adults and children to the same magnitude as it did in Ontario and a much greater magnitude in Alberta. So this is one of the very interesting differences from province to province.

I have to insist that what I'm showing you now and the tentative interpretation that I'm giving you and so on, government scientists aren't doing any of this.

[00:40:00]

This should give rise to huge amounts of research to do fieldwork: to go and find out what happened, where; who died, when. There should be forensic epidemiology that is done across Canada to understand these phenomena and to learn from them, but, to my knowledge, none of this research is being done. Government scientists are sitting at their computers, taking in the data as it comes in, doing this kind of analysis to some degree. **But** they're not planning to do the fieldwork and the real research that would allow us to understand with concrete information what exactly has happened and why. And so that's a main criticism that I have of the establishment that is supposed to study these questions.

[All-cause mortality by week, Ontario & Quebec (Canada) – all ages, 2010–2023]

This is now Ontario and Quebec but for all ages, and you can see that that very first sudden **peak** that occurs right after the announcement of a pandemic—the dashed vertical line—is much higher, in relative terms, in Quebec than in Ontario. Quebec was more aggressive in this regard. There was more abandonment of the elderly, who were particularly vulnerable and had comorbidity conditions, but both provinces are guilty of this.

And in Ontario, you see a large peak after the first winter following the announcement of the pandemic. There's a large peak immediately after, which is not as prominent in Quebec. And in Ontario, it coincides perfectly with the rollout of the vaccines. So there are all kinds of features like that that can be compared from province to province and analyzed in terms of the rollout of the vaccines.

Shawn Buckley

Can you just jump back to that other slide? Because if I recall correctly— So actually, no, to the next one. So you know, you've got that vertical line showing when a pandemic was implemented. My recollection of the Alberta one is there was no rise right after that declaration.

Dr. Denis Rancourt

Exactly, I pointed that out. I'm saying a lot of information very quickly. You're absolutely right.

Shawn Buckley

It's in theory, the same virus occurring at the same time. Like, Alberta was testing for— I mean, regardless of what anyone might feel about that, all the provinces are reporting, you know, a number of cases. And yet, in Quebec and Ontario, the statistics, as I understand it from your graph here, is showing a spike, an increase in death right after the pandemic's declared. And now, Alberta, there's no spike at all. In fact, if I remember, the mortality goes down after.

Dr. Denis Rancourt

I spent some time on this in the first part of my testimony. I mean, the virus, basically, was behind the gate waiting for the pandemic to be declared. And then it hit hotspots—only—in the world.

So only some provinces in Canada, but really it wasn't province-wide. It was certain big cities where there are big hospitals, right? And it did not affect 30 of the U.S. states. There's no peak like that in approximately 30 of the U.S. states. There is a prominent peak like that when you look at the high resolution, spatially, in Northern Italy, around Paris, one other spot in France where there is a large hospital, London. Stockholm, in Sweden, had a terrible peak of this type because they did the same things. Germany, as I said in the first part of my testimony, did not have anything like this and no excess mortality for quite a while because Germany did not apply these aggressive protocols, which I described last time, and just did business as usual in terms of clinical evaluation and then what to do about it in hospital.

So there is quite a story in that first peak. And it is the story of what vicious hospital protocols that you feel you can just apply because it's supposedly a new virus. So you can just try whatever you want because everyone's going crazy that it's going to kill everyone. So, therefore, MDs kind of have a licence to do whatever they think makes sense, you know? Whatever they think is logical and sometimes, quite often, they overdid it. And we identified specific drugs that were given at a toxic level. And, of course, the mechanical ventilators were extremely dangerous and were applied en masse in Northern Italy and in New York. And so, they are a big part of this peak.

Shawn Buckley

Right. And I'll let you go on. But just so that people watching understand—basically, it was the policies, not the virus, because the virus doesn't respect state lines. But it's policy difference from place to place.

[00:45:00]

Dr. Denis Rancourt

Absolutely. And this was the whole thrust of about an hour of testimony that I gave previously, where I tried to show many, many examples of that. Whereas this time, I'm just more trying to give a flavour of the different things that happened in Canada. That's right, yeah.

[All-cause mortality by week, New Brunswick (Canada) – all ages, 2010–2023]

This is New Brunswick. Now, New Brunswick and Nova Scotia are very special because there's the vertical dashed line where a pandemic was declared and nothing happens until much, much later. You have to get into September of 2021 before you can identify a transition to a higher regime of mortality. Okay, I put in a line there to guide your eye and

you can see that there's this higher mortality in New Brunswick—all ages here—but much, much later. Yeah?

Shawn Buckley

So, basically, we're hit with a pandemic that we're told is so deadly, we need to stay in our homes. We need to shut our economy down. We need to mask. And in New Brunswick, really—and we can see it—that there's no change in excess mortality at all when we're the most vulnerable. When we don't have any protection, let's say from a vaccine, all-cause mortality doesn't change. In fact, it almost looks like it decreased.

Dr. Denis Rancourt

Well, this rise that I'm illustrating in this figure, that happens late in the period that I'm illustrating here, coincides precisely with the vaccine rollout, and I'll show that in the next figure, okay?

So nothing happened. In terms of mortality in New Brunswick, there is no pandemic but—

[All-cause mortality by week, New Brunswick (Canada) – 65+ years, 2010–2023] Oh and by the way, this is the 65-plus-year-olds. It's to show that the phenomenon I'm talking about is affecting the elderly people in New Brunswick, okay? This is not a young person phenomenon, it's an elderly person phenomenon. And we showed in our research, as I mentioned last time, that the vaccines kill exponentially with age of the person.

[All-cause mortality by week, Vaccine doses rollouts, New Brunswick (Canada) – all ages, 2018–2023]

And now this next slide shows New Brunswick again, on a blow-up in time, but showing, also, the vaccine rollout. So in dark blue, you've got the cumulative vaccine doses of any dose that are being given. And you can see that as the vaccines are brought in, you've got that same vertical dashed line at the time of the announcement of the pandemic on the 11th of March 2020, and nothing happens. Then you can see how the vaccines are rolled out, and that's when you enter that high regime of mortality. You see that? And an increase in slope in the cumulative vaccine dose means a high rate of delivery of the doses, and that is corresponding to one or two of the peaks there when you analyze that in more detail. And so that is what's happening in New Brunswick.

[All-cause mortality by week, Vaccine doses rollouts, Nova Scotia (Canada) – all ages, 2018–2023]

And the same thing is happening in Nova Scotia, precisely the same phenomenon. You have no change in excess mortality. You can see the dashed vertical line is the announcement of a pandemic. Nothing happens. You roll out the vaccines, and you enter a regime of mortality where the mortality is much higher, and you have these peaks that coincide with the rollouts, the rapid rollout parts of the different doses of the vaccine. So this is very compelling evidence in terms of synchronicity and strongly suggests a relation of cause and effect between rolling out the vaccines and excess death of elderly people in Nova Scotia and New Brunswick, whereas nothing had happened before. Nothing that can be ascribed to the pandemic.

Now, I just want to point out before I go to the next slide that sometimes you can see it clearly like this—because there's not other factors causing excess death at the same time. In some jurisdictions, the people are so fragile that as soon as you lock them down and take

away their caretakers, they basically die within weeks, and so you do see excess mortality and that makes things complicated.

For example, in the United States, where there's 13 million mentally disabled people suffering from serious mental disease, there was huge mortality compared to Canada. There was 1.3 million people died, excess deaths in the U.S.,

[00:50:00]

whereas only about more than 300,000 of those we ascribe to the vaccine. So, it's more complicated to analyze. But Nova Scotia, New Brunswick are clear jurisdictions where nothing happened until you went in and vaccinated these elderly people and, exponentially with their age, there was a higher and higher probability that they would die from the injection, and they did.

And so, next. Now I want to show— Last time I talked about how you quantify the association between vaccine dose delivery and excess mortality. And I said that I wanted to do this for Canada, but we had only a rough estimate of the value at the time. So we've now done a more proper study, and I want to show you how that works.

[All-cause mortality by week, Canada 2016–2023 & weekly vaccine-dose administration]
This is a reminder of all-cause mortality for Canada, in the blue there. And that's what doses of vaccine per week now, instead of cumulative, look like in orange. And you can see peaks for the different doses that are being rolled out—doses one and two together, dose three, and then dose four, and five—you can actually see peaks. And it corresponds and gives rise to peaks in the mortality or peaks in the mortality that are higher than they would normally be or that are in places where you would normally have a summer trough. So you can see that correlation in time.

[All-cause mortality by week, Canada, all ages, 2018–2023]
And so what we do with Canada in order to estimate the deaths due to the vaccine is—we look at the period in which you were mostly vaccinating with the COVID-19 vaccine and we define a period for quantification from week 52 of 2020 to week 40 of 2022. And we're going to specialize on that in order to quantify this: the excess mortality in that period compared to the number of doses that were delivered in that period. We can do different periods and we can do specific peaks. We've done all that, and we're doing more and more of it in different jurisdictions.

[All-cause mortality by week, Canada – all ages, 2028–2023, Vaccine-period integration]
But this is what you get when you do what I just said. This is a graph, now, of all-cause mortality in blue, as usual. And now what we're going to do is we're going to integrate the mortality. We're going to add up all the deaths in that vaccination period that I described, which is between the two vertical dashed lines that you see there. And the result of that sum is represented by a dot that is on the graph there and corresponds to the y scale that's on the right. So it corresponds to more than 500,000 deaths total, okay?

And then we're going to back up that integration window by one step. We're going to say, well, a window of the same length, duration, and time, what are the total deaths just before, and then just before, and then just before? So the blue dots are these integration values for a period of 94 weeks, I believe, which is that vaccination period as we've defined it.

And so what you can see when you do this is that the integration values basically don't change in a period that would include the start of the declared pandemic. But the

integration value for the period when you were vaccinating and when you've vaccinated is significantly higher than the linear trend that is illustrated there, okay? That means that you are deviating from, historically, what has been happening in a significant way, and it means that the difference between that integrated value and what you would project with those straight lines is the excess mortality that is due to whatever happened that's different in that period. And what happened—that is different—is the vaccination, and it correlates in time with those peaks. So we're sure that it's the vaccination that's doing this, and so we can quantify it now.

And the biggest uncertainty in this quantification comes from how you extrapolate the historic trend. So you can include the point that includes the COVID period before vaccination or not include it. So we've got two straight lines there for two different ways of extrapolating the historic trend, and we can use those two and get the numbers.

[Vaccine Deaths in Canada]

And what we find is that in Canada, in the vaccination period, if you use the one approach, one of the straight lines—what we call the 6-point trend—you get 28,000 excess deaths. If you use the 5-point trend,

[00:55:00]

so not including what would have happened during COVID before vaccination, you get 31,000 deaths. So that's the number of deaths that are excess deaths, that are above the historic trend, clearly, in Canada. And this was at a time when a little over 90 million doses were administered to people. And therefore, the risk of dying from a given dose corresponds to 0.03 per cent. And that means one death for every 3,000 injections.

In the Western world, everywhere that we have quantified this, and on specific peaks that can be directly associated together like that—peaks of a rollout and peak of a mortality—every time we've quantified it, that's the kind of number we get in the Western world for when you consider the entire population, when you don't discriminate by age. When you do discriminate by age, you find that this risk of death increases exponentially with the age of the individual, with a doubling time of five years in age. So it's a dramatic effect which I described last time and I showed some graphs about it. Oh, I'm skipping ahead here.

So what's important from what I showed last time is that the risk of dying from being injected with the vaccine increases dramatically exponentially with age. And so this has **not** been considered in the risk-benefit analysis of whether or not you want to vaccinate the elderly. In fact, the States have done the opposite. They have gone and given priority to injecting the most fragile people who are most likely, by a long shot, to suffer from the vaccination itself. So there's huge problems with what was done by governments. And so, that's the story about the vaccines up to now. It's an update, really.

[Excess all-cause mortality 2020 – World map]

And now I want to show you, in the world, what's been happening. And so we're going to go now to a world map of all the countries that we've studied because we've got good data for it, and I'm going to show you the excess mortality by year on a world map.

And the thing that you've noticed so far in the data that I've showed you for Canada is that in Canada, the highest excess mortality is in the final year: it's when you roll out the vaccines. Very hard to quantify an excess in Canada until you do that, and you see it clearly in certain provinces. Apart from that very first peak of deaths in hospitals, there's nothing special happening in Canada until you roll out the vaccines. Now that is very special

because it means that there's more death after you've applied all the measures and vaccinated virtually everyone. Now there's more deaths than before, which is something of great concern.

So we wanted to see where in the world that occurs. And so we quantified excess mortality on a world map like this. There are a lot of countries that we have good data for, but they're too small to see on this map. And there's countries like— Africa does not have good all-cause mortality data, so you can't really do much with Central Africa. But this is what the world map looks like.

Now, in 2020, this year includes if you had that peak that was deaths in hospitals right after the pandemic was announced, and the very first part of the first winter of death is included in 2020. And so the Eastern Bloc countries and Russia had very high excess mortality compared to many other places. The U.S. had very high excess mortality compared to Western countries and compared to Canada. Canada has, as I said already, virtually no excess mortality, okay?

But now I'm going to go to the next two years and I want you to notice what happens to certain countries as I rolled through 2021 and 2022.

[Excess all-cause mortality 2021 – World map]

This is 2021: Canada is still white. Australia is still white. Germany is still white. Japan is still no excess mortality.

[Excess all-cause mortality 2020 – World map]

So let me start again, 2020: Japan has no excess mortality. Australia, New Zealand, Canada, Germany—no excess mortality.

[Excess all-cause mortality 2021 – World map]

2021: still no excess mortality in those places.

[Excess all-cause mortality, 2022 – World map]

2022: they change colours.

Shawn Buckley

Yeah, so just so that we're clear. I mean, the point of you breaking it up by years

[01:00:00]

is that when we are totally unprotected, in theory, during this pandemic that required draconian measures, we're not seeing excess mortality.

Dr. Denis Rancourt

That's right.

Shawn Buckley

So when it first hits us in 2020— And we shouldn't have any herd immunity because we haven't caught it yet. Like you would think even, you know, 2021, even without a vaccine, we'd be getting more and more herd mentality—or herd immunity, rather.

By 2022, my word, we should all be safe now because even without any vaccination, we would have had two years of exposure, all this herd immunity garnered. And this is why it's significant and why you've broken it down into years.

Dr. Denis Rancourt

Yes, you're describing exactly how an epidemiologist—no, sorry, an immunologist would describe it. They would say it's all about acquiring immunity by infection and vaccinating if you've got an effective vaccine. And once you do that, you're protected.

And what I'm saying is that in Canada, the opposite is true. Because of everything they've done, we're now in a regime of mortality that is higher than ever before, since the pandemic was announced. And that is a problem. And it is a problem in many countries.

And Japan is shocked by this. Australia, New Zealand, Germany—there are many other countries—and Canada are in this category. And so these are countries that did not mistreat their elderly too much, do not have particularly fragile populations in terms of, like, you have in the U.S. and in the Eastern bloc countries. For example, we have come to interpret that in Russia and Eastern European countries, the reason you have such high excess mortalities is because the baby boomers lost all of their security when the Soviet Union dissolved in the early 1990s. So these people have now aged, they are at an age where they are dying, and they do not have the social security system and network that had been promised to them and that was in place before the Soviet Union dissolved. So we think that that is a huge phenomenon in terms of determining the mortality in those countries.

So the lesson here is that mortality, and even susceptibility to be poisoned by this vaccine, is highly dependent on who you're vaccinating and what their conditions are: what their health conditions are; what their stress levels are like; what their social network is like. And so what we're seeing is much, much more variability due to, I guess, what some would call “the terrain”—the social and health terrain. The variability is there on the large scale: when you're comparing all countries, that's what causes it more than anything else. And so the simple story of immunology just is not the right approach if you want to understand these macro phenomena, if you like.

But the point of this map was to show that what's happening in Canada is very real, and it's happening in many other places as well.

[Conclusion – Vaccine Deaths]

So in conclusion regarding the vaccine deaths, and I said this last time and I'll just recap it. In the world, we estimate that 13 million people were killed by the injections and that the effective vaccine dose fatality rate for the world on average, all ages, is 0.1 per cent.

In India, we're quite certain that 3.7 million people were killed because it's absolutely stunning the magnitude of the excess mortality that coincides exactly with the rollout of the vaccines. And you can see videos on the internet of old people being held down, refusing to be vaccinated, and being forced to by police and so on, being injected in front of the camera. This is a very common thing. So India was particularly aggressive with their vaccination campaign. They even had a list of comorbidities and, if you had those, you especially were going to be vaccinated, and so on.

In the U.S., at least 330,000 people died as a result of the injections, we believe. And in Canada, there's a slightly lower vaccine dose fatality rate, but still around 28,000 to 31,000 people likely would have been killed by the vaccine.

Now because this death due to injection is exponential with age,

[01:05:00]

you don't see it. Because elderly people—the ones that are most susceptible to dying are the ones that are over 90, over 85, over 80—that's the majority of the deaths there. It's exponential with age and so you don't think of them dying from the injection. Or it's easy to cover it up, if you like, or it's easy not to see it if you don't want to see it. But typically, these elderly people would have been dying on the same day or in the days that followed the injection, and the cause of death on the death certificate would have been something else, whatever their preconditions were and so on.

So you're not going to see this. In a world where the entire establishment tells you that the vaccine is safe and effective, nobody dares—and this includes clinicians and MDs and heads of hospitals—no one is going to dare start to investigate whether or not, and look at the timing between injection and death and make graphs of that. Nobody is going to look into this. There is no forensic studies being done right now to look into these questions. The government is turning a blind eye to all of this. But our research shows that there has to have been a large number of deaths directly associated with the injections. And in Canada, we feel that that's the right number.

That was the new material that I had prepared to really concentrate on Canada, and I was going to be critical of the articles you had asked me to look at.

Shawn Buckley

Yes. So, let me, for the commissioners and those watching, just give a little bit of background.

And I will also say I forgot to mention that you had also written an essay to include some of this new information and we have appended that as an Exhibit OT-1e. So that will be available for the commissioners and the public, online, as part of your testimony because you adopt that essay as true?

Dr. Denis Rancourt

Yes, I do.

Shawn Buckle

So, basically, there were two different publications—although, like I say, one is in a pre-print version right now—that caught the commissioners' attention.

And one is now Exhibit OT-1c and the title is *How did the COVID pandemic response harm society? A global evaluation and state of knowledge review (2020–21)*. The author is Kevin Bardosh, and it's in a pre-print version. And I'll just read so that those watching and the commissioners— Well, the commissioners, already, will have reviewed it. But for those watching, just to get an idea of what it is, so I just pulled this out of the abstract. This is a 119-page document, but part of the abstract reads:

This cumulative academic research shows that the collateral damage of the pandemic response was substantial, wide-ranging and will leave behind a legacy of harm for hundreds of millions of people in the years ahead. Many

original predictions are broadly supported by the research data including: a rise in non-COVID excess mortality, mental health deterioration, child abuse and domestic violence, widening global inequality, food insecurity, lost educational opportunities, unhealthy lifestyle behaviours, social polarization, soaring debt, democratic backsliding and declining human rights. Young people, individuals and countries with lower socioeconomic status, women and those with pre-existing vulnerabilities were hardest hit.

And then the other study, which is now marked as Exhibit OT-1d, the title is *Did Lockdowns Work?* The authors are Jonas Herby, Lars Jonung, and Steve Hanke of the Institution of Economic Affairs, and they present this as a systematic review into the effects of lockdowns. And, basically, they use a couple of indexes. One, which they title a Stringency Index, shows that the average lockdowns reduced COVID mortality by 3.2 per cent, meaning 4000 [sic] [6,000] people in Europe were saved according to this calculation, 3,000 [sic] [4,000] in the U.S.

And then, just quoting from the abstract on a different index, they say, “Based on specific NPIs, we estimate that the average lockdown in Europe and the United States in the spring of 2020 reduced COVID-19 mortality by 10.7 per cent.

[01:10:00]

“This translates into approximately 23,000 avoided deaths in Europe and 16,000 in the United States. In comparison, there are approximately 72,000 flu deaths in Europe and 38,000 flu deaths in the United States per year.”

Now, because the commissioners have asked you to come and basically speak to those two studies, I understand you have some slides about that. So I'll invite you to give your presentation on these two studies.

Dr. Denis Rancourt

Okay. I have to warn listeners and the commissioners that I tend to be very critical of these studies. I admit that some of their conclusions may be comforting for us and we like to hear them, but I'm going to be radically critical of these articles. And by radical, I mean going to the root of what I think is fundamentally wrong with these articles, or the approach, okay? So it's going to have a critical slant. Because as a scientist, I don't just enjoy something because it gives a conclusion that I'd like to hear. I look at whether or not the conclusions actually follow from what you can measure and from empirical data. So that's the eye that I want to use to look at these studies.

[Part II: Critical review of a few recently published articles]

These are the two studies. I'm going to do the one about lockdowns first, and then the broader view about societal harms second. But overall, the critique I would make of these two, together—because both studies have the same problems, and this is the major problem—I would describe it in the next slide here.

[What did we learn?]

What did we learn? Well, the short answer that I would give is nothing that governments and scientists should have learned was learned or even questioned.

Okay, so it's a status quo. And what I mean by that is the disproved paradigm of “spreading pandemic-causing viral respiratory diseases” is completely intact in these studies that I'm

critiquing. And there is a problem with that because there is no empirical evidence of the spread of an agent that causes death, on the scale of the globe, that could cause something like a pandemic. Epidemics in care homes and hospitals due to bacteria and so on are very important and are very real, but large-scale, societal-scale spreading has never been demonstrated.

The so-called contact measurements that they do are completely fixed. If you want to understand spreading, all you have to do is look at a hundred years of epidemiological data. You look at all-cause mortality for the last hundred years across the world where they've been measuring it, and you have a regular seasonal pattern: there's a maximum in the winter, a trough in the summer. It's been that way forever. Everywhere. And when the maximum is a little higher in one place, it's a little higher everywhere, but synchronously in the entire hemisphere, either the northern hemisphere or the southern hemisphere, completely synchronously. These patterns are synchronous around the world, and in their distinctness, they are synchronous around the world.

This has been puzzling epidemiologists for more than a hundred years. And the great majority of them who have given it thought have concluded that the notion, the paradigm, that this is caused by spreading diseases, from person-to-person spreading of a disease, cannot hold up to this empirical data. Absolutely impossible.

So that paradigm has been severely questioned in the past by thoughtful people who are epidemiologists. And just because we have modern techniques and PCR instruments and so on, we think that we can stop thinking and we think that that hard data is going away. It's not going away. This disproves the notion that what could be causing those extra respiratory deaths in the winter is due to spreading across a territory, a province, a country, or even the world. It cannot be, given the hundred years of mortality data that we have.

[01:15:00]

So any scientist who starts their analysis with the notion that a disease can spread and cause a pandemic in the world— I'm not talking about very serious epidemics that occur in hospitals and care homes. That's not the point. The point is a completely different phenomenon where these things are supposedly spreading through the air and person to person, okay? So that is incorrect, in my view. And if you presuppose that, you're starting from a basis of something that's been disproved. That's the first problem.

Also, there is no admission of even the possibility— In these studies that I'm looking at now, that you've asked me to examine, there is no admission of even the possibility that excess mortality was exclusively due to the measures and to the vaccines. This is not even considered among any of the authors that are reviewed in these studies, okay? Because they reviewed— One of them reviewed 600 studies, the other did a detailed look at 22 studies. Everyone starts from the point that a particularly virulent pathogen was causing death, that's kind of a given—and now, did the measures also cause death? Did we do something to reduce the deaths that would have otherwise occurred because of this pathogen?

But nobody questions whether there's any hard evidence that there actually was a particularly virulent pathogen that appeared and had the kind of behaviour that you would predict from epidemiological theory. There is no such pathogen that you can see evidence for. In fact, the hard data disproves this notion: because there's no spreading; it doesn't

cross borders; it attacks the poor and the disabled. It doesn't behave at all like what is imagined of this viral respiratory disease—the cause of pandemic—so it's disproved.

So if there was no particularly virulent pathogen, then how can you talk about the excess mortality that was caused by it? You can't. The entire body of my work shows that there was no particularly virulent pathogen. And the only time that there was excess mortality is when you assaulted populations—either with vicious treatment protocols that were unusual and experimental in hospitals or with these incredible measures that destroyed people's lives. That's what caused death. Everywhere they did that, they did it. Everywhere they injected and rolled out—suddenly, all these injections—and went and got frail elderly people to inject them, they killed a certain number of them, and so on. So that's not acknowledged.

The other problem with both of these studies—and all of the studies that are reviewed in these studies—is that the dominant factors that determine public health and individual health are hidden from view in all of these studies. Because the dominant factors that determine the health of the individual are their living conditions, and that includes whether or not they're socially isolated; it includes the psychological stress that they are experiencing in their lives, which is related to their place in the societal dominance hierarchy. These are the things that determine whether you're going to live into old age and how sick you're going to be when you get sick and how often you're going to get sick. Science is clear and unambiguous on the dominant factors that determine individual health.

And these factors are not considered as dominant. What they say, instead, is the virus especially was hard on old people or the measures were especially hard on poor people, and so on. But they're not considering the basic medical knowledge—that's completely established—that what determines your health is whether or not you're healthy. And that is your ability to fight anything that you're assaulted with in the real world—any pathogen. There are always hundreds of pathogens. There are bacteria that are normally in your mouth that, under certain conditions, will invade your lungs and you get very sick. But there are hundreds of pathogens everywhere, all the time, and the notion that you're looking for and you think that a new one will come and cause a pandemic

[01:20:00]

is contrary to empirical results.

So that's my problem with these studies—is that they presume as true all these underlying assumptions that are false. And they ignore the really big factors that determine health. That's giving away my bias, before I look at these studies in more detail.

[Did Lockdowns Work?]

The first one that I can look at is relatively simple to analyze: *Did lockdowns work? The verdict on COVID restrictions*. Well, this is a study where they do what's called a meta-analysis of 22 studies. There's a problem here. So basically, a meta-analysis means you go and get studies that others have done and you try to put their results in a numerical form so that you can put them all together on a graph or in a statistical analysis. Okay, that's what meta-analysis means.

Now the problem with that is that—and this is well known—scientists know that there are big problems with meta-analyses. The problem is every study is different, meaning every study is of a different population, in very different circumstances, and was actually

performed in different ways. Very few studies are done, identically, in the same way. So you have these very different studies.

Now, the way, scientifically, to approach trying to understand a phenomenon is to look at one study at a time: The authors claim to have found results. They claim to be able to make conclusions that follow from what they did. What you need to do is you need to look at that study and see if there are any flaws, any errors, any uncertainties in that study. And instead, we've gotten into the nasty habit of doing these meta-analyses. And what that means is, instead of critically assessing one study at a time and recognizing that it is unique and that it needs to be criticized in its own right in every detail—what we do instead is we put a whole bunch of them together in a kind of an approximate way and see if they all kind of tend to give the same answer. And then estimate that that answer must be approximately right because they're mostly all giving that answer to some degree with some parameter that you use. That's what a meta-analysis does. It's a nasty way— It's an unscientific way to proceed, let me put it that way.

See, the problem here is many-fold. A given study that is published is necessarily biased by the environment in which the scientists worked. There are certain paradigms that are dominant and that you must accept or else the reviewers—when it's peer-reviewed—will simply choke, and the editors will simply reject the paper and not even allow it to be reviewed. So authors know this. They get promotions in their profession and grants to continue their research on the basis of publications, so the idea is to be published: so the idea is to say what you expect that the reviewers and editors want you to say.

And that is very much affected by the overall propaganda that is occurring in the society. There is no doubt about that and this has been demonstrated. John Ioannidis, a very famous epidemiologist, wrote a paper some years ago explaining that more than half of scientific research is wrong. That was the title of his paper. And so he looked at these biases and showed that they were necessarily present and that, therefore, in medical research anyway, more than half of the results were wrong. Well, you're taking these results and you're putting them all together and you're giving yourself the illusion that now you must be getting the right answer because they all agree. Well, they necessarily all agree because they're all confined to the same biases; they're all confined to the same limits. They cannot go outside of that. So a meta-analysis is of no help in any area.

For example, if you do randomized controlled trials, which is a strict way of doing science, you get a certain result and that can be criticized. And what people are doing now, is they're doing meta-analyses of 10 or 20 or 30 of these randomized controlled trials and coming up with kind of average answers.

[01:25:00]

It's wrong because each randomized control trial might give a slightly positive result, like the one that you know the editors want to hear, so you fudge everything you can to get a slightly positive result. And you say, but it's not statistically meaningful. But then when you put 20 together, who all got slightly positive results, you say, well, how could 20 of them all have gotten a positive result? Therefore, this average must be valid and the error on it must be small because there's now 20 of them. This is where we're going with these meta-analyses. So just the fact that it's a meta-analysis of 22 studies done in this kind of environment is already a big problem.

Shawn Buckley

Right. Well, you know, it's interesting because there's that kind of common saying that two wrongs don't make a right, but if I'm hearing you correctly, 10 wrongs might make a right.

Dr. Denis Rancourt

Here, let me put it this way. Yeah, that's one way to put it. Or another way to put it would be 10 slightly rights, maybe, still don't make a right pretty sure. You know what I'm saying? Like in terms of what they're thinking is right. But what they're thinking is right is the result of their bias and the very stringent limitations that they have if they want to advance their careers. And this is in an area where you're trying to evaluate the impact of lockdowns.

Now, they did this using so-called lockdown stringency indices, or an index in particular that's maybe a popular one. These are very flimsy parameters to describe the impact of a complex lockdown that is different in every single jurisdiction, on a complex population that is completely different in every jurisdiction. To summarize that as a number, which you call the stringency index value, is almost absurd, okay?

Shawn Buckley

If I might just interject—and it supports what you're saying—one thing that I experienced travelling with the National Citizens Inquiry to the different provinces is it was striking, actually, how different the experience was in each province. So I mean, just using the National Citizens Inquiry as an example, it validates what you're saying, is that each place will have a different experience because we noticed that just going from place to place and hearing what people had to say.

Dr. Denis Rancourt

Yeah. I mean, this is the opposite of the studies that should be done because they didn't look at time series analysis. In other words, they didn't look at the timing. They didn't say, "Well, the lockdown came in at this date and people started feeling sick and calling in or taking more drugs at this date." They didn't try to relate it on a temporal basis, but, also, they were not specific: what kind of lockdown and how did it affect which community? That's what you need to do to understand the phenomenon.

And that means you need to do field work. You actually need to send sociologists and a whole team of people going into a community to find out how people are affected by what and what that lockdown means in that community. Because in some communities, the sheriff is going to be very strict and others not so strict and doesn't really care, and considers that it's a federal thing, but, you know, "You can't tell these people what to do," and so on. So everything is different, everywhere. And the way to answer this—if you want to understand the mechanisms of harm—is to do field work: to do field work where you're looking for these causes, so you have to do the kind of investigation that a detective would do to understand a crime and you have to go in there and actually see and actually get the records and actually talk to people, and so on.

And that kind of field work was very common in the '50s and '60s, when scientists were trying to understand society, and is virtually non-existent now. And it doesn't get funded and nobody wants to do it because it does not give you research grants, and it does not advance your career, and it's just easier to do a spreadsheet, and so on. I do the kind of research I do because I can access the data, and because I can do it and I know how to do

statistical analysis. But really, in society, to understand these problems, we need to send teams out of researchers into the field to see what's happening. And that's not being done.

So this is a substitute for the real science that should be done to understand the phenomenon.

[01:30:00]

And it's done under a set of assumptions that we're just going to say that lockdowns were harmful; that lockdowns were not effective in stopping death. I mean, when you hear that the lockdowns reduced mortality by 3 per cent, that's completely obscene. There is no way that their study—so-called study—can deduce with certainty that there's a reduction in death of 3 per cent. First of all, for there to be a reduction, you presuppose that there's something else causing death and that you've alleviated that, which is nonsense because you can prove that there was not that something else.

But, also, 3 per cent is nothing. There's no way that that is a reliable number compared to the uncertainties that are involved here. So as soon as you read something like that in the abstract, you have to say, "Oh, my, what are they doing?" And I know what they're doing. They're taking averages of many studies to get a net positive that comes out in the average. You see, there's a law of statistics that tells you that the more measurements you do of the same thing in the same conditions, when you take the average of those measurements, the more you have, the smaller the error in the average. You can be more and more certain in the average. That's only true if they're independent measurements. That's only true if the measurements were done identically. That law does not apply to meta-analyses of these kinds of studies. It. Does. Not. Apply. And they have to wrap their head around this.

This is complete— Okay, I'm just going to be blunt: This is garbage science, in my view, okay? And I'm sorry, but there's a lot of it that's being published, and I think it's intended to cool us down. I don't think the authors are consciously intending their work to be used this way, but I think that it serves—in effect, serves—in society to "cool the mark out." We're the mark. We're the ones who have suffered this, and now we've got scientists telling us that, yeah, "No, you shouldn't have suffered that because it wasn't effective, it didn't really help you."

So in effect, psychologically, the social scientists would say, this has the effect of cooling the mark out. That's the purpose that it has. It's not good science. It's not reliable. It's not meaningful in terms of reliable results. It might be something that you want to hear because you've suffered these conditions, and it seemed absurd to you that the government was doing this and this paper is now confirming that. But it's confirming it only in words. It's not based on a rigorous analysis. That would be my criticism of this paper. I'm sorry to say.

Now, the other one—

Shawn Buckley

Well, I'll just say, I think it's inappropriate for somebody like you, who's been called in as an expert to comment on a paper, to apologize that you find the paper's research methods to be flawed and that they can't reach the conclusions because, then, that's the evidence we need to hear. We want to hear your opinion, so don't presuppose. These papers came up, and the commissioners— They were brought to the commissioners' attention, one way or

another, and they want to know what your opinion is. So I think you can give us a candid opinion.

Dr. Denis Rancourt

I'm really apologizing to all the people who are comforted by this and, you know, people out there—whether they're scientists or people in the public—who are comforted by hearing a headline along the lines of these studies, and who say, “Well, good, see, we knew it.” And I'm apologizing to them because I'm basically telling them, “I'm sorry, but you can't have that comfort. You have to think again, and more deeply. This is part of how they're manipulating you. They've really done something vicious to you and your family, and this is how they're getting you to accept it. They're saying, ‘Yeah, we made a mistake.’” So I'm apologizing in that sense, you know?

Shawn Buckley

Right, but we thank you for telling us what you actually think. And, actually, we thank you for doing the analysis because it's not like we asked you to—“oh, here's a 10-page paper and here's a 5-page paper.” I mean, we're over 300 pages here, between the two. So, Mr. Rancourt, we appreciate you being candid with us.

Dr. Denis Rancourt

I looked at it in detail,

[01:35:00]

and its references and its graphs and its methods. And, you know, I'm used to reading these papers—I've read so many of them—so I tend to pick up quickly what they're doing and the line that they're following, if you like. But, yeah.

Shawn Buckley

And I also realized, I mean, I should be calling you Dr. Rancourt because you have a PhD. You're just one of those people that aren't so concerned about that title.

Dr. Denis Rancourt

Yes, that's right. I have a physicist friend who used to tell members of his family that he was a “real” doctor. That's a physics joke, I guess. Or a PhD joke.

[How did the COVID pandemic response harm society?]

Okay, the next paper that you asked me to look at—this is a much broader look at all the different harms that could have come from the pandemic response. So you have to admire this author for, you know, making a list of all the potential harms. I really believe that he has put his finger on at least naming all the different things that he could think of. He pretty well covers the full spectrum. It even includes the degradation of institutions, the loss of civil rights, and so on. It's great to do this effort, but what I'm bothered by is the underlying presuppositions that are incorrect.

So, for example—I'm taking, now, lines from the abstract that I think you read in part just to illustrate the points: his “analysis synthesizes 600 publications with a focus on meta-analyses, systematic reviews, global reports, and multi-country studies.” So this is

important to understand. He's saying that he's really tried to capture all the literature that's in the published scientific journals, and he's especially interested in studies that are, themselves, meta-analyses; that are, themselves, systematic reviews; and that treat more countries—that are global reports; multi-country studies. So he's concentrating on those things.

So that tells you that he's picking from all the studies that each, individually, has this bias that I was describing to you: this incredible built-in bias that you don't publish what editors, reviewers, and society at large don't want to hear. So there's a built-in bias, and this is the basis for this big review, is all of these individual studies. And the meta-analyses that I've just been criticizing, he gives them more weight because they're meta-analyses, so there are more studies being included in those analyses. I think that's the wrong approach.

And he's concentrating on studies that studied more countries. I don't think, at this stage, we need to study more countries in thinking that that will give us more insight. It is important; you have to look at everything you can and all the data you can get. But you have to go into your own country, to your own community—to the major hospitals where people died, to the major places where people died and suffered and got sick—and find out what happened and find out how they were treated. Every time I talk to people who survived being in hospitals during the COVID period, I learn incredible things about what they were doing in hospitals. Absolutely incredible things. Why aren't we hearing this in scientific papers that go in and do that kind of study, where you interview people and you interview the staff and you find out what was going on?

So it's the opposite of the kind of study that I think we need, to really understand what was going on. So I don't think the purpose here is to really understand. The purpose is to review what scientists in science journals are saying. That's what the purpose is.

Then he goes on to say, "The cumulative academic research shows that the collateral damage of the pandemic response was substantial. . . ." See, here's the problem: it's not collateral damage because you weren't doing anything that was beneficial. So it's not something collateral on something beneficial that you were doing—because what you were doing, none of it was beneficial. So you see the bias is built right into the language here. It can't be collateral damage. Like when you have a worthy purpose and you're motivated to do something

[01:40:00]

and you have a good reason to do it, and everyone would agree that it needs to be done, then that can have associated collateral damage. But this was not a case like that. This was a case where everything they did was harmful to people. It was an assault against people and it was unnecessary. So, again, it shows you that this is the kind of study that, in effect, will cool out the mark or will "cool the mark out," I believe is the expression from the scientific literature.

He goes on to say, "Many original predictions are broadly supported by the research data including: a rise in non-COVID excess mortality. . . ." Well, that presupposes there is a COVID excess mortality. Well, I haven't seen one, and I've looked everywhere. And I only see a phenomenon that is inconsistent with the idea of a pandemic spread and of an especially virulent pathogen coming down on the planet. I believe that that has been disproved by the empirical data that I've been describing for three years. So there can't be non-COVID excess mortality—because there is no COVID excess mortality. That's the bias I was telling you about, again.

In the list, here, of harms, there's something called “democratic backsliding.” And I don't like that expression for the following reason: he's suggesting that in a time of turmoil or in a time of crisis, democracy, the institutions, and the functioning backslid. That presupposes that it can come back to normal. I don't see any evidence that the system wants to come back to normal, really. The people who practised the non-democratic behaviour have not all of a sudden realized that they were wrong and that now they're going to start behaving democratically—and I'm talking about judges and professionals and so on, and the institutions that change their rules to be able to behave in a non-democratic way because there's a crisis. They're going to put those things in place again next time.

So the term “backsliding” suggests that we can fix this. Or that they intend to fix this or that the system—that the establishment—would intend to fix this. I see the opposite: I see a march towards less democracy, and I've talked about that in the past. So that's my problem with that way of seeing it.

Shawn Buckley

Can I just interject on that?

Dr. Denis Rancourt

Sure.

Shawn Buckley

I'm just curious if you can comment. If it wasn't last week, it was the week before, but it **was** reported about a doctor in Germany that had written some COVID exemptions. And so here we are out of the pandemic, in, you know, the late spring of 2023, and she's sentenced to **two** and a half years of prison. Which is just outlandish that you could be in proceedings that you would face jail as a physician for writing— Like, when has that happened before? But then two and half years.

And I can tell you what I thought—and this is what I want you to comment on—is that this **had** nothing to do with punishing that doctor. It had everything to do to ensure that the next time we're in a similar situation, there won't be a single German doctor stepping out of line because they will all know that if they step out of line, they're actually facing prison. Which is a completely different kettle of fish than, perhaps, losing their licence to practise, as we've seen doctors in Canada. Plus, doctors in Canada will have to pay the hearing fees, which can be crippling. But I'm just curious on what your thoughts are in light of this democratic backsliding.

Dr. Denis Rancourt

My experience talking to many professionals, scientists and MDs, is that anyone who publicly stepped out of line or acted professionally with professional freedom and independence, using common sense and their medical knowledge, they were all systematically disciplined, one way or another. They were all told that this was completely unacceptable, and that's a huge damage that is not described in this list. The harm to the professions, where you take the independent-thinking professionals

[01:45:00]

who are just following what they believe to be right, and you systematically punish them severely—whether they're university professors or practising MDs or even scientific researchers—and you, basically, take them out of circulation: You damage them. This has wounded all their colleagues. As you say, the message to all their colleagues is, "Well, I'll never do that," and, "Oh, my god, you know, too bad he did that, he used to be a friend of mine."

We're in a Stalin-like system. This is horrible, and they expect all the other professionals to go along with this. They expect unions not to protect employees fully and not to go after the root problem at all but to be minimalistic, and so on. So you, as a lawyer, have seen this everywhere. I've seen it everywhere, talking to people. The damage is huge to professional independence. The damage to professional independence: I don't know when it can be repaired.

Shawn Buckley

And like, as you've got expertise in the area of academics and, you know, how it's affected there. It's interesting because I wonder, well, who would be willing—what type of personality now would be willing to become a medical professional when you know that, basically, you're in a situation where you have to go along with what is an official narrative, as opposed to using your professional judgment, now, in a physician/patient relationship?

Dr. Denis Rancourt

I want to step in and answer that question. The same people that used to go into medicine before. Because the main drivers if you're going to put up with medical school and be indoctrinated to that level and put up with everything they put you through—you're doing it for the social status of the position, recognition among your peers, and the comfortable lifestyle you will have. And that's why you do it, and that's why most professionals do what they do, and they put up with the indoctrination of their profession. And that was the same before. That's been the same pretty much always, and it continues to be the same.

But there used to be space for some professional independence. And professional independence is one of the main balancing forces in a democracy so that institutions don't become totalitarian and don't go overboard and continue to self-correct in a way. You know, you didn't have to have whistleblower protection laws before because people would bravely whistle-blow, and they would survive it. Because it was more common and because the backlash against the employer—if they were punished too harshly when they actually came up with something that was important—would have been too hefty. Now, that is completely absent. They can destroy you if you whistle-blow, and that's why there's talk about this whistleblower protection. In my view, that's one way to look at it, anyway.

But the point is, professional independence is one of the huge mechanisms that counterbalances against runaway totalitarianism. One of the other big counterbalances is individual resistance or autonomy. In other words, independent-thinking people, generally, not just professionals. But these are the forces that keep everything in line so that the elite cannot change the laws to their advantage, corrupt the system, and degrade and erode the institutions and all of the public services towards only serving them. There's always a tendency to go there.

And, traditionally, in a working democracy, the balancing forces are either strong institutions that have a sense of what the role of their profession is to protect that institution—and that includes professional independence—and the individual is

independent thinking. So they're going to complain; they're not just going to be programmed by the propaganda. Those are the balancing forces, and they're being removed systematically, completely removed.

We're marching towards a very dangerous place, especially at a time when the U.S. is talking about war with China. Not just talking about it, the Pentagon budget is mainly geared towards

[01:50:00]

encircling and isolating China, and threatening China. So this is a very serious time. And add to that the war in Ukraine, which is no small matter. These are very serious times and, at this time, instead of having a working democracy, they're pushing us to the brink: complete obedience and a totalitarian system.

There you go, I went too far.

Shawn Buckley

Yeah, well, no, no. I mean, it's an interesting conversation, and there's kind of two thoughts. I mean, we could add what Catherine Austin Fitts testified about at the National Citizens Inquiry: that, you know, we have the danger of it's time for this system to collapse. You go to war at these times so that the economic system, which was designed to fail eventually, isn't blamed for the misery—the war is blamed.

But when we're having a conversation about professionals losing their autonomy, and I'd suggested that who would go into medicine now? We could switch—and I don't think you'd be as pessimistic about it—into the areas of natural health practitioners: so your naturopathic doctors and traditional Chinese practitioners and nutritionists. I mean, they don't have social status, like medical doctors, and they definitely don't have the financial benefit.

I see two assaults. So in British Columbia, basically, if you're going to be a natural health practitioner, you basically have to accept that the government can tell you, "You need to take this vaccine or that vaccine or this medical treatment," or that.

And we just had, last week, come into law—snuck into the federal budget bill—basically applying what is known in Canada as Vanessa's Law [the *Protecting Canadians from Unsafe Drugs Act*] penalties on natural health practitioners because many of them advertise and sell natural health products. And the fine structure has just gone from a maximum of \$5,000, a week ago, to \$5 million per day of a violation. And I just wonder, well, who would go into those disciplines now, knowing that you anger a bureaucrat and you and your family are destroyed, because we have a responsibility to our children not being on the street?

So it's such an interesting time. And we've totally segued, so I'm going to ask you to carry on with your critique.

Dr. Denis Rancourt

Okay.

Shawn Buckley

But I've enjoyed the conversation, and it has been meaningful because it's part of what you're saying is the problem with this type of study.

Dr. Denis Rancourt

Yeah, I just want to comment, though, that these disproportionately large fines or punishments work against a stable democracy.

You know, I'm a physicist, and there's a physics paper that was written a couple of years ago by one of my collaborators, Joseph Hickey, that studied, theoretically, the stability of democracy from first principles. And he showed that in his work—which I think is very important—he showed that the stability of a democracy operates in a parameter space where you have two important parameters that control whether or not it will be stable. One is how authoritarian is the system: meaning when you have a conflict or a fight with another party, if the other party has a higher social status, does that pretty much guarantee that they will win? In that case, that's very authoritarian—the authoritarian parameter is very high.

The other parameter that controls the stability of a democracy is how violent it is: By that, it means, when you have a struggle or a conflict or a fight with another party or between companies or whatever, what is the loss that you suffer when you lose? How big is that loss? How big is the fine? How big is the jail time? If you go too far on one of these two parameters, or both of them, you create a structure that is completely unstable for runaway totalitarianism. Where you completely eliminate the strata of the different strata and societies, the middle class, everything goes away. You have an elite and its professional cadres—the high priests, if you like—and then everybody else is at the bottom. That's runaway totalitarianism, and it's those two parameters that theoretically control that stability.

And so, when you're making laws, it has to be fair punishment and the judicial system has to be one that is fair and doesn't just gauge what is your social status and make that person win. Well, we have evolved to a place where that's where we're at now, in my view.

Shawn Buckley

So, I mean, you know, I'm working on my 29th year of practising law in Canada,

[01:55:00]

and a large part of my practice has been resisting Health Canada on behalf of clients in the area of natural remedies because our drug laws are not designed for health outcomes, but they're designed to protect intellectual property rights, and there's a lot of money involved. So when you have a natural remedy that is tremendously effective for a serious health condition, the system has to take it away and it uses the court system for that. And sometimes when egregious things happen, you'll want to go to court and get a declaration that something violated the Constitution. But I've reached the place where I would do everything as a lawyer to discourage anyone from ever going against the federal government because it's like there's a playbook.

See, now understand: if you wanted the rule of law vis-à-vis the government—if that's what the government wanted—then whenever the government is engaged by the citizen in court, what the government should do is, well, what are the real issues? Let's admit

everything else, and let's just get down to it and have a judge decide. But, instead, they have a playbook to do everything they can to exhaust you financially, spiritually, and emotionally. So there's a large number of cases never even get to trial. And for sure, a litigant will never, ever dare go against the government again. And that's always grieved me because it's inconsistent with the rule of law, and it's one of the reasons I've reached the conclusion that a professional Department of Justice eventually is inconsistent with a liberal democracy.

Dr. Denis Rancourt

Well, this is a whole other discussion. I hear you. I hear you.

Shawn Buckley

We must get back on track, Denis. I'm sorry. I apologize to the commissioners.

Dr. Denis Rancourt

I hear you. And it ties into the theoretical paper that I was telling you about, which is fascinating, and I've given talks about that paper. It ties into that, and I hear you, and I know that, in practice, this is what it means. I know it's real.

But, okay, let's get back to this paper that I'm being critical of.

At one point, they say, "... it is likely that many COVID policies cause more harm than benefit..." Well, I'm sorry, there is no detectable benefit. There is only harm. If you say that you're admitting that some of these policies caused more harm than benefit, you're basically saying that only some of the policies caused more harm than benefit and that there was benefit somewhere. There was no benefit whatsoever, in terms of human suffering, in terms of death, and in terms of anguish.

The only people who were comfortable in all of this was the professional class that could work from home, didn't have to fight with traffic, could have everything delivered to their home—because there was this huge delivery system that was now put in place where they could receive everything at home—spend more time with their kids and family. They were better off for a while, you know, and they could still go outside, do their exercise, and so on. They're the only social class where there wasn't a serious harm. Everybody else suffered serious harm, and there was no benefit, apart from that ad hoc, kind-of-weird benefit that I just mentioned. No benefit at all. So that's why I'm very bothered by an article like this. It, in effect, is cooling the mark out.

Then the other last point is that— This is very disturbing because they say that "Planning and response for future global health emergencies must integrate a wider range of expertise to account for and mitigate social harms associated with government intervention." What these authors are saying, who reviewed 600 papers and are writing this authoritative paper—one author—is that we completely accept that there can be global health emergencies where you have to do these dramatic things to the entire world, but we should have experts look into how to mitigate these harms. I mean, that's obscene.

There is no empirical evidence that there ever was a pandemic. There is no empirical evidence for such a thing. And all the health emergencies that arise are basically local and need to be treated in terms of looking at the actual causes, locally, with the people who are having particular problems.

Shawn Buckley

And it goes back to one of your very first points. As you said, you looked at the three earlier pandemics.

Dr. Denis Rancourt

Yes.

Shawn Buckley

So 2009, you know, 1968, and then the '54/'55 [sic] ['57/'58],

[02:00:00]

and there was no excess mortality. So even if this urban myth that we have—that we face these pandemics, that the popular belief is a whole bunch of us die—you're saying that's a complete fallacy. And here we have this author basically perpetuating that for COVID.

Dr. Denis Rancourt

Exactly. There is a constructed and highly funded pandemic-response industry that is in place because, I'll call it, the USA-centred empire wants it in place. They want this, the ability to do this. And they have been working with the CDC for a long time, and this is part of one of their tools.

And the 1918 so-called pandemic was very special circumstances. And if you can analyze it and you can understand what actually happened there—although we're limited by having less data and it was long ago. But there is no reason to believe that these horrific things that happened in the past were not simply a consequence of horrendous living conditions of certain social classes.

Of course, bacteria are a problem. There are some vicious bacteria in hospitals that can be a real problem with people that have comorbidities and that are already sick that are in hospitals. There are horrendous things that, you know, it's absolutely necessary that clinicians and nurses wash their hands. I'm not saying that none of that is true.

What I'm saying is that population-scale health problems are due to regional circumstances and social economic circumstances of certain people. The wealthy won't die. There's very strong correlation that I found between excess mortality and poverty in the United States, for example. That's one of the strongest correlations I've ever seen in the social and medical sciences. There was a Pearson correlation coefficient, you'll remember, between excess mortality during the COVID period and the percentage of the population in the U.S. that was living in poverty: the Pearson correlation coefficient was plus 0.86, which is unheard of. And it was not just a correlation, it was a proportionality: the trend line went through the origin. This directly tells you that it's all about—if you were in these conditions that are represented by this poverty statistic, you had a high chance of dying. And in a state that didn't have anyone living in poverty, no one would have died. That's one interpretation of that graph.

So this is the kind of thing that is happening everywhere, all the time. Yeah, so, in fact, I'm going to conclude that way. I'm going to wrap this up. I'm going to say that I've critiqued these papers enough, now, without getting into the details, and I'm going to move on to my conclusions.

[Conclusions (Parts I & II)]

So, my overall conclusions are, regarding mortality, is that in addition to natural events—
There are natural events that cause excess mortality, and they're heat waves, earthquakes,
and extended, large-scale droughts that cause excess mortality that's visible. Those are
natural events.

You also have events that cause excess mortality that are large assaults against domestic
populations and that affect vulnerable residents in those populations.

And what are they? They are sudden, devastating economic deterioration. So, for example, I
see the excess mortality directly related to the Great Depression, the Dust Bowl, the
dissolution of the Soviet Union—without a doubt—and so on.

Another one is war, and war includes complete social class restructuring because it's not
every social class goes to war equally. It's the poor and the working class that end up being
the soldiers on the front line. And so, war and social class restructuring are devastating in
terms of mortality. They create excess mortality, obviously, and I can see that in the data in
Canada, in the USA, in many European countries, obviously. You can see the Second World
War; you can see the remnant excess mortality related to the Vietnam War, and you can see
that it is young men that die in those periods much more than women, and so on. The age
and the sex is a characteristic of that excess mortality.

[02:05:00]

Imperial or economic occupation and exploitation: that means big corporations, protected
by the U.S. military, occupying entire countries in Africa or Latin America, imposing a
certain use of the land on a large scale, displacing all the people who normally use the land
and putting them under horrendous conditions where the only thing left is to go into the
city and work in factories. This has a devastating effect on health—on population health—
and when that happens, you can see it in the excess mortality. And you can see it in how it
changes the age structure of the population, as well.

And now we've got a new thing, which we've just demonstrated by a huge, global
experiment. We now know— We have this well-documented case where these measures
and the destruction that was applied during the COVID period can cause excess mortality,
and certainly does. So that's the same kind of assault against a population that we know,
historically, can cause excess mortality. And it has done it again—except that it was
globally planned and executed across the world in different forms, in different jurisdictions,
and it did cause havoc, and it is measurable as excess mortality in the all-cause mortality
data.

And finally, there is no empirical evidence that excess mortality can be caused by the
sudden appearance of a new pathogen. That's important. I believe that, historically, you
cannot find and demonstrate that a new pathogen has all of a sudden appeared that causes
the Black Plague, or whatever, by the mere fact that it's a new pathogen that has now come
onto the planet. I believe that that is most likely not true. And with the modern examples
where you have enough data, it is not true.

So there's probably— I would venture that there is probably no example in humanity
where a new pathogen has appeared and caused massive excess mortality in a population. I
think that the whole concept needs to be seriously questioned because what causes death
is social economic changes—that give large pools of extremely fragile people living in very
unhealthy conditions, and that will always be associated with death because there are
always pathogens around.

You will always die of cancer, heart attacks—lung infections are very common. The lung is an organ that has a huge surface area of contact with the air. So whatever is in the air—and what's in the air you breathe, includes the bacteria that are in your mouth that you're breathing in. And so that's a place where there are— That's a huge problem in terms of a cause of death, is the lungs and respiratory problems. Heart attacks are also very intimately related to experience, stress, and so on.

You know, there are dozens and dozens of animal studies that conclusively show that in any animal population that forms a dominance hierarchy, the factor that determines whether or not individuals are relatively healthy and live longer and die and so on, is their position within that dominance hierarchy. And it's been shown now, more and more, that that gives rise to a dominance hierarchy stress and that stress—directly and at a molecular level—suppresses the immune system. So you're more susceptible to dying from all these causes. All these causes, and there are many more causes than the ones we know. And so that is the story that we need to start thinking about.

And scientists have the problem that they only look at what they're looking at. They only look at one thing at a time. And so, they get the impression that it's about the particular pathogen that they're studying, and so on. Okay.

Shawn Buckley

I'm just going to rein us in because I think you've given a pretty fulsome discussion. I'll ask the commissioners if— I know that they're going to have questions of you. So, if we can bring the commissioners on. Now, my understanding is that we have lost one commissioner. There we go, we've got three. So the rules obviously permit us to proceed with three. So this is why we kept going.

So, Commissioners, if you have any questions, I'll just give the floor to you.

[02:10:00]

Commissioner Massie

I have a few questions. Do you hear me?

Shawn Buckley

Yes.

Commissioner Massie

Okay. Actually, I have three questions, so to make sure that I can go through all of these questions, I'll start with the shortest one.

Your critique of the paper: knowing you now, I'm not surprised of the critique. I was going to ask you, when I was doing research— And one of the things that came very popular in the last 10 years of my career was that every time I would submit a grant application, there was a section we had to file, or to fulfill, and it says, "What's going to be the impact of your project or your research?" And I was always struggling with that, and I said, "Can somebody give me an "impact-o-metre" so I can measure the impact of my research?" I'm wondering whether the so-called stringency index is kind of suffering from the lack of a good "lockdown-o-metre." How do we assess that?

Dr. Denis Rancourt

I think it's not fruitful to search for a good index, or a better index, of lockdown because as I was trying to explain, the system is very heterogeneous. Populations are extremely different from one county to the next, one state to the next, one country to the next. And it's the population and, in particular, the vulnerable groups within that population that determine how susceptible they are going to be to death when you start perturbing the society. And so, even exactly the same lockdown on different populations can have dramatically different effects.

And so it's not about a— The stringency index has to be—I'll use a mathematical term—it has to be a convolution between the vulnerability of the population and the physical impact of the measure, okay? It has to be a convolution of the two. And none of the indexes come close to that. In other words, they're not dealing with reality.

And so, as I tried to say in my testimony, I think the proper approach to understand a phenomenon is to be able to actually look at the phenomenon. So you have to do field work. You have to go in and see, what did that lockdown mean in this community? What impact did it have? Who did it affect? How did it affect them? Why did these 15 people here die, and these 23 people here, and is it different, and so on? You have to interview people: you have to figure out what's going on because health is not just the result of the tests that MDs will give. It's not the result of a PCR test. It is a much broader concept, and we need those kinds of interdisciplinary teams to go in and figure out what's really going on.

And they need to have more of a voice than the MDs and the people who are designing how to do contact tracing and all these "spreadsheet scientists," and so on. They have to go away and give their place to real, committed people who really want to understand what's happening in the community. I think that would be part of my answer.

I know I applied for grants a lot and I know that they wanted to know, what is the benefit to Canada going to be? And what they really meant was, what is the benefit to collaborating corporations that you have contacts with going to be, in terms of them making money and being able to hire people, and so on? That's the kind of thing they meant. They didn't mean understanding phenomena, changing paradigms, helping society move to a better place. They didn't mean any of that when they asked those questions. That's what it was like when I was writing grant applications. It was very frustrating.

I don't know if I answered that first question, but—

Commissioner Massie

To come back to your critique about the meta-analysis, I don't know whether you've seen the meme on—I think it was on Twitter or some other source—of these Swiss cheese model for— You have ten slices of protection, personal and populational,

[02:15:00]

and at the end, each of them doesn't work very well. But if you stack them, in the end you'll get something, right? And the first time I saw that, I was thinking, it's almost as if somebody is asked to do 10 additions from the same numbers, same table, and he ends up with 10 different responses, and he says, "Okay, well, that's bad. I'll just average it."

Dr. Denis Rancourt

Yes, the answer is the average. That's right. That's the problem.

Also, another way that you can think of it is, when I was teaching at the university level, I would often ask the students in a class discussion, you know, difficult questions so that we could discuss and think about things. And I would often pick questions that they thought they knew the answer to, to see if everyone agreed that the answer that everyone thought was right was actually the right one.

And so, for example, in a physics course I would ask even a graduate class to explain a Newton's law of action and reaction. And I would draw a picture and I would say, "Here's the action, tell me what the reaction is, and so on, of a man standing on the floor." And they would give my answers, and almost everyone would give the wrong answer but the answer that they had kind of presumed from their first-year physics courses. One person, typically, in the class—sometimes no one, sometimes two or three people—would actually know the answer. If you said, "Well, most of these students who are graduate students must be right, this has to be; I've got to change how I teach it, how I understand it." You'd be completely wrong. But once you explain to them why they're wrong, they're just baffled. They argue among themselves, and when they actually get to understand it, they've understood that law of physics for the first time ever, even though they're graduate students. I've experienced this several times in my teaching.

Coming back to these meta-analyses: don't do meta-analyses, don't do that. Take one study that you consider a good study: look at it in detail; go talk to the authors; find out what they actually did; find out what tests they used that is supposedly certified; find out what the limits of that test are and what the caveats are; find out all the errors that they didn't think of, that they probably made or didn't even consider; go in great depth into that paper and show that, basically, they wrote this to get a paper published and it's very tenuous and they never should have done this, right? You're going to learn a lot more if you try to do that and if you do it, than if you read the 50 papers on this question and they're all agreeing and so that must be it, and I'll teach that.

Commissioner Massie

My last question will concern the Quebec data, in terms of excess mortality, that seems to somehow be different from the other provinces, okay? In terms of—

Dr. Denis Rancourt

Yeah, it's similar—

Commissioner Massie

I mean, in terms of significant excess mortality, for example, following vaccine period, let's put it this way. So I was kind of aware of this kind of result, and I agree with you that it's very difficult to explain all of these things unless we really go on the terrain and trying to understand what's happening. Are you aware that, in Quebec, they had a fairly different vaccination schedule?

Dr. Denis Rancourt

How different? No, I'm not sure. I don't know what you're referring to.

Commissioner Massie

Typically, the manufacturer would say you have to vaccinate at three-week interval for the second dose. Maybe sometimes they would do it a little longer than that, but typically it was three weeks. In Quebec, for all kinds of reasons, most of the vaccination, at least in the first year, was done at months interval. The reason was because they didn't have enough, I think, in stock. That could be one of the reasons. And there's been some analysis that was done after that to try to actually

[02:20:00]

assess whether this was good or bad. And when you look at the antibody, which is a matter you can examine, I mean, it turns out that spacing it was better, but, you know, in terms of antibody, okay?

Dr. Denis Rancourt

Yeah.

Commissioner Massie

I think that has not been done by the manufacturer. There's no real randomized clinical trial on that. I mean, it's just an observation. So my hypothesis is that if the vaccine has some toxicity and you space it in time, maybe you give the time to the most vulnerable people to recover from the first dose before they get the second or the third.

Dr. Denis Rancourt

Yes.

Commissioner Massie

Is that something you think is reasonable with what you've observed?

Dr. Denis Rancourt

Well, we are looking into this, and I presented some data to that effect at the first part of my testimony back in May. We're looking at the toxicity of the vaccine as a function of dose, **not only** as a function of age of the recipient. And you'll remember that I showed a graph where the toxicity was increasing with the dose number. And the problem is there are not very many jurisdictions where you have enough detail in both the vaccine rollout and mortality and by age and by dose to do that, but we now have several jurisdictions, so we're really looking at that more carefully.

The other interesting thing is, when they roll out these different doses at different times, the rollouts themselves tend to be very rapid, especially for a given age group. So that helps us a lot because we can really see if it is associated with an immediate peak in all-cause mortality, and we are seeing that systematically. So in jurisdictions where the third dose is rolled out sooner or later, the mortality peak also occurs sooner or later. So we are convinced that there is a very strong, non-coincidental relationship. There is no doubt about that in our minds, but I have not yet seen that the spacing would make a big difference.

The first and second dose, generally, in most jurisdictions are very close together in time and they seem to be less toxic, even together, than the third dose. The third dose is a real killer for a lot of jurisdictions. You see that third dose rollout and it really—

But, you know, yeah, there's a lot of complexity here because there's a seasonal pattern on top of it. We're doing excess mortality. Yeah, I could get into the details, but I haven't seen what you're referring to yet. But we're keeping an eye out for it and we're looking for it, yes.

Commissioner Massie

Maybe I can [ask] just one last question about the issue with the toxicity and the so-called risk-benefit analysis. You mentioned that based on what you've done on analysis of all-cause mortality, you cannot do such analysis for lockdown because there's no benefit. There was nothing to begin with to benefit from. Is that correct?

Dr. Denis Rancourt

That's right. I mean, if you take an objective look at empirical data, you have to conclude that the evidence is contrary to the idea of a spreading viral respiratory disease that killed people. The evidence is contrary to that. If you accept epidemiological theory, which is contact spreading between individuals—you have to spend enough time close together, breathing the same air, and then you get infected by the person who was infectious and that's how it spreads and everything—and you model that. And I've done the modelling, written papers about it, and so on. No matter how you slice the modelling, no matter what input parameters you put in, no matter how you design the model, all the things you predict—none of it is seen empirically in the mortality data, okay?

If it's a pandemic, it has to spread. That's the whole idea. We're seeing proof that it doesn't spread. You have hotspots of mortality that stay in one place; they don't expand outside of that place. You see mortality that does not cross borders—very strict borders—in Europe, between countries, et cetera. These are all completely contrary to the idea of a pandemic.

Commissioner Massie

I just want to— I understand that, and I'm wondering whether we can expand this idea

[02:25:00]

to the risk-benefit analysis of the vaccine? Because there's clearly some risk associated, excess death mortality associated with the vaccine.

Dr. Denis Rancourt

Yes. Well, as I said, there should not have been a vaccine because there's no empirical evidence that there was a particularly virulent pathogen for which you need a vaccine.

Commissioner Massie

Exactly. Exactly.

Dr. Denis Rancourt

So there should not have been a vaccine, and there can be no benefit from the vaccine because we've proven that there was no pathogen that could be given immunity to by this vaccine. So in my book, I put that side to zero, immediately, on the basis of empirical measurements. And it's over. The discussion is over, as far as I'm concerned.

So the only way that they can show benefit is to talk about so-called spread, which is a very tenuous thing to measure. You're coughing up particles. We're going to do PCR on those particles— You know, they do all this stuff. But in the end, the only real reliable data, I believe, is mortality. And the whole idea of a pandemic, and the reason everyone is afraid of pandemics, is it causes death. And so, I know there's an effort to redefine the pandemic so it doesn't matter that people died or not, and it's still a pandemic. But we're getting into nonsense land when we go in that direction.

You know, I think we have to rely on the hard data. If it's not killing anyone, what is it? And if what you're doing is clearly, synchronous in time, killing people in significant numbers, then why are you doing it? To me, it's just so clear, you know? I can't— I know everyone always asks me to think like the immunologists and, you know, to consider it this way and calculate this and calculate that. But I can't get past my grounding in what I've seen from the empirical data. I just can't get past it, myself.

Commissioner Massie

Thank you, Denis.

Dr. Denis Rancourt

You're welcome.

Commissioner Massie

You're mute.

Dr. Denis Rancourt

Commissioner Ken?

Commissioner Drysdale

I had to find the arrow on my mouse. It was on the other screen.

Dr. Rancourt, thank you very much for coming back and talking with us. My first question has to do with the stats that you showed for Canada, and I just want to make sure that I got that right. There was a thunderstorm going on here, and it was going in and out.

Did I understand you correctly, you talked about there were approximately 30,000 vaccine-related deaths in Canada that you were estimating?

Dr. Denis Rancourt

Yes.

Commissioner Drysdale

What was the total number of deaths that you're estimating are related to the vaccine plus the mandates and measures that were put in place?

Dr. Denis Rancourt

Yeah, I don't remember if I reported that last time, but I scribbled it down somewhere. You can do it by year, by calendar year, and get a pretty good number. It's not much more than that.

Commissioner Drysdale

Oh, really? Okay.

Dr. Denis Rancourt

In Canada, you have that first peak of deaths in hospitals, which is pretty significant, and that contributed to the first calendar year of deaths. There was also a more severe winter, just before the COVID vaccine started. So there's maybe—I don't remember exactly what the number was—but roughly another 15,000, giving you 45,000 total. So when you quantify excess mortality for that entire period for Canada, you get about 45,000.

Commissioner Drysdale

Okay.

Dr. Denis Rancourt

Yeah.

Commissioner Drysdale

You know, I have to say, there's been a number of testimonies we've heard that have terrified me and— My apologies to you, but your testimony has terrified me. It made me think about a time long ago when people were murdered because they said the earth turned around the sun—and they were murdered for that. And that made me think of times just recently. You may or may not be aware of Dr. Susan Crockford from Victoria who was a sacrifice on the altar of another theory. In 2018, I think, she was fired from her position for going against the orthodoxy.

[02:30:00]

And we're seeing that happening now: we're seeing doctors fired; we're seeing researchers afraid to speak up; we're seeing all of our institutions falling in line with this. This is terrifying to me.

Have you got any suggestions at what we can do to strengthen our ability to fight this? You know, we have laws in place, we have institutions in place. We have ethics and medicine that were thrown out the window, you know. We have laws against discrimination and genetic testing, and that was thrown out, you know, while the 16-year-old kid at the restaurant was asking what your medical history was—that's illegal. Have you got any suggestions as to what we might be able to do to counter this, coming forward?

Dr. Denis Rancourt

Well, I think that one chance that we have is through popular politics. I mean, there is still a remnant of democratic structures, and they still have to have elections, and there are still representatives. And so, if one can get people in position that potentially can be elected and then have a voice, that can certainly play a big role.

I think that there is clearly a class war, at the moment, in many countries: in France, you have the yellow vests; in the U.K., there was a Brexit movement; in the USA, there was the Trump movement, which is undeniably tied to the working class. But not just the working class, a lot of the professional class, as well, but people who are more into independence: independent thinking, small business, that kind of approach. These are very real political movements. There was recently a person like that elected in Italy and so on, right?

In fact, the establishment—the globalist establishment—openly says that this is what they're afraid of and openly manipulates elections in order to avoid this. And openly creates propaganda and AI systems to affect people's opinions in order to fight against this—because they call it the “populist threat.” And they mean that another social class could actually acquire some political power and influence. You know, the working class—the small business class—could actually acquire some pushback within society, and this is a huge threat for them.

So there's always a chance that these movements can rise and can have their day. I don't think that things are going to be fixed through a recipe of, “this is how we fix it, now let's all agree that we're going to apply these new rules.” It's going to be fixed through the usual struggles and battles that societies have. And they're going to try to take our tools away. They're going to try to fix elections through the usual propaganda methods, and so on. They're going to try to ensure that a lot of people are not represented in the system, and so on, in order to keep their relative advantage. It's a constant struggle.

At the professional level, you have to fight to be whistleblowers and have professional independence. At the individual level, you have to fight for your own bodily autonomy and the right to raise your children how you see fit. We all have to fight for these things.

I was explaining from a theoretical perspective that these are the forces that push back against the corrosion of institutions that is created by the elite manipulating things to their favour and having too much influence in which laws are written and how they're written, and so on. By the elite, I mean, these days, the corporations and big finance, and so on. So there is always this corruption that the deep state is happy to go along with because it gives them more absolute power, and it eliminates the domestic threat that they're challenged in any way when they want to do something in the world. So, we have to do all of these things. We have to—

And it helps me, anyway—personally—to understand the phenomenon: to be able to, you know, understand the theory of stability of democracy and what the parameters are and what they're doing and the big picture. And so, it helps me to— Because I'm an intellectual, I like to analyze it and explain it to others and understand it. And part of that is studying geopolitics because what is happening now in Ukraine,

[02:35:00]

and in the struggle between the U.S. and China for economic dominance of large parts of the world, that is going to determine our civil liberties and how we are in our own country, more than anything else. Those are the big factors that are going to affect our lives. Because

our government justifies its own corruption because it considers itself at war against this kind of “threat.”

The globalist class feels threatened by a system that is based on actual production and actual development in Eurasia. They're threatened by that. They want to control a finance-centred system that just exploits everybody. They're very threatened by this alternative, and China and Russia have understood that that alternative is the way that their nations can survive. So this is the geopolitical fight of the century, and it will determine what our democracies look like, what our social—

You know, even wokeness and all of this gender fluidity—all these things came up as part of globalization. I've written about this. I explained what the origin of the whole gender debate was, originally, in the United Nations. Most of these ideas that were instilled in universities and eventually into the public schools, originated at the same time, directly following the dissolution of the Soviet Union. The globalists decided, it's our day.

There was a globalization of finance—an acceleration of it like we'd never seen. The last time there was such an acceleration of globalization—which means the U.S.-centred system takes everything—was the unilateral withdrawal of the USA from the Bretton Woods Agreement in the '70s. So that was the last time that the U.S. decided, our allies can't be as developed as us, we can't have this, we're going to withdraw from this, we're going to completely put Europe and Japan in their place. And the next big, tectonic shift was the dissolution of the Soviet Union.

This is the world we live in, and those struggles and those fights determine our freedom. We had freedom after the Second World War. The '50s, '60s, and '70s were amazing in terms of professional development, democracy, everything. But the elite saw those freedoms as a threat and organized, systematically, against those freedoms. This is where we're at now, today. So every time they have a campaign, whether it's the wars following 9/11 or anything like that, they ratchet back our freedoms more and more. Unfortunately, the Supreme Courts are not able to balance things whatsoever, or are unwilling or are corrupt, or whatever.

But these big forces are— From my view as an observer of the world, this is going to determine what our societies are like more than anything. That and the local struggles that we fight every day.

Commissioner Drysdale

Well, you know, you had mentioned changing language, and we heard quite a bit of testimony on that: the definition of vaccines was changed; the definition of a pandemic has changed—it used to contain a clause about the number of deaths, it doesn't anymore; the terms for genetic treatment have now been used for vaccines and vice versa. You know, there appears to be an attack on the very fundamental way that people perceive the universe around them.

And just judging from what I see in media lately—and this is what I'd like you to comment on—you know, they appeared to use or we had testimony that they used, all kinds of techniques to get people to fall in line. Name-calling: we were “misogynists,” we were “unscientific,” we were “anti-vaxxers.” And I think the measure of the success that they've had is that I see that starting up again. Mr. Buckley mentioned the legislation, or regulations, coming out against health food products. And just the other day on the news—

I don't remember which network it was—I was watching a news broadcast and they were now calling people

[02:40:00]

“health food cult.” So they're starting to attack that in the same way they attack people during the pandemic, and it seems to be that they're believing that to be a successful ploy.

Dr. Denis Rancourt

Yes, but do you see that there's a pattern?

Commissioner Drysdale

Yes.

Dr. Denis Rancourt

There's a very definite pattern. It's not just to change the language to better manipulate everyone. They're actually attacking the groups that are a threat to them: small business; independent-thinking people; people who don't politically see things the same way; people who want society to be structured around the family unit, and that's how they see a stable community for themselves, and they want to preserve that. So all of these people—the working middle class—these are groups that are clearly threats to the globalist agenda and to keeping control of that agenda. So anyone who doesn't believe in climate change, anyone who doesn't side with wanting to help Ukraine—doesn't side with Ukraine.

And within those fights, there's horrible propaganda techniques that are being used that we don't even see, often. Even us who are used to seeing them, some of them we don't see.

For example, there is a real concerted and well-funded effort to get the right-thinking people—what I mean is the people on the right of the political spectrum—who see through a lot of this other stuff related to COVID, and so on, to get them to consider that China is the enemy. This is extremely well-funded that propaganda, and you can find its roots— You can go right down into the Pentagon to find the roots of that.

If you look at the roots of Epoch magazine, that everyone considers does really good reporting. It's true, they do very good reporting, and they're very critical of these social issues. But the one issue that they're uniform on is that China is the problem, okay? So they're making sure that all the different groups, when it comes down to it, will align on those things. They know that the left will go along with a war in China because it's in their interest because they're already the privileged class, okay? But if the right gives us trouble, then we might have a bit of trouble. So they have to continually fabricate, manipulate, but what they have in mind is geopolitical dominance and conquest and crushing systems.

You have to try and see it all. I spent a lot of my time agreeing with people on the right, but then explaining to them that I don't agree with them on China, and why I don't. And there's some fantastic researchers that are exposing all of this propaganda, you see.

Trump is really good on China. He has said many times, well, they just want to have families, they just want to live. Call them names, if you want, but we can get along with them. He's said that, and he's completely right, and that's the way to go to avoid pushing a whole nation towards war, you know.

Commissioner Drysdale

Have you considered that the pandemic is real, but the real pandemic is this globalization that you're talking about? Because it crosses international borders, it crosses boundaries, it crosses households, it crosses every artificial boundary in the world, and it's attacking people and causing death.

Dr. Denis Rancourt

Yeah, that's an interesting idea, but these corrupt elite are not infected by a pathogen. That's not what makes them corrupt. They are deeply corrupt because they are classist: They don't consider that the others are equal to them. They consider that they're entitled to their privilege, and they justify their actions in those terms. They basically see themselves as better people that can do whatever they want. So I don't think it's a pathogen that's infecting them. I think it's the usual class nastiness, you know, that makes them this way.

Commissioner Drysdale

Well, you know, I designed a correctional centre in Nunavut some years ago, and I learned that the Nunavut people don't believe that person does evil because they're evil. They do evil because they're sick,

[02:45:00]

is what their belief system is. They kept telling me, in a way that I look at things, that I was not designing a prison, but I was designing a health-correctional centre. And perhaps they're right in all of this.

Dr. Denis Rancourt

Well, the difference between Aboriginal communities and societies is that they're traditionally, historically, much less hierarchical than a highly technological society that is globalized, that has professional classes and elite classes and everything. So, as soon as you are very hierarchical, there's going to be exploitation between the different layers. And if you are more horizontal, and really living off the land and depending on each other, there's going to be less of that and you'll have a different world view, I think, of things.

Commissioner Drysdale

Yes, absolutely.

Dr. Denis Rancourt

Different politics and so. . . .

Commissioner Drysdale

Thank you, sir.

Dr. Denis Rancourt

You're welcome. I really flew off the end there on a few—

Commissioner DiGregorio

So, if I could just come in with a last, few questions.

Dr. Denis Rancourt

Oh, okay. Sorry.

Commissioner DiGregorio

Yes, thank you, Dr. Rancourt, for coming today.

I am going to bring you back, a little bit, to your excess mortality testimony that you were providing to us earlier. I really appreciate the Canadian update that you've given us today. I'm hoping you can help me understand a little bit more about this vaccine-dose fatality rate that you talked about, which I think I heard you say that you've calculated, or estimated, in Canada to be something around the area of 0.03 per cent. But then you had higher numbers for other places, such as the USA and, I think, India, maybe even the world overall. I'm just wondering if you can help me understand what's the reason why that number would vary.

Dr. Denis Rancourt

Yes. So that number, when I—The numbers that I gave, they were whole population numbers. And, by that, I mean that those numbers were not discerning age group. They were not discerning the very important age-dependence, okay?

So in a society that has a lot of elderly and fragile people, and you give, let's say, a thousand injections, more people are going to die in that society than one that has young, strong people. So that number is for an entire region, or country, and it's going to depend on which population you're injecting.

And, I have to admit, it's probably going to depend on the manufacturer, on the type of injection that you're using, but less so. I don't see a big difference there, okay, but we can see some difference.

But it is a population average number. And so it will not only depend on what the structure of the population is, but it will depend also on the clinical judgment culture when they inject someone. So there's a clinical judgment that you don't inject someone who is days from dying, who is on their deathbed. You don't inject them with, even, something that would cause discomfort and could be fatal to them. You avoid that. So the people who are in ICUs and have been there for a while and have horrible comorbidity and could die any time, generally most will not sign off on injecting them, okay? In many countries or in many hospitals.

Others, they just won't care. Like India, they didn't care. They even had a list of comorbidities and they were chasing these people down to inject them. I talked to a clinician in Quebec who said, "Yeah, that's what we do. We very carefully evaluate whether or not this person can be injected." So the culture of how you consider, even, flu shots or any vaccination of fragile elderly people is also going to affect this number, because it's an average number.

So if you're injecting less of those fragile ones, which have the highest probability of dying on being injected, then your average population-based rate is going to be lower, you see? So

it suggests to me that Canada probably has, on average, better clinical judgment and healthier populations, maybe,

[02:50:00]

or better protocols of who you inject when they're in ICU and this kind of thing, than places like Israel and Australia—which both have exactly the same population value of 0.05 per cent. A little higher. So it's going to depend on all those things.

So that is an average number. But every time I look at a jurisdiction, I can discriminate by age, and then I always see an exponential increase with age. And it always has a doubling time, per age of the person, of five years in age. So every five years in age older, you double your risk of dying per injection. So when you get into the 80s and 90-year-olds—whether it's Australia, Israel, Canada—you approach the 1 per cent mark, which is what they experienced in India.

Commissioner DiGregorio

Okay, thank you.

My last question, which, hopefully, is a quick one, given that we have been going for so long. And I apologize, everybody, that I'm still going. But at one point you showed—I think it was a world map with excess mortality by country, year over year, and of note in it was that certain countries did not appear to show a lot of excess mortality—such as Canada, Australia, Japan, New Zealand—until 2022. And so, leaving aside sort of the issue of vaccines and potentially causing the 2022 increase in deaths, wouldn't some people be able to look at these maps that you've showed us and said, “Well, this actually supports the view that these countries' lockdowns worked?” And I'm just interested what you would have to say to that.

Dr. Denis Rancourt

Well, you know, you can— There's just so much heterogeneity across the world. We have these lockdown indexes, and we look for correlations, and so on.

I mean, they can always make these counter arguments. But then I would answer, “Why is the mortality significantly higher now than before? And this is excess mortality, so you're above what, historically, you should be seeing. And why did young people experience, immediately, a higher mortality in many provinces and that that was maintained? And why is it that in Nova Scotia and New Brunswick, the mortality is clearly temporarily associated with the only thing that changed at the time which is the vaccine rollouts?” And, you know, I would send back all of those counter examples, would be my response.

But a lot of people do take the approach that you are suggesting. And the way that they approach it, in terms of statistical analysis, is they try to look for correlations between excess mortality in a given time period on one axis and stringency of lockdowns, let's say, over that same time period on the other axis, and they look for a correlation. And I've done this kind of work, for example, in the United States, in detail because you have 50 states, so it's almost like you have 50 countries. And generally, when people try to do that—it's difficult enough to do—there is no significant correlation. You get a big scatter plot, okay? It's just all over the place. There's no clear-cut correlation.

Now, in our study of the USA, what we did is we said, “Well, let's be a little bit more clever,” we think. We'll compare states that share a border, and one did not lock down whatsoever, and the other did lock down whatsoever. And we'll pick pairs of states that are very similar in terms of their populations, the number of poor people in the state, and so on. And we found something like a dozen pairs of states that we could directly compare in that way. And we found that there was, statistically, a very large, significant difference in excess all-cause mortality between the two groups of pairs, within pairs, and it was clearly higher in the lockdown states and lower in the non-lockdown states. So we did a study like that. I did that in collaboration with a professor, John Johnson, from Harvard University, and that was taken up by a corporation who published the article, as well.

[02:55:00]

So you can try to get around the difficulty that just looking for a correlation—with all these different jurisdictions—is just going to give you a scatterplot. You try to refine it. And when you do refine it, you find what we found, I think. And when you don't refine it, you just look for that. And it's a good idea to look for it because what if you did find a strong correlation, you know? That would show it. But what we find is that nobody can show a strong correlation when they look at many different countries like that, so I don't think it would be a good—

In other words, a lot of countries that had very strong lockdowns equal to Canada had very high mortality. So you can't make the relationship.

Commissioner DiGregorio

Thank you, that's helpful. That's all the questions I had.

Shawn Buckley

So I'll take it that the commissioners have no further questions.

So Denis Rancourt, on behalf of the National Citizens Inquiry, I sincerely thank you for coming and sharing with us today. I know that I am not a commissioner, but I really found your evidence interesting and rewarding to listen to, and enjoyed the dialogue that the commissioners had with you. I appreciate—and this is for the commissioners and the audience—that it was a lot of work to prepare for this and analyze those things, and we don't take your effort for granted. We sincerely appreciate it.

And then, on behalf of the National Citizens Inquiry, we thank everyone for supporting us by watching the testimony. For all of the witnesses, it is meaningful because you participate, and we thank you for your encouragement and your support.

And, so, good night.

[02:56:57]

Final Review and Approval: Margaret Phillips, September 9, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an “intelligent verbatim” transcription method.

NATIONAL CITIZENS INQUIRY

Virtual Testimony

July 19, 2023

EVIDENCE

Witness: Dr. Peter McCullough

Full Timestamp: 00:00:00–00:59:35

Source URL: <https://rumble.com/v30zcka-nci-virtual-testimony-dr.-peter-mccullough.html>

[00:01:52]

Shawn Buckley

So I'd like to welcome everyone who is attending online and watching this as we commence only the second time that the National Citizens Inquiry has had virtual testimony [after the conclusion of hearings held in eight Canadian cities]. The commissioners have requested that we have Dr. Peter McCullough return and address some further issues.

Commissioners, for the record, my name is Buckley, initial S. I am attending today as agent for the Inquiry Administrator, the Honourable Chestopher [sic][Chesley] Crosbie.

Now, Dr. McCullough, could I begin by asking you to state your full name, spelling your first and last name for the record?

Dr. Peter McCullough

First name is Peter, P-E-T-E-R, last name McCullough, M-C, capital C-U-L-L-O-U-G-H.

Shawn Buckley

And Dr. McCullough, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. Peter McCullough

Yes, I do.

Shawn Buckley

Now, because we have only an hour with Dr. McCullough, Commissioners, I'm not going to go through the regular expert vetting process. I will advise you that we have as Exhibit VT-2, Dr. McCullough's CV, which is 177 pages in length. He has over a thousand peer-reviewed medical publications. He's likely the most published and recognized medical expert in the world, let alone in the United States.

We've also got, as exhibits, two publications that you have asked that he comment on, marked as exhibits. We have as Exhibit VT-2a, an article called "A Systematic Review of Autopsy Findings in Deaths After COVID-19 Vaccination." We have as Exhibit VT-2b, "COVID-19 Vaccines: The Impact on Pregnancy Outcomes and Menstrual Function."

So Dr. McCullough, I'll just march right in and ask if you can start discussing that first article, the systematic review of autopsy.

Dr. Peter McCullough

The context for this paper is that there have been autopsies performed in people who have died after COVID-19 vaccination, but they largely have come in as single case reports. And it's very hard to see patterns when there's a single case or just a small number of cases from a particular site. They have come in from all over the world.

So I was contacted by Nick Hulscher, who's a graduate student at the University of Michigan, who applied for a research project. It was approved by the University of Michigan, this systematic review. We said we were going to find every published autopsy done after COVID-19 vaccination. And once approved, we embarked on our project. We searched over 600 papers where an autopsy could have been done. And then we narrowed it down to the final number of papers in the manuscript—I believe the number is 44.

[00:05:00]

And in total, that was 324 autopsy cases.

Now, importantly, when autopsies were done early on, all of the mechanisms of injury and death the vaccines have been shown to do weren't known at the time. So an early autopsy could have had a patient die of a fatal blood clot, a pulmonary embolism, and the conclusion of the autopsy, early on, would be—not related to the vaccine. Well, we know today that wouldn't be true, so we needed a contemporary review.

We had three reviewers who are expert in pathology—particularly cardiac pathology—who had experience directly with autopsy reports and tissue specimens. And then we reviewed each case, all the published details, independently and had three reviewers, had a system for tie-breaking, in order to ascertain—was the death either directly due to the vaccine or did the vaccine significantly contribute to death?

And our top-line findings were that 73.9 per cent of the cases, the vaccine played a role in the death, either directly or significantly contributing. And in the remaining quarter of cases, we exonerated the vaccine. It looked like the vaccine didn't play a role.

Now, of those with vaccine-induced death, about 90 per cent of it was cardiac, cardiovascular. And the most common pattern was heart inflammation, called myocarditis, leading to sudden death, largely in young people. So the implications of this paper are the next young person who dies, unexplained, and they've taken a COVID-19 vaccine, it's more likely than not the COVID-19 vaccine is the cause of death.

Now, the autopsies came to attention typically within 30 days of taking the vaccine. We don't know, as months and years go on, what is the effect on the heart. But I can tell you, as a cardiologist and someone experienced in cardiopathology, I'm very concerned.

I'm also very concerned about what happened after we initially submitted this for peer review and preprint.

Shawn Buckley

Right, and so my understanding is the article was accepted by *The Lancet*, and then what happened after that?

Dr. Peter McCullough

We had submitted the paper to Lancet. Now, I had previously published in Lancet. I'm the most published person in my field, in the world, in history, prior to COVID, so I'm very familiar to all the journals: they know me, I know them. And I actually had a paper accepted to Lancet very early on in 2021—or 2020, in the pandemic.

So we submitted to Lancet at the editorial level, editorial office level. It was favourably reviewed, but triaged to a lower-level Lancet journal, of which, as a senior author, I respectfully declined because it needs to be published at a high-level journal. But I did accept the offer to have it go on *The Lancet* preprint server: SSRN.

And so, in that preprint submission, there's two rounds of checks to make sure everything is good to go up on the server, and it did. And it was getting surges of downloads over the first 24 hours—like I've never seen before for a preprint paper. To give you an idea: a typical preprint paper on vaccines gets about 50 downloads and reads, because the academic community has interest in it, but it may be sporadic and nominal. But about 50 reads would be common. But we had surges of downloads—I don't know how many thousands of downloads and reads—and the next morning, Lancet stopped it, and they put out a bogus claim. They said that the methodology did not support the conclusions, and yet that wasn't anything they found fault with during the review or preprint submission process.

Within 24 hours, we submitted it on the European Commission preprint server, which is just showing the data to the world so people can look at it for themselves. It's not peer-reviewed, but it's on the Zenodo server and, astonishingly, it has—as we've seen here today—a hundred and fifty thousand downloads and reads.

Shawn Buckley

Well, I'm glad that we've entered it here as an exhibit.

Now, one thing that stuck out at me when I was reading the paper is that, basically, most of these deaths occurred within a week. And what I'm wondering is, so these are largely autopsies of what we could almost call, sudden deaths, very temporally related to the vaccine. Do you know of any work— We're hearing a lot about secondary mechanisms of death, like turbo cancers and the like. Do you know of any work, or is there any work in progress, to use autopsies to assess these other potential deaths being caused by the vaccines?

[00:10:00]

Dr. Peter McCullough

No, I don't. And I think it's particularly worrisome, since we showed such a high rate of causality that those who die months or even years after the vaccine, that, in fact, the vaccine could be a role.

And I've been particularly struck by a paper published by Li and colleagues—L-I and colleagues—demonstrating, even two years after initial shots of Pfizer and Moderna messenger RNA, two years later, there's an excess risk of retinal artery blood clots and retinal vein blood clots. Not everybody had them. But it was about a fourfold increased risk for those who took the shots compared to those who didn't: 750,000 sample size in the vaccinated; about double that in the unvaccinated comparator group.

So I'm worried the vaccines have long-lasting effects: certainly on blood clotting, maybe other factors.

Shawn Buckley

Now, the only other thing that I wanted to ask is, and I appreciate we're not in normal times where the government or the medical community reacts in the way we would anticipate pre-COVID. But what would you normally have anticipated with the publication of these findings? How the governments and medical community would react?

Dr. Peter McCullough

This paper would have been a high-level paper at any meeting. We clearly would have had interaction with the companies, the manufacturers, the FDA [Food and Drug Administration], the EMA [European Medicines Agency], TGA [Australian Therapeutic Goods Administration], SAHPRA [South African Health Products Regulatory Authority]—all the regulatory agencies. There'd be an invitation to make a presentation at one of the FDA vaccine meetings, which come up frequently. And then there would be a broader discussion of death after vaccination.

So when the Pfizer dossier was released— You know, Pfizer recorded 1,223 vaccine deaths within 90 days of release of their product. Five, 10, 15, no more than 50 deaths—back early in 2021, Pfizer should have pulled it off the market. That's my expectation. The FDA should have told them to do so. All the other regulatory agencies, worldwide, should have had alarms going off to get Pfizer off the market. Yet, 1,223 deaths and no one made the call to pull it off the market.

In fact, Pfizer tried to conceal that—and the lawyers from the FDA—for 55 years. Now we've had Moderna conceal their data. And under court order, finally, Moderna's data has been released to the ICAN [Informed Consent Action Network] NGO. Two years later, Janssen and Novavax and AstraZeneca still have not released their 90-day regulatory dossiers.

Shawn Buckley

So for those that may be watching, so you're referring to what's now called the "Pfizer dump," where Pfizer basically did not want—for 77 years—their clinical trial data to be released, and they were forced by a court to be releasing it in stages. That's what you're referring to?

Dr. Peter McCullough

That's correct. Remember: any product that's released on the market, the company has an obligation for 90 days to take phone calls from patients and their family members, and take down the report of any side effects. And when Pfizer was released—December 10th, 2020, in the United States—people started calling Pfizer, and the phone was ringing off the hook with complications, side effects, and, sadly, family members calling Pfizer and telling them that their loved ones had died after taking the Pfizer vaccine: sometimes in the vaccine centre—right where they took the vaccine—or within a few hours or a few days after taking Pfizer.

So it was an explosive number of deaths. And as you point out, the lawyer for the FDA wanted to block this release for 55 years and actually went further and extended it to 77 years during the proceedings. And finally, under court order, it was released—the Pfizer dossier was released. It's largely been analyzed by the analytic group at the *Daily Clout*. And Moderna will almost certainly be analyzed by the NGO ICAN [Informed Consent Action Network] because their attorneys forced release.

The public and doctors should be very disturbed that the companies are not publicly releasing their 90-day data. And in fact, they've intentionally tried to cover that up and not release it.

Shawn Buckley

Right, so that's the work of Aaron Siri, I believe, is the attorney's name for ICAN. Yeah, he does great work.

Now, one of the things that I understand has kind of come out from this Pfizer dump—and I want to use it to segue into the next article that we've entered of yours as an exhibit—is basically a focus on reproduction that one wouldn't anticipate. If you're doing clinical work on a vaccine for a respiratory virus, we wouldn't necessarily expect there to be much, or any, focus on reproductive health.

[00:15:00]

I'll ask you to comment on that, and then I'll ask you to basically discuss that paper that you participated in authoring, the miscarriage rate and other issues surrounding pregnancy and the COVID vaccines.

Dr. Peter McCullough

The clinical trials of the COVID-19 vaccines were very similar to clinical trials of new pharmaceuticals. Pregnant women and women of childbearing potential, breastfeeding women—strictly excluded from these trials. And the institutional review boards that looked over these applications, the sponsors and the FDA, and all the regulatory agencies agreed: under no circumstances should a woman of childbearing potential without contraception, a pregnant woman, or breastfeeding woman take a COVID-19 vaccine because the vaccine could cause harm. So all those entities agree, and that's the reason why not a single woman in that category was allowed to take a vaccine.

And then in a shocking move—December 10, 2020—the FDA and the CDC [Centers for Disease Control and Prevention] in the United States, who were sponsoring the vaccine administration program, encouraged pregnant women to take the vaccine with no assurances on safety. None. And this was a shocking move. The FDA and CDC did this. The

vaccine administration centres didn't provide any oversight or any clinical judgment to exclude them.

In my clinical practice, I would never have a woman in that category take any experimental product. It's considered Pregnancy Category X, meaning it should not be used, has a dangerous mechanism of action, and has no assurances on safety. And I published an opinion editorial in *TrialSiteNews* with Dr. Raphael Stricker—who runs the largest fetal loss clinic in the United States—early in 2021 stating that: that the COVID vaccine should be Pregnancy Category X.

What we know from that point forward is, I think, alarming: that our CDC is reporting 65 per cent of women—over the course of 2021 and 2022—65 per cent of women who got pregnant either took a COVID-19 vaccine before the pregnancy or during the pregnancy. This is an astonishing observation that women themselves, their obstetricians, their gynecologists, and others would not have an eye towards safety.

We had a paper, by the way, in *Annals of Internal Medicine*, of pregnant women who got COVID, by Pineles and colleagues. Pregnant women have better COVID outcomes than non-pregnant women because pregnancy is an enhanced immune state. It's a natural state, and it's not an immunodeficiency state. So there was no clinical indication, there was no medical necessity, and there was no safety.

To make matters worse, we learned that the Biden administration and the Health and Human Services Department through the COVID Community Corps program—discovered under FOI, or release of information act—that the American College of Obstetrics and Gynecology [sic] [American College of Obstetricians and Gynecologists] [ACOG] took federal money to promote COVID-19 vaccines through gynecologists and obstetricians on pregnant women without having assurances on safety.

Shawn Buckley

And I just want to make sure that people understand. So what you're saying is that they—We'll just use Pfizer as the example. So the Pfizer clinical trial, like all clinical trials—We call it a new drug, in Canada and our regulations. But as all clinical trials on a new drug, pregnant women are excluded, and that's for ethical reasons. And so when the FDA—and here, Health Canada—is then approving the COVID-19 [vaccine] for pregnant women, you're telling us there actually was no research showing that it was safe to use on pregnant women at the time the FDA approved it for use in pregnant women.

Dr. Peter McCullough

No. So yeah, that's a correct statement for the FDA, Health Canada, TGA—any of the regulatory agencies that allowed pregnant women to be vaccinated with novel, experimental vaccines. Initially, it was Pfizer. That's the messenger RNA coding for the lethal Wuhan spike protein. No regulatory agency, in good conscience, could ever approve that for a pregnant woman. This was very early on.

And because human ethics committees and the FDA and the pharmaceutical companies, just four months earlier, excluded these women from studies,

[00:20:00]

it should have been a strong signal that under no circumstances should they allow them to take the vaccines. Yet, as I've told you, the majority of women who got pregnant and delivered babies through these years in the pandemic took the vaccines. And what we've learned is the outcomes have been horrific for these women.

Shawn Buckley

So can you discuss that? Because that's what's in your paper, the miscarriage rate and other issues surrounding pregnancy and the COVID vaccines.

Dr. Peter McCullough

Well, let's just take the mothers first. And I'll cite a paper by Hoyert, a single author, H-O-Y-E-R-T. It's published by the National Center for Health Statistics; it's on the CDC website. Hoyert is reporting, during these pandemic years when the women took the vaccines, record maternal mortality: mothers dying during the pregnancy and, in that study, up to 42 days afterwards. So maternal death is one of the ultimate outcomes, and it appears as if it's associated with administration of the COVID-19 vaccine. It's erased about four decades of progress in obstetrics. So pregnant women are dying at record numbers at this point in time, and it's in the National Center for Health Statistics in the United States.

Now, in terms of the maternal-fetal outcomes in those who survive pregnancy, there's about three dozen papers that have concluded that they don't see a safety signal in pregnant women. But these studies—including a very early one in *New England Journal of Medicine* by Shimabukuro and colleagues from the CDC—they were either biased because the FDA and CDC are the vaccine sponsors, they were publishing the studies, or they were biased because the authors were members of the American College of Obstetrics and Gynecology and they took federal funding to push the vaccine. So many of the papers can simply be discarded because they're biased by people who, basically, are being paid or told to promote the vaccines.

And on top of that, the papers have shortcomings: The windows are too short; they don't look at a full nine months of pregnancy. There's no comparator group. So we assembled a team led by Dr. James Thorp, an obstetrician/gynecologist—I'm the senior author—and we evaluated the U.S. Vaccine Adverse Event Reporting System [VAERS]. And we did what the CDC asked investigators to do, is we benchmarked it against another vaccine pregnant women take, and that's the inactivated flu vaccine.

And what we found is that women who took the COVID vaccine compared to those who didn't and those who did take the flu shot as a comparator, we have a multifold increased risk of maternal hemorrhage, fetal loss in the first trimester, stillbirth, maternal hemorrhage after delivery, fetal hemorrhage, and then four fetal outcomes—including intrauterine growth retardation; oligohydramnios, that is a reduction in the amniotic fluid; fetal malformations; and then, sadly, fetal death.

So the Thorp paper is the safety signal of concern. It was done correctly, compared against the flu vaccine and the unvaccinated. And when we have three dozen papers that are biased or incomplete, but we have one paper showing a signal—I can tell you, I'm an expert in data safety monitoring—we follow the single paper that shows the safety concern. And so it's my testimony that the vaccines have been associated with maternal death at a record level and now, fetal loss, loss of pregnancy: the first trimester, that's a miscarriage; and then after 20 weeks, that's a stillbirth. Sadly, maternal hemorrhage after delivery and multiple fetal abnormalities.

Shawn Buckley

Now, is there— Because the governments will say, “Well, we’re trying to protect the mothers and babies.” And you’ve already indicated to us that, actually, a mother during pregnancy is in a kind of a hyperimmune state—the immune system is ramped up. Do babies and children face a risk from COVID that would justify the use of this vaccine during pregnancy?

Dr. Peter McCullough

They don’t. I mean, infants have an imperceptible syndrome, if they have any. We had very positive data in using hydroxychloroquine, prednisone, aspirin, and other drugs—good clinical experience in women who are pregnant. They worked fine. Monoclonal antibodies were used, even if it was off-label, in pregnant women: they were safe and effective. So we had treatments for the pregnant women. They clearly didn’t need to risk anything with a vaccine.

[00:25:00]

And then children had a negligible risk, particularly newborns.

So, you know, we have a situation now. Paper by Klaassen and colleagues, from Harvard, show that 94 per cent of Americans already through COVID; 97 per cent have some protection, even from subclinical illness. The COVID-19 vaccines and boosters are not clinically indicated or medically necessary, clearly in pregnant women but other populations as well. And that’s evidenced by the fact that 15 per cent or fewer of Americans have even taken a booster.

And so we’re largely through the pandemic. There are low-level residual cases that are very mild and we use the McCullough protocol or other standard published protocols to treat patients.

Shawn Buckley

Now, I’m going to go into that at the end of your testimony because I want to end on a positive note. So at the end of your testimony, I’m going to ask you about, how do we mitigate some of these things?

But because we’re short on time, you only have an hour to spend with us, I want to invite the commissioners to ask you questions because I know they were looking forward to being able to ask you questions.

And Dr. Massie, who’s unmuting, he used to run the National Research Council of Canada.

Commissioner Massie

Yeah, well, just to follow on the positive note about the protocol that’s been developed to reduce spike toxicity. I’ve seen a number of reports on that and I know you’re working on a publication that is probably going to come any time soon.

One of the things I was wondering, because this question has been asked to me by many people: if you think of the nattoxinase, for example—which is an enzyme produced from a bacteria—and the route of administration, if I’m not mistaken, is you swallow a pill, so it goes in your gut. So the question that people were asking is, how is it possible that it can

actually reduce or destroy the spike protein if the spike protein is not accessible to the enzyme? If it's running in the blood, for example, what's the likelihood that this enzyme will actually get to the blood circulation? Do you have any indication on that?

Dr. Peter McCullough

That's certainly a fair question, and I can't make any therapeutic claims on nattokinase. We don't have large prospective, double-blind, randomized, placebo-controlled trials or a giant pharmaceutical dossier—like pharmacokinetics and pharmacodynamics. I can tell you no such studies are planned and that have been registered in clinicaltrials.gov.

But this is what we know: The Japanese have been eating natto for about a thousand years. It's the fermentation product of soy. It's broken down by *Bacillus subtilis* [variant] *natto*. It's been used as a cardiovascular supplement for a few decades. It is a thrombolytic, so we know that at a single dose administration of 5,000 FUs—or Fibrinolytic Units—that blood parameters change. It is an oral anticoagulant. We know that for sure.

Three papers—the lead one by Tanikawa and colleagues—shows that nattokinase does degrade the spike protein. Whether it's inside cell preparations or whether it is in cell lysates, it dissolves the spike protein. So the enzyme appears to have functions both intracellularly and extracellularly where it is a protease. And the human protease system does not seem to be able to break down the spike protein itself.

Bruce Patterson has shown this in InCellDx: after severe COVID, the S1 segment is within CD16-positive monocytes—probably extracellular, as well—up to 15 months afterwards, in his data; up to nine months afterwards, after the vaccine. That's as far as he's looked. The full-length spike protein, S1 and S2.

So we believe, based on the data, that nattokinase has a degradative effect on the spike protein. And it's been our clinical experience now, about three months on nattokinase, empirically, we're seeing clinical improvement.

Commissioner Massie

Thank you.

Commissioner Drysdale

Dr. McCullough, I have a number of questions for you. On the first study that you were talking about, I believe you said that you had identified 678 studies. And of that 678 studies,

[00:30:00]

they thought that 325 of them were pertinent to the investigation you were undertaking. Now, can you tell me, what was the population from which those studies were extracted? Was it just the United States? Was it the world?

Dr. Peter McCullough

Yeah, the population was the world. But like, a prototypical study—that was in the 600, that didn't get included—is a paper by Patone and colleagues published in *Circulation*

where they described a hundred fatal cases of vaccine myocarditis in the U.K. A hundred cases, but not a single one had an autopsy.

Commissioner Drysdale

Well, you know, that's what I'm curious about because you went on to speak about the post-marketing informational dump from the vaccine manufacturer. And I believe that that study that they looked at, where they reviewed 42,086 cases of adverse reactions, was completed end of February 2021, was it not?

Dr. Peter McCullough

That's correct.

Commissioner Drysdale

So in the data that you talked about from that post-marketing study, you mentioned that there was 1,223 fatalities. Now, what you didn't mention was that in that same report, out of the 42,000, there were 9,400 cases they said the results were unknown. So there were 1,223 identified fatalities, 9,400 cases where the results were unknown—they could have been deaths, they could have been anything, they just weren't reported. But coming around to my point is, as early as February and with a sample size of only 42,000, BioNTech had identified 1,223 cases of death. And yet, years later, we could only find 370—plus or minus—autopsies that you could use in your study. How is that possible?

Dr. Peter McCullough

It's possible, and I distinctly remember this. I participated in a pathology lab on a regular basis, in a prior position. Most centres in the United States and worldwide shut down all autopsies during the pandemic. There was a great fear that the deceased body would transmit COVID to the people working on the body. And so we have an incredible dearth of autopsies because most clinical pathology programs shut them down for a couple years.

Commissioner Drysdale

Well, you, know that's interesting, Doctor, because we've had significant testimony from witnesses who said that by as early as March of 2020, the health profession understood that COVID really affected a particular age group and that is elderly people with comorbidities. And yet, healthy people—Health care workers were so afraid of it that they wouldn't do autopsies? I mean, that's incredible.

Dr. Peter McCullough

No, it was true. It's absolutely true. I can serve as a witness—as someone who regularly worked in a pathology lab—but that's in fact what happened. And when the Italians published the first autopsy papers in COVID, it was thought to be an amazingly courageous group that would perform a dissection on a patient who died of COVID, that they, quote, "took the risks of doing that." And the autopsies, as you alluded to, were incredibly valuable.

And what the original autopsies in COVID found—in COVID, not the vaccine, just COVID—is that people died of blood clots. Invariably, they had micro and macro blood clots in the lungs. So we learned from those papers that patients needed blood thinners. And in fact, in

the McCullough protocol—treated as an outpatient—we used very strong blood thinners in high-risk cases very early. And it's the lack of using blood thinners, I think, early that contributed to some COVID deaths.

Commissioner Drysdale

Well, you know, I want to switch over just a little bit and talk about the second study that you were discussing. How long did it take before the influenza vaccine was approved to be used on pregnant women? I mean, as I understand it, it took 10 months with this. How long did we wait before we were allowed to put the flu vaccines into pregnant women?

Dr. Peter McCullough

I don't know. As I sit here, I don't know. I would assume it probably took many years.

And it's still controversial, by the way, to give any pregnant woman a vaccine. And the reason being is that a vaccine—

[00:35:00]

if it's diphtheria, tetanus, pertussis, inactivated flu—the reason why it's controversial is that any vaccine can cause a fever. And a fever is a known precipitant for a spontaneous abortion or a stillbirth.

Commissioner Drysdale

So you don't really know how long, but how long have flu vaccines been on the market?

Dr. Peter McCullough

Flu vaccines have been on the market for many decades. I know, personally—I checked my own personal vaccine record—I've taken 40 flu shots in order to be a doctor and medical student, on staff. So I can tell you at least four decades because I'm a witness for that.

Commissioner Drysdale

So 40 years of influenza vaccines and they still caution to give them to pregnant women. But this mRNA vaccine was approved and encouraged for pregnant women within months of its development. Is that a fair statement?

Dr. Peter McCullough

That's correct. And, shockingly, it was encouraged by the U.S. FDA and CDC on the day it was released: December 10th, 2020. And yet, just two months earlier, pregnant women were prohibited from taking it in the clinical trials.

Commissioner Drysdale

Now, I also wanted to ask you a little bit about— You know, in listening to witness testimony and doing research for the report that the commissioners are writing, it seems that the mRNA vaccine—if you read the definition of these drugs from the CDC or Health Canada, the mRNA treatment—is really a biologic, is it not?

It's true. I would cite the work by H  l  ne Banoun—B-A-N-O-U-N, former INSERM [French Institute for Health and Medical Research] scientist in Marseille, France—where she's analyzed all the regulatory characteristics of messenger RNA. It's clearly gene therapy.

But they took a gene therapy—a biologic—and the reason biologics undergo a much higher level of investigation of testing is because of the complexity of their manufacture and the way they interact with the body, with the cells of the body. So how is it that we took a biologic that would have normally taken years and years and years—because it's a biologic and not a vaccine—how is it that we classified it as a vaccine and tested it on the basis of it being a vaccine when it's clearly a biologic?

It was regulatory malfeasance. Never should have been considered as a vaccine and received a short-track approach. We needed, clearly, five years of safety testing and observation. Even if it was released early, there should have been monthly safety meetings; everybody should have been in a registry checking in. And as I've already testified, the vaccine should have been pulled off the market January 2021 for excess mortality.

Now, with regard to the pregnant women, are you familiar at all with the, let's say, pre-2019, pre-COVID vaccine rate of mortality in women due to them being pregnant? What's the incidence that a pregnant woman—just from complications due to the pregnancy—what would that mortality rate be?

The absolute rate is in the Hoyert paper—H-O-Y-E-R-T. It's at the National Centre for Health Statistics. So I don't have it in my memory of the absolute number. But let me say, in the years prior to COVID, it was at a steady rate. It did go up in 2019 a little bit, more in 2020, and then it really jumped in 2021. And as I recall, in 2021, it's probably four times the baseline.

My understanding that the number prior to COVID was somewhere in around 1 in 16,000, or in that range. Does that sound in the ballpark?

No, to me that sounds high, but go ahead.

Okay, fair enough. The reason I was asking that is I wanted to compare—or I wanted you to compare or discuss—the risk of mortality due to being pregnant versus the risk of mortality for women of that age group dying of COVID-19.

Dr. Peter McCullough

Well, there were some maternal deaths due to COVID-19. They did occur; you can find them in the peer-reviewed literature. We do know that, again, pregnant women did better than non-pregnant women.

[00:40:00]

And just like the other patterns, the pregnant women who did die of COVID-19 tended to have baseline problems, like preeclampsia, systemic lupus, obesity, cystic fibrosis, other problems that they were carrying forward, and, so, they remained at risk.

But in my view, there wasn't justification for the vaccine because the vaccine—because it's applied to all women—if it caused harm, it would cause harm to a large number of women, as opposed to simply treating those isolated cases at high risk. We had success using hydroxychloroquine, prednisone, enoxaparin, corticosteroids: they were all safe and effective. Monoclonal antibodies: safe and effective. So we had a ready armamentarium.

It wasn't commonly done in the United States, but it was done extensively in Brazil: pregnant women could also receive ivermectin, and they did incredibly well. There's a published paper by Schechter and colleagues from Manaus, Brazil—where they had the gamma variant in the Amazon rainforest—and they clearly treated these women and they saved them, whereas without treatment, some died. So we knew that it was essential for some high-risk women to get early treatment.

Sadly, the vaccines have never been shown to reduce hospitalization and death in any prospective, double-blind, randomized, placebo-controlled trial. And that's the only design where we can ever make a claim regarding the vaccines.

Commissioner Drysdale

My last question, because other folks want to get in here—and I'm sorry for hogging the time here—but, you know, you talked about a significant increase in miscarriages and deaths in the fetus. But have you got any information with regard to the effect of fertility in the first place? In other words, we're talking about and counting deaths in the womb, but how many babies were prevented from getting in there in the first place due to fertility issues? Do we know that?

Dr. Peter McCullough

We know the basis for infertility is pretty strong because a bio-distribution study showed that the lipid nanoparticles do go to mammalian ovarian cells. We know the spike protein is damaging to cells and tissues.

Two studies—one by Gat, the other one by Huang—showed in men that the vaccine clearly reduces sperm count and motility: the two major indicators of male fertility.

And then I would say that one of the third largest sources of information on fertility is that the vaccines, in every study so far, disrupt the female menstrual period. A large study from the U.K. called the EVA project ["The Effect of Vaccination against SARS-CoV-2 on the Menstrual Cycle (EVA Project)"] showed this was the case. A very big study in *British Medical Journal* showed the same thing.

So here's the concept: you know, a woman only has a certain number of eggs and the ovulatory cycle needs to be precise—ovulation, fertilization, implantation. Anything that disrupts that cycle, which for sure the vaccines do, will reduce fertility. If the vaccines go to the ovaries and cause some loss of egg cells, that's going to reduce fertility. And on the male side, there's a range of fertility, and if the vaccines reduce some men's fertility into the infertile zone, we have a perfect storm for the vaccines lowering fertility. And now, all the data systems across Europe, which they have good tracking systems, show, indeed, population fertility is down since the vaccine campaign has started.

Commissioner Drysdale

So, I mean, what you're talking about is an unknown number of thousands and thousands of babies that may have died or may have not been conceived, and we just don't know the answer to this.

Dr. Peter McCullough

I agree with that.

Commissioner Drysdale

Thank you, sir.

Commissioner Massie

If I can jump back with another question. You actually did an interview with Christine Cotton and another French colleague about the clinical trial—the way they were actually executed with the Pfizer, and it was analyzed in a lot of details. So what is your overall take on the conversation you had with them, with respect to the, I would say, reliability of the clinical trial: both with respect to efficacy and safety, that the data that came out from this trial?

Dr. Peter McCullough

The registrational trials of Pfizer,

[00:45:00]

in my opinion, are invalid: that there were so many breaches of good study conduct that the results are not reliable. They didn't test each group equally to see if they got the infection on a regular basis. The groups weren't properly blinded: people knew if they took the vaccine or not. There were crossovers that occurred, dropouts. And putting this all together, we cannot conclude that the vaccines are either safe or effective.

Commissioner Massie

So I know that in the conversation, Christine Cotton was mentioning that she wanted to have an audit of the clinical trial. In your opinion, what would it take to get that audit?

Dr. Peter McCullough

The FDA simply can order an audit, and independent auditors or FDA auditors can audit the dossier. And it's Dr. Cotton's opinion and mine that the trial would not survive an audit.

The conclusion would be that the registrational trial is invalid. If the trial is invalid, therefore, the approval never should have happened.

Commissioner Massie

So if the FDA is not moving forward with the audit, is there any other way to enforce it?

Dr. Peter McCullough

Another regulatory agency could step forward—the EMA, the Canadian authorities, MHRA [Medicines and Healthcare products Regulatory Agency], SAHPRA. FDA is not the only game in town. Many of the other regulatory agencies actually relied on the U.S., so it would be nice to see an outside regulatory agency call for an audit, request the dossier, and analyze the procedures that were taken and, basically, the results of that flow process.

Commissioner Massie

And in your opinion, what would be the timeline in terms of asking for the audit? Is there sort of a defined window after which you can no longer do it?

Dr. Peter McCullough

Audits can be done retrospectively, particularly if we think there's malfeasance that's occurred. They can be done. Research centres, by the way, are required to keep records for years and years and years. So they could call an audit for any time, and particularly if we think malfeasance is a concern.

Commissioner Massie

Thank you.

Shawn Buckley

So if there are no further questions, I know that I have some because we wanted to speak at the end of your testimony about, basically, some positive solutions. But I think it would be important to explain to the people watching, basically what are the mechanisms of harm? Like, what is the concern—short of death—that you're seeing in the research and in your own clinical practice concerning vaccine injury? And I mean concerning COVID-19 vaccines.

Dr. Peter McCullough

There's over 4,300 papers in the peer-reviewed literature describing vaccine injuries, disabilities, and deaths—4,300. And the regulatory agencies agreeing the vaccines cause many serious syndromes, including myocarditis, heart inflammation, stroke—both hemorrhagic and ischemic stroke—other neurologic problems, including Guillain-Barré syndrome, small fibre neuropathy, seizures, blindness, hearing loss, blood clotting. All the regulatory agencies, all the peer-reviewed papers agree blood clotting is a major problem: deep venous thrombosis, pulmonary embolism, blood clots in the retinal arteries and veins—virtually every thrombotic syndrome one can imagine.

Fourth category is immunologic. Immunologic is disorders of the immune system: multisystem inflammatory disorder, vaccine-induced thrombocytopenic purpura, and now,

lingering immune systems called autoimmune problems, characterized by a positive ANA—or antinuclear antibody or an antinuclear cytoplasmic antibody—response.

So it's a broad breadth of problems. Most appear to be related to the spike protein, excessive production of the Wuhan spike protein. That's the spine on the ball of the virus.

The code for that was intentionally manipulated in the Wuhan Institute of Virology to be more infectious and more damaging. All of that has come out in the U.S. House of Representatives Select coronavirus investigations. A report was issued by that committee July 11th, 2023, outlining the fact that the virus was indeed engineered in the Wuhan lab. The U.S. regulatory officials had a role—including Dr. Anthony Fauci; Dr. Francis Collins; academic investigators—including Dr. Ralph Baric at the University of North Carolina at Chapel Hill; and NGO EcoHealth Alliance—led by Peter Daszak; and, of course, the Wuhan Institute of Virology—led by Dr. Shi Zhengli. So that now is all in the open.

[00:50:00]

We're left with the spike protein damaging the Canadians, Americans, others who took the vaccine. The spike protein, as we've outlined, does not appear to get out of the body quickly at all. It may be in the body for months or years.

To make matters worse, now, multiple labs have discovered the vials were contaminated with DNA—what's called cDNA, which comes off the manufacturing process. During the clinical trials, Pfizer and Moderna used naked DNA to produce the messenger RNA. And towards the very end, they switched to mass production using *E. coli*—not naked DNA, but *E. coli* DNA—to produce the code, the messenger RNA code. And that *E. coli* required certain additional elements called promoters: promoters that actually enhanced the production of the DNA, which made the RNA in *E. coli*. About 250 people— Out of the 48,000 in the clinical trial, 250 got the new manufacturing process compared to the old manufacturing process. So only about 250 do we have anything to rely on in terms of who got the new stuff.

To make matters worse, in the clinical trials they use single-use vials: one vial per person. And in the public program, they used the new process made from *E. coli* and multi-use vials where six different doses came from a vial—air is introduced through using multiple needle punctures through the diaphragm of the vial.

And now a lead paper by Kevin McKernan, validated by three other labs: the vials are contaminated with this *E. coli* DNA, and there's fragments of the DNA, including the promoter. There's both the promoter and the enhancer of what's called SV40—or simian virus 40. Not the full viral code, but the promoter that promotes the production of the DNA. **The reason why this is concerning is SV40 is a known promoter of cancers. It actually promotes proto-oncogenes and oncogenes.**

Separately, in a paper by Singh and colleagues, the S2 segment of the spike protein, which is in people who took the vaccine—not in people who got COVID, but those who took the vaccine—S2 segment seems to inhibit the P53 and BRCA tumour suppressor systems. So we have a perfect storm of cancer promotion and, then, inhibition of our cancer-surveillance system.

So what I'm leading to is, there's a great concern that the skyrocketing rates of cancer we're seeing worldwide—and there's no dispute that cancer is up—in fact, that may be due to COVID-19 vaccination, besides all of the known syndromes that I've outlined.

So this is bad news for those who took the vaccine. Most of this is dose-related, so if someone's following the U.S. schedule right now, they're on their seventh dose of messenger RNA—seven. Many people just stopped at one or two doses.

We know in a paper from Schmeling and colleagues—good news—a third of the batches, there were zero side effects. This is in Denmark. They had Pfizer, they had all the side effects. Zero side effects. Two thirds have some mild side effects. And yet the third batch, only 4.2 per cent of the vials had side effects through the roof, including fatal side effects that we've covered in this testimony.

So it looks like we have a product production problem. This small number of vials may have hyper-concentrated messenger RNA, contamination, other factors, but there are lethal vials of the vaccine. All of them should have been pulled off the market in 2021. The batch differences were submitted to the CDC and FDA in 2022 by Senator Ron Johnson. Those regulatory agencies dismissed that concern. Now we have this paper by Schmeling and colleagues, out of Denmark, clearly showing it's a batch problem, both good news and bad news. The good news, most people look like they probably will be unharmed, but a small number of people, sadly, have paid the ultimate price.

[00:55:00]

Shawn Buckley

Before we switch to the solution, one burning problem that I've wondered about—and you might be the perfect person to answer it because you're so connected with the research—is it seemed that early on, they knew the spike protein was the dangerous part of the virus, and yet that's the part that they chose to have manufactured within our bodies, when they could have chosen a more benign part of the virus for us to get immunity from. And then we've continued on with that. I mean, with other vaccines, once the delivery mechanism is approved, they can change the viral part without having to go through all the regulatory process. So is there any explanation as to why they chose the spike protein, and then why they haven't substituted to a less dangerous part of the virus?

Dr. Peter McCullough

The code of the spike protein appears to have been known years ahead of time. Years ahead of time. We've learned that vaccine developer Peter Hotez, in Houston, had biodefense grants based on that spike protein receptor-binding domain with the Chinese in 2015 through the National Institute for Allergy and Immunology [sic] [National Institute for Allergy and Infectious Diseases]. So the spike protein was known years ahead of time, and it was ready-made.

Within three days of President Trump declaring a COVID-19 disaster, Moderna declared they had a vaccine—within three days. And the only way they could have done that is they knew the code for the spike protein ahead of time. And they chose it, and it appears to be an intentional choice.

Shawn Buckley

Right, and an intentionally dangerous choice is what you mean.

Dr. Peter McCullough

Well, it was dangerous. Now there are papers and discussion about benign proteins and making a vaccine from the benign proteins. From the very beginning, the Chinese had a killed vaccine where they presented the whole virus to the body and that didn't work. That was exactly what Ralph Baric did in 2015: the whole virus vaccine didn't work. The spike protein clearly produced neutralizing antibodies and looked good, and they went with it largely, I think, because they had the genetic code ahead of time. We learn now that Moderna had a material transfer agreement with UNC-Chapel Hill with Ralph Baric before COVID was known. So this looked like it was all prearranged.

Shawn Buckley

Yeah, I wish we had more time for that conversation.

Can I have you address that last point that you wanted to address: just, kind of, the positive news about that there are some ways of addressing the primary problems with the vaccines because I think it would be helpful to leave people with some positive news.

Dr. Peter McCullough

Right, just in the last minute, let me say: there's no methods of getting messenger RNA out of the body. It appears as if Pfizer and Moderna is pseudouridinated, and there's no way to get it out of the body. It does produce the spike protein for an undisclosed duration and quantity. It may be forever.

But we do have a remedy for the spike protein to degrade it. One is with nattokinase, we've covered. A second is with a natural product called bromelain, also an enzyme—a family of enzymes that's FDA-approved for use topically for some deep wound problems, but it is orally available and does work in the human body. Both nattokinase and bromelain are blood thinners. And then the third natural product is curcumin, derived from turmeric: that even has randomized trial support that it reduces inflammatory factors in patients.

So we have a paper that's been accepted, it'll be out in the peer-reviewed literature, that a triple combination—what we call “Base Spike Detox”—of nattokinase, bromelain, and curcumin—nattokinase, 2000 units, twice a day; bromelain, 500 milligrams a day; and curcumin, 500 milligrams, twice a day—is a reasonable, empiric approach to try to detoxify the bodies that have been loaded with the spike protein. And this base, which is a natural, over-the-counter approach, can be something people can do with the caveats that we're using two blood thinners, there can be allergies, people need to be cautious. But it almost certainly will have a salient effect on the blood clotting problem and the spike protein issue in the tissues and cells. And then doctors can work on other advanced therapies, as needed, for the specific syndrome.

So spike detox, I've been doing this in my clinical practice now for months. I found very good success, a reasonable safety profile with the caveats: I can't make any therapeutic claims, and there are no large, randomized trials planned. There's no funding planned for this. It looks like we're going to have to be on our own in terms of our clinical judgment.

Shawn Buckley

Well, I don't know how it is in the U.S., but our drug approval laws really are there to protect intellectual property rights because they're so expensive that in my lifetime, there's

only been one product go through the new drug approval process that didn't have a patent, and that was funded by government. So, likely have the same problem in the States.

Are there any quick, final questions? We're at the end of our hour. So Dr. Peter McCullough, on behalf of the National Citizens Inquiry, we sincerely thank you for coming and testifying again with us today.

Dr. Peter McCullough

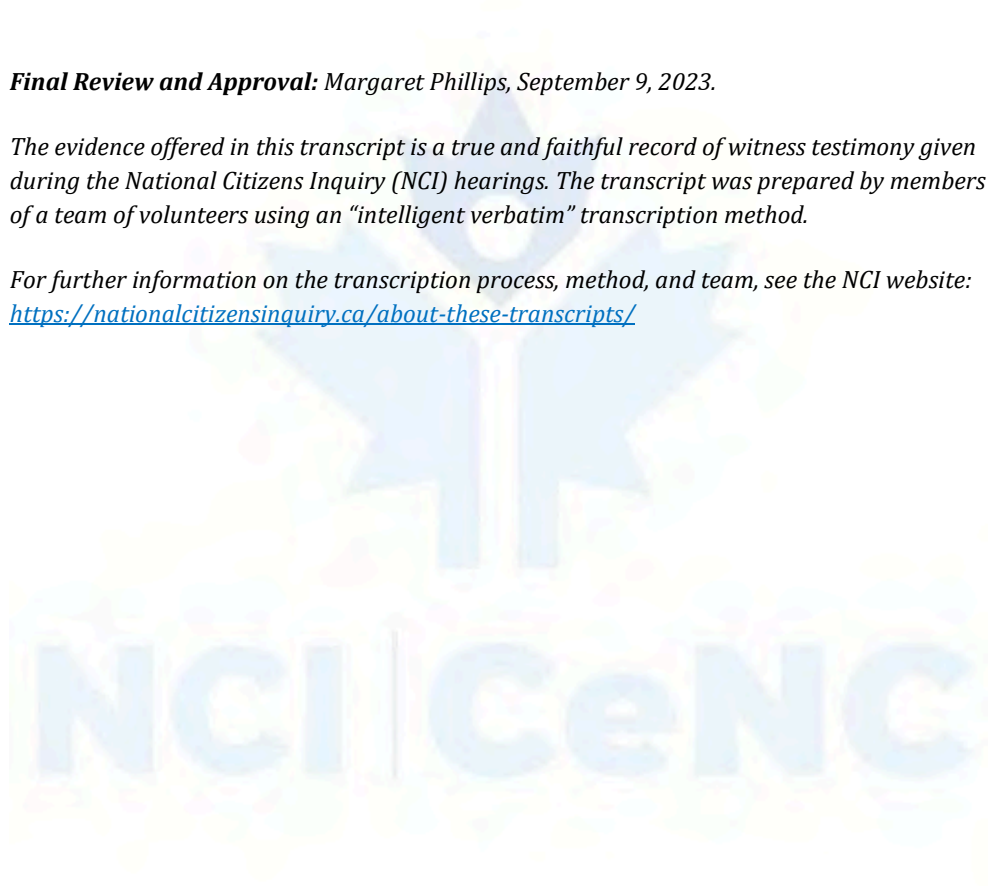

Thank you.

[00:59:35]

Final Review and Approval: Margaret Phillips, September 9, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

NATIONAL CITIZENS INQUIRY

Virtual Testimony

September 18, 2023

EVIDENCE

Witness: Dr. William Makis

Full Timestamp: 00:01:48–03:01:54

Source URL: <https://rumble.com/v3ipsi2-dr.-William-makis-september-18-2023-nci-virtual-testimony.html>

[00:01:48]

Shawn Buckley

Good evening and welcome to this special sitting of the National Citizens Inquiry. My name is Shawn Buckley. I'm a lawyer that volunteers at the National Citizens Inquiry, and we're very pleased to have Dr. William Makis, who will be testifying for the first time at the National Citizens Inquiry.

For those of you who are not familiar with us, we are a citizen-led, a citizen-run, and a citizen-funded group that just decided to appoint independent commissioners and march them across the country. And we basically have created the largest library of under-oath testimony in the world on COVID-19 issues. What's been accomplished has been absolutely fantastic. But we have some holes in our evidence, including evidence on cancer and some other interesting things that Dr. Makis is going to share with us today.

I guess I will start formally: Commissioners, for the record, my name is Buckley, initial S. I'm attending this evening as agent for the Inquiry Administrator, the Honourable Ches Crosbie.

Dr. Makis, before we begin, can I ask you to state your full name for the record, spelling your first and last name?

Dr. William Makis

My name is Dr. William Makis, V-I-L-I-A-M M-A-K-I-S.

Shawn Buckley

And Dr. Makis, do you promise to tell the truth, the whole truth, and nothing but the truth, so help you God?

Dr. William Makis

I do.

Shawn Buckley

Now, by way of just some background— And I will indicate for both the commissioners who have received your CV earlier today and for those that will be watching your testimony that your CV has been entered as Exhibit VT-3 in these proceedings, so everyone can view your expertise. And I will also indicate that every document that you refer to today and the slide presentation that you're going to use are also entered as exhibits and will be available on your testimony page online.

But briefly, you, in 2001, received a degree in Immunology from the University of Toronto. In 2005, you graduated from the Faculty of Medicine in McGill, but you made a decision to train for five more years at McGill in the area of nuclear medicine to become an oncologist. And that's what you are: you're a nuclear medicine radiologist and oncologist. You worked at the Brandon Regional Health Centre, Department of Nuclear Medicine, and then more recently at the Cross Cancer Institute, Department of Diagnostic Imaging in Edmonton.

Now, we've asked you to testify on a number of topics today, including your experience with vaccine mandates in Alberta, with sudden deaths involving doctors—which you've been a pioneer in bringing attention to that. We want you to also share with us about the Alberta government deleting COVID-19 vaccine data from,

[00:05:00]

basically, the public website that they run. We want you to speak about the relationship, if any, between COVID-19 mRNA vaccines and cancer, and then also about sudden deaths and cancer.

So, Dr. Makis, I invite you to begin. You have a presentation for us [Exhibit VT-3a], and then, just as needed, I'll interrupt you to clarify and ask some questions.

Dr. William Makis

Thank you very much.

I started raising concerns about COVID-19 vaccines on social media in August of 2021 [Exhibit VT-3b]. And it was at this time that Israel had just rolled out booster shots for its population. It was the first country that had rolled out COVID vaccine booster shots. And in my estimation, this was already an indication of failure of the first two doses of the COVID vaccines. Israel rolled out the boosters in people ages 60 and above, then 50 and above. And by the end of August of 2021, it was the country that had the highest COVID-19 infection rate in the world.

And it was right around this time that Alberta Health Services [AHS] announced that it was going to implement a vaccine mandate on all of its 105,000 health care workers. This was the announcement that Alberta Health Services had put out [Exhibit VT-3c]. And the announcement was really unilateral by AHS. There seemed to be no involvement of the Alberta provincial government, Jason Kenney's government.

It was announced by AHS president and CEO Dr. Verna Yiu. And the announcement stated that immunization against COVID-19 is the most effective means to prevent the spread of COVID-19 and that any AHS employee unable to be immunized due to a medical reason or a protected ground under the *Alberta Human Rights Act* would be reasonably accommodated. This announcement was carried in a number of mainstream media outlets [Exhibits VT-3d

to VT-3g] and one of these was the *Calgary Herald* [Exhibit VT-3d]. And I just wanted to bring this up—a statement from the Alberta Health Services CEO, Dr. Verna Yiu, stating that she is confident that most health care workers will want to get vaccinated and that if someone refuses and doesn't have a valid exemption that AHS officials would meet with them to discuss it and, quote, "provide educational resources," end quote. But that if this re-education was unsuccessful the employees would then be put on unpaid leave of absence.

I became involved at this point. There was tremendous opposition among Alberta health care workers to these COVID vaccine mandates. And there was an open letter that was authored and signed by over 3,500 Alberta health care workers. And I was one of those signatories. Seventy-three other physicians co-signed this letter, and it was then signed by nurses and other health care workers. This is an open letter to the president and CEO, Dr. Verna Yiu, and it outlined the reasons why Alberta health care workers, thousands of them, were opposed to COVID-19 vaccine mandates at this time.

I would like to highlight some of these. First of all, these mRNA vaccines had not been proven to prevent disease uptake or disease transmission. This was supported by the CDC's own data. The overall survival rate from COVID was approximately 99.7 per cent. The vaccine was already showing weakened efficacy after only a few months. Very importantly, United Kingdom and Israel, two highly vaccinated countries, had very high percentages of hospitalized patients who were fully vaccinated. Natural immunity was superior to vaccine immunity. And many health care workers, you know, had COVID already, had recovered, and already had natural immunity.

And the VAERS database at the time—this is the Vaccine Adverse Event Reporting System—this is as of August 27, 2021, had shown 650,000 people had been injured and 13,900 people had died soon after the administration of the vaccine. And we know that the VAERS reporting system has an underestimation factor of anywhere from 10- to 100-fold. So these numbers were much, much higher.

As health care workers, we believed that the vaccine mandate was contrary to

[00:10:00]

sections two and seven of the *Canadian Charter of Rights and Freedoms*. And so this letter respectfully requested that the vaccine mandate be rescinded immediately so that Alberta health care workers could continue to provide care for Albertans. This letter was sent to senior officials at Alberta Health Services. One of them was Dr. Francois Belanger, who is the Alberta Health Services vice president and chief medical officer. So he is the lead doctor in the province. It was also sent to the leadership of Covenant Health, which is a smaller health authority in Alberta.

It was signed by 3,544 health care workers, including 73 physicians, and I was one of those physicians.

Shawn Buckley

So can I just stop you, Dr. Makis? So I'm not aware of any other time in history where literally 3,500 health care professionals in Alberta would sign a letter to senior health officials. Are you aware of this ever happening before on any other issue?

Dr. William Makis

I'm not.

Shawn Buckley

And what was the response from these six senior health officials that the letter was sent to?

Dr. William Makis

As far as I know, there was never any response from Alberta Health Services.

However— So I signed the letter and I was very surprised to receive a letter about three weeks later from the College of Physicians and Surgeons of Alberta [Exhibit VT-3h]. And the College indicated to me that they had received a copy of this letter to Alberta Health Services regarding opposition to mandatory COVID vaccination for AHS employees. And they said, "You have been identified as a signatory on this letter." The College then says that it is their standard practice to maintain a copy of this on my record, on my permanent record at the College. And then a very interesting paragraph at the end—because they said that they've been made aware that some people who had signed the letter actually didn't agree to sign it or were not aware that their signature was on it and that if I personally did not agree to be a signatory on this letter that I should let the College know and then they would put that response on my permanent record as well. I took this—

Yes, go ahead.

Shawn Buckley

I was just going to ask you: How did you take this? Because it sounds pretty threatening.

Dr. William Makis

Well, I honestly took this letter as a threat. I took it as a threat on my medical licence and, really, on my medical career.

Now, I'd like to point out that there is no patient care issue here. So the College has jurisdiction, obviously, over patient care issues, licensing issues. You know, I had co-signed a letter in opposition to vaccine mandates that I felt were unethical, unscientific, abusive, and harmful. And, you know, I did not see a role for the College to put that letter on my record and then send me an intimidating letter like this.

So it is my understanding that the College probably sent this threatening letter to all 73 Alberta doctors who had co-signed the letter in opposition to the vaccine mandates. And, you know, I don't know what the other colleges did, like the nursing college, but, you know, I was very concerned to have been sort of implicitly threatened in this way.

Shawn Buckley

So I just want to be clear. So we have 3,544 health care workers sign a letter, citing specific concerns about the mandate, and there's no response by the four people that are basically heads of health authorities within the province of Alberta. But we have regulatory colleges, who the letter was not addressed to, responding, at least to doctors.

Dr. William Makis

Yes.

Shawn Buckley

Okay.

Dr. William Makis

And so, you know, I remain opposed to vaccine mandates to this day: I was opposed then and I'm still opposed now. I believe they're very harmful and that remains my stance to this day.

Shawn Buckley

It's quite fascinating. Now, you're moving now to doctor deaths, and I can tell you that I'm particularly interested in this one. So please proceed.

Dr. William Makis

This is a phenomenon— These sudden deaths of Canadian doctors was a phenomenon that I have been warning about since December of 2021.

[00:15:00]

And you will see this is my first post on the matter back in December of 2021 on Twitter. And the way I came to this topic and this phenomenon was there were two Canadian doctors—young Canadian doctors—who had died suddenly after taking the booster shot.

And the first of these doctors was Dr. Sohrab Lutchmedial. This was a 52-year-old interventional cardiologist from New Brunswick. Now he was one of the first doctors in Canada to take the COVID vaccine booster shot. He took his shot on October 24th, 2021. He described it on Facebook. He says, "Vax Shot Three: Electric Flu-Galoo." I'm assuming that he had some flu-like symptoms after he took the shot and people were asking him, "Is this the booster for health care workers?" He says, "Yes, exactly." And two weeks after he took the booster shot, he died in his sleep on November 8th, 2021.

And Dr. Lutchmedial was a very outspoken critic of people who didn't want to get vaccinated. And he made a number of Twitter posts that were controversial. I included some of them on this slide. In one of them, he says, "I think all of us would treat the **unvaxxed patient with respect and to the best of our abilities, but the people that convinced them not to get vaxxed, I want to punch those people in the face.**" There was another post where he stated, "For those who won't get the shot for selfish reasons, whatever, I won't cry at their funeral."

So I was aware of these posts, and then when he took his booster shot, died suddenly. I was very interested in what had happened to this young doctor.

The second doctor who died suddenly, very shortly after, on December 23rd, 2021, it was Dr. Neil Singh Dhalla. This is a family doctor in Toronto, Ontario, who ran clinics called Activa Clinics. And he took his booster shot. And three or four days later, he was at a

friend's Christmas party, felt unwell; he lied down on the couch, and he died suddenly while sleeping on that couch. He died on December 23, 2021.

And there was a TikTok video that had been put out by a friend who said, you know, "He just had his booster shot three or four days ago and this is what happened. He died suddenly a few days later." There were claims that there was an autopsy showing myocarditis. I was never able to verify that claim.

And so when these two doctors had died suddenly, I realized something was very wrong. There was that temporal association with the booster shot—dying very shortly after the booster shot—and dying in their sleep, which is extremely rare: highly unusual for a young person to die in their sleep. And so I began posting about this on Twitter, and I was trying to alert some doctors about this.

Dr. Irfan Dhalla, who is a very prominent doctor in Toronto, he talked about the risk of booster shots. He made a post in January of 2022. He said, there's a "huge gap between what scientists and health care workers think [about] the risk of boosters being close to zero long-term risk and what the public thinks." I responded. I said, "Not true—the long-term risks remain unknown." And look, there's these two doctors that died shortly after their booster shots.

I continued trying to raise the alarm on Twitter. Unfortunately, a couple of months later, I was raising concerns about COVID vaccines in children five to eleven years old and my Twitter account was locked, and I was censored and terminated from Twitter. And so I continued doing research on my own, but again, I could not really alert anybody. And so I simply continued looking into the sudden deaths of Canadian doctors. And that's how this whole thing started for me.

Once I had found 32 sudden deaths of Canadian doctors, I decided to contact the authorities. And I wrote a letter to the Canadian Medical Association on September 3rd of 2022 to their president, Dr. Alike Lafontaine—who was the current president at the time—and Dr. Katherine Smart, who was the previous president for the previous year [Exhibit VT-3i]. I also sent copies of this letter to Alberta Premier Jason Kenney and Alberta Minister of Health Jason Copping.

And I raised concerns about these sudden deaths of 32 young Canadian doctors. I attached photos and information about them. And I said, "Look, these doctors died suddenly or unexpectedly in the past 16 months. They were double, triple, or quadruple COVID-19 vaccinated." I said that each of these deaths is suspicious for COVID vaccine injury

[00:20:00]

as these previously healthy doctors died suddenly while engaging in regular physical activity. They died unexpectedly in their sleep. They suffered heart attacks, strokes, unusual accidents, or developed sudden-onset aggressive cancers. And I was not familiar yet with the term "turbo cancer" at the time, but I had noticed that some of these doctors suffered very aggressive, unusual cancers.

And I asked the Canadian Medical Association and the presidents to use their platform to publicly call for the immediate termination of COVID vaccine mandates in Canada's healthcare and to call for urgent investigations and public inquiries into what was killing young, COVID-vaccinated Canadian doctors.

I did not receive a response to this letter from the Canadian Medical Association or from the Alberta Premier and Alberta Minister of Health.

At this time, there was a group of people who had contacted me privately and they said, "Look, we're willing to offer our services, our time, to help you build a database of all Canadian doctor deaths going back several years so that we could compare and see if doctors were dying at a higher rate than normal, or if this was just some kind of an aberration and was not a real phenomenon." And so we put a team together and we started assembling this database and, about a month and a half later, our group of sudden deaths had grown to 80.

And so I sent another letter to the Canadian Medical Association [Exhibit VT-3j]. And I said, "Look, I'm providing you an update. Now it's 80 young doctors who have died suddenly or unexpectedly since the rollout of the vaccines." And I specify, I say, "Look, you cannot continue ignoring this. My team has assembled a database of 1,638 Canadian doctor deaths during the period of 2019 to 2022." And we had actually obtained a lot of this data from the Canadian Medical Association's own website: 972 entries of those were from the CMA's own website.

And I gave some statistics that the deaths were actually clustered around the young doctors. It was the young doctors who were dying at much, much higher rates than previously. At the time, doctors under the age of 30, it was looking like they were dying at an eight-fold rate higher in 2022 compared to the pre-vaccine rollout era. And I also made a note of young McMaster University medical residents: three of them had died suddenly in the summer of 2022. And I said, "Look, I'd never heard of anything like this in my career; this is unprecedented." And I once again asked, "Please call for the suspension of vaccine mandates and for investigations."

These are the three young McMaster residents who died suddenly in the summer of 2022. And look at their ages: Dr. Satyan Choudhuri, 25 years old, family medicine resident. Dr. Candace Nayman, 27 years old, pediatrics resident. Dr. Nayman was a triathlete, and she had actually participated in a triathlon that summer, and she collapsed during the swimming portion of the triathlon, and then died several days later. And Dr. Matthew Foss, 32-year-old anesthesiology resident who struggled with a very aggressive lymphoma.

I attached pictures and information of 80 Canadian doctors' sudden deaths. And I just wanted to bring up a few of those, if I may?

Shawn Buckley

Yes, please do.

Dr. William Makis

Just to highlight some of these sudden deaths.

Dr. Carl-Éric Gagné is a cardiologist from Trois-Rivières, Quebec, 56 years old, an avid cyclist. He was participating in a 100-kilometre cycling competition. He collapsed during the cycling event, and he died suddenly at the age of 56.

Dr. Paul Hannam, a 50-year-old emergency physician from Toronto. He's actually an Olympic athlete—an Olympian who went out for a jog. He collapsed while he was jogging, and he died suddenly during his jog.

Dr. Baharan Behzadzad was a 43-year-old family doctor from Newfoundland. She died in her sleep with no explanation.

Dr. Joshua Yoneda, 27-year-old medical student from UBC (University of British Columbia). He was mandated to take two COVID vaccines. A few months later, he develops back pain. It's discovered he has an extremely aggressive spinal cord tumour, and he died less than one year after diagnosis.

Dr. Bradley James Harris, a 49-year-old family doctor from Comox, BC, was out for a jog. He collapsed while he was jogging. He died suddenly.

Dr. Michael Stefanos, a radiologist from Mississauga, Ontario, 50 years old, died in his sleep.

Dr. Oliver Seifert, 58-year-old family doctor from Edmonton, again, died in his sleep.

[00:25:00]

Dr. Johannes Giede was a psychiatrist, 59 years old, from Prince George, BC. This is an interesting story because his son came out publicly, and he said, "My father had the booster shot." And a few days later, he started having stroke-like symptoms. And about a few weeks after that, he had a massive stroke, which was fatal. He died from that stroke.

There's a number of doctors who died after very brief illnesses.

Dr. Jun Kawakami, 48-year-old urologist from Calgary, died from a very, very aggressive pancreatic cancer.

Dr. Au, 53-year-old internist and geriatrician from Edmonton, Alberta. He was very athletic. He would go jogging every single morning and he would try to get his health care colleagues to go jogging with him every single morning. He died of a sudden cardiac vascular event.

Dr. Ainsley Moore, 57-year-old family physician from Hamilton, Ontario, died of a heart attack.

Dr. Inderjit Jassal, 42-year-old family physician from Surrey, BC, collapsed and died unexpectedly from a heart attack.

Dr. Mohammad Alam, 55-year-old family physician from High River, Alberta, had his first COVID vaccine, and he died within 24 hours of his first COVID vaccine.

Dr. James Tazzeo, 51-year-old family physician from Orillia, Ontario, died while he was cross-country skiing.

And so, you know, I gave all this information to the Canadian Medical Association.

Shawn Buckley

Dr. Makis, before you go on, I'll just let the commissioners know that your entire database, you've been gracious enough to share with us, and we have entered that as Exhibit VT-3m.

Dr. William Makis

Thank you.

And so, you know, I received a response that I really didn't expect. And these responses were in the form of personal attacks against me on social media.

The initial attacks came from a family physician in Ontario, Dr. Michelle Cohen, and she would refer to my database and my information as a "fake Canadian doctor vaccine death story." And so I included a number of posts here from Dr. Cohen that she made after my first letter to the CMA and after my second letter to the CMA as well. "The fake Canadian doctor vaccine death story continues to circulate." "This fake number keeps rising." So she's referring to the time when the doctor deaths went from 32 to 80. "We've gone from 'a few doctors died around the same time' to 'all doctor mortality is vaccine murder.' What a journey." And so there's a certain element of mockery in these posts. Another post: "It's easy to ridicule a conspiracy theory as absurd as one that claims all Canadian doctor mortality is vaccine murder." I never made any such claims.

Shawn Buckley

Now, Dr. Makis, did Dr. Cohen ever contact you to ask you about your data, maybe to get your— Basically relating to her what you were relying on and maybe even get a copy of the database that you were accumulating?

Dr. William Makis

Dr. Cohen never asked for this data.

Shawn Buckley

Okay, so you're being criticized without your data being looked at.

Dr. William Makis

That's right.

Shawn Buckley

Okay.

Dr. William Makis

And then another post: "The made-up number of Canadian doctors killed by COVID vaccines is now increased to 80." So now this is a made-up number.

Now, this is the only response that has ever been made by the Canadian Medical Association to my letters [Exhibit VT-3n]. And you can see it's not addressed to me; it's actually addressed to Dr. Cohen. And this was on October 20th, 2022, and the Canadian Medical Association actually quotes one of Dr. Cohen's posts, and it's a post with the pictures of the doctors who had died with a big red X crossed over their pictures. And the Canadian Medical Association says, "Thank you, Dr. Cohen, for standing up to disinformation. There's no evidence supporting the various theories that have been circulating. We encourage all Canadians to be up to date with all their vaccines to prevent serious health issues."

This is the only time that the Canadian Medical Association responded to my information. And you could see they're putting a picture, again, with a big red X across the pictures of deceased doctors.

Shawn Buckley

Now, you know what, can I just interrupt?

One thing that I find interesting about this is, pre-COVID, my understanding is, basically, there would be a problem with people running around doctors. Whether or not you take a vaccine is something that I used to think you would get your doctor's advice on. Like this is an experimental treatment. There's nobody can hide the fact that at the time that this is written,

[00:30:00]

really there was not any long-term or even medium-term data. And so it's interesting that here we have the Canadian Medical Association excluding doctors: just "we encourage all Canadians to be up to date." It's not that they're saying we encourage all Canadians to seek their doctor's advice as to whether or not they should get vaccinated.

Does that not strike you as odd, as a physician: that they're basically doing an end run around their own members when the safest thing is for people to get the advice, for them, from a qualified doctor?

Dr. William Makis

It is strange and, I'll be honest, the reason why I included, personally, my letters addressed to the presidents of the Canadian Medical Association—Dr. Alike Lafontaine; Dr. Katherine Smart—is because on their personal accounts, they were also encouraging people to get vaccinated.

One of the past presidents, Dr. Gigi Osler—who has been appointed to the Canadian Senate by Prime Minister Justin Trudeau recently—she was putting out pictures of having her daughter vaccinated with the Moderna vaccine. And she said, "Look, go get the Moderna vaccine," specifically. "I can tell you where you can get those appointments," and so on. So these individuals were, you know, very personally involved in recommending the vaccines.

One thing I would like to bring up with the Canadian Medical Association, another thing they said was that the In Memoriam service that the Canadian Medical Association offers to members to keep track of their colleagues and recognize their passing— Now this is an In Memoriam page on their website. And so they hosted this In Memoriam section on their website for many years, and it had thousands of doctor deaths, and this was a way to honour doctors who had died. And so they said, "Look, this is provided based on information sent to the Canadian Medical Association and should not be viewed as evidence to support theories surrounding COVID vaccines and other issues." And I gave a picture of what the In Memoriam page looked like.

Now, around this time, the Canadian Medical Association began deleting data from this In Memoriam website. They began deleting the doctor entries—the doctor deaths—and we had noticed this. We had downloaded all the data, but as we were trying to get some of the previous years, we noticed that the Canadian Medical Association had started to delete this

data. And eventually they deleted all the data from 2021 and prior, and they just left the 2022. And then by the end of the year, they deleted that as well.

And so I can tell you that we have a record of about 1,200 doctor deaths that we saved from their website but which they have since deleted. And so these entries are in the database that I've provided to the NCI [National Citizens Inquiry].

Shawn Buckley

It's interesting because— And you're going to go on to basically— How you were continually attacked about this. But we keep hearing about, you know, data disappearing or it being made very difficult.

We had witness after witness, Dr. Makis, testify—both professional and lay—on how it was near impossible to get an adverse reaction report actually filed with Health Canada. And the funny thing was, pre-COVID, citizens could file adverse reaction reports, but that was taken down pre-COVID. It's now back up because an access to information request was embarrassing them.

But it's just interesting that here we have one of the responses to you talking about doctor deaths is the medical association dropping that from their website.

Dr. William Makis

Yes. So, you know, we downloaded all the data from 2019 to 2022 because that was the only time period we were looking at. There were probably earlier entries that were deleted that we didn't save. But it was about 1,200 entries that we saved that the Canadian Medical Association subsequently deleted. And that website is no longer there. It might be accessible through the Wayback Machine, but they deleted all of it.

Now, shortly after I sent my letter about the 80 Canadian doctor deaths, I was attacked in a fairly coordinated mainstream media campaign and it was started by the *Toronto Star* [Exhibit VT-3p]. And the story that was put out by the *Toronto Star* was titled, "Why Won't a Debunked Conspiracy Theory About Doctors Harmed by the COVID Vaccine Go Away?" And in this *Toronto Star* piece, they featured this gentleman: Mr. Timothy Caulfield.

[00:35:00]

And at the bottom it says, Mr. Caulfield is the Canada Research Chair in Health Law and Policy at the University of Alberta. It says, "It's 'amazing' how the doctor conspiracy lives on 'as it was immediately debunked.'"

I had really not heard of Mr. Timothy Caulfield. He did not contact me before putting out the story, and so I really don't know what kind of debunking the *Toronto Star* is referring to here.

Shawn Buckley

So, Dr. Makis, can I ask—because you're going to explain that you were attacked a little more broadly than this—did anyone who attacked this doctor story ever contact you to have you share your actual data with them?

Dr. William Makis

I was contacted by two journalists, and I will mention that as I go through my presentation. But when I was contacted by those journalists—one was from Global News and the other one was from *Reuters*—they really contacted me with accusatory language right from the beginning, and they didn't ask to see my data. They said, you know, "You're lying. You're causing harm to families. Why are you causing harm to families?" This is the kind of language that I was approached with.

Shawn Buckley

Can I just add, because this is important and I want to make sure that your evidence is clear. So as a medical doctor, you didn't go looking for researching this. But you saw a couple of doctors had died suddenly and you became concerned, and so you started looking into it and then you basically had a team doing research.

And, I mean, you're a researcher. I'm just going by memory, but I think your CV lists 105 peer-reviewed published articles that you were an author in. I mean, you understand research, and you understand data needing to be correct. I mean, you do this wrong once, and your reputation is gone.

So you're looking into doctor deaths.

Dr. William Makis

Yes.

Shawn Buckley

And you're doing it in a robust way, and you're being attacked by the media, and not a single journalist or detractor asks to look at the data?

Dr. William Makis

No. And, you know, honestly, I've really been shocked at how this was approached by the media. And as I walk through some of these slides, you know, I think it'll become clear what the intent of the media was. It was not to, certainly, you know, look at the data themselves or look at what the real evidence is. It was, well— Let me move to the next slide.

I wanted to highlight some of the parts of the *Toronto Star* story. And Mr. Caulfield, who works at the University of Alberta—as I did—he said, "It's in my social media feed almost every day, if not every day. My hate mailers are emailing this to me," said Mr. Timothy Caulfield. So right there he's already coding it in a language of hate.

He says, "One of the things that's fascinating is that it was immediately debunked in the sense of 'No, this is wrong, *this* is actually how these individuals passed away.' But that didn't kill the story." And I think, again, here it sort of shows that—what is the intent? The intent here is to kill the story; it isn't to learn what the truth is.

"It's amazing how it won't die—and it's amazing the impact it continues to have." These are quotes from Mr. Timothy Caulfield.

Then the *Toronto Star* goes on to say, "To be clear, experts are united on the fact"—and I don't know who these experts are—"that this is a conspiracy theory. The causes of death

were well-documented by family in news stories and obituaries. It's not clear when they were vaccinated, and besides which, their symptoms do not match what we know about vaccine side effects from studies on millions of people." So now they're claiming that the obituaries had symptoms and there's studies on vaccine effects on millions of people? This is outright lying from the *Toronto Star*.

And interestingly, the *Toronto Star* now brings in Dr. Michelle Cohen, who had previously attacked me on social media saying that it was fake—it was a fake story; it was a made-up number—and she makes a couple of comments in this story as well. Dr. Cohen [sic] [The *Toronto Star*] says, it's "a particularly potent bit of misinformation, says Dr. Michelle Cohen, family doctor in Brighton, Ontario, who has been tracking the advance of the theory since summer. If you already believe that doctors are lying about the safety of vaccines, there is a 'dark joy' in the idea that those same health care professionals are being harmed, she argues."

I can tell you there's no dark joy in this at all, and this was highly offensive when I read this.

[00:40:00]

"The CMA does not note a connection between vaccines and sudden deaths." The CMA is quoted as saying, "There's no evidence to confirm or support the various theories that have been circulated," the CMA said in an email. The organization 'is concerned with misinformation and conspiracy theories spreading online about the recent deaths of physicians across the country.'"

Now, the Canadian Medical Association had not responded to my letter, had not asked to see my database. So they are responding without really having contacted me at all.

Shawn Buckley

You know, another interesting thing about this is, it would seem to me that if, you know, you're right—and I know that A, you've shared your database, and B, you're going to show us some of the actual figures—is you would think that both the media and the College of Physicians and Surgeons would be extremely interested in looking at your data and actually looking into the issue. Because if doctors are being harmed, then you would think that's the one group we need to protect. Because if the rest of us are in a world of hurt in this pandemic and what's appearing—starting to come from the data you're sharing—is vaccine injury, we need the medical professionals to be healthy. Like, that's the one group we need to protect.

So that's what I find interesting—is I would just assume that everyone would have been contacting you to verify your data out of concern that you would be right.

Dr. William Makis

I would think the only way to debunk—and they keep using this word "debunk"—would be to look at my data, have data analysts analyze it, and come out and say, "Look, there's nothing in this data; there's no evidence." But they're saying that there's no evidence without looking at any of the data.

And as I stated earlier, the majority of the data is taken from the Canadian Medical Association's own website. So they already had the majority of this data, but they didn't want to take a look at my data, which was more complete, because we obtained data from

other medical associations throughout the country: from the Royal College of Physicians and Surgeons [of Canada] in Ottawa, from the various provincial medical associations, from the various colleges, and from the various medical alumni associations from the various universities that have medical programs. And so I would have expected that they would have asked me for the copy of the data so that they could properly debunk it, and that simply never took place.

There were other media that got involved—international media [Exhibits VT-3q to VT-3s]. So *Reuters* from the United States, *Associated Press* [sic] [Agence France-Pres (AFP)], and even the *Australian Associated Press* put a big red cross across my letter to the Canadian Medical Association saying it was an unproven conspiracy.

Again, I was contacted by *Reuters* but in a very accusatory tone. I was not contacted by either of the *Associated Press* news outlets.

There was a big story that was carried in Global News [Exhibit VT-3t]. And I'd like to point out that Ashleigh Stewart did contact me, but she contacted me in a very accusatory manner, really accusing me of harming families, of making things up. And so I tried to answer her questions initially, but as her accusations grew stronger, I simply said, "Look, I don't want to talk to you anymore" because I understood that she was writing a hit piece and she didn't ask to see my database.

And so in the graphic that was used by Global News, I want to draw your attention: in the background, there are photos of the deceased doctors. And so on the red, behind the bird from Twitter, are actually the pictures of the deceased doctors, and then they made this graphic with this Pinocchio-like figure made out of a stethoscope. And the article is titled, "Kraken, Elon Musk and dead Canadian doctors: Disinformation surges three years into the pandemic." And in this Global News article, they state that Global News determined the cause of death of 48 of these doctors, and they talk about cancer and heart attacks and accidents and suicides.

Now, when I had this discussion before this article was published, I asked the reporter if she had any autopsy reports to justify her views and her accusations. And she was evasive and she said, "Even if I had autopsy reports, I wouldn't give them to you. I wouldn't share them with you." And in this newspaper article, there is no indication that there are any autopsy reports to substantiate Global News's claim that they were able to determine the cause of death of 48 of the 80 doctors.

[00:45:00]

In order to determine the cause of death, you must have an autopsy, and so what Global News did was they read the obituaries, and this was the extent of their investigation. They claimed they contacted some of the families, and so whatever the information the families shared with them. But there is no indication that they had any information about the autopsies of any of these doctors.

In this article they also say that while the efficacy of the vaccines is under debate, their safety is not. And so, again, this is the statement that the safety of vaccines is not under debate—is not debatable. They go on to say that 95 million vaccines were administered and only 0.01 per cent resulted in a serious adverse reaction and that there have been no deaths linked to the vaccine. I believe that they're referring to Health Canada and their adverse event reporting system.

And then, of course, there are the smears and personal attacks. They say, "Meanwhile, Makis continues to promote conspiracy theories online, most prominently on alt-right website Gettr." And I had an account on Gettr. Gettr is an alternative to Twitter. I did not see Gettr as an alt-right website, and I certainly did not promote conspiracy theories online, so I saw this as defamation by Global News.

So, you know, I continued despite these attacks. I continued. We continued to assemble our database. And I sent two more letters to the Canadian Medical Association. Really, I didn't expect any more response at this point, but I did it to simply document that, yes, I did try to contact the Canadian Medical Association. I gave them an update when it was 132 doctors [Exhibit VT-3k]. And at that point, we were able to calculate an excess mortality of physicians in 2022, which was 53 per cent excess mortality compared to 2019. And I sent one more letter on August 13, 2023 [Exhibit VT-3l], when it was 180 sudden deaths. And, again, I did not receive any response from the Canadian Medical Association.

I sent these letters to both Premier Jason Kenney and Alberta Premier Danielle Smith. I did not receive a response from their offices. And also to the Alberta Minister of Health Jason Copping and Alberta Minister of Health Adriana LaGrange, and I didn't receive a response from that office, either.

So this is the graph that I appended to my last two letters which contains the numbers from our database of the physician deaths, over time, going from 2019, 2021, and '22. And you can see a clear trend of a steady increase in physician deaths. And, really, the deaths are clustered in the younger physician population. We have calculated— And you could see in the physicians under the age of 30, if you look at 2019, there was one death; 2020, there were zero deaths. And in 2022, there were six deaths. If you average 2019 and '20, you get half a death a year. Now you've got six deaths in 2022. That's roughly about an 1100 per cent increase in mortality in the youngest doctors. You know, you see a similar pattern in doctors under the age of 40, under the age of 50.

And so, you know, this database is very robust. You know, the database that I gave to the NCI is about 2,300 Canadian doctor deaths over the period of 2019 to 2022. And honestly, you know, I don't know what else I could have done. I did everything I could to alert the proper authorities on this issue and I was ignored, I was ridiculed, I was insulted, I was smeared in the mainstream media, I was viciously attacked, and I was defamed for my efforts.

Shawn Buckley

And most surprisingly, no one asked to look at your database.

Dr. William Makis

No one has asked to look at the database.

Shawn Buckley

To me, that's the most interesting part about this, Dr. Makis, is just you went through all this trouble to create data. And we've asked you for it and thank you for sharing it. And so everyone can look at it. But it's curious that all this effort undertaken to debunk this without looking at the data. That's what I find very interesting.

Dr. William Makis

And I can tell you that this has taken a lot of my time over the past year and a half, and my volunteers have spent hundreds of hours putting this data together. You can see the data is extensive. And they have asked me to keep them anonymous because they are not comfortable sharing their names publicly,

[00:50:00]

and so I've honoured their request, but I have shared this database.

And so I would just like to close out this section with a couple of interesting observations: I was a longtime member of the Canadian Medical Association. I still receive the *Canadian Medical Association Journal*, which I receive a copy every single month. And I look at the journal fairly quickly. And in the April edition I noticed that the entire back cover of the *Canadian Medical Association Journal* was a Pfizer advertisement [Exhibit VT-3o]. And so I think that was relevant to note in my presentation that the Canadian Medical Association accepts advertisement money from Pfizer.

Recently, just a few weeks ago, the Canadian Medical Association held a health summit—an annual health summit—and the keynote speaker was Mr. Timothy Caulfield. And the keynote presentation was about “the spread of health misinformation” which “poses a genuine threat to Canadian health. But health providers can fight back. In this health summit presentation, [hear] from best-selling author Timothy Caulfield on the importance of debunking false and misleading health messages.” I thought this was an interesting thing to note that the individual who started the media campaign to smear me and to kill the story—as the *Toronto Star* story said, that they wanted the story of Canadian doctor sudden deaths killed—is giving the keynote presentation at the Canadian Medical Association summit just a few weeks ago.

And, you know, the Canadian Medical Association now has a new president, Dr. Kathleen Ross. This is a family doctor from British Columbia. She just took over on August 16, 2023. And on August 17th, she's posted a picture with Mr. Timothy Caulfield, and she says she's excited to listen to his talk on fighting misinformation in health care at the Canadian Medical Association health summit.

And again, I'm a strong believer of disclosing conflicts of interest. And so I wanted to point out that Mr. Timothy Caulfield is a fellow of the Pierre Elliott Trudeau Foundation, and he also runs a social media project that has received federal funding. And this federal funding is to promote vaccination confidence. This social media project is called ScienceUpFirst, and it has been given \$2.25 million as an investment, announced by the federal Minister of Health, Patty Hajdu, through the Immunization Partnership Fund. And this fund supports projects that encourage vaccine acceptance and uptake.

And so, in conclusion, I would just like to encourage— I'd like to encourage everyone to look at the data for themselves. I was more than happy to have the data analyzed. I believe there's a— To my analysis, I believe there's a very strong signal of excess deaths of Canadian doctors, which really is very significant after the rollout of the COVID-19 vaccines starting in December of 2020.

Shawn Buckley

Dr. Makis, did you notice, because you've been analyzing this data— So can you tell us, kind of temporally, was there an uptake— With COVID, was there any correlation between the

rollout of the first shot, the second shot, boosters, anything like that? Did you see anything that kind of correlated with any of those events?

Dr. William Makis

There is a mild increase in excess mortality in 2020. Now, of course, it would be ideal to have data going back maybe five years, maybe 10 years, and to compare to longer term baselines. And honestly, I simply didn't have the time or the access to that kind of data, so the best we could do was compare it to 2019.

There seems to have been a slight increase in 2020, but you see a significant increase in '21 and even a bigger increase in 2022. And again, I would encourage anyone with expertise in data analysis to analyze this data to see if there is something that—what I had seen.

I do believe, also, that there are spikes in deaths that cluster right around the rollout of the booster shots. So the first booster shot rollout: there seems to have been a spike in deaths just after the rollout of the first booster shot and the second booster shot, as well.

[00:55:00]

But I believe there is a very strong safety signal. I've been extremely disappointed that the Canadian Medical Association has ignored it. But I'm extremely pleased that I'm able to provide it to the public through this forum.

Shawn Buckley

Okay, Alberta government. This is interesting. So we have the Medical Association deleting information from their website—and the Alberta government. And it's fair to say, if the Wayback Machine didn't exist, you wouldn't have been able to recover some of this stuff.

Dr. William Makis

That's correct.

Shawn Buckley

Tell us how you became interested in this and what happened.

Dr. William Makis

You know, I had been tracking— When I was censored from Twitter, I was tracking all kinds of data. I was tracking the Canadian doctors' sudden deaths, but I was also tracking the data from the Alberta government website, from the BC government website, from the United Kingdom, from Australia. And the data was showing that, over time, the double vaccinated were filling the hospitals. And, you know, there was this push about the "pandemic of the unvaccinated," and the data just didn't support the claims that there was a pandemic of the unvaccinated in 2021 and 2022. It really showed that it was the vaccinated who were filling the hospitals.

But I was actually launching my Substack, and I wanted to launch my Substack with something substantial. And I did an investigation into the Alberta data, and I used the Wayback Machine, and I went through the data very carefully. And what I found was truly shocking, and so I wanted to share some of that tonight.

Shawn Buckley

Before you do, I'll just let the people watching— When we're saying Wayback or Wayback Machine, all that is, is it's a service that copies websites periodically. And so let's say there's a website that there used to be a page on, and you go back and it's missing. Well, you use a service like the Wayback Machine, and they'll go, "Oh, yes, well, six months ago we copied that page and here's the page." So it's a way of accessing old website pages that have changed or have been taken down.

Dr. William Makis

And, fortunately, for the Alberta.ca government website, which published vaccine outcome data, there were snapshots taken several times a day. And so there are thousands of these snapshots in the Wayback Machine that people can go and verify themselves. And so I'll start my presentation on that.

So on June 3rd, 2021, the Alberta government put a new section on the Alberta.ca website and it was called "Vaccine Outcomes." And the "Vaccine Outcomes" had tables of data and graphs. And one particular data set that grabbed my attention that I had seen many times before, and it was very interesting, and I wanted to see how that data set had evolved over time. It was a graph called Figure 11 [Exhibit VT-3u]. And Figure 11 was data that showed time from the first dose and second dose of the COVID vaccine to COVID diagnosis, and it was by age group. And so on the y-axis you have how many people are getting infected with COVID-19, and on the x-axis you have how long ago did they have their COVID vaccine.

And so you see these first three graphs on the left: these are people who had one vaccine. And you see there's a lot of infections initially, and then the infections sort of go down, suggestive of protection. And on the second group of graphs, these are the double vaccinated. And you see there's very few infections, very few hospitalizations, and very few deaths. And so as the government started putting out this initial data, the data was showing that the two-dose vaccine was protective against infections, hospitalizations, and deaths.

Now I show a set of graphs on the right to show how this data evolves over time, month to month, from July 2021 to August, September, October, November, and December. And these are the double vaccinated. And what it shows is specifically COVID infections in the double vaccinated.

As time goes on, the double vaccinated are doing worse and worse and worse. They're getting more and more infected. And by December, you see very large numbers of infections in the double vaccinated. And it seems to be worse the longer ago you've had your second vaccine dose. So if you've had your second vaccine dose six months ago, you're really doing quite badly, even compared to the people who've had their second vaccine dose recently.

[01:00:00]

So to me, this was already indicative that the double vaccinated, there was something wrong. Something had gone wrong with the vaccine, and their immune systems seem to be damaged over time, and this damage seemed to be getting worse as time went on.

By January of 2022, we are in the middle of the Omicron BA.1 outbreak, and this is the last data set that the Alberta government would publish. And there's a huge spike of COVID

infections. You can see the graph on the left: this is the double vaccinated. And there's a huge spike of infections: thousands. Thousands of infections in the double vaccinated and specifically individuals who've had their last dose five, six, or seven months ago, and they're doing really quite badly. In fact, they're the ones driving this outbreak, this Omicron BA.1 outbreak. And there's a cluster in the hospitalizations and deaths, as well, although it's not as prominent.

And if we compare how it started—how the double vaccinated looked in June of 2021 and how the double vaccinated looked in January of 2022 [Exhibit VT-3v]. These are infections in the double vaccinated. You can see that the double vaccinated are doing extremely badly. Thousands of them are getting infected with COVID-19. There seems to be no protective effect from the vaccines.

Shawn Buckley

And Dr. Makis, how does that compare with the unvaccinated? Because one factor could also be time of year, right? We, northern hemisphere, tend to—I call it low vitamin D season where we get more sickness in the winter months than we do in the summer months. Is there a comparison there?

Dr. William Makis

That's coming on the next set of graphs, yes.

And I just wanted to point out that this data had actually been shared internationally. It was all over Twitter. People were sharing it, and it was deleted. This figure was deleted by the Alberta government from the Alberta.ca website on January 14, 2022, and this data was never released again. So we never saw this data again.

Shawn Buckley

So was there any explanation as to why they would delete data? Because it certainly seems strange that here you have taxpayer-funded people putting out what should be as reliable as they can be, basically, data, while we're in the middle of a pandemic. It's of public interest. Did they give any explanation as to why they would take data down? So it's not that they even stopped publishing, but they took data down they'd already put up.

Dr. William Makis

That's right. And I want to point out that this data had been released daily. So every single day this data was updated, and it just disappeared from the Alberta.ca website on January 14th, 2022. As far as I'm aware, there was no announcement made on why this data disappeared on January 14th.

The next data set I'd like to show is Figure 10 [Exhibit VT-3v]. Again, this is in the same section: "Vaccine Outcomes." All of this data is in the "Vaccine Outcomes" section. This is just a different figure showing a different way that the data is formatted.

Figure 10 showed case rate: so COVID infection rate per 100,000 population by vaccination status. So as you brought up the question of, well, how does this compare to the unvaccinated?

This is the data set that compared the double vaccinated to the single vaccinated to the unvaccinated. And I'm showing here a graph from December 1st, 2021. And the graph really shows that the unvaccinated throughout all of 2021 seemed to have been doing poorly. There was some protective effect with one vaccine dose, and then there was a significant protective effect with two vaccine doses. Again, this is what you would expect if the COVID vaccines were protective. You would expect a much lower infection rate in the double vaccinated compared to the unvaccinated. And that's what the data showed initially in these graphs.

And so, again, when you look at the Omicron BA.1 outbreak in January of 2022, this data changes drastically [Exhibit VT-3v]. And what you find, especially on the figure on the right at the end of January, is that the double vaccinated are getting infected at the highest rate of all groups. And it's basically double the rate of the unvaccinated. And so once again, to me, this is evidence of immune system injury in the double vaccinated

[01:05:00]

where they are getting infected with COVID-19 at twice the rate as someone who is unvaccinated.

Interestingly, at some point in January, the government added data on the triple vaccinated. So you will see it as a purple line, and it is labelled as three doses. And initially it seems that the triple vaccinated are doing the best, that they have the lowest infection rate of all the groups, and they seem to be getting this protection that we were all told that the vaccines would provide and that the booster shots would provide. And even during the initial Omicron outbreak in January of 2022, the triple vaccinated are doing the best, which is why I feel—again, I'm just hypothesizing—that the government allowed the data to continue being published despite the fact of how poorly the double vaccinated were doing.

Now we move on to March of 2022 and, again, something has changed in the data [Exhibit-3v]. And what has happened was the triple vaccinated now have the highest infection rate of any group. And so while the Omicron BA.1 outbreak in January was driven by the double vaccinated who had the highest infection rate with COVID-19, now it is the triple vaccinated who have the highest infection rate. And we were actually heading into another wave of COVID, and this was the Omicron BA.2 wave that was going to happen in March, April, and May. And you could tell that the triple vaccinated are actually leading this wave with the highest infection rate of any group. In my interpretation, this is evidence of COVID booster failure. This failure seems to occur in middle of February of 2022, when the triple vaccinated take over as the group that has the highest infection rate of all the other groups.

And then—

Shawn Buckley

So I'm just going to stop you so that people can understand the chart. So you're really looking at the right-hand side of this chart—

Dr. William Makis

That's right.

Shawn Buckley

—in February '22 where the triple vaxxed takes over. Now, what's interesting is just looking at all of this—and part of this was on a different slide—is at the beginning, the unvaccinated are doing worse.

Dr. William Makis

That's right.

Shawn Buckley

And then the vaccinated. But then, let's say, when we move a little over, two-thirds to the right, the double vaccinated are really doing poorly here. And then by the time we're almost at the end of this chart, I mean, the unvaccinated are doing really well, and now it's the triple. So your explanation is that as time goes by, the vaccines are creating a problem. Because as time goes by—people—the more shots you have, the worse you're doing. Is that what the data is showing us here?

Dr. William Makis

Exactly, and so you will see the double vaccinated are doing really poorly in the January outbreak, but then the government is rolling out booster shots during this time. And so, as a little bit of time has gone by with the booster shots, now you start seeing the triple vaccinated are doing very poorly— And they shouldn't. You know, you shouldn't see this if the booster shots were protective. You know, the triple vaccinated should be doing better than the unvaccinated and better than the single and double vaccinated. And that's simply not what the data is showing.

And that is—

Shawn Buckley

And this is just showing us COVID infections. It's not showing us other health outcomes also.

Dr. William Makis

That's right. So it's not showing us hospitalizations or deaths. It's simply showing us infections.

But again, you know, to my estimation and assessment, the triple vaccinated shouldn't be getting infected at the highest rate. I mean, that is simply contrary to what the boosters are supposed to do. And so, you know, I would have loved to have seen more of this data. The reason why I put this slide on March 22nd, 2022, is because this is the last slide that the Alberta government would ever release. They deleted this Figure 10 data, and it was never seen again. It was deleted on March 23rd, 2022.

The next data set I would like to show is a table—this is Table 2—and this is COVID case outcomes in Alberta by vaccine status. And now we are looking at hospitalizations: those currently hospitalized and how the total number of hospitalized breaks down by vaccine status.

[01:10:00]

So you could see how many have had three doses, two doses, one, and unvaccinated.

And so you will see that even in March of 2022, the triple vaccinated made up the biggest portion of the hospitalized individuals. And the total vaccinated were—72 per cent were vaccinated in the hospital and only 28 per cent were unvaccinated.

What is interesting, however, is the trend over time. And so when you look at the trend, by the time you get to July of 2022, now the triple vaccinated make up 50 per cent of all the hospitalizations. And all of the vaccinated, as a group, make up 81 per cent of the hospitalizations [Exhibit VT-3w]. The unvaccinated make up 19 per cent. And you can track— If anybody wants to go use the Wayback Machine, you can actually track this trend every single day from March until July of 2022. And you can see that the vaccinated are doing worse and worse, but it is really the triple vaccinated who are flooding the hospitals and in ever-increasing numbers.

And on July 21st of 2022, the Alberta government deleted this data set and did not release it again.

Shawn Buckley

Right, so you had mentioned earlier, we were getting public messaging that basically the unvaccinated were the ones filling up the hospitals and the ICU [the intensive care unit]. And what you're showing here is for Alberta, the provincial data doesn't bear that out at all, that messaging.

But one thing that I'm wondering—that would be helpful to even make this more meaningful—is an understanding, well, how many people are vaccinated? How many people have one dose? How many have two? How many have three? And what percentage of the population is unvaccinated? Because the earlier charts were per 100,000, so we actually had a good comparison. Were you aware of that data? Like, I'm just wondering if that would help us with a kind of more meaningful analysis of percentages in the—

Dr. William Makis

Yes, I'm going to show— I don't have it for Alberta here, but I will show data from British Columbia that'll sort of give you a better idea of that.

Just to continue on, you know, there was Table 7, which showed those who were in the intensive care unit. And again, the trend shows that, you know, back in March, the vaccinated made up a total of about 48 per cent of those in the ICU, and that rose to 69 per cent by July. And so this data was deleted.

All the data that I'm mentioning now was deleted at the same time: on July 21st, 2022. So Table 2; Table 7 was also deleted.

And then finally, this is the COVID death data [Exhibit VT-3w]. So this is who is dying from COVID-19. And when you look at March, 68.9 per cent of who were dying were vaccinated. That number rises to 83.4 per cent of those who were dying are vaccinated [July 20, 2022]. And this was a trend that really worried me. And so that, you know, the vast majority of the deaths were actually in the vaccinated. And you could see, if you look at the three doses with condition, you could see that that number rises from 35.3 per cent, it rises to 61.1 per cent. So it is really the triple vaccinated that are driving the COVID deaths.

And, you know, I would go as far as to say that this is not just evidence of vaccine injury in the triple vaccinated; this is actually evidence of vaccine injury leading to death because these are deaths from COVID-19 in the triple vaccinated.

And at this time, the triple vaccinated population was about 38 per cent, and they were making up 61 per cent of the deaths. And so, you know, people can verify this, that the triple vaccinated were dying in disproportionate numbers to their prevalence in the population. And so this data was deleted on July 21st by the Alberta government, as well.

Shawn Buckley

I'm wondering, Dr. Makis, just looking at the chart on the right about the deaths: it's striking, actually, how few deaths there are where somebody doesn't have another condition. And I'm wondering if that speaks to, you know, COVID not being that dangerous if you don't have a different condition that's affecting you. Is that wild speculation or could there be something to that?

[01:15:00]

Dr. William Makis

No, you're absolutely right. I mean, when you look at the— Again, if people want to focus on the three doses with and without condition, you could see that with no condition, in March, the deaths were 0.8 per cent. It rises a little bit to 1.9 per cent, but the numbers are very small. Whereas, with condition, there is a dramatic rise over time from 35 per cent to 61 per cent. And so this was, to me, very, very concerning data. And I would have loved to see more of this data. And it was deleted on July 21st, and we never saw this data again.

And I would like people to remember that we've had a second booster rollout. So we have people who are quadruple vaccinated in Alberta—thousands of them—and we also have thousands of people who are five-times vaccinated, and the Alberta government has released no data on how those are doing.

Shawn Buckley

Would I even be correct in suggesting— I mean, this here is March 31st and then July 20th, 2022, which— And July 20th is the latest data, but we're not talking about a long data set at all. Like, wouldn't I be correct that, I mean, even if it went to today, we're still just talking short-term for these types of treatments?

Dr. William Makis

That's right, but when it comes to immune system injury, you can see dramatic effects on the immune system over a matter of months. And so you could actually see dramatic differences in how the double, triple, or quadruple vaccinated are doing—even just over a course of six months, twelve months.

And I think this data was absolutely crucial. It was crucial for Albertans to be able to make informed decisions—an informed decision of whether to take the third vaccine or the first booster shot or the second booster shot—and to see how people were doing. Were they doing better? Were they in the hospitals? And I can tell you, this is the last data set of vaccine status of people in the hospital that we have. As of July 21st, 2022, we have no data

from the Alberta government as to who is in the hospital, what is their vaccine status, and how they're doing.

I wanted to show for comparison that it wasn't just the Alberta government that was deleting data, it was the British Columbia government, as well. And here, the British Columbia government was putting out these nice graphics as to the hospitalizations, intensive care, and deaths. But they also break down what portion of the population is triple vaccinated, double vaccinated, unvaccinated [Exhibit VT-3w]. And so you could actually compare to how it compares to the population.

And I'd like to point out that this is the last data that the British Columbia government ever put out. This is July 16th of 2022. And the deaths— The vaccinated make up 89 per cent of the COVID-19 deaths. And it is, again, driven by the triple vaccinated: 77 per cent of the deaths are triple vaccinated. And if you look at all the way to the left, it shows you what proportion of the population are the triple vaccinated. They are 52 per cent of the population, but they're making up 77 per cent of the deaths.

And so, if you had a vaccine that simply did nothing and didn't work, you would expect 52 per cent of the population would be having 52 per cent of the deaths. And in fact, they have a disproportionately higher percentage of deaths. And again, I interpret this as vaccine injury in the triple vaccinated leading to death.

And so this was the last data set that was put out by the British Columbia government. The BC government deleted this data set on July 28th. And I would like to make a comparison to the Alberta government in that the BC government actually put out a press release stating that they were stopping reporting of this data—case outcomes by vaccination status—that that they would be removing this data. And they put out this press release and the explanation they gave was that the data had become "hard to interpret." And compare this to the Alberta government: the Alberta government did not put out any press release when they deleted their data.

Shawn Buckley

It's an interesting explanation, isn't it? "Hard to interpret." Because, you know, what does that mean and why would that be an excuse for deleting data?

Now, do you know what BC— Because they were helpful to publish the percentage

[01:20:00]

of people that were triple vaccinated and double vaccinated and single and unvaccinated. Did they ever publish a breakdown of, you know, age groups? So when we have that 52 per cent is triple vaccinated, you know, I wonder if more of those were of an older age group because people in care homes and stuff like that couldn't avoid it. And I'm just speculating. But was there ever any breakdown that way, which would also be helpful for people analyzing data?

Dr. William Makis

I don't believe so. I've never seen any breakdown by age of this information.

Shawn Buckley

Yeah, it'll be interesting when the data finally is publicly available and what people like you will discover going forward, so—

Dr. William Makis

And so that sort of brings to conclusion my presentation on the data deletion by the Alberta government.

One other thing I wanted to mention was that I believe that publishing this data would have been the responsibility of the public health chief, Dr. Deena Hinshaw, and her office. And beyond that, I don't know what the involvement of the Health Minister was or the Premier's office. But, you know, I believe that this data was crucial for Albertans to be informed and to be informed what the vaccine outcomes are. In fact, I will point out that the government deleted the entire "Vaccine Outcomes" section from the Alberta.ca website on July 21st, 2022. And so really, as an Albertan myself, I could say that we've been blind in terms of crucial information to make informed decisions on vaccination.

Shawn Buckley

Now, we're about to segue into your discussion on cancer. And I wanted to start that by just having you explain something because you're an oncologist—which means you're a cancer doctor, for those of you that don't know what an oncologist is—and you've spent most of your career heavily involved in cancer diagnosis and treatment. And one thing that we heard kind of as a theme in the media after we were allowed to go back to hospitals—because remember, you and I both live in Alberta, and I think it was the same for most other provinces—is for a short period of time, we were discouraged from seeking healthcare. And a whole bunch of tests and procedures were cancelled for a period of time, including cancer tests.

And so one of the themes that I've heard in the media is, "Oh, yeah, well, our cancer rates have gone up because we weren't testing early; like we dropped our testing and treatment." And I know you and I had a conversation on Saturday about this, and I really want you to explain to the public— Because I asked you the question, "Well, is there any truth to this?" What type of pattern, as an oncologist, would you expect if we did stop testing and treatment for a period of time? Would we actually have increased cancer numbers? What would you expect? And if you could start with that explanation because I think that would be really helpful for people to get your opinion on that.

Dr. William Makis

Certainly. So if you stopped screening for and diagnosing cancers for a period of time, let's say for a period of six months, you would expect the cancer diagnoses to drop in numbers during that time, since you're not screening people; you're not diagnosing people. And then when cancer services resumed, you would expect there to be a corresponding rise of cancer diagnoses, and it should be proportionate to the cancer diagnoses that you've missed during that time when the services were not available. And then, you know, you could compare that to a longer-term trend to make sure that there's no other factors involved.

Now, what you would expect to see is, you would expect to see some of those cancers would be a bit more advanced. So most cancers are very slow growing, so you would not expect a drastic change in the staging for a lot of the Stage 1 cancers, Stage 2 cancers. There'll be a very small percentage of them that might advance to the next stage, and so

you would see a slightly more advanced stage at diagnosis. And then, of course, you know, the Stage 3, Stage 4 cancer—Stage 3 might become Stage 4 because the cancer might start to metastasize, and so you would see that. But you would certainly not expect the behaviour of the tumours themselves to be any different.

[01:25:00]

So you would—

Shawn Buckley

Right, and the overall trend—I mean, if you're not diagnosing for a period of time and then you start diagnosing, you're going to catch those ones you missed. But overall numbers, you are not expecting to change a whole bunch from the trend just because you stopped testing for a period of time. Did I get that right?

Dr. William Makis

Yes, exactly.

Shawn Buckley

Okay.

Dr. William Makis

And as I mentioned, you know, some Stage 3s will become Stage 4. Some Stage 4s will become a bit more extensive, but, again, the behaviour of the cancers is not going to change. And you would be able to see that, yes, some are a little bit more advanced, but you're not going to see a big difference, certainly not in a short period of time, like six months, for example.

Shawn Buckley

And it's important that I've asked that because, like I say, the media has messaged that this change in cancer behaviour and change in cancer numbers is explained by us not testing and treating for that period of time that we didn't. And your opinion, as I understand it, is that the media is not correct in their messaging.

Dr. William Makis

That is not correct. As an oncologist, what I'm seeing in terms of cancers that are being diagnosed and the behaviour of those cancers is unlike anything I've seen in my career. And I've diagnosed tens of thousands of cancer patients with CT [computerized tomography], with cutting-edge PET-CT [positron emission tomography-computerized tomography]. I was the lead PET-CT radiologist in the province of Alberta, and I've correlated with MRI [magnetic resonance imaging] findings, with pathology findings—in tens of thousands of cases—and I treated hundreds of cancer patients as a primary oncologist myself.

What I'm seeing now, since the rollout of the vaccines, I've never seen in my career. And I want to go a little bit more into depth about what that means.

I actually didn't catch on to this phenomenon. I only first saw it as my database of Canadian doctors' sudden deaths grew. And I started seeing these highly aggressive cancers in young Canadian doctors, and that is where I actually first noticed this phenomenon as it was happening.

So what I bring up here is these are three doctors at the same hospital—Mississauga Hospital, Trillium Health Partners—in Mississauga, Ontario. And these three doctors died within three days of each other: And so Dr. Lorne Segall died on July 17, 2022; Dr. Stephen McKenzie on July 18; and Dr. Jakub Sawicki on July 19th. And this was a few days after the rollout of the second booster shot.

So the fourth COVID-19 vaccine was rolled out; a few days later, we have this cluster of deaths. And the only reason we know about these deaths was because a concerned health care worker had actually leaked internal hospital memos. This was not initially publicized in the media, but there were leaked memos announcing the deaths of three doctors in the span of three days at the same hospital. And once that information was leaked, it went viral and then, of course, the media had to address it and then the hospital had to address it, as well.

And so this was addressed in the mainstream media. And so I have some of the mainstream media outlets: here is the CTV News. And right away the hospital put out a statement and the statement said, "The rumour circulating on social media is simply not true. Their passings were not related to the COVID vaccine. We ask, please, to respect the families' privacy." Now, this was a very strange statement to me because there would have been no time to conduct autopsies in these three cases. And so there is no basis in reality for the hospital to make a statement like this, that their passings may or may not have been related to the vaccine.

And then additional information came out in subsequent days and weeks that all three of these doctors had cancer. And what caught my eye was the details of the types of cancer that they had.

Two of the doctors, we had more details on their cancer, and so Dr. Lorne Segall, a 49-year-old ENT specialist, just a year prior, had developed Stage 4 lung cancer, and he had died in less than a year. And Dr. Jakub Sawicki, 36-year-old family physician, had developed Stage 4 gastric cancer, and he had died less than a year. Both of these doctors would have presumably been double vaccinated, and then they would have developed this cancer that killed them in less than a year.

And to me, this was a big red flag because, you know, first of all, gastric cancers and lung cancers in individuals of this young age are unusual to begin with. So right there, you're already dealing with something that's quite unusual. But the fact that it killed them in less than a year, to me, was a big red flag that there was something very wrong here.

[01:30:00]

This is not how lung cancer behaves. This is not how gastric cancer behaves.

And again, you may have these situations once every few years in your career. So in my career, I would expect to see a case like this—very aggressive, young person with an aggressive cancer, kills them in less than a year—I might expect this once every few years. Here you have two young doctors, working at the same hospital, developing these extremely rare aggressive cancers: they're dead in less than a year. You know, it was a red

flag for me. This is what got me researching into what's happening with the vaccinated. Are we seeing cancers? What kind of cancers? And that really started my journey of investigating turbo cancers. And this was the summer of 2022.

I then became aware of other stories. You know, the tragic story of Dr. Joshua Yoneda, who was— I'd mentioned him earlier. This was the medical student, fourth year medical student at UBC (University of British Columbia), and I managed to obtain a lot more information about his tragic story. He was mandated to take two COVID vaccines to be able to continue his medical program. He was perfectly healthy and a few months after he took his second dose, he started having back pains. The back pains got worse. He was diagnosed with a spinal tumour. And initially, doctors felt that it was not an aggressive tumour, that it was treatable and that he would just have an operation and he would be fine. They did the operation and then they discovered that this was an extremely aggressive tumour, very rare. It was a spinal cord tumour, and they really struggled to offer him any kind of treatment, and he died less than a year after diagnosis.

And there were other physicians: Dr. Nadia du Toit from Edmonton, 44 years old, came down with an extremely aggressive brain cancer, died in less than a year; Dr. Murray Krahn, 65-year-old internal medicine doctor from Toronto, also developed an aggressive brain cancer and had died in less than a year.

And so at this point, I really suspected that there is something very wrong when it comes to the COVID vaccines and these aggressive cancers that, you know, I had really not seen in my career being this aggressive.

Shawn Buckley

And I just want to be clear because you basically just now walked us through five cases of young doctors that got aggressive cancers and died in a year. I appreciate there was a sixth, but you didn't have details to share with us. And as an oncologist, you wouldn't expect to see one of these, let alone five clustered together. Is that what you're sharing with us?

Dr. William Makis

I might expect to see one. And, again, you do see rare cancers in young people. I don't want to make it seem that you don't—you do, but it is exceedingly rare. And these are usually cases that we publish. I have published dozens of such cases: cancers behaving in unusual ways, unusual on imaging. This is something that is so rare you actually publish it in the medical literature to share with other doctors because they may not have seen a case like that in their career.

And so to have five of these cases of— And again, it's rare for a solid tumour to kill in less than a year. You know, even glioblastomas, which are very aggressive brain cancers, sort of the median survival is 18–24 months. And so to see lung cancer— And again, I'm going to talk about colon cancers, breast cancers, and so on, killing people in a matter of months or less than a year is just absolutely unheard of.

There is a case in the literature for those who want to look at— And I get attacked a lot with the line of attack that there's no such thing as "turbo cancer," and there's no literature about it. And there is actually a case published. Now, this is a case of a 66-year-old gentleman [Exhibit VT-3uu]. It was published by Serge Goldman: 66-year-old man who had two Pfizer vaccines and five months later he presents with enlarged lymph nodes. And so that is the scan on the left. This is a PET scan: a positron emission tomography. These are

the types of scans that I used to perform at the Cross Cancer Institute in Edmonton—thousands of these. I had analyzed over 10,000 scans like this at McGill University in Quebec. And he presents—and when you see these little dots around his neck and in his axilla,

[01:35:00]

and in his lower abdomen, these are tumours. These are lymphoma tumours. He was diagnosed with quite an aggressive angioimmunoblastic T-cell lymphoma five months after taking two COVID Pfizer vaccines.

Now, what is interesting about this story is that the doctors had no suspicion that his cancer may have been caused by the Pfizer vaccines. And so they were preparing a chemotherapy regimen for him, and they said, “Look, you’re going to be immunosuppressed with chemotherapy. We’re going to have to give you a Pfizer booster shot to protect you during chemotherapy.” So they give him the Pfizer vaccine booster shot and within days he develops swelling in his neck—big swelling—he feels very sick.

And they did something brilliant, and we’re all fortunate that they did this. They said, “Well, there’s something very wrong. We should repeat the scan. Even though you just recently had the scan, we should repeat the PET scan just to have a more precise baseline before we give you chemotherapy.” So they repeated the scan, and what they found was that the cancer had spread and it had spread to multiple new locations. It had grown in size—it had doubled or tripled in size—and it had spread extensively throughout the body. Now you see new lesions in the neck, in the axillae, in the mediastinum, and in the lower abdomen, and in the groin area. These lesions were not there before—

Shawn Buckley

So, Dr. Makis, according to this, it’s only 22 days between those two scans?

Dr. William Makis

Yes.

Shawn Buckley

How often had you ever seen anything like this?

Dr. William Makis

You would not expect a lymphoma to progress in this way. It simply doesn’t do that. And you know, it’s very fortunate that they decided to repeat the scan because other oncology groups may not have repeated the scan at all. And so it’s fortunate that we have this case where they repeated the scan.

And, you know, as the title says, “Rapid Progression of Lymphoma Following Pfizer mRNA Booster Shot.” And they said, “We have no explanation other than the Pfizer vaccine, the booster shot, for this progression.” And so this case is a stunning example, in my assessment, of what’s being called “turbo cancer.” These cancers that are arising after vaccination that are extremely aggressive, catching oncologists off guard, and they’re behaving unlike cancers that we’ve seen before.

Shawn Buckley

Now, can I just ask you about that term? Because I'm obviously not an oncologist, and so I don't know what terms are used. But I had never, until recently, even heard the words "turbo cancer" together. Like, to me, turbo is something you put in a sports car to make it go faster, or a diesel truck. So is that a common term that oncologists use or is this a term that's just come up to explain something that's new?

Dr. William Makis

No, so this is a word that's not used by doctors and, certainly, I would not have used this term. It's not a medical term. It is a term that has arisen in the population. This is how these cancers are referred to by people on social media because of the aggressive nature of these cancers.

Shawn Buckley

Had you ever heard that term prior to the COVID-19 vaccines being used?

Dr. William Makis

No. No, I've never heard this term before. And, in fact, when you look at my initial letters to the Canadian Medical Association in September of 2022, I referred to "aggressive cancers." I don't refer to the term "turbo cancer." This is a recent term. I did not come up with this term. It had arisen on social media. That's as far as I'm aware of it. It is not a medical term.

However, there is no term to describe the phenomenon of what I would call COVID-vaccine-induced cancers. Because, really, the cancers that we see after COVID vaccination behave so differently that you really have to almost create a separate class of cancers associated with vaccination specifically [Exhibits VT-3aa to VT-3dd]. I believe we are dealing with a completely brand-new phenomenon.

Shawn Buckley

Okay.

Dr. William Makis

I had done some extensive research in the literature, and I've actually published in peer-reviewed literature on one of the possible mechanisms of how these COVID vaccines may be causing these cancers—these "turbo cancers"—and I will talk about that shortly.

But I was contacted by a journalist from *The Epoch Times*,

[01:40:00]

who asked me, "Look, we would like to write an article about what are the possible causes of turbo cancers, and would you be willing to tell us? And can you supply, actually, some research from the literature to back up the possible mechanisms?" And so I did that, and this article was published on July 28, 2023, in *Epoch Times* [Exhibit VT-3z]. And I supplied nine possible mechanisms by which these cancers may be arising. I don't know if we have time to briefly go over those.

Shawn Buckley

Actually, I don't want us to skip over this at all. So please give us a detailed explanation on this. When you get to the IgG4 publication, I'll just indicate that's been entered as Exhibit VT-3hh.

But no, please give us a— You're the only oncologist we've had, and I think part of the difficulty, Dr. Makis, is that when we were running our hearings earlier, this phenomenon was just evolving. And so I'd actually like you to give us a full explanation if you can.

Dr. William Makis

Certainly.

So I'd like to first say that the exact mechanism by which cancers are arising in those who have had at least one COVID-19 vaccine, the mechanism is unknown. So this is theoretical at this point. We have theories on how these cancers may be arising, and there is literature to back up some of those theories. But at this time, the exact mechanism of how these cancers are arising is unknown. So these are nine possible theorized mechanisms by which these cancers may be arising.

The first one is that the COVID-19 mRNA vaccines specifically have a modified RNA. The messenger RNA has been artificially modified to contain a pseudouridine. So instead of a uridine, you're now replacing it with a methylated pseudouridine, which has been artificially modified. And this was actually— This has come out of the research of Dr. Karikó and Dr. Weissman, who invented the mRNA vaccines, and they had studied these modifications for many years. And they had discovered that if you modify the mRNA in this way, you could actually dampen the initial immune response of the individual receiving the mRNA so that they wouldn't destroy the mRNA agent right away. It was actually designed to protect the mRNA [Exhibit VT-3ee].

However, what it does is it interacts with receptors on T-cells and other immune cells, called toll-like receptors, and toll-like receptors are involved in signaling. Immune system signaling is the easiest way to explain it. You have binding of these toll-like receptors, and then you have downstream, signaling effects. Well, some of these changes in signaling are actually implicated in cancer formation, and so this is one of the first mechanisms that should be looked at [Exhibit VT-3ff].

The mRNA vaccines, once they get into your body, they actually dampen— They interact with the toll-like receptors on the immune cells, they dampen the signaling of your innate immune system, and they cause disruptions in immune signaling, which could actually, downstream, lead to cancers being formed. So this is one mechanism.

Dr. Seneff had discovered that there is impairment of a different kind of T-cell signaling, immune signaling, called type I interferon, and this type of signaling is involved in cancer surveillance. So I've attached a publication to that [Exhibit VT-3gg]. And again, these haven't been proven to cause cancer in the COVID vaccinated, but these are lines of investigation. These are theories that should be investigated to see if they are causing these cancers.

Next one, number three, is what's called the IgG4 antibody shift, and this is a very fascinating discovery. It's a recent discovery that people who have been vaccinated at least two times start producing a different kind of antibody. So initially, you produce what's

called IgG1 and IgG3 antibodies against the spike protein, and these are antibodies that are involved in protecting us against viruses, but also protecting us against cancer.

And so initially, when you get the first mRNA Pfizer or Moderna vaccine dose, you get these antibodies produced. However, once you get the second shot, the body starts to change the composition of these antibodies, and it starts to produce a different kind of antibody called IgG4.

[01:45:00]

And this antibody is involved in immune tolerance. So it is there to actually get the immune system to tolerate this antigen that you're now being exposed to several times. And if you get the third dose, it really spikes. And the IgG4 really skyrockets, and you get decreased production of IgG1 and IgG3, and you get a massive rise in IgG4.

And I actually published a paper— We published a paper theorizing what this might be doing in the COVID-vaccinated, that it may be implicated in forming cancers. It may also be implicated in autoimmune diseases and autoimmune myocarditis. We published this recently. It has been peer-reviewed [Exhibit VT-3hh].

And when it comes to cancer, what the IgG4 does is, you know— You've got the IgG1 that actually coats cancer cells and calls the immune system to come and destroy the cancer cells. But the IgG4 actually blocks that process from happening. So it can bind the IgG1 and actually prevent the immune system from destroying the cancer cell, or it can occupy sites on the immune cells, like the NK [natural killer] cells or macrophages, and then those cells don't see the cancer cells. And this is called immune evasion of cancers. And so this is a mechanism that has been published in the literature a number of times, and we are seeing these antibodies in the vaccinated individuals.

And so now you've got an immune system that is basically trained to ignore cancer cells, and it then provides an environment for cancer cells to start replicating at an uncontrolled rate because there's nothing to stop those cancers from replicating, from growing rapidly, and from spreading. Now—

Shawn Buckley

And just for people watching this, my understanding is it's not like all of a sudden, you know, somebody develops cancer for the first time, and it becomes a problem. But actually, cancer is something we deal with from birth onwards, but our immune system deals with it. We have cells that are made to deal with it. So cancer's actually a normal process; it's just when it gets out of control.

But what you're describing is that normal process is potentially being interrupted by these IgG4 cells.

Dr. William Makis

Yes, and so we produce mutated cells, cancerous cells, all the time, as you've mentioned, and it's our immune system that destroys those cells. And that's why when I refer to cancer surveillance, it's actually the immune system that's surveying the body, the whole body, for these cancerous and mutated cells, and then destroying those cells as it sees them. And we have a very intricately beautiful immune system that takes care of all these mutated, damaged, and pre-cancerous cells and destroys them throughout our lives. And so when

something interferes with the immune system, and interferes in a major way, then you're actually removing that shield and then now some of these pre-cancerous cells can actually start growing rapidly and can spread and metastasize throughout the body.

So this is, again, one of the proposed mechanisms—what's called an IgG4 shift. Because when the body starts producing this IgG4—especially when you've had your third COVID vaccine dose, fourth COVID vaccine dose—it seems the more COVID vaccine doses you've had, the more IgG4 you produce and the less IgG1 and 3 you produce. So you're really removing that shield that you get with the IgG1 and 3 protection against cancers.

Then there are other mechanisms that are really worrying. The spike protein has been found to interfere with tumour suppressor proteins, P53 and BRCA1 (B-R-C-A-1) [Exhibit VT-3ii]. Now, BRCA1 is implicated in breast cancer, ovarian cancer, and P53 is involved in a number of cancers. It's damaged in a number of cancers. And the spike protein seems to interact or damage these tumour-suppressive proteins. Now, again, it has to be shown that, you know, it's the vaccine spike protein that's doing it as well, but that is a very concerning issue.

There's another paper that shows the spike protein interferes with DNA repair mechanisms [Exhibit VT-3jj; 3-vv]. That is problematic. There's another paper that shows that the RNA could integrate into our genome and that if it integrates in an area that is a proto-oncogene or a tumour-suppressive protein that it can lead to cancer. This has been shown in vitro [Exhibit VT-3kk].

[01:50:00]

It hasn't been shown in vivo, but again, another very concerning finding from the literature.

And then there's been a recent discovery by U.S. geneticist Kevin McKernan who actually did sequencing of Pfizer and Moderna mRNA vials. And he was looking for something else, and he actually discovered that there is DNA contamination in those vials—Pfizer and Moderna vials—and that there is actually a high percentage of contamination of DNA plasmids.

DNA plasmids are rings of DNA that contain the spike protein sequence, and it's actually part of the normal manufacturing process of Pfizer and Moderna. The way they produce these mRNA vaccines is they put the sequence of the spike protein into a ring of DNA called a plasmid. They then insert that plasmid into *E. coli* bacteria. They grow those bacteria in large numbers, billions and billions of copies. They then extract those plasmids from the *E. coli*, and they then transcribe that DNA into the mRNA, and then that mRNA is packaged into the vials and sent out as the Pfizer and Moderna vaccine.

Now, in the quality control process, they are supposed to actually enzymatically destroy all DNA so that there is no DNA contamination from the manufacturing process. And what this geneticist discovered—and it has been replicated in several labs since then, internationally, as well—was that there is a high amount of DNA plasmid contamination in these vials, and that up to 35 per cent of the genetic material in the Pfizer or Moderna vials, up to 35 per cent is actually DNA contamination. And that's potentially millions or billions of copies of these DNA plasmids.

This is concerning because DNA is much easier to integrate into our genome than mRNA would be. And so if you've got all this DNA contamination with the spike protein sequence in it, and you have billions of these DNA plasmids that are injected into you, there is

actually a significant risk that these plasmids may integrate into your genome. And again, if it integrates in the wrong place—in a proto-oncogene or a tumour suppressor gene area—you can get cancer that way.

And so this is a recent finding, highly concerning. And I've included Kevin McKernan's extensive documentation and sequencing of this, of these DNA plasmids, as evidence [Exhibit VT-3nn to VT-3pp].

Shawn Buckley

And we've entered that as an exhibit. It's just the list of exhibits— Just so that the Commissioners are aware: almost everything that Dr. Makis is referring to from a research perspective, he's provided to us, and we've included it as part of the record.

Dr. William Makis

Now, just the last two potential mechanisms.

When Kevin McKernan discovered these DNA plasmid contamination in these Pfizer and Moderna vials, he discovered that—specifically in the Pfizer vials; not in the Moderna vials, but the Pfizer vials—the DNA plasmid contained additional genetic information in the DNA plasmid. And this additional genetic information sits before the spike protein sequence, and it's called the SV40 promoter or the simian virus-40 promoter [VT-3ll]. And this sequence, no one knows why it's there. Pfizer has not explained why the sequence is there in these DNA plasmids. Simian virus 40 causes cancer in humans [Exhibit VT-3mm] and the cancers that it causes specifically are lymphomas [Exhibit VT-3qq] and glioblastomas—brain cancers.

Now, it is of course a portion of that virus. It is not the entire virus. So only a portion of it was discovered. But again, the concern is it's a promoter. So it is the sequence that could then encourage transcription of an entire sequence afterwards. So again, if this oncogenic piece of DNA integrates into our genome in the wrong place, it could eventually lead to cancer. So this is another concerning finding that has not been explained by Pfizer, and it's another potential mechanism by which these cancers may be arising.

And finally, there are sequences in the Pfizer vaccine and Moderna vaccine which are called microRNAs. These are non-coding sequences, so these are additional sequences present, which don't seem to code for anything. But when they are transcribed, they themselves are potentially oncogenic and cancer-causing [Exhibit VT-3ss].

[01:55:00]

So I've attached literature concerning all of these potential mechanisms—these nine different mechanisms—and as I've stated, it is unclear at this time which of these mechanisms is the one that's causing cancer, and it may be more than one of these mechanisms that are causing cancers in different individuals.

Shawn Buckley

No, and I appreciate you being fair with us and making it clear that these are just now theories. There's not enough research. And I also thank you for providing the research articles. For those that are interested, it will all be part of the record and attached to your witness page. So thank you for doing that.

Dr. William Makis

I wanted to summarize the features of these turbo cancers, just briefly. I have documented over 200 of cases of what I believe are turbo cancers in COVID-vaccinated individuals on my Substack. I have documented these cancers in doctors, in nurses, in teachers, in young people, in pregnant women. And my concern here is that these seem to be arising in greater numbers in professions that had COVID-vaccine mandates implemented on them. So these are, again, doctors—had vaccine mandates—nurses, teachers, military, police officers, firefighters, city workers, and so on, and that is where I'm seeing a greater number of these cancers arising.

So the features of these turbo cancers: They present in young individuals. They can present in teenagers, people in their 20s, 30s, 40s. I do suspect that because I focus on younger individuals, then I'm seeing more of these in younger individuals. It is possible that they may occur across all ages.

Shawn Buckley

Can I just clarify, though, because at the beginning of your testimony on cancer, you were saying, you know, you just weren't seeing this type of thing before. So even though you're maybe focusing more on young people, is it still a type of cancer you just wouldn't expect to see in young people?

Dr. William Makis

I would not expect to see this, and I can tell you I have not seen cancers behaving this way in young people before the rollout of the vaccines. I've never seen this in my career. So when I write my Substack, I focus on young people because I feel that, you know, these vaccines should be stopped in young people. But it really— You know, I believe that these are probably occurring across all ages.

These cancers tend to present at Stage 4. They present late. They don't seem to be picked up. You know, I have not seen stories of Stage 1 and then, you know, it progresses extremely rapidly. They seem to be presenting at a late stage—Stage 3 and Stage 4. They have very rapid growth. And whatever the type of cancer it is, whether it's breast cancer or colon cancer, lung cancer, they grow so rapidly that they always catch the oncologists off guard.

And you will see these stories anecdotally, if you go to GoFundMe. And we're not seeing these stories from the medical establishment. This is what's so frustrating, is that doctors are not publishing these cases. We are seeing these cases on social media. We are seeing them on places like GoFundMe, where the patient will tell us what their experience and what their oncologist told them. And their oncologist will say, "I've not seen this. This is 10 years of growth in a month or two, you know?"

And so these tumours grow very, very rapidly over a very short period of time. They are highly metastatic, and what I mean by that is that they spread, and they spread to multiple locations in a very short time. So you know, in some of these cancers, like breast cancer or— Let's take colon cancer. You know, when colon cancer metastasizes, you expect the first metastasis to show up in the liver, for example, and then, you know, you can actually track that; you can actually surgically remove that, and you can deal with it. These seem to spread to multiple locations in a very, very short period of time.

And another feature which is fascinating, which I have no explanation for, is they seem to be quite resistant to conventional chemotherapy and conventional radiation therapy and other conventional treatments. And what you will find— Again, anecdotal evidence, but what you will find is people will say that they had partial response, but then it was very short-lived. And sometimes the patients will say that the tumour didn't respond at all to chemotherapy or radiation therapy. And that, again, is really quite unusual.

[02:00:00]

And again, something I really have not seen in my career, that you would have tumours that you would expect to respond to conventional regimens and they're not responding to chemo or radiation therapy.

And then I'd like to briefly talk about what kinds of cancers we're seeing. That I'm seeing. And I've tried to document, at least on an anecdotal level, how common some of these cancer types are. And it seems that lymphoma is the most common one, closely followed by glioblastoma: these are Stage 4 brain cancers. And then breast, colon, and lung seem to be the common ones. I have seen cancers of the hepatobiliary system: these are the gallbladder cancers; these are pancreatic cancers. They also seem to be happening at a higher rate than I would expect. And the leukemias.

Now, the leukemias. What's fascinating about the leukemias is that they are so aggressive that the time from diagnosis to death can be a matter of weeks, days, or even hours. I've reported on my Substack several cases of leukemia where a young person will feel unwell: they will present to emergency; they will have blood work done; and the doctors discover you have leukemia, and they will die a few hours after diagnosis. And this is, again, something that I have never seen in my career. To die in a matter of hours, even days, after diagnosis is something that I have simply not seen. That is another feature that is really frightening with these turbo cancers.

When it comes to fatality, they kill much more quickly than you would expect tumours of their type. And so, you know, the leukemias are particularly aggressive and deadly, as I had mentioned, but typically, you will see a lot of these cancers kill in a matter of three to six months. And the majority of them, it'll be six to twelve months. And again, you expect patients with breast cancer, lung cancer, colon cancer to live more than six to twelve months. Even at Stage 4, you expect them to live several years. You know, we have those survival charts, the five-year survival charts, and that's simply not what we're seeing. These are lethal, and they kill much more quickly than anything I've seen in my career.

And so, you know, that sort of concludes my presentation on the turbo cancers.

Shawn Buckley

Now, I know we were planning on doing sudden deaths during vaccination. Could we just do that in a minute or so? Just we're running a little late, and I'd like to leave this open for questions from the commissioners.

Dr. William Makis

Absolutely. I would just like to mention that we've coauthored a paper [Exhibits VT-3jjj and VT-3kkk]. Now, Dr. Peter McCullough has led this initiative. Dr. McCullough is a Texas cardiologist, and he's been at the forefront of warning about sudden deaths, specifically

cardiac-related sudden deaths, after a COVID vaccination—and Dr. Paul Alexander, Dr. Richard Amerling, Dr. Roger Hodkinson, and Dr. Mark Trozzi: a number of us had gotten together, and we'd conducted the largest review of autopsies that has ever been done of sudden deaths of COVID-19 vaccinated individuals. This is now a pre-print on the Zenodo server. It is under peer review.

We reviewed 325 autopsy cases, and we found that 74 per cent of those deaths were either directly caused by the vaccine or there was a major contribution by the vaccine. And these are sudden deaths shortly after COVID vaccination: the mean time to death was 14 days. And so, you know, this has been seen and downloaded hundreds of thousands of times. We submitted this to *The Lancet*, and *Lancet*, within 24 hours, removed it from their server. It was being downloaded hundreds of times a minute and I believe, as an act of censorship and to stop this finding from being peer-reviewed and published, *Lancet* removed our paper from their server. And so, you know, this is now under peer review and I hope that other researchers will— You know, I hope we get this published, and I hope that other researchers will sort of follow on and build on our research.

We've done a similar review of—

Shawn Buckley

Can I just stop you there? *The Lancet*, it was peer-reviewed and they accepted it for publication, right?

Dr. William Makis

It wasn't peer-reviewed. Now, it had gone through an initial review and so they saw that, you know,

[02:05:00]

this is an extensively referenced, big paper, so it passed initial reviews. They put it on their preprint server and then, 24 hours later, they removed it from their server; didn't really give a legitimate explanation why they removed it.

Shawn Buckley

And it was being downloaded extensively.

Dr. William Makis

Yes. And as you can see, it's been viewed and downloaded, you know, several hundred thousand times. But *Lancet*, in what appears to be an act of censorship, removed this paper from their preprint server.

Now this paper is being hosted on CERN [Conseil Européen pour la Recherche Nucléaire (European Council for Nuclear Research)], on a Zenodo server, which is sponsored by CERN in Switzerland. And so now people have access to it. They can download it; they can read it. We found that the majority of the sudden deaths of COVID-19-vaccinated individuals are cardiovascular. There's also a large component of hematological, so blood clots. I think it is a fantastic paper. And I think it sheds a light on the phenomenon of sudden deaths after COVID vaccination.

We wrote a similar review and a paper with myocarditis [Exhibit VT-3lll]. We looked at all the myocarditis cases in the literature in those who were COVID-vaccinated. And we found that 100 per cent of the myocarditis deaths were due to the vaccine. This is also under peer review right now.

And so I'd be happy to move on to answer questions.

Shawn Buckley

Let's open it up to the commissioners, except if you want to comment. In this slide that you just took down, you're calling for the suspension of COVID-19 vaccines?

Dr. William Makis

Yes, and so if I may just show the last slide. You know, the purpose of me presenting all this evidence and also giving documentary evidence, I feel very strongly about what I've seen in terms of the adverse events of the COVID-19 vaccines. And I am calling for the immediate suspension of the use of COVID-19 mRNA vaccines, especially in children of all ages and pregnant women.

Because the sudden deaths that I described, that we have reviewed—autopsy cases of these sudden and unexplained deaths when people are dying in their sleep or they're collapsing when they're playing sports or doing a physical activity, out for a jog, or they're collapsing in the classroom. I'm seeing this in teenagers—in vaccinated teenagers. I'm seeing these sudden deaths in children—elementary school children. I'm seeing these sudden deaths in pregnant women. It is very disturbing to me as a physician to watch these deaths and watch the injuries, as well [Exhibits VT-3xx to VT-3zz; Exhibits VT-3aaa to VT-3ddd].

I believe there is a substantial body of evidence of very serious adverse events, including deaths, caused by or significantly contributed to by the COVID vaccine [Exhibit VT-3tt; Exhibit VT-3rr]. And it is my conclusion that these pharmaceutical products are neither safe nor effective. And furthermore, I call for the immediate suspension of all remaining COVID vaccine mandates, especially in healthcare. And I hope that other physicians will join me and will find their voice and will find courage to stand up for their patients, to stand up for the Hippocratic Oath to do no harm, and to stand up for the ethical practice of medicine in Canada.

Shawn Buckley

Thank you. So I'll open this up for questions now. But just, you know, you actually calling for a stop of the vaccinations was worth us coming back to and having you comment on that.

So just go ahead and unmute yourself, Commissioner Drysdale.

Commissioner Drysdale

Dr. Makis, thank you very much. It is a very good presentation. There is a lot of pieces to it, so I want to kind of roll back to the beginning and ask some, probably, what are very fundamental questions.

In your opening part of your presentation, you talked about the Alberta Health Services' mandates to health care professionals. I believe in that slide you talked about how the—or

at least you showed—and I'm just taking a look at the slide right now. You showed how Alberta Health Services had made the statement that immunization against COVID-19 is the most effective means to prevent the spread of COVID-19. Do you have any information as to what scientific basis the Alberta Health Services used to make that statement?

[02:10:00]

Dr. William Makis

I have not seen any document that would support that statement from AHS.

Commissioner Drysdale

My second question, again, has to do with the Alberta College of Physicians and Surgeons. How is a mandate of a medical procedure, specifically a vaccine or a biologic—a lot of the testimony we had said this is not a vaccine, it's a biologic, but be that as it may—how does the mandating of this medical procedure square with the requirement for informed consent?

And before you answer that, I just want to take a look in— The College of Physicians and Surgeons of Alberta, they define exactly what is required to get informed consent. And one requirement is that the person making the decision to take the procedure has to be free of any undue influence, duress, coercion, or anything else that might influence their decision to give informed consent.

So once again, my question is: How does mandating a medical procedure adhere to the principles of informed consent, particularly when your job is at threat? How did the College of Physicians and Surgeons, do you believe, square that circle? It seems to me, in reading it on the face of it, that mandating a procedure with the threat of losing your job is against the, you know, it certainly violates the coercion part of informed consent. Would you agree with that or do you have any more information to add to that?

Dr. William Makis

Certainly. So I would like to clarify that the mandate was issued by Alberta Health Services. It seems to have been issued unilaterally by the leadership of Alberta Health Services. I know that at the time, the media was asking Jason Kenney, the Alberta Premier, for comment, and the Alberta Minister of Health for comment, and they deferred to Alberta Health Services. And so this was a unilateral imposition of a vaccine mandate.

And you can see in the letter of opposition to the vaccine mandates, the health care workers are clearly stating the scientific basis for opposing these mandates. I consider these mandates highly unethical, unscientific. The health care workers documented the hundreds of thousands of injuries in the VAERS reporting system, you know, over 10,000 deaths. And so I found this a gross violation of medical ethics, of the Canadian Medical Association code of ethics.

The mandates came from Alberta Health Services. Now, what's interesting is that the College of Physicians and Surgeons of Alberta, they did not put a mandate themselves, but they stepped in and they sent threatening letters to doctors who were opposed to these vaccine mandates. And so there's an additional layer of coercion where it's not just that you're being threatened by your employer, that you will lose your job, or, as was stated, that you will be put on unpaid leave. And we know that there were many health care

workers who lost their jobs or were forced into early retirement. But now, here you have the College providing an additional layer of coercion and intimidation by saying that we're aware of your opposition: we're putting it on your permanent record, and we're giving you the opportunity to withdraw your opposition to these vaccine mandates. That, again, to me, was a gross violation of everything I know about medical ethics.

Commissioner Drysdale

Well, you know, you make a point that Alberta Health Services unilaterally imposed these mandates. But the bottom line is that the injections were given by physicians or pharmacists or nurses, and they are all regulated under— At least the doctors are regulated under the Alberta College of Physicians and Surgeons. So the Alberta College of Physicians and Surgeons was directly involved in that they weren't regulating their members to adhere to the principles and requirements of informed consent.

I mean, I don't know how it is in Alberta, but I know that in Ontario, it's not just a regulation under the Ontario College of Physicians and Surgeons. But there's actually an Act that regulates informed consent in the medical profession outside of that. And I don't know if that's the way it is in Alberta or not.

[02:15:00]

Do you know that answer?

Dr. William Makis

So it wasn't part of my presentation tonight, but I am aware that the College of Physicians and Surgeons of Alberta had sent out a memo to all Alberta physicians indicating that they were not to do anything that would create vaccine hesitancy—and that conflicted with providing informed consent. And furthermore, you know, this includes discussion of risks of the COVID-19 vaccines, and informed consent requires that you discuss both the benefits and the risks.

I have run clinical trials in Alberta. You know, we had regulations that we adhere to very strictly. I had to provide to my end-stage cancer patients a detailed assessment of all the benefits—but of all the risks, as well, with whatever pharmaceutical product that I was going to give them. And in the end, there was no coercion. It was completely up to the patient whether they wanted the product or not.

I'm aware that the College put tremendous pressure on Alberta doctors where doctors were not allowed to provide this kind of informed consent to their patients when the vaccines were rolled out—the first two doses, the booster shots. In fact, that remains the case to this day.

Commissioner Drysdale

Yes, I mean, are you aware of the fact that the CDC and the FDA have approved a new COVID-19 vaccine? And it is my understanding that as of this date, the Pfizer documentation on this actually says that they don't know what the long-term side effects are. They don't know what all the side effects are, and they're still examining this. So that's current as of September 11th, 2023.

If we don't know all the side effects and the manufacturer is saying within the last week—September 11th, 2023—that they don't know all the side effects, how is it possible that they knew all the side effects in December of 2020 when Health Canada approved these vaccines for use in the general population?

Dr. William Makis

Well, I will go one step further: On September 12th of this year—this was a week ago—Canada's public health chief, Dr. Theresa Tam, and chief adviser to Health Canada, Dr. Supriya Sharma, approved the newest COVID-19 booster shot against XBB.1.5 and recommended these vaccines in children as young as six months old and in pregnant women at all stages of pregnancy. And I've read the document that shows the safety studies that were done, and there were no safety studies done on this product in regards to children or in regards to women in pregnancy.

And so, to me— And again, I don't know what to say about this as a physician, that we have our federal bodies—Health Canada, public health chief—recommending pharmaceutical products on which there were no safety studies done in populations like children as young as six months old and pregnant women.

Commissioner Drysdale

Well, I've also read those documents, and I wanted to ask you about that because in the Pfizer document, with regard to the new COVID-19 vaccine, it's my understanding that there were no clinical trials on it and that they relied on the original clinical trial information.

And also, when I read that documentation, I'm just wondering—since I believe you have read it, as well—they list what they believe are all the side effects for children and they don't mention death in that list. I mean, you've talked about death. I've heard many other witnesses talk about death in patients who receive the vaccines, and yet death is not a side effect listed in the Pfizer document. Is that unusual that they wouldn't list— I mean, that's a fairly serious side effect, I would think.

Dr. William Makis

It is very unusual, and I find it extremely unusual that to date, Health Canada has stated that there have been zero deaths linked to any of the of the COVID-19 vaccines. When in the United States, in the VAERS reporting system, we have something like over 30,000 deaths reported. Now, of course, you know, these should be investigated.

[02:20:00]

And this is the other part of it—that proper investigations aren't being done; proper autopsies are not being done. And so, you know, this entire process is, to me, very controversial and questionable.

Commissioner Drysdale

Well, Dr. Makis, that brings me to my next question. And you keep talking about the VAERS system. And for our listeners, the VAERS system is a— I would describe it as a voluntary reporting service for vaccine injuries in the United States. But Canada has its own system called CAEFISS [Canadian Adverse Events Following Immunization Surveillance System]

and I don't believe I heard you mention that word. Have you reviewed the data from the CAEFISS system? Is there a reason you relied on the VAERS system rather than the CAEFISS system?

Dr. William Makis

I have been anecdotally informed by a number of doctors who have submitted vaccine injury reports that whatever reports they submit come back rejected. And this is within Alberta Health Services. Their reports don't make it to Health Canada. And so their reports are rejected at the level of Alberta Health Services, and they've been very frustrated. They've of course asked me to remain anonymous. They fear retaliation because they are still working in the system.

Basically, I've relied on anecdotal evidence that I've seen, and I've relied on VAERS reports. I've also looked to the WHO VigiAccess database as well in my research.

Commissioner Drysdale

Well, we heard evidence from a number of doctors across the country that corroborate what you just said. As a matter of fact, there was one doctor, I believe, who testified in Truro who reported a number of adverse reactions, according to his testimony, and was dismissed, I believe, because of that, or was at least alleged to be dismissed.

But moving on, you talked about a fellow by the name of Tim Caulfield, who is— I think your title that you had in your slide was Canada Research Chair in Health Law and Policy. And I noticed that when they list him, it doesn't say doctor. Is he a doctor?

Dr. William Makis

No, Mr. Timothy Caulfield is a professor of law at the University of Alberta.

Commissioner Drysdale

How does a professor of law become the Research Chair in Health [Law and Policy] for the University of Alberta and make commentary on medical matters that you, as a qualified doctor, have made comment on?

Dr. William Makis

I honestly— I can't answer that question.

Commissioner Drysdale

I have another question that has to do with some of the slides that you had up. And I was searching for one of the references you made. And one of the references was in the slide that you had up and I'm just going to read it.

I don't see a number on your slide, but it says— It's a quote out of—oh, gosh, I can't remember—one of the newspapers who were critiquing what you were saying. And the newspaper said, "According to a recent *Epoch Times* story," and then it goes, "—an anti-China publication associated with Falun Gong." And when they referred to Gettr, they said, "a right-wing" whatever-it-was. And it seems that in a lot of these editorials or these

commentaries you've got, they put these labels on certain things, and other things they don't comment on.

And for instance, with Mr. Tim Caulfield, they didn't say, "a professor of law with no experience in medicine," which would have been consistent with "Epoch Times—an anti-China publication associated with Falun Gong," which really didn't have anything to do with the article.

Have you seen much of that, where the media seems to be putting labels on these outlets in order to— I can only guess it was to characterize them a certain way. Have you seen much of that?

Dr. William Makis

Yes, well, I can tell you— I can specify that the reference to the "anti-China publication" associated with Falun Gong, this was the *Toronto Star*. This was the *Toronto Star* article by reporter Alex Boyd. And then the reference to Gettr being an "alt-right" website, this is Global News by reporter Ashleigh Stewart.

These are mainstream media publications. I am not alt-right. I don't see Gettr as an alt-right website. I certainly don't subscribe to any of these labels, and I see these labels as, really, a smear tactic.

[02:25:00]

It is a tactic to smear me in their article and to really tarnish my reputation and tarnish my credibility, and really tarnish anything that I have to say.

You will notice that there is no reference that I have won 15 scholarships at the University of Toronto, that I have a four-year undergraduate degree in immunology with honours from the University of Toronto, that I have a five-year specialization from the best medical school in Canada—McGill University. There's never any reference to my qualifications. There's no reference to the fact that I'm a cancer researcher with over 100 peer-reviewed publications in international medical journals.

And so, you know, I see these as smear tactics, and I believe I was the victim of a smear campaign by the mainstream media.

Commissioner Drysdale

My next question has to do with Table 2 of the information that you are providing from the Alberta government and particularly— Well, it doesn't matter which one. You have two different versions of it: one from March 31st, the second one from July 20th. But I'm just looking down and it talks about currently hospitalized—three doses, two doses, one dose, unvaccinated. But when I looked down into the notes, the asterisk says, "Table does not include those with one dose." But one dose is— Am I misreading this? I mean the table has one dose, but the asterisk in the notes to this Alberta government document says that it doesn't include with one dose. Am I reading that wrong or is that a mistake by them?

Dr. William Makis

I do see that. And I honestly, you know, I took these—these are snapshots from the government website as it was at the time, in both of those times. I don't have an explanation of why that statement is there.

Commissioner Drysdale

And we heard testimony from other researchers that— And as a matter of fact, the CDC now says on their website that people who have had COVID-19—I can't remember if it was boosters or injections—have a higher risk of contracting COVID-19. And where I'm going with this question is, again, going back to Table 2: the government says that within 14 days of getting the vaccine, they don't consider you protected. But if that's the risk zone in which you might be getting COVID as a result of the vaccine, aren't they masking—? Is it possible they're masking those results?

Dr. William Makis

Yes. So what I would like to say about this data that was being put out by the Alberta government is that, you know, I'm taking this data at face value. I, personally, as a physician, have a problem with the designation within the first 14 days after vaccination that someone would be labelled as "unvaccinated." I know that this happened and that this was part of the problem with the data throughout the pandemic. And I certainly don't subscribe to that.

And I believe that data manipulation was used to hide a lot of adverse events following vaccination. And we know that, actually, the majority of the deaths happened in the first two weeks after vaccination. And then those injuries and deaths were actually blamed and labelled as "unvaccinated."

Commissioner Drysdale

Well, didn't Pfizer actually say in their monograph that you were considered vaccinated within seven days of receiving the dose? I thought— I'm going by my memory, but I thought we had some testimony on that previously. Are you aware of that, Dr. Makis?

Dr. William Makis

I'm not aware of that. But I know that in Alberta, you know, the definition was 14 days. And it is my belief that initially, when the public health chief, Dr. Deena Hinshaw, talked about the pandemic of the unvaccinated—and then similar sentiments were echoed by Dr. Theresa Tam, Canadian public health chief—that this pandemic of the unvaccinated didn't exist. That it was a manipulation of the data where— And this was one of the manipulations: that people in the first 14 days after vaccination were labelled as "unvaccinated."

Commissioner Drysdale

Well, I have two more questions. I know Dr. Massie is anxious to ask some questions, but I have two more questions.

Your specialty is oncology, so you're a cancer doctor, if you want to call it that. My understanding is that

[02:30:00]

the vaccines were tested initially for a period of about two or three months and then they were unblinded, which means that the side that received the placebo then received the vaccine. So they studied these vaccines—these biologics, as some other witnesses testified—for a period of a few months, two or three months at most.

As an oncologist, if I tested cigarette smokers for two months, would I discover that they got cancer from cigarettes?

Dr. William Makis

No. And there is no long-term testing on any of these products, whether it was the first doses or whether it was the booster shots, Pfizer or Moderna. There has been no long-term testing on any of these products, and this is one of the reasons I was opposed to vaccine mandates, to mandating these experimental products: that we had absolutely no data on what the long-term consequences were of mandating this product on all the health care workers, for example. That was just absolutely unconscionable, unscientific, unethical. And that is why I started my presentation with the vaccine mandates that were imposed in Alberta and, really, throughout Canada.

Commissioner Drysdale

Well, you know, talking about pregnant women: I mean, thalidomide was a drug that was prescribed to women in the early '60s, I believe, and caused significant issues with birth defects. And once again I ask the question: If you were testing thalidomide now on pregnant women and you tested it for two or three months, would you know whether or not you were going to have birth defects on those women nine months later or six months later?

Dr. William Makis

Well, again, the problem is that even the animal studies that they did were, in my view, insufficient. And when it comes to pregnancy— Sorry, that is my cat. When it comes to pregnancy, where I'm really concerned is that there is a blanket recommendation of these products in pregnancy. And I have published on my Substack, I have reviewed the VAERS database extensively in terms of what has been reported, the problems that have been reported in pregnancy, and there are very serious problems that have been documented in the VAERS reporting system.

When you take the COVID vaccines in early pregnancy, there are congenital malformations of the heart, of the brain, of the limbs [Exhibit VT-3ggg]. When you take them in the second trimester, the fetus can stop growing within 24 hours of taking the Pfizer or Moderna vaccine. There are many such reported cases. There's a cessation of fetal growth that can lead to miscarriages or stillbirths [Exhibit VT-3fff]. And in the third trimester, there are many cases of stillbirth [Exhibit VT-3hhh], of premature labour, of maternal death, death during delivery of the mother or the baby, postnatal deaths [Exhibit VT-3eee] . These are very highly concerning cases, and that's why I want to see these products stopped. It should not be recommended for pregnant women until there's much more robust studies done.

Commissioner Drysdale

We also heard significant— And I'm going to ask you this question because you talked about cancers, that there was no screening done for a year or two and that, of course, there was an increase in the number of cancers detected after they started screening again. So they essentially stopped screening for cancers. And my question to you, or at least what I'm wondering about is, we heard testimony after testimony after testimony from medical professionals who said the hospitals were empty, who said that there was nothing going on. We saw commercials of nurses dancing in the emergency rooms. I, myself, had an experience in an emergency room during the lockdowns, and the emergency room and the hospital was empty.

So my question is, how in good conscience did we stop doing cancer screenings with the full knowledge of what the impact that would have when the medical system was not overloaded? At least according to the testimony we had: the hospitals were not overloaded; the emergency wards were not overloaded. And yet we stopped all these preventative measures. And according to your testimony, you're expecting an increase,

[02:35:00]

or you have seen an increased number of cancers detected, partially because we weren't doing screening for a year and a half or two years. Have you any insight into how they decided to stop doing those screenings, knowing what the risk was, and knowing that the hospitals were not overloaded in the first place?

Dr. William Makis

Again, I can't really speak to the decision making. Certainly, I would not have stopped those visits or cancelled those visits, or cancelled the surgeries. There were many surgeries that were cancelled, as well.

I don't believe it was that long of a period of time. I believe it was a number of months. I can't tell you exactly the length of time, but I don't believe it was more than a year.

And in terms of the expected increase you would see, as we would sort of catch up on those patient visits and screenings, again, it does not explain the phenomenon that I'm seeing with these cancers that are arising, and very, very aggressive cancers. And I am seeing this phenomenon in the United States. I'm seeing this phenomenon in the United Kingdom, in Australia, in all the countries that have a high uptake of the COVID-19 vaccine—specifically the mRNA vaccines—and also have high booster uptake. I'm seeing the same types of cancers in these different countries. And these countries, some of them didn't have, you know, closures or cancellations of cancer screenings or cancer visits, so this is a completely separate phenomenon.

One thing I would like to add is that it is impossible to get good data on the rate of cancers. I've tried to get this data. I've gone to Statistics Canada. I've gone to the Public Health Agency of Canada. You know, I've looked at the Canadian Cancer Society. None of these institutions, which should be releasing this data to the Canadian public, none of them are releasing this data. These three institutions put out a report in 2022 where the data only goes up to 2018. So we're actually not seeing any data—any data—on the incidences of cancer in 2021 and 2022, which is the data that we need to see to be able to assess this phenomenon of these aggressive cancers arising. You know, what is the rate of increase of these cancers and the particular types of cancers, as well?

I mentioned that there seems to be, anecdotally, a huge spike in lymphomas, glioblastomas, Stage 4 breast cancer, Stage 4 colon cancer, Stage 4 lung cancers, but we need broader data from these institutions—Statistics Canada, Public Health Agency—and we're not getting them.

Commissioner Drysdale

Well, your commentary on that particular item seems to be confirmed by Dr. Denis Rancourt, who testified here three times, and testified a third time because during the first two testimonies, the Canadian data was not available and he had used data from other parts of the world.

But those are my questions, Dr. Makis. Thank you very much for your time and your expertise and your courage to come before this committee.

Dr. William Makis

Thank you very much.

Commissioner Massie

Good evening, Dr. Makis. Thank you very much for this very detailed and, I would say, comprehensive presentation. What you've covered actually overlaps with a lot of other stories we've got from many other experts. But the emphasis you're putting— And I will focus my question mostly around the cancer and the potential mechanism for the cancer.

I have some knowledge in the tumour biology: I've been trying to develop protocols to fight cancer with gene therapy and stuff like that, so I have some knowledge. And it seems to me that one of the keys in cancer is really the immune surveillance of cancer. And one of the things that I've heard anecdotally from people in my surroundings is that some people have had cancer in the past that would seem to have been completely cured for, sometimes, decades. And after their second or third shot, it just went back, and they basically died from cancer in a couple of weeks or months. So how could you actually explain these kinds of cancers that seem to have been completely cured for decades, but all of a sudden are coming back following the immunization with these mRNA vaccines?

[02:40:00]

Dr. William Makis

I would like to state that Professor Angus Dalglish in London, in the United Kingdom, has made a public statement—exactly what you are mentioning, as well—that he, as an experienced oncologist, has seen a number of instances of cancer patients who had been stable—for example, melanoma cancer patients who had been stable on a certain kind of immunotherapy for many, many years. And then they take a COVID-19 booster shot, and then their cancer just explodes and spreads. And he said other patients who've been in remission and then their cancer returns, and it is aggressive and it is much more aggressive than before.

And again, I don't have an explanation for this phenomenon. You know, again, it's theoretical at this point. And again, it may have to do with some kind of suppression, immune suppression: that could be why these cancers can suddenly come back, but, again,

it's something that really needs to be researched. And I don't believe this kind of research is being done because there's no acknowledgement within oncology, as a medical specialty, that this phenomenon exists or that this phenomenon could even be a problem in the COVID-vaccinated. And so I think this is something that requires research. But it would first require an acknowledgement that the problem exists, that it is something that needs to be researched.

I'm sorry, I don't really have a theory right now on that phenomenon.

Commissioner Massie

On a follow-up question on that: when I look at your different mechanisms you're proposing as potential triggers for these cancer, some of them seem to qualify, what I would call, hit-and-run. That is, something would trigger the initiation of the cancer, and then it might take some time before the cancer really flourishes and, in fact, affects the individual up to the point that they will die. So what kind of research would be required in order to really link the occurrence of the cancer to that kind of triggering, which sometimes may or may not leave a trace of the initial event?

Dr. William Makis

Well, you know, I wonder about these events where the RNA is reverse transcribed into our DNA, or this issue with the DNA plasmids potentially integrating. So there would probably need to be some kind of sequencing testing done on people who've been vaccinated to see if there have been any integration events.

And I know that this is a concern of a number of doctors: that it's one thing to have the mRNA persist for a certain period of time and have the spike protein being produced for a certain period of time, and then, you know, eventually the mRNA degrades. Even the modified mRNA—which is supposed to last longer now that it's been modified with the pseudouridine—it degrades at some point, and the spike production may cease. But the concern is—is this spike protein sequence being integrated, in certain cells, into our genome? And then you're now faced with a situation where you're potentially producing spike protein indefinitely, and it's causing all kinds of immune issues.

And so I would love to see much more research around this problem of this integration of this spike protein sequence into our genome. And I don't have the expertise in that to really go beyond that. But I think that, for me, that would be an area of really strong interest.

Commissioner Massie

So I understood from your previous answer that, at this point, we don't gather enough data, maybe, to get a good assessment of the occurrence of this phenomenon in terms of a serious side effect of the vaccination?

Dr. William Makis

I don't believe the research is being done.

Commissioner Massie

So my question would be:

[02:45:00]

Your best assessment based on what you've scanned or the data you gathered, how would you compare that to, say, the occurrence of myocarditis? Is it, like, much lower in terms of rate? Is it same ballpark? Is it higher?

Dr. William Makis

Well, so myocarditis is a very interesting issue because I believe we've been lied to by the public health authorities about myocarditis, specifically the incidence of myocarditis in the COVID-vaccinated. I know that public health officials in Ontario, for example, have admitted a rate of one in 5,000. You know, there's been different numbers published in the literature: one in 10,000; one in 20,000 per dose.

But then you have the studies, like the prospective study in Thailand by Mansanguan, which shows a potential of subclinical myocarditis as high as 1 in 30. One in 30 young boys—you know, the teenage boys. You have the study from Switzerland by Dr. Christian Mueller who had looked at, you know, 800, approximately, health care workers after taking the booster shot and finding some evidence of cardiac damage—and he says it's mostly mild damage, but some evidence of cardiac damage in 1 in 35.

So there's a huge disparity in terms of what the public health officials are willing to admit in terms of how frequent these events are and what is happening on the ground. When you look at large databases like the WHO VigAccess database, which has five million adverse events reported from COVID-19 vaccines, there's a disconnect there. And so I think when it comes to the cancers, as well, we have a worse situation because there's actually no admission from any of the public health authorities in Canada or the United States that this phenomenon even exists.

So it's one thing to have public health officials admit, yes, the vaccines cause myocarditis, it's rare and mild—and that's the lie. But there is an admission that it can cause myocarditis; it can cause blood clots. But in the case of cancer, there is no admission by any health authority in the world that this is even a possibility.

I'm sorry, you're muted.

Commissioner Massie

So, yeah, when you do autopsy for myocarditis, you can find the spike protein in cardiac cells and cardiac tissue and get some sort of reasonable assessment that seems to be a mechanism that linked the two events. But in cancer, what kind of autopsy could you do in order to link the cancer with the vaccine? Can you think of ways that we could actually sort that out?

Dr. William Makis

This is going to be a lot more difficult. I am aware of some work done by Dr. Arne Burkhardt in Germany, pathologist, who has done some staining for the spike protein. I believe he's done some staining on tumour tissue. Dr. Ryan Cole in the United States, pathologist, has talked about this phenomenon of at least staining for the spike protein in the tumour itself.

And that's not being done. That's not being done in Canada. That's not being done, you know, in the United States by any of the medical authorities, but at least this would be a start. This would be a start: Is there presence of the spike protein in these tumours and how much spike protein is present? That would at least be the starting point for me.

Now again, that may not be sufficient in terms of linking many of these cancers to the vaccines, but at least we could start with that. And unfortunately, that's not being done.

When it comes to these cancers, I can tell you, we are so far behind in terms of approaching this topic in any scientific way that I feel very alone on this topic. As I mentioned, there's Professor Dalglish in London, in the United Kingdom, an oncologist who is also calling for investigations into these types of aggressive cancers. Of course, Dr. Roger Hodgkinson, pathologist in Alberta, you know, believes this phenomenon of turbo cancer is happening. Dr. Ryan Cole in the United States, Dr. Arne Burkhardt in Germany, Dr. Peter McCullough in the United States, as a cardiologist.

[02:50:00]

Recently, Dr. Harvey Risch has talked about turbo cancers, as well. But this is a very, very small group of us that are sounding the alarm on what we are seeing on the ground level—at the anecdotal level, really. And unfortunately, the medical community is simply not willing to look at this. Really, similar to the way the Canadian Medical Association is not willing to look at the phenomenon of sudden deaths of Canadian doctors. There's just no interest in looking for answers.

Commissioner Massie

I have another question. I was really curious about one of the mechanisms you mentioned about microRNA that could actually perturb the gene expression in the cell. Have you looked at some of the data showing that these microRNA can actually be derived either from the plasmid that uses a template to make the RNA vaccine, or is it possible that in the process of generating the RNA, you are generating the short segment? And do we know anything about whether these segments can actually have been shown to be a potential sequence to affect gene expression? Have we done some genomic analysis on that?

Dr. William Makis

I'll be honest, this is not my expertise. You know, this is beyond my expertise. You know, I'm aware that some of these sequences could act as either tumour suppressors or proto-oncogenes, but this is really not my area of expertise.

Commissioner Massie

So let me get back to immunology because that seems to be one of your expertise. I'm really concerned about the IgG4 potential role in the triggering of cancer because you would actually interfere with normal immune surveillance and you would generate an environment that is conducive to growth of cancer.

So I have two questions here. The first question is, it seems that from the literature, the occurrence of IgG4 increased with the number of doses of the mRNA—at least starting at the third dose and after that it seems to be pretty high: stable high.

So my first question is about these new vaccines that the health authorities are pushing for the fall. And they somewhat changed the message, at least in the States. I don't know in Canada whether they're going to use the same spin on it, which is this is not a booster: this is just a new vaccine for a seasonal, if you want, COVID strain similar to flu seasonal vaccine. But it seems to me that if you use the same mRNA technology, it's another injection that actually should be on top of what you already have. So should that actually further stimulate IgG4 or maintain it at high levels for people that have been previously injected, say, twice, and they decided to get their shot in the next fall?

Dr. William Makis

I believe so. I believe the antigen is almost virtually the same as the initial vaccines that you would have been exposed to the first dose, the second dose, you know, the first and second boosters. You know, they may have made some very minor modifications in terms of, you know, the Omicron XPV.1.5, but it is my understanding that the body would recognize it as just another exposure and that would probably continue driving this mechanism, this IgG4 shift. And really, it's very interesting that there's a very minor rise in IgG4 with the second shot. But it is the third shot that seems to make a very dramatic increase in this production of these IgG4 antibodies. And so just continuing along this path, I think, is just absolutely reckless.

And, you know, I see this departure from the word booster as a marketing ploy. Canadians, by and large, have stopped taking booster shots. I believe only five or six per cent of Canadians are considered up to date on their booster shots or have taken a booster shot in the past six months. And so it's clear that booster shots are unpopular—highly unpopular—even among people who have taken vaccines before.

[02:55:00]

And so I have actually read in the literature—now this is referred to as vaccine hesitancy literature—that they want to actually change the marketing of these vaccines, remove the word booster, and make them appear as annual, updated shots that you would get at your regular doctor visit, just like you would get your flu shot. And they really— It seems to be that there's this desire to now move towards this idea that these are harmless, annual shots just like the flu shots because the flu shot is seen in the literature as being very successful in the way it was marketed. And the uptake of the booster shots over a number of years: that the marketing involves removing the word booster and now changing the name of these shots as “updated shots” as opposed to “booster shots.”

But they are booster shots. It's the same antigen. I believe you're just exposing your body to more of the same antigen. And if you are on this IgG4 shift, I presume that just taking another shot only worsens the situation.

Commissioner Massie

So maybe one last question. I mean, there could be many more, but it's been a long night.

We started to see in the literature a lot of study around what they call “spikopathy,” which means that the spike protein itself is toxic and creating all kinds of pathology. It could come from the infection with the virus, as well as the vaccine, and it could be a combination of both.

But there is a push, it seems to me, to say, “Okay, in the mRNA platform, the problem could have been the spike protein, but if we now develop other types of vaccine with other antigens, then it’s going to be fine”: In other words, the mRNA lipid [nano]particle platform is fine, is perfectly effective and safe. It’s just maybe the spike, which was not a good idea. But now if we put something else for RSV [respiratory syncytial virus] or any other of this long list of vaccines that they want to shift—I think they want to do flu, as well—then it’s going to be fine because these other potential antigens will not have the issue of the COVID because it was spike.

So what is your take on that? Is it mainly the spike that’s responsible for the issues we’re seeing with these type of mRNA vaccines, or is it also the platform?

Dr. William Makis

I believe it’s the platform. I believe the entire lipid nanoparticle mRNA platform is problematic. And I’ve noticed this same kind of phenomenon in terms of blaming the spike protein of the coronavirus and actually rehabilitating the platform and saying the platform is fine. I’ve seen this talked about with the protein they plan to use with influenza vaccines, for example, that it’s less likely to mutate and it’s not like the spike protein; it’s not going to cause the same problems. I believe the lipid nanoparticle mRNA platform is the problem, and the problem is that the lipid nanoparticles, when they’re injected with mRNA, regardless of the mRNA, they go systemic. And I believe that it is this systemic distribution that is the source of virtually all the injuries that we’re seeing—the vaccine injuries.

Now, of course, the spike protein is highly inflammatory and its expression in the various organs and the distal expression is highly problematic. But I believe that we would see similar kinds of problems with any other protein, whether it’s from influenza or RSV or HIV [human immunodeficiency virus] or CMV [cytomegalovirus]. I know that all these vaccines are planned, and I believe we’re going to see similar proteins because the lipid nanoparticle does not stay in the arm. There’s no mechanism for it to stay in the arm. It very quickly ends up in the bloodstream, is delivered systemically, and I believe that’s where you run into the problems: you’re delivering this mRNA systemically, which shouldn’t be delivered systemically.

Then you’ve got the translation of this foreign protein, and being expressed in tissues that should not be expressing this protein, causing all kinds of immune reactions and just causing immune havoc, which then leads to— You know, you’ve got the myocarditis, you’ve got the blood clots, you’ve got various autoimmune injuries.

[03:00:00]

And, of course, the lipid nanoparticles crossing the blood-brain barrier is a problem, crossing the placenta is a problem. This has not been addressed at all.

And I have seen a presentation by Stéphane Bancel, the CEO of Moderna, saying very clearly, “We’re going to use this same exact technology in all our future vaccines. We’re going to use the same production method, the same manufacturing methods.” And so I believe that this entire platform, this lipid nanoparticle mRNA platform has to be shut down, has to be stopped. There have to be a lot more independent studies, or what have you, before this is ever brought back again. I believe that this platform is the problem. It’s not the spike protein—it is the entire lipid nanoparticle mRNA platform.

Commissioner Massie

Thank you very much, Dr. Makis.

Shawn Buckley

Well, that being all the questions, Dr. Makis, first of all, on behalf of the National Citizens Inquiry, I want to sincerely thank you for coming and testifying. You have provided some information— And perhaps it's fortunate that your testimony got delayed. We did want to fit you in earlier, but we had scheduling problems. But you were able to share something that you couldn't have talked about until now. And I think this is going to go down as extremely important testimony, and I think a lot of people watching this are going to be really shocked by what you had to say. And so I sincerely thank you for taking the time and effort to attend at the National Citizens Inquiry and testifying with us today.

Dr. William Makis

Thank you very much for giving me the opportunity to testify.

[03:01:53]

Final Review and Approval: Margaret Phillips, October 27, 2023.

The evidence offered in this transcript is a true and faithful record of witness testimony given during the National Citizens Inquiry (NCI) hearings. The transcript was prepared by members of a team of volunteers using an "intelligent verbatim" transcription method.

For further information on the transcription process, method, and team, see the NCI website:
